How do I perform ServiceNow upgrades?

Questions addressed:

Page 1:
• How often should I upgrade?
• What is the value of staying current?

Page 2:
• What is the upgrade process?

Page 3:
• How do I speed up testing?
• Where can I find additional content to help me upgrade?

It’s important to stay on the current ServiceNow® release so you can take full advantage of the new products and capabilities as they’re released and so you maintain the highest levels of security, availability, and performance.

How often should I upgrade?

• The ServiceNow upgrade policy states that we provide support for the two most recent release families—the current release and one release behind the current. This means you need to upgrade at least once a year to stay current. Once you fall behind the supported versions, ServiceNow will schedule an upgrade for you.

• There are two major releases each year, typically in March and September. Determine your upgrade plan (once or twice a year) and plan ahead.

What is the value of staying current?

By consistently performing upgrades to the Now Platform®, the potential benefits you can expect include:

- **Achieve business value faster**
  Increase workflow efficiency by up to 25%*

- **Bring new capabilities to market faster**
  Get faster access to new features, reducing time spent on build-outs and developments by as much as 80%*

- **Improves platform performance and the upgrade process**
  Reduce the time spent on upgrades by as much as 81%*

*The Total Economic Impact™ Of Staying Current With ServiceNow Upgrades, a commissioned study conducted by Forrester Consulting, August 2020.

How do I perform ServiceNow upgrades? (Continued)

What is the upgrade process?

**Phase 1: Plan**
- Read the release notes and plan your upgrade
- Complete the preparation and planning tasks in Phase 2 of the upgrade planning checklist (Paris)
- Evaluate the level of customization on your instances
- Create a comprehensive test plan

**Phase 2: Prepare**
- Prepare for the development instance upgrade

**Phase 3: Schedule upgrade**
- Verify your upgrade configurations and schedule the development instance upgrade in HI

**Phase 4: Review upgrade**
- Upgrade and validate the development instance

**Phase 5: Test and validate**
- Upgrade and validate your other non-production instance(s), such as your test instance

**Phase 6: Remediate**
- Prepare to upgrade the production instance
- After validating that your upgrade was complete, apply update sets and fix scripts
- Perform post-upgrade user acceptance testing
- Hold a retrospective review to identify what worked well and what you can improve next time

**Phase 7: Production upgrade**
- Upgrade the production instance

Sub-production instances

- Read the release notes to understand the required upgrade and migration tasks
- Evaluate the level of customization on your instances
- Create a comprehensive test plan

- Complete the preparations and planning tasks in Phase 2 of the upgrade planning checklist (Paris)
- Evaluate the level of customization on your instances
- Create a comprehensive test plan

- Follow steps in the upgrade planning checklist to set up your instance for the upgrade and then schedule your upgrade in HI

- Track the progress of your upgrades with the Upgrade Monitor
- Use the Upgrade Monitor to process the skipped list of records that were not addressed in the upgrade
- Gather the update sets needed to address skipped records, changes to configurations needed for the upgrade, and items that must go live immediately after the upgrade. Then, perform functional testing

- Configure and refine your development instance
- Upgrade other sub-production instance(s) you have in your development to production stack
- Configure your test environment to be a good representation of your production environment

- Review and fix issues discovered during testing
- Communicate the upgrade to stakeholders and consumers

- Create a system clone of your production instance so you’ll be able to simulate an upgrade on your production configuration in a non-production environment

- Create a comprehensive test plan

- Perform post-upgrade user acceptance testing
- Hold a retrospective review to identify what worked well and what you can improve next time
How can I speed up testing?

- **Automated Test Framework (ATF)** is a native Now Platform application to create and run automated testing. ATF helps you complete upgrades faster by automating slow, complex, resource-intensive manual testing. When you upgrade, run ATF tests to confirm that the instance still works as designed.

- **Jumpstart Your Upgrade** is a service that ServiceNow offers to customers who would like to do a dry run of an upgrade in a demo environment. It’s a great way to work out some of the kinks before you start the real upgrade.
