Automate Clinician Service Requests with EMR Help

Resolving EMR issues and routing change requests with one click
Challenges and opportunities

The expanding role of EMRs in patient care

Healthcare is complex. That’s true for all those involved — patients, caregivers, clinicians, IT, administrators, and beyond.

The push from inpatient to outpatient settings and the shift from volume to value-based care adds to this complexity by contributing to market disruption. These disruptions can include mergers, acquisitions, expansions, and more. Healthcare organizations currently face a significant challenge when integrating systems and processes across the continuum of care.

Electronic Medical Record (EMR) systems have become a mission-critical component for delivering appropriate and timely high-quality care. They function as the single source of truth for providers and patients. Healthcare providers need their EMRs and supporting infrastructure to be always running and compliant with strict regulations for health data security and privacy.

Due to regulatory and operational requirements, clinicians today are spending more time behind a screen. These extra technology burdens and time away from patients contribute to physician burnout. And that’s when everything is going right.

But technology issues are inevitable, and it’s the last thing that clinicians have time to deal with. How can you make things easier to report issues and request enhancements to their experience?

Let’s look at what we can do to improve this experience for clinicians and IT, so providers can focus on what matters most – caring for patients.

58% of physicians say there is a big opportunity for improvement in clinical documentation²

EMR service requests made easy for clinicians and IT

In the past, an issue with the EMR or an enhancement request meant a clinician had to go through a difficult process of contacting their IT help desk, jotted down issues on sticky notes, or documenting requests in spreadsheets. But there is a better, more streamlined way.

By leveraging the NOW platform, clinicians can make a service request directly from the EMR into ServiceNow, whether that request is to flag a problem or to ask for an enhancements, such as adding blood pressure details to the intake screen.

EMR Help allows the clinician to automatically create this request with a click of a button. It can even take a screen shot to aid in the IT troubleshooting process.

The clinician’s request is also tagged to their user profile, so they can track its progress, and this workflow is expedited because requests are automatically routed to the proper teams for resolution.

Everyone wins by keeping clinicians’ attention focused on the patient experience.
Exploring the value of automating EMR service requests

What does this mean for clinicians?

- Clinicians are more inclined to report issues within the EMR, reducing unreported issues and walk aways
- EMR issues are captured, tracked, and resolved faster
- The user experience for clinician improves, as everything takes place within the EMR
- Clinicians can spend more time with patients, and less time dealing with IT

What does this mean for IT?

- Single platform for IT to manage projects, resources, and deliverables
- Minimizing the need for clinicians to reach out to IT for the status of issue remediation and enhancement requests
- Greater productivity and speed to resolve issues by auto-routing issues to the right teams
Making an impact at your healthcare organization

Health IT systems support clinicians in the delivery of high-quality care. When something goes wrong within the EMR and data becomes unavailable or compromised, these systems can instead get in the way.

As healthcare organizations expand and support more complex services and technologies, their IT leadership will face increasing challenges in keeping critical systems operational and optimized to streamline the care delivery process for clinicians.

By combining the power of ServiceNow IT Service Management with EMR Help, healthcare organizations can streamline EMR service requests for clinicians reporting issues and requesting enhancements that will improve their experience. This approach enables IT to respond quickly, ensuring patients receive the best experience possible at the point of care.
