

LIGHTSTEP PRODUCT OVERVIEW

ServiceNow Applications	
Lightstep Active Services	Provides the capability to report telemetry from, and monitor the performance of, Customer's selected services within a one-month period.
Lightstep Active Time Series	Provides the capability to view timestamped measurements that share a metric name and a unique set of tag keys and values.
Lightstep Key Operations	Provides the capability to monitor performance of Customer's selected operations by measuring the latency, error rate and operation rates of those operations.
Lightstep Span Data	Provides the capability to send Trace Data to the Lightstep Service in order to support analysis and correlations across application errors, latency, and system topology segmented by metadata attached to the Trace Data where Trace Data is the path of an individual transaction or request as it flows through an application. Also provides the capability to retain Trace Data and associated metadata in order to support analysis and correlations within the Lightstep Service.
Lightstep Span Data Ingest	Provides the capability to send Trace Data to the Lightstep Service in order to support analysis and correlations across application errors, latency, and system topology segmented by metadata attached to the Trace Data where Trace Data is the path of an individual transaction or request as it flows through an application.
Lightstep Span Data Retention	Provides the capability to retain Trace Data and associated metadata in order to support analysis and correlations within the Lightstep Service where Trace Data is the path of an individual transaction or request as it flows through an application.

Lightstep Streams	Provides the capability to display statistical time series data and example traces.
