DPM roles (continued)

Role title [name]	Description	Contains roles

	Note: The DPM manager can't view or map KPI groups in the ServiceNow AI Platform but users with the service_editor, service_admin, or service_author roles can map KPI groups to their services.
	
	• Functions that the DPM manager can't do:
	  ○ Edit services, offerings, business applications, or application services.
	  ○ Edit and update relationships to services, offerings, business applications, or application services.
	  ○ Create or edit a service in Service Builder.
	
	Note: Service Builder buttons are hidden for the DPM manager role unless the user has the correct role that provides edit access to a particular solution.	

Assign the DPM manager role to groups

To edit a personal portfolio, a group must have the DPM manager role.

To assign the DPM manager role to a group, the admin does the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Enter `dpm_personal_portfolio.list` in the Filter navigator.
2. Open the personal portfolio record that you want to assign the DPM manager role.
3. Select **Edit user groups**, and then search for the user groups to add to the DPM manager role.
4. Repeat the previous step for **View user groups** if you want to add the DPM manager role to the groups that view personal portfolios.
5. Select **Update**.

Tables installed with DPM

Tables installed with Digital Portfolio Management

Table	Description
dpm_available_item_type	Stores records for each type in a personal portfolio.
dpm_navigation_history	Stores records for navigating each type in a personal portfolio.
dpm_personal_portfolio	Stores records for each created personal portfolio.
dpm_personal_portfolio_item	Stores records for all types that are in a personal portfolio.
dpm_unified_backlog	Stores records for backlog information in a personal portfolio.
sn_dpm_kpi_group_m2m_spm_nodes	Stores records for key performance indicator (KPI) group nodes from Service Portfolio Management.
sn_dpm_kpi_group_m2m_viz_config	Stores records for KPIs grouped by data visualization.
sn_team_perf_kpi_group	Stores records for KPIs grouped by team performance.

Activate Digital Portfolio Management

Digital Portfolio Management homepage default solution cards

Digital Portfolio Management uses certain fields to auto-generate a set of default solution cards to display on your DPM homepage. After you add or remove solutions from your homepage, DPM remembers your updates and displays your personalized solutions cards instead of the auto-generated set.

DPM homepage overview

Each time that you log in to the DPM Workspace, the system uses certain fields to display a set of default solution cards. You can use the personalize option to add or remove solutions to your homepage. For more information, see Personalize the Digital Portfolio Management Workspace homepage.

After you add or remove solutions, the DPM system remembers your updates in the *dpm_home_page_item* table so that next time you log in to the DPM Workspace, your

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

personalized homepage displays. The system no longer generates a set of default solution cards for you.

Note:
Each time you access the DPM homepage, the solution card data refreshes, whether you have the auto-generated default solution set or a personalized solution card set.

System properties for number of solution cards

Two system properties determine the number of solutions cards on your DPM homepage.

System properties for solution limits on the DPM homepage

System property	Description	Solution type	Default limit
dpm.homepage.cmdb_ci_service_limit	The query limit when auto-generating services, service offerings, and application services for your DPM homepage.	cmdb_ci_service	750
dpm.homepage.cmdb_ci_business_app_limit	The query limit when auto-generating business applications for your DPM homepage.	cmdb_ci_business_app	250

These two system properties derive the overall limit on the DPM homepage of 1000. Even after you personalize your DPM homepage, the total number of solutions on your homepage can't exceed 1000.

You can personalize your DPM homepage to adjust the solution card count. For example, you can have 1000 services and zero business applications but the total number of solutions on the DPM homepage can't exceed 1000.

Important:
An administrator with the sn_dpm.dpm_admin role can change the system property limits to more than 1000 solutions on the DPM homepage. However, raising the limit may negatively impact system performance.

Default solution card fields

The DPM application uses certain fields to auto-generate a set of default solution cards to display when you first login to DPM (before you personalize).

Personal and enterprise portfolio reference

Use suggestions and tips for creating and organizing portfolios in DPM.

This DPM Academy series video provides tips for creating and organizing personal and enterprise portfolios. Tips and suggestions for personal and enterprise portfolios in DPM. Approximately 16 minutes long.

KPI groups installed with Digital Portfolio Management

Digital Portfolio Management (DPM) enables you to view standard key performance indicator (KPI) groups that are included with the base system. You can also configure KPIs with the sn_dpm.dpm_admin role.

Admins view the back-end details of KPI groups by navigating to **Digital Portfolio Management** > **All** > **KPI Groups**.

In addition to viewing the KPIs that come with the base DPM system, you can also configure them. For more information, see Configure KPIs in Digital Portfolio Management.

To see the latest score of KPIs, enable the latest score system property. For more information on this system property, see KPI groups in Digital Portfolio Management.

DPM base system KPI groups (continued)

KPI Group	Type	Contains KPIs	Supporting KPIs
		Requests by catalog item	• Catalog activity by item (sum) • Average time to close by item (average)
Service health	Application services	Critical incidents	• P1 incidents (sum) • P2 incidents (sum) • MTTR (average)
		Closed changes	• Emergency changes (sum) • High risk changes (sum)
Availability insights	Application services	Availability	• Unplanned outages (sum) • Degraded outages (sum) • Planned outages (sum)
		Unplanned outages	New emergency changes
		Average outage duration	No supporting KPIs
Portfolio success metrics	Enterprise portfolios	• Availability • Incidents with a breached SLA • Incidents caused by changes • Successful changes	No supporting KPIs
Service CSAT	Services	• Average CSAT • CSAT ratings	Average CSAT is 5 rating (highest) to 1 rating (lowest)

Note:
To view more details, select the KPI number. KPI charts aren't selectable.

Digital Portfolio Management related applications and data sources

Digital Portfolio Management (DPM) enables you to use related applications to view and edit service details in the plan-build-run life cycle. All related applications are optional, so they aren't required to use the DPM experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Sources

By design, DPM offers a broad reach of data sources to give you a high-level view of information that impacts your solutions. Its data sources reach across hundreds of data elements across more than 70 tables, as well as many indicators. This expansive reach gives you a broad perspective of items that may influence your solutions.

DPM has three main data sources:

- Record and field lookups, either in direct configuration in UIB or in data brokers. The lookups are listed in the data sources Excel file that you can download from KB1123710.
- Needs attention attributes are from data brokers. For more information, see KB1519343.
- Performance Analytics indicators, data collection jobs, and key performance indicator (KPI) groups.

For an overview on how DPM aligns with the Common Service Data Model (CSDM), see Apply the CSDM guidelines to Digital Portfolio Management.

To view details on the Digital Portfolio Management data sources including data elements, source tables, fields, and required plugins, see KB1123710, and select the option to **Download the Data Sources Excel File**.

Enterprise portfolios

Since the Utah release, you can install the enterprise portfolio plugin [enterprise portfolio] that's available as part of the core ServiceNow AI Platform. Installing the plugin installs two new roles:

- The enterprise portfolio admin [sn_ep.enterprise_portfolio_admin] can create, read, update, and delete (CRUD) enterprise portfolios.
- The enterprise portfolio viewer [sn_ep.enterprise_portfolio_viewer] can read enterprise portfolios.

  Installing the enterprise portfolio plugin results in the following:

  - The DPM admin role inherits the enterprise portfolio admin role.
  - The DPM manager role inherits the enterprise portfolio viewer role.

Services and service offerings

Note:
Your data view in DPM is the same as what your product license permits from the application that you pull data from (standard or pro).

Digital Portfolio Management persona

The Digital Portfolio Management (DPM) persona is a solution owner — That is one that owns services, service offerings, business applications, or application services.

Target persona

The Digital Portfolio Management (DPM) target persona owns solutions like services, service offerings, business applications, or application services. The DPM workspace enables a single view of the full life cycle to determine the overall health and performance of solutions.

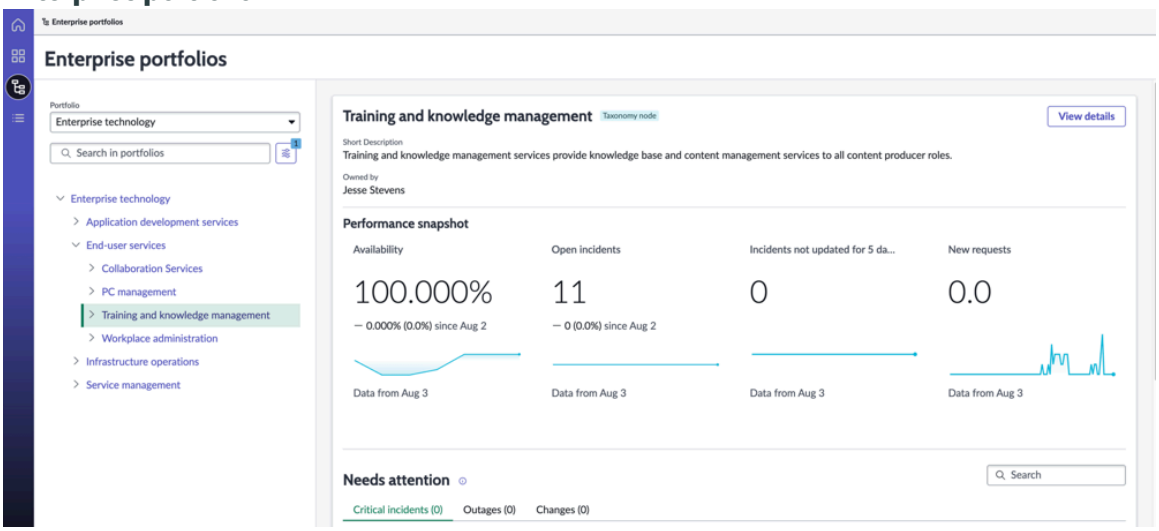
Enterprise portfolios

Create enterprise portfolios for business applications and application services. You can also view service portfolios that are shared with you. You can't alter service portfolios because they're created in Service Portfolio Management tables. However, you can still see the overall IT structure in the context of the services that you own. For more information, see Enterprise portfolios.

Enterprise portfolio



Domain separation and Digital Portfolio Management

Domain separation is supported in Digital Portfolio Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level Standard

- Includes Basic level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

The Digital Portfolio Management application uses Performance Analytics to collect data and provides domain separation support.

Request Digital Portfolio Management Domain Separation

The Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions.installer) must be activated by ServiceNow personnel. After this plugin has been activated, as an administrator, you can activate the Performance Analytics - Domain Support plugin (com.snc.pa.domain_support).

The Performance Analytics - Domain Support plugin (com.snc.pa.domain_support) must be activated to enable the features for Digital Portfolio Management.

ITSM Virtual Agent

You can use ITSM Virtual Agent to support and scale your IT organization. With ITSM Virtual Agent, your technicians can address more challenging IT-related user requests and incidents.

Request apps on the Store

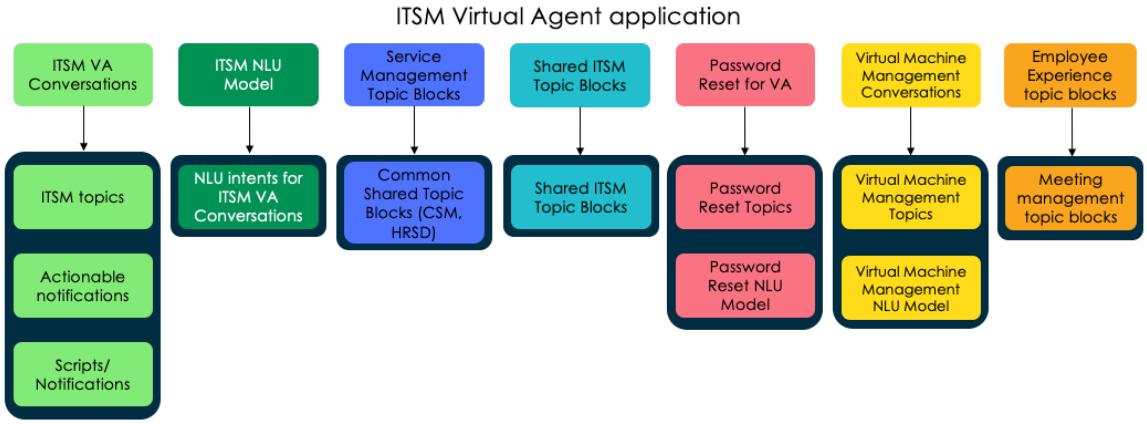
Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

About ITSM Virtual Agent

ITSM Virtual Agent helps you automate employee workflows by addressing common IT-related queries immediately. At any time during a virtual conversation, a user can request to interact with a live IT technician.

ITSM Virtual Agent includes pre-built topic conversations that cover common IT interactions. These conversations run in the web chat client and are also available in supported ITSM Virtual Agent messaging integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Conversations between Virtual Agent and the user accomplish an IT goal. The information exchanged during the conversation flow, such as user inputs and Virtual Agent responses, enables Virtual Agent to fulfill a request or help complete a task.

ITSM Virtual Agent integrates with ServiceNow® Integration Hub and Flow Designer. Some topics may require specific spokes to be installed.

For more information about Virtual Agent features, see Virtual Agent.

Languages supported for NLU services on the ITSM Virtual Agent

In addition to English, ITSM Virtual Agent supports the following languages for NLU:

- German
- French
- French (Canadian)
- Korean
- Spanish
- Brazilian Portuguese
- Japanese
- Italian
- Dutch
- Chinese (Simplified)

For details about NLU, see Natural Language Understanding in Virtual Agent.

The ITSM Virtual Agent topics re-factored with `gs.getMessageLang()` provide you the improved operations on the ITSM Virtual Agent by utilizing and displaying all the messages in the bot conversations in your preferred language. The `gs.getMessageLang` method checks the UI Message table [sys_ui_message] for the translated version of the text in the language provided using the `vaContext.getRequesterLang()` variable.

Edge Encryption for ITSM Virtual Agent

Edge encryption provides you with direct control over your data security. Encryption and key management are performed on your intranet between your browser and your ServiceNow® instance. For details about edge encryption, see Edge Encryption for ITSM Virtual Agent within ITSM.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Exploring ITSM Virtual Agent

The ServiceNow ITSM Virtual Agent provides assistance through conversations within an intelligent messaging interface.

ITSM Virtual Agent overview

Empower your IT technicians to concentrate on more challenging, demanding user requests and incidents by deflecting the most common, simpler incidents to a virtual agent. ITSM Virtual Agent enhances both the IT technician experience and the employee experience by addressing IT-related queries immediately.

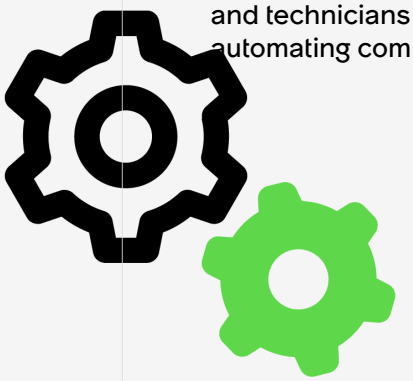
Virtual Agent benefits

 User Satisfaction	**User satisfaction** Provide better self-service by helping users and customers get what they need quickly with always-on, omni-channel experiences. Enable your users to get immediate help, day or night. Boost user and customer satisfaction by offering a personalized Virtual Agent experience, whereby user information is remembered and applied during the conversation.
	**Increased productivity** Deliver great experiences for your users, as well as your agents and technicians, by deflecting tickets and reducing call volume. Drive productivity by providing a virtual agent on familiar channels, such as Slack, Microsoft Teams, Facebook Messenger, and Workplace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automation support

Scale your support organizations and free your agents and technicians to focus on more complex user issues by automating common support tasks.



Empowered service owners

Enable service owners to deliver and refine AI capabilities quickly without data science expertise.

Components

Natural Language Understanding

You can use Natural Language Understanding (NLU) for all your ITSM Virtual Agent topic conversation flows. ITSM Virtual Agent uses NLU to comprehend word meanings, recognize word contexts, and infer user or system actions.

You can decide whether you want ITSM Virtual Agent to use only keywords, which result in quicker time-to-value in the short term. Or you can choose to use NLU, which results in a better employee experience in the long term.

ITSM Virtual Agent and the ITSM NLU Model for Virtual Agent Conversations are available from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

The ITSM NLU Model for Virtual Agent Conversations provides pre-built NLU entities, intents, and utterances. Some of the provided intents and utterances include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Escalate Ticket topic:
  - Raise incident INC0010023 ticket priority to higher level
  - Raise the priority on my open ticket
- Check Outages and Service Degradations topics:
  - Are there currently any reported company-wide issues?
  - Is there an outage?
- Email Setup topic
  - I want to set up email on my mobile device
  - How do I set up company email on my phone?

Enable NLU on the ITSM Virtual Agent application and republish your existing conversations to optimize user experience with the NLU feature.

ITSM Virtual Agent automatic notifications

Virtual Agent proactively informs you about the status of your incidents and requests. Managers are alerted when they have approvals.

ITSM Virtual Agent notification defined on the Task [task] table

These notifications are used by fulfillers and employees. The **Task type** filter on the Task table enables automatic status notification when the value is **Incident** or **Requested item**. When the state of the incident or requested item task changes, a Virtual Agent message is sent to the user.

ITSM Virtual Agent notification defined on the Approval [sysapproval_approver] table

These notifications are used by request management or knowledge management. When an approval is submitted, an automatic Virtual Agent message is sent to the approver alerting them of the approval request.

Setting up ITSM Virtual Agent

Set up the ITSM Virtual Agent features and components that you need to provide support to your employees, IT teams, and customers.

ITSM Virtual Agent topics must be activated and published before your employees can use them. By default, the base system provides topics as inactive and unpublished. To view, duplicate, preview, or publish ITSM topics in the Virtual Agent Designer, see Getting started with Virtual Agent Designer.

Set up ITSM Virtual Agent

You can create and publish conversation topics in Virtual Agent Designer if you have administrator roles.

Before you begin

Role required: admin

About this task

Virtual Agent must be activated before you can use the ITSM Virtual Agent topic conversations. Users with the admin roles can activate Glide Virtual Agent [com.glide.cs.chatbot].

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install ITSM Virtual Agent and the ITSM NLU Model for Virtual Agent Conversations by requesting them from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Topics must be activated and published before your employees can use them. By default, the base system provides topics as inactive and unpublished. To view, duplicate, preview, or publish ITSM topics in the Virtual Agent Designer, see Getting started with Virtual Agent Designer.

Procedure

1. Activate the Glide Virtual Agent plugin (com.glide.cs.chatbot).
2. Install ITSM Virtual Agent by requesting it from the ServiceNow Store.
3. Review the ITSM-related conversation topics in Virtual Agent Designer.
4. Configure Natural Language Understanding (NLU) in Virtual Agent.

   ITSM Virtual Agent topics use ServiceNow NLU models. The English NLU models are activated by default. If you are using other languages, you must activate those NLU models manually. For details, see Multilingual model management.
5. Publish the ITSM Virtual Agent topics and their corresponding NLU models in Virtual Agent Designer.

   Publishing them in Virtual Agent Designer lets users run the conversations in your Virtual Agent support client.

   Note:
   You can't edit the provided topics. You can duplicate a provided topic and then edit it. You can also create additional topics. For complete details about activating and publishing conversation topics, see Getting started with Virtual Agent Designer.
6. To test an active, published conversation topic, select the topic to test in Virtual Agent Designer and select **Test**.

Set up the Local Admin Access topic

Administrators and users with the Virtual_agent_admin role can install and activate the Agent Client Collector Spoke plugin. Developers can update scripts and configure commands as needed for their organization.

Before you begin

Role required: virtual_agent_admin or admin

Procedure

1. Install the Agent Client Collector Spoke plugin on the instance according to the Agent Client Collector installation instructions.
2. Update the sudoers file of the macOS devices with the following entry.
   This process allows the ServiceNow user to run the grant_admin_access script in sudo mode and bypass password requirements.

```
_servicenow ALL=
 SETENV: /
Library/Caches/servicenow/agent-client-collector/admin-access-m
ac/bin/grant_admin_access.sh *
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Defaults:_servicenow !requiretty
Defaults exempt_group += _servicenow
```

3. Activate the Agent Client Collector plugin (admin-access-mac), after validating the attached payload with your internal IT team.
4. Configure the following commands as needed for your organization.
   ACC Check Definition: `check-admin-access`, `grant-admin-access`
5. Duplicate and activate the Local Admin Access topic in the ITSM scope.
   To view, duplicate, preview, or publish IT Service Management topics in the Virtual Agent Designer, see Getting started with Virtual Agent Designer.

Set up actionable notifications for ITSM Virtual Agent

Administrators and users with the virtual_agent_admin role can enable system notifications, trigger Workflow Studio flows for actionable notifications topics, and activate notifications in Virtual Agent.

Before you begin

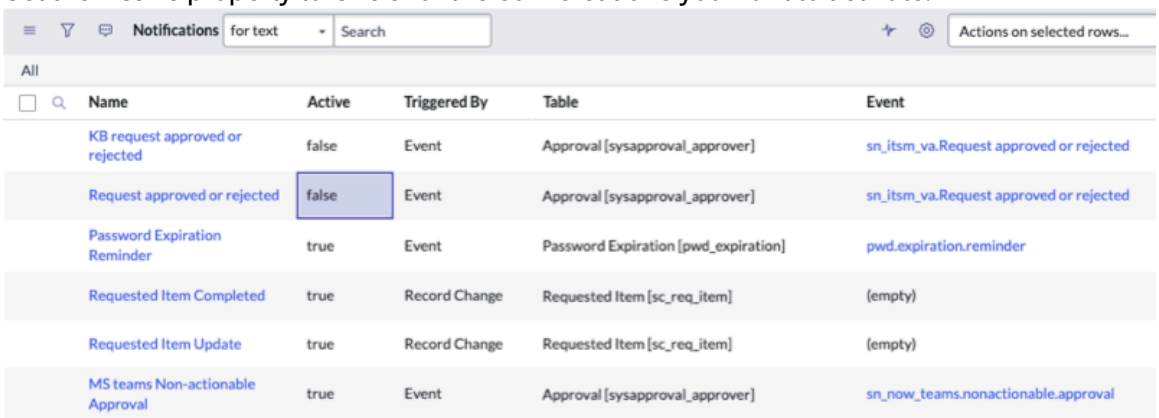
Role required: admin or virtual_agent_admin

Procedure

1. Enable system notifications.

   a. Navigate to **All** > **System Notification** > **Provider** > **Notifications**.

   b. Set the **Active** property to *true* for the conversations you want to activate.



2. Activate Workflow Studio flows for specific actionable notifications ITSM Virtual Agent conversations.

   These topics are inactive by default. For complete details about activating flows, refer to Activate a flow.

   The following flows for actionable notifications must be activated if you want to use them with Actionable Notifications:

   - ITSM Actionable Notifications trigger flow - Approval Reminder
   - ITSM Actionable Notifications trigger flow - Incident commented
   - ITSM Actionable Notifications trigger flow - Software Installation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the flow you would like to activate in Workflow Studio.

b. Select **Activate**.

3. Enable notifications in Virtual Agent.

Set up Issue Auto Resolution for ITSM Virtual Agent

Users with the virtual_agent_admin or admin role can configure Virtual Agent settings to indicate discoverable topics, set business rules, and more.

Before you begin

Role required: admin or virtual_agent_admin

- Activate Virtual Agent to use Virtual Agent as a response channel.
- Set up ITSM Virtual Agent

  Install the ITSM Virtual Agent Conversations app, which includes the ITSM NLU Model for Virtual Agent Conversations. Request this app from the ServiceNow Store. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

About this task

Most of the Issue Auto Resolution functionality is included with the Glide Virtual Agent (com.glide.cs.chatbot) plugin. More functionality is available in the ITSM Virtual Agent Conversations Store App. Issue Auto Resolution is automatically enabled.

Procedure

1. Train the Machine Learning model.
   Train the Issue Auto Resolution Machine Learning model before activating the Auto Resolution Configuration record.

   Note:
   The query on the Incident table must have the minimum number of records that you specify in the *glide.platform_ml.api.min_agent_zero_records* system property to train the model. The default value of this property is 300000 and should not be increased because training the model can fail with more than 300,000 records. Ensure that the conditions that you specify in the Auto Resolution configuration record return less than 300,000 records before you click **Train**. For more information about predictive intelligence properties, see Predictive Intelligence properties.

   a. Navigate to **All** > **Conversational Interfaces** > **Settings** > **Virtual Agent**.

   b. Under ITSM Virtual Agent (IAR), click **View Settings**.

   c. Select the target table.

   d. Under the **Details** tab, go to the Machine Learning Model section.

   e. Click **Train**.
   The **Training Progress** field displays the percentage of training complete and updates whenever the form is refreshed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. When the **Training Status** field displays `Solution Complete`, select the *`Active`* property.

g. **Optional:** Set a **Retrain Frequency** to define how often the Machine Learning model automatically retrains.
Users with the admin or virtual_agent_admin role can also manually retrain the model at any time.

2. **Optional:** Change any mappings for Issue Auto Resolution intents to matched ITSM Virtual Agent topics.

a. Navigate to **All** > **Conversational Interfaces** > **Settings** > **Virtual Agent**.

b. Under **Issue Auto Resolution (IAR)**, select **View Settings**.

c. Select the target table.

d. Under the **Auto Resolution Intent Topic Maps** tab, view the default mappings for the intents and matched topics and select the topic to change.
You can modify mappings, but only supported Issue Auto Resolution intents and active Virtual Agent topics are available for mapping.

These records are inactive by default. To use them, duplicate the template topics to create and publish them. After associating the intent to the topic of choice, make the intent topic map active.

e. For a given Issue Auto Resolution intent, double-click the corresponding **Matched topic**, select a different topic, and select **Save**.

Enabling dialog intelligence

Enable support for dialog intelligence in ITSM Virtual Agent to let the Virtual Agent dynamically react to user utterances and modifications during your conversation.

The IT Service Management topics leverage the latest platform Dialog Acts enhancements by changing the toggle from node-level to the topic-level. The Dialog Acts enhancement is enabled for all the topics available in Virtual Agent and Virtual Machine applications.

For more information about Dialog Acts enhancements on the ServiceNow AI Platform, see Dialog Acts for Virtual Agent.

Using ITSM Virtual Agent pre-built topics

ITSM Virtual Agent includes several pre-built topic conversations designed to help your users complete common IT-related tasks, such as resetting a password and creating an incident.

Once installed, ITSM Virtual Agent pre-built topics are read only and have **(Template)** after the name. To use them, duplicate the topic in the ITSM Virtual Agent conversation scope and rename it according to your company's naming conventions. Natural Language Understanding (NLU) models are used to identify and trigger the action that a user wants to perform.

The ITSM Virtual Agent pre-built topic conversations are organized in several topic categories. Use the following table to find the topics that fit your needs.

© 2026 ServiceNow, Inc. All rights reserved.

IT Issues pre-built topics for ITSM Virtual Agent

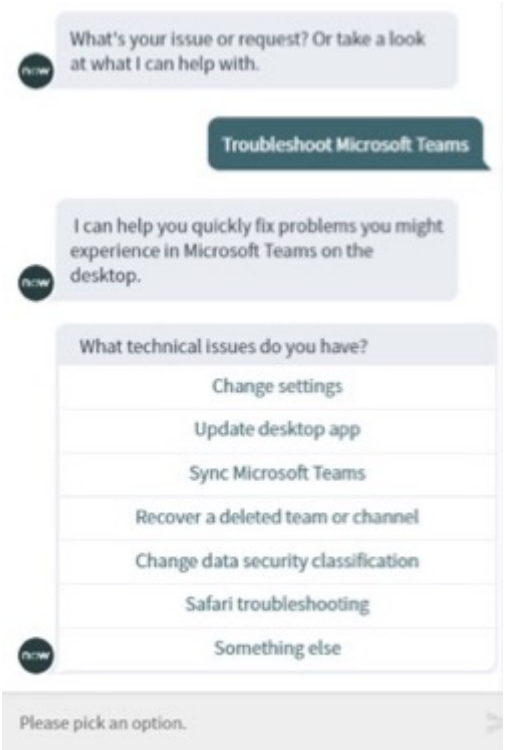
IT Issues topic conversations are designed to automate common IT-related issues, such as email setup, VPN connectivity, and conference room problems.

Collaboration Applications

Users can use Virtual Agent to troubleshoot common issues with collaboration software, such as Cisco Webex, Zoom, and Microsoft Teams. This topic uses topic blocks that can be customized for your environment. If the user isn't satisfied with the static help content for the issue they're facing, they can perform an AI search or Contextual search. The type of search is dictated by the system property *sn_itsm_va.fallback_search_option*.

This topic uses the following topic blocks:

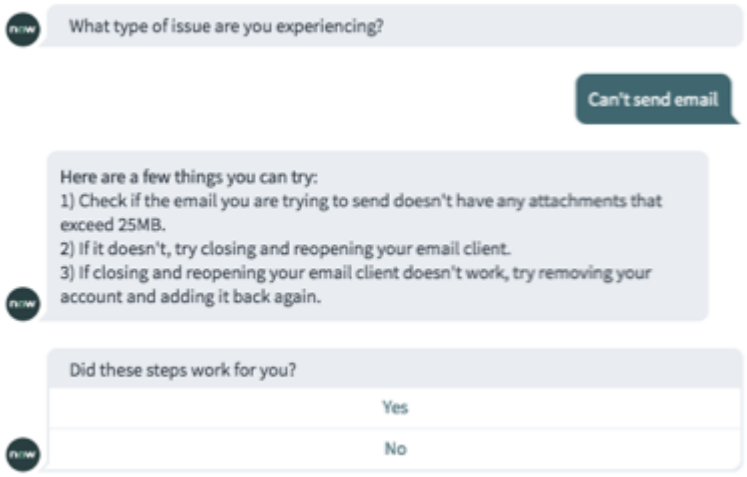
- Contextual Search
- Create Incident
- Troubleshoot Cisco Webex
- Troubleshoot Microsoft Teams
- Troubleshoot Zoom



Email Issues

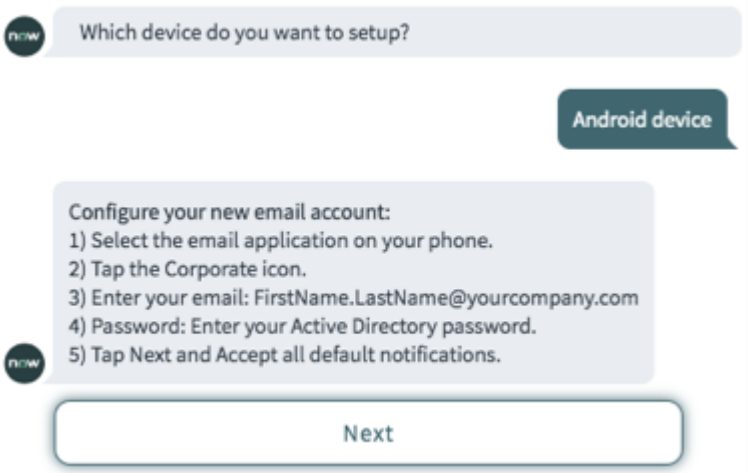
Users can request help with email problems, such as issues sending and receiving email or problems with the email client.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Email Setup

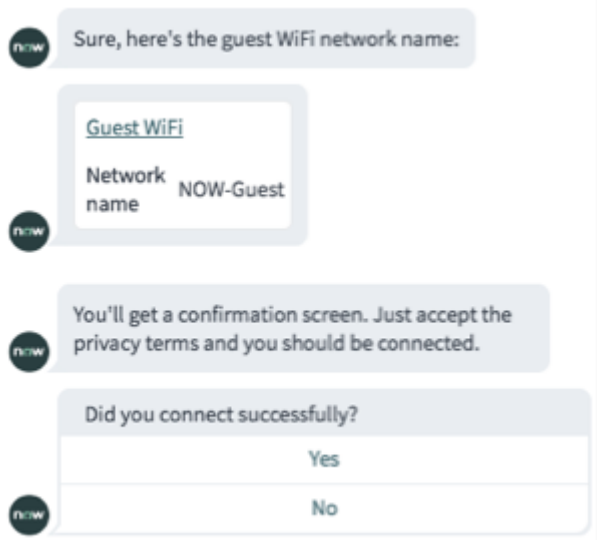
Users can request help with email access or setting up an email account accessible by computer or phone. Users can also request help with configuring email or setting up web mail.



Guest WiFi Access

Guests to your company can obtain WiFi access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Hardware Issues

Users can troubleshoot specific hardware issues.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident

Local Admin Access

Users can request and gain admin rights and permission to install or access software and other admin-related items within your system.

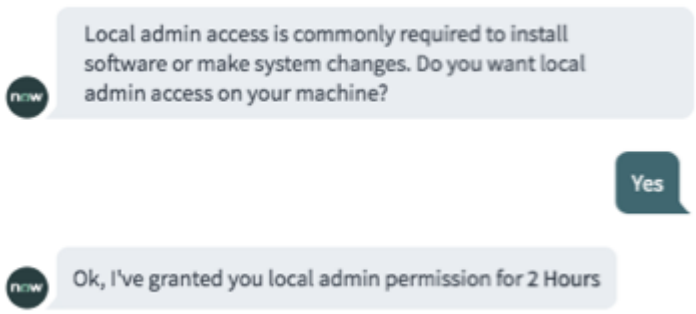
Virtual Agent grants admin access and removes the access for all users on the device after the designated time period (except users listed in DEFAULT_ADMIN_USERS).

When the user requests help with admin access, Virtual Agent asks the user to select the device they would like admin privileges for.

Requirements:

- Agent Client Collector spoke (com.sn.acc.spoke)
- Applies to macOS users only

  If the user selects another operating system, Virtual Agent provides relevant KB articles.



To set up and use the Local Admin Access topic, refer to Set up the Local Admin Access topic.

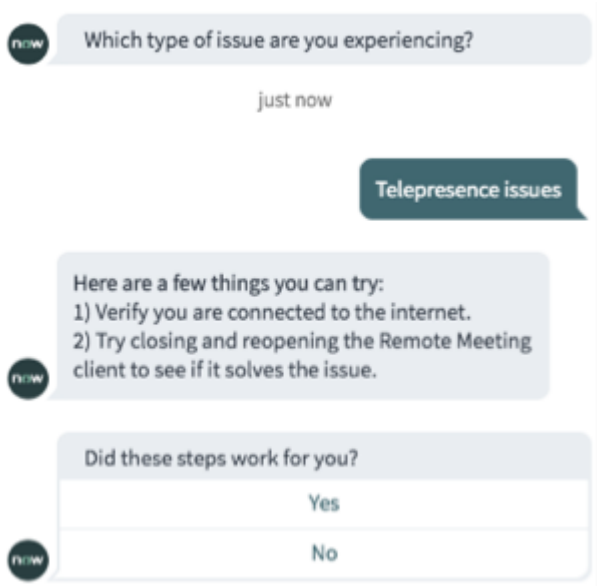
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Meeting Room Issues

Users can request help with meeting room issues, such as conferencing problems, sound issues, display, connectivity, sharing, and more.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident

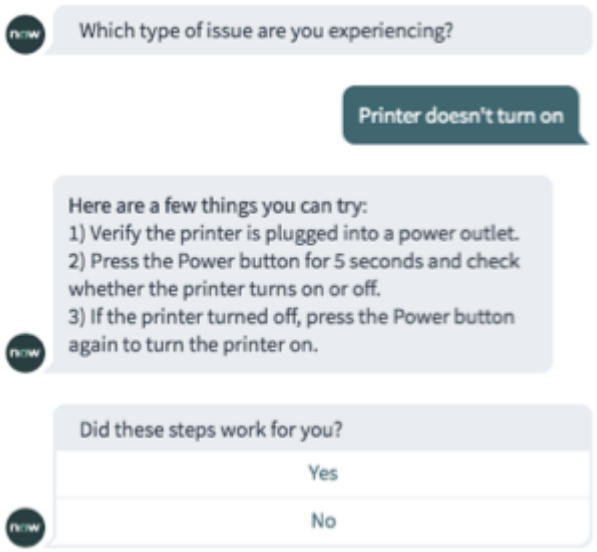


Printer Issues

Users can request help with issues associated with a printer, such as no ink, printer not working, or connectivity problems. This topic can be used with Issue Auto Resolution.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident

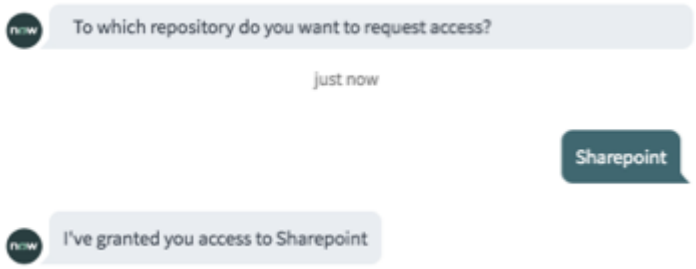


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Repository Access

Users can request and gain access to a data repository manually, or choose from preloaded available repositories.

This topic uses the Create Incident topic block.

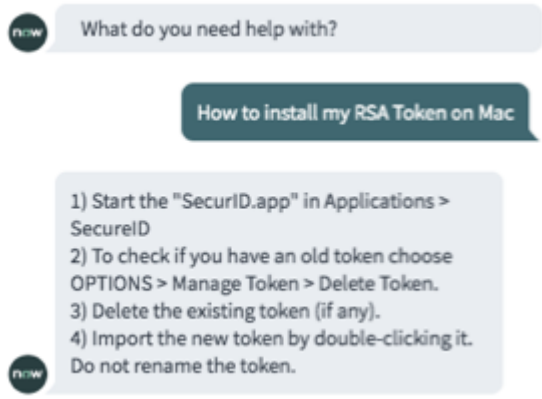


RSA Token

Users can request an RSA token or report a problem with an RSA token. Users can also request help with the setup of an RSA token.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident



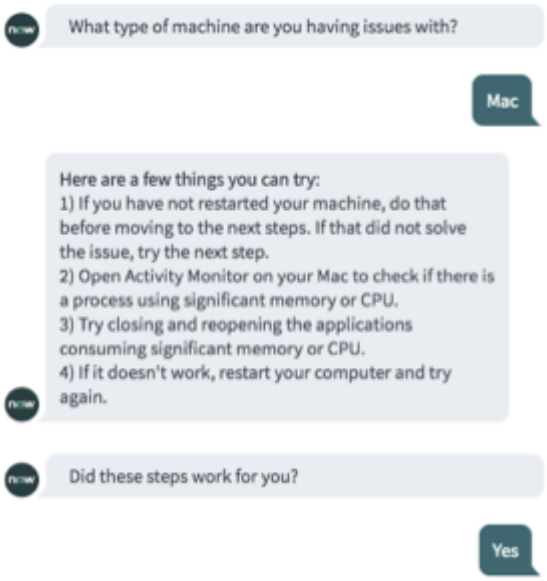
Troubleshoot Slow Computer

Users can request help associated with a slow computer, such as low RAM.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

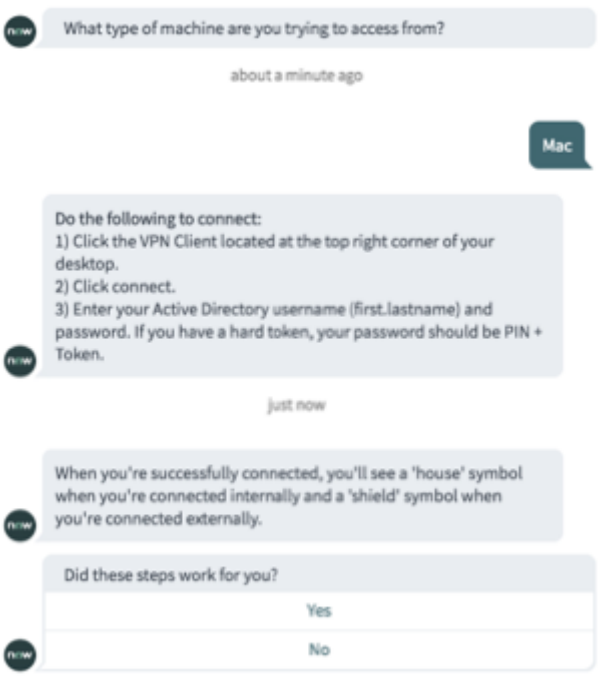


VPN Connectivity

Users can request help with connecting to VPN or setting up VPN to access business systems from remote locations.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident



Self-Service pre-built topics for ITSM Virtual Agent

Self-Service topic conversations are designed to give users to access IT-related information, such as open or check IT ticket status, verify assigned equipment, and Knowledge Base search.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Book Conference Room EXO

Users can book a conference room in Microsoft Exchange Online using Virtual Agent.

Requirement: Microsoft Exchange Online spoke (sn_ex_online_spke)

This topic uses the Create Incident topic block.

Basic flow:

1. User selects a city for the meeting.

   The city must be configured as a room resource.

2. User selects number of attendees and start date and time.
3. User selects meeting duration.

   By default, the minimum duration is 30 minutes.

4. Virtual Agent provides a list of available rooms.

   Room availability lookup is done in batches of 10 rooms. Five rooms are displayed at a time, with pagination through the lookup results.

5. User provides a meeting subject and can send the invitation to attendees if the user provides email addresses.
6. User confirms meeting details, and the request is submitted.

Book Conference Room OnPrem

Users can book a conference room in on-premises Microsoft Exchange Server using Virtual Agent.

Requirement: Microsoft Exchange Server spoke (sn_exchange_spoke)

This topic uses the Create Incident topic block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Basic flow:

1. User selects a city for the meeting.

   The city must be configured as a room resource.

2. User selects number of attendees and start date and time.
3. User selects meeting duration.

   By default, the minimum duration is 30 minutes.

4. Virtual Agent provides a list of available rooms.

   Room availability lookup is done in batches of 50 rooms. Five rooms are displayed at a time, with pagination through the lookup results.

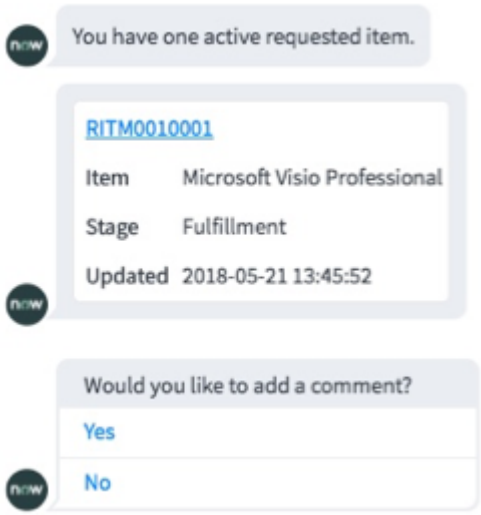
5. User provides a meeting subject and can send the invitation to attendees if the user provides email addresses.
6. User confirms meeting details, and the request is submitted.

Check IT Ticket Status

Users can check the status of active IT tickets (incidents or requests). When a user asks about a ticket status, Virtual Agent responds with a list of all active tickets for that user. Each ticket includes a link to the incident or request, the item, the status (**Stage**), and when it was updated.

Users can add comments and also ask to chat with a live agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



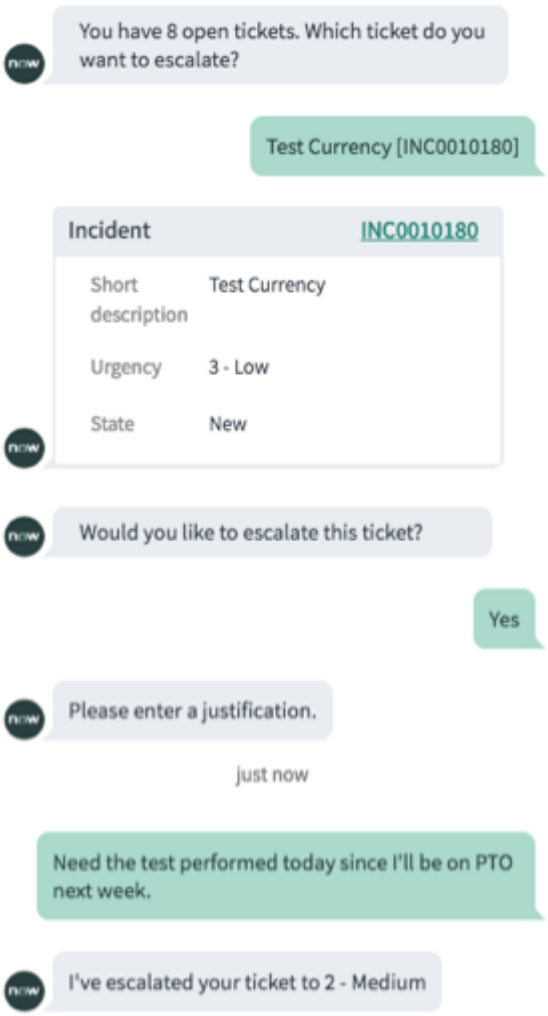
Check Ticket and Support Status

Users can search for an incident, a customer case, or an HR ticket by the ticket number, short description, or description. A search using the short description or description shows the ticket updated within the past month.

Escalate IT Ticket

Users can raise the urgency of an IT ticket for a faster resolution. Escalating a ticket priority requires choosing the incident and verifying the escalation. Users must provide a justification to escalate the incident. Virtual Agent escalates the incident to the next urgency level, for example, from low to medium, or from medium to high. If an incident is already at high-level urgency, Virtual Agent alerts the user to this and asks if the user would like to add a comment to help expedite resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Get Password Reset Link (deprecated)

This topic is deprecated. Use Reset Password instead.

Users can access a password reset link when system lockout occurs or when passwords are forgotten. When a user enters keywords related to password reset, Virtual Agent provides a link to the password reset process. If a user is not authenticated in the system, Virtual Agent requests the user's email address. If a user is not enrolled in Password Reset, Virtual Agent provides a link to **Password Enrollment**.

> **Note:**
> An admin must properly configure the password reset process with a valid verification type for this topic to work as described. For details, see Configure your Password Reset process.

Get Zoom Meeting Recording

Users can get a recording of a Zoom meeting that they hosted in Microsoft Exchange Online.

Requirements:

- Microsoft Exchange Online spoke (com.sn.msexchange.spoke)
- Zoom spoke (com.sn.zoom.spoke)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- User email address must be configured in the User [sys_user] table
- User email address must match the address in Microsoft Exchange Online and Zoom

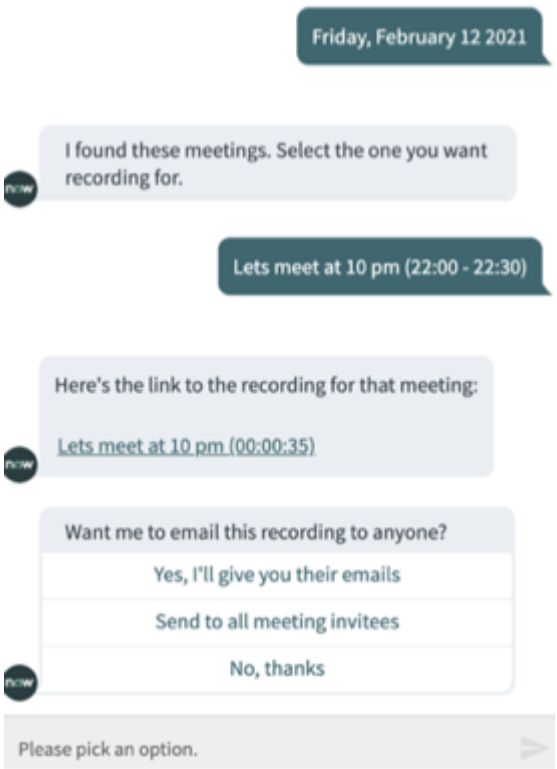
This topic uses the Create Incident topic block.

Basic flow:

1. User enters when the meeting took place.
2. Virtual Agent returns a list of possible meetings.
3. User selects the desired meeting.
4. Virtual Agent sends a link to the recording.

   If the recording has a passcode enabled, the email includes the passcode.

   The user can also share the recording with the meeting invitees or to a list of emails. If the host shares the meeting link, recipients receive an email notification.



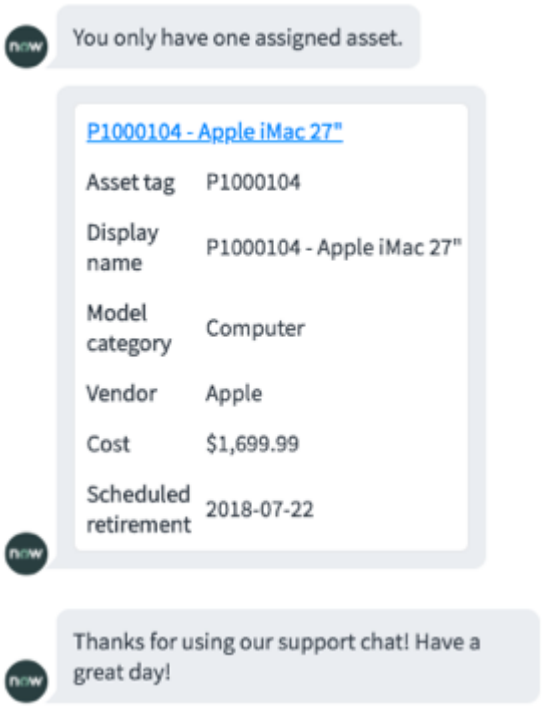
My Assigned Equipment

Users can view a list of all assigned equipment, such as laptops, mobile phones, and monitors. Clicking an item link provides additional details about the asset. Users can also create an asset-related incident directly within the conversation. Opening an incident from this conversation initiates the Open IT Ticket conversation topic by using the Create Incident topic block.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Open IT Ticket (deprecated)

This topic is deprecated. Use Open IT Ticket 2.0 instead.

Note:
This conversation topic is refactored to use the Create Incident topic block.

Users can open an incident or access relevant knowledge base articles to resolve an issue. After typing keywords, such as `open ticket` or `incident`, Virtual Agent prompts the user to enter a short description of the issue. Virtual Agent returns links to relevant knowledge base articles and asks if an article resolved the issue. If it did not, Virtual Agent asks for the urgency of the issue and creates an incident, providing a link to the actual incident.

This topic uses the following topic blocks:

- Contextual Search
- Create Incident

When creating an incident, if you also want to create an associated Universal Request and display the Universal Request card in Virtual Agent instead of the incident, the Universal Request plugin (com.snc.universal_request) must be active, and the **Create Universal Request with incident** system property (*`com.snc.create_universal_request_with_incident`*) must be set to **Yes** (the default is Yes).

Note:
Locate the property within the **Incident Properties** module, in the **Incident VA Conversation** category. Users with the itil_admin role have read and write permissions.

Open IT Ticket 2.0

This topic is recommended to create an IT incident. Users can leverage machine-learning algorithms with application logic for predicting similar open tickets. Prevent users from opening duplicate incidents by finding similar incidents and asking if the user wants to add comments to the similar incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirement: Predictive Intelligence for Incident plugin (com.snc.incident.ml)

This topic uses the following topic blocks:

- Add Comments-Similar Incident
- Contextual Search
- Create Incident

This topic was formerly called Intelligent Open IT Ticket. Both the Open IT Ticket and Report IT issue topics have been deprecated and replaced with this topic. If you have been using any of these three topics directly prior to the ITSM Virtual Agent Conversations version 5.6 release, the deprecated topic name will display in the portal and must be updated. To update to the new template, navigate to **All** > **Conversational Interfaces** > **Virtual Agent** > **Designer**. Duplicate the Open IT Ticket 2.0 topic, save it, and then select **Publish**.

Process Approval

Users with the approver_user role can access active approval requests. Virtual Agent returns all active approvals as a list. Users click an approval to access the actual approval record to approve or reject.

Service Disruptions

Users can access all known outage information. When a user asks if a particular system is down, Virtual Agent returns a list of links displaying planned or unplanned outages and any system degradations. Users can click the links for more detailed information about a specific outage or degradation, as well as click **Show more** when additional outages are known.

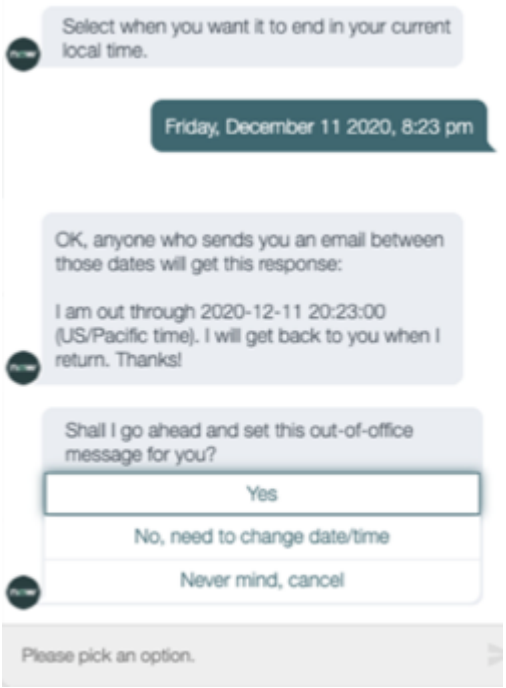
Set OOO reply Exchange Server

Users can set an automatic out-of-office reply for Microsoft Exchange Server using Virtual Agent. The user selects the start and end time using their current local time zone. This topic recognizes date-range entities and intents. The message is hard-coded and is the same for internal and external recipients.

Requirement: Microsoft Exchange Server spoke (sn_exchange_spoke)

This topic uses the Create Incident topic block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Submit a request (deprecated)

Note:
While you can use the Submit a request topic to search for and request catalog items, the recommended method is to use the Fallback setup topic.

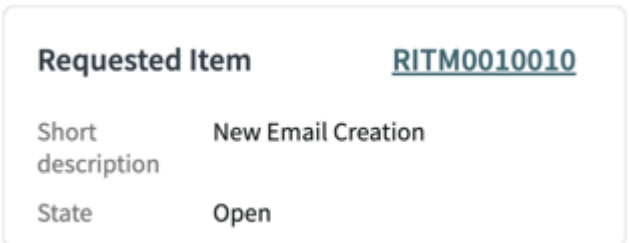
Users can submit a request by choosing from all available options. For example, when a user is requesting an item, the Virtual Agent prompts the user to enter a search keyword. After the user enters the keyword, Virtual Agent responds with available choices in a carousel view.

This topic uses the following Service Catalog topic blocks:

- Request Catalog Item
- Search Catalog Item

When the user selects the required item, the following scenarios are possible:

- A user can submit a request in the conversation mode (by answering the questions in line). After the request submission, a requested item card is displayed with the request number as a link to the request page.



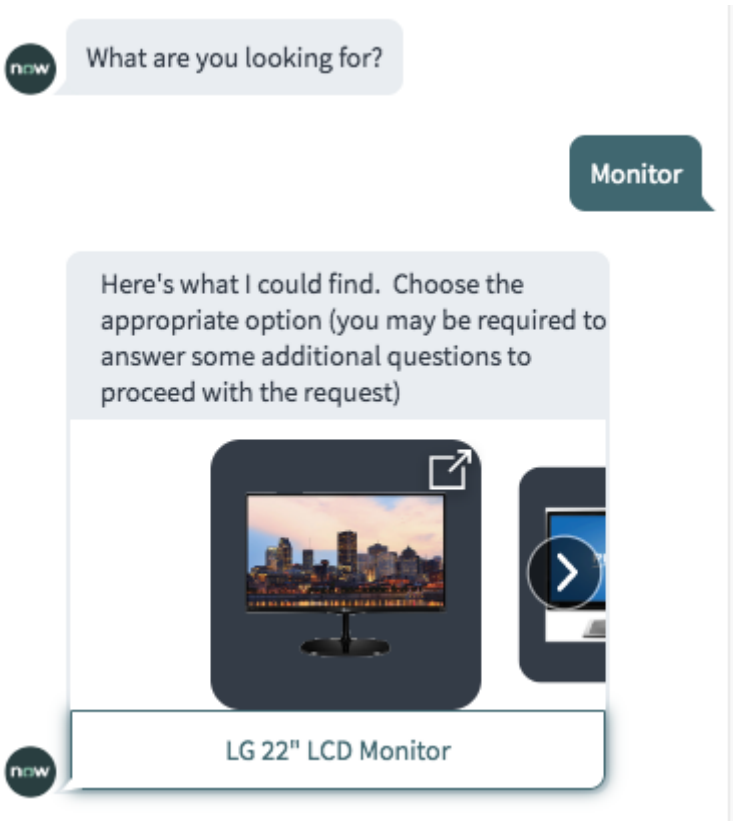
Note:
In Now® Mobile, the URL opens the native screen.

- A user can submit a request in a popup or a window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In case of a popup, Virtual Agent provides a link for the user to submit the request in a popup without navigating to a new tab. A non-conversational catalog item can be rendered as a popup only if it does not have any Custom, Custom with label, or UI Page variables. For more information, see Service Catalog topic blocks in Virtual Agent.
- In case of a window, Virtual Agent provides a link for the user to submit the request in the Service Portal defined in the *sn_itsm_va.com.snc.itsm.virtualagent.portal_url* property. A non-conversational item will be rendered as a window it has a Custom, Custom with label, or UI Page variable. For more information, see Service Catalog topic blocks in Virtual Agent.

Note:
Now Mobile opens the item in Mobile Employee Service Portal (mesp).



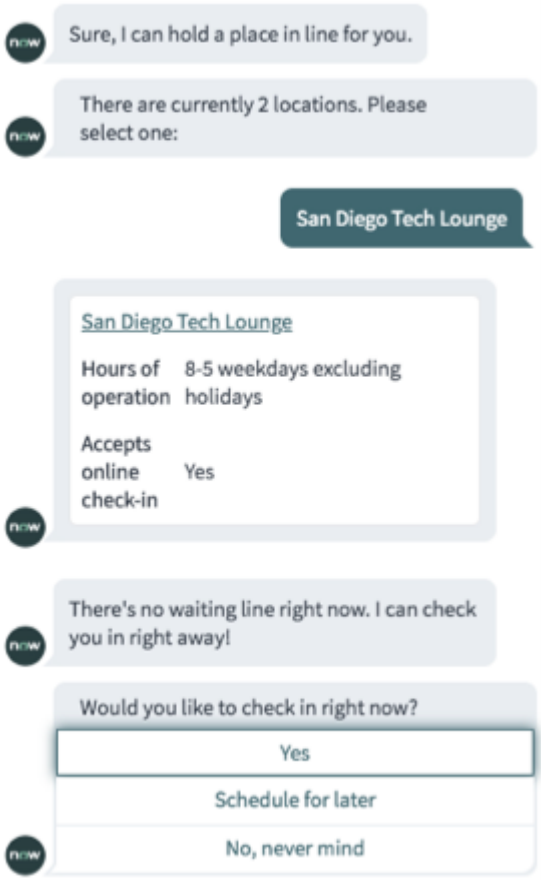
Walk-up Check-in

Users can check into a ServiceNow® Walk-up Experience location and secure a place in the queue, or they can schedule an appointment at a walk-up location for themselves. Users can also schedule an appointment on behalf of someone else.

Requirement: Walk-up Experience plugin (com.snc.walkup)

This topic uses the Create Incident topic block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Virtual Agent Academy: Get service faster with Virtual Agent and Walk-Up Experience (video from the Virtual Agent Academy)

Windows 365 Cloud PC

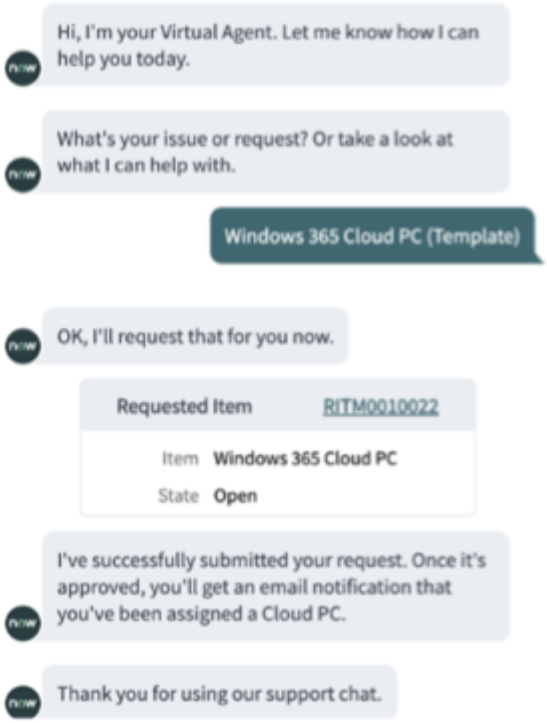
Users can request a Microsoft 365 Cloud PC for themselves through a Virtual Agent conversation. The provisioning is reviewed by the user's manager.

Requirements:

- Microsoft Azure Active Directory spoke (com.sn.azure_ad.spoke)
- Integration with the Microsoft service via ServiceNow® Integration Hub and Workflow Studio

This topic uses the Create Incident topic block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Citrix session pre-built topics for ITSM Virtual Agent

Users can reset any Citrix desktop or application session using Virtual Agent conversation flows. Users can also provision a Citrix desktop or application.

Natural Language Understanding (NLU) is used to identify and trigger the Citrix action that a user wants to perform.

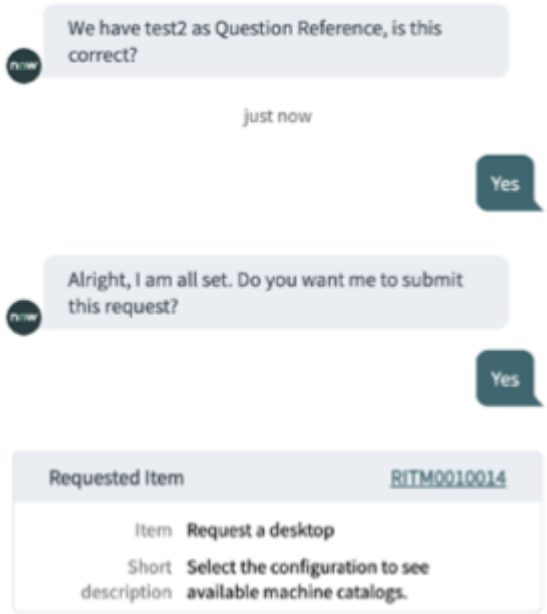
Requirement: Citrix IT Service Management Connector (x_cion_citrix_it_s)

Learn how the Citrix ITSM plug-in for ServiceNow can help your team easily deliver a first class experience to your end users, provide a new level of end user self-service, and free up valuable time for your IT team to focus on higher impact work.

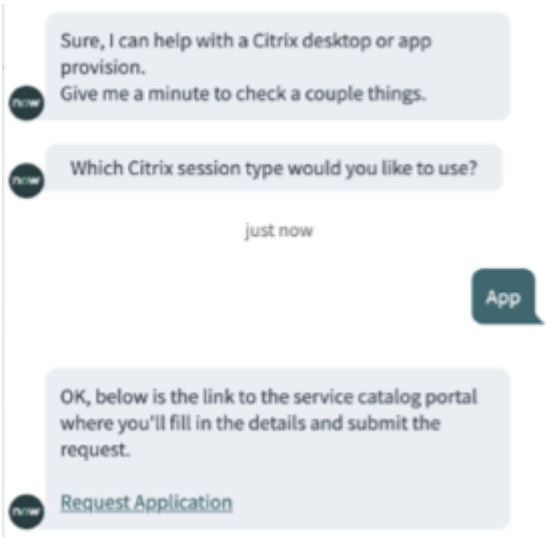
Provision Citrix Desktop/Apps

Virtual Agent can provision a Citrix desktop or an application directly from a conversation. The user selects the session type. When requesting a desktop, Virtual Agent asks for the OS and returns the requested item details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When requesting an application, Virtual Agent sends a link to the Service Portal, where the user can submit the request.



Virtual Agent sends an actionable notification to the user to inform them once the desktop or application has been provisioned, or if the provisioning was unsuccessful.

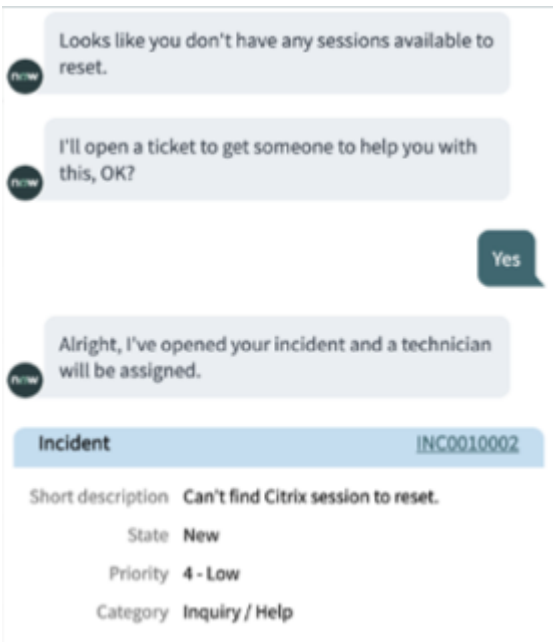
This topic uses the Request Catalog Item Service Catalog topic block.

Reset Citrix Sessions

Virtual Agent provides a list of possible sessions to reset, and the user can choose to reset an individual session or all sessions at once.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the user does not have any sessions available to reset, Virtual Agent can open an Incident on behalf of the user.



This topic uses the Create Incident topic block.

Password management topics for ITSM Virtual Agent

End users can perform password reset, password change, and account unlock actions using Virtual Agent conversations.

End users can initiate a password management conversation with Virtual Agent by entering the keywords `Reset`, `Change`, `Unlock`, or `Password`.

Users who are not logged in can perform the Reset Password and Unlock Account actions. Users who are logged in can perform the Change Password, Reset Password, and Unlock Password actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requirements:

- Password Reset (com.glideapp.password_reset) plugin
- Password Reset Virtual Agent Conversations (com.snc.password_reset.virtual_agent) plugin

Note:
In order for the password reset process to be available in Virtual Agent, ensure that you selected the **Enabled on Virtual Agent** check box in the Password Reset process configuration page.

For more information about the password reset process, see Password Reset for Virtual Agent.

Verification options for password reset in Virtual Agent conversations

The following identity verification options are supported in Virtual Agent conversations. Custom verifications are not supported in Virtual Agent.

- Personal data verification: User provides specific pieces of personal data.
- Google Authenticator verification: User enters the generated code from the Google service Authenticator mobile app.
- SMS code verification: User enters the code received via mobile text message.
- Email code verification: User enters the code received via email.
- Security question verification: User enters the configured security question answers.

For more information, see Configure your Password Reset process.

Change Password

Users can request to change their user password.

This topic uses the Display Password Reset URLs topic block.

Basic flow:

1. Virtual Agent asks the user to input their current password.
2. If the current password matches, the user can enter a new password.
3. Virtual Agent displays the password rules.
4. If the user provides a password that meets the password requirements, Virtual Agent updates the password.
5. If the user does not enter a valid password, the user must reenter the password.

Reset Password

Users can request to reset their user password.

This topic uses the Display Password Reset URLs topic block.

Basic flow:

1. Virtual Agent sends identity verification information to the end user, based on the password reset process configuration.
2. If the user successfully verifies their identity with the given inputs, Virtual Agent provides the reset steps.
3. Virtual Agent displays the password rules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. The user enters a new password, adhering to the password rules.
5. If the password does not meet the criteria, Virtual Agent prompts the user to reenter the password.
6. Once the password meets the criteria, Virtual Agent resets the password.

Unlock Account

Users can request to verify their locked user account.

This topic uses the Display Password Reset URLs topic block.

Basic flow:

1. Virtual Agent sends identity verification information to the end user, based on the password reset process configuration.
2. If the user successfully verifies their identity with the given inputs, Virtual Agent provides the verification information.
3. Once the user has been identified and verified, Virtual Agent unlocks the user's account.

Microsoft Office 365 Group pre-built topics for ITSM Virtual Agent

ITSM Virtual Agent helps you manage Microsoft Office 365 Groups using actions in conversation flows.

Natural Language Understanding (NLU) is used to identify and trigger the Microsoft Office 365 Group action that a user wants to perform.

Requirement: Microsoft Azure AD spoke (com.sn.azure_ad.spoke) plugin

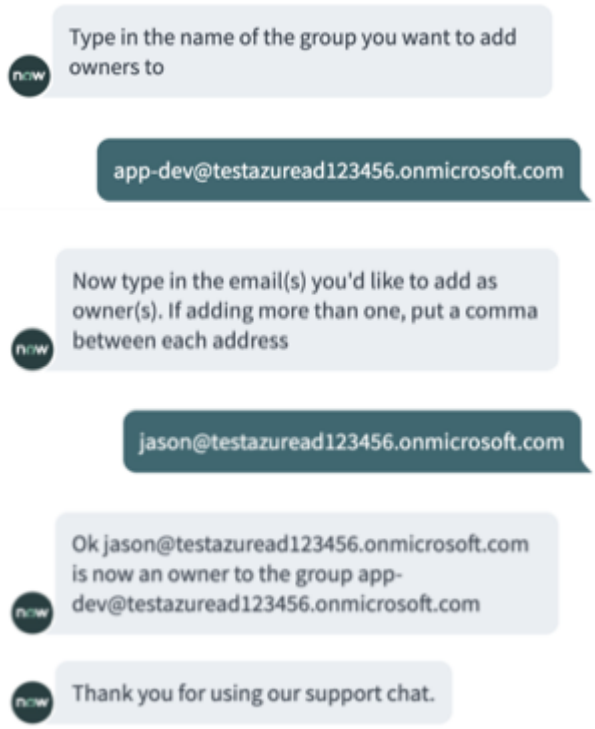
Note:
If the Microsoft Office 365 topics are duplicated in a different scope than ITSM VA Conversations, script logic can be affected and cause errors.

Add Owner to Office 365 Group

Group Owners can add other users as Group Owners by providing the group name and the user email addresses to add.

This topic uses the Create Incident topic block.

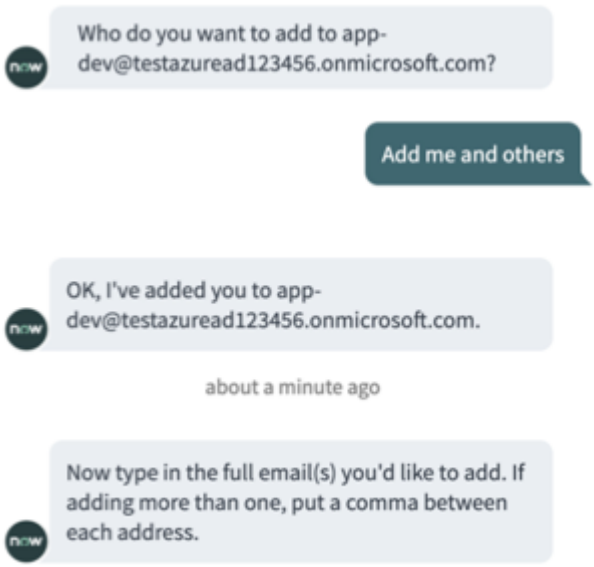
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Add User to Office 365 Group

Group owners can add themselves or other users to a Microsoft Office 365 group by providing the group name and the email address of one or more users to add.

This topic uses the Create Incident topic block.



Create Office 365 Group

Users can create a group in Microsoft Office 365 by providing the following information:

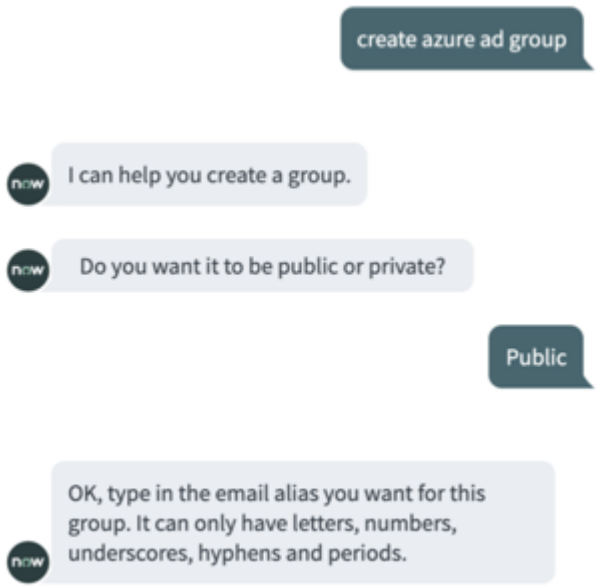
- Group privacy
- Group email alias
- Outlook display name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Group description
- Owners and members (optional)

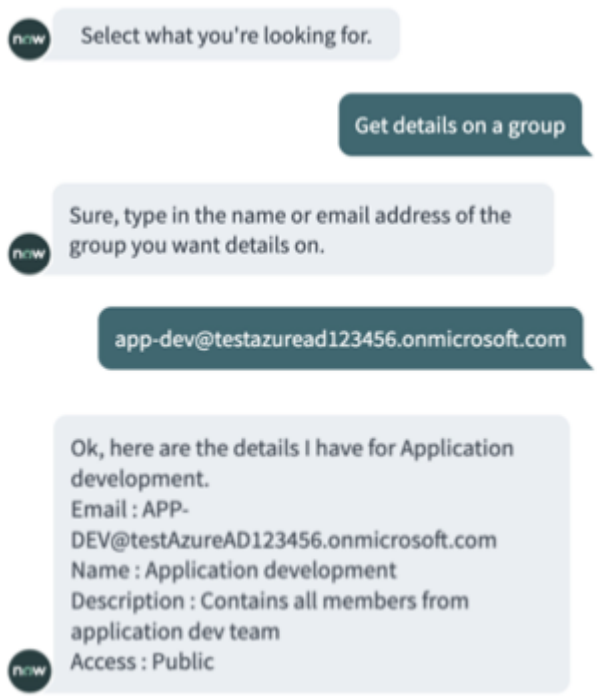
The current user is automatically added as the Group Owner, along with any other specified users.

This topic uses the Create Incident topic block.



Get Office 365 Group Details

Group members can get group details by providing the name or email of the group.

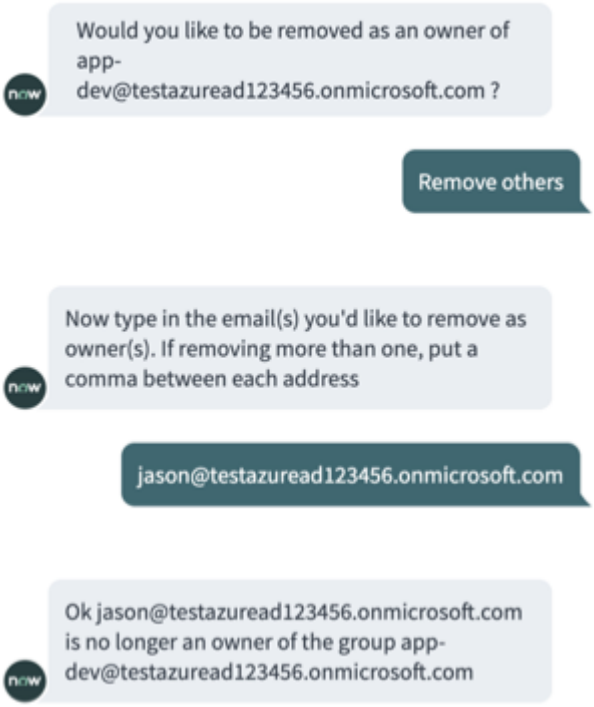


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remove Office 365 group Owner

Group Owners can remove themselves or other Group Owners by providing the group name and the user email addresses to remove.

This topic uses the Create Incident topic block.

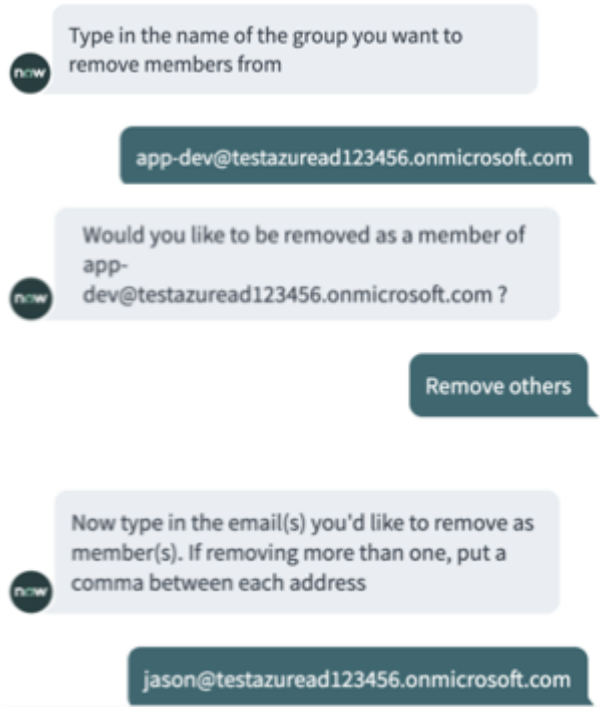


Remove Office 365 group Users

Users can remove themselves from a Microsoft Azure AD group. Group owners can remove other users from a group. Provide the group name and user email addresses to remove.

This topic uses the Create Incident topic block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Microsoft Active Directory pre-built topics for ITSM Virtual Agent

ITSM Virtual Agent helps you manage Microsoft Active Directory distribution lists using actions in conversation flows.

Natural Language Understanding (NLU) is used to identify and trigger the Microsoft Active Directory Group action that a user wants to perform.

Requirement: Microsoft AD spoke for Integration Hub (com.sn.ad.spoke) plugin

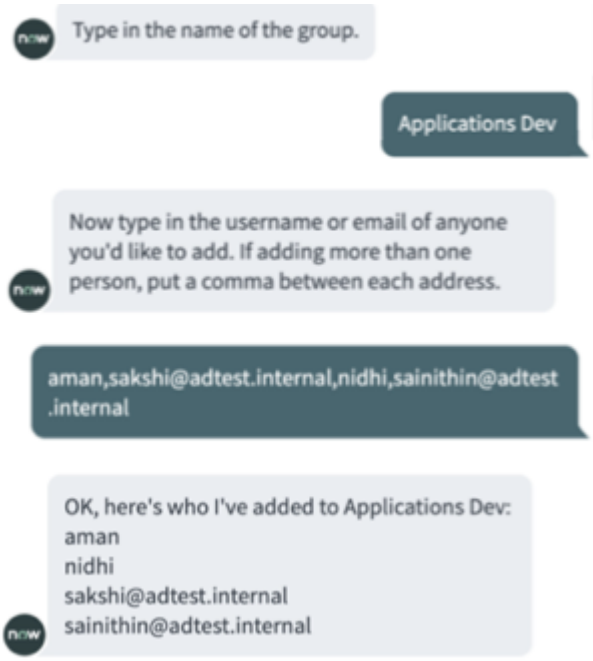
Note:
If the Microsoft Active Directory topics are duplicated in a different scope than ITSM Virtual Agent conversations, script logic can be affected and cause errors.

Add User to AD Group

Group owners can add themselves or other users to a Microsoft Active Directory Group distribution list by providing the group name and the email address or username of one or more users to add.

This topic uses the Create Incident topic block.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create AD Distribution Group

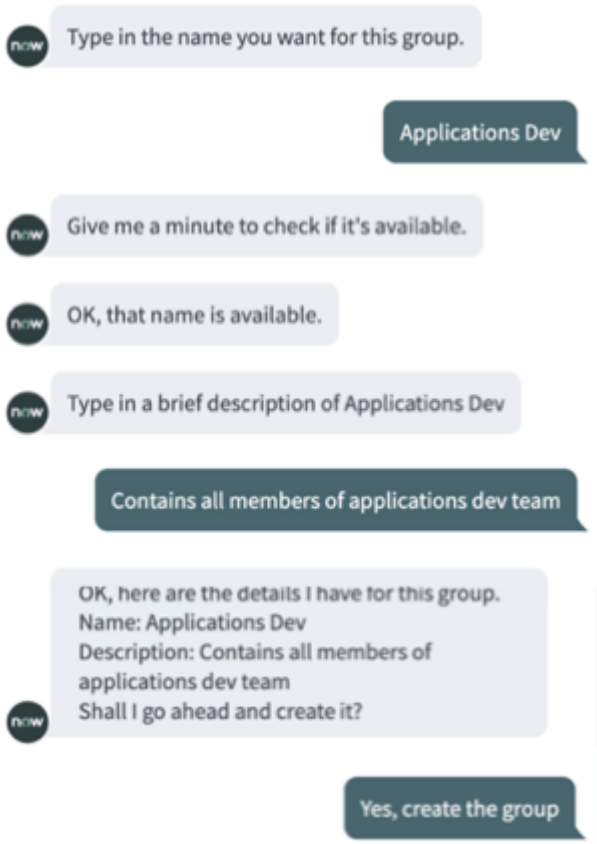
Users can create a Microsoft Active Directory distribution list by providing the following information:

- Group name
- Group description
- Members (optional)

The current user is automatically added as the group owner. Distribution lists are always public.

This topic uses the Create Incident topic block.

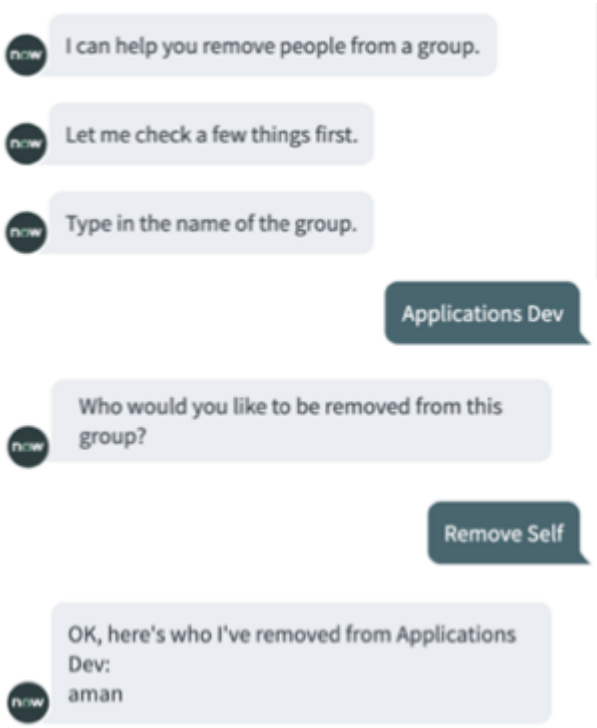
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Remove User from AD Group

Users can remove themselves from a Microsoft Active Directory Group distribution list. Group owners can remove other users from a group. Provide the group name and username or email addresses to remove.

This topic uses the Create Incident topic block.

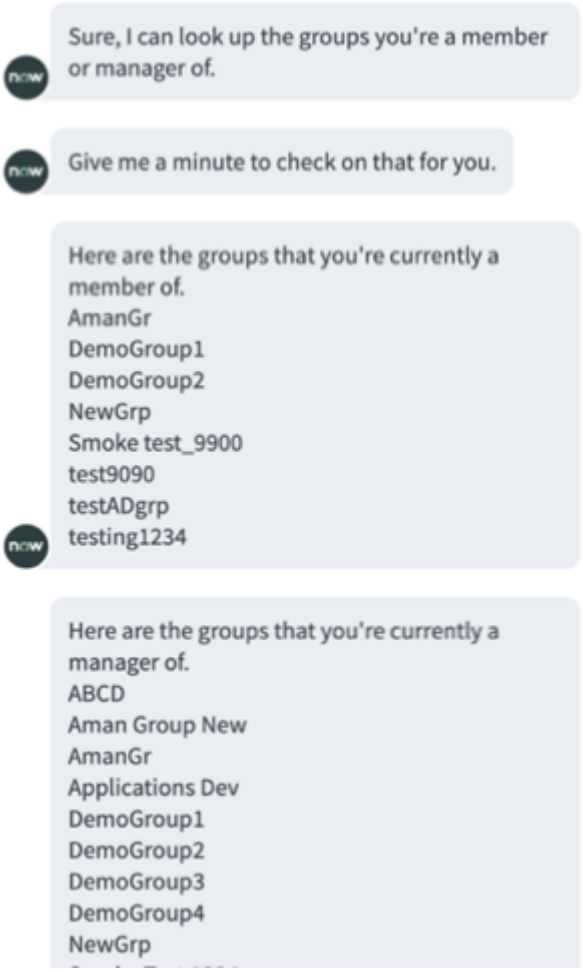


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Show My AD Group Membership

Group members can see a list of the Microsoft Active Directory distribution lists of which they are currently a member or manager.

This topic uses the Create Incident topic block.



Microsoft Exchange Online meeting management pre-built topic for ITSM Virtual Agent

ITSM Virtual Agent helps you manage meetings in Microsoft Exchange Online. Using the Manage Meetings EXO topic, you can schedule, reschedule, and cancel a meeting.

Manage Meetings EXO v1.0

Natural Language Understanding (NLU) is used to identify and trigger the meeting action that a user wants to perform. Users can schedule, reschedule, or cancel a meeting.

Requirements:

- Microsoft Exchange Online spoke (sn_ex_online_spke)
- Email addresses for meeting attendees must be configured in the User [sys_user] table to be added to meeting invites
- Some actions can use the Microsoft Teams Communication spoke (sn_msteams_com_spk) to send meeting links to Microsoft Teams
- Some actions can use the Cisco Webex Teams spoke (sn_cisco_teams_spk)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Some actions can use the Zoom spoke (com.sn.zoom.spoke) to add meeting links
- This topic uses the Employee Experience VA topic blocks

Note:
If this topic is duplicated in a different scope than ITSM Virtual Agent Conversations, script logic can be affected and cause errors. This topic must be duplicated in the ITSM Virtual Agent Conversations scope.

Basic flow for scheduling a meeting:

1. User enters the email addresses for all attendees, the meeting time, and the meeting duration.
2. Virtual Agent provides a list of available meeting times, based on the calendars of the invitees.
3. User enters the meeting subject and description.
4. User can choose the type of meeting: virtual/online, conference room, or hybrid.

   If the spokes are enabled on the instance, the user can add a meeting link for Microsoft Teams, Webex, or Zoom.
5. Virtual Agent returns the meeting link (if applicable) and the meeting details.
6. User confirms that Virtual Agent should schedule the meeting.
7. Once the user confirms, Virtual Agent sends the email invitations and schedules the meeting.

Note:
The user can also schedule a meeting through Virtual Agent using the Microsoft Teams service.

Basic flow for canceling a meeting:

1. User enters the start and end date and time of the original meeting.
2. Virtual Agent returns a list of potential meetings to cancel.
3. User selects the desired meeting or can choose to cancel all meetings during the specified duration.
4. Virtual Agent cancels all specified meetings and sends the user a confirmation email.

Basic flow for rescheduling a meeting:

1. User enters the original meeting date.
2. Virtual Agent returns a list of potential meetings to reschedule.
3. User selects the desired meeting.
4. User enters a new meeting time.
5. Virtual Agent confirms that the meeting has been rescheduled.
6. User can reschedule additional meetings, if desired.

Manage Meetings EXO (deprecated)

This topic is deprecated. Use Manage Meetings EXO v1.0 instead.

Requirements:

- Microsoft Exchange Online spoke
- Email addresses for meeting attendees must be configured in the User [sys_user] table to be added to meeting invites

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Some actions can use the Zoom spoke (com.sn.zoom.spoke) to add meeting links
- Some actions can use the Microsoft Teams Communication spoke (sn_msteams_com_spk) to send meeting links to Microsoft Teams

Note:
If this topic is duplicated in a different scope than ITSM Virtual Agent Conversations, script logic can be affected and cause errors. This topic must be duplicated in the ITSM Virtual Agent Conversations scope.

Basic flow for scheduling a meeting:

1. User enters the email addresses for all attendees, the meeting time, and the meeting duration.
2. Virtual Agent provides a list of available meeting times, based on the calendars of the invitees.
3. User enters the meeting subject and description.
4. If the admin configured the script variable **default_collaboration_software** and the appropriate spoke is enabled on the instance, the user can add a Zoom link or a Microsoft Teams link.
5. Virtual Agent returns the meeting link (if applicable) and the meeting details.
6. User confirms that Virtual Agent should schedule the meeting.
7. Once the user confirms, Virtual Agent sends the email invitations and schedules the meeting.

Note:
The user can also schedule a meeting through Virtual Agent using the Microsoft Teams service.

Basic flow for canceling a meeting:

1. User enters the start and end date and time of the original meeting.
2. Virtual Agent returns a list of potential meetings to cancel.
3. User selects the desired meeting or can choose to cancel all meetings during the specified duration.
4. Virtual Agent cancels all specified meetings and sends the user a confirmation email.

Basic flow for rescheduling a meeting:

1. User enters the original meeting date.
2. Virtual Agent returns a list of potential meetings to reschedule.
3. User selects the desired meeting.
4. User enters a new meeting time.
5. Virtual Agent confirms that the meeting has been rescheduled.
6. User can reschedule additional meetings, if desired.

Microsoft Exchange Server meeting management pre-built topics for ITSM Virtual Agent

ITSM Virtual Agent helps you manage meetings in Microsoft Exchange Server. Using the Manage Meetings EXS topic, you can schedule, reschedule, and cancel a meeting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage Meetings EXS

Natural Language Understanding (NLU) is used to identify and trigger the meeting action that a user wants to perform. Users can schedule, reschedule, or cancel a meeting.

Requirements:

- Microsoft Exchange Server spoke (sn_exchange_spoke)
- Email addresses for meeting attendees must be configured in the User [sys_user] table to be added to meeting invites
- Some topics can use the Zoom spoke to add meeting links

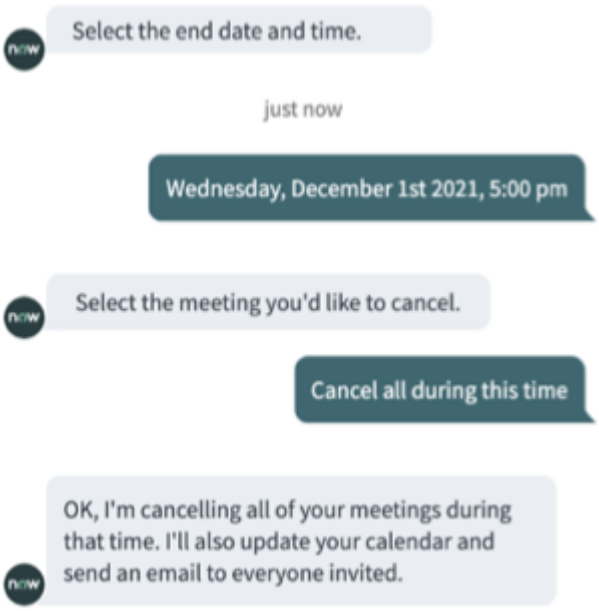
Note:
If these topics are duplicated in a different scope than ITSM Virtual Agent Conversations, script logic can be affected and cause errors. This topic must be duplicated in the ITSM Virtual Agent Conversations scope.

Manage Meetings EXS: Cancel a meeting

Users can send a message to Virtual Agent requesting to cancel a meeting, or users can select the desired template and select **Cancel Meeting**.

Basic flow:

1. User enters the start and end date and time of the original meeting.
2. Virtual Agent returns a list of potential meetings to cancel.
3. User selects the desired meeting or can choose to cancel all meetings during the specified duration.
4. Virtual Agent cancels the meetings, sends an email to all attendees, and updates the calendar.



Manage Meetings EXS: Reschedule a meeting

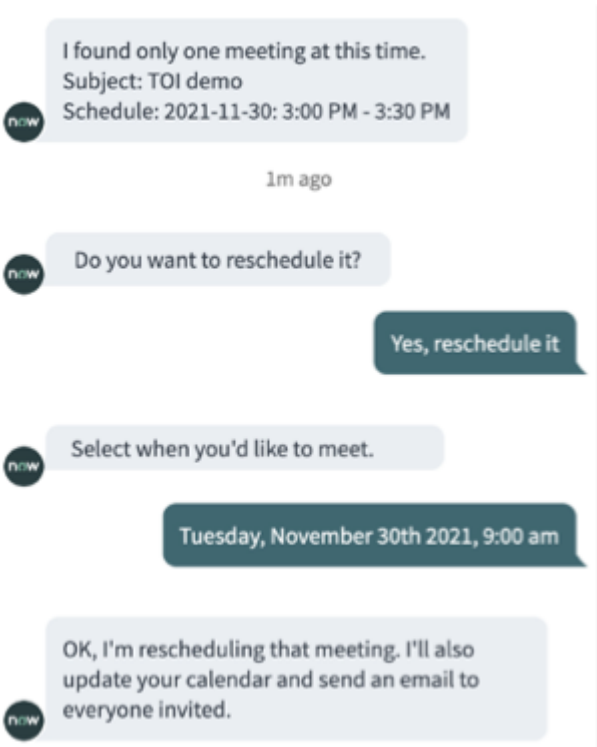
Users can send a message to Virtual Agent requesting to reschedule a meeting, or the user can select the desired template and select **Reschedule Meeting**.

Basic flow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. User enters the original meeting date.
2. Virtual Agent returns a list of potential meetings to reschedule.
3. User selects the desired meeting.
4. User enters a new meeting time.
5. Virtual Agent reschedules the meeting, emails the attendees, and updates the calendar.

Virtual Agent reschedules the meeting, emails the attendees, and updates the calendar.



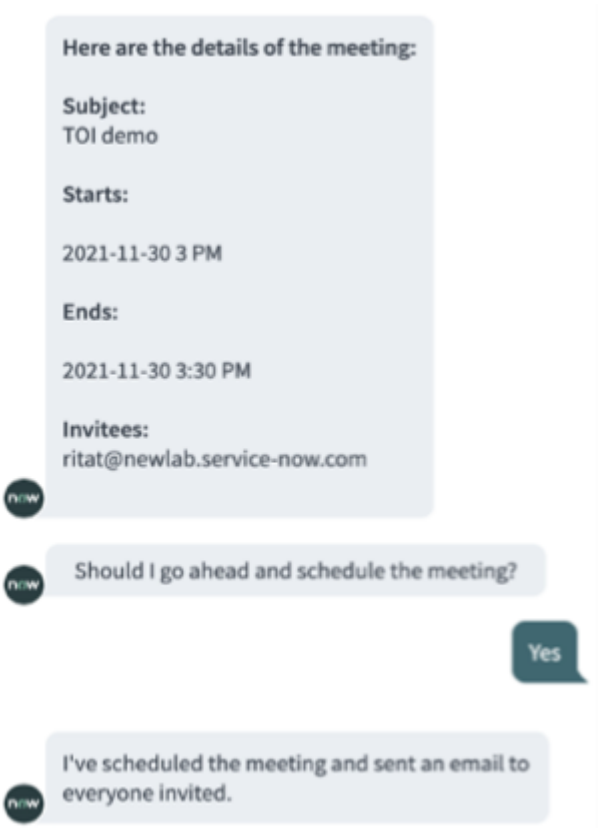
Manage Meetings EXS: Schedule a meeting

Users can send a message to Virtual Agent requesting to schedule a meeting, or the user can select the desired template and select **Set up Meeting**.

Basic flow:

1. User enters the email addresses for all attendees, the meeting time, and the meeting duration.
2. Virtual Agent provides a list of available meeting times, based on the calendars of the invitees.
3. User enters the meeting subject and description.
4. Virtual Agent returns the meeting details.
5. User confirms that Virtual Agent should schedule the meeting.
6. Once the user confirms, Virtual Agent sends the email invitations and schedules the meeting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Virtual machine pre-built topics for ITSM Virtual Agent

ITSM Virtual Agent helps you manage a virtual machine (VM) using conversation flows. With this conversation flow, you can start, stop, terminate, describe, and provision a virtual machine.

There are two categories of virtual machine management topics:

Topics that support AWS and Azure providers

Topics that are labeled **CAI** use the Cloud Access Interface to take action on virtual machines provisioned on AWS and Azure. The user must have the sn_managevm_va.cai_vm_user role to perform these actions. The Virtual Agent admin can set the script variable *`max_records`* (default value=100) to denote the number of records to be fetched from Azure in a single REST API call. The script variable *`carousel_entries_threshold`* denotes the number of records the carousel input shows. If the number of records are greater than the specified value, a reference choice list is shown to the user.

Cloud Provisioning and Governance is not required to describe, start, stop, and terminate a VM for AWS and Azure. You can perform the following actions with the Cloud Access Interface (CAI) topics for Virtual Agent:

- Start a Virtual Machine CAI
- Stop a Virtual Machine CAI
- Terminate a Virtual Machine CAI
- Describe a Virtual Machine CAI

Topics that use the Cloud Provisioning and Governance plugin (com.snc.cloud.mgmt)

The following topics integrate with Cloud Provisioning and Governance (required):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Manage Virtual Machine
- Provision Virtual Machine

Describe Virtual Machine CAI

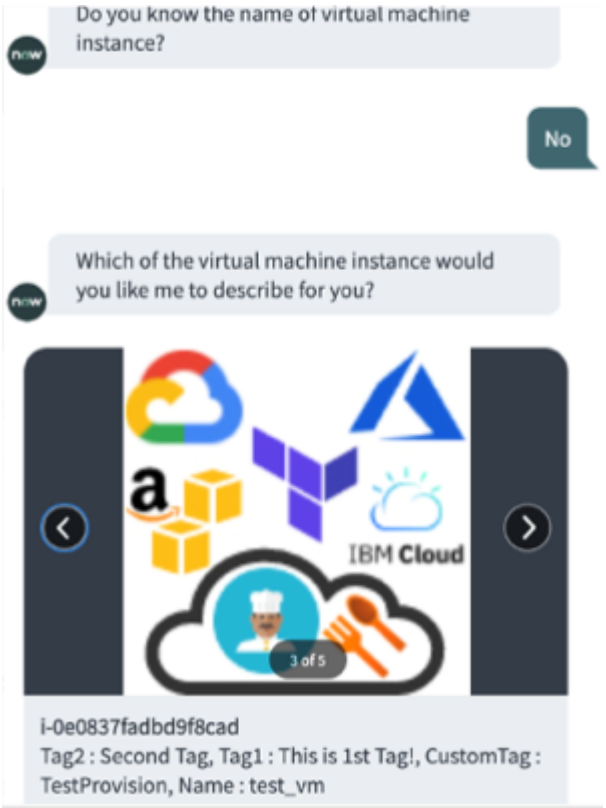
Users can see details of any assigned VM instance associated with the credential set up by the system administrator. If AWS encounters an error, Virtual Agent asks the user to create an incident for further investigation.

Returned details include Provider, Region, and Instance ID. The user can specify which VM to describe, or Virtual Agent can provide a list of available VM instances and the user can select the desired VM to describe.

Requirement: User must have the sn_managevm_va.cai_vm_user role to perform these actions.

This topic uses the following topic blocks:

- Virtual Machine Operation AWS
- Virtual Machine Operation Azure



Manage Virtual Machine

This topic calls the appropriate topic block (describe, start, stop, and terminate) to complete an end-to-end fulfillment of the request.

This topic calls the appropriate topic block (describe, start, stop, and terminate) to complete an end-to-end fulfillment of the request. This pre-built topic is read-only. Duplicate the topic in the Virtual Machine Management for Virtual Agent scope and activate it to use the conversation flow.

Requirement: Cloud Provisioning and Governance plugin (com.snc.cloud.mgmt)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This topic uses the following topic blocks:

- Describe Virtual Machine
- Start Virtual Machine
- Stop Virtual Machine
- Terminate Virtual Machine

Provision Virtual Machine

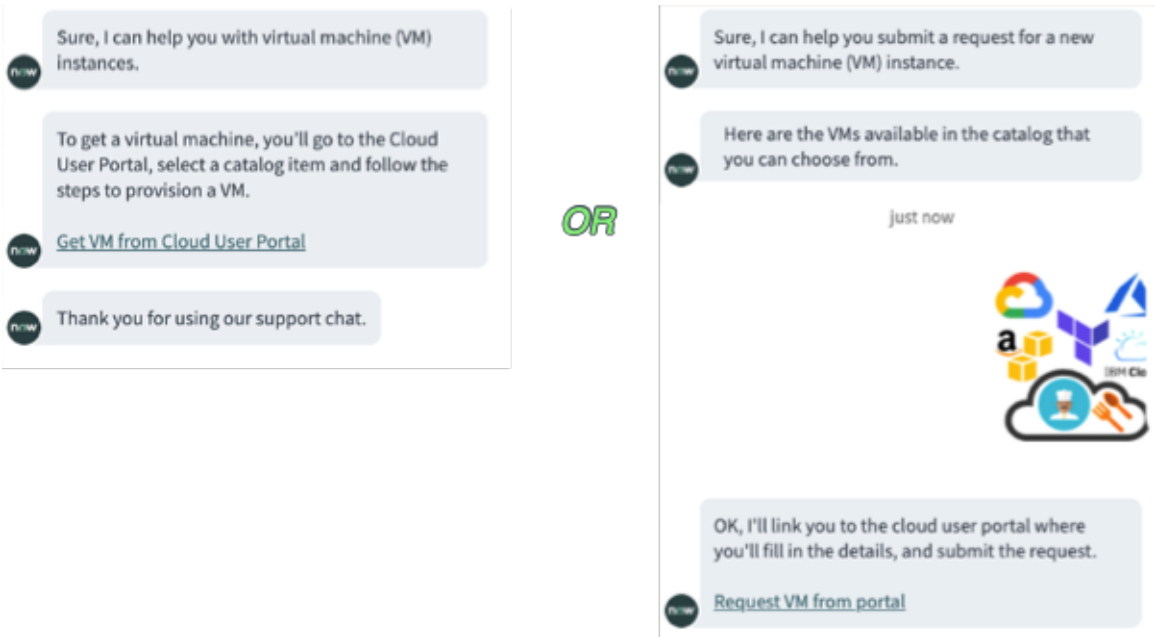
Users can request a new VM in a Virtual Agent conversation. Virtual Agent sends a link to the Cloud User Portal to submit the catalog item.

Requirement: Cloud Provisioning and Governance plugin (com.snc.cloud.mgmt)

Basic flow:

1. User requests a virtual machine.
2. Virtual Agent does one of the following:
   - Provides a link to the Cloud User Portal, along with instructions for requesting a VM from the catalog.
   - Displays items in the VM catalog that are assigned to the user.

     If the user can't find the desired catalog item, the user can either go directly to the Cloud User Portal or end the conversation.



Start Virtual Machine CAI

Users can start any assigned virtual machine instance associated with their credentials set up by the system administrator. If AWS encounters an error, Virtual Agent asks the user to create an incident for further investigation.

Requirement: User must have the sn_managevm_va.cai_vm_user role to perform these actions.

This topic uses the following topic blocks:

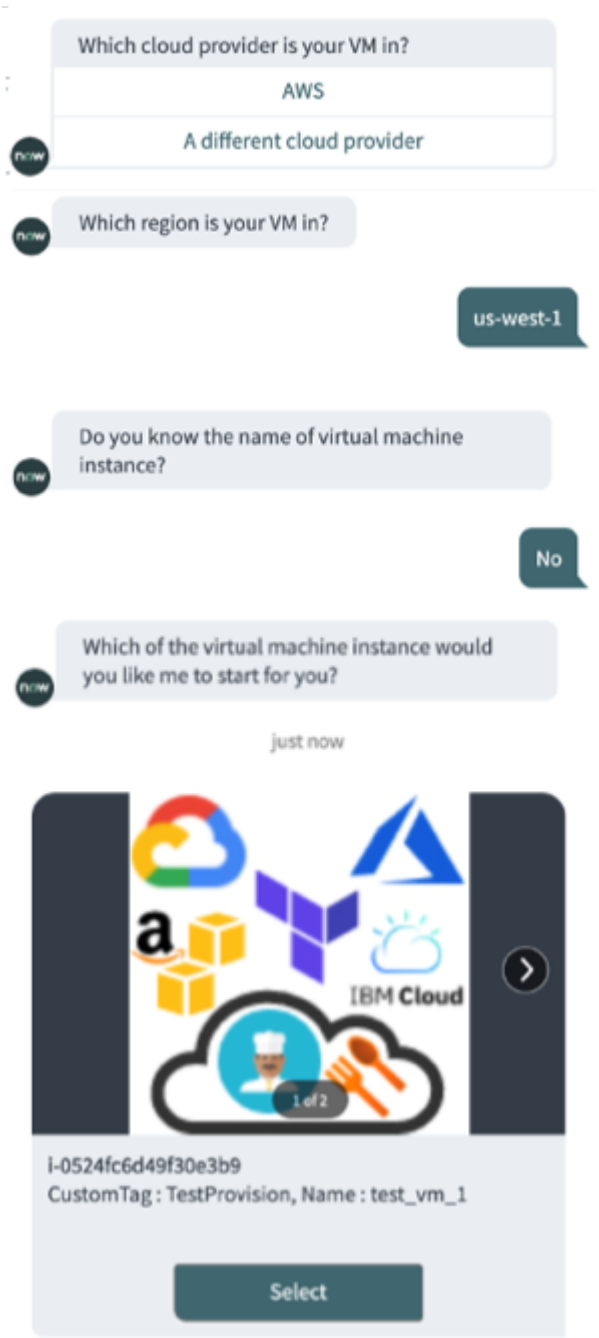
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Virtual Machine Operation AWS
- Virtual Machine Operation Azure

Basic flow:

1. User specifies which VM to start, or Virtual Agent provides a list of available VM instances for the user to choose from.
2. Virtual Agent sends the user an actionable notification when the requested VM starts.
3. User can choose to see details, request additional instructions to log in to the virtual machine, or skip the notification.

   Virtual Agent also notifies the user if the operation was unsuccessful.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stop Virtual Machine CAI

Users can stop any assigned VM instance associated with the credentials set up by the system administrator. If AWS encounters an error, Virtual Agent asks the user to create an incident for further investigation.

Requirement: User must have the sn_managevm_va.cai_vm_user role to perform these actions.

This topic uses the following topic blocks:

- Virtual Machine Operation AWS
- Virtual Machine Operation Azure

Basic flow:

1. User specifies which VM to stop, or Virtual Agent provides a list of available VM instances for the user to choose from.
2. Virtual Agent sends the user an actionable notification when the requested VM stops.
3. User can choose to see details, request additional instructions to log in to the virtual machine, or skip the notification.

   Virtual Agent also notifies the user if the operation was unsuccessful.

Terminate Virtual Machine CAI

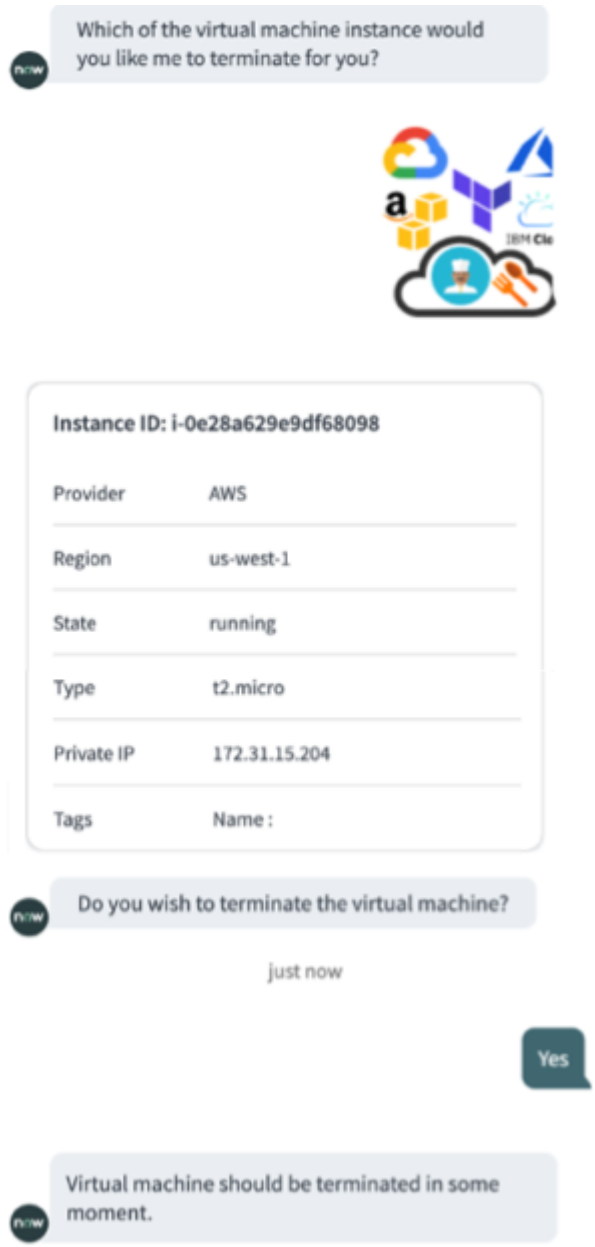
Users can terminate any assigned virtual machine instance associated with the credential set up by the system administrator. Because termination is a permanent action, Virtual Agent displays the VM details and asks for confirmation. If AWS encounters an error, Virtual Agent asks the user to create an incident for further investigation.

Requirement: User must have the sn_managevm_va.cai_vm_user role to perform these actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This topic uses the following topic blocks:

- Virtual Machine Operation AWS
- Virtual Machine Operation Azure



Pre-built setup topics for Virtual Agent

Use pre-built setup topics to create a standard welcome greeting and a conversation closing. In addition, setup topics can provide user feedback and surveys, as well as error handling.

For more information about setup topics, see Setting up chat experiences for Virtual Agent users.

For a complete list of setup topics that are included with Virtual Agent, see Working with setup topics.

Dynamic Greeting Topic

Users receive a dynamic, time-based greeting at the beginning of a conversation from a virtual agent. The greeting includes addressing the user by first name with the time of day, referencing any incident or request the user may have open, and mentioning outage information if an outage is occurring or planned. For example:

"Good morning, John. You currently have [x] incidents and [x] requests open. We are aware of [outage] with [service] that began at [start time]".

When the end time is known, the virtual agent includes the message:

"The [outage] is planned to end at [end time]".

Note:
If there are no incidents, requests, or outages these messages do not display.

The dynamic greeting is followed by the standard greeting, which asks the user to enter information.

For more information about configuring the greeting setup topic, see Change the Virtual Agent greeting messages in the Greeting setup topic.

Fulfiller pre-built topics for ITSM Virtual Agent

Fulfiller topic conversations are designed specifically for ITSM professionals with the itil role. These pre-built topics include resolving an incident, creating a problem, and updating data in the system.

Create Change Request

Users with the itil role can create change requests using their client of choice, such as Slack. Users indicate the type of change request (**Normal**, **Standard**, or **Emergency**). Change type definitions are provided by the virtual agent.

For normal and emergency change requests, Virtual Agent prompts the user to enter the following criteria:

- Short description
- Justification
- Configuration item
- Assignment group
- Planned start date
- Planned end date

For standard change requests, Virtual Agent sends a carousel link to a catalog of standard change items. After the user selects an item, Virtual Agent provides a link to open the associated category page to request the change.

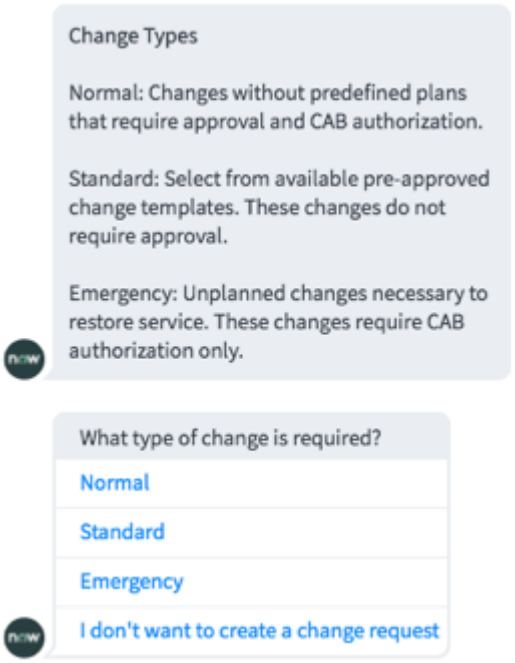
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create Problem

Users with the itil role can create problem records. Users provide a description of the problem and specify the urgency and the impact of the problem. Users must know and enter the associated problematic configuration item as well.

Identify Available Change Windows

Users with the itil role can check the next available change window for a configuration item. For example, you can determine the next available change window for a specific asset assigned to a user, regarding maintenance or black-out calendars. Users must enter the configuration item to check, such as `PROmonitor`, and then select a planned start and end date and time.

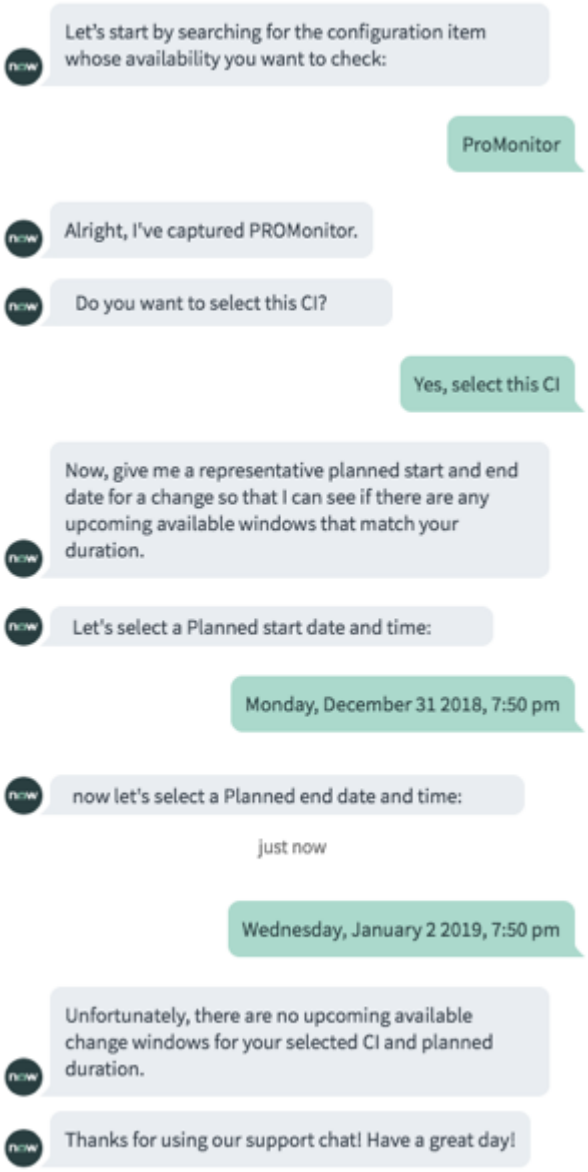
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



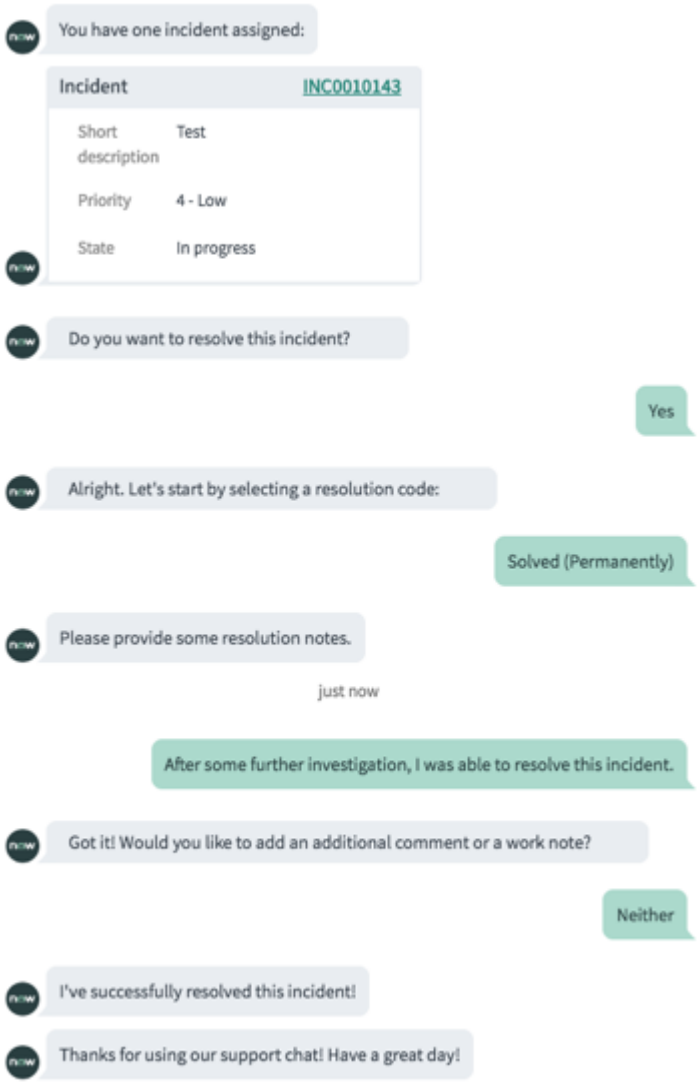
Identify Scheduled Changes

Users with the itil role can find upcoming change requests for a specific configuration item (CI). To see the change requests, users must type in the name of the configuration item that contains the changes.

Resolve Incident

Users with the itil role can resolve an incident through support chat by providing a close code, for example, **Solved (Permanently)** or **Solved (Workaround)**, and resolution notes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Update Assigned Task

Users with the itil role can update comments or work notes in assigned tasks. When a user wants to update a task, the virtual agent returns a list of all assigned tasks and asks which task the user wants to update. Users can select a single listed task to update or select **All** to load and update all assigned tasks. The virtual agent then asks if the user wants to add a comment, a work note, or both. Optionally, users can cancel the update.

Update Change Request

Users with the itil role can update the actual start and end time of a change, as well as move it to work in progress or closed states.

Reusable ITSM Virtual Agent pre-built topic blocks

Reuse topic blocks to perform common functions in ITSM Virtual Agent conversations, such as creating an incident or performing a search.

Use the **Type** list on the Topics page in Virtual Agent Designer to sort by **Topic Blocks**. For detailed information about topic blocks, see Maximizing code reuse with topic blocks.

ITSM Virtual Agent provides the following pre-built topic blocks and templates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Many of these topic blocks are available with the Service Management Virtual Agent Topic Blocks plugin (com.glideapp.cs.sm_topic_blocks). For more information about plugins, see ServiceNow Plugins

Contextual Search

Contextual Search topic block input and output parameters

Name	Description
Input parameters	
context	The sys_id of a Search Context (cxs_context_config) record. Defines what sources are included in the search. For example, sources can include the knowledge base or community.
query	The search keyword entered by a user during a virtual agent conversation.
portal	The portal from which the conversation initiated, such as a service portal or human resources portal. This portal is the URL suffix, such as sp, esc, csm, and hr, from which the search results open.
kb_knowledge_base	The sys_id of a Knowledge Base (kb_knowledge_base) record. Within context, search only these knowledge base articles.
Output parameters	
results_returned	True if search results are found, otherwise false.
results_helpful	True if user responds that search results are helpful, otherwise false.

Create Incident

This topic block initiates the **Open IT Ticket** conversation topic.

Create Incident topic block input and output parameters

Name	Description
Input parameters	
caller	The name of the user creating an Incident (incident) record.
short_description	The short description entered in the Incident (incident) record.
urgency	The urgency level indicated in the Incident (incident) record.
description	The description entered in the Incident (incident) record.
cmdb_ci	CMDB configuration item.
Output parameters	
created_incident_sys_id	The return sys_id of a newly created incident.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create MS Teams Meeting Link (deprecated)

This topic block is deprecated. Use Get MS Teams Meeting Link instead.

Users can request a Microsoft Teams meeting link using Virtual Agent. This topic block can be included in other topics. By default, this topic block runs in silent mode, and the output messages are not displayed.

Requirement: Microsoft Teams Communication spoke (sn_msteams_com_spk) plugin

Create Zoom Meeting Link

For more actions, the Zoom Meeting Actions topic block is also available.

Users can request a Zoom meeting link using Virtual Agent. This topic block can be included in other topics. By default, this topic block runs in silent mode, and the output messages are not displayed.

Requirement: Zoom spoke (com.sn.zoom.spoke) plugin

Describe Virtual Machine

Users can get details on any assigned virtual machine (VM) instance using the Manage Virtual Machine topic in Virtual Agent. Details include Provider, Region, Instance ID, and so forth.

Basic flow:

1. User specifies which VM to describe, or Virtual Agent provides a list of available VM instances for the user to choose from.
2. Virtual Agent provides the requested virtual machine details.
3. To get additional details, users can select the link provided, which redirects them to the Cloud User Portal.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Describe Virtual Machine topic block input and output parameters

Name	Description
Input parameter: vm_name	Name of the virtual machine instance.
Input parameter: vm_sys_id	Sys ID of the virtual machine instance in the cmdb_ci_vm_instance table.
Output parameter: incident_short_description	Short description for the Incident record, if one is recorded.

Display Password Reset URLs

If Password Reset is enabled on Virtual Agent, and the user has been authenticated, this topic block returns a password reset link. If Password Reset is not enabled, the user is directed to the service desk.

This topic block as one input parameter: *`unlock_account`*. If the user has been authenticated, the value is *`true`*. Otherwise, the value is *`false`*.

For more information, see Password Reset for Virtual Agent.

This topic block has one input parameter: *`unlock_account`*. If the user has been authenticated, the value is *`true`*. Otherwise, the value is *`false`*.

Request Catalog Item

For information about this topic block, see Service Catalog topic blocks in Virtual Agent.

Search Catalog Item

For information about this topic block, see Service Catalog topic blocks in Virtual Agent.

Start Virtual Machine

Users can start any assigned VM instance using the Manage Virtual Machine topic. If the VM is already on or in a state where it cannot be started, Virtual Agent notifies the user.

Basic flow:

1. User specifies which VM to start, or Virtual Agent provides a list of available VM instances for the user to choose from.
2. Virtual Agent sends the user an actionable notification when the requested VM starts.

   Virtual Agent also notifies the user if the operation was unsuccessful.
3. User can choose to see details, request additional instructions to log in to the virtual machine, or skip the notification.
4. If the user requests additional login instructions, Virtual Agent provides these instructions and the user can confirm if the login was successful.

Start Virtual Machine topic block input and output parameters

Name	Description
Input parameter: vm_name	Name of the virtual machine instance.
Output parameter: incident_short_description	Short description for the Incident record, if one is recorded.

Stop Virtual Machine

Users can stop any assigned VM instance using the Manage Virtual Machine topic. If the VM is already off or is in a state where it cannot be stopped, Virtual Agent notifies the user.

Basic flow:

1. User specifies which VM to stop, or Virtual Agent provides a list of available VM instances for the user to choose from.
2. Virtual Agent sends the user an actionable notification when the requested VM has stopped.

   Virtual Agent also notifies the user if the operation was unsuccessful.
3. User can choose to see details or skip the notification.

Stop Virtual Machine topic block input and output parameters

Name	Description
Input parameter: vm_name	Name of the virtual machine instance.
Output parameter: incident_short_description	Short description for the Incident record, if one is recorded.

Terminate Virtual Machine

Users can terminate any assigned virtual machine (VM) instance using the Manage Virtual Machine topic. If the VM is already terminated or is in a state where it cannot be terminated, Virtual Agent notifies the user.

Basic flow:

1. User specifies which VM to terminate, or Virtual Agent provides a list of available VM instances for the user to choose from.
2. Virtual Agent provides the details of the requested VM to terminate.
3. Terminating a virtual machine is a permanent action, so the user must confirm the operation to continue.
4. Virtual Agent sends the user an actionable notification when the requested virtual machine has been terminated.

Terminate Virtual Machine topic block input and output parameters

Name	Description
Input parameter: vm_name	Name of the virtual machine instance.
Output parameter: incident_short_description	Short description for the Incident record, if one is recorded.

Troubleshoot Cisco Webex

Users can find a solution for common Webex issues. This topic block is used in the Collaboration Applications topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the user is not satisfied with the static help content for the issue, the fallback is AI search or contextual search. The type of search is dictated by the system property *sn_itsm_va.fallback_search_option*.

Troubleshoot Cisco Webex topic block input and output parameters

Name	Description
Input parameter	
issue	The user application issue.
Output parameter	
user_query	Problem string used for search fallback.

Troubleshoot Microsoft Teams

Users can find a solution for common Microsoft Teams issues. This topic block is used in the Collaboration Applications topic.

If the user is not satisfied with the static help content for the issue, the fallback is AI search or contextual search. The type of search is dictated by the system property *sn_itsm_va.fallback_search_option*.

Troubleshoot Microsoft Teams topic block input and output parameters

Name	Description
Input parameter	
issue	The user application issue.
Output parameter	
user_query	Problem string used for search fallback.

Troubleshoot Zoom

Users can find a solution for common Zoom issues. This topic block is used in the Collaboration Applications topic.

If the user is not satisfied with the static help content for the issue, the fallback is AI search or contextual search. The type of search is dictated by the system property *sn_itsm_va.fallback_search_option*.

Troubleshoot Zoom topic block input and output parameters

Name	Description
Input parameter	
issue	The user application issue.
Output parameters	
user_query	Problem string used for search fallback.
ticket_description	Problem string used to create an IT ticket.

Virtual Machine Operation AWS

Users can use the Cloud Access Interface to take action on virtual machines provisioned on Amazon AWS. The user must have the sn_managevm_va.cai_vm_user role.

This topic block is used in the virtual machine management CAI pre-built topics. Available actions include Stop, Start, Terminate, or Describe the virtual machine.

Virtual Machine Operation Azure

Users can use the Cloud Access Interface to take action on virtual machines provisioned on Microsoft Azure. The user must have the sn_managevm_va.cai_vm_user role.

This topic block is used in the virtual machine management CAI pre-built topics. Available actions include Stop, Start, Terminate, or Describe the virtual machine.

Employee Experience topic blocks

ITSM Virtual Agent helps you manage meetings in Microsoft Exchange Online. Using the Manage Meetings EXO v1.0 topic, you can schedule, reschedule, and cancel a meeting.

Use the **Category** list on the Topics page in Virtual Agent Designer to sort by **Self Service** to view all Employee Experience topics blocks.

For detailed information about topic blocks, see Maximizing code reuse with topic blocks.

Cancel Meeting EXO

Users can send a message to Virtual Agent requesting to cancel a meeting.

Cancel a Meeting EXO topic block input and output parameters

Name	Description
Input parameters	
Start Date Time	Start date and time of the meeting in UTC.
End Date Time	End date and time of the meeting in UTC.
Output parameters	
status	Returns a cancel status for the meeting.
status_code	Returns one of the following status codes for the meeting: • MEETING_CANCELLED • TECHNICAL_ISSUE • INFORMATION_PROVIDED

Conference Room Availability

Users can choose an available conference room for their meeting.

Conference Room Availability topic block input and output parameters

Name	Description
Input parameters	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conference Room Availability topic block input and output parameters (continued)

Name	Description
Room Location	Location of the conference room.
Room Capacity	Number of people the conference room holds.
Start Date Time	Start date and time of the meeting in UTC.
Duration	Duration of the meeting in minutes. Values increment by 15 minute segments, from *15* to *1440* (1 day).
Output parameters	
selected_room_info	Name of the selected conference room.
booking_info	JSON string denoting additional booking information (location, start time, and duration of meeting).
status	Returns the status for the meeting.
status_code	Returns one of the following status codes for the meeting: • NO_EMAIL_FOUND • TECHNICAL_ISSUE • INVALID_SCHEDULE_INFO • INVALID_EMAIL • NO_ROOMS_AVAILABLE • ROOMS_SELECTED • ROOMS_VIEWED

Get MS Teams Meeting Link

If the Microsoft Teams Communication spoke (sn_msteams_com_spk) is installed on the instance, users can send a Microsoft Teams meeting link with their invitation.

Get MS Teams Meeting Link topic block input and output parameters

Name	Description
Input parameters	
email_id	Email address of the meeting organizer.
meeting_subject	Subject of the meeting.
silent_mode	Determines whether the topic block produces a message output. When the value is *true*, the topic block doesn't produce an output message.
service_user_azure	Service account Azure ID for the user. This will be used to initiate the meeting in Microsoft Teams meetings. Use a script variable to pass the user ID.
Output parameters	
url	Microsoft Teams meeting URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get MS Teams Meeting Link topic block input and output parameters (continued)

Name	Description
meeting_id	Microsoft Teams meeting ID.
output_status	Indicates whether the action was successfully completed.
output_error_message	Error message indicating that the meeting link didn't get generated.

Reschedule a Meeting EXO

Users can send a message to Virtual Agent requesting to reschedule a meeting, or the user can select the desired template and select **Reschedule Meeting**.

Reschedule a Meeting EXO topic block input and output parameters

Name	Description
Input parameters	
Start Date Time	Current start date and time of the meeting in UTC.
End Date Time	Current end date and time of the meeting in UTC.
Rescheduled Date	New date and time of the meeting in UTC.
Duration	Duration of the meeting in minutes. Values increment by 15 minute segments, from *15* to *1440* (1 day).
Output parameters	
status	Returns a rescheduled status for the meeting.
status_code	Returns one of the following status codes for the meeting: • MEETING_RESCHEDULED • TECHNICAL_ISSUE • INFORMATION_PROVIDED

Schedule a Meeting EXO

Users can send a message to Virtual Agent requesting to schedule a meeting, or the user can select the desired template and select **Set up meeting**.

Schedule a Meeting EXO topic block input and output parameters

Name	Description
Input parameters	
Attendees	Email addresses of the people invited to the meeting. Multiple attendee email addresses are separated by a comma.
Subject	Subject of the meeting.
Meeting Date	Start date of the meeting in the user's time zone.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule a Meeting EXO topic block input and output parameters (continued)

Name	Description
Meeting Time	Time of day for the meeting in minutes. For example, for 11:26 pm, the value is *1406*.
Duration	Duration of the meeting in minutes. Values increment by 15 minute segments, from *15* to *1440* (1 day).
Resource Type	Resources required for the meeting. Values include: • *Virtual*: Requires conferencing software, such as Zoom. • *Conference*: Requires a room to be booked. • *Hybrid*: Requires both conferencing software and a room. • *None*: No additional resources required.
Meeting Application	Conferencing software tool for the meeting. Values include: • *Teams* • *Webex* • *Zoom* • *None*
Body	Meeting agenda.
Service User Azure ID	Service account Azure ID for the user in Microsoft Teams meetings.
Output parameters	
event_id	ID for the scheduled meeting.
status	Returns the status for the meeting.
status_code	Returns one of the following status codes for the meeting: • MEETING_SCHEDULED • TECHNICAL_ISSUE • NO_MEETING_SELECTED

Webex Meeting Actions

If the Cisco Webex Teams spoke (sn_cisco_teams_spk) is installed on the instance, users can send a Webex meeting link with their invitation.

Webex Meeting Actions topic block input and output parameters

Name	Description
Input parameters	
Action	The Webex action for the meeting. Values include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Webex Meeting Actions topic block input and output parameters (continued)

Name	Description
	• *Schedule* • *Reschedule* • *Cancel*
Start Date Time	Current start date and time of the meeting in UTC.
Duration	Duration of the meeting in minutes. Values increment by 15 minute segments, from *15* to *1440* (1 day).
User ID	Email address or user ID of the meeting organizer.
Meeting subject	Subject of the meeting.
Agenda	Meeting agenda.
Meeting URL	Join URL for the virtual meeting.
Meeting Invitees	Email addresses of the invited users, separated by commas.
Output parameters	
meeting_url	Join URL for the virtual meeting.
output_status	Returns the status for the meeting.
status_code	Returns one of the following status codes for the meeting: • SCHEDULE_ACTION_SUCCESSFUL • RESCHEDULE_ACTION_SUCCESSFUL • CANCEL_ACTION_SUCCESSFUL • SCHEDULE_ACTION_FAILED • RESCHEDULE_ACTION_FAILED • CANCEL_ACTION_FAILED • INVALID_PAYLOAD • INVALID_EMAIL • MEETING_ID_MISSING

Zoom Meeting Actions

If the Zoom spoke (com.sn.zoom.spoke) is installed on the instance, users can send a Zoom meeting link with their invitation.

Zoom Meeting Actions topic block input and output parameters

Name	Description
Input parameters	

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zoom Meeting Actions topic block input and output parameters (continued)

Name	Description
Action	Zoom action for the meeting. Values are: • Schedule • Reschedule • Cancel
User ID	Account user's ID or email address.
Start date time	Current start date and time of the meeting in UTC.
Duration	Duration of the meeting in minutes. Values increment by 15 minute segments, from *15* to *1440* (1 day).
Meeting subject	Subject of the meeting.
Agenda	Meeting agenda.
Meeting ID	Unique Zoom ID assigned to the virtual meeting.
Output parameters	
output_status	Returns the status for the meeting.
status_code	Returns one of the following status codes for the meeting: • SCHEDULE_ACTION_SUCCESSFUL • RESCHEDULE_ACTION_SUCCESSFUL • CANCEL_ACTION_SUCCESSFUL • SCHEDULE_ACTION_FAILED • RESCHEDULE_ACTION_FAILED • CANCEL_ACTION_FAILED • INVALID_PAYLOAD • INVALID_EMAIL • MEETING_ID_MISSING
meeting_url	Join URL for the virtual meeting.

ITSM Virtual Agent pre-built actionable notifications

Send interactive messages to an employee through Virtual Agent, based on pending tasks or alerts. Deflect some of the most common ITSM incidents to ITSM Virtual Agent, reduce incident volume to Service Desk, and help employees discover ITSM Virtual Agent as a resolution channel.

Actionable notifications

Actionable notifications are interactive messages that Virtual Agent sends to the end user when the user takes certain actions on non-conversational service channels. These notifications have buttons that enable the recipient to perform certain actions, such as adding a comment

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

or requesting a live agent. When you create an actionable notification, you associate an action with a published Virtual Agent topic, a scriptable action, or a flow action that handles the action to be performed. For example, Virtual Agent can send a notification when an employee submits an incident through email or the ServiceNow® Service Portal, if there are any updates or actions needed from the employee. Employees can resolve the incident directly in the Virtual Agent conversation, without involving a live agent.

Admin or Virtual Agent admin (virtual_agent_admin) users activate notifications and the ITSM Virtual Agent Conversation topics.

To create your own custom notifications, see Configuring Virtual Agent notifications.

Pre-built ITSM actionable notifications

The following pre-built notifications are available for ITSM Virtual Agent. You must activate these notifications in Workflow Studio before you can use them. For details, see Set up actionable notifications for ITSM Virtual Agent.

I want to	Pre-built notifications
Notify users of changes to their incidents	Actionable notifications for incidents in ITSM Virtual Agent
Notify users of changes to their Service Catalog requests	Actionable notifications for Service Catalog requests in ITSM Virtual Agent
Notify users of approvals for change requests or KB articles	Actionable notifications for approvals in ITSM Virtual Agent
Notify users when their password is about to expire	Actionable notifications for Password Reset for Virtual Agent
Notify users of changes to virtual machines	Actionable notifications for virtual machines in ITSM Virtual Agent
Notify users when Virtual Agent finds a topic that can resolve the end user's issue	Actionable notifications for Issue Auto Resolution in ITSM Virtual Agent

Related topics

Issue Auto Resolution for ITSM Virtual Agent

Actionable notifications for incidents in ITSM Virtual Agent

Notify employees of pending tasks and incident alerts with notifications from ITSM Virtual Agent.

You must activate notifications in Workflow Studio in order to use them. For details, see Set up actionable notifications for ITSM Virtual Agent.

Incident commented

End users are notified whenever someone adds a comment to their incident. The end user can choose to view comments, resolve the incident, or skip the notification.

If the end user selects **View Comments**, Virtual Agent displays the three most recent comments on the incident.

After viewing the most recent comments, the end user can choose to add their own comments and images.

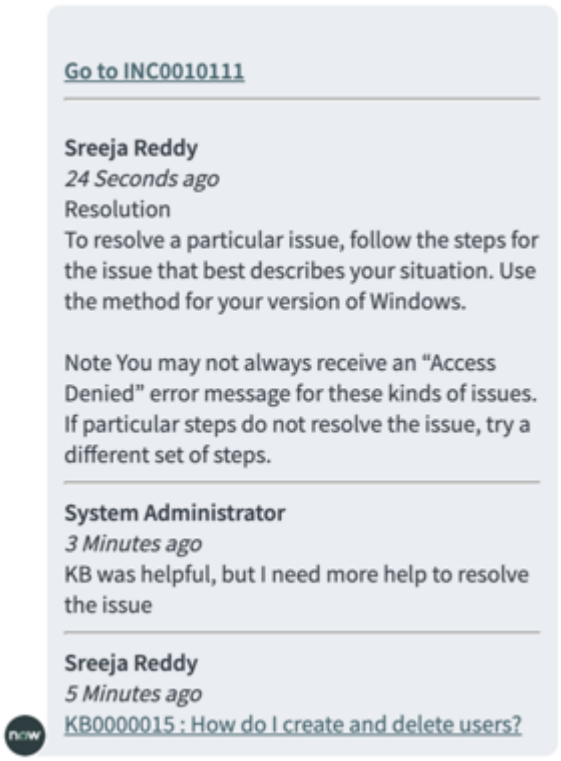
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

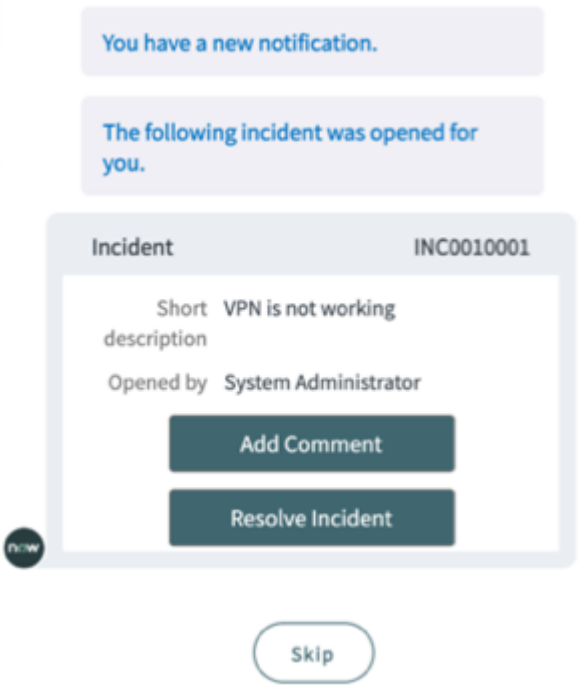


Incident on behalf of caller

End users receive this notification whenever someone opens an incident on their behalf. The end user can choose to add a comment to the incident, resolve the incident, or skip the notification.

If the end user selects **Add Comment**, Virtual Agent provides a URL to the incident and the end user can enter comments directly into the chat.

If the end user selects **Resolve Incident**, Virtual Agent resolves the incident and provides the incident URL.



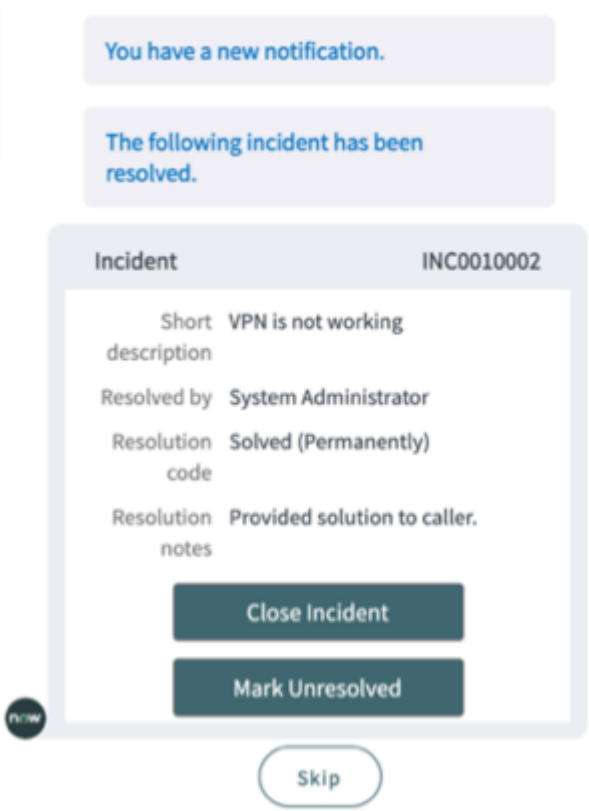
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident resolved

End users receive this notification whenever someone other than the end user resolves one of their incidents. The end user can choose to close the incident, mark the incident unresolved, or skip the notification.

If the end user chooses to mark the incident unresolved, Virtual Agent offers to add comments from the end user directly through the chat and reopens the incident.

If the end user chooses to close the incident, Virtual Agent closes the incident and provides the incident URL.



Incident Update

End users receive this notification whenever someone updates their incident. The end user can choose to add a comment to the incident, resolve the incident, or skip the notification.

KB attached to incident (deprecated)

End users receive this notification from Virtual Agent when a Knowledge Base article is attached to their incident. The end user can choose to view the article, resolve the incident, or skip the notification.

If the end user chooses to view the article, Virtual Agent displays a snippet and a link to the complete article.

The end user can also give feedback and add comments to the incident.

Actionable notifications for Service Catalog requests in ITSM Virtual Agent

Notify employees of Service Catalog tasks and alerts with notifications from ITSM Virtual Agent.

You must activate these notifications in Workflow Studio. For details, see Set up actionable notifications for ITSM Virtual Agent.

Citrix provision notification

End users are notified whenever a change occurs to a Citrix session or application. For information about pre-built topics for Citrix, see Citrix session pre-built topics for ITSM Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

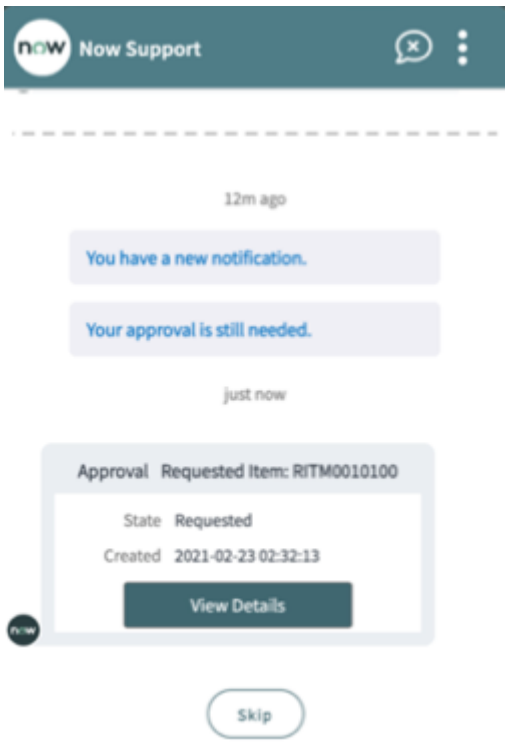
Request approved or rejected

Virtual Agent sends a notification to the requester of a generic Service Catalog request. The requester can choose to view the details or skip the notification.

Requested Item approval reminder

Virtual Agent sends a notification to the approver of a Service Catalog request. The approver can choose to view the request details or skip the notification.

Approvers can approve or reject the request directly in the chat. Approvers can also add comments to rejected requests directly in the chat.



Requested item commented

Virtual Agent sends a notification to employees who have requested Service Catalog items when a new comment is added to the request. Requesters can choose to view the comment or skip the notification.

If the requester selects **View Comment**, Virtual Agent displays the three most recent comments and the requester can choose to add their own comment.

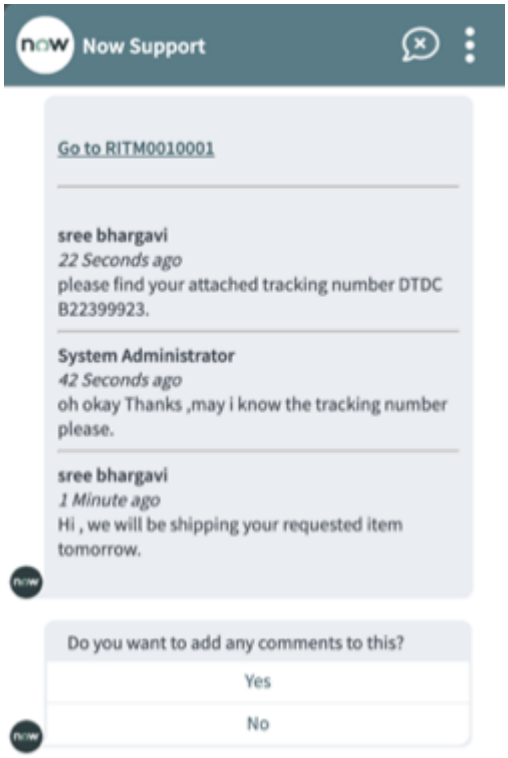
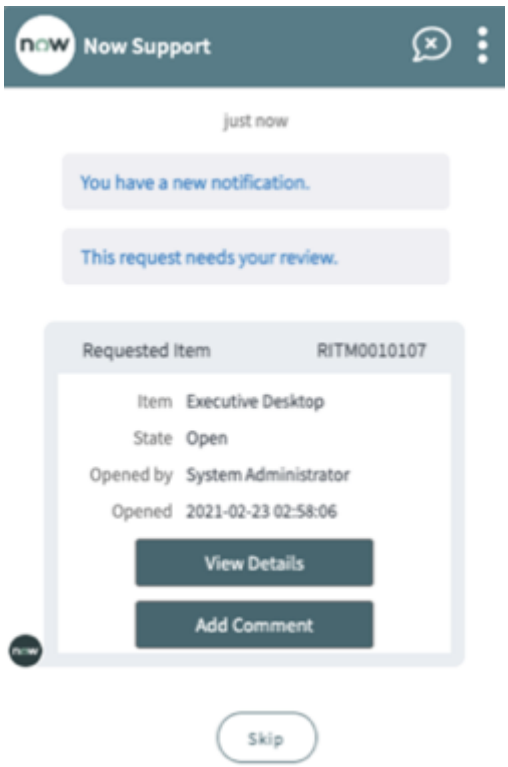
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The requester enters a comment and Virtual Agent adds the new comment directly from the chat.

Requested item on behalf of requester

Virtual Agent sends a notification to an end user when a Service Catalog request is opened on the end user's behalf. The requester can choose to view request details, add comments directly in the chat, or skip the notification.



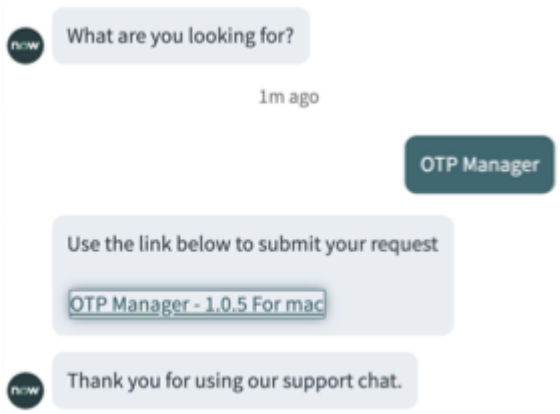
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requested Item Update

Virtual Agent sends a notification to the requester of a Service Catalog request any time the state changes. The requester can choose to view the details or skip the notification.

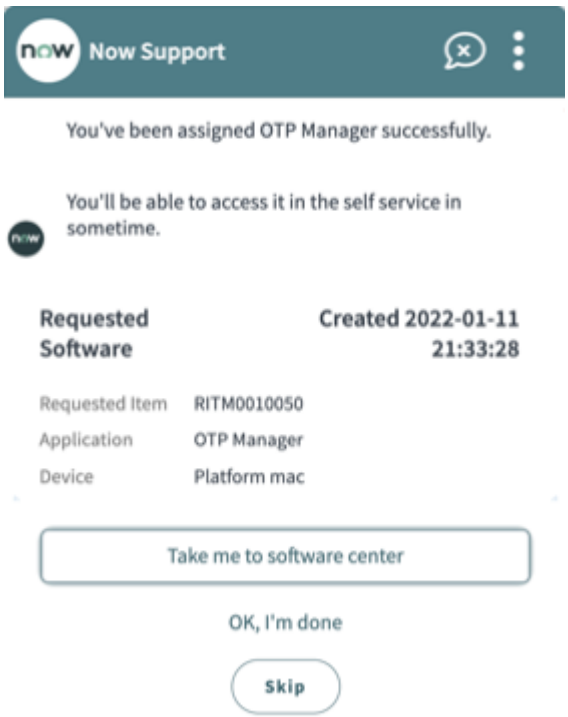
Software Installation

End users (requesters) can submit a request for software from the Software Catalog by selecting the link displayed under **Use the link below to submit your request**.



When the submitted request is approved, Virtual Agent sends an actionable notification to the end user letting them know that the software has been assigned and will be available soon.

Note:
End users must be using Client Software Distribution.



The requester can do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- See details about the software request by selecting **Take me to the software center**.
- See a list of relevant Knowledge Base (KB) articles, if any, by selecting **OK, I'm done**.

  By default, Virtual Agent displays the articles included in the sc_2_kb table. An admin can define which table is used by changing the value of the *sn_itsm_va.cat_item_related_kb* system property.

Actionable notifications for approvals in ITSM Virtual Agent

Notify employees of approvals for requests with notifications from ITSM Virtual Agent.

You must activate notifications in Workflow Studio in order to use them. For details, see Set up actionable notifications for ITSM Virtual Agent.

Some of the default actionable notifications in ITSM Virtual Agent that need approvals are as follows:

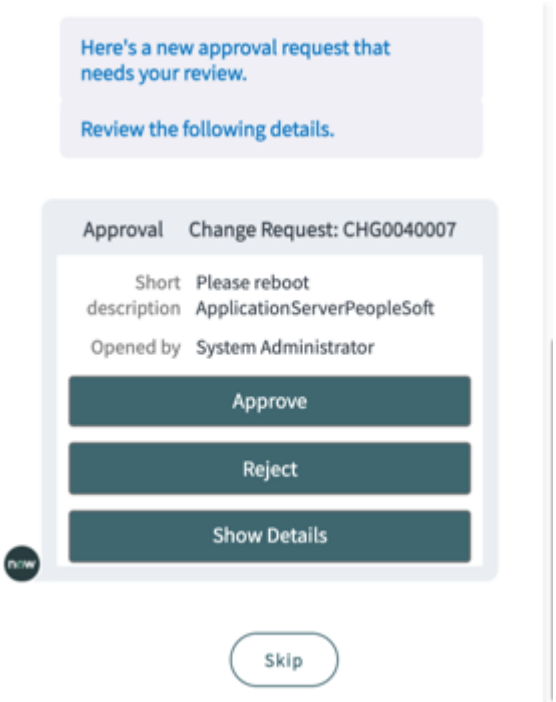
Approval request for requested items

Virtual Agent sends a notification to the approver of a Service Catalog item request. The approver can choose to view the request details or skip the notification.

Approvers can approve or reject the request directly in the chat. Approvers can also add comments to rejected requests directly in the chat.

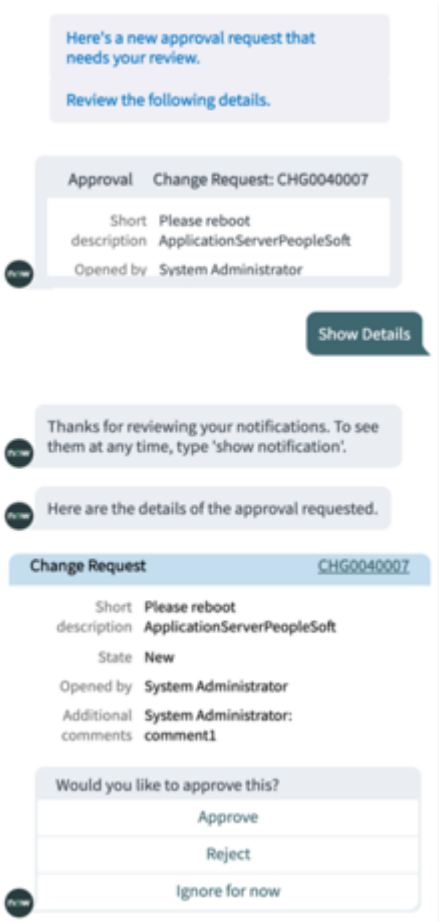
Approval request for requests

When an approval for a change is requested, Virtual Agent sends a notification to the end user who made the change request. The end user can be either the requester or the approver. Virtual Agent sends the notification to the end user, as applicable, who can then approve or reject the request, see details, or skip the notification.



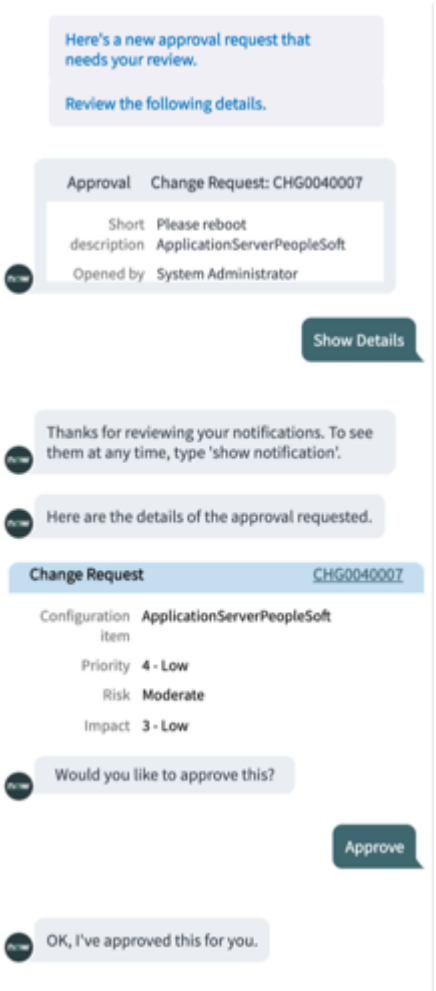
The fields shown below are the default fields for any task table (the **Show Details** field is not configured for the Task extended table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



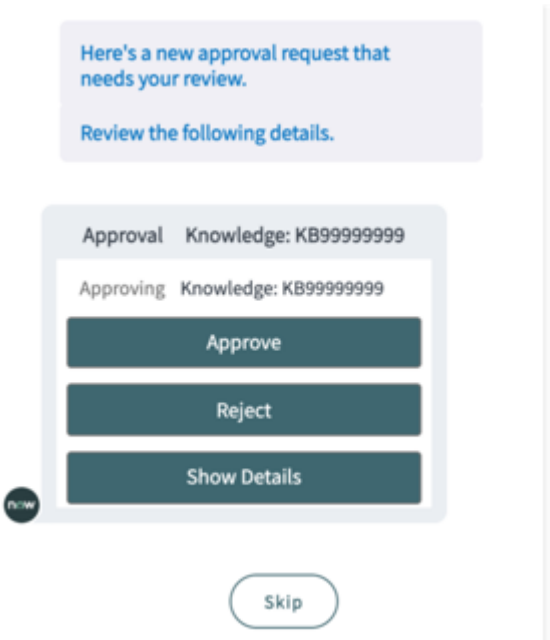
The fields below are the fields configured in the _show_approval_details_ topic (the **Show Details** field is configured for the Task extended table). Admin users can configure these fields by duplicating the topic and editing the approval_default_task_fields script variable within the topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



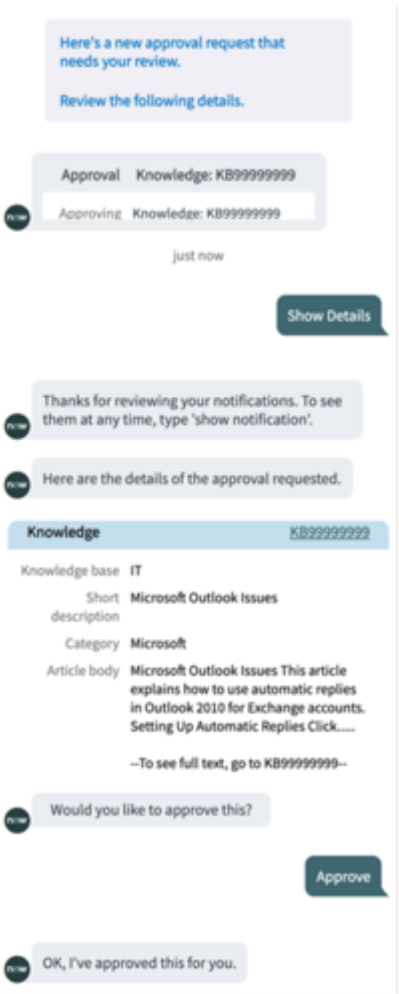
KB request approved or rejected

Virtual Agent sends a notification when an approval for a knowledge article is requested. End users approve or reject the request, see details, or skip the notification.



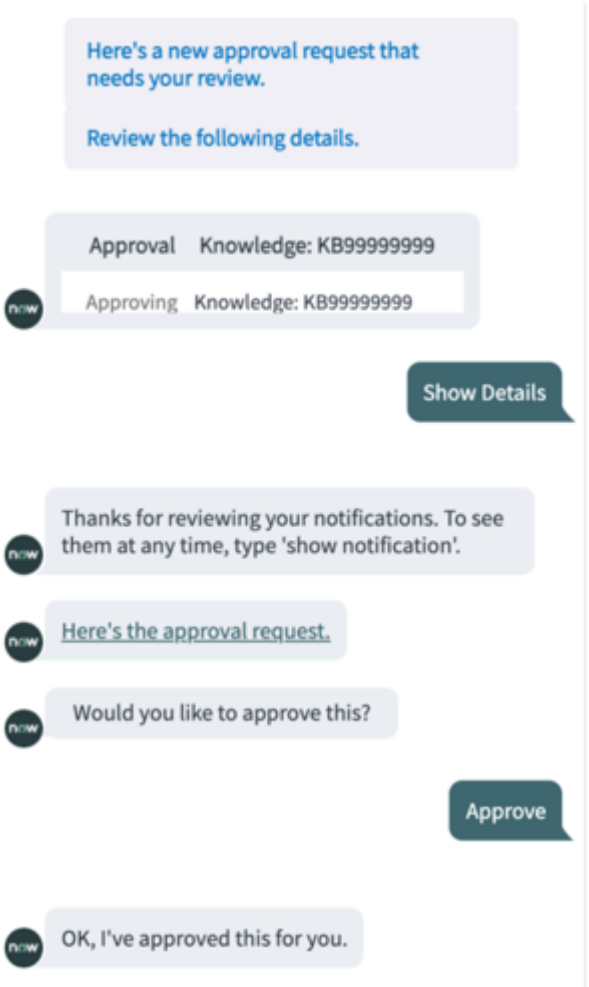
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The fields shown here are the fields configured in the _show_approval_details_ topic. Admin users can configure these fields by duplicating the topic and editing the approval_default_task_fields script variable within the topic.



For non-task tables, when no fields are configured in the _show_approval_details_ topic, a message displays with a link to the record being reviewed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Other approval

Virtual Agent sends a notification to the approver when a non-task record (such as a Knowledge Base article) needs approval. The approver can choose to view the request details or skip the notification.

Request approval reminder

Virtual Agent sends a notification to remind the approver of a pending Service Catalog request. The approver can choose to view the request details or skip the notification.

Request approved or rejected

Virtual Agent sends a notification to the requester of a Service Catalog item when their request has been approved or rejected. The requester can choose to view the request details or skip the notification.

Task approval

Virtual Agent notifies the approver about a newly created task that needs review and approval.

This notification is not applicable for tasks such as Change or Standard Change. It is also not applicable to Requests (sc_requests) and Requested Items (sc_req_item).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Actionable notifications for Password Reset for Virtual Agent

Use Virtual Agent to notify employees when their password is about to expire.

You must activate this notification in Workflow Studio. For details, see Set up actionable notifications for ITSM Virtual Agent.

Password Expiration Reminder

Virtual Agent notifies the user when their password is about to expire. Users can reset passwords and unlock accounts even if they are not logged in. When users are logged in, they can perform all actions, such as changing passwords. After changing or resetting a password, the user can't change or reset the password for the next 24 hours.

For more information about configuring password expiration, see Configure password expiration reminder.

Actionable notifications for virtual machines in ITSM Virtual Agent

Notify users when a change is made to a virtual machine (VM) instance.

You must activate notifications in Workflow Studio in order to use them. For details, see Set up actionable notifications for ITSM Virtual Agent.

Start VM failure

End users are notified when a change made to a virtual machine instance has failed. For example, the virtual machine failed to start or stop. For information about pre-built topics for virtual machines, see Virtual machine pre-built topics for ITSM Virtual Agent.

Start VM Success

End users are notified when a change made to a virtual machine instance has been successful. For example, the virtual machine successfully started or stopped. For information about pre-built topics for virtual machines, see Virtual machine pre-built topics for ITSM Virtual Agent.

Actionable notifications for Issue Auto Resolution in ITSM Virtual Agent

Notify employees when Virtual Agent finds a topic that matches the end user's intent.

Issue Auto Resolution sends actionable notifications through Virtual Agent directly to the end user on their preferred chat channel when the machine-learning model finds a topic that matches the end user's intent. Issue Auto Resolution must be enabled, and the end user must be subscribed to notifications.

Actionable notifications contain buttons that the end user can select. Each button is mapped to a topic that is enabled for Issue Auto Resolution. Based on the end user's selections, different aspects of Issue Auto Resolution execute, according to the logic of the matched topic.

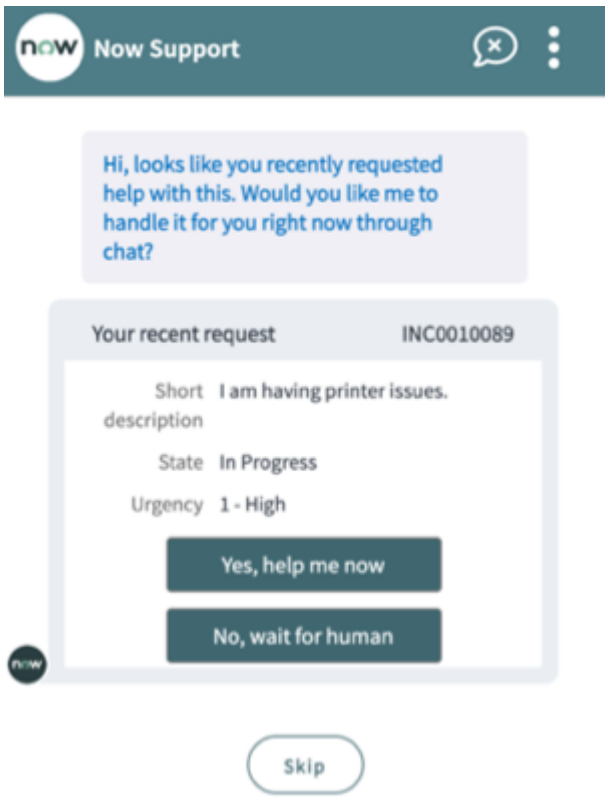
For more information about Issue Auto Resolution, see Using Issue Auto Resolution and Issue Auto Resolution for ITSM Virtual Agent.

Note:
You must activate notifications in Workflow Studio in order to use them. For details, see Set up actionable notifications for ITSM Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Auto Resolution

End users receive this notification when an incident is created and the incident short description relates to an existing Issue Auto Resolution topic intent. The end user can choose to accept the Virtual Agent assistance, wait for a human agent, or skip the notification.



If the end user accepts the Virtual Agent assistance, the matched Issue Auto Resolution topic runs and Virtual Agent provides suggestions to resolve the issue.

After Virtual Agent provides suggestions to resolve the issue, the end user can indicate if these suggestions were successful and can choose to close the ticket or to leave it open. If the end user chooses to leave the ticket open, Virtual Agent assigns the ticket to a live agent.

Issue Auto Resolution Reminder

End users receive this notification to remind them that virtual assistance has been found to help them. The end user can choose to accept the Virtual Agent assistance, wait for a human agent, or skip the notification.

Issue Auto Resolution for ITSM Virtual Agent

Proactively deflect common ITSM incidents to ITSM Virtual Agent. Initiate a conversation with an end user after they submit an incident through a non-conversational service channel, if an existing ITSM Virtual Agent conversation can resolve the issue.

Understanding Issue Auto Resolution

Issue Auto Resolution uses ITSM Virtual Agent to proactively resolve incidents through a conversation on the user's preferred chat channel. The Issue Auto Resolution flow follows these steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When an end user creates an incident through a non-conversation service channel, such as ServiceNow® Service Portal or email, the Natural Language Understanding (NLU) model checks for a matching intent that has Issue Auto Resolution enabled.
- If a matching intent and topic are found, Issue Auto Resolution sends an actionable notification to the end user on their existing chat channel. The user can accept or decline assistance.
- If the end user accepts the assistance, Issue Auto Resolution invokes the matched ITSM Virtual Agent conversation to resolve the incident.
- When the conversation completes, the user can indicate if the conversation resolved the incident and can choose to keep the ticket open or to close it.
- When there are no matching Issue Auto Resolution intents found, AI Search is enabled as fallback along with added intents. For more information, see Enabling AI Search in Issue Auto Resolution.

When an incident is unassigned from Issue Auto Resolution

An incident is unassigned from Issue Auto Resolution and is routed to an agent when any of the following conditions apply:

- The matched intent doesn't have a matching topic in the same domain as that of the incident.
- The matched topic doesn't have Issue Auto Resolution enabled.
- The end user has not subscribed to notifications.
- The end user declines, ignores, or abandons the Virtual Agent conversation.
- The matched topic didn't resolve the issue.

When an incident is assigned from Issue Auto Resolution

An incident is assigned from Issue Auto Resolution and is routed to a Virtual Agent when an intent to topic is matched for the incident.

You must ensure that you check the SLAs and Notifications to see if they trigger the **Assigned to is EMPTY** condition to avoid issues with SLAs and Notifications setup on the instance against the incident table.

Update your SLAs and Notifications trigger condition either to **Assigned to is EMPTY** or ensure that the **Assigned to** field is set to **Virtual Agent**.

Issue Auto Resolution dashboard

The Issue Auto Resolution dashboard provides metrics for the effectiveness of incident deflection, based on Virtual Agent conversations. This dashboard is only accessible to users with the admin role, the virtual_agent_admin role, the chat_analytics_viewer role, or the iar_admin role. The dashboard tracks both the usage of Issue Auto Resolution and the rate of successful incident resolutions. Users can see which tasks are deflected to Issue Auto Resolution and the overall success of Issue Auto Resolution through the following ServiceNow® Performance Analytics KPIs:

- Number of tasks solved by Issue Auto Resolution
- Number of notifications ignored by requester.
- Number of tasks not solved by Issue Auto Resolution to which the requester responded.

To view the dashboard, navigate to **All** > **Conversational Interfaces** > **Conversational Analytics** > **Virtual Agent Dashboard**. Select the **Issue Auto-Resolution** tab to view analytics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This tab also provides detailed visualizations on intent and topic matching performed for auto-resolution. For more information, see Issue Auto Resolution tab.

Issue Auto Resolution Intent Analytics dashboard

The Intent Analytics dashboard provides reports on intent prediction efficiency and other metrics that occur before launching the Issue Auto Resolution topic. This dashboard is accessible only to users with the admin, virtual_agent_admin, or iar_admin role. Intent Analytics and Reports are based on context records and are generated from the context data to do the following:

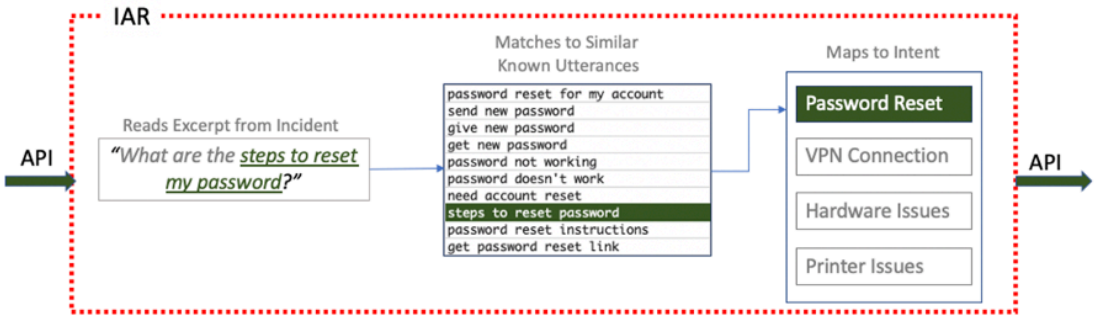
- Measure the efficiency of the Machine Learning API (NLU).
- Measure if Issue Auto Resolution successfully resolved the task.

To view the dashboard, navigate to **All** > **Conversational Interfaces** > **Incident Auto-Resolution** > **Intent Analytics**.

Natural Language Understanding and Issue Auto Resolution

Issue Auto Resolution uses NLU to identify Virtual Agent topics that match intents submitted by users. Intent matching is determined by the **incident Description** and **Short Description** fields. Intents must meet the required minimum confidence threshold to be considered a match.

Issue Auto Resolution NLU integration



To view, train, or retrain the NLU model, see Train and test your model in Virtual Agent Designer.

Note:
Issue Auto Resolution must be activated and ITSM Virtual Agent must be installed to access the NLU models. To learn more, see Set up Issue Auto Resolution for ITSM Virtual Agent.

About actionable notifications

Actionable notifications are interactive messages that Virtual Agent sends to the end user on their preferred chat channel. Issue Auto Resolution sends an actionable notification when the machine learning model finds a topic that matches the user's intent and the user is subscribed to notifications. Actionable notifications contain buttons that the user can select. Each button is mapped to an Issue Auto Resolution topic. Based on the user's selections, different aspects of Issue Auto Resolution execute, according to the logic of the matched topic. For more information on how actionable notifications work and how they're delivered to recipients, see Configuring Virtual Agent notifications.

ITSM Virtual Agent topics for Issue Auto Resolution

Users with the admin or virtual_agent_admin role can choose a subset of pre-built topics to be available for Issue Auto Resolution. The following ITSM Virtual Agent intents are supported by

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue Auto Resolution by default and some of the IAR intents are mapped to ITSM topics by default.

Intent to topic mappings supported by IAR

Intents	Mapped topics
CollaborationSoftwareIssues	n/a
HardwareRequest	n/a
HardwareIssues	Hardware Issues (Template)
LocalAdminAccess	Local Admin Access (Template)
SoftwareAccessRequest	n/a
SoftwareInstall	n/a
RSAToken	n/a
VPNConnectivity	VPN Connectivity (Template)
EmailIssues	Email Issues (Template)
RepositoryAccess	Repository Access (Template)
PrinterIssues	Printer Issues (Template)
ManageDistributionList	n/a
ResetPassword	Reset Password (Template)
MACHINE_GENERATED	n/a

The default intents and matched topics are listed in the **Auto Resolution Intent Topic Maps** tab. Users with the admin or virtual_agent_admin role can create their own custom topics to use, instead of the included pre-built topics. These custom topics must be mapped to a supported intent in the **Auto Resolution Intent Topic Maps** for Auto Resolution Configuration.

Issue Auto-resolution tuning

Tune the default IAR intents in the NLU Workbench before returning to the Issue Auto Resolution Admin Console and publish them. For more information, see Issue Auto Resolution Tuning in NLU.

Related topics

Using Virtual Agent for Issue Auto Resolution

Enabling AI Search in Issue Auto Resolution

You can enable AI Search as a fallback mechanism in Issue Auto Resolution when there are no matching intents found for the incident.

Applying AI Search for Issue Auto Resolution Configuration

When there are no intent matches found for Issue Auto Resolution, AI Search can be applied for the fallback capability. To use AI Search as fallback:

- Open the Auto-Resolution Configuration record.
- Navigate to the **AI Search** tab.
- Select the **Apply AI Search** check box to enable fallback.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can see the following AI Search settings from the IAR configuration record which will be used when there are no intent matches for the topic.

- **EVAM definition**: The entity view action mapper definition is set to **Virtual Agent Search** by default.
- **Search application**: The default application for AI Search fallback is set to **Service Portal default Search Application**.
- **AI Search display topic**: The AI Search display topic that is provided by default is the **IAR - AI Search** topic.
- **Search results portal**: The default portal for AI Search fallback is set to the **Service Portal**.

To support AI Search fallback, ITSM Virtual Agent provides the following intent to topic mappings.

Intent to Topic Maps

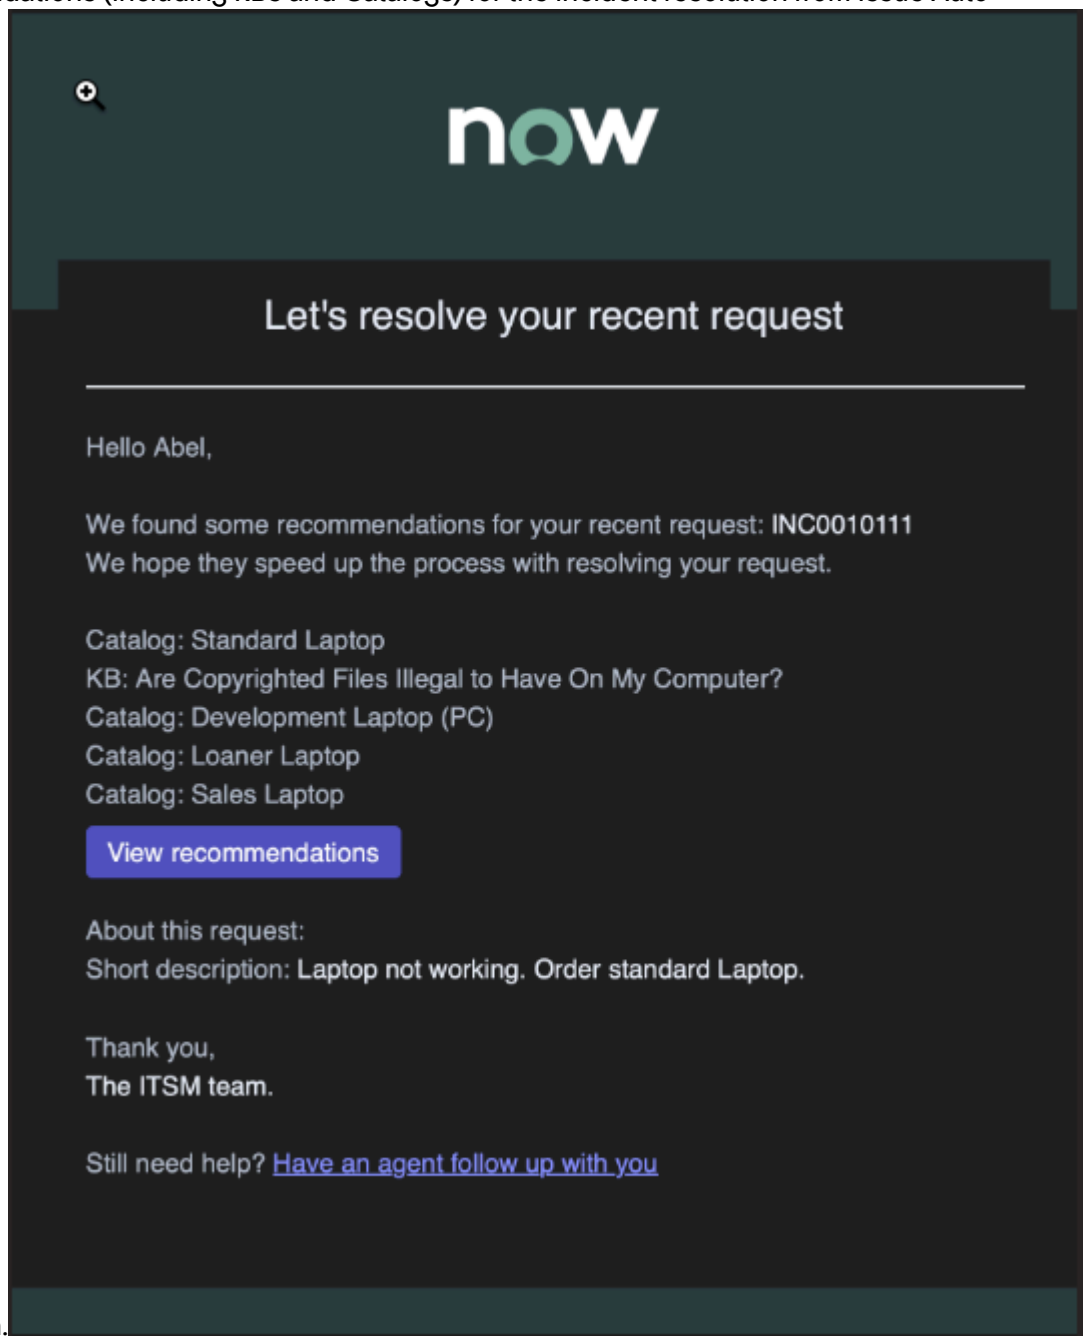
Auto-resolution intent	Matched topic
RepositoryAccess	Repository Access (Template)
Emailissues	Email Issues (Template)
RSAToken	RSA Token (Template)
LocalAdminAccess	Local Admin Access (Template)
CollaborationSoftwareIssues	Collaboration Applications (Template)

Whenever you try to create an incident using Email or Self-service as the channel that triggers IAR, you will receive the relevant recommendations.

There are three types for recommendations, KBs, Catalogs, and VA Topics. For example, if you create an incident and check for its email notifications, you will be shown various

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

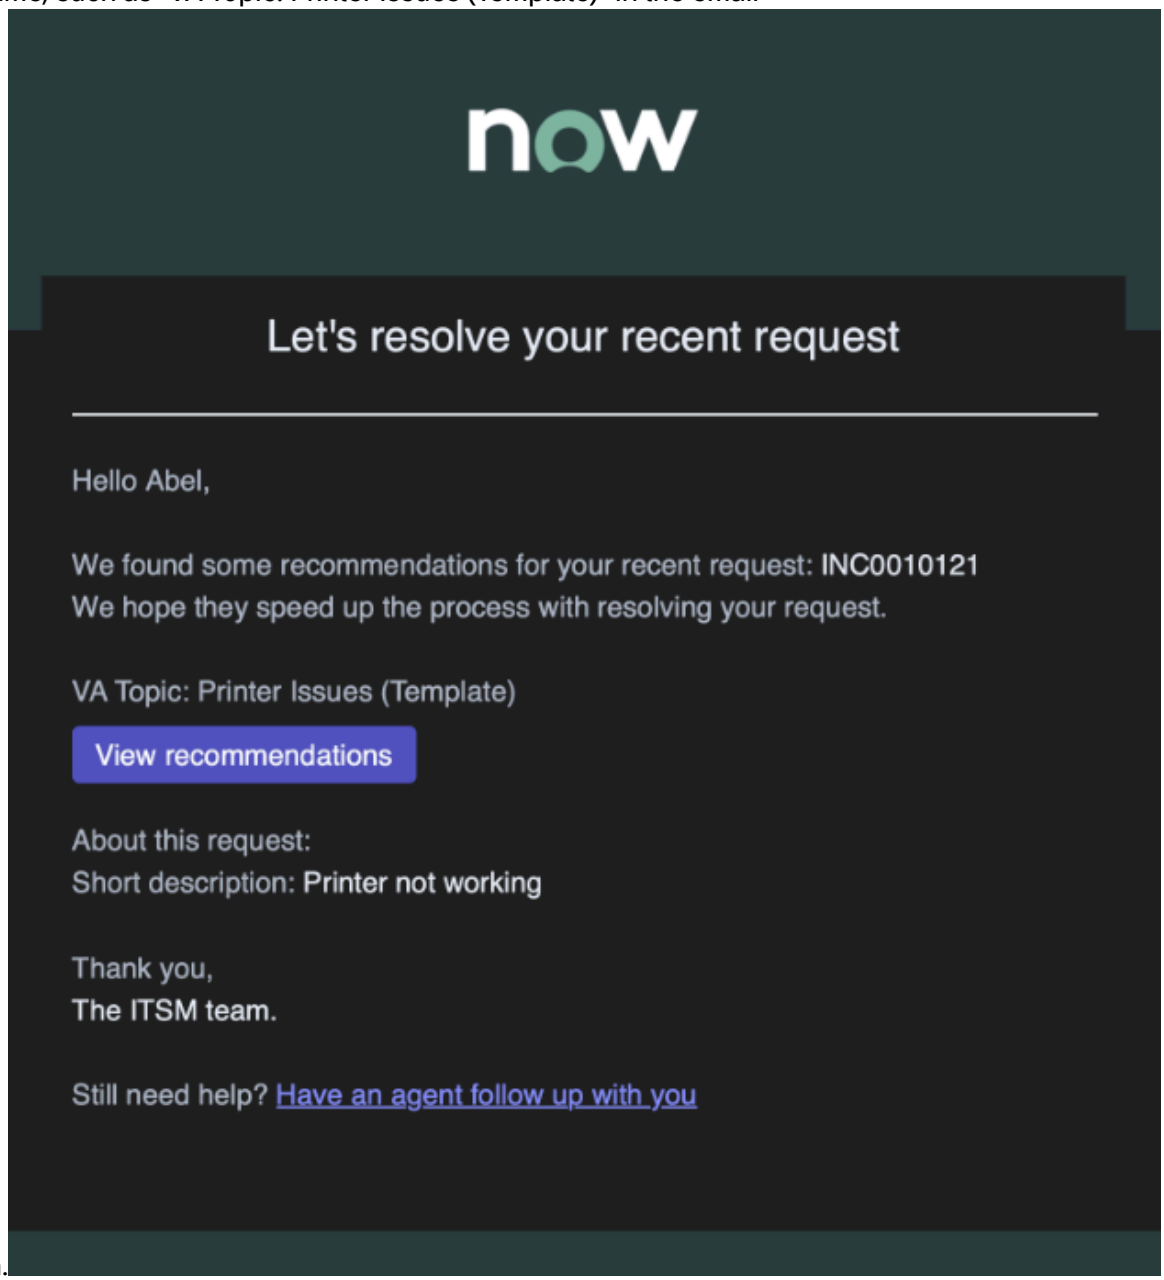
recommendations (including KBs and Catalogs) for the incident resolution from Issue Auto Resolution.



In case there is a matched VA topic from the intent to topic mapping, in that case, you will not receive the KB and Catalog recommendations, but the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VA topic name, such as "VA Topic: Printer Issues (Template)" in the email notification.



Once you click **View recommendations** from your email notification, you will be directed to the Service Portal incident which now has a **Recommendations** tab from where you can read the KB and mark the recommendation as helpful and resolve it.

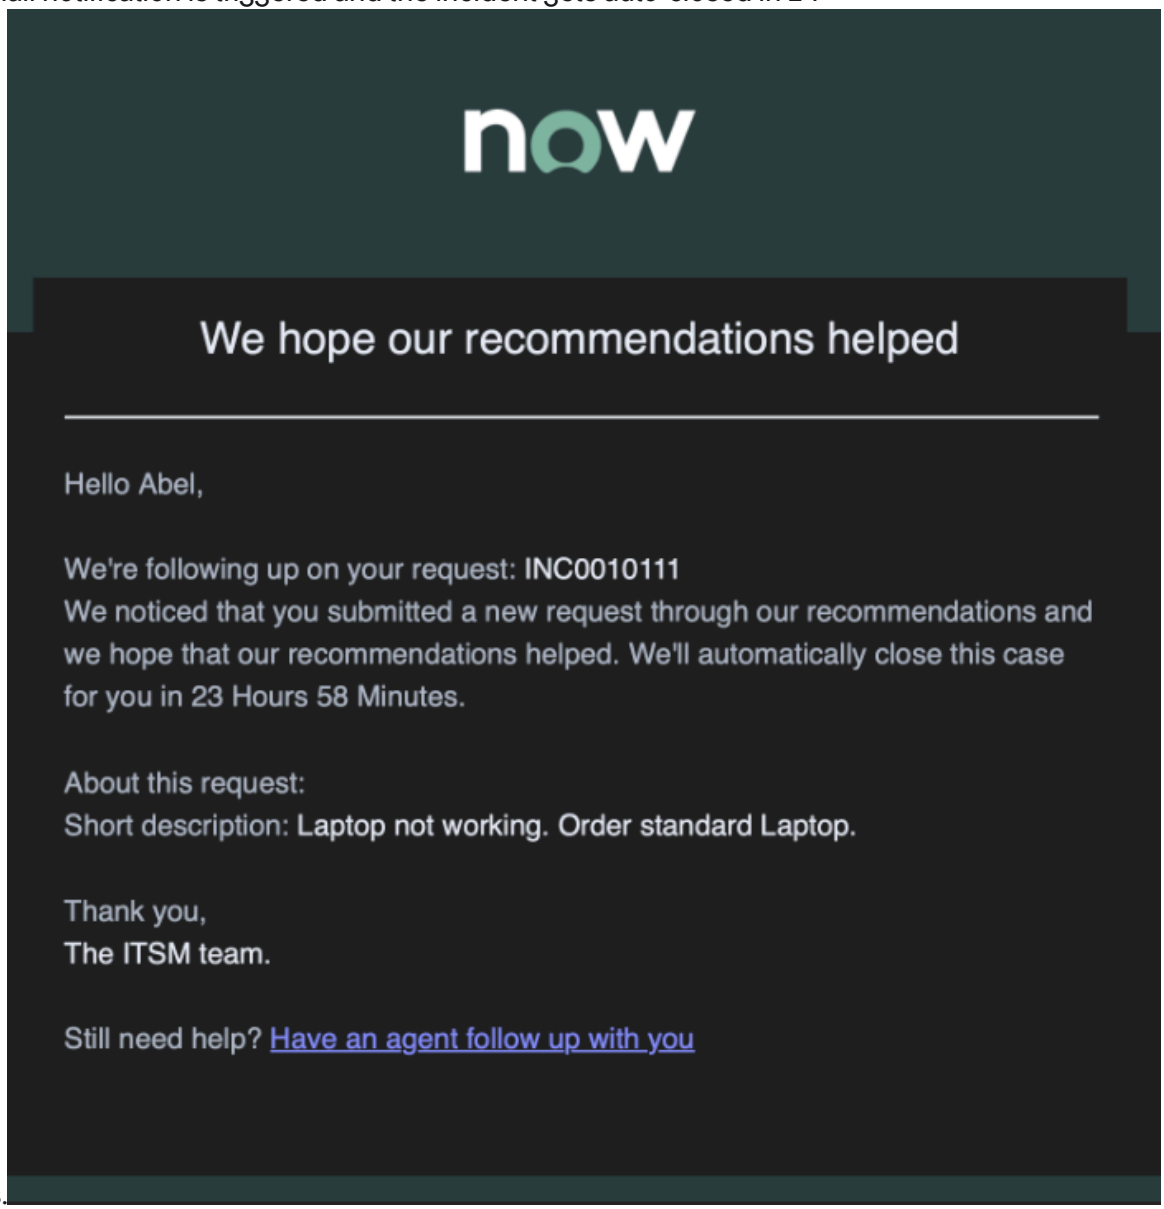
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
In case the recommendations have a catalog item as the recommended option and you create the catalog request from the Recommendations tab, an email notification is triggered and the incident gets auto-closed in 24 hours.



Tracking deflections in ITSM Virtual Agent

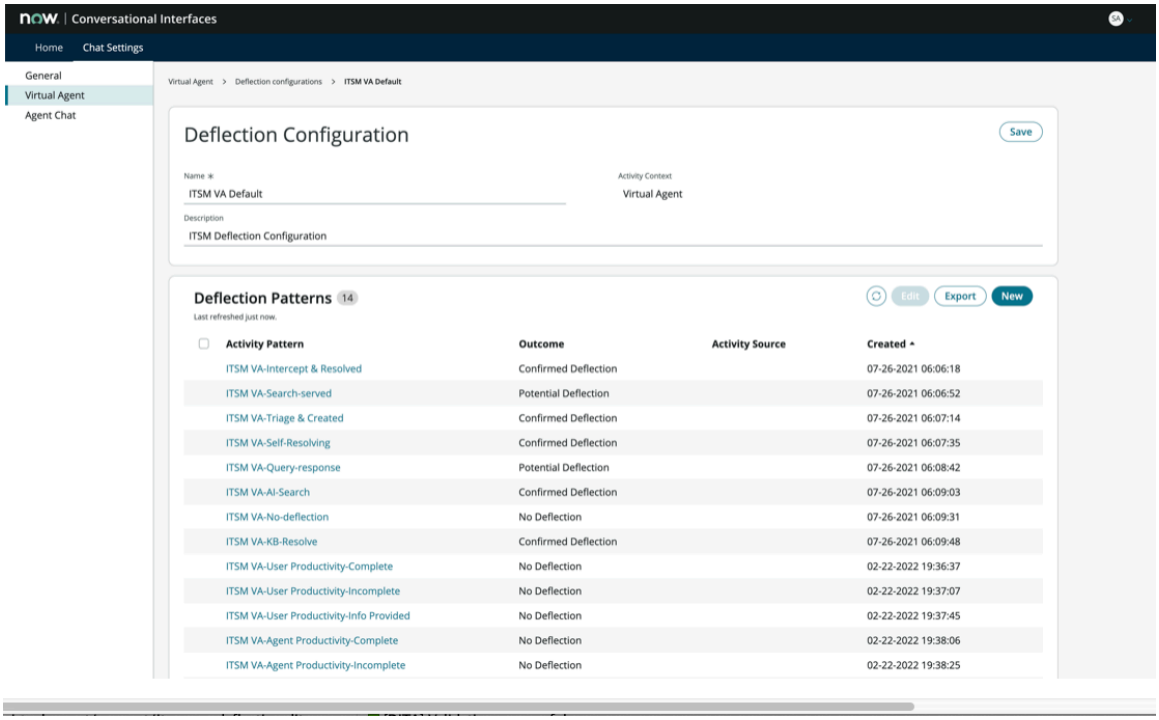
You can use the pre-built deflection topics and topic blocks in Virtual Agent conversations to track the incidents that ITSM Virtual Agent helped to resolve.

A deflection happens when ITSM Virtual Agent resolves an issue for you. By asking you relevant questions, ITSM Virtual Agent can create an incident in the correct assignment group. As a result, you might not need to create an incident, or need the assistance of a live agent.

Deflection tracking uses the topics and topic blocks created in Virtual Agent Designer and is enabled by default. For more information, see Tracking deflections using deflection topic blocks.

By default, ITSM Virtual Agent includes pre-built deflection configurations in the base system. You can use the deflection configurations in the base system or customize them, as needed. For more information, see Create deflection configurations and patterns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The pre-built deflection patterns in the base system are described in the following table.

Deflection pattern name	Description	Outcome
ITSM VA-Self-Resolving	Virtual Agent completes a task with or without filing a task record for ITSM. For example, Virtual Agent adds a user to a distribution list.	Confirmed deflection
ITSM VA-Triage & Created	Virtual Agent filed and created a task record based on end-user input. Creating this task record shortens the time to resolution.	Confirmed deflection
ITSM VA-KB-Resolve	User resolved the issue by using the Knowledge Base (KB) articles displayed.	Confirmed deflection
ITSM VA-Intercept & Resolved	Virtual Agent intercepted an end user-created incident, and helped to resolve and close it. For example, Virtual Agent resolves and closes the incident with Issue Auto-Resolution (IAR).	Confirmed deflection
ITSM VA-Search-served	Virtual Agent shows the search results based on the user's IT service needs.	Potential deflection
ITSM VA-AI-Search	Virtual Agent uses the AI Search results to provide support.	Confirmed deflection

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deflection pattern name	Description	Outcome
ITSM VA-Query-response	Virtual Agent responds to a customer query. It's unclear whether the response was helpful.	Potential deflection
ITSM VA-No-deflection	Virtual Agent is unable to assist the user.	No deflection
ITSM VA-User Productivity-Complete	User completes a task using Virtual Agent. This pattern tracks those completed tasks that saved time and improved productivity.	No deflection
ITSM VA-User Productivity-Info Provided	User was provided information that might be helpful to them.	No deflection
ITSM VA-User Productivity-Incomplete	User wasn't able to complete a task using Virtual Agent.	No deflection
ITSM VA-Agent Productivity-Complete	Agent (fulfiller) was able to complete a task using Virtual Agent as a service channel. This pattern tracks those completed tasks that saved time and improved productivity.	No deflection
ITSM VA-Agent Productivity-Info Provided	Agent (fulfiller) was provided information that might be helpful to them.	No deflection
ITSM VA-Agent Productivity-Incomplete	Agent (fulfiller) wasn't able to complete a task using Virtual Agent as a service channel.	No deflection

The deflection metrics are generated and stored in the Deflection Metric [ssa_deflection_metric] table. To view the deflection metrics for each deflection pattern, you can choose one of the following methods:

- Navigate to the Deflection Metrics module in the Self-Service Analytics framework.

  Note:
  The Self-Service Analytics framework requires the Self-Service Analytics Core plugin (com.snc.self_service_analytics_core).

  For more information, see Activate Self-Service Analytics.

- Use the **Overview** tab of the Conversational Analytics Dashboard.

  For more information about this dashboard, see Conversational Analytics Dashboard.

ITSM Virtual Agent Lite

Access a pre-built subset of ITSM Virtual Agent features to quickly and easily implement a virtual agent for your end users. ITSM Virtual Agent Lite offers an introductory collection of conversation topics for IT support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Understanding ITSM Virtual Agent Lite

ITSM Virtual Agent Lite enables you to use a limited version of Virtual Agent. The available keyword-based conversations run in the web chat client and also in the messaging applications, such as Slack, Microsoft Teams, Workplace by Facebook, and Facebook Messenger.

ITSM Virtual Agent Lite topic category and conversations

Topic conversations run in the web chat client and also in supported ITSM Virtual Agent messaging integrations. Get familiar with Virtual Agent technology to improve your ITSM self-service experience with a streamlined conversational interface.

The ITSM Virtual Agent Lite pre-built, read-only topic conversation templates are contained in the **ITSM Self Service Lite** Virtual Agent Designer category. The following conversation topic templates are ready for you to publish and use:

- Check Ticket Status
- Report an Issue

Setting up ITSM Virtual Agent Lite

Setup ITSM Virtual Agent Lite using to use the read-only, pre-built conversation topics for your most common ITSM self-service cases. For example, you can connect your users with a virtual agent to check ticket status, search the knowledge base, and report an issue.

Before you begin

Role required: admin or virtual_agent_admin

About this task

Virtual Agent Lite is a subset of the features available in Virtual Agent. Virtual Agent Lite is automatically activated. You don't need a subscription for Virtual Agent Lite.

Users with the admin or virtual_agent_admin role can activate the required plugins:

- ITSM Virtual Agent Conversation Topics Lite (com.snc.itsm.virtualagent.lite) plugin

  Activates the read-only conversation topics for basic ITSM self-service.

- The Service Management Virtual Agent Core (com.glideapp.sm_va_core) plugin

  Provides core functionality for Service Management Virtual Agent. This plugin is automatically activated with the ITSM Virtual Agent Conversation Topics Lite plugin.

Procedure

1. Activate the ITSM Virtual Agent Conversation Topics Lite (com.snc.itsm.virtualagent.lite) plugin to access the pre-built ITSM Virtual Agent Lite conversation topics.
2. Review the **ITSM Self Service Lite** read-only conversation topics in Virtual Agent Designer.
   a. Navigate to **All** > **Conversational Interfaces** > **Virtual Agent** > **Designer**.
   b. In the **Category** drop-down box, select **ITSM Self Service Lite**.
3. Select an available topic to open it.
   The conversation topic template opens in Virtual Agent Designer.
4. Select **Inactive** in the header bar, and slide the toggle switch to **Active**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Deactivate a topic by selecting **Active** and sliding the toggle switch to the inactive position.

5. Select **Publish** to publish the topic.

Note:
For details about activating and publishing conversation topics, see Getting started with Virtual Agent Designer.

6. Test an active, published conversation topic, by selecting the topic you want to test in Virtual Agent Designer and selecting **Test**.

ITSM Virtual Agent Lite pre-built topics

ITSM Virtual Agent Lite includes several pre-built, read-only topic conversations you can use to set up a virtual agent for your end users.

ITSM Virtual Agent Lite topics

Check Ticket Status

Users can check the status of active IT tickets (incidents or requests). When a user asks about a ticket status, the virtual agent responds with a list of all active tickets for that user. Each ticket includes a link to the incident or request, the item, the status (**Stage**), and when it was updated.

Report an Issue

Users can create incidents using a Record Producer.

Walk-up Experience

Walk-up Experience aims to enhance the user experience by providing in-person as well as remote assistance to the users for their IT-related issues.

Walk-up Experience overview

Walk-up Experience offers a convenient and efficient way for users to seek immediate assistance and support for their IT-related issues. With designated walk-up centers, users can seek in-person or remote assistance, report issues, and receive guidance from IT experts. The Walk-up Experience service aims to enhance the overall user experience and by resolving IT-related problems promptly and effectively.

Exploring Walk-up Experience

Use the Walk-up Experience application to create and manage an on-site support channel where your users can get their requests and issues resolved and fulfilled in real-time, either in person or remotely by experienced agents.

Walk-up Experience overview

With Walk-up Experience, you can help to increase the productivity of the agents that serve the requesters. Your requesters can also get real-time, either in-person or remote help with their issues and devices.

The main purpose of a walk-up service center is to support and resolve the information technology (IT)-related issues that a service desk comes across. For example, an agent can get a request for a mouse device or keyboard, unlocking an account, or setting up software on a mobile device. Some common names that you might use for your own walk-up center are Tech Lounge, Service Center, or Genius Bar.

Walk-up Experience workflow

In the following sample end-to-end workflow, learn how different users in your organization can leverage from Walk-up Experience.

1. The administrators configure and activate Walk-up Experience service channels, appointment booking schedules, walk-up locations, kiosks, and stockrooms. The administrators can also enable self-service online check-ins to support remote access to the requesters.
2. The agents manage the queues, interactions, and the scheduled appointments. They can also view the assigned locations, stockrooms, and assets to support the employees in resolving their IT issues.
3. The employees can schedule in-person or remote appointments to get their IT-related issues resolved. By using their mobile devices, your employees can view how long the wait list is in the queue, go to the kiosk location for quick resolutions, or book or modify appointments.
4. The administrators and managers can view and analyze the Walk-up Experience performance by using the Walk-up Experience dashboard. For more information about the dashboard, see Monitoring Walk-up Experience performance.

Walk-up Experience benefits

Walk-up Experience provides the following benefits.

Benefit	Feature	Users
Schedule a single or multiple appointments to visit the walk-up lounge or the support lounge Walk-up Experience Employee Center.	Plan your walk-up experience visit with Employee Center	Requesters/ employees
Access IT services in real time by visiting a walk-up location. You can also schedule appointments to visit the walk-up location at a convenient future time. Key features of Walk-up Experience

Walk-up Experience enhances user satisfaction and productivity by providing immediate and personalized support for IT-related needs.

Every employee or a guest can check in and get support at an established walk-up service center.

Requesters

Requesters can access the Walk-up Experience application in several ways.

- Online and via mobile device:
  - Quickly check in online to the nearest available walk-up venue via a prebuilt check-in widget on the Service Portal using your laptop, tablet, or mobile phone.

    Note:
    Geolocation interfaces with the Walk-up Experience application to route you to the nearest walk-up queue. You can change the location, if desired.

    Geolocation uses browsers or mobile device coordinates to determine location. If geolocation is blocked on the browser, Walk-up Experience defaults to Latitude/Longitude criteria in the user profile or mobile device.

  - View hours of operation, the estimated wait time, and your position in the queue at the check-in location via the **Walk-up Status** widget on the Service Portal. You can also access the online Walk-up Experience check-in from this widget.

    Note:
    The **Walk-up Status** widget must be configured to appear on the Service Portal.

  - View upcoming walk-up appointments and current queue position by location using the Now® Mobile application **Services** tab on your mobile device. **Tech Lounge visits** appears if there is associated data. If no data exists, the section is hidden.

    Note:
    Requires activation of the ServiceNow Mobile Request Native Application Screens and Applet Launcher plugin (com.glide.mobile-employee). See Mobile plugins and upgrades for more information. This plugin enables the Service Catalog functionality by default.

  - Schedule appointments for support and receive appointment reminders, as well as cancel or reschedule appointments from links in the reminder or from the online check-in interface.
  - Schedule only one appointment for each walk-up location queue at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Even with a scheduled appointment, you can still check into a walk-up location queue online or in person onsite.

- Schedule appointments on behalf of others who need IT support, such as executives or direct reports.

  Note:
  Configuration is necessary to make this available to the **Appointment delegation group** of users, such as executive assistants. This is configured in the Walk-up Location Queue (wu_location_queue) table.

- Receive notifications via email or your mobile device when your request is assigned to an IT support fulfiller, when you are close to next in line to be helped, and when your walk-up request has been closed or abandoned, should you decide not to attend the queue.
- View your Walk-up Experience appointments in your primary calendar with Microsoft Office 365 Outlook calendar integration. When you make an appointment, modify it, or cancel it, your calendar is sent invites to an appointment and any updates.

  Note:
  This feature is only available when Microsoft Office 365 Outlook is the hosted calendar service.

- Add your online Walk-up Experience appointment to a calendar of your choice with iCalendar. Click a link in the portal to download an iCalendar file containing appointment details, including appointment location.

- Onsite at the Walk-up Experience location:
  - Check into a queue at the physical walk-up location by manually entering either your name or email or by scanning an employee badge.

    Note:
    The badge scanning feature requires activation and configuration. Refer to Badge Reader Integration for Walk-up Experience.

  - Observe queue activities on a large monitor that displays both walk-in requesters and those with appointments.
  - View the monitor displaying how many people are currently in the queue, guest positions in the queue, who is being helped, and estimated wait times.
  - Hear an audio sound emitted from the on-site walk-up location large monitor when a person moves to the top of the queue for service.
  - Answer an available single-question survey which captures your user sentiment after a visit.
- After-hours support — Get support even when a walk-up queue is closed. An IT support phone number is displayed on the check-in device, along with a link to create an incident in real time.

Agents

The IT organization uses the Walk-up Experience application to meet the demand of urgent IT issues and requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Walk-up Experience IT technicians manage daily operations at the walk-up queue locations. They resolve IT-related issues, support mobile devices and laptops, and fulfill requests for software and hardware consumables.
- The agents can accept and close Walk-up Experience interactions through the Agent Workspace interface. Agent Workspace contains a personal inbox where walk-up interactions, if configured in Advanced Work Assignment, are automatically pushed for assignment.
- Agents can manage all aspects of Walk-up Experience fulfillment using Agent Workspace. Based on their capacity, and if records are on-hold, they can work on multiple transactions at the same time and promote interactions to incidents or requests, or access associated stockroom consumables.
- Technicians can view and accept scheduled appointments in their Agent Workspace personal inbox. Appointments are routed to the inbox according to agent availability. Alternatively, agents can pick and choose appointments manually.
- If necessary, technicians can work with anyone in the queue at any time. Technicians can manually assign themselves to a walk-up interaction, by accepting the interaction from a list of unassigned interactions in Agent Workspace.
- Agents can use the Agent Assist feature to expedite incident resolution.

Managers

IT managers supervise the walk-up location technicians and oversee daily operations.

- Walk-up managers can observe and capture operational and performance data by monitoring the walk-up dashboard.
- Walk-up managers can use the application to increase IT customer satisfaction, verify, and confirm that stockroom inventory is available, provide customer service in a timely manner, and report performance data to upper management.

Administrators

Configure and maintain walk-up related systems, such as the walk-up location branding and text, queue locations and schedules, appointments, advanced work assignments, and notifications, CSAT surveys, and associated stockrooms.

Access the pre-built **Walk-up online check-in Experience** widget for use in your Service Portal. Make minor label changes directly in the widget without the need to customize through code.

Enable Walk-up Experience Microsoft Office 365 calendar integration. When users make an appointment, modify it, or cancel it, the Outlook calendar is sent invites to an appointment and any updates. For more information about this feature, refer to Integrate Microsoft Office 365 calendar with Walk-up Experience.

Note:
This feature is only available when Microsoft Office 365 Outlook is the hosted calendar service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Devices required to deliver Walk-up Experience

The functionality of the Walk-up Experience application relies on different kinds of devices. Users can check into an online walk-up queue using a desktop or laptop computer, tablet, or mobile phone.

Onsite walk-up location users can check into the queue by scanning an employee badge or with a provided, typically stationary, tablet.

The following guidance describes what devices are needed and function best for each Walk-up Experience feature:

- Online check-in and appointment scheduling: Desktop or laptop computer, tablet, or mobile phone.
- Onsite check-in: Tablet or a desktop.
- Onsite queue: Large flat screen TV. This feature is designed for larger display devices, such as a TV monitor. It isn't supported on a tablet.
- Onsite CSAT survey: Tablet or a desktop.
- Onsite badge reader: Badge scanning integration. For complete details, refer to Badge Reader Integration for Walk-up Experience.

Note:
To optimize the experience for Apple iOS-based tablet devices, save the opened Check-in and CSAT survey tabs to the homepage of the device. When selected from the homepage, they open in full screen.

Configuring Walk-up Experience

Customize your Walk-up Experience portal and configure appointments, notifications, walk-up venue locations, associated stockrooms, customer satisfaction surveys, and hours of operation to meet your required needs.

Walk-up Experience includes associated notifications to alert requesters when the location is closed or when an interaction is assigned to an agent. Pre-built customer satisfaction surveys capture user sentiment about the experience. Also included are several configurable tables for customizing your walk-up portal and service center experience. You can configure and specify the following features for your experience:

- Configure an online check-in channel for requesters to join a walk-up queue before physically arriving at the walk-up location.
- Access the pre-built **Walk-up online check-in Experience** widget for use in your Service Portal. Make minor label changes directly in the widget without customizing through the code.
- Configure the physical walk-up location queue information to manage and administer the walk-up service centers.
- Establish walk-up locations, set hours of operation, enable online check-in, determine assignment groups, associate stockrooms, as well as design the queue time display and position notification system.
- Configure reasons for visits to a walk-up queue by location.
- Add a logo and brand your portal and walk-up location to fit your style.
- Access location-specific branding elements, such as logo images, for walk-up queues. These configuration options are found in the Walk-up Location Queue [wu_location_queue] table.

The following applications are included in the **Administration** module of the Walk-up Experience navigation bar:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Walk-up Experience administration applications

Application	Description
Portal Configurations	Create and modify custom Walk-up Experience online and on-site service portals.
Notifications	Access and configure alerts that keep requesters and agents informed of events that concern them.
Appointment Configurations	Create service configurations for individual walk-up queue locations. You can configure schedules, number of appointments allowed per day, how far in the future requesters can book appointments, and more.
Walk-up Locations	Create walk-up location queues with custom schedules, assignment groups, average wait time, and more.
Schedules	View, create, or modify walk-up venue schedules, such as 8-5 weekdays, and associate them to the walk-up location queues.
Walk-up Stockrooms	Establish walk-up venue stockrooms by location and specify available consumables.
Surveys	Access customer satisfaction surveys and enable public access to the surveys, set survey trigger conditions, and view requester responses.

Walk-up Experience administration

Walk-up Experience users with the sn_walkup.walkup_admin role and administrators can activate and configure the application to meet specific requirements.

You can configure appointments, decide when to send notifications to users, establish and configure physical queue locations and operating schedules, integrate with CSAT surveys, and associate stockrooms with queue locations. You can also customize your Walk-up Experience portal with a unique logo and branding.

Activate Walk-up Experience

You can activate the Walk-up Experience plugin (com.snc.walkup) if you have the admin role. This plugin includes demo data.

Before you begin

Role required: admin

About this task

The Walk-up Experience application is for pre-built support lounges. The application enables your organization to set up a walk-up contact channel to support online and on-site queue check-in.

The Interaction Logging, Routing, and Queuing (com.glide.interaction) plugin are activated with the Walk-up Experience plugin (com.snc.walkup). The following plugins must also be activated in order to use the Walk-up Experience application:

- Asset Management (com.snc.asset_management)
- Service Portal (com.glide.service-portal)

To activate Walk-up Experience Badge Reader Integration and for more information about this feature, refer to Badge Reader Integration for Walk-up Experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For enhanced security, activate the Explicit Role (com.glide.explicit_roles) plugin. The walk-up user is assigned snc_external automatically. This plugin was introduced in the ServiceNow AI Platform Paris release.

Note:
Refer to Explicit roles plugin for details about the plugin and Explicit Roles for more information about this upgrade process.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins (Xanadu)

Walk-up Experience portal security and access

Security is built into the application to prevent end-user facing devices at the Walk-up Experience on-site portal from offering elevated role privileges to users. The Walk-up Experience on-site portal is accessed by an account containing only the sn_walkup.walkup_login role.

Understanding Walk-up Experience portal security

Activate the Explicit Role (com.glide.explicit_roles) plugin to assign users security roles, either snc_internal or snc_external. This plugin was introduced in the ServiceNow AI Platform Paris release. With the Quebec release, for new installations, Walk-up Experience added a dependency on this plugin to explicitly set the Walk-up Experience user as an external user.

When upgrading Walk-up Experience installations prior to Rome, the Walk-up Experience user is assigned snc_internal instead of snc_external. This is because the Explicit Role plugin assigns all users, including Walk-up Experience users, to snc_internal. Walk-up Experience cannot remove snc_internal during upgrade. For new installations of Walk-up Experience, this process works automatically.

Note:
Refer to Explicit roles plugin for details about the plugin and Explicit Roles for more information about this upgrade process.

Access to Walk-up Experience

Agents opening up the on-site Walk-up location for business, or joining the support team during operation hours, access the user record account with sn_walkup.walkup_login role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to log into the Walk-up Experience portal. Internal and external users can access the on-site Walk-up Experience portal via a check-in device, typically a tablet, to enter a queue. Internal, authenticated users can also access an online queue check-in via desktop or mobile device.

Important information for upgrading Walk-up Experience to Xanadu

The Explicit Role (com.glide.explicit_roles) plugin was introduced in the ServiceNow AI Platform Paris release. When installed, users are assigned security roles, either snc_internal or snc_external. With the Xanadu, release Walk-up Experience has added a dependency on this plugin to explicitly set the Walk-up Experience user as an external user.

When upgrading Walk-up Experience to Xanadu, the Walk-up Experience user is assigned snc_internal instead of snc_external. This is because the Explicit Role plugin assigns all users, including the Walk-up Experience user, to snc_internal. Walk-up Experience cannot remove snc_internal during upgrade. For new installs of Walk-up Experience, this process works without issue because the Explicit Role plugin installs first, assigns all users to snc_internal, then the Walk-up Experience user account is created with the snc_external role already assigned.

Note:
Refer to Explicit roles plugin for complete details about the plugin and ServiceNow AI Platform explicit roles.

After upgrading to Xanadu, you need to remove the snc_internal role from the Walk-up Experience user account, or any users created to log into the Walk-up Experience kiosk. Then you need to add the snc_external role to the users. This process is not necessary for upgrades after Xanadu.

Note:
Refer to Explicit Roles for complete details about this process.

Configure the Walk-up Experience portal

Create engaging walk-up center service portals featuring your logo, portal theme, desired catalog, links to a knowledge base and social community, and more.

Before you begin

Walk-up Experience includes a complete base-system **Walk-up Portal** with theme. The **Walk-up Portal** pages are meant to be used as built. You can create custom portal pages to meet your needs by copying the portal pages and associated widgets and making changes to the copies. You can configure both an online check-in portal and a physical check-in portal for your walk-up locations.

There are several ways to configure the Walk-up service portal:

- **Service Portal** application: Modular user interface framework for quick and easy building and customization of application portals.
- Service Portal Walk-up form: Requires CSS and HTML experience.

Role required: sn_walkup.walkup_admin or admin

Procedure

1. To configure the Walk-up service portal using the **Service Portal** application, navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. To customize the base-system walk-up portal with your unique branding, title, logo, theme colors, layout, properties, widgets, and more, or to create a new walk-up portal, refer to Service Portal for detailed information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Alternatively, to configure the Walk-up service portal using the Service Portal Walk-up form, navigate to **All** > **Walk-up Experience** > **Administration** > **Portal Configurations**.
4. In the Service Portals list, select **Walk-up**.
5. Click the form menu icon and select **Configure** > **Form Design**.
6. In the form designer header drop-down list, select or search for any of the configurable walk-up forms to customize your portal appearance.

Option	Description
Walk-up context [wu_context]	Online check-in channel for requesters to join a walk-up queue before physically arriving at the walk-up location. Identifies a walk-up requester and the description of the associated interaction.
Walk-up Location Queue [wu_location_queue]	Physical walk-up location interaction queue to manage and administer the service center. You can establish walk-up locations, set hours of operation, enable online check-in, determine assignment groups, associate stock rooms, as well as design the queue time display and position notification system.
Walk-up Reason [wu_m2m_location_queue_reason]	Reasons why a requester needs walk-up support.
Walk-up Reason for Visit [wu_reason]	Order in which reasons for a visit should be prioritized at a walk-up location.

You can modify the form content to meet your portal requirements. For more details, refer to Form configuration .

Configure Walk-up Experience service channel

Configure the Walk-up Experience service channel to meet the needs of your walk-up agents and how they are assigned to and manage interactions in Agent Workspace.

Before you begin

Role required: sn_walkup.walkup_admin or admin

About this task

The Walk-up Experience service channel is viewed and configured through Advanced Work Assignment. You can modify default values and conditions as desired.

Procedure

1. Navigate to **All** > **Advanced Work Assignment** > **Service Channels**.
2. Select **Walk-up** to open the Walk-up Experience service channel.
3. Refer to Configure a service channel for detailed information regarding the Service Channel Walk-up form values and conditions.
   For more information regarding Advanced Work Assignment service channels, including configuring capacity and utilization, inbox layout, and overriding agent capacity for selected agents, refer to Service channels .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create or modify Walk-up Experience schedules

Once you know the hours of operation for your Walk-up Experience location, you can either access the base-system default schedules or create new schedules to associate with your walk-up location.

Before you begin

Role required: admin or sn_walkup.walkup_admin

Procedure

1. To view and use a base-system default schedule in the Walk-up Experience application, navigate to **Walk-up Experience** > **Administration** > **Schedules**.
   You can view all available base-system default schedules, such as **8-5 weekdays excluding holidays**.
2. To modify an existing base-system schedule, click the schedule name, otherwise click **New** to create a schedule if none of the default schedules apply for your walk-up location.
3. Complete the Schedule New record form or modify fields on an existing form.
   To complete this process and for detailed information on creating, modifying, and using schedules in the system, including a definition of all form fields, refer to Schedules .

Book Walk-up Experience appointments

With the Walk-up Experience appointment booking feature, walk-up users can view available appointment windows, make a selection, and book an appointment for a walk-up location using online **Walk-up Check-in** feature. Walk-up agents can also book appointments on behalf of customers.

Create appointment windows for walk-up queue locations enabling requesters to book service appointments.

The Appointment Booking plugin (com.snc.appointment_booking) must be activated to use the application. Activating the plugin adds the Appointment Booking menu to the application navigator and the following modules:

- **Appointment Booking Configuration**: Use this module to create an appointment booking configuration for an application and then configurations for each service within that application.
- **Appointment Bookings**: Use this module to view a list of appointments that have been booked for services. This list includes the work orders associated with each appointment.

Appointment booking requires configuration at both the application level, in this case, Walk-up Experience, and at the walk-up queue service level, represented by the actual location of the walk-up queue.

The Walk-up Experience application configuration contains settings that apply to all of the service locations within the application that support appointment booking.

A service configuration is required for each of the walk-up queue locations within the application that offer scheduled appointments. A service configuration includes settings that apply only to that specific walk-up queue service location.

Note:
Both the application configuration and the service configuration must be active to book appointments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For detailed information about the **Appointment Booking** application, refer to Managing appointments in Field Service Management.

Walk-up Experience appointment booking administration

Create or modify the Walk-up Experience **Appointment Booking** feature.

Administrators can create, modify, and enable the Walk-up Experience application configuration. Appointment booking administrators (appointment_booking_admin) can create, modify, and enable configurations for service locations within the Walk-up Experience application.

Walk-up Experience is an application level configuration provided with the base system appointment booking feature. You can include as many service level configurations as needed. The service level configurations apply to the individual walk-up queue locations that exist. Administrators can modify these configurations as needed or use them as examples to create new configurations.

For more information on appointment booking administration, see Administer appointment booking

Enable Walk-up Experience appointment booking

Enable or disable the appointment booking feature for Walk-up Experience as well as for the individual walk-up service locations available to requesters.

Before you begin

Role required: sn_walkup.walkup_admin or admin

About this task

The Appointment Booking plugin (com.snc.appointment_booking) must be activated to use the application.
When appointment booking is enabled, the **Schedule an appointment** tab appears on the online check-in page. The requesters can choose a reason for the appointment and select a date a time from current available appointments.

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Booking Configuration**.
2. Select **Walk-up Experience**.
   The **Walk-up Experience** configuration is provided with the base system **Appointment Booking** feature.
3. Click **Active** to enable appointment booking for the Walk-up Experience application.
4. In the Appointment Booking Service Configuration related list, select the name of a service.
   For Walk-up Experience, a service is defined by the physical location of a walk-up queue. Every walk-up queue associated with your application is a service that needs to be configured for appointment booking.
   The Appointment Booking Service Configuration form for the selected service opens.
5. Select **Active** to set the field to true.
6. Select **Update**.

Configure Walk-up Experience appointment booking

Create or modify appointment booking configurations for the Walk-up Experience. You can view or modify the Walk-up Experience application appointment booking configuration and create or modify related service appointment configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The base system Walk-up Experience application includes a default appointment booking configuration that can be modified. By default, the information stored in the Walk-up Experience application appointment booking configuration applies to all services within that application. Services within the Walk-up Experience application are defined as the actual walk-up queue locations. You can create new appointment booking service configurations for the Walk-up Experience application or modify existing configurations.

For example, you may want to configure one walk-up queue to accept appointment booking every day from Monday to Friday, but for another queue, you only want appointment booking available on Monday, Wednesday, and Friday. By configuring appointment booking at the service level, you can achieve this goal.

Specific Walk-up Experience set-up criteria for appointment booking include the following configurations:

- Define different appointment schedules and time windows per queue location.
- Define the time window in which you want to support appointments. For example, 15 minutes now_V. 30 minutes.
- Define the time window capacity. For example, the maximum number of appointments per time window.

View or modify a Walk-up Experience appointment booking configuration

View the base system default appointment booking application configuration to determine if the criteria meets your walk-up appointment booking needs. You can modify the application configuration to uniquely manage appointment booking for your experience. The information stored in the Walk-up Experience appointment booking application configuration applies to all the services within the application.

Before you begin

Role required: sn_walkup.walkup_admin or admin

About this task

The **Walk-up Experience** configuration is provided with the **Appointment Booking** feature.

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Booking Configuration**.
2. To view the **Walk-up Experience** configuration, select the configuration name.
3. In the Appointment Booking Configuration form, view or modify the following fields as needed.

Appointment booking configuration

Field	Description
Name	Name of the application configuration.
Task Table	Table where appointments are created for the tasks. The field is automatically populated with Walk-up Appointment [wu_appointment] table for configuring **Walk-up Experience**.
Availability Method	Option to determine the appointment availability. ○ **Number of appointments per slot**: Define a specific number of appointments per time slot. Use this availability method if the task assignment method is set to **manually**. This is the default setting. ○ **Scripted**: Use this configuration setting to determine availability if the task assignment method is set to **using auto assignment** or **dynamic scheduling**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Advanced Calendar view for Portal	Option to display advanced view of the calendar for booking an appointment.
Active	Option to activate the application configuration and enable appointment booking.
Auto acceptance	If the application configuration setting for **Process lifecycle** is set to **task-driven**, an agent must accept or reject an assigned task. Enable the **Auto acceptance** check box to override this configuration setting for appointment booking.
Portal View	Displays available appointments for a single day or for a week on the online **Self Service Walk-up Check-in** portal or from the **Service Portal** if the walk-up icon is configured there.

4. Select **Submit**.

Create a record producer to capture Walk-up Experience appointment records

Capture Walk-up Experience appointment records by creating unique record producers for your individual walk-up locations. The Appointment Booking Service Configuration form contains required fields that refer to variables in the associated record producer.

Before you begin
Role required: appointment_booking_admin or admin

About this task
In order to properly configure your walk-up location services for appointment booking, you must first create a unique record producer for each walk-up location. You must also add variable sets to the record producer. By creating the unique record producer with appropriate variable sets, you can capture all your walk-up appointment records for each location.

Procedure
1. Navigate to **All** > **Service Catalog** > **Record Producers**.
2. Click **New** to open the Record Producer New Record form.
3. Provide a unique name for the record producer in the **Name** field.
4. Search for and select **Walk-up Appointment [wu_appointment]** in the **Table name** field.
5. Provide a short description for added detail.
6. Click **Submit**.
7. Return to the Record Producers list and search for your newly created record producer.
8. Click to open your newly created record producer.
9. Scroll down the form and click to open the Variable Sets tab.
10. Select **Edit** to add the appropriate variable sets to the record producer.
11. Select and add the following variable sets to the record producer using the add button: *sn_appointment_variable_set* and *sn_walkup_variable_set*.
12. Click **Save**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create or modify a Walk-up Experience appointment booking service configuration

Create or modify appointment booking configurations for Walk-up Experience services. A service is defined as the actual physical location of a walk-up queue. The information stored in the Walk-up Experience application configuration applies to all services, or queue locations, within the application.

Before you begin

Role required: appointment_booking_admin or admin

About this task

To use the appointment booking feature, administrators must create a configuration for each service, or queue location, that is available to walk-up customers. Service configurations are created within the **Walk-up Experience** application configuration, as part of the **Appointment Booking** application.

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Booking Configuration**.
2. Select **Walk-up Experience**.
3. Create or modify Appointment Booking Configuration.
   - To create configuration for appointment booking, select **New.**
   - To modify an existing configuration, select the configuration from the list.
4. On the form, fill in the fields.

Appointment booking service configuration fields

Field	Description
Active	Option to enable appointment booking for the service. **Note:** If inactive, customers cannot schedule appointments for the service but can still create work orders.
Enable day level configuration	Option to configure the schedule at a day level. For more information, see Configure day-level appointment booking.
General Information	
Name	Name of the service configuration.
Configuration	Name of the appointment booking configuration to which this service belongs.
Availability table	Table used to calculate appointment availability. For Walk-up Experience, choose Walk-up Appointment [wu_appointment].
Holiday Schedule	Holiday schedule to use when determining availability. Appointment booking evaluates the holiday schedule when determining the number of available appointments and excludes any day in the schedule that is set to **Exclude**. Select the lookup icon and select a schedule from the Schedules list. **Note:** Holiday schedules are useful when the assignment method for tasks is set to **manually**, which does not consider agent schedules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Catalog Information	
Catalog item	The service in the service catalog for which this appointment booking configuration is being created. The catalog item must exist in the service catalog. Select the lookup icon and select the associated service from the Record Producers list. You must create a record producer for each walk-up service location. Refer to Create a record producer to capture Walk-up Experience appointment records. If you're using appointment booking with work orders, create a work order template before you configure appointment booking.
Location	The field on the record provider that determines the appointment location. **Note:** Ensure the **Location** field on both this form and the Walk-up Location Queue (wu_location_queue) form are configured in alignment. Walk-up Experience contains the *location* reference variable, which is a Location (cmn_location) record. Selecting **Location** from the search list icon ensures that you're aligning with the same time zone as the walk-up location you are configuring for. When you select **Location**, the online appointment scheduling calendar displays in the requester time zone. If this field is kept empty or if the requester preference for the instance is not configured to have an associated time zone, the appointment scheduling calendar defaults to display in the requester time zone. If a requester in Europe has User preferences for **Time zone** configured for **Europe/Brussels** and the Appointment Booking Configuration for the **Location** field is set to a cmn_location with the time zone **US/Pacific**, then the appointment scheduling calendar will display in the US/Pacific time zone. When a requester creates an appointment, the system defaults to use the schedule associated with the Walk-up Location Queue (wu_location_queue), regardless of the **Location** field value of this record producer.
Timezone	Time zone used for the location. Select **Appointment location** from the drop-down list.
Appointment is mandatory	Option for enabling the feature to make it mandatory for a requester to create an appointment when requesting this service. ○ If selected, the **Appointment** field appears on the record producer, and the requester selects an available appointment before submitting the service request. ○ If not selected, the requester can submit the service request without selecting an appointment.
User contact	The field on the record producer that determines who the appointment is being created for. Set this field to **Contact**. This is a reference field that looks for a sys_user variable on the record producer.

Field	Description
Booking	
Appointments per window	Number of available appointments for each configured appointment time slot. This number determines the number of available appointments that are displayed on the Select Appointment window. Enter a number in this field if the assignment method for tasks is set to **manually**. If set to either **using auto-assignment** or **using dynamic scheduling**, this setting does not apply, unless a location is not provided. Then the configuration defaults to the number of appointments per window.
Lead time	Number of hours or days from the current time after which an appointment can be booked for this service. Define the lead time in hours or days. The default is four hours.
Future bookable max days	Number of days in advance of the current day for which an appointment can be booked for this service. The default is 14 days.
Reschedule / Cancel by time	Number of hours or days prior to an appointment start time that are required for an appointment to be canceled or rescheduled. If a requester attempts to cancel or reschedule an appointment within this number of hours, the **Cancel** button is not available. Define the time in hours or days. The default is four hours.
Appointments	
Appointment window	Duration of the appointment window. **Note:** Allow enough time for the work to be started and completed within this window.
Work duration	Time required to complete all tasks created by the record producer. This duration is set for a task when it is created. Used to determine availability. The default is one hour.
Travel duration (round trip)	Estimated value of the average travel time required (round trip) for the agent performing the task. Set the value to 0 because the work is performed on site and travel time is not needed.
Daily Schedule	
Bookable days	Days of the week for which appointments can be booked. The default is Monday through Friday. Bookable days should reflect the appointment schedule. **Note:** Appointment schedules are separate from the walk-up queue location schedule but should be the same days and hours as the walk-up queue location schedule.
Daily start time	Start of the work day and the earliest start time for an appointment window. The default is 9:00.
Daily end time	End of the work day and the latest end time for an appointment window. The default is 18:00 PM.
Include daily break	Option to schedule a break for each bookable day, then select the break start and end times. You can define one break which applies to all days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Appointment booking preview	Option to provide a preview of the appointment windows and times based on the selected start and end times, break time, and appointment window.

5. Select **Submit**.

Configure day-level appointment booking

Create or modify different schedules at a day level when booking appointments for a service. The appointments can be scheduled for different slots such as morning, afternoon, and evening.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Appointment Booking** > **Appointment Booking Configuration**.
2. Select **Walk-up Experience**.
3. In the Appointment Booking Service Configuration related list, select a service configuration for which you want to configure the appointment schedules.
4. Select **Enable Advanced Configuration**.
5. In the Appointment Booking Day Configuration related list, click **New**.
6. On the form, fill in the fields.

Appointment Booking Day Configuration form

Name	Name of the day level configuration, such as Morning, Afternoon, or Evening
Active	Option to indicate if the appointment slot is active or not.
Start date	Start date of the appointment booking window
End date	End date of the appointment booking window
Daily start time	Start of the work day and the earliest start time for an appointment window. The field is automatically set to 9a.m.
Daily end time	End of the work day and the latest end time for an appointment window. The default is 6p.m.
Service configuration	Name of the service configuration for which you are scheduling configurations at a day level, such as Point-of-Sale Installation.
Work duration	Time required to complete all tasks created by the record producer. This duration is set for a task when it is created. Used to determine availability. The default is 1 hour.
Travel duration (round trip)	Estimated value of the average travel time required (round trip) for the agent performing

	the task. Used to determine availability. The default is 15 minutes.
Appointment window	Duration of the appointment window. **Note:** Allow enough time for the work to be started and completed within this window.
Appointments per window	Number of available appointments for each configured appointment time slot. This number determines the number of available appointments that are displayed on the Select Appointment window. Enter a number in this field if the assignment method for tasks is set to manually. If set to either using auto-assignment or using dynamic scheduling, this setting does not apply, unless a location is not provided. Then the configuration defaults to the number of appointments per window.
Include daily break	Option to schedule a break for each bookable day. Set the break start and end times. You can also define one break which applies to all days.
Appointment booking preview	Provides a preview of the appointment windows and times based on the selected start and end times, break time, and appointment window.

7. Select **Submit**.

Configure daily schedules for Walk-up Experience appointment booking

Define hours of operation and daily schedules for booking an appointment at your Walk-up Experience location.

Before you begin

Role required: appointment_booking_admin or admin

About this task

Create a unique appointment booking schedule for each day of the week or for specific days of the week. For example, you can set the appointment booking availability schedule to run from 9:00am to 5:00pm, Monday, Wednesday, and Friday. The Tuesday and Thursday appointment availability schedule can run from 9:00am to 12:00pm. You can completely remove appointment booking for a specific day of the week, for example, Friday.

Note:
To specify unique daily booking schedules, while using your associated appointment booking configuration, create new Schedule Entries to exclude the hours appointment booking is not available.

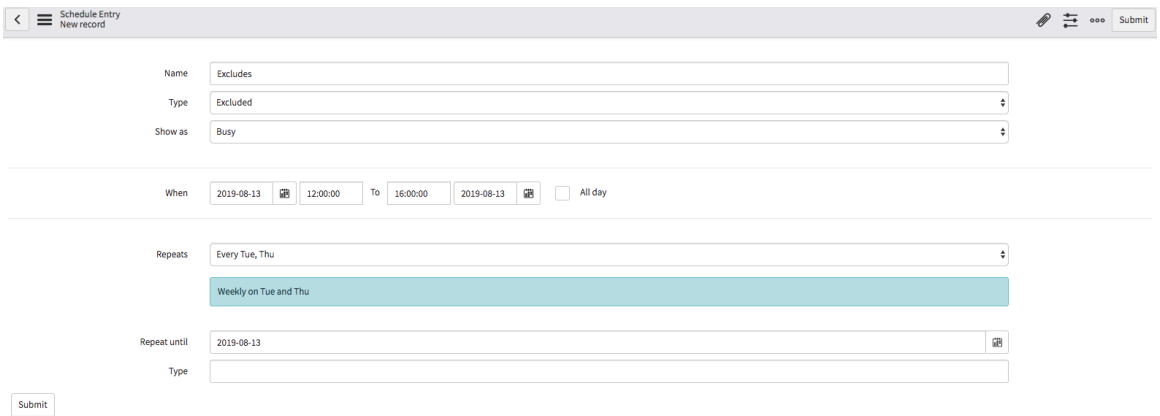
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Walk-up Experience** > **Administration** > **Schedules**.
2. Select the schedule you use, for example, the **8-5 weekdays excluding holidays** schedule.
3. In the Schedule Entries related list, select **New**.
4. Name the new record **Excludes** and fill in the form to create a unique daily booking schedule for Tuesday and Thursday appointments.

Schedule Entry Excludes configuration fields

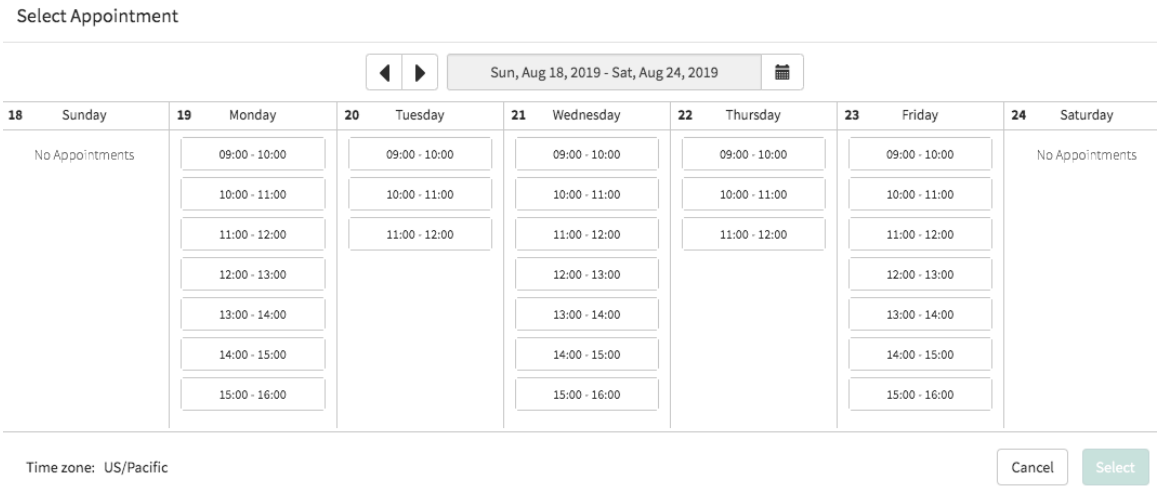
Field	Description
Name	Name of the record. For example, name the record **Excludes** to indicate the hours excluded from appointment booking.
Type	Choose **Excluded** as the type.
Show as	Choose **Busy** as the reason for the exclusion.
When	Indicate the date to begin using this booking availability schedule. Also indicate the time to exclude booking availability for this date. For example, the hours of 12:00pm through 5:00pm.
Repeats	Indicate the recurrence for this availability schedule. For example, **Weekly on Tue and Thu**.
Repeat until	Specify how long you want this availability schedule to run by selecting an end date.



5. Select **Submit**.
6. To verify that Tuesday and Thursday appointment booking is only available from 9:00am to 12:00am, navigate to your online Walk-up Check-in application.
   If configured for view, You can access the online Walk-up Check-in application from the **Service Portal Home** page or under **Self-Service** in the left navigation bar.
7. Select the walk-up location for which you are verifying the schedule.
8. Select **Schedule an appointment** and select a reason for the visit.
9. Select a date for the appointment.
   The **Select Appointment** window displays the first available appointment, by week and day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Determine that appointments are only available on Tuesdays and Thursdays from 9:00am to 12:00pm.



Configure excluded hours for Walk-up Experience appointment booking

Using the **Appointment Booking** application, you can specify excluded appointment hours in the schedule for your Walk-up Experience location.

Before you begin

Role required: appointment_booking_admin or admin

About this task

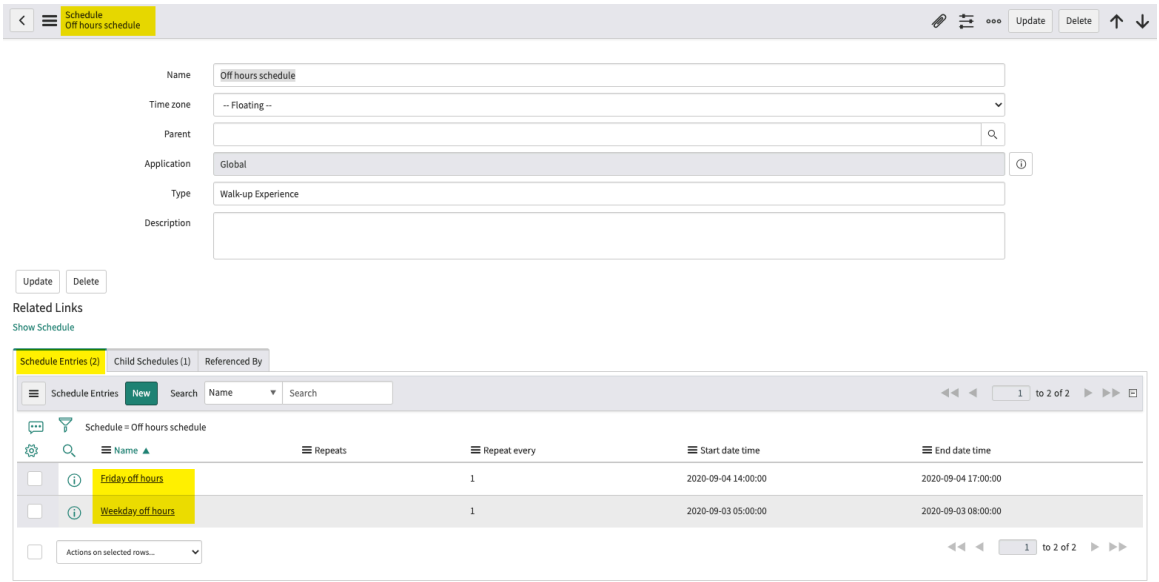
Configure your Walk-up Experience location to exclude certain hours of operation from users scheduling appointments. For example, you can set the appointment booking availability schedule to run from 8:00 a.m. to 5:00 p.m., Monday through Thursday. On Friday, you can schedule the appointment booking availability from 8:00 a.m. to 2:00 p.m. You can also completely remove appointment booking for a specific day of the week, for example, Mondays or Friday.

Reconfigure the **Holiday Schedule** field on the Appointment Booking Service Configuration form for your walk-up location to use a custom **Off hours schedule** instead of the default holidays schedule.

Procedure

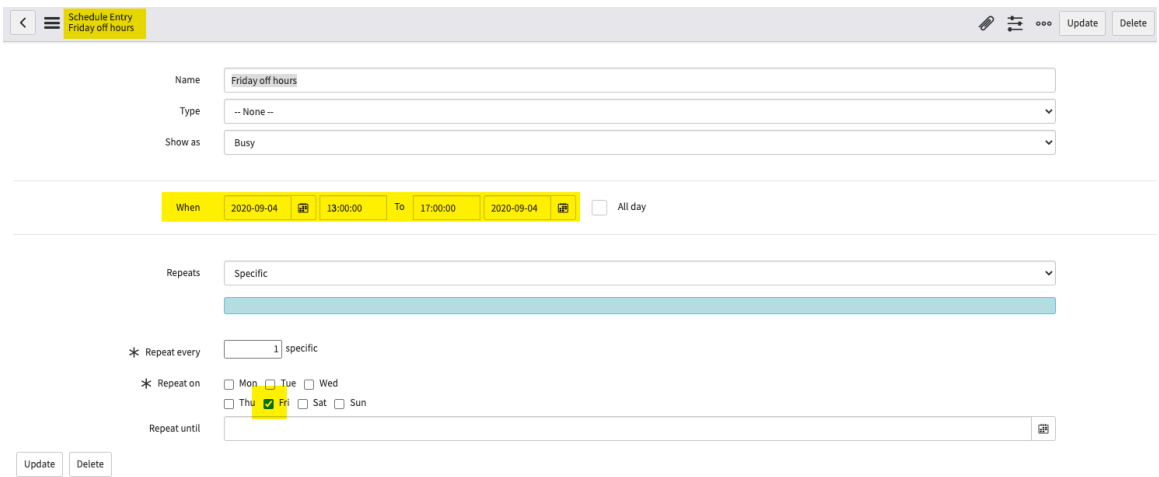
1. To create a schedule to exclude your unavailable appointment booking hours, navigate to **Walk-up Experience** > **Administration** > **Schedules**.
2. Select **New.**
3. Provide a name for your schedule, for example, `Off hours schedule`.
4. Add a description, if desired.
5. Select **Submit**.
6. In the **Schedules** list, search by **Name** for the new **Off hours schedule** record.
7. Select **Off hours schedule** to open the record.
   Use the Schedule Entries related list to create two separate excluded hours schedule entries, one for **Friday off hours** and one for **Weekday off hours**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select **New** in the Schedule Entries related list to create **Friday off hours**.

   You will configure Fridays to exclude all appointments after 1:00 p.m.



9. Select **Update** to save your changes.
10. Add the **U.S. Holidays** default off-hour schedule as a child schedule to the **Off hours schedule**.

    a. Click the Child Schedules related list.

    b. Click **Edit** and use the slush bucket to move the **U.S. Holidays** schedule into the **Child Schedules List** for the **Off hours schedule**.
    Adding the **U.S. Holidays** schedule as a child ensures that all holidays are excluded from appointment booking and overrides the **Off hours schedule** configurations for holidays.

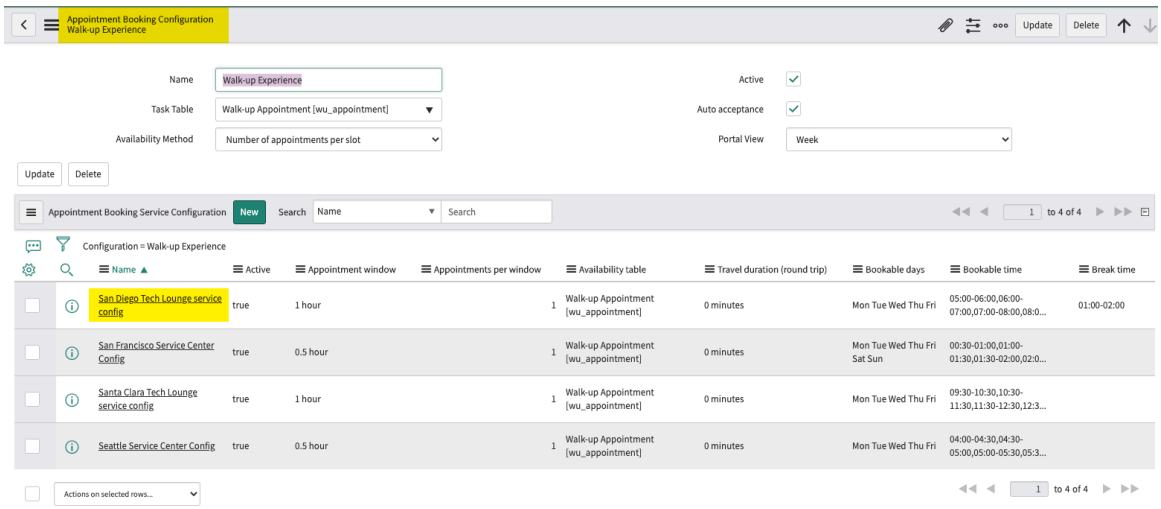
    Note:
    The **U.S. Holidays** schedule is the default off-hours schedule for the United States. Default off-hours schedules will differ depending on your location.

    c. Click **Save**.

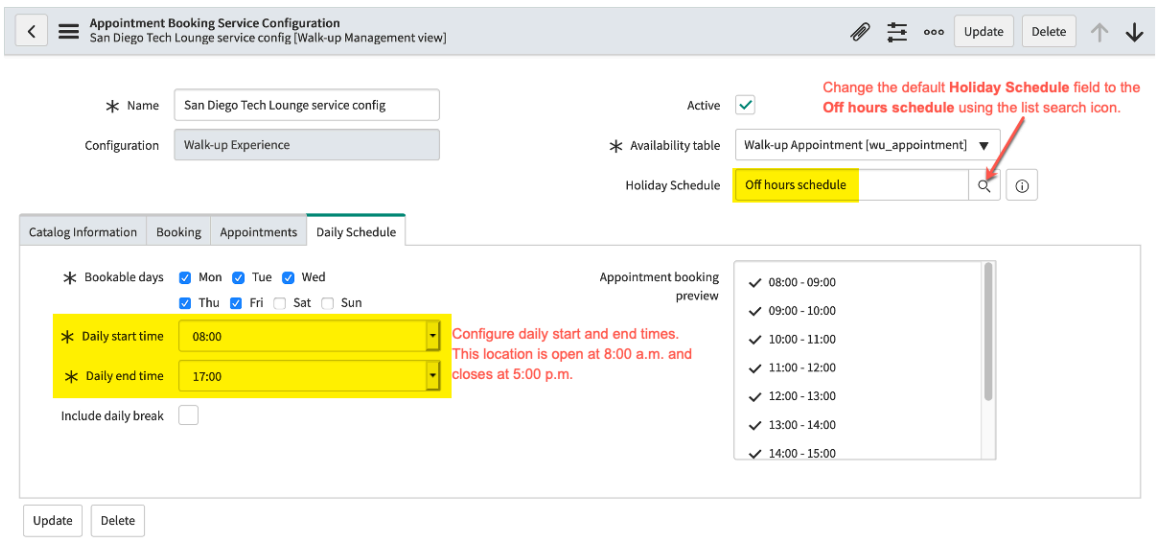
11. Click **Update** to save the **Off hours schedule** record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. Next, to configure your walk-up location to use the **Off hours schedule**, navigate to **Appointment Booking** > **Appointment Booking Configuration**.
13. Select **Walk-up Experience** and then the walk-up location you want to reconfigure, for example, San Diego Tech Lounge.

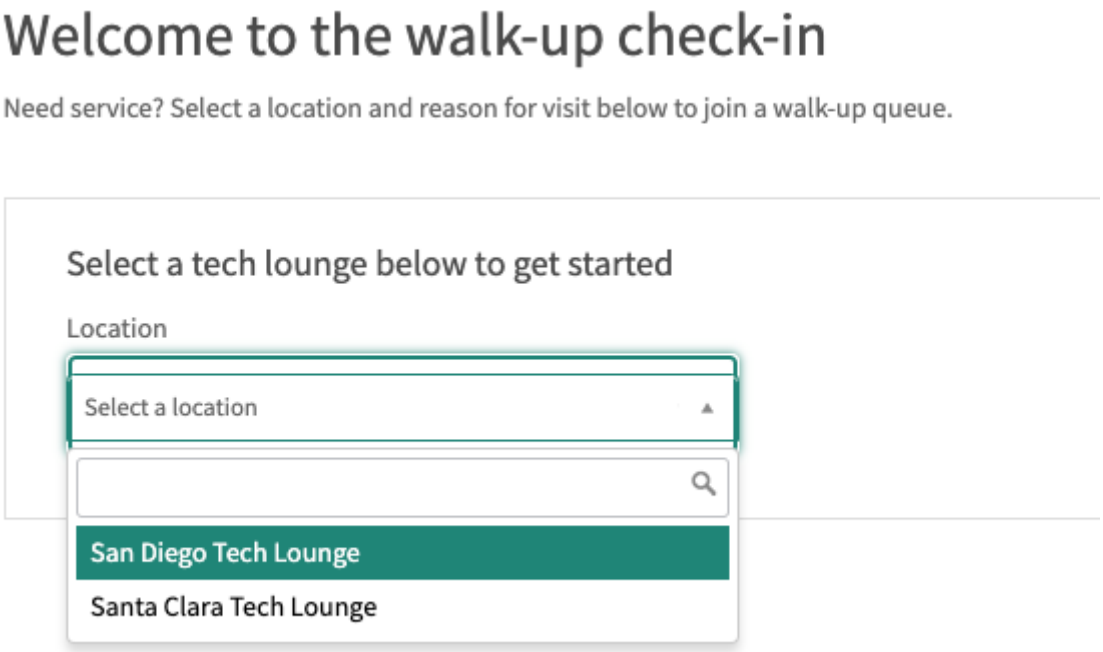


14. In the **Holiday Schedule** field, change the default, base system schedule value to **Off hours schedule**, using the list search icon.
15. Click the **Daily Schedule** tab to configure the daily start and end times for the walk-up location. For this location, the hours of operation begin at 8:00 a.m. and end at 5:00 p.m. (17:00), Monday through Friday.

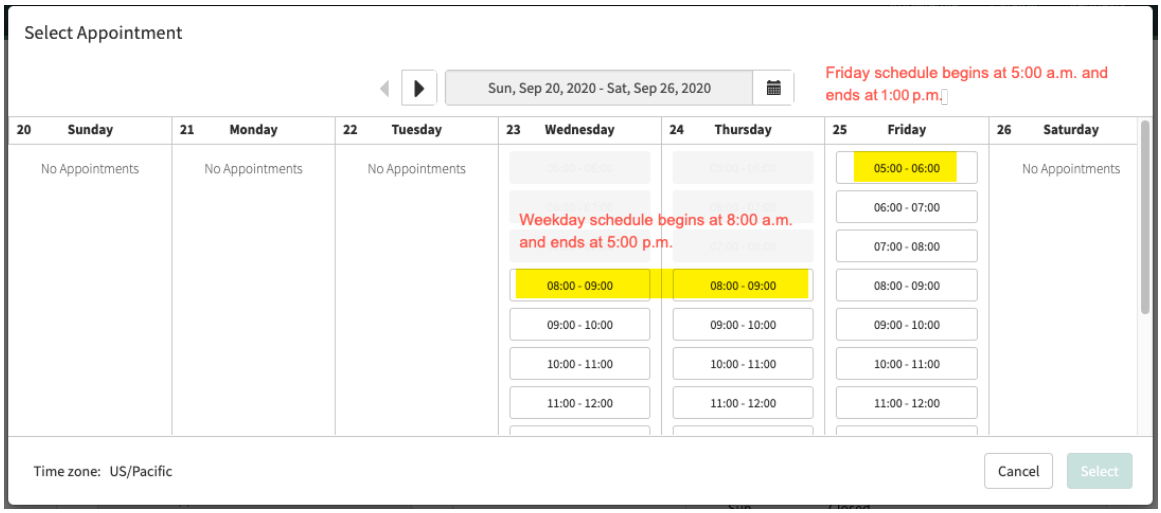


16. Select **Update** to save your changes.
17. To verify the hours you want excluded from appointment booking are unavailable, navigate to **Self-Service** > **Walk-up Check-in**.
18. Select the walk-up location with the excluded hours you want to verify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



19. Select **Schedule an appointment**.
20. Click the calendar icon to view the available appointment times for the walk-up location. The appointment schedule reflects the excluded hours you configured by using the **Off hours schedule**. Scroll down in the **Select Appointment** window to view the end times.



Activate and configure appointment booking reminders for Walk-up Experience

Configure scheduled appointment reminders for Walk-up Experience users. Reminders ensure users attend appointments in a timely manner or reschedule or cancel an appointment if they can no longer attend.

Before you begin

Role required: sn_walkup.walkup_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To operate appointment booking reminders, activate the **Appointment Booking Reminders** Scheduled Job, since it is not active by default. In addition, the **Appointment reminder** field does not appear on the **Appointment Booking Service Configuration** form by default. You must add it to the form and configure reminders. Reminders are inactive unless a configuration is set.

Procedure

1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Search for **Appointment Booking Reminders** by name and select to open.
3. Click the **Active** field to activate the scheduled job.
4. Click **Update**.
5. To add the **Appointment reminder** field to the **Appointment Booking Service Configuration** form, navigate to **Walk-up Experience** > **Administration** > **Appointment Configurations**.
6. Select a Walk-up Experience service configuration from the list.
7. Click the menu button ( ) and scroll to **Configure** > **Form Layout**.
8. Select **Appointment reminder** from the **Available** list and move it to the **Selected** list using the add button.
9. Select **Save**.
   The **Appointment Booking Service Configuration** form is displayed with the **Appointment reminder** field.
10. To configure an appointment reminder, choose time, in hours, from the **Appointment reminder** field drop-down list.
    The time represents the time before a scheduled appointment that you want to send a reminder. For example, a reminder is sent, two hours before a scheduled appointment.
11. Select **Update** to add the appointment reminder configuration.

Configure Variable time slots for appointment booking

Variable time slots, such as work duration and dates, for appointments can be configured and booked based on the reason for a location. The reason can be an issue or request.

This feature enables you to do the following:

- Configure variable time slots for booking an appointment based on the different reason for a location by creating advanced configurations and service configuration rules.

  Note:
  The service configuration rules and the advanced configurations must not overlap each other.

- Communicate to the customers about the availability of the agents for a location.
- Manage the walk-up locations and resources more effectively and efficiently.

To enable this feature, select the **Enable advanced configurations** check box on the Appointment Booking Service Configuration form.

You can create multiple advance configurations for a service configuration rule.

Configure variable time slots for appointment booking

Configure variable time slots for appointment booking in a walk-up location by defining rules and configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: appointment_booking_admin or admin

About this task
To use the appointment booking feature, administrators must create a configuration for each service or queue location that is available to walk-up customers. Service configurations are created within the Walk-up Experience application configuration, as part of the Appointment Booking application.

Procedure
1. Navigate to **All** > **Walk-up Experience** > **Administration** > **Appointment Configurations**.
2. Create or modify Appointment Booking Configuration.
   - To create a new configuration for appointment booking, select **New**.
   - To modify an existing configuration, select the configuration from the list.

   Note:
   For more information on creating or modifying appointment booking configuration for Walk-up Experience and field-related information, see Create or modify a Walk-up Experience appointment booking service configuration.

3. Select the **Enable advanced configurations** check box.
   The **Advance Configurations** and **Service Configuration Rules** tabs appear in the related list of the Appointment Booking Service Configuration form.
4. Click the **Service Configuration Rules** tab, and create or modify an existing rule.
   - To create a new rule, click **New**.
   - To modify an existing rule, select the configuration from the list.
5. On the Service Configuration Rule form, fill in the fields and click **Submit**.
   For more information on the fields, see Create appointment booking service configuration rules.

   Note:
   The **Task Table** and **Task Conditions** fields are not applicable for Walk-up Experience.

6. Click the **Advance Configurations** tab, and create or modify a configuration.
   - To create a new configuration, click **New**.
   - To modify an existing configuration, select the configuration from the list.
7. On the **Advance Configurations** form, fill in the fields and click **Submit**.
   For more information on the fields, see Create appointment booking advanced configuration.
8. Click **Submit**.

What to do next
You must map the defined advance configurations with the defined service configuration rule for a location. Use the Reasons for Visit related list on the Walk-up Location Queue form. For more information, see Create or modify Walk-up Experience locations.

Configure maximum multiple appointments

Enhance Walk-up Experience service experience by helping requesters to book multiple appointments simultaneously. You can configure the location to accept multiple bookings and also decide the maximum number of appointments a requester can book at a location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Only one appointment could be booked by a requester with Walk-up Experience appointment booking feature. The requesters could not book any follow-up appointments. For example, requester has scheduled a laptop drop-off appointment and wants to schedule a pick-up appointment in advance.

With enhanced appointment booking feature, the requesters can now book multiple appointments simultaneously.

Scheduling multiple appointments, the requesters and the agents can maintain the context of the service request. To reduce back and forth communication and resolve issues seamlessly, the agents can also book multiple appointments on behalf of the requester.

Implementation

- **Administrators:** The administrators can decide and configure the maximum number of appointments a requester can book for a particular location. For example, at Santa Clara tech lounge location, set up the maximum number of appointments as 2. The requester can only schedule two appointments in advance. If maximum number of appointments per user is changed or modified, existing appointments are not affected. The change is applied to all future appointment bookings. To configure and set the maximum number of appointments at a location, see Create or modify Walk-up Experience locations.
- **Agents:**To book a walk-up appointment on behalf of the requesters when incident resolution requires requesters for a follow-up visit, see Create an appointment through incident
- **Requesters:**To book multiple appointments and plan walk-up visits in advance, see Plan your walk-up experience visit with Employee Center.

Configure appointment type

Support requesters in-person and virtually and assist them through remote appointment.

A walk-up location can support in-person visits of a requester or support the requester virtually.

Extend services to your employees working remotely with the new Walk-up appointment booking type as **remote**. With the new remote appointment type, you can manage crowding at the location, support work from home and hybrid work model effortlessly. Integrate MS Teams to connect to the agents and the requesters and maintain the conversation context.

- **Administrators:** The administrators can set a location as remote, in-person, or both. To configure appointment type for a location, see Create or modify Walk-up Experience locations.
- **Agents:** The agents are notified whether the interaction is remote or in-person. They can start a conversation with the requester on Microsoft Teams and bring over the context from Microsoft Teams chat to walk-up interaction.
- **Requesters:**The requesters can choose if they want to be served remotely by selecting appointment type as remote while scheduling an appointment. For more details, see Plan your walk-up experience visit with Employee Center. They can still get their issues resolved by visiting the location.

Create or modify a Walk-up Experience stockroom

Create stockrooms and assign assets and groups specifically for your walk-up location. Walk-up stockrooms contain common assets that visitors to the walk-up location will typically request, such as a computer mouse, monitors, and cables. The walk-up location stockroom should be easily accessible to your walk-up location for fast request fulfillment.

Before you begin

Role required: sn_walkup.walkup_admin, asset_user, inventory_user, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Stockrooms are separate, standalone entities in the Asset Management application.

Procedure
1. To view walk-up location stockrooms, navigate to **Walk-up Experience** > **Administration** > **Walk-up Stockrooms**.
2. To modify an existing walk-up stockroom, click the stockroom name, otherwise click **New** to create a stockroom.
3. Complete the Stockroom New record [Walk-up view] form or modify fields on an existing form.

Fields	Description
Name	Display name and unique identifier of the stockroom.
Assignment group	Group that primarily uses the stockroom.
External	Whether this stockroom is managed internally (check box is cleared) or is managed externally by a third party (check box is selected).
Location	Physical location (address) of the stockroom.
Type	Type of stockroom. Chose **Walk-up** to create a walk-up stockroom.
Manager	Person in charge of the stockroom. Receives restocking notifications and requests for the stockroom stock rules.

For more information on creating or modifying a stockroom, and adding and managing stockroom assets, refer to Stockrooms .

Create or modify Walk-up Experience locations

Create or customize the predefined Walk-up Experience location. Walk-up Experience locations contain all the information about the walk-up support venue. You can define the way each location or support venue works.

Before you begin
Role required: sn_walkup.walkup_admin, sn_walkup.walkup_manager, or admin

About this task
You can configure walk-up locations for work schedules, appointment bookings, assignment groups, and associate stockrooms. Set up management and administrative rules for your walk-up location. Specify reasons-for-visit options and configure how interactions display for each walk-up location.

Procedure
1. Navigate to **All** > **Walk-up Experience** > **Administration** > **Walk-up Locations**.
2. To create or modify an existing walk-up location, do one of the following:
   - To create a new walk-up location, click **New**.
   - To modify an existing location, select the walk-up location from the list.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Walk-up location form

Fields	Description
Name	Name of the location. For example, `Santa Clara tech lounge`.
Description	Description of the location.
Schedule	Schedule of work operation days and hours that the walk-up location follows.
Appointment Booking	Appointment booking plan for the walk-up location. For more details, see Booking walk-up appointment.
Service channel	Service channel that the agents work on. Select the **Walk-up** service channel.
Define condition here	Option to route work items to a queue using a condition.
Condition mode	Condition modes to define the routing of work items. The available options are as follows: ○ **Simple** ○ **Advanced** This field appears only when the option **Define condition here** is selected.
Work item routing condition	Condition that defines who provides customer support at a walk-up location. Location is determined by physical address. This field appears only when **Simple** is selected from the **Condition mode** field.
Active	Option to set the walk-up location as active.
Enable away state	Option to set the location in a non-operational or closed state.
Away message	Display message to indicate that the location is temporarily closed for the specified time. The message is specified for work hours other than the scheduled closed times.
Stockroom	Stockroom that supplies assets to the location.
Location	Physical address of the location.
Location image	Picture of the location. For example, a picture of the city, building, or work-desks of the walk-up location.

4. Select the **Management** tab and fill in the fields.

Walk-up Management tab

Fields	Description
Position notification	Queue position at which a requester is sent a notification. For example, if the position notification is set to **3**, the requester receives a notification that is third in line to be assisted.
Last check-in	Last available check-in time in minutes. For example, 30 minutes before closing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Enable online check-in	Option to set this location for online checking in. Allow requesters to check in to the location remotely from a laptop or mobile phone.
Enable kiosk	Option to enable the kiosk feature at the location.
Show kiosk	Option to show the kiosk on the portal and on the on-site display monitor.
Enable appointment delegation	Option to enable agents and requesters to book an appointment on behalf of someone else.
Appointment delegation group	Group of people who can book an appointment on behalf of the requester or agent. Add a new group of requesters if an appropriate group does not exist. This field appears only when the **Enable appointment delegation** field is selected.
Maximum appointments per user	Maximum number of appointments that a requester can book at a location. This field is automatically set to 1. **Note:** If maximum number of appointments per user is changed or modified, existing appointments are not affected. The change is applied to all future appointment bookings.
Name configuration	Option to display the information of the requesters on the on-site queue display monitor and on the online check-in screen. You can display the names in any of the following manners: ○ First name (by default) ○ First name and last name ○ First name with initials of last name
Appointment routing time	Time defined, in minutes, to route the work item to an agent prior to an appointment.
Hold time	Time defined, in minutes, that you want to put an interaction on hold before attempting to route it again to an agent. For example, if this field is set to **5**, then the interaction is put on hold for 5 minutes before rerouting it to the other agent.
Show estimated wait time	Option to display the estimated wait time for a requester in walk-up queues. The wait time is calculated from the average wait time of the queue and how many requesters are currently in the queue. All estimated wait times are rounded to the nearest whole minute. The estimated wait time calculation requires the use of the Advanced Work Assignment queueing system to calculate the average wait time. Estimated wait times are displayed at the following places: ○ Online check-in. ○ On-site check-in and on-site queue display monitor. ○ **Status** widget on the Service Portal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Audio Playback	Specify when the audio confirmation will play. For example, when a requester checks into an on-site queue or checks in online or both, the audio is played. This field is automatically set to **None**.
Audio File	Audio to play for the following walk-up queue conditions: ○ When a requester checks into a queue, audio is played from the actual check-in location, typically a stationary laptop. ○ When a new requester moves up in the queue, audio is played from the queue display monitor. ○ When a requester makes an appointment online, audio is played from the device of the requester. The base-system default file is `walkup_checkin.mp3`. **Note:** Only `mp3` file formats are supported across all browsers. You may need to provide additional browser permissions to use an audio file on the Safari browser.

5. Click the **Administration** tab and fill in the fields.

Walk-up Administration tab

Fields	Description
Queue time display	Choice to display the time on the on-site display monitor. Choices are as follows: ○ None: If you do not want any display. ○ Check-in time: The check-in time of the requester. ○ Time waited. Time remaining for the requester to check in.
Queue message	Welcome message to display on the on-site display monitor of the location.
Check-in greeting	Greeting message to guide the requester to sign into the queue at the designated check-in monitor.
Closed message	Message to inform the requesters that the location is closed as it is outside the hours of operation.
Closed phone number	Contact phone number for requesters to reach out to, when the location is closed.
Closed phone number label	Label defined for the contact information. For example, `IT Support`, `Customer Support`, or `HR Support`.
Closed record producer	Mode of reaching out to the service providers when the location is closed. For example, if the option is set to **Create Incident**, the requesters are redirected to create incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Badge Check-in Reason	Reason for checking into a walk-up location. This field is automatically set to **Other**. **Note:** Badge scan check-in is not an authentication mechanism.
Badge Check-in reason description	Description of the reason for checking in. This field is automatically set to **Walk-up badge scan check-in**. **Note:** Badge scan check-in is not an authentication mechanism.
Closed image	Picture or an image indicating that the walk-up location is closed. The image is displayed on the on-site display monitor.
Maximum search results	Number of search results to provide for contextual searches.
Contextual search config	Context that the requesters use while checking in or booking an appointment.
Appointment type	Option to set the type of appointment the requesters can book for the location. The following options are available. ○ In-person ○ Remote ○ Both
Enable unregistered user entry	Option to allow requesters who do not have a user name in the system to check into the location for support. For example, such requesters can be non-employees who are guests visiting the location.
Enable lookup user entry	Option to enable requesters to quickly see their names on the list when they start typing.
Enable technician info	Option to display the names of the agents on the monitor at the location.
Enable technician avatar	Option to display the avatar of the agent on the wall monitor at the location.
Enable badge check-in notification	Option to show a notification when a requester checks into a queue using a badge scanner.
Header logo	Option to add a header logo. The header logo is location-specific. If no logo is specified, by default, the Walk-up Portal logo is used.
Queue logo	Option to add a logo for the designated on-site display monitor. Design this logo to work with a black background. If no logo is specified for the queue, then the Header logo is used by default. If no Header logo is specified, the Walk-up Portal logo is used.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Right-click in the form header and select **Save**.
   The following tabs appear:
   - **Interactions**: View interactions or configure how the walk-up interactions list is displayed.
   - **Walk-up Appointments**: View appointments or configure how the Walk-up appointments list is displayed.
   - **Reasons for Visit**: View, modify, or create a reason for visit.

     Note:
     For configuring variable time slots feature in Walk-up Experience, you must use this tab for mapping the advance configurations with the service configuration rule. For more information, see Configure variable time slots for appointment booking.

   - **Walk-up Location Kiosks**: Modify or create a kiosk for the location.
   - **Assignment Eligibility**: View, modify, or create an assignment rule for your walk-up locations.

     Assignment rules are configured in the Advanced Work Assignment application.

   - **Work Item Sort Order**: View, modify, or create a work order for your walk-up locations.
   - **Location Queues Badge Readers**: View, modify, or add a badge reader for your walk-up locations.
7. To save the new or modified walk-up location, Select **Update**.

Walk-up Experience kiosk

Walk-up Experience kiosks help your requesters to resolve information technology (IT)-related issues and access various IT services and resources in your organization.

As an administrator, you can activate kiosks at walk-up locations and customize them to support the IT-related requests from your requesters. For example, you can assign one kiosk to refresh the requester's laptops and another kiosk to supply computer devices. For more information, see Create a kiosk at a location.

The requesters can use desktop or mobile devices to make an appointment or to join the queue. For more information on using the mobile device to make an appointment, see Walk-up Experience on Now Mobile. Based on the requester's service requirement, they are directed to a designated kiosk. The requester can then check their queue number on the kiosk screen as well as on their desktop or mobile device.

The available agents at a kiosk can assign interactions to themselves or leverage skill-based routing to direct requesters to the designated kiosk for assistance. For more information about skill-based routing, see Configure skill-based routing in Walk-up Experience. However, the agents must check into a kiosk from the service operation workspace (SOW) to support the interactions. An agent can check into only one kiosk at a time. If an agent tries to check into another kiosk, that agent is automatically checked out of the previous kiosk.

Requesters can view the kiosk queue on their desktop or mobile device screens and then proceed to access the necessary services. For example, if a requester must refresh the laptop, they are led to the kiosk dedicated to laptop refresh.

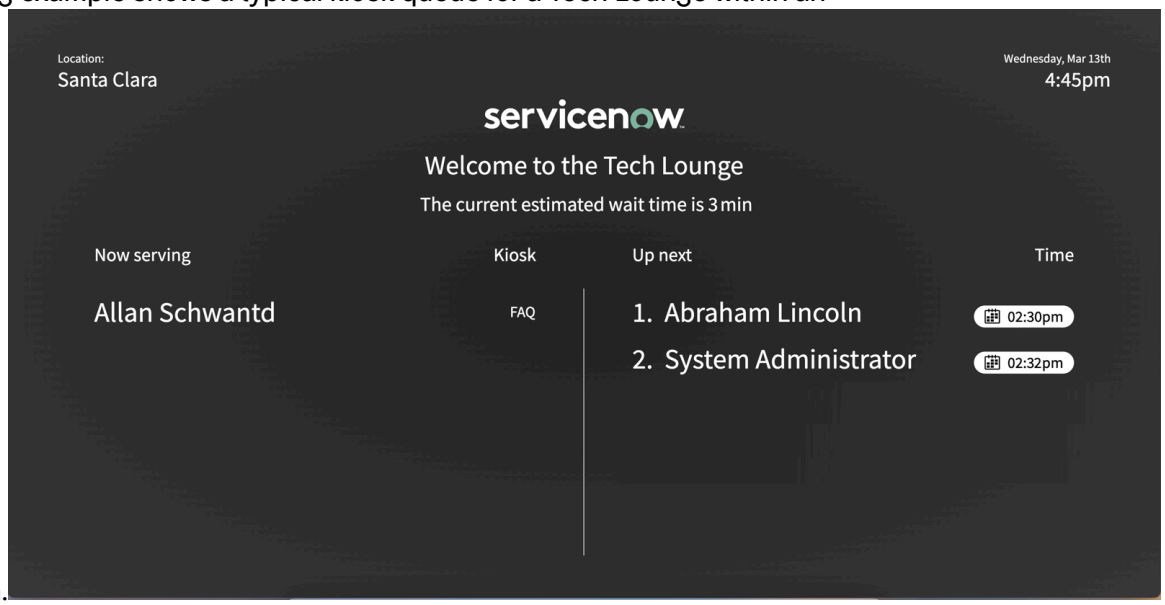
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following example shows a typical kiosk queue for a Tech Lounge within an organization.



Create a kiosk at a location

Walk-up Experience kiosks offer immediate assistance to the requesters by supporting them with technical issues, questions, or requests. The requesters can receive on-the-spot guidance or resolution for their IT-related problems.

Before you begin

Role required: admin

About this task

A kiosk refers to a platform specifically catering to a particular service that you have to offer to the requesters. The kiosks are an efficient way to offer services to the requesters to resolve their issues.

You can set up multiple kiosks at a walk-up location depending on various business processes. For example, financial organizations, hospitals, and IT companies can use kiosks as an alias to agents.

Procedure

1. Navigate to **All** > **Walk-up Experience** > **Administration** > **Walk-up Locations**.
2. Select a location from the list of Walk-up locations for which you want to create or add a kiosk.
3. On the Walk-up Location Kiosks related list, select **New**.
4. On the Walk-up Location Kiosk form, fill in the fields.

Walk-up Location Kiosk

Field	Description
Name	Unique name of the kiosk.
Description	Details describing the services provided at the kiosk.
Active	Option to make the kiosk active for the location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Location queue	Location where you want to create a kiosk. The field is automatically populated with the current location. You can create the kiosk for another location by selecting different locations from the look-up list.

5. Select **Submit**.

Configure skill-based routing in Walk-up Experience

Route work items to assigned groups. Use skill-based routing to ensure that the right work goes to the right agent depending on the walk-up reasons.

Identify skills for a specific set of conditions defined for walk-up reasons. Use business rules to automatically add the skills to those types of work items. In the Walk-up Experience application, the work items get automatically assigned to the right agents based on the skills.

- When a new walk-up interaction is opened trough the check-in portal or booking an appointment, Advanced Work Assignment routes the interactions to agents who have the skill set required to address the reason for interaction.
- The administrators must activate **Skill determination for interaction** BR on interaction table for Advanced Work Assignment to route interactions based on the agent's skills.
- New interactions opened after the set up are routed to the available agent with the respective skills.
- If an agent is unavailable and the interaction does not need any mandatory skills, the walk-up task is routed based on the assignment rule associated with the location.

For more information, see Skills Management

Route walk-up tasks to skilled agents

Use business rules to automatically route walk-up tasks to the agents based on their skill set.

Before you begin

Set up metadata in **All Skills**, **Group Skills**, and **User Skills**tables before configuring walk-up locations for skill-based routing. For more information, Configuring Skills Management.

Role required: admin

Procedure

1. Navigate to **All** > **Walk-up Experience** > **Administration** > **Walk-up Locations**.
2. Select the location to add skills of the agents.
3. In the related list, select **Reasons for Visit**.
4. Select a reason to associate the skills.
5. On the **Walk-up Skills for Reasons** related list, select **New**.
6. On the form, fill in the fields.

Walk-up Skills

Fields	Description
Active	Option to make the skill active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Skill	Skill required for the selected walk-up reason.
Mandatory	Option to make the skill mandatory. If the skill is set as mandatory, the walk-up task will not be routed to any agent who does not have that particular skill.
Walk-up Reason	Reason for which a requester needs help.

7. Select **Submit**

Create or modify Walk-up Experience notifications

Create and use Walk-up Experience notifications to keep requesters informed of queue events that concern them. The system can notify users by email, SMS text message, or push notification to a mobile device.

Before you begin

Role required: sn_walkup.walkup_admin or admin

About this task

Walk-up Experience includes several base-system notifications that you can use or customize to notify walk-up requesters about specific information and interactions, including:

Walk-up Experience notifications

Notification	Description
Walk-up Abandoned	Notifies when a walk-up interaction is closed.
Walk-up Threshold Notification	Notifies visitors when they are close to being next in line for support.
Walk-up Assigned	Notifies when an interaction is assigned to a technician.
Walk-up Closed	Notifies when a walk-up location is closed.

Procedure

1. To view Walk-up Experience notifications, navigate to **Walk-up Experience** > **Administration** > **Notifications**.
2. Click an available walk-up notification to view basic properties, as well as information about when to send it, who will receive it, and what the notification will contain.
3. To modify a walk-up notification, edit any of the form fields.
4. To create a new walk-up email or push notification, click **New** and refer to Create an email notification or Create a push message .
   For complete information regarding using the System Notification application, refer to Notifications .

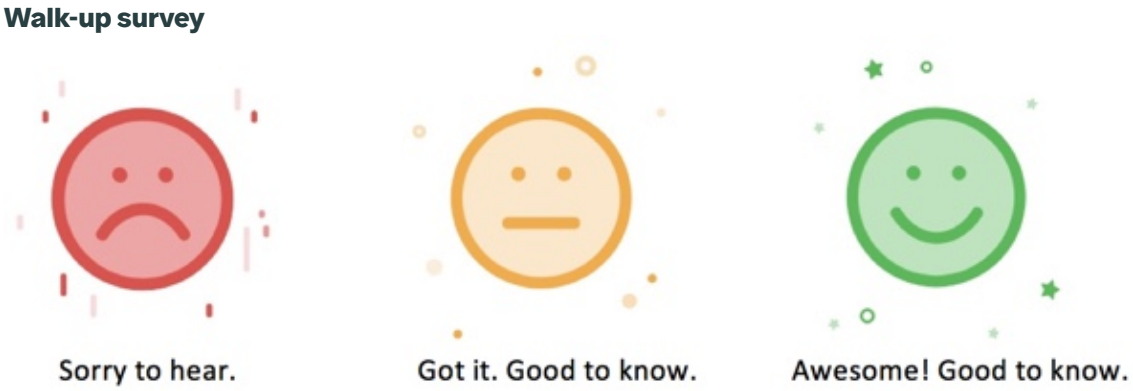
Configure Walk-up Experience customer satisfaction surveys

With Walk-up Experience surveys, requesters can rate their satisfaction with walk-up location interactions and provide feedback to improve the Walk-up Experience application.

Two base-system predefined Walk-up Experience surveys are provided:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Walk-up CSAT survey**: On-site one-click sentiment-analysis survey where the requester can quickly rate the service based on a 1 to 3 scale, where 1 is a negative experience and 3 is a positive experience. The survey uses an image scale of three faces with different sentiments (sad, neutral, and smiling).



- **Walk-up Experience Satisfaction Survey**: A survey link is sent via email when walk-up interactions are closed. It uses sentiment analysis for the overall experience, wait-time experience, agent experience, agent professionalism, and additional comments. This survey is based on a 1 to 5 numeric rating scale, where 1 is very unsatisfied and 5 is very satisfied.

Walk-up administrators and managers can modify these surveys and the associated trigger conditions. Managers and administrators can review responses by question and see a scorecard for each survey on the **Walk-up Experience Dashboard** module. Requester feedback is used to improve the performance of walk-up interactions.

For more information about working with surveys, sentiment analysis, trigger conditions, and survey questions, see Assessments and Surveys.

Create or modify a Walk-up Experience customer satisfaction survey

Improve your **Walk-up Experience** operations and customer service by using surveys and monitoring survey results. Walk-up surveys capture important information from users about the interaction experience provided to them at the venue.

Before you begin

Role required: sn_walkup.walkup_admin, sn_walkup.walkup_manager, or admin

About this task

Creating a new customer satisfaction survey requires that you first define a new survey and then use the Survey Designer to design, configure, and make it available to the requesters.

Procedure

1. To view and use a base-system predefined survey in the Walk-up Experience application, navigate to **Walk-up Experience** > **Administration** > **Surveys**.
2. To modify an existing walk-up survey, click the survey name, otherwise navigate to **Survey** > **View Surveys** and click **New** to define a new survey if none of the base-system surveys are optimal for your walk-up location.
3. To modify or complete the form, refer to Modify a survey definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Remove a Walk-up Experience location

If you permanently close down a physical Walk-up Experience location, you can also remove the location from the Walk-up Location Queues table.

Before you begin

Role required: sn_walkup.walkup_admin or admin

Procedure

1. Navigate to **All** > > **Administration** > **Walk-up Locations**.
2. Click the name of the walk-up location you want to remove to open the location queue record.
3. Click **Delete** in the form header.
   A confirmation pop-up appears ensuring you want to delete the record.
4. When the confirmation pop-up asks if you want to delete the record, click **Delete**.
   The Walk-up Experience location queue is removed from the application.

Integrate Microsoft Office 365 calendar with Walk-up Experience

With Microsoft Office 365 calendar integration, Walk-up Experience users can view appointments in their primary calendar. When they make an appointment, modify it, or cancel it, they are sent invites and updates via their Outlook calendar.

This feature is only available when Microsoft Office 365 Outlook is the hosted calendar service. Administrators enable the flows that execute the integration using Workflow Studio. Other prerequisites include:

- Microsoft Azure AD and the Microsoft Office 365 tenant exists and is configured.
- Associated connections and credentials are setup and tested.

Note:
These prerequisites are assumed already in place at your business.

Set up Microsoft Office 365 integration for Walk-up Experience

Enable Walk-up Experience Microsoft Office 365 calendar integration. When requesters make an appointment, modify it, or cancel it, the Outlook calendar is sent invites to an appointment and any updates.

Before you begin

Logging into the Microsoft Azure Portal (https://portal.azure.com) with your specific customer account is necessary. You will already have a tenant, as logging into the portal requires access to this tenant. For details about setting up a tenant, refer to Quickstart: Set up a tenant.

Also required is that you have a Microsoft Office 365 subscription linked to an existing tenant. For details regarding this, refer to Set up a Microsoft 365 developer subscription.

See the required permissions for Microsoft Azure client setup at Set up Microsoft Exchange Online spoke Set up Microsoft Exchange Online spoke.

Virtual Agent Academy: Get service faster with Virtual Agent and Walk-Up Experience (video from the Virtual Agent Academy)

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Confirm that the Walk-up Experience (com.snc.walkup), Microsoft Exchange Online Spoke (sn_ex_online_spke), and Microsoft Exchange Server Spoke (sn_exchange_spoke) plugins are activated on your instance.
2. Navigate to **System Oauth** > **Application Registry** > **Microsoft Exchange Online** to set up Oauth.
   a. Insert the client ID (Application ID), which you can get from the Microsoft Azure AD application.
   b. Insert the client secret, which you can get from the Microsoft Azure AD application.
   c. Copy and paste the following links to access authorization, token, and redirect:
      - Authorization url: https://login.microsoftonline.com/<tenant-ID>/oauth2/v2.0/authorize
      - Token url: https://login.microsoftonline.com/<tenant-ID>/oauth2/v2.0/token
      - Redirect url: https://<instance-name>.service-now.com/oauth_redirect.do
3. Navigate to **Connections & Credentials** > **Credentials** to set up credentials.
   a. Click **New**.
   b. Choose **OAuth 2.0 Credentials**.
   c. In the OAuth 2.0 Credentials new record provide a name for the Credential and in the **OAuth Entity Profile** form field, choose **Microsoft Exchange Online default_profile**.
   d. Click **Save**.
   e. Select **Get OAuth Token** in the Related Links section of the form.
   f. Sign in as a valid user on the Microsoft Exchange Tenant.
4. Navigate to **Connections and Credentials Aliases** to set up connection.
   a. Select **Microsoft Exchange Online**.
   b. In the **Connections** Related Links, click **New**.
   c. Name the connection `Exchange_Online_Connection` and choose the previously created credential in the **Credential** form field.
   d. In the Connection URL field, enter: `https://graph.microsoft.com`.
5. Navigate to **Flow Designer** to enable flows.
   a. Select **Create Walk-up Appointment Calendar Event**, open in Workflow Studio, and activate.
   b. Select **Update/Delete Walk-up Appointment Calendar Event**, open in Workflow Studio, and activate.
6. Schedule an appointment to confirm everything is working properly.
   a. Create a new test user in the system.
   Refer to Create a user for details.

   Note:
   Provide a user ID, first name, last name, password and email for the test user.

   b. Impersonate the test user in your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Navigate to **Self-Service** > **Service Portal** > **Walk-up Check-in** to schedule an appointment.

> **Note:**
> The **Walk-up Check-in** icon link must be configured to appear on the Service Portal landing page for you to see and click the link. Refer to Configure Walk-up Experience online check-in icon to appear on Service Portal if the link is not on the Service Portal landing page.

d. Schedule an appointment as the test user.

7. Verify everything is working correctly by navigating to **Flow Designer** > **Today's Executions**.
8. Click **Create Walk-up Appointment Calendar Event**.
9. Check the test user's corporate Microsoft Office 365 calendar to see the emailed calendar event.

> **Note:**
> It can take a minute or two before the calendar event is created. After you enable this feature, users automatically receive calendar invites, updates, and cancellations on their individual corporate calendars.

Register an application using the Microsoft Azure portal

Grant authorization to the ServiceNow instance by registering an application with Azure AD.

Before you begin

Role required: Azure Active Directory admin

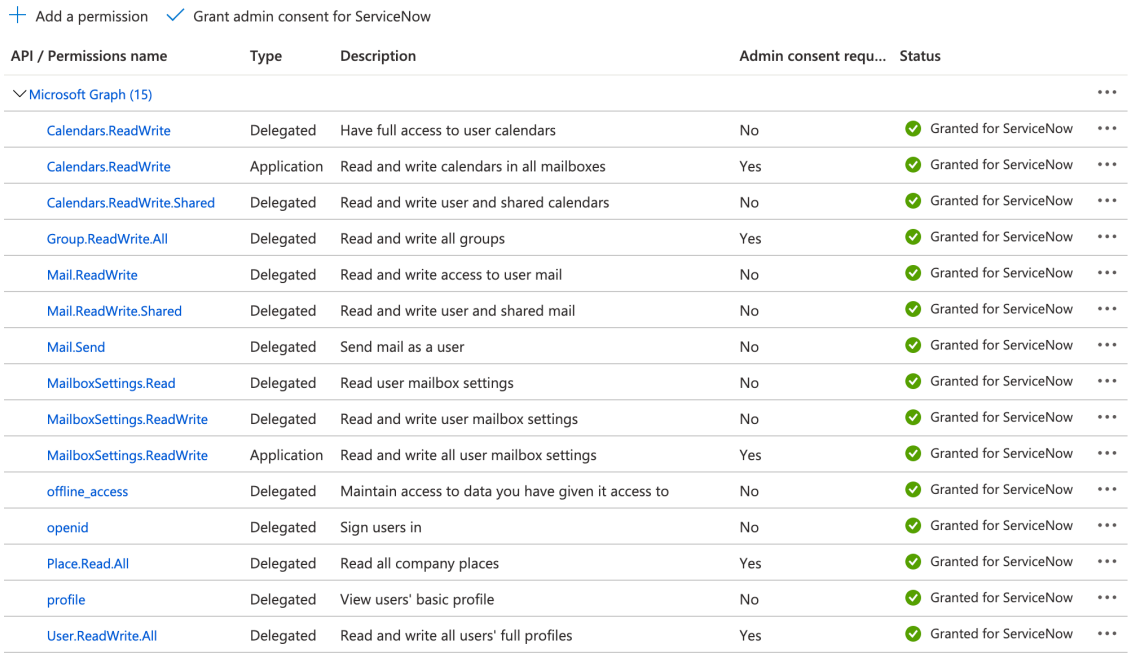
About this task

Complete these steps from the Microsoft Azure portal. For instructions on registering an application, see the Microsoft Azure documentation.

Procedure

1. In the Microsoft Azure portal, add the **Redirect URIs** in this format: `https://<instance-name>.service-now.com/oauth_redirect.do`
2. For the **Required Permissions**, select **Microsoft Graph**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



API / Permissions name	Type	Description	Admin consent requ...	Status
Microsoft Graph (15)				
Calendars.ReadWrite	Delegated	Have full access to user calendars	No	Granted for ServiceNow
Calendars.ReadWrite	Application	Read and write calendars in all mailboxes	Yes	Granted for ServiceNow
Calendars.ReadWrite.Shared	Delegated	Read and write user and shared calendars	No	Granted for ServiceNow
Group.ReadWrite.All	Delegated	Read and write all groups	Yes	Granted for ServiceNow
Mail.ReadWrite	Delegated	Read and write access to user mail	No	Granted for ServiceNow
Mail.ReadWrite.Shared	Delegated	Read and write user and shared mail	No	Granted for ServiceNow
Mail.Send	Delegated	Send mail as a user	No	Granted for ServiceNow
MailboxSettings.Read	Delegated	Read user mailbox settings	No	Granted for ServiceNow
MailboxSettings.ReadWrite	Delegated	Read and write user mailbox settings	No	Granted for ServiceNow
MailboxSettings.ReadWrite	Application	Read and write all user mailbox settings	Yes	Granted for ServiceNow
offline_access	Delegated	Maintain access to data you have given it access to	No	Granted for ServiceNow
openid	Delegated	Sign users in	No	Granted for ServiceNow
Place.Read.All	Delegated	Read all company places	Yes	Granted for ServiceNow
profile	Delegated	View users' basic profile	No	Granted for ServiceNow
User.ReadWrite.All	Delegated	Read and write all users' full profiles	Yes	Granted for ServiceNow

3. Record the **Client Secret** for use in later configurations.

Result
The ServiceNow application is created with Microsoft Azure AD.

Register Microsoft Exchange Online as the OAuth provider

Register Microsoft Exchange Online as the OAuth provider so that your Walk-up Experience instance can request OAuth 2.0 tokens.

Before you begin
Role required: admin

About this task
Use the information generated during the registration of the application in the Microsoft Azure portal.

Procedure
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Open the record **Microsoft Exchange Online**.
3. On the form, fill in the fields.

Application Registries form

Field	Description
Name	Name to identify the record. For example, `Microsoft Exchange Online`.
Client ID	Application ID created during application registration.
Client Secret	Client secret created during application registration.
OAuth API Script	Optional script to customize the request and response.
Logo URL	URL that contains an image to use as the application logo.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Default Grant Type	Grant type used to establish the token. Select **Authorization Code**.
Refresh Token Lifespan	Time, in seconds, that the refresh token is valid. The default time is 8,640,0000 seconds.
PKCE required	Option to enable public clients to require PKCE for an authorization. **Note:** You can use only **Authorization Code** as the **Default Grant type** when **PKCE** is enabled.
Application	Application scope that contains this record.
Accessible from	Application scope that this registry is accessible from.
Active	Option to use the application registry.
Authorization URL	OAuth authorization code endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/authorize`
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`
Token Revocation URL	OAuth server token revocation endpoint.
Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`
Use mutual authentication	Option to use mutual authentication for token request and revocation. This option requires a mutual authentication profile to be specified.
Send Credentials	Client credentials in the request.

4. Select and hold (or right-click) the form header, and click **Save**.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, `Microsoft Exchange Online default_profile`.
5. Navigate to **System OAuth** > **Application Registry**.
6. Open the record **Microsoft Exchange Online_clientCredentials**.
7. On the form, fill in the fields.

Application Registries form

Field	Description
Client ID	Application ID created during application registration.
Client Secret	Client secret created during application registration.
Default Grant Type	Grant type used to establish the token. Select **Client Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`
Redirect URL	OAuth callback endpoint. Enter `https://<instance-name>.service-now.com/oauth_redirect.do`

8. Right-click the form header, and click **Save**.
   A system-generated OAuth entity profile is created and displayed in the OAuth Entity Profiles related list. For example, `Microsoft Exchange Online_clientCredentials default_profile`.

Create credential records for the Microsoft Exchange Online spoke

Authorize the Microsoft Exchange Online spoke actions by creating credential records for the application registered in the Microsoft Azure portal. The Microsoft Exchange Online connection and credential alias uses these credentials to authorize actions.

Before you begin

Role required: admin.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message, `What type of Credentials would you like to create?`
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the record. For example, `Exchange_Online_Credentials`.
Active	Option to use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider with **Default Grant Type** as **Authorization Code**. For example, `Microsoft Exchange Online`.
Applies to	MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Order that the credentials are used. For example, enter `100`.

5. Right-click the form header and click **Save**.
6. To generate the OAuth token, click the **Get OAuth Token** related link.
7. Navigate to **Connections & Credentials** > **Credentials**.
8. Click **New**.
   The system displays the message, `What type of Credentials would you like to create?`
9. Select **OAuth 2.0 Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. On the form, fill in the fields.

OAuth 2.0 Credentials form

Field	Description
Name	Name to identify the record. For example, `Exchange_Online_Credentials_clientCred`.
Active	Option to use the credential record.
OAuth Entity Profile	OAuth profile created during the registration of Microsoft Exchange Online spoke as an OAuth provider with **Default Grant Type** as **Client Credentials**. For example, `Microsoft Exchange Online_clientCredentials default_profile`.
Applies to	MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Order that the credentials are used. For example, enter `100`.

11. Right-click the form header and click **Save**.
12. To generate the OAuth token, click the **Get OAuth Token** related link.

Result
The credential records for the Microsoft Exchange Online spoke are created.

Create connection records for the Microsoft Exchange Online spoke

Perform actions in Microsoft Exchange Online by creating connection records for your Microsoft Exchange Online account. The Microsoft Exchange Online spoke connection and credential alias uses these connections to perform actions.

Before you begin
Role required: admin.

Procedure
1. Navigate to **All** > **Connections & Credentials** > **Connection & Credential Aliases**.
2. Open the record, **Microsoft_Exchange_Online**.
3. In the Connections related list, click **New**.
4. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Exchange_Online_Connection`.
Credential	Credential record created for Microsoft Exchange Online. For example, `Exchange_Online_Credentials`.
Connection alias	Alias record associated with this connection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
URL builder	**Note:** Do not select the check box.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
Use MID server	Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

5. Click **Update**.
6. Navigate to **Connections & Credentials** > **Connection & Credential Aliases**.
7. Open the record, **Microsoft_Exchange_Online_clientCred**.
8. In the Connections related list, click **New**.
9. On the form, fill in the fields.

HTTP(s) Connection form

Field	Description
Name	Name to uniquely identify the record. For example, `Exchange_Online_Connection_clientCred`.
Credential	Credential record created for Microsoft Exchange Online. For example, `Exchange_Online_Credentials_clientCred`.
Connection alias	Alias record associated with this connection.
URL builder	**Note:** Do not select the check box.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
Use MID server	Option to use a MID Server. If the check box is selected, define the fields in the Advanced MID Server Configuration related list.
Active	Option to actively use the connection.
Domain	Domain that the action or activity runs in.

10. Click **Update**.

Result
The Microsoft Exchange Online spoke is set up and integrated with the Walk-up Experience instance.

© 2026 ServiceNow, Inc. All rights reserved.

Badge Reader Integration for Walk-up Experience

Improve Walk-up Experience user satisfaction by using the Badge Reader Integration application at your on-site walk-up queue locations. Walk-up Experience users can scan an employee badge to check in to a queue, rather than entering credentials.

Badge Reader Integration for Walk-up Experience on-site queue locations

Badge Reader Integration is a pre-built, domain-separated, base-system application. The application enables your Walk-up Experience users to simply scan an employee badge to join an on-site walk-up queue. Scanning a badge eliminates the need for users to look up a name or email to join a queue. Administrators can easily configure the badge scanning integration for use with Walk-up Experience.

By providing an enhanced, easier, and faster Walk-up Experience check-in process, the use of on-site walk-up location queues can increase and overall user satisfaction can improve. Users receive an on-screen confirmation and an audio alert after a successful check-in to a walk-up queue.

The Badge scanning integration requires activation of the Badge Reader Integration plugin (com.snc.badge_reader). The plugin enables applications, such as Walk-up Experience, to integrate with badge reader hardware. Badge Reader Integration administration requires the Badge Admin role (sn_badge.badge_admin).

Note:
Badge Reader Integration is not an authentication mechanism.

Walk-up Experience Badge Reader Integration components

The badge reader hardware and integration client are physically located at a walk-up queue location. The Badge Reader Integration application provides a generic, reusable REST API used by the badge integration clients. Walk-up Experience uses the Badge Reader Integration application as a soft dependency.

Walk-up Experience implementers install the badge reader hardware on a new computer at each on-site walk-up queue location. The hardware replaces any existing tablets used for on-site check-in.

The following are important associated components.

Associated components in badge reader

Component	Description
Badge number	Employee badge number.
Facility code	Unique facility or site code encoded into each card that identifies the organization.
Human Interface Device (HID)	Protocol for interfacing with user interface devices via USB.
Physical Access Control Services (PACS)	Method used to protect the security of a physical environment by setting authorization and authentication rules.
Badge reader client	Client for the badge reader. Acceptable platforms include macOS and Linux.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associated components in badge reader (continued)

Component	Description
Badge reader plugin	The Badge Reader Integration plugin (com.snc.badge_reader) is at no additional cost.

Badge Reader Integration modules

Badge admins can access several application modules.

Module	Description
Downloads	Badge Reader Integration client for download to your system.
Badge Readers	Configuration module for defining and activating your badge reader devices.
Badge Event Handlers	Configuration module for defining what action to take when a badge is scanned by a badge reader device. The script entered is the code executed when a badge is scanned. These records are typically delivered as part of the application-specific badge reader integrations.
User Badges	Configuration module for associating users with user badges. Configuration requires associating a sys_user with a unique badge number and facility code.
Badge Scan Logs	View-only module to monitor badge reader error events.
User Badge Configuration	Configuration module for defining the table from where the user ID and badge ID mapping information is retrieved.

Badge Reader Integration security

The Badge Reader Integration application is not an authentication mechanism. It provides a quicker, more convenient way for users to check into a walk-up queue. It is meant for use within the existing security perimeter at the facility. The application does not integrate with existing access control software at the facility.

Badge Scanner Integration scan logs

You can view the Badge Scanner Integration scan logs and fix the errors to connect to the badge reader. For more information, see View Badge Scanner Integration scan logs.

© 2026 ServiceNow, Inc. All rights reserved.

Activate Badge Reader Integration

You can activate the Badge Reader Integration plugin (com.snc.badge_reader) if you have the Badge sn_badge.badge_admin role.

Before you begin

Role required: sn_badge.badge_admin

About this task

The Badge Reader Integration application is a framework enabling other applications, such as Walk-up Experience, to integrate with badge reader hardware. Administrators configure and manage badge reader clients and integrations by linking badge scanners to walk-up locations and ensuring there is mapping between badge ID numbers and the reader.

Developers can extend the badge scanning framework to trigger actions in other applications based on a badge scan event. The Badge Reader Integration application does not require customization, but is customizable to respond to unique badge system hardware.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed with Badge Reader Integration

Several types of components are installed with activation of the Badge Reader Integration plugin, including tables and user roles.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
Badge admin [sn_badge.badge_admin]	Used to administer badge reader integrations.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table	Description
User Badge [sn_badge_user_badge]	Record used to configure a user badge, associating a user to a badge number and facility code.
Badge Event Handler [sn_badge_event_handler]	Record used to configure actions associated with a badge scan event. Stores an event handler script that can be mapped to a badge reader. Extends the Application File table.
Badge Scan Log [sn_badge_scan_log]	Record used to log all badge reader error events.
Badge Reader [sn_badge_badge_reader]	Record used to configure badge reader devices. Extends the Task table.

Walk-up Experience Badge Reader Integration setup and configuration

Badge Reader Integration set up and configuration enables your on-site Walk-up Experience users to scan a badge to quickly check into the queue.

The Walk-up Experience (com.snc.walkup) and Badge Reader Integration (com.snc.badge_reader) plugins must be activated before you set up and configure the integration. Refer to Activate Walk-up Experience and Activate Badge Reader Integration for details regarding activation.

Badge Reader Integration is automatically activated with Walk-up Experience via a conditional plugin.

Set up and configuration entails the following stages:

- Client software: Download the client executable file and install on your system.
- Badge reader device: Configure the badge reader device and register it manually or via an assisted process.
- Approval: Request and receiving device activation approval.
- Walk-up Experience application: Configure Walk-up Experience to integrate with a badge reader device.

Create or modify Badge Reader Integration event handlers

Configure actions associated with a badge scan event and define the code to execute when a badge is scanned.

Before you begin

Role required: sn_badge.badge_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Using the **Badge Event Handlers** module you can map badge event handlers to multiple badge readers. For example, you may have a badge reader at your San Diego, CA walk-up location and another badge reader at your Santa Clara, CA location. Both of these badge readers can be mapped to the same Walk-up Badge Reader event.

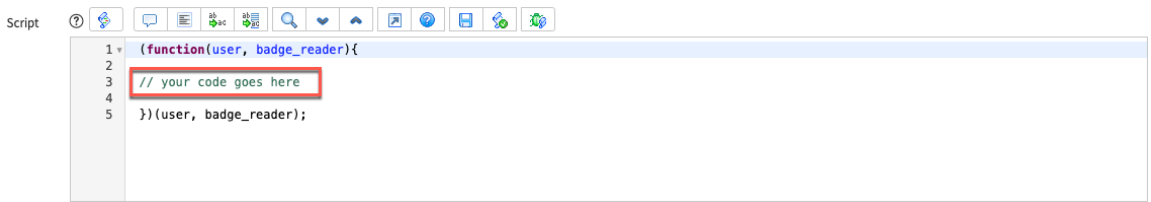
Badge Event Handler records are delivered as part of the Walk-up Experience application-specific badge reader integrations.

Note:

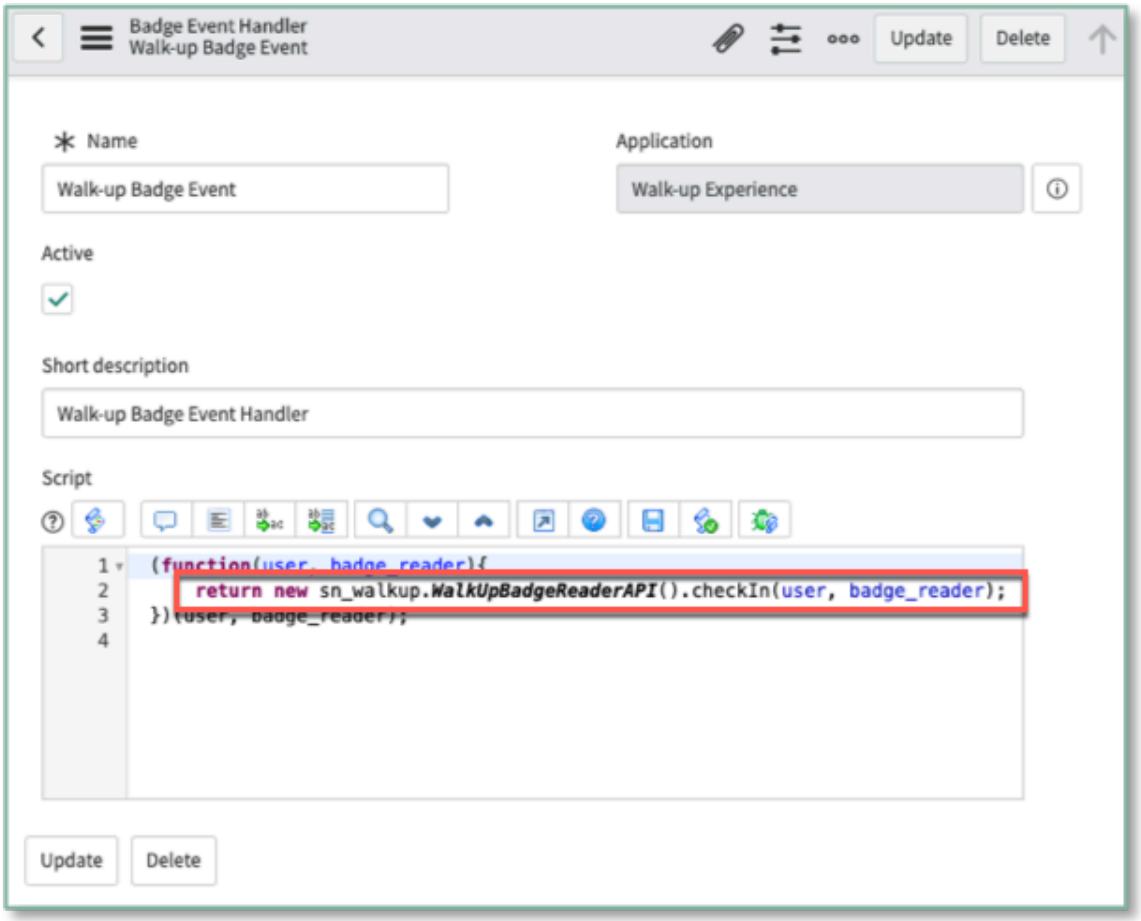
The code entered in the **Script** field of the Badge Event Handler form is executed using a GlideScopedEvaluator in the BadgeScanProcessor.

Procedure

1. Navigate to **All** > **Badge Reader Integration** > **Badge Event Handlers**.
   The Badge Event Handlers list appears and displays any existing badge event handlers.
2. To modify an existing badge event handler, click on the name.
   Otherwise, to create a new badge event handler, click **New**.
3. Enter a name for the badge event handler in the **Name** field.
   For example, `Walk-up Badge Event`.
4. Enter details in the **Short description** field, if desired.
5. Enter code after `// your code goes here` in the **Script** field.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
The **Application** field is set to **Global** until you enter the code specifying Walk-up Experience application in the **Script** field and save or submit the record.

6. Click **Submit** to create the record.

Define and register a badge reader device using the badge reader client

Use the Badge Reader Client to create a badge reader device for registration in your system. Registering your badge reader enables you to make it operational at your Walk-up Experience on-site queue.

Before you begin
Role required: sn_badge.badge_admin

About this task
There are two ways to register a badge reader device:

- Assisted method, through the **Badge Reader Client**. You must create your own custom badge reader client software to integrate with the badge reader.
- Manually, through the ServiceNow AI Platform®. Refer to Define and register a badge reader device manually for details on this procedure.

The **Badge Reader Client** assisted registration method creates an initial Badge Reader record. When a badge is scanned using the badge reader client, this method automatically populates the **Device Identifier** field in the record with the badge reader device serial number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatic population of the **Device Identifier** field saves you time from looking for the badge reader device serial number to add to the Badge Reader record.

To register your badge reader device with **Badge Reader Client** assistance, first you need to configure system properties to enable badge scan registration and disable the badge access token. The following System Properties must be configured:

- **sn_badge.enable_scan_registration**: Disabled by default. When set to **True**, this property enables n_badge.badge_admins to quickly register badge reader devices by scanning a badge.
- **sn_badge.disable_access_token**: Enabled by default. This property disables the access token requirement for the Badge Reader Integration API.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search by **Name** for the properties by typing `sn_badge`.
3. Click **sn_badge.enable_scan_registration** to open the system property record.
   The property is set to **False** by default.
4. Change the property **Value** field to **True** and click **Update**.
5. Click **sn_badge.disable_access_token** to open the system property record.
   The property is set to **False** by default.
6. Change the property **Value** field to **True** and click **Update**.
7. Create and then run your own badge reader client.
8. Swipe the badge admin's badge on the badge reader to register.
9. The badge reader client performs a REST API call to api/sn_badge/v1/reader/scan with the device identifier and the card data.
10. Navigate to **Badge Reader Integration** > **Badge Readers** to view the newly created record.
11. Provide a name for the badge reader in the **Name** field.
    For example, `Building B Tech Lounge Badge Reader`.

    Note:
    The **Status** field is read only and indicates **New** when configuring a new badge reader. The field indicates **Activated** when a badge reader is approved for activation. If a badge reader is deactivated, the field indicates **Deactivated**.

12. Specify a **Badge Event Handler** using the search list icon.

    Note:
    If no badge event handlers are available to select, create a new Badge Event Handler record. For details about this process, refer to Create or modify Badge Reader Integration event handlers.

13. Verify that the **Device Identifier** and **Secret Key** fields are populated.
    The Device Identifier uniquely identifies the badge reader hardware. The client defaults to using the badge reader device serial number. The value entered must match the device serial number received from the client software application.
14. Populate the non-mandatory **Short description** and **Location** form fields if desired.
15. Select **Submit** to register the badge reader.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define and register a badge reader device manually

Manually create a badge reader device for registration in your system. Registering your badge reader enables you to make it operational at your Walk-up Experience on-site queue.

Before you begin

Role required: sn_badge.badge_admin

About this task

There are two ways to define and register a badge reader device:

- Manually through the ServiceNow AI Platform®.
- As an assisted method through the **Badge Reader Client**. Refer to Define and register a badge reader device using the badge reader client for details on this procedure.

Procedure

1. To manually register your badge reader device, navigate to **Badge Reader Integration** > **Badge Readers**.
2. Click **New**.
3. In the **Name** field, specify a name for the badge reader.
   For example, `Building B Tech Lounge Badge Reader`.

   Note:
   The **Status** field is read-only. This field is set to New when configuring a new badge reader. The field is in the Activated state when a badge reader is approved for activation. If a badge reader is deactivated, the field is set to Deactivated.

4. Select a **Badge Event Handler**.

   Note:
   If no badge event handlers are available to select, create a new Badge Event Handler record. For details about this process, refer to Create or modify Badge Reader Integration event handlers.

5. Specify the **Device Identifier**.
   The Device Identifier uniquely identifies the badge reader hardware. The client defaults to using the badge reader device serial number. The value entered must match the device serial number received from the client software application.

   Note:
   The **Secret Key** field is automatically populated when you create the badge reader record.

6. Select **User Badge Configuration**.
   The badge reader uses this mapping configuration to retrieve the user ID from the badge ID when the requester scans their badge to check in to a location.

   Note:
   By default, a user badge configuration is available to select. For more information on defining a new user badge configuration, see Define a user badge configuration.

7. **Optional:** Specify the non-mandatory **Short description** and **Location** form fields if desired.
8. Register the badge reader by selecting **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define a user badge configuration

Define the table from where the user ID and Badge ID mapping information is retrieved.

Before you begin

Role required: badge_admin

About this task

The user ID and badge ID mapping configuration is used to retrieve the user ID of the user from the badge ID when requesters scan their badges to the badge reader for check-in into a location. You can define multiple configurations for mapping.

Procedure

1. Navigate to **All** > **Badge Reader Integration** > **User Badge Configuration**.
2. Click **New**.
3. On the form, fill in the fields.

User Badge Configuration form

Field	Description
Name	Name of the configuration.
Table Name	The table that has the mapping information on the user ID and badge ID. Select this table from the list.
User Field	User ID of the requester.
Badge Field	The entity to which the user badge is linked. Select this entity from the list.
Facility Code Field	Unique facility or site code that is encoded into each card. The code identifies the organization.
Active	Option to activate the configuration. This option is selected by default.

4. Click **Submit**.

Result

The mapping configuration is created. You can select this mapping configuration in the Badge Reader form to retrieve the user ID from the badge ID based on this mapping configuration.

Request activation approval for a badge reader device

Request activation approval for your badge reader device. Badge Reader Integration will not trigger event handlers until the badge reader is activated. Badge reader device approval and activation is granted by users with the itil role.

Before you begin

Role required: sn_badge.badge_admin

About this task

When you request activation approval, via the Badge Reader record, you initiate the device registration workflow. Activation requests are routed to a badge reader approvers group. System approvals require the itil role. Ensure users with the itil role are added to the badge reader approvers group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If there are no people in the approval group, the workflow will skip past the approval group requirement, and activate the badge reader. For detailed information about approvals, groups, and adding users to groups, refer to Approvals Creating groups and Add a user to a group.

Note:
Badge Reader record required fields are read only when the badge reader device is activated. Badge reader devices can be deactivated by de-selecting the **Active** field on the Badge Reader record. Reactivation of a badge reader requires going through the approval process again.

Procedure

1. Navigate to **All** > **Badge Reader Integration** > **Badge Readers**.
2. Select the name of the badge reader you want to activate.
   The Badge Reader record opens.
3. Ensure that all mandatory form fields are populated.
   The fields included are the **Name**, **Badge Event Handler**, **Device Identifier**, and **Secret Key** fields. See Define and register a badge reader device using the badge reader client or Define and register a badge reader device manually for information regarding populating Badge Reader form fields.
4. Select **Request Activation** to initiate the activation approval workflow.
   The request is approved by a user with the itil role in the badge reader approvers group. If there is no badge reader approvers group or the group is empty, then the badge reader is activated when a user with the sn_badge.badge_admin role requests activation.

Configure Walk-up Experience for Badge Reader Integration

Associate badge reader devices with an on-site Walk-up Experience queue. While you can associate more than one badge reader device to a walk-up location, individual badge reader devices are mapped to only one walk-up location.

Before you begin
Role required: sn_walkup.walkup_manager

About this task

- The Walk-up Experience application requires that a badge reader device is mapped to a walk-up location for feature integration.
- Walk-up Experience managers can configure badge reader integration to a walk-up location using the Location Queues Badge Readers related list on the Walk-up Location Queue (wu_location_queue) table.
- At least one badge reader must be activated and available to integrate with the walk-up location. Refer to Request activation approval for a badge reader device if no badge readers are activated for use.
- You can define a check-in reason for each badge reader. When the requester checks in a location using that badge reader, the associated check-in reason is auto populated for the check-in. If no check-in reason is associated with the badge reader, then the location reason is considered for the check-in.

Procedure

1. Navigate to **All** > **Walk-up Experience** > **Administration** > **Walk-up Locations**.
2. Click the name of the walk-up location queue that you want to associate with a badge reader device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the **Location Queues Badge Readers** related link.
4. Click **New**.
5. On the form, fill in the fields.

Location Queues Badge Readers form

Field	Description
Badge Reader	Badge reader that you want to associate with the location.
Location Queue	Location to which the badge reader is associated.
Check-in reason	Check-in reason that you want to link with the badge reader.
Check-in reason description	Description of the check-in reason that you want to link with the badge reader.

6. Select **Submit**.

Result

You can integrate multiple badge readers with walk-up location.

Customize badge Reader Integration

Badge Reader Integration includes several scripted extension points for you to customize script includes installed with the feature.

The underlying Badge Reader Integration script includes are read only. Customers who want to modify the look and feel of the feature can alter several script includes using scripted extension points.

Various scenarios exist whereby the ability to modify script-includes code is beneficial. For example, if you already use a data model to store your badge numbers, you may not want to use the Badge Reader Integration application User Badge (sn_badge_user_badge) table to store your badge numbers. Instead, you can create an extension implementation for `sn_badge.BadgeReader` that supports your data model.

Perhaps you want to customize the types of data you receive from a badge scan or how you want to parse that data. You can create an extension implementation for `sn_badge.BadgeReaderParser` that supports your data model.

The following code is available for alteration using scripted extension points with the Badge Reader Integration application:

Scripted Extension Points	Description
BadgeReader API name: `sn_badge.BadgeReader`	Extension point used by the BadgeReaderImpl script includes. Use this script to find a badge reader by its device identifier.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scripted Extension Points	Description
BadgeReaderParser API name: `sn_badge.BadgeReaderParser`	Extension point used by the BadgeReaderParserImpl script include. Use this to parse the card data string from the API.
BadgeReaderUser API name: `sn_badge.BadgeReaderUser`	Extension point used by the BadgeReaderUserImpl script include. Use this script to find a sys_user from a badge number and facility code. **Note:** If you already have a data model for storing your badge numbers, this is the script to use to override the Badge Reader Integration application code to support your data model.
BadgeReaderScanProcessor API name: `sn_badge.BadgeReaderScanProcessor`	Extension point used by the BadgeReaderScanProcessor script include. Use this frontage to manage the badge scan event.

For complete details about scripted extension points and how to create and use them, refer to Using extension points to extend application functionality and Creating and adding a scripted extension point.

Enable Self-Service online check-in for Walk-up Experience

Show or hide the Walk-up Experience online **Walk-up Check-in** module under **Self-Service** in the application navigator. You can enable or disable the module using the basic platform menu or module enablement process.

Before you begin

Role required: sn_walkup.walkup_admin or admin

About this task

The Walk-up Experience online **Walk-up Check-in** module is disabled (hidden) by default and does not appear under the **Self-Service** menu until enabled.

Procedure

1. Navigate to **All** > **System Definition** > **Application Menus**.
2. Click **All** in the conditions breadcrumbs to display both active and inactive application menus. This action removes the default filter condition.
3. Search by **Title** for the **Self-Service** application menu.
   Search yields the itil_self_service and mobile_self_service menu applications. You can enable (show) the **Walk-up Check-in** module for each menu application.
4. Click the **Self-Service** menu application with the **Name: itil_self_service**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The application menu Self-Service record opens and the Modules related list shows the modules that appear in the application navigator.

5. Search by **Title** for the **Walk-up Check-in** module.
6. Click **Walk-up Check-in**.
   The **Walk-up Check-in** module record opens.
7. In the **Visibility** tab, click **Active** to enable the **Walk-up Check-in** module.
   Active is **true** for the module. Alternatively, you can enable the module from the **Applications Menus Self-Service** Modules related list:
   a. Double-click the **Active** field beside the **Walk-up Check-in** module name in the Modules related list.
   b. Set **Active** to **true** (show) or **false** (hide).
8. Click **Update**.
   When you change application menus or modules, the application navigator automatically refreshes to display the changes.
9. To enable the **Walk-up Check-in** module to display under **Self-Service** on the mobile application, click **Walk-up Check-in** in the Mobile Modules related list.
10. Click the **Active** field to enable the module for mobile devices.
11. Click **Update**.

Configure Walk-up Experience online check-in icon to appear on Service Portal

Requesters can check into a walk-up location online via the Service Portal. You can edit the Service Portal Home page to replace the general IT **Get Help** support icon link with the Walk-up Experience online check-in support icon link.

Before you begin

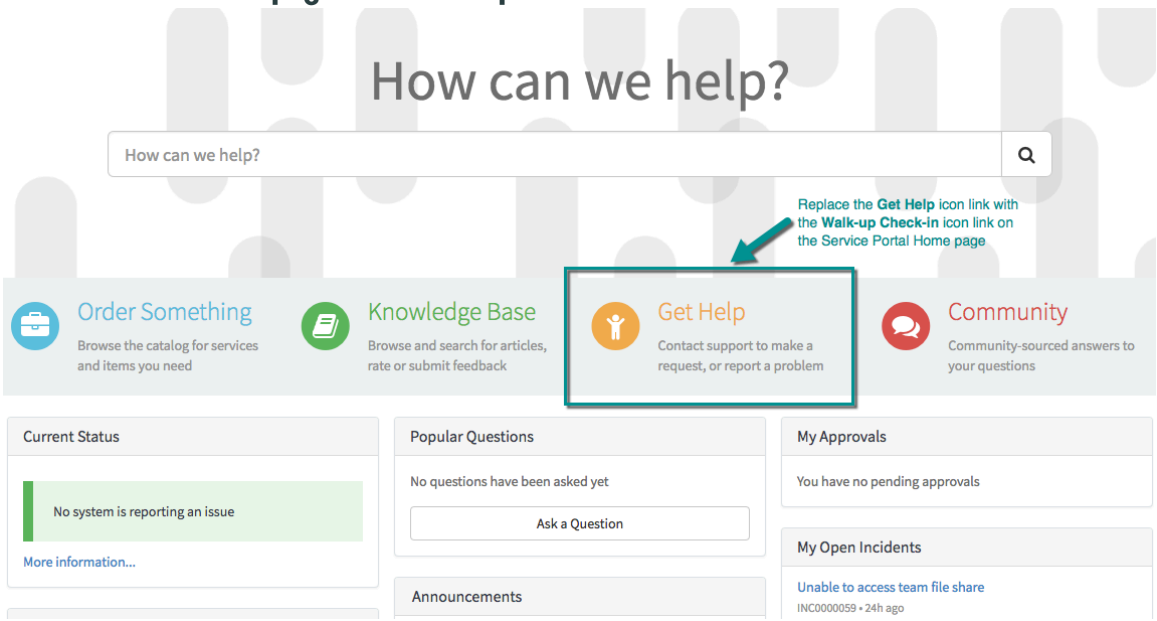
Service Portal for Enterprise Service Management (com.glide.service-portal.esm) must be activated.
Role required: sp_admin or admin

About this task

To replace the Get Help icon link with the Walk-up Check-in icon link on the Service Portal Home page, access Service Portal Designer. Alternatively, you can add a new container to the Service Portal for the Walk-up Check-in icon link, so that the Get Help icon link remains.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Portal Home page with Get Help icon link



Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Configuration**.
2. Click the **Designer** tile on the configuration page.
3. Select the **Service Portal** index page to edit.
4. Ensure you are in edit mode by verifying that **Edit** is highlighted as active in the Service Portal Designer banner.
   In edit mode, you can add a new container for the Walk-up Check-in icon link or edit an existing container, depending on where you want to place the icon link.
5. To edit an existing container, select the **Get Help** icon link container.
6. Click the edit icon in the upper right corner.
7. Edit the form fields with the following data and presentation details.

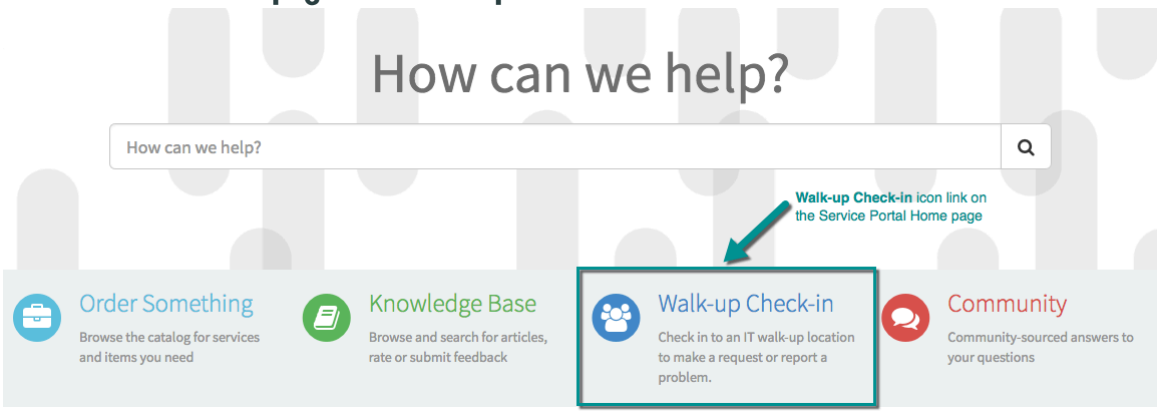
Fields	Configuration input
Data	
Type	Select **Page** to embed the walkup_online_checkin page with widget on the icon link.
Page	Select **walkup_online checkin**.
Presentation	
Title	Enter `Walk-up Check-in`.
Short description	Enter details about the icon link, that you want displayed, such as `Check in to an IT walk-up location to make a request or report a problem.`
Bootstrap color	Select **Default**.
Bootstrap class name	Enter a class name or leave this field empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Configuration input
Glyph	Select a glyph or you can select the empty glyph to bypass this field.
Template	Select **Circle Icon**.

8. Click **Save**.
   The Service Portal Home page opens in edit mode. The online Walk-up Check-in icon link with your selected glyph image and description displays in place of the former **Get Help** icon link.

Service Portal Home page with Walk-up Check-in icon link



9. Navigate to **Service Portal** > **Service Portal Home** to verify and test the newly created Walk-up Check-in icon link.
10. To add the Walk-up Check-in icon link to a new container, refer to Create and edit a page using the Service Portal Designer.
11. Edit the container form fields with the same data and presentation information as detailed above in the form configuration input descriptions and follow the remaining relevant steps.

Plan your walk-up experience visit with Employee Center

Schedule a single or multiple appointments to visit the walk-up lounge or the support lounge Walk-up Experience Employee Center. You can also get remote help.

Before you begin
Role required: itil

About this task
Employee Center portal enables users to easily scale their service solutions across departments, such as IT, HR, Workplace, Legal, and Procurement with digital workflows. This unified portal goes beyond the basic service delivery to provide a platform for communications, engagement, and content experiences. For more information, see Employee Center.

- Use Employee Center to schedule a walk-up appointment to get help, such as to request for new hardware, update software, or upgrade your system.
- You can make an appointment, request for the next open appointment, or see your upcoming appointments.

Procedure

1. Launch the Employee Center service portal in your browser.
2. On the portal home page, select the **IT** topic from the mega menu..

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the link **Walk-up: Plan your visit**.
   Alternatively, select **Walk-up visits** under the My active items widget.
4. On the walk-up check-in page, either join the queue or schedule an appointment for the future.
5. Select the **Schedule an appointment** tab.
6. Select a reason for your visit.
7. Click the calendar icon ( ) and select an available time slot.
8. Select the type of appointment.

   Note:
   You can choose the type of appointment only if the location accepts both, in-person and remote appointments.

9. Select **Schedule appointment**.

   Note:

   You can also schedule multiple appointments based on the selected location. When you reach the maximum appointment booking limit, a message is displayed.

Result
A success message is displayed. The details of the appointment are displayed under the **Your upcoming appointments** section.

You can also see your upcoming appointments under the My active items widget on Employee Center home page.

Manage Walk-up Experience queue and interaction

Walk-up Experience managers and agents can efficiently manage all aspects of a walk-up location queue and interactions. Agents can view assigned walk-up locations, interactions, and associated stockrooms used for fulfilling the walk-up requests.

Walk-up Experience helps the agents to organize and manage walk-up queues.

Agents primarily access Agent Workspace to manage requests. Using Agent Workspace the agents can do the following activities.

- Access personal inbox to view work assigned from multiple service channels, including the Walk-up Service Channel.
- Get assignments automatically pushed to the inbox from the walk-up interaction queue.
- Work on concurrent or multiple interactions at the same time.
- Promote interactions to incidents or requests.
- Work with any requester in the queue at any time by pulling from anywhere in the queue list, as well as from the top of the list.
- Use Agent Assist to expedite fulfillment.

With Agent Workspace, the agents can fulfill interactions on a first-come-first-served basis as interactions are pushed to individual walk-up inboxes. Interactions are distributed to walk-up agent inboxes based on assignment rule configurations in the Advanced Work Assignment feature.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The agents can directly open incidents in Agent Workspace when an issue is not resolved at the walk-up location. Agents can also directly create a request for hardware or software through the Service Catalog when an asset is not available at the walk-up location stockroom.

Walk-up Experience also includes **Agent** module in the application navigator where agents supporting a walk-up location can perform the following actions.

- Access personal walk-up inbox linking directly to Agent Workspace.
- View assigned walk-up interactions.
- Reassign and modify walk-up interactions when necessary.
- View all scheduled and upcoming appointments.
- View walk-up queue locations.
- View available assets and fulfill requests from a local stockroom.
- Create incidents and requests when necessary.
- Transfer walk-up interactions to other agents or queue locations when necessary.

The following applications are included in the **Agent** module of the Walk-up Experience navigation bar as well as viewed in the Agent Workspace Walk-up Experience interface:

Walk-up Experience Agent applications

UI view and application	Description
Platform: **My Walk-up Inbox** Agent Workspace: **Inbox**	Walk-up interactions assigned to you in on Agent Workspace. Interactions are pushed to your inbox according to assignment rule configurations in the Advanced Work Assignment feature.
Platform: **My Walk-up Stockrooms** Agent Workspace: **My Stockrooms**	Stockrooms and assets associated with the walk-up queue locations you support.
Platform: **My Walk-up Locations** Agent Workspace: **Walk-up Locations**	Walk-up locations that you are assigned to.
Platform and Agent Workspace: **My Assigned Walk-ups**	Walk-up interactions you are assigned to resolve or fulfill. These interactions have a **Work in Progress** state.
Platform and Agent Workspace: **Open - Unassigned**	List of all open and unassigned walk-up interactions for your locations. These interactions have either a **New**, **Queued**, or **Work in Progress** state.

Walk-up Experience Agent applications (continued)

UI view and application	Description
Platform and Agent Workspace: **Closed Walk-ups**	All closed walk-up interactions. Closed interactions have either a **Closed Complete** or **Closed Abandoned** state.
Platform: **Scheduled Appointments** Agent Workspace: **Appointments**	All upcoming appointments scheduled for your walk-up location.

For more information, see Service Operations Workspace and Advanced Work Assignment.

View Walk-up Experience inbox

View a personal inbox of automatically assigned Walk-up Experience interactions using the Agent Workspace feature interface.

Before you begin

Role required: sn_walkup.walkup_technician

About this task

There are two ways the agents can view the walk-up inbox. The agents primarily access Agent Workspace for all Walk-up Experience related information, including the inbox. However the agents can also access Walk-up Experience in the application navigator, or left navigation bar, to link to and view the inbox in Agent Workspace.

Procedure

1. To view the walk-up inbox using Agent Workspace, navigate to **Workspace Experience** > **Agent Workspace Home**.
   The Agent Workspace homepage opens, greeting you with your name.
2. Click **Inbox** in the left navigation bar of the interface.
   Automatically pushed interaction assignments appear in the inbox based on agent schedules and assignment rule configurations in the Advanced Work Assignment feature. The agents can set an inbox status of **Available**, **Away**, and **Offline**.
3. Alternatively, to view the walk-up inbox via the application navigator, navigate to **Walk-up Experience** > **Technician** > **My Walk-up Inbox**.
   You are linked directly to your personal inbox in Agent Workspace. Automatically pushed interaction assignments appear in the inbox based on agent schedules and assignment rule configurations in the Advanced Work Assignment feature.

Manage automatically assigned Walk-up Experience interactions

View assigned Walk-up Experience locations

Walk-up Experience agents can view a list of the walk-up queues they are assigned to support. Locations queues reveal all the information an agent needs to know to operate the queue efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_walkup.walkup_technician

About this task
The agents can view associated walk-up location stockrooms in following ways:

- Through Agent Workspace
- Through navigation menu.

Procedure
1. Navigate to **All** > **Workspace Experience** > **Agent Workspace Home**.
2. Select the **List** icon from the navigation menu.
3. Under **Walk-up**, select **Walk-up Locations**.
4. Select a queue name to view details about the location, such as, interactions, appointments, reasons for visits, and more.
5. Alternatively, to view walk-up locations through navigation menu, navigate to **Walk-up Experience** > **Agent** > **My Walk-up Locations**.
6. Select a location from the list to see the details such as, interactions, appointments, and reasons for visits.
   If there are any pending interactions with no associated guests at the queue, select **Abandon All** to cancel these interactions.

Manage automatically assigned Walk-up Experience interactions

The agents supporting Walk-up Experience locations can view and manage interactions automatically pushed to the Agent Workspace inbox.

Before you begin
Role required: sn_walkup.walkup_technician

About this task
Walk-up Experience interactions can be automatically pushed to a personal inbox in Agent Workspace based on agent schedules and assignment rule configurations in the Advanced Work Assignment feature. The agents fulfill interactions on a first-come-first-served basis as they appear in the inbox.

To manually assign and manage interactions using the Walk-up Experience Agent modules found in the application navigator, refer to Manage Walk-up Experience interactions manually.

The Agents set a status in the Agent Workspace inbox to indicate readiness to accept interactions. Status choices are **Available**, **Away**, and **Offline**.

Even though interactions are automatically pushed to the walk-up inbox, agents can work with anyone in the walk-up queue at any time.

View walk-up queue interactions assigned to you automatically in your walk-up inbox or in your **My Assigned Walk-ups** list. You can also view all **Open - Unassigned** interactions for the queue you support.

With Agent Workspace you can view lists of all your related walk-up interactions and appointments, your cases, requester accounts and contacts, incidents, requests, and more using one convenient interface. The Walk-up Experience related interaction list includes the following items:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Walk-up Experience related interaction list

List item	Description
My Assigned Walk-ups	Interactions you assign to yourself when you accept an active interaction or that are assigned to you. Agents assign interactions to themselves when they accept a queued interaction. Managers can assign interactions to specific agents. These interactions are in a Work in Progress state. Once assigned, an agent can transfer the interaction to another agent or queue to complete the work, if necessary.
Open — Unassigned	All open but unassigned interactions associated with your specific walk-up queue location. When a requester checks into a walk-up queue, an interaction is created. The interaction is Queued until an agent accepts it or is assigned the interaction. At that point, the state changes to Work in Progress.
Closed Walk-ups	All Closed Complete and Closed Abandoned interactions assigned to a specific walk-up location queue. Agents can abandon an interaction when a guest leaves the queue before receiving support.

Procedure

1. To begin supporting a walk-up queue requester, navigate to > **Workspace Experience** > **Agent Workspace Home**.
   The Agent Workspace homepage opens, greeting you with your name.
2. Click **Inbox** and ensure your status is set to **Available**.
   View interactions in your inbox automatically pushed to you.
3. Select the interaction at the top of the list and begin resolving the issue or fulfilling the request.

   When you create an associated incident or request through the Service Catalog, a **New Incident** tab or a **New Catalog Item** tab opens next to the **Details** tab of the original interaction. Fill out the new incident form or order assets. Click **Save** to save the new incident or complete the order confirmation. You receive a Request Number for your ordered item.

   a. If an interaction requires an unusual amount of time to resolve or if the closure depends on resources not readily available, you can place the interaction on hold.
   The requester does not lose position in the queue and you can help another requester simultaneously. Placing an interaction on hold does not affect your capacity for new interactions. To put an interaction on hold, click the **Put on Hold** button.

   b. You can associate the interaction with another record by selecting **Associate Record** from the more UI actions icon ooo in the interaction header.

   c. To view the walk-up location stockroom for fulfillment requests, click **List** in the left navigation panel of the Agent Workspace interface, then click **My Stockrooms**.

   d. If you cannot resolve an issue, click the **Create Incident** button in the interaction header.
   If you cannot fulfill a request from the stockroom, click the more UI actions icon ooo in the interaction header to view more actions. Select **Create Request** from the list to access the Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. When you are finished resolving the interaction, select the **Close** button in the interaction header.
   Closing an interaction affects your capacity because a new interaction will be pushed to your inbox.

Manage Walk-up Experience interactions manually

Agents supporting walk-up locations can manually manage queue requests with several Walk-up Experience interaction-related modules.

Before you begin

Role required: sn_walkup.walkup_technician

About this task

Manage interactions manually using the Walk-up Experience Technician modules found in the application navigator. To manage automatically assigned interactions from the Agent Workspace inbox, refer to Manage automatically assigned Walk-up Experience interactions.

Walk-up queues support requesters in the order that they check into the queue — first come, first served. The agents supporting the queue can decide who will work on the first interaction. As new requesters enter the queue and submit interactions, technicians share the workload, assigning queued interactions to themselves.

Certain requesters are considered VIPs. The system recognizes this when they check into the queue. An interaction for a VIP shows **true** for **VIP** in the Interactions list. The agents can move VIP requesters to the front of the queue by assisting them first.

Note:

Creating walk-up type interactions manually is not supported. A walk-up interaction is considered valid for check-in or appointment only if created via the check-in or appointment booking interfaces, and not via a table. Agents cannot check-in to a walk-up location on behalf of an end-user.

View walk-up queue interactions using several Walk-up Experience modules:

Walk-up Experience interaction modules

Module	Description
My Assigned Walk-ups	Interactions you assign to yourself when you accept an active interaction or that are assigned to you. Agents assign interactions to themselves when they accept a queued interaction. Managers can assign interactions to specific agents. These interactions are in a Work in Progress state. Once assigned, an agent can transfer the interaction to another agent or queue to complete the work, if necessary.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Walk-up Experience interaction modules (continued)

Module	Description
Open — Unassigned	All open but unassigned interactions associated with your specific walk-up queue location. When a requester checks into a walk-up queue, an interaction is created. The interaction is Queued until an agent accepts it or is assigned the interaction. At that point, the state changes to Work in Progress.
Closed Walk-ups	All Closed Complete and Closed Abandoned interactions assigned to a specific walk-up location queue. Agents can abandon an interaction when a requester leaves the queue before receiving support.

Procedure

1. Navigate to > **Walk-up Experience** > > **Agent** > **Opened - Unassigned**.
2. Find the requester name under the **Opened for** column of the Interactions list.
3. Click the interaction **Number** associated with the requester.
4. Enter your name in the **Assigned to** field on the form, change the **State** to **Work in Progress**, and select **Update**.
   a. To close an interaction if the requester has left the queue, click **Abandon** in the form header or choose **Closed Abandoned** from the **State** form field and click **Update**
   b. Alternatively, you can associate the interaction with another record by clicking the **Associate Record** button in the interaction header.
5. To resolve the interaction, navigate to **Walk-up Experience** > **Agent** > **My Assigned Walk-ups**.
6. Click the interaction number from the list to open the Walk-up Interaction form.
7. Resolve the issue or fulfill the request.
   a. Change the interaction status to **On Hold** if the requester is not present for an appointment or if the interaction entails a lengthy process, for example, an OS upgrade.
   b. To view the walk-up location stockroom for fulfillment requests, click the **Stockroom Consumables** related link.
   c. If you cannot resolve the issue or fulfill the request, click either the **Create Incident** or **Create Request** related link to create an incident or access the Service Catalog.

   When you create an associated incident or request through the Service Catalog, the associated related lists on the form populate accordingly. Related lists include the following details:
   - Incidents for Interaction: Incidents associated with the interaction
   - Requests for Interaction: Service Catalog requests associated with the interaction
   - Incidents by Same Caller: Incidents created for a walk-up requester
   - Requests by Same Caller: Requests created for a walk-up requester
8. Set the interaction **State** to **Closed Complete** and select **Update** to update the interaction, when you are finished resolving the interaction.
   Alternatively, you can click **Close** to complete the interaction.

View Walk-up Experience location stockroom and assets

Agent supporting Walk-up Experience locations can view and access stockrooms to provide commonly requested hardware and software assets for walk-up queue guests. Stockroom inventory is defined by asset and inventory managers. Walk-up location agents can monitor inventory and alert asset and inventory managers when additional consumables are needed.

Before you begin

Role required: sn_walkup.walkup_technician

About this task

The agents can view associated walk-up location stockrooms in following ways:

- Through Agent Workspace
- Through navigation menu.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Agent Workspace Home**.
2. Alternatively, to view walk-up locations through the application navigator, navigate to **All** > **Walk-up Experience** > **Agent** > **My Walk-up Stockrooms**.
3. From the navigation list, select **List**.
4. Under **Walk-up**, select **My Stockrooms**.
5. Select the name of your stockroom to view details such as the physical address, the group assigned to the stockroom, and the available assets (hardware, consumables, and software licenses).
6. Select any of the list tabs to see the available inventory.
   For example, you can select **Consumables** to see a list of all available consumables. The inventory list tabs include the following.

Option	Description
Hardware	Cables, connectors, batteries, and more.
Consumables	Computer monitors, video equipment, com puter mouse, and more.
Software Licenses	Available software programs and tools.
Other Assets	Miscellaneous other assets.

7. Select the name of an available consumable to see the details about the asset, such as quantity, cost, and expense information.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When a walk-up queue requester requests a consumable, such as a computer monitor or keyboard, you can quickly fulfill the request by accessing an associated on-site stockroom. Walk-up requester can leave the queue with the requested item in hand.

Procedure

1. Navigate to **All** > > **Technician** > **My Assigned Walk-ups**.
   The Interaction list opens.
2. Click the interaction **Number** associated with the request.
3. Select **Stockroom Consumables** in the Related Links section of the interaction.
   The associated Stockroom list opens displaying all available consumables.
4. Select the requested consumable **Display name**.
5. Select the **Consume** button.
6. Update the form with the **Quantity**, **Asset**, and **User** information.
7. Select **OK**.
   The Consumable form indicates that an item has been consumed and attached to the specified user.
8. Retrieve the item from the stockroom and provide it to the requester.
9. Return to the interaction in your **My Assigned Walk-ups** module to change the **State** to **Closed Complete** and click **Update** to update the interaction.

   Alternatively, you can click **Close** to complete the interaction.

   If you cannot fulfill the request from the associated stockroom, click the **Create Request** related link from the interaction form to access the Service Catalog. Refer to Create a request through a catalog to order an item for the requester.

Use Agent Assist to expedite Walk-up Experience fulfillment

Walk-up Experience agents can use the Agent Assist feature in Agent Workspace to expedite incidents and requests.

Before you begin

Role required: sn_walkup.walkup_technician

About this task

Agent Assist is a contextual search option available in Agent Workspace when a walk-up agent creates a new incident or new case associated with a Walk-up Experience interaction.

Procedure

1. To use Agent Assist navigate to **Workspace Experience** > **Agent Workspace Home**.
2. Open a walk-up interaction from your inbox or from **My Assigned Walk-ups** under **Lists** that you know requires an associated new incident or new case.
3. Click the **Create Incident** or **Create Case** button.
   A new incident or case tab opens next to the details tab for the original associated walk-up interaction.
4. Click the agent assist icon to use the feature.
   For more detailed information about Agent Assist and using it to expedite incidents and requests, refer to Using Agent Assist in Agent Workspace and Order a catalog item using Agent Assist.

View and manage Walk-up Experience appointments in Agent Workspace

Viewing upcoming scheduled Walk-up Experience appointments provides technicians with an estimate of future queue demand and workload. Managers can view future appointments and adjust staffing at walk-up queue locations to best support demand.

Before you begin

Role required: sn_walkup.walkup_technician

About this task

The walk-up agents and managers primarily use Agent Workspace for all Walk-up Experience related information, including viewing and managing scheduled appointments.

Note:
You can also view and manage scheduled appointments from Walk-up Experience in the application navigator, or left navigation bar.

Appointments are automatically routed to your Agent Workspace inbox based on availability. You can also view a list of scheduled appointments and choose which one to accept.

Upcoming appointments also display with a small calendar icon next to the user name on the onsite walk-up location queue wall monitor. The user with an appointment appears on the monitor a short time before the appointment is scheduled to begin.

Note:
Upcoming appointments are also displayed on online check-in screen with the same calendar icon next to the user name.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Agent Workspace Home**.
   The Agent Workspace homepage opens, greeting you with your name.
2. Click **List** in the left navigation bar.
3. Under **Walk-up**, click **Appointments**.
   Walk-up appointments assigned to your queue are listed.
4. Click an appointment number to view details, such as the requester name, the interaction number and description, and the appointment time.

   a. To open the associated interaction to view details, click the open record icon next to the interaction number.

   b. Click **Accept appointment** to begin working on the interaction.

      If necessary, you can assign the appointment to another agent and add work notes.

      If a significant time has passed and the requester does not show up for the appointment, you can delete the appointment by clicking the more UI actions icon in the interaction header and selecting **Delete**.

   c. Select **Save**.

Work on Walk-up interaction

Manage your Walk-up appointments in Agent Workspace.

Before you begin
Role required: sn_walkup.walkup_technician or admin

Procedure
1. Navigate to **All** > **Workspace Experience** > **Agent Workspace Home**.
2. Select **Inbox** from the side bar.
3. Set your status as **Available**.
   A Walk-up interaction task is automatically pushed in your inbox, if you do not already have any walk-up interactions assigned to you.
4. Select **Accept**.
5. On the details page, select one of the following options.

6. If you already have interactions assigned to you, navigate to **Lists** > **Walk-up** > **My Assigned Walk-ups**.
7. From the Walk-up list, select **Location Kiosk**.
8. Select a kiosk assigned to the location from the list.
9. On the **Walk-up Location Kiosk** page, select **Check-in**.

   Note:
   Walk-up location kiosks are displayed only when the Show kiosk option is enabled.

10. On the **My Assigned Walk-ups** page, select the Walk-up interaction assigned to you.
11. After you have fulfilled or resolved the request, set the state of the Walk-up interaction to **Closed Complete**.

Create an appointment through incident

Schedule an appointment on behalf of a requester through an incident record.

Before you begin
Role required: itil or admin

Procedure
1. Navigate to **All** > **Workspace Experience** > **Agent Workspace Home**.
2. From the navigation list, select **List**.
3. Under **Incidents**, select **Open** or **Assigned to me**.
4. Select the incident for which you want to schedule an appointment.
5. On the **Details** tab, select the More actions icon.
6. From the drop-down list, select the option **Book walk-up appointment**.
7. In the Walk-up Appointment Booking window, enter the required details to book an appointment on behalf of the requester.
8. Select **Submit**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- A walk-up appointment record is created.
- The **Walk-up Appointment** tab appears in the related list. The **Walk-up Appointment** related list must be added to the platform manually.
- The requester is notified of the appointment. The requester can also see the appointment created on the home page under the My active items widget.

View and manage Walk-up Experience appointments from application navigator

Viewing upcoming scheduled Walk-up Experience appointments provides technicians with an estimate of future queue demand and workload. Managers can view future appointments and adjust staffing at walk-up queue locations to best support demand.

Before you begin

Role required: sn_walkup.walkup_technician

About this task

Agents and managers can view and manage scheduled walk-up appointments from Walk-up Experience in the application navigator, or left navigation bar.

Note:
Primary access is through Agent Workspace for all Walk-up Experience related information, including scheduled appointments.

Upcoming appointments also display with a small calendar icon next to the user name on the on-site walk-up location queue wall monitor. The user with an appointment appears on the monitor a short time before the appointment is scheduled to begin.

Procedure

1. Navigate to **All** > **Walk-up Experience** > **Agent** > **Scheduled Appointments**.
   all walk-up appointments scheduled for the upcoming 14 days display.
2. Select an appointment number to view the details, such as the requester name, the interaction number and description, and the appointment time.

   a. If desired, to preview the associated interaction details, click the preview record icon next to the appointment number.

   b. To begin working on the interaction, click **Accept appointment** on the **Walk-up Appointment** form.

      If necessary, you can assign the appointment to an agent and add work notes.

      If a significant time has passed and the requester does not show up for the appointment, you can delete the appointment by selecting **delete**.

   c. Select **Update** to save any changes you make to the interaction form.

Monitoring Walk-up Experience performance

The Walk-up Experience dashboard and reporting module provides basic high-level reporting on incident and request types, record volume, average wait and service times, assignments by

% Abandoned walk-ups (by Walk-up type)	Percentage abandoned walk-ups distributed over check-ins, online check-ins and appointments

Walk-up Experience on Now® Mobile

You can create and manage your appointments for a walk-up venue like the Tech Lounge when you use the ServiceNow® Walk-up Experience on the Now® Mobile app on your own mobile device.

With the Now® Mobile app, you can use your mobile device to book appointments, see where you are in a queue, and cancel or modify your appointments for the Tech Lounge. You will never miss an appointment again. You will get reminders about your upcoming appointments and notifications if your appointment changes.

Book an appointment at a Walk-up Experience Tech Lounge

Book an appointment at a ServiceNow Walk-up Experience Tech Lounge by using the Now® Mobile app.

Before you begin
Role required: user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On your mobile device, tap the Now® Mobile app icon ( ).
2. Navigate to the list of available Tech Lounges using any of these options.
3. From the list of active Tech Lounges, tap your preferred Tech Lounge.
4. Tap **Make Appointment**.

> **Note:**
> The option to book a slot in advance is not available in all Tech Lounges. If the **Maximum future bookable day** field doesn't appear in the Tech Lounge details view, you can't book a slot in advance in that particular Tech Lounge.

5. On the form, fill in the fields.

Make Appointment form

Field	Description
Reason	Reason for your visit.
Date	Preferred date for the visit.
Time slot	Preferred time slot for your visit.

If you select a date when the Tech Lounge is closed or is not available for appointments, the time slot doesn't appear. Select a different date and time slot.

6. Tap **Submit**.
   Your appointment confirmation is displayed on the screen.
7. **Optional:** Tap **OPEN** on your appointment to view the details.
   Another way to view your appointment confirmation is to return to the Tech Lounge list view and tap the **Visits** tab, or return to the Now® Mobile app home page and tap **My Tech Visits**.

Modify an appointment at the Walk-up Experience Tech Lounge

Edit or cancel an appointment at a ServiceNow Walk-up Experience Tech Lounge by using the Now® Mobile app on your mobile device.

Before you begin
Role required: user

About this task
The time limit for modifying an appointment may vary across tech Lounges. You cannot modify a confirmed appointment within the time limit that was set for the particular tech Lounge. For example, a tech Lounge has set this time limit as two hours. So, if your appointment is at 10 a.m, you cannot modify it after 8 a.m. of the same day.

Procedure

1. On your mobile device, tap the Now® Mobile app icon ( ).
2. Navigate to your appointment card using any of these options.
3. Tap the appointment card to open it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Choose one of the following actions.
   You can also swipe the appointment card and tap your preferred action to modify the appointment.

Join a queue at the Walk-up Experience Tech Lounge

Join a queue at a ServiceNow Walk-up Experience Tech Lounge by using the Now® Mobile app for immediate assistance with an issue.

Before you begin

Role required: user

Procedure

1. On your mobile device, tap the Now® Mobile app icon ( ).
2. Navigate to the list of available Tech Lounges using any of these options.
3. From the list of active Tech Lounges, tap your preferred Tech Lounge.
4. Tap **Join Queue**.

> **Note:**
> This option is displayed only when the Tech Lounge is open. If the Tech Lounge is closed, wait to join a queue during the normal operating hours. Alternatively, you can book an appointment if the option is available. For more information on how to book an appointment, see Book an appointment at a Walk-up Experience Tech Lounge.

5. On the form, fill in the fields.

Join Queue form

Field	Description
Reason	Reason for your visit.
Description	Brief description of the problem.

6. Tap **Submit**.
   Your visit details and position in the queue are displayed on the screen.

Leave a queue at the Walk-up Experience Tech Lounge

Leave a ServiceNow Walk-up Experience Tech Lounge queue at any time by using the Now® Mobile app on your mobile device.

Before you begin

Role required: user

Procedure

1. On your mobile device, tap the Now® Mobile app icon ( ).
2. Navigate to **My Items** > **My Tech Visits**.
3. Navigate to your Queue card using one of these options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Tap your visit card to open it.
5. Tap **Leave queue**.
   You can also swipe your visit card and tap **Leave queue**.

Walk-up Experience reference

Explore comprehensive and additional information about the Walk-up Experience services.

The following topics offer additional information on Walk-up Experience, which assists you in customizing the application to address IT-related issues faced by your employees.

- View Badge Scanner Integration scan logs
- Quick start tests for Walk-up Experience
- User roles and tables installed with Walk-up Experience

Domain separation and the Walk-up Experience application

This is an overview of domain separation as it pertains to the Walk-up Experience application and how it relates to Service Portal pages, interaction queues, and configurations. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Walk-up Experience overview

Domain separation in the Walk-up Experience application is supported at the basic level. However, the application depends on the Service Portal, which is not supported for domain separation. Domain separation pertains to the Walk-up Experience application in the following ways:

- Walk-up location queues support domain separation in order to define which end users can access each location queue.
- The Interaction table supports standard domain separation for data security. Interaction tickets are opened for a specific domain.
- Walk-up location queues and interactions support domain separation. Therefore, the agents also work within a domain-separated environment when addressing interaction tickets associated with a location queue.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Management and administration configurations reside in the walk-up location queue records. Therefore, those configurations are available to the respective domain managers and admins.
- While the Service Portal pages are not domain separated, the Walk-up Experience application's portal pages retrieve data within the user's specific domain. Therefore, those pages can be reused across different service portals designed and configured for separate domains. The admins must build each portal themselves.
- The **Domain** field is available on the wu_location_queue table. Setting domain here ensures that the users only see queues that are a part of their domains during online check-in.
- For Advanced Work Assignment routing to operate, each wu_location_queue must include a work item routing condition which explicitly adds a reference to the domain the queue is part of.

Note:
The appointment booking feature is not domain separated. Since Appointment [itil_appointment] table data is not domain separated, list views could reveal data across domains.

How domain separation works in the Walk-up Experience application

For this application to be most effective, walk-up administrators should configure walk-up locations accordingly. This is done by configuring the `wu_location_queue` record to meet the needs of requesters. Each domain configured to the location queue record has its own set of rules. The same applies to other tables within the Walk-up application as well.

Note:
Elements of the Service Portal platform such as settings, portals and widgets cannot be domain separated. However, the data within the widgets displays based on how the domain is configured. The recommended approach is to set up separate portals for each MSP customer.

The elements of Service Portal that are used as part of the walk-up experience are as follows:

- Portal (Walk-up)
- Pages (`walkup_online_checkin, walkup_queue_on_site, walkup_home, walkup_survey, walkup_check_in`)
- Theme (Walk-up theme)
- Widgets (Online check-in experience, walk-up queue on site, walk-up check-in, walk-up exit survey, walk-up home, walk-up schedule)

To learn more, see Domain separation and Service Portal.

For data separation, the Walk-up Experience application uses the domain of the walk-up requester to determine in which domain the requester data should be placed.

- Requesters can check in only in locations for which they have visibility.
- Requesters are able to select the reasons that belong only to their own domain.
- Interaction records are created in the Requester's domain.

The application uses the domain of the walk-up agent or admin to determine which records are visible to the agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- By domain separation rules, Agents can work only on interactions that are visible to them.
- The agents are able to configure only walk-up location records that belong to their domain, are in the global domain, or have the parent-child hierarchy.
- The same visibility rules apply for the Many to Many `[wu_m2m_location_queue_reason]` table that controls the mapping between a location and the reason.
- The walk-up contexts records also have domain separation support. Thereby ensuring that the agents are able to view detailed information of the Requester only for the records that are visible by domain separation rules.

Walk-up Experience domain-separated tables

As part of the Walk-up Experience, records in the following tables can be domain separated.

- Walk-up location queues `[wu_location_queue]`
- Walk-up reasons for visit `[wu_reason]`
- Walk-up reasons `[wu_m2m_location_queue_reason]`
- Walk-up contexts `[wu_context]`
- Interactions `[interaction]`

Quick start tests

View Badge Scanner Integration scan logs

Monitor scanner-use error activity at a Walk-up Experience onsite location by viewing the scan logs. Each time a badge reader device triggers an error, a scan event is logged in the **Badge Scan Logs** module.

Before you begin

Role required: sn_badge.badge_admin

About this task

The **Badge Scan Logs** module only stores badge reader integration error messages. It does not display error messages for Walk-up Experience specific badge scans. You can fix the error and re-run the application to get the desired result.

Walk-up Experience badge scan errors can be found in the System Log.

Procedure

1. Navigate to **All** > **Badge Reader Integration** > **Badge Scan Logs**.
2. Select an event in the Badge Scan Logs list to view the associated **Message**, **Badge Reader**, and **User Badge**.

Workforce Optimization for ITSM

Manage and maintain the productivity of your workforce from a single location using Workforce Optimization for ITSM. Using this application, you can efficiently manage your team's skills and schedules, route work assignments to your team, and monitor their performance.

Workforce Optimization for ITSM in action

Here's how managers use Workforce Optimization for ITSM. Workforce Optimization for ITSM Overview

Get started

Workforce Optimization for ITSM enables you to do these tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Automatically route work to agents.
- Schedule your teams' work.
- Assign or reassign work from a central location.
- Monitor and measure team performance and provide feedback using assessments.
- Create opportunities to coach and train your teams based on the assessments.

Optimize your workforce

Learn how managers can use Workforce Optimization for ITSM

Channels

Route work to specific groups so that the right work goes to the right agent

Schedule

Manage your agents' schedule effectively

Work scheduler

Assign complex work items to agents based on their skills and availability

Teams

Organize your teams into assignment groups

Coaching

Assess the quality of your teams' completed interactions

Exploring Workforce Optimization for ITSM

Use Workforce Optimization for ITSM to optimize your workforce and manage your teams efficiently. Coach your teams so that they gain the skills that let you address the demands from your customers. Efficiently schedule your teams work to provide better coverage with integrated channel management.

Workforce Optimization for ITSM overview

As a manager, you can monitor the demand for agents and skills in your organization to resolve issues. Assess agent skills, identify areas where they need improvement and provide training to enhance their skills set. Track your teams performance, and manage the schedule of all agents in your assignment group—all from a unified location.

As an agent, you can manage your own schedule, access the schedules of your peers and request time off or shift swaps.

To plan for your Workforce Optimization for ITSM implementation, see Getting started with Workforce Optimization for ITSM.

Workforce Optimization for ITSM workflow

The image displays the manager workflow between the different modules in Workforce Optimization for ITSM. Each of these modules can be used independently or together in the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

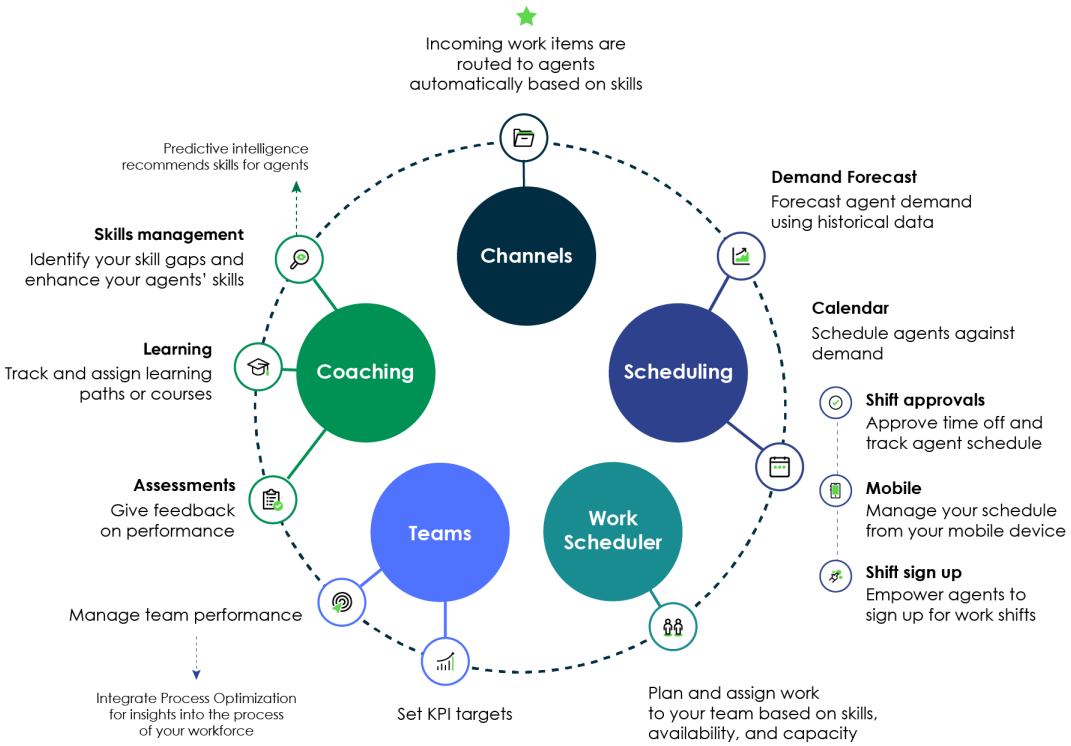
Workforce Optimization for ITSM workflow



Channel Management

Monitor your team in real time and jump in to help when there's a need.

Using this application, you can also:

- Route work to specific groups based on agent skills
- Review real-time performance as the team is actively working on tasks across channels
- Monitor pending work items in a queue

Scheduling

Access the calendar of your teams to know which agents are scheduled for coverage and which agents have taken time off.

Using the application, you can also:

- Assign agents to shifts
- Define break time
- Preview and publish team schedule
- Approve agent time-off or shift-swap requests

Work scheduler

Plan your teams' work and assign work items based on their skills, availability, capacity, and time zone.

Using the application, you can also:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View your teams' shifts, events, and work assignments
- Assign or reassign work items from a central location
- Use matching rules to rank team members
- Add criteria for matching rules to assign work items based on the rules

Teams

Monitor performance trends for your teams using KPI groups. Create a set of KPIs and apply them to all groups within a team and assess team performance from one location.

Using the application, you can also:

- Identify all the teams that you manage as well as the ones you have visibility into
- Analyze KPIs that are crucial for your team
- Drill into agents within each team and monitor their performance
- Access the profile of each agent to view details such as their manager, peers, and assignment groups
- Drill down into the skills for each agent or recommend them for coaching

Coaching and Skills Assessment

Enhance the quality of work done by your agents using Coaching. Use Predictive Intelligence to recommend skills based on issues the agents have resolved. Create coaching opportunities based on the recommendation and train the agents to acquire those skills.

Using this application, you can also:

- Automate the scoring, grading, and assessment of agent skills
- Use coaching opportunities to create assessments
- Track training assigned to agents based on their assessments
- Analyze the skill gap and recommend training

Getting started with Workforce Optimization for ITSM

Getting started with Workforce Optimization for ITSM

Learn the basics of getting Workforce Optimization for ITSM up and running.

To get started, you must first activate Workforce Optimization for ITSM, then organize your teams into assignment groups, and assign a primary assignment group for each agent.

Activate Workforce Optimization for ITSM

The Workforce Optimization for ITSM Configurable Workspace plugin (sn_wfo_cfg_itsm) is available with the ITSM Enterprise subscription package.

Before you begin

Role required: admin

About this task

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Workforce Optimization for ITSM plugins

Plugin	Description
Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm) **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activates related plugins that enable you to use the Scheduling, Work Scheduler, Coaching, Teams, and Channel Management applications in Workforce Optimization for ITSM.
MetricBase (com.snc.clotho)	Enables you to use Demand Forecast in Workforce Optimization for ITSM. To use Demand Forecast, you must activate the MetricBase plugin before you activate the Workforce Optimization for ITSM plugin. For more information, see Request the MetricBase product. When you activate both of these plugins, the Agent Forecast plugin (com.sn_agent_forecast) is activated.
ITSM Virtual Agent Conversations	Activates the ITSM Virtual Agent and enables you to use a virtual agent to create time-off requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workforce Optimization for ITSM plugins (continued)

Plugin	Description
(com.snc.itsm.virtualagent) **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	
ITSM Mobile Agent for Workforce Optimization for ITSM **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activates the ITSM Mobile Agent and enables agents to request shift-swaps or time off and managers to approve the requests using the ITSM Mobile Agent application.
Process Mining plugin (com.sn_po).	Integrates Process Mining with Workforce Optimization for ITSM.

You can also get these Workforce Optimization for ITSM application plugins from the ServiceNow Store.

Plugin	Description
Team Performance (sn_team_perf) **Note:** When you install this plugin, make sure that you've upgraded the following plugins to the latest store release version: • Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm). • Workforce Optimization Configurable Workspace Core (sn_wfo_cfg_ws). • Workforce Optimization Common(sn_wfo_common).	Enables you to track and analyze performance trends for your teams from a single location. **Important:** This plugin gets automatically installed when the Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm) plugin is activated.
Coaching (sn_coaching)	Enables you to assess your teams' abilities to resolve incidents efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	Description
Note: When you install the Coaching (sn_coaching) plugin, make sure that you've upgraded the following plugins to the latest store release version: • Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm). • Workforce Optimization Configurable Workspace Core (sn_wfo_cfg_ws). • Workforce Optimization Common (sn_wfo_common).	**Important:** This plugin gets automatically installed when the Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm) plugin is activated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note: When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configuring groups in Workforce Optimization for ITSM

As a manager, you can manage and optimize your entire workforce using Workforce Optimization for ITSM from one central location. Organizing your teams, for example, different levels of employees in your organizational chart, into groups is the foundation on which Workforce Optimization for ITSM operates.

Therefore, after you set up your teams as groups in Workforce Optimization for ITSM, as a manager, you can route work, set up schedules, train your teams, and analyze all aspects of your workforce from one location.

Planning for your Workforce Optimization for ITSM implementation

Before you start implementing Workforce Optimization for ITSM, make sure you do the following:

Important: Groups are synonymous with assignment groups. A team member can belong to multiple groups but must have one group identified as their primary assignment group. If not, that team member cannot view their schedules in Service Operations Workspace. For more information on Schedules in Service Operations Workspace, see Service Operations Workspace - Scheduling.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

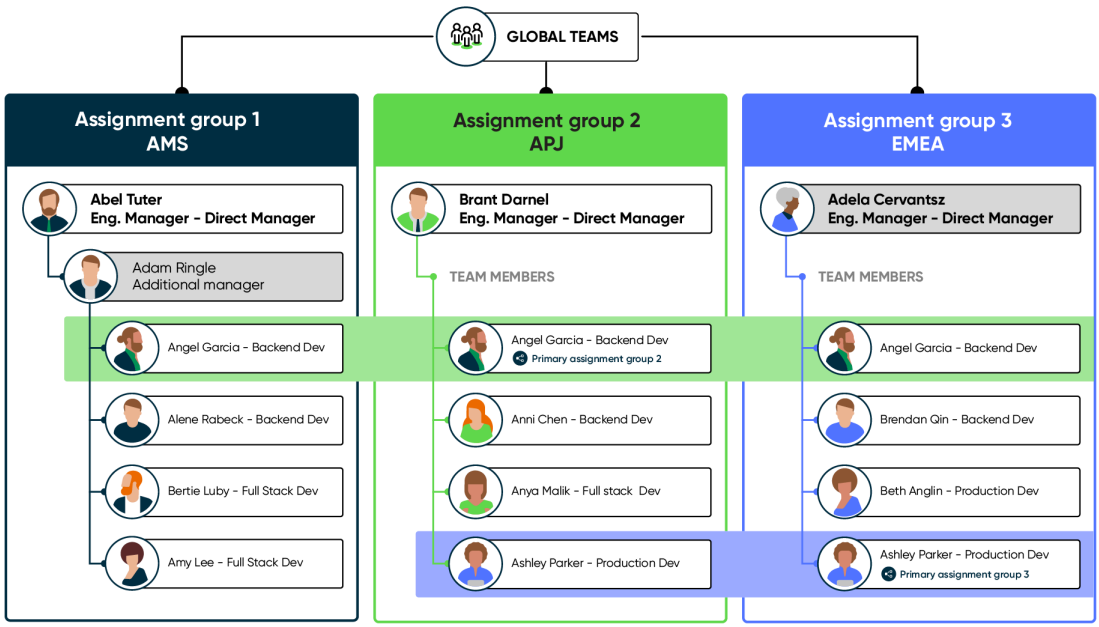
1. **Identify your teams**

   Define the different teams within your organizations that you want to manage. Each of these teams will be configured as a group in the User Groups [sys_user_group] table. When a user logs into Workforce Optimization for ITSM, the workspace will only display the logged-in user's teams and information related to those teams.

2. **Assign a primary assignment group for each member of your team**

   A team member can belong to multiple groups but you must identify one group identified as the primary group for each team member and assign it to them. This determines which assignment group's team calendar that the team member can view in the Schedules module in Service Operations Workspace and also determines activities such as coaching and approvals. For more information on setting a primary assignment group, see Assign a primary assignment group for each agent.

   The image below shows a representation of assigning a primary group to a team member who belongs to more than one group.



3. **Add a manager to each group**

   Each team must have a manager assigned. This manager is someone who would directly oversee the team.

4. **Add additional managers to each group**

   For each group that you create, you can also add managers who don't directly manage the group but need visibility into those groups. These managers are known as additional managers.

If you have three teams in different regions and the first team is in Americas (AMS), the second one is in Asia-Pacific (APJ) and the third one is in Europe, the Middle East, and Africa (EMEA), you must create an assignment group for each one of them and also associate each team member to one of the groups as their primary assignment group. You can also associate more managers to a team although they may not directly manage that team. These managers are referred to as additional managers who have visibility into the what the team does.

Related topics

Exclude access for specific groups in Workforce Optimization for ITSM manager workspace

Using extension points to include access for specific groups in Workforce Optimization for ITSM manager workspace

Assign a primary assignment group for each agent

Associate each agent in your team to a primary assignment group to enable them to see the KPI metrics for the groups to which they belong.

Before you begin

Role required: sn_wfo_cfg_itsm.admin

About this task

Before you set up Workforce Optimization for ITSM, you must assign each agent in your team to an assignment group that is identified as the primary assignment group to which they belong.

Procedure

1. Navigate to **All** > **User Administration** > **Users**.
2. Right-click the form context menu icon ( ) and select **View** > **WFO Workspace**.
3. In the **Primary Assignment Group** field, select a group as the primary assignment group for each agent.
   If you do not see the **Primary Assignment Group** field, select the gear icon and add the **Primary Assignment Group** field to the **Selected** column and select **OK**.

Admin Console in Workforce Optimization for ITSM

Use a guided approach to simplify the setup and configuration of groups within Workforce Optimization for ITSM from a central location.

Starting with the Australia release, Admin Console in Workforce Optimization for ITSM is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Configure access to each application within Workforce Optimization for ITSM tailored to your organizational needs. The foundation on which Workforce Optimization for ITSM operates is to organize all teams into assignment groups. For more information, see Configuring groups in Workforce Optimization for ITSM.

The Admin Console walks the admins through a step-by-step process of configuring Workforce Optimization for ITSM.

Using the Admin Console, admins can:

1. Manage WFO assignment groups.
   - Add groups that are in the **User Administration** > **Groups** list.

Note:

- When you select the desired groups and add them to the Admin Console, the groups are marked as type **WFO_ITSM**. The permissions for users in the group are retained as is.
- You can only view groups of type **WFO_ITSM**, also known as WFO assignment groups, in the Admin Console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Add managers to groups.
  - Assign a primary manager for each group.
  - Assign additional managers who need visibility into the groups.
- Add members to the groups and assign a primary group to each team member.

2. Define application access.

   Provide agents and managers access for each application within Workforce Optimization for ITSM.

Define groups as WFO assignment groups in the Admin Console in Workforce Optimization for ITSM

Identify existing groups relevant to WFO and add them to the Admin Console so that you can configure them easily based on your organization's needs.

Before you begin

Starting with the Australia release, Admin Console in Workforce Optimization for ITSM is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: admin

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Admin Center**.
2. In the **Manage assignment groups** section, select **Configure**.
   The **Manage assignment groups** screen appears.
3. Select **Add groups**.

   Note:
   The screen displays all groups that are in the **User administration** > **Groups** list, which are not defined as **WFO assignment groups** yet.

4. Select all groups that you want to add as the **WFO assignment group** to the admin console.
5. Select **Save selection.**

Result

All the selected groups are now defined as **WFO assignment groups**.

Define access to each application in the Admin Console in Workforce Optimization for ITSM

Configure assignment group access to each application in Workforce Optimization for ITSM based on your organizational needs.

Before you begin

Starting with the Australia release, Admin Console in Workforce Optimization for ITSM is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Admin Center**.
2. In the **Define application access** section, select **Configure**.
   The **Define application access** screen appears.
3. Select any application that you want to configure and select **Edit access**.
4. In the **Group access** tab, select **Add groups**.
   a. Select the groups that you want to grant access to for this application.
   b. **Optional:** Add managers of the selected groups.
   c. Select **Submit**.
      The managers and team members for the groups are granted access to the application.
5. In the **Manager access** tab, select **Add managers**.
   a. Select the managers that you want to grant access to for this application.
   b. Select **Submit**.
      The selected managers are granted access to the application.

Channels in Workforce Optimization for ITSM

Learn how you can use channels to route work to specific groups and with skill-based routing make sure that the right work goes to the right agent. Monitor the health of your queues reviewing real-time performance and jumping in to help with escalations.

Manage queues and monitor real-time team performance from a central location using Channel Management.

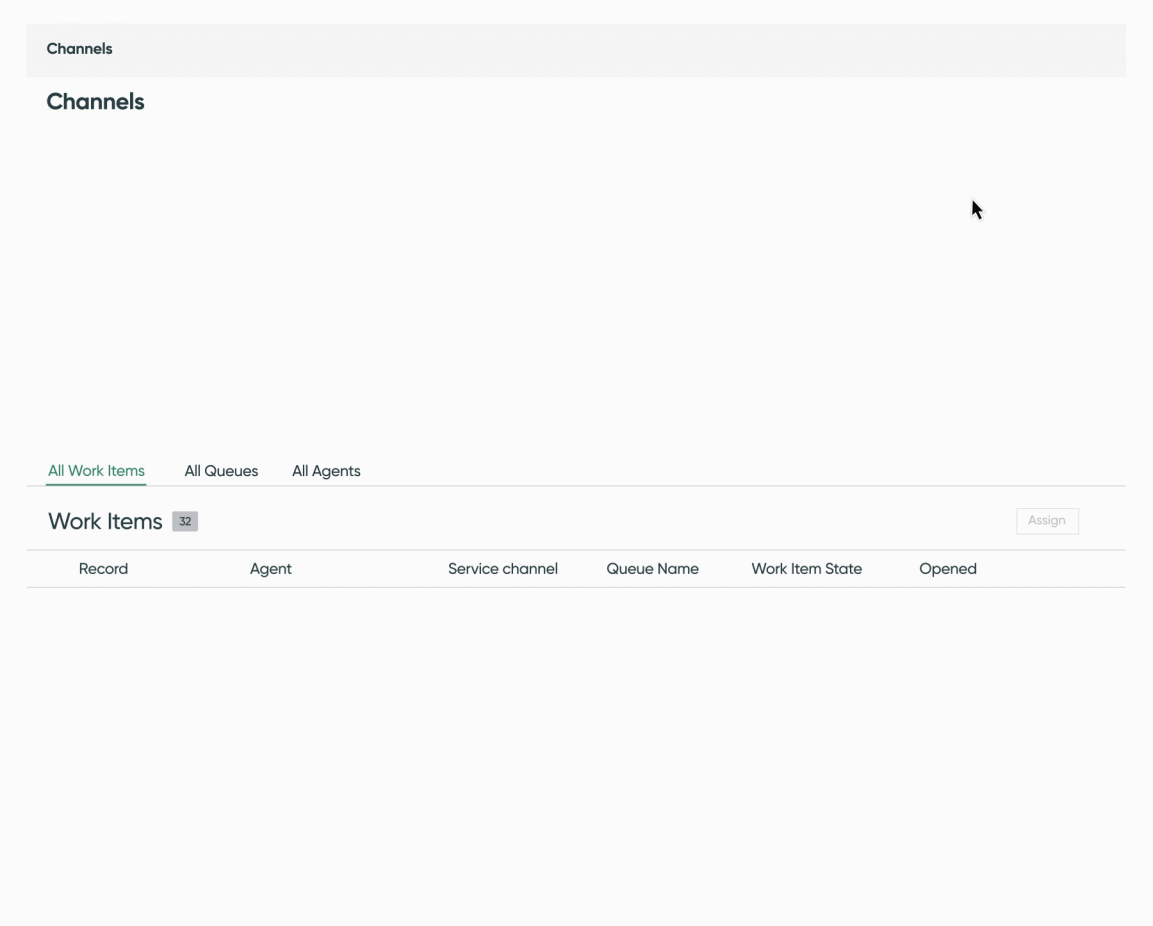
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



As a channel manager, you can:

- Associate assignment groups to queues
- Monitor the health of your queues in real time
- Track team performance
- Monitor pending work items in the queue

Getting started with Channels in Workforce Optimization for ITSM

Easily find the tasks that you must complete in the Channels module.

Example for using channel management in Workforce Optimization for ITSM

Understand how you can route work to specific groups and monitor real-time performance using Channel Management.

A manager manages IT operations for a large organization and has 12 teams reporting to them. Each of their teams has anywhere from 20 through 50 agents. They must ensure that incoming work gets effectively routed to the right groups across all channels.

As a manager, the manager must ensure that they can set up **Channel Management** to monitor team performance as follows:

- Add service channels and queues to route work items
- Add KPIs to the channels and queues to measure team performance
- Monitor their teams' ongoing work and performance
- Join chat conversations to assist agents

For detailed information on setting up channels using Workforce Optimization for ITSM, refer to Setting up Channels using Workforce Optimization for ITSM.

Setting up Channels in Workforce Optimization for ITSM

Set up service channels, queues, and key performance indicators (KPIs) to route work items automatically to agents based on an agent's availability, capacity, and skills.

With Workforce Optimization for ITSM:

- As a channel administrator, you can set up service channels and work item queues and then automatically route incoming work to agents. You can also configure real-time refresh intervals for the metrics and lists so that managers can always see the latest information about their teams.
- As a manager, you can view the real-time operational metrics for the work that is being done by your teams and the specific items that your teams are working on.

Note:
As an administrator, you can configure filters to refine the search and view targeted results. Filters are persisted across all channel management pages in the session. To view a list of the default interactive filters and the KPI reports for channels, queues, agents, and groups that you can map to the interactive filters, see the filter configuration tables for Channels. By default, the assignment group filter is applied to all lists and groups that you manage. You can disable interactive filters by using the *sn_channel_mgmt.filter_config.enable* property.

Add service channels and queues

Add service channels and queues to automatically route incoming work items to agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_channel_mgmt.admin

About this task
A service channel is a means of assigning a specific type of work items to agents. You can modify the existing service channels or create your own custom service channel.

Procedure
1. To create a service channel, do the following:
   a. Navigate to **Workforce Optimization for ITSM** > **Channel Management** > **Service Channels**.
   b. Click **New** and refer to the information in the Create a service channel to create the service channel.
   c. Click **Submit**.
   The service channel is created.
2. To create a queue, do the following:
   a. Navigate to **Workforce Optimization for ITSM** > **Channel Management** > **Queues** or select the service channel and click the **Queues** tab.
   b. Click **New** and refer to the information in Create a work item queue to create the queue.
   The queue is created in the service channel.

Create assignment rules and groups

Define agent assignment rules and specify groups of agents who are eligible to receive overflow work assignments for a queue.

Before you begin
You must first create a new assignment rule before you create a service channel. For more information, see create a service channel. Use Exploring Advanced Work Assignment (AWA) to route work items automatically to agents based on an agent's availability, capacity, and skills.

Role required: sn_channel_mgmt.admin

About this task
An eligible assignment group can consist of one or more groups of agents available to work on items in the queue.

Procedure
1. Navigate to **All** > **Workforce Optimization for ITSM** > **Channel Management** > **Queues**
2. Select a queue to define an assignment rule.
3. In the **Assignment Eligibility** tab, click **New**.
4. On the form, fill in the fields.

Field	Definition
Agent assignment rule	Name of the rule to assign work items to agents.
Eligible at	The duration that this assignment rule is valid for a set of agents.
Groups	The set of groups eligible for assignment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	○ Click the lock icon to unlock it and select the agent groups in the eligible assignment pool. ○ Click the lock icon to lock it.

5. Click **Submit** to create the eligible or **Update** if modifying an eligible assignment pool.
The Queues [awa_queues] table is updated with the eligible assignment group.

Note:
For a new service channel, you must first create a new assignment rule and then create a service channel.

Configure KPIs for service channels

Configure key performance indicators in service channels to track the ongoing work and real-time performance of your teams.

Before you begin
Role required: sn_channel_mgmt.admin

About this task
Add the Channel Management reports that are by default configured with Workforce Optimization for ITSM or create a new KPI report that matters the most to you. Key performance indicators help managers perform the following actions:

- Review real-time performance as the team is actively working on tasks across channels and queues.
- Track progress against KPIs and drill down into agents, team, and individual performance.
- Drill down into all queues and monitor ongoing incidents, interactions, and tasks.
- Jump in and support agents for help-requested work items using chat whisper or add work notes to a task.
- Refine data in the dashboard using the Assignment Group interactive filter without modifying the reports. For more information, see Interactive Filters.

Enable or disable KPI score auto-refresh

- By default, the KPI scores are set for auto-refresh every five seconds. You can change the interval using the *sn_channel_mgmt.kpi_auto_refresh.interval.seconds* system property.
- To disable auto-refresh, set the **sn_channel_mgmt.channels_card_auto_refresh.enable** property to **false**.

Refresh the service channel cards automatically or manually

- By default, the service channel cards are set for auto-refresh every two minutes. You can change the interval using the **sn_channel_mgmt.channel_card_auto_refresh.interval.seconds** syetem property.
- To manually refresh the service channel cards, select the refresh icon.

For more information on the properties, see Channel Management components in Workforce Optimization for ITSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workforce Optimization for ITSM** > **Channel Management** > **Service Channels**.
2. Click the service channel to which you want to add KPIs.
3. In the **Reports** tab, click **Edit**.

   Note:
   You must add the Reports related list if you do not see the **Reports** tab.

4. Add reports that are configured by default in Workforce Optimization for ITSM.
   For information on Channel Management reports, see Channel Management components in Workforce Optimization for ITSM.

   Note:
   Review the report's definition and add the corresponding filters that are applicable to the service channel that matters the most to you.

5. Add Workforce Optimization for ITSM KPIs filtered based on **My Managed Groups**.
6. Select **Save**.
7. **Optional:** To create a KPI report that explicitly apply to your teams, do the following:
   a. Navigate to **Reports** > **Create New** > **.**
   b. Fill in the details on the form. For more information, see Single score report.
   c. Select **Save**.

      The KPI report is created.

   d. Navigate to **Reports** > **Administration** > **Interactive Filters**.
   e. Select **Channel Management Groups Filter**.
   f. Select the Interactive filter references related list and select **New**.

      The Interactive Filter Reference - Channel Management Groups Filter page appears.

   g. Select the KPI report's table name and field name. For more information, see Create a reference field interactive filter.
   h. Select **Submit**.

      Repeat the steps above to add more reports.

      - KPI reports are added with an **Order** being shown as 100, 200 and so on. You can also change the order of a KPI report during selection.
      - By default, the report name is considered as the **Name**. However, you can change the display name per your business needs.

   The KPIs are added to the service channel and appear in the Channels page. The first five KPIs with the lowest order number appear in the service channel cards.

Configure KPIs for agents

Configure key performance indicators (KPIs) in service channels for your agents so that you can track the agents' ongoing work and real-time performance.

Before you begin

Role required: sn_channel_mgmt.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Add key performance indicators to channels to help managers perform the following actions:

- Review real-time performance of agents who are actively working on tasks across channels and queues.
- Track progress against KPIs and drill down into agents and individual performance.

The KPI scores are automatically refreshed at an interval of 30 seconds. However, you can modify the refresh interval by adding the *sn_channel_mgmt.kpi_auto_refresh.interval.seconds* system property. Also, the service channel card refreshes automatically in 2 minutes as configured in the *sn_channel_mgmt.channel_card_auto_refresh.interval.seconds*. You can also manually refresh by clicking the Refresh icon.

Procedure

1. Navigate to **All** > **Workforce Optimization for Customer Service** > **Channel Management** > **Service Channels**.
2. Click the service channel to which you want to add the KPIs.
3. Click the Agents Reports related list.
4. Add the reports for agents in Channel Management that are by default configured with Workforce Optimization for ITSM.

   Note:
   Review the report's definition and add the corresponding filters that are applicable to the service channel that matters the most to you.

5. Click **Save**.
6. **Optional:** To create a KPI report that is explicitly applicable to your teams, do the following:

   a. Navigate to **Reports** > **Create New**.

   b. Fill in the details.
   For more information, see Create a single score report.

   c. Click **Save**.
   The KPI report is created.

   d. Navigate to **Reports** > **Administration** > **Interactive Filters**.

   e. Click **Channel Management Agent Filter**.

   f. Select the Interactive filter references related list and click **New**.
   The Interactive Filter Reference - Channel Management Agent Filter page appears.

   g. Select the KPI report's table name and field name.
   For more information, see Create a reference field interactive filter.

   h. Click **Submit**.

   i. Repeat steps 1 to 4 for each KPI report to be added in the service channel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- KPI reports are added with an **Order** being shown as 100, 200, and so on. You can also change the order of a KPI report during selection.
- By default, the report name is considered as the **Name**. However, you can change the display name per the business needs.

Result

The KPIs that are configured in the service channel appear in the Current Work section of the agent's Overview page. For more information, see Track and analyze agent's performance.

Configure KPIs for queues

Configure key performance indicators in queues to track the incoming work for specific categories of work in a service channel.

Before you begin

Role required: sn_channel_mgmt.admin

Procedure

1. Add KPIs to a queue.
2. Click the **Reports** tab.

   Note:
   You may have to configure the related list to display the **Reports** tab.
3. Click **Edit**.
4. Add Workforce Optimization for ITSM KPIs (reports) that are filtered based on **My Managed Groups**.
   To create reports that explicitly apply to your managed teams, refer to Create a report.
5. Click **Submit**.
   The key performance indicators are added to the queue and appear in the **All Queues** tab in Manager Workspace. By default, the indicators get automatically refreshed at an interval of five seconds. You can add the *sn_channel_mgmt.kpi_auto_refresh.interval.seconds* property to the system properties to modify the interval time.

Configure supervisor lists for service channels

Configure supervisor lists in a service channel to view the list of active work items across service channels and queues.

Before you begin

Role required: sn_channel_mgmt.admin

About this task

A database view that defines table joins is used for generating reports for a supervisor list. For example, you can create a database view that can join the Incident table to the Interaction and Metric tables. When you use this database view, and create a supervisor list to report on the active work items, you may include fields from any of these three tables. For more information, see Working with database views for reporting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can configure three supervisor lists for each service channel. The first three lists with the lowest order number appear in Channel Management.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Channel Management** > **Service Channels**.
2. Select the service channel to which you want to add a supervisor list.
3. Click the **Supervisor Lists** tab.

   Note:
   If you do not see the **Supervisor Lists** tab, you must configure the form layout and the Reports related list.

4. Click **New**.
5. On the form, fill in the fields:

Supervisor Lists form

Field	Description
List Title	Display name for the list.
Tab Title	Title for the tab that appears in the manager workspace.
Service Channel	Service channel in which the list appears.
View Name	Database view for the service channel.
Order	Number that displays the order. **Note:** The first three lists with the lowest order number appear in Channel Management.

6. Click **Submit**.
   The supervisor list is added to the service channels and appears in the Channels module in Manager Workspace.

Schedule the generation of a daily report

Generate and distribute a daily scheduled report that summarizes the agent's work performance via email.

Before you begin
Role required: sn_channel_mgmt.admin

About this task

When	Then
The *Send Daily Agents Report* schedule job is run	The *sn_channel_mgmt.agents_report* event is executed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When	Then
The *sn_channel_mgmt.agents_report* event is executed	The *Daily Agents Report* notification is triggered
The *Daily Agents Report* notification is triggered	The *daily_agents_reports* email script is executed
The *daily_agents_reports* email script is executed	An email is sent to all managers

Note:
To change the existing report, modify the *daily_agents_reports* email script.

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Search and select **Send Daily Agents Report**.
   The scheduled script form appears.
3. Click the link **here** to edit the record.
4. Select the **Active** check box.
5. In the **Run** field, ensure that the option **Daily** is selected.
   The script, by default, sends the agents' work summary report daily to the managers.
6. Select the **Time zone**.
7. Do any of the following:
   - To update the scheduled job, select **Update**.
   - To execute the scheduled script, select **Execute Now**.

Result
All managers and additional managers of the teams receive an email notification that summarizes their agents' performance.

Channel Management extension point in Workforce Optimization for ITSM

Use extension points to call scripts to configure the list sort order in Channel Management.

To see a list of extension points that you can use for Workforce Optimization for ITSM, navigate to **System Extension Points** > **Scripted Extension Points**. Use scripted extension points to integrate customizations without altering the core components in the application code. When customizing a base application, you implement the scripted extension points by creating the custom script includes and registering them against the scripted extension points. For detailed information on implementing extension points, see Using scripted extension points in server-side scripts.

Extension points to configure

Extension script	Description
sn_channel_mgmt.ChannelMgmtExtensionPoint	Add or modify the columns and sort directions in the `vardata` section to configure the sorting mechanism for the All Agents and All Queues lists in Channel Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extension points to configure (continued)

Extension script	Description
	As an example, The Presence State column with **ASC** as a sort direction in the extension script displays the Presence State records in an ascending order in the All Agents list. **Note:** You can create multiple implementations; however, the implementation with the lowest order number is executed.
sn_channel_mgmt.AgentListColumns	Add or update the `getColumns` to modify the current implementation to configure the columns for the All agents list in Channel Management.
sn_channel_mgmt.QueueListColumns	Add or update the `getColumns` to configure the columns in the All queues list for Channel Management.

Routing work items using Channels in Workforce Optimization for ITSM

Route work items to assigned groups using channels. Use skill-based routing to ensure that the right work goes to the right agent. Review real-time performance as your team is actively working on tasks across channels. When you see escalations, you can help your agents resolve issues without the requester being aware of it.

Monitor ongoing work in service channels and queues

Monitor the incoming data and on-going work done by your agents against each service channel and queue.

Before you begin

Role required: sn_wfo_cfg_ws.manager

About this task

Track the real-time performance of your teams directly reporting to you and the teams you have visibility into. Drill down into the data for a work item, a specific agent, service channel, queue, or assignment group. Filter agents based on assigned queues and assignment groups. Assign the work items or help agents as needed.

Drill-down into the specific record and perform the following actions against each channel and queue:

- Real-time information of ongoing incidents, interactions, and other tasks.
- Work done during the day.
- Waiting work items that must be assigned.
- Drill down and view agent information in one or more assignment groups.
- Summary information across queues and agents
- Take or change ownership.
- Add comments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Using one of the following ways, select a service channel:
   - From the **Overview** section.
   - From the **Active Work Items** tab.
3. Monitor ongoing work from agents.

Manage service channels and queues

Manage your agents' on-going work against every queue. Monitor the incoming data of the service channels and track real-time performance of your direct reporting teams and additional managing teams using key performance indicator reports in service channels and queues.

Before you begin
Role required: sn_wfo_cfg_ws.manager

About this task
The work item views display the list of pending and queued work items from all channels and queues. Drill down into the specific record to get an idea of how much work is at-hand within the team on various channels and queues pertaining to the assignment groups. The work item is allocated to qualified agents using work item queues, routing conditions, and assignment criteria that you define. Using channels and queues, managers at a glance can gain visibility into the team's on-going work, quality of service, and improve agent performance and end-user experience.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the **Channels** icon.
3. Click the **Queues** tab.
4. Select a queue and do any of the following:
   - Assign work items to agents.
   - Take or change work item ownership.
   - Review agent performance.

Assist agents by joining their chat conversation

Assist agents in real time by joining their chat conversation and collaborate on any record by connecting with the right people instantly to achieve faster resolution.

Before you begin
Role required: sn_wfo_cfg_ws.manager

About this task
View the work-in-progress chat interactions and see if any of the agents has set the **Help Requested** flag as **Yes**. Open the interaction record and view all messages exchanged between the end user and agent, gain the context and choose to join the conversation by either sending internal messages or joining the conversation in public.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Click the **Help Requested** indicator on the landing page.
- Click the **Channels** icon, select a queue and then click the **Active Interactions** tab.
- In **Lists**, click **Conversation Monitoring**.

3. Click the interaction record for which you want to join the conversation.
4. Choose **Join Conversation** to start interacting with the agent or **Send Private Message** to send an message that only goes to the agent.
   The chat conversation is established.

Allocate work items manually to agents

Allocate pending work items to agents to complete the work.

Before you begin

Role required: sn_wfo_cfg_ws.manager
Ensure that the agent has relevant skills, availability, and access to at least one queue in the service channel.

About this task

The active work items remain in the queue pending manual allocation for one of the following reasons:

- The agent's capacity is exceeded to the maximum.
- Work items may not be accepted by any available agents.
- Agents with required skills are not available.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the **Channels** icon.
3. Do any of the following to manually allocate the work items.
   The list of available agents appears with details such as presence state, capacity, and matching skills.
4. Select the agent to assign the work item.
   For example, if the capacity is 0/4, it means that the agent's maximum capacity is 4 work items.

   Note:
   You can allocate a single work item at a time to the agent.

5. Click **Allocate**.
   The work item is allocated to the selected agent. The agent gets an alert on the assigned work item.
   - If the agent accepts the work item and the status moves from **Pending Accept** to **Accepted** state. The **Assigned To** field is updated with the agent's name.
   - If the agent rejects the work item and the status moves to **Queued** state.
   - If the agent does not accept the work item for a long time, with the status as **Pending Accept** and you must allocate it again.

Track and analyze agent's performance

View your agent's profile and summary information in Agent 360 and review their performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_wfo_cfg_ws.manager

About this task
You can drill down into the data for a specific agent and view the following details.

- Real-time information of ongoing cases, interactions, and other tasks.
- Upcoming time off.
- Assigned training tasks.
- Skill set, schedule, and profile

Procedure
1. Navigate to **All** > **Workforce Optimization for ITSM** > **Channel Management** > **Service Channels**.
2. To view information about the agent and their work, click the **All Agents** tab.

Field	Description
Agent	Agent name. Click the agent's name to view the agent's profile summary in Agent 360.
Service Channel	Service channel name.
Total Capacity	Number of items automatically assigned to agents (pending overrides). ○ Chat: The default is 4. ○ Incident: The default is 2.
Capacity in use	The number of on-going work items.
Utilization	Condition that determines what constitutes an active item that counts toward agent workload/capacity in percentage.
Assignment Group	Group to which the work item is assigned.

3. Select an agent to view real-time reports.
   You can also view agent presence history such as how often they were active or were on breaks on a given day.

Override channel capacity for an agent

Change the default number of work items that an agent can handle for a service channel.

Before you begin
Role required: sn_wfo_cfg_ws.manager

About this task
By default, the override capacity is valid for 12 hours. Administrator can change the duration using the *sn_channel_mgmt.awa_agent_temporary_override_time.minutes* system property. For information on adding a system property, see Add a system property. The capacity resets to the previous value after the specified time. The scheduled job *Reset Temporary Capacity Override* is executed every two minutes to check the invalid or expired overridden capacity and resets to the previous value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can override the channel capacity for a single agent at a time. Ensure that an agent to whom you want to override the channel capacity needs to be associated with Advanced Work Assignment and the required channels.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Navigate to an agent's profile.
3. Click the **Overview** tab.
4. In the **Channels** section, select the service channel for which you want to override the capacity.
5. Click **Capacity Override**.
   The **Agent Capacity Override** page appears.
6. In the **Override Capacity** field, enter the new capacity.
7. Click **Apply**.

Result

A message appears indicating the capacity update is valid for the defined duration. The capacity resets to the previous value after the specified time.

Using Voice with Workforce Optimization for ITSM

Use Voice to deflect incidents away from your human agents using bots. You can record phone interactions when agents resolve issues. Also, you can monitor those interactions to evaluate and improve the quality of incident resolutions.

This video provides an overview of the Voice application: Cloud Call Center Overview

With the Voice application, you can:

- Enable your workforce to use the voice channel and get call recordings, call transcripts, and reports of sentiment analysis when agents interact with callers. You can visualize all of this information within the Channels application in Workforce Optimization for ITSM.
- Analyze the call transcripts and sentiments of users after an interaction is complete so that you can create assessments and provide feedback and training for agents.
- Synchronize agent presence within the queue.

Note:
You can integrate any third-party telephony service with the ServiceNow Voice Center application. By default, the Voice provides you with the ability to integrate with the Amazon Connect application.

You can visualize the metrics from the Amazon Connect phone queues that are routed through Voice using the Channels application in Workforce Optimization for ITSM.The Voice application uses Advanced Work Assignment to report data from the Amazon Connect queues.

Voice Amazon Connect integration workflow

Here's how the Voice integrates with Amazon Connect:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits of using Voice with Workforce Optimization for ITSM

As a manager, you can:

- Monitor your agent's calls as they resolve customer issues.
- View synchronized agent presence states within the Channels application in Workforce Optimization for ITSM.
- Assess your agents by reviewing recordings of the agent interaction and call transcripts.
- Analyze sentiments from the call transcripts and use that information to coach and train your agents.

As an agent, you can:

- Get information about the caller before you answer an incoming call.
- Analyze call transcripts and listen to recordings after you complete an interaction.
- Place outbound calls using automated outbound dialing.

Associate Amazon Connect queues for ITSM to a ServiceNow instance

Set up phone queues for Amazon Connect to gain visibility into the queues using Workforce Optimization for ITSM.

Before you begin

Enable the Advanced Work Assignment plugin (com.glide.awa) to create the Amazon Connect queues. You must activate this plugin before you activate the Cloud Call Center Core (sn_cti_core) plugin so that you can successfully integrate the two applications.

After you install the Cloud Call Center applications, when you enable the Advanced Work Assignment plugin (com.glide.awa), the Amazon Connect (phone) service channel appears in the Workforce Optimization for ITSM.

Role required: sn_wfo_cfg_ws.admin or sn_cti_amzn_cct.admin

About this task

After an agent completes a call using Workforce Optimization for ITSM, you can learn:

- Who was on hold and how long they were on hold
- How long the calls are taking
- Which agents are available and when they're available
- How many agents are available and what is their current utilization

You can see the following queues when you install the demo data with the sample contact flow:

Amazon Connect Phone Queues

Calls get routed to this queue	When
Basic Queue	An utterance is generic, such as, "Let me talk to an agent."
VIP Queue	A user who has the VIP field enabled calls Support.
IT Equipment Support	An utterance includes IT equipment support or hardware issues.
Application Support	An utterance includes application support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A routing profile links queues to agents. Every agent must have a routing profile in the Amazon Connect instance that is integrated with the ServiceNow instance. For more information, see create a routing profile.

Note:

- You can associate each profile with multiple Amazon Connect queues.
- You must associate each of these queues in your Amazon Connect instance with the corresponding queue in your ServiceNow instance using an Amazon Connect ARN number. This association enables you to report on queue statistics and call metrics within Workforce Optimization for ITSM.

Procedure

1. Create placeholder queues for an Amazon Connect (phone) service channel if you need additional queues.
   For more information on creating a queue, see Create a work item queue.

   Note:
   Do not add work item routing conditions when you create placeholder queues.

2. Associate the ServiceNow Advanced Work Assignment (AWA) queue record with the Amazon Web Services (AWS) queue ARN.
   a. In the Amazon Connect instance, navigate to **Routing** > **Queues**.
   b. Select a queue.
   c. Copy the ARN for the queue.
   d. In the ServiceNow instance, navigate to **Advanced Work Assignment** > **Queues** and select the corresponding queue.
   e. In the **Cloud Call Center Source ID** field, enter the ARN number.
   f. Click **Update**.
   g. Repeat these steps for each queue.
3. Add assignment groups to a queue.
   a. Select a work item queue.
   b. Click the Group Queue Priorities related list.

      Note:
      You may have to configure the form to display this related list.

   c. Click **New**.
   d. In the **Group** field, add an assignment group that include agents who can handle this queue.
   e. In the **Order** field, select the order number for the assignment group that shows the priority in which incoming calls are handled.
   f. Click **Submit**.

Listen in to an agent call

Monitor agent calls when they are resolving issues for external callers by using Workforce Optimization for ITSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
You must have an active session with Amazon Connect and be able to monitor live conversations. For more information, see Monitor live conversations.

Role required: sn_wfo_cfg_ws.manager

About this task
When the Amazon Connect application answers a call from an external source, an interaction record is created.

Procedure
1. Monitor your agent's call queue when an agent is talking to an external caller in Workforce Optimization for ITSM.
2. Open the active interaction record when the phone call is in progress.
3. Click **Monitor Call** and listen into the call in Amazon Connect.

Analyze transcripts and sentiments for the Amazon Connect phone channel

Analyze your agent's call recordings, transcripts, and sentiment reports. With this information, you can assess the call quality and train your agents to handle calls better in the future.

Before you begin
Role required: sn_cti_core.user_manager

About this task
When an agent interacts with an external caller, the call gets recorded and transcribed. The application tags every statement within a transcript with a sentiment score. After a call has been completed, a sentiment report is automatically generated.

Note:
The manager must have an active session with Amazon Connect to view the transcripts and sentiments. The transcripts and sentiments are generated in the Amazon Connect application. They are then displayed in the Channels application in Workforce Optimization for ITSM.

Procedure
1. Navigate to **All** > **Workspace Optimization for ITSM** > **Manager Workspace**.
2. Select an interaction record for analysis.
3. Click **Call Analysis**.
   The Amazon Connect application generates the interactions and sentiment analysis of those interactions and displays them as a report in Workforce Optimization for ITSM.

Analyze skills for your teams in Workforce Optimization for ITSM

Add skills to groups and view skill assignments for your teams.

Before you begin
Role required: skill_admin

Procedure
1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the Teams icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select a team for which you want to analyze skills.
4. Add a skill for the group.

> **Note:**
> A group is synonymous with a team.

a. Select the **Skills** tab.

> **Note:**
> In the right pane, you can analyze the top 5 skills that your team is using at any time. Select a skill to analyze skill data such as the number of users using the skill or tasks that have been assigned that need that skill, the overall skill coverage, and how many experts you currently have with that skill.

b. Click **New**.
c. In the **Skill** field, select a skill.
d. In the **Skill level** field, select a level for the selected skill.
e. In the **Inherited from** field, select the skill from which this skill is inherited.
f. Click **Save**.

Channel Management components in Workforce Optimization for ITSM

Workforce Optimization for ITSM has roles to administer channels and queues, properties to configure default behavior, and reports to analyze data in Workforce Optimization for ITSM.

Roles

Role title [name]	Description	Contains roles
Channel Management User [sn_channel_mgmt.user]	Grants read access to channel reports, channel view, and queue report tables.	awa_manager
Channel Management Admin [sn_channel_mgmt.admin]	Grants administrative rights to create, read, update, and delete (CRUD) channel reports, channel view, and queue report tables.	• sn_channel_mgmt.user • awa_admin • sn_wfo.admin • report_admin

Properties

> **Note:**
> To use channel management properties, they must be added to the System Property [sys_properties] table. For information on how to add a system property, refer to Add a system property.

Property	Description
sn_channel_mgmt.list_auto_refresh.enable	Set this property to **false** to disable auto-refresh of lists in Channel Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type**: True or False • **Default value**: True
sn_channel_mgmt.channels_card_auto_refresh.enable	Set this property to **false** to disable auto-refresh of lists in Channel Management. • **Type**: True or False • **Default value**: True
sn_channel_mgmt.list_auto_refresh.interval.seconds	Sets the frequency for refreshing the channel management list data. • **Type**: Integer • **Default value**: 30
sn_channel_mgmt.kpi_auto_refresh.interval.seconds	Sets the frequency for refreshing the channel management indicator data. • **Type**: Integer • **Default value**: 5
sn_channel_mgmt.channel_card_auto_refresh.interval.seconds	Sets the auto-refresh interval for the cards on channel management overview container. • **Type**: Integer • **Default value**: 120
sn_channel_mgmt.filter_config.enable	When set to **true**, displays the **Assignment Group** interactive filter in channels. • **Type**: True or False • **Default value**: True
sn_channel_mgmt.awa_agent_temporary_override_time.limit	Overrides the duration set for the channel capacity. • **Type**: Integer • **Default value**: 12 hours

Reports

Report name	Description
Interaction Work Items Assigned Today	Number of interaction work items assigned on a given day.
Abandoned Interaction Work Items	Number of abandoned interaction work items.
Unassigned Interaction Work Items	Number of interaction work items not assigned to agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report name	Description
Average Work Item CSAT Score	Customer Satisfaction score for an average work item.
Unassigned Incident Work Items	Number of incident work items not assigned to agents.
Completed Interaction Work Items	Number of interaction work items completed by agents.
Today's Average Interaction Service Time	Average time it takes to close an interaction.
Interaction Work Items Resolved Today	Average number of interaction work items resolved on a given day.
New Incident Work Items Created Today	New work items created for incidents on a given day.
Average Handling time for Interaction Work Items	Average time taken to resolve interaction work items.
Agents Available to take Interaction Work Items	Number of agents available to work on the interaction work items.
Breached SLA Incident Work Items	Number of work items with breached SLAs.
Open P1 Incident Work Items	Number of work items open for P1 incidents.
Incident Work Items Resolved Today	Number of work items resolved on a given day.
Average Walkup Interaction Wait Time	The average time a user is in queue before starting a walk-up interaction.
Currently Waiting Interaction Work Item	Work items currently in queue waiting to be processed.

Interactive Filters for Reports

Name of the interactive filter	Description	Reference table
Channel Management Agent Filter	Filters the reports based on an agent.	[sys_user]
Channel Management Group Filter	Filters the reports based on groups.	[sys_user_group]
Channel Management Queues Filter	Filters reports based on queues.	[awa_queue]
Channel Management Service Channel Filter	Filters reports based on service channels.	[awa_service_channel]

Scheduling in Workforce Optimization for ITSM

Learn how you can plan shifts with automatically staggered break times for your agents to manage their schedule effectively in Workforce Optimization for ITSM. Publish schedules for the next scheduling period to get a snapshot of which agent is lined up to solve issues for that time period.

As a shift planning administrator, you can:

- Create shifts to make sure you have team coverage for the required span of time.
- Add breaks to the shifts that automatically stagger agent availability for those shifts.
- Preview the schedule and make necessary changes before publishing it to your agents.
- Access the schedule of all of your teams from one location.

As a shift planning agent, you can:

- Look up your schedule and request time off when required.
- Swap your shift with one of your peers.

Example for using scheduling in Workforce Optimization for ITSM

Understand how you can set up and publish agent schedules and how your agents can manage their own schedule based on an example.

A manager manages IT operations for a large organization and has 12 teams reporting to them. Each of their teams has anywhere from 20 through 50 agents. At any given point, they needs visibility into their teams' schedule. They must also be able to create shifts, and approve or reject shift-swap or time-off requests from their agents.

As a manager, they can manage their entire teams' schedule using **Scheduling**. Ingrid's team can manage their own schedule effectively by requesting shift-swaps or time-off.

The manager and their team can manage schedules by performing the following steps from one central location:

1. Create shift plan
2. Create a schedule plan
3. Assign agents to work shifts
4. Publish the schedule
5. Agents make requests to change the schedule or take time off

   For more information, refer to Service Operations Workspace - Scheduling.
6. Approve requests

Get an overview of how to you can create shift plans and assign agents to the shifts using the schedule plan in this video. Create schedule plans and shifts

Get an overview of how you can monitor shifts and schedule for your entire team from a single location in this video.

Workforce Optimization for ITSM Monitor Team Schedule

Workforce Optimization for ITSM Agent Schedule

For detailed information on creating and managing schedules using Workforce Optimization for ITSM, refer to Scheduling in Workforce Optimization for ITSM.

Setting up Scheduling in Workforce Optimization for ITSM

Manage events using the team calendar. You can create different types of event categories and use scripted extension points to customize the event types.

Configure the due date logic for shift approval flows

As an administrator, you can configure the due date logic for the time-off request and shift-swap request approval flows.

Before you begin

Make sure that your application is in the Shift Planning scope.

Role required: admin

About this task

You can configure the flows to restrict who can approve the requests. For example, you can set it to only the manager of the agent's primary assignment group who can approve them. If the agent submits the request for approval within two days before the agent time-off start date, then the request for approval is auto-rejected.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
   Each flow has a requester and an approver workflow.
2. Configure the due date logic for the Time-off request flow.

Configure event categories for the ITSM Manager Workspace

Add an event category. Create or update field configurations for events. You can also specify if an event category must be excluded when the shift coverage for agents is calculated.

Before you begin

Role required: sn_shift_planning.admin

The following event category configurations are available by default:

- Work
- Meeting
- Training
- Custom Event
- Time Off
- Break

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Scheduling** > **Event Categories**.
2. In the **Event Categories** list, click **New**.
3. In the **Name** field, enter a name for the event category.
4. If you want to exclude this event category for agent coverage calculation, enable the **Exclude from coverage** check box.
5. In the **Event field configuration** dialog box, edit the following configuration as needed:

Note:

- You can remove any property that does not apply to a type of event.
- By default, agents can add attendees to the meeting and training event types.

```
{
            "create": {                 //Creates an event type
 form
                "attendees": {          //Adds the Attendees
 field
                "mandatory": true,      //Sets this field as
 mandatory
```

            }
        }
```

6. Click **Submit**.

Configure an event load order in Workforce Optimization for ITSM

Add a system property to display your preferred event categories first on the calendar.

Before you begin

Set the map application scope to **Shift Planning**. For information on how to set the scope, see Set map application scope.

Role required: admin

Procedure

1. In the application navigator, enter `sys_properties.list`.
2. Click **New**.
3. Enter the following field values.

Field	Value
Suffix	`sn_shift_planning.event_load_order`
Application scope	Shift Planning
Type	String
Value	`{ "fastLoad":[ "07e433f449a11010f877de942e7c1d18" ] }` where *`fastLoad`* is the array of sys_ids for event categories that you would like to load first. The remaining custom event categories will be loaded after all event categories with *`fastLoad`* categories are loaded and updated on the calendar.
Read roles	sn_shift_planning.agent

Field	Value
Write roles	sn_shift_planning.admin

4. Click **Submit**.

Create or enable access to event types to add them to the team calendar

Create multiple events from the same category and add them to the calendar in ITSM Manager Workspace. Enable agents or managers to create specific event types.

Before you begin

Role required: sn_shift_planning.admin

Procedure

1. Create an event type.

   a. Navigate to **All** > **Workforce Optimization for ITSM** > **Scheduling** > **Event Types**.

   b. Click **New**.

   c. On the form, fill in the fields.

   Event Type form

Field	Description
Name	Unique name for the event type.
Priority Order	Priority of the event type that you want to exclude from the coverage. The higher the number means the higher the priority. For example, let's say you are attending a work event for four hours in a day. You have marked that time window as both a time off and as a meeting event type. If time off has a higher order of priority, then the application excludes that event type from coverage.
Color	Color that identifies this type of event in the team calendar.
Use custom colors	Preferred color that you can select to display the background and border of the event type in the team calendar.
Active	Option that when enabled, displays the event type on the calendar.
Category	Type of event, for example, custom, meeting, break, or time off.

   d. Click **Submit**.

2. Enable agents or managers to create specific event types.
   For information on adding or removing access to user for event types, see Include or exclude access for event types.

What to do next

Add events to the team calendar

Event type extension points in Workforce Optimization for ITSM

Use extension points to call scripts for event categories such as a meeting, time off, or work time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Creating custom event types using extension points

When you create extension points for custom events, consider the following:

- Which users can create an event?
- Does the event have to go through an approval process?
- Is it a work-type or a non-work type event?

Here are some examples that provide guidance on some of the considerations you may want to take into account when you create a new custom event using extension points:

- When you create an event for monthly staff meetings, take the following into consideration:
  - Only managers can create this type of event.
  - This is a non-work type event.
  - The event does not have to go through an approval process.
- When you create an event for time-off requests, take the following into consideration:
  - Any employee can create this event.
  - The is a non-work type event.
  - The event has to go through a manager approval process.

To see a list of extension points that you can use for Workforce Optimization for ITSM, navigate to **System Extension Points** > **Scripted Extension Points**. In the Extension Points list, open the *sn_shift_planning.EventManager* extension point.

Use scripted extension points to integrate customizations without altering the core components in the application code. When customizing a base application, you implement the scripted extension points by creating the custom script includes and registering them against the scripted extension points.

Extension points for event types

Extension point name	Description
sn_shift_planning.EventManager	Implement this extension point to customize the logic for the event categories that you create.

You can use extension points to create events such as meeting, training, and time-off requests. For example extension point implementations, see the following extension instances in the Implementations related list:

Category	Extension script
Meeting	*AgentScheduleMeetingEventManager*
Break	*AgentScheduleBreakEventManager*
Training	*AgentScheduleTrainingEventManager*
Time off	*AgentScheduleTimeOffEventManager*
Work	*AgentScheduleWorkEventManager*

Using extension points to extend application functionality

Synchronize agent calendar in Workforce Optimization for ITSM with the Microsoft Outlook calendar

Streamline the way that agents manage their calendar so that they can view their schedule in one location.

As an admin, you can synchronize the agents' calendar in Workforce Optimization for ITSM with their Microsoft Outlook calendar.

When the two calendars are integrated, agents with the Shift Planning Agent (sn_shift_planning.agent) role can also view the calendar information in their Microsoft Outlook calendar in real time. This information includes the agent's shifts, schedules, and events such as meetings, trainings, and time-off.

Note:
When you create events of type **Custom**, you must use extension points to synchronize the custom events in the two calendars.

Set up the Workforce Optimization for ITSM agent calendar integration with their Microsoft Outlook calendar

Display the schedules, shifts, and events from the agent's calendar also in their Microsoft Outlook calendar when you synchronize both the calendars.

Before you begin
Role required: admin

Procedure

1. Set up the Microsoft Exchange Online spoke.

   Note:
   Verify that the following Microsoft Graph permissions are set correctly in the Microsoft Azure portal:

Permission	Type	Description
Calendars.ReadWrite	Delegated	Full access to user calendars
Calendars.ReadWrite.Shared	Delegated	Read and write access to user and shared calendars
Calendars.ReadWrite	Application	Read and write access to calendars in all mailboxes

2. Set the *sn_wfo_outlook.enable_outlook_sync* system property to **true**.
   For more information, see Scheduling components in Workforce Optimization for ITSM.
3. Add the email IDs of the users that you want to synchronize to the User [sys_user] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Your agents' Workforce Optimization for ITSM calendar is now synchronized with their Microsoft Outlook calendar.

Important:
If the swapped shifts don't appear in the Microsoft Outlook calendar, verify that you've followed all steps in this procedure to make sure that the schedule for the shifts have been synchronized with Microsoft Outlook.

Scheduling your teams' work in Workforce Optimization for ITSM

Manage your workforce efficiently by planning shifts for each day and assigning users to the shifts. With Scheduling, you can use your resources efficiently by planning and managing schedules and staffing needs across your teams from one location. You can also integrate with on-call scheduling and create shifts and schedule for on-call rotations.

You can add meeting, training, time-off request, or an ad hoc work shift using the team calendar. You can also filter agents in the team calendar based on their location, region, assignment groups, schedule plan, list of team members, or any field in the agent's record.

Important:
You must index new tables to see them in Work Scheduling. For more information on indexing tables, see Configure a table for indexing and searching.

Create a shift plan

Schedule shifts for your team so that you can make sure that you are covering all work assignments and breaks. You can also specify the days of the week that you might need to override scheduled shifts.

Before you begin
Role required: sn_shift_planning.admin

About this task
In the **Shifts** tab, you can view the work shifts and on-call shifts in separate tabs. The shifts are grouped by active and inactive shifts. The contextual side panel displays the active and then the inactive shifts in the order it is displayed in the **Shifts** tab. You can scroll through the shifts using pagination.

Note:
Your administrator can set user preferences for the pagination size to view work shifts and on-call shifts. For more information see, Scheduling in Workforce Optimization for ITSM

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Click the Schedule icon ( ).
3. Click the **Shifts** tab.
   - **Search shift plans:** Type keywords in the Work shift or On-call shift search field to access related shift plans easily.
   - **Filter shift plans:** Use the filter icon ( ) to view shifts based on whether the shift is in draft or published state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To filter work shifts, in the **Work shift** tab, click the filter icon ( ) and select the desired state of shifts you want to view using the **State** field. Use the **Days of week** filter to narrow down the display of shifts based on the desired days in a week.
- To filter on-call shifts, in the **On-call shift** tab, click the filter icon ( ) and select the desired state of shifts you want to view.

4. Click the plus (+) icon.
5. Create a shift.

Related topics

On-Call Scheduling

Create a schedule plan

Manage your team's schedule by creating a schedule plan that covers a span of time and includes your team's work shifts. You can also assign agents to shifts based on their skills and availability. This way, you can make sure that you are using your resources in the best way possible for your organization.

Before you begin

Role required: sn_shift_planning.admin

About this task

You can set the number of days to cache agent schedules using the *sn_shift_planning.number_of_days_to_cache* system property.

If you do any of the following:

- Import agent schedules using table import
- Disable business rules and use a script to load the data

you must manually run the *Shift Planning - Delete All Agent Schedules Cache* schedule job to clear the cache.

Note:
Your administrator can set user preferences for the pagination size to view schedule plans. For more information see, Scheduling in Workforce Optimization for ITSM

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Click the Schedule icon ( ).
3. Create a schedule plan.
   a. Click the **Team Calendar** tab.

      Note:
      You can analyze the staff alignment for a day or for the week.

   b. In the contextual side panel, click the Show Schedules icon to display the schedules.
   c. In the Schedules panel, click the + icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:

- **Search schedules:** Type keywords in the Schedules search field to access related schedule plans easily.
- **Filter schedules:** Select the filter icon ( ) and then select the desired schedule states using the **Schedule plan state** filter and the desired start and end dates using the **Schedule plan dates** filter to narrow down the display of schedules in the team calendar.

You can duplicate an existing schedule to create another one. The start date changes to the day after the current date and the end date changes to 30 days from the current date.

d. In the **Name** field, enter a name for the schedule plan.

e. From the **Start Date** field, select a date to start the schedule plan and click **OK**.

f. From the **End Date** field, select a date to end the schedule plan and click **OK**.

g. In the **Assignment groups** section, assign the schedule plan to your groups.

- To assign it to all groups you manage, select **Groups I manage**.
- To assign it to specific groups, select **Specific groups**.

You can view the schedule of all agents in the assignment group that you directly or additionally manage.

h. Click **Save schedule**.

.

4. Add a work shift to the schedule plan.

Note:
To add more shifts to an existing schedule plan, select the schedule plan and then add the work shift.

a. Click **Add Shift**.

b. In the **Shift** field, select the work shift that you want to add to the schedule plan.

c. In the **Event type** field, select the work event that categorizes the work shift.

5. Add agents to the work shift.

a. In the **Assign agents** field, search for agents and add one or more agents to add to the shift.

b. To publish the schedule plan, select **Publish**.

It may take a few minutes for the screen to refresh. For more information on publishing a schedule plan, see Publish a schedule plan for visibility into team coverage.

Enable your teams to sign up for work shifts

Empower your teams to sign up for work shifts based on their availability and preference.

Before you begin

Role required: sn_shift_planning.admin

About this task

When a schedule plan is enabled for sign-up, you can receive notifications. You can also receive notifications when the schedule plan that's open for sign up is due on the current day or when it's due soon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Your administrator must set the value in the *glide.ui_notification.max_recipients* property to the maximum number of agents for which you want to send the notifications.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**
2. Select the Schedule icon ( ).
3. Add a schedule plan.

   a. Select the **Team Calendar** tab.

   b. In the Contextual side panel, click the Show Schedules icon to display the schedules.

   Tip:
   Select the filter icon ( ) and then select the desired sign-up state and sign-up dates to narrow down the schedule plans enabled for sign-up.

In the filters, to add the desired	Do this
Sign-up state	i. Double-click one or more sign-up states in the **Available** column to move them to the **Applied** column. ii. Select **Apply**.
Sign-up dates	i. Select a predefined option such as **Last 7 days** or select the start and end date for which you want to see the schedule plans enabled for sign-up. ii. Select **Apply**

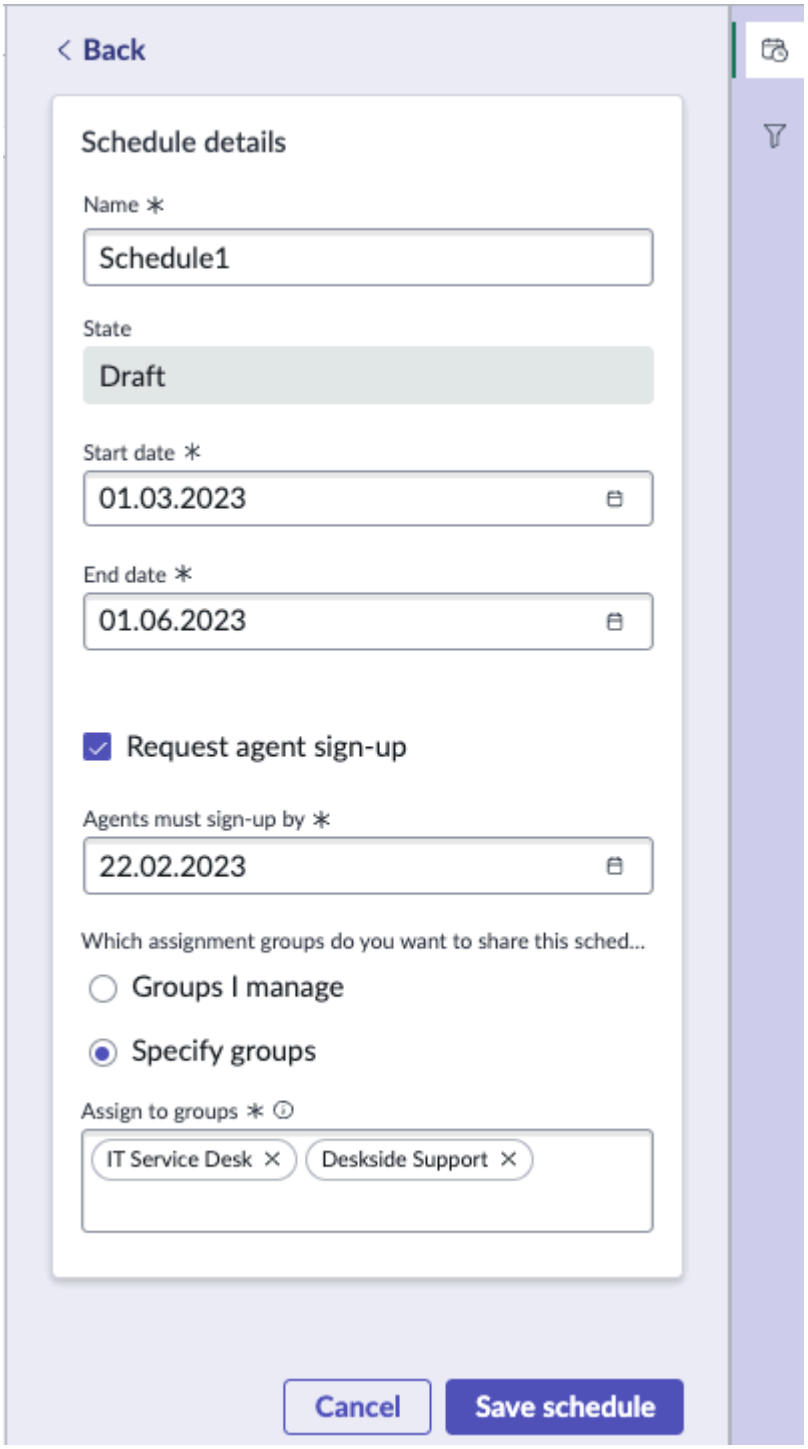
   c. In the Schedules panel, select the + icon.

   You can duplicate an existing schedule to create another one. After you duplicate a schedule that has the shift sign up enabled, you can update the start date, end date, and the date for which the agents must sign up for the schedule.

   Note:
   If there are no agents associated with the schedule, then the shifts associated with the schedule aren't duplicated.

   d. Fill in the required fields on the form.
   The image below shows an example of a filled-in Schedule form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. To enable your agents to sign up for work shifts, do the following:

i. Enable the **Request Agent Signup** check box.

ii. In the **Agents must sign-up by** field, enter the date by which they must sign up for shifts within that schedule.

> **Tip:**
> If your agents have signed up for their preferred shifts, the **Assigned To** field is auto-populated with those agents.

f. Select **Save schedule**.

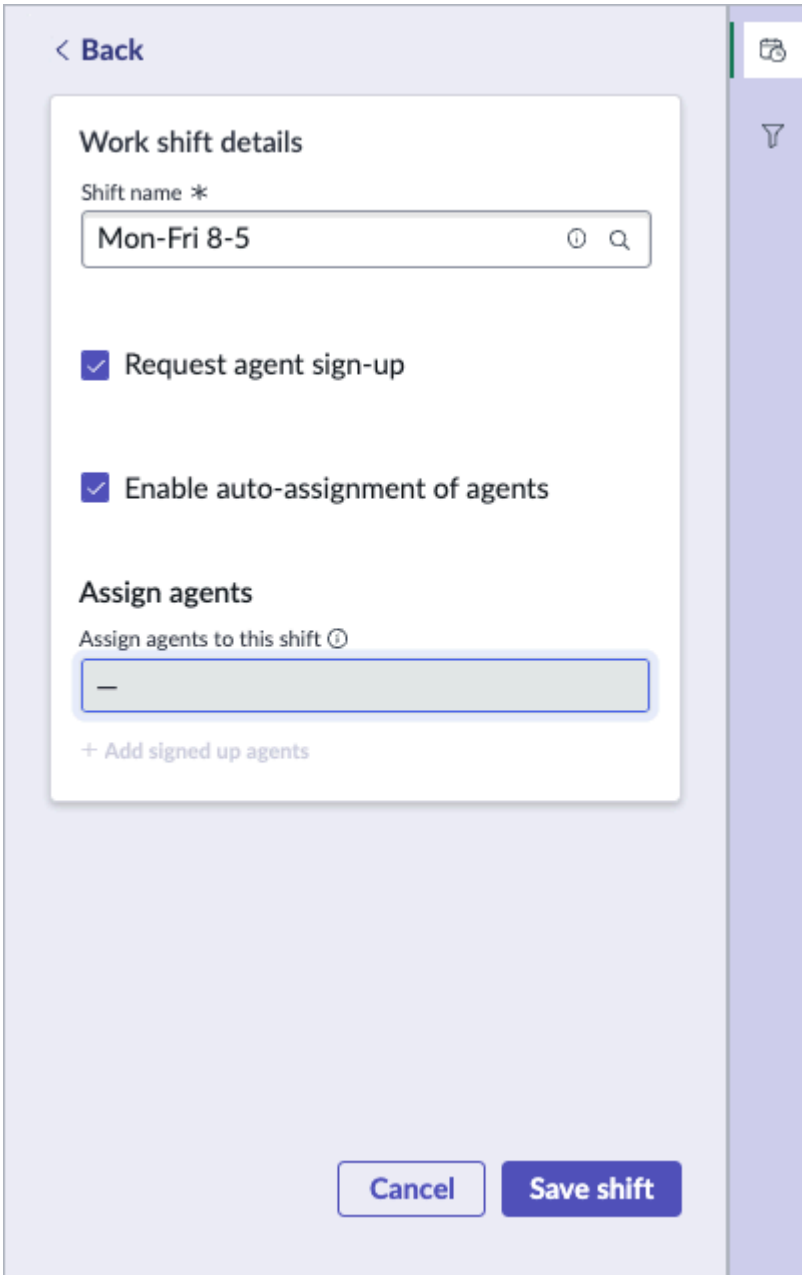
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Add a work shift to the schedule plan.

   a. Select the schedule plan you've created.
   The image below displays the schedule plan that was created.

   b. Select **Add Shift**.
   The image below provides an example of a form to enter the details for a shift.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. In the **Shift** field, select the work shift that you want to add to the schedule plan.

Note:
If the schedule plan has been enabled for agents to sign up for shifts, the following fields are automatically enabled:

- **Request agent sign-up**
- **Enable auto-assignment of agents**

If you want to assign agents manually, you can disable these check boxes at any time.

d. If the shifts are enabled for sign-up, you can select **Send for signup**.
All shifts that have been enabled for sign-up are sent to the agents to sign up for their shifts. You can select **Close sign-up** to close agent sign-up for a shift before the sign-up due date and manually assign the agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Enabled for sign-up** highlighted label changes to **Closed for sign-up**.
- The system will automatically close the sign ups after the sign-up due date.

5. Add agents to the work shifts.

6. Select **Save shift**.
   The state for the schedule plan changes to **Generating Preview**.
7. To publish the schedule plan, select **Publish**.

Note:
It may take a few minutes for the screen to refresh.

The table describes the different shift sign-up states in the schedule plan.

Schedule plan sign up state	Description
Sign-up not enabled	The schedule plan isn't enabled for sign-up.
Enabled for sign-up	○ Schedule plan is enabled for sign-up but isn't yet ready for agents to sign up for shifts. ○ Schedule plan can't be published when enabled for sign-up.
Open for sign-up	○ Schedule plan is enabled for sign-up and is ready for agents to sign up. ○ Schedule plan can't be published or deleted when it's open for sign-up. ○ When open for sign-up: ▪ The sign-up due date can't be changed. ▪ The work shift details can't be changed. ▪ New shifts can't be added. ▪ If enabled for auto-assign, the agent assignment in a shift can't be changed.
Closed for sign-up	Schedule plan is closed for agents to sign up.

Publish a schedule plan for visibility into team coverage

Generate a preview of your schedule plan and publish it so that your agents can see their shifts and schedules ahead of time. You can unpublish a schedule to make changes and then publish it again.

Before you begin
Role required: sn_shift_planning.admin

About this task
You can make a copy of a schedule and update it to create a new schedule. Updates could include modifying the schedule start and end dates as well as adding or removing shifts or agents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you make a copy of the schedule, the following updates are automatically made to the schedule copy:

- The start date is set to the current date and the end date to 30 days from the current date.
- The schedule state changes to **Draft**. You can make the necessary changes to the shift and click **Save**.
- The schedule only displays agents in the assignment group of the current logged in user.

You can also unpublish a schedule make updates, and then publish it again.

When you unpublish a schedule:

- If the start date is the either the current date or had occurred in the past, the schedule state remains as **Published** and the end date changes to tomorrow.
- If the start date is in the future, the application changes the schedule state to **Draft**.
- If you delete one or more groups in a schedule plan, all agents who are part of the deleted groups are removed from the shifts in the schedule. After you remove the groups, the schedule changes to draft state and the team calendar refreshes with the updated data.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the Schedule icon ( ).
3. Generate a schedule preview.
   a. Click the **Team Calendar** tab.
   b. Click the show schedules icon ( )to display in the contextual side panel.
   The team calendar refreshes and generates the preview when you save a work shift.
4. Publish a schedule.
   a. Select a schedule and edit the schedule if necessary.
   b. Edit the schedule if necessary and click **Save**.
   c. Click **Publish**.

   Note:
   You can click **Delete** in **Draft** state and delete the schedule if you no longer need it.

   All the schedules that are in **Draft** state move to **Published** state. You can view the published schedule in the team calendar and also edit the name of the schedule.

Note:
You can use pagination to scroll through your agents' schedules.

Track and manage your teams' schedule

Create, update, or monitor your teams' schedule from one location. You can approve or reject requests for swapping shifts or time off for agents within your assignment group.

Before you begin

Role required: sn_shift_planning.admin

About this task

Using the team calendar, you can access the list of all of your agents by assignment group. When you select a shift for an agent, you can see the agent's work schedule including the break time. You can also view the number of agents that are scheduled at every time interval for each group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Modify an agent's shift.
   The schedule that includes this shift must be in **Preview** or **Published** state.
   a. Navigate to **Workforce Optimization for ITSM** > **Manager Workspace**.
   b. Click the Schedule icon ( ).
   c. In the **Team Calendar** tab, navigate and point to the shift for the agent that you want to modify the schedule for.
   d. In the shift pop-up window, click the Edit icon ( ).
   e. Modify the agent's shift as desired.

      Note:
      If the existing shift has a break, you can add more breaks to the shift.

   f. Click **Save**.
2. Approve or reject an agent's time off or shift-swap with another agent.

   Note:
   You must approve a request two days before the time-off or shift-swap start date. If not, the approval will be auto-rejected. An administrator can change this default setting. For more information, see **Setting the due date for time-off and shift-swap request approvals** in Scheduling in Workforce Optimization for ITSM in configurable workspace.

   a. Click **Approvals**. You can view all agent requests in your queue and the details for each request. You can use the **Compose** field to communicate with the agent.
   b. Select a request that you want to approve or reject and do one of the following:
      - To approve a request, click **Approve**.
      - To reject a request, click **Reject**.

   If you approve the request, the schedule gets updated in the team calendar based on the approvals.

Analyze your staff alignment using Demand Forecast

Use Demand Forecast to plan the number of staff members that you require so that you have enough agents to do the job.

Before you begin

Role required: sn_agent_forecast.user

About this task

Using Demand Forecast, you can:

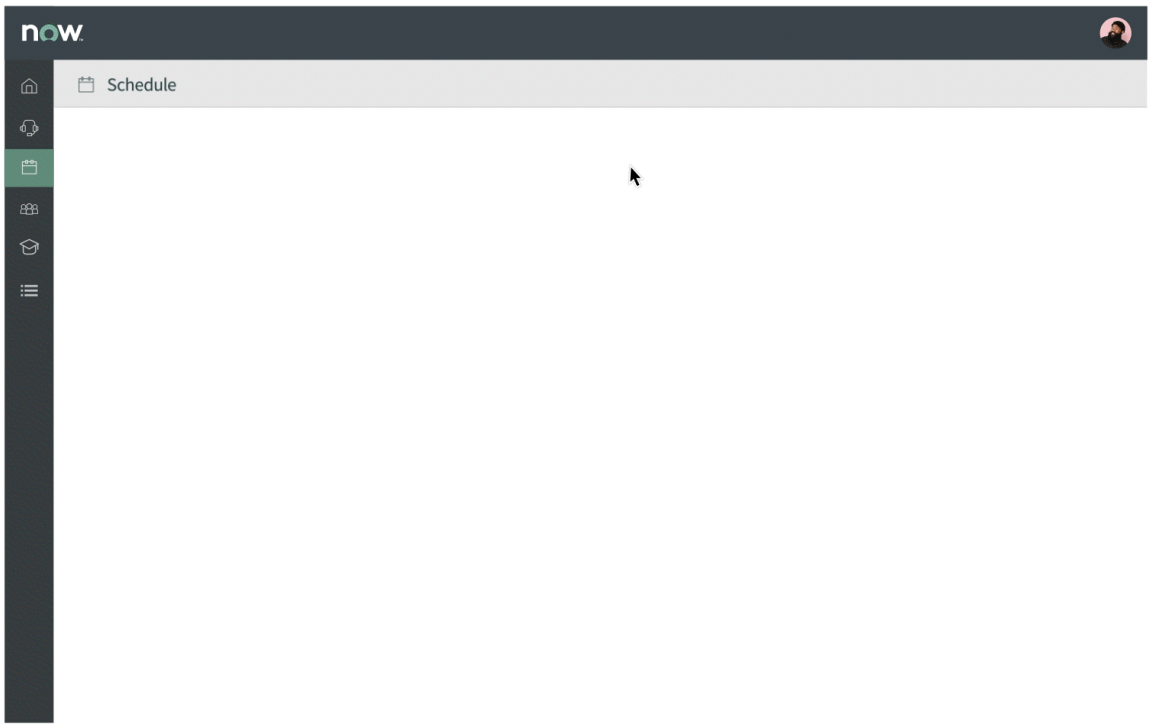
- Monitor agent or team shift coverage for any day or week.
- Analyze if you are overstaffed, understaffed, perfectly staffed, or not aligned well with your staffing needs.
- Adjust your staff alignment depending on the coverage that you need and the schedule of your teams.
- Analyze your staff alignment as you are creating a schedule.
- You can analyze the agent coverage you have and the actual demand for the number of agents based on assignment groups and work shifts in a day.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the Schedule icon ( ).
3. Click the **Team Calendar** tab.
4. Analyze your staff alignment for each shift.
   You can click the filter icon and select the assignment groups and shift plans for which you want to view the staff alignment.

   The following image shows an example of the staffing alignment in a Week view. The misaligned staffing indicator in the pop-up window shows that the forecast manager has scheduled four agents for each shift but more agents are needed to cover the shifts.



Understanding user criteria for event types in Workforce Optimization for ITSM

Manage user access for any event type such as meeting, training, and time-off requests in the team calendar.

You can include or exclude Create, Read, Write or Update, and Delete (CRUD) rights for event types using the inclusion and exclusion user criteria access. You can perform the CRUD operations for users, groups, or roles.

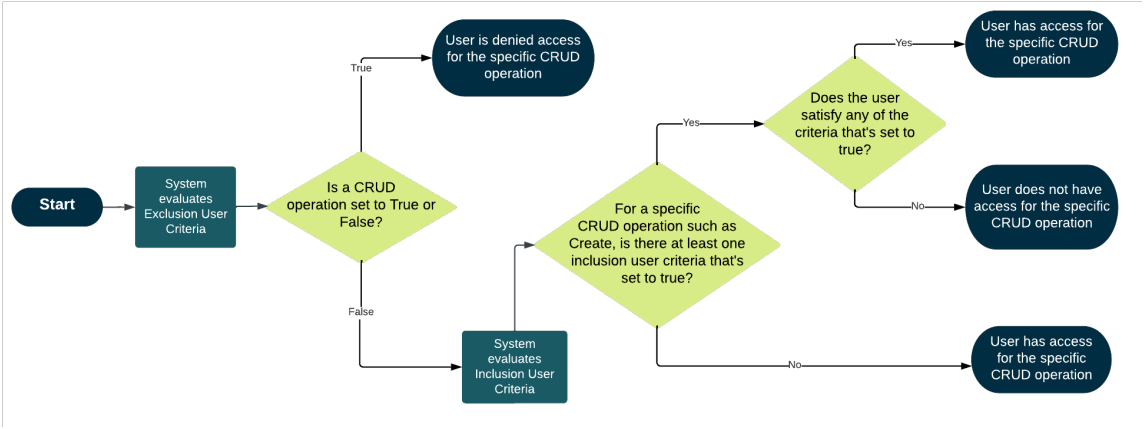
Note:
By default:

- Users have role-based access to manage event types.
- Team members don’t have read-access to events of type **Actual work**.

For additional flexibility around managing the CRUD access, you can set the user criteria for each event type. For example, if team members don't have access to edit their work shifts using their role-based access, you can set that access using user criteria. You can set this access for specific team members or for the whole group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The flow diagram shows the logic on how inclusion and exclusion user criteria access work for event types.



How inclusion and exclusion user criteria access works

When the user criteria rules get evaluated, it's done in the following order:

1. The system first evaluates the exclusion access for each criteria.
   - If the exclusion access for a CRUD operation is set to **true**, then the system evaluates the user criteria.
     a. If the user doesn't have access based on their role, then the user is denied access for the specific CRUD operation.
     b. If the user isn't denied access, then the system evaluates the inclusion criteria.
   - If the exclusion access for a CRUD operation is set to **false**, then the system evaluates the inclusion criteria.
2. For the inclusion access, for a specific CRUD operation such as Create, the system checks if at least one of the inclusion user criteria is set to **true**. If yes, then the system evaluates the user criteria based on the user's role access.
   - If the user:
     - Has access for the CRUD operation based on their user role, then the user can perform that action. For example, if the event type is training and the CRUD operation is **Create** then the user can create the training event types.
     - Doesn't have access for the CRUD operation based on their user role, then the user can't perform that action.
   - If at least one of the inclusion criteria isn't set to **true**, the user doesn't have access to the specific CRUD operation. In this example, the user can't create the training event types.

Note:
The exclusion access always takes precedence over the inclusion access. If no inclusion or exclusion access is set, then the role-based access is used for managing event types.

Create user criteria for event types in Workforce Optimization for ITSM

Add a user criteria record to specify which users, roles, and groups can access event types in Workforce Optimization for ITSM.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **User Criteria**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for the user criteria
Users	Users who can access event types.
Groups	Groups who can access event types.
Roles	Roles who can access event types when you apply the user criteria.
Advanced	Option to create a script for the user criteria.
Active	Enabling the check box makes the user criteria available.
Companies	Companies who can access event types.
Location	Locations that can access event types.
Departments	Departments that can access event types.
Match All	Option to make every condition that is set required when the user criteria are applied.

4. Select **Submit**.

Related topics

Create a user criteria record for Service Portal

Include or exclude user access for event types

Add or remove access to users for any event type so that they can view event types that are relevant only to them.

Before you begin

Role required: sn_shift_planning.admin

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Scheduling** > **Event Types**.
2. Select an event.
3. Exclude or Include specific CRUD access for users to events.
4. Click **Update**.

Verify access criteria for a group or a team member in Workforce Optimization for ITSM

Check what create, read, update, and delete rights your groups or your team members have for events to make sure that they have the correct permissions that they need.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_shift_planning.admin

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. In the lists module, go to **Scheduling** > **Event type**.
3. Select an event for which you want to verify user access.
4. Select the **User access** tab.
5. Do any of the following.
   The screen displays the create, read, write, and delete columns as **true** for each team member that has access to the specific type of access to the selected event.

Add events to the team calendar

Create a meeting, training, time-off request, a custom event, or an adhoc work shift from the team calendar.

Before you begin
Role required: sn_shift_planning.admin

About this task
You can create custom event types and add or remove the desired fields. For more information, see Configure event types for the ITSM Manager Workspace.

Note:
In the team calendar, when you select an event for a team member and delete it, the event is also deleted for other participants in the event.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the Schedule icon ( ).
3. Select the **Team Calendar** tab.
4. Select **+New**.
5. Create an event.
6. Select **Save**.

Swap your agents' shifts in Workforce Optimization for ITSM

Swap an agent's shift in your assignment group with another agent who can work on that shift and skip the approval process.

Before you begin
Role required: sn_shift_planning.admin

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the Schedule icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Team Calendar** tab, navigate and point to the shift for the agent that you want to swap with another agent.
4. In the shift pop-up window, click the Shift Swap icon ( ).
5. In the **Requested Shift** section, click the **Agent** field and select the agent who can work on that shift.
6. Click **Submit**.
   The team calendar displays the updated schedule.

Scheduling components in Workforce Optimization for ITSM

Workforce Optimization for ITSM has roles to administer agent shifts and schedules and properties to configure default behavior.

Roles

Role title [name]	Description	Contains roles
Shift Planning User [sn_shift_planning.user]	Grants read access for scheduling including the ability to view schedules and shifts.	
Shift Planning Agent [sn_shift_planning.agent]	Grants agents access to their calendar. Agents can request shift swap or time off.	sn_shift_planning.user
Shift Planning Admin [sn_shift_planning.admin]	Grants administrative access to create, read, update, and delete (CRUD) schedules and work shifts.	• sn_shift_planning.approver • sn_shift_planning.user • sn_shift_planning.agent

Properties

Property	Description
sn_itsm_ mobile_agent.events_query_days_past	The maximum number of days past events for your shifts can be displayed on your mobile application. You can enter values that range from -1 to -31. • **Type:** Integer • **Default value:** -31
sn_itsm_ mobile_agent.events_query_days_future	The maximum number of days future events for your shifts can be displayed on your mobile application. You can enter values that range from 1 to 90. • **Type:** Integer • **Default value:** 90

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
sn_uib_agent_sp.allow_agent_edit_break	Enables agents to edit the start and end time of their break time in a shift span. • **Type:** true|false • **Default value:** false
sn_uib_agent_sp.allow_agent_add_remove_break	Enables agents to add or remove their break time in a shift span. • **Type:** true|false • **Default value:** false
sn_shift_planning.number_of_days_to_cache	Number of days to cache agent schedules. • **Type:** Integer • **Default value:** 5
sn_shift_planning.max_shifts_to_autoassign	Number of preferred shifts from a schedule plan that will be auto-assigned. • **Type:** Integer • **Default value:** 1
sn_shift_planning.max_shifts_allowed_for_signup	The maximum number of shifts that agents can sign up for within a schedule plan. • **Type:** Integer • **Default value:**1
sn_shift_planning.enable_agent_signup	Enable agents to sign up for their own shifts. • **Type:** true|false • **Default value:**true
sn_shift_planning.enable_schedule_signup_link	Enables or disables the link in the Upcoming section in the Service Operations Workspace landing page where agents can view shifts that they've signed up for that are due on the current day and the day after the current day. • **Type:**true|false • **Default value:** true
sn_shift_planning.days_to_signup_due_date	The number of days before the shift sign-up due date when agents and managers are notified. • **Type:** Integer • **Default value:** 2

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
sn_shift_planning.display_shift_name	Set this property to true to display the shift name. If the value is set to false, the event type will be displayed. • **Type:** Boolean • **Default value:** True **Note:** It will take 24 hours for any changes you make to the property value to take effect. To view the changes immediately, run the *Shift Planning - Delete All Agent Schedules Cache* scheduled job.
assignShiftAgentsTypeaheadDisableAutoClose	Turns off the closing of the **Assign agents to this shift** typeahead list every time an agent is selected. In the application navigator, enter `sys_ux_page_property.LIST` and press **Enter**. • **Type:**true|false • **Default value:** false
sn_wfo_outlook.enable_outlook_sync	Set this property to **true** to turn on the synchronization between the agent's calendar and the Microsoft Outlook calendar. • **Type:** Boolean • **Default value:** False

Scheduled jobs

Scheduled Job

Name	Description
Shift Planning - Delete All Agent Schedules Cache	Deletes cache from the sn_shift_planning_agent_availability table. • Runs automatically everyday at 2:30 am • Run this job on-demand when you import data.

User preferences

Navigate to **All** > **User Administration** > **User Preferences** and add the preferences listed in the table below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To set a system-wide user preference, select the **System** check box.

For information on setting user preferences, see User preferences.

User Preference	Description
workspace.onCallShiftsPageSize	Set the maximum number of on-call shifts to view per page in the **On-call shifts** tab in the Shifts side panel. • **Name:** workspace.onCallShiftsPageSize • **Type:** Integer • **Value:** Enter the preferred number of on-call shifts you want to view per page.
workspace.workShiftsPageSize	Set the maximum number of work shifts to view per page in the **Work shifts** tab in the Shifts side panel. • **Name:** workspace.workShiftsPageSize • **Type:** Integer • **Value:** Enter the preferred number of work shifts you want to view per page.
workspace.schedulePlanPageSize	Set the maximum number of scheduling plans to view per page in the Schedules side panel. • **Name:** workspace.schedulePlanPageSize • **Type:** Integer • **Value:** Enter the preferred number of schedules you want to view per page.

Schedule Adherence in Workforce Optimization for ITSM

Analyze how closely your agents adhere to their scheduled activities. You can also analyze whether they complete the total time they were scheduled to work. Use these metrics to align your staffing needs better and forecast the demand for agents more effectively.

Adherence measures how closely agents follow their schedule to complete their assigned work. Conformance measures the work completed regardless of when it was completed.

Use Schedule Adherence to:

- Gain insights into how agent resources were historically used and plan your staffing needs based on that data.
- Measure whether the effort spent on forecasting agent demand and scheduling team members is used in an optimal manner.
- Discover coaching opportunities for your agents when you find gaps in their adherence. For more information, see Coaching.

As a manager, you can do the following actions:

- Gain insights into whether your team is complying with published schedules.
- Increase your team's performance by setting expected adherence targets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View the time attendance of your agents by looking at such details as clock-in and clock-out times.
- Analyze the historical time attendance of your team members.
- View planned versus actual historical data for your team and individual agents.
- Modify the clock-in and clock-out times of your agents.

As an administrator, you can set the threshold percentages and change the formulas for calculating schedule adherence and conformance.

As an agent, you can clock-in to and clock-out of your work shift. For more information, see Service Operations Workspace - Scheduling.

Here's a typical schedule adherence and conformance workflow:

1. The administrator sets the *`Agent Time Work Event Trigger`* business rule as active to record the clock-in and clock-out times of Workforce Optimization for ITSM agents.
2. An agent works for the ITSM team and reports to a manager. Let's assume this scenario is a typical work day:
   a. The agent logs in to ITSM Agent Workspace .
   b. The agent changes the presence status to **Available** and starts work. The clock-in event gets generated.
   c. The agent changes the presence status to **Break** and goes for lunch. The clock-out event gets generated.
   d. When the agent comes back from lunch and answers a phone call, the presence state becomes **Busy** and the clock-in event gets generated.
   e. The agent then logs out from CSM Agent Workspace or changes the presence status to **Offline**. The clock-out event gets generated.
   f. At the end-of-the-day, the agent's time worked summary is generated with key performance indicators (KPIs), such as Start Time, End Time, Planned Work, Time Not Worked, Available Non Planned Time, Time Worked, and Adherence%, Conformance %.
3. The agent's manager logs in to Manager Workspace to view the agent's time worked in the **Team Calendar**. The manager can also view the agent's actual time worked and working pattern for all historical days. If required, the manager can coach the agent to a desired performance that fits in with the team culture.

Monitor schedule adherence of your agents

Evaluate whether or not your agents are adhering to their assigned schedules. Look for areas where agent activities that do not offer much value can be reduced or eliminated and fine-tune your staffing levels requirements based on their adherence.

Before you begin

Role required: sn_shift_planning.admin

About this task

- A high adherence rate indicates that agents are sticking to their schedules and resolving work items as expected. Low adherence rates indicate that you may want to analyze the processes or decisions and tweak them to manage your teams' schedule efficiently. The numbers are highlighted in red for non-adherent agents.
- Schedule adherence and conformance calculations are based on the formulas to calculate schedule adherence and conformance and also the agents' actual and planned work timings. The following are the default formulas that are used to calculate adherence and conformance

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

for agents. However, your administrator can customize the Schedule adherence extension points to configure the formulas as required.

Components and formulas used in schedule adherence:

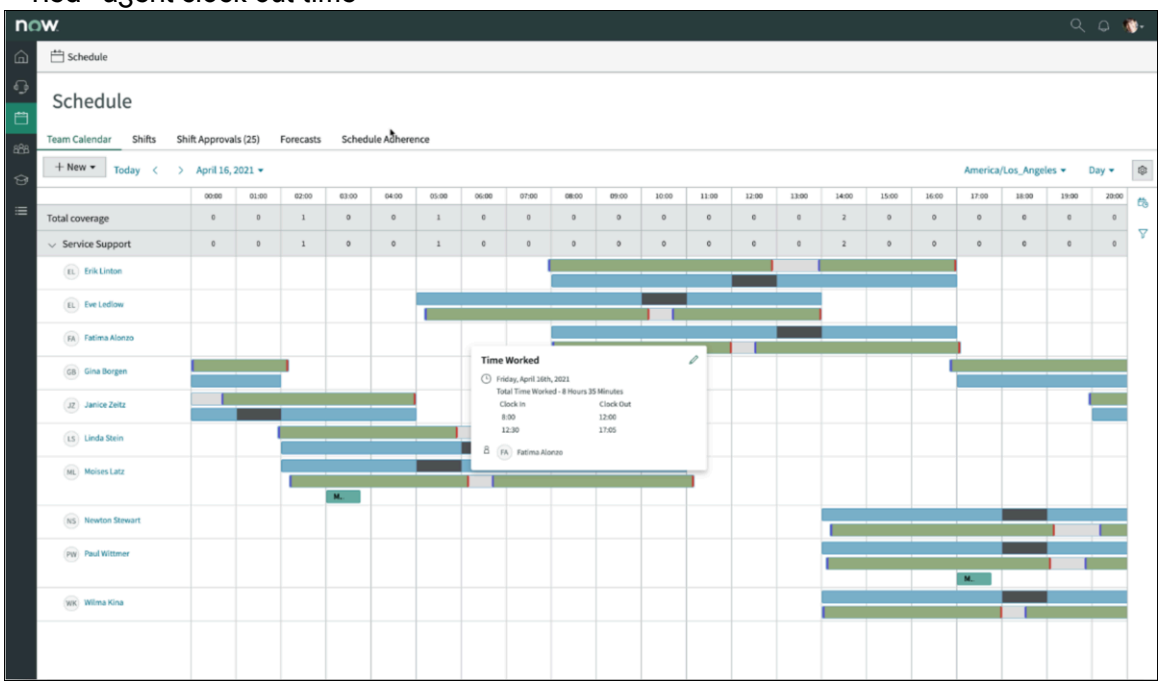
- The *Agent Time Work Event Trigger* business rule generates clock-in and clock-out events anytime there's a change in agent's presence state. The *shift_planning_clock-in* and *shift_planning_clock-out* scripts generate the agents' clock-in and clock-out events from the login and logout sessions.
- Formulas:
  - Schedule adherence is calculated as `(Minutes worked in shift/Scheduled shift time in minutes + Overtime)`.
  - Conformance is calculated as `(Minutes worked in shift + Overtime)/ Scheduled shift time in minutes`.

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Click the Schedule icon ( ).
3. Monitor the schedule adherence of your agents.

The image below shows an example of how well the team members are adhering to their work schedules. The bar colors are represented as follows:

- Blue—planned work shift
- Gray—agent not available
- Green—agent is available
- Purple—agent clock-in-time
- Red—agent clock-out-time



© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use time-worked summary to analyze agent schedule adherence and conformance

Analyze if your teams are adhering to planned schedules. Use historical adherence to see how well your agents have followed their schedules in the past.

Before you begin

Role required: sn_shift_planning.admin

About this task

Note:

- Historical adherence provides a reports of real-time adherence.
- Adherence and conformance calculations are based on your agents' actual and planned work schedules. Your administrator can modify the schedule adherence and conformance configurations. For more information, see Schedule Adherence reference.

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Click the Lists icon ( )
3. In the **Schedule Adherence** category, do any of the following:
   - To analyze your agents' time-worked summary, select **Time Worked Summary**.
   - To analyze your agents' time attendance, select **Time Attendance**.

Note:
The **Available Non Planned time** captures the time the agent was available and clocked in outside of the agent's scheduled work events. For example, if an agent is scheduled to attend a training from 1 pm to 2 pm, but forgets to clock out that attendance, then that time is considered as the clocked-in time. Therefore, the training time from 1 pm to 2 pm will be captured as the available non-planned time.

Example:

To understand the computations of the fields in a time worked summary, let's consider Fatima Alonzo's work day:

- Shift time begins at 8 a.m. and goes to 4 p.m. = 8 hours
- Planned time = 8 hours = 480 minutes
- Clocks in 8 a.m. and clocks out at 12 p.m. for a break. Back from the break, clocks in at 12:30 p.m. and clocks out at 4 p.m.
- Minutes worked in shift = 480 - 30 = 450 minutes
- Schedule adherence= (minutes worked in shift/scheduled shift time in minutes + overtime) = 450/(480+65) = 82.57%
- Conformance= (minutes worked in shift + overtime)/scheduled shift time in minutes = (450 + 65) / 480 = 107.29 percent.

Note:
Fatima Alonzo is adherent because the schedule adherence and conformance are within the threshold. To see which agents are non-adherent, look for the numbers that are highlighted in red.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule adherence extension points in Workforce Optimization for ITSM

Use the schedule adherence extension points to call custom scripts for agent schedule adherence and conformance.

To access the extension points, navigate to **System Extension Points** > **Scripted Extension Points**.

Extension points for schedule adherence

Extension point name	Description
`sn_shift_planning.ScheduleAdherenceExtPoint`	Implement this extension point to customize the logic for schedule adherence and conformance.

Related topics

Using extension points to extend application functionality

Configure properties for schedule adherence and conformance

Configure schedule adherence properties to calculate the adherence and conformance of your agents so that you can improve the operational efficiency of your organization.

Before you begin

Role required: admin

About this task

The threshold settings for adherence and conformance indicate how many minutes early or late an agent can clock in or clock out to a scheduled work shift without being considered as non-adherent.

Procedure

1. Navigate to **All** > **Shift Planning** > **Schedule Adherence** > **Settings**
2. On the form, fill in the fields.

Schedule Adherence properties form

Field	Description
Enable Schedule Adherence	Calculation and information about the agents' adherence to the schedules.
Threshold for early checkin for planned shift (in Minutes)	Time that you can set for early check in. This time is the acceptable time for an agent to start the work shift before the actual shift time. The default value is 60 minutes. For example, if an agent's planned work shift is 8 a.m. to 5 p.m. and the agent clocks in at 7 a.m., the threshold time allows flexibility and the agent is not considered as a non-adherent agent.
Threshold for adherence % of Time Worked Summary	Percentage that you can set for a threshold in adherence. The agents who do not qualify to be above the defined threshold value (70%) are considered non-adherent agents.
Lower threshold conformance % of Time Worked Summary	Lower threshold percentage that you can set for flexibility in conformance. The agents who do not qualify for the defined lower and upper conformance threshold values (80-120) are considered as non-conformant agents. The default value is 80%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Upper threshold for conformance % of Time Worked Summary	Upper threshold percentage that you can set for flexibility in conformance. The agents who do not qualify for the defined lower and upper conformance threshold values (80-120) are considered as non-conformant agents. The default value is 120%.
Default threshold time for clock-out event generation (in Minutes)	Default threshold time to generate an automatic clock-out event if an agent fails to clock out. The default value is 60 minutes. For example, if an agent's planned work shift is 8 a.m. to 5 p.m. and the agent fails to clock out at 5 p.m., the system waits for 60 minutes as the threshold time and generates an automatic clock-out event.

3. Click **Save**.

Schedule Adherence in Workforce Optimization for ITSM

Demand Forecast in Workforce Optimization for ITSM

Learn how you can use Demand Forecast to predict resources based on historical data.

The video below shows an overview of the Demand Forecast application.

Demand Forecast in Workforce Optimization for ITSM

Demand Forecast uses MetricBase to forecast the demand for teams.

When you create demand forecast configurations, the application creates metrics:

- To forecast the number of agents you need for interactions.
- To resolve incidents throughout a given day.

Note:
You can create forecast configurations for any table.

Analyzing Demand Forecast resource prediction

Watch this video to see how you can model demand scenarios and view updated demand on the calendar.

Demand Forecast - Model Demand Scenarios

As a manager with the forecast admin role, you can create forecast parameters in the Workforce Optimization for ITSM Manager Workspace. Modify forecast parameters to visualize forecast data and preview time-series data before publishing it. You can create any number of forecasts to preview the time-series data in real time.

You can also make manual adjustments to tweak the forecast and analyze the forecast pattern. You can overlay the manual adjustments on the visualized forecast data and view the time-series data to analyze the forecast model. For example, if you have a specific pattern for the upcoming week but you know that a national holiday falls in the middle of the week where you need more agents because you expect the sales to go up, you can manually tweak the forecast to increase it by 10% and analyze that data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demand Forecast

The Demand Forecast application includes the following four modules:

Demand forecast application modules

Module Name	Description
Data Collection Definitions	Set conditions to define the data you want to collect for incidents, interactions, or any table.
Formula Parameters	Add parameters to be defined in the formula to calculate the resource count per hour in a day.
Resource Conversion Formula	Add formulas to convert forecast to resources.
Group Forecast Configuration	Associate the configured formula for resource conversion to groups.

As a forecast admin (sn_agent_forecast.admin), you can forecast the number of agents you need for a shift.

To forecast the demand:

1. Collect data by defining data collection definitions
2. Create forecast parameters.
3. Create formulas to convert the forecasting number of incidents into the number of resources you must respond to those incidents.
4. Associate the formulas to assignment groups.
5. View the predicted demand on the calendar.

Note:
Refer to Demand Forecast in Workforce Optimization for ITSM configurable workspace for information on default components and configurations installed with Demand Forecast.

Collect data by defining data collection definitions

Use the **Data Collection Definitions** application to define the data you want to collect for forecasting agents.

- Use the *Collect daily data for automated forecast configurations* scheduled job to gather data for the metrics defined in the data collection definitions. The scheduled job fetches the records from the previous day for each hour and for every assignment group. It stores this data in the MetricBase.

  You can access the time series for the collected data using the MetricBase `list` on the Group [sys_user_group] table. For more information on accessing MetricBase data, refer to Access MetricBase data using the list command.

- Use the *Collect historical data for automated forecast configurations* on-demand job to collect hourly historical data. This job collects data for the past three years.
- Use the **Forecast resources for future** scheduled job to forecast the resources based on the collected data. The scheduled job stores the data in the Agent Forecast metric in MetricBase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refer to the forecast properties to set the collection frequency such as the number of days you must collect the data. You can use this information to calculate the forecast or the time period for which you want to store the data.

Note:
The time series metrics created for data collection definitions use the **WFO Forecast** retention policy. This policy stores data at a one-hour interval for the past three years.

Create formula parameters

Use numeric values or a script to define parameters to use in the formula for forecasting. Refer to the resource forecast configurations for the configured resource forecast formulas available by default.

Associate formulas to assignment groups

To convert the number of incidents to agents, associate assignment groups to the resource-conversion formula.

View the predicted demand on the calendar

The data collected by the Agent Forecast metric in MetricBase is used to forecast the agents you need for each hour in a day. This data is displayed on the team calendar. In a Week view for the calendar, it displays the staffing levels for a given week.

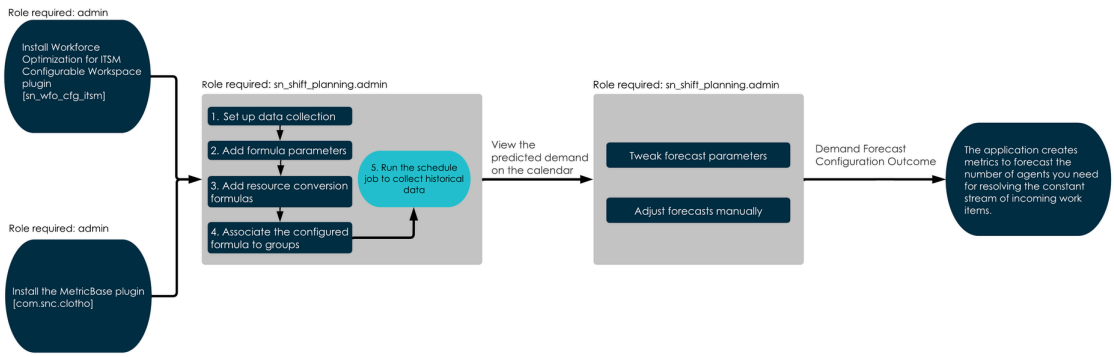
Related topics

Set up Demand Forecast

Setting up Demand Forecast in Workforce Optimization for ITSM

Configure the data you want to collect, modify forecast parameters and calibrate manual adjustments using Demand Forecast.

The image shows the end-to-end flow of setting up Demand Forecast.



Configure Demand Forecast

Define the data that you want to collect for incidents, interactions, or any table to forecast the number of agents that you require for your staffing needs.

Before you begin

- You must have the MetricBase plugin [com.snc.clotho] enabled to use Demand Forecast in Workforce Optimization for ITSM. For more information, see Requesting the MetricBase product.
- You must be in the Global scope.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_agent_forecast.admin

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Demand Forecast**
2. Define the data that you want to collect for forecasting the number of agents that you need.
   a. Click **Data Collection Definitions**.

      See the forecast configuration tables for demand forecast for the list of configurations that are available by default.

   b. Click New.
   c. On the form, fill in the fields.

Forecast Configuration form

Field	Description
Name	Unique name for the collection forecast configuration.
Type	Data Collection Definition type that is set to **Collection** by default and collects data using a scheduled job.
Table	Table that is used for collecting data. From the list, do one of the following: ▪ To collect data to forecast incidents, select **Incidents**. ▪ To collect data to forecast interactions, select **Interactions**.
Condition	Conditions that you can set so that you can capture the data that you need.
Date Field	Data that you can add to forecast for the future.

   d. Click **Submit**.

> **Note:**
> A forecast parameter in **Published** state is automatically created.

   e. Create an index for the table that you have created using the date field and the conditions that you have added to the table. For information on creating a table index, see Create a table index.

3. Add parameters for the formula to calculate how many agents you need per hour in a day.
   a. Click **Formula Parameters**.
   b. In the **Name** field, enter a name for the parameter.
   c. Do one of the following:
      ▪ To add a value to be calculated for the formula, in the **Value** field, enter the value.
      ▪ To use the performance analytics score card API or a custom API, click **Advanced,** and add the script.

   The Average Chat Duration and Average Walkup Duration forecast parameters that are provided by default are examples of how you can use scripts to add the parameters. For a list of parameters provided by default, see the forecast parameters in demand forecast for the list of configurations that are available by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A resource conversion formula uses multiple data collection definitions to calculate the resource conversion. In a data collection definition, if the forecast parameters set for each of the forecast configurations vary, the resource conversion formula uses the lowest parameter values set for a forecast configuration.

For example, let's assume:

- The P1 Incidents Created forecast configuration has the period length set to seven days and periods to forecast set to 2. Therefore, the next number of days for which the forecast would be calculated is 14 days.
- The Chat Interactions Created forecast configuration has the period length set to seven days and periods to forecast set to 4. Therefore, the next number of days for which the forecast would be calculated is 28 days.

When you add both of these forecast configurations to the resource conversion formula, it only considers the lower of the two forecast configuration values, which is 14 days, to calculate the resource conversion.

d. Click **Submit**.

4. Configure the resource conversion formula.

a. Click **Resource Conversion Formula**.

b. Click **New**.

c. On the form, fill in the fields.

Forecast Configuration form

Field	Description
Name	Name for the resource forecast configuration.
Type	Type that is set to **Resource Conversion Formula**.
Formula	Formula to calculate the forecasted number of agents that you need. In the Related Links section, do the following: ▪ Click **Browse Forecast Configuration**, select the forecast configuration to add to the formula and click **Add**. ▪ Click the **Browse Forecast Parameter** related link, select the forecast parameter to add to the formula, and click **Add**. **Note:** **FC** refers to Forecast Configuration and **FP** refers to Forecast Parameter.

d. Click **Submit**.

5. Associate an assignment group with a resource conversion formula.
You can assign a forecast configuration to multiple assignment groups, but an assignment group can have only one forecast configuration.

a. Click **Group Forecast Configurations**.

b. Click **New** and do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Assignment Group** field, click the search icon ( ) and select the group to which you want to associate a forecast configuration.
- In the **Forecast Configuration** field, click the search icon ( ) and select a **Resource Conversion Formula**.

What to do next

Run the *`Collect historical data for automated forecast configurations`* scheduled job. For more information, see scheduled jobs for demand forecast .

Related topics

Use Demand Forecast

Define the minimum and maximum number of agents to forecast demand

Set the minimum or maximum number of agents required per hour so that you always have the desired staffing coverage.

Before you begin

Role required: sn_agent_forecast_admin

About this task

When you calculate the number of agents for your staffing needs, you have the option of defining how many minimum or maximum number of agents you would need by default per hour using the `Math.min` and the `Math.max` functions.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Demand Forecast** > **Formula Parameters**.
2. Create a formula parameter to set either the minimum or maximum number of agents you need every hour.
   a. Click **New**.
   b. In the **Name** field, enter a unique name for the parameter.
   c. In the **Value** field, enter the number of agents required when converting resources.
      - To set the minimum number of agents, enter the lowest number of agents you would require per hour.
      - To set the maximum number of agents, enter the highest number of agents you would require per hour.
   d. Click **Submit**.
3. Create a Resource Conversion formula.
   a. Click **Resource Conversion Formula**.
   b. Click **New**.
   c. in the **Name** field, enter a unique name for the resource conversion formula.
   d. Right-click the form header and click **Save**.
   e. In the **Formula** field, do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create a formula for the minimum number of agents required per hour:

  i. Add the `Math.max` function.

  ii. Click **Browse Formula Parameters** and select the formula you have created to set the minimum number of agents.

  iii. Click **Browse Forecast Configuration** and select the formula you want to use for the forecast configuration.

  When the resource conversion formula is calculated, the higher of the two values is used as the lower limit for the minimum number of agents required per hour.

  For example, let's assume you need a minimum of two agents per hour and you're using the following formula: `Math.max(([FP:Min Number of Agents]), (([FC:Chat Interactions Created] * [FP:Average Chat Duration]) / [FP:Average Agent Work Time Per Day]))`, where,

  - You've set the `[FP:Min Number of Agents]` value to 2.
  - The output value for this formula `[FC:Chat Interactions Created] * [FP:Average Chat Duration]) / [FP:Average Agent Work Time Per Day]` is 0.

  Although the forecast configuration indicates that no agents are required, because you've set the minimum number of agents to two, that value will be used for resource conversion.

- To create a formula for the minimum number of agents required per hour:

  i. Add the `Math.min` function.

  ii. Click **Browse Formula Parameters** and select the formula you have created to set the maximum number of agents.

  iii. Click **Browse Forecast Configuration** and select the formula you want to use for the forecast configuration.

  When the resource conversion formula is calculated, the lower of the two values is used as the upper limit for the minimum number of agents required per hour.

  For example, let's assume you need a maximum of eight agents per hour and you're using the following formula: `Math.min(([FP:Max Number of Agents]), (([FC:Chat Interactions Created] * [FP:Average Chat Duration]) / [FP:Average Agent Work Time Per Day]))`, where,

  - You've set the `[FP:Max Number of Agents]` value to 8.
  - The output value for this formula `[FC:Chat Interactions Created] * [FP:Average Chat Duration]) / [FP:Average Agent Work Time Per Day]` is 10.

  Although the forecast configuration indicates that 10 agents are required, because you've set the maximum number of agents to eight, that value will be used for resource conversion.

f. Click **Submit**.

Modify forecast parameters to visualize forecast data

Configure and tweak forecast parameters to see how the forecast behaves when you vary the period length, periods to forecast, or algorithm. You can view the modified forecast on the time-series visualization.

Before you begin

Role required: sn_agent_forecast.admin and sn_wfo_itsm.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The user with these roles must also be a manager of the assignment group that is associated with the resource conversion formula.

About this task

You can define the start and end dates for which you want to visualize the forecast data. The start date for a forecast configuration is based on the number of historical days you want to consider for data visualization. This is set using the *sn_agent_forecast.number_of_historical_days_in_timeseries_chart* property.

The default start date is set to 90 days ago starting from the day before the current day. The end date is calculated based on the period length and the periods to forecast represented in days. For example, if the period length is 7 days and the periods to forecast is 5, then the end date is 35 days including the current day.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the Schedule icon .
3. Click **Forecasts**.
4. Select the forecast model for which you want to view the time-series data.
   You can visualize each of the forecast parameters that were created for the forecast model.
5. Click the gear icon .
6. Click the plus (+) sign.
7. Configure the forecast parameter.
   a. From the **Period length unit** list, select the unit for the length of the period to forecast.
   b. In the **Period length** field, enter the length of a season to forecast.
   c. In the **Periods to forecast** field, enter the number of seasons, which is the period length, for which you want to forecast.
   d. In the **Algorithm** field, select an algorithm you want to use to calculate the forecast.
   e. Click **Update**.
   The forecast is created in **Draft** state. The forecast is calculated and displays in the forecast model. You can analyze the forecast with the new forecast parameters before you publish it.
8. To preview a forecast before publishing it, click **Preview**.
   The forecast is calculated using the algorithm and parameters configured in the forecast parameter. When you create a manual adjustment to predict future resources, Demand Forecast overlays the adjustment in the time-series chart.
9. Publish the forecast parameters.
   a. To publish a newly created forecast parameter, click **Save** and then click **Publish**.
   b. To publish an active forecast parameter, click **Publish**.

   Note:
   You can only have one forecast in **Published** state, which is used to calculate the resources.

   When the forecast parameter is published:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The state of the record changes to **Published**.
- The **Forecast resources for future** job runs daily and uses the published forecast parameters to calculate the agent forecast. The calculation uses the resource conversion formula to calculate the forecast data from the current point forward. You can view the updated resources in the team calendar.
- Any other forecast parameters that were created would be unpublished and inactive.

What to do next

Create a manual adjustment for a forecast

Create a manual adjustment for a forecast

Adjust forecasts manually to fine-tune them for greater accuracy. Create the adjustment for a specified time period and analyze how it impacts your forecast.

Before you begin

Role required: sn_agent_forecast.admin and sn_wfo_cfg_itsm.manager

The user with these roles must also be a manager of the assignment group that is associated with the resource conversion formula.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the Schedule icon.
3. Click **Forecasts**.
4. Select the forecast model for which you want to make a manual adjustment.
5. Click the Manual Adjustments icon.
6. Make a manual adjustment.
   a. Click the manual adjustment icon.
   b. Fill in the following fields.

Field Name	Description
Name	Unique name for the manual adjustment.
Start Date Time	Date and time when the manual adjustment for the forecast must start.
End Date Time	Date and time when the manual adjustment for the forecast must end.
Adjustment Unit	Unit for the manual adjustment. Available values: ▪ Percentage—adjustment value percentage. For example, if the forecast data shows incident count and if the adjustment value is 15, the manual adjustment shows a 15% increase in incident count than the forecast data. ▪ Number—adjustment value count. For example, if the forecast data shows incident count and if the adjustment value is 15, the manual adjustment shows 15 more incidents than the forecast data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field Name	Description
Adjustment Value	The numeric value for which you want to adjust the forecast. The value is applied to each group in the Groups [sys_user_groups] table. The manual adjustment visualization on the time-series chart displays the data for your groups. For example, let's assume that the value is 15 and the unit is number. On a given day, if you have two groups for a forecast model and both have 2 agents each before you do the manual overlay, when you enter the value as 15, it is applied to each of the two groups and the total value displays as 34. This is calculated as follows: ▪ Two agents for group A + the adjustment value 15 = 17 ▪ Two agents for group B + the adjustment value 15 = 17 The total is 34.

c. Click **Save**.
The manual adjustment is created in **Draft** state. The manual adjustment is calculated and displays as a green line in the forecast model. You can analyze or update the forecast with this manual adjustment before you publish it.

7. Publish the manual adjustment.

a. Click the saved manual adjustment that you want to use for forecasting resources.

b. Click **Publish**. The state changes to **Ready to Publish**.
When the **Forecast resources for future** job is run, it calculates the forecast, checks for manual adjustments, applies those values if any, and moves it to the **Published** state.

Note:

- When you unpublish a forecast, it moves to **Draft** state. You can delete a forecast that is in **Draft** state.
- If you want to end a manual adjustment after it has started and before its end date, you can click **End Now**.

The forecast will no longer be used in the resource conversion formula.

When the manual adjustment is published:

- The state of the record changes to **Published**.
- The adjusted values will be used in the resource conversion formula and the demand forecast displayed on the calendar.
- Any other manual adjustment configurations that were created would be unpublished and moved to **Draft** state.

Demand Forecast components in Workforce Optimization for ITSM

Workforce Optimization for ITSM installs roles to administer ITSM Manager Workspace Demand Forecast, properties to configure default behavior, scheduled jobs to collect data for the configurations, tables to store data, forecast configurations to collect data for incidents and interactions and a retention policy to store metric data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Forecast configurations

Name	Description
Chat Interactions Created	Collects data for chat interactions.
Non P1 Incidents Created	Collects data for all incidents that are not tagged as priority 1.
P1 Incidents Created	Collects data for priority 1 incidents.
Walkup Interactions Created	Collects data for walk up interactions.

Metric retention policy

The **WFO Forecast** time series metric retention policy is available by default for all forecast configurations. By default, this retention policy stores data at a one-hour interval for the past three years.

Formulas to create resource forecast configurations

Name	Formula to create this resource forecast configuration
Chat Interactions to Agent Conversion	`([FC:Chat Interactions Created] * [FP:Average Chat Duration]) / [FP:Average Agent Work Time Per Day]`
Incident and Interaction Resources	`[FC:Incidents Created to Agent Conversion] + [FC:Chat Interactions to Agent Conversion] + [FC:Walkup Interactions to Agent Conversion]`
Incidents Created to Agent Conversion	`(([FC:P1 Incidents Created] * [FP:Average P1 Incident Work Time]) / [FP:Average Agent Work Time Per Day]) + (([FC:Non P1 Incidents Created] * [FP:Average Non P1 Incident Work Time]) / [FP:Average Agent Work Time Per Day])`
Walkup Interactions to Agent Conversion	`([FC:Walkup Interactions Created] * [FP:Average Walkup Duration]) / [FP:Average Agent Work Time Per Day]`

Forecast parameters

Name	Description
Average Agent Work Time Per Day	Average time an agent works in a given day.
Average Chat Duration	Average duration of an agent chat for each incident or interaction.
Average Non P1 Incident Work Time	Average time an agents spends working on all incidents that are not categorized as Priority 1.
Average P1 Incident Work Time	Average time an agents spends working on all incidents that are categorized as Priority 1.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Average Walkup Duration	Average duration an agent spends on a walkup interaction.

If you create forecast parameters for a forecast configuration, the values set in the configuration are used instead of the default forecast parameters listed in the forecast properties section. For information on configuring forecast parameters, see Modify forecast parameters to visualize forecast data

Forecast properties

Name	Description	Example
sn_agent_forecast.historical_data_points	The hourly historical data points to be used for the forecast. The maximum allowed data points is 26280. The default value is 8760 and represents the hourly data points for a one year time period (24 hours x 365 days x 1 year).	For example: 24 hours x 365 days x 3 years = 26280
sn_agent_forecast.seasonal_frequency	The seasonal frequency of a repeated pattern. The default value is 168.	For example: • Daily data pattern = 1*24 = 24 • Weekly data pattern = 7 * 24 = 168 • Monthly data pattern = 30 * 24 = 720
sn_agent_forecast.forecast_periods	The number of periods/ seasons to forecast. A period is the length of a season.The default value is 5.	For example: • If the length of a season is daily which is equal to 24 hours (1 day) and the forecast period is 30, then the number of periods to forecast is equal to 24 * 30 = 720 hours. • If the length of a season is weekly which is equal to 168 hours (1 week) and the forecast period is 5, then the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Example
		number of periods to forecast is equal to 168 * 5 = 840 hours.
sn_agent_forecast.number_of_historical_days	The number of historical days that will be plotted in the time-series chart in Manager Workspace.	For example, if the number is set to 90,then the number of days is counted from the current day to 90 days ago.

Roles for Demand Forecast

Role title [name]	Description	Contains roles
Forecast admin [sn_agent_forecast.admin]	Grants administrative rights to create, read, update, and delete (CRUD) forecast configuration tables.	• sn_agent_forecast.users • clotho_admin
Forecast user [sn_agent_forecast.user]	Grants read access to forecast configuration tables.	

Tables for Demand Forecast

Table	Description
Forecast Configuration [sn_agent_forecast_configuration]	Define data collection definition and resource conversion formula configurations.
Forecast Parameter [sn_agent_forecast_parameter]	Define forecast parameters required for the formula.
Forecast Configuration group [sn_agent_forecast_configuration_m2m_sys_user_group]	Associate resource conversion formula with assignment groups.

Forecast configurations available by default

By default, forecast configurations are available for the following groups:

- Deskside Support
- IT Service Desk
- Application Support
- Technical Support

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Schedule jobs for Demand Forecast

Name	Description
Collect historical data for automated forecast configurations	• On-demand job to collect historical data • Collects historical data daily for every hour for the past three years
Collect daily data for automated forecast configurations	• Runs daily at 2 am • For each table defined in the Data Collection Definition configuration, it fetches the records from the previous day for each hour for every group and stores it in the MetricBase • You can access the time series for the collected data using the MetricBase list command on the Group [sys_user_group] table • Uses the WFO Forecast retention policy for data retention
Forecast resources for future	Calculates the forecast resources for the future based on the collected data. • Runs daily at 3 am • Collects hourly data every day for the formula forecast configuration • Stores the data in the Agent Forecast metric in MetricBase • Uses forecast properties to set the data collection frequency or time period to store the data. The forecast properties will not be used if a published forecast parameter exists for a data collection definition.

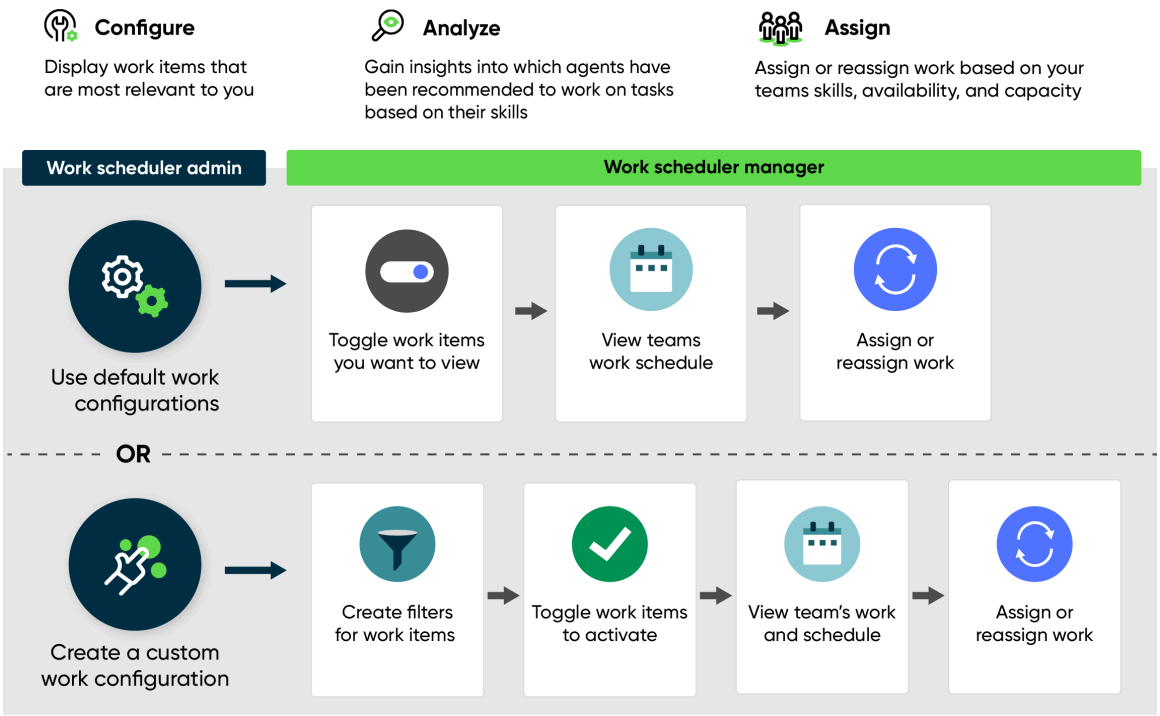
Work scheduler in Workforce Optimization for ITSM

Manage the work of all your teams from a central location. You can get visibility into your entire teams' workload. You can assess the complexity level of your teams' tasks, their capacity to take on the work, and assign or reassign work—all from a calendar interface.

Here's an overview of Work scheduler. Work scheduler

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The image provides a high-level overview of Work scheduler.



As an admin, you can:

- Create work configurations that managers can view in their work queue. For information on setting up work configurations, see Set up a work configuration.
- Create work scheduler cards and configure them based on your needs. For more information, see Create a Work scheduler card using the Next Experience UI Builder.
- Associate the work scheduler cards with work configurations. For more information, see Associate a work scheduler card to the work configuration.

As a manager, you can:

- Create custom preset filters to prioritize your work items based on what's important for you.
  - You can define the filters based on task type. For example, you can set filters for incidents that are categorized as Priority 1 and Priority 2.
  - You can also define filters based on use cases. For example, if you want to prioritize catalog tasks from a VIP business unit over other units, you can define those conditions for the filter.
- Configure your work queue to display the most relevant work items.
- Assign work items based on skill recommendation.
- Assign work items based on your teams' shifts.

For more information, see Assign work based on your teams' skills and capacity.

Getting started with Work scheduler in Workforce Optimization for ITSM

Easily find the tasks that you must complete in the Scheduling module.

Setting up Work scheduler in Workforce Optimization for ITSM

Customize an existing work scheduler card based on your need. You can also create a work configuration and work scheduler card from scratch and associate them so that managers can view the cards in their work queue.

Customize a Work Scheduler card using the Next Experience UI Builder

Customize the Work Scheduler card components, such as adding an extra field, or changing the color or order of a field, to display them in the Work scheduler queue.

Before you begin

Role required: admin, workspace_admin, or ui_builder_admin

About this task

You can duplicate an existing work item variant such as an Incident, Problem, Change Request and customize it based on your needs.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. In the **My experiences** list, select **Manager Workspace**.
3. Select the Pages icon.
4. In the **Page** menu, select **Work scheduler**.
5. In the left pane, go to the **Content** section and navigate to **Body (Flex)** > **Work queue (Flex)** > **Sidebar**.
6. In the right pane, select the icon (⬚) in the **Work item cards default** sub-page.
7. In the left pane, select **Body (Flex)** > **Viewport1**.
8. In the right pane, select the icon (⬚) next to a card, for example, **Incident default**, that you want to configure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. To duplicate the selected variant, in the left pane, in the **Variants** section, hover over the variant you want to duplicate, select the ( ) icon and select **Duplicate**.
10. Hover over the variant you have duplicated, select the ( ) icon and select **Edit conditions**.
11. In the **Order** field, set the order to be the lowest value so that this variant will display in manager workspace.

    Tip:
    You can only display one variant for a work item type.

12. Click **Save**.
13. Customize the variant you've created using any of the tasks or steps listed in Create a Work scheduler card using the Next Experience UI Builder.

Example:

If you'd like to configure this in the Work Scheduler card	Refer to
Add fields	Create page scripts for Work scheduler and refer to the Create the **Transform workItem to cardProps** page script steps.
Add an avatar	Configure an avatar component for Work scheduler

Related topics

Create a page in UI Builder

Set up a work configuration

Create a work configuration for a work item. Add filters that display key information that the manager wants to analyze. This work configuration will determine how the work items display on the Work scheduler calendar in manager workspace.

Before you begin
Role required: sn_wfo_work_sched.admin

Procedure

1. Navigate to **All** > **Work Scheduler** > **Work Configurations**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for the work configuration.
Table	Table for which you want to create the work configuration. The following tables are available by default to create work configurations: ○ Catalog Task ○ Change Request

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Change Task ○ Incident ○ Interaction ○ Problem ○ Request ○ Requested Item
Description field	The field from the selected table that you want to use for describing the work item.
Assigned to field	The field from the selected table that you want to use for assigning an agent to the work item.
Assignment group field	The field from the selected table that you want to use for assigning a group to the work item.
Start date field	The field from the selected table that you want to use to display the start date for the work item.
End date field	The field from the selected table that you want to use to display the end date for the work item.
Default color	The preferred color to display the work item card in the manager workspace.
UX app route	The route where the card layout is defined for this work item type. The route displays in UI Builder in the list of experiences. This UX app route determines the layout of the work item card. By default, it is set to **Default card**, which displays the following fields: ○ Description field ○ Assigned to field ○ Assignment group field ○ Start date field ○ End date field If you need additional fields, you must add them in the **Extra fields** field. For information on defining a card layout, see Create a Work Scheduler card using UI Builder.
Order	The display order of the work item.
Extra fields	**Important:** If you need additional fields on the selected table that you would like to display in the work item card in the manager workspace, you must add it in this field.
Matching rule	Select a matching rule for the work configuration.

4. Right-click the form header and click **Submit**.
5. Create a work configuration filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Work Configuration filters** related list, click **New**.

b. In the **Name** field, enter a unique name for the filter.

c. Right-click and save the form to add the selected table.

d. Add the desired conditions for the work configuration filter.
For information on adding conditions, see Condition builder.

e. Select **Update**.

Create a Work scheduler card using the Next Experience UI Builder

Create a work scheduler card and add the components that you want to display based on your needs in the Work Scheduler application in manager workspace.

Before you begin
Role required: admin, workspace_admin, or ui_builder_admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. In the **My experiences** list, select **Manager Workspace**.
3. Select the Pages icon.
4. In the **Page** menu, select **Work scheduler**.
5. In the left pane, go to the **Content** section and navigate to **Body (Flex)** > **Work queue (Flex)** > **Sidebar**.
6. In the right pane, select the icon ( ) in the **Work item cards default** sub-page.
7. In the left pane, select **Body (Flex)** > **Viewport1**.
8. In the right pane, select **+Add** and enter a name for the card.
The **Path** field is automatically populated.
9. Select **Create**.
A new card is created.

> **Important:**
> After you create the work scheduler card, you must select the name of this card in the **UX app route** field in the work configuration you have created. For information on setting up a work configuration, see Set up a work configuration.

10. Select **Done**.
Follow the steps listed in each of the topics below in the given sequence to customize Work scheduler.

Create page scripts for Work scheduler

Add custom page scripts for the Work scheduler so that you can update the client state through events or update transform workItem object to properties.

Before you begin
Role required: admin, workspace_admin, or ui_builder_admin

About this task
Add the *Handle card clicked* and the *Handle card action clicked* page scripts to handle events that are generated when the card and its actions are clicked.

Add the *Transform workItem to cardProps* page script to transform the *workItem* object in the Work queue to properties for the card components.

Note:
If you have customized a Work scheduler card, you can follow the steps below to add client scripts.

Procedure

1. Select the Client Scripts icon ( ).
2. Create the *Handle card clicked* page script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Page scripts** section, click **+Add**.

b. In the **Script name** field, enter *Handle card clicked*.

c. In the **Script Includes** section, add the following script:

```
/**
* @param {params} params
* @param {api} params.api
* @param {any} params.event
* @param {any} params.imports
* @param {ApiHelpers} params.helpers
*/
function handler({api, event, helpers, imports}) {
  const {workItem} = api.context.props;
  api.emit('CARD_CLICKED', {workItem});
}
```

3. Create the *Handle card action clicked* page script.

a. In the **Page scripts** section, click **+Add**.

b. In the **Script name** field, enter *Handle card action clicked*.

c. In the **Script Includes** section, add the following script:

```
/**
* @param {params} params
* @param {api} params.api
* @param {any} params.event
* @param {any} params.imports
* @param {ApiHelpers} params.helpers
*/
function handler({api, event, helpers, imports}) {
  const {workItem} = api.context.props;
  const {action: actionItem} = event.payload;
  api.emit('CARD_ACTION_CLICKED', {workItem, actionItem});
}
```

4. Create the **Transform workItem to cardProps** page script and attach the *WorkSchedulerUIBCardUtils* script include.

a. In the **Page scripts** section, click **+Add**.

b. In the **Script name** field, enter *Transform workItem to cardProp*.

c. In the script editor, add the following script:

```
/**
* @param {params} params
* @param {api} params.api
* @param {any} params.event
* @param {any} params.imports
* @param {ApiHelpers} params.helpers
*/
async function handler({api, event, helpers, imports}) {
    const {workItem} = api.context.props;
    const {mappingFields, recordFields} = workItem;
    const cardUtils =
 imports['sn_wfo_work_sched.WorkSchedulerUIBCardUtils']();
    const fallbackValueLabel = await helpers.translate('<not
 defined>');
```

```
    const dropdownItems = workItem.tableMetadata.canDelete
        ? [{id: 'delete', label: await
helpers.translate('Delete')}]
        : [];
    // Fields for getContent() and getAria()
    const contentFields = [{
        name: 'assigned_to',
        label: await helpers.translate('Assigned to')
    },
    {
        name: 'assignment_group',
        label: await helpers.translate('Assignment group')
    },
    {
        name: 'start_date',
        label: await helpers.translate('Start date')
    },
    {
        name: 'end_date',
        label: await helpers.translate('End date')
    }];
    // Create cardProps
    const cardProps = {};
    cardProps.tagline = {
        label: workItem.recordFields._row_data.displayValue
|| null
    };
    cardProps.heading = {
        label: mappingFields.description ?
mappingFields.description.displayValue : fallbackValueLabel
    };
    cardProps.dropdowns = dropdownItems.length > 0
        ? [{id: 'dropdown1', items: dropdownItems, icon:
'ellipsis-v-outline'}]
        : [];
    cardProps.content = await cardUtils.getContent(helpers,
contentFields, workItem, null, null, true);
    cardProps.aria = await cardUtils.getAria(helpers,
contentFields, workItem, null, true);
    cardProps.assignedTo = mappingFields.assigned_to ?
mappingFields.assigned_to.displayValue : null;
    api.setState('cardProps', cardProps);
}
```

To customize the display of the fields, refer to https://developer.servicenow.com/dev.do#!/reference/next-experience/utah/now-components/now-label-value-stacked/overview.

5. Click **Save**.

Define the workItem property in the Work scheduler page configuration

Add the *workItem* property to the Work scheduler page configuration to receive the *workItem* object provided by the work queue.

Before you begin
Role required: admin, workspace_admin, or ui_builder_admin

Procedure

1. In the **Page configuration** section, select the **Config** tab.
2. In the **Properties** section, select **Edit**.
3. In the **Edit properties** pop-up window, select **+Add**.
4. In the **Property name** field, enter *workItem*.
5. From the **Type** menu, select *JSON*.
6. Select **Add**.
7. Select **Save**.
   The *workItem* property is created.
8. Hover over the *workItem* property and select the Dynamic data binding icon ( ).
9. In the *workItem* field, type *@state.workItem*.
10. Click **Save**.

What to do next
Define event mappings for Work scheduler

Define event mappings for Work scheduler

Add event mappings required for card interactions and for the card properties transformation to the page configurations in Work scheduler.

Before you begin
Role required: admin, workspace_admin, or ui_builder_admin

Procedure

1. In the **Page configuration** section, select the **Events** tab.
2. Attach the *Transform workItem to cardProps* to the **Page ready** event.
   a. In the **Page ready** menu, select **+Add a new event handler**.
   b. In the pop-up screen, go the Scripts section and select *Transform workItem to cardProps*.
   c. Select **Add**.
3. Attach the *Transform workItem to cardProps* to the **Page ready** event.
   a. In the **Page ready** menu, select **+Add a new event handler**.
   b. In the pop-up screen, go the Scripts section and select *Transform workItem to cardProps*.
   c. Select **Add**.
4. Attach the *Transform workItem to cardProps* to the **Page property changed** event.

Associate a work scheduler card to the work configuration

Associate the work scheduler card that you've created to the work configuration to display the card in the Work scheduler sidebar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin, workspace_admin, or ui_builder_admin

Procedure

1. Navigate to **All** > **Work Scheduler** > **Work configuration**.
2. Select the work configuration to which you want to associate the work scheduler card.
3. In the **UX app route** field, select the name of the work scheduler card.
4. Select **Update**.
   The work configuration card displays in Work scheduler in manager workspace.

   For information on setting up a work configuration, see Set up a work configuration.

   For information on creating the work scheduler card, see Create a Work Scheduler card using UI Builder.

Create extension points for Work scheduler

Create extension points to customize your implementation in Work scheduler. For example, if you want your team members to work on an on-site task, you can configure the location of your team members to the work items assigned to them so that they can get to the tasks quickly.

Before you begin
Role required: admin

You must set the application scope to Work scheduler (sn_wfo_work_sched).

About this task
The *WorkItemSkillsRecommendationManager* extension point is available by default.

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. Open the *sn_wfo_work_sched.WorkItemRecommendationManager* extension point.
3. In the Related Links section, select **Create Implementation**.
4. Define the functions based on your needs to customize your implementation.

Assigning work using Work Scheduler in Workforce Optimization for ITSM

Manage your teams' work assignments easily by customizing your work queue to display the most relevant work items.

Gain insights into which agents have been recommended to work on a task based on the mandatory and optional skills they have.

Assign work based on your teams' skills and capacity

Plan your teams' work and assign work items such as incidents, problems, change requests, or interactions to them based on their skills, availability, and capacity. View your teams' shifts, events, and work assignments and assign or reassign the work items from a central location.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Note:
Your administrator must add sys ids for event categories that you want to display in the calendar to the *sn_wfo_work_sched.shift_data_categories* system property. For more information, see Work Scheduler components in Workforce Optimization for ITSM reference.

Role required: sn_wfo_work_sched.manager

About this task

Analyze the tasks that your agents are assigned to and their actual shift plans. If the agent doesn't work during the duration the task has to be completed, you can reassign the task based on agent availability.

Note:

- Each type of task is displayed in the color defined in the queue configuration.
- You can enter keywords in the **Search** field in the sidebar to search a card.

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the **Work Scheduler** icon.
   - You can view the work shifts of all of your agents for all teams you manage. When you select the shift, the pop-up displays the shift details such as the shift time span and agent break times.
   - In the contextual side panel, select the Filter icon ( ) and then select any filter, add the desired criteria, and select **Apply** to narrow down the display of the team members in the calendar. You can filter based on your team's assignment group, skills, location, schedule plan, or shift plan.
3. **Optional:** If you don't have any queue configurations in the Work scheduler, select the queue settings icon ( ) and then enable up to five work item types.
   The application creates a queue configuration and corresponding filters for each enabled work item type.
4. **Optional:** Create a queue configuration.
   a. Select **Queue configurations**.
   b. In the **My queue configurations** list, select **New**.
   c. On the form, fill in the fields.

Name	Description
Name	Name for the queue configuration.
Work configuration	The type of work configuration you want to use for the queue configuration.
Color	The work item color that displays in the calendar.
Order	The order number in which you want the queue configuration displayed in Work scheduler.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Matching rule	The matching rule for the work item type.

d. Select **Save**.

5. Analyze your teams' work and schedule.

a. From the **Queue** menu, select a work item to view related tasks.

For example, if you select **Unassigned Incidents**, you can see all tasks related to the Unassigned Incident queue.

You can select a time zone to view the agent schedule in that time zone.

b. Analyze the tasks and work shifts for each agent in the calendar.
You can use the pagination to scroll through the work shifts.

6. Assign a work item to an agent.

a. Select a task that you want to assign to an agent.

When you enable the **Show suggested only** option, by default, you can choose to display team members based on their availability, skills, or time zone. The ranking of the team members are based on matching assignment rules set for each criteria. Work scheduler uses Assignment workbench to evaluate agents to work on tasks.

You can select one or more of these criteria and the ranking of the team members will be based on the selected criteria:

- **WFO - Availability**—The number of hours the team member is available.
- **WFO - Mandatory skills**— If the task has mandatory and optional skills associated with it, the work scheduler displays agents who have all of the mandatory skills first and then the agents who have the optional skills.
- **WFO - Optional skills**— If the task only has optional skills associated with it, then the list displays the agents with the optional skills.
- **WFO- Timezone overlap**—The delta between the task time zone and the user's time zone. For example, if the user is located in the Pacific time zone and if the task location is in the Eastern time zone, then it will display as **+3**; if the task location is Hawaii, then it will display as **-3**.

To add your own matching rule, see Create a criteria for a matching rule in Work scheduler.

All of these criteria are based on the **More is better** ranking method where a higher value is better. For example, when the WFO-Mandatory skills criteria is enabled, team members that have more skills that are mandatory to work on the work item will be ranked higher.

For each criteria, if there is 100% match, then the values are displayed in green color; if not, the values are displayed in yellow color. If all criteria match a 100% then the matching details are displayed in green color; if not, they're displayed in yellow color.

b. Select an agent from the work scheduler calendar to whom you want to assign the task.

c. Click and drag your mouse device for the time span on the calendar for which you want the agent to work on the task.

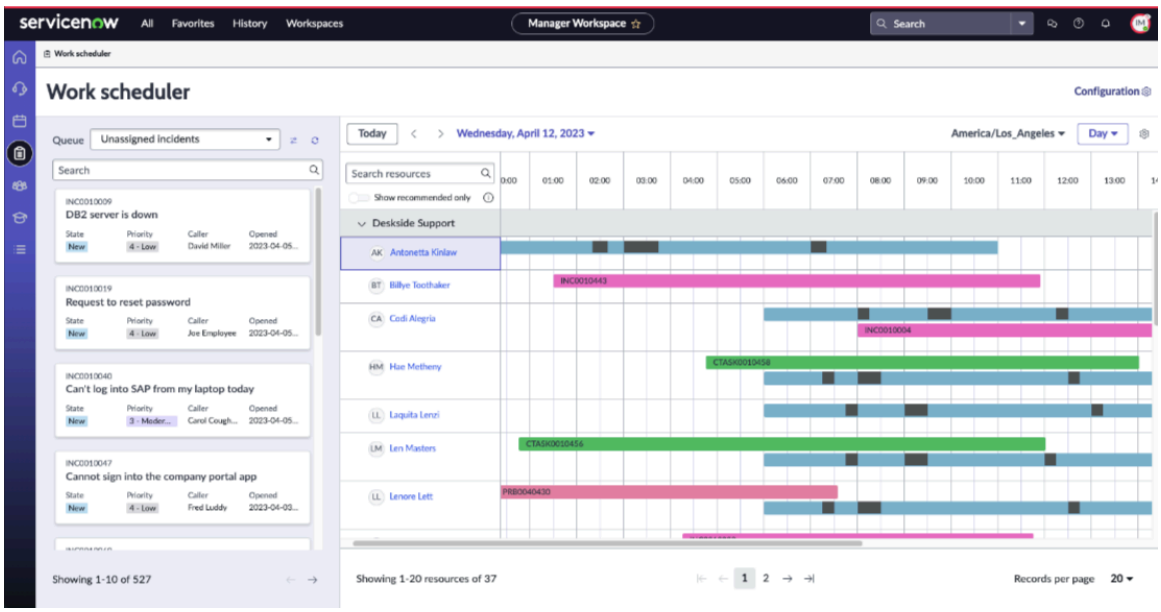
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The task is assigned to that agent. You can also edit the duration of the time span or drag the time span and reassign the task to another agent.

Note:
From the work queue, when you select a task that has been assigned to an agent, the application auto-scrolls to the page that has the timespan for the task and displays the schedule for the agent.

7. **Optional:** Update a work item from the calendar.
   a. Select a desired task on the calendar that you want to update.
   b. Select the Edit icon to access a work item record.
   c. On the form, make the necessary updates.
   d. Select **Update**.

(Optional) The image below is a representation of the Work scheduler screen.



Create a criteria for a matching rule in Work scheduler

Add a criteria for a matching rule to enable assignment of work items to team members based on the rule.

Before you begin
Role required: admin

About this task
The following matching rules, which are available by default, are based on the selection criteria matching type:

Rule name	Work configuration name	Table	UX app route
Incident Matching rule	Incidents	Incident [incident]	Incident
Problem Matching rule	Problems	Problem [problem]	Problem

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Rule name	Work configuration name	Table	UX app route
Requested item Matching rule	Requested items	Requested Item [sc_req_item]	Requested item
Request Matching rule	Requests	Request [sc_request]	Request
Catalog Task Matching rule	Catalog Task	Catalog Task [sc_task]	Catalog task
Change Request Matching rule	Change Request	Change Request [change_request]	Change requests
Change Task Matching rule	Change Task	Change Task [change_task]	Change task

For information on how matching criteria works, see Matching criteria for work items in Work scheduler.

The following four criteria are available by default:

- WFO-Mandatory skills
- WFO-Availability
- WFO-Optional skills
- WFO-Timezone overlap

Procedure

1. Navigate to **All** > **Work scheduler** > **Matching Rules**.
2. In the Matching Rules list, select a matching rule; for example, the **Incident matching rule**.
3. In the Select Criteria related list, select **New.**
4. Fill in the fields on the form.
   For information on creating a new matching criteria, see Create assignment workbench matching criteria.
5. Select **Submit**.

Matching criteria for work items in Work scheduler

The assignment workbench uses configurable matching criteria, such as skills and availability, to evaluate the agents in a selected group and provide an overall ranking.

There are three types of matching criteria:

- **Simple Match**: creates one-to-one matching, such as matching the time zone of an agent with the time zone of a task location.
- **Aggregate**: uses a simple query and returns an aggregate result. For an aggregate type, select a table and create a filter, and then select an aggregate field such as the **Assigned to** field. This type of query returns a set of users.
- **Scripted**: uses a scripted query which returns a list of users.

Several matching criteria are provided with the assignment workbench:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Availability Today**: Availability is calculated based on the agent's work schedule, assigned work, and personal time off. The more availability an agent has, the higher the contribution to the agent's overall rank.
- **Matching Skills**: The number of agent skills that match the skills required for the incident. The more skills that match, the higher the contribution to the agent's overall rank.
- **Matching Skills - Mandatory Skills Support** Calculates the number of agent skills that match the mandatory skills. It does this by filtering out all agents who do not have the mandatory skills and ranks the remaining agents. The more skills that match, the higher the contribution to the agent's overall rank.

> **Note:**
> If using the mandatory skills feature, use the **Matching Skills - Mandatory Skills Support** criterion to match agents with the Configuring the mandatory skills feature identified for an incident.

- **Assigned Incidents**: The number of incidents already assigned to this agent. The more incidents assigned, the lower the contribution to the agent's overall rank.
- **Last Assigned**: For the sake of balancing assigned work, prioritized the agent based on the last assigned work.

To create matching criteria, select the type and use the fields related to that type to build the query. After creating matching criteria, you can create a configuration for the assignment workbench by creating a matching rule of the type **Selection criteria** and selecting the desired matching criteria.

As part of selecting the matching criteria for the workbench configuration, you can specify the following settings for each individual criterion:

- ranking and display usage
- ranking method
- ranking weight
- threshold
- active/inactive

Ranking and display usage

In the **Use for** field, specify how you want that matching criterion to be used:

- Ranking and display: uses the criterion to determine agent ranking and displays it in a column on the workbench.
- Display only: displays the criterion in a column on the workbench but does not use it to determine agent ranking.
- Ranking only: uses the criterion to determine agent ranking but does not display it on the workbench.

Ranking method

There are two ranking methods:

- More is better: for example, more availability is better when determining the agent ranking.
- Less is better: for example, fewer assigned incidents are better when determining agent ranking.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Weight

Each matching criterion has an assigned weight. By default, the matching criteria has an assigned weight of 10. You can assign a higher weight to the criteria that's more important.

Threshold

A threshold sets a minimum requirement for a criterion. For example, set the threshold of the Matching Skills criterion to 3 if you want to see only those agents who have at least three of the required skills for a task. For availability, set the threshold to the desired number of hours to display only those agents who have that minimum number of work hours available. You can set the threshold in the **Select Criteria** related list on the Matching Rule form. If necessary, personalize the list and add the **Threshold** column.

Active/Inactive

There can be several matching criteria associated with the matching rule that determines the assignment workbench configuration. Each individual criterion can be set to active or inactive. Changing this setting has an immediate impact on the agent ranking. You can make this change in the **Select Criteria** related list on the Matching Rule form. If necessary, personalize the list and add the **Active** column.

Calculating the agent ranking

The assignment workbench adds the values of the matching criteria and their respective weights and uses these values to determine the overall agent ranking.

1. Calculate a number for each criterion.
2. Multiply that number by the criterion weight.
3. Divide the result by the total of all criterion.
4. Repeat for each criterion and add the results.

The following example shows how the ranking is determined for an agent with these matching criteria values:

- Matching Skills with Mandatory Skills Support: 5/6
- Availability Today: 7 hours
- Assigned Incidents: 2

Calculations:

- **Matching Skills**: `2 / 3 = 0.666` (with 3 being the maximum number of skills)
- **Availability Today**: `7 / 8 = 0.875` (with 8 being the maximum number of hours)
- **Assigned Incidents**: `2 / 26 = 0.0769` (with 26 being the total number of tasks in the table)
- **Weight**: each matching criteria has an equal weight of 10

```
((0.666 x 10) / Total of criterion weight (10+10+10)) + ((0.875
 x 10) / Total of criterion weight (10+10+10)) + ((0.0769 x
 10) / Total of criterion weight (10+10+10))
```

```
(6.66 / 30) + (8.75 / 30) + (0.769 / 30)
```

```
0.222 + 0.291 + 0.0256 = 0.53
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This calculation is performed for each agent in the assignment group. Agents are ranked based on the value of this calculation, with the highest number earning the highest ranking.

Work Scheduler components in Workforce Optimization for ITSM reference

Workforce Optimization for ITSM has properties to configure the Work scheduler default behavior.

Properties

Enter *sys_properties.list* in the Workspace filter navigator and search for the work scheduler properties listed below.

Properties

Property	Description
sn_wfo_work_sched.allowed_tables	Defines the list of tables that a Work scheduler admin (sn_wfo_work_sched.admin) can use to create configurations for work assignments in the Workforce Optimization for ITSM manager workspace. • **Type:** string • **Default value:** incident,problem,change_request,change_task,sc_task,sc_request,
sn_wfo_work_sched.shift_data_categories	Comma separated sys ids for event categories that display in the Work scheduler calendar in the manager workspace. **Type:** string
sn_wfo_work_sched.should_fetch_shift_data	Enables the display of shift spans in Work scheduler in Workforce Optimization for ITSM manager workspace. • **Type:** true|false • **Default value:** true
sn_wfo_work_sched.recommend_criteria_limit	Defines how many matching criteria can be created for each matching rule in Work scheduler when suggestions are enabled. • **Type:**integer • **Default value:**10
sn_wfo_work_sched.match_criteria_threshold	Defines which users are shown in Work scheduler when suggestions are enabled and the matching criteria percentage is greater than the value indicated. • **Type:** integer • **Default value:** 0

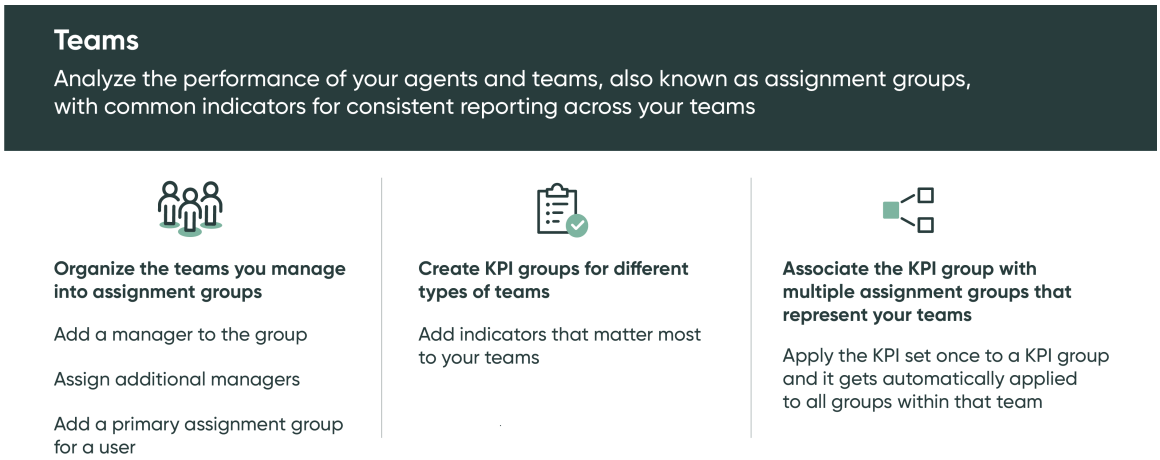
Teams in Workforce Optimization for ITSM

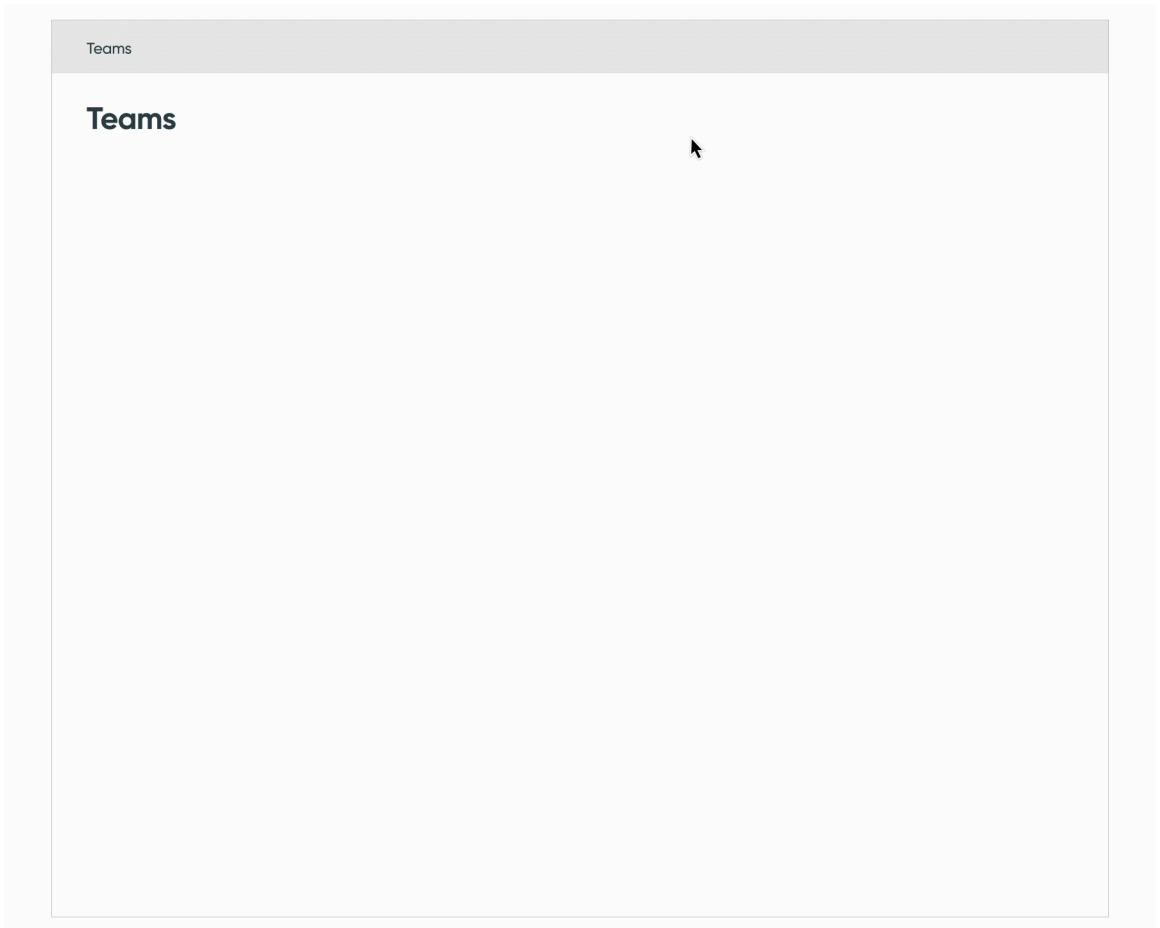
Learn how you can organize each of your teams into assignment groups. You can then define a set of Key Performance Indicators (KPIs) to analyze the performance of all groups within that team. Drill into the metrics for a group, an agent, or an incident within that team—all from a central location.

This video gives you an overview of how you set up your teams into assignment groups and add KPIs to measure performance. Organize your teams into assignment groups

The image shows a visual representation of how you can organize your teams into groups.



Drill down into your reports.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an administrator for **Teams**, you can:

- Create a KPI group for a common set of indicators (KPIs) you use to measure your teams' performance.

  Note:
  Your teams are called assignment groups within the **Teams** application.

- Add the KPIs to the KPI group.
- Add assignment groups to the KPI group.

  Note:
  Make sure that you've added a manager to each assignment group. The manager either directly manages the assignment group or needs visibility into the assignment group.

As a manager, you can:

- Analyze the performance trends for your teams.
- Drill down into the performance of teams, agents, or incidents.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A manager of IT Service Desk directly manages 3 teams. They are an additional manager of other teams that they have visibility into although they don't directly report to them.

To analyze team performance, the manager:

1. Organizes the teams into groups called assignment groups. The teams either directly report to the manager or the manager may have visibility into team performance.
2. Creates a KPI group with a set of indicators that matter most to measure the performance of their assignment groups.
3. Adds all assignment groups that use the set of KPIs to the KPI group.

With this set up, the manager can effectively analyze the performance of the teams grouped by KPI groups.

The manager can set up and use Teams by performing the following steps:

1. Create a KPI group
2. Add KPIs to that group
3. Add managers to assignment groups
4. Add assignment groups to the KPI group
5. Associate multiple KPI groups with one or more assignment groups.
6. Drill down into a KPI, agent, or an incident to analyze performance

Get an overview of how you can analyze team performance in this video. Use Teams to track performance

For detailed information on how to setup and use Teams, see Teams.

Setting up Teams in Workforce Optimization for ITSM

Organize your teams into assignment groups and create reports for those groups so that you can gain visibility into the team's performance.

Set up Teams in Workforce Optimization for ITSM

Important:
If you have enabled the Team Performance (sn_team_perf) plugin from the ServiceNow Store, you must make sure that you have upgraded the following plugins to latest version of the store release for the Tokyo family release:

- Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm).
- Workforce Optimization Configurable Workspace Core (sn_wfo_cfg_ws).

For more information, see Activate Workforce Optimization for ITSM.

Add a system property to set default date range in Workforce Optimization for ITSM

Add a system property to set the default date range in the configurable Workforce Optimization for ITSM application.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
The Teams application uses the sn_optimize.default_date_range property in the configurable Workforce Optimization for ITSM application to set the default date range in the date range picker to view your team's performance for that time period.

Procedure
1. Select **All** and in the application navigator, enter enter `sys_properties.list`.
2. Select **New**.
3. Enter the following field values.

Field	Value
Name	sn_optimize.default_date_range
Type	Integer
Value	The preferred number of days based on which the start and end dates are set in the date range picker in the Teams module.
Read roles	sn_team_perf.team_performance_user
Write roles	sn_team_perf.team_performance_admin

Create KPI groups to monitor team performance

Create key performance indicator (KPI) groups with the KPIs that matter most to your teams. When you associate your KPI groups with assignment groups, you can monitor your team's performance.

Before you begin
Role required: sn_team_perf.team_performance_admin

About this task
By default, the KPIs that are associated with your KPI assignment groups are scheduled to collect data daily. The KPIs must have the following indicator breakdown:

- Assignment groups
- Assigned to

Procedure
1. Create a KPI group.
   a. Navigate to **Workforce Optimization for ITSM** > **Team Performance** > **KPI Groups**.
   b. Click **New**.
   c. In the **Name** field, enter a name for the KPI group.
   d. In the Type menu, select **Teams**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you select a type that isn't supported in Team Performance, such as the Channels type, the Related list for the KPI group will show the default list from the sn_team_perf_kpi_group_m2m_pa_indicators table.

e. Right-click the form header and click **Save**.

You can add up to five KPIs to a KPI group. For more information about KPIs and how the aggregates are calculated, see the overview video in the Teams example section.

2. Add KPIs to a KPI group.
   a. In the KPIs related list, click **New**.
   b. In the **KPI** field, select the KPI to apply for this group.
   c. Click **Submit**.
3. Add KPI assignment groups to the KPI group.

Note:
- You can associate multiple KPI groups with one or more assignment groups.
- You can add additional managers to each assignment group.
- You can associate a user with a KPI group as the primary assignment group for that user.

   a. In the **Assignment Groups** tab, click **Edit**.
   b. Move the desired assignment groups from the Collection to the Assignment Groups list.
   c. Click **Save**.

Note:
When you open a KPI Group, by default, the KPI Groups form displays the KPI Group's type based on the application you've currently selected.

Copy a KPI group

Copy an existing KPI group. In the copied KPI group, everything, including the KPI threshold, gets copied except the assignment group mapping. You can modify the copied KPI group according to your requirement.

Before you begin
Role required: sn_team_perf.team_performance_admin

Procedure
1. Navigate to **All** > **Workforce Optimization for ITSM** > **Team Performance** > **KPI Groups**.
2. Open any KPI group that you want to copy.
3. Select **Copy**.

The copied KPI group opens. The copied KPI group name is the same as the one that you copied with Copy of in the front of the name.

You can change the name, description, and order according to your requirements. You can also change the supporting KPIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a threshold for each KPI in a KPI group

Create a threshold for each KPI in a KPI group to monitor the indicator status and analyze your team's performance. Define the threshold with upper- and lower-limit values to assess team performance for each indicator.

Before you begin

Role required: sn_team_perf.team_performance_admin

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Team Performance** > **KPI Groups**.
2. Open any KPI group for which you want to create a KPI threshold, for example, IT Service.
3. Open any KPI, for example, Closed incidents.
4. Select the **KPI Thresholds** tab.
5. On the form, fill in the fields.

KPI Threshold

Field	Description
KPI	Name of the KPI that you selected. This field is auto-filled.
Lower Threshold	Lower limit defined for this KPI.
Upper Threshold	Upper limit defined for this KPI.
Status	The status for the defined threshold: Critical, Positive, or Warning. **Note:** The corresponding icon for each status is displayed in the Workforce Optimization workspace when the **Show Icon** check box is enabled for the status. This option is enabled by default for the critical status.
Order	A number for the defined threshold limits. This number must be unique for each set of limits.
Show Icon	Corresponding icon for each status. The icons are displayed only on the Manager Workspace when the **Show Icon** check box is selected. The parent KPI related to the KPI group shows the icons based on a threshold in the grid component, if applicable. Users can view the following icons based on a threshold in the Workforce Optimization workspace. ○ The critical icon ( ) ○ The positive icon ( ) ○ The warning icon ( )

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The icons are displayed on all the pages where the parent KPIs are related to the KPI group based on the values that you set for the lower- and upper-threshold limits.

6. Select **Submit**.

Note:
In the Manager workspace, when users drill down into a KPI, the single scorecard component shows a threshold warning for critical thresholds nearing or exceeding the threshold limit. The following are examples of the messages that the scorecard shows:

- Approaching threshold of 95%
- Exceeded threshold of 170

The scorecard shows the warnings corresponding to the followings conditions:

For maximize type KPIs

- Value < Lower Threshold (Critical): Exceeded <Lower Threshold Value>
- Lower Threshold (Critical) < Value < Upper Threshold (Critical): Approaching <Lower Threshold Value>

For minimize type KPIs

- Value > Upper Threshold (Critical): Exceeded <Upper Threshold Value>
- Lower Threshold (Critical) < Value < Upper Threshold (Critical): Approaching <Upper Threshold Value>

Add managers to a KPI assignment group

Assign one or more managers to each KPI assignment group so that they can gain visibility into the group and monitor the team's performance.

Before you begin
Role required: sn_wfo_admin or admin

About this task
You can associate a user with a primary assignment group by selecting the group in the user record.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Team Performance** > **Additional Managers**.
2. Click **New**.
3. In the **Assignment Group** field, select an assignment group.
4. In the **Manager** field, select a manager that you want to add to this assignment group.
5. Click **Submit**.

What to do next
Analyze the performance trends for your teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Analyzing team performance using Teams in Workforce Optimization for ITSM

Use Teams to track and analyze performance trends for your teams from a single location. You can monitor the trends for each agent within your team and compare your agents or team members with one another. With Teams, you can identify skill gaps so that you can recommend which skills are needed to coach your agents.

Organize your teams into assignment groups. You can add a set of key performance indicators (KPIs) to help you measure team performance consistently across the groups.

For example, let's say that you manage the IT Service Desk unit. The unit contains multiple teams, such as Hardware and Network Support. You can create a KPI group for the IT Service Desk unit and then add Hardware and Network Support as assignment groups to this KPI group. Next, you add a set of KPIs to the KPI group. With this data, you can measure the performance trends across the Hardware and Network Support teams.

Also, an admin can associate multiple KPI groups with one or more assignment groups. For example, let’s say that there are two KPI Groups:

- IT Service
- Operations

The IT Service KPI group comprises two assignment groups:

- IT Service Desk
- Deskside support

So, an admin can add one or more assignment groups already available in the IT Service KPI group to the Operations KPI group. For example, Deskside support.

As the Deskside support assignment group is a part of both the KPI groups, it means one or more KPI groups can be associated with one or more assignment groups.

Add KPI targets for agents

Set key performance indicator goals that you want your agents to achieve so that they can improve the quality of how they resolve incidents. You can also set goals to monitor and improve an existing baseline measurement.

Before you begin

Role required: pa_target_admin and sn_team_perf.team_performance_admin

About this task

You can set a global KPI target for an agent or a team that you manage. You can create the target for any indicator in the KPI group associated with the KPI assignment group that you manage. When you set the global target, it is visible to anyone within the assignment group and also displays on the time-series widget.

When you set a personal target, it is only visible to you.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the teams icon.
3. Select a team.
4. Select the agent for whom you want to set KPI targets.
5. Click the target icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create a new target, click the plus (+) sign.
- To edit an existing target, select the target you want to edit.

6. Select the target type.
   - To set a global target, click **Global**.
   - To set a personal target, click **Personal**.
7. Set the KPI target.
8. In the **Start date** field, click the calendar icon, select the date when you want to start tracking the goal for the target, and click **OK**.
9. In the **Review date** field, click the calendar icon, select the date when you want to review the set goal, and click **OK**.
10. Set the target.
    - If you are creating a new target, click **Save**.
    - If you are updating an existing target, click **Update**.

    You can analyze the target trend in the indicator time-series metric.

Performance Analytics targets

Analyze the performance trends for your teams

Analyze trends to monitor your team's performance within a KPI group.

Before you begin

Role required: sn_team_perf.team_performance_admin

About this task

Analyze the data by drilling down into the data for a team, a specific team member, an indicator, or an incident.

Procedure

1. Navigate to **All** > **Workspaces** > **Manager Workspace**.
2. Click the Teams icon.
3. From the **KPI group** list, select the KPI group to analyze performance.

   You can view the data for the top-level KPIs.

   Note:

   The Teams page shows the list of assignment groups that are associated with the selected KPI group.

4. Select a date range to view your team's performance for that time period.

   You can set the default date range using the *sn_optimize.default_date_range* system property.

   All teams that you manage are identified with a **My team** highlight in the group header. You can also see the team that you have visibility into.
5. Drill down into the data for the team.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To	Do this
Analyze indicator performance	Click the **Performance** tab to track and analyze the overall indicator performance for all members in the team. **a.** To analyze the indicator performance for the team, click on an indicator. You can then select a location on the time-series visualization or on an incident count in the table to drill down further. **b.** To analyze indicator performance for a team member, click an indicator value for the team member.
Track incidents	Click the **Incidents** tab and analyze all incidents that are related to the team. ○ To view the incident details, select an incident. ○ To view a team member's details, from the **Assigned to** column, select a team member.
Analyze skills for your team	Click the **Performance** tab to analyze skills for each agent in your team. **a.** Select an agent for whom you want to analyze skills based on skill-level type. **b.** Do one of the following: ▪ To analyze all skills for the agent, click the **Skills** tab. ▪ To analyze skills based on the skill level types associated with the agent, click the **Overview** tab and in the **Skills** section, select a score for the skill level type.

You can also review incidents, details of assignment groups, additional managers, and information that is relevant to the team.

Get insights into performance of your team

Get insights into process bottlenecks and find potential areas that you could optimize. You can also view variation analysis.

Before you begin

Role required: sn_process_optimization_analyst

You must have mined the project for that KPI group for which you want to analyze process insights. For more information, see Create a Process Mining project for a KPI group.

About this task

You get the process insights and variation analysis for a parent or a child KPI. You can also view the metrics and records for a parent or child KPI.

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Teams icon ( ).
   The Teams page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Teams page shows assignment groups and their corresponding details, for example, Average handle time, Closed incidents, or Final call resolution. You can click the values for the related assignment group if you want more details. Such as, if you click a value for Average handle time, the new page shows the average handle time metrics detail page for the group IT service desk.

3. Select the assignment group, for example IT Service Desk, for which you want to analyze process insights.

   The Teams page shows the KPIs that are mapped to an assignment group and the KPI groups that you selected in the KPI group list. You can change the KPI group using this list. You see the KPIs belonging to the KPI group for the same assignment group. But if only one KPI group is associated with the selected assignment group, the **KPI group** list is displayed as inactive.

   If you further drill down into a specific user in an assignment group, the user details page shows the assignment group that the user belongs to and the KPI group that the assignment group belongs to.

4. Drill down into a KPI, for example, Closed incidents.

Note:
If you want to view insights for a parent KPI, click the **Process analysis** tab. Click the **Metrics** tab to view the metric details, for example, the details of Closed incidents. To see the number of records for closed incidents, click the **Records** tab.

5. Drill down into a KPI for an agent, for example, P1 incidents.
6. Select the **Process analysis** tab and perform process insights and variation analysis.
   You can analyze the process insights for the date range for which you've mined the data. For more information on business insights, see View business insights.

Related topics

Analyze and get process insights

View the performance data of your team for a specific date

You can view your team's performance data for a specific date using a time-series chart.

Before you begin

Role required: sn_wfo_cfg_itsm.manager and sn_team_perf.team_performance_admin

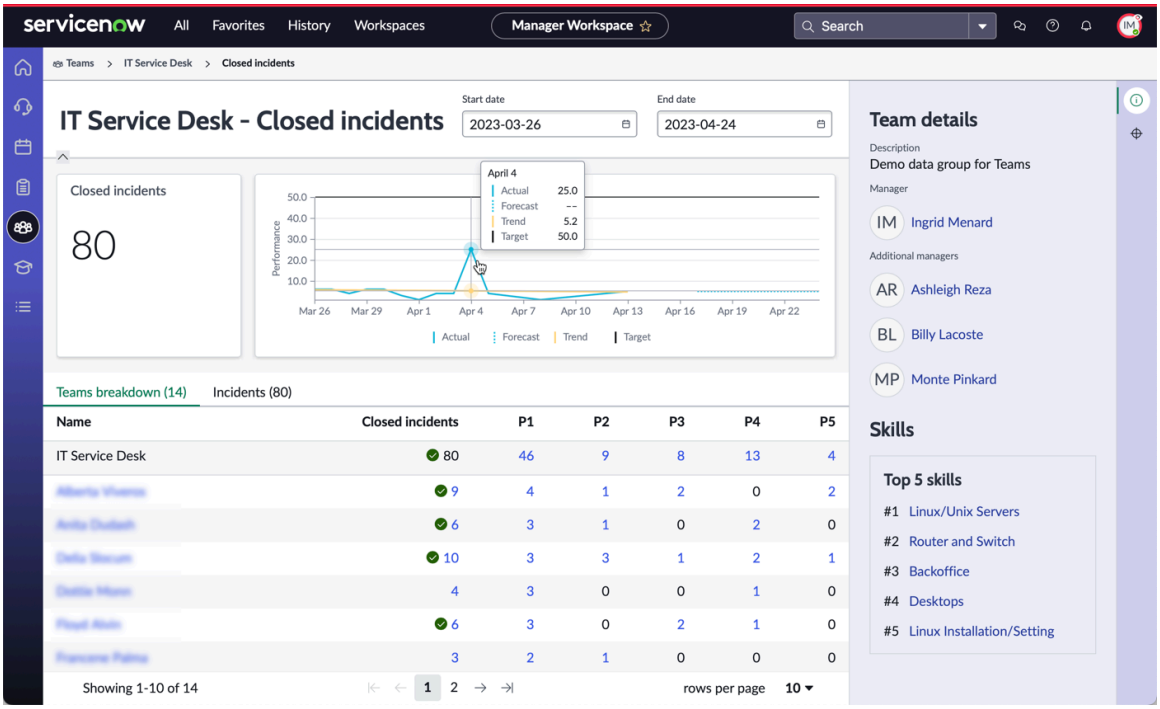
Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the teams icon.
3. Select a team and drill down to a KPI, for example, Closed incidents.
4. Point to the time-series chart.

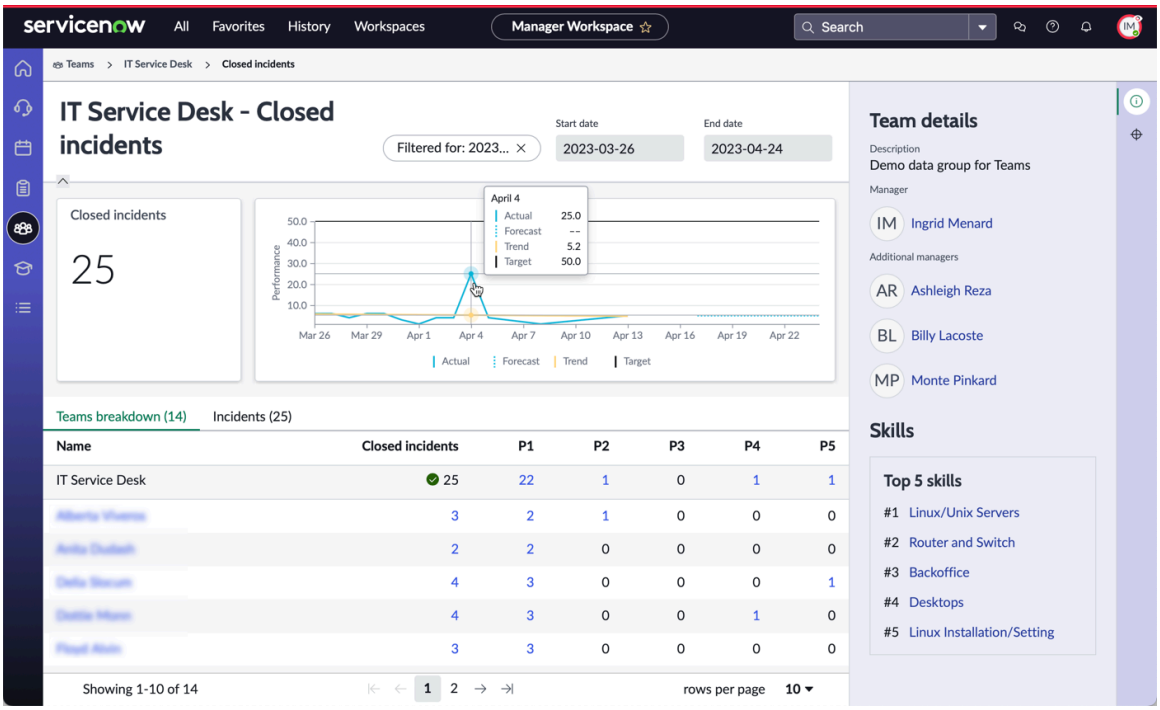
   The chart shows the performance data for the selected date range. The time-series chart shows the specific date. You can view the data for any available date.

5. Select the chart for the date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The KPI details page shows the selected date (date filter) in the same format as the date in the date range fields. For example, Filtered for: 2023-04-15. This page also shows the filtered data for that selected date. The following image shows the selected date and the corresponding data.



6. Drill down further to a KPI, for example, P1.

   The details page shows the data for the selected date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

When you select a date on the time-series chart, the date range fields become inactive. You can close the date filter anytime to go back to the data filtered by the date range.

You can close the date pill filter to go back to the data you want to see for the selected date range.

Teams components in Workforce Optimization for ITSM

Workforce Optimization for ITSM uses roles to administer teams and properties to modify default behavior.

Roles

Role title [name]	Description
Teams User [sn_team_perf.team_performance_user]	Grants access to read KPI tables.
Teams Admin [sn_team_perf.team_performance_admin]	Grants access to create and configure KPIs, KPI groups, and assignment groups in the Teams module.
Teams Manager [sn_team_perf.team_performance_manager]	Grants access to Team Performance module in Manager Workspace.

Properties

Property	Description
sn_team_perf.kpi_group.max_parent_kpis	The maximum number of parent indicators that you can add to one KPI group. • **Type:**Integer • **Default value:**5
sn_team_perf.kpi_group.max_supporting_kpis	The maximum number of supporting KPIs you can define for a parent KPI. • **Type:**Integer • **Default value:**10
sn_team_perf.ws.max_assignment_groups	The maximum number of assignment groups prioritized by order number to display on the Teams application in Manager Workspace. • **Type:**Integer • **Default value:**15
sn_optimize.default_date_range	The default date range set in the date range picker.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type:**Integer • **Default value:**30

Indicators

Indicator Name	Description
Closed Incidents	Number of incidents closed.
Customer Satisfaction	Average customer satisfaction for incidents based on CSAT survey results. This indicator is associated with agent and assignment group breakdowns. It provides the customer satisfaction survey results for each agent and the agent's team.
Quality	Provides calculated assessment feedback score.
Average Handling Time (MTTR)	Mean time taken to resolve an incident.
First Call Resolution	Percentage of incidents resolved on first call.
Trainee Quality Rating	Average score, in percentage, of all surveys taken by the coach to assess the trainee.
Incidents triaged by VA	The number of incidents automatically created by the Virtual Agent for your team when tasks are deflected. You must have ITSM Virtual Agent Conversations (com.snc.itsm.virtualagent) installed on your system to analyze this KPI.

Coaching in Workforce Optimization for ITSM

Learn how you can review and assess the quality of the interactions and tasks completed by your teams. You can enhance the skills set of your teams by assigning training that is based on those assessments. You can also add skills to the profiles of your teams after they get trained.

Initiate a skill review process to have your teams assess their own skill set and approve or reject the skills. After it's approved, they'll automatically be added to the skill set of the team member.

Coaching overview

The image shows a high-level workflow on how coaching admins set up Coaching, and how managers and agents use Coaching.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Here's an example of how Workforce Optimization for ITSM uses Predictive Intelligence to recommend skills for agents:

Step	Description	Example
1.	Predictive Intelligence associates the incidents that were closed using similar skills and then groups the tasks by the agents who resolved them.	Predictive Intelligence looks at the similarity between the tasks that were resolved using the skill Firewall.
2.	When agents resolve incidents, the Skill Recommendation application stores the skill and agent associations.	Agent A completes a task that requires the skill Firewall, but that skill is not in the agent's user profile yet.
3.	System administrators set the threshold for the skill and agent associations. When the threshold is reached, the Skill Recommendation application recommends to the agent's manager that the skill be added to the agent's profile.	The system administrator sets the threshold at 10. That means that the agents must have the same skill and complete 10 similar tasks. Agent A completes 10 tasks using the skill Firewall. The Skill Recommendation application recommends the skill Firewall for Agent A to the agent's manager.
4.	The manager approves and adds the skill to the agent's profile.	Agent A's manager approves the skill Firewall and adds that skill to Agent A's profile.
5.	Advanced work assignment (AWA) uses the new skills that were added to the agent's profile, looks up tasks that require those skills, and assigns the agents to complete those tasks.	When a task requires the skill Firewall, Agent A is automatically considered for that task assignment.
6.	Over time, the Predictive Intelligence machine learning algorithms learn which skills were assigned to the agents to resolve the incidents.	

The infographic shows how you can use Predictive Intelligence to recommend skills for your agents.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Terminology	Description
	the conditions set in the opportunity. As assessment can also be generated manually.
Coaching opportunity	A critical moment in a process that generates an assessment based on set conditions. A coaching opportunity can be generated at any time during the life cycle of any task record, which could include incidents, problems, change requests, or request items.
Virtual coach	A record that can be associated with a coaching opportunity that automatically completes tasks associated with an assessment.
Coaching survey	A survey associated with a coaching assessment that lets coaches provide feedback on the work completed by the agents. It also lets agents provide feedback on the coaching effectiveness.

Coaching assessments

You can create coaching assessments manually and associate it with a task record or generate them automatically using coaching opportunities. When the trigger conditions set in a coaching opportunity are met, an assessment is automatically generated. It's then automatically assigned to the coach for the trainee to assess the context in which the assessment was triggered. For example, let's assume an employee doesn't write clear work notes when they escalate an incident. You can set conditions for this scenario in the coaching opportunity to create a coaching assessment. The coach can evaluate the employee using the assessment and add learning tasks to train them to write better work notes.

After you create coaching assessments manually or automatically, you can do any of the following:

- Award skills
- Assign learning tasks
- Associate coaching surveys to the assessment

Note:
You can automate these tasks using a virtual coach that's associated with the coaching opportunity.

Awarding skills: After the coach completes an assessment, they can award skills that's related to the assessment to the trainee.

Assigning learning tasks: Coaching assessments can have learning tasks associated with it to train the agent based on the assessment. When the agent completes the training, the skills associated with the learning tasks are added to the skills set of the agent. For example, let's assume that the agent resolved an escalation that required router skills. If the agent doesn't have that skill, then the learning tasks can include training for router skills. After the agent completes the training, the router skill is added to the skill set of the agent. Next time when an incident that requires router skills is assigned to the agent, they'll be able to resolve the incident successfully.

Setting up coaching surveys: Coaching surveys can be associated with a coaching assessment. When the coach completes the coaching assessment, a survey can be triggered. Coaching surveys let coaches provide feedback on the ability of the agents' to resolve incidents or the quality of their completed tasks. Trainee surveys let agents provide feedback on the coaching effectiveness.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Survey for the coach** is taken by the coach where the coach can provide feedback to rate the trainee. For example, did the trainee demonstrate the knowledge and technical competence required?
- **Survey for the trainee** is taken by the agent where the agent can provide feedback to rate the coach. For example, were the learning tasks assigned to the agent useful in building skills?

Coaching opportunity

A coaching opportunity is a critical moment in a process where coaching assessments get triggered based on conditions set in the coaching opportunity record. A coaching opportunity can be generated at any time during the life cycle of any task record. These records could include any task such as an incident, problem, change request, or request item. For example, you can set conditions to trigger a coaching opportunity when an incident reassigned or escalated. For examples on identifying coaching opportunities, see Identifying coaching opportunities.

You can do the following in a coaching opportunity record:

- Set trigger conditions.
- Associate skills, learning tasks, or surveys with the coaching opportunity. These items are automatically associated with the assessment that is associated with the opportunity.
- Define a virtual coach. When an assessment is automatically created from an opportunity, and if a virtual coach record is associated with it, then the assessment is automatically moved to the closed, complete state. It will also automatically award skills and any learning tasks associated with the assessment to the trainee. The surveys associated with the opportunity will be assigned to the coach or the trainee as well.

Note:

- All virtual coach records have a coaching opportunity associated with it but not all coaching opportunities have an associated virtual coach record.
- A virtual coach can't be associated with a manually generated assessment.

For information on virtual coach, see Identify and add course items for a virtual coach.

Example of assessment triggers

Did the coaching opportunity trigger an assessment?	Is a virtual coach associated with the coaching opportunity and are the conditions set met?	Result
Yes	Yes	Because a virtual coach is associated with the coaching opportunity, it completes the following tasks automatically: • Award skills • Assign learning tasks • Associate coaching surveys to the assessment
Yes	No	Because a virtual coach isn't associated with the coaching opportunity, you must complete the following tasks manually:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Did the coaching opportunity trigger an assessment?	Is a virtual coach associated with the coaching opportunity and are the conditions set met?	Result
		• Award skills • Assign learning tasks • Associate coaching surveys to the assessment
No	No	You can create a manual assessment and complete the following tasks manually: • Award skills • Assign learning tasks • Associate coaching surveys to the assessment

You can use Coaching for any task-based process for such as Change Management, Customer Service Management or Incident Management to set up Coaching. You can also use Coaching for a non-task or custom table source by configuring a business rule.

As a coach, you can:

- Use surveys to evaluate the performance. of your teams.
- Recognize improvement opportunities and assign training tasks.
- Assess the ability of trainees to resolve incidents.
- Assign training that is based on the assessments.
- Add skills to the skill set of a trainee that is based on a recommendation from Predictive Intelligence.
- Initiate a skill review process to have your teams assess their own skill set.
- Approve or reject a skill assessed by members of your team.

As a trainee, you can:

- Get trained to address your skill gaps.
- Evaluate the skill proficiency for an existing skill or add a new skill to your skill set.
- Request approval from your manager to add the evaluated skills to your skill set.

Getting started with Coaching in Workforce Optimization for ITSM

Easily find the tasks that you must complete in the Coaching module.

Manage skills for your teams from a central location	Skill admin	Manage skills in Workforce Optimization for ITSM

Example for using Coaching in Workforce Optimization for ITSM

Understand how you can assess your agents performance, identify skill gaps, and train them to enhance their skills sets with Coaching.

An IT manager manages IT operations for a large organization that has 12 teams reporting to the manager. Each of the manager's teams has anywhere from 20 through 50 agents. This manager is also added as a manager of other teams where they need visibility.

The manager wants a single location to:

- Monitor the skills that the teams use the most to solve issues
- Analyze metrics and monitor pending coaching assessments and training for the teams
- Add skills used for resolving issues or when Predictive Intelligence Workbench recommends them.

The manager can manage all of these actions by doing the following:

1. Set conditions that trigger coaching opportunities.
2. Assess agents' skills and assign training.
3. Add skills to agent profile when they complete training or using recommendations from Predictive Intelligence.

Get an overview on coaching, creating assessments, taking surveys, assigning training, and adding skills.

Workforce Optimization for ITSM Coaching Overview

Get an overview of how you can add skills manually or the ones recommended using Predictive Intelligence and the Skill Recommendation application.

Workforce Optimization for ITSM Skill Recommendation

For detailed instructions on setting up and using Coaching for Workforce Optimization for ITSM, see Coaching.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up Coaching in Workforce Optimization for ITSM

Manage agent skills and assess the quality of completed tasks. Use predictive intelligence to recommend skills for agents. Train your agents with internal and external learning content.

To identify and add course items for a virtual coach, see Identify and add course items for a virtual coach.

Important:
If you have enabled the Coaching (sn_coaching) plugin, make sure that you have upgraded the following plugins to latest store release version:

- Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm).
- Workforce Optimization Configurable Workspace Core (sn_wfo_cfg_ws).
- Workforce Optimization Common (sn_wfo_common).

For more information, see Activate Workforce Optimization for ITSM.

Configure an indicator to display in the Coaching Overview tab in Workforce Optimization for ITSM

Add a system property to display the desired indicator in the Coaching Overview tab in the Coaching application.

Before you begin

Set the map application scope to **Coaching**. For information on how to set the scope, see Set map application scope.

Role required: admin

About this task

Replace the existing indicator with any Performance Analytics indicator that has the Assigned to and Assignment group breakdowns to display in the Coaching Overview tab in the Coaching application.

Procedure

1. In the application navigator, enter `sys_properties.list`.
2. Click **New**.
3. Enter the following field values.

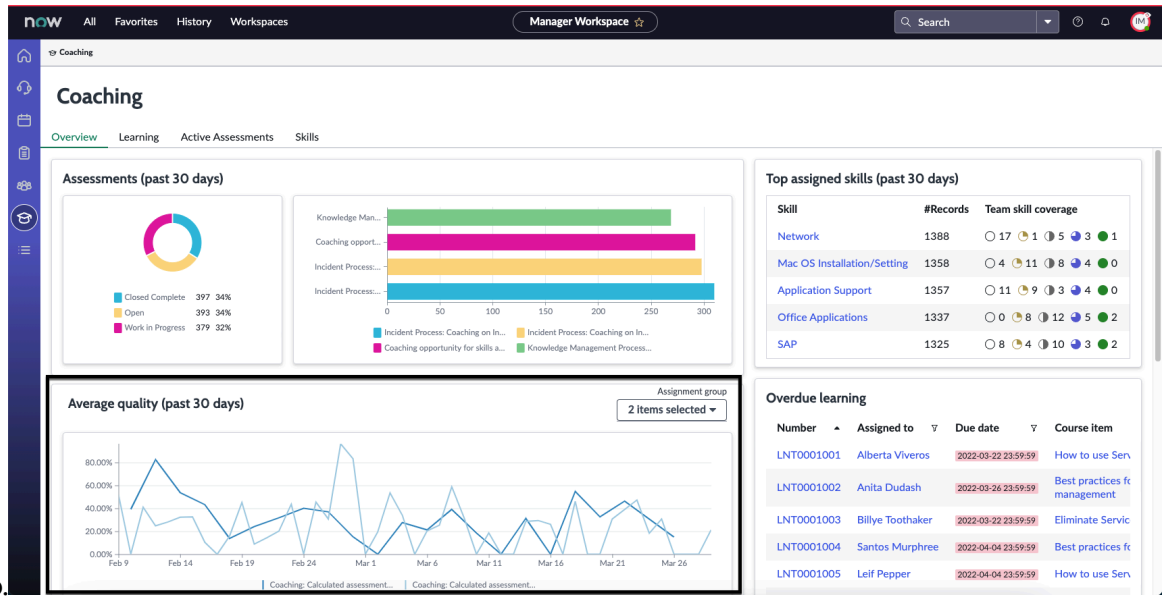
Field	Value
Suffix	sn_coaching.coaching_overview_default_quality_indicator
Application scope	Coaching
Type	String
Value	{"title": "<name>", "sys_id": "<sys id>"} where <name> is the name of the indicator that you want to display in the Coaching Overview tab and <sys id> is the unique record identifier (sys_id) of the indicator. Example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	○ Name: % of P1 incidents resolved on first call. ○ Sys ID: 0423e59387401010ca99e12397cb0bbb {"title": "% of P1 incidents resolved on first call", "sys_id": "0423e59387401010ca99e12397cb0bbb"}
Read roles	sn_coaching.coach

4. Click **Submit**.
   The configured indicator replaces the existing indicator in the Overview tab in the Coaching application in Workforce Optimization for ITSM.

   The image below show an example of the configured indicator displayed in the Coaching Overview tab.



Configure a list menu to display in the Learning tab in Workforce Optimization for ITSM

Add a system property to add to or modify the list menu for Coaching with Learning in the Coaching application in Workforce Optimization for ITSM.

Before you begin

Important:
This feature is available with the Coaching with Learning plugin (sn_coach_lrn) from the ServiceNow Store. To enable this feature, see Activate Workforce Optimization for ITSM for configurabe workspace.

Set the map application scope to **Coaching With Learning**. For information on how to set the scope, see Set map application scope.

Role required: admin

Procedure

1. In the application navigator, enter `sys_properties.list`.
2. Click **New**.
3. Enter the following field values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Suffix	learning_list_menu_props
Name	sn_coach_lrn.learning_list_menu_props
Application	Coaching With Learning
Type	String

Value	<pre>[{
	    “children”: [{
	            “conditions”: “<filter condition on table>“,
	            “label”: “<list name>“,
	            “id”: “<unique identifier for the selection path>“,
	            “selectionPath”: [
	                “<list parent name>“,
	                “<unique identifier for the selection path>”
	            ],
	            “table”: “<table name>”
	        }
	    ],
	    “label”: “<list name>“,
	    “id”: “<list parent name>“,
	    “isExpanded”: true,
	    “selectionPath”: [“<list parent name>“]
	}]</pre> where:
	○ <children> is an array of objects to create the list
	○ <conditions> is the condition set on the selected table
	○ <label> is the name of the list
	○ <id> unique identifier for the selection path
	○ <selectionPath> is the path to establish parent-child relationship in the menu
	○ <table> is the name of the table for the menu item

Read roles	sn_wfo_cfg_ws.user
Write roles	sn_wfo_cfg_ws.admin

4. Click **Submit**.
   The configured list displays in the Learning tab in Coaching in the Workforce Optimization for ITSM manager workspace.

What to do next

You can copy the code below into the Value field in the system property and modify as required.

Integrate Coaching With Learning with third-party learning management systems

Connect your ServiceNow instance with third-party learning sites to pull learning content into your repository.

Before you begin

Important:
Coaching with Learning application is available from the ServiceNow® Store. To enable this application, see Activate Workforce Optimization for ITSM.

Role required: learning_admin

About this task

Applications to integrate third-party learning sites

Activating the Coaching with Learning (sn_coach_lrn) plugin enables the following applications from the ServiceNow Store:

- Enterprise Service Management Integrations Framework
- Cornerstone spoke
- Pluralsight spoke
- Udemy spoke
- ServiceNow University spoke. For more information on the ServiceNow University spoke, ServiceNow University Spoke.

For information on integrating with third-party learning sources, see Integrating Learning Core with third-party learning management systems.

Procedure

1. Create the integration source for each of your third-party systems.

   Note:
   Cornerstone, Pluralsight, Udemy, ServiceNow University integrations are available by default.

   a. Navigate to **Integrations Framework** > **Source**
   b. Click **New**.
   c. In the **Name** field, enter the name of the integration source, for example, Pluralsight.
   d. Right-click the form header and click **Save**.
   e. In the Integration Services related list, click **New**.
   f. On the form, fill in the fields:

Field	Description
Name	Name of the integration service, for example, Pluralsight.
Import set tables	List of intermediate tables which store records from the third-party system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is enabled only when Scheduled pull service is selected in the **Service type** field.
Flow	Flow that interacts with the third-party system to pull the required data.
Active	Option to indicate that the integration service is available for use.
Application	Application which contains the integration service record.
Source	Name of the third-party system with which you want to integrate your application.
Order	Order in which you want to run transformation scripts.
Service type	Option to indicate the type of service **Scheduled pull** or **Ondemand Push**.
Retry policy	Configuration set to push a record if the previous push fails. **Note:** This field appears only when Ondemand Push service is selected in the **Service type** field.

g. Click **Update**.

2. Integrate your ServiceNow instance with your third-party learning source accounts.
The records from the third-party content are pulled into your ServiceNow instance using and API call. To successfully run this API call, you must do the following:

   a. In the application navigator, enter `sys_properties.list` and press **Enter**.

   b. For each of the following properties, set the value to **1638400**:

   - com.glide.transform.json.max-partial-length
   - com.snc.process_flow.reporting.serialized.val_size_limit

   For more information on these system properties, see Coaching With Learning System Properties.

3. Activate schedule flows to integrate third-party learning content.

   a. Navigate to **Process Automation** > **Flow Designer**

   b. In the **Flows** section, select each of the following flows and click **Activate**:

   - Trigger Cornerstone Learning Sync
   - Trigger Pluralsight Learning Sync
   - Trigger Udemy Learning Sync
   - Trigger ServiceNow University Sync

   c. Navigate to **Learning** > **Administration** > **Learning System Configuration**

   d. Select each of the third-party learning sources and set the **Active** field to **true**.
   Schedule flows automatically run on a scheduled basis to synchronize third-party learning content into your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. After you configure the third-party integration sources you can refresh the entire third-party content or synchronize new and updated services into your ServiceNow instance.
   - To refresh the entire content, set the *full_pull* property to **true**.

     Note:
     We recommend that you periodically refresh the entire content.

   - To synchronize new and updated services, set the *full_pull* property to **false**.

   a. Open any integration source for which you want to pull content.

   b. Click **Run Job**.
   The integration framework pulls the corresponding third-party learning courses into the Learning External Content [sn_lc_external_content] table on your ServiceNow instance.

   When synchronizing new and updated services, the content is populated as described in the table below.

Third-party content	New and Updated Services Synchronized
Udemy	○ Courses ○ User activity
Cornerstone	○ Users ○ Courses ○ User activity
Pluralsight	○ Courses ○ Course progress such as percentage
ServiceNow ServiceNow University	○ Courses ○ User activity

External Content Integration Sources

When you integrate Coaching With Learning with third-party learning management systems, the source record for Cornerstone OnDemand, Pluralsight, Udemy, and ServiceNow University applications are automatically created in the Enterprise Service Management Integrations Framework. These source records contain a predefined set of properties and integration services.

Integration source record for Cornerstone Ondemand

Field	Description
Name	Name of the record in Enterprise Service Management Integrations Framework: Cornerstone.
Properties	Set of properties that are predefined for Cornerstone OnDemand application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration source record for Cornerstone Ondemand (continued)

Field	Description
	• **page_size**: Number of records that are pulled through an API call from Cornerstone OnDemand application. • **full_pull**: When set to **True**, all the active users and learning courses from the Cornerstone OnDemand system are pulled into the ServiceNow instance. When set to **False**, modified users, modified transcripts, and updated courses are pulled from the Cornerstone OnDemand system into the ServiceNow instance. • **url_prefix**: Deep link prefix to pull learning objects from Cornerstone OnDemand system during run time. • **pull_offset_hours**: The time, in hours, calculated from the last successful run for the next synchronization to occur For example, the last successful run was on 12/12/2021 at 17:00:00, pull_offset_hours is set to 5, and full_pull is set to False. The next pull fetches all the records that have been modified from 12/12/2021 12:00:00 until current date and time.
Integration Services	Services interact with Cornerstone Ondemand application to pull or push learning courses. • **Course assign service**: Assigns a course to an employee in the Cornerstone Ondemand application. • **Sync users**: Maps users in the Cornerstone OnDemand system to users in the ServiceNow system using email Ids. **Note:** If you want to use user_id or user_name field for mapping users, then override**getCornerstoneUser method** in the sn_lc.UserMappingUtil script. • **Courses**: Pulls learning courses from Cornerstone OnDemand system into ServiceNow. • **User activity**: Pulls details of user activity on learning courses from Cornerstone OnDemand system into ServiceNow.

Integration source record for Pluralsight

Field	Description
Name	Name of the record in Enterprise Service Management Integrations Framework: Pluralsight.
Properties	Set of properties that are predefined for the Pluralsight system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration source record for Pluralsight (continued)

Field	Description
	• **page_size**: Number of records that are pulled through an API call from Pluralsight. • **full_pull**: When set to **True**, all the learning courses are pulled from Pluralsight into the ServiceNow instance. When set to **False**, updated learning courses progress is pulled from Pluralsight into the ServiceNow instance. • **pull_offset_hours**: Value that is considered for pulling modified records. For example, the last successful run was on 12/12/2021 at 17:00:00, pull_offset_hours is set to 5, and full_pull is set to False. The next pull fetches all the records that have been modified from 12/12/2021 12:00:00 until current date and time.
Integration Services	Integration services interact with Plural sight application to pull learning courses into ServiceNow. • **Courses**: Pulls learning courses from Pluralsight into ServiceNow. • **Course progress**: Pulls the progress of learning courses from Pluralsight into ServiceNow.

Integration source record for Udemy

Field	Description
Name	Name of the record in Enterprise Service Management Integrations Framework: Udemy
Properties	Set of properties that are predefined for the Udemy system. • **page_size**: Number of records that are pulled through an API call from Udemy into ServiceNow. • **full_pull**: When set to **True**, all the learning courses are pulled from Udemy into the ServiceNow instance. When set to **False**, updated learning courses and learning course progress are pulled from Udemy into the ServiceNow instance. • **pull_offset_hours**: Value that is considered for pulling modified records. For example, the last successful run was on 12/12/2021 at 17:00:00, pull_offset_hours is set to 5, and full_pull is set to False. The next pull fetches all the records that have been modified from 12/12/2021 12:00:00 until current date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration source record for Udemy (continued)

Field	Description
Integration Services	Integration services interact with Udemy application to pull learning courses into ServiceNow. • **Pull Courses:** Pulls learning courses from Udemy into ServiceNow platform. • **Pull user activity:** Pulls details of user activity on learning courses from Udemy into the ServiceNow platform.

Integration source record for ServiceNow University

Field	Description
Name	Name of the record in Enterprise Service Management Integrations Framework: ServiceNow University
Properties	The **full_pull** property is predefined for the ServiceNow University system. • When set to **True**, all the learning courses are pulled from ServiceNow University into the ServiceNow platform. • When set to **False**, updated learning courses and learning course progress are pulled from ServiceNow University into the ServiceNow platform.
Integration Services	Integration services interact with ServiceNow University application to pull learning courses into ServiceNow. • **Pull Courses:** Pulls learning courses from ServiceNow University into the ServiceNow platform. • **Pull user activity:** Pulls details of user activity on learning courses from ServiceNow University into the ServiceNow platform.

Training your teams using Coaching in Workforce Optimization for ITSM

Assess your teams' abilities to resolve incidents efficiently by reviewing their work at critical service moments using Coaching in Workforce Optimization for ITSM.

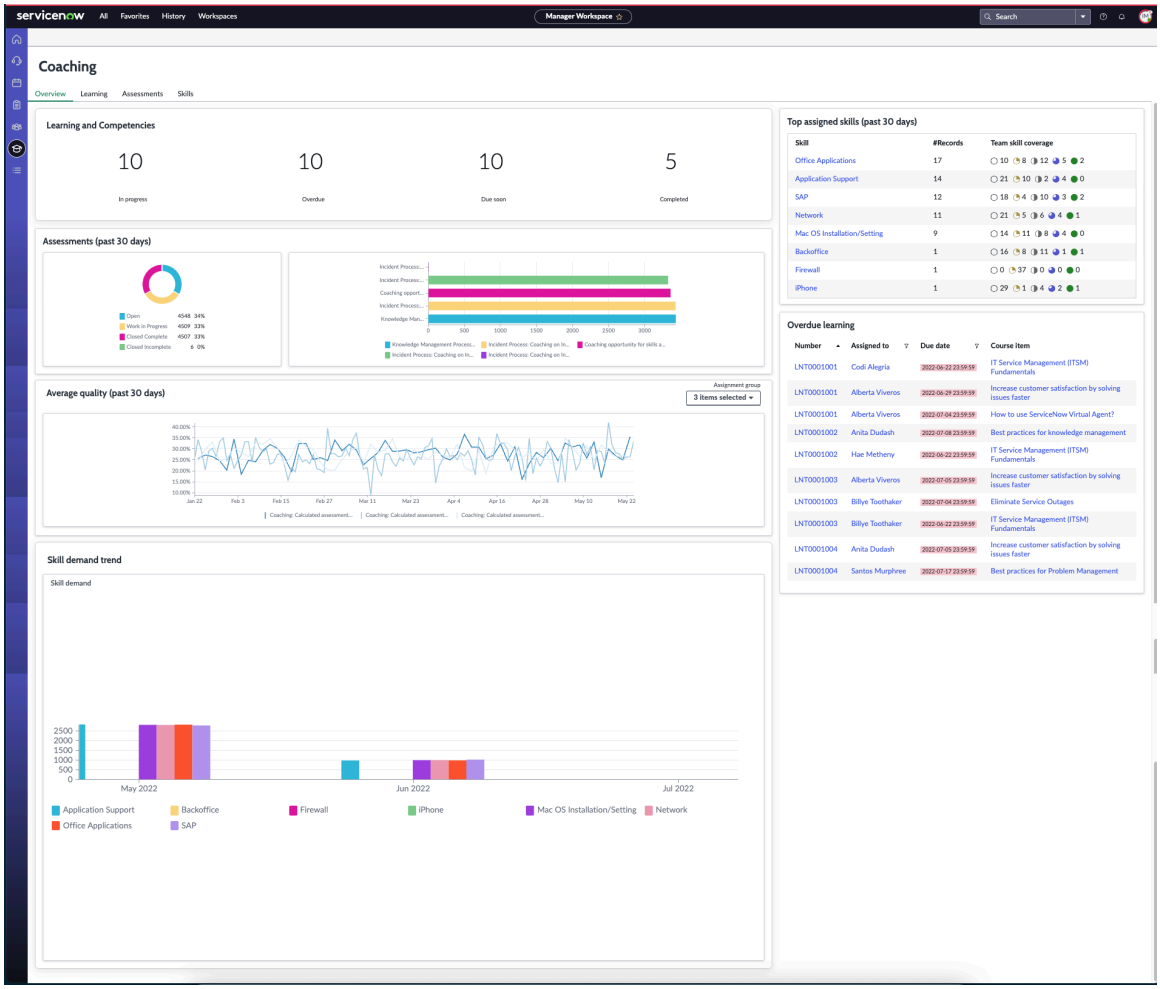
With Coaching, you can do the following:

- Provide training for your agents to address skill gaps.
- Use surveys to apply consistent, measurable scores across teams.
- Create opportunities for improvement using the Coaching application.
- Use Predictive Intelligence to recommend skills for your agents and provide training to address those skill gaps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Coaching Overview page

Monitor the progress of assessments and track learning tasks that are overdue. You can also add a coaching quality indicator to monitor trends. Analyze which skills have been assigned the most to your team recently and which top skills are in demand.



Access the Coaching Overview page

To open the dashboard:

- Navigate to, **Workspaces** > **Manager Workspace**.
- Select the Coaching icon .
- Select the **Overview** tab.

End user and roles

End user and goals	Required role
As a coach, you can analyze: • The status of assessments for the past 30 days. • Which learning tasks are past their due date for completion.	sn_coaching.coach

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End user and goals	Required role
• Which skills you've assigned the most to your teams during the last 30 days. • The trend for the top five skills that are in demand.	

Data visualizations

Title	Type	Description
Learning and Competencies	Single score	The number of learning tasks that are in progress, overdue, due to be completed in the next 5 days, or have been completed in the last 30 days.
Assessments	Donut chart	Status of assessments for the past 30 days.
Average quality	Line chart	Trend in the average quality of coaching assessment in the last 30 days.
Skill demand trend	Bar chart	Trend for the top five skills that are in demand.

Learning in Workforce Optimization for ITSM

Use Coaching with Learning to train your agents with internal and external learning content. Organize similar content into learning libraries. Assign learning tasks to your agents and track completion. Create learning paths that include a collection of courses on a specific topic associated with a set of skills.

Important:
Coaching with Learning is available when you enable the Coaching with Learning application from the ServiceNow® Store. To enable this application, see Activate Workforce Optimization for ITSM .

Coaching with Learning in Workforce Optimization for ITSM

Create a course catalog in Workforce Optimization for ITSM

Create course catalogs and set user criteria to define user access to the course items and learning paths associated with it.

Before you begin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Coaching icon ( ).
3. Select the **Learning** tab.
4. Go to **Learning course catalogs** > **All course catalogs**.
5. Select **New**.
6. Create a course catalog.
   For more information, see Create a course catalog .

Create a learning library

Create a learning library to organize related content into categories.

Before you begin

Role required: sn_wfo_cfg_itsm.manager

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the coaching icon.
3. Select the **Learning** tab.
4. Select **Learning Libraries** and select **My learning libraries**.
5. Create a learning library.
   a. Select **New**.
   b. In the **Title** field, enter a unique name for the learning library.
   c. In the **Description** field, enter a description for the learning library.
   d. Select **Save**.

   Note:
   The learning library is visible to all groups that you directly or additionally manage.

6. Add learning courses to learning libraries.
   a. Select the **Content** tab.
   b. Select **Add**.
   c. In the **Add Learning Courses** pop-up window, select all course items you want to add to the learning library.
   d. Select **Add**. The course items are added to the learning library.

   Note:
   To remove any course item you have added, select the course item and Select **Remove**.

7. Add a group to a learning library.
   a. Select the **Applicable Groups** tab.
   b. Select **New**.
   c. In the **Group** field, select a group that you want to associate with the learning library.
   d. Select **Save**.

Create internal learning content

Add internal courses so that agents can learn new content and enhance their skill set.

Before you begin

Role required: sn_wfo_cfg_itsm.manager

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the coaching icon.
3. Select **Learning Courses** and select **Internal Courses**.
   You can search courses based on keywords using the **Search courses** field or narrow down the display of the courses based on skills using the **Filter courses by skill** field.
4. Create an internal learning course.
   a. Select **New**. The **Learning Internal Content** screen appears.
   b. Fill in the following fields.

Name	Description
Title	Name of the course.
Internal source	Select the type of content for the course. Here are the available types of courses: ▪ URL—Youtube, Vimeo, or any link for a video ▪ Knowledge article ▪ Free form ▪ Quiz
Days to complete	The number of days required to complete the course. Default value is set to 5.
Course catalog	The catalog associated with the course.
Knowledge article	If the internal source is a knowledge article, select the article.
URL Domain	If the internal source is URL, select the domain for the URL. Here are the available URL domain types: ▪ Youtube ▪ Vimeo ▪ Other
URL	If the internal source is URL, enter the URL for the selected domain.
Estimated duration	Length of time when the course has to be completed. For example, for a video, it is the duration of the video. For a KB article, the duration is estimated based on the length of the article.

5. Select **Save**.
6. Add a skill to the internal content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the **Associated skills** tab.

b. Select **New**.

c. In the **Skill** field, select a skill you want to associate with the internal content.

d. In the **Skill level** field, select a skill level for the selected skill.

e. Select **Save**.

7. Add a learning task to the internal content.

a. Select the **Learning Tasks** tab.

b. Select **New**.

c. In the **Assigned to** field, select a trainee to whom you want to assign the learning task.

d. In the **Course item** field, select the course item to associate with the learning task.

e. In the **Due date** field, Select the calendar icon and select the date and time when you want to trainee to complete the learning task.

f. Select **Save**.

Access external courses using Coaching with Learning

Add courses from external sources such as Udemy, Pluralsight, or Cornerstone to enable your users to gain skills from external content.

Before you begin

Role required: sn_wfo_cfg_itsm.manager

You must integrate Coaching with third-party learning management systems. For information on how to perform this integration, see Integrate Coaching With Learning with third-party learning management systems.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the coaching icon.
3. Click the **Learning** tab.
4. Go to **Learning Courses** > **External Courses**.
   You can search courses based on keywords using the **Search courses** field or narrow down the display of the courses based on skills using the **Filter courses by skill** field.
5. Select a course.
6. Click **Go to course**.
   You can review and learn the external course.

Integrating Learning Core with third-party learning management systems

Assign a course item to agents

Assign a course item to one or more agents and add a due date for them to complete the course.

Before you begin

Role required: sn_wfo_cfg_itsm.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can analyze the course items that were most taken by your team members. You can also see which courses were created in the last five days.

> **Note:**
> You can close the status of a course item for any of your team members that you directly or additionally manage by selecting **Mark as complete** for that course item.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the coaching icon ( ).
3. Select the **Learning** tab.
4. Select **Learning Courses** > **All Courses**.
   - You can search courses based on keywords using the **Search courses** field or narrow down the display of the courses based on skills using the **Filter courses by skill** field.
   - In the course item cards, you can view details of each course, for example:
     - The course duration.
     - The type of course item, for example, a URL or a knowledge article.
     - Whether the course item is an internal or an external course item.
     - Skills associated with the course. If a course has more than one skill, you can select the count next to a skill and view all skills. To remove a skill, select a skill and select **Remove**.
   - You can close the status of a course item for any of your team members that you directly or additionally manage and by selecting **Mark as complete** for that course item.
5. Select the assign icon ( ) for the course item you want to assign to agents.
6. In the **Assign learning course** screen, assign the learning course to groups or team members.

   a. If the agents have to complete the course item within a given date, select the **Mandatory** check box.

   b. In the **Due date** field, select the date by which they need to complete it.

   c. Select **Assign**.

> **Note:**
> - The course that is most taken by your agents is identified with the **Most taken** highlight.
> - The course that has been created less than five days before the current date is identified with the **New** highlight.

Create a learning path in Workforce Optimization for ITSM

Create a learning path, add relevant skills and course items, and publish the path. When your agents complete the path, any skills associated with the path are automatically added to the agent's profile.

Before you begin

Role required: sn_wfo_cfg_ws.manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This video walks you through the steps for creating a learning path. Create a learning path

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Coaching icon ( ).
3. Select the **Learning** tab.
4. Navigate to **Learning Paths** > **All learning paths**.
   - You can search a path based on keywords using the **Search** field or narrow down the display of the paths based on skills using the **Filter by skill** field.
   - You can select a learning path to view the details. You can analyze the path objective, the skills associated with the course items, the total number courses in the path, and the duration to complete them.
   - You can select the link that displays the skills and view all skills associated with the learning path. The list of skills will display if there are more than 5 skills associated with the learning path.
5. Select **Create new path**.
   The **New learning path** screen displays.
6. Create a learning path.
   a. In the **Path name** field, enter a unique name for the learning path.
   b. In the **Course Catalog** field, select the catalog to which you want to associate the learning path.

   > **Important:**
   > You can customize the publish flow for any catalog other than the **Default Catalog**. For information on publish flow, see Create a course catalog and the Course catalog form.

   c. Select **Next**.
   The learning path that is created is in **Draft** state. You can choose to complete it later.
7. Add or remove course items.
   - You can search courses based on keywords using the **Search** field or narrow down the display of the courses based on skills using the **Filter by skill** field.
   - You can select a course and preview the details.

   > **Note:**
   > You can add a quiz as a course item.

   a. Enable or disable the check box for the course items that you want to add or remove from the learning path.
   b. Select **Add items**.
   The **Review** screen appears. A learning path consists of a list of courses that a trainee takes in a given order. You can drag the courses in the list to set the order in which the trainee has to complete the path. In the **Items in the learning path** list, the added course items display in the order you have selected them. You can drag and reorder these items.
8. Review the learning path.
   The skills associated with the selected courses are automatically populated in the **Course skills** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Review and edit any required details.
You can also add additional skills to the learning path.

b. **Optional:** To remove items that you no longer want to associate with the learning path, select the item and then select **Remove selected items**.

c. Select **Next**.
The **Publish** screen appears.
   - The screen displays the agent view of the learning path.
   - The **Curriculum** section displays the course items in the order that you have selected in the **Review** screen.
   - If you do not want to publish the learning path, you can select **Save** and come back to it later.

9. Select **Submit** to publish the learning path.
The learning path is published based on the Publish flow.

Assign a learning path to agents

Assign a learning path to one or more agents and add a due date for them to complete the path.

Before you begin

Role required: sn_wfo_cfg_itsm.manager

About this task

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the coaching icon ( ).
3. Select the **Learning** tab.
4. Select **Learning paths** > **All learning paths**.
   - You can search paths based on keywords using the **Search** field or narrow down the display of the paths based on skills using the **Filter by skill** field.
   - Each path displays a highlight that shows whether it is in draft or published state. You can select a path that is **Draft** state and complete it. You can select a path that is in **Published** state and view the path details.
5. Select the Assign icon ( ) for the path you want to assign to agents.
The Assign icon is only available when the path is in **Published** state.
6. In the **Assign learning path** screen, assign the learning path to groups or team members.
   a. If the agents have to complete the path within a given date, select the **Mandatory** check box.
   b. In the **Due date** field, select the date by which they need to complete the path.
   c. Select **Assign**.
   You can see the progress your agents have made as they work on a path.

Create a learning task

Create learning tasks for agents to keep track of their learning activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_wfo_cfg_itsm.manager

About this task
Set learning task completion due dates to include or exclude weekends using the *exclude_weekends_on_learning_task_due_date* system property. For more information, see Workforce Optimization for ITSM Reference.

Procedure
1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Click the coaching icon ( ).
3. Click the **Learning** tab.
4. Click **Learning Tasks** and select **All Tasks**.
5. Create a learning task.
   a. Click **New**.
   b. Fill in the following fields.

Name	Description
Assigned to	Name of the agent to whom you want to assign the learning task.
Learning library	The learning library that contains the course item for the learning task.
Course item	The course that needs to be completed by the agent.
Due date	Date when the agent must complete the course. Default is 5 days after the creation of the learning task. This value is calculated from the **Days to Complete** field for the course item. For learning tasks that are assigned or in progress, the due date field is highlighted as follows: ▪ Green—if the task is due after the current day. ▪ Yellow—if the task is due on the current day. ▪ Red—if the task was due before the current day.

6. Click **Save**.

Analyze quiz details in Workforce Optimization for ITSM

Access a quiz to analyze the details.

Before you begin
Role required: sn_wfo_cfg_itsm.manager

Procedure
1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the coaching icon.
3. Select the **Learning** tab.
4. Go to **Learning courses** > **Internal courses**.
5. Select a quiz.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **View quiz details**.
   The quiz details page appears.

Surveys in Workforce Optimization for ITSM

Assess the quality of your teams' completed tasks. Use surveys to get feedback on from your team.

> **Note:**
> For detailed information on how to create a survey and associate with a coaching opportunity, see Create a survey and associate with a Coaching opportunity.

Assess the quality of your agent's completed tasks

Assess the ability of your agents to resolve incidents or the quality of their completed tasks.

Before you begin

You can create an assessment from an interaction or any task type. When you manually create an assessment, you can add a survey to it. Coaching assessments also get created and assigned to the coach based on the trigger conditions that are defined in coaching opportunities.
Role required: sn_coaching.coach

About this task

If the coaching opportunity includes a survey, you can opt to take the survey and the assessment. When you use a survey to assess a trainee, the score for the survey is automatically calculated when you complete the survey. The assessment rating is then updated based on that score.

The Coaching Overview screen displays the average quality of the tasks that were completed in the past 30 days for your assignment groups.

- The donut chart displays the number of assessments in various states of completion. You can point to one of the states and click to open all assessments in that state.
- The bar chart displays assessments created by coaching opportunities. You can click on any of the data in the graph to access the assessments.
- You can click on the graph that displays the indicator data and access detailed information on the indicator.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Perform adhoc assessments or the ones triggered by coaching opportunities.

3. On the form, fill in the fields to assess the agent.

Assessment form

Field	Description
Opportunity	Coaching opportunity that is associated with the coaching assessment.
State	State of the assessment. ○ **Open**: New coaching opportunity. ○ **Work in progress**: Trainee is being coached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Resolved**: Trainee is assigned coaching programs and training modules. ○ **Closed Complete**: Assessment has been resolved and closed. ○ **Closed Incomplete**: Assessment that has been closed but not completed, typically because the coaching assessment **Due Date** has expired.
Assessment Rating	How well the agent resolved the incident. The Coaching application automatically populates this field when a coach completes a survey for the trainee.
Follow up	Whether the coach must take further action to improve the trainee performance.
Comments	Notes, if any, to add about the assessment.
Survey taken by coach	Survey for the trainee taken by the coach. You can add a survey for an assessment when you create the assessment manually or when the coaching opportunity triggers an assessment that does not have a survey. When a coaching opportunity triggers an assessment and contains a survey, the survey is automatically added to the assessment and cannot be changed by the coach.
Survey taken by trainee	Survey for the coach taken by the trainee.
Add skills	Skills to add to the trainee profile when the assessment is complete. When you click this field, it displays all skills and the skill levels that are not in the trainee profile.
Add training	Training to assign to the trainee. You can also assign learning tasks from course items.

4. Do the following:
   - To complete the adhoc assessment, click **Save**.
   - To complete assessments creating using coaching opportunities, click **Complete assessment**.

Create a survey in Workforce Optimization for ITSM

Create surveys and publish them. You can assign published surveys to an agent or a group. You can also share the survey with other teams by adding managers of those teams as the owners of the survey.

Before you begin

Role required: sn_wfo_cfg_ws.manager

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Coaching icon ( ).
3. Select the **Assessments** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Surveys** > **View Surveys**.
5. Add a survey.

   Note:
   For detailed information on how to create a survey and associate with a coaching opportunity, see Create a survey and associate with a Coaching opportunity.

6. Configure the survey based on your needs.
   For information on configuring a survey, see Configure a survey using Survey Designer.

   Note:
   To share the survey with other managers, you must add managers of those teams as the owners of the survey.

Assign a survey to agents or groups

Assign a published survey to agents or groups so that they can take the survey.

Before you begin
Role required: sn_wfo_cfg_ws.manager

About this task

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Coaching icon ( ).
3. Assign a survey to an agent or a group.

   Note:
   You can only assign surveys that are in the **Published** state.

   a. Select **Assign Survey**.
   The **Assign a new survey** pop-up appears.

   b. Assign the survey to an agent or a group.
   - To assign the survey to a group, in the **Assign at group level** field, add the groups to which you want to assign the survey.
   - To assign the survey to agents, in the **Assign to specific team members** field, add the individual members of the team to which you want to assign the survey.

   c. Select **Assign**.
   The survey is assigned to the agent. When agents complete the survey, you can select **View Scorecard** and analyze reports from the survey.

   Agents receive a notification when a survey is assigned to them.

Coaching components in Workforce Optimization for ITSM

Workforce Optimization for ITSM installs the roles and tables when you enable the Workforce Optimization for ITSM plugin (sn_wfo_cfg_itsm).

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles

Role title [name]	Description	Contains roles
Coaching Admin [sn_coaching.admin]	Grants administrative rights to create, read, update, and delete (CRUD) coaching opportunities, assessments, training, and skills.	• sn_coaching.coach • sn_lc.learning_admin
Coaching Coach [sn_coaching.coach]	Grants administrative rights to create, read, or update coaching opportunities, assessments, training, and skills.	• sn_coaching.trainee • pa_viewer • sn_lc.catalog_manager
Coaching Trainee [sn_coaching.trainee]	Grants access to add training, assessments, and skill records.	• skill_user • pa_viewer • survey_reader

Coaching Opportunities

This coaching opportunity	Triggers when
Coaching on Incident SLA Breach	An SLA is breached.
Coaching on interaction long call time	A phone call lasts longer than 10 minutes.
Coaching on interaction long chat time	A chat interaction lasts longer than 30 minutes.
Coaching on interaction long walk-up time	A walk-up interaction lasts longer than 60 minutes.

Coaching surveys

Name	Description
Phone Quality Survey	Survey associated with the Phone Interaction coaching opportunity. The coach assesses the agent using this survey after the agent completes a phone interaction.
Chat Quality Survey	Survey associated with the Chat Interaction coaching opportunity. The coach assesses the agent using this survey after the agent completes a chat interaction.
Walk-up Quality Survey	Survey associated with the Walk-up Interaction coaching opportunity. The coach assesses the agent using this survey after the agent completes a walk-up interaction.

Business rule

Business rule	Table	Description
Calculate coaching survey score	Assessment Instance [asmt_assessement_instance]	Sets the feedback rating based on the survey score.

Coaching with Learning

Important:
This feature is available with the Coaching with Learning plugin (sn_coach_lrn) from the ServiceNow Store. To enable this feature, see Activate Workforce Optimization for ITSM configurable workspace.

Roles in Coaching with Learning

Role title [name]	Description	Contains Roles
Learning admin [sn_lc.learning_admin]	Grants administrative rights to create, read, update, and delete (CRUD) catalog, learning content, roles, and configure learning source.	• sn_lc.catalog_manager • sn_hr.integr_fw.admin
Learning course catalog admin [sn_lc.learning_course_catalog_admin]	Grants administrative rights to create, read, or update learning course catalogs.	
Learning catalog manager [sn_lc.catalog_manager]	Grants administrative rights to create, read, or update learning libraries.	• sn_lc.task_creator • sn_lc.content_writer
Learning catalog group manager [sn_lc.catalog_group_manager]	Grants administrative rights to create, read, or update learning libraries based on groups.	• sn_lc.task_creator • sn_lc.content_writer
Learning content writer [sn_lc.content_writer]	Grants read or write access for learning courses.	sn_lc.content_creator
Learning content advisor [sn_lc.learning_advisor]	Can assign learning tasks.	
Learning task creator [sn_lc.task_creator]	Grants read or write access for learning tasks.	

Tables in Coaching with Learning

Table	Description
Learning External Content [sn_lc_external_content]	Stores details of external course items that are pulled from third-party systems.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Learning User Course Activity [sn_lc_user_course_activity]	Stores details of learning course activities such as user to whom the course is assigned, status, due date, and name of the learning course.
Learning Content [sn_lc_content]	Stores details of internal learning content such as knowledge articles, videos that are created in ServiceNow.
Learning Course Item [sn_lc_course_item]	Stores details of learning course items, such as the source to which the learning course belongs.
Learning Catalog [sn_lc_catalog]	Stores details of learning catalog items with its course items.
Learning Task [sn_lc_learning_task]	Stores details of learning tasks, such as user to whom the learning task assigned, and due date by when the learning task must be completed.
Learning System Configuration [sn_lc_learning_system_configuration]	Stores configuration parameters of sources (third-party learning management systems).

Properties in Coaching with Learning

Property	Description
glide.ui.sn_coaching_assessment_activity_fields	Edit coaching assessment activities. • **Type:** string • **Default value:** assigned_to,cmdb_ci,state,impact,priority,opened_by,work_notes,comments,*Attachme
sn_coaching.recommended_learning_deprecated	Coaching with Learning - deprecated Trainings is being deprecated and replaced with the Learning Tasks and course items from Coaching with Learning. • **Type:** string • **Default value:** true
sn_coach.lrn.exclude_weekends_learning_tasks	Enable to exclude weekends while setting the due date for learning tasks. • **Type:** true|false • **Default value:** true
sn_coach_lrn.learning_list_array_properties	List array properties for the now-list-menu component on the Learning Tasks tab, coaching module. • **Type:** string • **Default value:** script for data array

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
com.glide.transform.json.max-partial-length	Transforms JSON objects to internal objects and sets the word limit for records fetched through an API call. • **Type:** integer • **Default value:** 16384 **Note:** You must Add this system property to set the desired value. When you synchronize third-party learning content with your ServiceNow instance, if the word count of the content being pulled into your instance exceeds the value set for this property, the synchronization will fail.
com.snc.process_flow.serialized_var_size_limit	Specify the serialized variable size limit allowed for runtime values in each step in the flow execution details. To prevent truncation, set the value to an integer equal to or less than zero. • **Type:** integer • **Default value:** 16384 **Note:** When you synchronize third-party learning content with your ServiceNow instance, if the word count of the content being pulled into your instance exceeds the value set for this property, the synchronization will fail.
sn_coach_lrn.learningpath_detail_overview	Number of overview records on learning path page that will display in Service Operations Workspace. • **Type:** integer • **Default value:** 50
sn_coach_lrn.sn_lc_enable_discover	Enables the **Discover** tab in the Service Operations Workspace learning application. • **Type:** Yes|No • **Default value:** Yes
sn_coach_lrn.sn_lc_enable_learningpaths	Enables learning path recommendations in the Service Operations Workspace learning application. • **Type:** Yes|No • **Default value:** Yes

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Surveys in Coaching with Learning

Name	Description
Phone Quality Survey	Survey associated with the Phone Interaction coaching opportunity. The coach assesses the agent using this survey after the agent completes a phone interaction.
Chat Quality Survey	Survey associated with the Chat Interaction coaching opportunity. The coach assesses the agent using this survey after the agent completes a chat interaction.
Walk-up Quality Survey	Survey associated with the Walk-up Interaction coaching opportunity. The coach assesses the agent using this survey after the agent completes a walk-up interaction.

Recommendation grouping

The recommendation groups listed in the table below are available by default to the logged-in user's primary assignment groups.

Note:
You can deactivate the recommendations for the recommendation groups provided by default, but you cannot delete them. To deactivate the recommendations, in the Recommendations related list in the Context form, change the **Active** field value to **false**.

You can create additional recommendations and recommendation groups and associate them with recommendation contexts. For more information, see Recommended Actions application

Recommendation group name	Recommendation provided based on this criteria
Based on your work items	The work you've done in the past.
Based on your team's activity	The activities from the teams to which you belong.
Based on your previous courses	Courses you've completed in the past.
Most popular in your team	Courses that are considered the most popular by your team.
New from your library	Courses in your learning library.
Most popular in your organization	Courses that are most popular in your organization.
New from your catalogs	New courses in your course catalog.

Deleting course activity records

Course activity records are used for learning recommendations and are retained for 365 days by default. Do the following to change the number of days, represented as Age in seconds, for which you want to retain the record.

1. In the application filter navigator, enter `sys_auto_flush.LIST` and press **Enter**. The **Auto Flushes** list displays.
2. In the **Tablename** column, select the Learning User Course Activity [sn_lc_user_course_activity] table.
3. In the **Age in seconds** field, change the value to the time you desire to retain the records.

Skills Management in Workforce Optimization for ITSM

Manage skills for your teams from a central location. Analyze skill data and assess the skills that you need for your organization. Use Predictive Intelligence to recommend skills for your team.

Note:
As an admin, you can add sample data to get started building your skill taxonomy using the Skills Library Data for Skills Management (com.snc.skills_management.seed_data) plugin. You must have the Workforce Optimization for ITSM Configurable Workspace plugin (sn_wfo_cfg_itsm) installed. For more information on downloading skills sample data, see Create skill categories using sample data.

Setting up skill prediction in Workforce Optimization for ITSM

Collect skill data based on skills agents have used for incident resolution. Use supervised learning to recommend these skills for agents to resolve similar open incidents. You can also find patterns in how skills are used for incident resolution and use unsupervised learning to recommend skills for agents.

Before you begin

Predictive Intelligence must be set up and configured on your instance to train the models. For more information, see Predictive Intelligence.

Activate the Skill Recommendation application plugin (com.snc.sre) to use predictive intelligence for recommending skills.

Role required: sn_sre.admin

Procedure

1. Configure the properties for the Skill Recommendation application.
2. Run the solution definition models to train the supervised and unsupervised solutions.
   For more information on training a solution, refer to Create and train a similarity solution.
3. Run the *Start skill prediction* scheduled job everyday to start predicting skills for incidents or agents.
   This scheduled job is inactive by default. When you activate it, the job runs daily at 1:00 AM on all incidents resolved the previous day. The job then adds the skills to the User Predicted Skill [sn_sre_user_predicted_skill] table and Task Predicted Skill [sn_sre_task_predicted_skill] table.

Use extension points for skill prediction

Use scripted extension points to customize skill prediction for tasks.

Before you begin

The Skill Recommendation extension point is included with the Skill Recommendation (com.snc.sre) plugin.
Role required: admin

About this task

You can create multiple implementations for each extension point and provide an order number for each implementation. The implementation that has the lowest order number is executed.

Procedure

1. Navigate to **All** > **System Extension Points** > **Client Extension Points**.
2. From the Extension Points list, select **Skill Recommendation** (sn_sre.SkillPredictionAPI).
3. Do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create a new skill recommendation implementation, click **Create Implementation**.
- To modify an existing implementation, from the **Implementations** related list, select a class.

4. Modify the script as required.
5. Click **Update**.

Adding skills to agents' skill set in Workforce Optimization for ITSM

Analyze all skills and the levels for each skill that your agents have from one location.

Skill Recommendation

The skill matrix in Workforce Optimization for ITSM in the Coaching application displays all skills for all the teams that you manage or additionally manage.

Using the skill matrix, you can:

- View a list of all skills and the level for each skill for every agent grouped by assignment group.
- View the overall skill coverage for each group.
- Filter the skill matrix based on users, groups, skill type, skill level, or skill category.

> **Note:**
> Reset the filter if you want to view the skills for all users. When you reset the filters, all filters other than the Skill filter are reset. The Skill filter retains the skill selections that you've applied to display in the skill matrix.

You can view up to 50 skills at any point in time. For more information on skills and skills levels, see Skills Management.

When your agents gain new skills you can add them manually or use Predictive Intelligence to recommend skills that agents have used that have not yet been added to their skill set. For information on how predictive intelligence works to recommend skills for agents, see Coaching in Workforce Optimization for ITSM.

Add or update skills using Workforce Optimization for ITSM

Add skills or update skill levels for an agent so that it gets added to their skill set.

Before you begin

Role required: skill_manager

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the coaching icon.
3. Select the **Skills** tab.
4. Add a skill or update a skill level.

Approve or reject recommended skills in Workforce Optimization for ITSM

Approve predicted skills if the skill is necessary for the agent to complete assigned tasks. If the skill doesn't apply to the agent, you can reject a skill.

Before you begin

Role required: skill_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Predictive Intelligence application for skills displays the recommended skills on each agent's profile. The application uses sample incidents that the agent has worked on to recommend skills for an agent.

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace**.
2. Select the coaching icon.
3. Select the **Skills** tab.
4. Approve or reject a skill that is recommended by Predictive Intelligence.
   a. In the skill matrix, select **Recommended** to approve and recommend a skill for the user.
   b. In the **Details** tab, review the request for skill approval, the sample incident resolutions that were used to predict the skill, and the activity stream.
      - To approve a skill, select **Approve**. The skill is added to the agent and the lowest level for the skill is automatically associated with the added skill. The state for the request changes to **Approved** and the skill is added to the agent.
      - To reject a skill, select **Reject**. The state for the request changes to **Rejected**. Predictive Intelligence doesn't recommend the skill for the user again and the field changes to **Add**.
   c. Select the more options (···) icon and select **Save**.
   The application assigns the skill to the user. If the assigned skill doesn't have a skill level, the application adds the basic skill level to the user.

Initiate a skill review for teams or groups

Start a skill review process for your groups or specific team members so that they can review and update their existing skills or to add new skills. Provide a due date for them to complete the skill review.

Before you begin

Skill Review

Role required: sn_wfo_skillreview.manager

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Coaching icon ( ).
3. Select the **Skills** tab.
4. Select **Generate skill request**.
   You can save the generated skill request in **Draft** state and work on it at a later time.
5. Fill in the fields on the **Initiate skill review** form:

Field	Description
Title	Name for the skill review.
Due Date	Date by which the team member or group must complete the skill review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assignment	○ **To my groups:** sends the skill review to the team members is all of your groups. ○ **Specific groups or team members:**sends the skill review to the specified groups or team members.
Skills to review	○ **Team member's existing skills:** request for team members to review their existing skill levels and update them. ○ **Additional skills:** request team members to add new skills.

6. Select **Submit**.

Note:
You can cancel a skill review request that you have submitted for review.

The agent will receive a notification to review the request.

Approve or reject a skill review request

Review skills when your team updates their skill proficiencies and requests approval. You can approve or reject each of those skills. The skills that you approve are added to the agent's profile.

Before you begin
Role required: sn_wfo_skillreview.manager

About this task
You will receive a notification when an agent in your assignment group submits a skill review request.

Procedure

1. Navigate to **Workspaces** > **Manager Workspace**.
2. Select the Coaching icon ( ).
3. Select the **Assessments** tab.
4. Select **Skill review requests** > **Pending manager review**.
5. Select an agent to approve or reject the skills.
   In the **Comments** field, you can add a comment for approving or rejecting the skill.
   - To approve one or more skills, select the skills and select **Approve**. You can also select **Approve All** to approve all skills.
   - To reject one or more skills, select the skills and select **Reject**. You can also select **Reject All** to reject all skills.
6. Select **Complete**.

The skills you've approved gets added to the agent's skill set.

Routing work based on skills in Workforce Optimization for ITSM

Route work to your teams based on skills, schedule your teams' work, and train your teams to enhance their skills set using Workforce Optimization for ITSM.

The video shows how skill-based routing works in Workforce Optimization for ITSM.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Skill-based routing

Automatically add skills to incidents or interactions in Workforce Optimization for ITSM

Define conditions for incidents or interactions and add skills required for those conditions using skill determination rules. When new incidents and interactions that are created meet these conditions, the skill determination business rule automatically adds the skills to those records. In the Workforce Optimization for ITSM Channels and Work scheduler applications, the work items get automatically assigned to the right agents based on the skills.

Before you begin

Role required: skill_admin or admin

About this task

The following business rules are used in Workforce Optimization for ITSM skill determination:

- *`Skill determination for incident`* evaluates new incidents for the conditions defined in the skill determination rules set for all incidents and adds those skills to the incident records.
- *`Skill determination for interaction`* evaluates new interactions for the conditions defined in the skill determination rules set for all interactions and adds those skills to the interaction records.

The table below shows the skill determination rules available for Workforce Optimization for ITSM.

Note:
To add language detection skills, you must set dynamic translation APi. for more information, see Dynamic Translation API.

Default skill determination rules for Workforce Optimization for ITSM

Skill Determination Rule	Source Table	Type	Description
Language Detection Incident	Incident [incident]	Advanced	The business rule evaluates new incidents for the language entered in the incident short description and adds that language as a required skill for those incidents.
Language Detection Interaction	Interaction [interaction]	Advanced	The business rule evaluates new interactions for the language entered in the interaction short description and adds that language as a required skill for those interactions.
SAP Skills	Incident [incident]	Simple	The business rule evaluates new incidents for the **Service** field that starts with 'SAP', 'sap', or 'Sap' and adds **SAP** and **Backoffice** skills as required skills for those incidents.
VPN Incident	Incident [incident]	Simple	The business rule evaluates new incidents for the **Short description** field that contains 'VPN', 'vpn', or 'Vpn' and adds **Router and Switch** and **Network** skills as required skills for those incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default skill determination rules for Workforce Optimization for ITSM (continued)

Skill Determination Rule	Source Table	Type	Description
VPN Interaction	Interaction [interaction]	Simple	The business rule evaluates new interactions for the **Short description** field that contains 'VPN', 'vpn', or 'Vpn' and adds **Router and Switch** and **Network** skills as required skills for those incidents.
Windows	Incident [incident]	Simple	The business rule evaluates new incidents for the **Configuration item** field that contains 'Windows', 'windows', or 'WINDOWS' and adds **Windows Installation/Setting** and **Windows Servers** skills as required skills for those incidents.

Procedure

1. Navigate to **All** > **Skills** > **Skill Determination Rules**.
2. Add the desired rule for an incident or an interaction.
   For information, see Create Skill Determination rules to assign skills to work items.

Skill review request components in Workforce Optimization for ITSM

Workforce Optimization for ITSM installs roles and enables notifications when you install the application.

Roles

Role title [name]	Description
Skill review manager [sn_wfo_skillreview.manager]	Grants administrative rights to create, read, update, and delete (CRUD) skill review request records.
Skill review user [sn_wfo_skillreview.user]	Grants administrative rights to create, read, or update skill review request records.

Notifications

Navigate to **All** > **System Notifications** > **Provider** > **Notifications** to access the notifications below that are provided by default. For more information on adding notifications, see Provider notification

Notification name	Value
Skill Request Pending Manager Review	When enabled, the manager receives a notification when their agent submits a skill review request to their manager for review.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notification name	Value
	• **Type:**string • **Default value:**true
Skill Request Reviewed	When enabled, the agent receives a notification when their manager submits a skill request that has been reviewed. • **Type:**string • **Default value:**true
Skill Request Cancel	When enabled, if the agent or manager cancels the skill review request then the skill review request assignee will receive a notification. • **Type:**string • **Default value:**true
Skill Request Pending User Review	When enabled, the agent receives a notification that their manager has submitted a skill request for the agent to review. • **Type:**string • **Default value:**true

Skill Recommendation components in Workforce Optimization for ITSM

Workforce Optimization for ITSM uses roles to administer skill recommendation, tables to store skill data, and properties to modify default behavior, and scheduled job to recommend skills in configurable Workforce Optimization for ITSM.

Roles

Role title [name]	Description	Contains roles
Skill Recommendation User [sn_sre.user]	Grants rights to view skill recommendation tables.	wfo.user
Skill Recommendation Admin [sn_sre.admin]	Grants administrative rights to edit the properties for skill recommendation.	• wfo.admin • sn_sre.user

Properties

Navigate to **Skill Recommendation** > **Configuration** to configure these properties.

Property	Description
Enable skill recommendation.	Enable this p

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
sn_sre.enable_skill_recommendation	• **Type:**true • **Default va**
Maximum number of skills to predict based on supervised learning. sn_sre.max_supervised_skills	Using superv ordered by c • **Type:**Integ • **Default va**
Maximum number of skills to predict based on supervised learning. sn_sre.max_unsupervised_skills	Using unsup incident ord • **Type:**Integ • **Default va**
Number of resolved similar tasks to use for predicting skills. sn_sre.number_of_similar_incidents	The number learning, ord • **Type:**Integ • **Default va**
Number of times Predictive Intelligence must predict the same skill for an agent before recommending it for the agent. sn_sre.user_predicted_skill_threshold	The number before recor • **Type:**Integ • **Default va**
Similarity solution definition to recommend skills from similar incidents. sn_sre.unsupervised_solution_definition_for_incidents	Name of the resolve incid definition, yo • **Type:**Strin • **Default va**
Similarity solution definition to recommend skills for incidents. sn_sre.supervised_solution_definition_for_incidents	Name of the resolve incid definition, yo • **Type:**Strin • **Default va**

Scheduled job

Scheduled job	Description
Start skill prediction	Runs the job every day at 1 AM on all incidents that were closed the previous day. Recommends the skills used to close the incidents to resolve similar open incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables

Table	Description
User Predicted Skill [sn_sre_user_predicted_skill]	• Stores how many times a skill has been predicted for the user. • Skills not recommended in the last 60 days are automatically deleted from this table.
Task Predicted Skill [sn_sre_task_predicted_skill]	• Stores the skills predicted to resolve each type of incident. • Tables created over 60 days ago are automatically deleted from this table.

Integrating Process Mining with Workforce Optimization for ITSM

Integrate Workforce Optimization for ITSM with Process Mining to discover bottlenecks in your processes and take action.

Setting up the integration of Process Mining with Workforce Optimization for ITSM

Use default templates so that you can create process mining projects for your assignment groups to mine the data.

The Process Mining template for the Incident tables is available by default with the Default template type.

But you can create a new template with the Default template type on a new table. For more information, see Create Process Mining templates.

Note:
Workforce Optimization only mines the data for the Incident table. So, Workforce Optimization uses only the Incident table.

Create Process Mining templates

Create templates on tables for which you want to create the process mining projects.

Before you begin
Role required: admin

Note:
You can only create templates for tables where Sys Audit (sys_audit) is enabled. For more information on Sys Audit, see Sys Audit and Audit Relationship Change tables and Enable auditing for a table.

Procedure

1. Navigate to **All** > **Process Mining** > **Templates** > **All Templates**.
2. Create a default process mining template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Process Mining template for the Incident table is available by default.

a. Select **New**.
The **Project Definition** screen appears.

b. In the **Name** field, enter a name for the process mining template.

c. In the **Template type** field, select **Default**.

d. Right-click the form header and select **Save**.

3. Create table configuration for the process mining template.
   a. In the Table Configuration related list, select **New**.
   b. In the **Name** field, enter a name for the table configuration.
   c. In the Table menu, select the table, for example, Incident, for which you want to mine the data.
   d. Select **Submit**.
4. Create an activity definition.

   a. Select the table configuration that you've created.

   b. In the Activity Definitions related list, select **New**.
   You must add at least one activity to create the process project.

   c. In the **Field** field, select the field for which you want to create the activity definition.

   d. Select **Submit**.

5. Select **Submit**.
   Repeat these steps and create a template for each table for which you want to mine the data.

Related topics

Create a Process Mining project for a KPI group

Workforce Optimization for ITSM integration with Process Mining components

Workforce Optimization for ITSM installs roles and properties to configure the Workforce Optimization for ITSM integration with Process Mining.

Properties

Property	Description
sn_team_perf.enable.po.wfo	Enable the integration of Process Mining with Workforce Optimization for ITSM. • **Type:** true | false • **Default value:** false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
promin.wfo.run_frequency	Time interval to re-mine Process Mining projects. After you run the Process Mining - WFO Remine Projects scheduled job to mine the data, you can run it again only at the set interval. If you run the job earlier than that, it will not remine the data. • **Type:** integer • **Default value:** 7 days

Roles

Role title [name]	Description	Contains roles
Process Mining Analyst [sn_process_optimization_analyst]	Create and share Process Mining projects.	sn_process_optimization_viewer

Scheduled jobs

Navigate to **All** > **System Definition** > **Scheduled jobs**.

Name	Description
Process Mining - WFO Remine Projects	Automatically runs once a day. You can run this job on demand when additional data is added to a project so that you get the up-to-date process insights into your projects. The job will remine data based on the frequency set in the *promin.wfo.run_frequency* property.

Identifying bottlenecks using Process Mining integration with Workforce Optimization for ITSM

Get insights into your teams' performance and analyze anomalies or bottlenecks within the process when you drill down into a leaf node KPI.

A leaf node KPI is a child KPI that cannot be drilled down further.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- To integrate Process Mining with Workforce Optimization for ITSM, you must enable the Process Mining plugin (com.sn_po) after you enable the Workforce Optimization for ITSM (sn_wfo_cfg_itsm) plugin from the ServiceNow Store.
- You must enable the *sn_team_perf.enable.po.wfo* system property to **True** to enable the integration of Process Mining with Workforce Optimization for ITSM. For more information, see Workforce Optimization for ITSM integration with Process Mining.
- You can create your own process finding definitions. You also have the option of enabling process finding definitions that have default process configurations for incidents, problems, and change requests when you install the ITSM Process Mining Content Pack (sn_itsm_po) plugin available from the ServiceNow Store. If you do not enable this plugin, you can analyze process variations but not process findings.

For more information, see Activate Workforce Optimization for ITSM and Access Process Mining.

Create a Process Mining project for a KPI group

Create Process Mining projects for each KPI group and its assignment groups. One project is created per KPI group per table.

Before you begin

Your administrator:

- Must have created templates on tables that you want to create the process projects for. For information on creating templates, see Create Process Mining templates.
- Must run the *Process Mining - WFO Remine Projects* on-demand scheduled job when additional data is added to the projects so that you get the up-to-date process insights into your projects. The job is run on all projects that meet set criteria such as the frequency to remine that is set using the **promin.wfo.run_frequency** system property. Also, the scheduled job updates the project and remine when there are any changes to the assignment groups.

  For more information, see Workforce Optimization for ITSM integration with Process Mining.

Role required: sn_process_optimization_analyst

The KPI assignment group manager must have this role to create process projects for their KPI groups.

About this task

After you mine the project, the Project Definition for Process Minings (sn_team_perf_promin_project_groups) project mapping table holds the reference for Workforce Optimization. Each project in the table has a unique source associated with each application. For example, the **Source** field in the table shows the assignment group associated with the Workforce Optimization project. The **Source** field is an identifier for the specific applications. The table also shows the KPI group associated with the project that you've mined.

Procedure

1. Mine the project to create process mining projects for each KPI group.

   a. Navigate to **All** > **Workforce Optimization for ITSM** > **Team Performance** > **KPI Groups**.

   b. Select a KPI group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Initiate Process Mining**.

The process mining is run on active assignment groups. The project mining process is run on all leaf node automated or formula indicators in the KPI group.

A corresponding project is created in the **All** > **Workforce Optimization for ITSM** > **Team Performance** > **WFO Projects** module. When the mining is complete, the **Mining state** field changes to **Available**.

A user with the role, sn_wfo_cfg_itsm.manager, has a access to create or view the project, and can view the process insights and variation analysis in the **Process analysis** tab.

Note:

- If a project process has been mined for a specific table in an assignment group, the projects are created for those assignment groups. Therefore, you can't mine the table in that assignment group again.
- If you're using a formula indicator for process mining, you can select any indicator source that is used in the formula.

2. **Optional:** If you add additional assignment groups to the KPI group after you do process mining, you must remine the group again.

a. In the Assignment Group related list for the selected KPI group, select **Edit**.

b. Add the desired assignment group to the KPI group.

(Optional) A process is automatically created for the assignment group. If you add an assignment group to the KPI group, the assignment group will be updated in the filter condition, and if you remove any assignment group, it will be removed from the project filter condition. An informational message is displayed when an assignment group is added to the KPI group only if the KPI group is already mined.

All the assignment groups associated with the KPI group for which you've created the project are updated in the filter condition of the table configuration.

For more information on mining data, see Generate a model.

After any previous versions of Team Performance are upgraded to the latest version (Team Performance App Version: 7.0.1), all the previous projects will be removed for KPI groups that had multiple projects for assignment groups and new projects will be created for each of them.

Advanced configurations for Workforce Optimization for ITSM

You can perform advanced configurations such as customizing Workforce Optimization for ITSM pages, and defining filters for different modules. You can also specify the access to assignment group data to display only the assignment group data relevant to the logged-in user.

Workforce Optimization for ITSM reference

Refer to install components such as roles, tables, and system properties to configure and administer Workforce Optimization for ITSM.

To get details on which roles can be associated with each Workforce Optimization for ITSM persona, see Roles in Workforce Optimization for ITSM.

Scheduled job

Name	Description
WFO data collection	Runs the job on demand and collects data for all Workforce Optimization for ITSM indicators.

Domain separation and Workforce Optimization for ITSM

Domain separation is supported in Workforce Optimization for ITSM. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Workforce Optimization for ITSM

Domain separation is supported in Workforce Optimization for ITSM and does not require any setup or configuration.

Domain separation for Channels Workforce Optimization for ITSM

For information on how domain separation works in Channel Management for Workforce Optimization for Customer Service, refer to Domain separation and Advanced Work Assignment

Domain separated tables for Channel Management

- sn_customerservice_case
- interaction

Domain separation for Scheduling Workforce Optimization for ITSM

When an agent schedule is generated and assigned to an agent, the schedule is only available in the domain to which that agent belongs.

Domain separated tables for Scheduling

- sn_shift_planning_agent_schedule
- sn_shift_planning_agent_schedule_request
- sn_shift_planning_break

Global Search in Workforce Optimization for ITSM

Locate what you're looking for quickly using the global search in Workforce Optimization for ITSM.

As an agent or a manager, easily find the information you need by searching users, groups, shifts, schedules, or tasks using the search icon .

Note:
To search shifts and schedules, you must generate the text index for the following tables before you start performing the search for shifts and schedules:

- Schedule [sn_shift_planning_schedule_plan]
- Shift Plan [sn_shift_planning_shift_plan]

Requesting time-off using the ITSM Mobile Agent for Workforce Optimization for ITSM

Using the ITSM Mobile Agent app, shift planning agents can access their schedule. They can request time off to get their manager's approval or swap shifts with their peers and receive notifications for those requests and approvals.

Workforce Optimization for ITSM Mobile Agent

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The ITSM Mobile Agent for Workforce Optimization for ITSM features are available with the ITSM Mobile Agent 5.0 store application. For more information, see Activate Workforce Optimization for ITSM.

Using On-Call Scheduling with Workforce Optimization for ITSM

If you are using Mobile experience for On-Call Scheduling along with the ITSM Mobile Agent for Workforce Optimization for ITSM, you can access the On-Call Scheduling actions from the Schedule section.

To access:

- **Upcoming shifts**: tap **My calendar** and view your shifts.
- **Time-off requests**: tap **On-call time-off requests** and view the list of requests awaiting your approval and the ones for which you have completed the approval process.
- **Who is on-call**: tap **Who is on-call** to view the list of groups in the on-call schedule.

Setting the number of days to display events in shifts on the ITSM Mobile Agent

As a Workforce Optimization admin [sn_wfo.admin], you can configure the number of days events for shifts can be displayed on the mobile application using system properties. For more information, see **Properties** in the **Scheduling** section in Scheduling in Workforce Optimization for ITSM.

Related topics

Mobile experience for On-Call Scheduling

Notifications in ITSM Mobile Agent for Workforce Optimization for ITSM

Receive notifications when you manage shift-swap and time-off requests. Enable notifications for the actions that are most relevant to you. For example, get notified when you receive a request for approval from an agent who wants to swap shifts with a peer.

As a Workforce Optimization for ITSM agent (sn_shift_planning.agent) and a Workforce Optimization for ITSM manager (sn_wfo_cfg_ws.manager), you can enable or disable notifications for shift-swap and time-off requests and approvals. Agents can request a shift-swap with their peers and get approval from their manager. They can also request approval for time-off from their managers.

You must set your notification preferences in your desktop application to receive the notifications in your ITSM Mobile Agent application.

To enable the notifications:

1. On your desktop application instance, click the gear icon in the top-right corner. The **System Settings** screen appears.
2. Click **Notifications**.
3. Enable **Allow Notifications**.
4. In the **Notifications Category** section, click **Mobile - Shift Planning**.
5. Enable the desired notification.

Setting notification preferences in Core UI

Make a request to swap shifts or take time off using the Mobile Agent application

Use the ITSM mobile app to look up your schedule, request time off, or swap your shift with your peers. If you can work during the requested shift, you can also approve your peer's request for the shift swap.

Before you begin

Role required: sn_shift_planning.agent

Procedure

1. Navigate to the ITSM Mobile Agent application.
2. Request time off.
3. If you are using:
   - An Android application, tap the send icon.
   - An iOS application, tap **Submit**.

   A notification to approve your request is sent to your manager.
4. Request a shift-swap.
   You can communicate with other agents by using Connect Chat or the activity stream on the record to make sure that they would like to swap the requested shift with you.
5. In the **Schedule** section, tap **My calendar**.
6. Tap the date for which you want to make the request.
7. Tap the work shift for that day.

Note:
Alternatively, you can swipe left on the shift you want to request time off or shift swap and select the desired option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Tap **Request shift swap**.
9. In the **Swap with** field, tap and select the agent you want to swap with.
10. Make a shift-swap request.
11. In the **Requested shift** field, tap and select the agent's shift that you want to swap with.
12. If you are using:
    - An Android application, tap the send icon.
    - An iOS application, tap **Submit**.

    A notification is sent to the agent to approve your request.

Approve or reject a shift swap using the ITSM Mobile Agent application

Using your ITSM Mobile Agent application, approve a shift swap requested by your peer if you are available to work at that time. You can reject it if you are unable to work then.

Before you begin

Role required: sn_shift_planning.agent

Note:
If you have notifications enabled, you can approve or reject shift-swap requests from the notifications without opening the request.

Procedure

1. Navigate to the ITSM Mobile Agent Agent application.
2. Tap **Approvals**.
3. In the **Pending** list, select a request to approve and review the request details.
4. Do one of the following:
    - To approve a request, tap **Approve**.
    - To reject a request, tap **Reject**.

    Your peer receives a notification on the request approval status.

Track and manage your agent's schedule using the ITSM Mobile Agent application

Monitor the shifts and schedule of teams within your assignment group using the ITSM Mobile Agent application. You can approve or reject requests for swapping shifts or time off for your agents.

Before you begin

Role required: sn_shift_planning.admin

Note:
If you have notifications enabled, you can approve or reject shift-swap or time-off requests from the notifications without opening the request.

Procedure

1. Navigate to the ITSM Mobile Agent application.
2. Monitor your team's schedule.
    a. Tap **My team**.
    b. In the **Schedule** section, click **Team Calendar**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Tap the day for which you would like to monitor the schedule.

d. Tap a shift for the day to view the details for the shift.

3. Approve or reject an agent's time off or shift-swap with another agent.

a. Tap **My work**.

b. Tap **Approvals**. You can view the pending requests in your queue waiting for approval and also the approvals you have completed and the details for each request.

c. From the **Pending** list, tap a request to approve.

- To approve a request, tap **Approve**. The schedule gets update in the calendar based on the approval.
- To reject a request, tap **Reject**.

The agent receives a notification when you approve or reject the request.

Workforce Optimization for ITSM landing pages

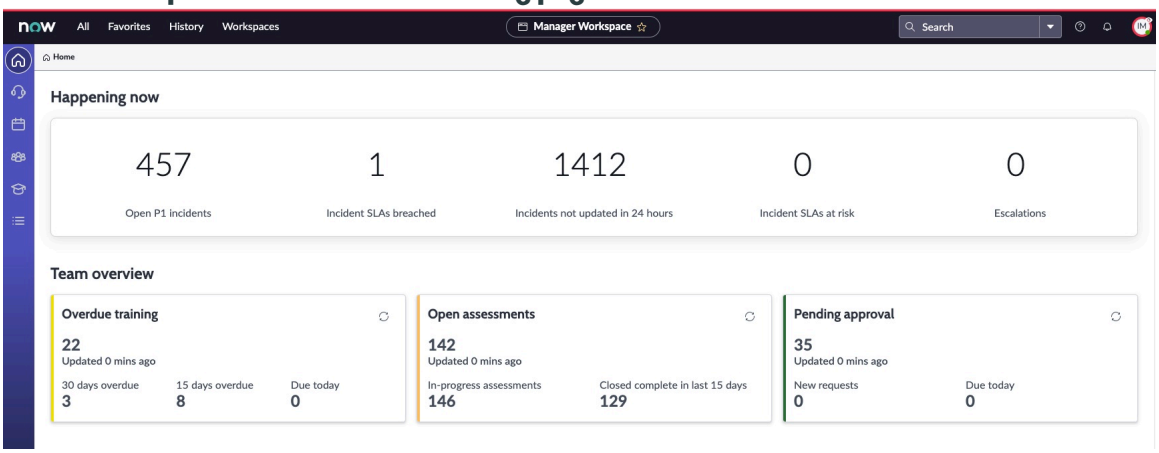
Track and monitor the performance of your organization using the Workforce Optimization for ITSM landing pages. If you are a coach or a channel manager, you can access metrics specific to your application using the Channels or the Quality landing pages respectively.

You can clone an existing landing page and customize it using the Next Experience UI Builder. For more information, see Customize a Workforce Optimization for ITSM page using Next Experience UI Builder.

Workforce Optimization for ITSM manager landing page

Stay on top of the status of incidents your teams are working on at a given time. Monitor training that's overdue and how many assessments are open and require approval. Analyze your teams' work and SLA status for the desired time period.

Workforce Optimization for ITSM landing page



End user and roles

End user and goal	Required role
As a workspace manager, you can:	sn_wfo_cfg_ws.manager

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End user and goal	Required role
• Monitor open P1 incidents, SLAs that have been breached, at risk, the ones not been updated in 24 hours, or escalations. • Analyze the incidents your team is currently working on or incidents that have not yet been assigned. • Track the mean time to resolution, first call resolution, and customer satisfaction based on the assignment group for the desired time period.	

Use case

Monitor your agent's work when you start your day, view reports that need your attention, and navigate to the incidents on which you want to take action. Analyze the performance of a specific team for a desired time period by selecting the team from the Teams list and also the desired date range.

Indicators

Mean time to resolution

The average time taken to resolve incidents.

First call resolution

Number of incidents resolved the first time it was handled.

Customer satisfaction

Overall customer satisfaction on incident resolution.

Team Performance

A list of incidents assigned to the teams managed by the current logged-in user.

Unassigned incidents

A list of incidents assigned to groups managed by the current logged-in user that does not have an assignee.

Breakdowns

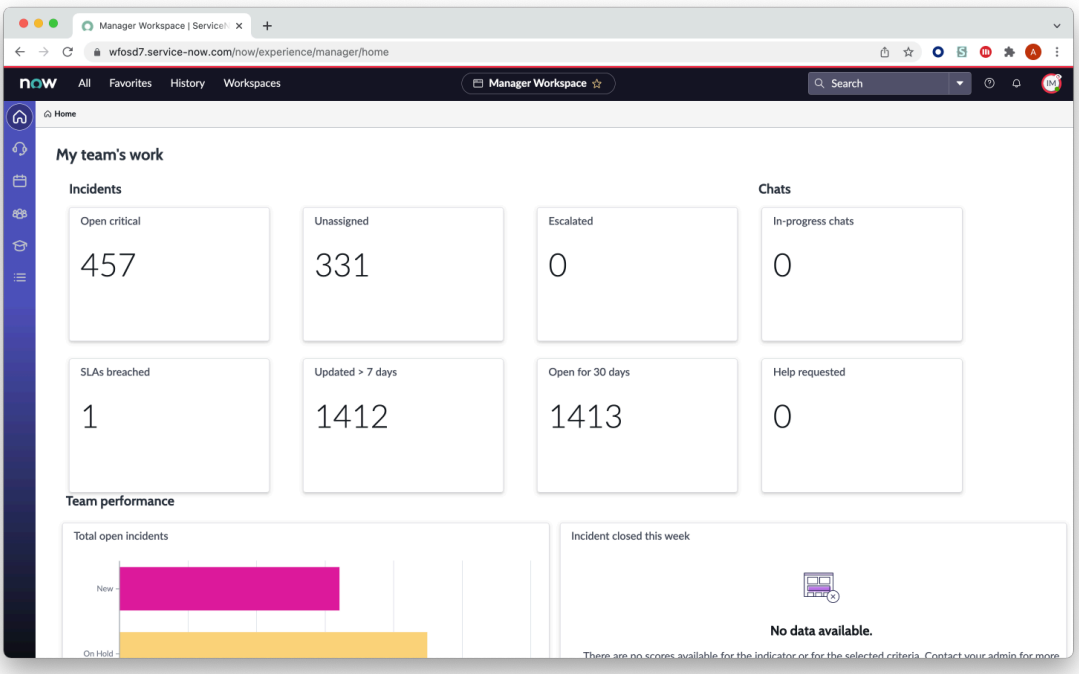
Title	Type	Description
Open P1 Incidents	42 Single score	Number of open incidents with top priority.
Incidents not updated in 24 hours	42 Single score	Number of incidents that have not been updated in the last 24 hours.
Incident SLAs Breached	42 Single score	Number of incidents with SLAs that have been breached.
Incident SLAs at Risk	42 Single score	Number of incidents with SLAs that are at risk.
Escalations	42 Single score	

Workforce Optimization for ITSM Channels landing page

Manage queues and analyze the status of incidents and chats using the Channels landing page. You can also monitor team performance and work assignments from one location.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

End user and roles

As an admin, you can create or customize landing pages for the channel manager. For more information, see Creating custom landing pages for workspaces. If you have multiple landing pages, you can set the order for the landing pages. The lower the order, the higher the precedence in displaying the pages.

End user and goal	Required role

As a channel manager, you can:
• Analyze real-time data such as:
  ○ The number of incidents with critical priority, breached SLAs, escalated or unassigned incidents.
  ○ The number of chats that are in progress or with requests for help.
  ○ Agent distribution across work assignments, work items awaiting to be assigned, and number of agents available.
  ○ The performance of your team.
• Drill down into each report or analytics to get more data.
	sn_channel_mgmt.user

Use cases

As a channel manager, you can monitor key information such as the number of SLAs that have been breached, how many open incidents have critical priority, and how many work items are waiting to be assigned from one location.

Performance Analytics Indicator

Incidents closed this week: The number of incidents closed during the current week.

Customize a Workforce Optimization for ITSM page using the Next Experience UI Builder

Clone an existing Workforce Optimization for ITSM page and customize it based on your needs using the Next Experience UI Builder.

Before you begin

Role required: admin, workspace_admin, or ui_builder_admin

About this task

All Workforce Optimization for ITSM Next Experience UI Builder pages and page variants are read-only. You can copy a page variant and then customize it. You can create a page variant from scratch or use a page template. For more information, see Create a variant of a page.

Note:
After you copy and customize a page variant, any automatic updates applied to the original read-only page variant will not be applied to the page variant that you have customized.

To open your configurable workspace experience in UI Builder, see Open a Configurable Workspace experience in UI Builder

For a list of all workspaces ServiceNow offers to target specific users, see List of workspaces.

Procedure

1. Navigate to **All** > **UI Builder**.
2. In the UI Builder screen, select **Manager Workspace**.
3. In the **Page** menu, select the page you want to edit.
   For example, Landing Page or Work Scheduler.
4. In the **Variants** section, select the menu icon (⋮) of the variant you would like to copy select **Duplicate**.
5. In the variant that you've duplicated, select the menu icon (⋮) and select **Edit page variant settings**.
6. In the Edit settings pop-up window, do the following:
   - In the **Variant name** field, enter a unique name for the variant.
   - If you would like to use a different page template, in the **Page template** field, select the page template.
   - Select **Save** to keep the changes.

     If you do not want to make any updates, select **Cancel** or select **Delete** to delete the variant.
7. Select the menu icon (⋮) and select **Edit conditions**.
   - To add or edit conditions for the variant, in the **Variant Conditions** field, and add your preferred conditions for the variant.
   - To display the variant in Workforce Optimization for ITSM, in the **Order** field, set the preferred order number.
8. Select **Done**.

Configure filters for ITSM Manager Workspace

Define filter configurations for Schedule, Coaching, and Channels applications. You can use these filters to refine your search and view targeted results.

Before you begin

Role required: sn_wfo_cfg_ws.admin

About this task

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace Configurations** > **Filter Configurations**.
2. Click **New**.
3. On the form, fill in the fields.

Filter Configuration form

Name	Description
Filter Name	Unique name for the filter configuration.
Table	Table that is used for the filter configuration. **Note:** ○ You can filter only on specific tables or database views for each module. ○ For a list of tables and database views that you can use for each module, see the Filter Configuration Tables section in Workforce Optimization for ITSM components.
Field	Field on which to filter.
Filter Query	Query to narrow down the filter options.
Type	Type of field to choose from: ○ Choice: choice type field. ○ Reference: reference type field.
Order	Filter that you can use to see the display order in Manager Workspace.
Workspace Module	Workforce Optimization for ITSM module that displays the filter configuration.
Active	Option that enables the filter configuration in Manager Workspace.

4. Click **Submit**.

Add or remove access to assignment groups in Workforce Optimization for ITSM manager workspace

Include or exclude access to assignment group data to display only the groups that are relevant for the logged-in user in the Workforce Optimization for ITSM manager workspace.

As a manager, by default, you can see all groups that you directly or additionally manage. You can add access to additional groups or remove access to any of the groups displayed by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To add access to more groups, use an extension point.
- To remove access, use filter conditions to exclude groups for which you don't need visibility.

Using extension points to include access for specific groups in Workforce Optimization for ITSM manager workspace

Use scripted extension points to add access for managers to view assignment groups data other than the default groups that they manage in Workforce Optimization for ITSM manager workspace.

To see a list of extension points that you can use for Workforce Optimization for ITSM, navigate to **System Extension Points** > **Scripted Extension Points**. In the Extension Points list, open the *sn_wfo_common.ApplicableGroupsDefinitionManager* extension point.

Use scripted extension points to integrate customizations without altering the core components in the application code. When customizing a base application, you implement the scripted extension points by creating the custom script includes and registering them against the scripted extension points.

Extension points to include access for specific groups

Extension point name	Description
sn_wfo_common.ApplicableGroupsDefinitionManager	Implement this extension point to customize the logic to include access for managers to see assignment groups other than the default groups that they manage in the Workforce Optimization for ITSM manager workspace.

Related topics

Using scripted extension points in server-side scripts

Exclude access for specific groups in Workforce Optimization for ITSM manager workspace

You can remove access to assignment group data and display only the assignment groups that are relevant for the logged-in user in the Workforce Optimization for ITSM manager workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Workforce Optimization for ITSM** > **Manager Workspace Configuration** > **Group Exclusions**.
2. On the **Groups not included in WFO** form, select **New**.
3. In the **Name** field, enter a meaningful name for one or more groups you want to exclude from displaying in the Workforce Optimization for ITSM manager workspace.
4. Set the filter conditions to exclude the groups.

   For example, if you define a condition as **[Name] [does not contain][Support]**, then the Workforce Optimization for ITSM manager workspace doesn't display any groups that contain Support in the group name.

   For information on configuring condition builders, see Condition builder.
5. Select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify the display of the right groups in Workforce Optimization for ITSM

Verify that the logged in user can access the correct assignment groups data.

Before you begin

Role required: sn_wfo_cfg_ws.manager or admin

Procedure

1. Impersonate the manager for which you want to verify access.
2. Select **All** and in the filter navigator, enter `sys_user_grmember.list`.
3. Select the filter icon and set the condition as **[Group] [is(dynamic)][MYWFOGroups]**.

   The output displays all assignment groups that have access to the manager workspace. This output is based on the configurations in the **Group Exclusions** filter and the implementations using the extension points.

   If the assignment groups listed are missing any groups that the logged-in user must have access to, verify that the **Group Exclusions** filter, and the extension points are configured correctly.

Exploring Incident Communications Management

The ServiceNow® Incident Communications Management application enables organizations to create and manage communications related to major business issues or incidents.

Incident Communications Management overview

Incident Communications Management allows incident communications administrators to bring together all involved users during these events and establish quick and easy communication within this group.

For example, a major issue occurs in a server room, which leads to a high-priority incident to be raised. The incident can potentially impact all users, so it is important to bring together key representatives and communicate quickly and effectively. An incident communication plan can facilitate this communication process and help resolve the source incident.

Incident Communications Management benefits

ServiceNow® Incident Communications Management supports the incident communications management process in the following ways:

- Create an incident communication plan when a crisis occurs.
- Set up contact responsibilities to identify the individuals who receive automatic notifications when incident communication plans are created. If they want to receive notifications, Self-Service users can subscribe to incident communication plans.
- Manage incident communication plans to improve communication while dealing with the crisis.
- Use the optional Notify feature to send notifications by SMS messages and voice mails, and to set up conference calls.
- Monitor events and results with the incident communication plan dashboard and reports.

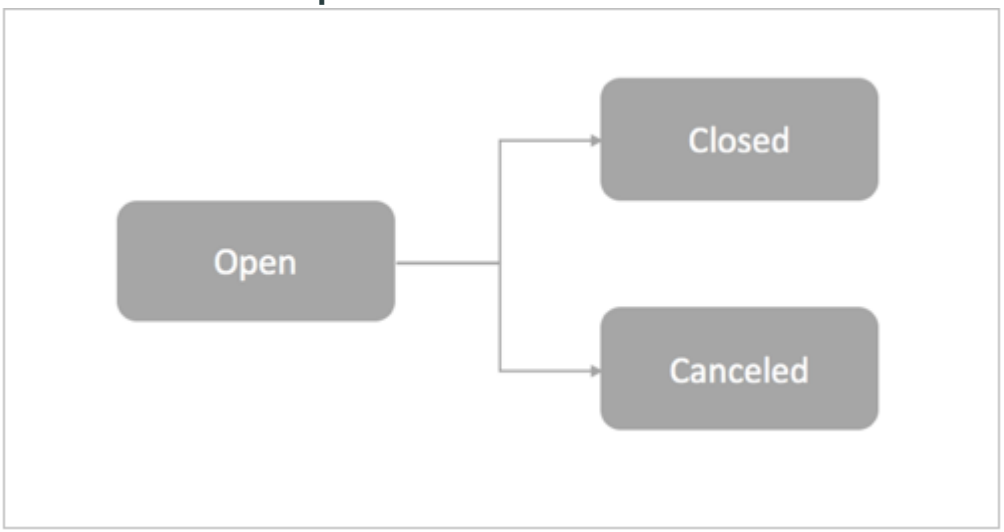
Incident communication plan state model

Incident communication plan state model helps you to understand the different states through which a plan can progress and track the plan through its states.

Incident communication plans are created with an **Open** state. They follow a process that finishes with the **Closed** or **Canceled** state. The following state model is applicable to new customers starting the Madrid release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident communication plan state model



The following two properties are responsible for different actions that take place on Incident Communication Plan and Incident Communication Task:

- The **Close open Incident Communication Plans when Incident is closed or canceled** property (*com.snc.incident.incident_alert.closure*) is responsible for the following action:
  - When incident is closed, any open Incident Communication Plan is closed.
  - When an incident is canceled, any open Incident Communication Plan is canceled.
- The **Close open Incident Communication Tasks when an Incident Communication Plan is closed or canceled** property (*com.snc.iam.incident_alert_task.closure*) is responsible for the following actions:
  - If an Incident Communication Plan is **Closed** or **Canceled**, then the state of any open Incident Communication Task on which communication is not yet performed, is set to **Skipped**.
  - If an Incident Communication Plan is **Closed** or **Canceled**, then the state of any open Incident Communication Task on which communication is performed at least once, is set to **Complete**.

Note:
The **Close open Incident Communication Plans when Incident is closed or canceled** and **Close open Incident Communication Tasks when an Incident Communication Plan is closed or canceled** property is visible when you activate the Incident Communications Management plugin (com.snc.iam). This property is set to false for both new and existing customers.

For more information on the old Incident Communications Plan state model, see Incident communication plan state model (old).

Incident communication plan state model (old)

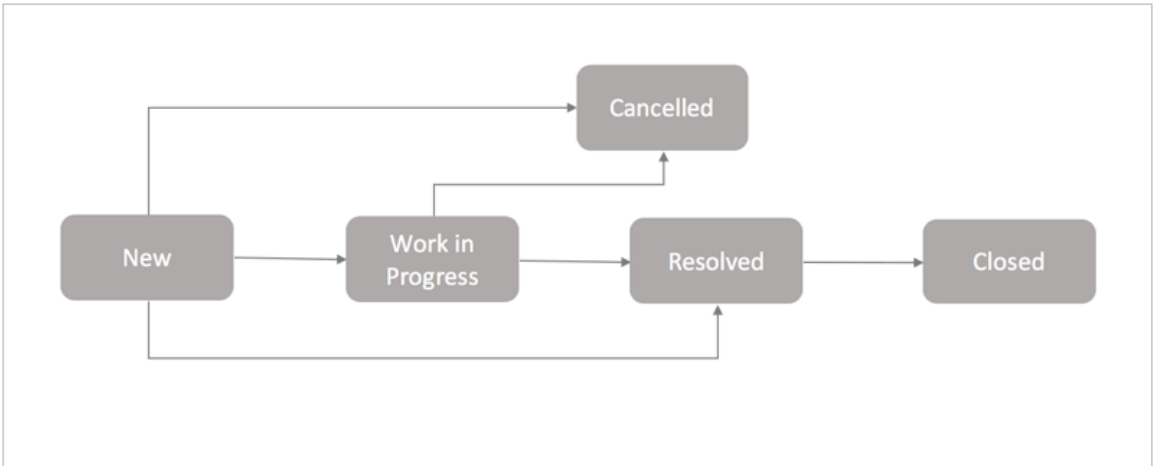
Incident communication plan state model helps you to understand the different states through which a plan can progress and also to track the plan through its states.

Incident alerts are created with a **New** state. They follow a process that finishes with the **Closed** or **Canceled** state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The state model shown below is available only for customers prior to the London release. Beginning London release, customers who have upgraded to the latest release, can refer to Incident communication plan state model.

Incident communication plan stages



The incident communication plan changes from the **New** state to the **Work in Progress** state when you update the **Actions Taken** field. Only the incident communication plan creator or a user with the admin role can cancel an incident communication plan.

The following two properties are responsible for different actions that take place on Incident Communication Plan and Incident Communication Task:

- The **Close open Incident Communication Plans when Incident is closed or canceled** property (*com.snc.incident.incident_alert.closure*) is responsible for the following actions:
  - If an incident is closed or canceled when the incident communication plan state is **New** or **Work in Progress**, the incident communication plan state is set to **Canceled**.
  - If an incident is closed or canceled when the incident communication plan state is **Resolved**, the incident communication plan state is set to **Closed**.
- The **Close open Incident Communication Tasks when an Incident Communication Plan is closed or canceled** property (*com.snc.iam.incident_alert_task.closure*) is responsible for the following actions:
  - If an incident communication plan is closed, the state of all open incident communication tasks is set to **Closed Incomplete**.
  - If an incident communication plan is canceled, the state of all open incident communication tasks is set to **Closed Skipped**.

Note:
The **Close open Incident Communication Plans when Incident is closed or canceled** and **Close open Incident Communication Tasks when an Incident Communication Plan is closed or canceled** property is visible when you activate the Incident Communications Management plugin (com.snc.iam). This property is set to false for both new and existing customers.

Configuring Incident Communications Management

Configure Incident Communications Management to create and manage communications related to major business issues or incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration overview

Configure Incident Communications Management by installing and activating the Incident Communications Management (com.snc.iam) plugin.

Install and activate Incident Communications Management

Install and activate the Incident Communications Management (com.snc.iam) plugin if you have the admin role.

Before you begin

Role required: major_incident_manager, ia_admin, or admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics

Incident Communications Management

Managing Incident Communications

Incident Communications Management provides a framework for defining and managing a communication process for an incident. It helps you to streamline a communication process by creating designated incident communication plans for effective communication during an event.

Communication plan definition

An incident communication plan helps you to streamline a communication process with regards to an incident. It defines the stakeholders who should be informed, what information should be shared, when the information should be delivered, and the methods of communication.

For information on how to create a communication plan definition, refer to Create communication plan definition .

Important:
While creating the Communication Plan definition, ensure that the table is Incident [incident]. If you have upgraded to London or a higher release and you use communication plan to streamline the communication process, deactivate the Major Incident Response and Resolution flow designer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication task definition

Each communication plan involves a series of communication tasks. A communication task definition helps you to specify the mode of communication (channel) and the frequency at which the communication must be carried out.

For information on how to create a communication task definition, refer to Create communication task definition.

Communication contact definition

Communication contact definition helps you to define the recipients of a particular communication plan. The contact determines the target audience involved in each communication task and the responsibilities they are expected to handle. A notification for a task is sent to all individuals specified for that task. You can add or remove any particular communication contact manually.

For information on how to create a communication contact definition, refer to Create communication contact definitions.

Communication channel definition

You can define a communication channel for each communication task. The communication channel determines which mode of communication to use for the task when a plan is attached to an incident. The modes of communication available are: email, SMS, conference, and Slack.

For information on how to create a communication channel definition, refer to Create communication channel definition.

Create adhoc incident communication plan

Create an adhoc incident communication plan to manage and track communications around a high-priority incident or other issues.

The adhoc incident communication plan can be created in the following ways:

- Create adhoc incident communication plan from Incident Communications Management.
- Create adhoc incident communication plan from an incident.

Create adhoc incident communication plan from Incident Communications Management

Create an incident communication plan from Incident Communications Management when an issue is not considered earlier. If you need collaboration on that issue, you can create an incident communication plan.

Before you begin

Role required: major_incident_manager, ia_admin, or admin

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Create New**.
2. On the form, fill in the fields.

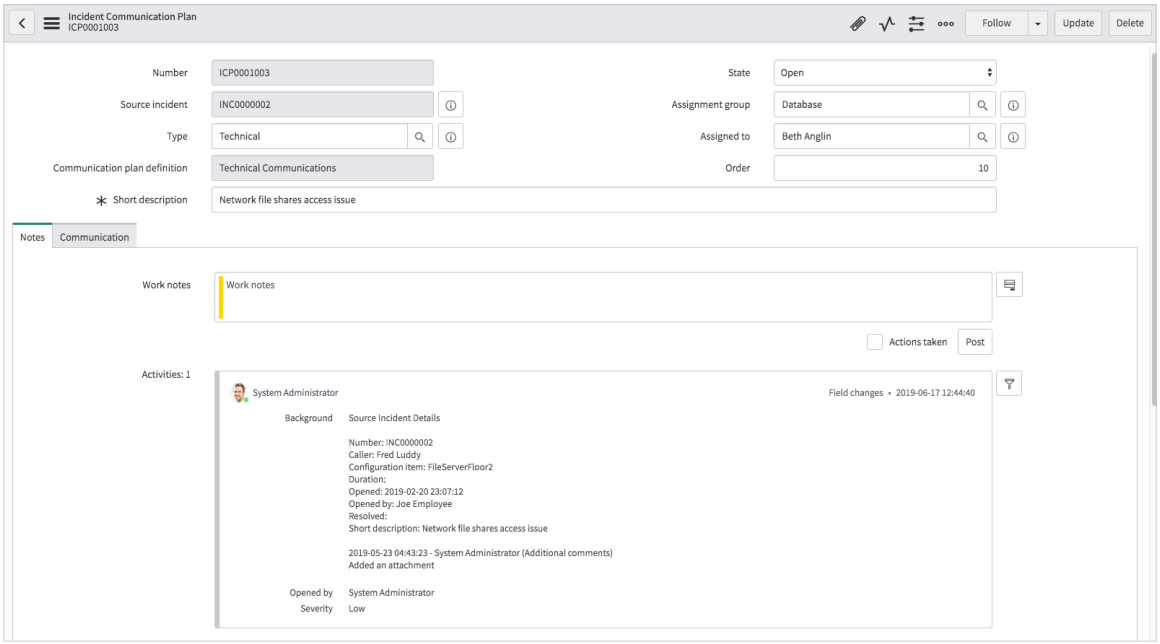
Incident Communication Plan form



Field	Description
Number	Unique incident communication plan ID, in the ICPxxxxxxxx format.
Source incident	The source incident for this communication plan, if any. If you select a source incident, the **Background** field is populated with data from this incident, unless there is existing data in this field.
Type	Type of communication plan available are Ad hoc, End User, Stakeholder, and Technical.
Communication plan definition	The communication plan definition based on which this incident communication plan is attached.
State	The state of the communication plan. The available values are **Open**, **Closed**, or **Canceled**.
Assignment group	The assignment group, if any, for that incident communication plan. For example, there might be a group that represents a crisis management team, including several Incident Managers, Duty Directors, and Duty Managers.
Assigned to	The assigned user for the communication plan. By default, the assigned to user is the one who creates the communication plan. The communication plan can also be assigned to an ITIL user or an incident communication plan administrator.
Order	Order in which the communication plan appears in the incident. If there are multiple communication plans, this field indicates which communication plan to execute first.
Short description	A brief summary of the communication plan.
Description	A detailed description of the communication plan.
Notes	Work notes, activities, and background information regarding the incident communication plan.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Submit**.
   An incident communication plan is created. The **Communication** tab lists the communication tasks that have email, SMS, or slack as the communication channel. The **Conference** tab lists the communication tasks that have conference as the communication channel.

Create adhoc incident communication plan from incident

Create an adhoc incident communication plan from an incident when an issue related to the incident is not considered earlier. The incident automatically populates the required information in the adhoc communication plan, saving you time and effort.

Before you begin

Role required: major_incident_manager, ia_admin, or admin

Procedure

1. Navigate to **All** > **Self-Service** > **Incident** > **Open**.
2. Open an existing incident.
3. Click the Incident Communication Plans related list.
4. Click **New**.
   The original incident becomes the source incident of this communication plan.
5. On the form, fill in the fields.

Incident Communication Plan form

Field	Description
Number	Automatically generated unique incident communication plan ID, in the ICPxxxxxxxx format.
Source incident	The source incident for this communication plan, if any. If you select a source incident, the **Background** field is populated with data from this incident, unless there is existing data in this field.
Type	Type of communication plan available are Ad hoc, End User, Stakeholder, and Technical.
Communication plan definition	The communication plan definition based on which this incident communication plan is attached.
State	The state of the communication plan. The available values are **Open**, **Closed**, or **Canceled**.
Assignment group	The assignment group, if any, for that incident communication plan. For example, there might be a group that represents a crisis management team, including several Incident Managers, Duty Directors, and Duty Managers.
Assigned to	The assigned user for the communication plan. By default, the assigned to user is the one who creates the communication plan. The communication plan can also be assigned to an ITIL user or an incident communication plan administrator.
Order	Order in which the communication plan appears in the incident. If there are multiple communication plans, this field indicates which communication plan to execute first.
Short description	A brief summary of the communication plan.

Field	Description
Description	A detailed description of the communication plan.
Notes	Work notes, activities, and background information regarding the incident communication plan.

6. Click **Submit**.
   An incident communication plan is created. The **Communication** tab lists the communication tasks that have email, SMS, or slack as the communication channel. The **Conference** tab lists the communication tasks that have conference as the communication channel.

Create adhoc incident communication task from Incident Communications Management

Create an adhoc incident communication task while you are working on the communication plan. The communication task helps you to specify the mode of communication (channel) and the frequency at which the communication must be carried out.

Before you begin

Role required: major_incident_manager, ia_admin, or admin

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Open**.
2. Open the incident communication plan for which you want to create the communication task.
3. In the Incident Communication Tasks related list and click **New**.
4. On the form, fill in the fields.

Incident Communication Task form

Number	Unique incident communication task ID, in the ICTxxxxxxxx format.
Incident Communication Plan	[Read-only field] Incident communication plan for which you create the task.
Source incident	[Read-only field] Lookup icon to select the incident on which you want the plan to be attached.
Type	Lookup icon to select the type of task such as internal communication.
Communication task definition	[Read-only field] Unique name of the communication task definition for which you are creating the task.
State	The state of the communication plan. The available values are **Pending**, **Open**, **In Progress**, **Complete**, and **Skipped**.
Assignment group	The assignment group, if any, for that incident communication task.
Assigned to	The assigned user for the communication task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Order	Order in which the communication task appears in the communication plan. If there are multiple communication tasks, this field indicates which communication task to execute first.
Communication frequency	Frequency of the communication task execution. You can send the notification once or the notification can be repeated.
Due in	Time by which the communication task must be completed.
Last communication sent	The date and time when the last communication is sent to the user or the group.
Short description	A brief summary of the communication task.
Description	Detailed description of the communication task.

5. Click **Submit**.

What to do next

Create adhoc incident communication channel. For more information on how to define a communication channel, refer Define a communication channel.

Incident Communications Management and Contacts

You can define contacts to associate users or groups to an incident communication plan. The users or groups are contacted to complete the tasks included in a communication plan.

If you have the ia_admin role, you can assign users or groups to an incident communication plan based on the information provided in these records:

- Contact responsibilities: Provides a name, such as Incident Duty Manager, for a set of tasks related to incident communication plan. The contact responsibility record also indicates whether the tasks are performed by an individual user or a group of users. Contact responsibilities can also be used to manually add contacts to an incident communication plan.
- Contact definitions: Identifies a set of conditions to determine which specific user or group is assigned to handle a particular responsibility for an incident communication plan. For example, All P1 Incidents must have an Incident manager, assigned to US Incident Management group.

Contact responsibilities and contact definitions allow you to define and modify data-driven contact information for automatic notifications. You do not have to specify individual users or groups directly for each incident communication plan.

You can use group contacts. You can use the Group contacts functionality when you have on-call scheduling, Notify, and Incident Communications Management. Group contacts include the people that are on-call. The group contacts can be included when initiating a conference call that is a result of an incident communication plan. By default, the primary and secondary on-call persons are available. To modify this behavior, set the system property `com.snc.iam.on_call_escalation_level`.

Responsibilities for Incident Communication Plan

Contact responsibilities helps you to identify contacts by their responsibilities and to understand what you can expect from the user throughout the life cycle of the communication plan.

There are two types of responsibilities available for use with incident communication plans:

- Default Responsibilities: Contacts who are notified by default.
- Other Responsibilities: Contacts who can be selected for notification.

Use contact definitions to view and modify the rules that determine the specific users associated with contact responsibilities.

Default Responsibilities

By default, contacts with the following responsibilities are notified when an incident communication plan is created:

- Duty Manager
- Incident Manager
- Duty Director

These roles are involved with resolving the source incident or original event that the incident communication plan relates to. They are seen as key contacts for the incident communication plan.

The following sections describe typical operational roles for these responsibilities.

Contact Administration Default Responsibilities

Responsibility	Description
Duty Manager	The senior point of presence in the monitoring environment at the time an incident occurs. The Duty Manager assesses the incident against standard operating procedures, escalation triggers, and personal knowledge and experience, to take corrective actions. To clarify the urgency and impact of an incident, the Duty Manager can contact the Incident Manager for advice.
Incident Manager	A senior technician, accountable for coordinating and managing all technical resources required to resolve incidents. After being notified by the Duty Manager of a serious incident, the Incident Manager assesses the seriousness and associated business impact. Based on this assessment, the Incident Manager decides whether to escalate the incident to the Duty Director. The Incident Manager may escalate to the Duty Director to gain access to resources outside of the department, if necessary.
Duty Director	The escalation point for all issues that affect critical services. The Duty Director works in partnership with the business directors in the organization to approve recovery plans developed by the Incident Manager. The Duty Director also manages the senior level communications for the source incident.

Other Responsibilities

Incident Communications Management provides the following additional responsibilities that can be added to incident communication plans. You can also create contact responsibilities, as needed. The associated users receive notifications about the incident communication plan.

© 2026 ServiceNow, Inc. All rights reserved.

Contact Administration Other Responsibilities

Responsibility	Description
Business Director	Director within the business who is identified as a potential contact when an incident communication plan occurs.
Communication Manager	Business-facing role in the event communication is required in an incident communication plan.
Crisis Action Manager	Overall responsibility and accountability for managing incident communication plans.
Crisis Action Team Member	Nominated department heads who are involved when an incident communication plan occurs.
Development personnel	Development personnel involved in the troubleshooting and resolving an incident communication plan.
Operations support personnel	Personnel involved in the second or third level of support in troubleshooting and resolving an incident communication plan.
Service Owner	Service owner or manager who is identified as a potential contact when an incident communication plan relates to one or more of their services.
Technical Support	Second or third level technical support personnel involved in troubleshooting and resolving an incident communication plan.

Define contact responsibilities

Define the different contacts or target audience involved in the communication process and their responsibility to understand the expectations from those contacts throughout the process.

Before you begin

Role required: ia_admin or admin

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Contact Administration** > **Contact Responsibilities**.
2. Click **New**.
3. On the form, fill in the fields.

Contact Responsibility form

Field	Description
Global	Check box to determine whether the contact responsibility is available for all tables or for a specific table. If the check box is not selected, the **Table** field appears where you can select the table for which you are defining the contact responsibility.
Name	Unique name of the contact, such as Business Director or Communication Manager, involved in the communication process.
Type	Type of contact such as user, group, or recipient list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table	Table on which contact is activated when a communication plan is attached.

4. Click **Submit**.
   Contact responsibilities are defined.

Create a contact definition

Define the recipients of a particular incident communication plan to determine the target audience involved in each communication task and the responsibilities the recipients are expected to handle.

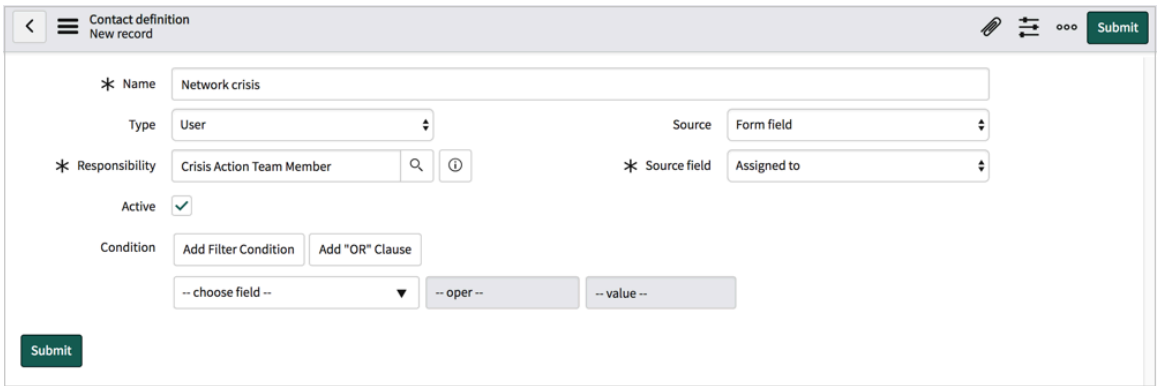
Before you begin

Role required: ia_admin or admin

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Contact Administration** > **Contact Definitions**.
2. Click **New**.

Contact definition form



3. On the form, fill in the fields.

Contact definition form

Field	Description
Name	Unique name for the contact definition.
Type	Type of contact such as user or group that you want to involve in the plan.
Responsibility	Responsibility that the user or group is expected to handle.
Source	Method to determine the user or group to associate with this definition. The source can be:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **None**: Use no association. You should associate users or groups manually within the Incident Communication Plan form. ○ **Default Override**: Use default override to associate users or groups based on conditions. ○ **Form Field**: Use information from the incident communication plan form based on the value specified in the **Source field**.
Quantity	The maximum number of contacts that can be associated with the selected responsibility for each incident communication plan record. **Note:** The **Quantity** field appears only when you select **None** as the value for the **Source** field.
Source field	The field on the Incident Communication Plan form whose value is considered to be the contact associated with the selected contact responsibility. ○ For contact type as **User**, the values are **Assigned to**, **Closed by**, **Opened by**, or **Resolved by**. ○ For contact type as **Group**, the value is **Assignment group**. **Note:** The **Source field** appears only when you select **Form field** as the value for the **Source** field.
Active	Check box to indicate whether the definition is active or not.
Condition	The conditions that must be met to associate this contact definition to a particular user or group. If multiple conditions are defined, each condition is evaluated in the order listed.

4. Click **Submit**.

Create a default override

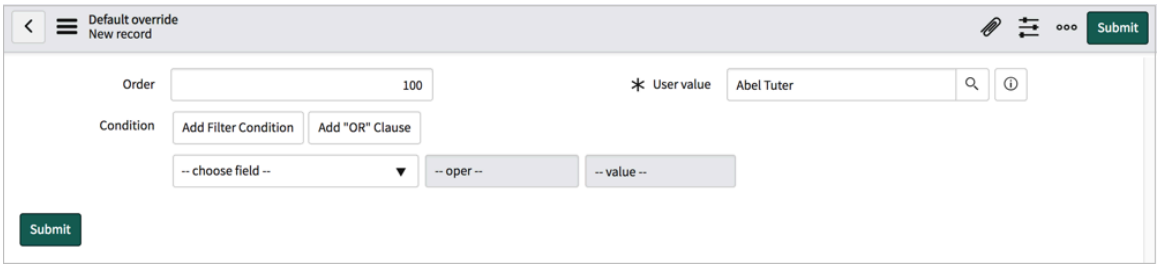
Create a default override to specify user or group for a contact definition of an incident communication plan. It helps you to set multiple conditions based on which a user or a group is considered as a contact.

Before you begin
Role required: ia_admin or admin

About this task
The Default overrides related list is available only if you select **Default override** as the value of the **Source** field in the Contact definition form.

Procedure
1. Navigate to **All** > **Incident Communications Management** > **Contact Administration** > **Contact Definitions**.
2. Open the contact definition record.
3. In the Default override section, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the form, fill the fields.

Default override form

Field	Description
Order	The order in which the condition in default override should be evaluated.
User value	User specified in the **User value** field is assigned as the contact if the condition in the default override matches. **Note:** The **User value** field appears if the value of the **Type** field in the Contact definition form is **User**.
Group value	Group specified in the **Group value** field is assigned as the contact if the condition in the default override matches. **Note:** The **Group value** field appears if the value of the **Type** field in the Contact definition form is **Group**.
Condition	The conditions defining whether the default override values are to be applied. If multiple conditions are defined, each condition is evaluated as per the listed order. If no conditions match, the default override is not applied.

5. Click **Submit**.
   Default override and its conditions are defined for a contact definition.

Add a user as a contact

Add a user to a communication plan if you have not added the user earlier in the contact. You can assign a communication task to the user to resolve an issue.

Before you begin

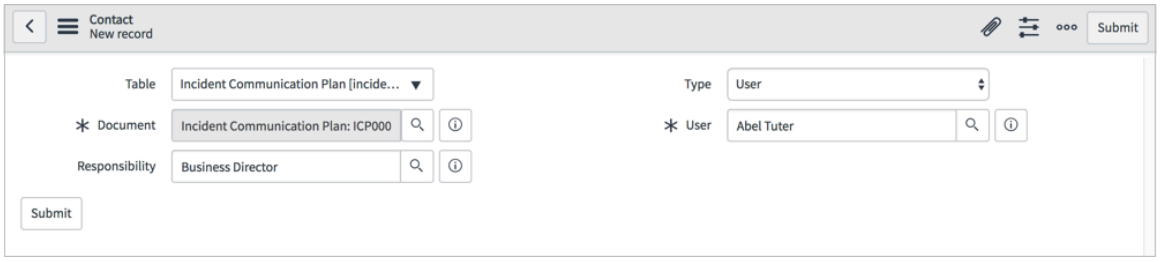
Role required: ia_admin or admin

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Open**.
2. Open an incident communications plan record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the **Users** related list and click **New**.



4. On the form, fill in the fields.

Contact form

Field	Description
Table	Task table for which you are creating the contact.
Document	The incident communication plan for which you are creating the contact.
Responsibility	Responsibility that the user is expected to handle throughout the communication process.
Type	Type of contact such as user, group, or recipient list that you want to involve in the plan. **Note:** To add a user, select **User** for the **Type** field.
User	Name of the user who is considered as the contact.

5. Click **Submit**.
The contact information appears in the Users related list.

Close an incident communication plan

Close an incident communication plan after its execution or if it is no longer needed.

Before you begin

Role required: itil, ia_admin, or admin

About this task

- The business rule *IA_State_Management* allows any user with the ia_admin role or an itil user who is assigned to the incident communication plan, to close or cancel an incident communication plan.
- If a user with the itil role closes or cancels a parent incident, all related incident communication plans are closed or canceled.

Note:
Use the incident management property **Close open Incident Communication Plans when Incident is closed or canceled** (*com.snc.incident.incident_alert.closure*) to control this behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Incident Communications Management** > **Open**.
2. Open the incident communications plan record that you want to close.
3. In the **State** field, select **Closed**.
4. Right-click on the form header and click **Save**.

Initiate conference call on incident communication task

Initiate a conference call and include all the required stakeholders to discuss on the resolution of the incident and the communication task.

Before you begin

Role required: sn_comm_management.comm_plan_manager or sn_comm_management.comm_plan_admin

Activate the Notify plugin (com.snc.notify), configure the Twilio account, configure the *com.snc.iam.notify_number* property and create a default provider selector. You can also create a provider selector on the Incident Communication Task table [incident_alert_task]. The provider selector specifies the Notify group containing the Notify phone numbers or conference provider to make outgoing calls.

Procedure

1. Navigate to **Incident** > **All**.
2. Open an incident record.
3. From the Incident Communication Plan related list, open the incident communication plan.
4. From the Incident Communication Tasks related list, open the incident communication task.
5. In the related link, click **Initiate Conference Call**.
6. Select the conference bridge number and the participants for the conference call and click **Start Call**.

Join or end conference call on incident communication task

After a conference call is initiated, join the call to participate in the discussion or end the call when the conference is no longer required.

Before you begin

Role required:

- Join conference call: ia_admin, itil, or sn_incident_write
- End conference call: sn_comm_management.comm_plan_manager or sn_comm_management.comm_plan_admin

Procedure

1. Navigate to **Incident** > **All**.
2. Open an incident record.
3. From the Incident Communication Plan related list, open the incident communication plan.
4. From the Incident Communication Tasks related list, open the incident communication task.
5. In the related links, perform any of the following actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Send communication updates

Update users on the latest communication on an incident through selected communication channels.

Before you begin

- Role required: itil (itil user is assigned to incident communication task) or ia_admin or mim_manager or admin.
- Activate the Notify plugin (com.snc.notify) if you want to send communication through SMS.
- Set atleast one communication channel of a communication task as SMS or email.

Procedure

1. Navigate to **Incident Communications Management** > **All**.
2. Open an incident communication plan record.
3. From the Incident Communication Tasks related list, open the incident communication task for which you want to send updates.
4. In the related links, click **Send Updates**.
5. Fill in the required information and click **Compose**.
   For sending an SMS communication, in the **From** list, select a number from which you want to send the communication. It contains a list of phone numbers derived from the selected **Provider selector** column which is a reference to the Provider selector table [notify_group_selector]. The **From** list displays phone numbers of all the groups associated with the Provider selector only when the following conditions are met:
   - The **Manual selector** check box in the Provider selector form is selected.
   - The value of the **Source table** field in the Provider selector is either empty or the same table that you have selected.
6. Click **Compose**.

Run an incident communication plan report

Run an incident communication plan report to view the status of communication plans. You can track the progress of the plan and intervene to improve the overall efficiency and effectiveness of the communication process.

Before you begin

Role required: ia_admin or admin

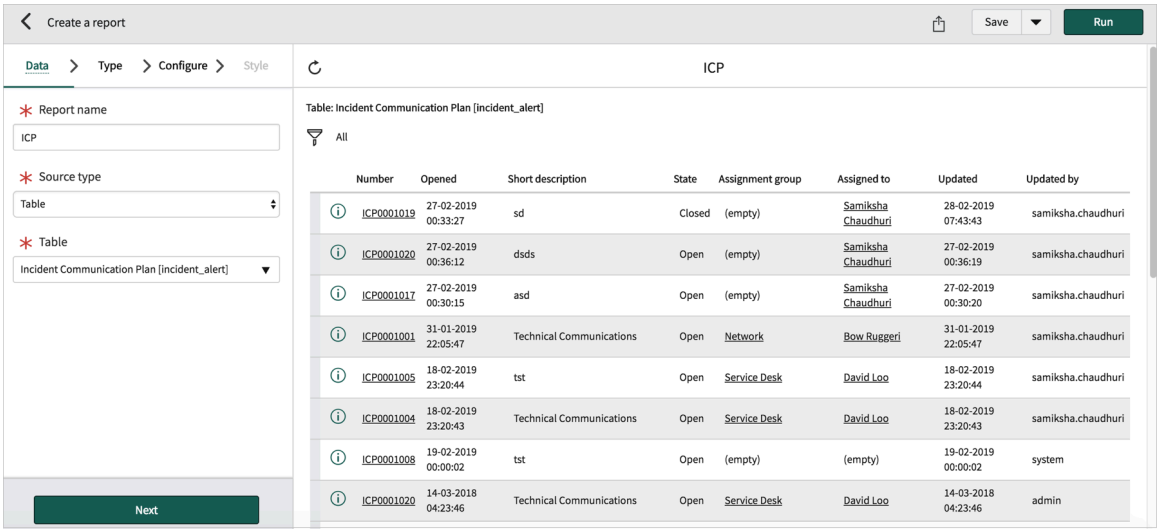
Procedure

1. Navigate to **All** > **Reports** > **View / Run**.
2. Click **Create a report**.
3. Under **Data**, fill in the fields.

Fields	Description
Report name	Unique name for the report.
Source type	Source from which the data is populated. The default value is Table.
Table	Table from which the data is retrieved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click **Run**.



Note:
You can also choose a graphical representation for the report or narrow down the result using the **Type** and **Configure** options.

Subscribe to incident communication notifications

Subscribe to incident communication notifications to get periodic information about issues related to incident communication plans.

Before you begin

Role required: itil, ia_admin, or admin

Procedure

1. Navigate to **All** > **Self-Service** > **My Notification Preferences**.
2. Under System Settings, select **Notifications**.
3. Under **Notifications By Category**, select **Incident Communication Plan**.
   The following notification options appear for incident communication plan: **IA Actions Taken**, **IA Cancelled**, **IA Resolved Or Closed**, and **New IA Raised**.
4. Click the notification option for which you want to receive notifications.
5. Under **NOTIFICATION CHANNELS**, right-swipe or left-swipe the toggle button to subscribe or unsubscribe from a notification.
6. Click the channel name to add a schedule for the notification and to filter the notification conditions as required.

Note:
Apply filter to your notification channel to avoid receiving every notification for the subscription.

7. Click **Save**.
   You are subscribed to incident communication notification.

Incident Communications Management reference

Reference sections provide additional information about components installed with Incident Communications Management.

Components installed with Incident Communications Management

Several types of components are installed with activation of the Incident Communications Management plugin (com.snc.iam), including tables and user roles.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title	Description	Contains roles
ia_admin	Can create, edit, or cancel incident communication plan, incident communication task, and manage contact information.	• contact_admin • sn_comm_management.comm_plan_manager • notify_view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title	Description	Contains roles
	Note: The role is available when you activate the Notify plugin.	
contact_admin	Can create and edit contact definitions and contact responsibilities.	contact_user
contact_user	Can view contacts, contact definitions, contact responsibilities, and default overrides.	NA

Tables installed

Table	Description
Impacted CI [impacted_ci]	The CIs impacted by the source CI in the incident communication plan.
Incident Communication Plan [incident_alert]	The Incident Communication Plan table extends from the Communication Plan table [comm_plan] so that the incident communication plan inherits any future enhancements made to the communication object.
Incident Communication Task [incident_alert_task]	The Incident Communication Task table extends the Communication Task table [comm_task].

Domain separation and Incident Communications Management

Domain separation is supported in Incident Communications Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on support levels, see Application support for domain separation.

Incident Communications Management overview

- The Incident Communications Management application enables organizations to create and manage communications related to major business issues or incidents. Incident communication plan administrators can bring together all involved users during these events and establish quick and easy communication within this group.
- Typically, Incident Communication Plan Admin or Major Incident Manager creates incident communication plans for an existing incident. Multiple incident communication plans can be created against the same incident.
- The incident communication plan and incident communication task tables support domain separation. Therefore, an Itil/Fulfiller sees only incident communication plans or incident communication tasks that have been created within the (tenant) domain that they belong to.

How domain separation works in Incident Communications Management

Fulfillers see only incident communication plan and incident communication plan tasks that have been created within the (tenant) domain that they belong to.

Domain separated tables

- Incident Communication Plan [incident_alert]
- Incident Communication Task [incident_alert_task]

Use cases

An Incident Communication Plan Admin or Major Incident Manager is able to view incidents only of those domains that they have access to. They can create incident communication plans against only those incidents.

Exploring Incident Management

ServiceNow Incident Management supports the incident management process with the ability to identify and log incidents, classify and prioritize incidents, assign incidents to appropriate users or groups, escalate, resolve, and report incidents.

Incident Management overview

Any user can record an incident and track it until service is restored and the issue is resolved. Each incident is generated as a task record that contains pertinent information. Incidents can be assigned to appropriate service desk members, who resolve the task and document the investigation. After the incident is resolved, you can manually close the incident. You can also

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

close incidents automatically based on the last updated date or the resolution date of the incident. For more information about auto-closing incidents, see Configure incidents to close automatically.

Any user can log an incident within the system using the following methods.

Incident Management workflow

ServiceNow Incident Management process follows these steps:

1. Incident identification - The first step in the life of an incident is incident identification. You can report incidents through emails, sms, phone call, support chats, walk-ups, and applications. The service desk decides if the issue is truly an incident or if it is a request.
2. Incident logging - Once identified as an incident, the service desk logs the incident. The incident should include information, such as the caller, business service, configuration item, and contact type. The logging process includes:
   - Incident categorization - Incident categorization is a vital step in the incident management process. Categorization involves assigning a category and at least one subcategory to the incident.
   - Incident prioritization - Incident prioritization is important for SLA response adherence. The priority of an incident is determined by its impact on users or business and its urgency.
3. Incident response - Once identified, categorized, prioritized, and logged, the service desk can handle and resolve the incident. Incident resolution involves the following steps:
   - Initial diagnosis - Occurs when the user describes the problem and answers troubleshooting questions.
   - Incident escalation - Happens when an incident requires advanced support, such as sending an on-site technician or assistance from certified support staff.
   - Investigation and diagnosis - Takes place during troubleshooting when the initial incident hypothesis is confirmed as being correct. Once the incident is diagnosed, service desk can apply a solution, such as changing software settings, applying a software patch, or ordering new hardware.
   - Resolution and recovery - Happens the service desk confirms that the service of the user is restored within the stipulated SLA time.
   - Incident closure - At this point, the incident is considered closed and the incident process ends.

Incident Management benefits

ServiceNow Incident Management supports the incident management process in the following ways:

- Log incidents in the instance or by sending email.
- Classify incidents by impact and urgency to prioritize work.
- Assign to appropriate groups for quick resolution.
- Escalate as necessary for further investigation.
- Resolve the incident and notify the user who logged it.
- Use reports to monitor, track, and analyze service levels and improvement.

Any user can record an incident and track it through the entire incident life cycle until service is restored and the issue is resolved.

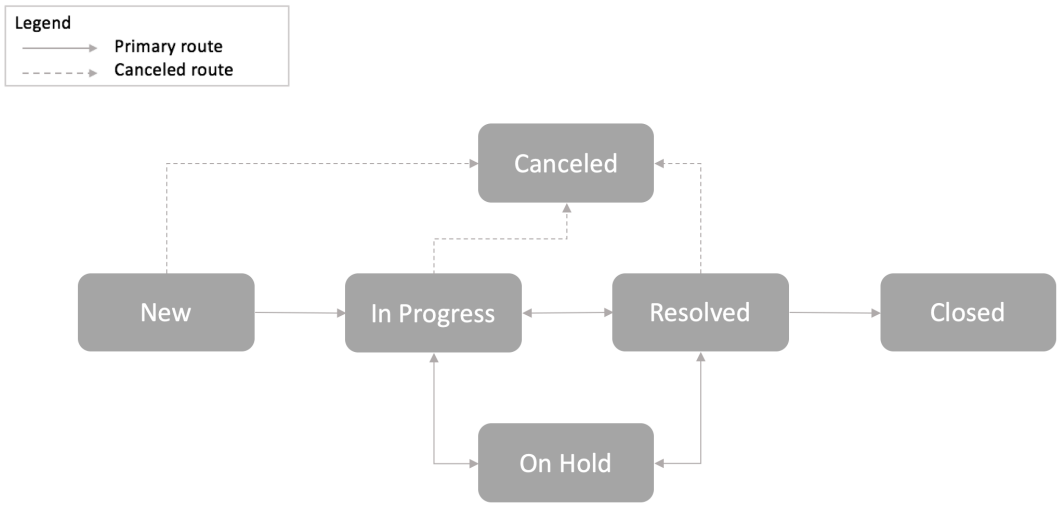
Life cycle of an Incident

Incident Management is responsible for managing the life cycle of incidents, from creation to closure.

The Incident Management process has many states, and each is vitally important to the success of the process and the quality of service delivered. The different states can be represented in a diagram as follows:

Incident management state model flow



Incident states

State	Description
New	Incident is logged but not yet investigated.
In Progress	Incident is assigned and is being investigated.
On Hold	The responsibility for the incident shifts temporarily to another entity to provide further information, evidence, or a resolution. When you select the **On Hold** option, the following **On hold reason** list appears. • Awaiting Caller • Awaiting Change • Awaiting Problem • Awaiting vendor If the **On hold reason** is **Awaiting Caller**, the **Additional comments** becomes mandatory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident states (continued)

State	Description
	Note: If the caller updates the incident, the **On hold reason** field is cleared and the state of the incident is changed to **In Progress**. An email notification is sent to the user whose name is mentioned in the **Assigned to** field as well as to the users in the **Watch list**. An incident can be placed in the **On hold** state one or more times prior to being closed.
Resolved	A satisfactory fix is provided for the incident to ensure that it does not occur again.
Closed	Incident is marked **Closed** after it is in the **Resolved** state for a specific duration and it is confirmed that the incident is satisfactorily resolved.
Canceled	Incident was triaged but found to be a duplicate incident, an unnecessary incident, or not an incident at all.

Configuring Incident Management

You can configure the incident form and other incident features, such as incident categories and UI behavior. The ITSM guided setup helps you configure incident management on your ServiceNow instance.

Configuration overview

Configure the Incident form in the base system to follow ITIL best practices. The administrator can configure the incident form and use the form designer to customize it. You can copy or create child incident to reduce the effort of configuring the functionality of an open incident.

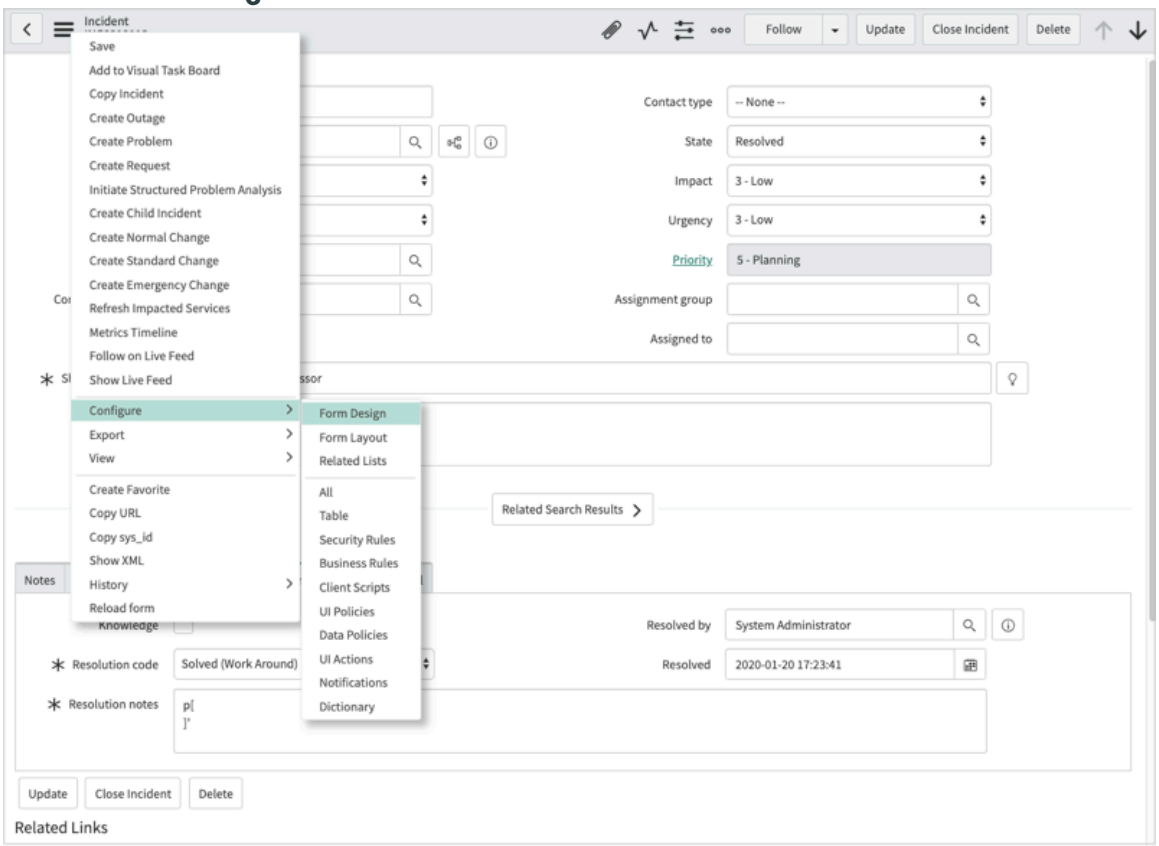
Incident form configuration



Form configuration and design

Menu option	Description
Form design	Administrators or users with the personalize_form role can use the form design feature to quickly create new or change existing form views. Form design is an alternative to configuring forms that combines several configuration options into one tool.
Form layout	Administrators or users with the personalize_form role can configure a form to show or hide fields from a view. You can create new fields on the table associated with the form.
Related lists	Related lists display records in another table that have a relationship with the current record. Administrators or users with the personalize_form role can configure related lists to appear on the form.

Using guided setup to implement Incident Management

IT Service Management guided setup provides a sequence of tasks that help you configure Incident Management on your ServiceNow instance. To open ITSM guided setup, navigate to **Guided Setup** > **ITSM Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Quick start tests for Incident Management

Validate that Incident Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Properties for Incident Management (continued)

Property	Description
	Note: Starting with the Xanadu release, this property is automatically set to **true** for new customers. Existing customers have to set the property to **true** manually.
Copy attachments from Interaction to Incident, when created from Interaction (com.snc.incident.create_from_interaction.copy_attachments)	Select the check box to copy the attachments from the interaction record to a new incident record when it's created from the interaction record. Type: Boolean **Note:** Starting with the Xanadu release, this property is automatically set to **true** for new customers. Existing customers have to set the property to **true** manually.

Major Incident Management

If you have the admin or incident_manager role, you can edit the major incident properties. You can define whether a new major incident must be created or whether a major incident candidate must be promoted to a major incident. The properties are available only when you activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim).

These properties are available at **Incident** > **Administration** > **Major Incident Properties**.

Properties for Major Incident Management

Property	Description
Create major incident from candidate (sn_major_inc_mgmt.com.snc.incident .mim.major_incident_creation)	Create a new major incident or promote a major incident candidate to a major incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Major Incident Management (continued)

Property	Description
	Note: When a new major incident is created from an incident, the current incident is marked as a child of the new major incident.
Compose Email on Major Incident Overview (sn_major_inc_mgmt.com.snc.incident.mim.compose_email_on_iatasks)	Provide a comma-separated list of incident communication task types that can have the **Compose Email** option on the Major Incident Workbench.
PIR export ui page url (sn_major_inc_mgmt.pir_export_pdf_ui_page)	Associate a custom UI page to an exported post incident report.
Major Incident Management Group (sys_id) to whom the Major Incident should be re-assigned on promotion to 'Major Incident' (sn_major_inc_mgmt.major_incident_management_group)	Auto-assign a major incident to different assignment groups based on the actions taken on the incidents and the conditions related to the assignment group.
Default recipient location of emails for Communication Tasks (sn_comm_management.default_email_recipient_field)	Select the default recipient location of emails for communication tasks. The default value is **BCC**.
Property to toggle support for Recipient List on Email Client, on Communication Tasks (sn_comm_management.email_client_recipient_items_enabled)	Use the recipient list to send emails as part of the communication tasks.
List of attributes (comma-separated) that will be copied from the child Incident when creating a Major Incident (sn_major_inc_mgmt.com.snc.major_incident.create.copy.attributes)	Select the fields that must be copied from the incident when creating a major incident.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident categories and subcategories

Categorization of incidents helps in routing to the right team and saves a lot of time in troubleshooting and bringing the service to normalcy.

One of the KPIs (Key Performance Indicators) of the Incident Management process is to identify how many times the Incident is sent to different teams. It also helps in analyzing incidents based on the classification to do proactive Problem Management which, in turn, helps to reduce Incidents. Proper incident classification is very important to identify and prioritize on which Incidents to work on first.

Using categories and subcategories also improves the clarity and granularity of report data. The following categories and associated subcategories are in the base system. An administrator can add additional categories and subcategories, and use them in assignment rules and notifications.

Incident categories

Category	Subcategory
Inquiry / Help	• Antivirus • Email • Internal Application
Software	• Email • Operating System
Hardware	• CPU • Disk • Keyboard • Memory • Monitor • Mouse
Network	• DHCP • DNS • IP Address • VPN • Wireless
Database	• DB2 • MS SQL Server • Oracle

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure incident category or subcategory

Configure incident category and subcategory for easy classification of incidents which helps in routing incidents to the right team. You can also generate reports based on category and subcategory of incidents.

Before you begin
Role required: admin

Procedure

1. Navigate to **Incident** > **All**.
2. Open an incident record.
3. Do any of the following:
   - Right-click on the **Category** field name and select **Configure Choices**.
   - Right-click on the **Subcategory** field name and select **Configure Choices**.
4. Move the required category or subcategory from the **Available** list to the **Selected** list.
5. Click **Save**.

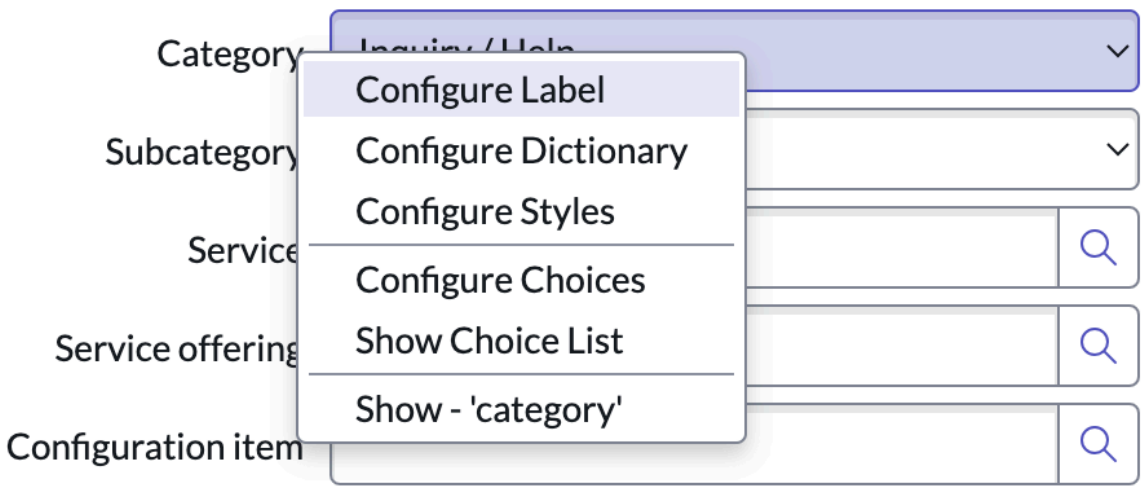
Add a category or a subcategory

Add category or subcategory to assign incidents to the correct team and save time in troubleshooting and bringing the service to normalcy.

Before you begin
Role required: admin

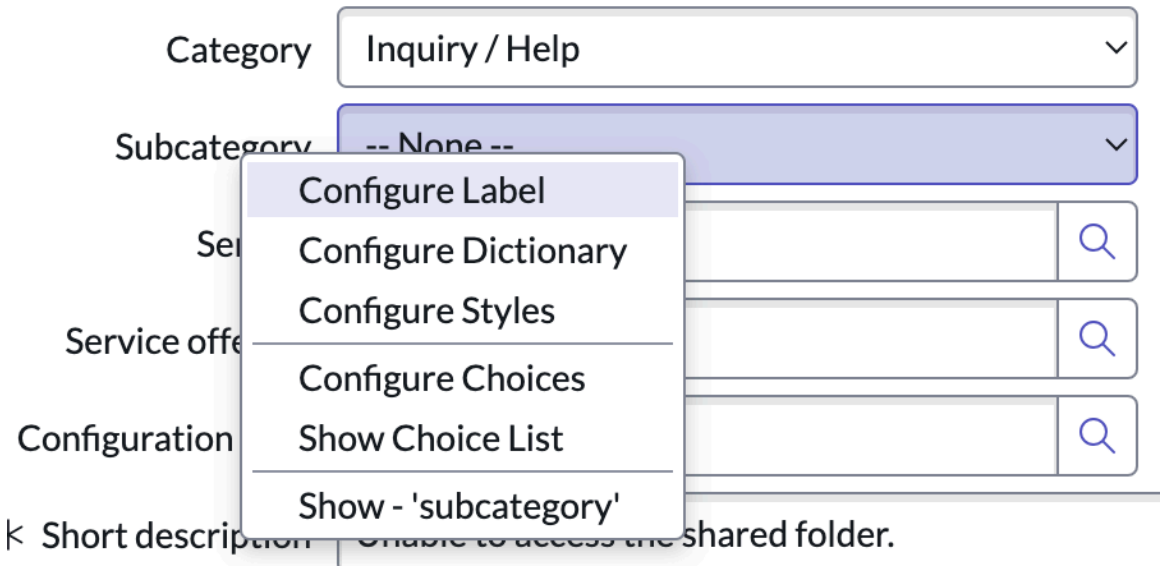
Procedure

1. Navigate to **All** > **Incident** > **All**.
2. Open an incident record.
3. Do any of the following:
   - Right-click **Category** > **Configure Choices**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Right-click **Subcategory** > **Configure Choices**.



4. In the **Enter new item** field, enter the new category or the subcategory name.
5. Click **Add**.
   The new category or subcategory is added under the **Selected** list.

Delete a category or a subcategory

Delete a category or subcategory if your organization no longer uses the category or subcategory.

Before you begin
Role required: admin

Procedure

1. Navigate to **Incident** > **All**.
2. Open an incident record.
3. Do any of the following activities:
   - Right-click on the **Category** field name and select **Configure Dictionary**.
   - Right-click on the **Subcategory** field name and select **Configure Dictionary**.
4. Click the Choices related list.
5. Select the category or the subcategory record that you want to delete.
6. Click **Actions on selected rows** menu and select **Delete**.

Define priority lookup rules

Define impact and urgency of an incident to calculate the priority. The priority calculation can then be used to prioritize work and drive service level agreements.

Before you begin
Role required: data_lookup_admin, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Priority Lookup Rules**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Impact	Impact is a measure of the effect of an incident, problem, or change on business processes.
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident, problem, or change has a significant business impact.
Priority	Priority is based on impact and urgency, and it identifies how quickly the service desk should address the task.
Application	Application scope of the rules. The scope defines whether the rules are available for all applications or for scoped applications.
Active	Option to define whether the rule is active or not.
Order	Sequence in which the rules appear in the priority lookup list. This field indicates the sequence of the rule that is executed first.

Note:

Priority is calculated according to the following sample data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

By default, the **Priority** field is read-only and must be set by selecting the **Impact** and **Urgency** values. To change how the priority is calculated, you can either alter the priority lookup rules or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

disable the **Priority is managed by Data Lookup - set as read-only** UI policy and create their own business logic.

4. Click **Submit**.

Define assignment rules for incidents

Define assignment rules to identify the right group or the user which is skilled to work on an incident.

Before you begin

Role required: assignment_rule_admin or admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Assignment**.
2. Create assignment rules by following the steps provided in Create an assignment rule.
3. Click **Submit**.

Incident templates and record producers

Templates simplify the process of submitting new records by populating fields automatically. A template ensures consistency in the way information about the incident is captured. A record producer is a specific type of catalog item that allows end users to create task-based records, such as incident records, from the service catalog.

You can use incident templates to quickly create incidents for similar issues.

- An administrator or user with the template_editor_global role can create templates that are available to everyone.
- An administrator can enable the global option for any personal template that a user creates so that all other users can access the template.
- A user with the itil role can create their own templates for incidents they log frequently.

ESS users typically log incidents using a record producer in the service catalog. A template can be used to create an incident record producer. The template automatically populates fields in the incident form.

For example, an incident record producer can be created to request account access to a network server. The user who submits the incident enters variable values, such as the server name, level of access needed, and due date. The incident template assigned to the record producer populates the incident **Category**, **Subcategory**, and **Assignment Group**. These fields and values applied from the template do not appear in the record producer form.

Create incident template

Create an incident template to ensure consistency in the way information about the incident request is captured. A template also helps you to create incident easily and accurately.

Before you begin

Role required: admin

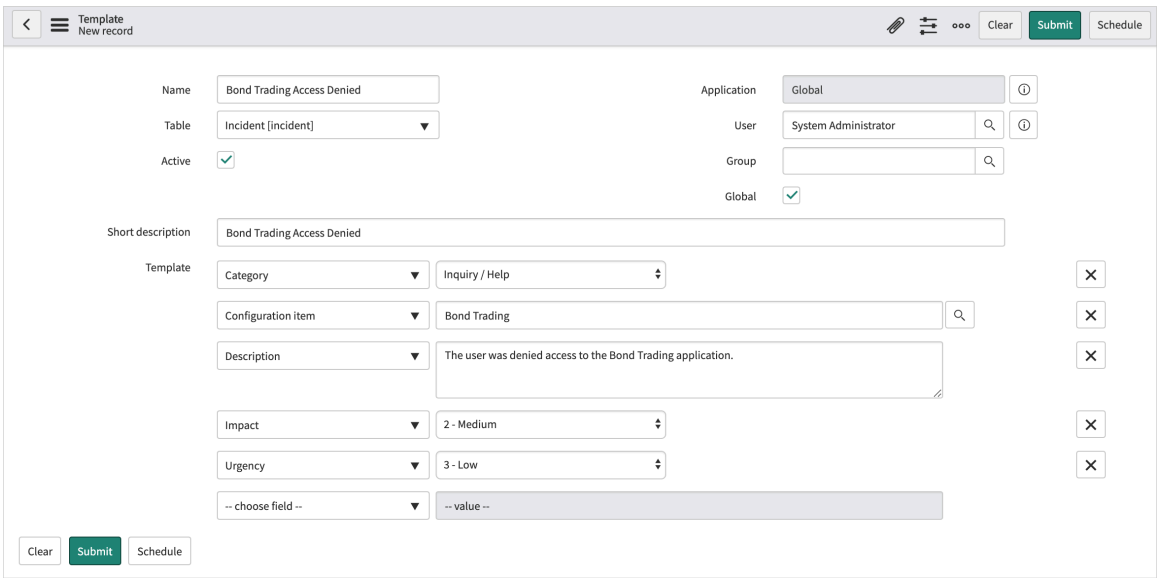
About this task

Let us consider an example where you want to create a template to log an incident when you are denied access to the Bond Trading application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Templates**.
   You can also Create a template from the incident form.
2. Complete the steps in Create a template using the Template form using the following information:
   - **Name**: `Bond Trading Access Denied`
   - **Table**: Incident [incident]
   - **Global**: Select the check box. The **Global** option allows any user to use the template, not just the template creator.
   - **Short Description**: `Bond Trading Access Denied`
   - **Template**: Add the following values to define the fields that are filled in when the template is used:
     - **[Category]: [Inquiry / Help]**
     - **[Configuration Item]: [Bond Trading]**
     - **[Description]: [The user was denied access to the Bond Trading application]**
     - **[Impact]: [2 - Medium]**
     - **[Urgency]: [3 - Low]**



3. Click **Submit**.

Create a module that uses incident template

Create a module to log an incident with pre-filled field values from an existing template.

Before you begin

Role required: admin

About this task

In the Create incident template topic, you have created the Bond Trade Access Denied template. In this topic, you can use the template with a module in the Self-Service application.

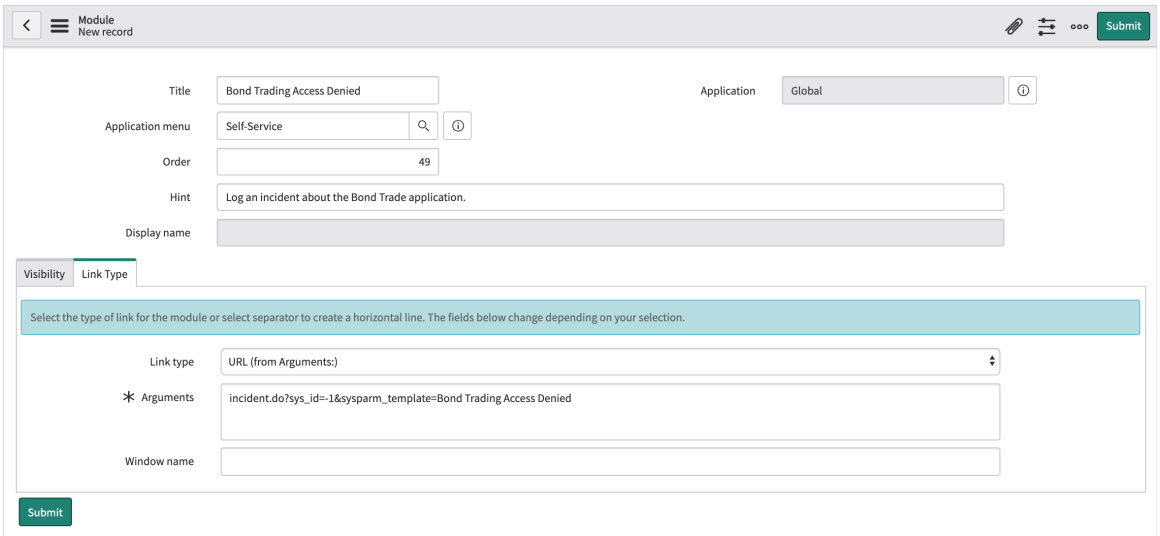
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Point to **Self-Service** and click the edit icon .
2. In the Modules related list, click **New**.
3. On the form, fill in the fields.
   - **Title**: `Bond Trading Access Denied`.
   - **Order**: In the Module records list, view the order numbers and enter a number that is appropriate. For example, if the order number of **Homepage** is 50 and the order number of **Business Applications** is 52, and you want to place the new module between **Homepage** and **Business Applications**, enter the order number as 51.
   - **Hint**: `Log an incident about the Bond Trade application.`

   Link Type section:
   - **Link Type**: URL (from Arguments:)
   - **Arguments**: `incident.do?sys_id=-1&sysparm_template=Bond Trading Access Denied`

   Note:
   This path deploys the template in the new incident record.



4. Click **Submit**.
   The new module appears in the Self-Service application.

What to do next

Click the module to open a new incident record with the applied Bond Trading Access Denied template.

Create a record producer to log incidents

Create record producers to log incidents directly from Service Catalog.

Before you begin

Role required: catalog_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

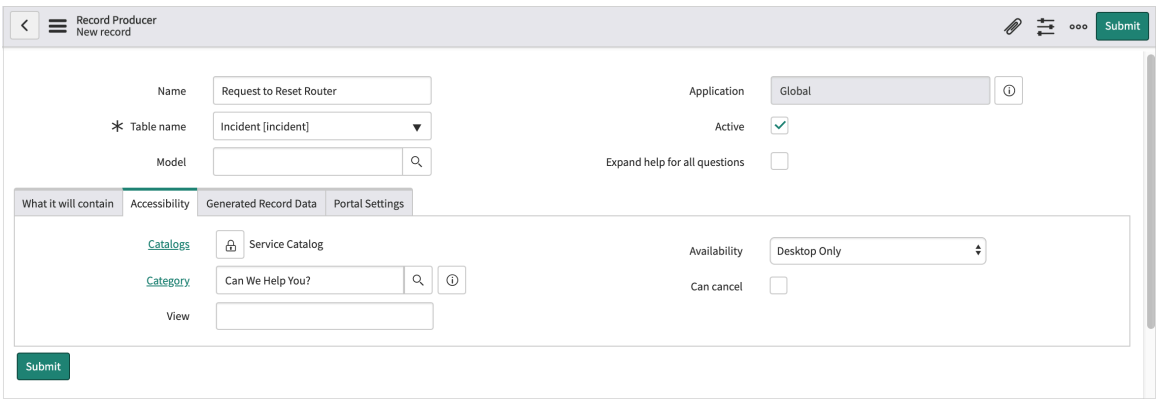
Incident record producers provide users with an interface from which user can log an incident. For example, the default **Can We Help You?** category features record producers such as **Create Incident** to enable users to log incidents from the catalog.

The following example demonstrates how to create a record producer to request a wireless router reset.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Record Producers**.
2. Click **New** and complete the steps in Create a record producer using the following information:

Field	Entry
Name	`Request to Reset Router`
Table name	Incident [incident]
What it will contain	
Short description	`Reset wireless router request`
Description	`Please reset the building's router`
Accessibility	
Catalogs	Service Catalog
Category	Can We Help You?

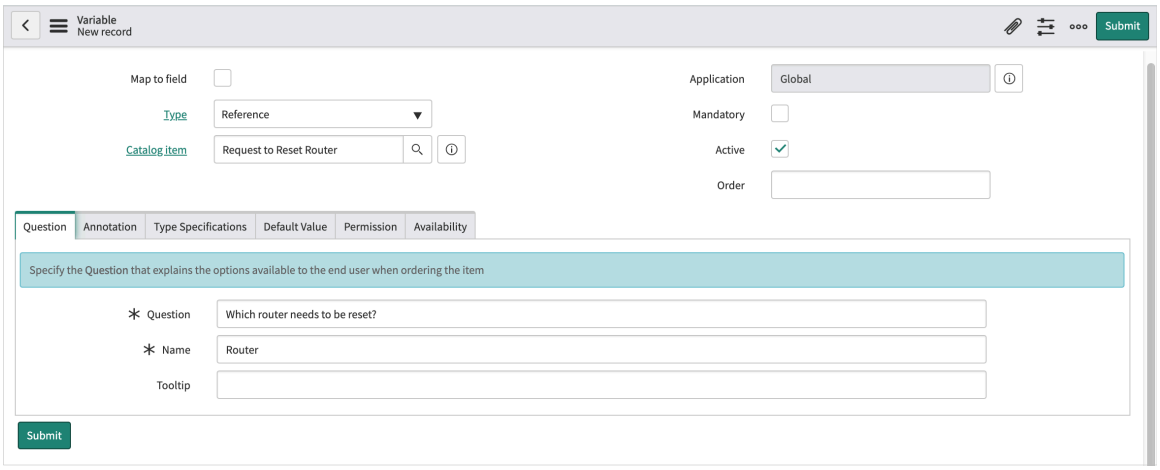


3. Right-click on the form header and from the context menu select **Save**.
   Several related lists appear at the end of the form, including Variables and Variable Sets.
4. In the Variables related list, click **New**.
5. On the form, fill in the fields.

Field	Entry
Type	Reference
Question	
Question	`Which router needs to be reset?`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Entry
Name	Router
Type Specifications	
Reference	IP Router [cmdb_ci_ip_router]



6. Click **Submit**.
7. **Optional:** To view the new record producer, click **Try It** in the form header.

   (Optional) In Service Catalog, the new catalog item appears and any user can select it.

Create a record producer using a template

If a predefined incident template exists, it can be used with the record producer to fill in standard information for the incident.

Before you begin
Role required: catalog_admin or admin

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Record Producers**.
2. Click **New** and complete the steps in Create a record producer.
3. Click **Generated Record Data** and select the incident template to populate fields when the record producer is submitted.
4. Right-click on the form header and click **Save**.

View incident notifications

View incident notifications that are sent during specific events in an incident life cycle. These notifications are sent to various recipients including the ESS and the ITIL users.

Before you begin
Role required: admin

About this task
Incident notifications use the email notification layout and template that are shipped with the Employee Experience Foundation plugin (com.snc.sn_ex_emp_fd). The plugin delivers notifications that are consistent and built with the industry best practices for layouts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you are an upgrade customer, to use the latest email layout, install the Employee Experience Foundation app (com.snc.sn_ex_emp_fd) from the ServiceNow® Store. Activate the default incident notifications that use the latest template.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **notifications**.
2. Filter the list of notifications by **[Table] [is] [incident]**.
3. View the list of default notifications for incidents.
4. Click the notification name to view the details.

What to do next

In email notifications, you can decide where the links to an incident record are redirected. Instead of an incident record automatically opening in the classic UI16 interface in Incident Management, the incident record can be opened in Service Operations Workspace (SOW). The ITSM Notifications Redirection (com.snc.itsm.notifications_redirection) plugin is installed and activated automatically to support this behavior. The incident record link in an email notification opens in SOW only if the following conditions are met:

- The **Redirect SOW Email notification** (*sow_email_notification_redirect*) system property is set to true.
- The user selecting the incident record link has the sn_sow_user role.

To ensure consistency, the email notification template for incident is updated to send the notification from SOW in the same format as sent from classic UI16 interface. Also, the template theme is updated to match the Next Experience theme.

To receive these notifications, the end user must enable notifications. For more information, see Subscription-based notifications.

Related topics

Create an email notification

Configure default user for auto-closing incidents

Change the default user who last updated an incident to the user you mention for auto-closing incidents.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs**.
2. Open the **Autoclose Incidents** schedule job.
3. In the **Job context**, add the following:

```
fcRunAs=<user_name>
fcScriptName=incident autoclose
```

For example, if you add `fcRunAs=admin`, the code places **System Administrator** in the **Updated by** field.

Applying CSDM guidelines to Incident Management

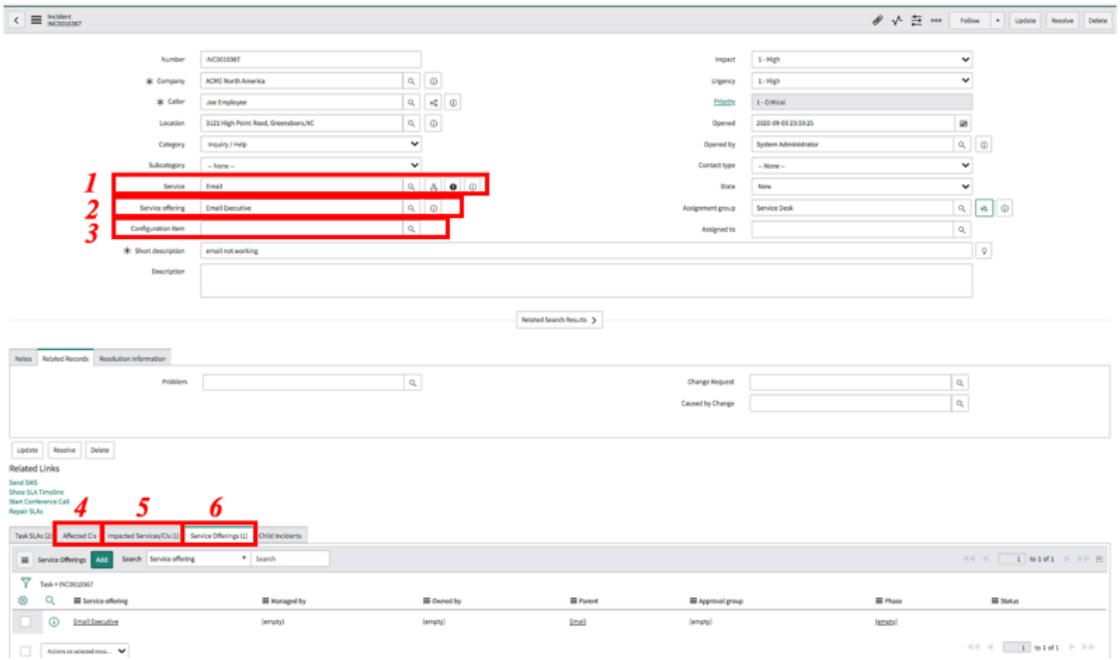
Incident Management supports the incident management process with the ability to identify and log incidents, classify and prioritize incidents, assign incidents to appropriate users or groups, escalate, resolve, and report incidents. The goal of this product view is to help you to understand how Incident Management key entities work with the core CSDM framework.

Features of Incident Management that get the most benefit from the CSDM include:

- Agent Workspace gives agents the information they need to quickly prioritize and resolve incidents.
- The major incident workbench includes a single-pane view you can use to identify, track, and resolve high-impact incidents.
- The native mobile app allows agents to quickly view and respond to tasks on-the-go, and can approve the requests with a single swipe.
- Incident deflection encourage self-help by suggesting related knowledge base articles.
- Improves collaboration on incident tasks by using drag-and-drop functionality on visual task boards.
- Performance analytics provide detailed insights into performance trends.

Incident Management includes a form you can use to report incidents.

Incident form



The incident form references the following attributes and related lists.

1. Service — References the [cmdb_ci_service] table.
2. Service Offering (attribute) — References the [service_offering] table. Displays the service offerings affected by the incident in the Service Offerings related list.
3. Configuration Items — References the [cmdb_ci] table
4. Affected/Causal CIs — Related list [task_ci] table. (The Incident form allows Application Services to be chosen as CIs)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Impacted Services — Related list [task_cmdb_ci_service] table
6. Service Offering — Related list [task_service_offering] table

For more information

For more details about Incident Management, see Incident Management.

Incident Management and CSDM tables

Incident Management manages and uses CSDM tables. Several ServiceNow products benefit from and add value to Incident Management.

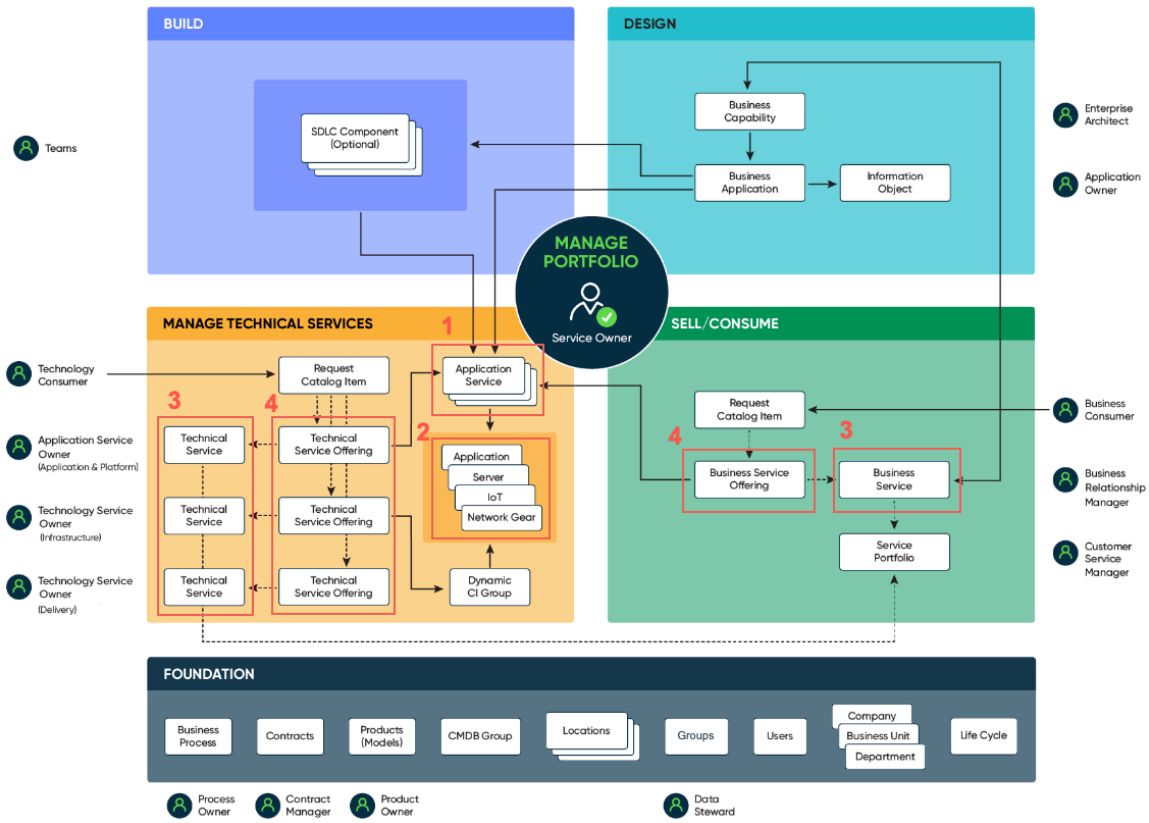
CSDM tables used by Incident Management

The Incident form references the following CSDM tables:

1. Application Service [cmdb_ci_service_discovered] table or any infrastructure CI.
2. Configuration Item tables [cmdb_ci*]
3. Business Service [cmdb_ci_service_business] table and Technical service [cmdb_ci_service_technical] table: Use the service classification attribute to identify business services, technical services, and application services as types of services.
4. Service Offering [service_offering] table: Uses the service classification attribute to identify business services, technical services, and application services as types of service offerings.

   See the Incident Management documentation for information about service commitments on a service offering (for example, resolution time for incident).

Tables used by Incident Management



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Products that add value to Incident Management

When you use Incident Management with other ServiceNow products, you increase the value you get from Incident Management. These other ServiceNow products include:

Discovery

Discovery provides details about the hardware and software CIs you are using.

Service Portfolio Management (Service Portfolio Management)

Provides life-cycle information for a service.

Asset Management

Provides the related product model. Software Asset Management (SAM Foundation) and Hardware Asset Management (HAM) provide lifecycle data for Incident Management.

Security Management

Provide initial information that helps in containing, eradicating, and recovery of security related incidents.

Risk Management

Provides IT risk and financial risk information.

Products that benefit from Incident Management

IT Service Management (ITSM)

Services have the context of the business and applications, along with the information and technologies layered beneath them.

Information Technology Operations Management (ITOM)

Understands the business context for the application services along with the hardware and software being managed.

Governance, Risk, and Compliance (GRC)

Auditors can leverage the business applications and related Information Objects. This helps auditors understand the design-time data sensitivity for scoping audits, measuring risks, and managing audit activities.

Asset Management

Manages the software and hardware life cycles for business applications and business services.

Customer Service Management (CSM)

Incident Management use case

Incident Management restores normal service operation, while also minimizing impact to your business and maintaining the quality of your data.

Incident Management Use Case

Use Incident Management to create an incident that captures information about the asset-related CIs. An incident keeps a record of the updated, repaired, swapped, or retired CIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By keeping track of the assets, you can tell where the assets are located, how they are used, and when changes were made to them. This information helps you systematically monitor and manage the assets in your company.

A CI generates an incident. Use a dependency view to identify other CIs that are affected by the incident. Associate the affected CIs with an incident record to find out how the incident affects other dependent CIs.

Following the CSDM framework provides value to Incident Management in the following ways:

- Incident Management understands the impact of the Incident on services and service offerings.
- Incident Management dynamically routes incidents.
- Incident Management identifies all affected services.

Results of the use case

The CSDM framework provides context for incidents—both the CIs involved in the incident and the services that it affects.

Use the Incident form to see the impact of an incident and restore affected services. Complete the following steps:

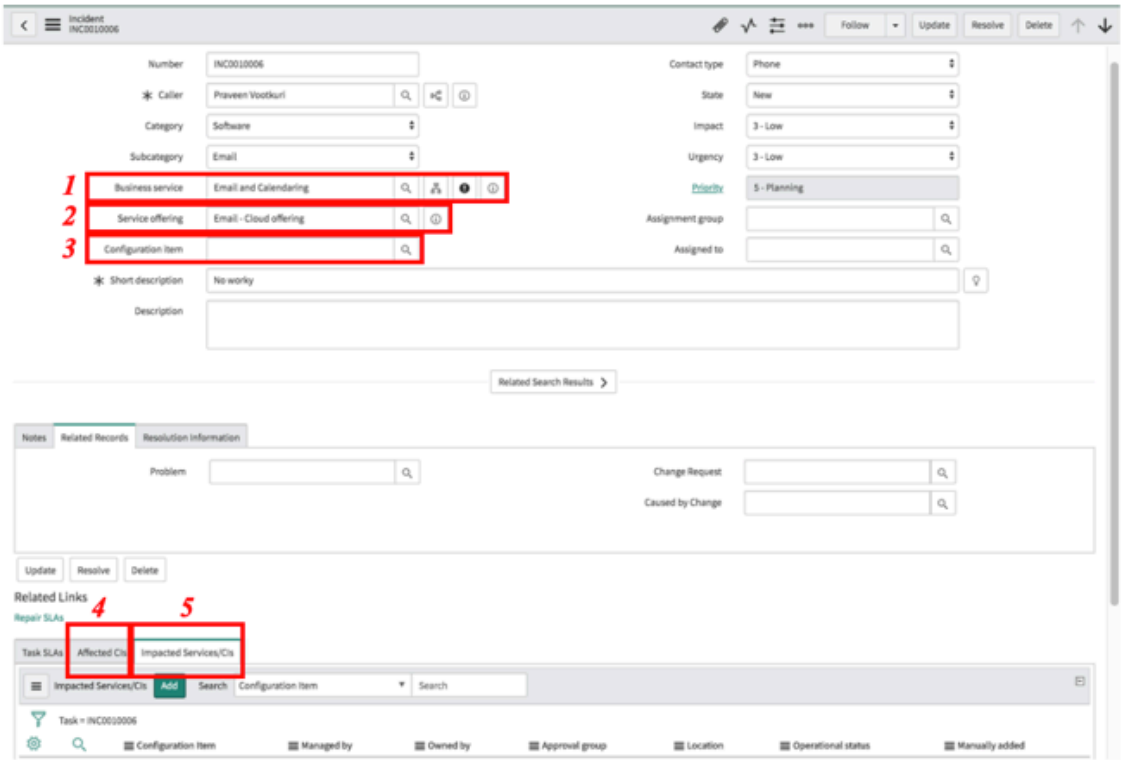
1. Populate the **Impacted Services** related list with the services and service offerings that are related to the populated CI.
2. (Optional) Use the **Service** and **Service Offering** attributes to help narrow the list of available CIs.

   Note:
   Narrowing the list of available CIs is not a feature of the base system. To narrow the list, you need to configure the Incident form.

3. Populate the **Configuration Item** attribute [configuration_item] with the CI or the affected service. You can then use the CI to identify details for incident routing. For example, you can use the CI data like Support Group and provide information about the service impact by using dependency relationships.
4. (Optional) Add the **Affected CI** related list [task_ci] to identify the CIs that might have caused the incident.
5. (Optional) Add the **Impacted Services** related list [task_cmdb_ci_service] to see the services and CIs that are impacted by the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident form for use case



Set up the Incident Management form

Configure the Incident form to see the impact of an incident and then restore affected services. The CSDM framework enables you to view rich context for incidents: the CIs involved in the incident and the service offerings, business applications, and business services that the incident affects.

Before you begin

Role required: admin

About this task

Incident Management leverages the CSDM data structure to display information that assists in solving the incident.

Go to the 1:00:00 mark on this video to learn about setting up the Incident form to include the related lists that leverage the CSDM framework.

Procedure

1. Navigate to **All** > **Incident** > **Administration** > **Incident Properties**.
2. In the Incident Related List Properties section, enable the following properties and then select **Save**.
   - **Populate Impacted Services based on Affected CIs**. This property enables display and update of the **Impacted Services/CIs** related list when you perform the **Refresh Impacted Services** action.
   - **Populate the Business Application related list for incidents**
   - **Populate the Service Offering related list for incidents**

   The properties are fully described in Incident Management properties.

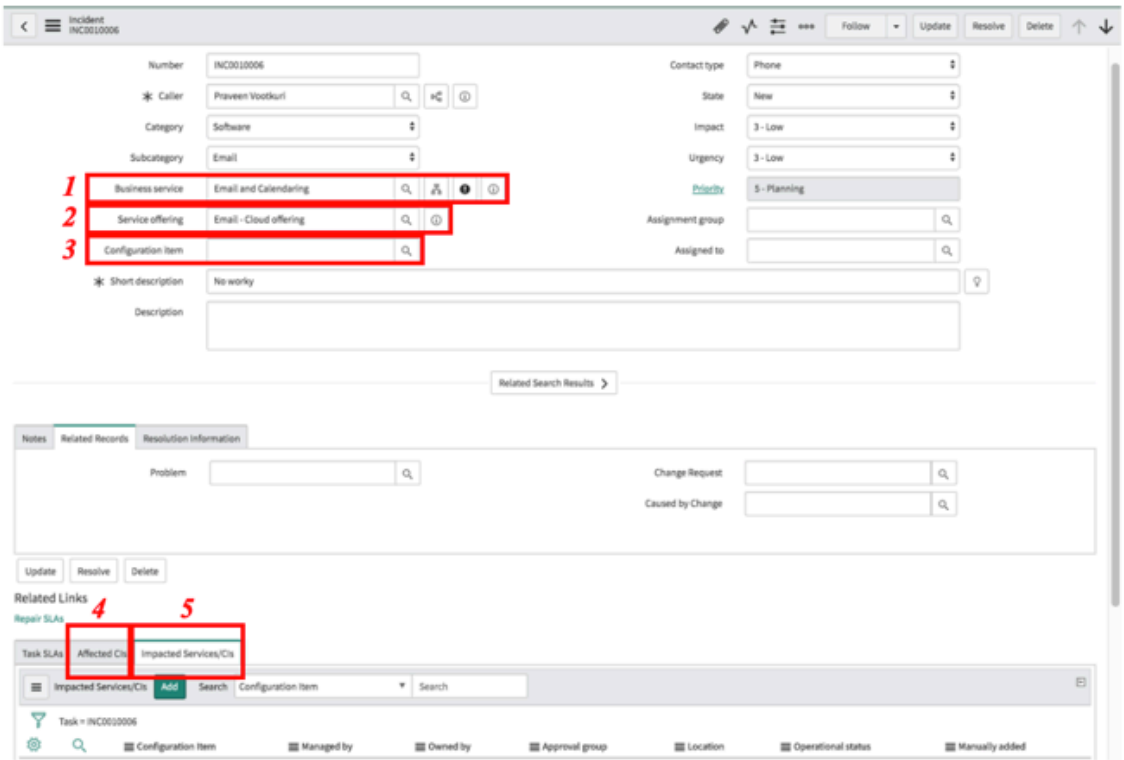
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Ensure that the **Principle Class** option is selected for the CI or CI class as described in Create a CI class and Update the list of classes in the Principal Class filter.
4. Navigate to **All** > **Incident** > **Open** and fill in the following fields:

Incident form

Service	The business service or technical service associated with the incident. The value that you specify narrows the list of available CIs that appear for selection in the **Configuration Item** field. **Note:** Narrowing the list of available CIs isn't a feature of the base system. To narrow the list, you must specify values for **Service** and **Service Offering**.
Service Offering	The business service offering (product) or technical service offering associated with the incident. The value that you specify narrows the list of available CIs that appear for selection in the **Configuration Item** field. **Note:** Narrowing the list of available CIs isn't a feature of the base system. To narrow the list, you must specify values for **Service** and **Service Offering**.
Configuration Item	The CI or the affected service. (Hardware, application, and cloud [physical CIs] or application service [logical CIs]) You can then use the CI to identify details for incident routing. For example, you can use the CI data like Support Group and provide information about the service impact by using dependency relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Review the information.
   - The CIs that may have caused the incident appear in the **Affected CIs** related list [task_ci].
   - The services and service offerings that are related to the populated CI appear in the **Impacted Services/CIs** related list [task_cmdb_ci_service].
   - The services and CIs impacted by the incident appear in the **Impacted Services/CIs** related list [task_cmdb_ci_service].

Incident Management considerations

Consider these points while implementing the CSDM framework.

Incident Management considerations

Business applications are not referenced in Incident Management

Business applications are portfolio objects used for designing and planning your enterprise architecture. Business applications don't contain attribute-level details such as version, environment, and localization (for any deployments using one or more applications).

Application service

An application service is an operational CI and a unique instance of an application.

An application service is the logical representation of the underlying hardware and software CIs that work together to implement a business application or system. The application service represents an instance of the business application or system.

Using application service on an Incident form

You can use the application service CI on the Incident form in scenarios like the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The incident is for an application-related issue. On the Incident form, you can enter Application Service in the **Configuration Item** field to represent the application. For example, you can report the application service called MyApp 3.0 Production as unavailable.
- The incident is for an infrastructure CI that is affecting one or more services. On the Incident form, the **Impacted Services/CIs** related list identifies the application service affecting services. For example, the Server Acme42 CI might be identified as affecting the MyApp 3.0 Production and other related services.

Incident ticketing integrations

An incident ticketing integration exchanges ticket data between your ServiceNow instance and a third-party system.

The advantages of an incident ticketing integration include the following items.

- Establishing a ticket number that provides a unique key between systems.
- Synchronizing the systems so that notifications can be triggered.
- Transforming data for more uniform processing.
- Tracking ticket activity for accurate reporting.

The level of data and the direction of the data that is exchanged categorizes the integration as uni-directional or bi-directional. In a uni-directional integration, a third-party system creates an incident ticket, passes data to your instance, and receives a ticket ID back as confirmation. In a bi-directional integration, incident data is exchanged, synchronized, and updated while data is sent between the systems.

For both integration types, a good practice is to implement a record-based log of the individual transactions for a given time period. If an outage occurs, a record-based log can tell you what data was exchanged, how it was transformed, when processing occurred, and if there were any errors. Record-based logs also allow you to run all the validation and transformation logic away from the main form, helping performance.

Before implementing your project, develop an integration plan in which all the implementation aspects and requirements are defined. Developing the integration plan helps you to review the current data, plan for future requirements, and identify and sequence project tasks.

Uni-directional incident ticketing integrations

Consider the requirements for an external, third-party system to create tickets. Define the data that must be sent to create a ticket, and what validation is required.

In this way, a standard web service interface can be created and published. This integration responds with a ticket number on success, or with a structured error message for validation failures and processing issues. An advantage of this implementation is that you can publish once and reuse for multiple applications, provided the additional integrations follow the integration specifications. A good practice is to create a dedicated account for each interface. Accounts provide accountability and report user statistics, and use a simple connectivity Point of Contact (POC).

Integration plan contents

- Firewall requirements
- Protocols to be used
- Required middleware (for example, MS Biztalk)

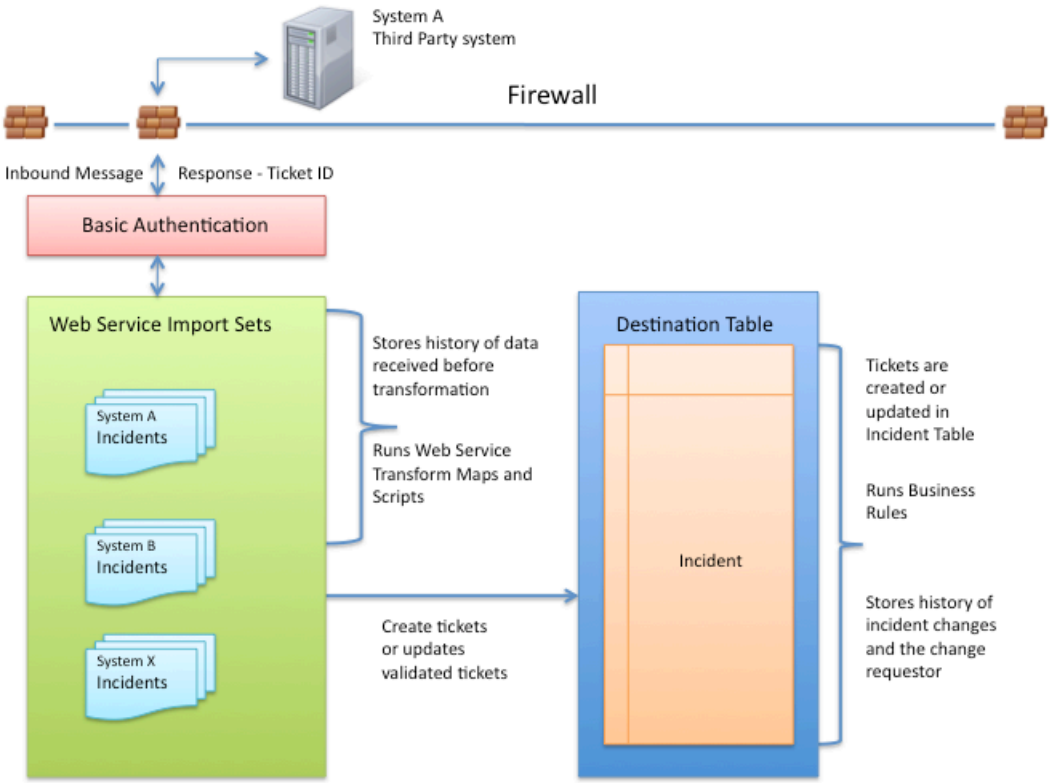
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Error messages
- Validation rules

Example using basic authentication

This implementation responds to the third-party system with the ticket ID. The Import Set tables function as a staging area for your data.

Uni-directional ticketing integration using basic authentication

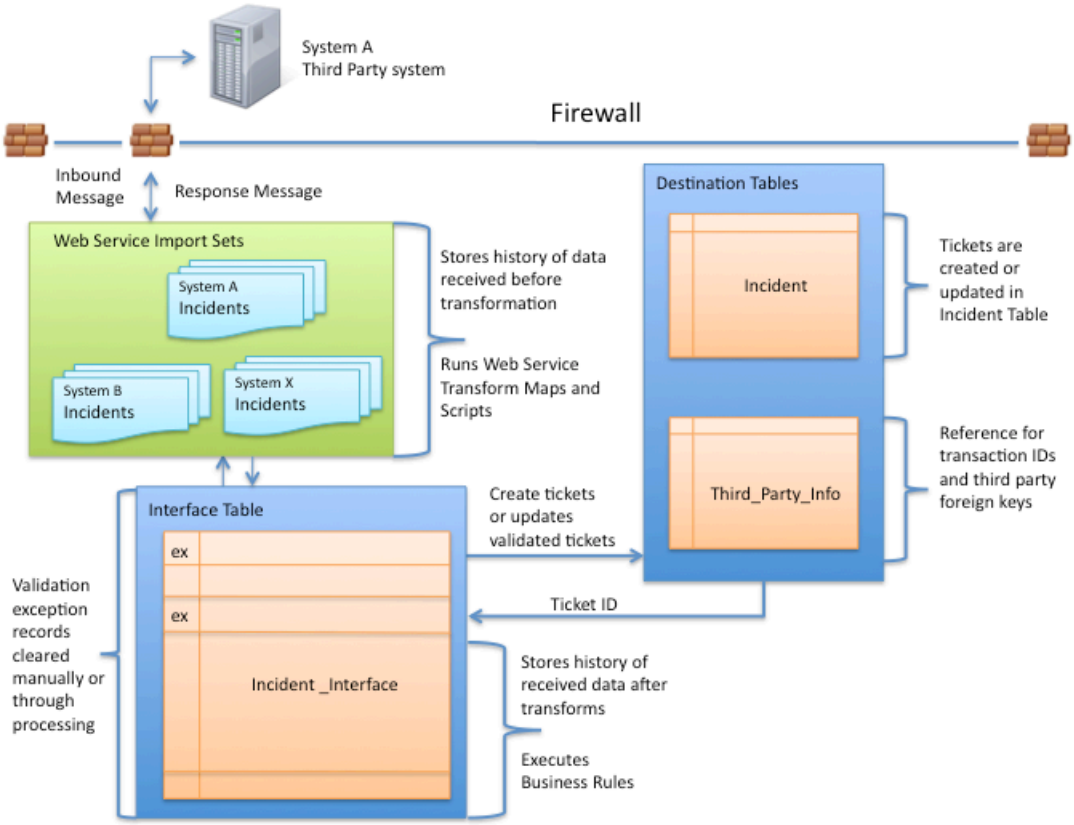


Example using import sets

An implementation variation for the inbound path would be to use the Import Set Tables as interface tables. In this example, the Incident_Interface Table stores a history of data as it was received and before the data was transformed. The destination Incident Table could store a history of how the incident has changed over time and who changed it. The transform scripts would process the import set and the business rules would run on the target table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Uni-directional ticketing integration using import sets



Bi-directional incident ticketing integrations

A bi-directional integration exchanges data between your ServiceNow instance and a third-party system so that incident information is synchronized between the systems.

This integration is more complex than a uni-directional integration because it has the following requirements.

- Comprehensive definitions of field mappings.
- Standardization of where transformations take place: inbound, outbound, or both.
- Consideration of the ownership of reference data.
- How updates are performed on an ongoing basis.

Implement error handling. Include all these implementations in the integration plan.

While bi-directional implementations are developed on their own merits, you can develop a framework in the ServiceNow AI Platform that can be reused, for example, data driven validation rules.

Integration plan contents

- Plan contents for all the aspects needed for a bi-directional integration.
- State models for each organization.
- Business rule definitions for keeping the tickets synchronized.
- Requirements to store history of individual transactions. If this form of audit is a requirement, consider creating an interface table which is populated prior to creating and updating the destination table.

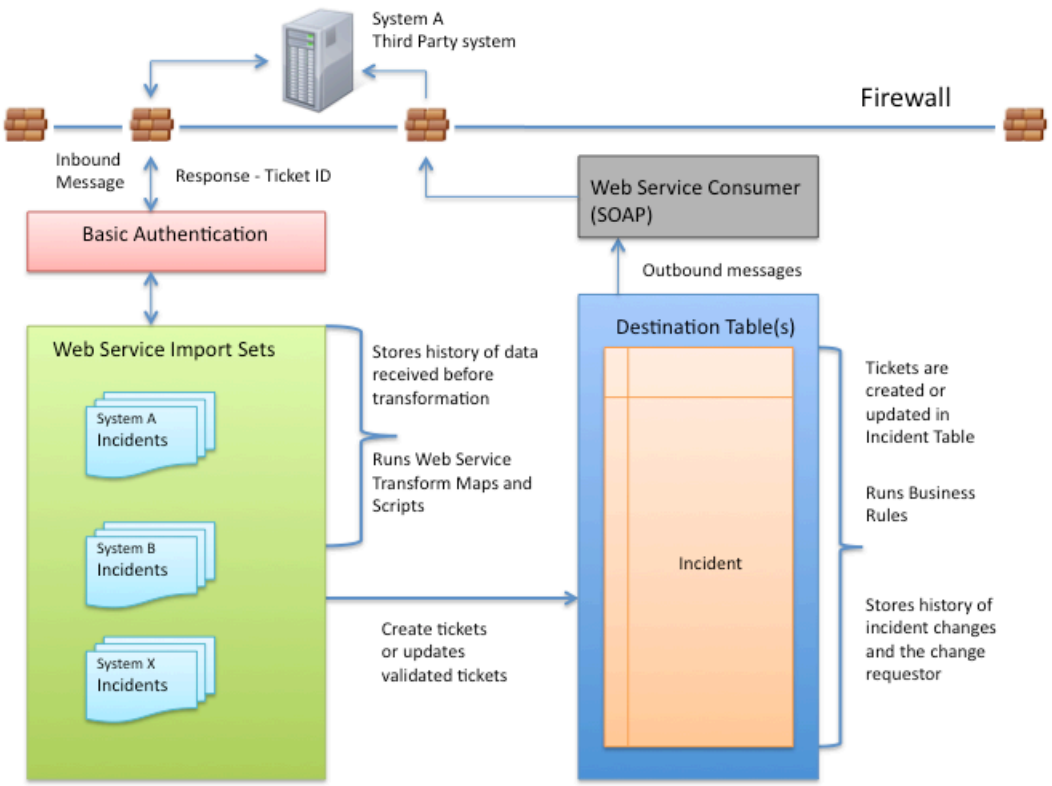
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Transformation rules for all data elements.
- Time lines for when reference data is transported to the information system. Include requirements to perform transformations before sending the data to and from each system.
- Statement of reference data ownership at all stages.
- Update schema definitions.

Example using import sets and web services

In this implementation, data authentication is done before insertion into the import set. Transform maps and scripts execute before the data reaches the Incident table. The Incident table is used to store the history of the incident records. For the outbound data path, the target table could trigger business rules before the data is queued in the outbound web service.

Bi-directional ticketing integration using import sets and web services



Example using import sets and the ECC queue

An implementation variation for the inbound path would be to use an import set table (in our example, the Incident Interface table) to store historical data. Data validation is also done now, and you can clear exceptions with processing or manual intervention. The Incident table uses a Third-Party Information table as a reference, and messages are generated based on business rules.

Implementing this type of integration involves a web-service component for third-party applications for inbound data. The ECC queue is recommended for outbound data.

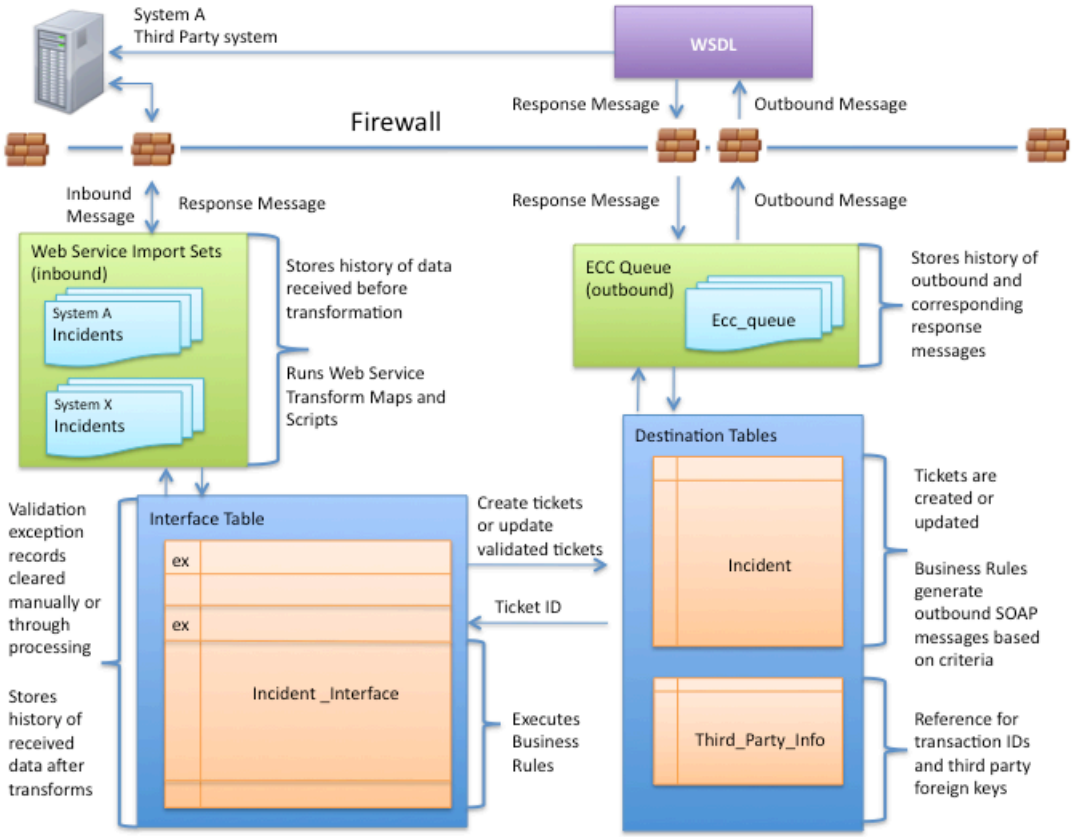
Bi-directional ticketing integration using import sets and the ECC queue



Configuring Microsoft Outlook to create incidents and VTB tasks

To create incidents and VTB tasks, or to chat with a virtual agent from within your Outlook email, activate and deploy the ServiceNow Add-in for Microsoft Outlook.

The ServiceNow Add-in for Microsoft Outlook lets you engage with IT directly from an email or, for IT users, quickly create an incident from an email and immediately assign it to the correct team. It also lets you create a VTB task.

Activate the ServiceNow Add-in for Microsoft Office

You can activate the ServiceNow Add-in for Microsoft Office plugin (com.sn_outlook_addin) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the ServiceNow Add-in for Microsoft 365 application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with ServiceNow Add-in for Microsoft 365:

- Plugins
- Store applications

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Roles
- Scheduled jobs
- Tables

For more information, see Install the ServiceNow Add-in for Microsoft 365 and Components installed with ServiceNow Add-in for Microsoft 365.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ServiceNow Add-in for Microsoft 365 application (sn_outlook_addin) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Deploy the ServiceNow Add-in for Microsoft Outlook

Deploy the ServiceNow add-in for Microsoft Outlook to chat with a virtual agent, create incidents and VTB tasks from within the Microsoft Outlook.

Before you begin

In addition to having one of the following roles on the ServiceNow instance, you must be an Office365 administrator to deploy the ServiceNow add-in.

Role required: admin, sn_outlook_addin.outlook_addin_setup

About this task

Deploy the ServiceNow add-in to Microsoft Outlook using the instructions in this Microsoft article: Publish Office Add-ins using Centralized Deployment via the Office 365 admin center.

Note:
You must be an Office365 administrator to deploy the ServiceNow add-in.

The ServiceNow add-in is only supported for use with Outlook for Mac and Outlook for Windows (Requirement set 1.4).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add or remove fields directly on the Incident form for users with the itil role by customizing the Outlook view form layout. For users that do not have the itil role, you can configure a Service Catalog record producer to use for creating new incidents.

Procedure

1. Navigate to **All** > **ServiceNow Add-Ins for Office** > **Office Add-In Manifests**.
2. Click **New** on the **Office Manifests** page.
3. On the form, fill in the fields.

Deploy MS Outlook add-in form

Field	Description
Add-in Name	A user-friendly name for the add-in. For example, if the add-in needs to be deployed only for administrators, you can choose to name it accordingly.
Description	A short description of the add-in. For example, if the add-in is for a help desk, you can write a short description accordingly.
Plugin ID	A unique identification string for the add-in you are deploying. You can change the plugin ID value to a new UUID to allow usage of multiple instances of the add-in.
Version	Version of the plugin execution.
Icon URL	HTTPS URL or relative URL for ServiceNow icon to be displayed in Microsoft Outlook.
Active	Indicates that the add-in is active.

4. Click **Submit**.

> **Note:**
> The Office Controls related list shows the menu and menu items associated with the add-in.

5. Click **Download Manifest** to download the add-in manifest file and follow the instructions in the Microsoft article for deployment. Microsoft article: Publish Office Add-ins using Centralized Deployment via the Office 365 admin center page.
6. **Optional:** You can also customize the add-in by clicking **Clone Manifest** from the context menu.
   This option clones the current manifest into a new record that allows customizing the labels, icons, menus, and menu items.
7. To customize the Incident form for users with the itil role, configure the Incident form layout directly.
   a. Click the context menu icon ( ) on the form and select **View** > **Outlook**.
   b. Click the context menu again and select **Configure** > **Form Layout**.
   c. Add or remove fields, as needed.
8. To customize the Incident form for users that do not have the itil role, use a Service Catalog record producer to configure the Incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Service Catalog** > **Record Producers**.

b. Right-click the record producer to use for creating new incidents and select **Copy sys_id**.

c. Paste the copied sys_id into the **Value** field of the **Provide sys_id of the record producer for create incident action from Outlook Add-In** (*sn_outlook_addin.create_incident_cat_item*) system property.

Managing incidents

Working on incidents involves diagnosing and investigating the incident, recording results, and sometimes escalating or promoting the incident.

Initial diagnosis of incidents is largely a human process. The service desk agent looks at the details of the incident and communicates with the user to diagnose the issue.

To aid in the diagnosis, the service desk agent can query the configuration management database, or CMDB. The CMDB contains information about hardware and software within a network and the relationships between them. The CMDB can be populated by: Discovery . Discovery is available as a separate product.

Incident investigation

Incident investigation is also a human process. The service desk continues to use the information in the Incident form as well as the CMDB to solve the issue. Work notes are added to the incident as the service desk evaluates the incident, facilitating communication between the concerned parties. Work notes and other updates can be communicated to the concerned parties through email notifications .

One way to investigate incidents is to determine whether related records exist, using one of the following features.

Related incidents icon

The show related incidents icon ( ) appears beside the **Caller** field when it is populated. Click the icon to view the list of incidents for the same caller.

Note:
Administrators can add this icon to any reference field by modifying the dictionary entry and adding the *ref_contributions=user_show_incidents* dictionary attribute. The icon appears only for users who have read or write access to the field. A UI macro named *user_show_incidents* defines the behavior. The UI macro must be active to view the related incidents icon.

Incidents by Same Caller related list

Another way to research related incidents is to use the **Incidents by Same Caller** related list. The administrator may need to configure the form to display this related list.

Dependency views

Dependency views can help find related incidents based on configuration items (CI). If a configuration item is attached to an incident, click the map icon ( ) to display the dependency views map. In the dependency map, if you want to view the tasks that are attached to the CI, click the down arrow next to the CI and from the menu, select **View Related Tasks**.

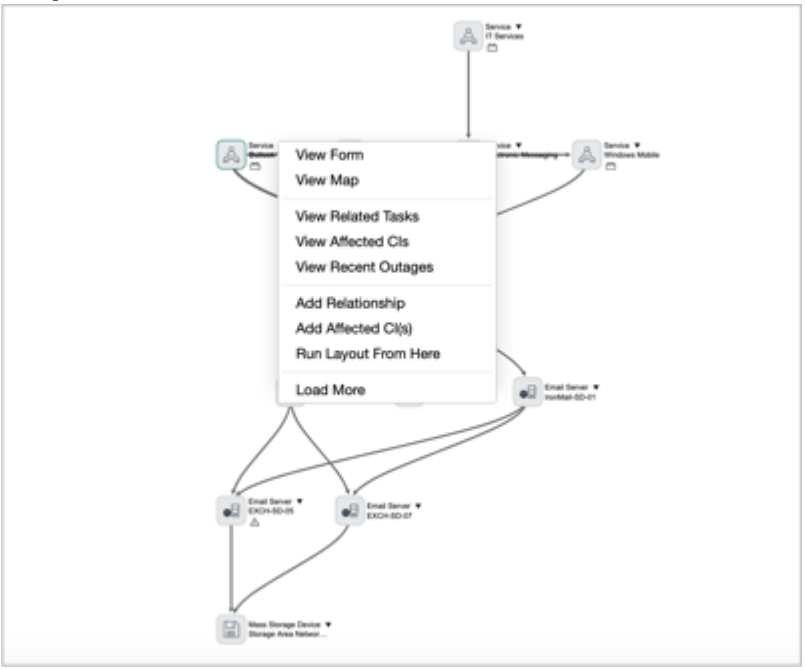
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI options



Incident promotion

When the incident management team has determined that the cause of an incident is an error or widespread problem, the team initiates the problem management process. When the issue requires a change to the infrastructure or a business service, the team initiates the change management process.

A menu item on the Incident form lets you create a problem or change record easily and associate the incident with the problem or change record. For more information, refer Create a record from incident

Note:
If the incident already has an associated problem or change record, you cannot create another record of the same task type.

Sometimes, the resolution for the user is to request hardware or software for them. For example, a user may report a problem that requires a new mouse device or keyboard. The service desk agent can create a request from the incident. The incident is associated with the requested item.

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

Incident escalation

There are two escalation methods the platform uses to track and report on incidents that are not being resolved according to your organization standards.

Service level agreements (SLAs)

SLAs monitor the progress of an incident according to a set of agreements between a service provider and customer that define the scope, quality, and speed of the services being provided. As time passes, the SLA escalates the priority of the incident and leaves a marker as to its progress. SLAs are also used as a performance indicator for the service desk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Inactivity monitor

The inactivity monitor generates an event to prevent incidents from going unnoticed. When a certain amount of time has passed without an update to the incident, the event creates an email notification or triggers a script.

Logging an incident

Log incident records from sources such as email, service desk, service catalog, or external applications as per your convenience. You can also generate incident using business rules or SOAP messaging.

Where	How
Service desk	User can call a service desk agent and the agent can log an incident based on the information provided by the user. Service desk (ITIL) agents can log an incident from the **Self-Service** > **Incidents** > **Create New** module.
Service catalog	User can log an incident in service catalog from the **Self-Service** > **Service Catalog** > **Can We Help You?** > **Create Incident** record producer.
Email	User can send an email to the instance mailbox. An incident is created according to the inbound email actions.
SMS	User can send an SMS to ServiceNow Customer Service number and an incident is automatically created for the user. **Note:** The user must install the Notify plugin (com.snc.notify) and set up a Twilio account in order to avail the messaging service.
Chat window	User can request to create an incident using the Connect chat icon ( ) that appears on the upper-right corner of the instance. On the chat window, the user can add an ITIL user and also provide a short description of the issue. Based on the description, the ITIL user creates an appropriate incident.

Note: If you want to create a security incident, first activate the Security Incident Response Dependencies plugin (com.snc.si_dep). You can then click **Create Security Incident** on a new incident form to create a security incident from the currently displayed incident.

ESS users can:

- View the incidents they have opened. By default, the **Watch list**, **State**, and **Urgency** fields are available on the ESS view of the **Incident** form.
- Update the **Watch list** and **Short Description** fields, and enter **Additional comments**. The administrator can configure other fields to be editable.

User who do not have the itil role can view an incident only if the user is the caller for that incident, has opened the incident, or is included in the watchlist. The *`incident query`* business rule controls this function.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Automatically generated incidents

- Incidents can be automatically generated using business rules. Business rules use JavaScript to generate an incident if pre-defined conditions are met.
- Incidents can be generated from outside the platform with SOAP messaging. For more information, refer to SOAP messaging .

Create an incident

Create an incident record to document a deviation from an expected standard of operation.

Before you begin

Role required: itil, sn_incident_write, or admin

About this task

This procedure describes how an ITIL agent completes the Incident form. Incidents are also logged when a user fills out a record producer in the service catalog, or sends an email to the instance.

Procedure

1. Navigate to **All** > **Incident** > **Create New**.
   You can also click **New** from the Incident list view.
2. **Optional:** Use a template, if one exists for the type of incident that you are logging.
   If the organization uses form templates, then you can apply a template to pre-populate some of the fields for specific types of incidents.
3. On the form, fill in the fields.
   Your organization has configured the Incident form to adhere to its incident management process. Enter information in the form field is based on the process. The following table describes typical Incident form fields.

Incident form

Field	Description
Number	Unique system-generated incident number.
Caller	User who contacted you with an issue.
Category and Subcategory	Type of issue. After selecting the category, select the subcategory, if applicable.
Service	Affected business service, if applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you select a business service as the configuration item and if that business service is also listed as the configuration item in any other active task, then the active tasks icon ( ) appears. Click the icon to view the list of all the other active tasks that are affecting the business service. You can view the BSM map (dependency view) of the selected business service by clicking the dependency icon ( ).
Service Offering	Service offering consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. This field enables you to receive different features and their levels of performance for a given service.
Configuration item	Affected CI, if applicable. After a CI is selected, you can click the open dependency views icon ( ) next to the field to see how the CI maps into the infrastructure. The dependency view shows you what is impacted and whether other CIs or services are experiencing issues. To capture information on the affected CIs, refer to Capture information on affected configuration items in an incident.
Channel	Communication method that is used by the user to create the incident. Following are the available options: ○ Chat ○ Email ○ Phone ○ Monitoring ○ Self-service ○ Virtual agent ○ Walk-in
Origin	Source of the incident. For example, if an incident is created from alert, this field contains the value Alert. This is a auto-populated field and you cannot fill the value manually.
State	State of the incident. The state moves and tracks incidents through several stages of resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Tip: Use the **State** field, rather than the **Incident State** or **Problem State** fields, as your primary means of tracking the state of an incident because this state progresses through the entire processing cycle. To learn more, see Life cycle of an Incident.
Impact	Impact is a measure of the effect of an incident, problem, or change on business processes.
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident, problem, or change has a significant business impact.
Priority	Priority is based on impact and urgency, and it identifies how quickly the service desk should address the task.
Assignment group	Group who will work on the incident. The business rule *Populate Assignment Group based on CI/SO* populates the **Assignment group** field based on the support group available for the configuration item (CI) or the Service offering consecutively. **Note:** The business rule is triggered when an incident is created or updated, and when the **Assignment group** and the **Assigned to** fields are empty. If you want to override the default value, then you need to create new properties and provide the field in the property value that must be used to populate the **Assignment group** field. Create the properties in the following order of preference: ○ *com.snc.incident.ci_assignment_group.field_name* Identifies which CI field populates the **Assignment group** field. ○ *com.snc.incident.service_offering_assignment_gi* Identifies which service offering field populates the **Assignment group** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ The sys_user_group *read* ACL calls the *SNCRoleUtil* function. The function verifies whether the group that is reviewed contains either the admin role or security_admin role. The function enables the user to view the group only if the user has the same role. As a result, a user with the itil role cannot assign an incident to a group that has the admin role or security_admin role, nor to any group whose parent has those roles. ○ Other than using the read ACLs, you can also restrict incidents with specific assignment group(s) for visibility only to the group members using before-query business rule. For details, see How to restrict a specific group incidents to only its group members [KB0790987] article in the Now Support Knowledge Base. You must log in to view the article.
Assigned to	User who works on this incident. If the **Assignment group** changes, the **Assigned to** field is cleared.
Short description	Brief description of the incident.
Description	Detailed explanation on the incident.
Attachments	Attachments related to the incident that helps in incident resolution such as screenshots or pdfs. Select the Attachment ( ) to add and manage the attachments.
Notes	
Watch list	Users who receive notifications about this incident when comments are added. Click the add me icon ( ) to add yourself to the watch list.
Work notes list	Users who receive notifications about this incident when work notes are added. Click the add me icon ( ) to add yourself to the work notes list. **Note:** The administrator must create an email notification for the work notes list.
Additional comments	More information about the issue as needed. All users who can view incidents see additional comments.
Work notes	Information about how to resolve the incident, or steps taken to resolve it, if applicable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actions taken	A journal field where you can enter details of the actions taken for a major incident. This field is for only internal users. **Note:** This field is only visible when you activate the Major Incident Management plugin (com.snc.incident.mim).
Related Records	
Parent Incident	Unique number of the parent incident for this incident record.
Problem	Unique number of any related problem record that is related to the incident.
Change Request	Unique number of any related change request that is related to the incident.
Caused by Change	Unique number of the change request that resulted in the creation of the incident.

Note:
The **Caller** and **Company** fields are optional for the following situations:

- An incident is created from an alert.
- An incident is created from a change request. In such case, the change request number is populated in the **Caused by Change** field.

4. Click **Submit**.

Result
The incident is created.

What to do next

- If you want to mail the incident record, click the more options icon ( ) in the title bar and select **Email**.

  The user who requested the incident and the user who is assigned to the incident are automatically populated in the list of recipients.

- When an incident is created from a case, the Customer Service with Service Management plugin (com.sn_cs_sm) is installed and you have a customer service agent (sn_customerservice_agent) role, you can view the **Customer Cases** tab in the Related Links section of the Incident form. This tab contains the list of the customer cases associated with the incident record.
- When there are one or more interaction records associated with the incident record, you can view the **Interaction** tab in the Related Links section of the Incident form that contains the list of the interaction records.
- A **Primary device health** link appears on the Related Links section of the Incident form. Select to launch the Digital End-User Experience application and device health page for the selected CI in Service Operations Workspace on a separate browser tab. This tab enables agents to view all the available metrics and the device health for the selected CI, which were collected

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

by DEX. You can also access this feature using the **View device health** option on the classic U16 CI record.

Note:

- DEX requires a separate entitlement.
- This link is available to the agent only if the following conditions are met:
  - The selected CI is of type Device, which is also known as Endpoint.
  - The DEX plugin is installed on the instance. For more information on DEX, see Digital End-User Experience.
  - The DEX agent is installed on the selected CI.

Create a record from incident

Managing major incidents

Capture information on affected configuration items in an incident

Capture information on affected configuration items (CIs), with type as asset, in an incident to keep a record of the updated, repaired, swapped, or retired configuration items.

Before you begin

Role required: itil or admin

Activate the Hardware Asset Management Professional plugin (com.sn_hamp).

About this task

You can tell where the assets are located, by keeping track of the assets, how they are used, and when changes were made to them. This information helps you to monitor and manage the assets in your company using a systematic approach.

If you are not the caller of the incident and have a CI value in the affected CIs list, it is mandatory to provide information on the CI before changing the state of the incident to **Resolved**.

You can enter CI information either from the **Affected CIs** related list or from the form layout of the Affected CIs. You need to manually add the **Asset Action** and the **Swapped CI** fields in the related list.

Add fields in the related list

Where	How
Related list	• In the **Affected CIs** related list, click the settings icon . • Move the **Asset Action** and the **Swapped CI** fields from the **Available** column to the **Selected** column. • Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The CI value is updated only if the incident state is updated to **Resolved** by any user excluding the caller. The CI value is not updated if:

- The incident state is updated as **Resolved** by the caller even if the **Asset Action** is populated.
- The incident is directly moved to **Closed** state.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open an incident.
3. Navigate to the **Affected CIs** related list before resolving the incident.
4. **Optional:** If you want to enter information in the form layout, click the CI.
5. On the related list or the form, fill in the fields.

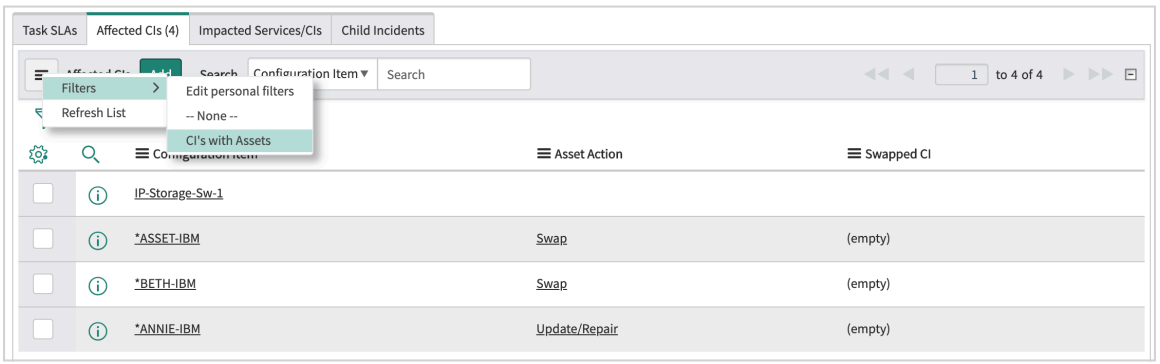
Information on Affected CIs

Field	Description
Asset Action	Information on whether a CI is updated or repaired, swapped with another CI, or retired from the system. The options available are: No action, Update/Repair, Swap, and Retire. **Note:** If you swap or retire a CI, the sn_hamp_asset.swap or sn_hamp_asset.retire events are generated respectively.
Swapped CI	Information on the new CI that is swapped with the existing CI. **Note:** ○ This field appears only when you select the value of the **Asset Action** field as **Swap**. ○ The CI values available for swapped CI are the ones with asset CI class as hardware. ○ The Swapped CI is assigned to the Caller. If the Caller is an Asset Manager, they have the option to reassign it to the appropriate user.

6. Click **Update**.
The record is saved and the information about CI is stored in the [task_ci] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can filter the **Affected CIs** related list to have the list of affected CIs with class as Asset.



Create a template from the incident form

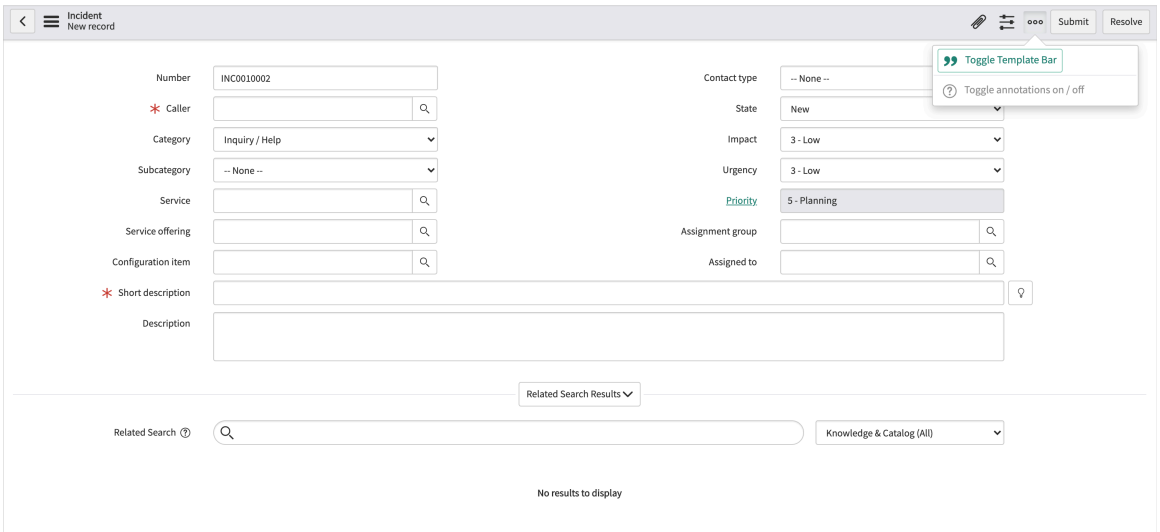
Create a template that define default values for forms so that users can easily create incident. You need to have appropriate permissions before creating templates.

Before you begin

Role required: itil, sn_incident_write, or admin

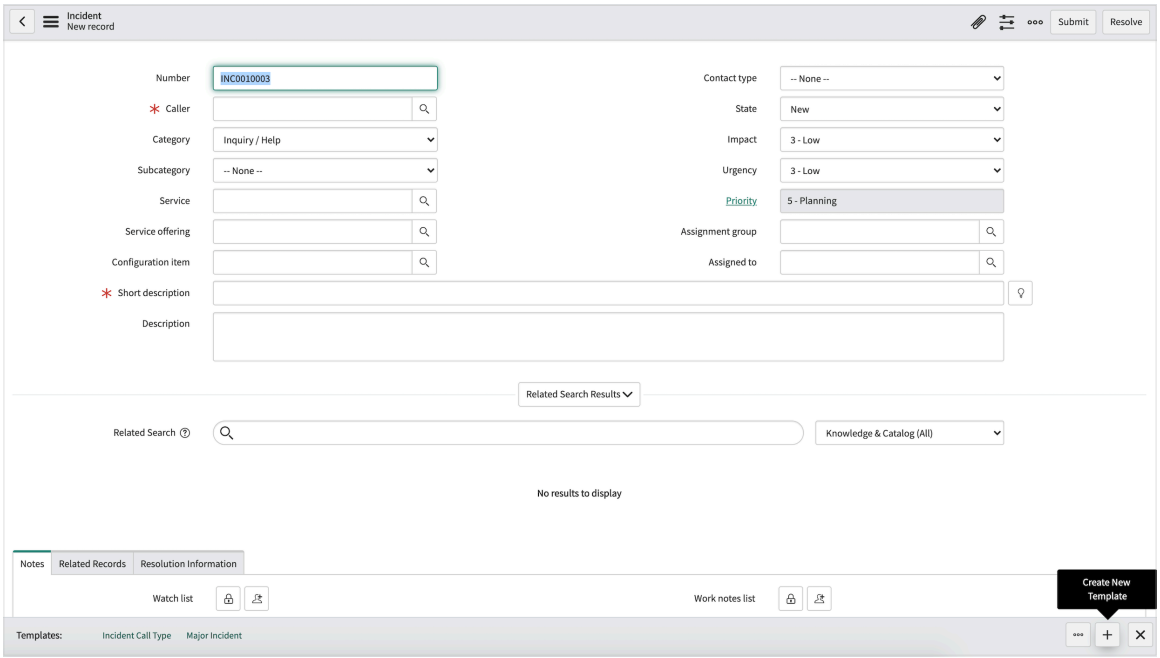
Procedure

1. Navigate to **All** > **Incident** > **Create**.
2. Click the more options icon and then click **Toggle Template Bar** to see the template bar.



3. On the template bar, click the add icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. On the form, fill in the fields.

Create New Template form

Fields	Description
Name	Name of the template.
Table	Table that this template applies to. Select **Global** to make the template available for use with all tables. **Note:** The table list shows only the tables and database views that are in the same scope as the template.
Active	Option for making the template available for use. A template must be active to be used.
Application	Application scope of the rules. The scope defines whether the rules are available for all applications or for scoped applications.
User	User who can configure and apply the template. If you define a user, no other users can see the template unless you select the **Global** option.
Groups	Group whose members can configure and apply the template. If you define a group, no other groups can see the template unless you select the **Global** option.
Global	Option for allowing any user who can access the templates to view and apply this template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Short description	Description of the template. **Note:** Adding content to this field does not add that content to the **Short description** field of the forms that use this template.
Template	Content that automatically populates records that are based on this template. Select a field from the specified table in the left column and then enter the data to automatically populate in the right column. **Note:** Even though you can select dot-walked fields in the template, they do not apply to fields that are on the form.

5. Click **Submit**.
   The template is created and you can find it on the template bar.

Apply a template in the Incident form

Apply a template to a new incident record if the pre-populated information in the template is applicable to the incident record. It saves your time and effort to enter values in the incident record fields individually.

Before you begin

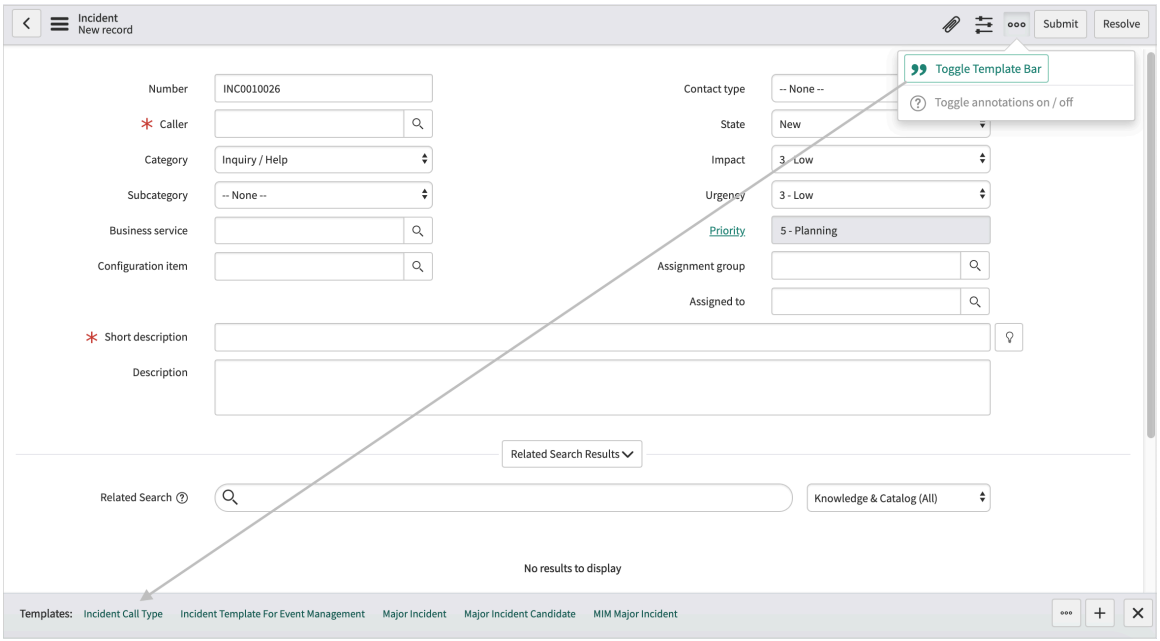
You must create a template before applying the template in the incident form. For more information, see Create a template from the incident form.

Role required: itil, sn_incident_write, or admin

Procedure

1. Navigate to **All** > **Incident** > **Create New**.
2. Click the more options icon and then click **Toggle Template Bar** to see all templates in the template bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Click a template to apply the template on the incident record.

Create incident template

View VIP status for a caller in incident

View the callers with VIP status on the incident records list view as well as incident form. Organizations commonly designate VIP status in the user record for some of their VIP users.

Before you begin

Role required: personalize_list or admin

About this task

When a caller is assigned to an incident, the user record is automatically checked for VIP status. If the caller is a VIP caller, an icon appears beside the caller name in the list view or the caller field in the form view.

To set the status of the VIP caller manually, navigate to **All** > **System Security** > **Users** or select on the required caller name from the list of incident record. On the User form, select the **VIP** check box to set the VIP status of the caller.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. View the record for the VIP caller in the list of incident records.

Use Microsoft Outlook to create incidents and VTB tasks

Create an incident or VTB task or chat with a virtual agent directly from within Microsoft Outlook using ServiceNow icons.

Before you begin

You must activate and deploy the ServiceNow Add-in for Microsoft outlook. For more information, see Configuring Microsoft Outlook to create incidents and VTB tasks

Role required: none

Procedure

1. On the Microsoft Outlook Home tab, click the **ServiceNow** icon () and select **Create Incident** or **Create VTB Task**.

2. In the ServiceNow IT Service Management pane, click **Login** and enter your ServiceNow credentials.
   You may need to reauthenticate if your session has expired.
3. For an incident record, fill in the following fields and click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident form

Field	Description
Number	Auto-generated incident number.
Caller	Current logged in user (default).
Short description	Subject of the current email (default).
Additional comments	Email body in text format (default).
Category	Category of incident. ○ Inquiry / Help ○ Software ○ Hardware ○ Network ○ Database

You can add or remove fields directly on the Incident form for users with the itil role by customizing the Outlook view form layout.

Note:
For users that do not have the itil role, the configured Service Catalog form for creating new incidents is shown.

4. For a task record, see fill in the following fields and click **Create**.

VTB Task form

Field	Description
Select Board	VTB board to which task belongs.
Select Lane	Lane of the VTB board.
Short Description	Short description of the task.

5. To chat with a virtual agent, select the **Chat with Virtual Agent** UI action to open the chat window.

Create an incident task

Create an incident task to communicate with and request work from assignment groups other than the one that is mentioned for the incident.

Before you begin

Role required: itil, sn_incident_write, or admin

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open the incident record.
3. In the **Incident Tasks** related list, click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you do not see the **Incident Tasks** related list, you need to add it. For information on how to a related list, refer Add a related list to a form.

Alternatively, you can also right-click on the header form and on the context menu, select the **Create Incident Task**.

4. On the form, fill in the fields.

Field	Description
Number	Unique system-generated incident task number.
Incident	Incident with which the task is associated.
Configuration item	The affected CI.
State	The state moves and tracks incident task through several stages of resolution.
Priority	
Assignment group	The group who works on the incident task. If you leave it blank, the incident is automatically assigned.
Assigned to	The user to whom the incident task is assigned to work on. **Note:** If the **Assignment group** changes, the **Assigned to** field is cleared.
Short description	A brief description of the incident task.
Description	Detailed explanation on the incident task.
Notes	
Work notes list	Users who receive notifications about this incident task when work notes are added. **Note:** You can the add me icon to add yourself to the work notes list.
Work notes	Information about how to resolve the incident task, or steps taken to resolve it, if applicable.

5. Click **Submit**.

Synchronization between an incident and its incident tasks

Use incident tasks to collaborate with and request work from other stakeholders. An incident and its tasks are synchronized such that the state of incident tasks changes depending on the state of the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Close open Incident Tasks when Incident is closed or canceled** property (*com.snc.incident.incident_task.closure*) is responsible for different actions that take place on incident tasks based on the state of the incident.

The synchronization between an incident and its open incident task is as follows:

- When an incident is closed, the state of any open incident task is set to **Closed Incomplete**.
- When an incident is canceled, the state of any open incident task is set to **Closed Skipped**.

Create a record from incident

Create a problem, change, or request record from an incident.

Before you begin
Role required: itil, itil_admin, or admin

About this task
When the cause of an incident is an error or widespread issue, a problem is generated from the incident. When the issue requires a change to the infrastructure or a business service, a change record is created from the incident. When the resolution for the user is to request hardware or software, a request is created from an incident.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open the incident record.
3. Right-click on the header form and on the context menu, select the appropriate option.
   The form for the new record appears and is already saved. Some specific fields are copied to the newly generated record from the incident. You can find reference of the newly created task record in the Related Records section of the Incident form.
4. **Optional:** Complete the Problem, Change, or Request form with additional information and click **Update**.

Create a request from an incident

When you work on an incident and determine that the user needs one or more catalog items, such as an application or a new laptop, you can create a request from the incident. It helps you in tracking the requests associated with an incident and vice versa.

Before you begin
Role required: itil or sn_incident_write

The Best Practice - Incident Resolution Workflow plugin (com.snc.bestpractice.incident) should be active for creating a request from an incident. To associate a parent incident with the request created for a record producer, the catalog_admin should add the following script in the script block of the record incident.

To associate a parent incident with the request created for a record producer, the administrator should add the following script in the script block of the record producer:

```
var incRPUtil = new LinkRecordProducerToIncident();
incRPUtil.linkRecordProducerToParentIncident(RP.getParameterValu
e('sysparm_req_parent'), current);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you set the **Use the sc_layout driven cart macros (default true)** (*glide.sc.use_cart_layouts*) property to **false** and create a request from an incident, the request is not associated with the incident.

Procedure

1. Navigate to **Incident** > **All**.
2. Select the required open incident.
3. Click the additional actions menu icon and select **Create Request**.
   The Catalogs home page is displayed with all active catalogs that you can access.

   Note:
   If there is only one active catalog, then that catalog page is displayed with available categories.

4. Select the required catalog and navigate through its categories and items.
5. Check out the required catalog item, order guide, or record producer.
   For information on checkout models, see Service Catalog checkout models.
   For a catalog item or order guide, a request is created and displayed under the **Requests** tab of the incident. For a record producer, the corresponding task is created and displayed under the **Problems** tab of the incident.

   Note:
   - The associated incident is specified in the annotation message throughout the request process.
   - Both for the one-step and two-step checkout, the caller of the incident is automatically set as the **Requested For** user for the request. If the two-step checkout is enabled, the fulfiller can change the **Requested For**.
   - You cannot add items to the wish list, or save a record producer in this flow.

Copy an incident or create a child incident

Copy an incident or create a child incident without manually entering the value of all the fields in the new incident.

Before you begin

- Role required: itil, sn_incident_write, or admin
- Select the **Enable copy incident feature** (*com.snc.incident.copy.enable*) and the **Enable create child incident feature** (*com.snc.incident.create.child.enable*) incident properties at **Incident** > **Incident Properties**.

Note:
An itil user can copy or create a child of any incident whereas a user without any role can copy only the incident which the user has created.

About this task

The Copy Incident functionality copies the details of an existing incident record to a new incident record. The Create Child Incident functionality copies the details of the parent incident and links the new incident to the parent incident. You can enable the options as well as add or remove fields or related list using the copy incident and create child incident properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Incident** > **Open**.
2. Open an existing incident that you want to copy or from which you want to create a child incident.
3. Perform one of the following actions.

4. Fill out the other fields, as required.
5. Click **Submit**.

The default fields and related lists that are copied from the parent incident are:

From where	What are copied
Fields	○ Category ○ Subcategory ○ Business Service ○ Configuration item ○ Impact ○ Urgency ○ Assignment group ○ Short Description ○ Description ○ Related lists ○ Caused by Change ○ Location ○ Company ○ Problem ○ Change Request ○ Parent incident **Note:** If the problem, change, or the parent incident is not active, then details of those fields are not copied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From where	What are copied
Related lists	○ Affected CIs ○ Impacted Services ○ Service Offerings **Note:** The supported related tables are: ○ Affected CIs (task_ci) ○ Impacted Services (task_cmdb_ci_service) ○ Service Offerings (task_service_offering) ○ Business Applications (task_cmdb_ci_business_app) You cannot add any other table in this field but you can remove any of the default values.

Synchronization between a parent and a child incident

The parent and the child incidents are synchronized such that the state of a child incident changes depending on the state of the parent incident.

Parent-Child state synchronization

Parent State	On Hold Reason (Parent)	Child State	On Hold Reason (Child)
In Progress	NA	In Progress	NA
On Hold	Awaiting Change/ Awaiting Problem/ Awaiting Vendor	Same as parent	Same as parent
On Hold	Awaiting caller	Not updated	Not updated
Resolved	NA	Resolved. The Activity log in the child incident form is updated with the resolution notes copied from the parent Incident.	NA
Closed	NA	Not closed. Child incidents must always be closed by the caller or by the system based on the auto-closure property.	NA

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parent-Child state synchronization (continued)

Parent State	On Hold Reason (Parent)	Child State	On Hold Reason (Child)
Canceled	NA	NA	NA

Note:

When an incident has a child incident, the following actions take place:

- If an ITIL user reopens the parent incident, then the parent incident as well as the child incident reopens. Both the parent and the child incident state is set to **In Progress**.
- If an ESS user reopens the parent incident, the parent incident state is set to **In Progress** but the child incident is not reopened.

Enable the display of incident special handling notes

Enable the display of informative notes for a specific record or for a set of records that meet one or more conditions. Use these notes to help users understand the action that was taken for the incident or the next course of action to be taken.

Before you begin

Role required: admin

Activate the Special Handling Notes plugin (com.sn_shn) to add the **Create Special Handling Notes** related link from which you can create the notes.

Procedure

1. Navigate to **Incident** > **All**.
2. Open any incident record.
3. Click the Additional actions icon and select **Configure** > **Form Layout**.
4. From the **Available** list, select **Special Handling Notes Pop Up** and move it to the **Selected** list.
5. Click **Save**.
   The Incident form can now display special handling notes.

Create a special handling note

Create a knowledge article from an incident using an article template

Provide a resolution for an issue by creating a knowledge article from an incident with fields defined in an article template.

Before you begin

Role required: itil, sn_incident_write, or admin

Activate the KCS Integration for Incident Management plugin (com.snc.incident.knowledge).

About this task

You can create a knowledge article only when the incident is resolved and you have not already created a knowledge article from that incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Incident managers with the sn_km_ml.knowledge_curation_user role can use the Demand Insights for Incidents dashboard to identify which incidents have no or insufficient knowledge coverage. For more information, refer Demand Insights for Incidents dashboard.

Procedure

1. Navigate to **All** > **Incidents** > **Resolved**.
2. Open a resolved incident record.
3. Access the Incident-KCS article - HTML form using one of the following methods:
   - Under Related Links, click **Create Knowledge**.
   - Right-click the form header and click **Create Knowledge**.

   The Incident-KCS article - HTML template provided with the base system appears. If you want to create your own article template, refer to Create an article template.
4. On the form, fill in the fields.

Incident KCS Article form fields

Field	Description
Number	[Auto-generated] Unique number to identify the knowledge article.
Knowledge base	Knowledge base in which the article is stored. The Incident KCS Article is stored in the [kb_template_incident_kcs_article] table.
Category	[Auto-generated] The value of this field is automatically provided from the **Category** field of the knowledge.
Valid to	Date after which the knowledge article is deleted from the database. After this date, the article does not appear in the search result.
Confidence	Maturity of an article based on its completeness and reusability.
Version	[Auto-generated] Displays the article version number, which is incremented when changes are made to a published article.
Workflow	[Auto-generated] Workflow that is followed for creating the knowledge article. For more information, refer Knowledge workflows .
Source Task	[Auto-generated] Incident record from which you have created the article.
Attachment link	Check box to automatically download an attached article instead of opening the article, when you access an article.
Display attachments	Check box to display attachments in the knowledge article. The attachments appear below the article text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Governance	An attribute of an article that enables you to control sensitive, critical, or regulated information. Not all articles have the same requirement for compliance reviews. Some articles are based on the collective experience of the people who use the articles (experience-based). Other articles have policy or legal information that require tight control (compliance-based).
Short description	Brief description of the knowledge article.
Issue	Information on the cause of the incident.
Resolution	Method used to resolve the incident.

Note:
The **Confidence** and **Governance** fields appear when the Knowledge Management KCS Capabilities plugin (com.snc.knowledge_kcs_capabilities) is activated. For more information, see Managing the KCS article state.

5. Click **Submit**.
   A knowledge article is created. The article record is listed in the Knowledge related list.

Create a knowledge article from an incident

When you are ready to close an incident, you can create a knowledge article so the next time the issue comes up the resolution is easy to find.

Before you begin

KCS Integration for Incident Management plugin (com.snc.incident.knowledge) must be activated. When activated, **Incident Create Knowledge** business rule does not run. For more information, see Activate KCS Integration for Incident Management.

Role required: itil, sn_incident_write, or admin

About this task

When an incident is closed automatically or by the caller, a draft knowledge article is created.

Procedure

1. Open a resolved incident that you want to close.
2. Perform one of the following methods to create a knowledge article from an incident:
   - Under Related Links, click **Create Knowledge**.
   - Right-click the form header and click **Create Knowledge**.

   Note:
   The **Create Knowledge** related link is visible only if:
   - Incident must be in **Resolved** state.
   - A knowledge article does not exist for the same incident.

3. Click **Close incident**.
   A new draft knowledge article is created. The content in the fields listed in the following table is copied from the Incident form to the Knowledge form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field on Incident form	Field on Knowledge form
Short description	Short description
Additional comments	Text
Number	Source

The **Knowledge** related list on the Incident form is populated with the new draft knowledge article. The draft article does not appear in the knowledge base (KB) for users until it is reviewed and published.

If the **Knowledge submission** workflow (glide.knowman.submission.workflow) is enabled from the System Properties [sys_properties] table, the content in the **Short description** and **Additional comments** fields of the incident form become a knowledge submission instead of an article. The **KB Submissions** related list on the Incident form is populated with the new knowledge submission. For more information on creating a knowledge article and workflows, see Create knowledge from incident and Knowledge workflows.

When the KCS Integration for Incident Management plugin (com.snc.incident.knowledge) is not activated, **Knowledge** check box is visible instead of **Create Knowledge** related link. You can select the check box and enter a resolution in the**Additional comments (Customer visible)** field and then close the incident. In such case, a knowledge article is created automatically using the **Incident Create Knowledge** business rule.

What to do next
To see the draft articles, navigate to **Knowledge** > **My Knowledge Articles** and then open the draft article by its KB number in the Knowledge form.

View affected CIs in the dependency views map

A configuration item (CI) can result in an incident. Use dependency view to identify other configuration items (CIs) that are affected by the CI that resulted in the incident.

Before you begin
Role required: Itil, itil_admin sn_incident_write, or admin

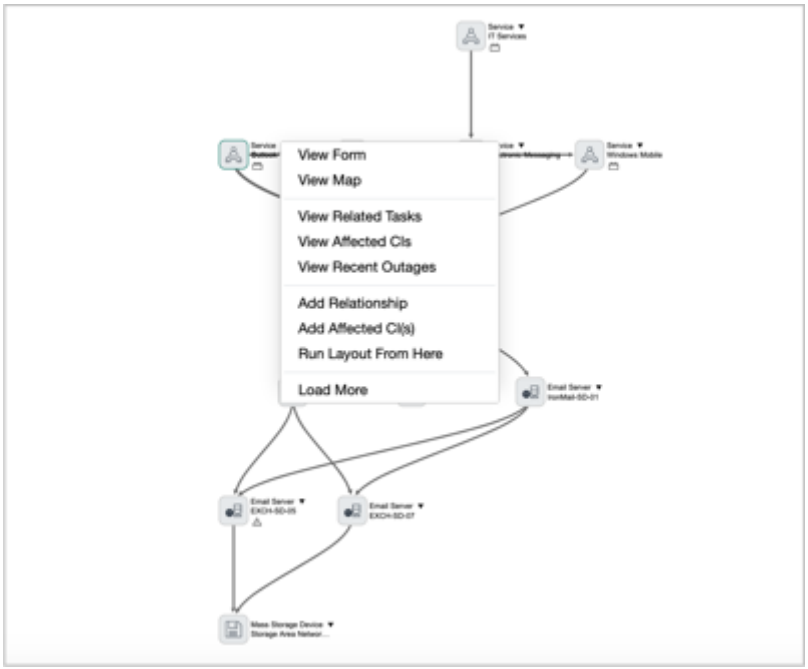
About this task
Often, an incident is related to one or more specific configuration items (CIs). If the configuration management database (CMDB) is populated, the CI records hold valuable information to help resolve incidents. You can associate configuration items to an incident to see how the incident affects dependent CIs.

Use the **Configuration Item** field when a single CI is the cause of the incident and use the **Affected CIs** related list when multiple CIs are affected by the incident. For example, suppose a load-balancer in a data center is no longer operational. The **Configuration Item** field lists the specific server which is out of memory. The **Affected CI** related list contains the load-balancer, the data center, the servers that depend on the load-balancer, and business services that are impacted by the missing server.

Procedure
1. On the Incident form, associate the CIs.
2. Click the dependency views icon ( ) beside the **Configuration item** field.
   The Dependency Views map opens in a new tab or window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. To see items that this CI affects, click the down arrow and select **View Affected CIs**.



To add another affected CI to the incident, click the down arrow beside the CI and click **Add Affected CI(s)**.

Related topics

Refresh impacted services and CIs for incident

The impacted services and CIs related list refreshes its records and also the records listed in the Service Offerings and Business Applications related lists based on the affected CIs. You can identify the impacted services and CIs and take necessary action.

Before you begin

Role required: itil, incident_manager, sn_incident_write, or admin

Ensure that you have configured the Business Applications related list.

About this task

When you refresh impacted services, the Impacted Services/CIs, Business Applications, and the Service Offerings related lists get updated based on the affected CIs. The records in each of the related list are unique even though the impact can be from a single affected CI. The following properties are responsible for this functionality:

- **Populate Impacted Services based on Affected CIs. Note: This requires any Business Service identified to have previously been converted to an Application Service.** (*com.snc.incident.refresh_impacted.include_affected_cis*)
- **Impacted CIs/Services related list is generated via events. When enabled the refresh will be executed in the background and the user will be notified on completion.** (*com.snc.incident.refresh_impacted.event*)
- **Populate the Business Application related list for incidents** (*com.snc.incident.populate_business_application*)
- **Populate the Service Offering related list for incidents** (*com.snc.incident.populate_service_offering*)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Populate the Refresh impacted services has been initiated message that is displayed on the UI when the Refresh impacted services UI action is clicked.** (*com.snc.incident.refresh_impacted_services.message.show*)

  Note:
  By default, the property is set to true.

- **Control and refresh the creation of live feed messages** (*com.snc.incident.refresh_impacted_notify_user*)

  Note:
  By default, the property is marked true.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open the incident record for which you want to refresh the related lists those values are based on affected CIs.
3. Click the Additional actions icon and then select **Refresh Impacted Services**.
   The records in the Impacted Services/CIs, Business Applications, and Service Offerings related lists are updated.

Associate CIs with incident

Associate affected or impacted configuration items (CIs) with an incident record to find out how the incident affects other CIs with dependent relationships.

Before you begin
Role required: admin

About this task
Use the **Configuration Item** field when there is a single, primary CI that is the cause of the incident and the **Affected CIs** or the **Impacted Services/CIs** related list when multiple CIs are affected by the incident.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open the incident record to which you want to associate CI items.
3. Perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate CI items

Options	Procedures
Configuration item	**a.** Click the lookup icon ( ). **b.** Select configuration item. **Note:** By default, Service Offering is filtered out and CIs with Principal Class are selected. The Principal Class filter functionality is applicable to the new customers starting the Paris release.
Affected CIs	**a.** Click **Add**. **b.** Select configuration items. **Note:** By default, Service Offering is filtered out and CIs with Principal Class are selected. The Principal Class filter functionality is applicable to the new customers starting the Paris release.  **c.** Click **Add Selected**.
Impacted Services/CIs	**a.** Click **Add**. **b.** Select configuration items. **Note:** By default, Service Offering is filtered out. **c.** Click **Add Selected**.

Update the resolved incident notification template

Modify the content of the email template that is sent to the user when you resolve an incident.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Notification** > **Templates**.
2. Open the **incident.ess.resolve** template.
3. Manually update the template content.
4. Click **Update**.

Incident resolution and closure

An incident is considered resolved when you provide the user with a temporary workaround or a permanent solution for the issue.

When an incident is resolved, the escalators stop, and the caller can review the resolution. If the caller is satisfied with the resolution, the caller can close the incident or the incident is auto-closed after a certain time based on the incident auto-close properties.

If the cause of an incident is understood but cannot be fixed, the service desk can create a problem from the incident to find the root cause of the issue. The problem is then evaluated through the problem management process.

If the incident creates the need for a change in IT services, the service desk can generate a change from the incident, which is evaluated through the change management process.

Incident closure

You can configure incident properties to auto-close an incident.

Your organization can also generate customer satisfaction surveys when incidents are closed. Surveys allow the service desk to gather information about the quality of their service directly from the user.

Resolve and close an incident

When the service is restored by rectifying the issue that resulted for an incident, you can set the incident state as resolved. If the user is satisfied with the resolution, the user can close the incident or the incident is auto-closed after a certain time based on the incident auto-close properties.

Before you begin

Role required:

- For resolution: itil, list_updater, sn_incident_write, or admin
- For closure: itil_admin or admin

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open the incident that you want to resolve and close.
3. In the Resolution Information section, fill in the fields.

Resolution Information fields

Field	Description
Resolved by	The user who resolved the issue and the date and time the incident was closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Resolved	The date and time when the incident was resolved.
Resolution code	Information to categorize resolved cases.
Resolution notes	Document how an incident is resolved.

4. Click **Resolve**.
   The incident is in the resolved state.
5. Click **Close Incident**.
   The incident is closed.

> **Note:**
> Even when an incident is closed or canceled, you can edit the following fields on the Incident form, if you have an admin role: **Subcategory**, **Service**, **Service Offerings**, **Description**, **Contact type**, **Watch list**, **Work notes list, Parent Incident**, **Problem**, **Change Request**, **Caused by Change**, **Resolved by**, **Resolved**, **Reassignment count**.

Configure incidents to close automatically

Close incidents automatically based on the last updated date or the resolution date of the incident by configuring incident properties. You can also mention the number of days system must wait before initiating the auto-closing functionality.

Before you begin
Role required: admin

About this task
You can auto-close incident based on the last updated date or the resolution date of the incident using the property **Enable auto closure of incidents based on Resolution date. Setting this to 'No' will make auto closure to run based on the Updated date** (*com.snc.incident.autoclose.basedon.resolved_at*). This property is set to true only for the new customers starting the London release. Existing customers before the London release have to manually set the property to true.

> **Note:**
> You cannot auto-close a major incident based on the incident auto-closure property. For more information, refer Close a major incident.

A scheduled job called *Autoclose Incidents* (**System Scheduler** > **Scheduled Jobs** > **Scheduled Jobs**) runs the *Incident Autoclose* business rule to close incidents as described. By default, it assigns the name of the administrator, who is logged in when the *Autoclose Incidents* job runs, to the **Updated by** field.

Procedure
1. Navigate to **Incident** > **Administration** > **Incident Properties**.
2. Select the **Enable auto closure of incidents based on Resolution date. Setting this to 'No' will make auto closure to run based on the Updated date** check box if you want the incident to be auto-closed based on the resolution date.
3. In the **Number of days (integer) after which Resolved incidents are automatically closed. Zero (0) disables this feature** (*glide.ui.autoclose.time*) property, enter the number of days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you have an inactivity monitor triggering on your incident, it resets this auto-close clock each time it triggers, preventing your incident to be closed. To prevent this reset, set a **Reset Condition** on your inactivity monitor to **[Incident state] [is not] [Resolved]**.

4. Click **Save**.

Related topics

Configure default user for auto-closing incidents

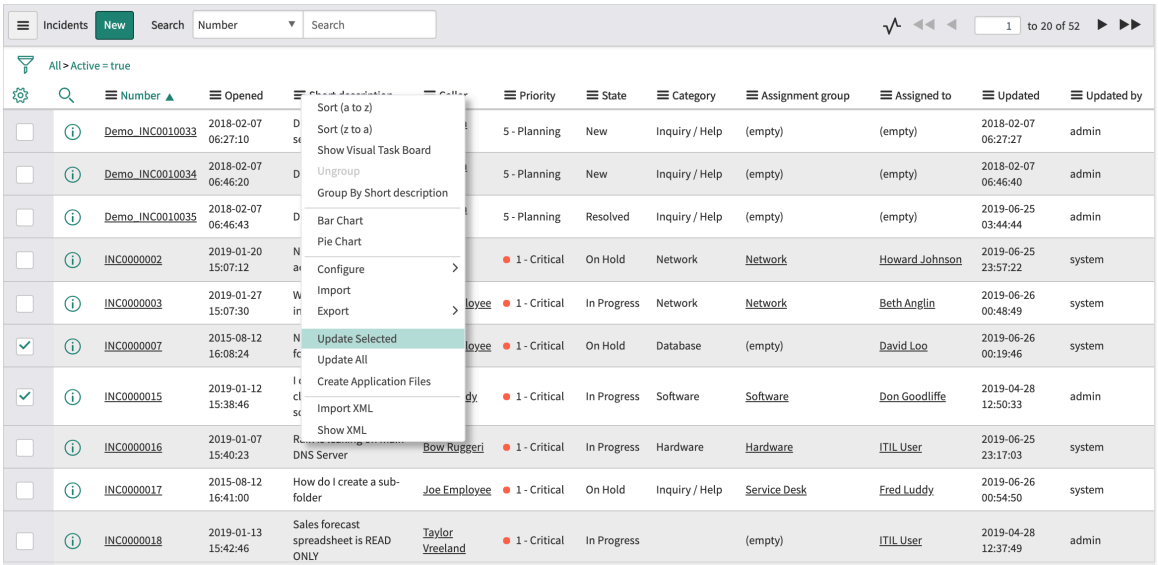
Close multiple incidents from list

Close multiple incidents from the incident list simultaneously that can have the same resolution code.

Before you begin
Role required: itil, list_updater, sn_incident_write, or admin

Procedure

1. Select the check box beside each incident that you want to close.
2. Right-click on any list column header and click **Update Selected**.



3. Set the value of **State** to **Closed**.
4. In the Resolution Information section, select a **Resolution code** and enter your notes in **Resolution notes**.
5. Click **Update**.
   The changes apply to all the selected records.

Create a UI action to close multiple incidents

Create a UI action to close multiple incidents at once from the **Actions** list in the list view.

Before you begin
Role required: business_rule_admin (for business rule), ui_action_admin (for UI action), or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Closing an incident from **Actions** list adds the same close note to all the incidents that are closed and does not require the list_updater role. Implementing this process requires a script include that is referred from a UI action and a custom UI page.

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes** and click **New**.
2. Create the script includes with the following information.
   - **Name**: IncidentClosure
   - **Client callable**: Select the check box
   - **Active**: Select the check box
   - **Script**: Paste the following information:

```
var IncidentClosure = Class.create();
IncidentClosure.prototype =
 Object.extendsObject(AbstractAjaxProcessor, {
    closeIncidents: function() {
        var selectedIncidents =
 this.getParameter("sysparm_incidents");
        var notes = this.getParameter("sysparm_closeNote");
        var code = this.getParameter("sysparm_closeCode");
        var incidentGr = new GlideRecord('incident');
        incidentGr.addQuery('sys_id', 'IN',
 selectedIncidents);
        incidentGr.query();
        while (incidentGr.next()) {
            incidentGr.setValue('state', 7);
            incidentGr.setValue('close_notes', notes);
            incidentGr.setValue('close_code', code);
            incidentGr.update();
        }
        return true;
    },

   type: 'IncidentClosure'
});
```

3. Save the record.
4. Create the following steps to create a UI page.
   - **Name**: mandatory_fields_to_close_incident_ui
   - **HTML**: Paste the following information:

```
<?xml version="1.0" encoding="utf-8" ?>
<j:jelly trim="false" xmlns:j="jelly:core" xmlns:g="glide"
 xmlns:j2="null" xmlns:g2="null">
    <style>
        #content_row .reference-label {
            padding-right: 15px;
        }

        #page_timing_div {
            display: none;
        }
```

```
    });
})();
```

5. Save the record.
6. Complete the following steps to create the UI action for closing multiple incidents.
   a. Navigate to **System Definition** > **UI Actions** and click **New**.
   b. Create the UI actions with the following information:
      - **Name**: Close incidents
      - **Table**: Incident [incident]
      - **Show update**: Select the check box
      - **List choice**: Select the check box
      - **List v2 Compatible**: Select the check box
      - **Client**: Select the check box
      - **Onclick**: closeIncidents()
      - **Condition**: current.getValue('state') !== '7'
      - **Script**: paste the following information

```
function closeIncidents() {
    var list = GlideList2.get('incident');
    var title = list.getTitle();
    var incidents = list.getChecked();
    if (incidents) {
        var o = new
 GlideModal('mandatory_fields_to_close_incident_ui');
            getMessage("Close Incidents", function(msg) {
                o.setTitle(msg);
                o.setPreference('selected_incidents',
 incidents);
                o.render();
            });
        }
    }
```

7. Save the record.

Result
Service desk agents can close multiple incidents using **Close incidents** in the **Actions** list below the Incident list.

Reopening an incident

Reopen an incident from the resolution notification email or from the incident to get answer for your query.

When an incident is resolved, an incident resolution email notification is sent to you. If you are not satisfied with the resolution of your incident, you can request to reopen the incident using any of the following methods:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the **Reopen incident** link from the incident resolution email notification.
- Select the **Reopen incident** option on the incident form in Incident Management.

Once an incident is reopened, the state of the incident is then changed from **Resolved** to **In Progress**. You can reopen a resolved incident if you are an agent with incident write access (sn_incident_write) role.

If the incident is already closed and you request to reopen the incident by replying to the resolution notification email, a new incident is opened with selected field values from the closed incident. The values of the fields that you mention in the **List of fields (comma-separated) to copy from the original incident when an incident is reopened by email** property (*com.snc.incident.clone_fields_on_reopen*) are copied from the closed incident to the new incident. Add the text `Please reopen` to the subject line of the email.

- If an incident is reopened by a user after it was resolved, the **Last reopened by** and the **Last reopened at** fields are automatically populated with the name of the person who reopened it and the date and time when the incident is reopened. During audit, this information helps you to generate various reports for reopened incidents.
- On the Incident form, there is an existing field named **Reopen count**. Incidents that were reopened prior to the Kingston release, may already have some non-zero values in the **Reopen count** field while the values in the new fields, **Last reopened by** and the **Last reopened at** are null. For incidents that are reopened after the Kingston release, the **Last reopened by** and the **Last reopened at** fields are populated.
- If you do not have any roles in the system (ESS) and you change the incident state to **Resolved**, you receive a notification with a **Reopen incident** link.
- If you do not have any roles in the system (ESS) and you are the caller, you can click **Reopen incident** on the incident form to reopen the incident. Add the text `Please reopen` to the subject line of the email.

Note:
An ESS user is not able to resolve, reopen, or close a major incident even if the user is the caller.

Incident standard ticket page

The Incident standard ticket page is where you and your employees can view the details of an incident and can be used with service portal.

You can access the Incident ticket page in Service Portal using the **Requests** option from the main menu header of Service Portal. The Incident ticket page is available by default for new as well as upgrade users. The Incident standard ticket page shows the details of an Incident, such as the short description, caller, and urgency. It also shows the **Actions** list from where you can resolve, close, or reopen incident.

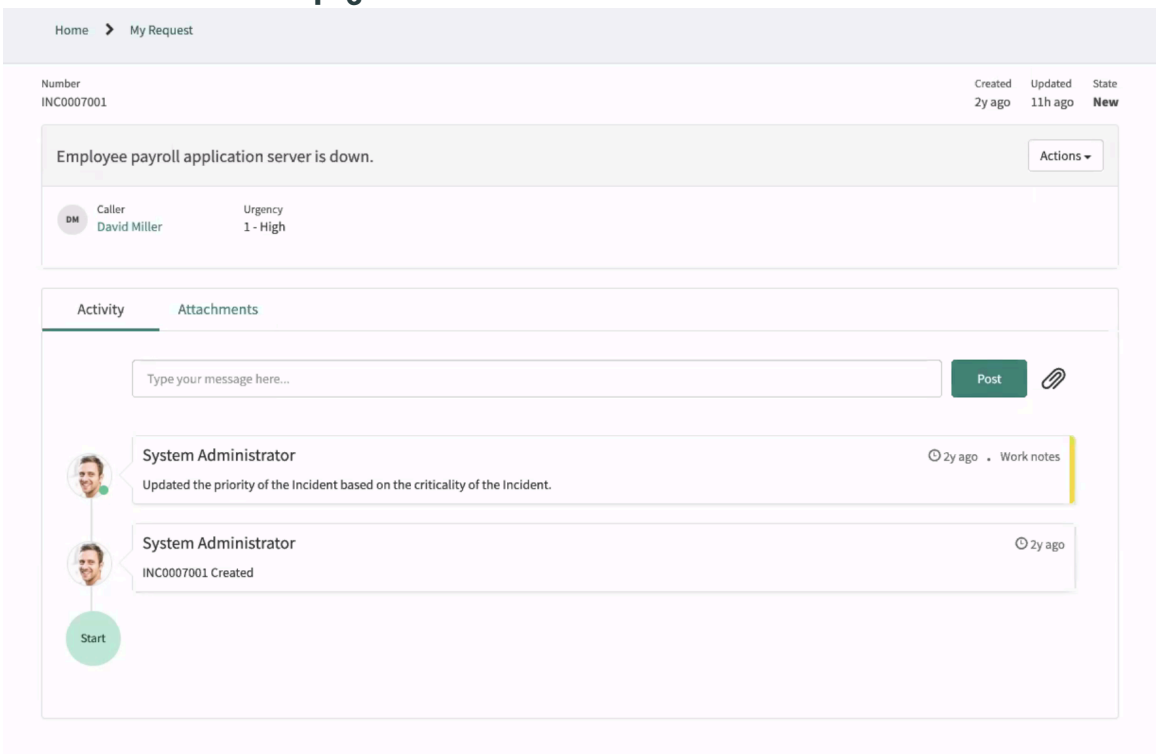
Incident standard ticket page



Incident standard ticket page configuration

You can configure the appearance of the Incident standard ticket page header and tabs from **Standard Ticket** > **Standard Ticket Configuration** > **Incident**. For more information, refer Configure incident ticket page.

Configure incident ticket page

Configure the Incident ticket page from where users can view the details of an Incident in Service Portal.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Standard Ticket** > **Standard Ticket Configuration** > **Incident**.
2. Click the Incident record.
3. On the form, configure the fields.

Ticket Configuration form

Field	Description
Table	Task-extended table for which you want to configure the standard ticket page.
Active	Option to specify if the ticket configuration is active.
Application	Application associated with the ticket configuration.
State field	Any field of the task-extended table. By default, this field is mapped to the **State** field of the task-extended table. You have to configure the form to add this field.

Field	Description
Action widget parameters	Comma-separated list of action widget parameters.

Note:

- By default, the Activity and Attachments type tab configurations are available for all standard configurations.
- You cannot duplicate any tab type other than Custom.
- You can configure a maximum of five tabs.
- You can add only one of these tab types:
  - Variable Editor (Read-Only)
  - Variable Summarizer

4. Right-click the header menu and click **Save**.
5. On the Tab Configurations related list, configure the fields.

Tab Configuration form

Field	Description
Type	Tab type based on which a widget is displayed. Possible options are: ○ None ○ Activity ○ Attachments ○ Custom ○ Variable Editor (Read-Only) ○ Variable Summarizer
Tab name	Name of the tab.
Application	Application associated with the ticket configuration.
Order	Order in which the tab should be displayed in the tabs section.
Visible	Conditions for the tab visibility.
Widget	Widget that should be displayed in the tabs section. This field appears only when **Custom** is selected from **Type**.
Widget parameters	Comma-separated list of tab widget parameters. This field appears only when **Custom** is selected from **Type**.

6. On the Ticket Configuration form, click **Update**.

Managing major incidents

A major incident (MI) is an incident that results in significant disruption to the business. A major incident demands a response beyond the routine incident management process. Major incidents have a separate procedure with shorter timescales and higher priority, so that there is a faster resolution process for incidents with high business impact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

https://player.vimeo.com/video/990305784?h=fa145c9c15&badge=0&autopause=0&player_id=0&app_id=58479

The definition of what constitutes a major incident must be determined and agreed on. For example, a major incident can be created if a critical business service is impacted or if there is a service outage that affects many users.

There are multiple ways to create a major incident candidate, such as the following:

- Propose an incident as a major incident candidate by clicking **Propose Major Incident** from the context menu of the Incident form.
- Create a new major incident candidate by clicking **Create Major Incident Candidate** from the left navigation pane.
- Mark an incident as a major incident candidate based on the major incident trigger rules.

Note:
When a major incident is created from a major incident candidate, the new major incident is considered as a parent record for the current major incident candidate. In such case, the **Caller** and **Company** fields are optional.

As a major incident manager, you can do the following:

- Promote a candidate to a major incident by clicking **Promote to Major Incident** from the context menu.
- Create a new major incident by clicking **Create Major Incident** from the left navigation pane.
- Promote an incident to a major incident without going through the proposal process.

When responding to a major incident, some crucial actions involve finding the right resources, communicating updates to users and stakeholders, setting up conference calls to investigate and resolve the incident, and escalating the incident when required. Using Task Communications Management, you can define communication plans that are associated with a major incident based on pre-defined conditions. Incident communication plans and related communication tasks are created for a major incident based on the communication plan definitions. Thereafter, tasks get executed as defined in the attached incident communication.

Major Incident Management process

A major incident is a highest-impact, highest-urgency incident that affects a large number of users, depriving the business of one or more crucial services. Given the urgency of the situation, a well-coordinated response process is required to accelerate the resolution and minimize the business impact.

The goal of an organization is to have an effective and efficient system for responding to major incidents. The requirements are to:

- Minimize the impact of service interruptions.
- Ensure that an appropriate Incident Manager/Major Incident Team/Management Group are in place to manage a major incident.
- Ensure that stakeholders are well-informed of service interruptions, degradations, and resolutions.
- Conduct a review of each major incident once service is restored. Its purpose is to analyze the incident, and understand what can be done to prevent a similar incident in the future. This review also provides an opportunity to evaluate the incident response process and identify areas for improvement.
- Create a problem for root cause analysis.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Keeping the goals in mind, a major incident management process can be broadly classified into the following phases:

Identification

The first step in the process is to identify a potential major incident. A potential major incident can be identified automatically based on trigger rules or an existing incident can be proposed as a major incident candidate. These incidents are classified as major incident candidates and are reviewed by major incident managers who initiate the major incident response process.

Communication and Collaboration

Timely communication during a major incident is crucial to ensure that the IT teams, business stakeholders, end users, and customers are informed about the impact and progress of the incident. An occurrence of a major incident requires a comprehensive communication plan that includes who is contacted, the methods and frequency of communication, messaging, and so on. The communication plan enables the incident response team to focus their efforts on the resolution process and sets expectations for any future communications.

You can define one or more communication plans based on the type, priority of the incident, or the target audience. For example, communication plans for a P1 major incident could have more frequent communication than a communication plan for a P2 major incident.

Throughout the life cycle of the major incident, notifications and status updates are sent to the stakeholders to keep them informed and involved.

Resolution

In this phase, the agreed upon path to resolution is followed to resolve the issue. Resolving a major incident resolves all associated child incidents, and the individual callers receive a notification about incident resolution.

Post incident review

This is the final phase of a major incident life cycle. After the major incident is resolved, a post-incident review is conducted. Its purpose is to analyze the incident and understand what can be done to prevent a similar incident in the future. This review also provides an opportunity to evaluate the incident response process and identify areas for improvement.

To streamline the process, a post-incident report is created when an incident is resolved. The post-incident report can be reviewed and updated during the review process before it is shared with stakeholders.

A major incident progresses through different states during its life cycle. The following diagram illustrates the different states involved in a major incident management:

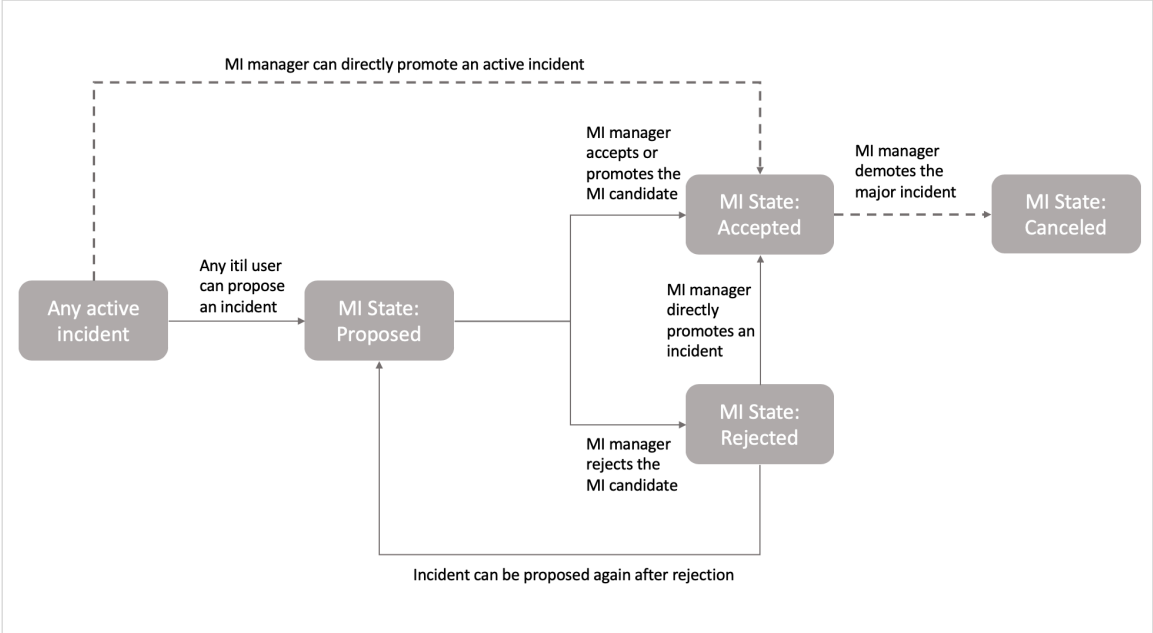
Major Incident Management state flow



Major Incident Management plugins

You can activate the Major Incident Management plugins if you have the admin role.

Activate Incident Management - Major Incident Management

You can activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Incident Management - Major Incident Management plugin (com.snc.incident.mim) must be manually activated for new and existing customers.

Incident Management - Major Incident Management plugin activates these related plugins if they are not already active:

- Incident Communications Management (com.snc.iam)
- Incident Updates (com.snc.incident.updates)
- Task-Outage Relationship (com.snc.task_outage)

Additional plugins for Incident Management - Major Incident Management

Plugin	Description
Notify [com.snc.notify]	Provides platform features for workflow-driven voice calls, conference calls, and SMS messages. Requires the Twilio Direct Driver and a separate contract with Twilio for SMS and Voice capabilities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Additional plugins for Incident Management - Major Incident Management (continued)

Plugin	Description
	Note: Existing users already using Twilio Driver need to migrate to Twilio Direct Driver.
On-Call Scheduling [com.snc.on_call_rotation]	Provides the ability to create on-call schedules and escalation trees. When an incident is created, dynamically route the escalation to an on-call resource. On-Call Scheduling enables you to configure and build different on-call schedules per process and assignment group.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Major incident manager [major_incident_manager]	A major incident manager can: • Initiate the major incident process by assessing and approving major incident candidates or creating a major incident. • Reject a major incident candidate. • Demote a major incident after it is accepted so that the incident can be handled as a regular incident. • Maintain the ownership and accountability for the life cycle of the incident. • Identifies the users and groups to be involved in the resolution activities. • Creates adhoc communication plans and tasks. • Edits a communication plan that is attached to a major incident. • Close a major incident.	This role inherits the ia_admin role.
Communications manager [communication_manager]	• Manages communications for major incidents and is responsible for communicating with all stakeholders. • Creates adhoc communication plans and tasks. • Edits a communication plan that is attached to a major incident.	This role inherits the ia_admin role.
Incident Manager [incident_manager] (Existing role with added responsibilities)	• Manages incident properties and major incident trigger rules. • Can create and edit Communication Plan Definitions.	None

Tables installed

Table	Description
Major Incident Trigger Rules [major_incident_trigger_rule]	This table extends the Application File [sys_metadata] table and stores the major incident trigger rules.

Slack notification installed with Major Incident Management

Slack notifications are added with activation of Incident Management – Major Incident Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Slack notification	Description
Major Incident Candidate assigned	Notifies Major Incident Management Group when **Major Incident State** changes to **Proposed**.
IAT conference notification	When conference call is initiated, a slack notification is sent to all the participants of the conference call.

Quick start tests for Major Incident Management

Validate that Major Incident Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Major Incident Major Incident Management

Major Incident Management quick start tests require activating the Incident Management - Major Incident Management plugin (com.snc.incident.mim).

Quick start tests

Create trigger rules for major incidents

Create trigger rules to define the conditions under which a trigger action is executed. You can create major incident trigger rules to define the conditions under which an incident is automatically considered as a major incident candidate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: incident_manager or admin

About this task
Major incident trigger rules are evaluated asynchronously each time an incident is created or updated provided the following conditions are met:

- The incident record doesn't have the Parent Incident populated, which means that the current incident isn't a child incident.
- The major incident isn't proposed or accepted.
- The incident is active.

Note:
The base system major incident trigger rules are inactive by default.

Procedure
1. Navigate to **All** > **Major Incidents** > **Administration** > **Major Incident Trigger Rules**.
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Name	Unique name of the trigger rule.
Table	Table on which the trigger rule executes.
Application	Application scope of the trigger rule. The trigger rule is available for all applications or for scoped applications.
Execution Order	The rule with lowest execution order is triggered first. In the following example, the rule with order = 100 is executed first. Example: ○ If business criticality of business service is 1-most critical or 2-somewhat critical, Order = 100. ○ If the number of child incidents is greater than 20, then Order = 200. ○ For a P1 incident, Order = 300. **Note:** If any of the existing trigger rule conditions are met, the incident is considered to be a major incident candidate. Verification of the remaining rules isn't required. Otherwise, all the rules are verified based on the execution order.
Action to take	Action taken on the incident when the trigger rule is executed. The possible values are the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Propose Major Incident**: Incident is proposed as a major incident candidate when the trigger rule is executed. After it's approved, the incident is promoted to a major incident. ○ **Promote Major Incident**: Incident is promoted directly to a major incident when the trigger rule is executed. ○ **Note:** The **Create major incident from candidate** (*sn_major_inc_mgmt.com.snc.incident .min.major* system property creates different behaviors depending on which options are selected. When the system property is set to **Create new**, the following behaviors occur in relation to the **Action to take** values: ○ **Propose Major Incident**: The incident is proposed as a major incident candidate. After it's approved, a new major incident is created and the incident is marked as its child. ○ **Promote Major Incident**: A new incident is created and promoted to a major incident. The existing incident is marked as its child. When the system property is set to **Promote**, the following behaviors occur in relation to the **Action to take** values: ○ **Propose Major Incident**: The incident is proposed as a major incident candidate. After it's approved, a new major incident is created and the incident is marked as its child. ○ **Promote Major Incident**: The existing incident is promoted to a major incident.
Active	Option to activate the trigger rule.
Conditions	Conditions that must be met to execute the trigger rule.

4. Select **Submit**.

Working on major incident management

The section covers topics that help you with a variety of technical concepts related to major incident management such as the different ways to create a major incident, ways to reject a major incident candidate, demote a major incident, or close a major incident.

Create a major incident candidate

You can create a major incident candidate in multiple ways. After a major incident candidate is created, the major incident manager evaluates the candidate and decides whether the candidate should be promoted to a major incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: itil, sn_incident_write, or admin

About this task
A major incident manager can accept or reject a major incident candidate.

Procedure

Perform any of the following actions.

Note:

- When an incident is proposed as a major incident candidate, the Major incident **State** field in the incident form under the Major incident section is set to **Proposed**.
- When you create a new major incident from a candidate, a new incident is created and becomes the major incident. The candidate is added as the child of the major incident. To get this behavior, the incident manager needs to set the major incident management property **Create major incident from candidate** (*sn_major_inc_mgmt.com.snc.incident.mim.major_incident_creation*). A new incident is created from a candidate as a major incident. The candidate is associated with the new incident as a child.
- System automatically assigns the newly created parent major incident to a user when the On-Call Scheduling plugin (com.snc.on_call_rotation) is activated, a shift is defined for the major incident management group, and a user is available for the on-call shift. If no on-call shift exists, the major incident manager decides the user for the **Assigned to** field.

Create a major incident

Create a major incident directly or review the candidates and promote the candidates to major incidents.

Before you begin
Role required: major_incident_manager

Procedure

Perform any of the following actions.

Major incident assignment

A major incident is assigned to a group automatically at the time of proposal and promotion based on the value of the property **Major Incident Management Group (sys_id) to whom the Major Incident should be re-assigned on promotion to 'Major Incident'** (*sn_major_inc_mgmt.major_incident_management_group*). The assigned group works on the major incident and resolves it.

The incident is assigned to an individual if the On-Call Scheduling plugin (com.snc.on_call_rotation) is activated and a shift is defined for the group. The following table illustrates the different conditions under which a major incident is assigned to a group and a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment of major incident

Action	Condition	Assignment group	Assigned to
Incident is proposed as a candidate manually or based on major incident trigger rules	Assignment Group is empty	Group based on the property value	• If on-call is activated, shift is defined and a user is available on-call then the incident is assigned to the on-call user • If on-call is not activated, the **Assigned to** field remains empty
	Assignment Group is not empty	No change - incident retains the current value of the assignment group	No change - incident remains with the current value in the **Assigned to** field
Incident is manually promoted to a major incident	Assignment Group is empty	Group based on the property value	The value for the **Assigned to** field is the user who promoted the incident to a major incident
	Assignment Group is not empty	• Incident reassigned to group based on the property value • Send a notification to the original Assignment Group members about the latest incident reassignment.	• **Assigned to** value is overwritten by the user who promoted the major incident candidate • Send a notification to the user to whom the major incident was previously assigned
Major incident is created	Assignment Group is empty	Group based on the property value	The value of the **Assigned to** field is the user who has created the major incident
	Assignment Group is not empty	No change - incident retains the current value of the assignment group	No change - incident remains with the current value in the **Assigned to** field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assignment of incident communication plan and communication task

Action	Condition	Assignment group	Assigned to
Incident communication plan is created with source as major incident	Assignment Group is empty	The value for the **Assignment group** field is copied from the source incident	The value of the **Assigned to** field is copied from the source incident
	Assignment Group is not empty	No change - incident communication plan retains the current value of the assignment group	No change - incident communication plan retains the current value of the **Assigned to** field
Incident communication task is created from incident communication plan whose source is major incident	Assignment Group is empty	The value for the **Assignment group** field is copied from the incident communication plan	The value of the **Assigned to** field is copied from the incident communication plan
	Assignment Group is not empty	No change - incident communication plan retains the current value of the assignment group	No change - incident communication task retains the current value of the **Assigned to** field

Accept or reject a major incident candidate

When an incident is proposed as a major incident candidate, a major incident manager can accept or reject the candidate. The manager accepts a candidate as a major incident if the incident requires accelerated resolution.

Before you begin
Role required: major_incident_manager

Procedure

Perform any of the following actions.

Associate multiple incidents with a major incident

You can associate one or more incidents with a major incident using the Actions menu.

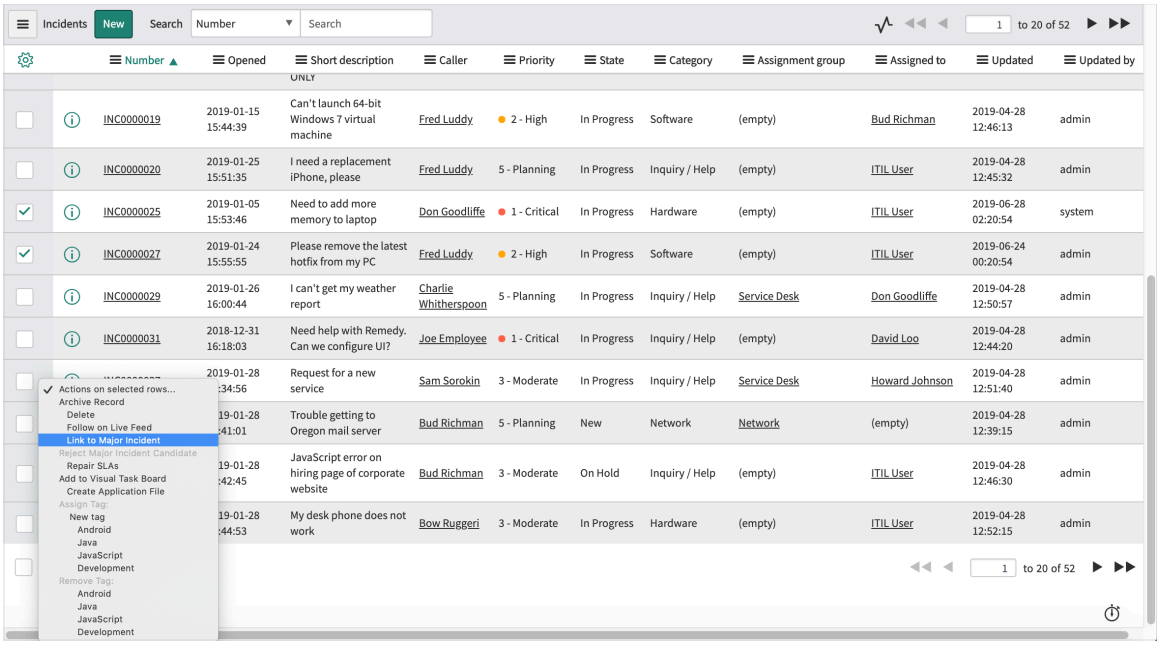
Before you begin
Role required: itil, sn_incident_write, or admin

About this task
When a major incident occurs, there are usually multiple incidents created for the same issue and there might be multiple major incident candidates created for a single issue. All the incidents for a single issue can be associated with the appropriate major incident.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Select the incidents that need to be associated with a major incident.
3. On the Actions menu, click **Link to Major Incident**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the Choose a Major Incident dialog box, select the major incident with which you want to associate the incidents.
5. Click **OK**.
   The incidents are added as a child to the major incident.

Reject multiple major incident candidates using the Actions menu

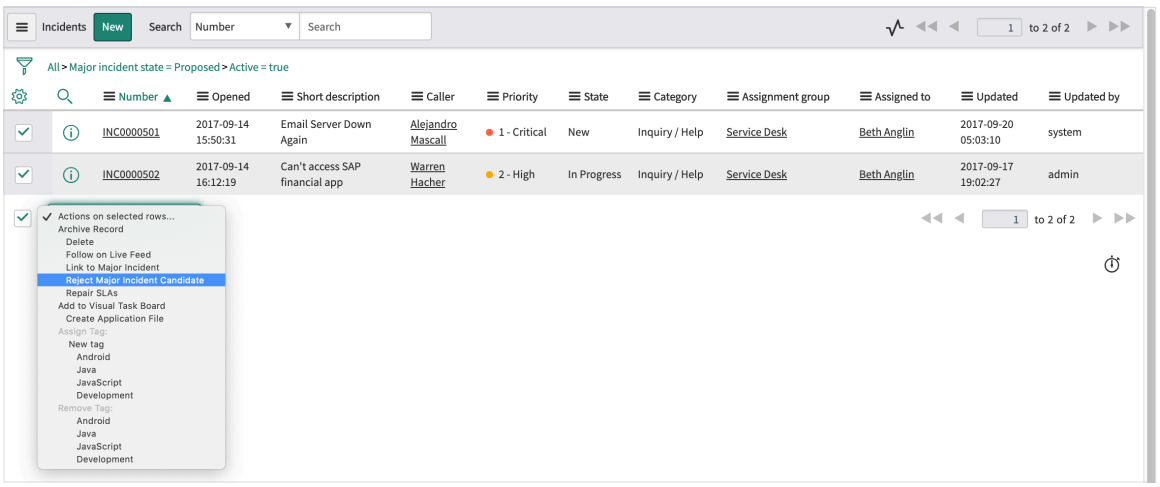
You can reject one or more major incident candidates using the Actions menu. If you decide that the candidates do not qualify to be major incidents, then you can reject multiple candidates at once and provide the rejection reason.

Before you begin

Role required: major_incident_manager

Procedure

1. Navigate to **All** > **Incident** > **Major Incidents** > **Candidates**.
2. Select the candidates that you need to reject.
3. On the Actions menu, click **Reject Major Incident Candidate**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the Rejection Reason dialog box, enter the reason why you decided not to accept the candidates as major incident.
5. Click **Reject**.
   The major incident candidates are rejected.

Demote a major incident

When an incident is incorrectly evaluated to be a major incident, you can demote the major incident even after it is accepted so that the incident can be handled as a regular incident.

Before you begin

Role required: major_incident_manager

Procedure

1. Navigate to **All** > **Major Incidents** > **Open**.
2. Open the major incident that you want to demote.
3. Click the additional actions icon and select **Demote Major Incident**.
4. Enter the reason for the demotion.
   The major incident state is set to **Canceled** but the incident state remains the same.

Close a major incident

You can close a major incident manually after validating the resolution and when the major incident is in the **Resolved** state.

Before you begin

- Role required: major_incident_manager or admin
- Major incident is in resolved state

Procedure

1. Navigate to **All** > **Major Incidents** > **Open**.
2. Open the major incident that you want to close.
3. Click **Close Incident**.

Note:

- If you cancel an incident and the major incident state is in **Proposed** or **Accepted** state, the major incident state changes to **Canceled**.
- The incident auto-closure property **Enable auto closure of incidents based on Resolution date. Setting this to 'No' will make auto closure to run based on the Updated date** does not close any incident record that is accepted as a major incident. Users with the major_incident_manager or admin role must close a major incident manually, after validating the resolution and when the major incident is in the **Resolved** state.
- If an incident was promoted as a major incident, then an ESS user cannot resolve, close, or reopen the incident.

View major incident information on the Incident form

When an incident enters the major incident life cycle, the **Major Incident** and the **Post Incident Report** tab appears on the incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: itil, sn_incident_read, or admin

Incident is in the major incident life cycle.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Select the incident which is in the major incident life cycle.
3. Click the **Major Incident** tab.

Field	Description
Major incident state	A major incident state can be one of the following: ○ **Proposed**: The initial state when a major incident candidate is created or proposed. ○ **Accepted**: The state when a major incident is directly created by a major incident manager or when a candidate is promoted to a major incident by a major incident manager. ○ **Rejected**: The major incident candidate is rejected by a major incident manager. ○ **Canceled**: The major incident is demote by a major incident manager.
Proposed by	The user who proposed the incident as a major incident candidate.
Proposed	Date and time when the incident was proposed as a major incident candidate.
Promoted by	The user who promoted the incident to a major incident.
Promoted	Date and time when the incident was promoted to a major incident.
Business impact	The business impact of the issue identified in the major incident.
Probable cause	The probable cause of the issue identified in the major incident.

4. Click the **Post Incident Report** tab.
   If you have already filled the post incident report information in the major incident workbench, the same information appears in the following fields:

Field	Description
Overview	Summary of the incident.
Findings	Information on what caused the major incident and any lessons learnt in the process.

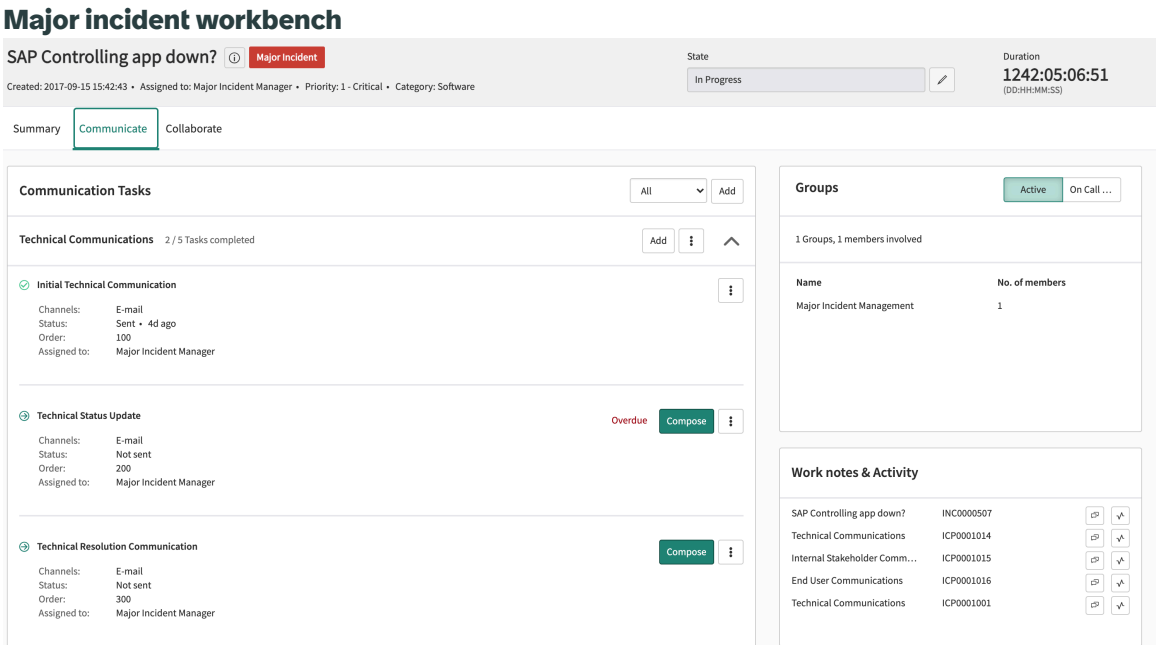
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Timeline	Information of all the activity feeds not only of the incident but also of the incident communication plan and incident communication tasks related to the incident.

Major incident workbench

The major incident workbench is a single pane view designed for major incident managers, communication managers, and resolver groups. The workbench helps to manage major incidents by aggregating and providing actionable information.

To navigate to the major incident workbench, open a major incident or a major incident candidate, and click **View Workbench** on the form header.



Note:
Groups and number of members involved in the groups widget are populated from the **Assignment group** and the **Assigned to** fields of incident, incident communication plan, incident task, as well as the members involved in an active conference call.

Header components

- From the workbench, to navigate back to the incident form, click **View Form** that appears on the header of the workbench.
- If an incident is not yet in the **Resolved** state, then the header displays the **Resolve** button. To resolve an incident, click **Resolve**.
- When an incident is not yet accepted as a major incident, then the workbench displays a choice list on the header. The list displays options to promote the incident to a major incident or to reject the incident.
- Use the chat icon ( ) on the header to initiate a chat on the incident level. The chat is a record feed — whatever you write in the chat appears in the activity stream.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You can click to change the state of the incident.
- Duration is an active timer that tracks the time since the creation of the incident. The timer stops when the incident is resolved.

Major incident workbench UI elements

The major incident workbench provides UI elements which display the summary of tasks, progress of communication plan, conferencing information, and a report on the cause and resolution of the major incident.

The major incident workbench has the following UI elements: **Summary**, **Communicate**, **Collaborate**, and **Post Incident Report**.

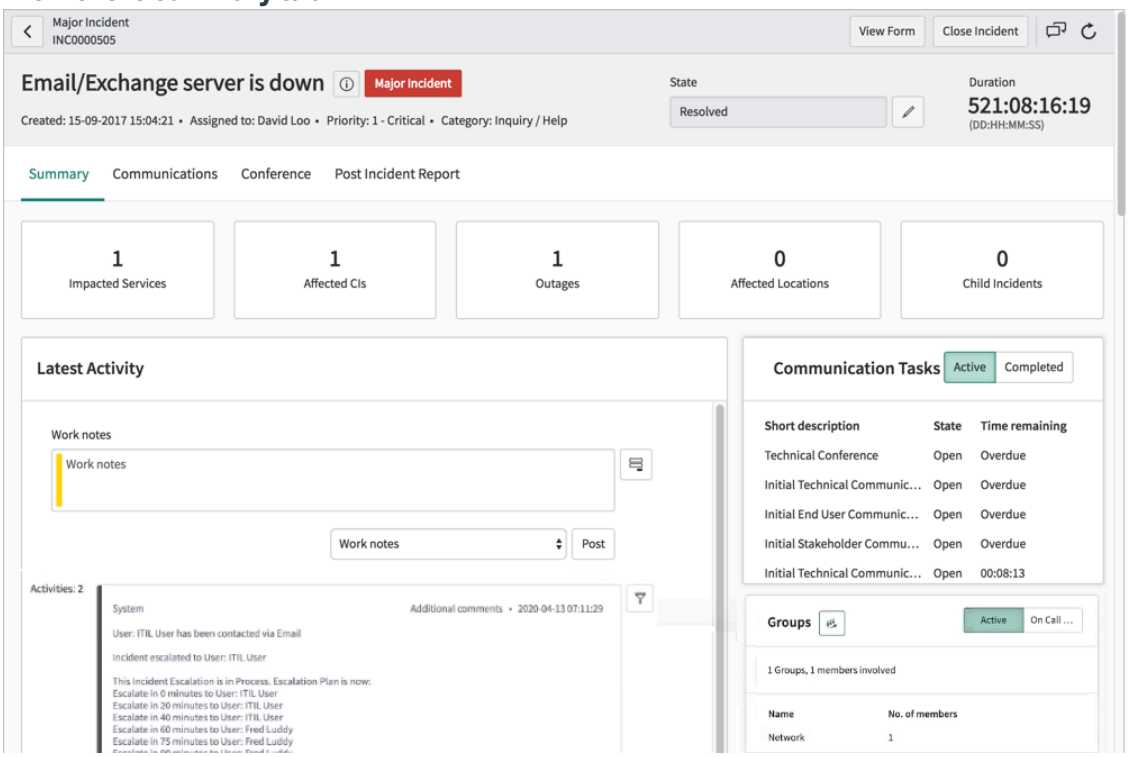
Note:
You need to activate the Notify plugin (com.snc.notify) for the **Collaborate** tab to appear. The **Post Incident Report** tab is visible only when the incident state is either **Resolved** or **Closed**.

Major Incident workbench — Summary tab

The **Summary** tab provides a unified view of information in the form of a card layout. The information on impacted services, affected CIs, active outages, locations that are impacted, and child incidents helps to keep you informed about related records associated with an incident.

Summary tab

View of the summary tab



You can add, create, or edit each of the components. You can also view, post, or filter the latest activity on the major incident.

The tab also provides a quantitative summary of the active and completed tasks, as well as users or groups who are involved in resolving the major incident. The communication tasks are sorted in ascending order based on the order value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Time remaining** column provides information regarding the time when the communication task is due.

- If you do not perform the communication task within the set time, the value changes to **Overdue**.
- If you activate the On-call Scheduling plugin (com.snc.on_call_rotation): The user who is on-call for the respective group and the group name appear in the summary.

The Groups section displays On-Call information, including the On-Call Escalation Tracking icon ( ) that indicates the active status of the escalation. Green indicates an active escalation, and black indicates a finished escalation. Click the icon to view the On-Call Escalation Tracking pop-up.

Activate the Event Management plugin (com.glideapp.itom.snac) to add an **Alert** card under the **Summary** tab that keeps you up-to-date on the number of alerts for each incident. The count is the total of all primary and secondary alerts for the incident.

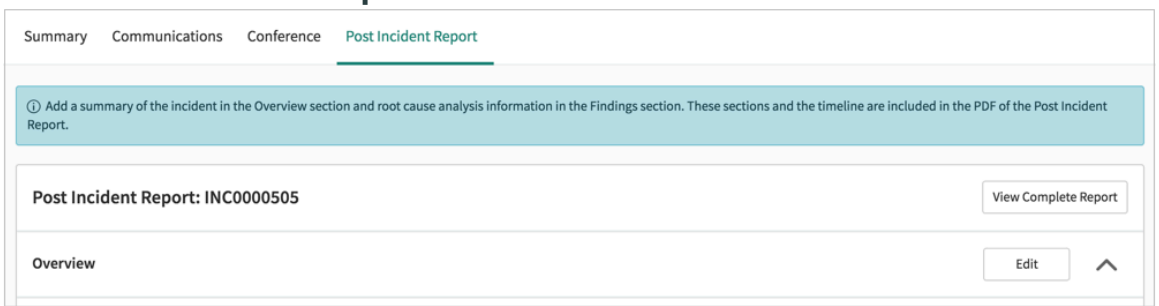
Major Incident workbench — the Post Incident Report tab

The **Post Incident Report** tab helps you to understand the cause of the major incident, and the actions taken by the teams to resolve the incident.

The teams can assess the incident response and resolution process and determine follow-up action items. The post incident report is required to record the actions performed, the reasons for doing them, and findings.

Note:
The major incident manager can edit a report when the incident is in the **Resolved** state.

View of the Post Incident Report tab



The post incident report includes the following sections where a major incident manager can provide required information:

- **Overview**: Summary of the incident.
- **Findings**: Information on what caused the major incident and any lessons learned in the process.
- **Resolution**: Information on the resolution steps taken to resolve the issue. The major incident manager can also add or edit any related Problem or Change information by clicking **Add** or **Manage** respectively.
- **Timeline**: Information of all the activity feeds, not only of the incident but also of the incident communication plan and incident communication tasks related to the incident. You can update the timeline with the latest activity by clicking **Regenerate Timeline**.

Note:
The information that you provide for **Overview**, **Findings**, and **Timeline** gets updated in the Post Incident Report section on the Incident form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you activate the Continual Improvement Management (CIM) plugin (com.sn_cim), the Related Improvement Records section is displayed in the report. This section displays the Inbound CIM Integrations records.

When you click **View Complete Report**, all the information entered by the major incident manager is compiled together and you can download the report in the .PDF format by clicking **Download Report PDF**.

The following links appear in the Incident form under the Related Links section:

- **Regenerate PIR Timeline**: This link appears when incident is in the **Resolved** state and the user has the major_incident_manager role.
- **Preview PIR**: This link appears when incident is in the **Resolved** or **Closed** state and the user has the itil role.

Note:
On the downloaded report, under **Incident Response Timeline**, the time displayed in the timing type **Time to Identify** is calculated in the following ways:

- If you propose the incident as a major incident: The time indicates the time from creation of the first related alert for this incident or creation of the incident (in case there is no alert or the Event Management plugin is inactive), whichever occurs first, until the time the incident is first proposed as a major incident.
- If you create a major incident directly: The time indicates the time from creation of the first related alert for this incident or creation of the incident (in case there is no alert or the Event Management plugin is inactive), whichever occurs first, until the time the incident is promoted as a major incident.

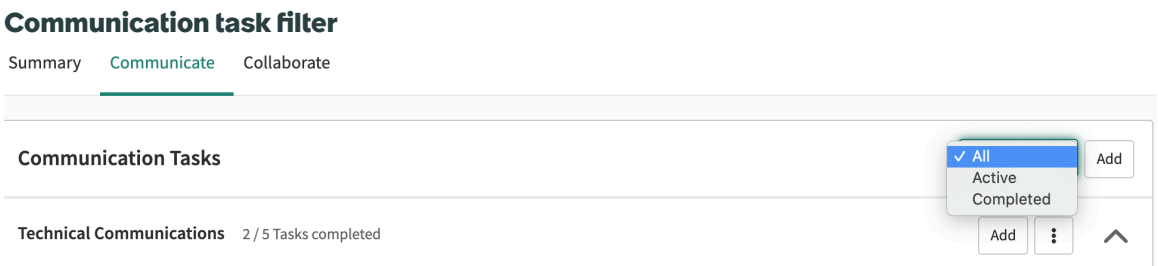
Associate a new post incident report

The Communicate tab in the Major Incident workbench

The **Communicate** tab helps you understand the progress of a communication plan and its related tasks.

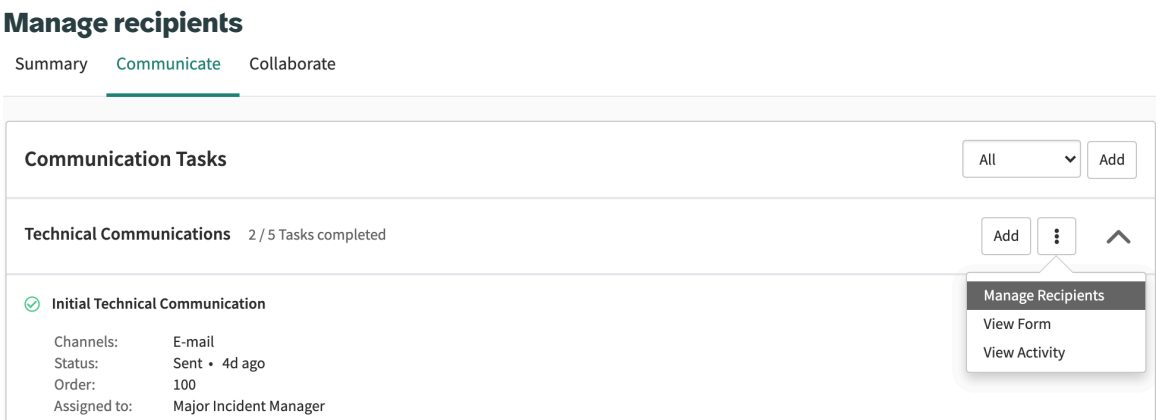
If there are multiple communication tasks associated with a communication plan, all the tasks appear under the respective communication plan.



You can filter the communication task to view all tasks, active tasks, or completed tasks. You can also add a new communication plan by clicking **Add**. You can create a communication task for an existing plan by clicking **Add Task**. For more information, see Add communication plan from the major incident workbench. If you want to add or remove recipients from a particular plan after the plan is saved, click **Manage Recipients**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you create a communication task for sending an email on the Major Incident Management Workbench and select a recipient list, the recipient list is added instead of individual users. The list of users in the recipient list is calculated by the system while processing the email request, thus improving the system performance. Also, you can add users, groups, and email addresses as required in the Recipients section. Activate this feature by selecting the **Property to toggle support for Recipient List on Email Client, on Communication Tasks** (*sn_comm_management.email_client_recipient_items_enabled*) option in the Major Incident Management Properties. You can create a recipient list using a script to retrieve a custom list of users or include a pre-defined list of users.



The following actions can be performed on a given communication task:

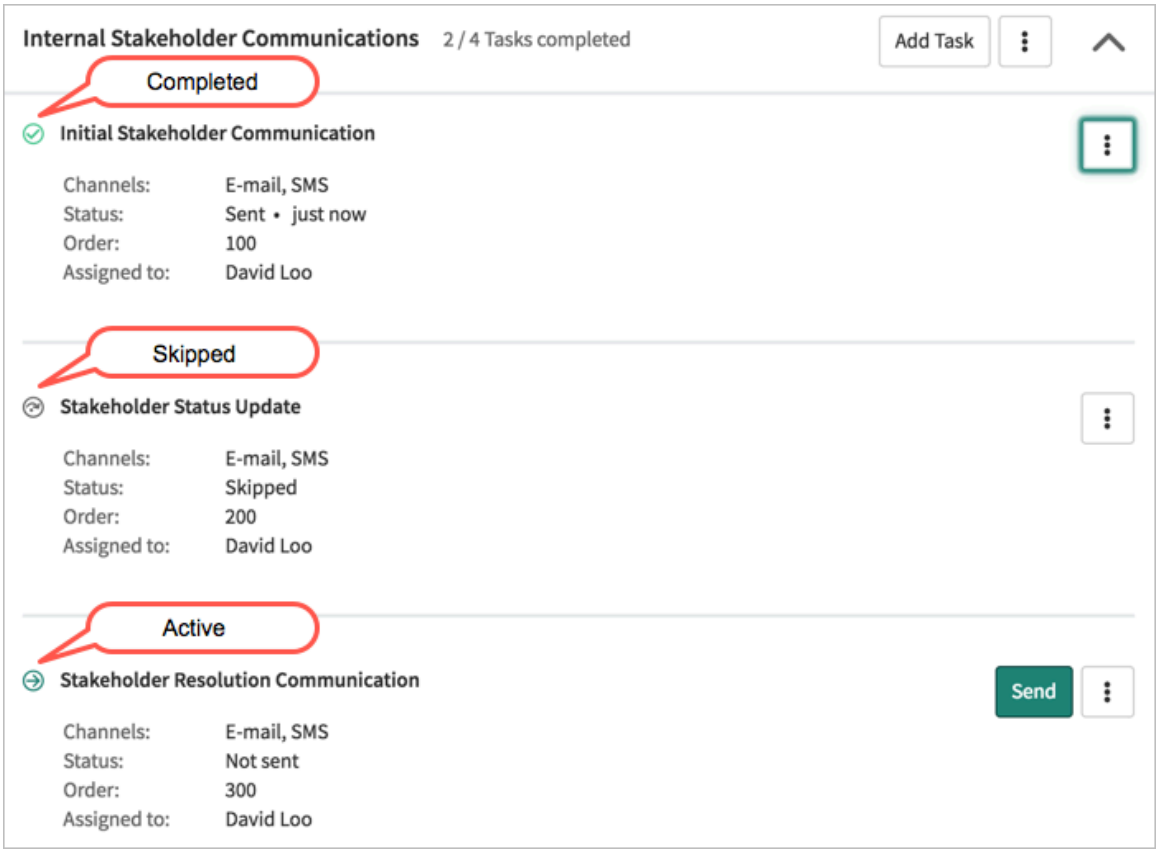
- **Close Task**: If the task is performed at least once, closes the communication task and changes the state to Complete. Otherwise, the state changes the state to Skipped.
- **Snooze**: Available only for recurring communication task. Enables the user to skip the communication task once and the due-in timer is refreshed.
- **View Form**: For each task in the plan, you can navigate back to the form.
- **View Activity**: Enables you to view activity history and post your work notes or additional comments for a communication task.

You can also view the due time of upcoming tasks and the overdue time in case the task isn't completed within the expected time.

To send a notification, click **Compose**. If the notification has to be send only once, then after sending the notification, the status of the task changes to Complete. If the task is recurring, the status of the task changes to Open. After a recurring communication task is performed, the status of the communication task changes to **Sent** followed by the number of times the recurring communication task is performed until that time. For example, Sent(2x) means that the communication task is performed twice.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Communication task state



Icons to the left of the Communication Task name represent the state of the communication task such as completed, skipped, or active.

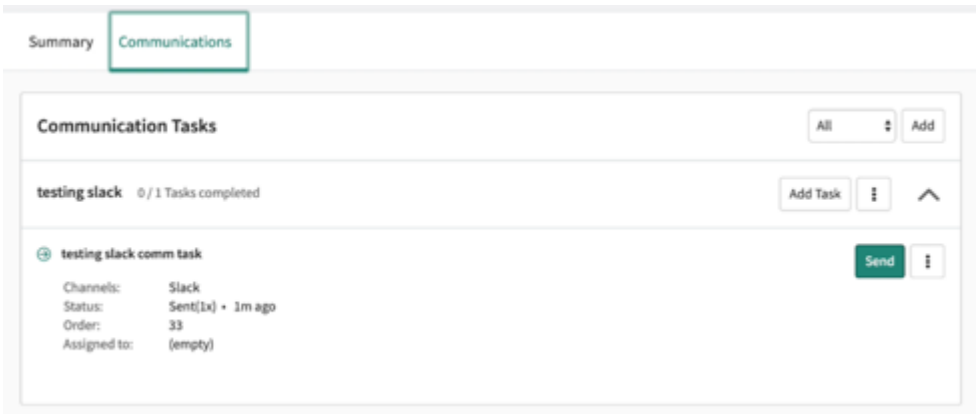
Under the Work Notes & Activity section, you can initiate a chat at the incident or incident communication plan level. You can also view the activity stream for that record.

Messaging users through Slack

For Slack functionality, install Collaboration services from the ServiceNow Store.

When you add Slack as a communication channel, it appears as follows:

View of the slack communication channel



Click **Compose** to convey the Slack message to the contacts that you've already mentioned in the communication contact while defining the communication plan. The selected contacts will

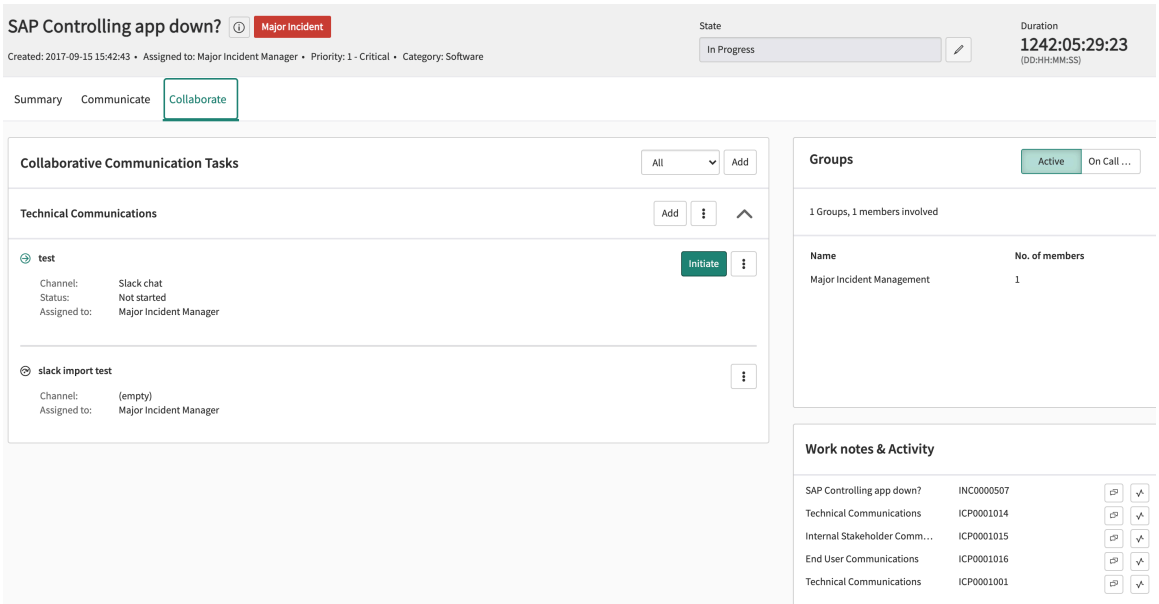
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

receive a direct message from the *Slack* bot. You can perform the communication task actions such as **Closed Task**, **Snooze**, **View Form**, and **View Activity**.

Major Incident workbench — the Collaborate tab

The **Collaborate** tab helps you to view information about communication tasks that have conference as their communication channel. It also allows you to manage the participants in a conference call.

View of the Collaborate tab



Like the **Summary** tab, you can add a new communication plan by clicking **Add**. You can create communication task for an existing plan by clicking **Add Call**. For more information, see Add-communication-plan-from-mim-workbench. If you want to add or remove recipients from a particular plan after the plan is saved, click **Manage Participants**.

To initiate a conference call, click **Initiate**. If the communication task is a one-time task, then after the call is ended, the status of the task changes to **Complete**. If task is recurring, the status of the task changes to **Open** and it displays the number of times the conference call is initiated.

Note:
When you add a user group to the conference call, the group itself is added to the call, and the escalation hierarchy is automatically followed once you start the call. Set the *com.snc.iam.conference_call_follow_on_call_escalation* property to true. For more information about the property, see System properties for On-Call Scheduling.

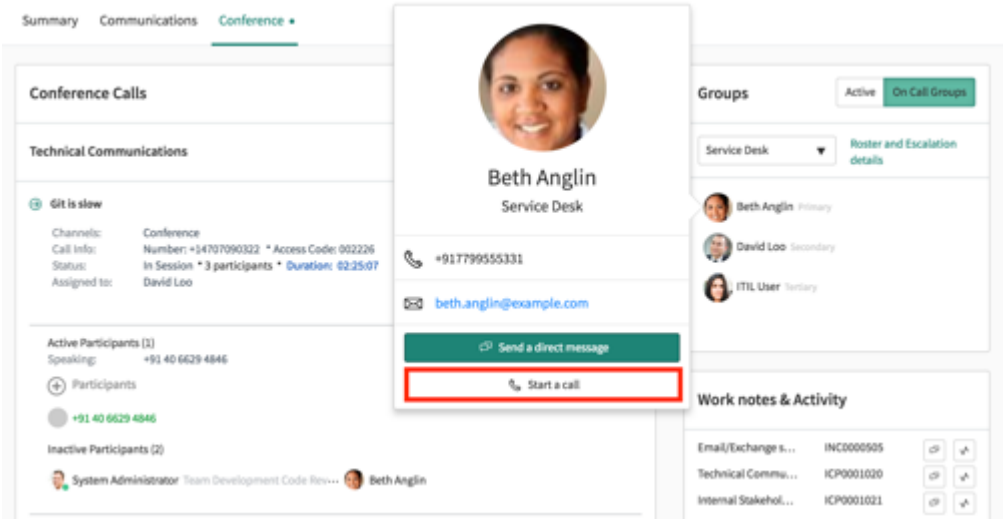
Under each task, the Active participant section displays the active participants and the Inactive participant section displays the inactive participants.

If the call is in progress, the itil user, who has access to the workbench, can join the conference call by clicking **Join Call**. The participants can also add another user to an ongoing conference call by clicking **+ Participants**. The conference leader can end the conference call by clicking **End Call**. The conference leader can mute, unmute, or kick an active participant by hovering over the active participant and clicking .

Under the Work Notes & Activity section, you can send connect message at incident or incident communication plan level. You can also view the activity stream.

To initiate a call directly to the group members, click **Start a call**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To start a call, populate the *sn_major_inc_mgmt.notify_webrtc_number* property with a valid notify number that has voice capability. For user who is already in an active conference call, **Start a call** is disabled. You can mute or unmute all the participants using the **Mute All** and **Unmute All** options. If you activate the Notify - Twilio Direct Driver plugin (com.snc.notify.twilio_direct), the active participants are highlighted in green.

For information on how to send a Microsoft Teams notification from major incident workbench, see Send a notification from Major incident management workbench.

For information on process flow for slack communication, see Process flow for Slack communication.

For information on how to add a collaborative communication task, see Add a collaborative communication task.

Associate a new post incident report

Create your own post incident report and associate the UI page with the **View Complete Report** button under the **Post Incident Report** tab. Using the customized report, you can add information that is specific to your organization.

Before you begin

Role required: itil, major_incident_manager, or admin

About this task

For associating the **View Complete Report** button with your customized post incident report page, set the value of the **PIR export ui page url** major incident property to the new UI page.

Procedure

1. Navigate to **All** > **System UI** > **UI Pages** and click **New**.
2. Create a UI page.
   For information on how to create a UI page, refer UI pages.
3. Navigate to **Incident** > **Major Incident Properties**.
4. In the **PIR export ui page url** (*sn_major_inc_mgmt.pir_export_pdf_ui_page*) property, enter the link of the new UI page.
5. Click **Save**.
   When you click the **View Complete Report** button, the new UI page opens.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add communication plan from the major incident workbench

You can create a new communication plan or add a new communication task to an existing communication plan from the workbench. This UI action is helpful when you do not have an existing well-defined communication plan in the system.

Before you begin

Role required: major_incident_manager

Procedure

1. Navigate to Major incident workbench.
2. Click the **Communications** tab and then click **Add** that appears in Communication Tasks section to display the Adhoc Communication pop-up window.
3. On the form, fill in the fields.

Field	Description
Communication Plan	List to select a new communication plan or to select an existing plan and add communication tasks to the plan.
Plan Short description	Brief description of what the communication plan is all about.
Task Short description	Brief description of what the communication task is all about.
Channels	Check box to select email, SMS, slack, or conference as mode of communication for the plan.
Frequency	Frequency at which a specific task needs to be executed. A task can be executed only once or on specific durations.
Due in (Minutes)	Time span when the task must be executed after the task initiates. For recurring tasks, it also indicates the time span after which the task must repeat.

Add similar incidents from major incident workbench

Add similar incidents to a major incident so that the support teams can work on the parent record for a coordinated response process.

Before you begin

Role required: itil, major_incident_manager, communication_manager, incident_manager, or admin

- Activate the Predictive Intelligence plugin (com.glide.platform_ml).
  - Configure Predictive Intelligence and train the solution definition with the name *ml_sn_global_similar_incidents_mim*. For more information on how to train a solution definition, refer to Create and train a similarity solution.
- Ensure that there is an active ML solution at **Predictive Intelligence** > **Similarity** > **Solutions** with the solution name *ml_sn_global_similar_incidents_mim*.

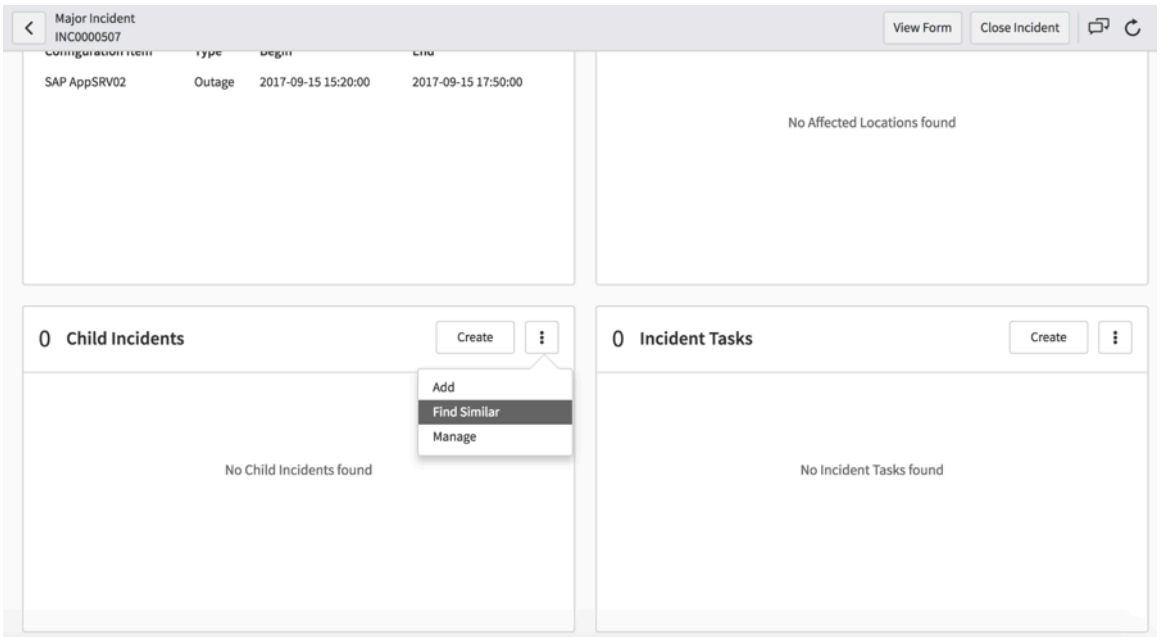
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to Major incident workbench.
2. Click the **Summary** tab.
3. In the Child Incidents section, click ⋮ and then click **Find Similar**.



4. From the Add Similar Incidents dialog box, select the similar incidents that you want to relate to the major incident and then click **Add Selected**.
   The similar child incidents appear under the Child Incidents section.

Access on-call escalation path from major incident workbench

Access on-call roster and escalation details from major incident workbench to reach out to a support group.

Before you begin

Role required: itil, sn_incident_read, sn_incident_write, major_incident_manager, communication_manager, incident_manager, or admin

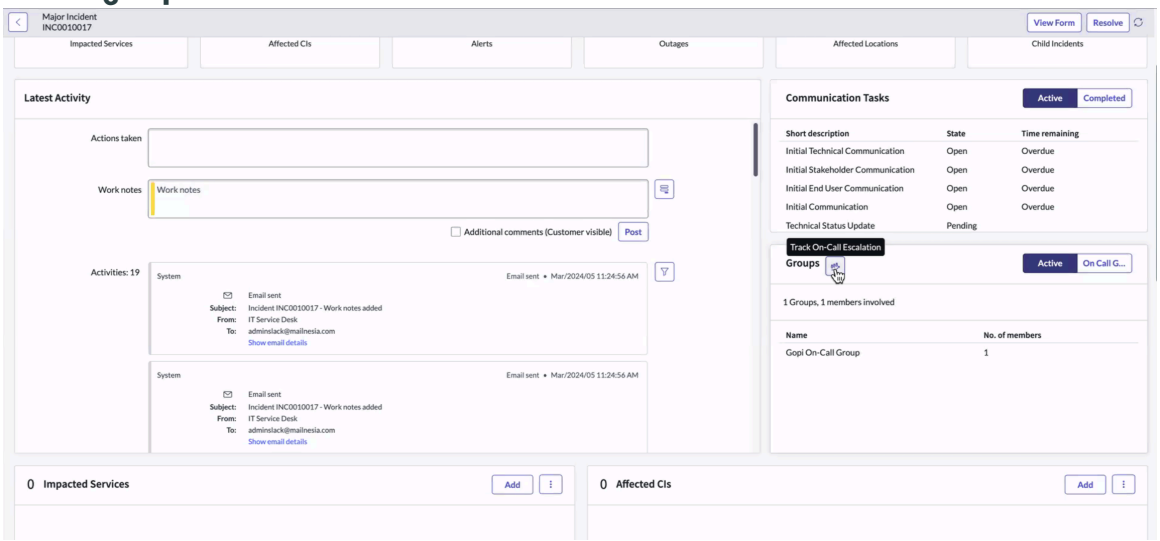
Activate the On-Call Scheduling plugin (com.snc.on_call_rotation).

Procedure

1. Navigate to Major incident workbench.
2. Click the **Communications** tab.
3. Under the **Groups** section, click **On Call Groups**.
4. From the list, select a group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On-call groups



5. Select **Track On-Call Escalation**.
6. In the escalation path section, select **Escalation**.

Result
You can access the on-call escalation information.

Legacy: Major incident overview dashboard

Major Incident Overview module provides two versions of the Performance Analytics (PA) Dashboard to review major incident information at a glance.

> **Important:**
>
> Starting in Xanadu release, the Major incident overview dashboard is deprecated. Users can use Major incident dashboard to view the process and communication related metrics for Open and Closed major incidents.

Users with itil, sn_incident_write, major_incident_manager or communication_manager role can access the dashboard.

The two versions of the Performance Analytics (PA) Dashboard are normal and premium. You must activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim) to view the normal dashboard. To access the premium version of Major Incident Overview dashboard, activate Performance Analytics – Content Pack for Major Incident Management (com.snc.pa.incident.mim).

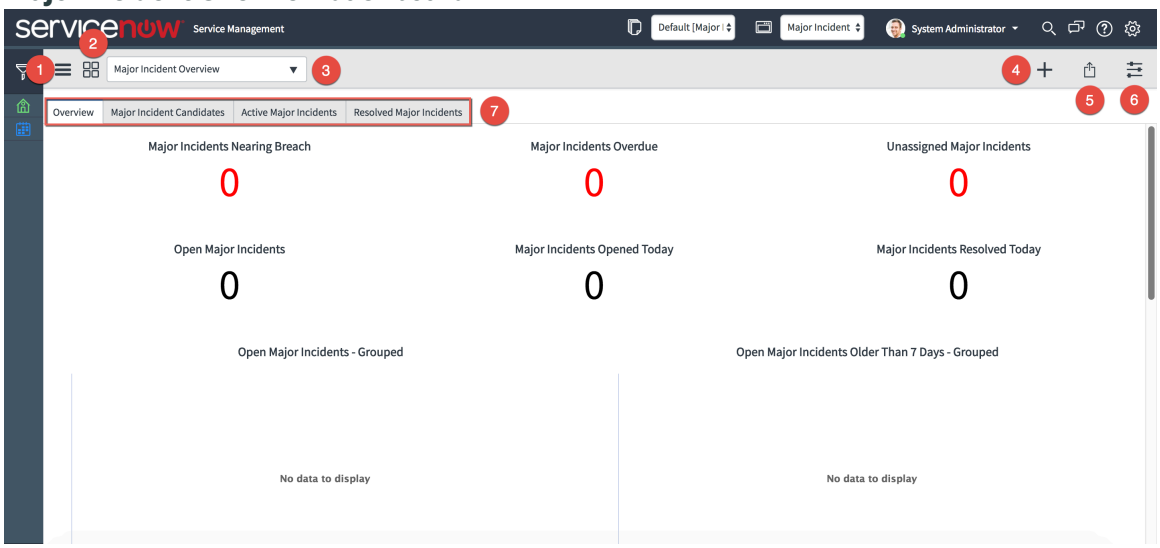
You can navigate to the dashboard in the following ways:

- **Incident** > **Major Incidents** > **Overview**
- **Self – Service** > **Dashboard** > **Major Incident Overview**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Major incident overview

Major Incident Overview dashboard



Major Incident Overview module provides information on the following content:

#	UI component	Description
1	Dashboard controls	Provides options to create, duplicate, or delete a dashboard. You can copy the dashboard URL or duplicate the dashboard. In addition, you can add the dashboard in your favorite list, create a tab, or reset filters in the dashboard.
2	Dashboard overview	Takes you to the UI page where you view the recently accessed dashboard, dashboards owned or shared by you, or all the dashboards in the system. To create a new dashboard, click **New**.
3	Dashboard choice list	Provides options to select between different dashboards in the system.
4	Add widgets	Provides option to add widgets. You can drag to move or resize the widget on the dashboard.
5	Sharing	Provides option to specify groups, users, and roles for the dashboard.
6	Configuration	Provides the configuration pane to select a layout to snap the widgets against or to modify a layout as required.
7	Tabs	• **Major Incidents Nearing Breach**: Number of active major incidents where the Major incident state is **Accepted** and the response or resolution SLA has reached 75% of the allotted time. • **Major Incidents Overdue**: Number of active major incidents where the Major incident state is **Accepted** and the response or resolution SLA has breached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

#	UI component	Description
		• **Unassigned Major Incidents**: Number of active major incidents where **Assigned to** is empty. • **Open Major Incidents**: Major incidents which are open and has major incident state as **Accepted**. • **Major Incidents Opened Today**: Major incident state is **Accepted** and the major incident is created on the current day. **Note:** Major incidents opened for that day includes both active and inactive incidents. • **Major Incidents Resolved Today**: Major incidents that are resolved on the current day and have the state as **Resolved**. • **Open Major Incidents – Grouped**: You can filter these incidents based on **Group by** and **Stacked by**. • **Open Major Incidents Older Than 7 Days – Grouped**: You can filter these incidents based on **Group by** and **Stacked by**. • **Major Incidents by Priority and State** • **Major Incidents by Priority and State Older than 7 Days** • **Major Incidents Opened per Week** • **Major Incidents Closed per Week**

Major Incident Overview – Premium

Major Incident Overview – Premium provides the following additional functions:

- **Process KPIs**: Provides information on **Active Major Incidents**, **Number of resolved major incidents**, **Average resolution time of Major Incidents**, and **New Major Incidents Vs Resolved**.
- Interactive filters: Helps to filter incidents based on category, priority, assignment group, and state.

- Major incident workbench

Reporting incidents

Service desk and other IT managers can use dashboards and reports to monitor and track incident status and service levels.

Incident Overview

The **Incident** > **Overview** dashboard provides a quick glance at the current state of open incidents. At the top, single score widgets enumerate the open incident statuses, such as critical incidents, unassigned incidents, and overdue incidents. Charts in the dashboard group incidents by factors such as priority and state. The incident overview is fully interactive and configurable.

Incident reports

Various incident reports are available in the base system, and you can modify the existing reports or create new ones. Navigate to **Reports** > **View / Run** and enter `incident` in the search box to view all incident reports. Base system reports include the following:

- Basic bar or pie chart reports, such as incidents by assignment group, location, priority, or state. These reports help you analyze a specific data point, for example, whether enough staff is allocated to an assignment group.
- Time series reports, such as **Incident Trend by Configuration Item**. This report lets you analyze closed incidents by configuration item (CI) to identify potential problems.
- Multidimensional reports, such as **Incidents by Priority and State older than 30 Days**. This report can help you identify gaps in service levels. For example, if a high number of low-priority incidents are still in **New** state after being open more than 30 days.

Incident metric definition

A metric measures and evaluates the effectiveness of IT service management processes. The service desk can improve the incident management process using information gathered

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

within the platform. You can activate the Metric Definition plugin (com.glide.metrics) and define the metrics to monitor within the system. With these metrics, and the information within the database, it is possible to generate reports that can be added to dashboards or automatically generated and distributed.

Using this information, it is possible to refine automatic rules such as the assignment rules, service level agreements, or inactivity monitors to better suit the unique environment of the service desk. Unnecessary incidents can be avoided by encouraging users to consult the knowledge base before creating an incident. The related search results function in the Incident form assists with this strategy.

Complimentary Performance Analytics for Incident Management

Complimentary Performance Analytics for Incident Management and aggregates data over time, and is enabled by default for Incident Management. Complimentary Performance Analytics for Incident Management provides an Incident Management dashboard with 15 indicators to help you assess organizational performance. For more information, see Performance Analytics for Incident Management.

If you subscribe to Performance Analytics, additional Platform Analytics Solutions are available for Incident Management. The Platform Analytics Solution for Incident Management contains preconfigured dashboards.

A subscription to Performance Analytics also gives you access to In-form analytics. In-form analytics integrate performance insights into Incident records so that users can access important metrics in context and make better decisions. For more information, see Text-To-Display.

Related topics

- Creating reports

Legacy: Incident Management Platform Analytics Solutions

Platform Analytics Solutions and in-form analytics contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Important:

Starting in Xanadu release, the Incident Management Platform Analytics Solutions dashboards are deprecated. Users can use Incident management dashboard to view the actionable data visualizations that help in improving the business processes and practices.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

The Platform Analytics Solution for Incident Management is available by default as part of Complimentary Performance Analytics for Incident Management.

End user and roles

End User	Description	Required role
IT Agent	Views, opens, updates, tracks, and closes incidents and tasks for managing customer issues.	itil
IT Agent Admin	Can perform all the activities of an IT agent. In addition, the admin can also modify the data and layout.	itil_admin

Data visualizations

The dashboard includes the following visualizations:

Title	Type	Description
Critical Tasks	Single score (42)	Total number of open critical task records for which **Priority** is set to **1**.
Unassigned Tasks	Single score (42)	Total number of open tasks that are still not assigned.
Tasks assigned to me	Single score (42)	Total number of tasks assigned to the logged-user of the dashboard.
Active Incidents older than 7 days	Single score (42)	Total number of active incidents logged before seven days.
Incident SLA Breached	Single score (42)	Total number of incidents that exceed its SLA.
Incident SLAs at Risk	Single score (42)	Total number of active incidents that have not yet exceeded an SLA but have elapsed 75% of the duration of the SLA.
My Groups Work	List	Outstanding work load (tasks) of the logged-in user's group.
My Work	List	The logged-in user's outstanding work load (tasks).

Legacy: Incident Overview dashboard

Use this dashboard to view the status of the incidents for planning, prioritizing, and managing customer issues.

Important:

Starting in Xanadu release, the Incident Overview dashboard is deprecated. Users can use Incident management dashboard to view the status of the incidents for planning, prioritizing, and managing customer issues.

Indicators

Number of open incidents

Daily count of the number of incidents that do not have a resolution date. This indicator is used as the basis of several other indicators on this dashboard.

Number of open incidents not updated in last 5 days

Daily count of the number of incidents last updated more than five days ago.

Number of open incidents not updated in last 30 days

Daily count of the number of incidents last updated more than 30 days ago.

Number of new incidents

Daily count of the number of incidents opened 'today.'

Number of resolved incidents

Daily count of indicators with State = Resolved.

Incident Backlog Growth

Tracks the increase or decrease in open incidents. The score is calculated according to the formula [[Number of new incidents]] - [[Number of resolved incidents]].

Average age of open incidents

The average age in days in which an incident has been open. The score is calculated according to the formula [[Summed age of open incidents]]/([[Number of open incidents]]*24).

% of new critical incidents

The percentage of new incidents filtered on the Priority breakdown with the breakdown element 1 - Critical. The score is calculated according to the formula ([[Number of new incidents > Priority = 1 - Critical]] / [[Number of new incidents]]) * 100.

Average resolution time of resolved incidents

The average number of days it takes to resolve an incident, provided it is resolved. The score is calculated according to the formula [[Summed duration of resolved incidents]] / ([[Number of resolved incidents]] * 24).

The following indicators are not shown directly on the dashboard but are used in calculating formulas:

- Summed age of open incidents
- Summed duration of resolved incidents

End user and roles

End user	Description	Required role
IT Agent	Views the assigned work and group work, reports, and prioritize workload	• itil • sn_incident_read • pa_contributor • pa_viewer
IT Manager	Views the group work and reports and also can edit the required data and dashboard layout	• itil • sn_incident_read • pa_contributor • pa_viewer • pa_admin • pa_power_user

Indicators

Number of open incidents

Daily count of the number of incidents that do not have a resolution date. This indicator is used as the basis of several other indicators on this dashboard.

Number of new incidents

Daily count of the number of incidents opened 'today.'

Number of closed incidents

Daily count of indicators with State = Closed.

Number of resolved incidents

Daily count of indicators with State = Resolved.

Average age of open incidents

The average age in days in which an incident has been open. The score is calculated according to the formula [[Summed age of open incidents]]/([[Number of open incidents]]*24).

Average reassignment of open incidents

The average number of times currently open incidents have been reassigned. This indicator is shown as 'Average re-assignment times' in the Process by State tab. The score is calculated according to the formula [[Summed re-assignment of open incidents]] / [[Number of open incidents]].

Average age of last update of open incidents

How long on average it has been since the last update to one of the currently open incidents, in days. The score is calculated according to the formula [[Summed age of last update of open incidents]] / ([[Number of open incidents]] * 24)

% of incidents not updated in last 5 days

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The percentage of currently open incidents that have not been updated for the last five days. The score is calculated according to the formula ([[Number of open incidents not updated in last 5 days]] / [[Number of open incidents]]) * 100

% of incidents not updated in last 30 days

The percentage of currently open incidents that have not been updated for the last 30 days. The score is calculated according to the formula ([[Number of open incidents not updated in last 30 days]] / [[Number of open incidents]]) * 100

% of new critical incidents

The percentage of new incidents filtered on the Priority breakdown with the breakdown element 1 - Critical. The score is calculated according to the formula ([[Number of new incidents > Priority = 1 - Critical]] / [[Number of new incidents]]) * 100.

Average close time of incidents

The average amount of time in days it takes to close an incident. The score is calculated according to the formula [[Summed duration of closed incidents]] / ([[Number of closed incidents]] / 24)

% of incidents resolved without reassigning

The percentage of incidents with a State of Resolved that were never reassigned from the first assignment group. The score is calculated according to the formula [[Number of resolved incidents by first assigned group]] / [[Number of resolved incidents]] * 100.

% of incidents closed by self-service

The percentage of incidents with State = Closed and Close code = Closed/ Resolved by Caller. The score is calculated according to the formula [[Number of incidents closed by self-service]] / [[Number of closed incidents]] * 100.

% of open incidents reassigned at least once

The percentage of incidents that are open and that have been transferred at least once. The score is calculated according to the formula [[Number of reassigned open incidents]] / [[Number of open incidents]] * 100

% of incidents resolved same day opened

The percentage of incidents with State = Resolved where the day in the Resolved field is the same as the day in the Opened field. The score is calculated according to the formula [[Number of incidents resolved on the same day opened]] / [[Number of resolved incidents]] * 100.

% of incidents not solved

The percentage of closed incidents where Close code = Not Solved (Not Reproducible) or Not Solved (Too Costly). The score is calculated according to the formula [[Number of incidents not solved]] / [[Number of closed incidents]] * 100.

The following indicators are not shown directly on the dashboard but are used in calculating formulas:

- Summed age of open incidents
- Summed re-assignment of open incidents
- Summed age of last update of open incidents
- Number of open incidents not updated in last 5 days
- Number of open incidents not updated in last 30 days
- Summed duration of closed incidents

Indicators

Number of open incidents

Daily count of the number of incidents that do not have a resolution date. This indicator is used as the basis of several other indicators on this dashboard.

Average age of open incidents

The average age in days in which an incident has been open. The score is calculated according to the formula [[Summed age of open incidents]]/([[Number of open incidents]]*24).

Average reassignment of open incidents

The average number of times currently open incidents have been reassigned. This indicator is shown as 'Average re-assignment times' in the Process by State tab. The score is calculated according to the formula [[Summed re-assignment of open incidents]] / [[Number of open incidents]].

Average age of last update of open incidents

Legacy: Incident SLA Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Important:

Starting in Xanadu release, the Incident SLA Management Platform Analytics Solutions dashboards are deprecated. Users can use Incident management dashboard to view the actionable data visualizations that help in improving the business processes and practices.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

To enable the solution for Incident SLA Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Incident SLA Management. The guided setup takes you through the entire setup and configuration process.

The dashboards in this content pack are inactive when installed. Complete configuration and run data collection jobs before you activate these dashboards. You can activate dashboards in Dashboard Properties, accessible from the context menu. You have to assign an owner to the dashboard to activate it. For more information about configuring Platform Analytics Solutions, see Configure Platform Analytics Solutions.

Indicators

Number of open and overdue incidents

The number of open incidents with the following characteristics:

- Related to an SLA task of type 'SLA' (contract_sla.type)
- Not in stage 'Cancelled' (task_sla.stage)
- The amount of time taken to work on the task is over the SLA limit, determined by having an elapsed percentage (task_sla.percentage) value more than 100%.

Number of open incidents that should be resolved in time

The number of open incidents with the following characteristics:

- Related to an SLA task of type 'SLA' (contract_sla.type)
- Not in stage 'Cancelled' (task_sla.stage)

% open and overdue incidents

The percentage of open incidents that are overdue. The score is calculated according to the formula ([[Number of open and overdue incidents]] / [[Number of open incidents that should be resolved in time]]) * 100.

Number of incidents resolved in time

The number of SLA tasks related to an incident with the following characteristics:

- The resolution date (incident.resolved_at) is the date that the score is collected.
- The type is 'SLA' (contract_sla.type).
- The stage is not 'cancelled' (task_sla.stage).
- The amount of time taken to close the task is under the SLA limit, determined by having an elapsed percentage (task_sla.percentage) value less than or equal to 100%.

Number of incidents resolved that should have been resolved in time

Number of incidents resolved that should have been resolved in time is measured daily as unit #.

The goal for this indicator is to maximize.

The score is the COUNT DISTINCT on the data source Incidents.SLA.Resolved, which is using the table Incident SLA [incident_sla] with the following conditions:

- The resolution date (incident.resolved_at) is the date that the score is collected.
- The type is 'SLA' (contract_sla.type).
- The stage is not 'cancelled' (task_sla.stage).

% incidents resolved in time

The percentage of resolved incidents that were resolved in time. The score is calculated according to the formula ([[Number of incidents resolved in time]] / [[Number of resolved incidents that should be resolved in time]]) * 100.

Average Resolution Time In Hours For Resolved Incident SLA Tasks

The score is calculated according to the following formula: [[Summed duration time of resolved incident SLA tasks in hours]]/[[Total resolved Incident SLA tasks]].

Total resolved Incident SLA tasks

The score is the COUNT on the data source Incidents.SLA.Resolved, which is using the table Incident SLA [incident_sla] with the following conditions:

- The resolution date (incident.resolved_at) is the date that the score is collected.
- The type is 'SLA' (contract_sla.type).
- The stage is not 'cancelled' (task_sla.stage).

Number of incident assignments responded to in time

The number of SLA tasks related to an incident with the following characteristics:

- The close date (task_sla.end_time) is the date that the score is collected.
- The type is 'OLA' (contract_sla.type), meaning that it is a response task.
- The stage is not 'cancelled' (task_sla.stage).
- The amount of time taken to close the task is under the SLA limit, determined by having an elapsed percentage (task_sla.percentage) value less than or equal to 100%.

Number of incident assignments that should have been responded to in time

The number of SLA tasks related to an incident with the following characteristics:

- The close date (task_sla.end_time) is the date that the score is collected.
- The type is 'OLA' (contract_sla.type), meaning that it is a response task.
- The stage is not 'cancelled' (task_sla.stage).

Number of open and overdue incident assignments

The number of SLA tasks related to an incident with the following characteristics:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The type is 'OLA' (contract_sla.type), meaning that it is a response task.
- The stage is not 'cancelled' (task_sla.stage).
- The amount of time taken to work on the task is over the SLA limit, determined by having an elapsed percentage (task_sla.percentage) value more than 100%.

Number of open incident assignments that should be responded to in time

The number of open incidents related to an SLA task with the following characteristics:

- The type is 'OLA' (contract_sla.type), meaning that it is a response task.
- The stage is not 'cancelled' (task_sla.stage).
- The response task is still open.

% incident assignments responded to in time

The percentage of response tasks that were responded to within the SLA limit. The score is calculated according to the following formula: ([[Number of incident assignments responded to in time]] / [[Number of incident assignments that should have been responded to in time]]) * 100.

% open and overdue incident assignments

The percentage of open incident assignments that are overdue according to the SLA limit. The score is calculated according to the following formula: ([[Number of open and overdue incident assignments]] / [[Number of open incident assignments that should be responded to in time]]) * 100.

Summed duration time of resolved incident SLA tasks in hours

This indicator sums the results of a script run on the Incident SLA [incident_sla] table that calculates the time it took for an incident SLA task to be resolved. This indicator is used to calculate formulas but is not displayed directly on the dashboard:

Reference section for Incident Management

Reference sections provide additional information about components installed with Incident Management.

Domain separation and Incident Management

Domain separation is supported in Incident Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Incident Management overview

- The goal of Incident Management is to restore normal service operation as quickly as possible, while minimizing impact to business operations and ensuring quality is maintained.
- Typically, end users log incidents when a service they are using is impacted or not available. ITIL / Fulfiller users in your organization classify these incidents, route them as appropriate and work on resolving the incident.
- The incident and incident task tables support domain separation. Therefore, a Fulfiller sees only incidents or incident tasks that have been created within the (tenant) domain that they belong to.

How domain separation works in Incident Management

Fulfillers see only incidents and incident tasks that have been created within the (tenant) domain that they belong to.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident Management domain separated tables

- Incident [incident]
- Incident Task [incident_task]

Incident Management use cases

- An ESS user belonging to “Initech” domain, creates an incident. Only those ITIL users belonging to “Initech” domain or global domain can see this incident.
- An ITIL user belonging to a parent domain can see incidents of all its child domains as well.
- An ITIL user belonging to a specific domain can create incidents only on behalf of the domains that they have access to.
- An ITIL user can associate child incidents only of those domains that they have access to.
- If a user has access to multiple domains, the domain specified on the current record drives the functionality of that record and reference fields.

Incident Management data model

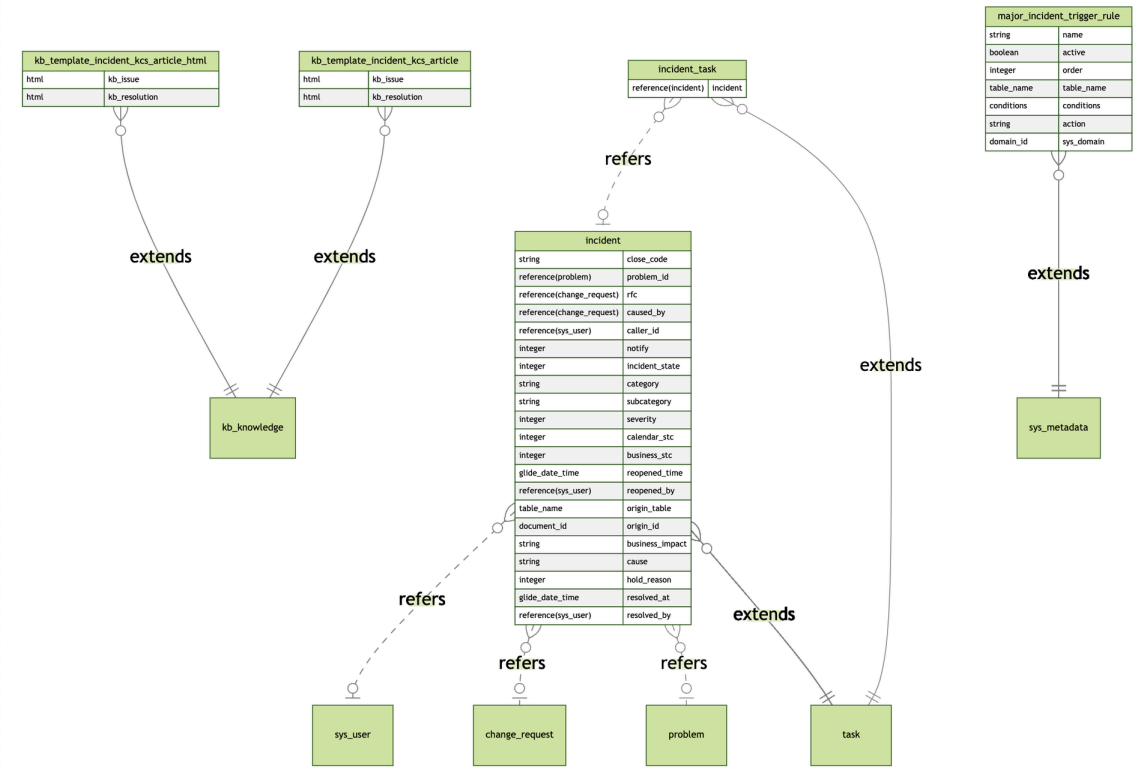
Learn about the Incident Management application by viewing the data model diagram. This diagram shows the relationships between the tables within the application and provides an overall picture of how the Incident Management application operates.

Data model

The following diagram shows the tables and their relationships within the Incident Management application.

The flexibility of the Incident Management platform provides you with a data model that you can extend and leverage to fit your needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Incident Management plugins

Many of the Incident Management plugins are activated in the base system. Others, you can activate when you are ready to use them. Some plugins include demo data.

Incident Management Best Practice – San Diego

The Incident management best practice -San Diego plugin (com.snc.best_practice.incident.sandiego) enhances the integration and workflows for incidents and problems. This plugin enables you to update the progress of the reported incident and problem to the agent and caller.

Requirements and dependencies

Install these additional plugins to use the Incident management best practice — San Diego plugin:

- Problem Management Best Practice — Madrid plugin (com.snc.best_practice.problem.madrid).

  For more information on this plugin and the activation process, see Activate Problem Management Best Practice — Madrid.

- Problem Management Best Practice — Madrid – Knowledge Integration plugin (com.snc.best_practice.problem.madrid.knowledge).

  For more information on this plugin and the activation process, see Activate Problem Management Best Practice — Madrid — Knowledge Integration.

- Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta).

  This plugin is not installed by default for zBoot customers. Install the plugin manually. This plugin is responsible for known error article behavior in the incident or problem workflow. For more information on this plugin and the activation process, see Activate Problem Management Best Practice — Jakarta.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All the plugins except for com.snc.best_practice.problem.jakarta are activated by default for the new customers. Existing or upgrading customers must request the plugin or install the plugin manually. For more information, see Request a plugin.

Impacts on upgrading customers

For the existing or upgrade customers, if they install the Incident management best practice -San Diego (com.snc.best_practice.incident.sandiego) plugin, the existing configured workflows might get changed. If the customer wants to install the plugin, they must install the plugin in the sub-production or testing environment and test the workflows before using the plugin in the production environment to ensure the desired workflow is maintained.

When the plugin is installed:

- New options are populated along with the old (existing or already configured) options.
- These files are affected:
  - Business rule: Close Code
  - ML Solution Definition: Similar Resolved Incidents -> The Filter must be updated
  - Script Action: Update Incident when Problem closes -> Update the resolution code to proper choice

  Note:
  Files are overridden if no customizations or configurations are done. In such case, new options are populated.

- Customer must manually remove the old (existing) options. If customer has configured a combination of the old (existing) and new options, then the necessary workflows must be updated.

Enhancements

This plugin enhances the incident and problem workflow to support the following activities:

Create a problem

When you create a problem from an existing incident, the incident **State** is set to **On Hold** and the **Reason** is set to **Awaiting Problem** until the linked problem is resolved.

Attach a Known Error (KE) article

- When you associate a Known Error (KE) article to the incident, and if the KE article has a problem associated to it, then the problem also gets associated with the incident.
- When you select **Known error** as **Resolution code** to resolve an incident but the incident contains no associated KE articles, then the system prompts you to select a KE article.

Communicate Workaround

If a workaround is added to the problem, and if you click the **Communicate Workaround** related link, then the following occurs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The workaround is copied to the **Work notes** field. A notification is sent to the users listed in the **Assigned to** and **Work notes list** fields. The notification is sent only when the incident state is New, On Hold, or In Progress.
- The workaround is copied to the **Additional Comments** field. If **Known error** is selected from the **Resolution code** field of the incident, then a notification is sent to the caller and to the users listed in the **Assigned to** and **Watch list** fields.

Communicate Fix

If a fix is added to a problem and if you click the **Communicate Fix** related link, then the following occurs:

- The fix is copied to the **Work Notes** field.
- A notification is sent to the users listed in the **Assigned to** and **Work notes list** fields of the problem record. The notification is sent only when the incident state is New, On Hold, or In Progress.

Activate Incident Management Best Practice – San Diego

Activate the Incident Management Best Practice — San Diego plugin (com.snc.best_practice.incident.sandiego) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

The Incident Management Best Practice – San Diego plugin modifies the problem and incident management workflows to enhance the customer experience.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Incident

You can activate the Incident plugin (com.snc.incident) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Incident plugin activates these related plugins if they are not already active.

Plugins for Incident

Plugin	Description
Service Management Basics [com.snc.service]	Provides the baseline for Service Management functionality.
Incident Management Notification [com.snc.incident_notification]	Provides notification functionality for Incident Management.
Incident Overview Homepage [com.glideapp.report.itsm.incident.overview]	Incident Overview Homepage

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Components installed with the Incident plugin

Several types of components are installed with activation of the Incident plugin in Incident Management.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [role name]	Description

Incident task assigned user
 	
[sn_incident_task_assigned_user]
	Provides read and write operation privileges to an incident task record for an agent when the record is assigned to the agent.
	
	Note:
	• You must install and activate the ITSM Roles plugin (com.snc.itsm.roles) to use the base system ACLs related to this role.
	• When the ITSM Roles plugin (com.snc.itsm.roles) isn't installed and activated on the instance, you can still use the Assigned incident user role [sn_incident_task_assigned_user] but with the following limitations:
	  ○ The agent has the read access to the assigned incident task record except for the **Work notes** and **Work notes list** fields.
	  ○ The agent has the write access to the assigned task record except for the following fields:
	  ▪ Assigned to
	  ▪ Short description
	  ▪ Description
	  ▪ Priority
	  ▪ State
	  ▪ Work notes
	  ▪ Work notes list

Tables installed

Table	Description
Incident [incident]	The Incident table is extended from the Task [task] table. It inherits all the fields, rules, and policies from the Task table.

Request Incident Management — Core

Incident Management - Core plugin (com.snc.incident_management) is a new incident state model that includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

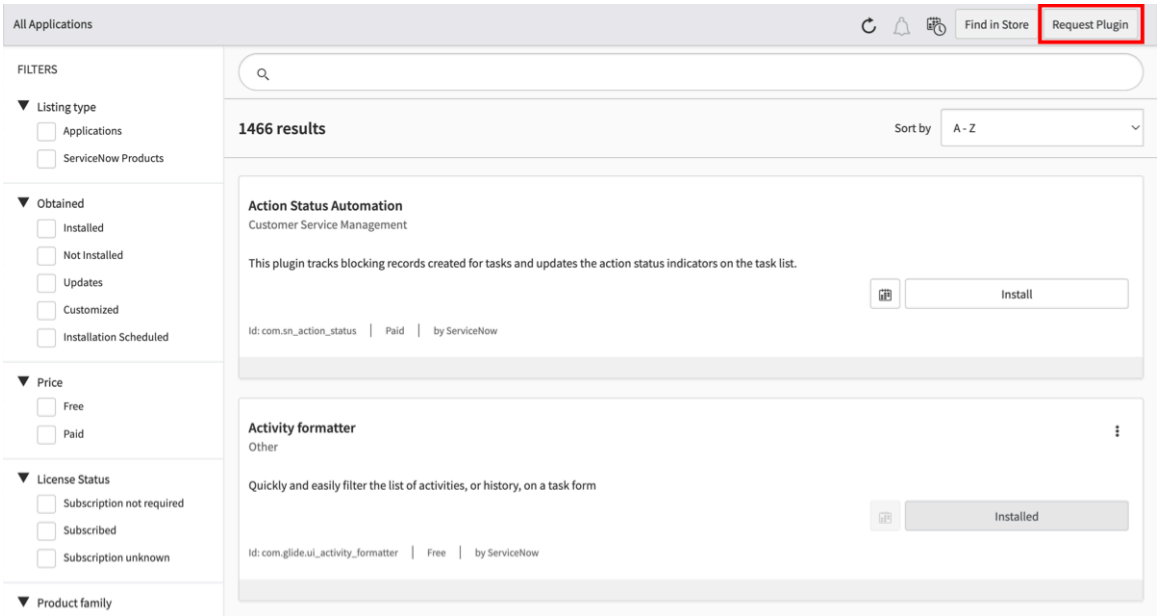
Incident Management - Core (com.snc.incident_management) is available by default in new instances. Customers upgrading from Geneva or earlier versions must request the plugin. For more information, see KB0564465.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

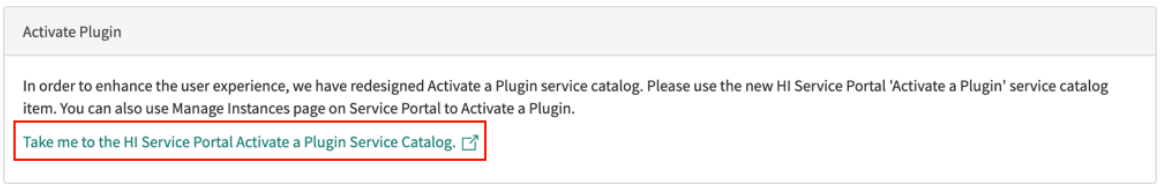
Note:
If the new state model is installed on upgraded instances, then ensure that the old states are mapped to the new ones. The mapping is especially important if you have made customizations, implemented workflows, added script includes, and added business rules.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate.

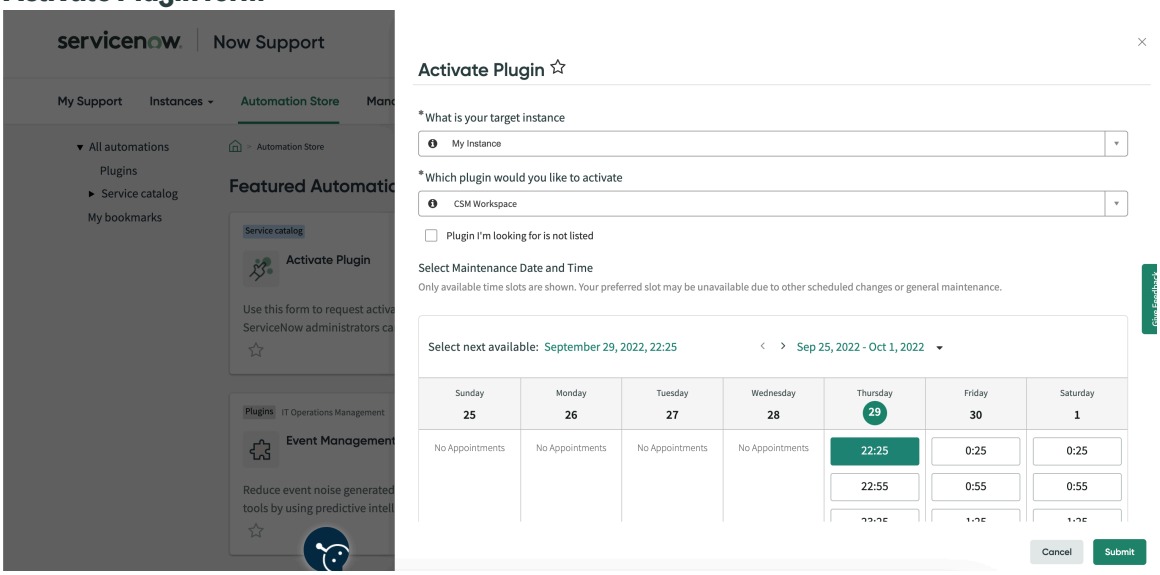
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Request ITSM Roles — Incident Management

Request the ITSM Roles plugin (com.snc.itsm.roles) to activate the ITSM Roles — Incident Management plugin (com.snc.itsm.roles.incident_management) to gain more control over the access that different service desk agents, technicians, and managers have within your Incident Management process.

Before you begin

Role required: admin

About this task

The ITSM Roles plugin (com.snc.itsm.roles) includes an additional security model. The security model provides more granular roles across ITSM applications as well as within them, allowing you flexibility in setting up access controls. The ITSM Roles plugin is available by default in new instances. Users upgrading from Madrid or earlier versions must request the plugin.

Plugins for ITSM Roles

Plugin	Adds roles
Business Stakeholder [com.snc.business_stakeholder]	business_stakeholder **Note:** The business_stakeholder role contains the sn_incident_read, sn_problem_read, sn_change_read, sn_request_read, and approver_user roles.
ITSM Roles — Incident Management [com.snc.itsm.roles.incident_management]	• sn_incident_read • sn_incident_write
ITSM Roles — Problem Management [com.snc.itsm.roles.problem_management]	• sn_problem_read • sn_problem_write
ITSM Roles — Change Management [com.snc.itsm.roles.change_management]	• sn_change_read • sn_change_write
ITSM Roles — Request Management [com.snc.service_management.roles.request_management]	• sn_request_read **Note:** As there are future updates expected for the sn_request_read role, do not assign it to users without the business_stakeholder role. • sn_request_write

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

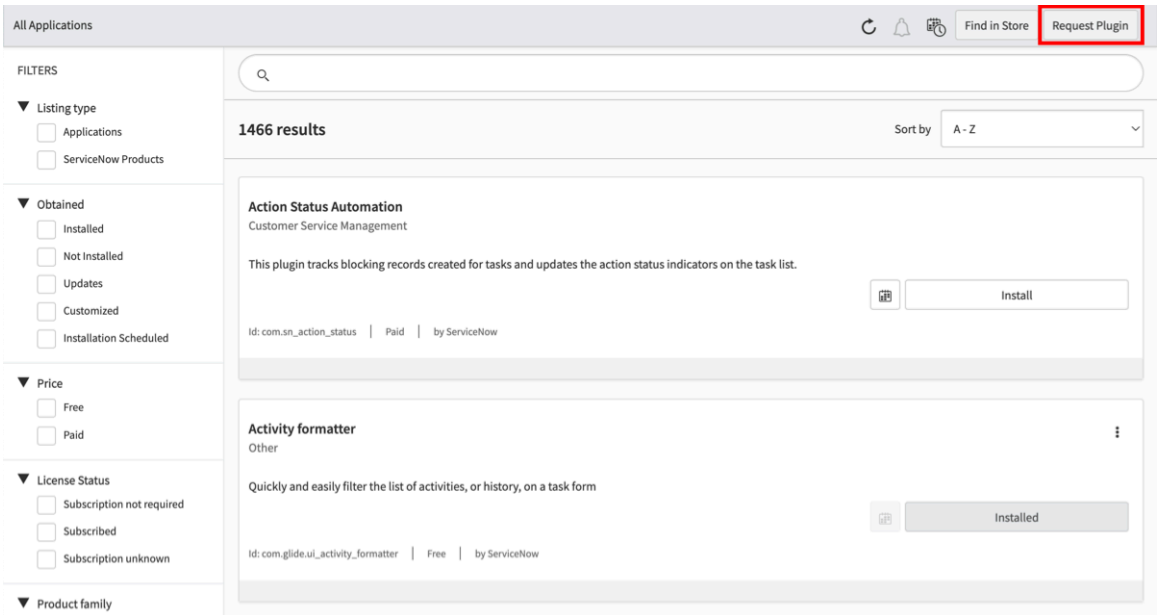
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

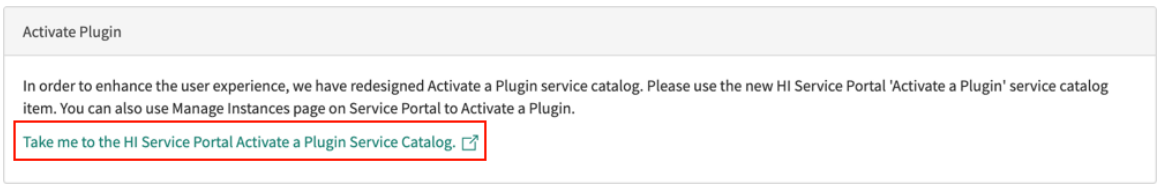
Note:
Activate the ITSM Roles plugin on a subproduction environment and test the functionality before requesting activation in the production environment. For assistance, contact the ServiceNow Professional Services team.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Components installed with ITSM Roles — Incident Management

Several user roles are installed with activation of the ITSM Roles — Incident Management plugin (com.snc.itsm.roles.incident_management).

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Incident read [sn_incident_read]	Read access to the Incident Management application and related records. **Note:** An ESS user (user with no role) can view only those incidents that they create or someone else creates on their behalf. A user with the sn_incident_read role can view all incidents as well as the major incident workbench.	• dependency_views • agent_workspace_user • view_changer • cmdb_read • cmdb_query_builder_read
Incident write [sn_incident_write]	Write access to the Incident Management application and related records.	• sn_incident_read • template_editor

Activate Business Stakeholder

Activate the Business Stakeholder plugin (com.snc.business_stakeholder) if you have an admin role. This plugin installs the Business Stakeholder role. Users with this role can view and approve records at all ITSM product levels.

Before you begin
Role required: admin

Note:
Ensure that ITSM Roles plugin (com.snc.itsm.roles) is activated before you activate the Business Stakeholder plugin. For more information to activate ITSM Roles plugin, refer Request ITSM Roles- Change Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed with Business Stakeholder

The Business Stakeholder plugin (com.snc.business_stakeholder) installs the Business Stakeholder role when activated.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Business Stakeholder [business_stakeholde	Users with this role can view and approve records within all products of ITSM. **Note:** The business_stakeholder role contains the following ITSM roles sn_incident_read, sn_problem_read, sn_change_read, sn_request_read, and approver_user roles.	• pa_viewer.business_stakeholder • approver_user.business_stakeholder • cmdb_read.business_stakeholder

Activate KCS Integration for Incident Management

Activate the KCS Integration for Incident Management plugin (com.snc.incident.knowledge) if you have the admin role. This plugin provides integration of Incident Management with the Advanced Knowledge Management features.

Before you begin
Role required: admin

About this task
The KCS Integration for Incident Management plugin (com.snc.incident.knowledge) activates the Knowledge Management Advanced Installer plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin for KCS Integration for Incident Management

Plugin	Description
Knowledge Management Advanced Installer [com.snc.knowledge_advanced.installer]	Use this plugin to install the Knowledge Management Advanced plugin. Activating or upgrading this plugin validates knowledge articles and knowledge bases to ensure that the Knowledge Management Advanced plugin can be successfully installed.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Incident Management integrations

Users of an incident management solution need to have access to a multitude of features so that they can address specific challenges directly. Incident Management integrations aims to fully integrate and automate your incident response system.

Universal Request integration - Incident Management

Incident Management integrates with Universal Request to provide incident-related service as unified services to users. The integration helps users to have a single service desk.

Install and configure the Universal Request Integration for the Incident Management plugin (com.snc.incident.universal_request). The integration provides the following configurations and functionalities:

Features of the Incident Management integration with Universal Request

The integration of Incident Management with Universal Request provides the following features:

- The Universal Request form has the UI action to create an incident. The following fields are copied by default from the universal request record to the incident record when a new incident is created:
  - universal_request
  - short_description
  - description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - caller_id
  - opened_by

  An incident manager can customize the fields using the system property *sn_inc_uni_req.incident.universal_request.copy_fields*.
- The **Universal Request** field appears on the Incident form only when an incident is associated with a universal request record.
- The **Routing reason** field appears on the incident form when an itil agent routes an incident back to the universal request.
- On the record producer, if you select the **Create Universal Request** check box, a new incident created from that record producer automatically creates a universal request record. This universal request record is associated with the incident record.
- You can activate the *Create Universal Request for Incident* business rule and create incidents using any channel, such as record producer, virtual agent support, email, and so on. When you do this, a universal request record is automatically created. This universal request record is associated with the incident record. The incident is added as a primary ticket to the universal request record. By default, this business rule works as follows:
  - The rule is inactive. To activate this business rule, navigate to **System Defination** > **Business Rules** > **Create Universal Request for Incident**, and then select **Active** check box to activate this business rule.
  - The rule is not applicable to child incidents for which the parent incident is associated as a primary ticket to the universal request record.
- When a universal request record is automatically created based on the incident, Incident record information is copied from the incident record fields to the universal request record fields. An incident manager with admin role can customize and configure the fields using the **Create UR Mappings** and **Create UR Information** tabs in the Mapping Configuration form for incidents in Universal Request. For more information, see Mapping configuration.

Visibility of Incidents to a requester

The requesters cannot view the incidents that are associated with the Universal Request records. Instead, the requesters can only view the Universal Request record using the following ways:

- On ServiceNow AI Platform, you can access the universal request records under **Self-Service** > **Universal Requests**.
- On Service Portal, you can access the universal request records under **Service Portal** > **Requests**.

Suppression of email notifications

If any incident is a part of Universal Request, then the notifications sent to the caller from an Incident are suppressed. In all other incident email notifications, the universal request number is displayed instead of the incident number.

Requester Actions on Service Portal

For an Universal Request record that has an incident-related as its primary task, an Actions widget with the requester actions is displayed. The actions can be **Resolve**, **Reopen**, or **Close** depending on the state of the incident.

Request Universal Request integration for Incident Management

To activate the integration between Incident Management and Universal Request, request the Universal Request: Integration for Incident management plugin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(com.snc.incident.universal_request) through the Now Support Customer Service system. This plugin includes demo data and activates related plugins if they are not already active.

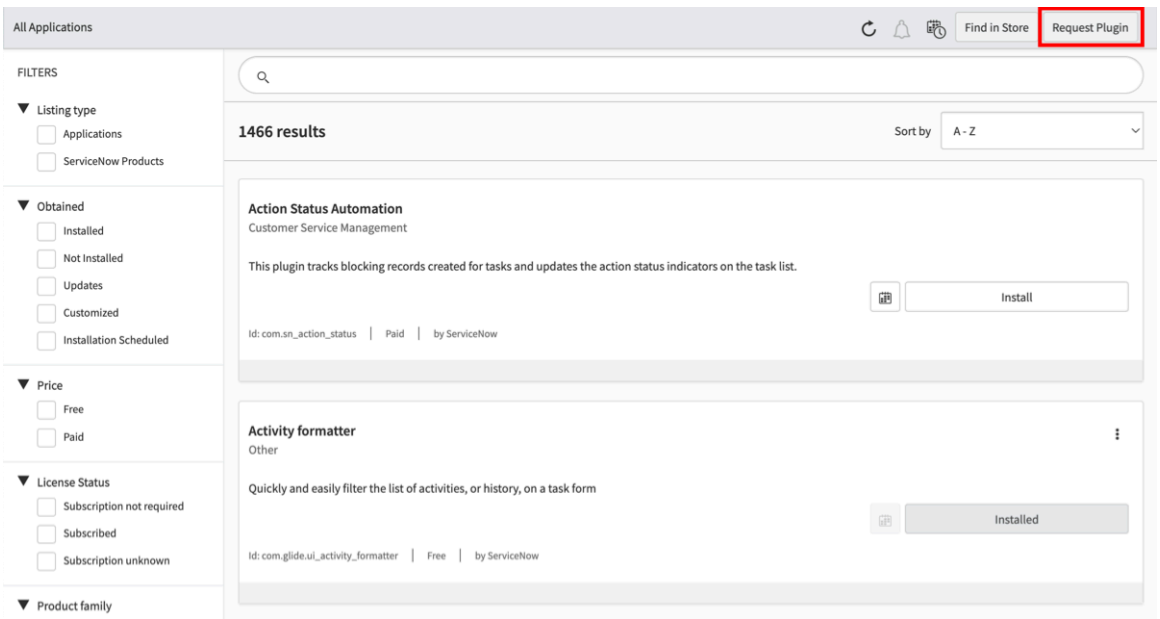
Before you begin
Role required: none

About this task
The Universal Request Integration for Incident management plugin activates these related plugins if they are not already active.

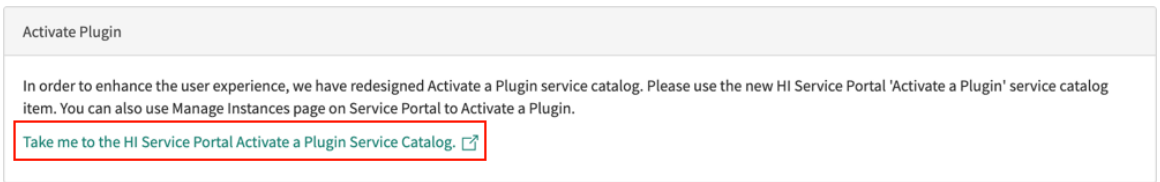
Plugins for Universal Request Integration for Incident management

Plugin	Description
Universal Request [com.snc.universal_request]	Enables seamless service experience across different groups and task types.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

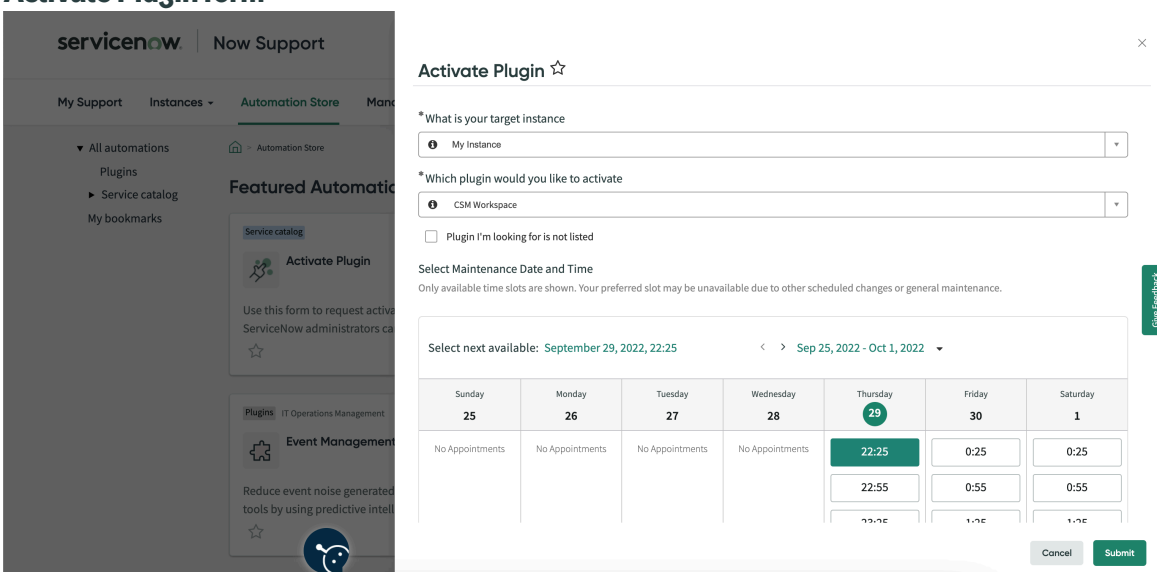
Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

List of plugins (Xanadu)

Create incident from Universal Request

Create an incident from a universal request record to restore service to a customer as soon as possible. After creating the incident record, you can investigate potential solutions.

Before you begin

Role required: routing_agent and ITIL or admin

Activate the Universal Request (sn_uni_req) and the Universal Request Integration for Incident Management (sn_inc_uni_req) plugins.

Procedure

1. Navigate to **Universal Requests** > **All**.
2. Open the universal request record from which you want to create an incident.
3. Click **Create Incident**.
   An incident record is created and associated with universal request. The incident record is not saved until you submit the record.
4. Fill in the fields on the incident form and click **Submit**.
   The universal request number from which the incident is created appears in the **Universal Request** field on the Incident form. The incident number appears in the **Primary Ticket** field and also in the **Associated Tickets** related list of the Universal Request form.

Transfer incident

Transfer the back to the Universal Request queue, or to another department with or without resolution. When you realise that the issue is not incident related, transfer the incident without any resolution to the relevant department or service. If you resolve the issue, you can transfer the incident with the resolution.

Before you begin

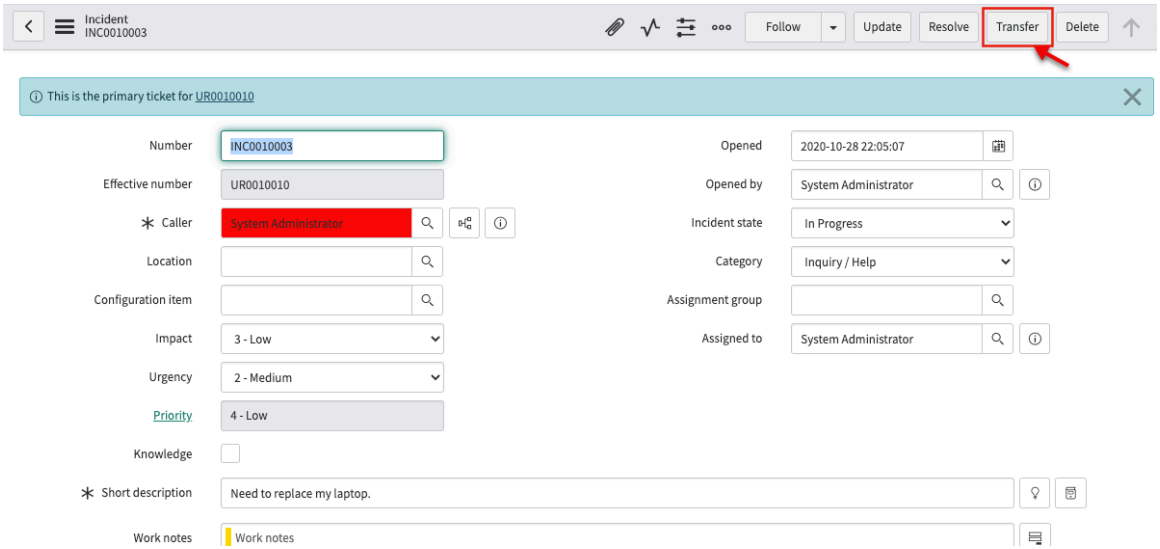
Role required: agent to whom the ticket is assigned to

Associate an incident with a Universal Request record.

Procedure

1. Open the incident that you want to transfer.
2. Click **Transfer**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the **Transfer Ticket** dialog box, provide the following details.

> **Note:**
> Based on your transfer type configuration, the given fields are displayed. For more information, see Universal Request properties.

- **Action**: Select if the case should be transferred to another department or back to Universal Request
- **Department**: Select the department from the list.
- **Service**: Select the specific service of the chosen department.

> **Note:**
> This field does not appear if you have selected **Transfer to Department** in **Action**

- **Transfer reason**: Select the reason from the list.
- **Transfer notes**: A brief description for routing the primary ticket that you want to pass to the UR Routing agent.
- **Copy additional comments and attachments**: Deselect if you do not want to transfer the ticket with additional comments and attachments. By default, all attachments and comments are transferred.

> **Note:**
> Work notes are not copied while transferring.

4. Click **Transfer**.

Create an associated ticket from an incident

Create an associated ticket for another relevant department from an incident (primary ticket) when you realize that the issue can be resolved in that department.

Before you begin
Ensure that the incident has an associated Universal Request record.

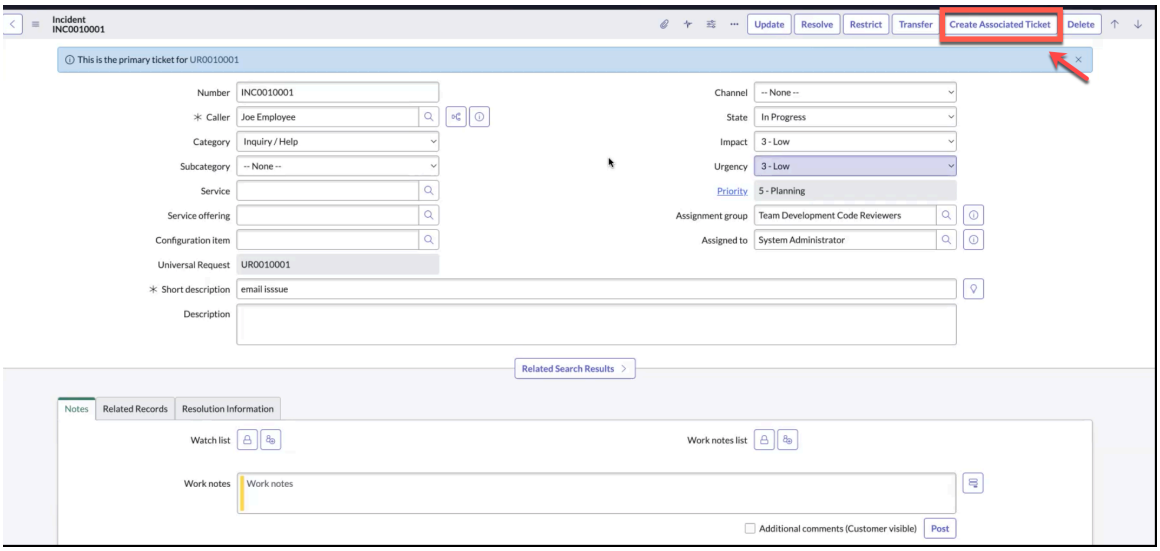
Role required: Ensure you have one of the following roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The agent to whom the incident is assigned.
- The agent who belongs to the assignment group to whom the incident is assigned

Procedure

1. Navigate to **Incidents** > **All**.
2. Open the incident record from which you want to create an associated ticket.
3. Click **Create Associated Ticket**.



4. In the Create Associated Ticket dialog box, fill in the fields.

Create Associated Ticket dialog box

Field	Description
Department	Department for which you want to create an associated ticket.
Short description	A brief description of the issue for which the associated ticket is created.
Description	A detailed description of the issue for which the associated ticket is created.
Work notes	A brief description of the issue. You can communicate this issue to the Universal Request Routing agent or to the agent of the department for which the associated ticket is created.

5. Click **Create**.

Result

The ticket is created for the relevant department and is associated with the universal request record. You can view the associated tickets in the Associated Tickets related list of the Universal Request form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When an associated ticket is created, the information is copied from the fields of the universal request record to the fields of the associated ticket record. You can use the **Associated Ticket Information** and **Associated Ticket Mappings** tabs of the Mapping Configuration form for incidents. For more information, see Mapping configuration.

Resolve, reopen, or close incident associated with universal request

Resolve, reopen, or close are actions from the **Incident Actions** widget that is available on the universal request record for the requester. The **Incident Actions** widget is available only when an incident is the primary task of a Universal Request record.

Before you begin
Role required: none

Associate an incident with a Universal request.

Procedure

1. Navigate to your portal page.
2. Click **Requests**.
3. Open the universal request that is associated with the incident.
4. Perform any of the following actions from the **Actions** widget.

Note:
The state of Universal Request record is updated based on the configuration provided on the State Mapping [universal_request_state_mapping] table.

Customize fields copied from Universal Request to incident

Customize fields so that the values of some fields in the universal request automatically get copied to an incident record when an incident is associated with a universal request record. It saves your time from manually entering the information every time you create an incident.

Before you begin
Role required: incident_manager or admin

Procedure

1. In the left navigation pane, enter `sys_properties.list` and press the Enter key.
2. Search and open the system property *`sn_inc_uni_req.incident.universal_request.copy_fields`*.
3. In the **Value** field enter the universal request and the incident field.
   For example, `caller_id=opened_for` means that the value of the field called_id from the universal request form is copied to the opened_for field in the incident form.

Restrict an incident access

You can restrict an incident ticket that contains sensitive information. By marking an incident as restricted, you limit its access for the agents.

Before you begin
Role required: admin or user

About this task

Both agents and users can mark an incident as restricted. Users can mark an incident as restricted while creating it. An agent can also mark an incident a restricted while triaging it or while working on it. Cases marked as restricted can only be accessed by

- Routing agents who are part of the assignment group and has sensitive agent role.
- All primary ticket agents.

Procedure

1. Navigate to **All** > **Incident** > **All**.
2. Open the incident record that you want to restrict.
3. On the form, click **Restrict**.
   The restricted fields are hidden, and the form is only for view purpose.

   Note:
   To mark the request as unrestricted only agents with the access role can modify.

4. Click **Update**.

Now Assist for IT Service Management (ITSM)

Use the ServiceNow® Now Assist for IT Service Management (ITSM) application to summarize the incident information, generate incident resolution notes, and summarize the chat for an interaction. You can enable your agents to understand the chat and incident context so that they can propose quicker resolutions to your requesters.

AI limitations

This application uses artificial intelligence (AI) and machine learning, which are rapidly evolving fields of study that generate predictions based on patterns in data. As a result, this application may not always produce accurate, complete, or appropriate information. Further, there is no guarantee that this application has been fully trained or tested for your use case. To mitigate these issues, it is your responsibility to test and evaluate your use of this application for accuracy, harm, and appropriateness for your use case, employ human oversight of output, and refrain from relying solely on AI-generated outputs for decision-making purposes. This is especially important if you choose to deploy this application in areas with consequential impacts such as healthcare, finance, legal, employment, security, or infrastructure. You agree to abide by ServiceNow's AI Acceptable Use Policy, which may be updated by ServiceNow.

Data processing

This application requires data to be transferred from ServiceNow customers' individual instances to a centralized ServiceNow environment, which may be located in a different data center region from the one where your instance is, and potentially to a third-party cloud provider, such as Microsoft Azure. This data is handled per ServiceNow's internal policies and procedures, including our policies available through our CORE Compliance Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collection

ServiceNow collects and uses the inputs, outputs, and edits to outputs of this application to develop and improve ServiceNow technologies including ServiceNow models and AI products. In addition, this application will collect incident data (for Incident Assist and Knowledge Assist) and chat transcripts (for Chat Assist).

Customers can opt out of future data collection at any time, as described in the Now Assist Opt-Out page.

For more information, see the Now Assist documentation.

Exploring Now Assist for IT Service Management (ITSM)

With the Now Assist for IT Service Management (ITSM) application, your agents can summarize the chat conversations and incident details, generate the incident resolution notes to share with other agents.

Now Assist for IT Service Management (ITSM) overview

The following generative AI capabilities are available for an agent:

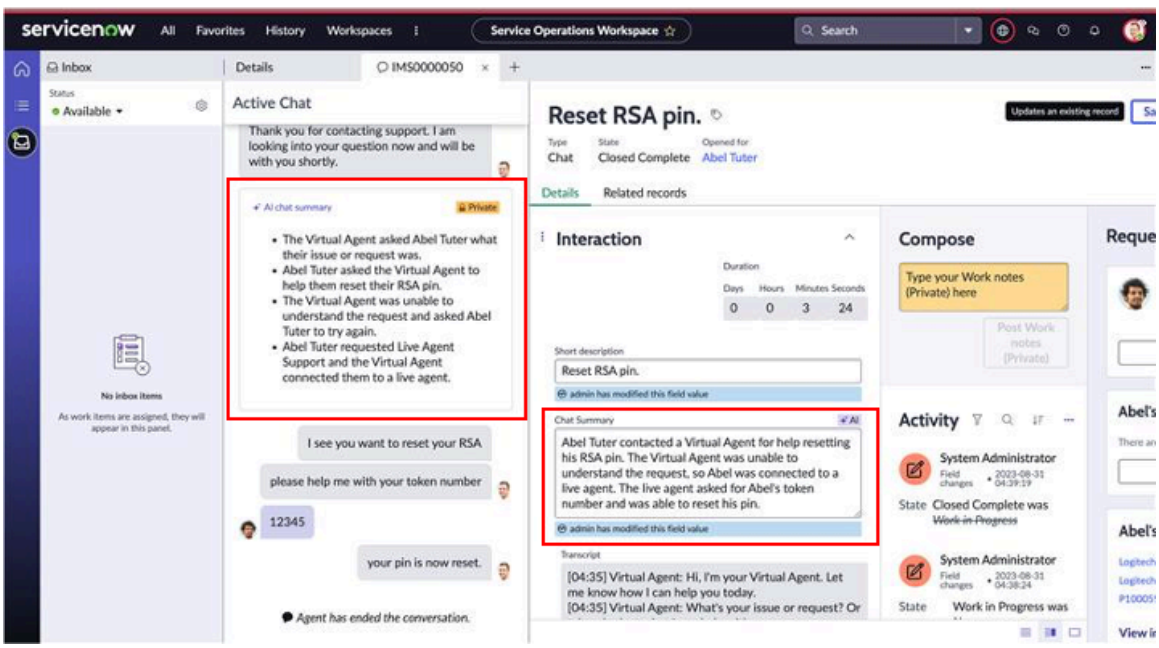
- An incident summary enables your agents to understand the incident context.
- The incident resolution notes provide the context to other agents who might encounter similar incidents.
- An interaction chat summary provides the context about the chat conversation to an agent by specifying all points of the handoff, including the Virtual Agent conversation.

Now Assist for IT Service Management (ITSM) skills

The Now Assist for ITSM application includes the generative AI skills and features that enable your agents to understand the chat and incident context so that they can propose quicker resolutions to the requester.

Chat summarization

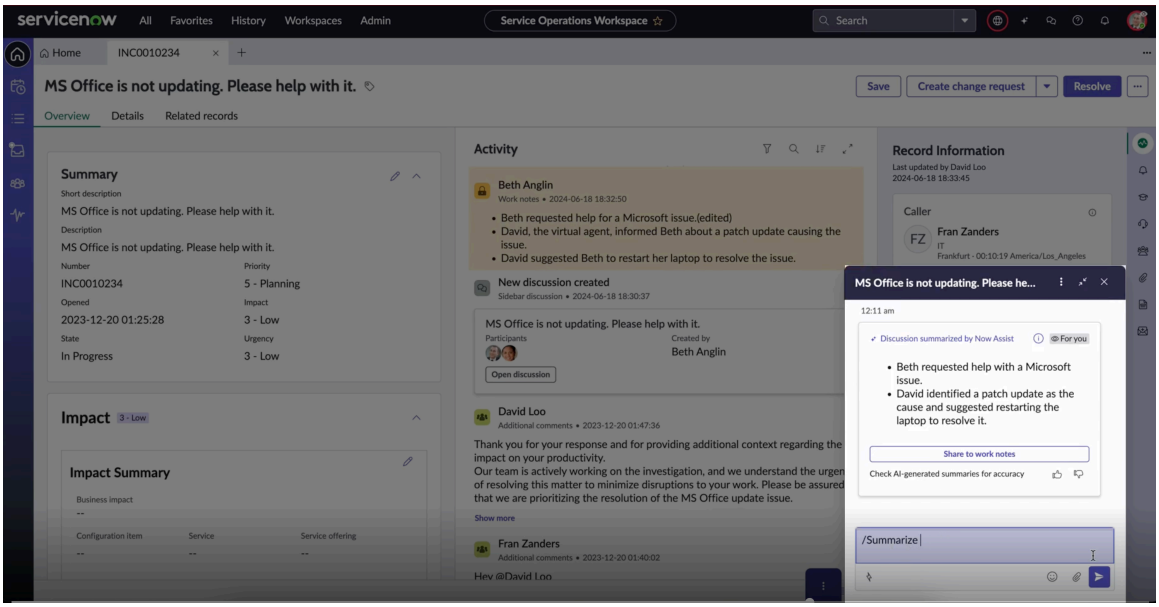
Provides an agent with a summary of a requester's Virtual Agent chat history. An agent can also generate a summary of the entire interaction when the chat ends or when an incident is created for further troubleshooting before or after the chat ends.



Sidebar discussion summarization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provides an agent with a summary of a requester's Virtual Agent Sidebar discussion history. An agent can also post the summary to the incident work notes for further troubleshooting before or after the chat ends.



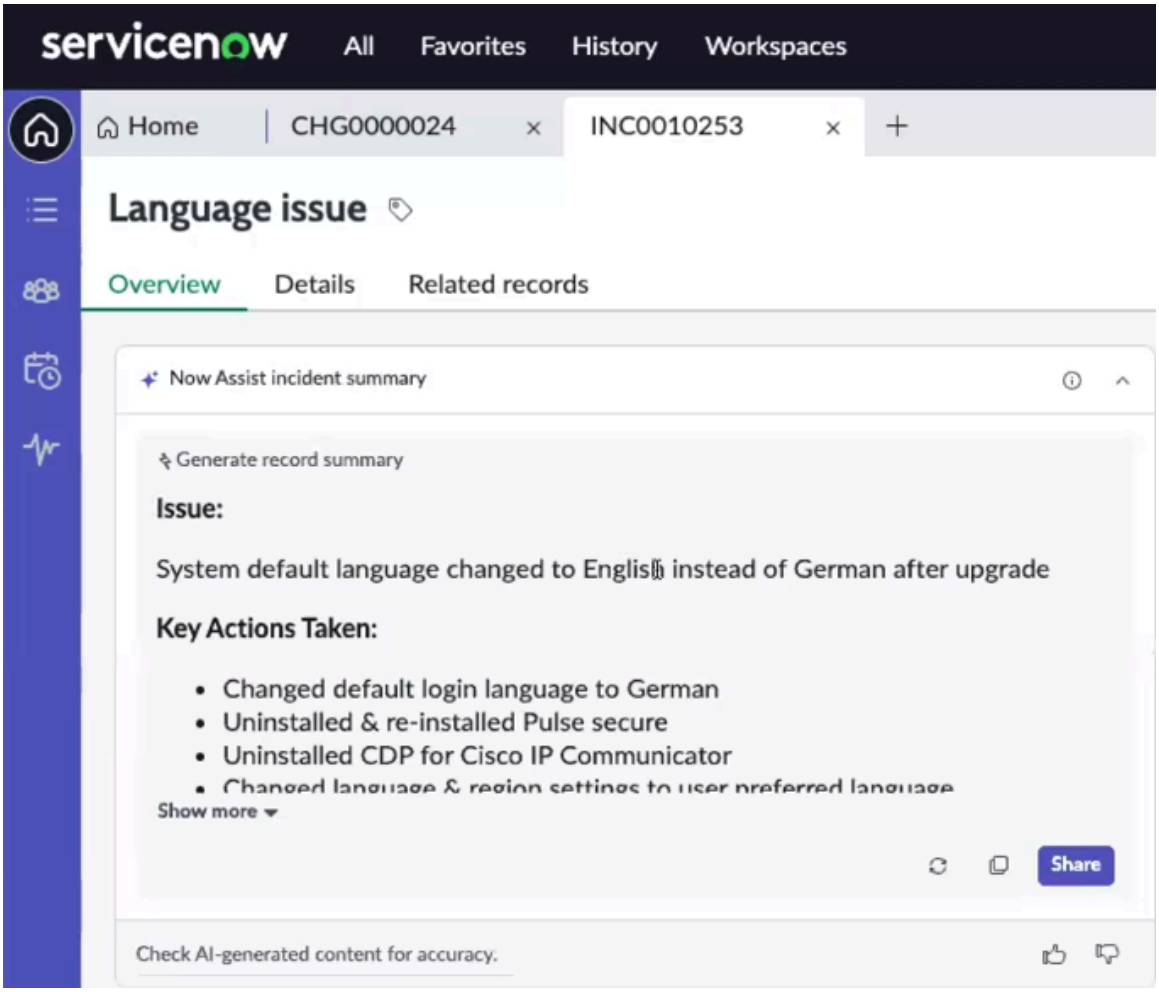
Incident summarization

Enables an agent to expedite the incident troubleshooting process by reviewing its summary that includes the issue, actions taken, and resolution. Your agent can generate an incident summary for active incidents to understand the incident context. Your agent can also refresh the summary, post the summary to the incident work notes, copy the summary, and provide feedback about the summary.

The incident summary includes the information that an agent enters in the following incident record fields:

- Short description
- Description
- Work notes
- Additional comments
- Email

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



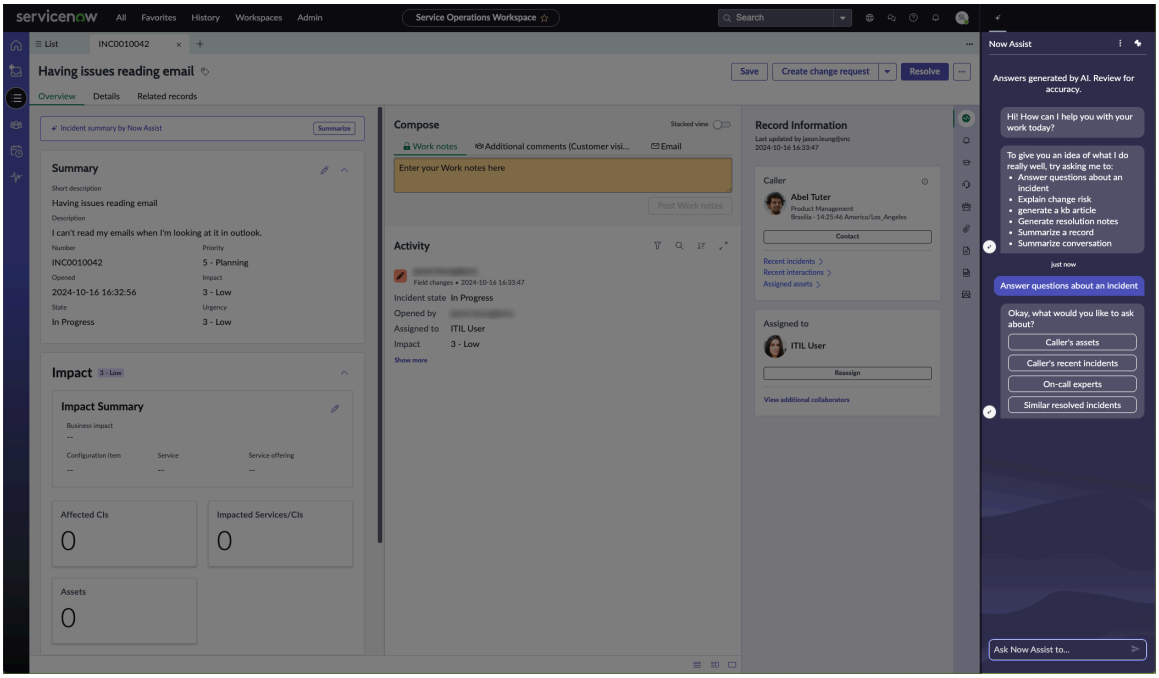
Incident assist

Enables an agent to quickly obtain common incident related information conversationally within the incident record by asking questions related to the supported topics in the Now Assist panel.

Incident assist topics supported in the Now Assist panel include:

- Caller's assets
- Caller's recent incidents
- On-call experts from support groups
- Similar resolved incidents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Change request summarization

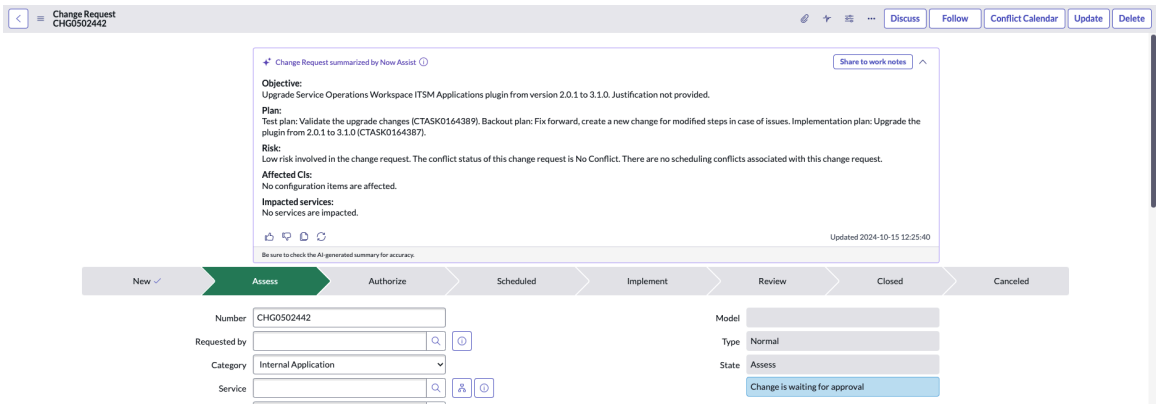
Enables an agent to expedite the change request process by reviewing its summary that includes objective, plan, and risk. Your agent can generate a change request summary for active change requests to understand the change request context. Your agent can also refresh the summary, post the summary to the change request work notes, copy the summary, and provide feedback about the summary.

The change request summary includes the information that an agent enters in the following incident record fields:

- Short description
- Description
- Work notes
- Additional comments
- Risk
- Impact
- Justification
- Implementation plan
- Risk and impact analysis
- Test plan
- Backout plan
- Close code
- Close notes
- Configuration item
- Service
- Service offering
- State

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Conflict status
- Type



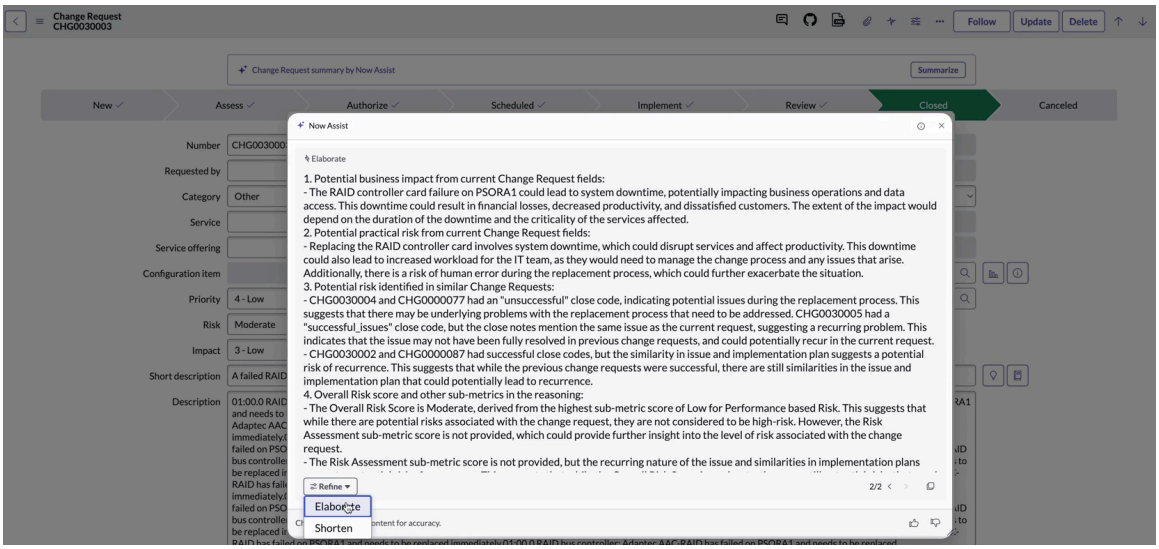
Change request risk explanation

Enables an agent to understand the change request risk by reviewing the explanation for the risk rating. Your agent can generate a change request risk explanation for change requests that have a risk rating (high, med, low). Your agent can also copy the summary, and provide feedback about the summary.

The change request risk explanation includes the information that an agent enters in the following incident record fields:

- Short description
- Implementation plan
- Assignment group
- Risk

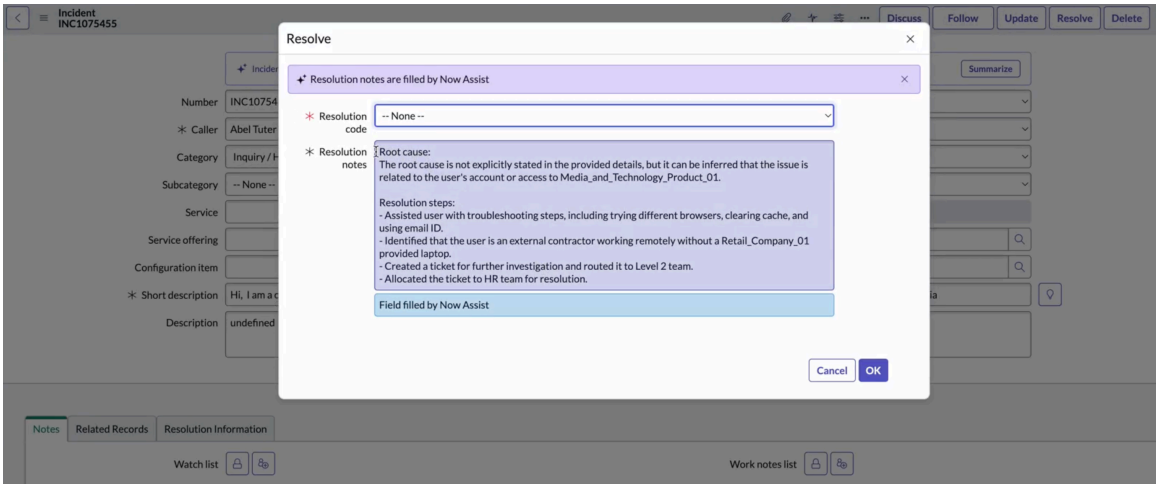
Additional inputs include: similar change requests and the incidents caused by those changes, and risk condition that was met.



Resolution notes generation

Automatically generates the resolution notes for an incident using the Now Assist icon and provides context to the other agents who might encounter similar incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

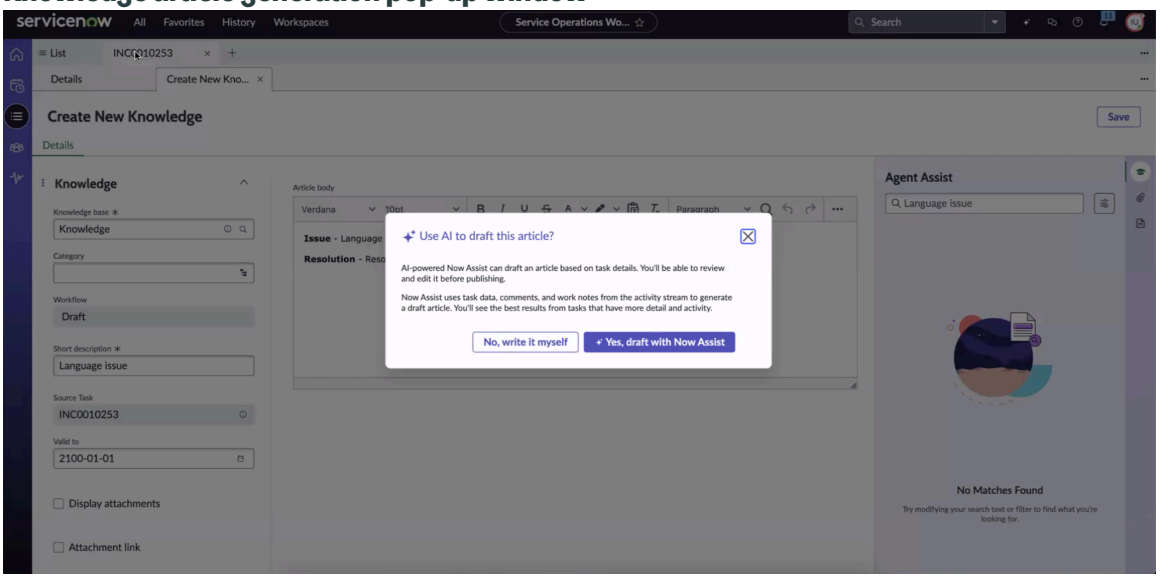


Knowledge generation

Enables an agent to generate a knowledge article from an incident after proposing a resolution or closing the incident.

The knowledge generation skill displays a pop-up window that an agent can use to generate a knowledge article and review it before publishing the knowledge article draft.

Knowledge article generation pop-up window



Chat reply recommendation

Enables an agent to generate a reply recommendation from a chat using the Now Assist icon.

The chat reply recommendation skill displays a pop-up window that an agent can use to generate a recommendation and review it before sending it as a reply to the requester.

Supporting information for Now Assist for IT Service Management (ITSM)

Get a quick overview of the important information that is related to the Now Assist for IT Service Management (ITSM) application.

Supported versions

- For Core UI: Starting with Vancouver Patch 2
- For Service Operations Workspace for ITSM: Starting with version 6.0.0

Supported user interfaces

The Now Assist for ITSM application includes the skills that are listed in the following table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Next Experience must be enabled to use the Now Assist panel. For more information, see Considerations for activating Next Experience.

Now Assist for ITSM supported interfaces

Interface	Features
Service Operations Workspace for ITSM	• Incident summarization • Resolution notes generation • Chat summarization • Now Assist panel • Knowledge article generation • Sidebar discussion summarization • Change request summarization • Chat reply recommendation • Change request risk explanation • Incident assist • Email reply recommendation • Major Incident Management email content recommendation
Core UI	• Incident summarization • Resolution notes generation • Now Assist panel • Knowledge article generation • Sidebar discussion summarization • Change request summarization • Change request risk explanation • Incident assist • Email reply recommendation

Configure Now Assist for IT Service Management (ITSM)

If you have the admin role, you can configure the Now Assist for IT Service Management (ITSM) application so that agents can use the generative AI capabilities in Service Operations Workspace for ITSM and in Core UI.

Before you begin
Role required: admin

About this task
Use the Now Assist Admin console to configure Now Assist for IT Service Management (ITSM). This console contains everything that you need to install the plugins and configure the generative AI skills. For additional information, see Now Assist Admin console.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation is supported in Now Assist for IT Service Management (ITSM). For details, see Domain separation in the Now Assist Admin console.

Here's a list of all skills supported in Now Assist for IT Service Management (ITSM):

- Chat summarization
- Sidebar discussion summarization
- Chat reply recommendation
- Incident assist
- Incident summarization

> **Note:**
> The incident summarization is applicable only for incidents in the New, In progress, On-hold, and Resolved states as long as the incident state mappings that are provided in the base system aren't customized.

- Resolution notes generation
- Email reply recommendation
- Knowledge article generation
- Change request risk explanation
- Change request summarization

> **Note:**
> The change request summarization is applicable only for change requests in the Assess, Authorize, Scheduled, Implement, Review, and Closed states as long as the change request state mappings that are provided in the base system aren't customized.

- Major Incident email content recommendation

> **Note:**
>
> Now LLM Service is currently the only provider for this Now Assist application's skills.

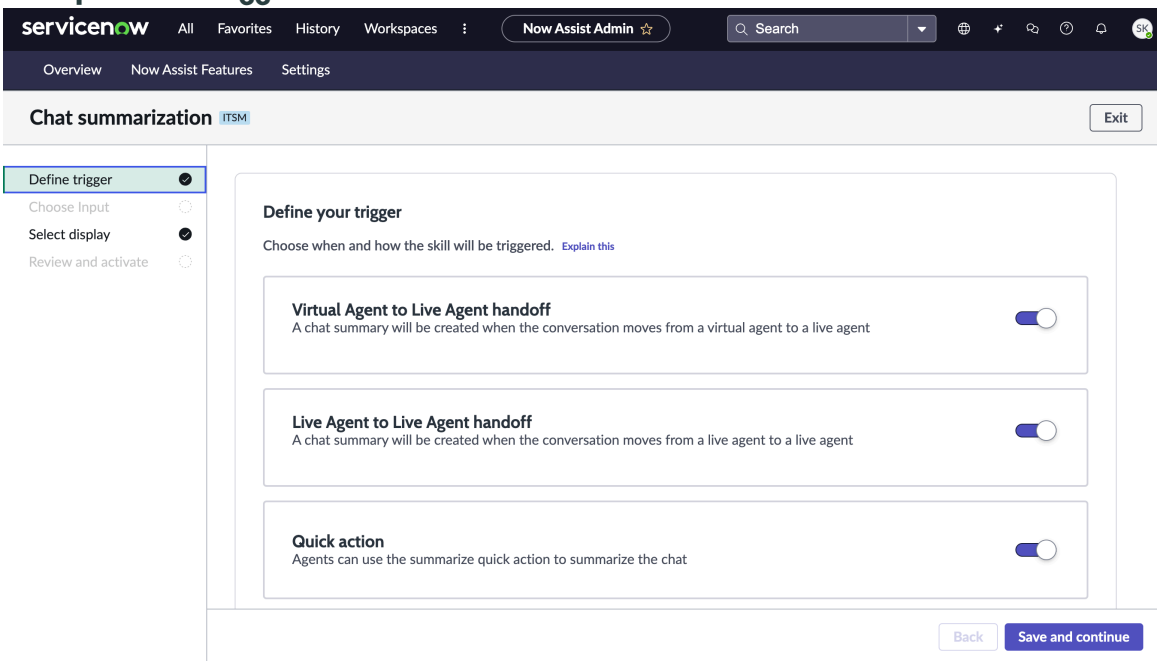
Procedure

1. Install the Now Assist for IT Service Management plugin (sn_itsm_gen_ai).
   - For information about the application dependencies, see Supporting information for Now Assist for IT Service Management (ITSM).
   - For information about the installation process, see Install Now Assist plugins.
2. Navigate to **Admin** > **Now Assist Admin**.
3. Select the **Now Assist Skills** tab.
4. Activate and configure the skills for the Now Assist for ITSM features.
   These features are grouped under the **Technology** workflow group. Each feature has its associated skills.
5. On the tile for your skill, select **Activate skill**.
6. Select the inputs or triggers for the selected skill.

   For information about the inputs and triggers for each skill, see Skill inputs and triggers for Now Assist for IT Service Management (ITSM).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example Define trigger screen for the Chat summarization skill



7. After you've configured the inputs or triggers for the selected skill, select **Save and continue** to go to the next step.
   You can return to a previous step by using the **Back** button.
8. Select where you'd like to display the skill.

   - **In-product**: When selected, the Now Assist skills are displayed on forms and workspaces. For the skills that appear in-product, select the down arrow to identify the roles that can use the skill.
   - **Now Assist panel**: When selected, the Now Assist skills are available in the Now Assist panel. If you don't see this option, you must activate the Now Assist panel. For more information, see Turn on the Now Assist panel.

     For the skills that appear in the Now Assist panel, select the down arrow to identify the roles that can use the skill.
9. After you've configured the display for the selected skill, select **Save and continue** to go to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Review your choices and select **Activate** to complete the configuration.
    Your skill is configured.

Skill inputs and triggers for Now Assist for IT Service Management (ITSM)

Get a quick overview of the skill inputs and triggers for Now Assist for IT Service Management (ITSM). By configuring the inputs or triggers for a skill, you can determine how and when a skill is used.

Now Assist for IT Service Management (ITSM) overview

Depending on the selected skill, you can configure the inputs or triggers. These settings determine how and when a skill is used. An input identifies the data that is used for a skill, such as the table and fields that are used to generate an incident summary. A trigger initiates an action, such as when the system generates a chat summary.

Incident sentiment analysis skill

Inputs for the sentiment analysis skill

Input	Description
Input table	Incident [incident]
Input fields	• Short description • Description • Priority • State • Created • Additional comments • Task SLA

Outputs for the sentiment analysis skill

Output	Description
Sentiment values	• Positive • Neutral • Negative

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Outputs for the sentiment analysis skill (continued)

Output	Description
Sentiment trend	• Improving • Declining • Stable
Sentiment reasoning	Reasons for providing the sentiment value.

Scheduled job for the sentiment analysis skill

Scheduled job name	Default value	Description
Sentiment analysis scheduled job (incident)	True	Refreshes sentiments based on the trigger frequency.

Suggested steps generation skill

Inputs for suggested steps generation skill

Input	Description
Input table	Incident [incident]
Input field	Short description The skill uses this field to cluster incidents based on similar incidents closed in the past.
Conditions	Filter conditions to generate the suggested steps. Similar incidents closed within the last 6 months are used by default to create the incident clusters.

Major Incident email content recommendation skill

Note:

- When you create a Major Incident email content recommendation using the default templates, you can use the corresponding Gen AI variables to compose the content.
- For information on generating Major Incident email content recommendation, see Major Incident Management email content recommendation.

Inputs for Major Incident email content recommendation skills

Input	Description

Input	Description
Input fields	• Short description • Description • Additional comments • Work notes • Activities
Additional fields	• Business impact • Resolution notes

Chat summarization skill

For the chat summarization skill, select the triggers that determine when a chat summary is generated. You can also select the properties that control how a chat summary is displayed.

The following table lists the triggers that determine when a chat summary is generated and how a chat summary is displayed.

Triggers for the chat summarization skill

Trigger	Description
Virtual Agent to Live Agent handoff	Chat summary that is generated when the chat handoff is done from Virtual Agent to a live agent.
Quick action	Chat summary that is generated when the live agent performs the `/summarize` quick action.
Chat wrap-up	Chat summary that is generated when the live agent ends the chat. The **Chat Summary** field is updated for the interaction.
Short description	**Short description** field that is updated for the interaction when the live agent ends the chat.
Task creation	**Short description** and **Description** fields that are auto-populated on the task record when a task is created.

The following table lists the property for the chat summarization skill.

Property for the chat summarization skill

Property	Description
Bulleted list	If selected, the chat summary is displayed as an unordered list.

Chat reply recommendation skill

For the chat reply recommendation skill, select the triggers that determine when a chat reply recommendation is generated.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table lists the triggers that determine when a chat reply recommendation is generated.

Triggers for the chat reply recommendation skill

Trigger	Description
User triggered	Chat reply recommendation that is generated when the agent manually triggers the skill.

The following table lists the fields for the Now Assist icon for the chat reply recommendation skill.

Now Assist icon

Field	Description
Button Props	Trigger button properties, for example: • Variant • Size • Icon
Refine Actions	Action options shown when the **Refine** button is selected, for example: • Shorten • Elaborate
Recommendation Dialog Props	Recommendation dialog window properties, for example: headerLabel.
WWNA Component ID	Component ID that supports the Now Assist icon, for example: agent-chat.
Default Preset Action	Default action when the trigger button is selected with no text in the chat window.
Table	Table used for the interaction.
Timeout Error Message	Error that displays after a timeout.
Preset Actions	Action options shown when text is entered in the chat window and the trigger button is selected, for example: • Shorten • Elaborate

Sidebar discussion summarization skill

For the Sidebar discussion summarization skill, select the triggers that determine when a Sidebar discussion summary is generated.

The following table lists the triggers that determine when a Sidebar discussion summary is generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Triggers for the Sidebar discussion summarization skill

Trigger	Description
Quick action	Sidebar discussion summary that is generated when the live agent performs the `/summarize` quick action.

Property for the Sidebar discussion summarization skill

Property	Description
Bulleted list	If selected, the Sidebar discussion summary is displayed as an unordered list.

Incident summarization skill

The incident summarization skill includes the inputs that identify the table and fields that are used when an incident summary is generated.

In this release, you can't modify a skill's input data source. The data source contains the tables and fields that the skill relies on.

Triggers for the incident summarization skill

Trigger	Description
Assign modal	Open assign modal during save action when assignment group or assigned to is changed.

The following table lists the inputs for the incident summarization skill.

Inputs for the incident summarization skill

Input	Description
Input table	Incident [incident]
Input fields	• Description • Short description • Work notes • Additional comments • Email
Input template states	• New • WIP • Resolved • Closed

The following table lists the descriptions for the incident summarization skill.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Descriptions for the incident summarization skill

Description	Mandatory for input state
Issue	• New • WIP • Resolved • Closed
Key Actions Taken	• WIP • Resolved • Closed
Resolution	• Resolved • Closed
Affected CIs and Impacted Services	• WIP • Resolved • Closed
Service Level Agreement	• WIP • Resolved • Closed
Child Incidents	• WIP • Resolved • Closed

Incident assist skill

The incident assist skill includes the incident topics to be available in the Now Assist panel.

In this release, you can't modify a skill's input data source. The data source contains the tables and fields that the skill relies on.

Incident assist topics:

- Find similar resolved incidents
- Consult on-call experts from support groups
- Retrieve caller's assets
- Retrieve caller's recent incidents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolution notes generation skill

The resolution notes generation skill includes the inputs that identify the table and fields that are used when the resolution notes are generated for an incident.

In this release, you can't modify a skill's input data source. The data source contains the tables and fields that the skill relies on.

The following table lists the triggers that determine when and how the resolution notes for an incident are generated.

Triggers for the resolution notes generation skill

Trigger	Description
User triggered	If selected, user input is required before resolution notes are generated. Otherwise, resolution notes are generated automatically by default when certain conditions are met.

The following table lists the fields for the Now Assist icon for the resolution notes generation skill.

Now Assist icon

Field	Description
Refine Actions	Action options shown when the **Refine** button is selected, for example: • Shorten • Elaborate

The following table lists the inputs for the resolution notes generation skill.

Inputs for the resolution notes generation skill

Input	Description

Close notes	Closed
Incidents caused by change	Closed

Change request risk explanation skill

The change request risk explanation skill includes the inputs that identify the table and fields that are used when the change risk explanation is generated.

In this release, you can't modify a skill's input data source. The data source contains the tables and fields that the skill relies on.

The following table lists the inputs for the change request risk explanation skill.

Inputs for the change request risk explanation skill

Input	Description
Input table	change_request
Input fields	• Short description • Implementation plan • Assignment group • Risk • Description • Blackout plan • Model type • Similar change requests and the incidents caused by those changes • Risk condition that was met

Configure Now Assist in Virtual Agent for ITSM

Enable your requesters to have a streamlined, conversational experience that is based on generative AI as they submit a catalog item request in Virtual Agent. By offering this generative AI experience, your organization can provide an additional self-service tool.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Detect and mask sensitive data using the Sensitive Data Handler so it is not viewed by the agent or requester. For more information, see:

- Sensitive Data Handler
- Configuring Sensitive Data Handler

About this task

The generative AI capabilities can provide a human-like catalog request experience over the Virtual Agent conversational interface. By using the generative AI capabilities with Virtual Agent, your organization can provide a conversational experience for request submissions.

Drive productivity by providing a virtual agent on familiar channels, such as Slack, Microsoft Teams, and Microsoft Copilot.

When you configure generative AI for catalog item request submissions, your requesters get the following experience:

- Contextual question prompts that enable a more human-like conversation that is based on answers to previous questions.
- Slot filling that recognizes the answers to one or more questions on the requester's input.
- Ability to answer catalog item questions.
- Ability to exit the request submission process at any point.

Although the following catalog item question types are supported in the conversation mode, natural language responses aren't supported for them:

- Reference
- Lookup select box
- Lookup multiple choice
- Requested For
- Attachment
- Multiple choice question with more than 10 choices

Now Assist features supported in Now Assist for ITSM Virtual Agent

Feature	Topic Reference
Upload file formats such as text, PDF, Word (.doc, .docx) and image files such as JPEG and PNG.	Upload documents in Now Assist in Virtual Agent.
Combine AI Search with generative AI chat skills to speed up issue resolution and reduce deflection to a live agent using Now Assist for ITSM in Virtual Agent.	Enhanced chat
Use the structured and unstructured data from ServiceNow records, knowledge bases, and external sources to enhance the performance of Now Assist in Virtual Agent, AI agents, and generative AI skills using Knowledge Graph.	Knowledge Graph
Define crawl settings for external content connectors to crawl source systems and send it to AI Search for indexing.	Configuring External Content Connectors

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature	Topic Reference
Monitor your device's performance and diagnose potential issues.	

Procedure

1. Turn on the required Virtual Agent skills: **Now Assist Multi-Turn Catalog Ordering**, **Now-Assist Q&A Genius Results**, or **Now Assist Topics**.
2. Set up Now Assist in Virtual Agent.
   For more information on how to turn on the skills and set up generative AI for Virtual Agent, see Configuring Now Assist in Virtual Agent.

Note:

- Configure the required conditions for the Virtual Agent skills.
- ITSM Virtual Agent is now replaced with the generative AI Virtual Agent.

ITSM Virtual Agent pre-built LLM topics

ITSM Virtual Agent includes pre-built Large Language Model (LLM) topic conversations designed to help your users complete the common IT-related tasks such as checking and resetting a password.

LLMs are used to identify and trigger the action that a user wants to perform.

ITSM Virtual Agent pre-built LLM topics are read only and have **(Template)** as the suffix in their name. To use them, duplicate the topic in the ITSM Virtual Agent conversation scope and rename it according to your company naming conventions.

For ITSM Virtual Agent pre-built Natural Language Understanding (NLU) topics, see Using ITSM Virtual Agent pre-built topics.

Check Ticket and Support Status	Check the status of your IT tickets and support cases. Once the conversation is initiated, it progresses by collecting data about the ticket one question at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Note: For HR cases, an Admin must allow Core RCA records for Read operation and Write operation. • sys_scope = Now Assist in Virtual Agent • target_scope = Human Resources: Core • target = Table: HR Case • status = Allowed • source = Script Include: ITSMTopicsHelper See Requested restricted caller access (RCA) for more information.
Show Pending Approvals	Check pending approvals that are needed to take action upon and pick those to be processed. You can either Approve or Reject your tickets by picking the list numbers provided to you by the Virtual Agent.

Core ITSM topics

Check IT Ticket Status	Check the status of your IT ticket. Once the conversation is initiated, it progresses by collecting data about the ticket one question at a time.
Escalate IT Ticket	Raise the urgency of your IT ticket for a faster resolution. Escalating a ticket priority requires choosing the incident and verifying the escalation. Users must provide a justification to escalate the incident. Virtual Agent escalates the incident to the next urgency level. For example, from low to medium, or from medium to high. If an incident is already at high-level urgency, Virtual Agent alerts the user to this and asks if the user would like to add a comment to help expedite resolution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Open IT Ticket	Open a ticket leveraging machine-learning algorithms with application logic for predicting similar open tickets. Prevent users from opening duplicate incidents by finding similar incidents and asking if the user wants to add comments to the similar incident.
Service Disruptions	Access all known outage information. When a user asks if a particular system is down, Virtual Agent returns a list of links displaying planned or unplanned outages and any system degradations. Users can click the links for more detailed information about a specific outage or degradation, as well as click **Show more** when additional outages are known.

Password reset topics

End users can initiate a password management conversation with Virtual Agent by entering the keywords `Reset`, `Change`, `Unlock`, or `Password`.

Users who are not logged in can perform the Reset Password and Unlock Account actions. Users who are logged in can perform the Change Password, Reset Password, and Unlock Password actions.

Requirements:

- Password Reset (com.glideapp.password_reset) plugin
- Password Reset Virtual Agent Conversations (com.snc.password_reset.virtual_agent) plugin

Note:
In order for the password reset process to be available in Virtual Agent, ensure that you selected the **Enabled on Virtual Agent** check box in the Password Reset process configuration page.

For more information about the password reset process, see Password Reset for Virtual Agent.

Change Password	Request to change your user password. User must be logged in.
Reset Password	Request to reset your user password.
Unlock Account	Request to verify your locked user account.

The following identity verification options are supported for password reset in Virtual Agent conversations. Custom verifications are not supported in Virtual Agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Personal data verification: User provides specific pieces of personal data.
- Google Authenticator verification: User enters the generated code from the Google service Authenticator mobile app.
- SMS code verification: User enters the code received via mobile text message.
- Email code verification: User enters the code received via email.
- Security question verification: User enters the configured security question answers.

For more information, see Configure your Password Reset process.

Actionable notification topics

ITSM Virtual Agent includes pre-built actionable notifications used to send interactive messages to a user based on pending tasks or alerts, such as RITM and request notifications, task approval notifications, and incident notifications.

Note:
You must activate notifications in Workflow Studio. For details, see Set up actionable notifications for ITSM Virtual Agent.

Requested items (RITMs)

Topic	Actionable notification
RITM View Comment	Notification: Requested Item commented Sent to the approver of a Service Catalog request.
RITM Add Comments	Notification: Requested item on behalf of requester Sent to the end user when a Service Catalog request is opened on the end user's behalf.
View Request Details for Approver	• Notification: Request approval reminder Sent to the approver of a Service Catalog request. • Notification: Approval request for requests Sent to the end user who made the change request when an approval for a change is requested.
View RITM Details For Approver	• Notification: Approval request for requested items Sent to the approver of a Service Catalog item request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Requested items (RITMs) (continued)

Topic	Actionable notification
	• Notification: Requested Item approval reminder Sent to remind the approver of a pending Service Catalog request.
View RITM Details For Requester	Notification: Requested item on behalf of requester Sent to the end user when a Service Catalog request is opened on the end user's behalf.

Incidents

Topic	Actionable notification
Add Comment To Incident	Notification: Incident on behalf of caller Sent to end users whenever an incident is opened on their behalf.
Close Incident	Notification: Incident resolved Sent to end users whenever one of their incidents is resolved by someone other than the end user.
Mark Incident Unresolved	Notification: Incident resolved Sent to end users whenever one of their incidents is resolved by someone other than the end user.
View Comments	Notification: Incident commented Sent to end users whenever a comment is added to their incident by someone other than the end user.
Resolve Incident	• Notification: Incident commented Sent to end users whenever a comment is added to their incident by someone other than the end user. • Notification: Incident on behalf of caller Sent to end users whenever an incident is opened on their behalf.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task approvals

Topic	Actionable notification
Approve Sysapproval Approver	• Notification: Other approval Sent to the approver when a non-task record (such as a Knowledge Base article) needs approval. • Notification: Task approval Sent to the approver about a newly created task that needs review and approval.
Reject Sysapproval Approver	
Show Approval Details	

Customize a Now Assist Virtual Agent topic

Copy and customize a core ITSM Virtual Agent topic and use that topic to track the status of common IT-related tasks using Now Assist.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

Procedure

1. Navigate to **All** > **Conversational Interfaces** > **Virtual Agent** > **Designer**.
2. Select a topic template.

Available Core ITSM topic templates

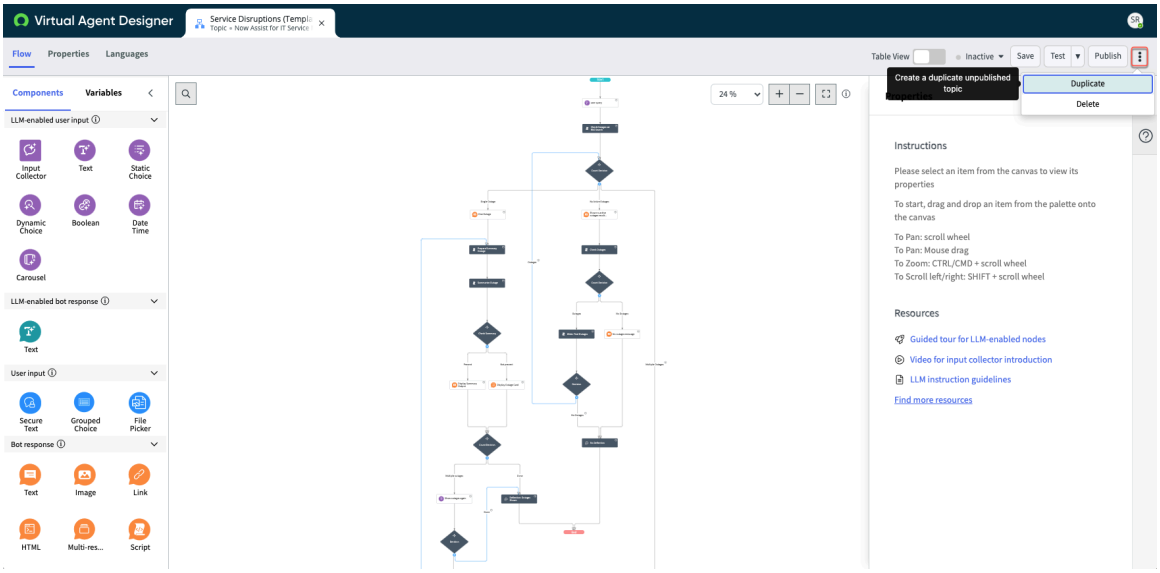
Template	Usage
Check IT Ticket Status (Template)-LLM	Check the status and progress of IT tickets and incidents.
Escalate IT Ticket (Template)-LLM	Escalate an IT ticket or incident that's already open or by reopening a closed one.
Open IT Ticket (Template)-LLM	Create an IT ticket or incident.
Service Disruptions (Template)-LLM	Check the status of outages or service disruptions.

3. Select a template for a topic to track the status.

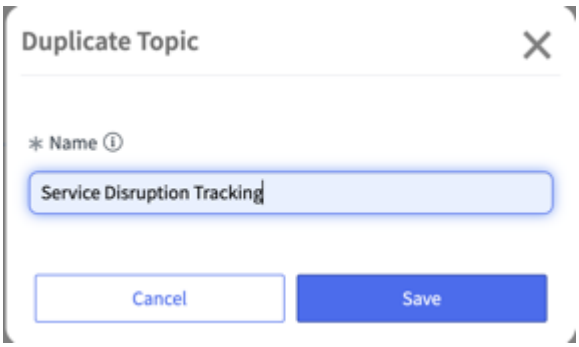
Note:
The images show an example of the Service Disruption flow. You can follow the same actions for any core ITSM topic template.

4. Select the Topic actions icon at the top-right corner of the screen and select **Duplicate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

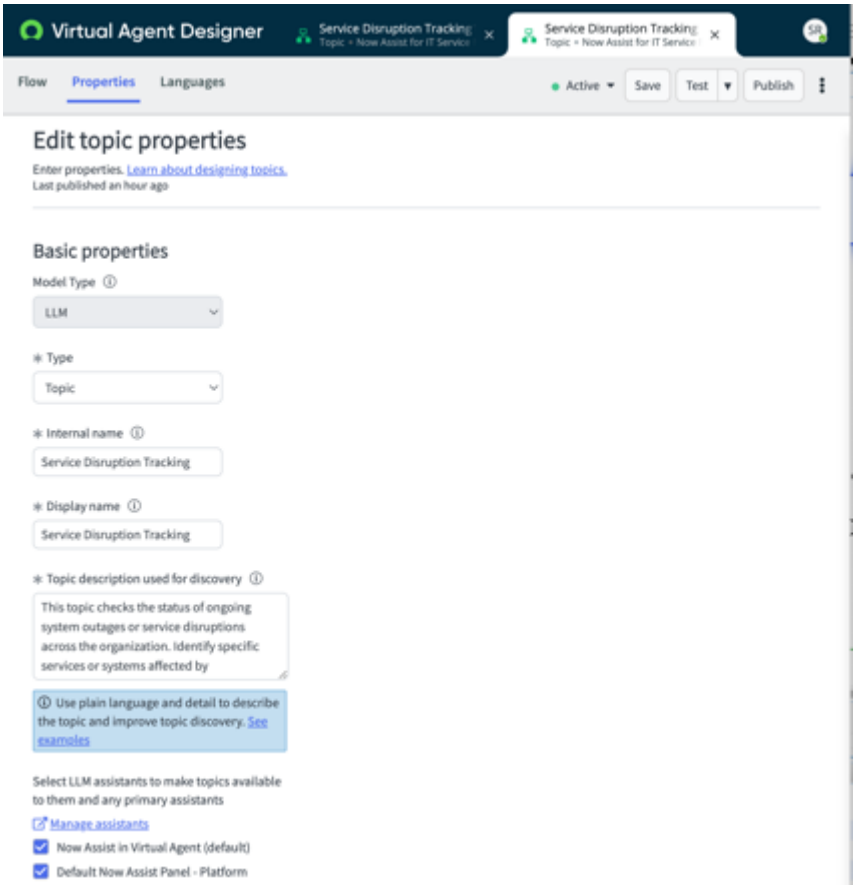


5. In the **Name** field, enter the name for the topic you want to use for the summarization.



6. Select **Save**.
7. In the topic you've duplicated, select the **Properties** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. **Optional:** Enable the following check boxes:
   - Now Assist in Virtual Agent (default).
   - Default Now Assist Panel - Platform.
9. Select **Save**.
10. Select **Publish**.

> **Note:**
> If you have multiple topics to summarize the same skill, you can unpublish the ones that you do not intend to use.

Customize a Now Assist for IT Service Management (ITSM) skill

If you have the admin role, you can customize a Now Assist for IT Service Management (ITSM) skill so that agents can use the generative AI skills in Service Operations Workspace for ITSM and in Core UI.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

About this task

From the Now Assist Admin console, you can select the input tables, related lists, and fields for each input template of the incident summarization skill. You can then configure prompt headers to include in the generated summary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Admin** > **Now Assist Admin**.
2. Select the **Now Assist Skills** tab.
3. In the **Technology** feature group, select **ITSM** from the product list.
4. Activate and copy the Now Assist for ITSM feature skill for customization.

   a. On the feature card that is associated with the skill that you would like to activate, select **View details**.

   b. In the All available skills section, locate the skill that you would like to activate and select **Activate skill**.
   You can choose to make a copy of the skill before activating it.

   c. Select the more actions icon for the skill in the Active skills section, and create a copy that you can customize by selecting **Make a copy**.
   The copy that you make is listed in the Active skills section.

   > **Note:**
   > You can only duplicate a summarization skill or the Change risk explanation skill. The fields for the skills that you can't duplicate have read-only values.

   d. Select the copied skill from the Active skills section to open it.
   A guided setup leads you through the configuration of the general details, input, prompt, availability, display, review, and activation of the customized skill.

5. In the General details step, fill in the fields.
   For information about the inputs and triggers for each skill, see Skill inputs and triggers for Now Assist for IT Service Management (ITSM).

   a. Enter a name and description for the skill.

   b. Select **Save and continue** to go to the next step.

6. Choose input data.

   Configure the base input table fields and related lists for the different input templates (New, WIP, Resolved, and Closed states) for the skill.

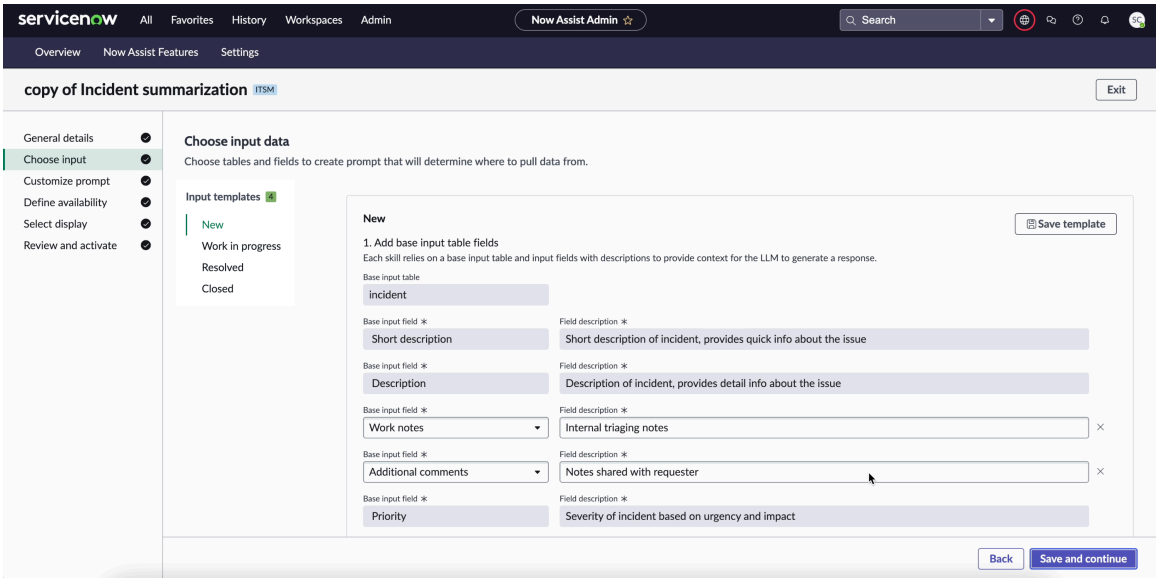
   Each skill relies on a base input table and input fields with descriptions to provide context for the Now LLM Service to generate a response.

   Select only those related tables that are offered with the base system as part of the input data.

   a. For each input template state (New, WIP, Resolved, and Closed), select **+New related table field** and configure the base input table fields.

      Add multiple base input fields if more inputs are needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following table lists the base input table fields and descriptions, including a relevant example.

Base input fields

Field	Description
Base input field	Field in the Incident table whose value this skill uses in its response. For example, `Short description`.
Field description	Description of the base input field value. For example, `Short description of incident, provides quick info about the issue.`

b. For each input template state (New, WIP, Resolved, and Closed), configure the rule conditions by using the condition builder to filter the data further.

The rule conditions determine when the input template is used. By default, the record state determines the input template that the Now LLM Service uses.

You can build the condition out further by selecting **+New condition** and configuring additional parameters.

The following table lists the input template states.

Input template states

State	Description
New	State is New.
WIP	State is Work in Progress.
Resolved	State is Resolved.

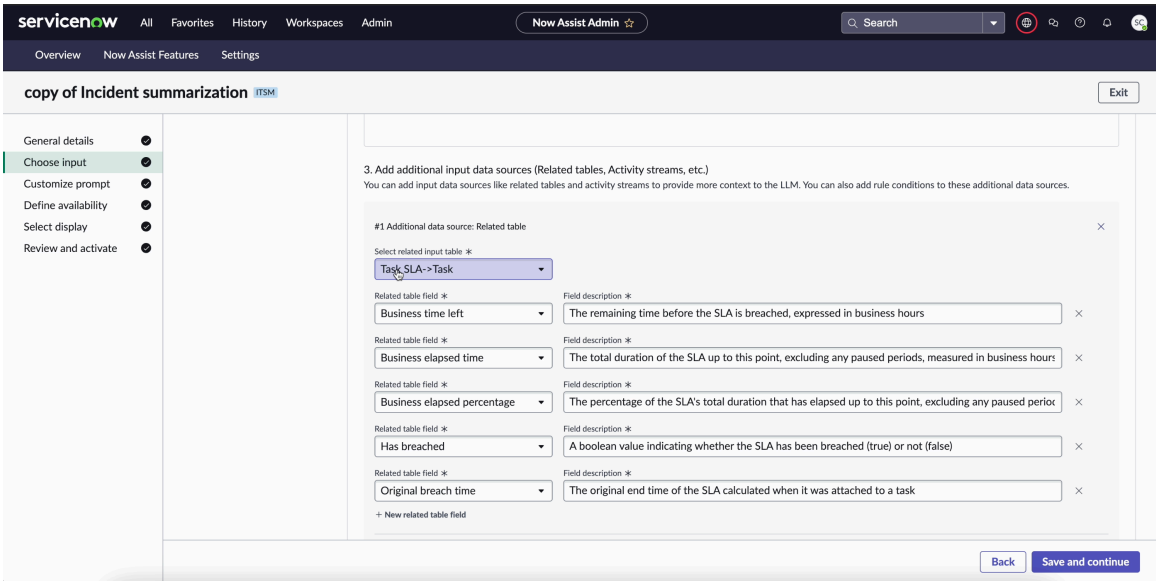
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Description
Closed	State is Closed.

c. For each input template state (New, WIP, Resolved, and Closed), select **+New data source** to configure the additional related table and activity stream data, as needed.

Adding the input data sources, such as the related tables and activity streams, provide more context to the Now LLM Service in a related list.

You can also add the rule conditions to these additional related table and activity stream data sources.



The following table lists the data sources you can add to the input data.

Additional data sources

Data source	Description
Related Table	Fields for a related list: ▪ Select related input table ▪ Related table field ▪ Field description Configuring the related table fields follows the same format as the base input table fields in the Choose input step.
Activity: Email	Email that is attached to the incident in the incident summarization.
Activity: Attachment	Summarizes attachments of type PNG or JPEG in the Incident summarization skill record using Document Intelligence.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data source	Description
	Note: Attachment summaries aren't available in child incident records and are only supported in the English language.

d. Select **Save and continue** to go to the next step.

e. **Optional:** Handling custom state choices for the Change request summarization skill.

Note:
When you add a new state or modify an existing state in a Change request record, you must add the GenAI Summary Card to the Change Overview Container record to display the **Summarize** button.

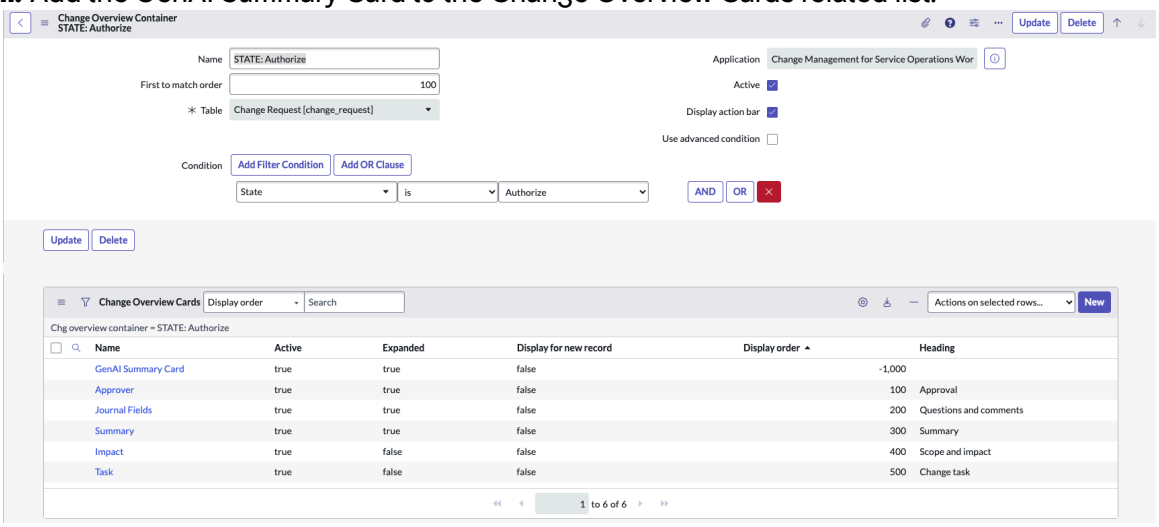
To add the GenAI Summary Card:

i. Navigate to **All** > **Change** > **Workspace Configuration** > **Overview Container.**

Make sure the application scope is set to **Change Management for Service Operations Workspace**.

ii. In the Change Overview Containers list, select the state that you've added or modified.

iii. Add the GenAI Summary Card to the Change Overview Cards related list.



For more information, see the KB article on Handling custom state choices for the Change request summarization skill.

7. Trigger frequency
Refreshes the sentiments for all updated incidents. You can set the trigger frequency for the refresh using the *`Sentiment Analysis Scheduled Job (Incident)`* scheduled job. See Sentiment Analysis for more information on Now Assist Sentiment Analysis.

8. Cluster incidents
If you're using the Suggested steps generation skill, select **Launch clustering** in the **Record clustering** screen to group records based on similar past closed incidents.

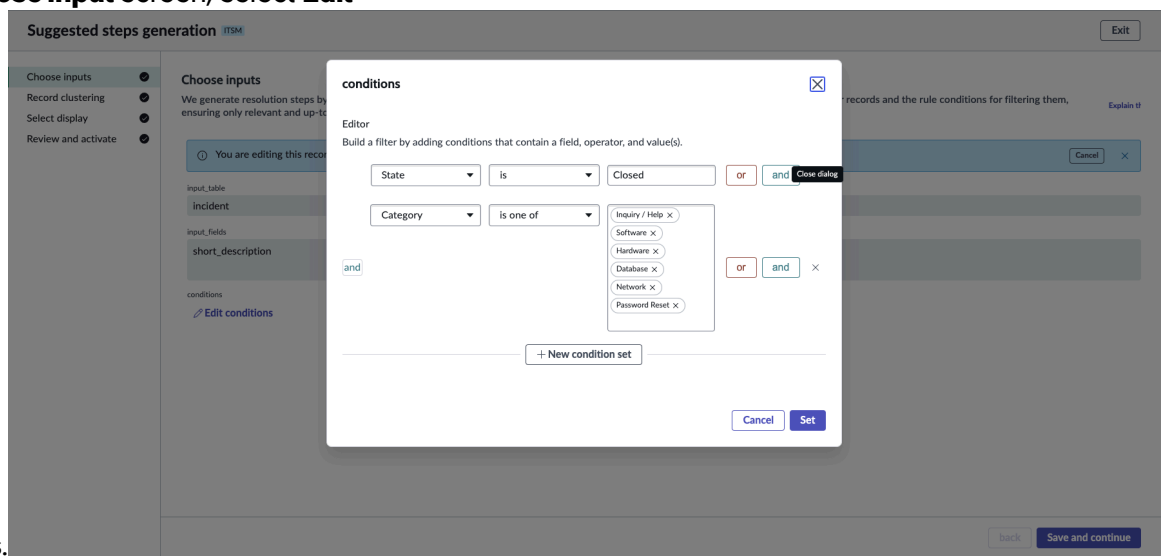
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- You should have at least 2000 records for successful clustering. If you get an error that there aren't enough records to cluster, broaden your filter criteria. You can perform this action by setting the rule conditions to include more records or add more data.
- For information on troubleshooting steps to resolve issues with the Suggested steps generation skill, see Troubleshoot Suggested steps generation skill set up.
- Domain separation is not supported for the Suggested steps generation skill.

To broaden the criteria:

a. In the **Choose input** screen, select **Edit conditions**.



Select **Switch scope** if you're unable to edit the conditions.

b. Optional: Change the conditions as needed and select **Set**.
The updates you make are displayed in the **GAF Suggested Steps ITSM grouping** in Now Assist Skill Config record.

9. Customize the prompt.

Review and test the prompt for each input template configuration. You can edit the prompt by adding new predefined sections and ordering the sections as needed.

a. For each input template state (New, WIP, Resolved, and Closed), select the prompt sections from the list of available sections to include in the generated summary.

To add a section, you must configure the relevant input data in the Choose input data step before you do this step.

The available prompt sections that you can select:

- **Issue**
- **Key Actions Taken**
- **Resolution**
- **Service Level Agreement**
- **Affected CIs and Impacted Services**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Child Incidents**

> **Note:**
> When there are too many child incidents and the size of the data goes beyond the LLM token limit, the child incidents section shows the "Too much information and cannot be shown" message.

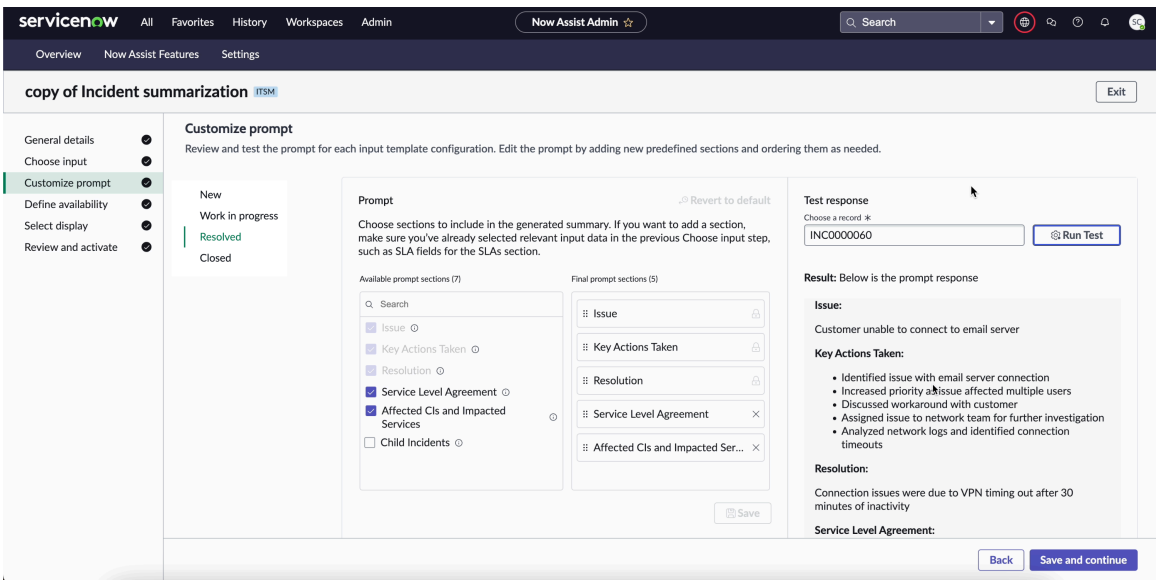
The following table lists the mandatory prompt headers.

Mandatory prompt headers

Input template state	Mandatory prompt header
New	Issue
Work in progress	▪ Issue ▪ Key Actions Taken
Resolved	▪ Issue ▪ Key Actions Taken ▪ Resolution
Closed	▪ Issue ▪ Key Actions Taken ▪ Resolution

b. Select **Save** to continue to the test response.

c. Select the incident record in the Test response section, and test the prompt response output format by selecting **Run Test**.



The prompt response is shown. You can make changes to your selections and retest as needed.

d. Select **Save and continue** to go to the next step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Define availability.

    Define how the skill will be available to users.

    a. Configure the skill to be always available to users, or select the conditions that must be met before the skill is available.
    Selecting **Customize skill availability** displays a condition builder to filter the data further.

    b. Select **Save and continue** to go to the next step.

11. Select display.
    Configure where to display the incident summarization.

    a. Select either **In-product**, or **Now Assist panel**.

    - **In-product**: When selected, Now Assist skills are displayed in all ITSM products (on forms and in workspaces).

      For the skills that appear in-product, select the down arrow to identify the roles that can use the skill.

    - **Now Assist panel**: When selected, Now Assist skills are available in the Now Assist panel.

      If you don't see this option, you must activate the Now Assist panel. For more information, see Turn on the Now Assist panel.

      For the skills that appear in the Now Assist panel, select the down arrow to identify the roles that can use the skill.

    b. Select **Save and continue** to go to the next step.

12. Review and activate.
    Review your choices and select **Activate** to complete the skill customization.
    You can now select **Summarize** in an incident and generate the custom incident summary.

Customize a Now Assist for IT Service Management (ITSM) change risk explanation skill

Enhance the efficiency to explain the risk of a change request by adding input fields and custom fields. You can also add more information to generate the explanation the using Now Assist for ITSM.

Before you begin

Role required: sn_nowassist_admin.nsa_admin

About this task

Procedure

1. Navigate to **Admin** > **Now Assist Admin**.
2. Select the **Now Assist Skills** tab.
3. In the **Technology** feature group, select **ITSM** from the product list.
4. Activate and copy the desired Change request skill for customization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Change request** card, select **View details**.

b. In the All available skills section, locate the skill that you would like to activate and select **Activate skill**.
You can choose to make a copy of the skill before activating it.

c. Select the More actions icon ... for the skill in the Active skills section, and create a copy that you can customize by selecting **Make a copy**.
The copy that you make is listed in the Active skills section.

d. Select the copied skill from the Active skills section to open it.
A guided setup leads you through the configuration of the general details, input, prompt, availability, display, review, and activation of the customized skill.

5. In the General details step, fill in the fields.
For information about the inputs and triggers for each skill, see Skill inputs and triggers for Now Assist for IT Service Management (ITSM).

   a. Enter a name and description for the skill.

   b. Select **Save and continue** to go to the next step.

6. Choose the change request input data.

   Configure the base input table and fields that are used as the source to generate a response.

   Each skill relies on a base input table and input fields with descriptions to provide context for the Now LLM Service to generate a response.

   Select only those related tables that are offered with the base system as part of the input data.

   a. Add base input table fields.

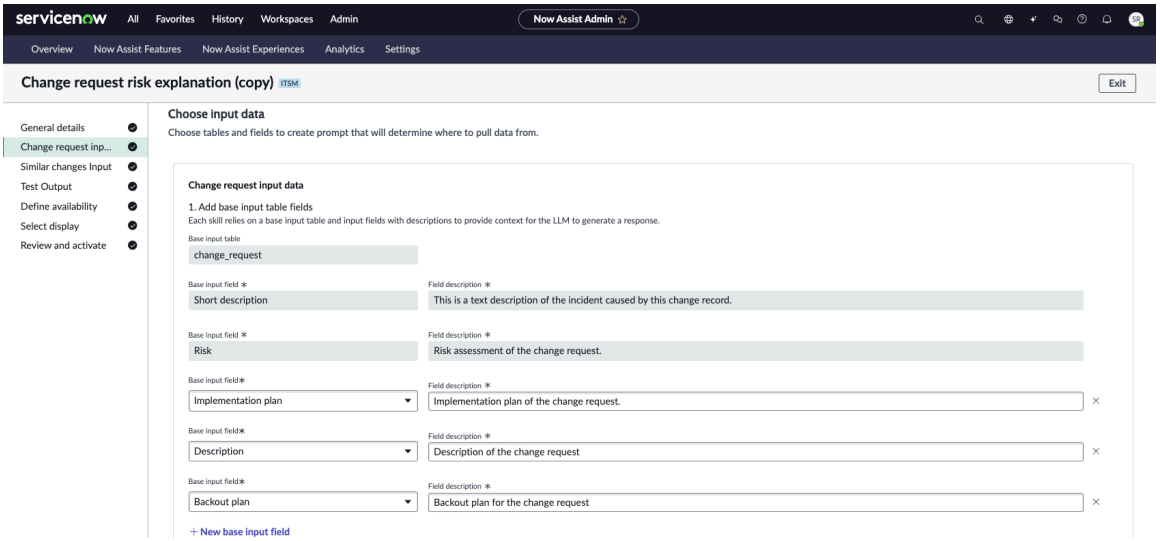
      The following Base input fields values are available by default:

      - Short description
      - Risk
      - Implementation plan
      - Description
      - Backout plan

      You can edit or remove the **Implementation plan**, **Description**, and **Backout plan** fields. You can also add new fields and descriptions for them by selecting **+New base input field**.

      Important:
      If you add a new field with the same name as an existing field, the name and description of the new field will override the description of the existing field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



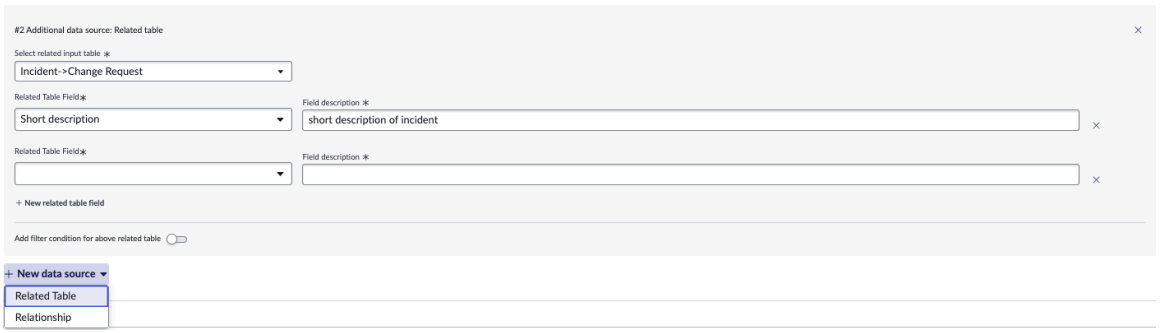
The following table lists the base input table fields and descriptions, including a relevant example.

Base input fields

Field	Description
Base input field	Field in the Incident table whose value this skill uses in its response. For example, `Short description`.
Field description	Description of the base input field value. For example, `Short description of incident, provides quick info about the issue.`

b. Add additional input data sources.

The data sources could include related tables and relationships. The Change Risk Details related input table with read-only fields is available by default. You can't edit the existing data source fields but you can add new related tables or relationships by selecting **+New data source** and then selecting the desired option.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New data sources

Data source	Description
Related Table	Fields for a related list: ▪ Select related input table ▪ Related table field ▪ Field description Configuring the related table fields follows the same format as the base input table fields in the Choose input step. **Important:** When you add a new related table with the same name as an existing table, the fields and the descriptions in the new table will override the fields and descriptions in the existing table.
Relationship	Relationship between the input table and the table field.

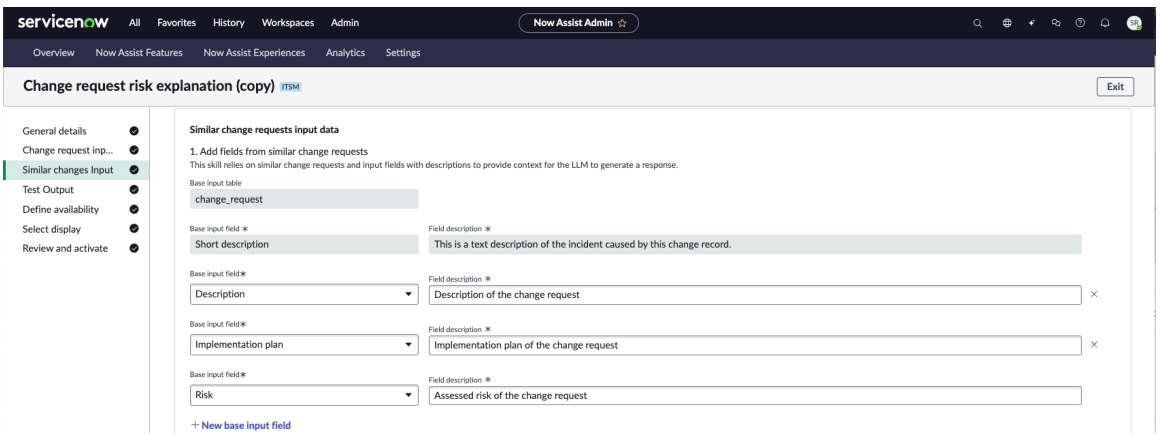
c. Select **Save and continue** to go to the next step.

d. Select input data from past similar changes.

Adding tables and fields as the input data sources provides more context to the Now LLM Service to generate the explanation.

If you turn the **Use similar changes as a data source** toggle button off, past similar changes won't be included.

Note:
You must have AI Search implemented to retrieve similar changes. For more information on AI Search, see AI Search.



The **Short description** field is available by default. You can edit or remove the following fields:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

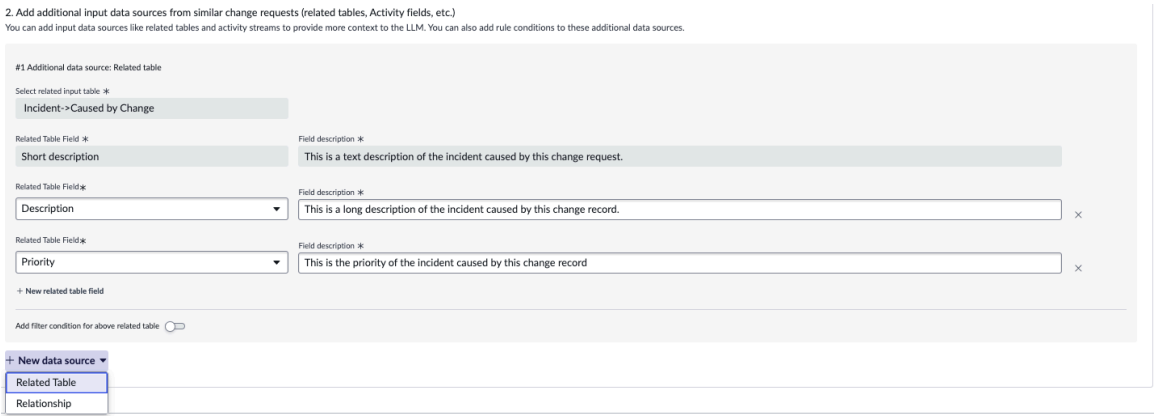
- Description
- Risk
- Implementation plan

You can also add new fields and descriptions for them by selecting **+New base input field**.

> **Important:**
> If you add a new field with the same name as an existing field, the name and description of the new field will override the description of the existing field.

The Incident Caused by Change input table is available by default as an additional data source. In this table, the **Short description** field is read only. You can edit or remove the **Description** and **Priority** fields.

> **Important:**
> When you add a new related table with the same name as an existing table, the fields and the descriptions in the new table will override the fields and descriptions in the existing table.



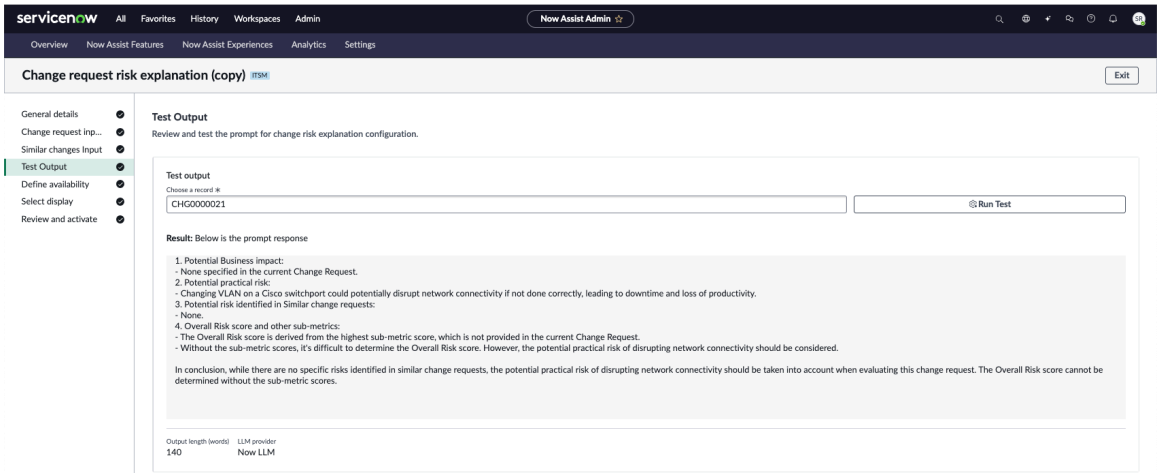
e. Select **Save and continue** to go to the next step.

7. Test the output.

a. Select the change record in the Test output section, and test the prompt response output format by selecting **Run Test**.

If the result shows that risk isn't calculated for the change request, then the prompt created isn't effective. If the output displays a prompt response, then the LLM has used the configurations in the previous steps and has passed them to the prompt to create the explanation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



b. Select **Save and Continue** to go to the next step.

8. Define availability.

Define how the skill will be available to users.

a. Configure the skill to be always available to users, or select the conditions that must be met before the skill is available.
Selecting **Customize skill availability** displays a condition builder to filter the data further.

b. Select **Save and continue** to go to the next step.

9. Select display.
Configure where to display the incident summarization.

a. Select either **In-product**, or **Now Assist panel**.

- **In-product**: When selected, Now Assist skills are displayed in all ITSM products (on forms and in workspaces).

  For the skills that appear in-product, select the down arrow to identify the roles that can use the skill.

- **Now Assist panel**: When selected, Now Assist skills are available in the Now Assist panel.

  If you don't see this option, you must activate the Now Assist panel. For more information, see Turn on the Now Assist panel.

  For the skills that appear in the Now Assist panel, select the down arrow to identify the roles that can use the skill.

b. Select **Save and continue** to go to the next step.

10. Review and activate.
Review your choices and select **Activate** to complete the skill customization.

Using agentic workflows in Now Assist for ITSM

Use the IT Service Management AI agent collection to complete tasks autonomously.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Available agentic workflows for IT Service Management AI agent collection

Agentic workflow name	Description	Available AI agents
Triage and categorize ITSM incidents	Enables fulfillers to determine the category, subcategory, and configuration item automatically for a given incident. After categorizing the incident, it looks for related major incidents or known problems and links them automatically.	**1.** Categorize incident AI agent **2.** Link major incident AI agent **3.** Link incident to problem AI agent
Investigate and resolve ITSM incidents	Provides recommendations for a resolution using catalog, Knowledge, and past incidents and sends the information to the user.	**1.** Find catalog item AI agent **2.** ITSM incident resolution investigation AI agent
Manage Microsoft 365 group members	Adds or removes groups and email distribution lists from the Microsoft 365 group.	Microsoft 365 group membership AI agent
Generate post incident reviews	Generates a post-incident report for major incidents and notifies the fulfiller.	Post-incident review AI agent
Generate change request plans	Generates a comprehensive implementation, test, and backout plan based on the specified change request number. It also analyzes the potential risk and impact of a change request and proposes a justification.	**1.** Change implementation plan AI agent **2.** Change backout plan AI agent **3.** Change test plan AI agent **4.** Change risk and impact analysis AI agent **5.** Change justification proposal AI agent **6.** Finish change plan AI agent
Notify users with Twilio	Sends text messages to recipients using Twilio.	Twilio SMS text AI agent

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
By default, all agentic workflow and AI agent records are read-only.

To run the AI agents autonomously, you must first duplicate the agentic workflow, and then proceed with the following steps:

- Activate the agentic workflow.
- Activate all agents within the agentic workflow.
- Activate the trigger to invoke the agentic workflow automatically. The triggers for each agentic workflow must be unique. If you prefer to invoke it manually, activating the trigger isn't necessary.
- Azure OpenAI is recommended for ITSM agentic workflows. For information on Large Language Models (LLMs) for AI agents and agentic workflows, see Select the LLM for AI agents and agentic workflows.

Note:
The Notify users with Twilio agentic workflow can only be invoked using a manual trigger.

Looking for an AI agent?

- There might be AI agents installed with the Now Assist application that are not used in agentic workflows. To learn how to see all agents that are available on your instance, see Find AI agents.
- To find agents that might not be installed on your instance, visit the AI Agent Marketplace on the ServiceNow Store.

IT Service Management AI agent collection Triage and categorize ITSM incidents agentic workflow

Use the Triage and categorize ITSM incidents AI agent team to assign incident categories, subcategories, configuration items (CI), major incidents, and known problems autonomously.

Triage and categorize ITSM incidents agentic workflow overview

Using the Triage and categorize ITSM incidents agentic workflow, autonomously assign incident categories by assigning a category, subcategory, and a configuration item (CI) to incidents based on the incident short description. After categorizing the incident, automatically link incidents to major incidents or known problems.

To modify the Triage and categorize ITSM incidents agentic workflow, duplicate it, and adjust the settings according to your requirements.

Note:
You must enable the semantic indexing for the Problem table when you duplicate the agentic workflow. For more information, see Semantic Index Field form.

Important:
When you modify an agentic workflow, AI agent, or a tool, make sure that you update all instructions accordingly.

Important:
To search for related major incidents, you must activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim). For more information, see Activate Incident Management - Major Incident Management.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Triage and categorize ITSM incidents agentic workflow

This workflow does the following:

1. Automatically categorizes the incidents.
2. Then, searches for related major incidents and if found, links them to the incident.
3. If no major incidents are found, then it searches for related problems, and if found, links them to the incident.

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Triage and categorize ITSM incidents**.

Important:
In the Edit trigger form, make sure that the **Active** button is turned on to enable the AI agent to trigger autonomously. You must enter the sys_id of the user with the itil role when the trigger is activated.

Setting automatic or manual triggers for the agentic workflow

Based on the incident assignment, state, and priority, the Triage and categorize ITSM incidents agentic workflow is triggered either automatically or manually.

Type of trigger	Field values
Automatic	• **State** is **New** • **Assigned to** is **empty** • **Priority** is **3, 4, or 5**
	• **State** is updated to **In progress** • **Assigned to** is empty • **Priority** is **3, 4 and 5**
Manual	• **State** is **In progress** • **Assigned to** isn't empty

AI agents used in the Triage and categorize ITSM incidents agentic workflow

The Triage and categorize ITSM incidents agentic workflow uses a team of AI agents to identify the category, subcategory, and configuration item for an incident automatically, and link associated major incidents or known problems.

Important:
In the Define availability screen for the AI agent, make sure that the **Status** field is enabled to activate the AI agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents and their roles listed in the order of execution in the Triage and categorize ITSM incidents agentic workflow

AI agent	AI agent role
Categorize incident AI agent	Automatically assigns service, service offerings, and configuration items (CI) to the incidents.
Link major incident AI agent	**Important:** To search for related major incidents, you must activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim). For more information, see Activate Incident Management - Major Incident Management. If this AI agent identifies a related, most similar major incident, it automatically links it to the current incident and ends the workflow.
Link incident to problem AI agent	If the Major incident linker AI agent doesn't find a related major incident, then the Incident problem linker AI agent takes over. If it identifies any ongoing problem that best matches the incident, then it automatically links it to the incident.

Assigning incident categories

In the agentic workflow record:

1. Review the information in the Describe and connect screen and in the Define trigger screen. Make the necessary updates, and then select **Save and Continue**.
2. In the Select display screen:
   a. Choose where you want the agentic workflow output to be displayed.
   b. Use the arrow next to the display option to add roles that can access the agentic workflow.

      Note: The itil role is added by default.

   c. Select **Save and test**.

      The agent executes the request for the agentic workflow.

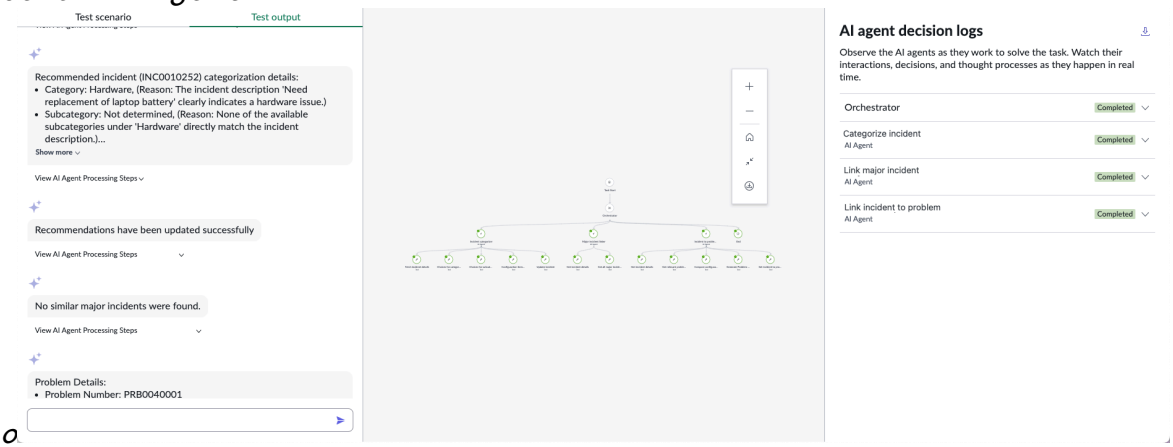
Example of Triage and categorize ITSM incidents agentic workflow output in the *ServiceNow AI Agent Studio*



In the AI Agent Studio, the human agent gets notified as soon as the category recommendation is generated so that they can follow the on-screen instructions and complete the task. For more information, see Request the generative AI capabilities in ITSM by using the Now Assist panel.

IT Service Management AI agent collection Investigate and resolve ITSM incidents agentic workflow

Use the Investigate and resolve ITSM incidents AI agent team to get recommendations to resolve an incident based on the incident number. Check for related catalog items, Knowledge articles, and similar resolved incidents to generate resolution steps for the incident.

Investigate and resolve ITSM incidents agentic workflow overview

Using the Investigate and resolve ITSM incidents agentic workflow:

1. Check for related catalog items and select the most relevant item.
2. Check for Knowledge articles and similar incidents.
3. Get recommended steps for incident resolution.

To modify the Investigate and resolve ITSM incidents agentic workflow, duplicate it, and adjust the settings according to your requirements.

> **Important:**
> When you modify an agentic workflow, AI agent, or a tool, make sure that you update all instructions accordingly.

Link catalog items and Knowledge articles to incidents

When you make a query or a request in the Now Assist panel, you can get recommendations for relevant catalog items. After you select a catalog item, the workflow uses relevant Knowledge articles and similar incidents to get recommended steps for incident resolution.

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Investigate and resolve ITSM incidents**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting manual triggers for the agentic workflow

The Investigate and resolve ITSM incidents agentic workflow is triggered manually based on the following conditions:

Note:
In the **Define trigger** screen, the value in the **Run as** field must be set to **Assigned to**.

- **State** is updated to **In progress**
- **Assigned to** isn't empty

AI agents used in the Investigate and resolve ITSM incidents agentic workflow

In the Investigate and resolve ITSM incidents agentic workflow, use specific AI agents for each type of resolution to generate the desired recommendations.

Important:
In the Define availability screen for the AI agent, make sure that the **Status** field is enabled to activate the AI agent.

AI agents and their roles listed in the order of execution in the Investigate and resolve ITSM incidents agentic workflow

AI agent	AI agent role
Find catalog item AI agent	Recommends catalog items related to the selected incident.
ITSM incident resolution investigation AI Agent	1. Looks up similar incidents and provides an incident resolution. 2. Looks for Knowledge articles and adds relevant Knowledge articles to the incident.

Generating a recommendation using the Investigate and resolve ITSM incidents agentic workflow

In the agentic workflow record:

1. Review the information in the Describe and connect screen and in the Define trigger screen, make any necessary updates, and then select **Save and Continue**.
2. In the Select display screen:
   a. Choose where you want the agentic workflow output to be displayed.
   b. Use the arrow next to it to add roles that can access the agentic workflow.

      Note:
      The itil role is added by default.

   c. Select **Save and test**.

      The agent executes the request for the agentic workflow.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the AI Agent Studio, the human agent gets notified as soon as the recommendations to resolve incidents get generated so that they can follow the on-screen instructions and complete the task. For more information, see Request the generative AI capabilities in ITSM by using the Now Assist panel.

IT Service Management AI agent collection Manage Microsoft 365 group members agentic workflow

Use the Microsoft 365 group membership AI agent to manage users in the Microsoft 365 email distribution list.

Manage Microsoft 365 group members agentic workflow overview

Using the Manage Microsoft 365 group members agentic workflow, add or remove names and their email address from the Microsoft 365 email distribution list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- To enable the Manage Microsoft 365 group members agentic workflow, you must install the Microsoft Entra ID spoke. For more information, see Microsoft Entra ID Spoke (formerly Microsoft Azure Active Directory spoke).
- After you add or remove users to the group using the Microsoft 365 agentic workflow, follow the instructions listed in the table.

If	Do this
You want the workflow output of adding or removing users to go through an approval process.	1. Add the *sn_itsm_aia.office_365_group_member_appr* system property. **Note:** This property is set to **true** by default. 2. Add the *sn_itsm_aia.office_365_group_member_appr* system property. 3. Add the sys_id of the group that you want to use for approvals as the value of the *sn_itsm_aia.office_365_group_member_appr* system property. 4. Add users that you'd like to approve the output for this agentic workflow in the **Office 365 Approval** group.
You don't want the workflow output of adding or removing users to go through an approval process.	Set the *sn_itsm_aia.office_365_group_member_appro* system property to **false**.

Note:
The Manage Microsoft 365 group members agentic workflow doesn't have a trigger and is invoked manually.

To modify the Manage Microsoft 365 group members agentic workflow, duplicate it, and adjust the settings according to your requirements.

Important:
When you modify an agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Manage Microsoft 365 group members

Autonomously manage adding and removing users in a Microsoft 365 email distribution list.

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Manage** *Microsoft 365* **group members**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

AI agents used in the Manage Microsoft 365 group members agentic workflow

The Microsoft 365 group membership AI agent is used to look up Microsoft 365 groups and add or remove members from the email distribution list.

> **Important:**
> In the Define availability screen for the AI agent, make sure that the **Status** field is enabled to activate the AI agent.

Add or remove group members in a Microsoft 365 group

In the agentic workflow record:

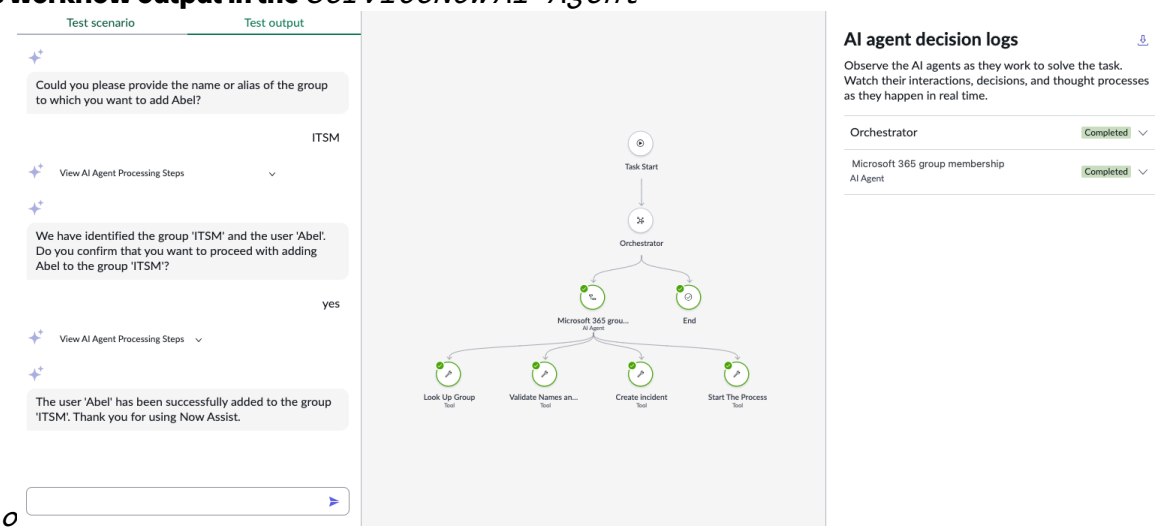
1. Review the information in the Describe and connect screen and in the Define trigger screen, make the necessary updates, and then select **Save and Continue**.
2. In the Select display screen:
   a. Choose where you want the agentic workflow output to be displayed.
   b. Use the arrow next to it to add roles that can access the agentic workflow.

      > **Note:**
      > The itil role is added by default.

   c. Select **Save and test**.

      The agent executes the request for the agentic workflow.

Example of the Manage Microsoft 365 group members agentic workflow output in the *ServiceNow AI Agent Studio*



In the AI Agent Studio, the human agent gets notified as soon as one or more users are added or removed so that they can follow the on-screen instructions and complete the task. For more information, see Request the generative AI capabilities in ITSM by using the Now Assist panel.

IT Service Management AI agent collection Generate post incident reviews agentic workflow

Use the Post-incident review AI agent to generate a review report after a major incident is closed. You can review and revise this report if necessary.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate post incident reviews agentic workflow overview

Using the Generate post incident reviews agentic workflow, generate reports after an incident is closed. The report includes the following sections:

- Executive Summary
- Customer/Service Impact
- Detailed Technical Summary
- Action Items & Prevention

The time taken to resolve incidents may be reduced, and the business impact may be minimized when responses to major incidents are both effective and efficient. For information on how major incidents are created, see Major Incident Management process.

To modify the Generate post incident reviews agentic workflow, duplicate it, and adjust the settings according to your requirements.

> **Important:**
> When you modify a use case, AI agent, or tool, make sure that you update all instructions accordingly.

Generate post incident reviews agentic workflow

Autonomously generate a report for the fulfiller once a major incident has been closed.

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Post-incident reporting**.

> **Important:**
> In the Edit trigger form, make sure that the **Active** button is turned on to enable the AI agent to trigger autonomously.

> **Important:**
> To enable the display of the Generate post incident reviews agentic workflow, you must activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim). For more information, see Activate Incident Management - Major Incident Management.

AI agents used in the Generate post incident reviews agentic workflow

The Post-incident review AI agent is used to fetch incident details, related records, and the post incident summary.

> **Important:**
> In the Define availability screen for the AI agent, make sure that the **Status** field is enabled to activate the AI agent.

Generating the report

In the agentic workflow record:

1. Review the information in the Describe and connect screen and in the Define trigger screen, make the necessary updates, and then select **Save and Continue**.
2. In the Select display screen:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Choose where you want the agentic workflow output to be displayed.

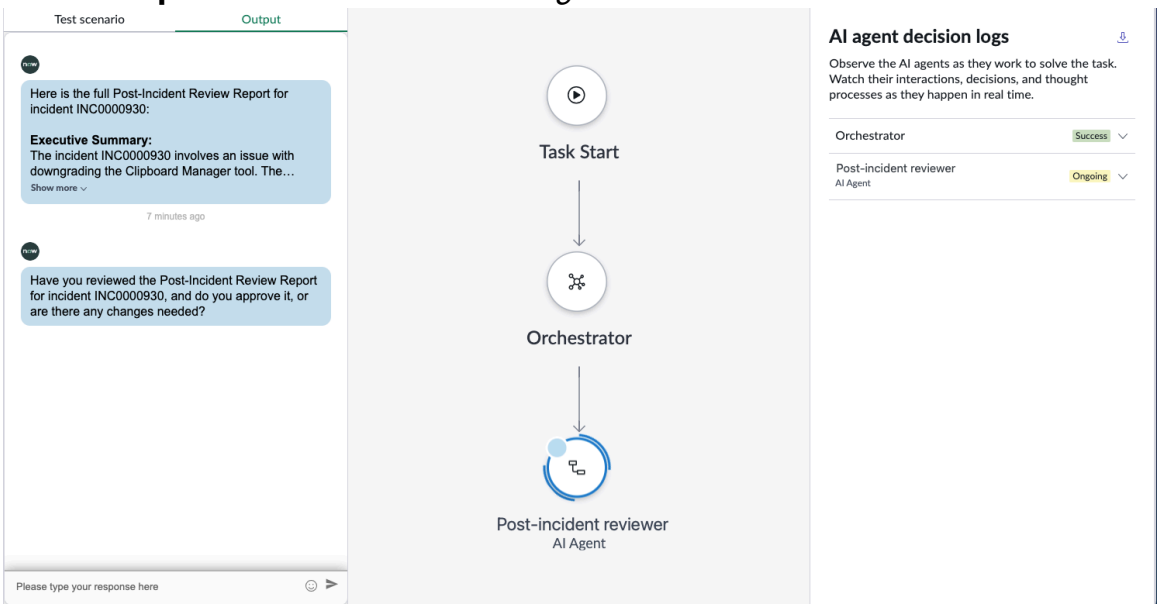
b. Use the arrow next to it to add roles that can access the agentic workflow.

> **Note:**
> The itil role is added by default.

c. Select **Save and test**.

The agent executes the request for the agentic workflow.

Example of a Generate post incident reviews agentic workflow report in the *ServiceNow AI Agent Studio*



In the AI Agent Studio, the fulfiller receives a notification as soon as the report is generated, enabling them to follow the on-screen instructions and complete the task. For more information, see Request the generative AI capabilities in ITSM by using the Now Assist panel.

IT Service Management AI agent collection Generate change request plans agentic workflow

Use the Change request planning AI agent team to monitor similar change requests autonomously and generate the necessary plans. This approach may help reduce the time required for scheduling changes and managing change-related risks.

Generate change request plans agentic workflow overview

Generate the desired change plans using a team of AI agents in the Generate change request plans agentic workflow.

To modify the Generate change request plans agentic workflow, duplicate it, and adjust the settings according to your requirements.

> **Important:**
> In the Edit trigger form, make sure that the **Active** button is turned on to enable the AI agent to trigger autonomously.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate change request plans agentic workflow

Autonomously generate the implementation, backout, or test change plans for a given change request number using similar change requests. After generating the plans, complete the plan execution by flushing the cache.

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Change request planning**.

Change request planning AI agents

In the Generate change request plans agentic workflow, use specific AI agents for each type of planner to generate the desired plans.

Important:
In the Define availability screen for the AI agent, make sure that the **Status** field is enabled to activate the AI agent.

Change request planning AI agents and their roles listed in the order of execution

AI agent	AI agent role
Change implementation plan AI agent	Collaborates with the user to create a step-by-step implementation plan and revises it based on the feedback.
Change backout plan AI agent	Collaborates with the user to create a step-by-step backout plan and revises it based on the feedback.
Change test plan AI agent	Collaborates with the user to create a step-by-step test plan and revises it based on the feedback.
Change risk and impact analysis AI agent	Analyzes the potential risk and impact of a change request.
Change justification proposal AI agent	Proposes justification for a change request.
Finish change plan AI agent	Flushes the cache and informs the user that the execution completed successfully.

Generating a change plan

In the use agentic workflow:

1. Review the information in the Describe and connect screen and in the Define trigger screen, make the necessary updates, and then select **Save and Continue**.
2. In the Select display screen:
   a. Choose where you want the use case output to be displayed.
   b. Use the arrow next to it to add roles that can access the use case.

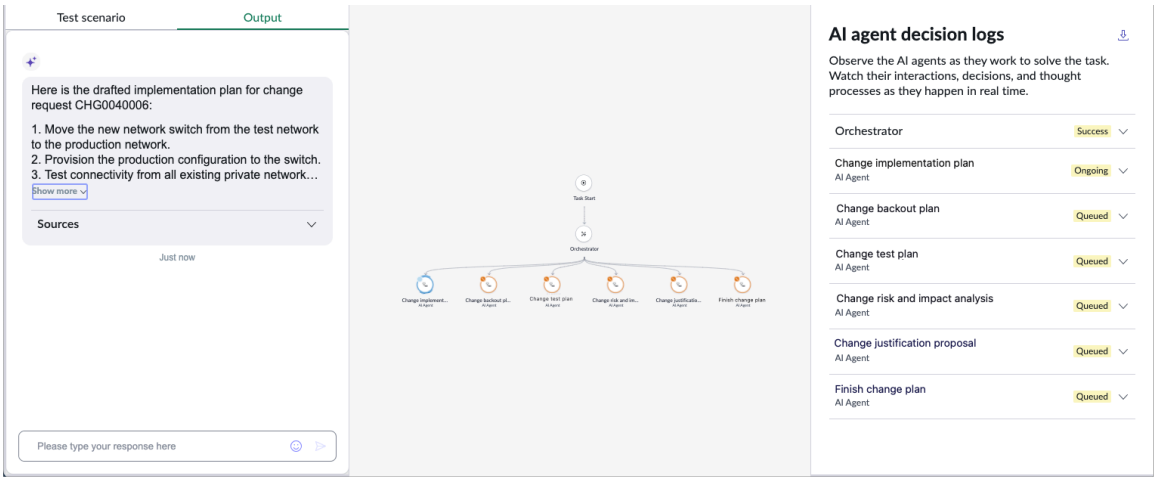
Note:
The itil role is added by default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Save and test**.

The agent executes the request for the use case.

Example of a Generate change request plans agentic workflow output in the *ServiceNow* Studio*AI Agent Studio*



In the AI Agent Studio, the human agent gets notified as soon as the report gets generated so that they can follow the on-screen instructions and complete the task. For more information, see Request the generative AI capabilities in ITSM by using the Now Assist panel.

IT Service Management AI agent collection Notify users with Twilio agentic workflow

Use the Twilio SMS text AI agent to help streamline communication processes and enhance workflow efficiency.

Notify users with Twilio overview

Using the Notify users with Twilio agentic workflow, send text messages via SMS to recipients manually to help improve the time required for subject matter expert response.

Note:
The Notify users with Twilio agentic workflow doesn't have a trigger and is invoked manually.

To modify the Notify users with Twilio agentic workflow, duplicate it, and adjust the settings according to your requirements.

Important:
When you modify a agentic workflow, AI agent, or tool, make sure that you update all instructions accordingly.

Notify users with Twilio agentic workflow

Send messages from a Twilio number to a recipient's phone number.

To access the agentic workflow:

1. Navigate to **All** > **AI Agent Studio** > **Create and manage**.
2. Select **Twilio texting**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
To enable the display of the Notify users with Twilio agentic workflow, you must activate the Twilio Spoke plugin (sn_twilio_spoke). For more information, see Twilio Spoke.

AI agents used in the Notify users with Twilio agentic workflow

The Twilio SMS text AI agent is used to generate text using the Notify users with Twilio agentic workflow.

Important:
In the Define availability screen for the AI agent, make sure that the **Status** field is enabled to activate the AI agent.

Note:
The itil role is added by default.

In the ServiceNow AI Agent Studio, the human agent gets notified as soon as a text message is generated so that they can follow the on-screen instructions and complete the task. For more information, see Request the generative AI capabilities in ITSM by using the Now Assist panel.

Related topics

Configure Notify with Twilio

Using Now Assist for IT Service Management (ITSM)

If you have the itil role, you can summarize the chat interactions with a requester, summarize an incident, and generate resolution notes by using the Now Assist for IT Service Management (ITSM) application. You can also understand the chat and incident context and propose resolutions more quickly to the requester.

Note:
If you want a subset of users with itil role to access the Now Assist for IT Service Management (ITSM) skills, you can create a role or a group for those users. For more information, see Create a new role or a group to access Now Assist skills.

Summarize a chat conversation by using Now Assist for IT Service Management (ITSM)

Summarize the Virtual Agent chat conversation between a live agent and a requester in Service Operations Workspace for ITSM. You can generate the summary by using the chat summarization skill in Now Assist for IT Service Management (ITSM).

Before you begin
Role required: itil

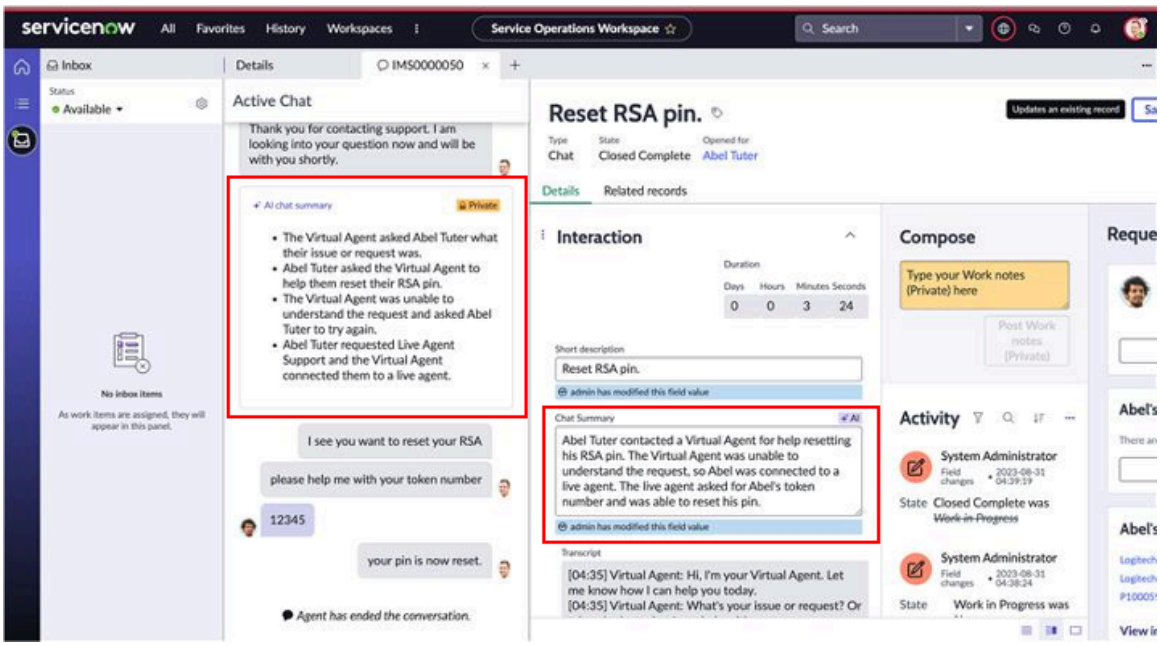
About this task
In a Virtual Agent conversation, when a requester chooses to connect to a live agent, a chat interaction appears in your inbox. When you accept the interaction, a summary of the Virtual Agent conversation is generated. You can request more details from the requester to resolve the issue.

You can also summarize the chat interaction when the chat ends or when an incident is created for further troubleshooting before or after the chat ends. The summary includes all points of the handoff, including the Virtual Agent conversation, and provides a context of the interaction to you and the other agents who might want to refer to it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Open the inbox and accept the chat interaction.
   In the **Active Chat** section of the interaction, a summary of the Virtual Agent conversation is generated. The summary includes the actions taken before the requester engaged with the live agent. With this information, you can get an overview of what the requester has already mentioned in the Virtual Agent conversation and troubleshoot the issue.
3. Chat with the requester to get any additional details about their question or issue.
   For example, if the requester is having an issue with hardware, you may need the hardware model number and serial number.
4. Summarize the chat while interacting with the requester by using the `/summarize` quick action in the **Active Chat** section.
   For more information, see Chat summarization.
5. End the chat by selecting **End Chat**.
   The **Short description** and **Chat Summary** fields are updated for the interaction.



6. **Optional:** Review the text in the **Short description** or **Chat Summary** fields and edit if necessary.

   (Optional) For example, you might want to make the summary more descriptive.

   Note:
   Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

7. Select **Save**.
8. **Optional:** If you think that you need further help after the initial troubleshooting before or after ending the chat, create an incident from the interaction by selecting **Create incident**.
   - When you create an incident before ending the chat, the **Short Description** and **Description** fields of the incident are updated with the interaction summary and saved.
   - When you create an incident after ending the chat, the following information is generated:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Chat summary** field of the interaction is updated with the interaction summary.
- The **Short Description** and **Description** fields of the incident are updated with the interaction summary and saved.

Summarize a Sidebar discussion by using Now Assist for IT Service Management (ITSM)

Generate a summary of Sidebar discussions between agents, requesters, and subject matter experts by using the Sidebar discussion summarization skill in the Now Assist for IT Service Management (ITSM) application.

Before you begin

- Next Experience must be enabled to summarize Sidebar discussions in Core UI. For more information, see Considerations for activating Next Experience.
- The Sidebar Chat Summarization skill must be enabled. For more information, see Activate a Now Assist skill.

Role required: itil

About this task

You can do these actions by using the Sidebar discussion summarization skill:

- Summarize the Sidebar discussion at any point during the discussion.
- Share the Sidebar discussion to the work notes.
- Provide feedback for the summary.

Note:
The Sidebar discussion summarization skill is on the Chat skill card in the Technology group.

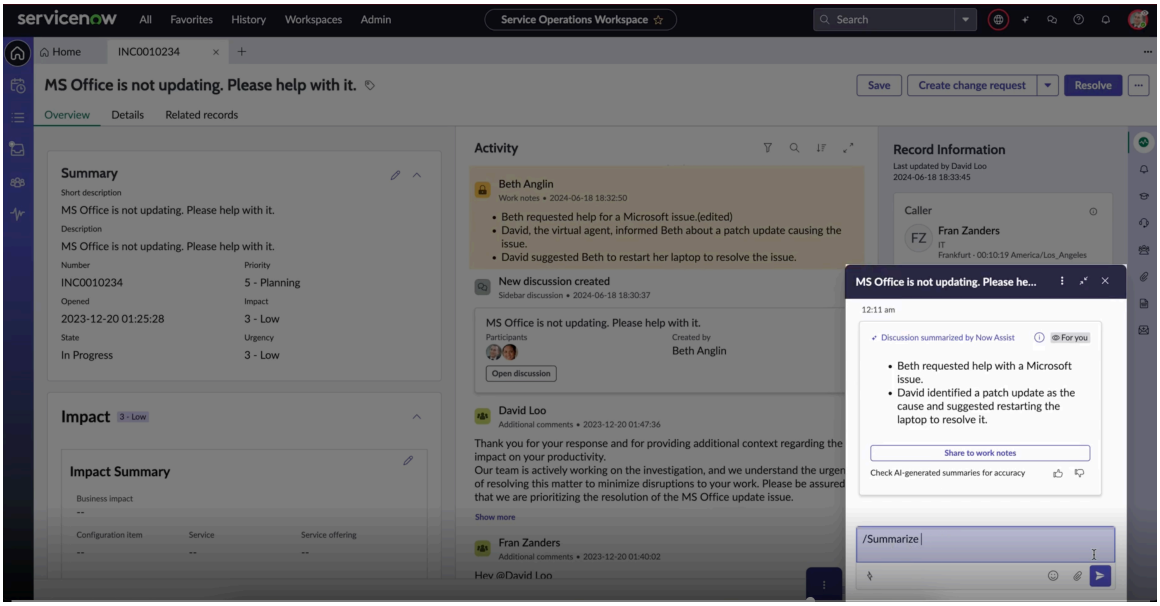
You can use Sidebar discussion summarization for any task table that you have enabled Sidebar on.

Summarizing Sidebar chats integrated with Microsoft Teams is supported. For more information, see Sidebar and Microsoft Teams.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and open an incident that supports Sidebar discussion and summarization.
2. Choose an existing discussion, or start a new discussion.
3. Generate a summary of the Sidebar discussion during the conversation either by either entering `/Summarize` in the Active Sidebar discussion window, or by selecting the quick action icon and selecting **Summarize**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The Sidebar discussion summary appears in the Discussion that is summarized by the Now Assist modal.

4. Add the summary to the incident work notes, and provide feedback about it.

Summarize an incident by using Now Assist for IT Service Management (ITSM)

Quickly understand the incident context and respond to a requester's inquiries by using the incident summarization skill in the Now Assist for IT Service Management (ITSM) application.

Before you begin

Role required: itil

About this task

An incident summary provides you with a concise summary of an incident. The summary is based on the incident state and is generated from the information that you enter in the following fields:

- Short description
- Description
- State
- Priority
- Work notes
- Additional comments
- Resolution notes (for a resolved incident)

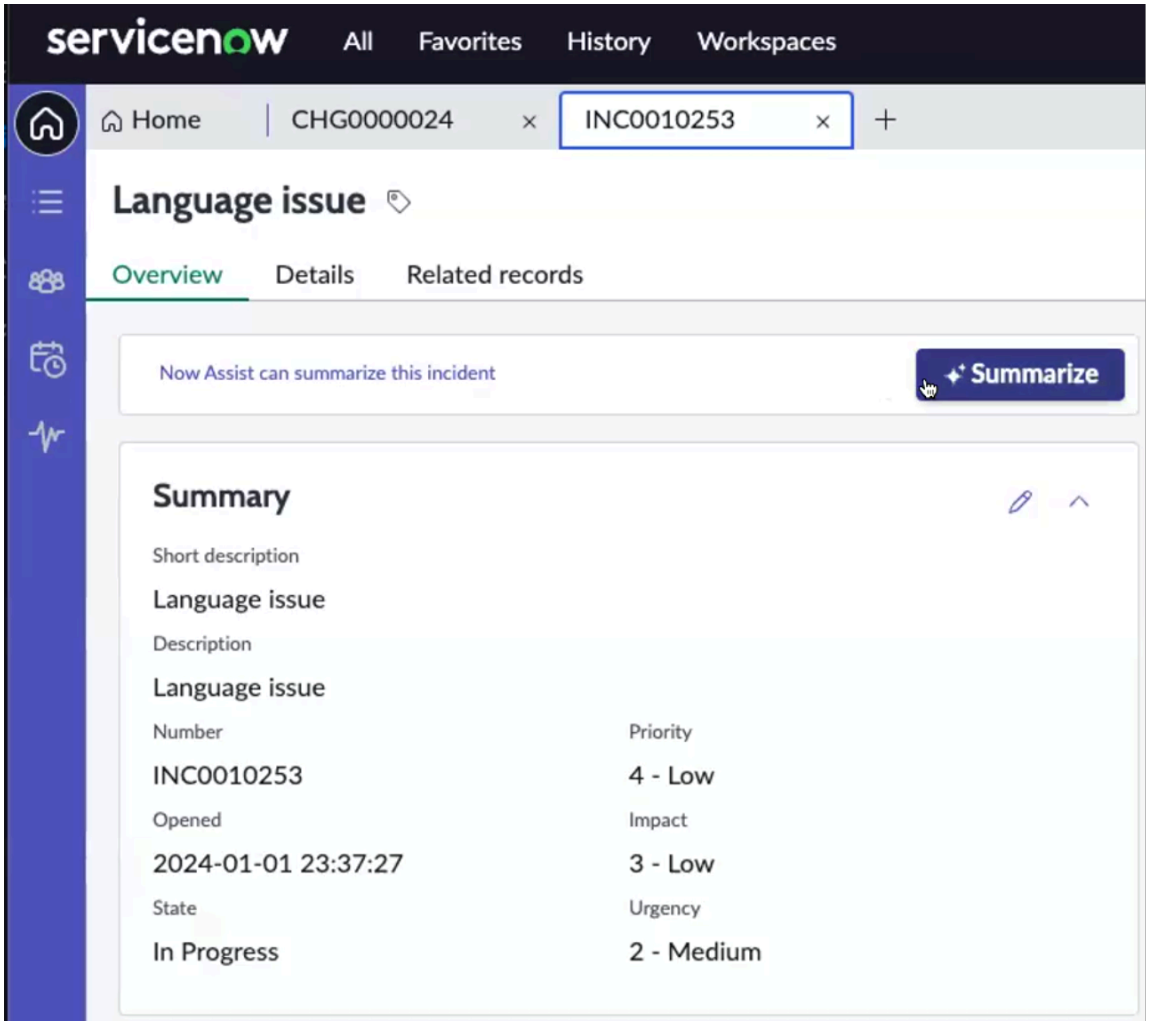
For information about the incident states, see Life cycle of an Incident.

You can summarize an incident in Core UI and Service Operations Workspace for ITSM.

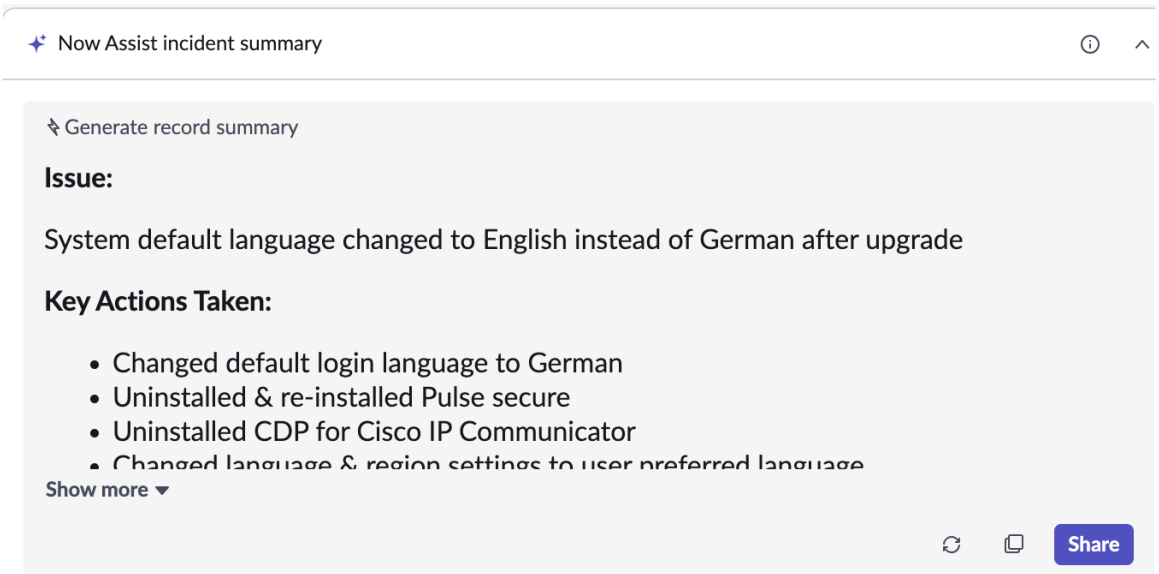
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In Core UI or Service Operations Workspace for ITSM, open an incident that is assigned to you.
2. Select **Summarize**.



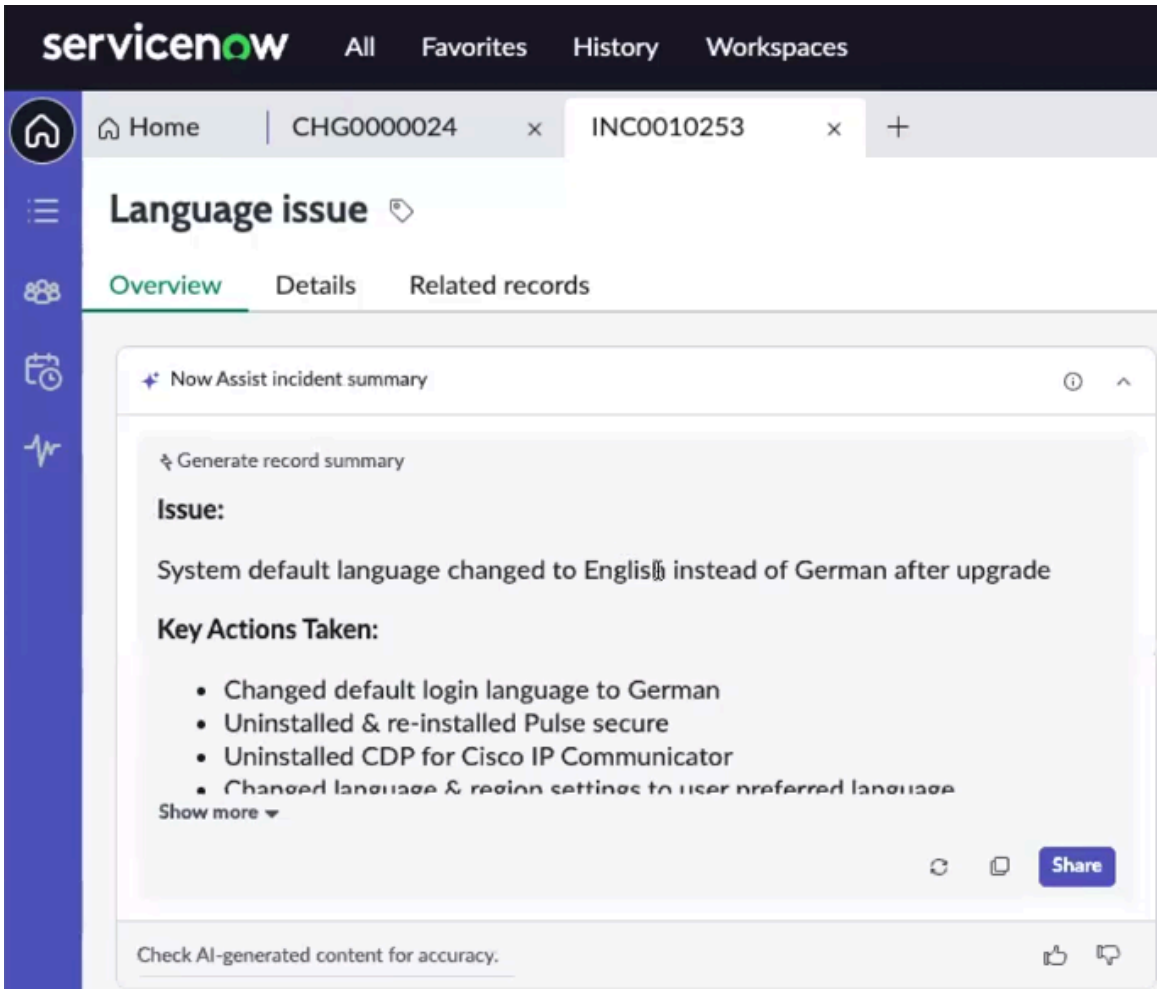
- In Core UI, the summary appears in a banner of the incident record.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In Service Operations Workspace for ITSM, the summary is generated in the **Overview** tab.

  You can provide feedback by selecting the thumbs up or thumbs down icon. You can also share the summary using the **Share** button.



3. **Optional:** When you're finished summarizing an incident, you can add it to the work notes, expand or collapse it, provide feedback, copy it, or view information about it.

Summarize a change request by using Now Assist for IT Service Management (ITSM)

Quickly capture the important details of a change request, including the current status, by using the change request summarization skill in the Now Assist for IT Service Management (ITSM) application.

Before you begin

Role required: itil

About this task

A change request summary provides you with a concise summary of a change request. The summary is based on the change request state and is generated from the information that you enter in the following fields:

- Short description
- Description

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Work notes
- Additional comments
- Risk
- Impact
- Justification
- Implementation plan
- Risk and impact analysis
- Test plan
- Backout plan
- Close code
- Close notes
- Service offering
- State
- Conflict status
- Type

For information about the change request states, see State progression for normal, standard, and emergency changes.

You can summarize a change request in Core UI and Service Operations Workspace for ITSM.

Procedure

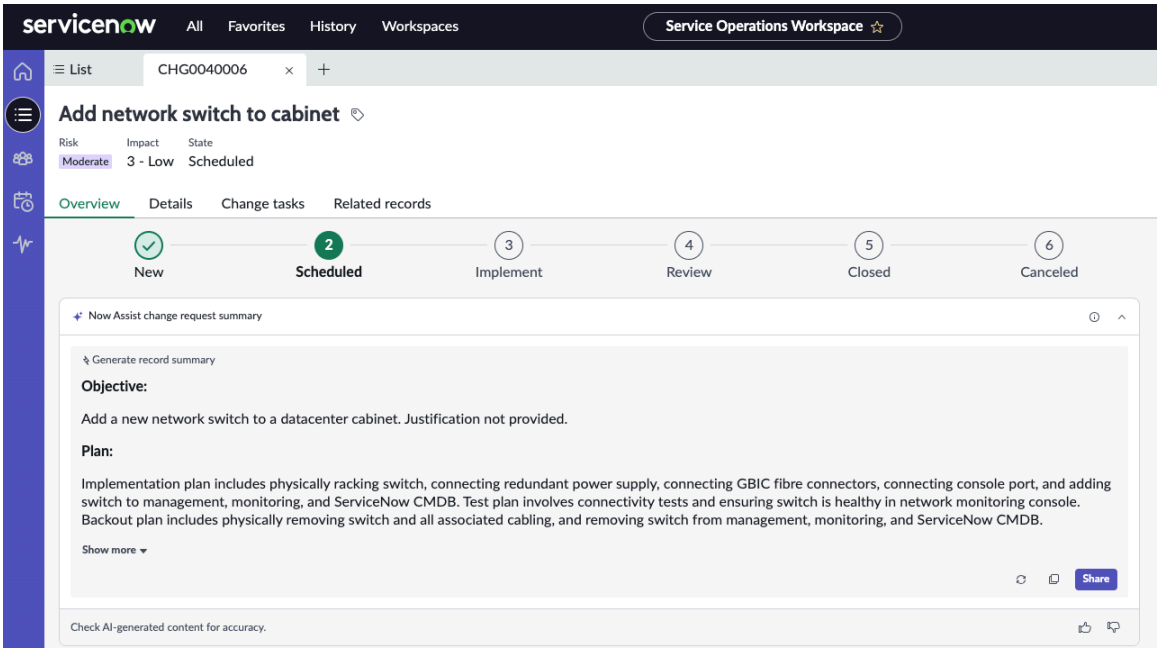
1. In Core UI or Service Operations Workspace for ITSM, open a change request that is assigned to you.
2. Select **Summarize**.

   Note:
   The Summarize UI action isn't available for the New or Canceled state.

   The summary appears in a banner on the change request record in Core UI.

   The summary appears in the **Overview** tab on the change request record in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can provide feedback by selecting the thumbs up or thumbs down icon. You can also share the summary using the **Share** button.

3. **Optional:** When you're finished summarizing a change request, you can add it to the work notes, expand or collapse it, provide feedback, copy it, or view information about it.

Summarize an incident when reassigning it by using Now Assist for IT Service Management (ITSM)

Provide information about the incident when assigning it to another agent or assignment group by summarizing all actions until hand off. For example, an agent can summarize an incident when reassigning it to another agent if the incident is incorrectly assigned or needs troubleshooting by another agent or assignment group.

Before you begin

Role required: itil

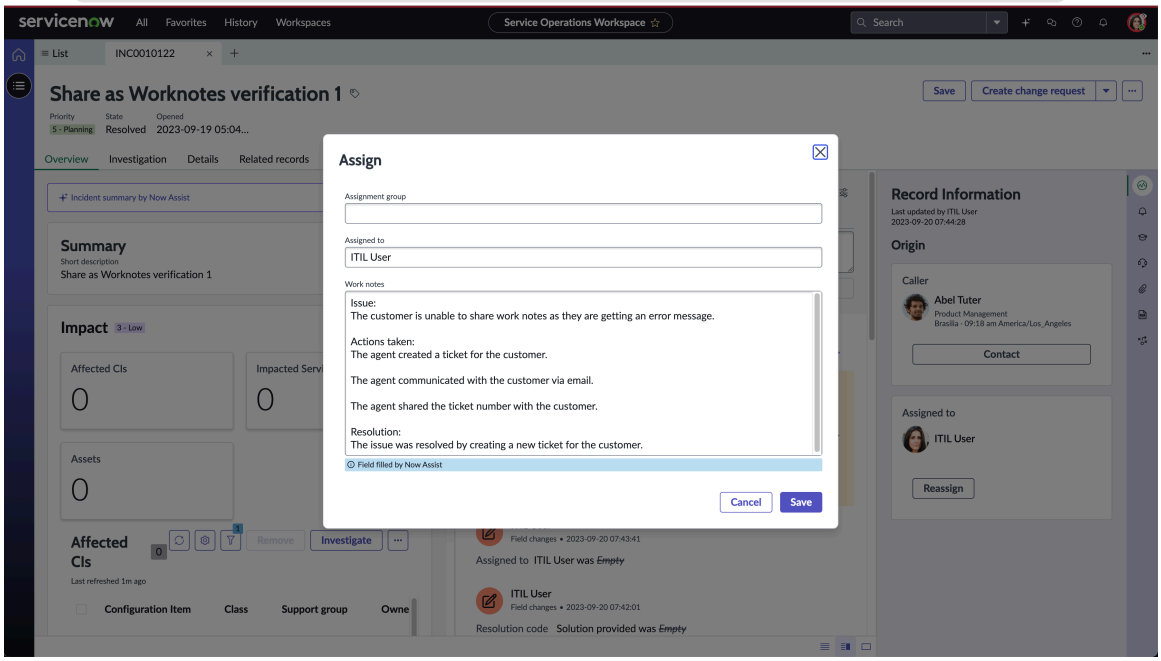
About this task

You can reassign an incident in Core UI and Service Operations Workspace for ITSM.

Procedure

1. In Core UI or Service Operations Workspace for ITSM, open an incident that is assigned to you.
2. Perform one of the following steps.
   A summary of the incident is generated in the **Work notes** field in the Assign dialog box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
If the incident is saved without any changes to the **Assigned to** or **Assignment group** fields, the Assign dialog box isn't displayed and the incident is saved directly.

3. Edit the **Assigned to** or **Assignment group** fields if necessary.
4. Select **Save**.
   The generated incident summary is posted as work notes for the incident.

Explain the risk of a change request by using Now Assist for IT Service Management (ITSM)

Quickly generate the explanation of the calculated risk rating for a change request by using the change request risk explanation skill in the Now Assist for IT Service Management (ITSM) application.

Before you begin

Role required: itil

About this task

Data from these input fields in the change request input table is used to explain why a change risk is rated high, medium, or low:

- Short description
- Implementation plan
- Assignment group
- Risk
- Description
- Backout plan
- Model type

Additional inputs include:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Similar change requests and the incidents caused by those changes
- Risk condition that was met
- Risk assessment

  By default, the assessment uses the top five normalized risk values sorted in descending order. If there's a tie between the two values, the one with the lower order number is used. For information on risk assessment, see Risk assessment.

You can also add custom input fields.

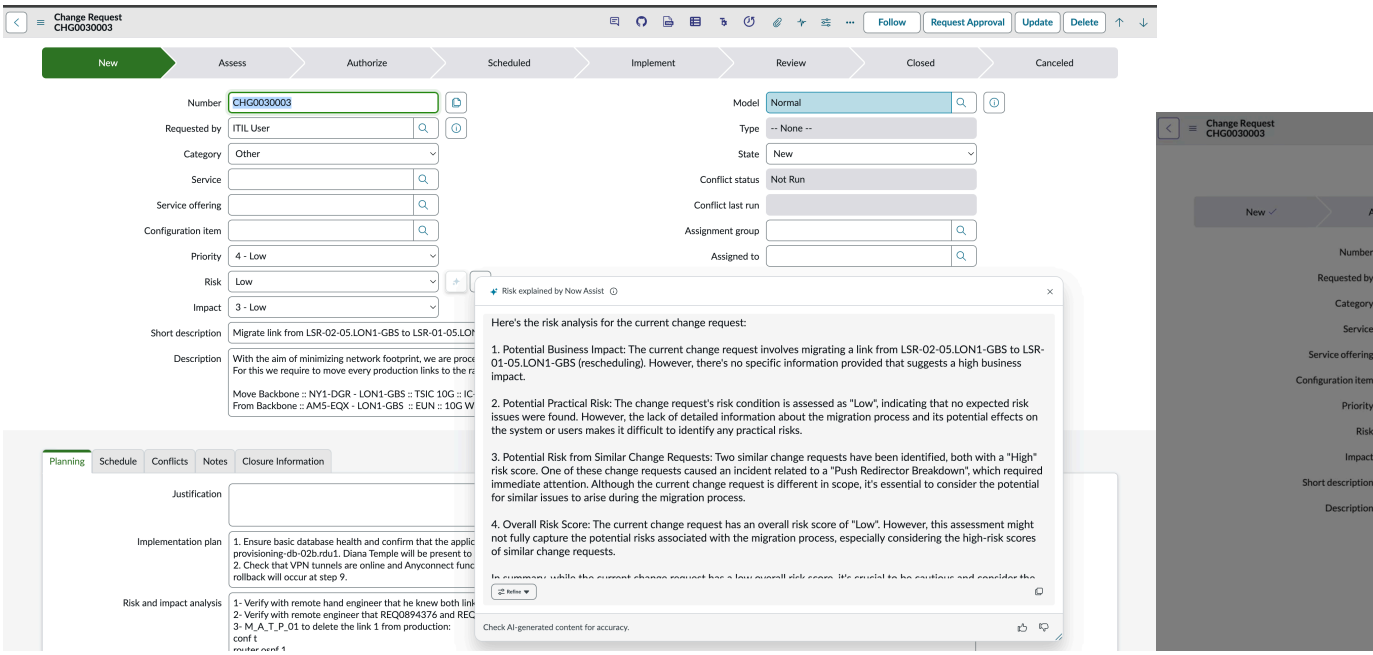
You can generate the explanation of the calculated risk rating for a change request in Core UI and Service Operations Workspace for ITSM.

Procedure

1. In Core UI or Service Operations Workspace for ITSM, open a change request that is assigned to you.
2. Select the Now Assist icon for the **Risk** field.

   Note:
   The Now Assist icon isn't available if the risk for the change request hasn't already been calculated.

   The risk explained by Now Assist appears in a window on the change request record.



3. **Optional:** Elaborate or shorten the risk explained by Now Assist.
   - To lengthen the generated response, select **Refine** > **Elaborate**.
   - To shorten the generated response, select **Refine** > **Shorten**.
4. **Optional:** When you're finished generating the explanation for a change request risk rating, you can provide feedback, copy it, or view information about it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate the resolution notes for an incident by using Now Assist for IT Service Management (ITSM)

Automatically generate the resolution notes for an incident on demand using the Now Assist context menu. You can improve the quality of the resolution notes by providing a summary of the root cause and the steps taken to resolve the issue. Generating resolution notes lets you provide information about the incident resolution to other agents who might encounter similar issues.

Before you begin

Role required: itil

About this task

You can do these actions by using Now Assist icon:

- Generate resolution notes that are based on the information in the incident.
- Refine the resolution notes by elaborating or shortening them.

Incident resolution notes are generated from the information that you enter in the following fields:

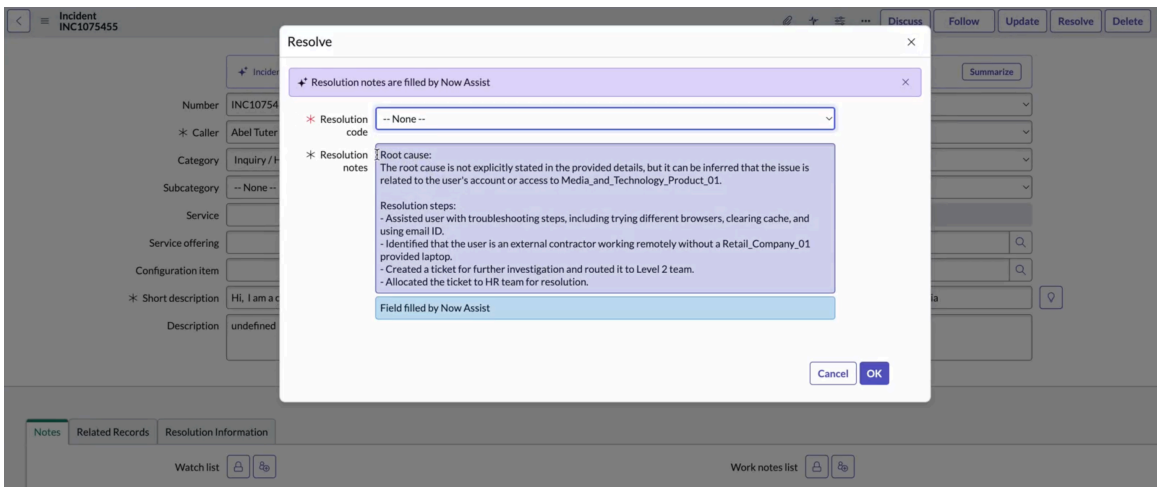
- Short description
- Description
- State
- Work notes
- Additional comments

Note:
To change resolution notes generation from automatic to manual (requiring user input), set the trigger for the skill in the Now Assist Admin console.

You can generate incident resolution notes in Core UI and Service Operations Workspace for ITSM.

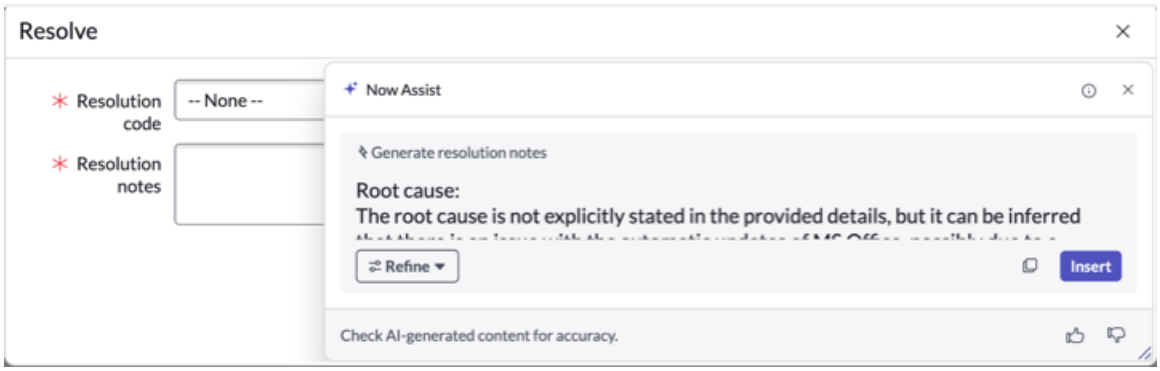
Procedure

1. In Core UI or Service Operations Workspace for ITSM, open an incident that is assigned to you.
2. Select **Resolve**.
   - For automatic resolution notes generation, the **Resolution notes** field is updated in the Resolve dialog box using Now Assist.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For user-triggered resolution notes, manual resolution notes are generated by selecting inside the **Resolution notes** field, and then selecting the Now Assist icon ✨.



Resolution notes are generated in the Now Assist dialog box.

You can perform these actions on the resolution notes:

- Select **Refine**: To elaborate or shorten.
- Select **Insert**: To paste into the Resolve window.

(Optional) When you're finished generating the resolution notes manually, you can provide feedback, copy it, or view information about it.

Option	Procedure
Provide feedback for the resolution notes	If you think that the resolution notes were helpful, select the helpful icon (👍). If you think that the resolution notes were not helpful, select the not helpful icon (👎). **Note:** This feedback improves the generative AI model and can help to improve future versions of this skill.
Copy the resolution notes	If you want to reuse the resolution notes, select the copy to clipboard icon (⧉).
View the information about the resolution notes	If you want to check some details about the resolution notes, select the more info icon (ⓘ).

3. **Optional:** Review the resolution summary in the **Resolution notes** field and make any necessary corrections.

   Note:
   Because the information in these fields is automatically generated, it's a good idea to review the text and make sure it's accurate.

4. Update the resolution code in the **Resolution code** field and select **Resolve**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A resolution code categorizes how the incident is resolved. For example, Known error and Solved (Permanently).
The resolution information is updated and the state of the incident is set to Resolved.

5. In Core UI or Service Operations Workspace for ITSM, resolve the incident by changing its state.

Generate a knowledge article from the Service Operations Workspace for ITSM and classic environment by using Now Assist

As an agent or knowledge writer, quickly generate knowledge articles from resolved and closed incidents within the Service Operations Workspace for ITSM application and classic environment by using the Now Assist application.

Before you begin

https://player.vimeo.com/video/1009282001?h=fc84a7cd87&badge=0&autopause=0&player_id=0&app_id=58479

To generate a knowledge article for an incident, the incident must be in the resolved or closed state, and not have an existing knowledge article that is associated with it.

Important:

- Install the applications and plugins listed in the tables below and update them to the corresponding store app version before configuring the Knowledge Generation skill.
- For information on the plugin version numbers that correspond to the release you are installing, see https://store.servicenow.com/store/app/2c09636e1be06a50a85b16db234bcb74#versionSummary

- For knowledge management, you must install and update the following store apps to the corresponding application version.

Store application name	Plugin ID
Now Assist in Knowledge Management [app-knowledge-gen-ai]	com.sn.km.gen.ai, sn_km_gen_ai
Knowledge Capabilities in UI Builder [app-knowledge-uib]	com.snc.uib.knowledge, sn_km_uib

- For ITSM Service Operations Workspace,you must install and update the following store apps to the corresponding application version.

Application name	Plugin ID
Service Operations Workspace ITSM Applications	sn_sow_itsm_cont
Now Assist for IT Service Management (ITSM)	sn_itsm_gen_ai
Service Operations Workspace Core	sn_sow
Record Page for Service Operations Workspace	sn_sow_record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application name	Plugin ID
Service Operations Workspace ITSM Common	sn_sow_itsm_common
Incident Management for Service Operations Workspace	sn_sow_inc
Interaction Management for Service Operations Workspace	sn_sow_interaction

- To use the Knowledge Centered Services (KCS) template (Incident-KCS article - HTML) in the Service Operations Workspace ITSM application, you must install the KCS Integration for Incident Management plugin. Otherwise, Now Assist uses the Standard article.

To enable an agent to see the Now Assist experience on the Create Article page, configure the following knowledge base generation criteria:

- Install the knowledge skills. For more information, see Configure Now Assist for IT Service Management (ITSM).
- Make sure that the following criteria are in place in the Now Assist Admin console:
  - Specify the table record and input fields.
  - Specify the conditions for the skill availability from the list of attributes.
  - Specify that the knowledge base generation feature for the In-product or Now Assist panel is displayed.
- Configure the Create Article feature to apply the supported template, Incident-KCS article - HTML, or Standard article.
- Currently, only the Create Article experience is available.

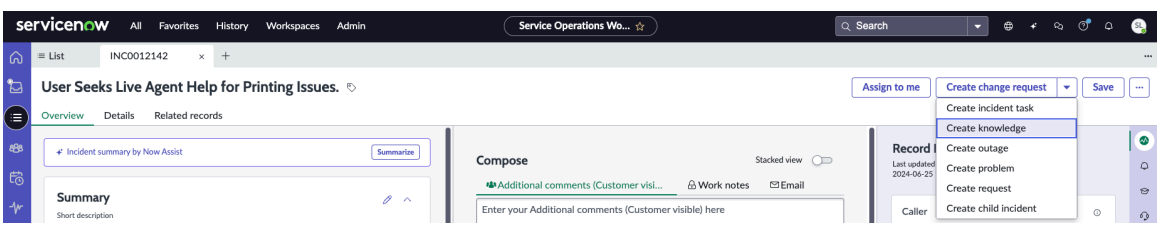
Role required: itil

About this task

In the Service Operations Workspace for ITSM and classic environment, you can generate the knowledge article information for an incident by selecting **Create Knowledge** on the incident record. This UI action displays the Use AI to draft this article modal. By using this modal, you can choose to write the article yourself or draft an article and then you can review and edit the knowledge article text.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Open an incident that is assigned to you.
   In the incident record, resolve and close the incident.
3. Create the article by selecting the **Create knowledge** option from the UI action drop-down menu in the incident.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Create knowledge UI action is only visible when an incident doesn't have an existing knowledge article that is associated with it.

4. In the Create article modal, select a Knowledge Base and an Article template, if displayed.

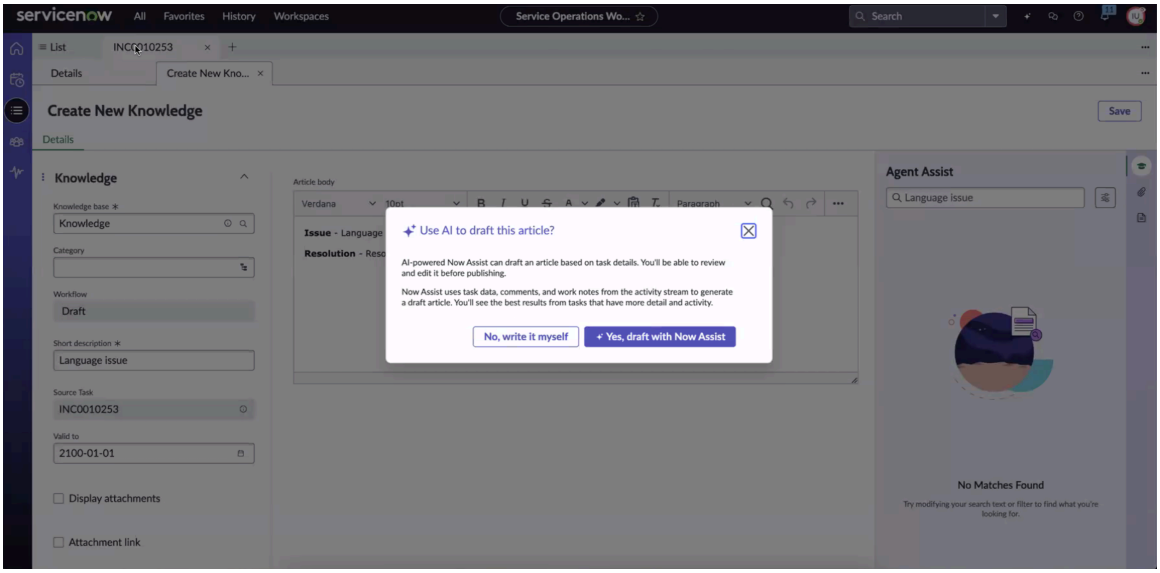
Note:
Using the templates to create the articles is optional. Your system administrator must enable the *sn_sow_inc.enable_kb_template* system property and you must have at least one active template to see the modal. For information on available templates, see Knowledge article templates.

The KCS template (Incident-KCS article - HTML) is used to generate the article only if the KCS plugin is installed. If the plugin isn't installed, the article is generated by using the Standard article.

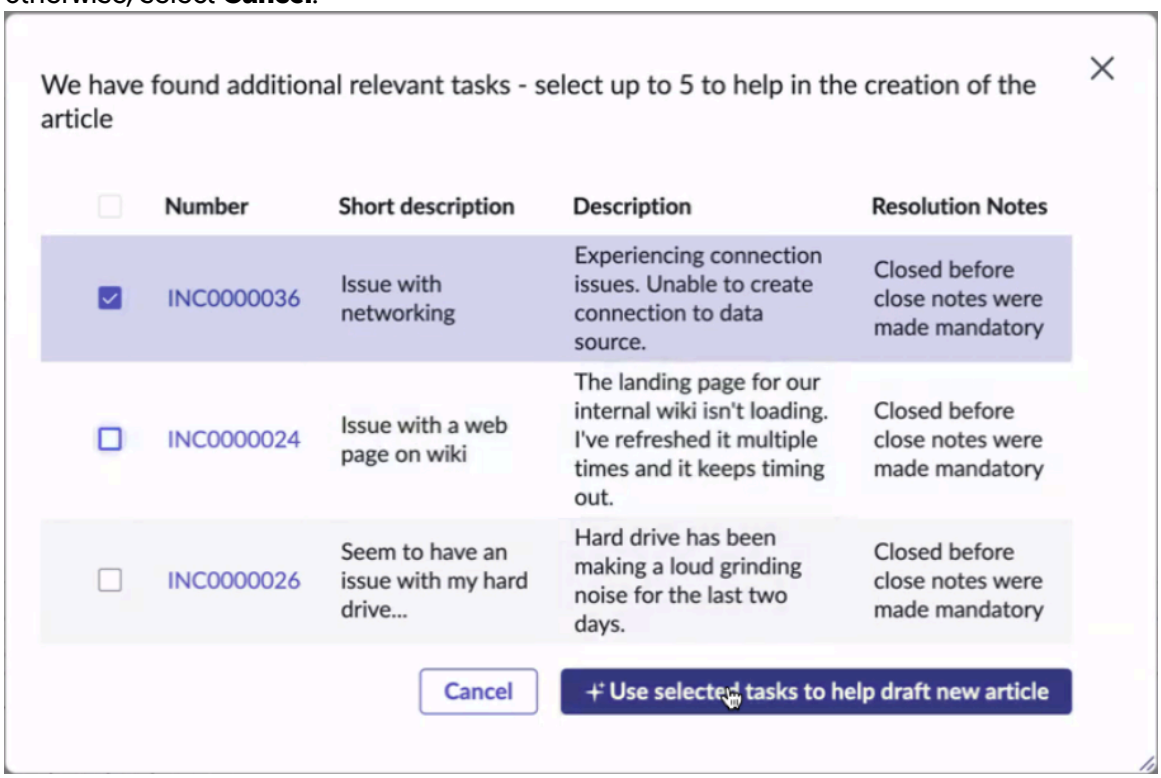
The Knowledge Base is selected based on your administrator's configuration in the Now Assist Admin console.

5. Select **Create article**.
6. In the Use AI to draft this article? modal, choose to write the article yourself, or draft an article with Now Assist.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. **Optional:** If you are drafting the article with Now Assist, you can choose up to five relevant tasks for the creation of the article, and select **Use selected tasks to help draft new article**; otherwise, select **Cancel**.



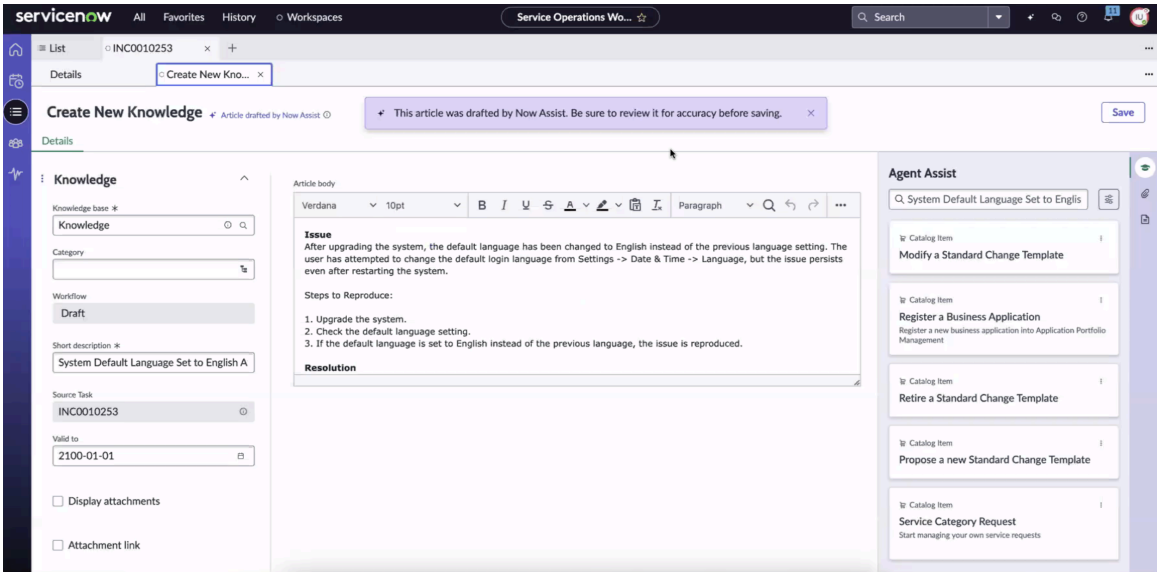
When creating an article that includes information that spans multiple similar incidents, a single article is created containing the details from the selected incidents.

Note:

If no similar tasks exist, this modal won't appear, and the article is created. The generated article, based on the chosen relevant records, is linked to both the parent task and all the relevant cases selected.
The article appears in a new tab, has a unique ID number for the knowledge article, and is attached to the parent record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Review the article and edit it if necessary.



9. Select **Save** or **Publish**.

   The Now Assist success message disappears indicating that it's no longer a Now Assist generated article.

   If Now LLM Service fails to generate a result, you see an error message.

   When creating an article using Now Assist, the process once triggered can't be stopped. Now Assist continues to generate the article even if you close the dialog box.

Now Assist in Knowledge Management

Generate a chat reply recommendation by using Now Assist for IT Service Management (ITSM)

Generate a reply based on the context of the chat conversation using the Now Assist icon. Chat reply recommendations provide agents with quick replies to common questions.

Before you begin

Role required: itil

About this task

You can do these actions by using Now Assist icon:

- Generate a recommended reply that is based on the context of the conversation.
- Refine the recommendation by elaborating or shortening the response.

Note:
The Chat reply recommendation skill is on the Chat skill card in the Technology group.

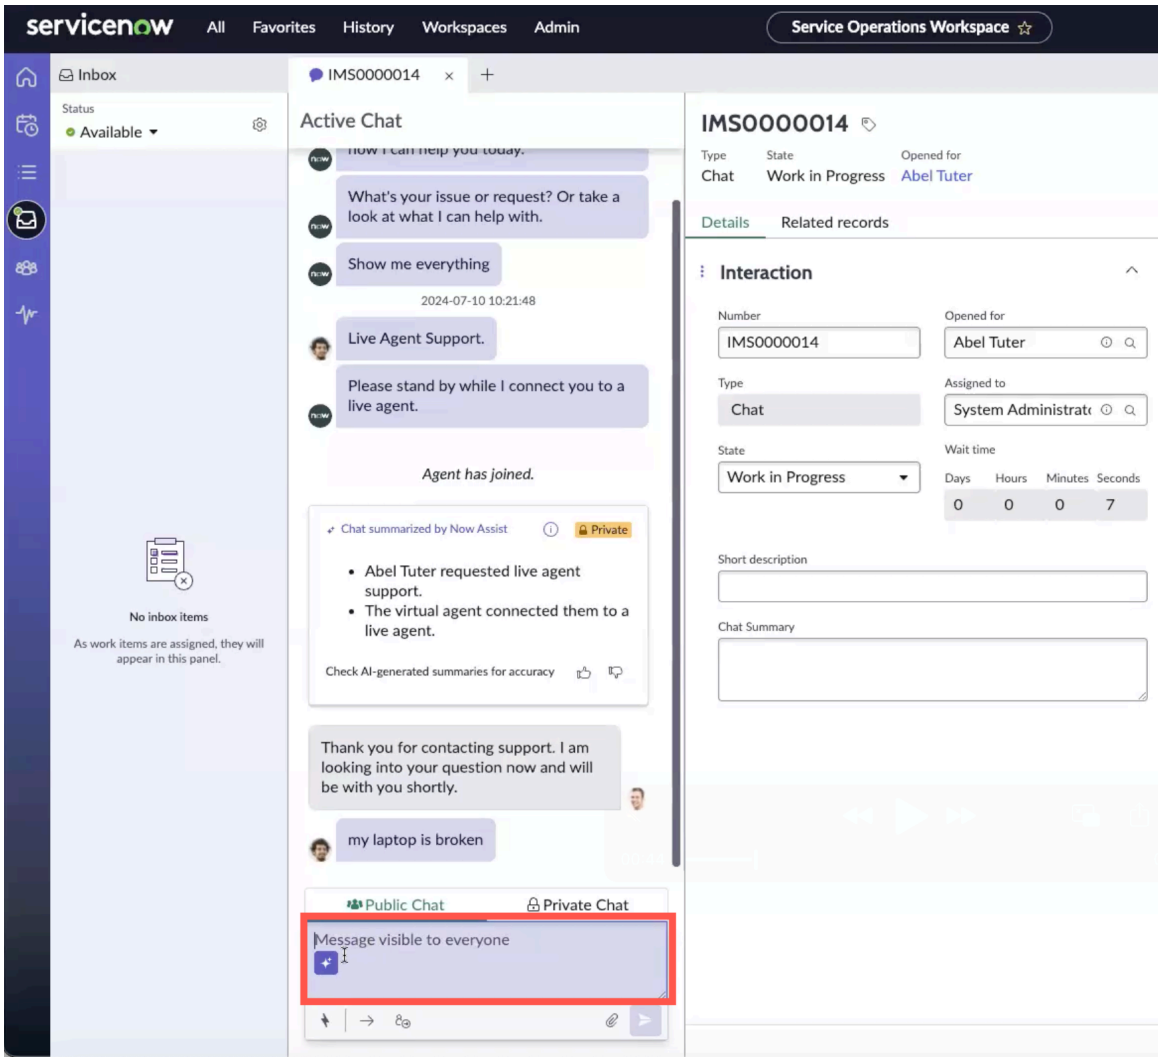
Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Open the inbox and accept the chat interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

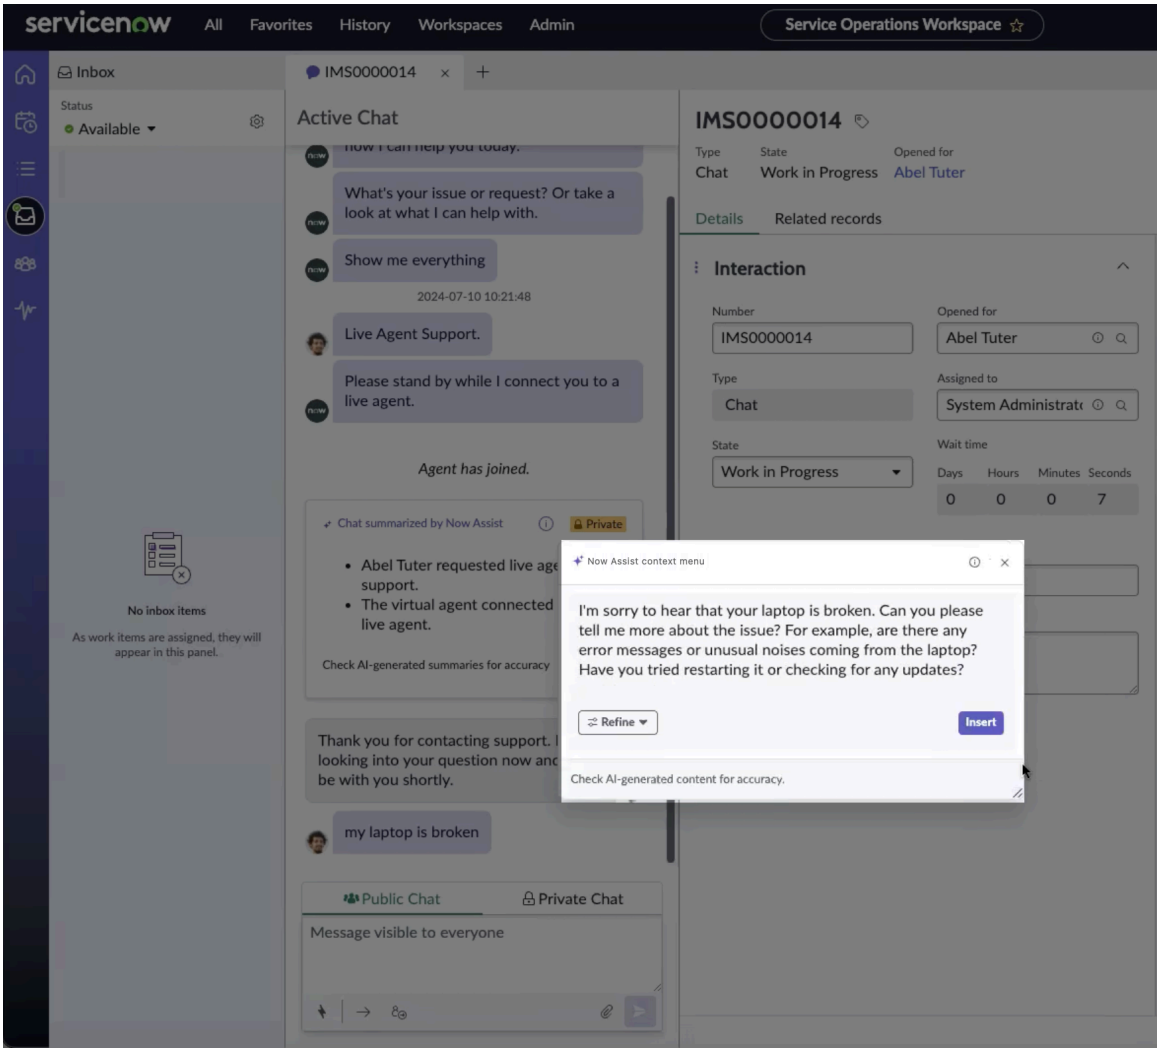
In the Active Chat section of the interaction, a summary of the Virtual Agent conversation is generated. The summary includes the actions taken before the requester engaged with the live agent. With this information, you can get an overview of what the requester has already mentioned in the Virtual Agent conversation and troubleshoot the issue.

3. Chat with the requester to get any additional details about their question or issue, if needed. For example, if the requester is having an issue with hardware, you may need the hardware model number and serial number.
4. In the chat message window, either type a response, or leave blank, and then select the Now Assist icon ✦.



The reply response appears in the Now Assist context menu modal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Review the generated reply and select **Refine** to modify the response, or select **Insert** to paste the response into the chat message window.

   Note:
   If the reply response was refined, you can toggle between versions.

6. In the chat message window, select **Send**.
7. End the chat by selecting **End Chat**.

Generate an email response by using Now Assist for IT Service Management (ITSM)

Generate an email as a recommendation based on the context of the incident using the Now Assist icon. Email responses can help agents save time and learn efficient ways to respond to requesters.

Before you begin

An admin must activate the email response skill. For more information, see Email response skill.

Role required: itil

About this task

As an agent, you can do these actions using the Now Assist icon:

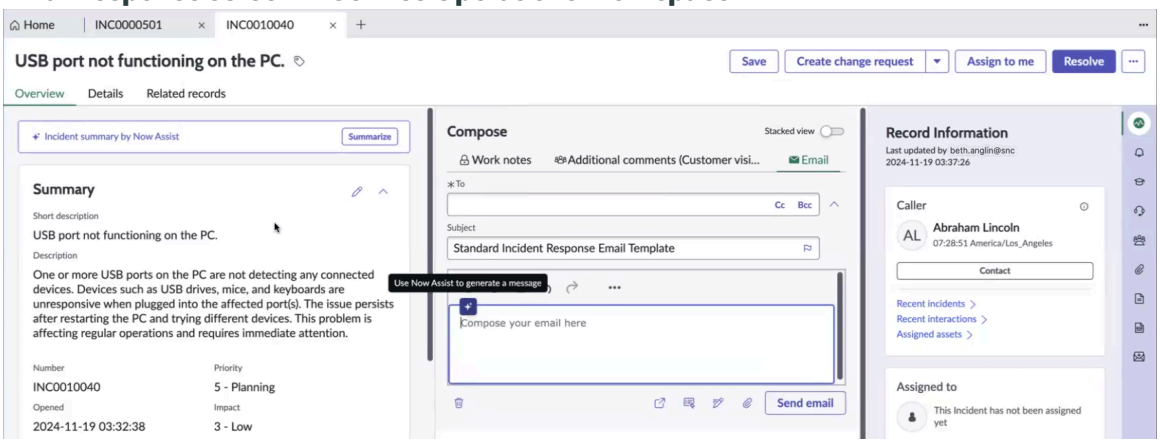
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Generate an email response as a recommendation based on the context of the incident and the email.
- Generate an email response as a recommendation for replies to new, forwarded, and draft emails.
- Refine the recommendation by elaborating or shortening the response.
- Get email template recommendations while composing an email.

Procedure

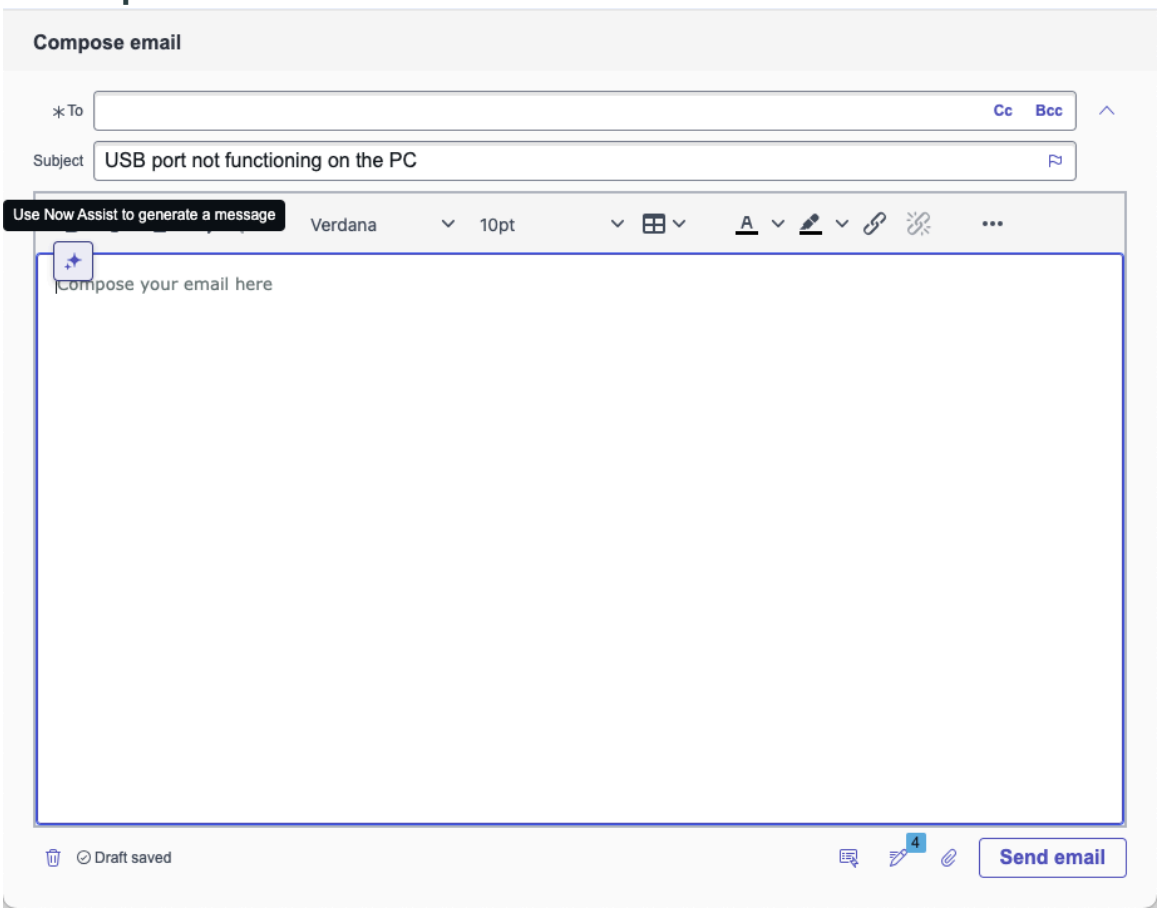
1. In Core UI or Service Operations Workspace for ITSM, open an incident that is assigned to you.
2. Start composing an email using the More actions icon or from the activity stream.
3. In the email message window, either type a response or leave it empty, and then select the Now Assist icon.

Email response screen in Service Operations Workspace



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email response screen in Core UI



4. Update the selected text with refined text by selecting **Replace**.
5. Review the generated email response and select **Refine** to modify the response, or select **Insert** to paste the response into the chat message window.
6. Select **Send email** or discard the draft if you don't like the recommendation.

Generate a Major Incident email content recommendation by using Now Assist for IT Service Management (ITSM)

Create a draft version of an email to communicate with stakeholders on a major incident using an email template. You can complete field values in the template using an AI-generated response. Use different GenAI variables in the template types for efficient communication with the requesters.

Before you begin

Note:
An admin must activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim) installed to enable the Major Incident Management email content recommendation skill. For more information on activating the plugin, see Activate Incident Management - Major Incident Management.

Role required: major_incident_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace.**
2. Using the List icon ( ), open a major incident.
3. Select the **Communicate** tab.
4. Select **Compose** in any task where the channel is email.

> **Note:**
> The default template defined for the selected task displays in the **Email template** field. You can choose any template and any type of communication plan within the template for your communication.
>
> The following four types of communication plans are available by default:
>
> - Ad hoc AI
> - Business user AI
> - End user AI
> - Technical AI
>
> For more information, see these KB articles:
>
> - Email templates and Gen AI variables
> - Persona as an input for Gen AI email templates

5. Compose and send the email.
   a. In the **To** field, enter one or more email addresses of the users you have to communicate with.
   b. In the **Subject** field, enter a short reason for the communication.
   c. In the body of the email, enter the message you want to communicate.
   d. Select **Send**.

Ask questions about an incident by using the Now Assist panel

Quickly obtain common incident related information conversationally within the incident record by asking questions in the Now Assist panel.

Before you begin

Role required: itil

About this task

Incident assist topics in the Now Assist panel include:

- Caller's assets
  - A caller must be associated with the incident to retrieve caller's assets.
  - Incident number must be provided, unless triggered from the incident record.
- Caller's recent incidents (within the past 7 days)
  - A caller must be associated with the incident to retrieve caller's recent incidents.
  - Incident number must be provided, unless triggered from the incident record.
- On-call experts from support groups

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

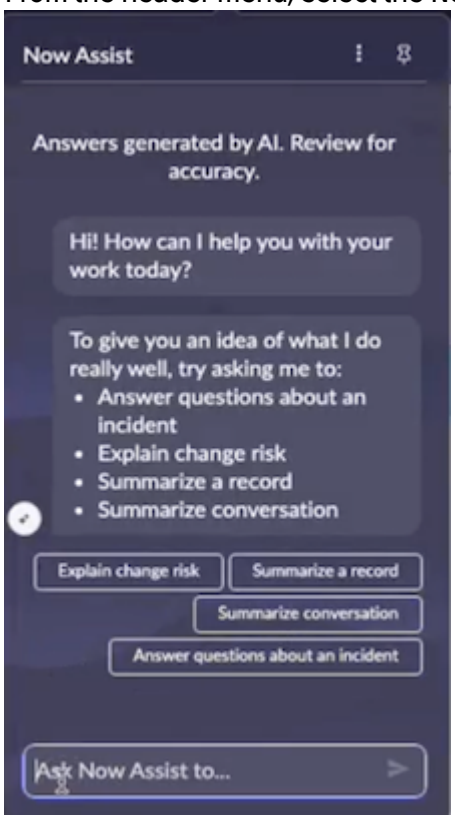
- Ability to search on-call experts that are in any support group.
- Group members are configured in **On-Call Scheduling** > **On-Call Schedules**.

- Similar resolved incidents
  - Similar incidents must be resolved or closed.
  - Incident number must be provided, unless triggered from the incident record.

You can ask questions about an incident by using the Now Assist panel in Core UI and Service Operations Workspace for ITSM.

Procedure

1. In Core UI or Service Operations Workspace for ITSM, open an incident that is assigned to you.
2. From the header menu, select the Now Assist icon to open the Now Assist panel.



3. In the Now Assist panel, either type in a question related to an incident assist topic, or select **Answer questions about an incident** and select an incident assist topic to ask about.

> **Note:**
> Incident assist uses the Similar Resolved Incidents search profile with the incident index source. For information on indexed sources, see Managing the indexed sources from the AI Search Admin console.

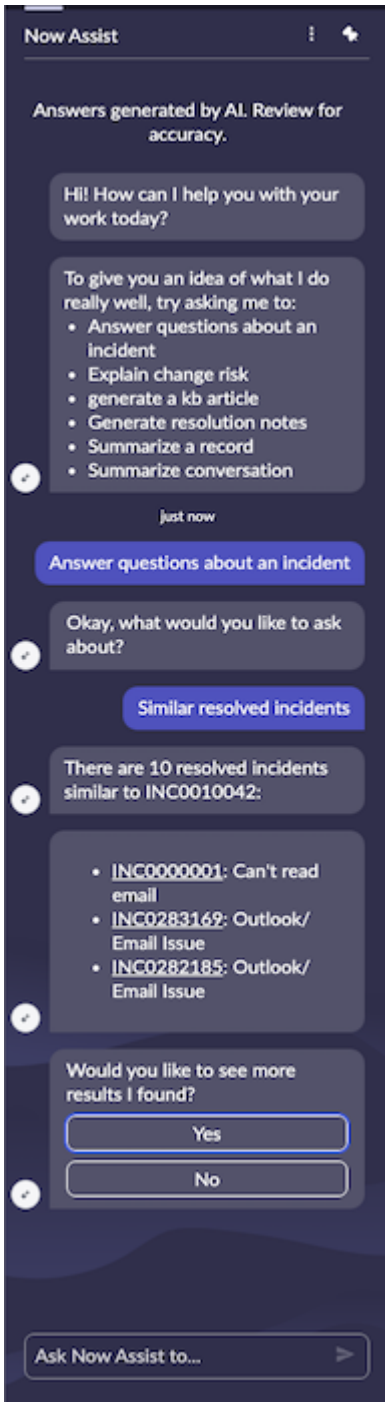
Information requested about the incident is shown.



Request the generative AI capabilities in ITSM by using the Now Assist panel

Use the Now Assist panel to request the contextual generative AI capabilities in IT Service Management (ITSM) such as a chat summary, incident summary, or incident resolution notes in a conversational manner. You can also add comments and work notes. These capabilities provide you with a quick resolution to issues.

Before you begin

Make sure that Next Experience is enabled in the instance. For information about enabling Next Experience, see Considerations for activating Next Experience. For information about Next Experience, see Next Experience UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: itil

About this task

You can access the Now Assist panel from the Core UI or Service Operations Workspace for ITSM to request generative AI capabilities for Now Assist for ITSM skills. For information about these skills, see Skill inputs and triggers for Now Assist for IT Service Management (ITSM).

Using the Now Assist panel saves time for an agent, for example, the agent can quickly learn the details of an incident by reading the incident summarization. The summarization gives enough details about the associated interaction so that the requester doesn't have to repeat the same information to the agent. For information about the Now Assist panel, see Now Assist panel.

For information about how to activate the Now Assist panel, see Turn on the Now Assist panel.

Procedure

1. Log in to an instance where Now Assist for IT Service Management (ITSM) is installed.
2. Request generative AI capabilities to summarize a chat for an interaction, summarize a chat for an incident that was created from an interaction, summarize an incident, or generate incident resolution notes.

© 2026 ServiceNow, Inc. All rights reserved.

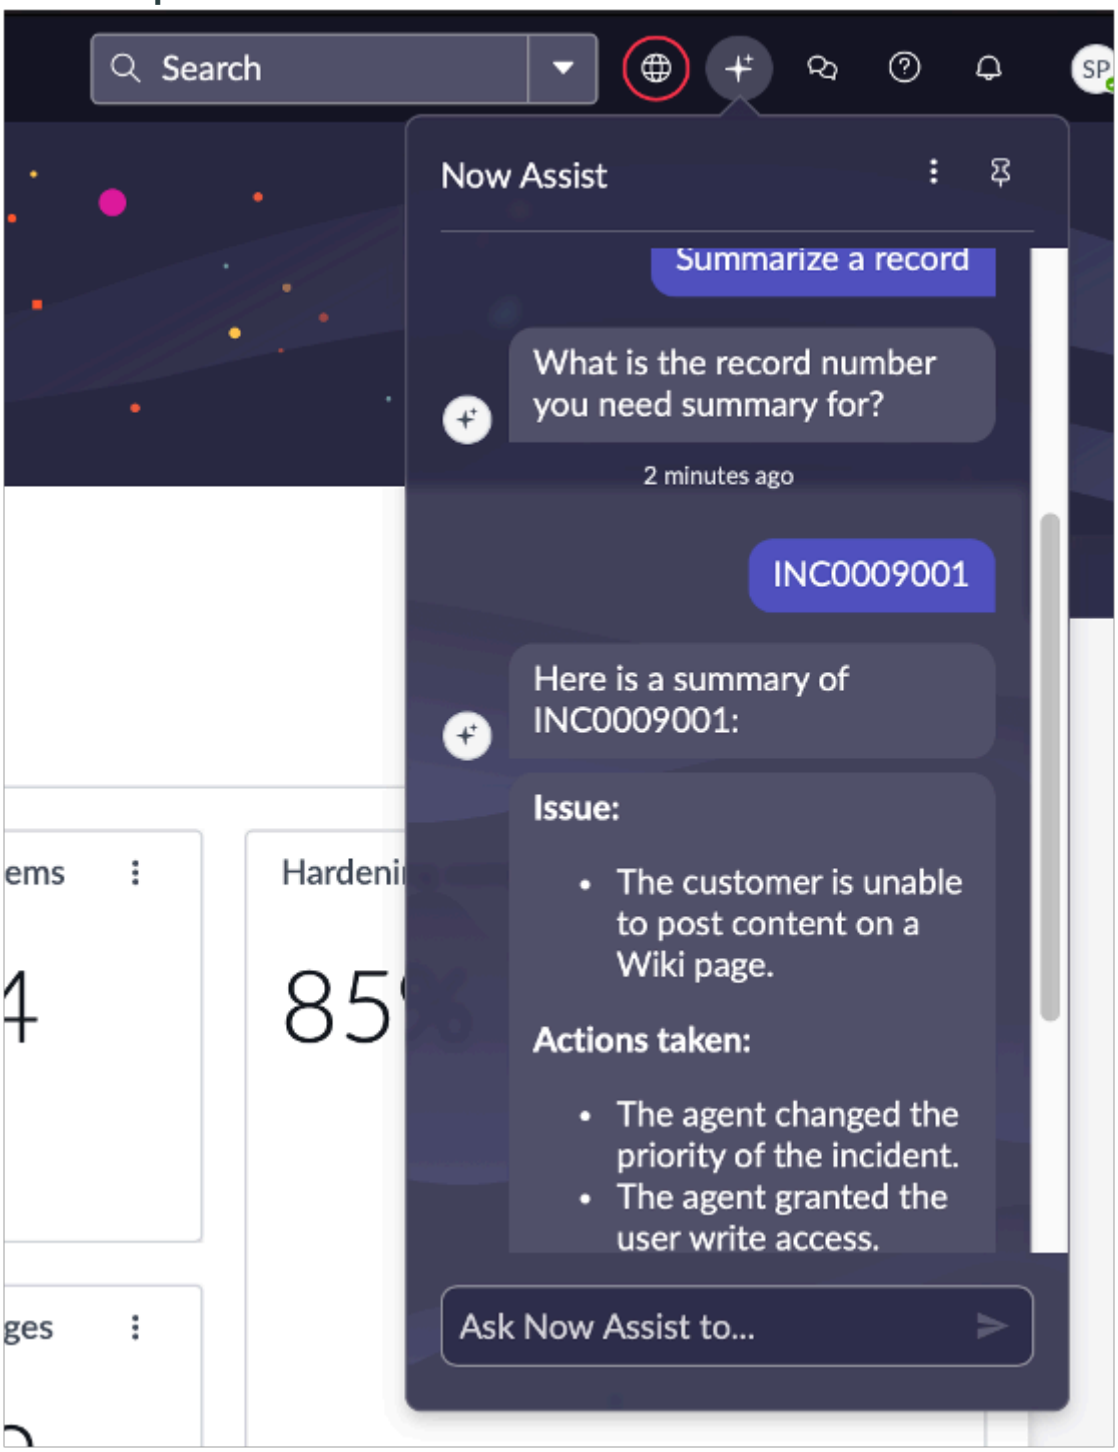
Now Assist panel for ITSM skills



Use self-service to deflect incidents in a ServiceNow portal using Now Assist

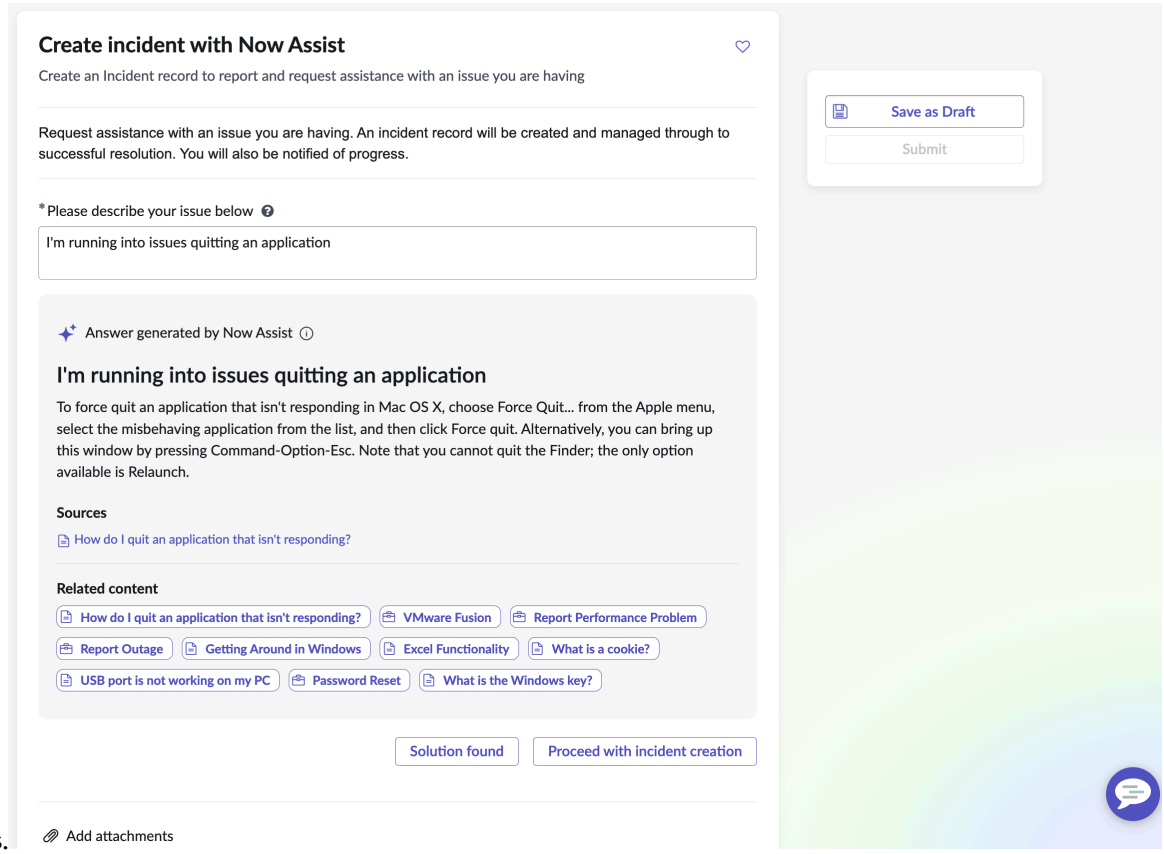
Designed to reduce the number of incidents to be resolved by deflecting issues with self-service.

Before you begin
Role required: none

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to a ServiceNow portal.
2. Select the Create Incident with the **Now Assist** record producer.
3. In the **Please describe your issue below** field, enter the issue you'd like to resolve and click outside of the field to generate the results.



Now Assist AI generates the results based on available knowledge articles and catalog items.

4. Resolve the issue or track it with an incident.

Analyze sentiments in Now Assist for IT Service Management (ITSM)

Make informed decisions on incidents based on requester's sentiment and the reasoning behind it in the Now Assist for IT Service Management (ITSM) application.

Before you begin

Role required: itil

Procedure

1. Navigate to the incident list or incident form in the Core UI or in Service Operations Workspace for ITSM.
2. **Optional:** In the Core UI or in Service Operations Workspace for ITSM list view, you can sort the incidents based on the sentiment and the sentiment trend.
3. **Optional:** Manually refresh a sentiment.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Core UI or in Service Operations Workspace for ITSM, enter a comment in the Additional Comments field.

b. In the Service Operations Workspace for ITSM interface, a red dot appears on the information icon ( ) next to the sentiment.

c. Select the information icon ( ) and then select the refresh icon ( ) to see the updated sentiment and sentiment trend.

Suggested steps generation in Now Assist for IT Service Management (ITSM)

Generate suggested steps automatically by analyzing clusters of closed incidents with similar incident resolution in the Now Assist for IT Service Management (ITSM) application.

Before you begin

Role required: itil

About this task

Data from the short description field and the filter conditions set in the incident input table are used to generate the clusters based on similar past resolved incidents.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace.**
2. Using the List icon ( ), open an incident that is not in **Closed** or **Complete** state.
3. Select the Recommendations icon ( ).
   The **Recommended actions** tab displays.
4. In the **Suggested steps by Now Assist** card, select **Generate**.

Exploring On-Call Scheduling

The On-Call Scheduling application helps you ensure that dedicated support team members are available to resolve issues as they arise. Learn more about On-Call Scheduling and the benefits it can provide for the different user roles in your organization.

On-Call Scheduling overview

On-Call Scheduling provides a way to determine which member of a user group is available to work on a task.

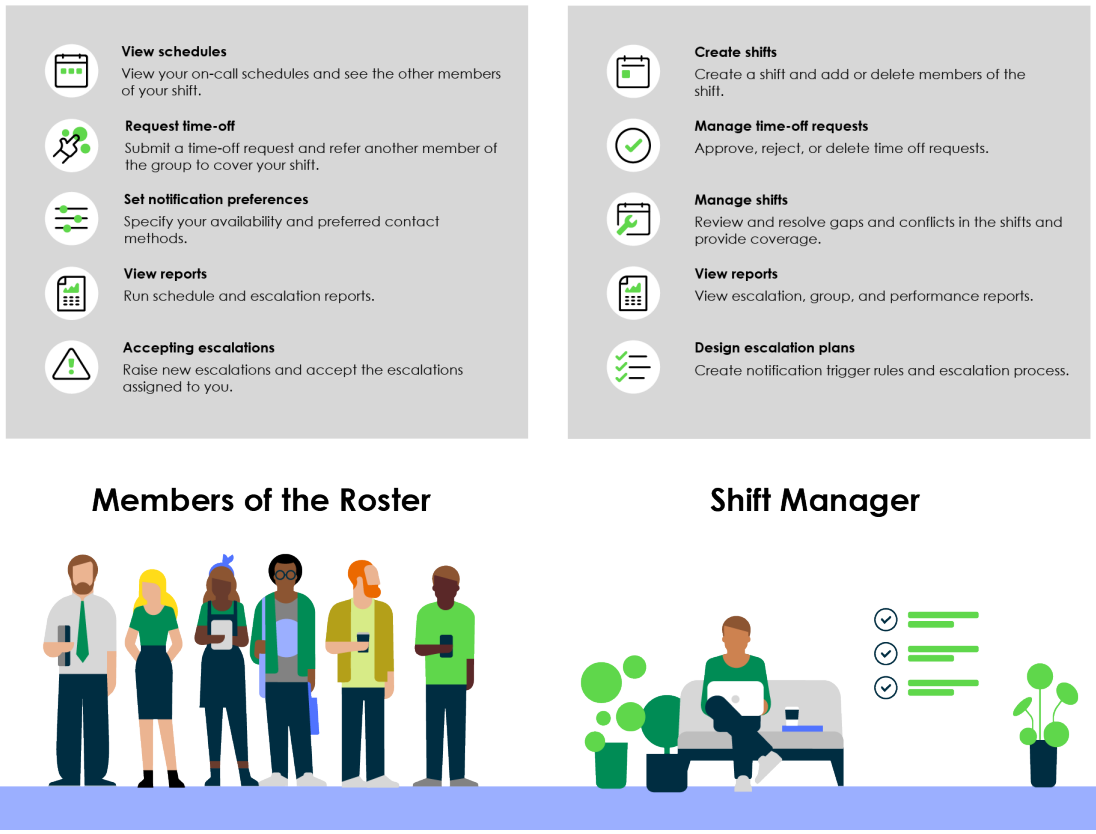
On-Call Scheduling finds the right person to assign an incident to, by rotation through a hierarchy of duty rosters. The automated process relieves the administrative burden on resource managers and makes it easy for the incident managers to bring the right resources to the table when needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On-Call Scheduling can be used by process owners and support managers who want to collaborate more effectively. On-Call Scheduling simplifies the manual shift maintenance and administration efforts while improving the mean time to resolve (MTTR) efficiencies.

On-Call Scheduling workflow

The various members of an organisation use On-Call Scheduling to work together. See a sample end-to-end



workflow:

1. Shift admin creates shift and group templates.
2. Shift admin assigns role and configures escalation trigger rules.
3. The shift manager creates a shift and add or delete members to the shift.
4. Shift manager designs the entire escalation process for the new shift.
5. Roster member views their on-call schedules and find out who the other members on their shift are.
6. Roster member can specify their availability and preferred contact methods from the methods set up by Shift admin.
7. Roster members can submit a time-off request and refer another member of the group to cover the shift.
8. Roster members views the roster and escalation details for a shift.
9. Roster members view on-call reports and receive reminders.
10. The shift manager approves or rejects the time-off requests.
11. Shift manager reviews the on-call schedules for their groups for any gaps and time-off requests.
12. Shift manager provides, replace, or delete coverage and time-off requests.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

13. Roster members receive on-call escalation notifications to acknowledge tasks or conference requests.
14. Shift manager views escalation, group, and performance reports of their on-call teams.

On-Call Scheduling benefits

Benefit	Feature	Users
Use the calendar to view or select a shift. You can set a day, week, or month view as your preference. The calendar also allows you to set your preferred start day of the week.	View my On-Call calendar on my calendar app	itil, rota_manager
Create your own escalation policies and path. On-Call Scheduling allows you to create an escalation trigger rule using the templates available, based on your requirement.	Designing an escalation process	itil, rota_manager, rota_admin
Use any one of the multiple channels such as Slack, Microsoft Teams, mobile push messages, SMS, and voice messages to set as the preferred contact method for receiving notifications.	Configure my availability and contact preferences	itil, rota_manager, rota_admin, admin
Generate escalation reports, shift reports, and performance reports.	Viewing On-Call Scheduling reports	itil, rota_manager, rota_admin
Access the performance reports that are available for premium dashboard users.	Legacy: Viewing the Performance reports for escalations	premium dashboard user
Download and use the Mobile agent to perform all these activities on the go.	Getting started with the On-Call Scheduling mobile app	itil, rota_manager

On-Call Scheduling capabilities

The key features and capabilities of On-Call Scheduling can be used by the various user roles.

On-Call Scheduling supports the Members of the roster (itil role), Shift Manager (rota_manager role), shift administrator (rota_admin role). Based on the user role, you can perform the following actions:

itil role

- View your on-call schedules and see the other members of your shift.
- Submit a time-off request and refer another member of the group to cover your shift.
- Specify your availability and your preferred contact methods.
- View the roster and escalation details for a shift.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Run schedule and escalation reports.
- Use the ITSM Mobile Agent for viewing schedules and requesting time off.

rota_manager role

- View the on-call schedule including any gaps and time-off requests for your group.
- Approve or reject time-off requests
- Review and manage gaps and conflicts.
- Provide, replace, or delete coverage and delete time-off requests.
- Create a shift and add or delete members to the shift.
- View escalation, group, and performance reports.
- Use the Mobile Agent for viewing the schedule of your groups and approve or reject time-off requests.

rota_admin role

- Set up Slack, Microsoft Teams, text and voice messages, as a contact method for an on-call escalation.
- Assign roles and configure escalation trigger rules.
- Create shift and group templates.
- Design the entire escalation process.

On-Call Scheduling new schedule engine

Introducing the new On-call schedule engine with enhanced capabilities and user experience.

The new On-call schedule engine is more efficient with the following enhanced features:

- It reduces the time taken to move, add, or remove members from a shift.
- It resolves the gaps arising when members are scheduled for extra-time or partial workdays due to the holiday calendar.
- It reduces the gaps caused by adding, removing, or replacing members of the shift.
- It refers the previous rotation to determine the next person to start the new assignment with. To ensure fair assignment, it starts the rotation with a person not yet assigned in the previous rotation.

Note:

- New shift will automatically work with the new schedule engine.
- For existing shifts, you can go to the shift record page and manually migrate using the **Migrate Now** option.
- To migrate all the existing shifts in bulk, run **On-Call Upgrade shifts to 2024 schedule engine** schedule job.

Configuring On-Call Scheduling

Plan and configure On-Call Scheduling properties, templates, trigger rules, escalation policies, rosters, and schedules.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As an administrator, you can configure preferences and application behavior and create tools that improve the effectiveness of roster members and shift managers. These are some of the tasks you can perform as an administrator.

Activate On-Call Scheduling

You can activate the On-Call Scheduling (com.snc.on_call_rotation) plugin if you have the admin role.

Set up contact methods

You can configure the following contact methods and enable users to receive notifications for escalations.

- Slack: You can also configure a template and subflow for user responses to the notifications.
- Text and voice messages: You can configure phone number and workflows to drive escalation via text and voice message.
- Microsoft Teams: Ensure that your ServiceNow instance is configured to integrate with Virtual Agent and IT Service Management integration with Microsoft Teams plugin (sn_now_teams_it) is active.
- Mobile push notifications: Configure ServiceNow Agent and enable mobile push notifications

Activate On-Call Scheduling

You can activate the On-Call Scheduling (com.snc.on_call_rotation) plugin if you have the admin role.

Before you begin

Role required: admin

About this task

Activating the On-Call Scheduling plugin activates the following third-party libraries:

- Subscription-based notifications
- Advanced Schedules support
- NG shared components
- ServiceNow common calendar
- Fullcalendar library

Note:
The On-Call Scheduling plugin (com.snc.on_call_rotation) is active by default for zBoot customers.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

On-Call Scheduling

Setting up Slack as a contact method

You configure Slack to enable users to receive Slack notifications for escalations. To offer Slack as a contact method for shift members, you install the IntegrationHub spoke for Slack.

Configuring Slack for On-Call Scheduling

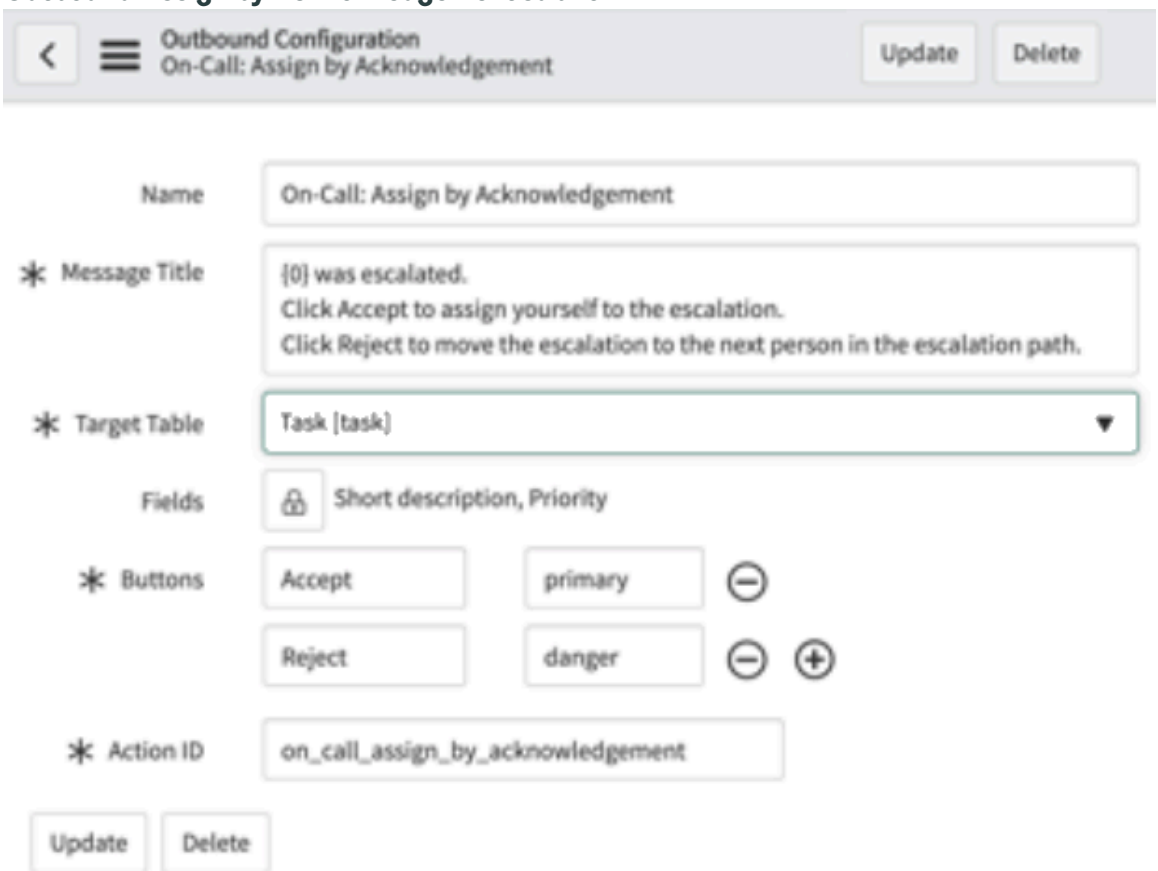
The Slack spoke automates On-Call Scheduling notifications and responds to them. The following configurations support On-Call Scheduling notifications:

Outbound Configurations

Slack > Outbound Configurations > On-Call: Assign by Acknowledgement

Generates a general escalation message. Modify the record to customize the message template.

Outbound Assign by Acknowledgement subflow

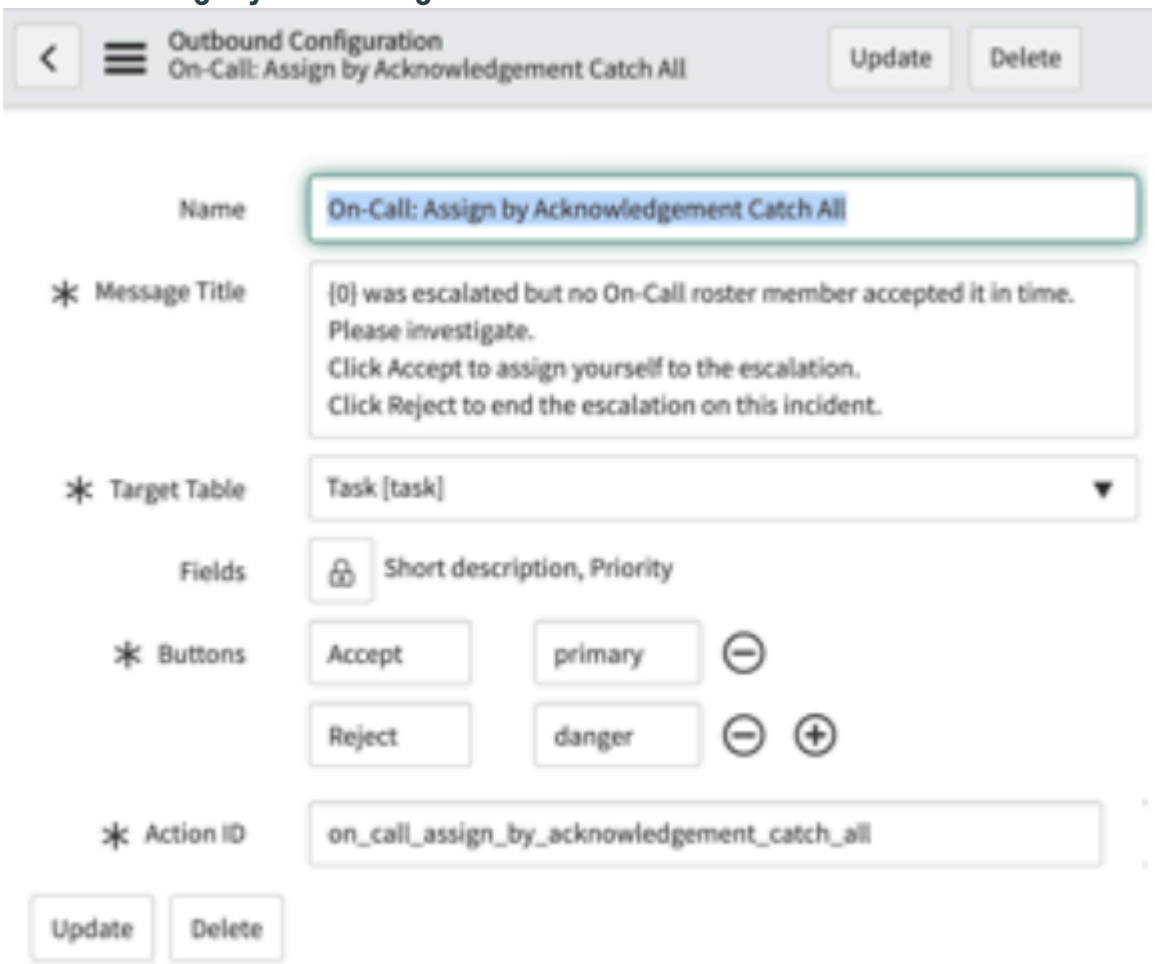


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Slack > Outbound Configurations > On-Call: Assign by Acknowledgement Catch All

Generates a catch-all escalation message. Modify this record to customize the message template.

Outbound Assign by Acknowledgement Catch All subflow



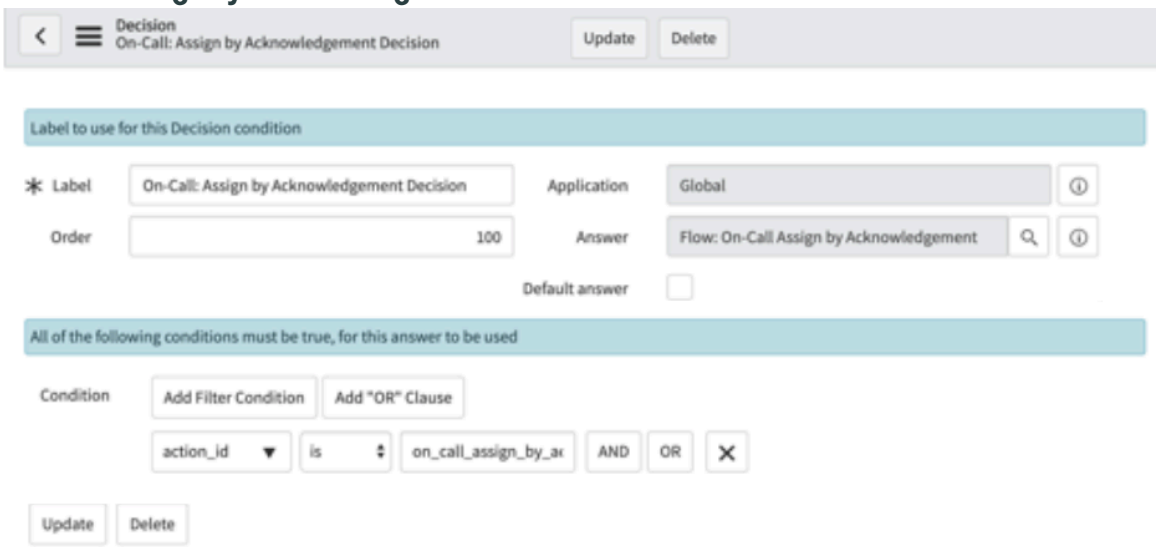
Inbound Decisions

Slack > Inbound Decisions > On-Call: Assign by Acknowledgement Decision

Defines inbound configuration for general response handling for Accept or Reject escalation messages. Use *`action_id`* as the key to map outbound configuration and inbound decisions for general escalations. The answer points to the subflow that is executed when the user clicks **Accept** or **Reject**. Modify the record to change the response handling behavior.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

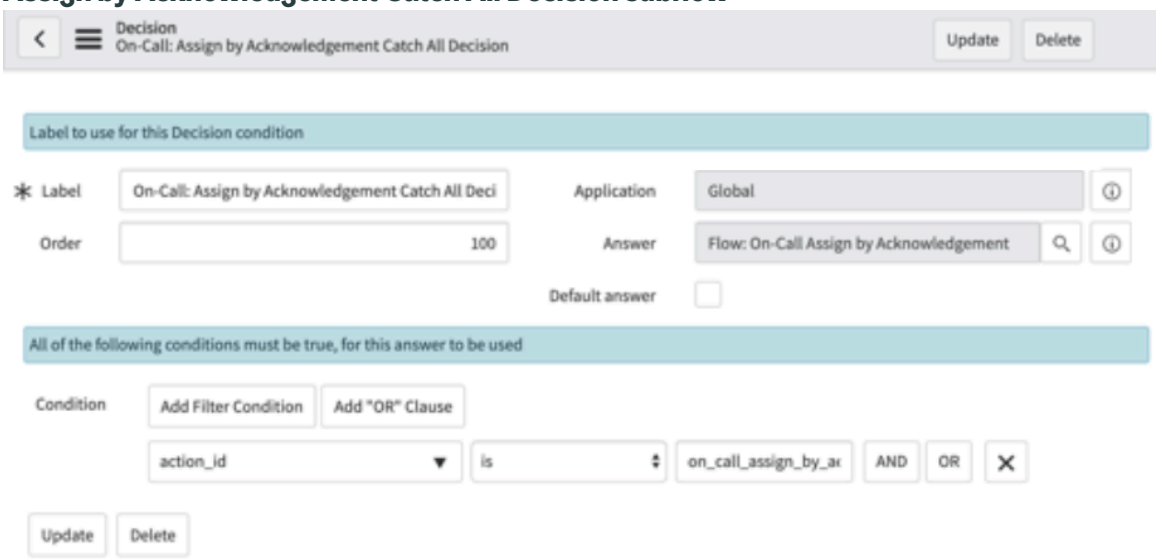
Inbound Assign by Acknowledgement Decision subflow



Slack > Inbound Decisions > On-Call: Assign by Acknowledgement Catch All Decision

Inbound configuration for catch-all response handling for escalation for Accept or Reject messages. Use *`action_id`* as the key to map outbound configuration and inbound decisions for catch-all situations. The answer points to the subflow that is executed when the user clicks **Accept** or **Reject**. Modify the record to change response handling behavior.

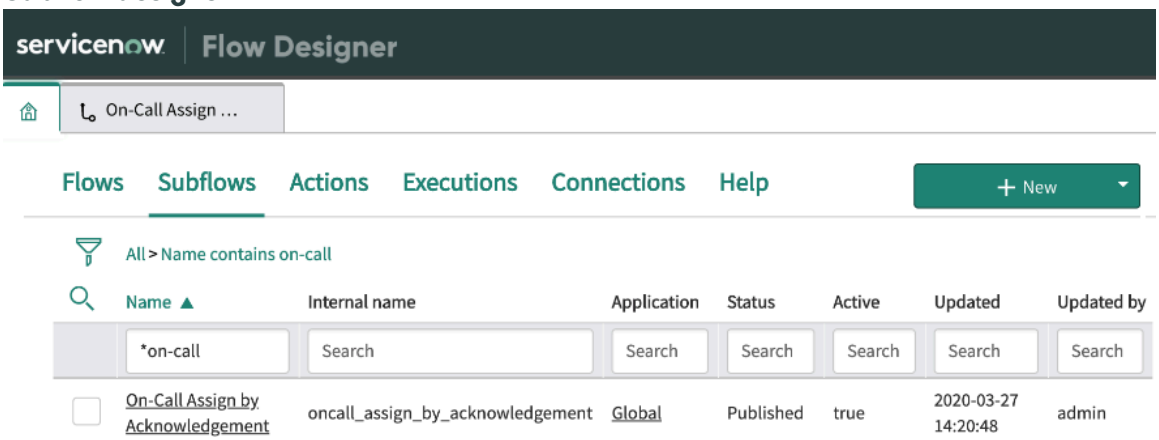
Assign by Acknowledgement Catch All Decision subflow



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows

Subflow designer



On-Call Assign by Acknowledgement

This subflow handles incoming responses from Slack and then acts. For example, assign a task to a user and return an acknowledgement message. In case of rejection, the subflow logs the response and moves the escalation to the next escalatee.

Insert Slack Response

This action creates a record in the [sn_slack_ah_v2_inbound] table for incoming Slack responses. You can reference the response by workflow based on `context_id`.

On-Call Response Controller

This action performs appropriate operations when the user clicks **Accept** or **Reject** from Slack. It invokes the utility methods to perform actions from the `OnCallSlackUtils` script include.

Setting up SMS and voice messaging as contact methods

To send On-call escalation notifications as SMS or voice messages, you must configure Notify.

Configure the following items to use Notify with On-Call Scheduling:

- You must add at least one Notify phone number to the On-Call Group number group. This group is configured by default to handle inbound SMS responses (via On-Call: Check Assignment Response) that accepts or rejects an on-call assignment and to handle outbound voice calls (via On-Call: Assign by Acknowledgement Voice) to accept or reject assignments.
- You must configure workflows, such as the On-Call: Assign by Acknowledgement to drive escalations via SMS and Voice.

To set up SMS and voice message as contact methods, see Set up Notify with On-Call Scheduling

Related topics

On-Call Assign by Acknowledgement workflow

Controlling the on-call communication channel with Notify

Set up Microsoft Teams as a contact method for an on-call escalation

Enable users to receive Microsoft Teams notifications for an on-call escalation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

User should have Microsoft Teams user credentials.

Role required: admin

Procedure

1. Ensure that your ServiceNow instance is configured for Conversational Integration with Microsoft Teams and the IT Service Management integration with Microsoft 365 plugin (sn_now_teams_it) is active.

   For information on Virtual Agent permission policies, see Manage Now Virtual Agent permission policies.

2. Select **Microsoft Teams** as your preferred notification channel while defining the escalation settings for a user group.
   For information on escalation settings, see Escalation and reminder settings for rosters.
3. For the required user group, create a trigger rule that uses the On-Call: Assign by Acknowledgement trigger workflow.

   If a user or shift manager sets the preferred contact channel as Microsoft Teams, a notification is sent to the user in Microsoft Teams along with the actions that a user can perform.

   For information on creating a trigger rule, see Create an escalation trigger rule.

Set up mobile push as a contact method for an on-call escalation

Enable users to receive mobile push notifications for on-call escalations.

Before you begin

Role required: admin

Procedure

1. Install ServiceNow Agent and enable mobile push notifications from the **Notifications** tab.
   For information on this tab, see Base system functionality for ServiceNow mobile.
   The mobile push appears as a communication channel in the ServiceNow instance.
2. Select **Mobile push** as your preferred notification channel while defining the escalation settings for a user group.
   For information on escalation settings, see Escalation and reminder settings for rosters.
3. For the required user group, create a trigger rule that uses the On-Call: Assign by Acknowledgement trigger workflow.

   If a user or shift manager sets the preferred contact channel as mobile push, a mobile push notification is sent to the user along with the actions that a user can perform.

   For information on creating a trigger rule, see Create an escalation trigger rule.

Viewing schedules and request time-off

View your schedule, see the members of your group, request time off, and set your preferences for contact methods.

As an itil user you can perform these tasks:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View On-Call schedules
- Configure my availability and contact preferences
- Request time off and suggest who can cover

View On-Call schedules

The tiled grouping of on-call shift schedules helps you to review shifts rather than having to search through all shifts in the system.

Before you begin

Role required: itil, rota_manager, or rota_admin

About this task

Each card on the On-Call Schedules page represents a shift and identifies the on-call members. A card displays the group name, the shift name, and rosters (Primary and Secondary).
On-Call schedules enable you to view the presence of on-call members. For more information on presence, see User presence.

Note:
By default, on-call schedules are loaded in batches of 20. You can use the *com.snc.on_call_rotation.landing_page.group_limit* property update the setting. For details, see System properties for On-Call Scheduling.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Schedules**.

   Note:
   For a group with overlapping shifts, shift cards are displayed based on the escalation setting.

   The following tabs appear:

   - **Pinned On-Call Schedules**: Displays a personalized list of who is on-call for the groups you are most interested in. Pin groups here for fast access.
   - **My On-Call Schedules**: Displays only the On-Call schedules that you manage or are a member of.
   - **All On-Call Schedules**: Displays the list of all groups that have active On-Call schedules. You can also find who is on-call for groups that you have not pinned.

   Use the filter to display On-call schedules by group, schedule, or username.

2. **Optional:** In the **All On-Call Schedules** tab, pin a shift card by pointing to the card and clicking the Pin icon ( ).

   Note:
   When you pin a shift card of a group with overlapping shifts, all other shift cards of that group are also pinned.

3. **Optional:** In the **Pinned On-Call Schedules** tab, unpin a shift card by clicking the Pin icon.
4. To view details of a shift, click the shift card.

   Note:
   Each shift card displays only the first two rosters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you are a shift manager or roster member, the schedule opens. For more information, see Updating an On-Call schedule. In all other cases, you are redirected to the calendar view. For more information on on-call scheduling calendars, see Manage shifts from the Calendar view.

5. **Optional:** To view roster and escalation details, click **Roster and escalation details** on the shift card.
   A dialog box displays the following tabs:
   - Roster: Displays a list of all rosters and contact number, email address, group, and the shift for the active On-Call member.
   - Escalation Path: Displays the escalation path defined for the shift.

   Note:
   By default, the details of the on-call member of the primary roster are displayed. Click **Send a direct message** to send a direct message to the on-call member. Alternatively, call the member if the Notify WebRTC is configured. For more information on real-time messaging, see Connect. For information on Notify WebRTC, see Forward call workflow activity. For information on the **Specify a valid Notify Number with voice capability** property that enables the Notify WebRTC for on-call, see System properties for On-Call Scheduling.

6. **Optional:** To view gaps and conflicts in a shift, click the info badge on the shift card.
   - This is applicable only for group managers, shift managers, and delegated shift managers.
   - This information is displayed based on the setting of the *com.snc.on_call_rotation.landing_page.show_pending_actions* property. For more information, see System properties for On-Call Scheduling.

Configure my availability and contact preferences

You specify your availability and the methods to use to contact you for On-Call escalations. The instance notifies you if an admin overrides your settings for some reason.

Before you begin

Role required: itil or admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Preferences**
2. On the **Contact Attempts** tab, click the + icon and fill in the **Availability** form.

Availability form

Name	A unique and meaningful name for this record of your availability settings.
User	The user for whom you are creating the availability (typically yourself).
Active	Option to enable this availability record. Select the check box to activate your availability.
Schedule type	Select an existing availability schedule or create a custom schedule.
Use these fields to create a custom availability schedule:	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start time	If this shift is not an all-day shift, then specify the start time of your availability.
End time	The end time of your availability.
Repeat on	The time of a single duration. For example, if you select weekly repetitions, specify the days of the week when you are available.
Time zone	The time zone of your availability. **Note:** The time zone is not editable and is taken from your user's profile.

3. Click **Submit.**
4. On the **Contact Preferences** tab, click the contact **Attempt** method to configure.
   The **Contact Preferences** dialog box appears.
5. Select the contact methods that the instance should use to contact you while you are on-call.
   The methods you select are the contact methods that the instance should use for this contact attempt. Depending on your instance configuration, you can specify any or all of the following notification methods:
   - SMS text
   - Email
   - Slack
   - Voice
   - Microsoft Teams. For information on setting up this channel, see Set up Microsoft Teams as a contact method for an on-call escalation.
   - Mobile push. For information on setting up this channel, see Set up mobile push as a contact method for an on-call escalation.
6. Repeat the process for each contact attempt.

Note:
Admins can specify overrides of your contact methods for all members of your group. Override settings appear on the **Contact Overrides** tab.

View my group schedules

You can see the on-call schedules for your groups.

Before you begin

Role required: itil

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
2. Open a schedule.
3. **Optional:** To view a roster, click its order number in the **Rosters** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View my personal schedule on the My Schedule report

You can view when you are on call and the escalation lineup for a particular date range.

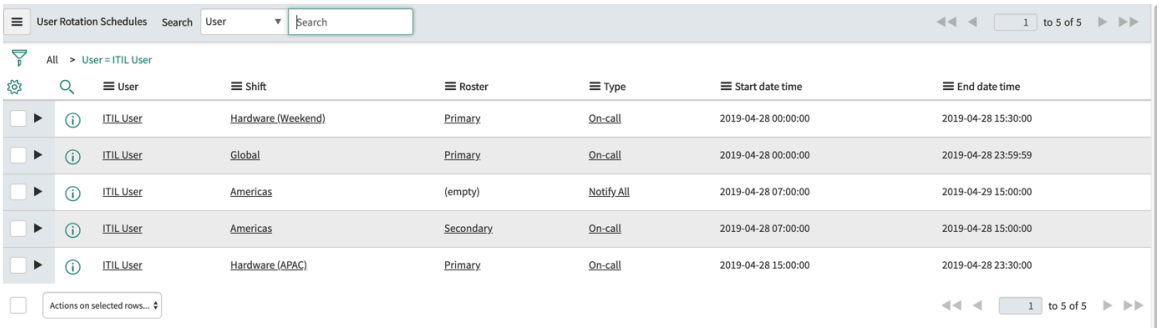
Before you begin

Role required: itil

Procedure

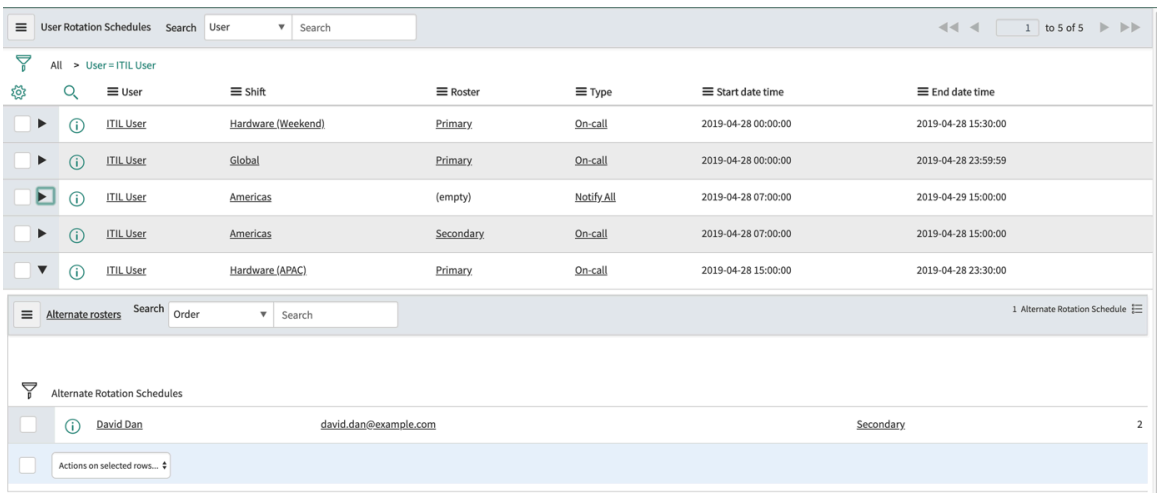
1. Navigate to **All** > **On-Call Scheduling** > **Reports** > **My Schedule Report**.
2. In the **Show for** field, select a date range and then click **Submit**.

   The User Rotation Schedules list shows the shift, the roster, and the start and end times for each timeslot.



3. To view alternate rosters, expand an entry by clicking the arrow.

   The alternate roster appears for that timeslot. For example, if you are the primary contact, this list shows secondary and tertiary contacts for the timeslot.



Request time off and suggest who can cover

You can schedule your own time off and suggest a suitable cover from among fellow roster members.

Before you begin

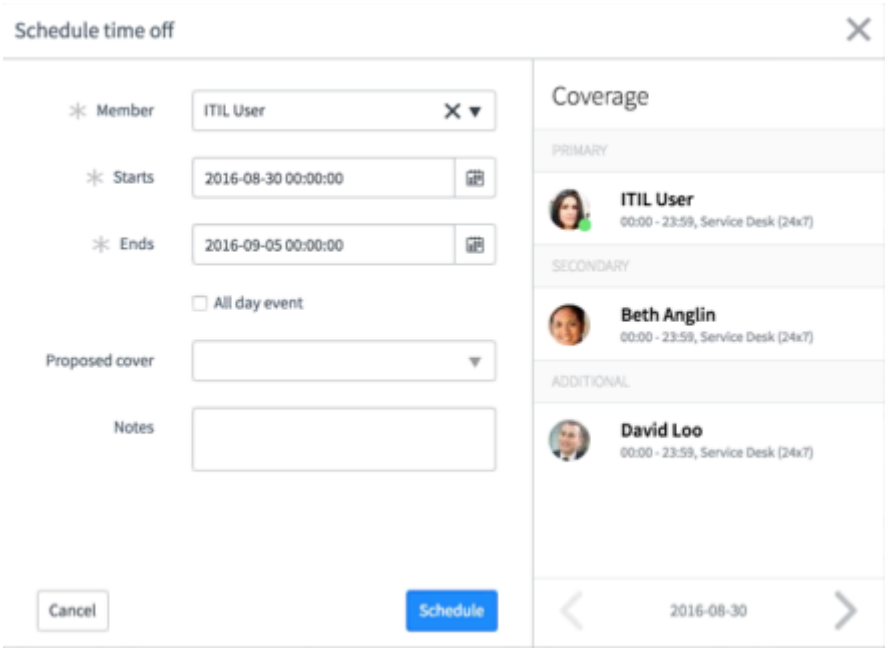
To use this feature, the system administrator must enable the **Configuration to determine if PTO requests need approval** system property (*com.snc.on_call_rotation.pto.approval.required*).

Role required: itil

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **On-call Scheduling** > **On-call Calendar**.
2. Select the shift entry for the time off.
3. Click **Schedule Time Off** and fill in the form.



Schedule time off form

Field	Description
Member	The member getting time off (typically, yourself).
Starts and Ends	Start and end dates for the time off.
Propose cover	Name of a roster member who can provide cover in the absence.
All day event	Option to specify that the time-off period involves full workdays.
Notes	Optional. Comments to help the shift manager understand the request.

4. Click **Schedule**.
   The time off is tentatively scheduled in your On-Call calendar.

View my On-Call calendar on my calendar app

You can subscribe to your On-Call calendar using your personal calendar client.

Before you begin

1. Ensure that your calendar client uses and supports the iCalendar format.
2. Ensure that your calendar client can subscribe to an external calendar.
3. If calendar client meets the requirements, ask your shift manager to send your On-Call calendar subscription URL by email notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
You must provide your instance credentials to authenticate yourself to use the subscription URL to view On-Call events. Currently, only the Calendar application on Mac OS X 8.0 and newer and the Outlook application on Windows 2013 and newer support authenticated calendar subscriptions.

Role required: rota_admin, itil, rota_manager, or admin

Procedure

1. On your calendar client, add a new external calendar subscription.
2. Enter the On-Call calendar subscription URL that you received.
3. Click **Subscribe**.
4. Enter your login details for your instance.
5. Specify additional details such as how frequently to update the calendar.

Related topics

Assigning On-Call Scheduling roles

Managing schedules and shifts

You can configure and manage an On-call schedule and shift. Add or remove members to a shift and override their contact preferences.

you can configure roster, shift and on-call schedule details. Add or remove members to a shift and override their contact preferences.

As a rota_manager or rota_admin you can perform most of these tasks for the members of your group.

- Configure or update an On-Call shift
- Configure or update an On-Call schedule
- Managing roster members
- Manage requests for time off
- Override contact preferences for a shift
- Configure preferences for a user group
- Delegate the shift manager [rota_admin] role

Enable users to subscribe to the On-Call calendar

Configure an On-Call calendar subscription URL and send it to the members of a shift. The URL is an iCal link that enables users to subscribe to their on-call calendar from their preferred calendar client.

Before you begin
Role required: admin, rota_admin, or rota_manager

About this task
The Subscription URL supports SSO authentication to view and download on-call calendar.

Note:
Don't share the subscription URL for security reasons.

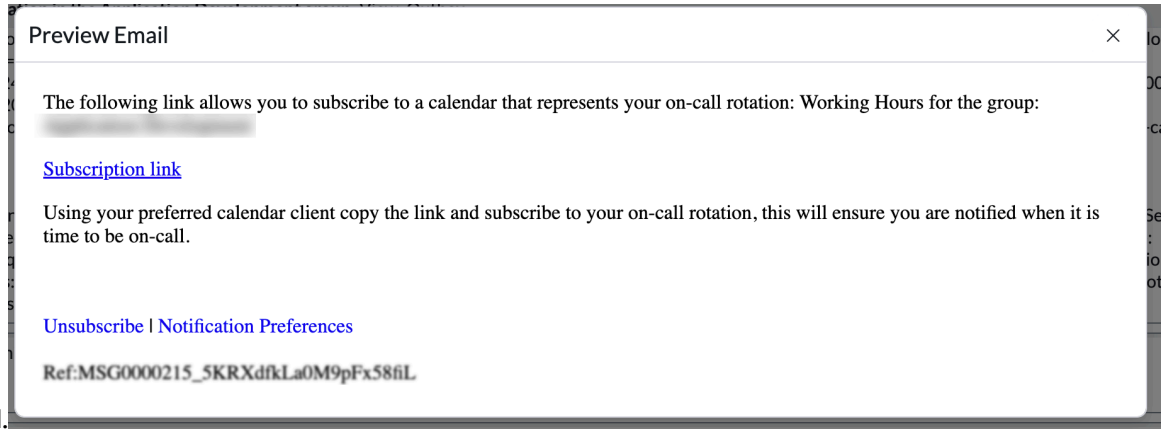
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

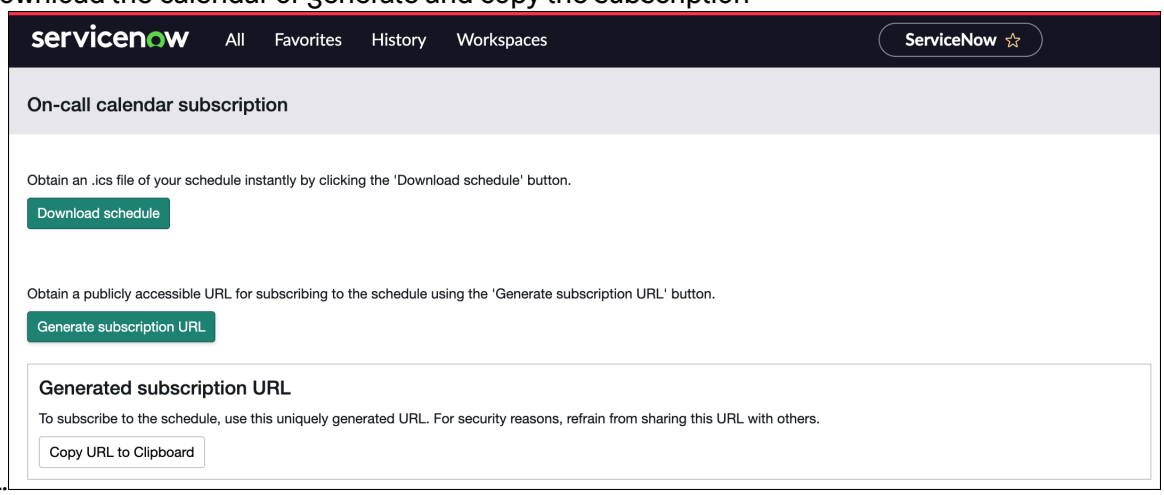
1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
2. Select the shift for which you want to send the on-call calendar subscription URL.
3. Specify the following details in the **Calendar Subscription** section.

Name	Definition
Coverage interval	Select if you want to update the subscribed calendar with weekly or daily coverage details.
Get coverage for	Based on your coverage interval selection, select the number of weeks or days for which you want to update the subscribed calendar.

4. Select **Update**.
5. Select **Send Subscriptions** to send the calendar subscription URL to all members of the shift by email.



Members of the shift will receive an email with the subscription link. Select the **Subscription link** and log in with SSO credentials to download the calendar or generate and copy the subscription URL.



Configure preferences for a user group

Specify the On-Call preferences for a user group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin, rota_admin, or rota_manager.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Group Preferences** and then set the values as needed.

On-Call Group Preference form fields

Field	Description
Group	User group for which the On-Call preferences should apply.
Shift managers	Users who can manage the shift in addition to group managers, shift administrator [rota_admin], and delegated shift managers. You can also select the current group members.
Allow Shift Schedule Overlap	Specifies if overlapping schedules are allowed for shifts within the group. When set to `Default`, the value selected for the **Configuration to control whether to allow overlapping Shift schedules** (*`com.snc.on_call_rotation.allow_rota_overlap`*) property is applied. **Note:** Shift overlap is required to have a hand-off period between shifts. With this, multiple shifts can be on-call for the same duration. On-call members from multiple shifts can be contacted.
Escalation rule on Shift overlap	Escalation rule that applies when there is a shift overlap. When set to `Default`, the value selected for the **Escalation rule which applies when Shifts overlap** (*`com.snc.on_call_rotation.escalation_rule_rota_over`*) property is applied.
PTO approval preferences	Specifies if an On-Call member in the group can create time-off request (PTO). When set to **Default**, the value selected for the sys property *`com.snc.on_call_rotation.pto.configuration`* (**This property governs if an On-Call user (Not "admin, rota_manager, group manager or rota_admin") is allowed to create PTO**) is applied.
First Day of the Week	Select a preferred start day of the week for the selected group

2. To view On-Call property settings, click **View Global Settings**.
3. Click **Submit** to configure the settings or **Delete** to delete the preference.

Override contact preferences for a shift

Override all shift members' contact preferences to enforce a communication channel, for example, in case of an emergency.

Before you begin
Role required: rota_admin, rota_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Use one of the following methods to open the Edit Escalation and Contact Preferences page:
   - **a.** Navigate to **On-Call Scheduling** > **On-Call Schedules**. The On-Call Schedules page opens to the All On-Call Schedules tab.
     b. Click a schedule card.
     c. On the **Shifts** tab, click the Actions icon ( ) for the shift and select **Edit Escalation and Contact Preferences**.
   - **a.** Navigate to **On-Call Scheduling** > **My Group Schedules**.
     b. Select the shift.
     c. Click **Edit Escalation and Contact Preferences**
2. On the **Contact Preferences** tab, click the contact **Attempt** method to configure.
   The **Contact Preferences** dialog box appears.
3. Select the contact methods that the instance should use for all shift members for the selected contact attempt.
   Depending on your instance configuration, you can specify any or all of the following notification methods:
   - SMS text
   - Email
   - Slack
   - Voice
   - Microsoft Teams. For information on setting up this channel, see Set up Microsoft Teams as a contact method for an on-call escalation.
   - Mobile push. For information on setting up this channel, see Set up mobile push as a contact method for an on-call escalation.

   Note:
   SMS and voice require that Notify is active.
4. Enable the **Override user preference** option.

Configure or update an On-Call shift

You can add extra coverage, specify extra times for when a shift is active, and schedule time off.

Before you begin
Role required: rota_admin or rota_manager

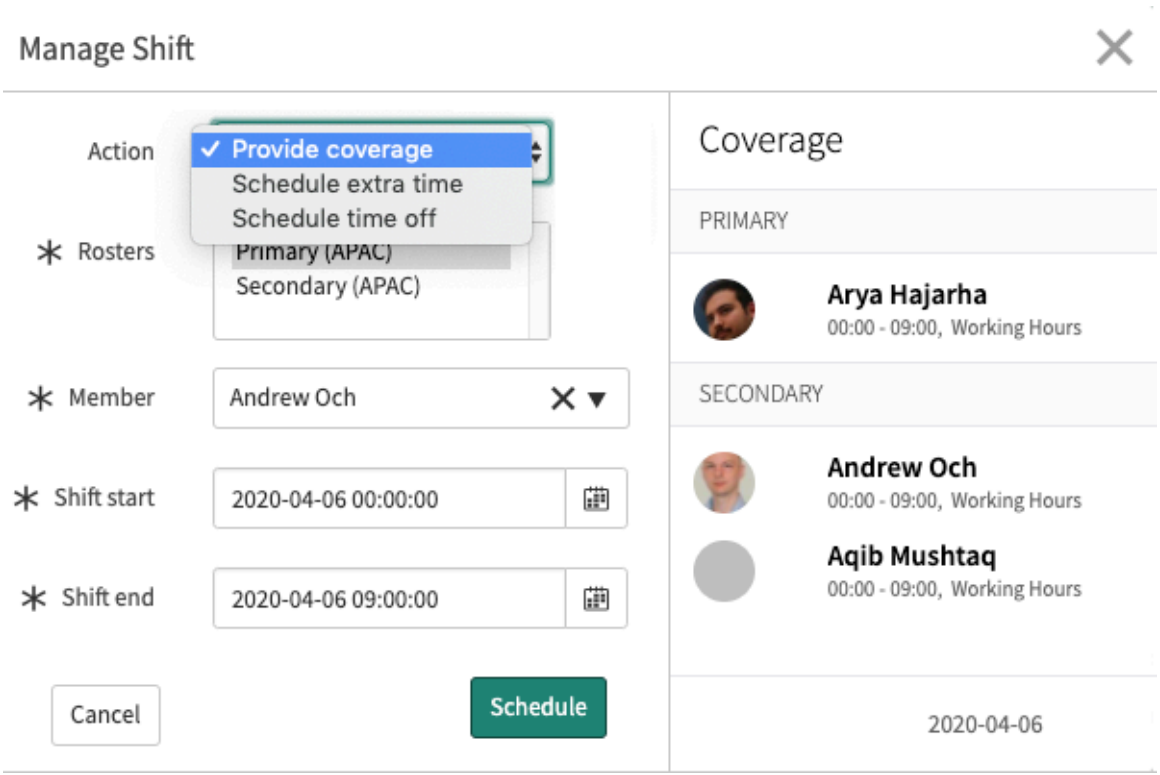
About this task
You can update the calendar only for the time zone specified in your user profile.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
   The on-call calendar opens.
2. Click the Timeline view icon ( ).
3. Click the Filters icon ( ) and then select the group.
   The calendar displays the selected group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Right-click a block that represents a member of the shift and select **Manage Shift**.
The Manage Shift dialog box displays the current shift settings.



5. Select an **Action**, as appropriate.

Option	Description
Provide coverage	Select details of the member who will provide on-call coverage for an other roster member. The following options appear when you select this option: ○ Rosters: Select one or more rosters for which the member will pro vide coverage. ○ Member: Select the member to provide extra coverage. ○ Shift start: Select the date from which the coverage will start. ○ Shift end: Select the date on which the coverage will end. **Note:** The coverage is created between the start and end date of the shift based on its schedule time.
Schedule extra time	Specify extra coverage for the selected shift. The following options ap pear when you select this option: ○ Shift: Select the shift for which you want to specify extra time. ○ Shift start: Select the date from which the extra time will start. ○ Shift end: Select the date on which the extra time will end.
Schedule time off	Specify the group member who will take scheduled time off during the selected time frame. The following options appear when you select this option:

View On-Call schedules

Manage shifts from the Calendar view

Configure a roster

Edit a roster to specify its reminder and escalation settings and to identify a subset of group members to participate in the On-Call roster.

Before you begin

Role required: rota_admin or admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
2. Right-click a shift and select **Edit Shift** from the **Actions** list.
3. In the **Rosters** related list, select a roster and then fill the form.

Roster form fields

Field	Description
Name	Name of the roster.
Shift	Shift associated with the current roster.
Active	If selected, the roster is active for on-call operations.
Order	Order of the roster.
Rotation interval	Type of the rotation interval.
Day of week for rotation	Weekday on which the roster rotation should start. When this field is specified, roster rotation happens based on the specified frequency and the weekday. **Note:** This field is displayed only if the **Rotation interval** field is set to **Weekly**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Rotate every	Frequency of the rotation interval.
Rotation start date	Start date of the rotation.
Rotation start time	Start time of the rotation.
All day rotation	If selected, roster rotation happens throughout the day. To specify a particular time of day for roster rotation, for example 08:00 instead of midnight, deselect the check box and specify the time.
Escalation Settings	
# reminders	Number of times that reminders are sent to a user who does not reply within the time frame defined in **Time between reminders**.
Time between reminders	Time between each reminder.
Time before escalation	Values in the**Number of reminders** and **Time between reminders** fields determine the value in the **Time before escalation** field. For example, if **Number of reminders** is 2 and **Time between reminders** is 10 minutes, then the **Time before escalation** is 30 minutes. That is, the time that passes between the first notification of a non-responsive roster member and the first notification of the next member in the escalation path.
Reminder Communication	
Send on-call reminders	If selected, a reminder is sent to the email address specified in the user record, unless it is specified somewhere else in the notification preferences. Notification preferences take precedence over the user record.
Reminder lead time (days)	Lead time for email reminders. **Note:** This field is displayed only when the **Send On-Call Reminders** check box is selected.

4. Click **Update**.

Note:

- Initially, roster members are automatically populated from the user group.
- All members of a roster must be members of the same user group.

Escalation and reminder settings for rosters

Update shift details from the On-Call calendar

To save time, update shift details directly from an on-call calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: rota_admin or admin

Procedure
1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
2. In the title bar, click the toggle filters icon and select a user group.
3. Click the shift name on the calendar.
   A dialog box displays the **Actions** list and information about the primary and secondary rosters. For each listed user, you have an option to either connect through phone, email, or chat. The application that is launched for phone or email is dependent on the client that is installed in the local machine.
4. Navigate to **Actions** > **Edit Shift**.

Edit Shift form fields

Question	Description
Name	The name of the shift.
Group	Select **Yes**, and then select one of the predefined options in the next question. Select **No** to set up the schedule's configuration manually.
Active	Shows the state of the shift
Schedule	The shift is a part of this schedule. Choose from a predefined list of schedules using the lookup if you want to change the schedule. Click the calendar to view the complete schedule.
Based on	The template that the schedule is based on
Background Color	Use this field to specify the background color of the shift or to change from an existing color. Differentiate between groups with the colors.
Catch All	Specify who should receive notifications in case none of the people who are on-call accepted the incident assignment. It can be none, a group manager, a shift manager, an individual, or any or all roster members. ○ Select **Notify Individual** to specify a member of the group to notify. ○ Select **Notify All** to specify a shift. All shift members are notified.
Manager	The user with the shift manager [rota_admin] role.
Override user preference	User preferences are overridden with contact preferences when set to true.
Send On-Call Reminders	If selected, on-call reminders are sent.
Reminder lead time (days)	Lead time for email reminders. **Note:** This field is displayed only when the **Send On-Call Reminders** check box is selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question	Description
Coverage interval	Update interval for the subscribed calendar: Weekly or daily coverage details.
Get coverage for	Number of weeks or days for which you want to update the subscribed calendar.

Send or resend reminders of an upcoming shift

Remind roster members of an upcoming shift by sending an email notification. You specify the number of days before their shift starts for the email.

Before you begin
Role required: rota_admin or admin

About this task
The reminder is sent to the email address specified in the user record, unless the address is specified in other notification preferences. Notification preferences take precedence over the user record.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
   The option is also available when you edit a shift in an On-Call calendar.
2. Select the shift.
3. On the Shift form, select the **Send on-call reminders** check box and then specify the number of days in the **Reminder lead time** field.

   Note:
   If you set the value of **Reminder lead time (days)** to more than one day and also set the roster to daily rotation, the instance does not send reminder emails.

4. To resend a reminder, click **Resend**.
5. Click **Update**.

Related topics

Assigning On-Call Scheduling roles

Manage shifts from the Calendar view

Configure the lead time for email reminders

On-Call Scheduling includes a scheduled job that checks if any shift members should be notified about upcoming On-Call commitments. Modify the lead time for the reminder to be sent.

Before you begin
Role required: rota_manager or rota_admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
2. Right-click the shift and select **Edit Shift**.
3. Update the **Reminder lead time (days)** value for the on-call schedule record or for any of its rosters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The reminder lead time defined on a roster is always respected. If no lead time is defined, the instance uses the schedule reminder lead time. If the reminder lead time is not defined for either the schedule or its rosters, then the instance uses a default of 2 days.

Note:
The **Reminder lead time** on the Roster form is different from the **# reminders** and **Time between reminders** values in the Escalation Settings section of the form.

The escalation settings are used only to configure reminders for escalations. The **Reminder lead time** is in the Reminder Communication section of the Roster form, and is used to email reminders for upcoming on-call commitments.

Manage requests for time off

As a shift manager, you can review and approve time-off requests from shift members. You also specify the roster member who can cover for the time.

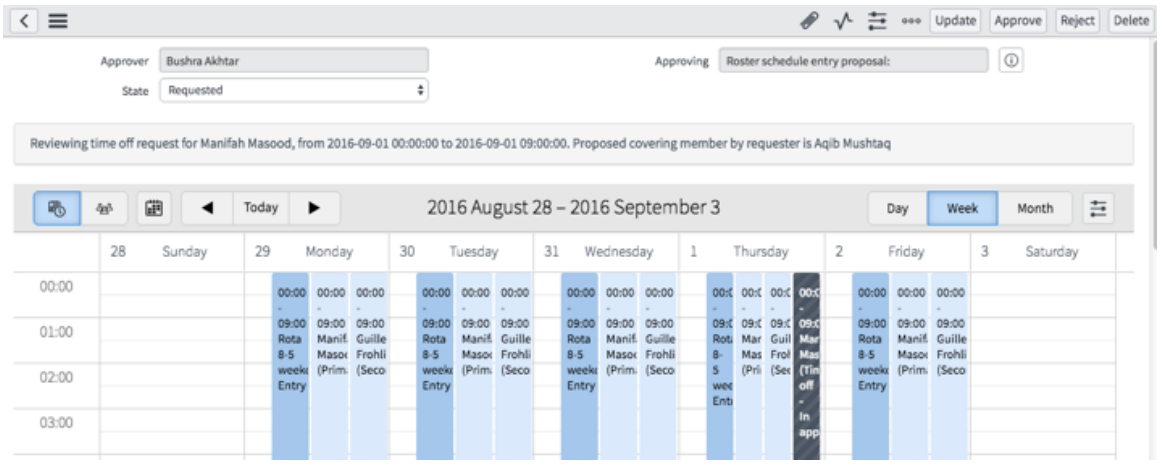
Before you begin

Role required: rota_manager

Procedure

1. Navigate to **All** > **Self-Service** > **My Approvals**.
2. Select the time-off request record to approve.

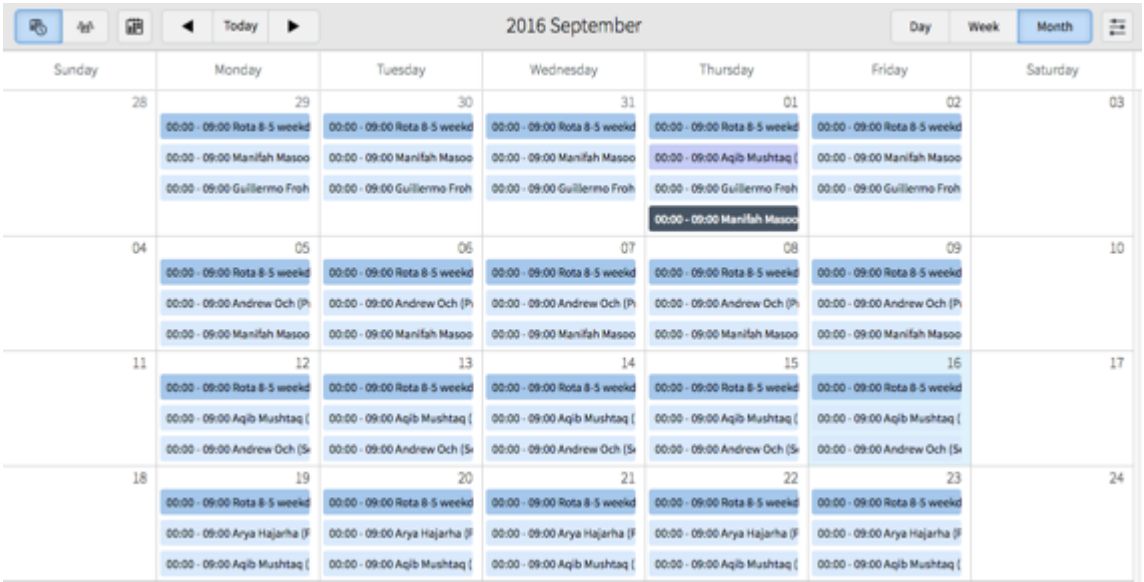
   The time-off request displays the details of the time-off requested by the member of your team. In this example, the dark blue shade with stripes represents the requested time-off. A message also gives you the request details including that of the proposed cover.



3. **Optional:** Enter comments in the **Comments** section.
4. Select **Approve** or **Reject**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For rejection, the On-Call calendar no longer indicates the time-off details and the requester receives email notification.
- For approval, the On-Call calendar indicates the time-off details and the requester receives email notification.



Related topics

Assigning On-Call Scheduling roles

Resolve gaps, conflicts, and time-off requests in a shift

Review and resolve gaps and conflicts. Find a replacement on-call member for time-off requests to ensure proper support coverage.

Before you begin

Role required: rota_manager

About this task

Possible reasons for gaps are:

- Time off without coverage
- User has been moved out of the group
- User is marked as inactive

A conflict is possible if a user is assigned as both the primary and secondary point of contact for a shift.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Schedules**.
2. Click a shift card.

Note:
If you are a shift manager or roster member, the schedule view opens. In all other cases, you are redirected to the calendar view. For more information on on-call scheduling calendars, see Manage shifts from the Calendar view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The On-Call Schedules page open. For more information, see Updating an On-Call schedule
- The pending actions for the current shift appear in the **Pending Actions** section.

.

3. To resolve gaps or conflicts, perform the following steps.

   a. Click **Review** in the **Pending Actions** section.
   The calendar view appears, and gaps or conflicts are highlighted.

   b. Click the Information icon ( ) to view gaps.

   c. Right-click the shift and select **Edit shift** from the **Actions** list.

   d. Scroll down to the **Rosters** list and select the roster where the user is unavailable.

   e. In the **Members** related list, add a **To** value for the unavailable user.

   f. Add a new member with a **From** value to close the gap.

4. To resolve a time-off request, perform the following steps.

   a. Click **Review** in the **Pending Actions** section.
   The calendar view appears, and time-off requests are highlighted.

   b. Right-click the shift and select **Manage shift** from the **Actions** list.
   The Manage Shift dialog box appears.

   c. Approve the time-off requests.

Managing roster members

You can manage roster members by adding and removing users to or from the roster as needed. You can also modify the order number for a member without affecting the past shift schedule.

Add a new or returning employee to a roster

You can add a new employee or an employee who had previously been a member to a roster.

Before you begin

Role required: rota_manager, rota_admin, or admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
2. Open the required shift form.
3. In the Rosters related list, click the information icon ( ) for the roster to which you want to add a member.
4. Click **Open Record**.
5. On the Roster form, click **Add** in the Members related list.
6. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On-Call Add Member form

Field	Description
From date	Date on which the employee will join the roster. **Note:** The member will be active on the roster in the next rotation.
Add after member	Name of the member after whom the new member will be in the order. The order number determines where the member starts on the rotation cycle.
Shift	Name of the shift.
Member	Name of the member to add to the roster.
Rosters	Rosters affected after modifying the order of a member. This field is auto-populated by comparing the members in the rosters. If a member exists in more than one roster, both the rosters are auto-populated to avoid conflicts in schedule.
Current roster	Roster from which you navigated to the form.

7. Click **Submit**.
   The instance adds the employee to the roster.

   Note:
   For a returning employee: The instance displays two shift member records for the same employee with different start and end validity dates.

Modify the order of a member in a roster

You can modify the order number for a member without affecting the past shift schedule.

Before you begin

Role required: rota_admin, rota_manager, or admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
2. Open the required shift form.
3. In the Rosters related list, click the information icon ( ) for the roster in which you want to modify the order of a member.
4. Click **Open Record**.
5. On the Roster form, click **Move** in the Members related list.
6. On the form, fill in the fields.

On-Call Move Member form

Field	Description
From date	Date from when the order change applies to the member.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The member's order will be active on the roster in the next rotation.
Member	Name of the member to update the order.
Current roster	Roster from which you navigated to the form.
Shift	Name of the shift.
Move type	Type of move. ○ **Move after**: Moves the order of the member after the target member. ○ **Swap**: Swaps the order of the member with the target member.
Target member	Name of the member with whom the order is swapped or after whom the member will be in the execution order.
Rosters	Rosters affected after modifying the order of a member. This field is auto-populated by comparing the members in the rosters. If a member exists in more than one roster, both the rosters are auto-populated to avoid conflicts in schedule.

7. Click **Submit**.
   The member appears in the new order. The original record has a **To** date for the end of validity and the new record has the current date as the **From** date for the start of validity.

Remove a member from a roster

You might remove a member from a roster, for example, if they are no longer a member of the organization or of the group.

Before you begin

Role required: rota_manager, rota_admin, or admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
2. Open the required shift form.
3. In the Rosters related list, click the information icon ( ) for the roster from which you want to remove a member.
4. Click **Open Record**.
5. On the Roster form, click **Remove** in the Members related list.
6. On the form, fill in the fields.

On-Call Remove Member form

Field	Description
From date	Date from when the member is removed.
Rosters	Rosters affected after modifying the order of a member. This field is auto-populated by comparing the members in the rosters. If a member exists in more than one roster,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	both the rosters are auto-populated to avoid conflicts in schedule.
Delete member	Option to delete the member record. **Warning:** When you enable this option to delete the member record, the deleted member rotation history is removed, and the rotation history of other members is affected.
Member	Name of the member to remove from the roster.
Current roster	Roster from which you navigated to the form.
Shift	Name of the shift.

7. Click **Submit**.

Related topics

Assigning On-Call Scheduling roles

Configure or update an On-Call schedule

Create an On-Call schedule or edit an existing schedule by defining shifts and rosters.

Set up an on-call schedule

Before you begin

Role required: rota_admin, rota_manager

About this task

You can use the wizard to create an on-call schedule using an existing template or you can create shifts from scratch. You can create multiple shifts at given time and can preview shifts while creating them. This enables you to create rosters, define escalation policies, and review and publish shifts.

After running the wizard, you can adjust individual roster, escalation, and reminder settings to fine-tune the setup. You can also enable on-call notifications by setting up rotation workflow triggers.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Create/Edit Schedule**.
2. In the **Define Schedule**, from the **Select Group** choice list, select the group for which you are defining the schedule.
   You can edit an existing shift for a selected group. If you want to create a new schedule, click **Add shift** button.

   Note: When creating a new on-call group schedule, you are redirected to oc_creation_wizard page instead of expert_shell page which is no longer supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Choose an existing template for the shifts or create a new shift.
4. **Optional:** Select the **Allow Shift Schedule overlap** check box to allow overlapping schedules for shifts within the group.
   For example, if a group has a 24x7 schedule, you can create multiple schedules for the group. Shift overlap is required to have a hand-off period between shifts so that multiple shifts can be on-call for the same duration.

   (Optional) If you select **Allow Shift Schedule overlap**, then the **Escalation rule on Shift overlap** check box appears.
5. **Optional:** Select the **Escalation rule on Shift overlap** check box to specify which shift needs to be notified of an escalation during a shift overlap.
   You can escalate to an incoming, an outgoing, or to all shifts.
6. Fill in the form fields.

Define Schedule

Question	Description
Name	Name of the shift that appears on the **On-call calendar** page.
Would you like to use an existing schedule?	Option to use an existing schedule. ○ Select **Yes** to use an existing or predefined shift. ○ Select **No** to create a new schedule.
Schedule	Select the value to base your schedule on. Some options are available in the base system, for example, 24x7, Workday 8-5. This option appears only if you answer **Yes** to **Would you like to use an existing schedule?**. The logged-in user's time zone is used as the basis for these schedules. If the logged-in user does not have a time zone specified, the instance time zone is used.
Start date	The date on which the shift is scheduled to begin.
Specify holidays	Option to define holidays. ○ Select **Yes** to define holidays for the on-call shift. You can select an existing holiday schedule. ○ Select **No** to not specify holidays for the shift.
Holiday Schedule	Specify a holiday schedule for the group.
Additional fields **Note:** The following fields are displayed only when the **Would you like to use an existing schedule?** field is set to **No**.	
Time Zone	The time zone in which the shift operates.
Is the shift for this schedule all day?	List of options. Specify whether this shift is an all-day shift.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Question	Description
Start	The time of day the shift is scheduled to start. The start and end time represent one shift. The date is different only if the shift spans midnight.
End	The time of day the shift is scheduled to end. The start and end time represent one shift. The the date is different only if the shift spans midnight. For example, for the 8 a.m. to 8 p.m. shift, the start is 2014-01-01 08:00:00 and the end is 2014-01-01 19:59:59. For the 8 p.m. to 8 a.m. shift, the start is 2014-01-01 20:00:00 and the end is 2014-01-02 07:59:59.
Repeats	The days that the shift repeats. **Note:** The wizard does not provide a monthly or yearly option. Creating a monthly or a yearly shift by editing the schedule manually is not advised because it is hard to determine the on-call person over a long period. In this case, create a yearly or a monthly schedule with only one roster and one member so that the same person is always on-call. Make any exceptions as a one-time change in the roster for the shift.
Send On-Call Reminders	Option to send on-call reminders to members of the roster.
Reminder lead time (days)	Lead time for email reminders. **Note:** This field is displayed only when the **Send On-Call Reminders** option is selected.
Coverage interval	Interval for updates of coverage details. Specifies whether you want to update the subscribed calendar with weekly or daily coverage details.
Get coverage for	Number of weeks or days for which you want to update the subscribed calendar.

Note:
The instance saves the schedule and adds it to the list of existing schedules.

7. Click **Next**.
8. **Optional:** Click **Add Shift** to add another shift to the schedule if needed.
9. Use the **Members** page to specify members for a shift and rosters.

Configure Members

Field	Description
Roster Name	Use the edit icon to edit the name of the roster that you are adding members to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Which members would you like to be in your schedule?	Move the members you want to add from Available list to Selected list.
Rotation start date	Date on which the rotation needs to start.
Rotation interval	Type of the rotation interval.
Rotate every	Frequency of the rotation interval. **Note:** This field appears only if the **Rotation interval** field is set to **Weekly**.
Day of week for rotation	Day of the week on which the roster rotation should start. When this field is specified, roster rotation happens based on the specified frequency and the day of the week. **Note:** This field appears only if the **Rotation interval** field is set to **Weekly**.
Send On-Call Reminders	If selected, on-call reminders are sent to the members of the roster.
Reminder lead time (days)	Lead time for email reminders. **Note:** This field is displayed only when the **Send On-Call Reminders** option is selected.

10. Click **Next Step**.
11. Use the Escalation Setup form to specify escalation settings.

Escalation Setup steps

Field	Description
Escalation type	Method used to determine who receives an escalation notification. Its value is automatically set to **Rotate Through Members** if a shift has only one roster. The escalation path goes through all members of that roster. If a shift has more than one roster, the default value is **Rotate Through Rosters**. The escalation path goes through all the rosters to determine who to notify. Click **Override escalation** to change the default setting.
Catch-All	Specifies users who receive a notification when no other on-call users have acknowledged the escalation. The value can be none, a group manager, a shift manager, an individual, or any or all roster members. ○ Select **Notify Individual** to specify a member of the group to notify. ○ Select **Notify All** to specify a shift. All shift members are notified.

12. Click **Next Step**.
13. Click **Edit Reminder** to edit the reminder settings for an escalation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. Use the Edit Reminder form to edit the reminder settings for a schedule.

Escalation Reminder form fields

Field	Description
# reminders	When escalations are configured for this group, the instance first sends this number of reminders before notifying the backup personnel.
Time between reminders	The interval of time between reminders. Default: 15 minutes If your choice is not in the list, select the closest value. Edit the roster to update the number of reminders after the schedule is generated.
Time before escalation	The interval of time to wait before escalating a task.

15. Review the schedule and then click **Save**.
The schedule is saved in Draft mode.
16. Select **Send subscriptions** to send a subscription URL to an on-call member after the shift is published.
17. After the schedule is complete, click **Finish** to save and publish the schedule.

What to do next

Perform one of the following procedures to update the schedule.

Updating an On-Call schedule

Shift managers and members can use the **Schedules** tabs to view and update the on-call schedules of a group. Shift managers can review, manage, and resolve gaps or conflicts in your On-Call schedule from a single view.

Opening the Schedules page

To open and start working on a schedule, navigate to **On-Call Scheduling** > **On-Call Schedules** and then click the card for the group.

Edit an on-call schedule

Overview tab

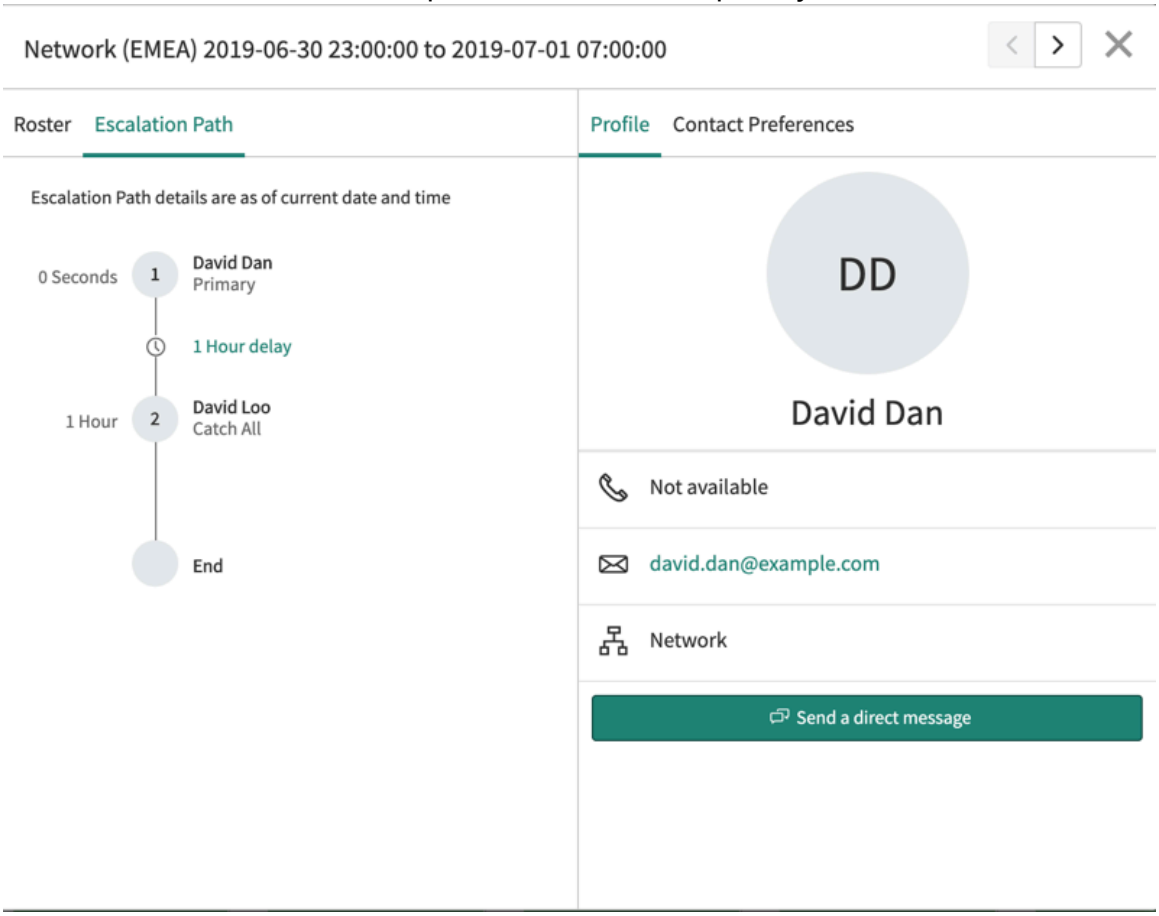
This tab gives an overview of the current shift. The following sections are available:

- **On-Call**: Displays information about the current on-call shift. From here, you can:
  - Navigate to the previous and next shifts.
  - View the roster and escalation details of the current shift. When you click **Roster and escalation details**, a dialog box displays the following tabs:
    - Roster: Displays a list of all rosters along with its active on-call member. Information of the on-call member such as the contact number, email address, group, and the shift to which the user belongs to is also available.
    - Escalation Path: Displays the escalation path defined for the shift.
    - Profile: Displays the user profile of the primary on-call member. You can send a direct message to the on-call member by clicking **Send a direct message** or call the member if Notify WebRTC for on-call is set up. For more information on real-time messaging, see

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect. For information on Notify webrtc, see Forward to notify client workflow activity. For information on the **Specify a valid Notify Number with voice capability** property that enables the Notify WebRTC for on-call, see System properties for On-Call Scheduling.

- Contact Preferences: The contact preferences set for the primary on-call member.



- **Pending Actions**: Displays the pending actions for the group's on-call schedule. You can review gaps, conflicts, and time-off requests to find a replacement and ensure proper support coverage. For information on resolving the pending actions, see Resolve gaps, conflicts, and time-off requests in a shift and Resolve gaps, conflicts, and time-off requests in a shift.

  Note:
  This section is displayed only for a shift manager.

- **Your Upcoming Shifts**: Displays your upcoming shifts in a calendar view.

  Note:
  This section is displayed for a shift member or a Shift Manager who is a shift member.

- **On-call calendar**: This section displays the calendar view of all shifts of the group. By default, the week view is displayed. For more information on on-call calendar, see Manage shifts from the Calendar view.

Shifts tab

This tab displays all shifts defined for the user group. From here, you can edit a shift or create a custom escalation policy to override the default policy. For information on editing the escalation type, see Create an escalation policy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also edit contact preferences from this tab. For more information on configuring a contact preference, see Configure my availability and contact preferences

Settings tab

This tab displays the group preferences set for your group's on-call shift. If not already set, click **Create Custom Group Settings** to set the group preferences. For more information about group preferences, see Configure preferences for a user group.

Note:
The group preferences set here affect only this group. These settings override the global settings.

To view on-call properties, click **View Global Settings**.

Note:
View Global Settings is only visible to rota_admin.

Update a schedule entry

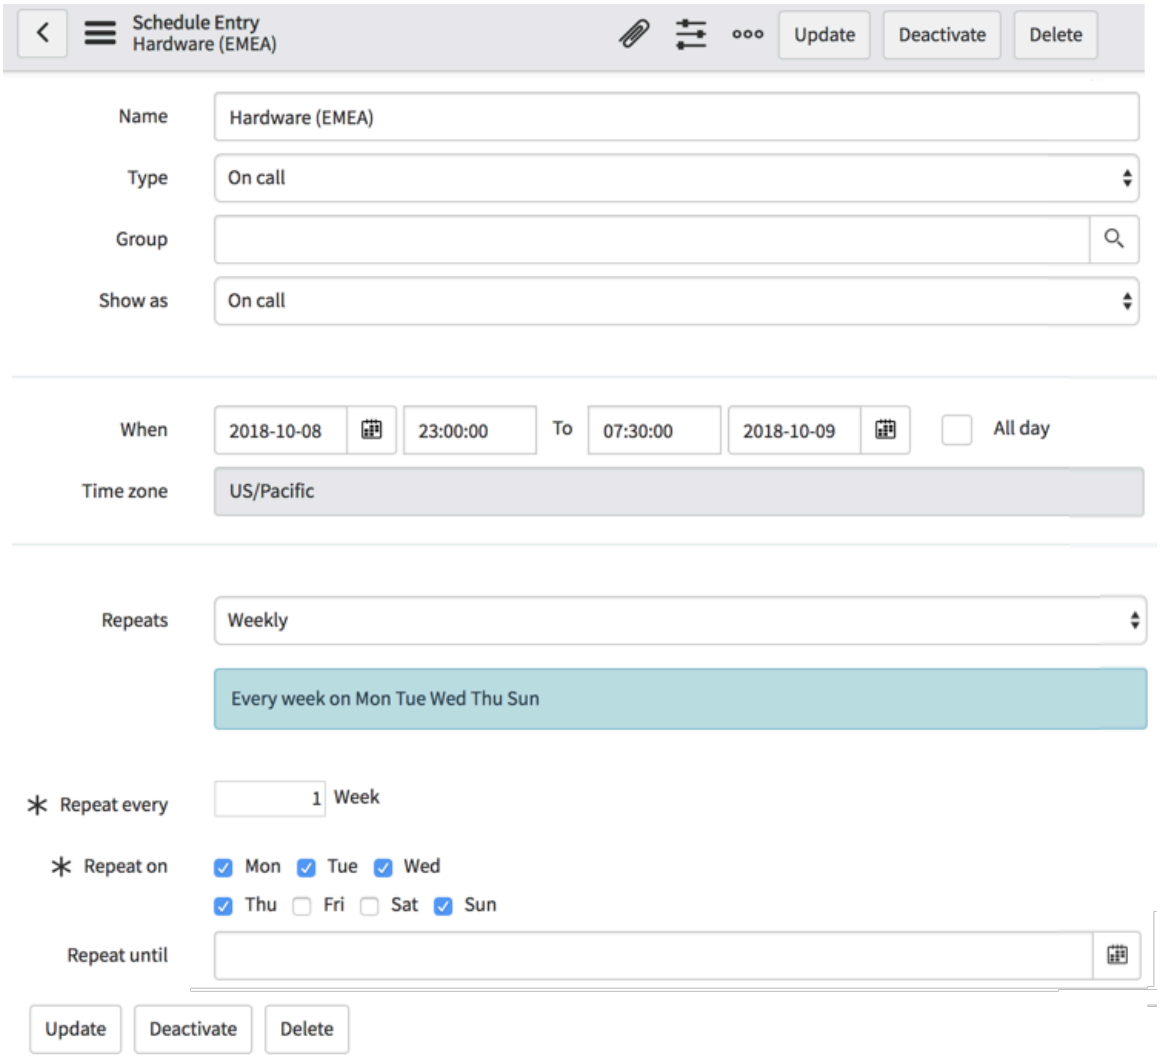
You can deactivate a schedule entry or update setting like schedule entry type, date, or time.

Before you begin
Role required: rota_admin or rota_manager

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
   The on-call coverage for your group's calendar appears.
2. Click the shift name and navigate to **Actions** > **Edit span**.
   The **Schedule Entry** dialog box is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Update the fields as needed.

Schedule Entry

Field	Description
Name	Modify the name of the schedule entry, if required.
Type	Select the type of schedule entry. For example, on-call or time off.
Group	The **Group** field is empty by design. **Warning:** If the **Group** field is populated, then the spans for the entry are not displayed.
Show as	Select what the schedule entry must be displayed as. For example, busy or on-call.
When	Select the appropriate start and end date, and time for the schedule entry.
All day check box	Select the check box to make the schedule entry active for the entire duration.
Timezone	Displays the time zone for the schedule entry. This cannot be modified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Repeats	Select the frequency with which the schedule entry repeats. For example, daily or weekly. The following fields appear if you select **Monthly**: **Monthly type**: specify the date of the month when the schedule entry repeats. The following fields appear if you select **Yearly**: **Yearly type**: specify the date of the year when the schedule entry repeats or if it is floating. If you select the **Floating** option, then the following fields appear: ○ **Float week**: Select the week of the month when the schedule entry repeats. ○ **Float day**: Select the day of that week when the schedule entry repeats. ○ **Month**: Select the month when the schedule entry repeats.
Repeat every	If the schedule entry is selected to repeat, then specify how often it repeats. For example, if you select weekly repetitions, specify the frequency such as every week or every two weeks.
Repeat on	If the schedule entry is selected to repeat, then specify when it repeats. For example, if you select weekly repetitions, specify the days of the week when it would repeat.
Repeat until	If the schedule entry is scheduled to repeat, then specify an end date until which the schedule entry repeats itself.
Deactivate	Deactivate the schedule entry. A warning message appears.
Delete	Delete the schedule entry. A warning message appears.

4. Click **Update**.

Assigning On-Call Scheduling roles

Specify the sources of contact information for schedule notifications

Configure the communications methods that shift managers can choose from to send on-call schedule notifications. For example, add email and phone contact sources.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Contact Sources**.
2. Click **New** and then fill in the form.

On-Call Contact Source form

Name	Unique and meaningful display label for the type of contact source.
Table	Table that contains the contact source.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User Field	Reference field to the user table. This field appears only for some tables.
Active	Option to activate the contact source for use.
Source Type	Type of communication method.
Source	○ For email, the source of the email address. ○ For phone numbers, the source of the phone number.

3. Click **Submit**.

Manage shifts from the Calendar view

The Calendar view displays all shifts for a user group for a specified time interval. Use the Calendar view of an On-Call schedule to update or manage shifts.

Before you begin

Role required:

- View and update: rota_admin, rota_manager, or admin
- View only: itil

About this task

- For information on updating a shift, see Update shift details from the On-Call calendar.
- For information on managing a shift, see Configure or update an On-Call shift.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
2. Click the Calendar View icon ( ) to open the calendar view of shifts.
   By default, the calendar displays one month of shifts.

> **Important:**
> The Time Zone view displays shift members grouped by shift within the specified geographical time zone. To open the Time Zone view on this page, click the Time Zone icon ( ). See Manage shifts from the Timeline view.

3. Perform any of the following operations to organize the view for your needs:
   - Specify the time period that appears: View events for the current day, week, or month: In the title bar, click **Day**, **Week**, or **Month**.

     > **Note:**
     > You cannot view the calendar for a month in the Timeline view.

   - Navigate to the previous or the next occurrence of the time period: In the title bar, click the left or the right arrow next to **Today** ( ).
   - View the event of any specific day, week, or month: In the title bar, click the Calendar icon ( ) and specify the date.
   - View the list of navigation shortcuts: In the title bar, click the keyboard shortcuts icon .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Configure the view: Click the Filter icon ( ).
   - To show working hours for a time zone, enable **Time zone**.
   - To view roster assignments within a time zone, click the **Primary**, **Secondary**, or **Tertiary** check box as needed.
   - To view roster assignments for all rosters in all time zones, select the **Show all rosters** check box.

   - To show gaps: In the **Review options** section, enable **Show gaps**. An info icon indicates a shift with gaps. Click the icon to view the gaps. Gaps occur when no one is on-call when support coverage is required. Possible reasons:
     - Time off without coverage.
     - User has been moved out of the group.
     - User is marked as inactive.

     For information on resolving gaps and conflicts, see Resolve gaps, conflicts, and time-off requests in a shift.
   - >To show conflicts: In the **Review options** > **Show conflicts**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, a conflict occurs when a user is assigned as both primary and secondary point of contact for a shift. An info icon indicates a shift with conflicts. Click the icon to view the conflicts.

For information on resolving gaps and conflicts, see Resolve gaps, conflicts, and time-off requests in a shift.

5. To save the view settings, click the Bookmark this filter icon ( ).

Manage shifts from the Timeline view

Use the Timeline view of an On-Call schedule to update or manage shifts based on the geographical location of roster members.

Before you begin

Role required: rota_admin, itil, rota_manager, or admin

About this task

- For information on updating a shift, see Update shift details from the On-Call calendar.
- For information on managing a shift, see Configure or update an On-Call shift.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **On-Call Calendars**.
2. Click the Timeline view icon ( ).

> **Important:**
> The Calendar view on this page displays all shifts for a user group for a specified time interval. To open the Calendar view, click the Calendar View icon ( ). See Manage shifts from the Calendar view.

3. Perform any of the following operations to organize the view for your needs:
   - Specify the time period that appears: View events for the current day, week, or month: In the title bar, click **Day**, **Week**, or **Month**.

     > **Note:**
     > You cannot view the calendar for a month in the Timeline view.

   - Navigate to the previous or the next occurrence of the time period: In the title bar, click the left or the right arrow next to **Today** ( ).
   - View the event of any specific day, week, or month: In the title bar, click the Calendar icon ( ) and specify the date.
   - View the list of navigation shortcuts: In the title bar, click the keyboard shortcuts icon .
4. Configure the view: Click the Filter icon ( ).
   - To show working hours for a time zone, enable **Time zone**.
   - To view roster assignments within a time zone, click the **Primary**, **Secondary**, or **Tertiary** check box as needed.

  - Time off without coverage.
  - User has been moved out of the group.
  - User is marked as inactive.

  For information on resolving gaps and conflicts, see Resolve gaps, conflicts, and time-off requests in a shift.
- >To show conflicts: In the **Review options** > **Show conflicts**.

  For example, a conflict occurs when a user is assigned as both primary and secondary point of contact for a shift. An info icon indicates a shift with conflicts. Click the icon to view the conflicts.

  For information on resolving gaps and conflicts, see Resolve gaps, conflicts, and time-off requests in a shift.

5. To save the view settings, click the Bookmark this filter icon (☆).

Set a shift to Draft mode while waiting for info

If you do not have all the information that you need to define a shift, you can set the shift to Draft mode. Later, when all the information is available, you can publish the shift so you can add it to a schedule.

Before you begin

Role required: rota_manager

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **My Group Schedules**.
2. Select the shift that will include the group.
3. On the **Shift** dialog box, click **Move to Draft**.
   A message confirms that the rotation schedule is updated for the shift that you moved to a draft mode.

Delegate the shift manager [rota_admin] role

As a shift manager, you can delegate your role to a member of shift.

Before you begin

Role required: rota_manager or admin

Procedure

1. Navigate to **All** > **User Administration** > **Delegate Roles in Group**.
2. Follow the instructions to Delegating roles the shift manager role to a member of your shift.

   Note:
   Ensure that you select the shift group where you want to delegate the shift manager role.

3. Submit the role delegation request.

Assigning On-Call Scheduling roles

Viewing On-Call Scheduling reports

Generate escalation and schedule reports. You can also view performance report.

All the users can generate and view the following reports:

- Escalation report
- Schedule report
- Escalation over report
- Group overview report

Users with premium dashboard access can view an additional performance tab. You can generate and view performance reports using the performance tab.

Run an Escalations report to view who is on call

The Escalations report displays the escalation sequence and the rules that apply for a selected date. For each group that you are authorized to see, you can choose to show either the active roster members or the on-call person.

Before you begin

Role required: itil

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Reports** > **Escalations Report**.
2. Select a value for the **For each group, show** setting.
   - **Active escalation members**: Display the on-call persons and catch-all persons in the escalation order, along with their delay times.
   - **On-call person**: Determine who is on duty.
3. Select the start date for the report.
4. Move at least one group into the **Selected** list.
   Enter the first few letters of the group into the **Name starts with** field to see a list of groups that start with those letters. Or select the **All groups** check box to see the list of all groups.
5. Click **Run Report**.

Run a Schedule report to view my schedule

An On-Call Rotation Schedule report shows users or groups that are on-call for a specified time period.

Before you begin

Role required: itil, roster_admin, rota_admin, rota_manager

Legacy: Viewing Escalation Overview reports

Run Escalation Overview reports to view count and rate information on escalations currently in progress, acknowledged and unacknowledged escalations, and Mean Time to Acknowledge (MTTA). You can view data for all groups or for one or more selected groups.

Important:
Starting in Xanadu release, the On-Call dashboard is deprecated. Users can use On-call dashboard to view, maintain, and track the escalation reports.

Opening the reports

Any user with the itil role can view the reports. Use one of the following methods to open the reports:

- Click **Self-Service** > **Dashboards** and select **On-Call Overview**. If you have licensed the premium version, then click **On-Call Overview - Premium**.
- Click **On-Call Scheduling** > **Reports** > **Overview**.

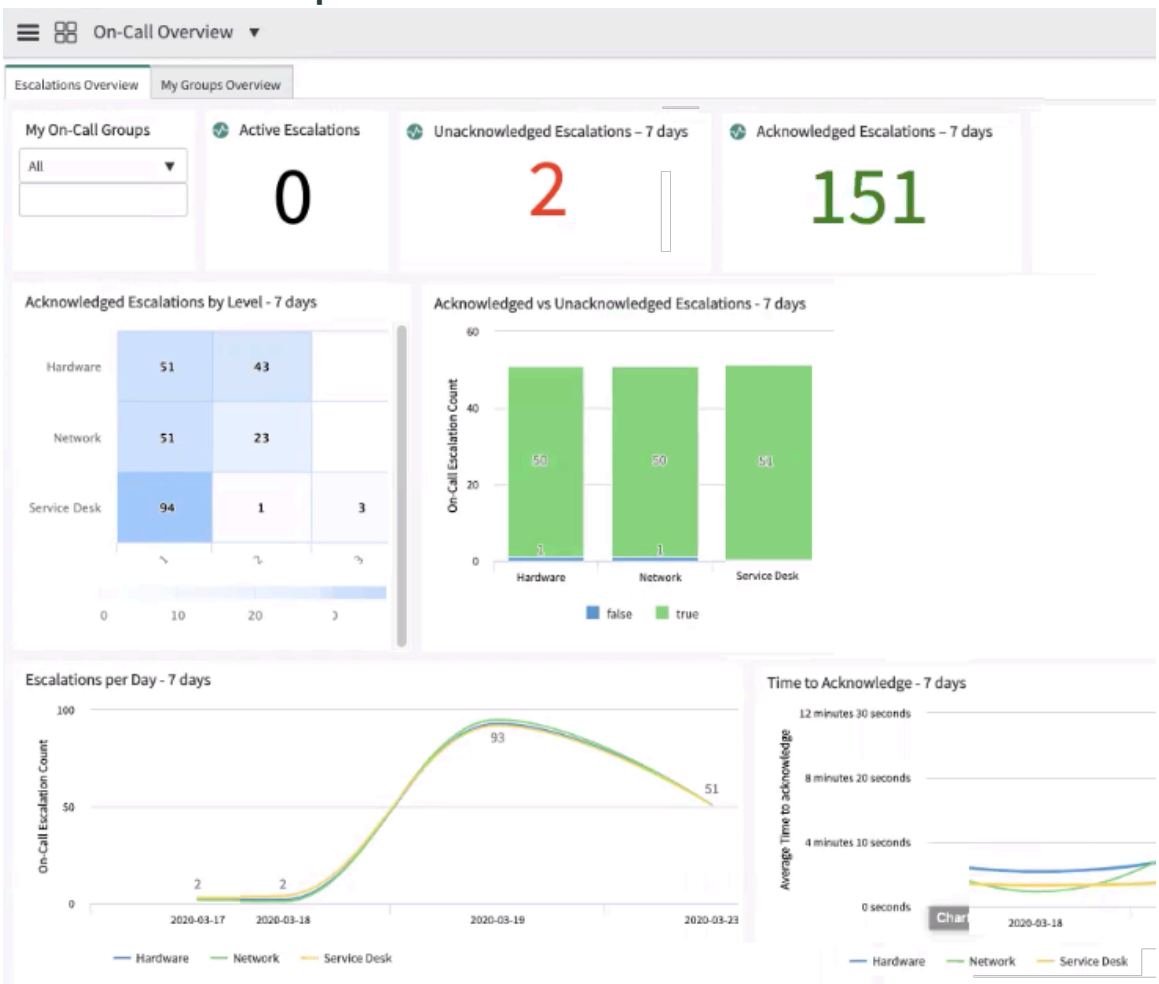
Click the **Escalations Overview** tab.

Escalations Overview reports

- Acknowledged escalations are accepted by at least one user. The "true" value indicates acknowledged escalations.
- Unacknowledged escalations are not accepted by any user or are rejected by all users. The "false" value indicates unacknowledged escalations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Escalations Overview reports



My On-Call Groups

Select one or more groups. Only data for selected groups appears in the reports. If no group is specified, then data for all groups appears.

Active Escalations - 7 days

The number of escalations that are currently in progress.

Unacknowledged Escalations - 7 days

The number of escalations that nobody has yet acknowledged during the most recent seven-day period.

Acknowledged Escalations

The number of escalations that escalatees have acknowledged during the most recent seven-day period.

Acknowledged Escalations by Level - 7 days

The number of acknowledged escalations during the most recent seven-day period.

- The Y axis indicates groups.
- The X axis indicates escalation level.
- The color shade indicates the count of escalations in the box.

Acknowledged and Unacknowledged Escalations by Group - 7 days

The number of escalations by group during the most recent seven-day period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The "true" value indicates acknowledged escalations.
- The "false" value indicates unacknowledged escalations.

Escalations per Day

The number of escalations for the specified date.

- The Y axis represents the count of escalations.
- The X axis represents time by date.

Mean Time to Acknowledge (MTTA) - 7 days

The average time that it took a user to acknowledge an escalation during the most recent seven-day period.

- The Y axis indicates the time it took a user to acknowledge an escalation.
- The X axis indicates the group.

Legacy: Viewing the Performance reports for escalations

The Performance reports enable detailed review of how well escalations are being processed. You have precise control of the data that describes escalation progress using filters like group, priority, level, or escalation category.

Important:
Starting in Xanadu release, the On-Call dashboard is deprecated. Users can use On-call dashboard to view, maintain, and track the performance reports.

Opening the reports

You must have the Premium Dashboard user [rota_prem_dashboard_user] role to view the Performance reports. Use one of the following methods to open the reports:

- Click **Self-Service** > **Dashboards** and select **On-Call Overview - Premium**.
- Click **On-Call Scheduling** > **Reports** > **Overview**.

Click the **Performance** tab and then select the date of interest. The time line shows the time of day at which escalations happen. Use the tabs to control the type of data to view:

Breakdowns tab

Use the filters to segment the data into categories that suit your need. For example, if you are investigating your SMS costs, you can set filters to display how many notifications of the SMS type are sent and to which groups or users they are being sent. For example, you might notice that you sent 68 SMS messages to users in the Network group. The group, however, did not acknowledge any escalations. You might therefore consider that you can lower SMS costs by not sending SMS notifications to that group.

- Groups
- Escalation Category

Records tab

The **Records** tab lists the individual records that make up the results that you configured on the **Breakdowns** tab. Click a name to view record details.

- Designing an escalation process
- Track the progress of an escalation
- Create a shift template to simplify configuring shifts
- Create a group template to simplify configuring schedules

Escalations in On-Call Scheduling

An escalation is a mechanism that ensures that important issues are addressed in a timely manner.

On-Call Scheduling monitors response time for a task. You can define the actions to take when a task is not acknowledged. The actions, like sending out an email or an SMS, are fired by trigger rules. You define a trigger rule by specifying the conditions that trigger the actions and the actions to take when the conditions are met.

For example, a critical incident is raised for Acme Pharmaceuticals regarding a problem with their network access. An SMS task notification is sent to Ken, the third-line support engineer who is on call for this type of incident. Ken is unavailable, however, and does not respond within the specified 30-minute response time.

A trigger rule that is defined for Acme Pharmaceuticals critical incidents starts an escalation if a task goes 30 minutes without a response. The person specified as the next point-of-contact is Nakul, Ken's line manager, so an SMS notification is sent to Nakul. Settings in the escalation policy specify how many notifications to send, how long to wait, and so on.

Shift administrators and shift managers can define trigger rules and configure escalation policies.

Related topics

Legacy: Viewing Escalation Overview reports

Legacy: Viewing the Performance reports for escalations

Designing an escalation process

To design an escalation process for a task, you define a trigger rule and configure one or more escalation policies.

A trigger rule specifies both the conditions under which an escalation process should begin and the escalation actions (workflow or script) to perform. An escalation policy describes the order in which escalation notifications are sent, the escalation audience, and other aspects of the escalation.

How a trigger rule works

When a task is created or updated, the instance compares the assignment rules with the rule's conditions to determine whether a condition is met. If there is a match, then the instance activates the workflow or script that is specified by the rule's action. Trigger rules are an extension of assignment rules and they have the same behavior as assignment rules.

For example, a trigger rule might specify:

- If (rule condition): An incident with level **Critical** or **High** is raised and is assigned to the **Network** group.
- Then (rule action): Run the **Assign and Notify** workflow. (The workflow sends an email notification to the current on-call roster member.)

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
An on-call escalation is canceled when the assignment group of the associated task record, for example, an incident, changes to a different group without a matching trigger rule. It ensures that an existing irrelevant escalation workflow is no longer associated with that task record.

See Create an escalation trigger rule.

About escalation policies

An escalation policy includes the following configurations:

- The escalation audience (roster members and managers).
- A policy type that defines the order in which rosters and roster members receive escalation notifications.
- Other aspects of the escalation process like the contact methods to use and the number of reminders to send for each notification.

You can create a custom escalation policy for a shift by overriding settings in a default escalation type, for example, by configuring custom delays between escalation steps.

Configure a table for escalation trigger rules

Configure escalation trigger rules for the tables that do not extend tasks.

Before you begin
Role required: admin

About this task
Tables that are configured in the Trigger Rule Table Configuration [trigger_rule_table_cfg] table do appear in the **Table** field in the Trigger Rule form for creating an escalation trigger rule.

Procedure

1. Navigate to **All** > **On-Call Administration** > **Administration** > **Trigger Rule Table Configuration**.
2. Click **New**.
3. On the form, fill in the fields.

Trigger Rule Table Configuration form

Field	Description
Table	Name of the table that will be enabled for creating escalation trigger rules.
Trigger group field	Group field value in the table based on which trigger rule processes.
Trigger user field	User field value in the table based on which trigger rule processes.
Journal field	The ongoing escalation activity.

4. Click **Submit**.
The Trigger Rules related list shows the escalation trigger rules that are configured for the table.

Create an escalation trigger rule

Create a trigger rule to specify both the conditions under which an escalation process should begin and the actions (workflow or script) to perform for the escalation.

Before you begin

Role required: rota_admin, admin, or rota_manager

About this task

- Users with rota_manager role can create escalation trigger rules (with the **Trigger action** field set to **Workflow**) only for the groups that are managed by the rota_manager.
- Users with rota_admin role can create escalation trigger rules (with the **Trigger action** field set to **Workflow**) for all the groups.
- Users with admin role can create escalation trigger rules to execute both **Workflow** and **Script** for all the groups.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Trigger Rules**.
2. Click **New**.
3. On the form, fill in the fields.

Trigger Rule form

Field	Description
Name	Unique and meaningful name for the trigger rule.
Table	Task table that applies to the trigger rule. **Note:** ○ Only tables and database views that are in the same scope as the trigger rule appear in the list. ○ Tables that do not extend tasks do appear in the list only if those tables are configured for trigger rules in the Trigger Rule Table Configuration [trigger_rule_table_cfg] table. .
Execution order	Run order of the trigger rule.
Active	Option to activate the trigger rule.
When to activate	
Trigger when group assigned changes	Option to process the trigger rule only when the **Group** field value in the table is changed. ○ **False**: Trigger rules fire only if the**assigned_to** and **assignment_group** fields are not populated on a record. ○ **True**: Trigger rules fire only if group field populated or changes and **assigned_to** is not populated on a record.
Trigger when	Type of trigger for the table that is the default behavior or conditional. This field is available only when the **Trigger when group assigned changes** check box is enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Condition matches**: Triggers escalation when conditions match. ○ **Default**: Triggers escalation based on only the **Trigger action** field value.
Match conditions	Conditions type to match before triggering escalation. ○ **All**: Each condition must be met. ○ **Any**: Any one of the conditions can be met.
Conditions	Conditions that must be met for the trigger rule to fire (run the workflow or script that is the action for the rule).
What action to take	
Group	Group that becomes the **Task assignment group** when the trigger rule fires. This field is available only when the **Trigger when group assigned changes** check box is cleared.
Trigger action	**Workflow** or **Script** (server-side JavaScript) to execute when the **Match conditions** and **Conditions** are met.
Trigger workflow	Workflow to execute. Available only if **Trigger action** is set to **Workflow**.
Trigger script	Script (server-side JavaScript) to execute. Available only if the **Trigger action** field is set to **Script**. **Note:** This action is available only for users with the rota_admin and admin roles.

4. Click **Submit**.

Create an escalation policy

An escalation policy includes the policy type that defines the order in which rosters and roster members receive escalation notifications. You can create a custom escalation policy for a shift by overriding settings in a default escalation type, for example, by configuring custom delays between escalation steps.

Before you begin
Role required: rota_admin, rota_manager, or admin

About this task
Users with rota_manager role can edit policies only for their groups. Users with rota_admin and admin role can edit policies for all the groups.

The escalation type determines the order in which members of a user group are notified about the escalation. The escalation type depends on the number of rosters.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If a shift has only one roster, the escalation type is automatically set to **Rotate through members** and the escalation path goes through the member list of a roster (primary, secondary, tertiary) to determine whom to notify.
- If the shift has multiple rosters, the escalation type is automatically set to **Rotate through rosters** and the escalation path goes through all rosters to determine whom to notify.
- If the shift has a customized escalation hierarchy, the escalation type is set to **Custom** and the escalation path goes through members as defined in the escalation hierarchy. See Create an escalation policy for details.

On-Call Scheduling supports multiple escalation policies per shift; for example, policies based on the priority of the incident or type of task record.

Procedure

1. Create a custom escalation policy using the escalation designer.

Option	Description
Access the designer from the On-Call Schedules module	**a.** Navigate to **On-Call Scheduling** > **On-Call Schedules**. **b.** Click the required shift card. **c.** In the **Shifts** tab, click the actions icon for the shift. **d.** Click **Override escalation** and click **OK** in the confirmation window.
Access the designer from the My Group Schedules module	**a.** Navigate to **On-Call Scheduling** > **My Group Schedules**. **b.** Open the required shift. **c.** Click **Override Escalation Policy** and then click **Yes** in the confirmation dialog box.

2. Click the Add Escalation Step icon and then fill in the Add Escalation Step form.

Add Escalation Step form

Field	Description
Name	Name of the escalation step.
Escalation level	Hierarchy level of the step.
Time to next step	Wait time from the last reminder to run the next step.
Escalation set	Escalation set for the step.
Number of reminders	Number of reminders to send in this step.
Time between reminders	Time between each reminder of this step.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Escalation audience	
Roster	Rosters to which escalation notifications and reminders are sent.
Groups	User groups to which escalation notifications and reminders are sent.
Users	Users to whom escalation notifications and reminders are sent.
Devices	Devices to which escalation notifications and reminders are sent. For example, a mobile phone that is rotated between group members.
Group manager	Option to send escalation notifications and reminders to the group manager.
Group manager field	Option to select group managers hierarchically to send escalation notifications and reminders. This field is available only when the **Group manager** check box is selected.

Add Escalation set form

Name	Name the escalation policy.
Shift	The shift to which the escalation policy applies.
Default	Select the check box to mark the escalation policy as default. The default escalation policy is used for all on-call escalations in the case that none of the specified **Conditions** are met.
Table	Choose the table for which you want to set the escalation policy.
Condition	Use the condition section to add filters to the escalation criteria.
Description	Short description of the escalation policy.
Active	Select the check box to enable the escalation policy.
Override user preference	Select the check box to override the user's contact preferences.
Order	When there are multiple escalation policies defined for a shift, the order in which to apply this policy. Smaller numbers first.

3. **Optional:** To edit an escalation step, click the edit escalation step icon and perform the edits.
4. **Optional:** Add multiple escalation steps if required.
5. **Optional:** To edit the escalation hierarchy for the shift, click the actions icon and click **Edit escalation**.
6. **Optional:** To reset to the default escalation type for the shift, click the actions icon and click **Reset escalation**.

Escalation and reminder settings for rosters

Use the escalation settings to specify how and when escalations occur and when reminder notifications are sent.

Escalation and reminder settings

You can specify unique settings for each roster. When you configure a roster, you can specify

- **Forced communication channel**: You can specify a mandatory communication channel: SMS, voice, Slack, email, Microsoft Teams, or mobile push.
  - SMS and voice require that Notify is active.
  - An on-call member must have an SMS device to receive SMS notifications. If the member does not have an SMS device, then no further attempts are made and the lack of an SMS device is logged.

  For information on setting up MS Teams as a notification channel, see Set up Microsoft Teams as a contact method for an on-call escalation.

  For information on setting up mobile push as a notification channel, see Set up mobile push as a contact method for an on-call escalation.

- **Number of reminders**: The number of times the instance sends reminders to a person who does not reply within the time frame specified by **Time between reminders**.
- **Time between reminders**: The time interval between sending reminders.
- Values in the **Number of reminders** and **Time between reminders** fields determine the value in the **Time before escalation** field. For example, if **Number of reminders** is 2 and **Time between reminders** is 10 minutes, then the **Time before escalation** is 30 minutes. That is, the time that passes between the first notification of a non-responsive roster member and the first notification of the next member in the escalation path.

Instructions

For detailed instructions, see Configure a roster.

Example escalation reports

Because escalation reports depend on the escalation type, report content can vary greatly.

Because escalation reports depend on the escalation type, report content can vary greatly. Example reports follow:

Example report for a Rotate through members escalation type

In this example, users can see which shifts they are part of in My Schedule reports. Users who are not the first on-call person appear as well. This action enables the user to view the shift from a personal perspective, which is the preferred method for most users.

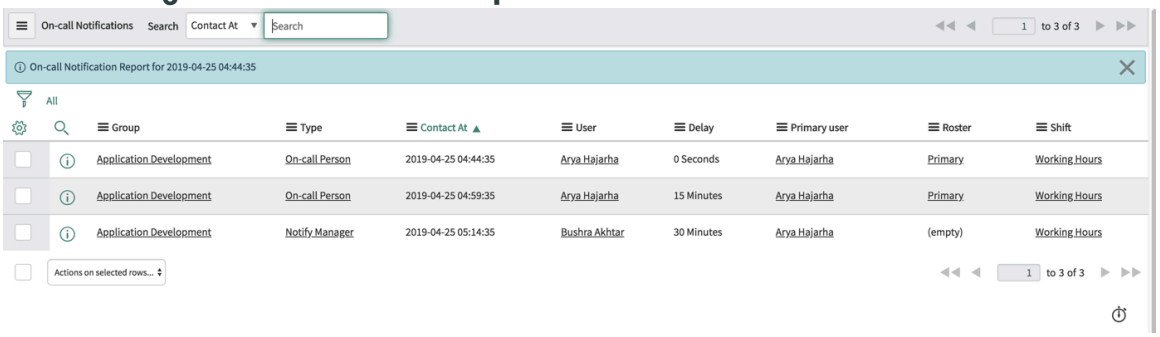
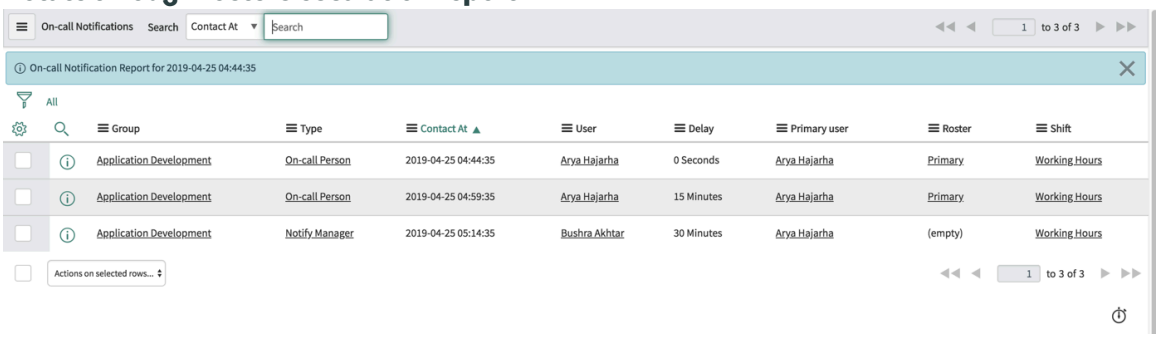
Rotate through members escalation report



Example report for a Rotate through rosters escalation type

In this example, reminders are defined for the **Primary**, **Secondary**, and **Tertiary** rosters. Members of the primary roster are notified first, then the members of the secondary, and so on, for all rosters.

Rotate through rosters escalation report



Track the progress of an escalation

Use the On-Call Escalation Tracking page for full visibility into the time line of an active or closed escalation as it progresses through its on-call escalation path.

Before you begin

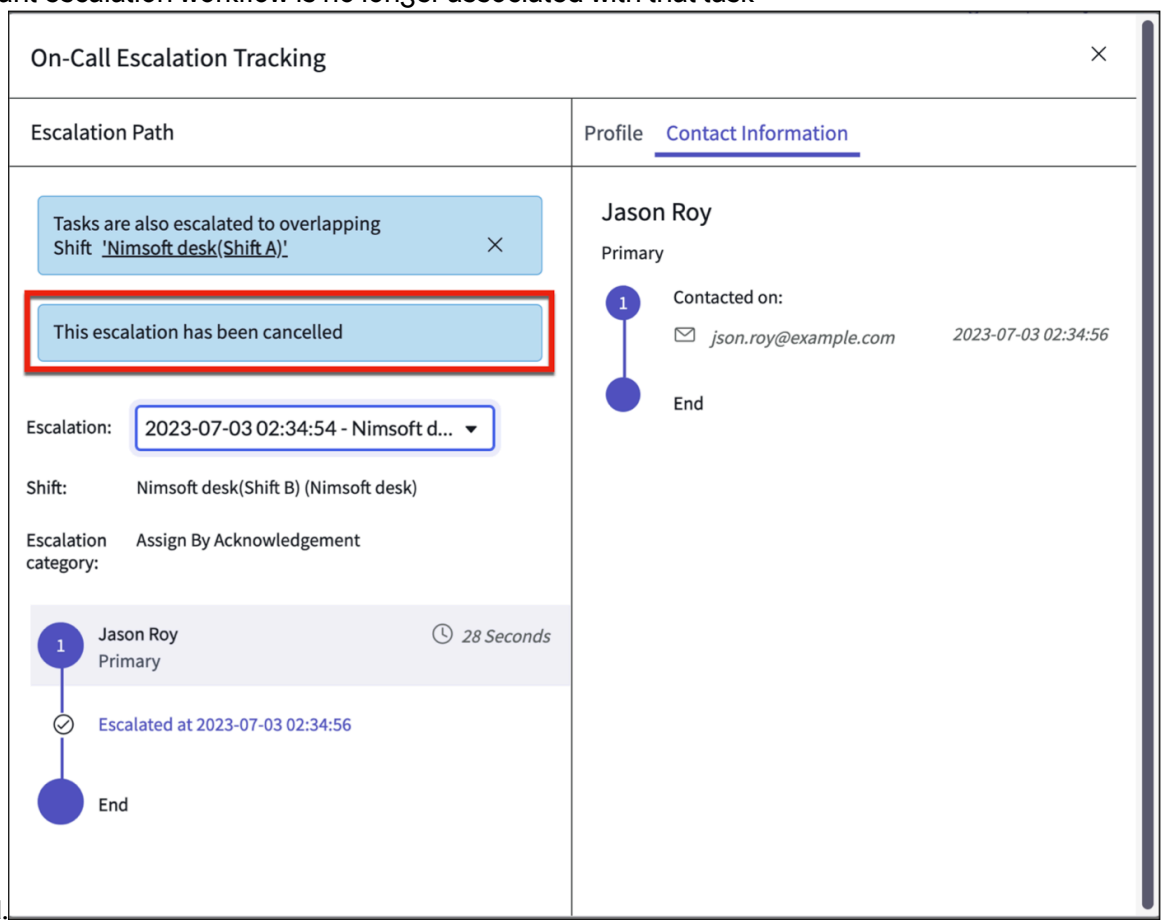
Role required: Any role that enables the user to read incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:

- Escalation logging must be enabled to view the On-Call Escalation Tracking page. See the *com.snc.on_call_rotation.log_escalations* property in System properties for On-Call Scheduling.
- An on-call escalation is canceled when the assignment group of the associated task record, for example, an incident, changes to a different group without a matching trigger rule. It ensures that an existing irrelevant escalation workflow is no longer associated with that task record.



Procedure

1. Navigate to **Incident** and open the incident.

   The **Assignment group** field includes the On-Call Escalation Tracking icon ( ) that indicates the active status of the escalation. Green indicates an active escalation, and black indicates a finished escalation.

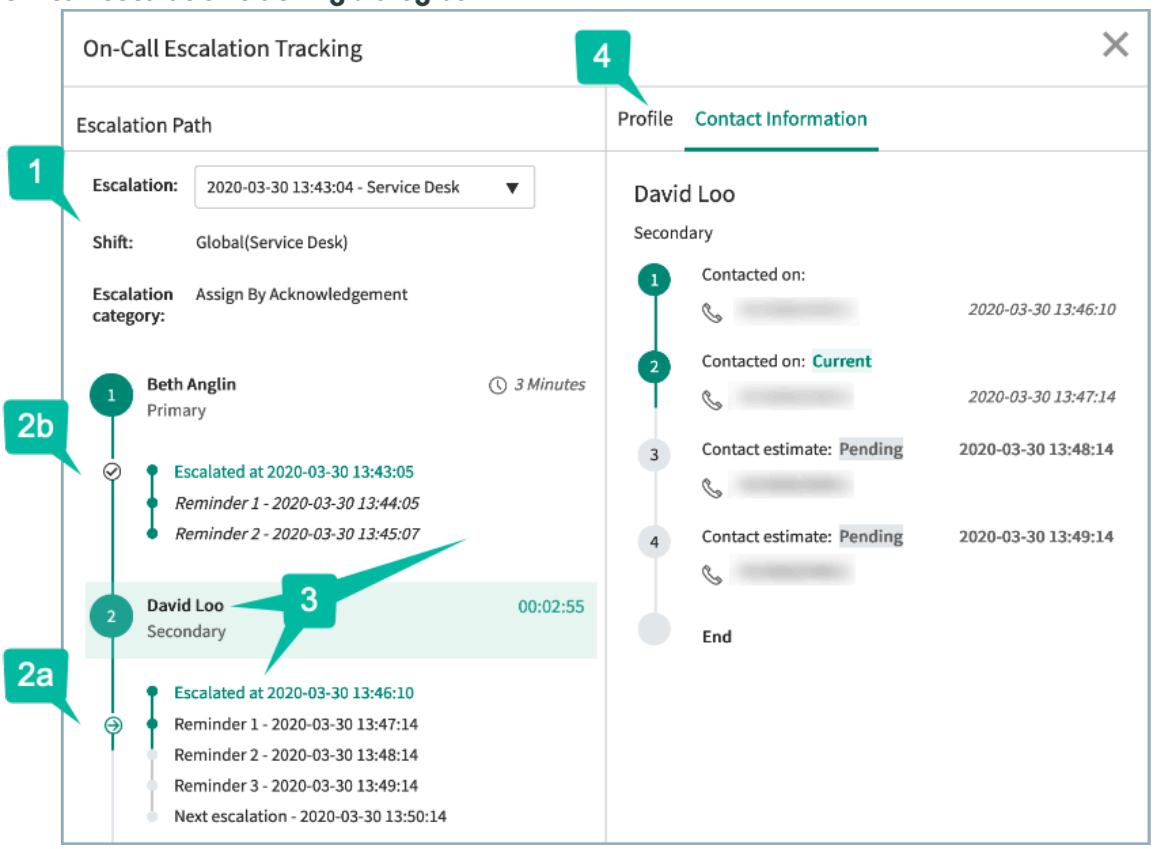
2. Click the On-Call Escalation Tracking icon.

   The On-Call Escalation Tracking dialog box opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: On-call escalation tracking

On-call escalation tracking dialog box



1. The Escalation Path section identifies the escalation with start time, group, and shift that handles the escalation, and Escalation category.
2. Indicators on the time line show status:
   a. For active escalations, a green arrow on the path time line indicates the current active response phase.
   b. Unfilled check mark: Skipped response.
   c. Filled green check mark: Accepted response.
   d. Red X: Rejected response.
3. Click the escalation timestamp for an escalatee or escalatee's name to view timing details. The list on the **Contact Information** tab shows contact times, modes of contact, and responses for the associated escalation phase.

   The dots for the escalation timestamps indicate overall acceptance. Point to a dot to view further information. Color codes of the dots:

   - Green: At least one escalatee has accepted the escalation.
   - Orange: At least one escalatee has rejected the escalation.
   - Red: All escalatees have rejected the escalation.

Note:
To enhance the visual differences between dots, use the high-contrast user interface.

© 2026 ServiceNow, Inc. All rights reserved.

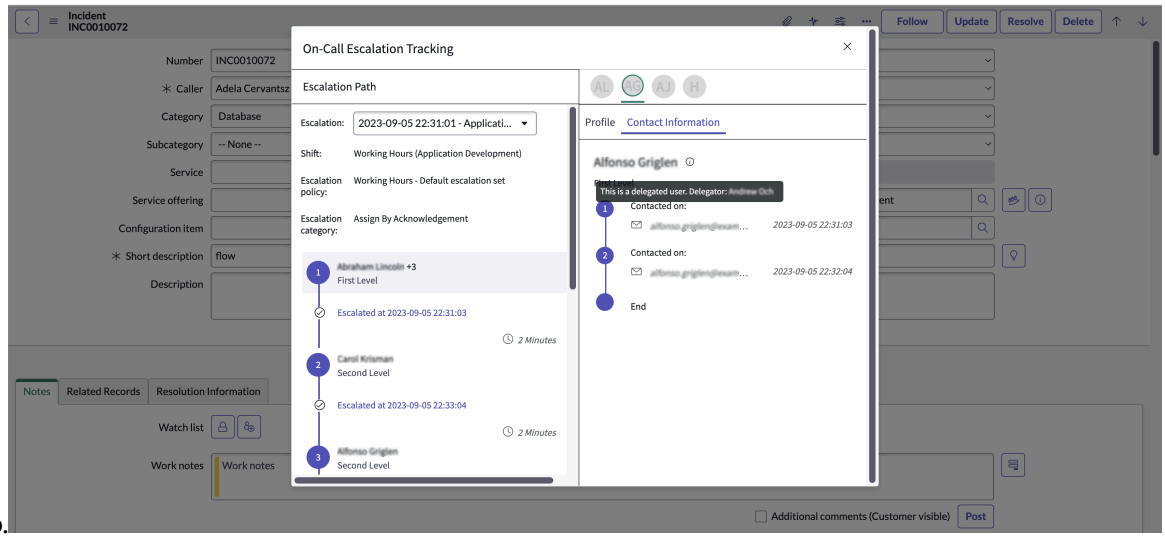
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Depending on the contact settings, you can call or send a direct message to the person from the escalatee's **Profile** tab.



Click ⓘ to view delegator and delegated user's information.

View details in an escalation log

View the escalation log record for full details on the time line and actions for an on-call escalation as it progressed through the on-call escalation path. You can also access escalation and escalation notification information from reports.

Before you begin

Role required: rota_admin or admin

About this task

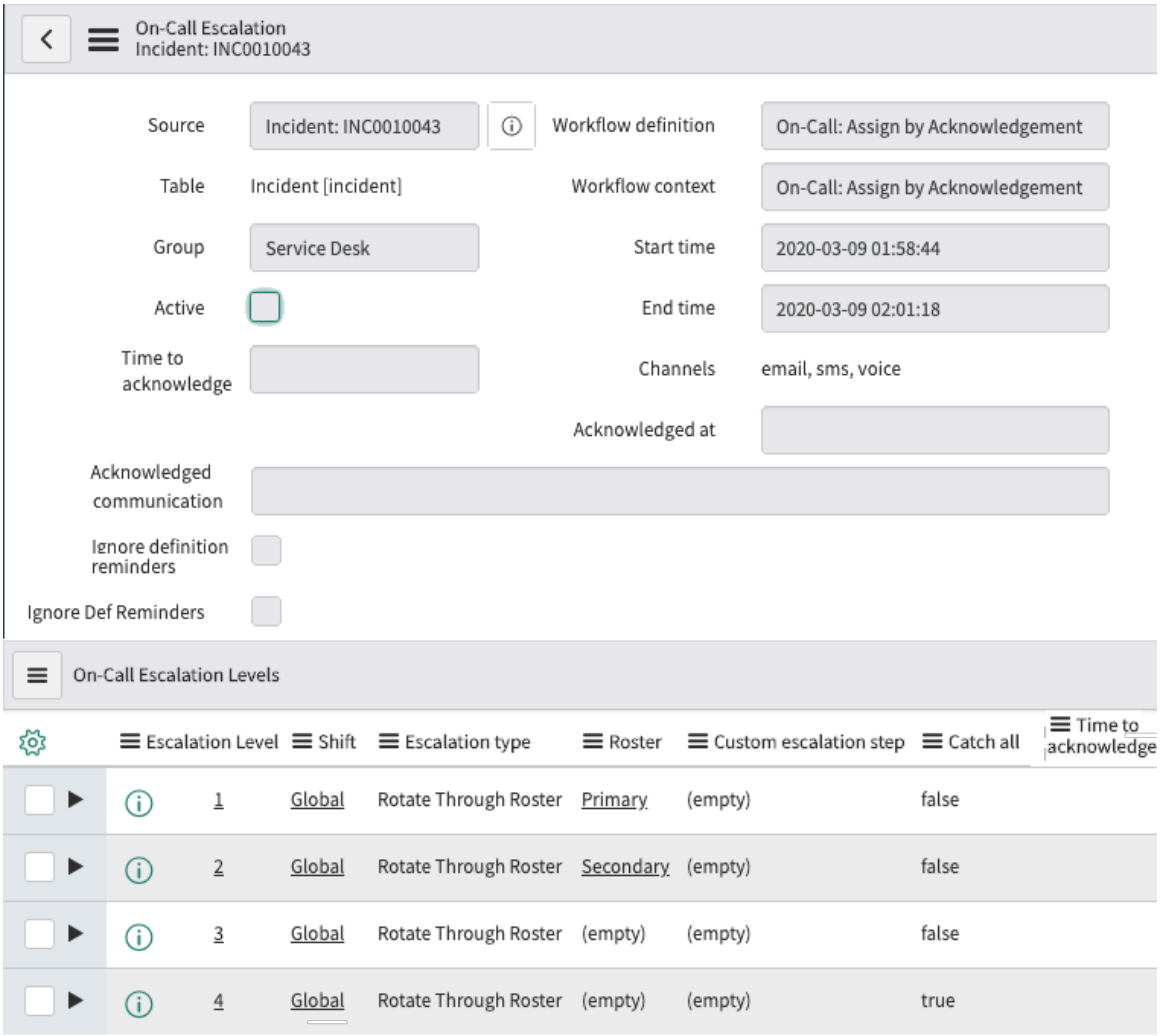
This topic describes how to use the logs to access escalation information. You can also access escalation notification information from reports. See Legacy: Viewing the Performance reports for escalations.

You can enable or disable logging using the *com.snc.on_call_rotation.log_escalations* property, as described in System properties for On-Call Scheduling.

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Escalations** > **Escalation Logs** and open the incident. The On-Call Escalations [Escalation Logs view] opens.
2. Click the Information icon (ⓘ) to open the incident record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. For each item in the related lists, you can click the Information icon ( ) to drill deeper into the details of the escalation (for example, to determine **Time to acknowledge** values).

Assigning On-Call Scheduling roles

Admins can assign On-Call Scheduling roles to user groups and to individual users based on user activities and responsibilities.

On-Call Scheduling roles tasks and access permissions

Role	Tasks and access permissions
Shift administrator [rota_admin]	A user with the rota_admin role can create, read, update, and delete shifts. The rota_admin can create shifts using the Create new schedule wizard, modify shifts and rosters, and maintain coverage and time off on the Manage shifts from the Calendar view. The rota_admin role contains the platform assignment_rule_admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Tasks and access permissions
Shift manager [rota_manager]	The Shift manager role is for the manager of a group. The purpose of the role is to distinguish a member that has been delegated the role of managing shifts of a group. The role cannot be used to manage all groups on the instance. The role can be delegated to the members of a group. See Delegating roles . A user with the Shift manager role that meets any of the following requirements can manage shifts for their group: • The user is the manager of the group. • The user was delegated the rota_manager role. For information on delegating the shift manager role, see Delegate the shift manager [rota_admin] role. For information on role delegation, see Delegate roles . **Note:** When a user is delegated a role on behalf of a group, the user can manage the shifts only for that group. • The user is configured as a shift manager for a group. For information on configuring group preferences, see Configure preferences for a user group.
itil	A user with the itil role can view the Manage shifts from the Calendar view, on-call commitments on reports, and has general read-only access to their group's shifts.
Premium Dashboard user [rota_prem_dashboard_user]	Access to the On-Call Premium dashboard. The Premium dashboard displays performance metrics across groups. See Legacy: Viewing the Performance reports for escalations.
DEPRECATED: roster_admin	**Warning:** Do not use this role for new users. This deprecated legacy role exists only to support customers that still use the role.

Create a shift template to simplify configuring shifts

You can predefine sets of shift settings using shift templates. Shift templates are a subset of group templates.

Before you begin

Role required: rota_admin

Procedure

1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Group Templates**.
2. From the list of group schedule templates, select the template for which you want to create a new shift template.
3. On the related list of the shift templates, click **New** and then fill in the On-Call Shift Template form.

New shift template fields

Shift name	The friendly name of the shift template. For example, US or EMEA.
Schedule type	The type of schedule. You can specify settings for a Simple schedule. Alternatively, you can select an existing template.
All day	Select the check box if the shift spans the full workday.
Start Time	If this is not an all-day shift, then specify the start time of the shift.
End time	The end time of the shift.
End time day	The day on which the shift should end.
Repeat on	For repeating shifts, the days of the week on which the shift should repeat.
On-Call Group Template	The group template to which the shift belongs.
Time zone	The time zone of the members of the rosters that will fill the shift.
Specify holiday Schedule	Select the check box to specify the holiday schedule for the shift. The setting is applied to the shift.

4. Click **Submit**.

Result

The template is now available for you to choose when creating or updating a shift.

Create a group template to simplify configuring schedules

Create templates to help your group create on-call schedules. For example, use the 24/7 template, which is available in the on-call demo data, to create on-call schedules for continuous service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: rota_admin

Procedure
1. Navigate to **All** > **On-Call Scheduling** > **Administration** > **Group Templates**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	A name for the new template. For example, 8-5.
Description	A short description of the template.

4. Click **Submit**.

Mobile experience for On-Call Scheduling

View and manage on-call schedules from a mobile device with the On-Call Scheduling mobile applet.

On-call managers and shift managers can perform the following actions:

- View your group's on-call schedule including any gaps, time-off requests, and so on.
- View roster and escalation details for a shift.
- Review and act on gaps and conflicts.
- Approve/Reject time-off and shift swap requests.
- Provide, replace, or delete coverage and delete time-offs

Members of a roster can perform the following actions:

- View your on-call schedules, who else is on-call during a shift, and your role for the shift (primary/secondary).
- View the roster and escalation details for a shift.
- Submit time-off and shift swap requests.
- Send a message (Slack /MS teams/ Push notifications) to find a replacement.

Getting started with the On-Call Scheduling mobile app

Use the ServiceNow Agent mobile app to access the On-Call Scheduling mobile application. Then log in to an instance and work on your schedules.

Before you begin
Depending on your device, go to the Apple App Store or the Google Play Store and download the ServiceNow Agent mobile app.

Role required: rota_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Tap the mobile app icon on your device, and then tap **+** to open an instance.
2. In the instance address field, enter the instance address in one of two ways.

Option	Description
Manual input	Type the instance address in the instance ad dress field. **Note:** You do not need to include `ser vice-now.com` at the end of the in stance name.
Scan QR code	Tap the QR icon (Scan a QR code), and then scan the QR code that was provided by your administrator.

3. Tap **Login**.

Mobile On-Call Scheduling overview

Members and managers of a shift can use the On-Call Scheduling applets and navigation menu on the Mobile Agent application to view and manage shifts and schedules.

Applet launchers

Applet launchers serve as landing pages or home pages. When you log in to your instance, you see an applet launcher and the applets configured to display on that launcher. The system administrator configures the applet launcher and applets for the Now Agent mobile application.

Navigation bar

The navigation bar appears at the bottom of the mobile application screen. This bar includes the following tabs that you can use to access different applets and application launch pages:

- *`My Work:`* As a member of a shift, view your upcoming shifts, request time off, and accomplish daily tasks related to your schedule.
- *`My Team:`* As an on-call manager, view your team's schedule and act upon important activities, like approving time-off requests and providing coverage.
- *`Notification:`* View a list of the notifications that have been pushed to an agent. Tap a notification in the list to see the details, then tap the details open the case.
- *`Settings:`* Manage settings for the mobile application.

Manage work with ITSM Mobile Agent

As a member of a shift, view your upcoming shifts, request time off, and accomplish daily tasks related to your schedule.

My work application in the ITSM Mobile Agent app has the On-Call Scheduling applet to view your upcoming shifts and request time-off. You can also view the members of your group available on call.

For detailed procedure see Managing incidents and tasks using My Work applet.

© 2026 ServiceNow, Inc. All rights reserved.

On-call schedule actions- Upcoming shifts

Action	Description
Tap on **Upcoming shifts**	View all upcoming shifts for the current month. The shift are grouped based on the events. Multiple-day event are displayed at the top.
Swipe left on the shift card	Request a time-off for the shift.
Tap on the shift card	View details for the shift like the group, roster, start time, and end time.
Tap **Request time-off**	Request a time-off for the shift.
Tap the icon.	Changes the view of the calendar from monthly to daily.

On-call schedule- Time-off requests

Tap on **Time-off requests**	View a list of time-off requests divided into pending and completed requests.
Tap the filter icon	Filter the time-off requests.
Tap the menu icon	Request time off from the Time-off requests screen.
Tap a pending time-off request	View the details of the request.
Tap **Cancel time-off**	Cancel the time-off by clicking **YES** on the confirmation message.

On-call schedule- Who is on-call

Tap on **Who is on-call**	View a form that lets you select a group from a list of groups.
Tap the right arrow	View the list of groups that should be on-call in a schedule.
Select a group	Select a group from the list of groups and click the arrow to view who is on-call for the schedule.

Manage team with ITSM Mobile Agent

As a shift manager, view your team's schedule and perform activities like approving time-off requests and providing coverage.

Upcoming shifts in On call schedule actions

Action	Description
Tap **Upcoming shifts**	View all upcoming shifts for the current month.
Swipe left on the shift card	Request time off for this shift.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upcoming shifts in On call schedule actions (continued)

Action	Description
Tap the shift card	View details for the shift (like group, roster, start time, and end time).
Tap **Request time-off**	Request a time-off for this shift by providing information on the Request time-off screen.
Tap **Provide Coverage**	Provide coverage for a shift member.

Time off requests in On-call schedule actions

Action	Description
Tap **Time-off requests**	View a list of time-off requests divided into pending and completed requests.
Tap the filter icon	Filter the time-off requests using filters like End date or group.
Tap the menu icon	Request time off on the Time-off requests screen.
Tap a pending time-off request	View details of the request.
Tap **Approve** or **Reject**	Approve or reject a time-off request. **Note:** Add a reason for rejection of a time-off request.

Gaps and conflicts in On call schedule actions

Action	Description
Tap **Gaps and conflicts**	View a list of all the gaps and conflicts for the shifts in your group.
Tap any day of the month	View all gaps and conflicts for shifts on that day.
Tap any of the shift cards	View gaps and conflicts for the shift.
Swipe left on any of the shift cards	Tap **Provide coverage** to provide coverage for the shift.
Tap **Provide Coverage**	Provide coverage for a gap in the shift.

For detailed procedure see Managing teams and incidents using My Team applet.

Reference section for On-Call Scheduling

Reference section provides additional information about components installed with On-Call Scheduling

Definitions of On-Call Scheduling terms

Some terms have specific meaning in the On-Call Scheduling application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Shift

A shift is the time period during which the members of a roster are on-call. You can view the details of any shift from the calendar.

Roster

A roster is a set of members that is on call for a shift. Because there is typically a roster for each escalation level (primary, secondary, tertiary), there are typically multiple rosters for a shift. The members of any roster are contacted in the order that is defined by the escalation policy.

Roster members (members)

The members of a roster are the users that have been added to a single roster. Roster members typically have the itil role. During an assigned shift, members must be available to act if notified of an escalation.

- Users must be members of the same group.
- The shift manager (rota_manager role) might or might not be a roster member.

Rotation

Rotation is the process of exchanging the turn of duty of members of a roster.

Members' From and To dates determine when they are members of the roster.

Schedule

A schedule specifies the times that shifts are active. For example, a company that wants coverage of tasks around the clock would use a 24-7 schedule. Companies that provide support around the globe could use a follow the sun schedule to cover time zones across continents.

Escalation

Escalations are a series of notifications to roster members for a task. The notifications happen in the order specified by the escalation path for the shift.

Notification

On-Call Scheduling sends escalation notifications to members of a shift. Notification methods include email, voice, Slack, SMS, Microsoft Teams, and mobile push.

Holidays and time off

Roster members can request time off. Managers can plan for and manage holidays and requests for time off.

Components installed with On-call scheduling

Several types of components are installed with activation of On-call scheduling, including tables and user roles.

Tables installed with On-Call Scheduling

On-Call Scheduling adds the following tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with On-Call Scheduling

Note:
Tables with prefix "v_" such as [v_alternate_rotation] are view-only tables used for generating on-call reports. Do not use these tables to create reports.

Display name [Table name]	Description
On-call Member [cmn_rota_member]	Table of group members that are participating in the on-call schedule and escalations.
Roster [cmn_rota_roster]	Table that holds the members of the shift, the shift interval, and escalation settings.
Shift [cmn_rota]	The table that holds the on-call schedule for a shift.
Roster Schedule Span [roster_schedule_span]	Table that contains the schedule span definitions. On-Call Scheduling adds a group reference and the On-call type to the Type field.
Trigger Rule [trigger_rule]	Table that extends the Assignment Rule [sysrule_assignment] table and stores when the escalation process is triggered and what actions to take.
On-call Notifications [v_on_call]	Table that lists the reminder notifications that were sent.
Rotation Schedule [v_rotation]	Table that lists shift schedules by start date and time and includes user contact information, if available.
User Rotation Schedule [v_user_rotation]	Table that lists the shift schedule by user.
Alternate Rotation Schedule [v_alternate_rotation]	Table that lists the alternate user schedules by shift and roster and the start and end date and time stamps.
Rotation Escalation [cmn_rota_escalation]	Table that lists the escalations including the event and last updated time stamp.
Shift Contact Preference [cmn_rota_contact_preference]	Table that holds the contact preferences for default and custom escalations.
On-Call Communication Type [on_call_communication_type]	Table that lists the type of communication channel used.
On-Call Group Template [sys_on_call_group_template]	Table with information about the template used to create/edit a schedule of a group.
On-Call Shift Template [sys_on_call_shift_template]	Table with information about the template used to create/edit a schedule of a shift.
On-Call User Preference [on_call_user_preference]	Table with information on a member's preferences.
On-Call User Contact Preference [on_call_user_contact_preference]	Table with information on a member's contact preferences.
[sys_on_call_contact_source]	Table that lists the contact sources and devices
On-Call Escalation [on_call_escalation]	Table that records the source, group, and related details for escalation tracking.
On-Call Escalation Level [on_call_escalation_level]	Table that logs the escalation levels reached for an escalation and related details for escalation tracking.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display name [Table name]	Description
On-Call Escalation Contact Attempt [on_call_escalation_con_attempt]	Table that logs contact attempts at an escalation level and related details for escalation tracking.
On-Call Escalation Notification [on_call_escalation_comm]	Table that logs both the notifications and the responses for a contact attempt and related details for escalation tracking.
On-Call Escalation Response [on_call_escalation_response]	Table that tracks On-Call escalation responses by On-Call workflows. Once consumed, entries are deleted by the system.
Trigger Rule Table Configuration [trigger_rule_table_cfg]	Table that lists the tables that are enabled for creating escalation trigger rules. The table is used to enable the escalation trigger rules for the tables that do not extend tasks.
On-Call Add Member [on_call_add_member]	Table that records the member details for adding a member to the roster.
On-Call Remove Member [on_call_remove_member]	Table that records the member details for removing a member from the roster.
On-Call Move Member [on_call_swap_member]	Table that records the member details for swapping the order of a member with the target member or moving the order of a member after the target member in the roster.

Scheduled jobs installed with On-Call Scheduling

On-Call Scheduling includes scheduled jobs.

Schedule job	Description
On-Call Reminders	Sends daily reminders to on-call roster members.
On-Call Gaps Conflicts Report	Sends a weekly report of gaps and conflicts in on-call schedules to shift managers, group managers, and admin.

Quick start tests for On-Call Scheduling

Validate that On-Call Scheduling still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

On-Call Scheduling

Activate the On-Call Scheduling plugin (com.snc.on_call_rotation) to run the On-Call Scheduling quick start tests.

On-Call Scheduling workflows

Workflows perform On-Call Scheduling operations.

Workflows installed with On-Call Scheduling

On-Call: Assign by Acknowledgement

The workflow uses data from escalation settings, including overlapping shifts and custom escalation settings for shifts and rosters. Depending on the settings, the workflow moves through the escalation path and sends notifications by SMS, voice, or email that ask users to accept a task.

To send notifications, a trigger rule is required. Trigger rules supersede some On-Call business rules in earlier releases. To define a trigger rule, you must deactivate business rules that you customized in earlier releases.

The workflow respects time off as specified in rosters. Roster members with time off are not included in the escalation path and no notifications are sent to them.

If **Force communication channel** is specified in the **Escalation settings** for rosters, the Subscription-based notifications is used: SMS, email, voice, Microsoft Teams, or mobile push. If the preferred method is SMS and the on-call member does not have an SMS device defined, the user is not contacted even if the user has an email address. When forcing a communication channel on an escalation level does not succeed, no further communication attempts are made. The failed contact attempt is logged. The setting **Force communication channel** is available only if Notify is installed.

- Until acknowledged, sends on-call notifications to escalatees based on the escalation policy and configured contact preference.
- Logs escalation details for each communication.
- Resumes the workflow immediately after rejection.
- Catch-all users are treated like all other escalation users: A response is expected and the incident might be assigned to them based on their response.

Note:
This workflow internally launches the On-Call: Assign by Acknowledgement per Rota workflow.

On-Call: Escalations by Email

- Until acknowledged, sends on-call email notifications to escalatees based on the escalation policy and configured email contact preferences.
- Logs escalation details for each communication.
- Catch-all users are treated like all other escalation users: A response is expected and the incident might be assigned to them based on their response.

On-Call: Assign

Assigns the task to the current primary roster member.

On-Call: Check Assignment Response

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Triggered when an inbound SMS message is received.
- Based on the response in the message, assigns the task to the roster member.
- Updates the response in the corresponding notification record.

On-Call: Assign by Acknowledgement Voice

- Triggered when an outbound call is made from the on-call number to any user or device.
- Based on the response to the voice call, assigns the task to the roster member.
- Updates the response in the corresponding notification record.

On-Call: Time-off approval

- Triggered when vacation time off (PTO) is requested by a user.
- Sends approval requests to appropriate managers.

On-Call: Conference Call Escalation

- Triggered when a conference call is initiated and a group is added to the call.
- Makes a voice call to the first group member in the escalation policy.
- If the member does not join the conference call, then escalates to next group member in the policy

Workflow Activities for On-Call Scheduling

Workflow activities in On-Call Scheduling workflows.

Escalation workflow activities

On-Call: Log Escalation Start

Creates an escalation record based on group, task, and workflow details.

Note:

The escalation that the workflow creates the `workflow.scratchpad.escalationSysId` sys_id. Use the sys_id in any of the other workflow activities.

Setting	Description
Group	sys_id of the group that the escalation belongs to.
Table	Table name of the task record of the incident.
Source	sys_id of the task record on which the escalation happened.
WorkflowDefinition	sys_id of the workflow definition that is used to escalate.
WorkflowContext	sys_id of the workflow context.
ParentEscalationLevelId	sys_id of the parent escalation in the case that the escalation was triggered from another escalation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Description
Category	Category of the escalation. One of: [assign_by_acknowledgement, auto_assignment, notify_manual_assignmen,conferencing].
Channels	Comma-separated list of the channels used to communicate during the escalation. Any or all of: [email, sms, voice, slack]. For example, sms,email,voice
IgnoreDefReminders	If true, the workflow sends notification reminders as specified by the workflow, rather than as specified in On-Call Escalation settings. For example, in Conference On-Call escalations, the workflow might to dial the on-call members at one-minute intervals instead of the standard 15-minute intervals.

On-Call: Log Escalation Level

Creates an escalation level record given escalation and level details.

Setting	Description
EscalationId	sys_id of the escalation to which the level belongs.
RotaId	sys_id of the shift for which the escalation is happening.
Level	Current escalation level. For example, 2.
Escalatee	Escalatee object at current escalation level. For example, getEscalationPlan()[1].
CatchAll	True if the escalation level belongs to a catch-all.

On-Call: Log Escalation Attempt

Creates a Contact attempt record given an escalation, level, and attempt details.

Setting	Description
EscalationId	sys_id of the escalation to which the contact attempt belongs.
RotaId	sys_id of the shift for which the escalation is happening.
Level	Current escalation level. For example, 2.
ContactAttempt	Contact attempt number within the escalation level. For example, 1.

On-Call: Log Escalation Communication

Creates a communication record given escalation, level, attempt, and communication details.

Setting	Description
EscalationId	sys_id of the escalation to which the communication belongs.
RotaId	sys_id of the shift for which escalation is happening.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting	Description
Level	Current escalation level. For example, 2.
ContactAttempt	Contact attempt number within the escalation level. For example, 1.
EscalateeType	Type of escalatee to whom the communication is sent. One of: [user,device]
EscalateeId	sys_id of the user or device, depending on escalatee type.
CommType	Type of communication. One of: [sms, voice, email, slack]
CommValue	Phone number or email address, depending on communication type. For example, `abel.tuter@servicenow.com`
Status	Status of the communication. One of: [sent, failed].
Escalatee	Escalatee object at current escalation level. For example, getEscalationPlan()[1].
CatchAll	True if the escalation level belongs to a catch-all.

On-Call: Log Escalation End

Completes the escalation by setting active flag to false.

Setting	Description
EscalationId	sys_id of the escalation.

On-Call: Send Notification

Sends notification to the current escalatee via voice, SMS, Slack, Microsoft Teams, or mobile push.

Setting	Description
Notification type	Type of notification. One of: [sms, voice, slack].
Message	Text of message to send to current escalatee if notification type is sms.
Notification detail	List of parameters that are required for a notification: • SMS: notify_number, users, groups, numbers • Voice: numberToCallFrom, numberToCall, user • Slack: slack user, taskId, catchAllOption, wFContextId • Microsoft Teams: user, taskId, catchAllOption, wFContextId • Mobile push: userSysId, tablename, recordSysId

On-Call: Manage Escalation Response

Manage an escalation response record (insert escalation record, clean escalation records, update response to an escalation). An escalation response record keeps track of a response received for an escalation through the SMS, voice, email, or

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Slack notification channels. An escalation response record is used to resume the **On-Call: Assign by Acknowledgement** workflow upon rejection of an escalation.

Setting	Description
Workflow Context	Workflow context ID.
Escalatee Id	UserID of the current escalatee.
Table Name	Table name of the task record. For example, `incident`.
Current Record Id	sys_id of the task record.
Action Type	Type of action. One of: [add,clean,update]
Response	Response by escalatee to an escalation. One of: [accepted,rejected]

Example uses:

- Insert (add) - Workflow Context, Escalatee ID, Table Name, Current Record ID
- Clean - Workflow Context
- Update - Escalatee ID, Table Name, Current Record ID, Response

Domain separation and On-Call Scheduling

Domain separation is supported in On-Call Scheduling. The On-Call Scheduling application helps you to ensure that dedicated support team members are available to resolve issues as they arise. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

On-Call Scheduling overview

- On-Call Scheduling behaves the same with domain support as it does without domain support. Customers have the same ability to create and maintain on-call shifts.

- A shift includes a selection of users from a group. It uses the base-system Advanced Schedules Support plugin to specify when the shift is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How domain separation works in On-Call Scheduling

With domain separation enabled, a user with the rota_admin role uses the Create New Schedule wizard to generate schedules in the group's domain. All generated related records for the new schedule are created with a matching domain.

This setup is enforced with a combination of the domain field and the *domain_master* attribute. The attribute is used to derive the domain of the record from the master record. For the roster table, it derives the domain from the associated shift record.

On-Call Scheduling domain-separated tables

- Shift [cmn_rota]
- Rotation Escalation [cmn_rota_escalation]
- Shift Escalation Set [cmn_rota_escalation_set]
- Shift Escalation Step Definition [cmn_rota_esc_step_def]
- On-Call Group Preference [on_call_group_preference]
- On-Call Contact Source [sys_on_call_contact_source]
- On-Call Group Template [sys_on_call_group_template]
- On-Call Shift Template [sys_on_call_shift_template]
- On-Call Template Contact Attempt [on_call_template_contact_attempt]
- On-Call Template Contact Preference [on_call_template_contact_preference]
- On-Call Template Escalation Policy [on_call_template_escalation_policy]
- On-Call Template Escalation Step [on_call_template_escalation_step]
- On-Call Escalation [on_call_escalation]
- On-Call Escalation Level [on_call_escalation_level]
- On-Call Escalation Contact Attempt [on_call_escalation_con_attempt]
- On-Call Escalation Notification [on_call_escalation_comm]

On-Call Scheduling tables that use the domain_master attribute

- Roster [cmn_rota_roster]: *domain_master=rota*
- Rota Member [cmn_rota_member]: *domain_master=roster*
- Roster Schedule Span [roster_schedule_span]: *domain_master=schedule*
- Shift Escalation Set [cmn_rota_escalation_set]: *domain_master=cmn_rota*
- Shift Escalation Step Definition [cmn_rota_esc_step_def]: *domain_master=cmn_rota_escalation_set*
- On-Call Escalation Level [on_call_escalation_level]: *domain_master=escalation*
- On-Call Escalation Contact Attempt [on_call_escalation_con_attempt]: *domain_master=escalation_level*
- On-Call Escalation Notification [on_call_escalation_comm]: *domain_master=contact_attempt*

To learn more, see Domain support for schedules

On-Call Scheduling use cases

For the following On-Call Scheduling features, domain separation ensures that end users (whether they possess the itil or rota_admin role) are able to see only shifts accessible via their domain:

- On-Call calendars
- On-Call schedules
- My Schedule reports
- Schedule reports
- Escalations

Exploring Proactive Engagement

It is a solution where the self-resolution remediation process is proactive, seamless, and consistent without the organization having to publish all solution sets.

Proactive Engagement overview

ServiceNow® Proactive Engagement helps an organization in improving employee digital experience, productivity, and satisfaction by proactively enabling employees to self-solve digital issues they experience on a day-to-day basis. The self-remediation process is seamless and consistent without the organization having to publish all solution sets.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

https://player.vimeo.com/video/1027809866?h=be338c1bca&badge=0&autopause=0&player_id=0&app_id=58479

Proactive Engagement Key features

- Enables employees to self-solve digital experience issues by leveraging the proactive issue detection and resolution capability of the ServiceNow Digital End-User Experience product.
- Engages employees to provide a seamless resolution experience through remedial actions (automations) and self-service content.
- Provides quick scaling and consistent support for increasing the range of applications.

ServiceNow Digital End-User Experience integration with Proactive Engagement

ServiceNow Digital End-User Experience empowers IT to take proactive measures and offers a clear view of end-user applications, devices, and networks. It further along with Proactive Engagement enables employees to independently resolve issues, troubleshoot, and engage with the Virtual Agent.

ServiceNow Proactive Engagement integrates with ServiceNow Digital End-User Experience to define issue detection rules, resolution content, and engagement settings that help employees to self-solve digital experience issues by leveraging proactive identification of issues.

For information on the ServiceNow Digital End-User Experience, see Digital End-User Experience.

DEX Admin/Engagement admin experience

- A DEX or engagement admin is part of the customer's organization.
- Creates a metric rule for each device or application CI to enable DEX to detect specific issues and defines the specific alert action. An Alert action defines the action to be taken whenever a threshold in the metric rule is reached and it supports a configuration of resolution types like remedial actions, self-help instructions, URL, create incident. For example, when an application crashes, clearing the application cache or updating the application to the latest version.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure engagement settings such as channels to notify and engage with the organization's employees, notification content, and fallback options for unsuccessful resolution of issues.
- Captures and reports insights that reflect the usage patterns of Proactive Engagement in ITSM Success Dashboard.
- Customize the Proactive Engagement base system resolutions that are shipped by ServiceNow.
- Manage the Proactive Engagement resolutions through the Proactive Engagement workbench.

Note:
The Engagement Admin role is required to add an alert action.

Employee experience

- Employee is a part of the customer's organization.
- When an employee experiences an issue for which the metric rule and resolution is already configured, the employee is proactively notified and engaged and offered a resolution for the issue in real-time over the configured engagement channel. The employee engagement occurs as soon as the issue is detected and even before the employee reaches out to the helpdesk.
- The employee can be more productive and efficient after virtually engaged while self-solving issues. It also reduces the number of incidents and load on agents due to this seamless digital experience.
- Virtual Agent installation and integration with a third-party messaging application to enable push notifications for proactive employee engagement.

Proactive issue detection and Resolution

1. ServiceNow Digital End-User Experience application proactively detects a digital experience issue on an employee device by monitoring the metric rule threshold breach and creates an experience issue.
2. Proactive Engagement validates the experience issue and sends a notification (based on the notification settings) to the employee through configured channels such as Virtual Agent on Employee Centre/Service Portal, integration with any messaging application such as MS Teams. The employee can choose to accept help based on this notification or ignore it.

   Note:

   - When the employee accepts help, the employee is engaged through the configured engagement channel.
   - Currently, only Virtual Agent is the supported configured channel to send notifications to the employee.

3. Proactive Engagement retrieves the configured proactive resolution for the metric rule and engages the employee by providing solutions such as URLs, self-help instructions, or executes the relevant remedial action on the employees device with their consent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the resolution has successfully resolved the issue, the engagement is marked as successful.
- If the resolution has not resolved the issue, the employee is given fallback options such as incident creation or will be connected to an agent.

Note:
Fallback options are configured by the DEX or Engagement admin.

The ServiceNow Proactive Engagement provides base resolution content. You can create your own resolution content as well. For more information, on the base resolutions, see Proactive Engagement solution.

Configuring Proactive Engagement

Configure Proactive issue detection rules and resolutions so that employees can self-solve digital issues seamlessly.

Configuration overview

The Proactive Engagement application helps you to configure and provide instructions as remedial actions. These remedial actions act as self-help instructions to resolve their digital issues proactively.

Setting up Proactive Engagement

Setting up Proactive Engagement enhances the issue resolution capabilities of the organisation to help employees resolve their digital experience issues.

Before you begin

Note:
Proactive Engagement integrates with ServiceNow DEX to proactively detect the digital experience issues.

- Activate the Glide Virtual Agent plugin (Id: com .glide.cs.chatbot).
- Install the ServiceNow Proactive Engagement application from the ServiceNow® Store.
- Activate the Remedial actions framework plugin to use remedial actions as a resolution type.
- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Proactive Engagement application listing in the ServiceNow® Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Note:

To view the Virtual Agent notifications:

- Set the system property **com.glide.cs.notification_newuser_webclient** to **True**.
- Navigate to **sys_cs_live_agent_setup.do?sys_id=f0acbc4c5f091300e6333654de7313c8** and **enable** the notifications for all users.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Proactive Engagement application (com.snc.proactive_engagement) using the filter criteria and search bar.

   Note:
   You can search for the application by its name or ID. If you cannot find the application, you must request it from the ServiceNow® Store. In the list next to the **Install**, the available versions are displayed.

3. Select a version from the list and select **Install**.

   Note:
   Any dependencies that are installed along with the application are also listed.

4. If you are prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Configuring Proactive Engagement resolutions with DEX

Metric rules help the organization by setting the criteria and trigger alerts when the device or the application monitored deviates from the specified metrics.

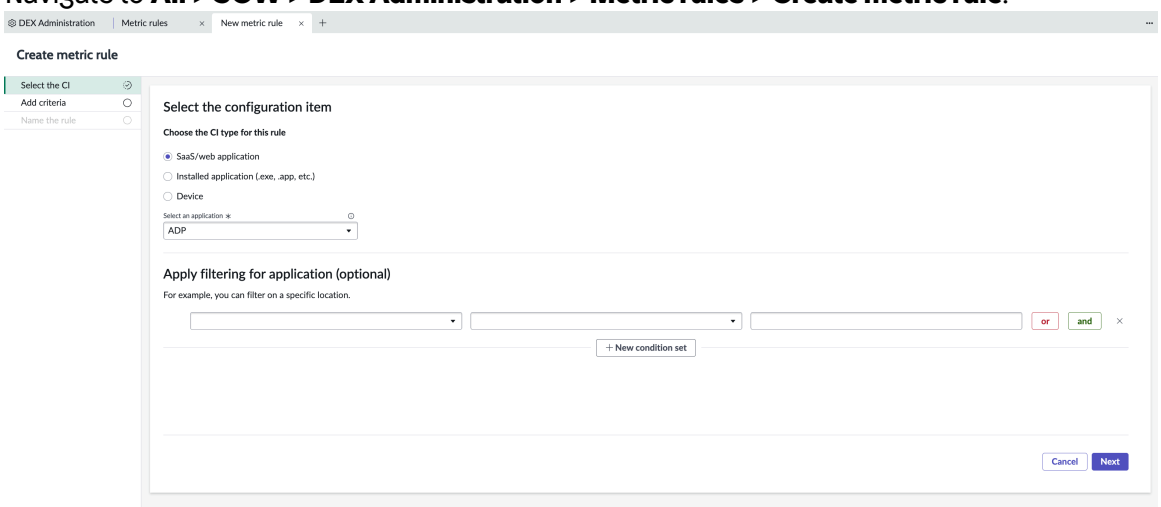
Before you begin

Set the resolutions to help you proactively resolve the digital issue using the ServiceNow Digital End-User Experience. For details on the installation of the Digital End-User Experience application, see Install Digital End-User Experience.

Role required: admin

Procedure

1. Navigate to **All** > **SOW** > **DEX Administration** > **Metric rules** > **Create metric rule**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select the device or type of application that you want to monitor and detect issues in the CI selection window.

   For more information on CI selection, see Specify the configuration item for metric rules.

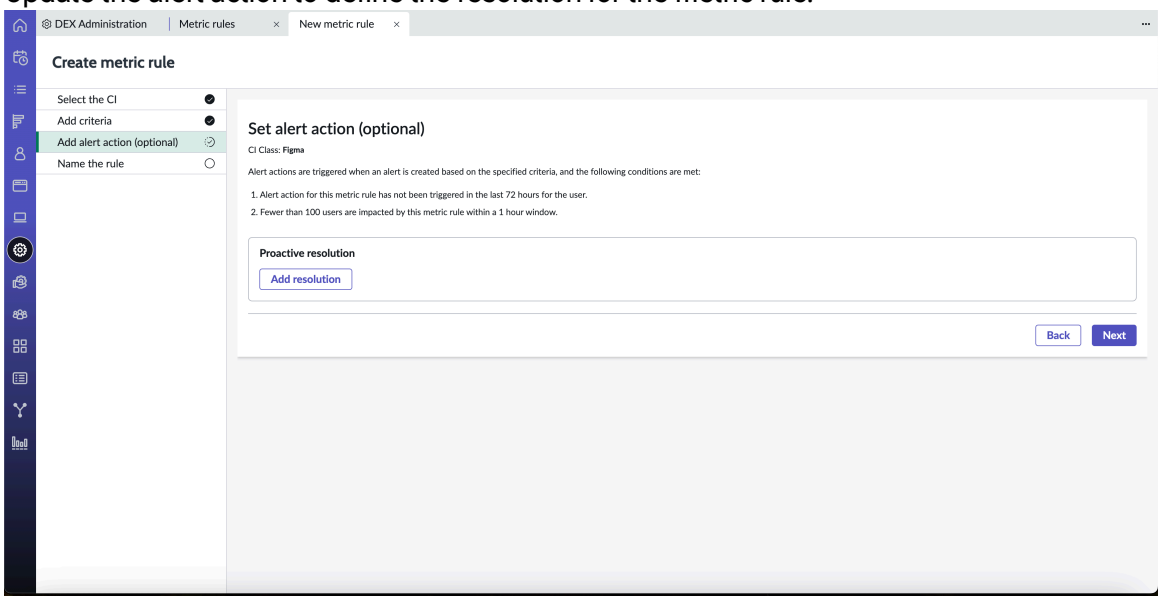
3. Select **Next**.

4. Select the metric and criteria to create an alert.

   For more information on Alert criteria, see Define alert metric criteria.

5. Select **Next**.

6. Update the alert action to define the resolution for the metric rule.



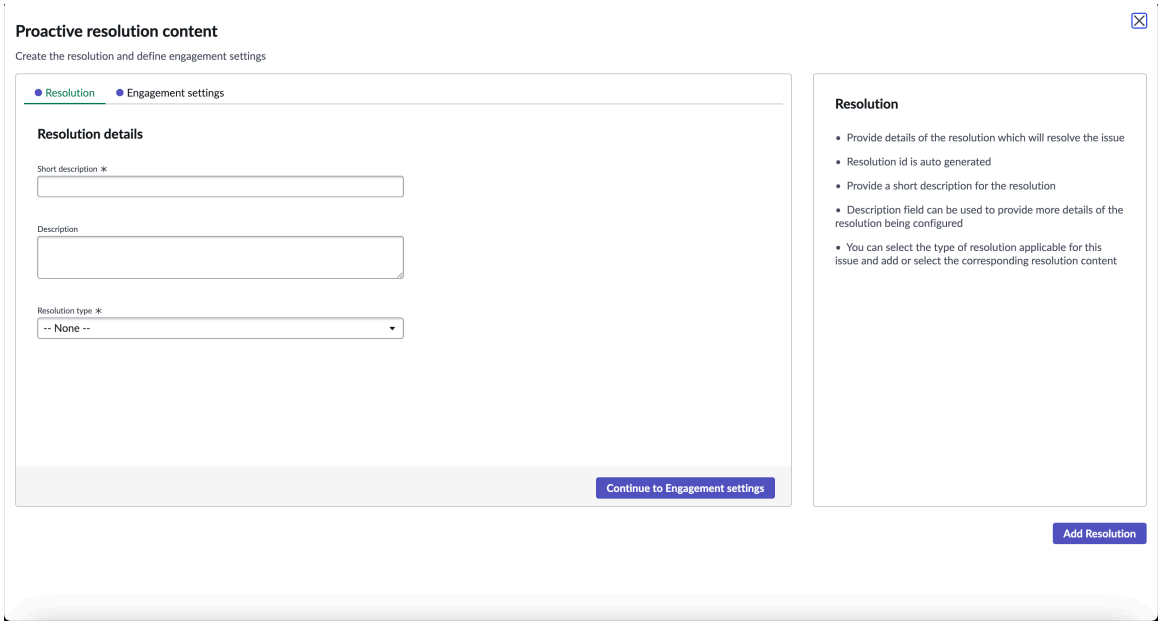
> **Note:**
> Remedial actions that require entering parameters are not supported and you won't be able to select when the resolution type is Remedial Action.

7. Select **Next**.

8. Select the type of resolution and update the resolution details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

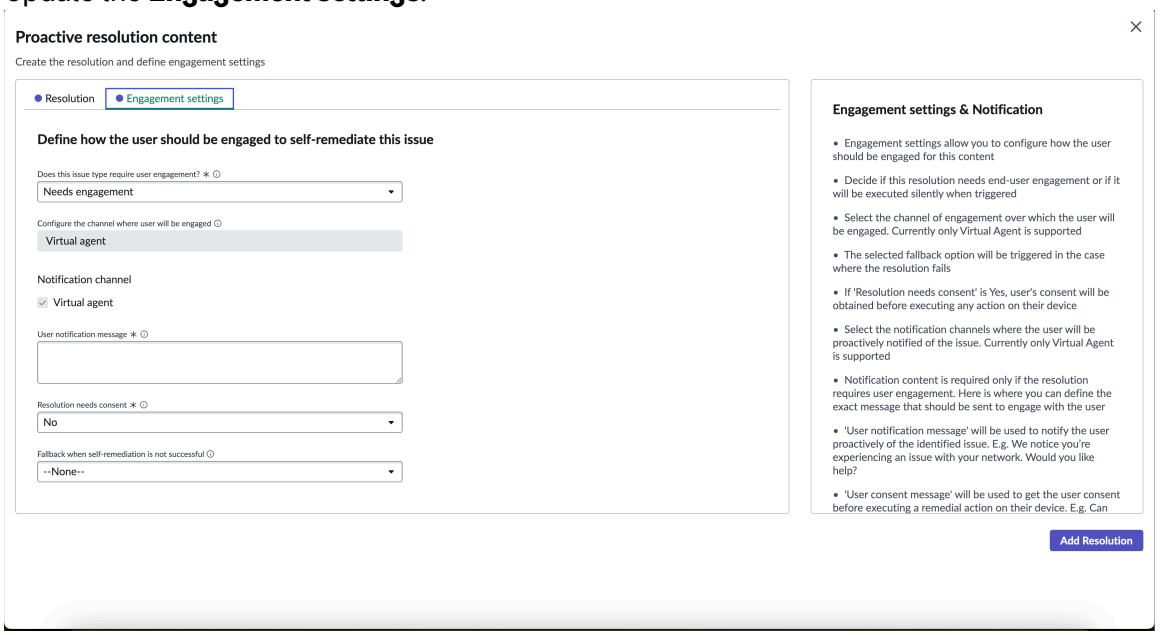
For more information about the different types of resolution, see Resolution for Proactive Engagement.



9. If you select resolution type as remedial action that has input parameters, enter the **Advanced settings** for each of the input parameters of the selected remedial action.

   For more information about the Advanced settings, see Input parameters for Remedial action in Proactive Engagement.

10. Select **Continue to Engagement Settings**.
11. Update the **Engagement settings**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- For information on updating the Engagement Settings, see Engagement Settings for Proactive Engagement
- Choose Desktop Assistant as the notification channel to notify the users with any self-help instructions or URL. For more information, see Desktop Assistant notifications.
- Choose Email notification channel to notify the users with any self-help instructions or URL. For more information, see Configuring Email as a notification channel for Proactive Engagement.

.

12. Select **Add Resolution**.
13. For defining the name and activation, see Metric rule triggering Proactive Engagement through alerts

Note:
Every time the criteria set in the metric rule is met, it triggers the resolution and helps you resolve the issue.

Configuring notification using Proactive Engagement

Notification is a type of engagement where you can notify the user and do not need any user interaction.

Before you begin

Role required: admin

Notification type of engagement is available only for self-help instructions and URL type of resolution currently. The user is notified through the Virtual agent integrated with the messaging application. The experience issue is closed once the notification is sent to the user.

To create the **Notification** metric rule, follow the instructions (step 1 to step 8) listed in the Configuring Proactive Engagement resolutions with DEX.

Procedure

1. Select the option self-help instructions or URL from the **Resolution type** drop-down. Enter the self-help instructions or the URL according to the use case.
2. Select **Continue to Engagement Settings**.
3. Select the option **Notification** under **Does this issue type require user engagement?**

Note:
The option Virtual Agent is selected by default as the notification channel.

4. Select **Add Resolution**.

Configuring Email as a notification channel for Proactive Engagement

Email notification is one of the notification channel along with Desktop assistant and Virtual agent when you choose self-help instructions or URL as the resolution type.

Email notification is the new notification channel supported for the self-help instructions and URL resolution type. To enable email notification channel as an option in SOW and in core UI, mark the Active field True in the `sn_pren_channel_configuration` table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once email notification is chosen while setting the engagement settings, a new field, Choose email notification is enabled, this field helps you choose the email template. Proactive engagement notification option is the out of box email notification template created in the `sysevent_email_action` table. You can customize the email template according to the required subject, email body, and so on. To customize the email subject, use the field issue reference name from the issue registry template `sn_pren_issue_registry_template]`. Leverage the out of the box platform capability to configure and send an email notification. The created experience issue is automatically set to closed complete once the notification is sent. For more information on how to configure an email template and set up the notification, see the links in the related information. For more information on creating an email notification, template and layouts see, Email and SMS notifications.

User Criteria Settings

User criteria settings details the settings in Proactive Engagement to group the users for certain conditions.

You can access user criteria settings through **All** > **Proactive Engagement** > **User Criteria Settings**. User criteria includes or excludes a user or certain group of users from receiving PE notifications. User criteria helps in grouping the users based on certain conditions such as role, location, department, or Business unit and so on. Once the user criteria is created, the users are excluded or included as per the defined criteria. As a prerequisite, set the role to Engagement admins `sn_pren.engagement_admin` to be able to set the user criteria. The criteria for user settings are applied at the framework level rather than the use case level. Once these criteria are established, notifications will be enabled/disabled corresponding to the criteria set.

You can access any pre-defined user criteria. To know more, see User criteria diagnostics for Knowledge Management. To create a new user setting, fill the following details:

Field	Description
User Criteria	User Criteria name
Order	Number of user
Type	Inclusion/Exclusion criteria **Note:** Exclusion always takes precedence over Inclusion.
Active	Yes/No

Using Proactive Engagement

Proactive Engagement helps you in proactive detection of digital issues and provides self-help instructions to resolve them.

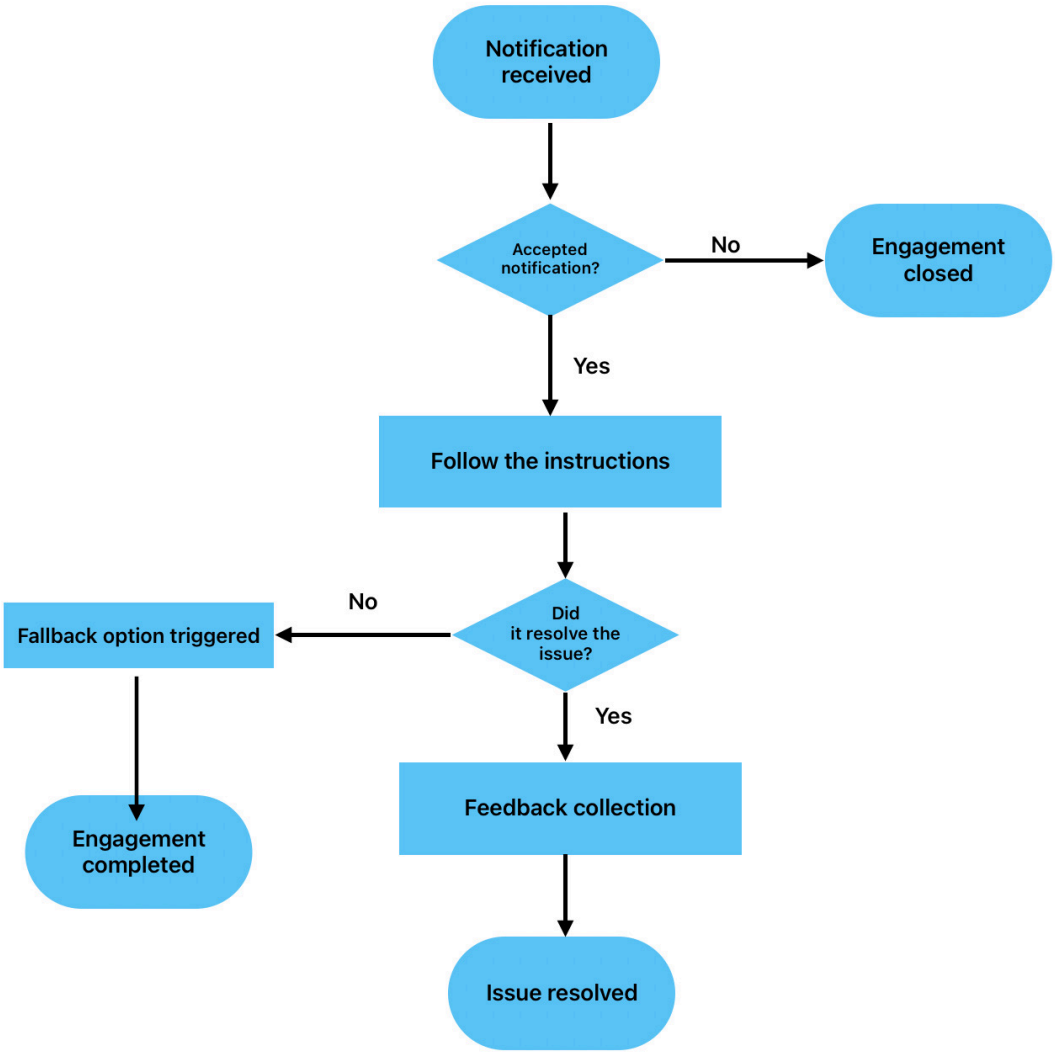
Employee engagement experience through Proactive Engagement

This experience details the employee engagement through the Proactive Engagement application.

Every Proactive Engagement trigger creates an experience issue record. When the metric rule with a Proactive Engagement resolution is triggered, it creates an experience issue record to start engaging with the end user. Once the engagement is triggered, you get a notification for the issue. If the end-user consents for help, they are engaged over a Virtual Agent to self-solve the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

issue. Once the resolution is executed successfully, end-user confirmation is requested. If the issue is not resolved, the configured fallback option is provided. If the issue is resolved, the end-user feedback on the experience is requested.



Agent experience through Proactive Engagement

This experience details the agent experience through the Proactive Engagement application.

Proactive Engagement executes a set of resolutions on the end-user device. If the resolution doesn't resolve the issue, as one of the fallback options, the incident created reaches the agent.

The agents can refer to the interaction summary which includes the resolution executed and the outcome or state of the execution.

The reason for failure could be resolution execution failure or if the employee marks the issue as unresolved and requires further assistance. This interaction summary is available in the work notes of the incident record created as a fallback.

The agents can refer to the Experience Issue that is tagged as the Origin of the Incidents created as a fallback.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Proactive Engagement solution

The base system solution detects and enables you to resolve high disk usage issues by providing a detailed self-help instruction specific to the operating system.

There are two base system resolutions provided by the ServiceNow Proactive Engagement.

- Check system disk usage for Windows
- Check system disk usage for Mac

These base system solutions can be accessed from the metric rule tab in the DEX Administration. These metric rules are created to monitor the disk usage on end-user devices and triggers the alert action when it exceeds the set criteria. To use this metric rule for issue detection and employee engagement to enable self-remediation, we need to activate the rule.

1. Navigate to **Workspaces** > **Service Operation Workspace** > **DEX Administration** > **Metric rules**.
2. Select **Name the rule**.
3. Select **Active** under rule status.

Metric rule triggering Proactive Engagement through alerts

Metric rules create an alert based on its trigger criteria.

Alert actions are triggered when an alert is created in the specified criteria. You can create an alert based on the values shared in the system properties. The system properties can be set as conditions based on which the alert action is triggered. Applications and devices need a different set of system properties to be set. The alert action is triggered when an alert is created based on the specified criteria and the conditions met. Through system properties, you can customize the values of these conditions.

- Alert action for this metric rule is not triggered in the last 72 hours for the user.
- Fewer than 100 users are impacted for this metric rule within an 8 hour window.

System property	Condition	Description	Type
sn_pren.resolution_freeze_period	Metric rule not triggered in the last 72 hours (default).	The duration (in hours) for imposing a freeze period for a specific user for any unique metric rule configured in Proactive Engagement. Set this value to zero to disable the rule.	integer
sn_pren.device_resolution.throttling_limit_per_user	Fewer than 100 users (default) are impacted.	Maximum number of users for which a Proactive Engagement device-related resolution is triggered within a defined time period. The value of the time period configured in property sn_pren.device_resolution.throttling_window_duration.	integer

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert closure in Proactive Engagement

There are different methods followed for closing the alerts in Proactive Engagement for devices and applications.

- Devices: Alerts generated from Metric rule triggered for devices, are closed once Proactive Engagement helps the impacted users to successfully resolve their issue.
- Applications: Alerts generated from Metric rule triggered for applications are not closed.

Proactive Engagement life-cycle management

The Proactive Engagement application enables you to work in the life-cycle model to manage solutions that you own and to view solutions that may have an impact on services or products that you care about.

You can access the Proactive Engagement workbench by navigating to **All** > **SOW** > **Proactive Engagement workbench**.

The Proactive Engagement Workbench provides an overview of all the Proactive Engagement solutions available on an instance. It displays the details of all the solutions available, deployed, and not deployed.

Deployed solutions, where the engagement settings are configured and are used within the organization. Proactive Engagement resolutions created through the metric rules are deployed by default. For more information, see the Configuring Proactive Engagement resolutions with DEX. Deployed solutions can be deployed as custom or original. Solutions created by using the metric rules are original. You can customize the resolution by selecting the deployed record and choosing a custom resolution. Engagement settings for the not deployed solutions are not configured.

Review solutions for the available updates

For each custom solution where an update is available, the updates can be reviewed by either selecting **Review update** available on the card or when you click on the record to open and access the record. **Review update** provides a comparison between the updated and customized solutions for users to make an informed decision on the next steps. The following actions can be performed:

- *`Auto update`* Removes reference to the custom resolution and will be up to date with the provider solution. The update status is changed to Up to date.
- *`Manual update`* Users go back and manually make any changes required for the solution. The solution update status updates to Manual update pending. Once the changes are done select Solution updated option either on the card or on the Review update page to move the solution update status to Up to date.
- *`Ignore update`* - The update will be ignored, and the solution update status will move to Up to date.

Proactive Engagement will be triggered only for the deployed solutions. There are different **State** in the deployed solutions.

- **Update available** New updates for out-of-the-box deployed solutions are available.
- **Update up-to-date** Solution shipped by ServiceNow and is up to date.
- **Update ignored** Available updates in the provider out-of-the-box solution is ignored.
- **Pending manual update** Available updates were reviewed and manually updated the solution.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For custom resolutions, you can update them automatically or manually update them. Once the updates are completed, the status changes to Update up-to-date. The **Update provider data** updates or refreshes the solutions in the Proactive Engagement workbench.

Proactive Engagement reference

Reference topics provide additional information about the cards, lists, and forms that help you configure and use Proactive Engagement.

Components installed with Proactive Engagement

Several types of components are installed with activation of the Proactive Engagement application (com.snc.self_remediation_framework), including user roles.

Roles installed with ServiceNow Proactive Engagement

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed with Proactive Engagement

Role title [name]	Contains Roles	Description
sn_pren.solution_provider	sn_pren.issue_registry_template_write	This persona is responsible for creating the Issue registry template, Resolution, and Resolution prompt records.
sn_pren.engagement_admin	sn_pren.issue_registry_write sn_pren.experience_issue_read sn_pren.issue_registry_template_write	• This persona is responsible for deploying the Issue registry templates. • Configuring the engagement settings, notification channels and fallback. • Create a custom resolution and notification for an existing template.

Tables installed

Table	Table name	Description
Proactive engagement provider	sn_pren_provider	Record used to maintain the details of the DEX solution provider such as name and provider code. As of today, we only have Servicenow as the provider.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Table name	Description
Issue Registry Templates	sn_pren_issue_registry_template	This table stores all the end-user issues for which a customer could potentially engage the end-user to self-solve in case of an issue occurrence. Issue registry template records can either come from a third-party DEX/ DEX provider or be created directly by the customer, with a reference to the provider. This table specifies the resolution for the issue and how the end user should be engaged, and it holds descriptive fields for the issue, such as Short Description and Description. Additionally, it contains a Unique Issue Code, which is a combination of the Provider Code and Issue Code, ensuring uniqueness across all template records for a customer.
Issue Registries	sn_pren_issue_registry	This table holds all the issues that the customer has chosen for end-user self-solution. An Issue Registry record is created by deploying the Issue Registry template record. Simply having the Issue Registry template record does not make the issue eligible for self-solving; the Engagement Admin must deploy the template to create the Issue Registry record. The table stores all the configurations deployed by the customer, including details on whether a custom resolution and notification were configured by the customer, engagement settings, notification channel settings, fallback options, and template parity status.
Resolutions	sn_pren_resolution	Record used to store the resolutions configured to be executed when a threshold breach occurs, as per the metric rule configuration. This record could include a self-help instruction with defined steps, a URL with a specified link, a remedial action with a reference to the configured remedial action, or of type incident creation.
Notification content	sn_pren_notification_content	Record used to maintain the notification settings such as notification prompt message and resolution consent prompt
Experience Issues	sn_pren_experience_issue	Experience issue record is created once the engagement is initiated with the end-user. This stores data such as user info, **State** of the resolution execution,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Table name	Description
		end reason state, fallback result (if triggered), investigative details, etc. This record will be the source of truth for any proactive engagement with end-user.
Experience issue alert	sn_pren_experience_issue_m2m_alert	Record used to create a log of the alert that caused experience issue. This is a mapping table between alert and experience issues, with details on count of throttled users and throttling reason.

Resolution for Proactive Engagement

Resolution is information provided to the end user to self-solve the issue, or execute a remedial action on the end user device.

The resolution information is provided to the end user through the following methods:

Resolution Type	Description
Remedial Action	Remedial action triggers an action on the end user device.
Create Incident	Create incident to resolve the issue where ServiceNow Digital End-User Experience will detect the issue based on the metric rule and create an incident with details so the agent can resolve the issue.
Self-help instructions	Set of instructions for the user to follow and resolve the issue.
URL	Link to any page (including KB articles) with details on how to resolve the issue.

Remedial action

Remedial action is a framework. We need to install the remedial action framework to select remedial action as a resolution type.

Remedial action allows you to trigger an action on the end user device. With the user's consent, we share different remedial action types to resolve the issue.

- Execute an action on the end user device. The user can create their own remedial action and refer to the <remedial action framework>.
- If there are any existing Virtual Agent topics, these can be populated as a resolution to the end user.
- When the metric rule criteria is met, a catalog item is displayed for the user to fill and submits.

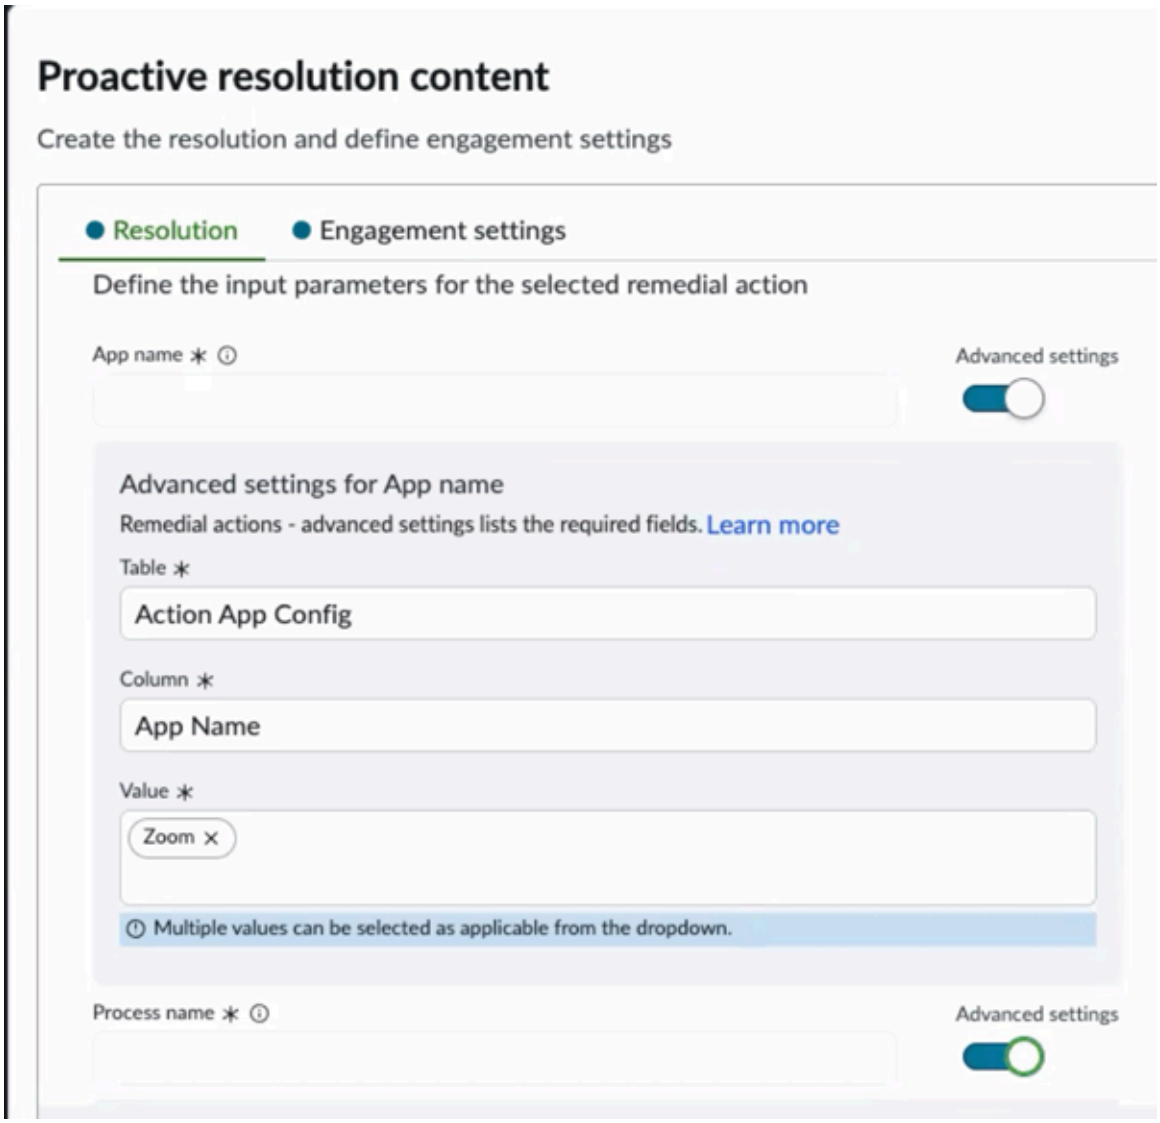
For creating your own remedial action, see Configure the Remedial Actions Framework.

Input parameters for Remedial action in Proactive Engagement

Additional input parameters are listed based on the type of remedial action chosen. Advanced settings for each of those input parameters list the information of the input parameters of the selected remedial action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on the remedial action chosen from the list, specific input parameters are listed which will fetch a static input. To fetch data from the table, enable and configure the advanced settings of the input parameters to capture the data during the run time. Find below the details of all the advanced settings of one of the out-of-the-box remedial action input parameters for Clear application cache. On saving the resolution, we should save parameter information in the `sn_pren_resolution table` remedial_action_parameters field



Input parameter	Description
App name	Name of the application for clearing cache.
Process name	Name of the process that needs to be shut down.
Cache path	Folder path to clear the cache files of the specific application.

Only text, boolean, or choice are the supported format for the input parameters. The Boolean format do not have the advanced configuration option.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Check the alert action of Proactive Engagement to configure the input parameters. Currently, input parameters for remedial action cannot be configured from the Proactive Engagement workbench or the Core UI.

Engagement Settings for Proactive Engagement

It allows you to configure and define how an end user should be engaged to self-solve the issue. Virtual agent is the only notification channel used to engage with the user. As a fallback, an incident can be created or route to a live agent.

Virtual Agent is the only notification channel used to engage with the user. As a fallback, an incident can be created, or user is routed to a live agent. The following field names are displayed in the Engagement settings tab while creating a Proactive Engagement resolution from the metric rules.

Field name	Description	Options
User engagement	Decide if this resolution needs end user engagement or could be executed silently when triggered.	• Engage user • Silent execution (remedial action) • Notification only (self-help instructions and URL).
Engagement channel	Select the channel of engagement. **Note:** Install `com.glide.cs.chatbot` to avail virtual agent as the engagement channel.	Virtual Agent
Notification channel	Channel where the user will be proactively notified. Configure the notification channels from `sn_pren-channel-configuration` from Metric rule triggering Proactive Engagement through alerts. This channel is applicable only if the engagement type is Notification only.	• Virtual Agent • Desktop Assistant • Email Notification
User Notification message	Details the message that should be sent to engage the user.	Custom message Example: Your device is running low on disk space. Would you like help to free up some space?

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Description	Options
Resolution needs consent	Decide if user's consent is needed for the resolution before executing any action on the end-user device. This option is available only for Remedial Action and Create Incident resolution types.	Yes/No
User consent message	Details the message where user consent is required.	Custom message Example: Can we free up some disk space using Windows disk clean-up? This will only clear temp files and recycle bin. Your work will not be affected in any way.
Choose email notification	This option is applicable only when we select self-help instructions or URL and select Email notification as the notification channel. **Note:** Choose email notification is visible only for notification channel Email.	Proactive Engagement notification.
Issue reference name	The issue reference name is used to identify the issue when communicating with the user.	low disk space/disconnected Zscaler
Fallback when self-remediation is not successful.	Select the fallback option that will be triggered when the resolution fails.	Create incident/Route to live agent

These engagement settings are furnished when you configure the metric rule. To configure a new metric rule, see Configuring Proactive Engagement resolutions with DEX.

Limitations in Proactive Engagement

You must be aware of a few limitations when you create a new metric rule and choose the remedial action.

Limitations in Proactive Engagement:

- Remedial action resolution type cannot be used if the remedial actions require any runtime parameters.
- Actionable notifications for LLM will be supported from WP3 and Xanadu. However, In Vancouver, the portal with NLU will get notifications.

© 2026 ServiceNow, Inc. All rights reserved.

Proactive Engagement use cases

This section lists some of the most common use cases in Proactive Engagement that are designed for seamless implementation and quick results. You can deploy these use cases that are tailored to some of the common challenges seen as required by your organization to meet your specific needs.

Use case name	Description	Symptom	Configuration details	Resolution
Low disk space - Disk cleanup using windows disk clean-up	The slow performance of the system is due to insufficient disk space. It can be resolved by freeing up disk space and restoring optimal system performance through **Windows Disk Cleanup** as a remedial action.	• Low performance • Unable to install system updates	• **Configuration Type**: Metric rule • **Threshold condition**: Device disk space is greater than the set threshold. • **OS**: Windows	Clearing unwanted files/ cache using windows disk cleanup • Internet cache files • System error memory dump files • System error mini-dump files • Temporary files • Windows error reporting
Low disk space - self-help instructions to clean up disk space	The slow performance of the system is due to insufficient disk space. It can be resolved by freeing up disk space and restoring optimal system performance through self-help instructions to clean up disk space	• Low performance • Unable to install system updates	• **Configuration Type**: Metric rule • **Threshold condition**: Device disk space is greater than the set threshold. • **OS**: Mac	Provide end users with self-help instructions to clean up disk space.
Poor battery health - Catalog request for battery replacement	The battery performance is low due to a deteriorated battery. This issue can be resolved by raising a battery replacement request with the user consent.	• Fast discharge of the device battery and poor charging rate. • Overheating of the device	• **Configuration Type**: Flow • **Threshold condition**: Battery health status is poor. • **OS**: Mac and Windows	Submit a catalog request to replace the deteriorated battery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case name	Description	Symptom	Configuration details	Resolution
System reboot - Notification to remind system reboot	Notify the user of a required system reboot which is pending over a time period. Device not being rebooted for a long time, causing pending installations to be stalled or applications to run improperly in the background.	• Slow system performance • incomplete software updates	• **Configuration Type**: Metric rule • **Threshold condition**: System up-time is greater than the set threshold. • **OS**: Mac and Windows	Notify the end user to reboot their device.
Disconnected Zscaler - Self-help instructions to connect to Zscaler.	Alert users when the VPN connection remains disconnected for an extended period. To confirm secure access to organization resources and maintain security compliance. These instructions work for any installed VPN application.	Inability to access any application in a secure, private network.	• **Configuration Type**: Metric rule • **Threshold condition**: Zscaler is disabled. • **OS**: Windows	Provide end users with self-help instructions to reconnect to Zscaler.

Problem Management

The ServiceNow® Problem Management application helps you identify the cause of errors in the IT infrastructure that are reported as occurrences of related incidents.

Exploring Problem Management

Problem Management supports the ITIL process used to find and fix the root cause of issues that result in incidents. You can record problems, associate incidents, and assign them to the appropriate groups. You can document and communicate known errors and initiate actions to resolve the situation.

Problem Management is responsible for managing the life cycle of all problems and preventing problems and resulting incidents from happening. It also aims to eliminate recurring incidents and minimize the impact of incidents that can't be prevented. Resolving a problem includes the activities required to diagnose the root cause of incidents and determine the resolution for the problem. Problem resolution and elimination of the root cause often calls for applying a change to the configuration item in the existing IT environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem Management also maintains information about problems and the appropriate workarounds and resolutions, enabling an organization to reduce the number and impact of incidents over time. Problem Management interfaces with Knowledge Management, which is used to document known error articles thoroughly for future reference.

Problem Management workflow

The Problem Management workflow includes the following:

1. Problem Creation: You can create a problem to identify and permanently fix the underlying root cause when:
   - You've resolved a major incident.
   - You have recurring incidents.
2. Assign the problem: You can now assign the problem to be assessed.
3. Assess the problem: You can now assess the problem:
   - Find and relate any additional incidents that the problem represents.
   - If the problem was created from an incident, it has inherited fields from the incident that may not provide a specific description of the issue. In this case, update the **Problem Statement** and other fields to specifically describe this issue to help the team performing the root cause analysis during the later stages.
   - Do any of the following:
     - Confirm that you plan to work on this problem. This confirmation moves the problem to the Root Cause Analysis state.
     - Mark this problem as a duplicate of an existing problem to close the problem.
     - Cancel this problem if it's not a valid problem. Canceling it closes the problem.
4. Analyze the root cause of the problem:
   - If you're the subject matter expert, analyze the problem to uncover the root cause and identify a fix.
   - If you're not the subject matter expert, create a Root Cause Analysis Problem task to assign to the relevant team. Coordinate with that team as they analyze and uncover the root cause and fix.
   - If there's no permanent fix for the problem, or you don't have the sufficient budget to fix the problem at this time, accept the risk that it can't be fixed at this time. The problem enters the Closed state. It's a good idea to review risk-accepted problems periodically.
5. Communicate the outcome of the problem:
   - After you identify the fix or workaround of the problem, update the workaround or fix for the problem. Communicate updates to the related incidents.
   - If the problem is a known error, create a known error article that is primarily available to help others find information and deflect additional incidents. The known error article can also be referred to by agents who are facing similar problems and incidents.
6. Fix the underlying root cause if possible. If you can fix the root cause, create a change request and assign it to the relevant team. When the change request is completed, resolve the problem. If no new incidents come in, close the problem.
7. Reanalyze the problem if it resurfaces. If you're the problem manager and you're not satisfied with the analysis after resolving or closing the problem, or the problem resurfaces, you can decide to reanalyze the problem. The problem is reopened and the state is changed to#Root Cause Analysis.

Problem Management benefits

Benefit	Feature	Users
Create a problem to identify the root cause of the incident.	Create a problem	Agent and Problem write users
Add multiple incidents to a problem to avoid creating multiple problems for incidents that have the same issue.	Add multiple incidents to a problem	Agent
Create a problem task to initiate the root cause analysis.	Create a problem task	Agent, Problem write users, and Problem task analyst
Document and communicate a workaround to restore service failures and lessen the impact of a problem that an actual resolution is not yet available.	Communicate workaround for Problem	Problem Coordinator
Create known error articles as reference material.	Create a known error article	Problem Coordinator
Implement a resolution to a problem by applying a standard change procedure and testing it to confirm service recovery.	Create change request from a problem	Problem Coordinator
Resolve the issue and add detailed notes for the resolution for future reference.	Resolve and complete a problem	Problem Coordinator

Problem Management process

Within the platform, problems are handled using the task record system. Each problem is generated as a task record through various means, and is populated with the pertinent information. These tasks are assigned to Problem Management team members to resolve and then close.

Identify and log problems

A problem can be created in several ways. For detailed information, refer Create a problem.

Associating a problem with a configuration item using CMDB helps the Problem Management team see the affected items and its relationship to other configuration items.

A problem can be associated with one or more incidents in the **Incidents** related list. The association is automatic if the problem is generated from an incident. Associating incidents provides the Problem Management team with access to the information gathered during incident investigation.

Investigate and update problems

If the Problem Management team has a problem model process for dealing with certain problems, they can be added to the system with workflows . Workflows standardize and automate a process.

As a problem is updated, email notifications are sent to concerned parties. If inbound email actions are specified, the problem can be updated via email.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can use the other active tasks icon next to **Configuration item** to look up active problem records. When you click the icon, it shows all active tasks linked to that configuration item.

The platform provides escalations rules to ensure that problems are handled promptly. Two types of escalation rules are available in the system.

- Service level agreements: SLAs can be used to ensure that problems are highlighted. As investigating and fixing a problem could be a long-term effort, it is not recommended that you apply SLAs to an overall problem. SLAs are also used as a performance indicator for the Problem Management team.
- Inactivity monitors : The inactivity monitors prevent problems from being overlooked by generating an event. When a problem has not been updated within a certain amount of time, the event can create an email notification or trigger a script.

Resolve problems

If a problem needs a change request to be resolved, it is possible to request a change that goes through the change management process. After requesting a change, the problem appears on a related list on the Change Request form.

Note:
For Madrid Best Practices: The problem coordinator, whom the Problem is assigned to, is notified when all related change requests are completed or canceled.

The following information applies for London and prior releases:

- A business rule (*SNC - ITIL - Close - related*) automates the process of closing problems in **Pending Change** state when the change request is closed. If the problem is closed, another business rule (*SNC - ITIL - Resolve Related Incidents*) automatically sets the **State** to **Resolved** for all incidents associated with that problem whose **State** was **On Hold** and **On hold reason** was **Awaiting Problem**.
- If the cause of a problem has been determined but there is no permanent fix, change the problem state to **Known Error** to communicate this fact. IT agents can click the Known Errors module and look for the issue they are investigating to reduce time spent on a similar issue. To communicate information related to a problem, you can open the problem and describe a workaround, create a knowledge base article, or create a news item.

Life cycle of a problem

Problem Management is responsible for managing the life cycle of underlying problems. State transition of a problem guides you through the stages of a problem life cycle, from creation to closure.

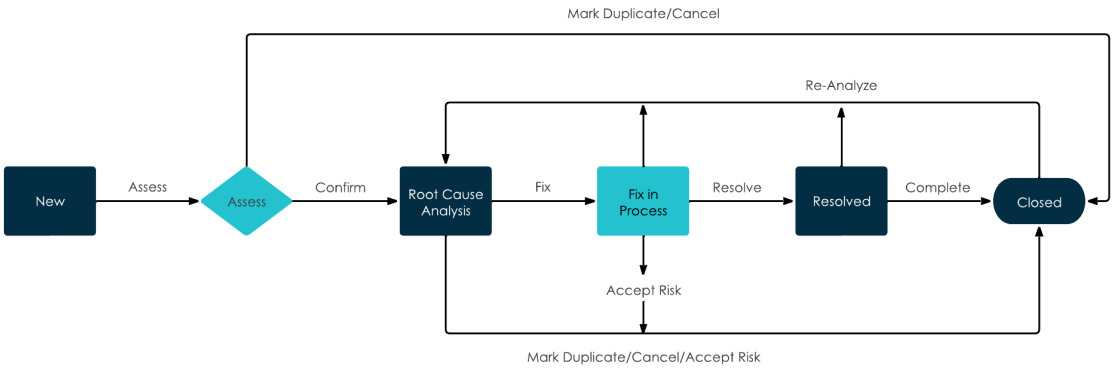
Problem Management has one single goal: Identifying and resolving the underlying issues that cause Incidents. Problem Management is a systematic, methodical process where time to resolution is less important than identifying and resolving the root cause.

Note:
The state-based information is available only in new instances starting from the Madrid release. Activate the Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) plugin. Existing users (London and prior releases) cannot activate this plugin.

The Problem Management process has many states, and each is vitally important to the success of the process and the quality of service delivered. The different states can be represented in a diagram as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem Management state transitions



Note:

Starting with the Xanadu release, you can use Problem Management models to tailor processes for specific use cases. For more information, see Problem Management models.

Life cycle of a problem task

A problem task is the smallest unit of work that you should perform to complete a problem. State transition of a problem task guides you through the stages of a problem task life cycle, from creation to closure.

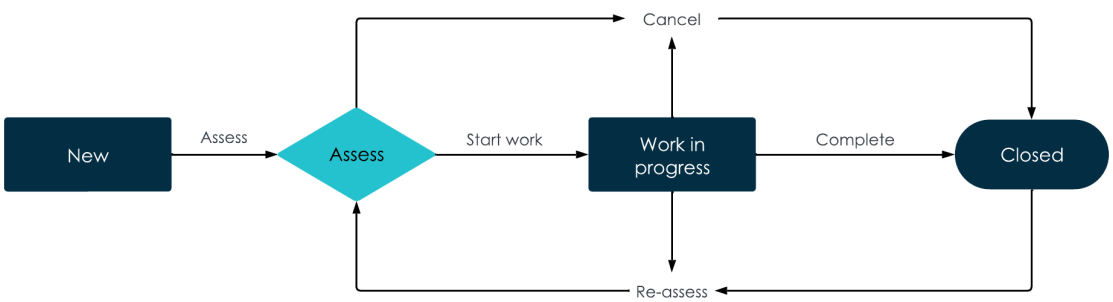
If a problem coordinator requires help to resolve a problem, the coordinator can create and assign problem tasks to assignment groups or users to complete those activities.

Note:
The state-based information is available only in new instances starting from the Madrid release. Activate the Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) plugin. Existing users cannot activate the plugin.

By default, you can create the following types of tasks:

- **Root Cause Analysis**: When you need to investigate the root cause and the resolution for a problem
- **General**: For any other task

Problem task state transitions



Note:

Starting with the Xanadu release, you can use Problem Management models to tailor processes for specific use cases. For more information, see Problem Management models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem Management models

You can use Problem Management models to tailor processes for specific use cases.

You can create custom models for problems and problem tasks to extend their default models without compromising on existing capabilities. To use these capabilities, enable the *com.snc.problem_management.models.enabled* system property introduced in the Xanadu release. Enabling Problem Management models is optional.

Problem Management models enable you to define:

- States for specific use cases
- State transitions
- State transition conditions

The following default models are provided to replicate the non-model versions included as part of the base problem life cycle. The base problem life cycle is included with the Problem Management#Best Practice - Madrid - State Model (com.snc.best_practice.problem.madrid.state_model) plugin. Use the Problem Management Migration Utility store application to enable this plugin and migrate your records to the base problem life cycle.

Problem model

Model	Description
General	Problem process equivalent to the non-model base problem life cycle.

Problem task models

Model	Description
Root cause analysis	Task process equivalent to the non-model base problem life cycle.
General	Task process equivalent to the non-model base problem life cycle.

Enabling Problem Management models

Test Problem Management models in a non-production instance first. If you have changed the base problem life cycle or life cycle actions, you must make the equivalent changes to your custom models.

To begin working with custom models, see the following topics:

- Enable Problem Management models
- Create a problem model
- Create a problem task model

Note:
Any problems or problem tasks that were created before you enable Problem Management models will continue to use the non-model life cycle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Disabling Problem Management models

Before disabling Problem Management models, you must apply any additional features you have added through custom Problem Management models to your non-model life cycle.

Considerations for Problem Management models and Service Operations Workspace

Service Operations Workspace 6.x is based on the Xanadu release and it supports Problem Management models.

Service Operations Workspace 5.x is based on the Washington DC release and it doesn't support Problem Management models.

If you are using Service Operations Workspace 5.x and you enable Problem Management models, you will manage problems and problem tasks in the classic UI16 experience, rather than in Service Operations Workspace.

Configuring Problem Management

Create or redesign problem form layouts to align them with the business process workflow of your organization. Categorize problems for monitoring and reporting. Use data lookup and assignment rules to automatically assign a task to a user or group based on predefined conditions.

Note:

- Use data lookup and assignment rules to automatically assign a task to a user or group based on predefined conditions. For more information, see Data lookup for prioritizing problems.
- Configure the Problem Management properties to control features such as creating a problem task on a closed problem and reanalyzing a closed or canceled problem. For more information, see Problem management properties.
- Use quick start tests to check if the Problem Management application still works after you make any configuration change such as applying an upgrade or developing an application. For more information, see Quick start tests for Problem Management.

Migration Utility

The Problem Management Migration Utility, available in the ServiceNow® Store, is a guided setup application that helps you upgrade to adopt the base version of Problem Management using the guided problem life cycle.

Important:

- You only need to use the migration utility if you started using ServiceNow before the Madrid release and you want to adopt the guided problem life cycle, as that was included for new customers starting from Madrid.
- If you run into issues or need additional help with resolving your modifications, contact your ServiceNow Account Representative or ServiceNow Solution Consultant. You might need help from ServiceNow Customer Outcomes or a partner.

The migration utility consists of several guided activities:

Introduction

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Describes the purpose of the Problem Management Best Practice State Model plugin and the migration utility. This activity also confirms that you have practiced or are practicing on a sub-production instance that is a clone of the production instance.

Preparation

Helps you prepare for your migration, including optional scenarios if you want to remove all of your existing problem and problem task records.

Migrate

Guides you through the Migration job.

Clean-up

The guided setup activity guides you through the manual clean-up activities after you have completed the main migration.

Introducing activities for migration

The Introduction activity helps you to understand the purpose of the migration utility.

The activity helps you understand the Problem Management Best Practice State Model plugin and the new problem and task states. This activity also confirms that you have practiced or are practicing on a sub-production instance that is a clone of the production instance.

Preparing for migration

You can prepare your instance for migration before you start the migration activity.

Before you start the migration activity, if you want to optionally remove all of your problem records or all of your problem task records, take a backup of the records first before you remove them.

Migration job

Get your instance ready for the Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model) and so you can update your existing records with the new states.

The stages to get your instance ready for the problem state model and to migrate your records are:

1. Resolve blocking modifications
2. Review warning modifications
3. Map problem states
4. Map problem task states
5. Activate Problem Management Best Practice — Madrid — State Model
6. Prepare base plugins
7. Restore base plugins
8. Resolve blocking and warning modifications
9. Migrate active records
10. Migrate inactive records

Resolve blocking modifications

Blocking modifications that are detected in your instance are not compatible with the problem state model and you must resolve them before you activate the Problem Management Best Practice — Madrid — State Model plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Review and resolve all blocking modifications.
   For more information about modifications that block the problem state model plugin from being activated, see the KB0819060 article in the HI Knowledge Base.
2. Click **Run Checks**.

What to do next
Review warning modifications.

Review warning modifications

Warning modifications do not block the Problem Management Best Practice — Madrid — State Model plugin from being activated.

Before you begin
Role required: admin

About this task
For more information about warning and informational modifications and how to resolve them, see the Problem Management Migration Utility - How to resolve detected modifications [KB0819196] article in the HI Knowledge Base.

Procedure

1. Review and resolve all warning modifications.
   Warning modifications, though initially are not blocking, can become blocking when you activate the problem state model plugin. You must resolve them before you can migrate your records.
2. View informational modifications.

   Informational modifications provide information about only the changes that you have made that do not impact the migration.
3. If you resolved any warnings, click **Run Checks**.
4. Click **Next**.

What to do next
Map problem states.

Map problem states

Define how problem records are updated when you migrate the records.

Before you begin
Role required: admin

Procedure

1. Provide information for all the mandatory fields at this stage.
   The required field values are used when you apply new states to the existing problem records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The **Assigned to** field is used when the new state is beyond **101 - New** and the problem is not already assigned to a user.
- If you have activated the problem state model plugin, the **Assigned to** field is filtered to users with the problem_coordinator, problem_manager or problem_admin role.
- The ${current.state} variable is replaced with the current state value and label.

2. Map all current problem states to the new states.
   The following table provides an example of state mapping for the base system version of the problem records:

Mapping of the current states to the new states

Current state	New state
1 - Open	101 - New
2 - Known Error	107 - Closed as Risk Accepted
3 - Pending Change	104 - Fix in Progress
4 - Closed/Resolved	107 - Closed as Fix Applied

3. Click **Detect Unmapped States** to verify whether any state is not mapped.
   If any state is not mapped, you must provide a mapping.

What to do next

Map problem task states.

Map problem task states

Define how problem task records are updated when you migrate the records.

Before you begin

Role required: admin

Procedure

1. Provide the information for the mandatory fields at this stage.
   The mandatory field values are used when you apply new states to the existing problem task records.

Note:

- The **Assigned to** field is used when the new state is beyond **151 - New** and the problem task is not already assigned to a user.
- If you have activated the problem state model plugin, you can assign only users with the problem_task_analyst, problem_coordinator, problem_manager or problem_admin role.
- The ${current.state} variable is replaced with the current state value and label.

2. Map all current problem task states to the new states.
   The following table provides an example of state mapping for the base system version of the problem task records:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mapping of the current states to the new states

Current state	New state
-5 - Pending	151 - New
1 - Open	151 - New
2 - Work in Progress	154 - Work in Progress
3 - Closed Complete	157 - Closed as Complete
4 - Closed Incomplete	157 - Closed as Canceled
7 - Closed Skipped	157 - Closed as Canceled

3. Click **Detect Unmapped States** to verify whether any state is not mapped.
   If any state is not mapped, you must provide a mapping.

What to do next

Activate Problem Management Best Practice — Madrid — State Model.

Activate Problem Management Best Practice — Madrid — State Model

You can activate the Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model) on your instance using the Problem Management Migration Utility store app.

Before you begin

Before you activate the plugin, be sure to resolve blocking modifications. For more information, see Resolve blocking modifications.

Role required: admin

About this task

An administrator must activate the Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model) (first introduced in the Madrid release) through the Migration Utility because the plugin includes features that are not compatible with the previous version of Problem Management.

New York Patch 9 or Orlando Patch 3 or later are required before the administrator can see and activate the problem state model plugin on an instance. If you do not have the required patch, you have to request the plugin as it is a development plugin.

Procedure

1. Activate the plugin.
   If you have the required patch level, you have access to the plugin and can activate it. If you do not have the patch level, you must request it.

Option	Description
Activate the plugin (required patch level is installed)	**a.** Click **Request Plugin** in the plugin activa tion stage of the migration utility migration job. **b.** On the System Plugin page, click the **Acti vate/Repair** related link. **c.** Click **Activate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	d. Close and reload the form. The plugin status changes to **Activated**. You can return to the Migration Utility and continue with the migration.
Request the plugin	**a.** Click **Request Plugin** in the plugin activa tion stage of the migration utility migration job. **b.** On the page, provide the required details. ▪ Target instance: Instance on which to re quest the plugin ▪ Plugin Name: `com.snc.best_prac tice.problem.madrid.state_ model` ▪ Reason/Comments: `Request from the Problem Management Migra tion Utility` ▪ Select Maintenance Start Time: Select your preferred start time **c.** Click **Submit**. **d.** Once the plugin is activated, return to the Migration Utility and continue with the mi gration.

2. Continue with the migration process.

What to do next

Prepare base plugins.

Prepare base plugins

Prepare to restore the base functionality that is required for the problem state model you have modified.

Before you begin

Role required: admin

About this task

Note:
You cannot move back to any earlier stage because in the previous stage you activated the Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model) on this instance and the old states are invalid.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Resolve blocking modifications.
   a. For each blocking modification, click **View Modification**.
   b. Select the **Replace on upgrade** check box.

      Note:
      If this option is not available, add the **Replace on update** field to the form using **Configure** > **Form Layout**.

   c. Click **Update**.
   d. Click **Back**.
2. Click **Run Checks**.

What to do next

Restore base plugins.

Restore base plugins

Repair the plugins in the specified order to restore the base functionality that is required for the problem state model.

Before you begin

Role required: admin

About this task

New York Patch 9, or Orlando Patch 3 or later are required before you can see and repair the Problem Management Best Practice – Jakarta (com.snc.best_practice.problem.jakarta) and Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) plugins. Before the mentioned patches, these plugins were development plugins.

Note:
If you do not have the required patch, refer to Blocking modifications for required base functionality in the KB0819196 article in the HI Knowledge Base.

Procedure

1. Repair the plugins, one at a time.
   a. Repair the plugin or apply the update set as required.

      Note:
      Certain plugins contain functionality for applications including Problem Management. For those plugins, refer to the specified knowledge article to restore the required problem functionality instead of repairing the plugin.

   b. Return to the migration job and mark that plugin as repaired.
2. Click **Run Checks**.

What to do next

Resolve blocking and warning modifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolve blocking and warning modifications

Resolve any blocking modifications and resolve or verify any warning modifications that are detected on your instance.

Before you begin
Role required: admin

About this task
For more information about blocking, warning, and informational modifications and how to resolve them, see the Problem Management Migration Utility - How to resolve detected modifications [KB0819196] article in the HI Knowledge Base.

Procedure

1. Review and resolve all blocking modifications.
2. Review and resolve or verify warning modifications.
3. **Optional:** View informational modifications.
4. Click **Run Checks** after you have resolved all blocking modifications and you have either resolved or verified the warning modifications.

What to do next
Migrate active records.

Migrate active records

Migrate active records to apply the new mappings to your active problem and problem task records.

Before you begin
Role required: admin

Procedure

Click **Migrate Active Records**.

If there are no active records to migrate, the migration job moves to the migrate inactive records stage.

Note:
Even if you close the migration window or navigate away from the migration job, the migration of records continues. If you click **Migrate Active Records**, the migration window displays the current progress.

If any record fails to migrate, it is listed in one of the related lists:

- Failed Active Problem Updates
- Failed Active Problem Task Updates

Verify the reason for their failure, resolve it, and migrate the records again.

What to do next
Migrate inactive records.

Migrate inactive records

Migrate inactive records to apply the new mappings to all the remaining problem and problem task records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

Click **Migrate Inactive Records**.

If there are no inactive records to migrate, the migration job moves to the migrated stage.

> **Note:**
> Even if you close the migration window or navigate away from the migration job, the migration of records continues. If you click **Migrate Inactive Records**, the migration window displays the current progress.

If any record fails to migrate, it is listed in one of the related lists:

- Failed Inactive Problem Updates
- Failed Inactive Problem Task Updates

Verify the reason for their failure, resolve it, and migrate the records again.

What to do next
View the Migrated topic.

Migrated

You have successfully activated the Problem Management Best Practice - Madrid - State Model plugin and updated your problem and problem task records to the new best practice states.

Before you begin
Role required: admin

Procedure

1. **Optional:** View the records after migration in the related links.
   The records are listed in one of the following related lists:
   - Problems by State
   - Problem Tasks by State
2. **Optional:** If any record failed to migrate, verify the reason for the failure, resolve it, and migrate the records again.
   The failed records are listed in one of the following related lists:
   - Failed Active Problem Updates
   - Failed Active Problem Task Updates
   - Failed Inactive Problem Updates
   - Failed Inactive Problem Task Updates
3. Click **Finish** to return to guided setup to perform the clean-up tasks.

Modifications

A modification is any alteration such as addition, deletion, or update that you carry out on Problem Management. If you have made significant modifications, you will need to review and resolve some possible blocking modifications.

For more information on modifications, see the following KB articles:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For more information about modifications that block the problem state model plugin from being activated, see the KB0819060 article in the HI Knowledge Base.
- For more information about other types of modification and how to resolve them, see the Problem Management Migration Utility - How to resolve detected modifications [KB0819196] article in the HI Knowledge Base.

Activities to clean up after migration

After you complete your main migration, you must do some manual clean-up to make your instance similar to the base version of problem management.

Manual clean-up involves the following activities:

- Reactivate problem state models
- Remove old module menus
- Remove old filters
- Remove old UI actions
- Remove old business rules
- Remove old UI policies
- Update the dashboard overview
- Reset problem form layouts

> **Note:**
> You can skip this action if you have not modified your form.

- Search for problems from incidents
- Remove old process fromatters

Update dashboard overview

When you activate the problem state model, you need to update the overview dashboard to use the new states.

Before you begin

Role required: admin

About this task

In the problem overview dashboard, refer to the closed problems by setting Active = false instead of state = 4.

> **Note:**
> If you have added your own custom dashboards or charts, you may need to manually update them as you have migrated to the problem state model.

Procedure

1. If you are prompted with the message `To edit this record click here`, then click **here**.
2. Click the configuration icon ( ).
3. Hover your mouse on **Problems Closed per Week** chart to view and select the Edit Content menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the filter to open the condition builder and update the condition from **Problem state** is **4** to **Active** is **false**.
5. Click **Run**.
6. Click **Save**.
7. Click **Back** to return to the dashboard.

Problem Management plugins

Many of the Problem Management plugins are activated in the base system. Others, you can activate when you are ready to use them. Some plugins include demo data.

Activate Problem Management

You can activate the Problem Management plugin (com.snc.problem) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

The Problem Management plugin activates these related plugins if they are not already active.

Plugins for Problem Management

Plugin	Description
Problem Overview Homepage [com.glideapp.report.itsm.problem.overview]	This plugin delivers content for Problem Overview home page.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears:
   `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Table	Description
Problem [problem]	The Problem table is extended from the Task [task] table. It inherits all the fields, rules and policies from task.

Activate Problem Management Best Practice — Jakarta

The Problem Management Best Practice - Jakarta plugin introduces lookups (impact, urgency and priority) for Problem Management.

Before you begin

Role required: admin

About this task

Important:
Do not activate this plugin if you have upgraded from a pre-Jakarta release.

If you have modified the base functionality required for the Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model), use the Migration Utility to repair the plugin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Request ITSM Roles — Problem Management

Request the ITSM Roles plugin (com.snc.itsm.roles) to activate the ITSM Roles — Problem Management plugin (com.snc.itsm.roles.problem_management) to gain more control over the access that different service desk agents, technicians, and managers have within your Problem Management process.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

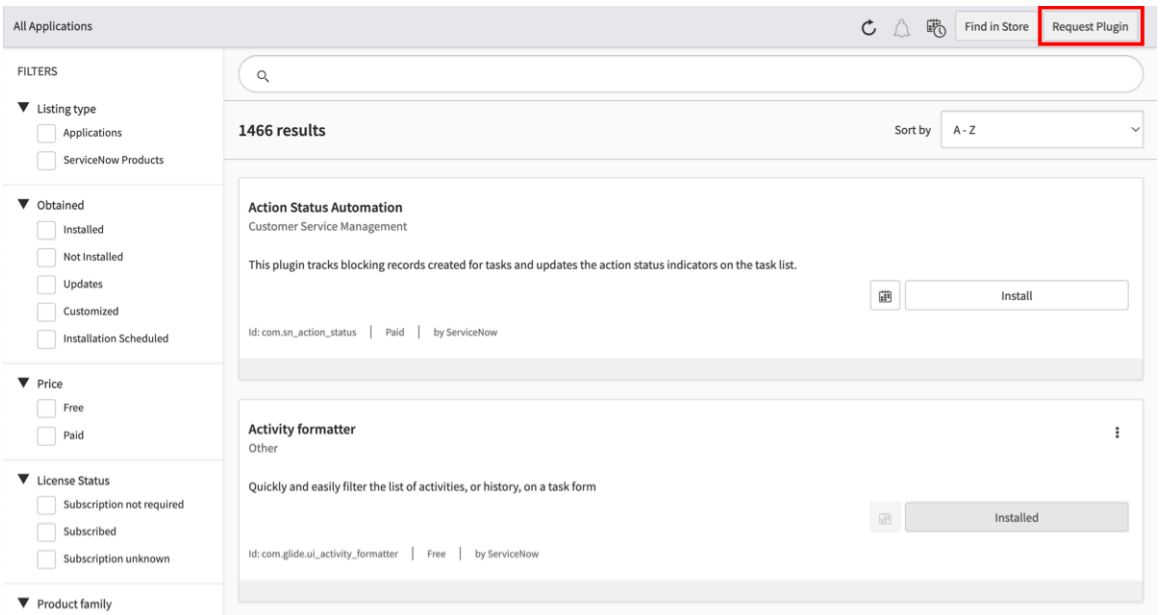
About this task

The ITSM Roles plugin activates several related plugins such as Business Stakeholder (com.snc_business_stakeholder), ITSM Roles — Incident Management (com.snc.itsm.roles.incident_management), ITSM Roles — Problem Management (com.snc.itsm.roles.problem_management), ITSM Roles — Change Management (com.snc.itsm.roles.change_management), and ITSM Roles — Request Management (com.snc.service_management.roles.request_management). The related plugins updates the security model and introduces roles for respective products.

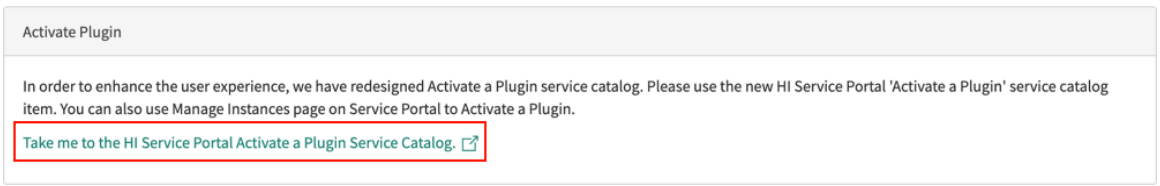
With the introduction of the new roles, ITSM provides more control over the access that users have within the process.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Problem read [sn_problem_read]	Read access to the Problem Management application and related records.	NA
Problem write [sn_problem_write]	Write access to the Problem Management application and related records.	• sn_problem_read • template_editor

Activate Problem Management Best Practice — Madrid

Activate the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

The Problem Management Best Practice — Madrid plugin identifies the cause of a service interruption reported by a significant or recurring incidents. The plugin does the following activities:

- Provides roles for problem management including a problem task analyst, a problem coordinator, a problem manager, and a problem administrator.
- Provides fields to record the category where the issue was first reported, the workaround, the cause notes, and the fix notes.
- Searches for and attaches knowledge articles.
- Communicates when a workaround or fix is available.
- Clears the **Assigned to** field when changing the **Assignment Group**.

Note:
The plugin is activated by default for the new customers. Existing customers need to request the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Problem Management Best Practice — Madrid — State Model

The Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model) introduces new best practice states and guided actions to navigate the life cycle of a problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The new best practice states are not compatible with the previous version of Problem Management and require verification before this plugin can be activated. The plugin is activated by default for the new customers.

Existing customers should use the Migration Utility to verify and migrate to this plugin.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Problem Management Best Practice — Madrid — Knowledge Integration

Activate the Problem Management Best Practice — Madrid — Knowledge Integration (com.snc.best_practice.problem.madrid.knowledge) plugin if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
The Problem Management Best Practice — Madrid – Knowledge Integration plugin (com.snc.best_practice.problem.madrid.knowledge) helps you to create known error articles to help with incident deflection. The plugin helps in the following activities:

- Creating a known error article from a problem.
- Creating a knowledge base for known error articles.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Configure the problem form

Configure the problem form layout to conform to the workflow and the process of your organization. Add, remove, and customize fields and related lists, create problem categories, and modify links as needed.

Before you begin

Role required: admin

About this task

The Problem form in the base system is configured to follow recommended ITIL practices. Evaluate the form layout and design with your existing business processes, and plan the changes to make.
For additional form customization not described in this page, such as adding company-specific annotations or configuring related lists, see Form administration and Configuring the form layout.

By default, auditing is enabled for the problem table. The administrator can configure the form layout to add the Audit Records and Audit History related lists. For more information about options for auditing a table, see Enable auditing for a table.

Procedure

Navigate to **Problem** > **Create New**.
Some of the following configuration activities are not accessed from within the problem form. These activities are noted in the procedure.

Configure the problem form layout

Configure the problem form so the information it collects is relevant to your organization's processes. You can easily modify the form to show only the fields, related lists, and other elements that you need.

Before you begin

Role required: personalize_form

Procedure

1. Navigate to **All** > **Problem** > **Create New**.
2. In the problem form context menu, select **Configure** > **Form Layout**.
3. Follow the steps in Configuring the form layout to perform any of the following layout modifications.
   Some of these modifications are illustrated in the example.
   - Show or hide fields on a form.
   - Add a related list to a form.

     The **Incidents** and **Problem Tasks** related lists appear by default. Review the available related lists and select appropriate lists. For example, if you enable auditing for the Problem table, add the **Audit History** related list.
   - Add an annotation to a form.
   - Create a form section.

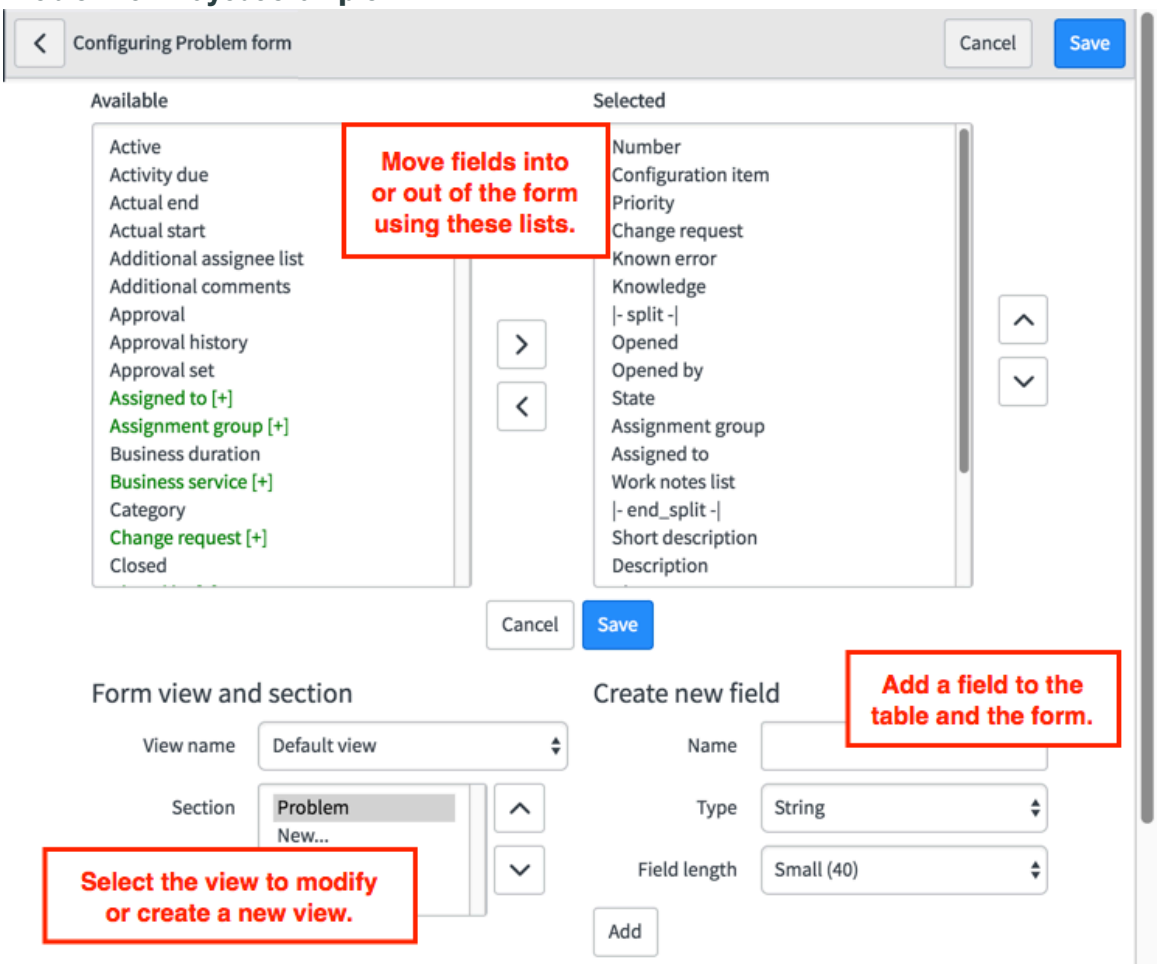
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Embed a list within a form.

  This activity allows the embedded list to be used like any other element on the form. In addition, technicians can create records in the list view. Changes made to the contents of the embedded list are saved when the form is saved.

Note:
There are other activities described in the form layout topic, but the items listed here are commonly configured during initial setup.

Problem form layout example



Add a field in the assess mandatory field dialog

Add the mandatory fields necessary to move a problem or a problem task record from the **New** state to the **Assess** state in the assess dialog form. If you miss filling any of the fields, you can always fill those in the assess dialog form.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Form Sections**.
2. Search and open **Assess Dialog Form View** or **PTASK Assess Dialog View** for problem record or problem task record respectively.
3. Click the **Form Sections** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click problem or problem_task from the list for problem record or problem task record respectively.
5. Click the **Section Elements** tab.
6. Click **New**.
7. On the form, fill in the fields.

Section Element form

Field	Description
Element	Name of the field that you want in the assess dialog form.
Position	Position of the field in the assess dialog form.
Type	Type of the element that you want to enter in the form such as an element or a split.
Sys UI section	Name of the UI section under which the element appears.
Sys UI formatter	Name of the formatter that is used to display information. **Note:** The formatter information is not the value of any field.

8. Click **Submit**.

Redesign the problem form

The form designer allows you to customize elements in the problem form to create different form views, display a field navigator, or provide field properties.

Before you begin
Role required: admin

About this task
Form design is an alternative to configuring forms that combines several configuration options into one tool. You can make and save changes, then return to the browser tab with the open problem form and reload the form to test your changes. Using the form designer lets you try out the changes you want to make for the best result.

Procedure

1. In the form context menu, select **Configure** > **Form Design** to open the form designer in a new browser tab.
2. Follow the directions in Form design to customize elements in the problem form.

Configure problem categories

Configure problem categories to provide a refined way of monitoring and reporting problems. Add to or remove category and subcategory choices from the list of problem categories or subcategories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

Follow the steps in Define an option for a choice list to enter your problem categories.

Define an assignment rule for problems

After a problem is logged, it must be assigned to the appropriate group or individual to handle the problem. You can define assignment rules to automate the assignment process.

Before you begin
Role required: assignment_rule_admin or admin

About this task
Some assignment rules are predefined for Problem Management. Review the predefined assignment rules, and verify that the problem assignment rules you want to use are active. For example, the **Network Problem** assignment rule looks at the configuration item class for network problems and assigns the problem to the **Network** group.

In this procedure, define an assignment rule to assign database problems to the **Database** group. It is just an example to let you know how to define an assignment rule. The **Database Problem** assignment rule is already available in the base system.

Procedure

1. Navigate to **All** > **System Policy** > **Assignment** and click **New**.
2. Complete the form using the following information.
   - **Name**: `Database Problems`
   - **Applies To** tab or section:
     - **Table**: Problem [problem]
     - **Conditions**: Dot-walk to **[Configuration Item.Class] [is] [Database]**.
   - **Group** in the **Assign To** tab or section: **Database**
3. Click **Submit**.
4. Test the assignment rule by completing the following steps.
   a. Navigate to **Problem** > **Create New**.
   b. Complete the problem form and select a configuration item with a class of **Database**.
   c. Click **Submit**.
   d. Open the problem and verify that the assignment group was added.

Categorize a problem as a major problem

You can prioritize a problem and highlight that it needs a review.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

- If the Problem Management Best Practice – Madrid plugin (com.snc.best_practice.problem.madrid) is activated, configure the Problem form to include the **Major problem** check box and add the **Major problem review** field to the **Resolution Information** tab.
- If the Problem Management Best Practice – Madrid plugin (com.snc.best_practice.problem.madrid) is not activated, add the **Review outcome** field to the **Closure Information** tab.

Procedure

1. Open a Problem record to categorize it as a major problem.
2. Select the **Major problem** check box.
   The **Work notes** field is mandatory. Either the **Major problem review** field is displayed in the **Resolution Information** tab, or the **Review outcome** field is displayed in the **Closure Information** section.
3. Fill out the **Review outcome** field to document review results and lessons learned.
4. Click **Update**.

Enable Problem Management models

Enable the Problem Management models system property so that you can create and use custom models.

Before you begin

See considerations for enabling and disabling Problem Management models at Problem Management models.

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. From the Name column, search for `*models`.
3. Select the *`com.snc.problem_management.models.enabled`* system property.
4. Set the **Value** field to **True**.
5. Select **Update**.

Result

Problem Management models are enabled.

Create a problem model

Create custom Problem Management models with states and transitions tailored to your use cases.

Before you begin

See considerations for enabling Problem Management models at Problem Management models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enable the system property *com.snc.problem_management.models.enabled*. For more information, see Enable Problem Management models.

Role required: admin

Procedure

1. Open the Problem Models table in one of the following ways.
   - In the navigation filter, enter `prb_model.list`.
   - Navigate to **All** > **Problem** > **Administration** > **Problem Models**.

   Note:
   For more information about enabling menu items for Problem Management models, see Enable or disable an application menu or module.

   a. Select **New**.

   b. On the Problem Model form, fill in the fields.

   For more information, see Problem model form.

2. Choose the states for your custom model by selecting **Save** from the form context menu icon ( ).

   a. From the Model States context menu that appears, select **New**.

   b. On the Model State form, fill in the fields.

Model State form

Field	Description
State	State that you want to include in your model.
Initial state	Option to enable this state as the initial state for your model. This field is automatically selected when you add the first state to your model.

   c. Select **Submit** for each state you choose.

3. Apply a transition to each model state by selecting the display/hide hierarchical lists icon ( ).

   a. From the Model State Transitions context menu, select **New**.

   b. On the Model State Transitions form, fill in the fields.

Model State Transition form

Field	Description
From	State that the problem record is moving from.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
To	State that the problem record is moving to.
Automatic transition	Option for enabling automatic transition to the problem record when the defined conditions are met. Selecting this option also prevents you from manually selecting the **State** field on the problem record.

c. Select **Submit** for each model state transition that you add.

4. **Optional:** Apply transition conditions by selecting any of your model state transitions.

a. From the Transition Conditions context menu, select **New**.

b. On the Model State Transition Condition form, fill in the fields.

(Optional) For more information, see Problem Management model state transition condition form.

c. Select **Submit** for each transition condition you add.

Result

If you selected the **Default problem model** option in the Problem Model form, your custom problem model is used when new problems are created.

Create a problem task model

Create custom Problem Management models with states and transitions tailored to your use cases.

Before you begin

See considerations for enabling Problem Management models at Problem Management models.

Enable the system property *com.snc.problem_management.models.enabled*. For more information, see Enable Problem Management models.

Role required: admin

Procedure

1. Open the Problem Task Models table in one of the following ways.
   - In the navigation filter, enter `prb_task_model.list`.
   - Navigate to **All** > **Problem** > **Administration** > **Problem Task Models**.

> **Note:**
> For more information about enabling menu items for Problem Management models, see Enable or disable an application menu or module.

a. Select **New**.

b. Save the sys_id for creating an interceptor (as described in later steps) by selecting **Copy sys_id** from the form context menu icon ( ).

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) For more information, see Problem Management model state transition condition form.

c. Select **Submit** for each transition condition you add.

5. Create an interceptor for your model by navigating to **All** > **System Definition** > **Interceptors**.

a. From the Name column, search for `*models`.

b. Select **Problem Task Models** from the list.

c. From the interceptor list for problem task models, select **New**.

d. Select **Simple question to redirect the URL**.

e. On the Interceptor Answer form, fill in the fields.

Interceptor Answer form

Field	Description
Name	Unique name for the intercept.
Order	Order in which the associated model is displayed.
Active	Option to make the intercept active.
User Prompt	Name of the model that your user sees.
Roles	Option to define the roles to select the problem task model.

Note:
In the **Target URL** field, specify your model's sys_id in the following format:

`problem_task.do?sys_id=-1&sysparm_query=prb_task_model=[sys_id]`.

f. Select **Submit**.

Result
Your custom problem task model is available as a choice for the roles specified in your interceptor.

Managing Problems

Understand how Problem and Problem task is created, assessed, investigated, and fixed in a Problem or Problem task states.

Create a problem

A problem is a cause of one or more incidents. Create a problem to identify the root cause of the incidents and try to prevent them from happening again.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: itil, sn_problem_write, admin, problem_admin, problem_manager, or problem_coordinator

If you do not have Problem Management Best Practice — Madrid plugin (com.snc.best_practice.problem.madrid) activated, see Create a problem (legacy).

About this task

- You can generate a problem record manually from the problem module.
- You can generate a problem from an incident.
- You can create a record producer to log problems from the service catalog.
- You can also generate a problem from an email when an appropriate inbound email action is configured.

Procedure

1. Create the problem with one of these options.

Option	Description
From the Problem module	Navigate to **Problem** > **Create New**.
From an incident	**a.** Open the incident. **b.** On the context menu, click **Create Problem**. **Note:** Use the property **List of attributes (comma-separated) that will be copied from the incident to create a new problem** (*com.snc.problem.create_from_incident.at* to specify fields on the Incident form. The values of these fields are copied to the respective fields on the Problem form.

2. On the Problem form, fill in the fields.
   For a description of the field values, see Problem form
3. Click **Submit**.
   The problem enters the **New** state. If you have filled the mandatory fields that are necessary to move a problem record to the **Assess** state, the problem record directly moves to the **Assess** state. If you want to add any additional field for the assess state, you must add the field at

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System UI > **Form Sections**. For more information, refer Add a field in the assess mandatory field dialog.

Note:

When an incident is promoted as major incident, a problem record is created automatically if the following conditions are met:

- The incident does not have a problem record associated with it.
- Major Incident Management is installed along with problem management.
- The Problem Management Best Practice – Madrid plugin (com.snc.best_practice.problem.madrid) and Incident Management - Major Incident Management plugin (com.snc.incident.mim) must be active.
- You must activate **Create Problem from Major incident** flow, which is inactive when shipped in base system.

To configure the incident field information which must be copied to problem record, activate the **List of Attributes (comma-seperated) that will be copied from the incident to create a new problem** (com.snc.problem.create_from_incident.attributes) property.

You can copy attachments and knowledge articles if the Problem Management Best Practice – Madrid plugin (com.snc.best_practice.problem.madrid) is active and **com.snc.problem.create_from_incident.copy_attachments** property is true.

What to do next
Assess the problem.

Create a problem (legacy)

A problem is a cause of one or more incidents. Create a problem to identify the root cause of the incidents and try to prevent them from happening again.

Before you begin
Role required: itil

Procedure

1. Create the problem with one of these options.

Option	Description
From the Problem module	Navigate to **Problem** > **Create New**.
From an incident	**a.** Open the incident. **b.** On the context menu, click **Create Problem**.

2. Complete the form, as appropriate.
   For a description of the field values, see Legacy Problem form.
3. To enter work notes for the problem, click the **Notes** tab.
   When you initially create and save a problem, entering notes in the **Work notes** field is not mandatory. If you change the priority of the problem by selecting different **Impact** or **Urgency** values on an existing problem, the **Work notes** field becomes mandatory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

4. To enter notes on why the problem is closed, click the **Closure Information** tab and enter the information.
   The date on which the problem was closed and the user who closed it populate automatically.
5. Click **Submit**.

What to do next
Assess the problem.

Assess a problem

Assess a problem to determine whether the problem requires a thorough investigation.

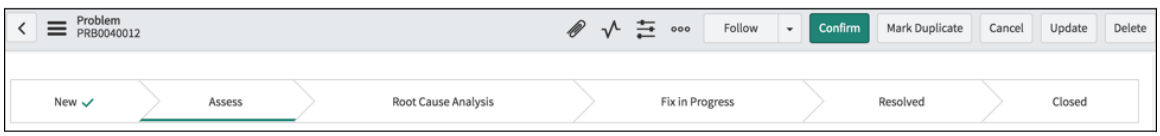
Before you begin

- Role required: admin, problem_admin, problem_manager, or problem_coordinator
- Activate the Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) to get the new best practice states and guided actions to navigate the lifecycle of a problem. For details, see Activate Problem Management Best Practice — Madrid — State Model.

About this task
Assessing a problem involves analyzing the scale and extent of the problem, as well as its cause and effect.

Procedure

Click **Assess** and fill the mandatory fields.



After assessing the problem, you can perform any one of the following actions:

What to do next
After you confirm that the problem needs investigation and a resolution, the problem enters the **Root Cause Analysis** state.

Add multiple incidents to a problem

Add multiple incidents to a problem to avoid creating multiple problems for incidents that have the same issue.

Before you begin
Role required: itil, admin, problem_admin, problem_coordinator or problem_manager

About this task
The topic applies to problems where you've activated the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open a problem record.
3. In the related list, click the **Incidents** tab.
4. Click **Add**.
5. From the list, you can add incidents in the following ways.
   - Select the incident records and select **Add Selected**.
   - Select **Add All**.

Result

The selected incidents appear under the **Incidents** tab.

Extension point for Problem Management

Extension points enable you to extend the functionality of an application and integrate customizations without altering the application code.

`global.MRABulkAddRecordsFilter` is a generic extension point that you can use to attach associated records. You can add its implementation to use a multi-record associator for attaching the records.

Navigate to **All** > **Scripted Extension Points** to add `global.MRABulkAddRecordsFilter` to the Extension Point [sys_extension_point] table.

Note:
If you've already created implementations using the old extension point `global.BulkAddIncidentsFilter` in previous releases, you can still use that extension point for your existing customized implementations. But in the future, the `global.BulkAddIncidentsFilter` extension point will be deprecated. You're encouraged to migrate your implementation to the `global.MRABulkAddRecordsFilter` the extension point. If you're creating implementations, use the extension point `global.MRABulkAddRecordsFilter` for adding one or multiple incident records to a problem.

Associate CIs with Problem

Associate multiple affected or impacted configuration items (CIs) to a problem to find out all the CIs that are affected by the same problem.

Before you begin

Role required: itil, sn_problem_write, admin, problem_admin, problem_coordinator or problem_manager

About this task

Use the **Configuration Item** field when there is a single, primary CI that is the cause of the problem and the **Affected CIs** or the **Impacted Services/CIs** related list when multiple CIs are affected by the problem.

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open the problem record to which you want to associate CI items.
3. Perform the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate CI items

Options	Procedures
Configuration item	**a.** Click the lookup icon ( ). **b.** Select configuration item. **Note:** By default, Service Offering is filtered out and CIs with Principal Class are selected. The Principal Class filter functionality is applicable to the new customers starting the Paris release.
Affected CIs	**a.** Click **Add**. **b.** Select configuration items. **Note:** By default, Service Offering is filtered out and CIs with Principal Class are selected. The Principal Class filter functionality is applicable to the new customers starting the Paris release.  **c.** Click **Add Selected**.
Impacted Services/CIs	**a.** Click **Add**. **b.** Select configuration items. **Note:** By default, Service Offering is filtered out. **c.** Click **Add Selected**. **Note:** If the Impacted Services/CIs is not visible on the form, configure the form layout.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Investigate root cause of a problem

Identify the root cause of the problem to analyze, track, and resolve recurring incidents permanently.

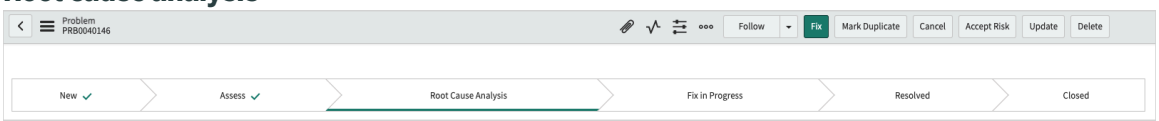
Before you begin

Role required: problem_admin, problem_coordinator, problem_manager, or admin

About this task

Activate the Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) to get the new best practice states and guided actions to navigate the life cycle of a problem. For details, see Activate Problem Management Best Practice — Madrid — State Model.

Root cause analysis



Procedure

You can perform any one of the following tasks.
If you had created any known error article for this problem or any similar problem, you can add the reference of that article in the **Primary Known Error article** field.

Note:
The **Primary Known Error article** field is available only when you activate the Problem Management Best Practice — Madrid — Knowledge Integration plugin (com.snc.best_practice.problem.madrid.knowledge).

What to do next

You can resolve and complete the problem. You can also create a change request to implement a fix for the problem.

Resolve and complete a problem

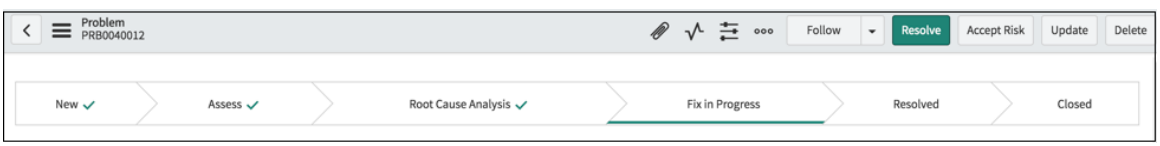
Resolve the issue and add detailed note of the resolution for future reference.

Before you begin

- Role required: admin, problem_admin, problem_coordinator, or problem_manager
- Activate the Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) to get the new best practice states and guided actions to navigate the lifecycle of a problem. For details, see Activate Problem Management Best Practice — Madrid — State Model.

Procedure

1. Click **Resolve**.



The problem enters the **Resolved** state with **Resolution code** as **Fix Applied**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click **Complete**.

The problem enters the **Closed** state with **Resolution code** as **Fix Applied**.

Note:

- When a problem is closed or canceled, all related open problem tasks are canceled provided you select the problem management property **Cancel open Problem Tasks when closing a Problem** (*problem.closed.cancel_open_tasks*).
- When a problem is closed, you can still create problem tasks provided you select the problem management property **Can create a Problem Task on a Closed Problem?** (*problem.closed.can_create_tasks*).

You can reanalyze the problem even after it is closed by clicking **Re-analyze**. The state of the problem changes from **Closed** to **Root Cause Analysis**. The following problem management properties controls who can reanalyze the problem:

- **Who can Re-analyze a Canceled Problem?** (*problem.closed.role.reanalyze_from_canceled*)
- **Who can Re-analyze a Risk Accepted (Closed state) Problem?** (*problem.closed.role.reanalyze_from_closed_riskaccepted*)
- **Who can Re-analyze a Completed Problem?**(*problem.closed.role.reanalyze_from_completed*)

When all the related tasks mentioned in the problem management property **List of related task records (comma-separated) to track as fixes for this Problem. Used to notify the Coordinator when the all of the related fix records are Completed or Canceled. E.g. incident.problem_id, change_request.parent** (*problem.fix.records*) are completed, a notification is sent to the problem coordinator regarding the same.

Note:
Changing this property to include new tables also requires you to create a corresponding Business Rule for the overall functionality to work seamlessly. For example, for the Change request, the Business Rule is *Check Related Problem Fixes - Change Req*.

Create change request from a problem

After you investigate and perform a root cause analysis of the Problem, you can understand whether the Problem can be resolved or you should find a temporary workaround for the Problem. If the Problem can be resolved, implement the fix, or the resolution for the Problem.

Before you begin

Role required: problem_coordinator or admin

About this task

You can implement a resolution to a problem by applying a standard change procedure and testing to confirm service recovery. For a normal change, you raise a Request For Change (RFC). The Change Advisory Board (CAB) needs to approve the RFC before a resolution is applied to the Problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Problem** > **Open** and open a problem record.
2. On the context menu, perform any one of the following activities.
   A change request is created to implement the solution for the problem.

Add multiple change requests to a problem

Add multiple change requests to a problem to capture all the requests that you need to implement to fix the problem.

Before you begin

Role required: itil, admin, problem_admin, problem_coordinator or problem_manager

About this task

The topic applies to Problems where you have activated the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin.

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open a problem record.
3. In the related list, click the **Change Requests** tab.
4. Click **Add**.
5. From the list, select the records and click **Add Selected**.
   The selected change requests appear under the **Change Requests** tab.

Create a problem task

Problem tasks are how the problem coordinator asks subject matter experts for help with identifying the root cause and proposed fix for a problem. Divide the problem into multiple problem tasks to help with the investigation. You can assign the problem tasks to different assignment groups or users.

Before you begin

Role required: itil, sn_problem_write, admin, problem_admin, problem_coordinator, problem_manager, or problem_task_analyst

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open the problem record for which you want to create a problem task.
3. In the related list of the problem record, click **Problem Tasks** and click **New**.
4. Select any one of the following problem tasks.

5. On the form, fill in the fields.
   For a description of the field values, see Problem Task form.
6. Click **Submit**.
   The problem task enters the **New** state. If you have filled the mandatory fields that are necessary to move a problem task record to the **Assess** state, the problem task record directly

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

moves to the **Assess** state. If you want to add any additional field for the assess state, you must add the field at **System UI** > **Form Sections**. For more information, refer Add a field in the assess mandatory field dialog.

What to do next
Assess the problem task.

Assess a problem task

Assess a problem task to determine the feasibility of working on the task.

Before you begin
Role required: problem_admin, problem_coordinator, problem_manager, problem_task_analyst, or admin

About this task
Assessing a problem task involves analyzing the scale and extent of the task, as well as its cause and effect.

Procedure

1. Select **Assess**.

   The problem task enters the **Assess** state. You can confirm whether there's enough information to work on the task or if the task should be canceled.
2. After assessing the task, perform the action based on your option.

What to do next
Complete the problem task as resolved.

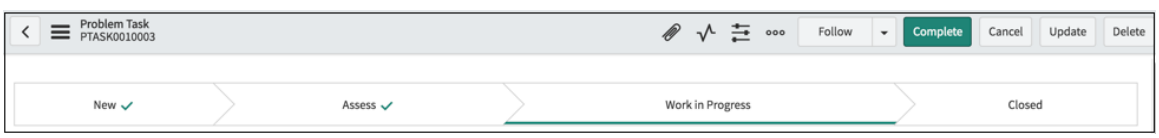
Complete a problem task

Resolve and complete the problem task.

Before you begin
Role required: admin, problem_admin, problem_coordinator, problem_manager, or problem_task_analyst

Procedure

Select **Complete**.



The problem task enters the **Closed** state with **Close code** as **Complete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can configure the Problem properties to reanalyze a task even after it is closed by selecting **Re-assess**. The state of the task changes from **Closed** to **Assess**. After all the problem tasks are completed or canceled, a notification is sent to the problem coordinator regarding the same.

Resolve related incidents from a problem

After you consider a problem to be resolved, the incidents related to the problem with the state **On Hold** may be resolved using a UI action from the **Problem** form.

Before you begin
Role required: itil

About this task
The topic only applies to legacy problem — Jakarta to London.

Procedure

1. Open a resolved problem that has associated incidents.
2. From the context menu, click **Resolve Incidents**.
3. Enter values for mandatory fields.

Note:
Only the incidents in state **On Hold** and with **Awaiting Problem** as the on hold reason can be resolved.

The state of the incidents in the problem related list is changed to **Resolved** and work notes are added to the activity feed.

Communicating the outcome of a problem

Document the cause and resolution of a problem to resolve incoming incidents quickly and avoid further problems to be raised on the same issue.

Communicate workaround for Problem

Document and communicate workaround to let others know that you are aware of the issue. The workaround is a temporary way to restore service failures and lessen the impact of a Problem for which an actual resolution is not yet available.

Before you begin
Role required: admin, problem_admin, problem_manager or problem_coordinator

About this task
When you communicate a workaround, notification is sent to related incidents that a workaround is available. The Incident process is designed to use the workaround information or to notify the user of the same. For more information on notification, refer Synchronization between incident and problem records.

Note:
The topic applies to Problems where you have activated the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open the Problem record.
3. Enter the information in the **Analysis information** > **Workaround** field.
4. Save the record.
5. Under Related Links, click **Communicate Workaround**.

Communicate workaround (legacy)

You can enter a workaround note into a problem record, and then post the information into every associated incident.

Before you begin
Role required: itil or admin

About this task
The **Communicate Workaround** related link on the Problem form eliminates the need to manually update each incident related to the Problem.

Procedure

1. Open the problem for which you have a workaround.
2. Enter the information in the **Workaround** field.
3. Click **Post**.
4. Click the **Communicate Workaround** related link.
   The problem number and the content of the **Workaround** field are added to the activity stream on all related incidents. By default, any entries made in an incident activity stream field generate an email notification to the **Caller** that you mention on the Incident form.

   If group on-call rotation scheduling is in effect when you communicate a workaround, the system stops the escalations on the associated incidents. Escalation stops because a workaround is available. This action effectively communicates knowledge to the appropriate audience, but does not create a knowledge article.

Communicate a fix

After you have completed root cause analysis of a problem and have come up with a resolution or fix for that problem, submit change requests to get the problem fixed. Documenting and communicating fix helps user to know the solution to a problem.

Before you begin
Role required: admin, problem_admin, problem_manager or problem_coordinator

About this task
When you communicate a fix, notification is sent to related incidents that a fix is available. The Incident process is designed to use the fix information or to notify the user of the same. For more information on notification, refer Synchronization between incident and problem records.

Note:
The topic applies to Problems where you have activated the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open the Problem record.
3. Enter the information in the **Resolution Information** > **Fix notes** field.
4. Save the record.
5. Under Related Links, click **Communicate Fix**.
   The fix information is copied from the **Fix notes** field on the Problem form to the **Additional Comments** field on the Incident form. An email notification is sent to the caller and the user who is assigned to the Incident.

Knowledge articles from problems

Knowledge bases house the information an organization wants to keep and share. The Problem form includes four options for creating knowledge and communicating information.

Note:
If you have Problem Management Best Practice — Madrid — Knowledge Integration plugin (com.snc.best_practice.problem.madrid.knowledge) activated, see Create a known error article. The topic applies to legacy Problem (London or a prior release) only.

- You can select the **Knowledge** check box and automatically submit a knowledge article when a problem is closed.
- You can enter a workaround note into a problem record, and then post the information into every associated incident.
- You can create a knowledge article from the problem immediately, and not wait for when the problem is closed.
- You can quickly create and publish a knowledge article in the News category.

By default, most new articles are created as drafts and move through a review state before they are published. An exception to the standard workflow is posting news from the Problem form.

If the administrator enables the optional knowledge submission workflow, articles created from incidents or problems become knowledge submissions, which are processed through a different path. For more information, see Knowledge workflows.

Use the knowledge check box

As with incidents, problems often generate information that may be needed in the future. The system can automatically submit a knowledge article when a problem is closed.

Before you begin
Role required: itil

About this task

Note:
If you have Problem Management Best Practice — Madrid — Knowledge Integration plugin (com.snc.best_practice.problem.madrid.knowledge) activated, see Create a known error article. The topic applies to legacy Problem (London or a prior release) only.

You can select the **Knowledge** check box and automatically submit a knowledge article when a problem is closed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select the **Knowledge** check box on the Problem form.
2. Resolve and close the problem.

   Closing the problem triggers the business rule *`Problem Create Knowledge`*. By default, the business rule creates a knowledge article in the **Draft** workflow state, ready for a knowledge team member to review and publish. The problem **Short description** becomes the article **Short description**, and the problem **Work notes** become the article **Text**.

   If the knowledge submission workflow is enabled, the problem **Work notes** become a knowledge submission instead of an article. For more information, see Knowledge workflows.

Create a known error article

Create known error articles as reference material. The known error articles document the root cause and the workaround of the problem to help with deflecting incidents.

Before you begin

Role required: admin, problem_admin, problem_coordinator, or problem_manager
Activate the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) and the Problem Management Best Practice — Madrid — Knowledge Integration (com.snc.best_practice.problem.madrid.knowledge) plugin.

About this task

After you create a known error article from a problem, the article is saved in the knowledge base and maintained in the Knowledge Management application. The publishing and retirement processes for a knowledge article are controlled by workflows defined for the knowledge base that the article belongs to. For more information, see Knowledge workflows.

Procedure

1. Navigate to **All** > **Problem** > **Open**.
2. Open the Problem record.
3. Under **Related Links**, click **Create Known Error Article**.

   Note:
   The link appears when the **Primary Known Error article** field is empty under the **Analysis Information** tab on the Problem form.

4. Click **Submit**.

   Note:
   To read the content of the article, click **View Article** under **Related Links**.

5. On the form, fill in the fields.

   Note:
   Click **Search for Duplicates** to search for existing known error articles. The search is based on short description, category, and topic.

   For a description of the field values, see Known error article form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Click **Publish** to send the article for review and approval. Depending on the Knowledge base where the article is stored and the Knowledge Base access controls, this Known Error article may be available to search for users outside of the IT team to help with Incident deflection.

Post knowledge

You can create a knowledge article from the problem immediately, and not wait for when the problem is closed.

Before you begin
Role required: itil, knowledge

About this task
If you have Problem Management Best Practice — Madrid — Knowledge Integration plugin (com.snc.best_practice.problem.madrid.knowledge) activated, see Create a known error article. The topic applies to legacy Problem (London or a prior release) only.

Procedure
1. Open a problem from which to post a knowledge article.
2. Click the **Post Knowledge** related link.
   The resulting knowledge article contains the following information.
   - The problem number and **Short description** become the knowledge article **Short description**.
   - The problem **Description** and **Workaround** become the knowledge article **Text**.
   - The problem **Configuration item** becomes the knowledge article **Configuration Item**.
   - The article **Topic** is set to **Known Error**.

   By default, the system creates a knowledge article in **Draft** workflow state. If the knowledge submission workflow is enabled, the problem **Short description** and **Work notes** are placed into a knowledge submission instead of an article. For more information, see Knowledge workflows.

Legacy: Problem Management Platform Analytics Solutions

Platform Analytics Solutions and in-form analytics contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

To enable the solution for Problem Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Problem Management. The guided setup takes you through the entire setup and configuration process.

Several of the dashboards in this content pack are inactive when installed. Complete configuration and run data collection jobs before you activate these dashboards. You can activate dashboards in Dashboard Properties, accessible from the context menu. You have to

The average time in days since the last update of an open problem. The score for this indicator is calculated according to the formula [[Summed age of updated since of open problems]] / [[Number of open problems]] / 24.

% of new critical problems

The score for this indicator is calculated according to the formula ([[Number of new problems > Priority = 1 - Critical]] / [[Number of new problems]]) * 100

Average close time of problems

The score for this indicator is calculated according to the formula [[Summed duration of closed problems]] / [[Number of closed problems]] / 24

% of problems reassigned at least once

The score for this indicator is calculated according to the formula ([[Number of reassigned open problems]] / [[Number of open problems]] * 100).

% of problems closed on first assignment

The score for this indicator is calculated according to the formula ([[Number of problems closed on first assignment]] / [[Number of closed problems]] * 100).

Average reassignment count of closed problems

The average value of the Reassignment Count field on closed problems, where Reassignment Count is not empty.

% of open problems classified as known error

The score for this indicator is calculated according to the formula ([[Number of open problems classified as known error]] / [[Number of open problems]]) * 100.

% of closed problems without any close notes

The score for this indicator is calculated according to the formula ([[Number of closed problems without close notes]] / [[Number of closed problems]]) * 100.

% of open problems with at least one incident

The score for this indicator is calculated according to the formula ([[Number of open problems with at least one incident]] / [[Number of open problems]]) * 100.

The following indicators are not shown directly on the dashboard but are used in calculating formulas:

- Summed age of open problems
- Summed age of updated since of open problems
- Summed duration of closed problems
- Summed re-assignment of open problems
- Number of reassigned open problems

Reference section for Problem Management

Reference topics provides field descriptions of various forms.

Problem form

Description of the field values for the problem form.

Problem form

Name	Definition
Number	Read-only field. Unique number to identify the problem.
Origin task	Task that first identified this problem.
Category	Group to which the problem belongs to such as software, hardware. After selecting the category, select the subcategory, if applicable.
Service	Business service that the problem applies to. If you select a business service as the configuration item and that business service is also listed as the configuration item in any other active task, the active tasks icon ( ) appears. Click the icon to view the list of all the other active tasks that are affecting the business service. You can view the BSM map (dependency view) of the selected business service by clicking the dependency icon .
Service Offering	Consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Service offering

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem form (continued)

Name	Definition
	enables you to receive different features and their levels of performance for a given service.
Configuration item	Configuration item (CI) that the problem applies to. The CI class of the selected configuration item identifies the type of problem, for example, hardware, network, or database.
State	For existing customers, the available states are: **Open**, **Pending Change**, **Known Error**, and **Closed** or **Resolved**. For new customers from Madrid, the state management process is applied. This state field is a read-only field. The field value changes as the problem proceeds from one state to another state. The states available are: **New**, **Assess**, **Root Cause Analysis**, **Fix in Progress**, **Resolved**, and **Closed**.
Resolution code	Indicates whether the problem is resolved, a fix is applied, a duplicate is available, or the problem coordinator accepts the risk. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Duplicate of	When **Resolution code** is **Duplicate**, the **Duplicate of** field is the reference to the Problem from which the current Problem is duplicated.
Impact	Effect that the problem has on business. Select the appropriate impact level (**High**, **Medium**, or **Low**).
Urgency	Extent to which the problem resolution can bear delay. Select the appropriate urgency level (**High**, **Medium**, or**Low**).
Priority	How quickly the service desk should address the problem (**Critical**, **High**, **Moderate**, **Low**, or **Planning**). The **Priority** field is read-only and is set according to the **Impact** and **Urgency** values entered.
Assignment group	The group who will work on the problem. The business rule *`Populate Assignment Group based on CI/SO`* populates the **Assignment group** field based on the support group available for the configuration item (CI) or the Service offering consecutively. **Note:** The business rule is triggered when an incident is created or updated and when the **Assignment group** and the **Assigned to** field is empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem form (continued)

Name	Definition
	If you want to override the default value, you need to create new properties and provide the field in the property value that must be used to populate the **Assignment group** field. Create the properties in the following order of preference: • *com.snc.problem.ci_assignment_group.field_name*: identifies which CI field populates the **Assignment group** field. • *com.snc.problem.service_offering_assignment_group* identifies which service offering field populates the **Assignment group** field. If the **Assignment group** field is blank, the incident is automatically assigned to a group.
Assigned to	Specific problem coordinator that the problem is assigned to. If an assignment rule applies, the problem is automatically assigned to the appropriate user or group.
Problem Statement	Description of the problem that the problem-solving team addressing. When you update the problem statement and move to another field, the **Related Search** field displays knowledge articles. If you configure the problem properties, then the **Related Search** field displays other related information related to the problem statement.
Description	Detailed description of the problem.
Related Search	Result of a search. **Note:** If you want to search and link a known error article or knowledge article to the Problem, click **Attach**.
Notes	
Work notes list	Users who receive notification when work notes are added to the problem.
Work notes	Inscription about the work that you perform on the Problem.
Analysis Information	
Workaround	Method that you have used to overcome the Problem. Providing a workaround if useful for fast Incident resolution. It can be a way of dealing with a problem or making something work despite the problem not being resolved. If a workaround is available, the problem coordinator can click the Communicate Workaround action to notify the related Incidents.
Cause notes	Inscription on what had caused the problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Problem form (continued)

Name	Definition
Resolution Information	
Resolved by	Read-only field. Name of the user who resolved the issue. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Resolved	Read-only field. The date and time when the Problem is resolved. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Fix notes	Inscription on how you have fixed the problem. If a fix is available, the problem coordinator can click the Communicate Fix action to notify the related Incidents.
Other Information	
Opened by	Read-only field. Name of the user who opened the problem.
Opened	Read-only field. The date and time when the user opened the Problem.
Confirmed by	Read-only field. Name of the user who confirms that the problem is valid and needs a resolution. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Confirmed	Read-only field. The date and time when the user confirms that the Problem is valid and needs a resolution. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Fix by	Read-only field. Name of the user who started the fix.
Fix	Read-only field. The date and time when the user started the fix.

Problem Task form

Description of the field values for the problem task form.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem task form

Field	Description
Number	Read-only. Unique number to identify the task.
Type	Read-only state. Determines whether the problem task is created specifically to investigate the cause of the problem or is a general task. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Configuration item	Configuration item (CI) that the problem applies to. The CI class of the selected configuration item identifies the type of problem, for example, hardware, network, or database.
Due date	Date within which the problem task should be completed.
Source problem	Unique number of the problem for which the problem task is created.
State	For existing customers, the available states are: **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, and **Closed Skipped**. For new customers from Madrid, the state management process is applied. This state field is a read-only field. The states available are: **New**, **Assess**, **Work in Progress**, and **Closed**.
Close code	Read-only field indicating whether the problem task was completed or canceled. **Note:** This field appears only for new customers from Madrid or a later release as it is part of the state management process.
Priority	How quickly the service desk should address the problem task (Critical, High, Moderate, Low, or Planning).
Assignment group	Specific group to whom the problem task is assigned to.
Assigned to	Specific problem analyst to whom the task is assigned to.

Problem task form (continued)

Field	Description
Short description	Brief description of the problem task. When you update the short description, and move to another field, the **Related Search** field displays knowledge articles. If you configure the problem properties, then the **Related Search** field displays other related information related to the short description.
Description	Detailed description of the problem task.
Related Search	Result of a search. **Note:** If you want to search and link a knowledge article to the Problem task, click **Attach**.
Notes	
Work notes list	Users who receive notification when work notes are added to the problem task.
Work notes	Inscription about the work that you perform on the problem task.
Analysis Information	
Cause code	Cause of the Problem such as Environmental disaster, Hardware issue, People/Process/ Documentation.
Workaround (Root Cause Analysis only)	Method that you have used to overcome the Problem. It can be a way of dealing with a problem or making something work despite the problem not being resolved.
Closure Information	
Completed by	Read-only field. Name of the user who completed the task.
Completed	The reason why this problem task has been canceled.
Proposed fix notes (Root Cause Analysis only)	Inscription on how you have fixed the problem task.
Close notes (General task only)	Inscription on the work you have completed.

Problem form fields (continued)

Name	Definition
	You can view the BSM map (dependency view) of the selected business service by clicking the dependency icon .
Configuration item	Configuration item (CI) that the problem applies to. The CI class of the selected configuration item identifies the type of problem, for example, hardware, network, or database.
Change request	Change request associated with the problem.
Major problem	Check box to prioritize a problem and highlight that it needs a review.
Knowledge	Check box to automatically submit a knowledge article when a problem is closed.
State	State of the problem: • **Open**: Open and unassigned. • **Pending Change**: Waiting for the corresponding change request to be closed. • **Known Error**: This problem is not going to be fixed and there is a workaround. Users with the itil role have access to the **Known Errors** module. • **Closed/Resolved**: The problem is fixed and closed.
Impact	Effect that the problem has on business. Select the appropriate impact level (**High**, **Medium**, or **Low**).
Urgency	Extent to which the problem resolution can bear delay. Select the appropriate urgency level (**High**, **Medium**, or**Low**).
Priority	How quickly the service desk should address the problem (**Critical**, **High**, **Moderate**, **Low**, or **Planning**). The **Priority** field is read-only and is set according to the **Impact** and **Urgency** values entered.
Assignment group	The group who will work on the incident. The business rule *`Populate Assignment Group based on CI/SO`* populates the **Assignment group** field based on the support group available for the configuration item (CI) or the Service offering consecutively. **Note:** The business rule is triggered when an incident is created or updated and when the **Assignment group** and the **Assigned to** field is empty. If you want to override the default value, you need to create new properties and provide the field in the property value that must be used to populate the **Assignment**

Problem form fields (continued)

Name	Definition
	group field. Create the properties in the following order of preference: • *com.snc.problem.ci_assignment_group.field_name*: identifies which CI field populates the **Assignment group** field. • *com.snc.problem.service_offering_assignment_group* identifies which service offering field populates the **Assignment group** field. **Note:** The sys_user_group *read* ACL calls the *SNCRoleUtil* function. The function verifies whether the group that is reviewed contains either the admin role or security_admin role. The function allows the user to view the group only if the user has the same role. As a result, a user with the itil role cannot assign an incident to a group that has the admin role or security_admin role nor to any group whose parent has those role.
Assigned to	Specific user that the problem is assigned to. If an assignment rule applies, the problem is automatically assigned to the appropriate user or group.
Parent	The parent task for this problem.
Short description	Summary of the problem.
Description	Detailed description of the problem.
Work notes list	Users who receive notification when work notes are added to the problem. Click the **Add me** icon to add yourself to the work notes list for problems you are interested in monitoring.

Known error article form

Description of the field values for the legacy problem form.

Known Error article form

Field	Description
Number	Read-only field. Unique number to identify the known error article.
Knowledge base	Knowledge base (defaults to Known Error) in which the article is stored for future reference. The article is saved in the Known Error article [kb_template_known_error_article] table.
Category	Read-only field. The value of this field is reference from the Category field of the Problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Known Error article form (continued)

Field	Description
Valid to	Date after which the known error article is deleted from the database. After this date, the article does not appear in the search result.
Version	Read-only field. Managed by the Knowledge Management process when changes are made to a published article.
Workflow	Read-only field.
Source Task	Read-only field. The Problem record on which you are creating the article.
Attachment link	Select the check box so that the article appears as an attachment in the Problem record. If you do not select the check box, the content of the article appears in the work note of the Problem.
Display attachments	Select the check box so that all attachments to the article appear when you view the article. The field is relevant only when the Attachment link field is not selected.
Short description	Brief description of the Known Error.
Description	Detailed explanation of the Known Error.
Workaround	Method that you have used to overcome the Problem. It can be a way of dealing with a problem or making something work despite the problem not being resolved.
Cause	Information on what had caused the problem.

Data lookup for prioritizing problems

To follow ITIL guidelines, problem records are prioritized by the impact and urgency of the problem.

Problem prioritization is available on new instances.

On the problem form, users select values from the **Impact** and **Urgency** fields that determine which priority value is generated for the problem.

ITIL problem order

Field	Definition
Impact	Impact is a measure of the effect of an incident, problem, or change on business processes.
Urgency	Urgency is a measure of how long the resolution can be delayed until an incident, problem, or change has a significant business impact.
Priority	Priority is based on impact and urgency, and it identifies how quickly the service desk should address the task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Priority is calculated according to the following data lookup rules:

Priority Data lookup rules

Impact	Urgency	Priority
1 - High	1 - High	1 - Critical
1 - High	2 - Medium	2 - High
1 - High	3 - Low	3 - Moderate
2 - Medium	1 - High	2 - High
2 - Medium	2 - Medium	3 - Moderate
2 - Medium	3 - Low	4 - Low
3 - Low	1 - High	3 - Moderate
3 - Low	2 - Medium	4 - Low
3 - Low	3 - Low	5 - Planning

By default, the **Priority** field is read-only and must be set by selecting the **Impact** and **Urgency** values. To change how the priority is calculated, you can either alter the priority lookup rules or disable the **Priority is managed by Data Lookup - set as read-only** UI policy and create their own business logic.

In the Problem Priority Data Lookup [dl_problem_priority] table, you can modify the data lookup rules for the task priority.

Work notes for problem priorities

When you initially create and save a problem, the **Work notes** field is not mandatory. If you change the priority of the problem by selecting different **Impact** or **Urgency** values on a problem form that was saved, the **Work notes** field becomes mandatory.

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

Problem management properties

Problem Management properties are used to control features such as creating problem task on a closed problem and reanalyzing a closed or a canceled problem.

These properties are available at **Problem** > **Administration** > **Problem Properties**.

Properties for Problem Management

Property	Description
Problem State Transition Properties	
Accept Risk moves the Problem to Closed state instead of Resolved state problem.acceptrisk.move_to_closed	• Type: true or false • Default value: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Problem Management (continued)

Property	Description
Can create a Problem Task on a Closed Problem? problem.closed.can_create_tasks	• Type: true or false • Value: true or false • Default value: false
Who can Re-analyze a Canceled Problem? problem.closed.role.reanalyze_from_canceled	• Type: choice list • Default value: problem_manager
Who can Re-analyze a Risk Accepted (Closed state) Problem? problem.closed.role.reanalyze_from_closed_riskaccepted	• Type: choice list • Default value: problem_manager
Who can Re-analyze a Completed Problem? problem.closed.role.reanalyze_from_completed	• Type: choice list • Default value: problem_manager
Problem Task State Transition Properties	
Cancel open Problem Tasks when closing a Problem problem.closed.cancel_open_tasks	• Type: true or false • Value: true or false • Default value: true
Who can Re-assess a Completed or Canceled Problem Task? problem_task.closed.role.reaassess_from_closed	• Type: choice list • Default value: problem_coordinator

Can Re-Assess a Problem Task on a Closed Problem?
 	
problem_task.closed.can_reassess_on_closed_problem
	• Type: true or false
	• Default value
	  ○ Upgrade: true
	  ○ New instances: false

Problem Related List Properties	
List of related task records (comma-separated) to track as fixes for this Problem. Used to notify the Coordinator when all the related fix records are Completed or Canceled. E.g. change_request.parent problem.fix.records	• Type: string • Default value: change_request.parent, rm_defect.parent, rm_release.parent, rm_enhancement.parent, sn_cim_register.source_id

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for Problem Management (continued)

Property	Description
List of related task records (comma-separated) to move over when a problem is marked as a duplicate of another. E.g. incident.problem_id problem.duplicate.records_to_move	• Type: string • Default value: incident.problem_id, sn_customerservice_case.problem, problem_task.problem

Who can relate closed Incidents to a Problem?
 	
problem.role.relate_closed_incidents
	• Type: choice
	• Default value:
	  ○ Upgrade: Nobody
	  ○ New instances: Problem coordinators

Problem Created from Incident Properties	
List of attributes (comma-separated) that will be copied from the incident to create a new problem com.snc.problem.create_from_incident.attributes	• Type: string • Default value: number, description, short_description, cmdb_ci, impact, urgency, priority, company, sys_domain, business_service, category, subcategory
Problem Created from Interaction Properties	

Create saved problem
 	
com.snc.problem.create_from_interaction.save
	• Type: Boolean
	• Default value:
	  ○ Upgrade customers: No
	  ○ New customers: Yes

Allow problem creation from interaction glide.problem.interaction.allow_create	• Type: true or false • Value: true or false • Default value: false

Quick start tests for Problem Management

Validate that Problem Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Problem Management quick start tests require activating the Problem Management Best Practice — Madrid plugin (com.snc.best_practice.problem.madrid) and the Problem Management — ATF Tests plugin (com.snc.problem.atf). For all state related test, the Problem Management State Model (com.snc.best_practice.problem.madrid.state_model) plugin needs to be active.

Quick start tests

Domain separation and Problem Management

Domain separation is supported in Problem Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Domain separation in Problem Management - Overview

- Problem Management is about eliminating the root cause of a service interruption.
- The problem and problem task tables support domain separation. Therefore a Problem user sees only problems or problem tasks that have been created within the (tenant) domain that they belong to.
- Only Problem users can create and access Problems and problem tasks.
- Problem and problem task tables both support domain separation. Therefore, a Problem user sees only problems and problem tasks that have been created within the (tenant) domain that they belong to.

How domain separation works in Problem Management

Problem users see only problems and problem tasks that have been created within the (tenant) domain that they belong to.

Problem users can use Problems and problem tasks within the tenant domains. Problem users can create and update problems and problem tasks of their domain, any child domains, and the global domain.

Known Issues

Task-Outage Relationship `[cmdb_ci_outage]` is not domain separated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If installed, the Task-Outage Relationship table is not domain separated. Therefore Fulfillers or Problem users can view any Task-Outage Relationship records regardless of the domain that the records belong to.

The Task-Outage Relationship table is installed when administrator activates the optional Task-Outage Relationship plugin.

Related topics

Domain separation for service providers

Data for problem resolution

The quick resolution of problems requires gathering as much information as possible about the problem.

In addition to the information within the problem ticket, useful information is often found in other tables.

Pertinent related records

Common related records include changes (through the **Change request** related list) and incidents in the **Incidents** related list. All the directly related records are accessible through related lists. If the appropriate related list does not appear on the form, the administrator can configure the form to add it.

Known errors and knowledge articles

Information about already-known issues can be found in two places: the **Known Errors** module in the Problem Management application, or in the Knowledge application. The **Known Errors** module filters the problem table to present all the problems whose cause has been identified but cannot be fixed. The knowledge base can have information that was gathered from incidents, and may also have useful workarounds for problems.

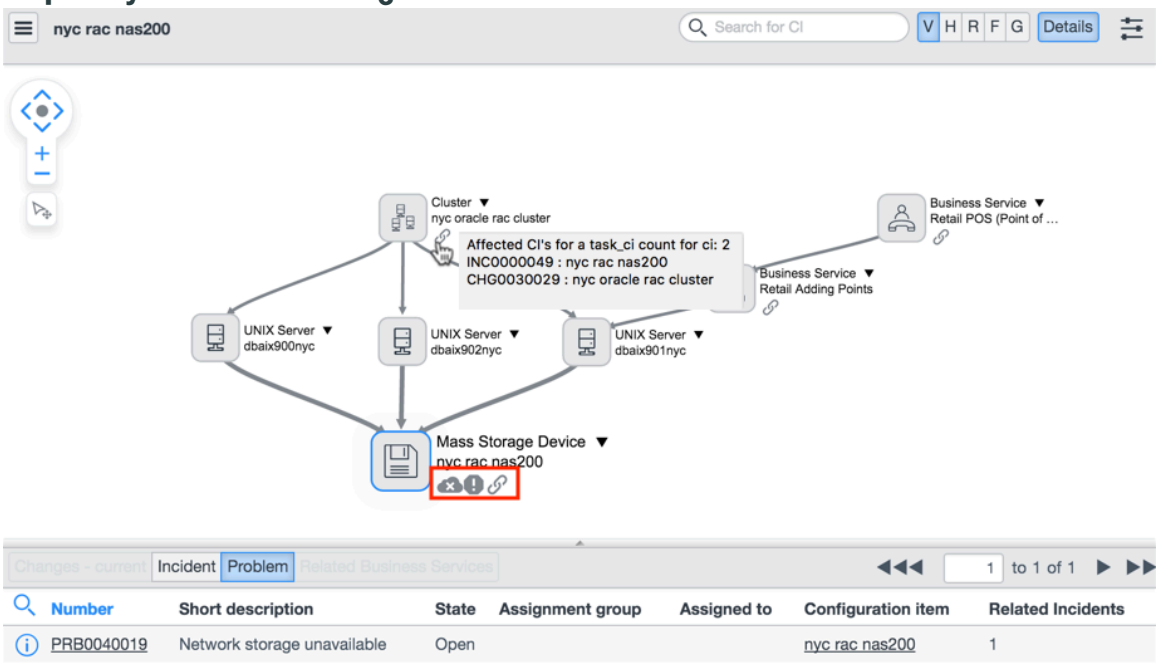
Dependency Views map

The Dependency Views map provides a visual representation of the configuration items and their relationships and displays information about related issues.

For example, the following image is a map for the CI **nyc rac na200**, which is a mass storage device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map for nyc rac nas200 storage device



The icons beside CIs indicate the following information. You can view information for the selected CI by clicking **Details** in the form header, or by pointing to the icon and viewing a pop-up box.

- The cloud **x** icon indicates that the CI has an associated problem, which is listed in the **Problem** details pane.
- The **(!)** icon indicates that there is a related incident.
- The link icon indicates that there are associated tasks, which can be incidents, problems, or changes. If you select the CI, the Details pane displays the associated records.

To open the incident or problem record, click the number in the Details pane.

The map shows the upstream and downstream relationships of the CI. The storage device problem might be an improper change to one of the UNIX servers.

CMDB baseline history

If a baseline is generated, planned or unplanned changes are tracked within the system. A common cause of problems is improperly executed changes, and reviewing the history of changes to a CI helps track problems caused by improper changes.

To check the CMDB Baseline, view the CI record and check **Baseline Differences** and **Scheduled Changes**. The administrator can use the form designer to add these formatters.

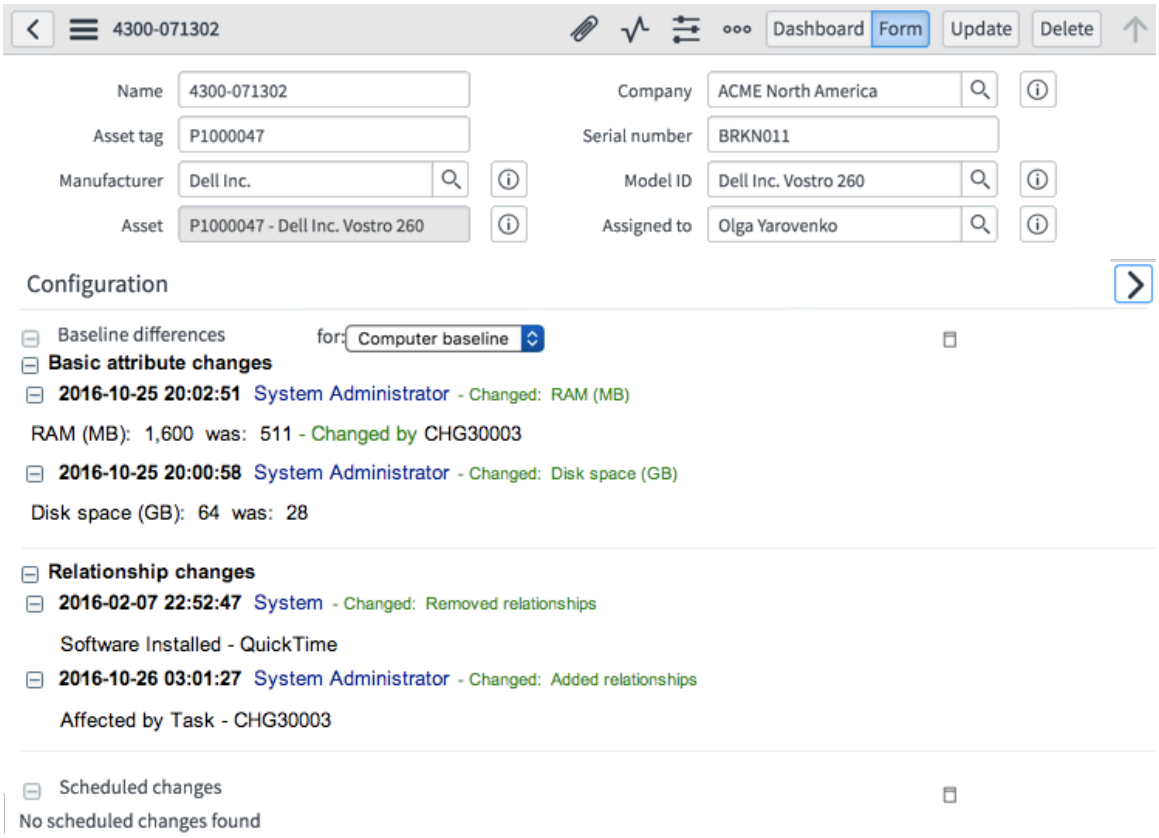
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem baseline



In the example above, the change in RAM is associated with a change request. You can review the change and see what was planned and what was implemented. The removal of QuickTime software was recorded as an unplanned change.

Synchronization between incident and problem records

Change in a Problem record impacts related Incident records. Notification is sent to the user for each such update.

When you activate the Problem Management Best Practice — Madrid (com.snc.best_practice.problem.madrid) and the Problem Management Best Practice — Madrid — State Model (com.snc.best_practice.problem.madrid.state_model) plugin, the changes in a Problem record impact incidents that are associated to that Problem.

Impact on incident records

Plugin	Incident state	Problem state	Action on Problem	Action on Incident

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Working with contextual search

Contextual search display results on forms and record producers based on the text that you provide in a field.

Note:
Contextual Search is available for problems in instances starting with the Madrid release. Existing users can request to activate the Problem Management Best Practice — Madrid plugin (com.snc.best_practice.problem.madrid).

You can:

- Find articles using the **Related Search** field. The articles can be based on any category that you select from the choice list.
- Use the choice list next to the **Related Search** field to select the category such as **Knowledge (All)**, **Pinned Articles**, **Incidents**, **Open Problems**, and **Resolved Problems**.
- Attach the article in the **Notes** > **Work notes** if your search result displays knowledge articles.

Exploring Release Management

Learn about Release Management that helps you in managing hardware and software releases to create a defined set of release components.

Release Management overview

Release Management The RM v2 application enables you to plan, design, build, configure, and test hardware and software releases to create a defined set of components.

The Release Management v2 application handles releases using the task record system. Each planned feature is generated through various means as a task record, populated with the pertinent information in individual fields. These tasks can be assigned to appropriate release management team members, who deal with the tasks as appropriate until the release has been properly deployed.

Release Management can be effectively used to coordinate releases as a vehicle for planning releases, composed of individual work items such as projects, epics, stories, and problems. After the release scope (projects, stories, and so on) is finalized, you can generate Change Items and associate them to the release, enabling the implementation and deployment of a release to be handled within the change management process.

What to explore next

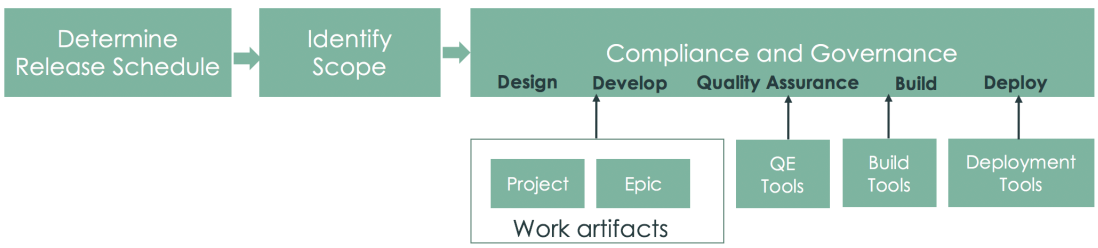
Release Management concepts

The Release Management application encompasses the planning, design, build, configuration, and testing of hardware and software releases to create a defined set of release components.

Release management comprises of a series of activities performed to ensure that the changes are applied successfully to both pre-production and product environments.



Release Management concepts

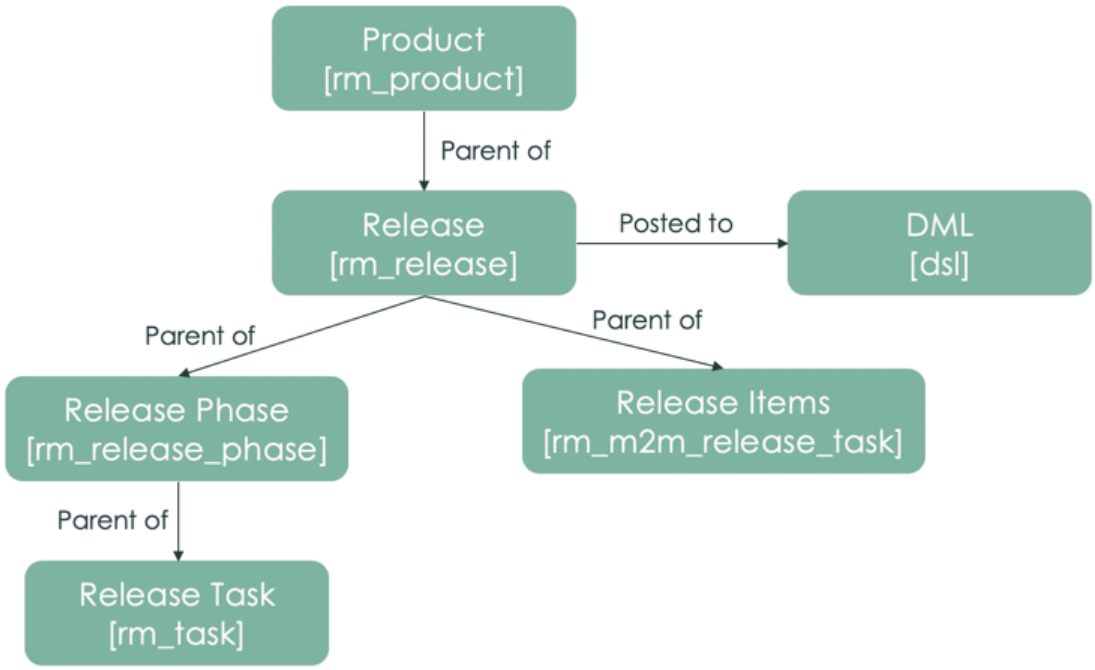
Concept	Description
Products	Represents the hardware or software for which releases are built. A product can be linked with a Business Service in the CMDB to link it with other ITIL processes.
Releases	Bundles all the work done (projects, epics, stories, enhancements, defects, problems, incidents, and so on) for products or services together and ensures that these work items are built, tested, and deployed on non-production and/or production environments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Release Management concepts (continued)

Concept	Description
Release Phases	Represents the planned phases within a release, which are used to group the tasks required to carry out the release. For example, gathering requirements, planning, design, development, testing, and deployment.
Release Tasks	Represents any of the tasks required to implement a feature of a product.

Table relationships in Release Management



Note:
The tables for Feature and Feature Task under a release are not removed. If you already use Feature and Feature Task under a release, you can continue doing so.

Business stakeholder role for Release Management

Use the business stakeholder role to read and retrieve data from any table of the Release Management application to generate reports.

When you activate the Business Stakeholder plugin (com.snc.business_stakeholder) in your ServiceNow instance, the Read only roles for Release Management plugin (com.snc.release_management_read_roles) is also activated. This plugin provides a business stakeholder role (sn_release_read) with which you can access all the tables of the Release Management application. You can assign this role to any user in your organization who is a business stakeholder.

Plugin availability

If you are a new customer, the Read only roles for Release Management plugin (com.snc.release_management_read_roles) is activated on zBoot. However, the business stakeholder role (sn_release_read) is available only when you activate the Release Management plugin (com.snc.release_management_read_roles).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you are an upgrade customer, you must manually activate the read-only roles for Release Management plugin and the Release Management plugin (com.snc.release_management_v2).

Release Management tables accessible by users with the business stakeholder role

When the Read only roles for Release Management plugin (com.snc.release_management_v2) is active in your ServiceNow instance, the user with the business stakeholder role (sn_release_read) has read access to the following tables.

Release Management tables

Table	Description
Product [rm_product]	Represent whole products whose releases are being managed. It is optional to use the Product construct. A generic release can also be defined without any specific product.
Release [rm_release]	Represent individual releases of the product.
Release Phase [rm_release_phase]	Represent the different stages of work required to complete a release.
Release Tasks [rm_task]	Represent tasks under a phase for phase activities.
Release Items [rm_m2m_release_task]	Represents work items and change records associated to the release.

Configuring Release Management v2

Plan and configure the Release Management application.

Activate Release Management

Activate the Release Management plugin (com.snc.release_management_v2) with the admin role.

Before you begin
Role required: admin

About this task
For more information, see Components installed with Release Management v2.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Using Release Management v2

The Release Management v2 plugin (com.snc.release_management_v2) provides release tables which store information about the planned release and tasks that are required to execute the release.

Product

Use a Product record in Release Management to store information about a product for reference purposes and groups all the releases and work artifacts for the product.

You can use the **Configuration Items** reference field to link the product with a corresponding CI in the CMDB. Each CI keeps information about how it relates to other CIs, and can track any incidents, problems, or changes related to it. Specifying a CI for the Product connects information from the release process to other processes in the instance.

Defining a product is not mandatory to manage the release process. A release can be an enterprise release in which it is associated with all products or services, or it can be associated to more than one product as well. In either of these cases, defining a product is not mandatory.

Once releases are defined for a product, the Product Hierarchy related link displays the hierarchy of releases, release phases, and release tasks associated with the product.

Release

Once a product is defined, you can plan and execute a release. Start by defining a release for the product and add child releases or release phases for the release. Then, scope the release by defining work artifacts for the release.

Release Phase

Define multiple release phases for a release for release governance and smooth execution.

For example, if the release is managed more like a waterfall process, the release phases could be requirement gathering, design, development, testing, build, acceptance, and deployment. For each phase, there can be release tasks associated to it. The phase gets completed as and when all tasks are completed for a phase. Release managers must keep the release phases updated.

If the release is divided into multiple merges, the phases could be merge 1, merge 2, merge 3, and so on. The type and number of phases would depend upon the release management process of your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scoping a release

Before starting the release execution, you must define scope of the release. Scope of a release includes the work artifacts such as projects, epics, stories, enhancements, and defects that are a part of the release.

For example, a minor release might only have a few problems and enhancements whereas a major release might have multiple projects or epics associated to it.

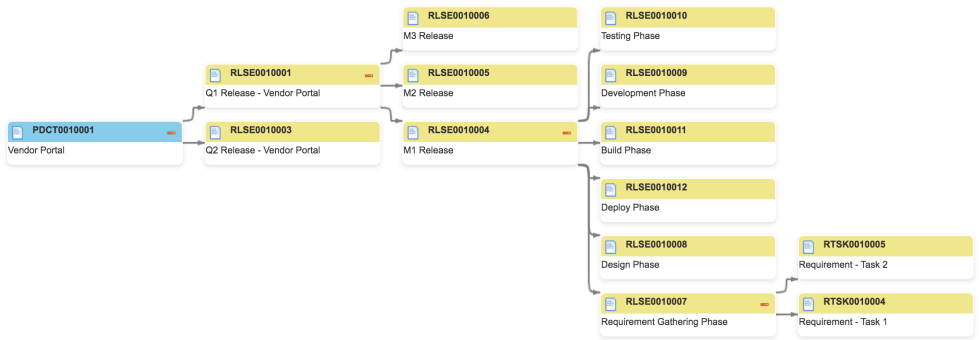
Important:
Starting with the New York release, scoping a release using SDLC or Scrum (Agile Development 1.0 (com.snc.sdlc.scrum.pp)) is not available.

While scoping the release, you can use the Release Hierarchy related list on the Release Form to view the release as a hierarchy.

Product hierarchy in Release Management

A release can be an enterprise release, in which it is associated to all products or services or to more than one product. In either case, defining a product is not required.

If a product has releases defined, the **Product Hierarchy** related link displays the hierarchy of releases, phases, and phase tasks associated with the product.



Define a product in Release Management

Define a product in the Release Management application to facilitate managing a release process.

Before you begin

Role required: release_v2_admin

Procedure

1. Navigate to **All** > **Release** > **Products**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Input value
Number	Auto-generated unique identifier for the Product.
Configuration Item	CI that corresponds to the product.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input value
Assignment Group	Group responsible for the product.
Assigned To	user responsible for the product.
Short Description	Brief description of the product.
Description	Detailed description of the product.
Work Notes	A journal field for logging notes about the product.

4. Click **Submit**.

Define a release in Release Management

During the release planning process, release managers define the type of the release (major, minor, and so on.), schedule of the release (planned start and end dates), required phase, phase tasks, and the scope.

Before you begin

Role required: release_v2_admin

Procedure

1. Navigate to **All** > **Release** > **Products**.
2. Open the product to which you want to add a release.

   If a release belongs to no product or more than one product, you can directly navigate to **Release** > **Releases** to define the release. You need not define a release in the context of a product.
3. In the **Releases** related list, click **New**.
4. On the form, fill in the fields.

Release form

Field	Description
Number	Auto-generated unique identifier for the release.
Release Type	Type of the release such as Major, Minor, Upgrade, Patch, or others.
Priority	Priority of the release such as Critical, High, Moderate, or others.
State	State of the release such as Draft, Work in progress, testing, or others. If you want to customize the options in this list, reach out to your admin. Custom states can be added according to the default state categories of the release table. Learn more about the default states of the release table.
Percent complete	Progress of the release as a percentage of the whole.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Short description	Brief description of the release. This description helps in identifying this release from a list of releases.
Description	Details of the release.
Planned start date	Tentative start date of the release.
Planned end date	Tentative end date of the release.
Planned duration	Duration of the release in days. When you submit the form, this field auto-populates based on the values of Planned start date and Planned end date.

5. Click **Submit**.

What to do next

- Attach documents such as release and deployment plans, installation manuals, and training documentation to a release.

  For more information, see Add and manage attachments.

- Releases can have child releases. So, you can group minor releases under major releases.

  Add a child release by clicking **New** in the Releases related list in the Release form.

- Define a release phase in Release Management.
- Define scope of a release in Release Management.

Define a release phase in Release Management

Define a release phase to represent the different stages of work required to complete your release.

Before you begin

Role required: release_v2_admin

Procedure

1. Navigate to **All** > **Release** > **Releases**.
2. Click the release number to which you want to add a release phase.
3. In the **Release Phases** related list, click **New**.
4. On the form, fill in the fields.

Release form

Field	Description
Priority	Priority of the phase such as Critical, High, Moderate, or others.
State	State of the phase such as Draft, Work in progress, testing, or others.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Percent complete	Progress of the phase as a percentage of the whole.
Short description	Brief description of the phase. This description helps in identifying this phase from a list of release phases.
Description	Details of the phase.
Planned start date	Tentative start date of the phase.
Planned end date	Tentative end date of the phase.
Planned duration	Duration of the phase in days. When you submit the form, this field auto-populates based on the values of Planned start date and Planned end date.

5. Click **Submit**.

Define scope of a release in Release Management

Add projects, epics, stories, enhancements, and defects to define the scope of a release.

Before you begin

Role required: release_v2_admin

Procedure

1. Navigate to **All** > **Release** > **Releases**.
2. Click the release number for which you want to define the scope.
3. On the Release form, navigate to one of the following related lists.
   - Projects
   - Scrum Epics
   - Scrum Stories
   - SAFe Epics
   - SAFe Features
   - SAFe Stories
   - Defects
   - Enhancements
   - Incidents
   - Problems
   - Changes

   Note:
   To view the respective work items, ensure that the plugins Agile Development 2.0, Project Portfolio Management, Essential SAFe, and Portfolio SAFe are active.

4. Add a task to the related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **Attach task**.

b. Find and locate the required task by clicking the search icon ( ).

c. Add the task as a release task by clicking the task number.

5. Click **Submit**.

Release Management v2 reference

Reference topics provide additional information about the lists and forms that you use to configure and administer Digital Product Release (DPR).

Components installed with Release Management

Several types of components are installed with activation of the Release Management v2 plugin, including tables and user roles.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
Release admin [release_v2_admin]	Can access the entire application	release_v2_user
Release user [release_v2_user]	Can access the all the various feature and task-related modules but cannot update any content.	None

Tables installed

The Release Management v2 application contains with a flexible product, release, phase, release work items, and task hierarchical table layout to allow for releases of varying complexity.

Table	Description
Product [rm_product]	Represent whole products whose releases are being managed. It is optional to use the Product construct. A generic release can also be defined without any specific product.
Release [rm_release]	Represent individual releases of the product.
Release Phase [rm_release_phase]	Represent the different stages of work required to complete a release.
Release Tasks [rm_task]	Represent tasks under a phase for phase activities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Release Items [rm_m2m_release_task]	Represents work items and change records associated to the release.

Default state categories for Release and Release task tables

Understand how the different states of the Release [rm_release] and Release Task [rm_task] tables are configured by default. Use this information to customize the states according to your organizational release processes.

State categories for Release table

State category	State number
completed_states	3
close_states	3, 7
default_close_state	3
default_work_state	2
default_open_state	1
default_skipped_state	7
default_pending_state	-5
pending_states	-5
open_states	1
work_in_progress_states	2, 4, 10
skipped_states	4, 7

State categories for Release task table

State category	State number
completed_states	3
close_states	3, 4, 7
default_close_state	3
default_work_state	2
default_open_state	1
default_skipped_state	7
default_pending_state	-5
pending_states	-5
open_states	1
work_in_progress_states	2
skipped_states	4, 7

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software control distribution

The application enables the Release Management team to control the distribution of software by creating a Definitive Media Library (DML) stored in the CMDB.

The DML table [dsl] consists of a physical store and a logical store.

- The physical store holds the original copies of all software media. This tends to be software that has been provided from an external source.
- The logical store is the index of all software and releases, versions, and so on, highlighting where the physical media can be located. The logical store may also be used to store software that is developed within the organization.

Both physically and logically stored software are represented as records on the DML table [dsl].

Domain separation and Release Management

This is an overview of domain separation and Release Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Recommendation Framework

ServiceNow® Recommendation Framework provides a framework with relevant, contextual, and actionable recommendations for a user in a configurable workspace.

Recommendation Framework is now deprecated and no longer supported or available for new activation. Recommended Actions for ITSM feature provides the latest experience for this functionality. To get the advanced version, you must install the Advanced Recommended actions for ITSM (com.snc.uib.sow_itsm_ra_advanced) plugin and you must procure ITSM Pro package subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The best practice to get the advanced version is to install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription. For more information, see Exploring Recommended Actions for ITSM in Service Operations Workspace.

Get started

Explore	Configure	Integrate
Learn about Recommendation Framework concepts and features.	Configure environment and properties.	Integrate Recommendation Framework with other applications.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Exploring Recommendation Framework

A reusable framework to deliver outcome-based recommendations for a user in a configurable workspace.

Recommendations are available in multiple areas of a configurable workspace.

Recommendations in a contextual panel

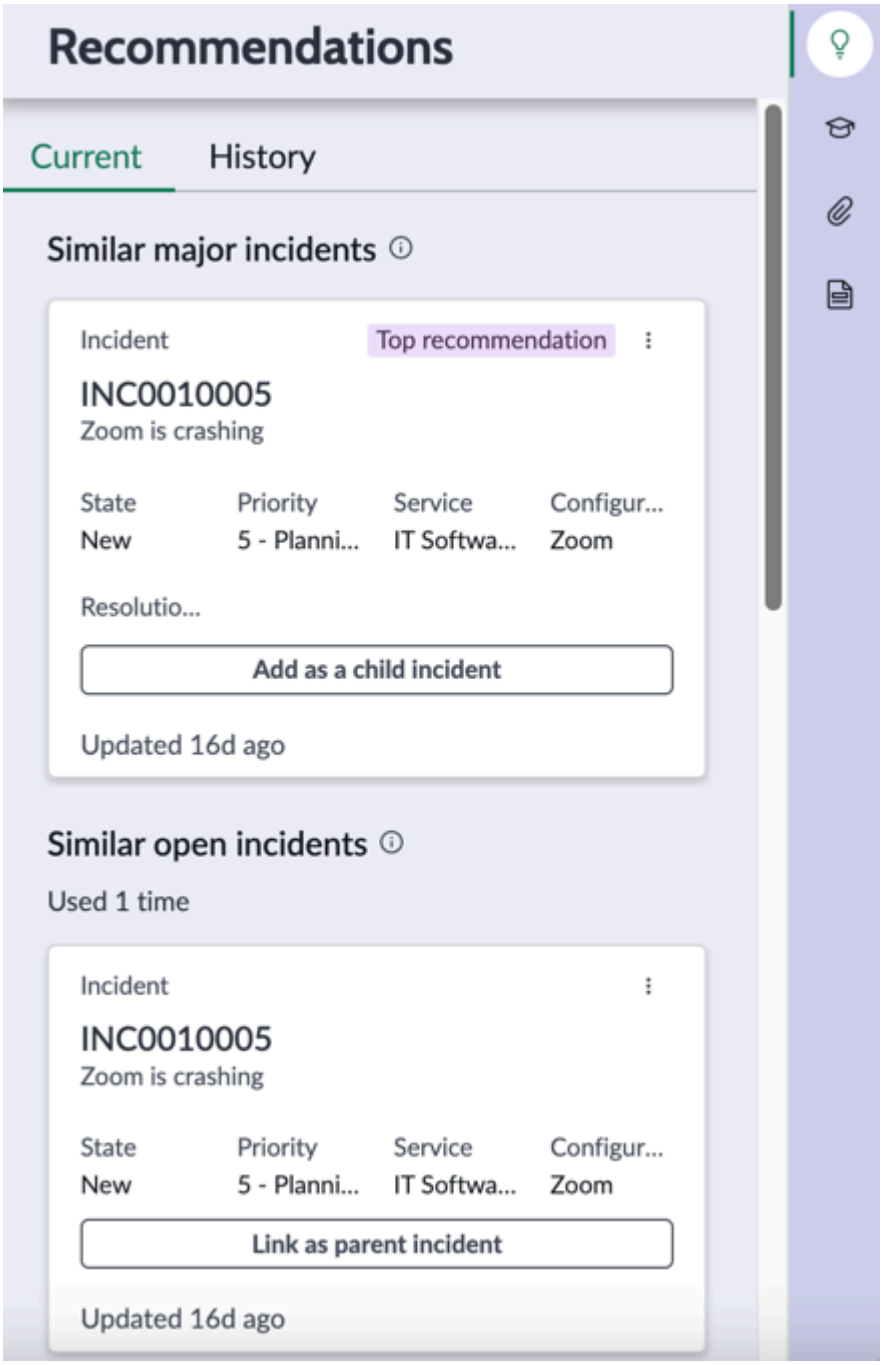
You can configure recommendations in a contextual panel, for example, the **Recommendations** panel that can be accessed from the sidebar of an incident in Service Operations Workspace. Recommendations can be configured and grouped in any of the following formats.

- Record card: Relevant record details of a table and corresponding actions are available.
- Message card: A message derived from the recommendation and corresponding actions are available. For example, **Propose major incident** card for an incident in Service Operations Workspace.

Note:
All cards of the same recommendation rule are grouped. For example, for the Similar open incidents rule for an incident in Service Operations Workspace, all relevant incidents are grouped as cards under **Similar open incidents**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations from the sidebar



For information on available card groups and their dependencies on recommendation rules, see Recommendation rules for an incident in Service Operations Workspace.

When you click a card or its record number, detailed information about that card and its actions are displayed in a new tab.

Every card has a primary action and multiple other actions. For every action you perform on the card, the recommendations are recomputed. You can discard a recommendation if not relevant. Also, when you perform a primary action on a card, it moves from the **Current** tab to the **History** tab.

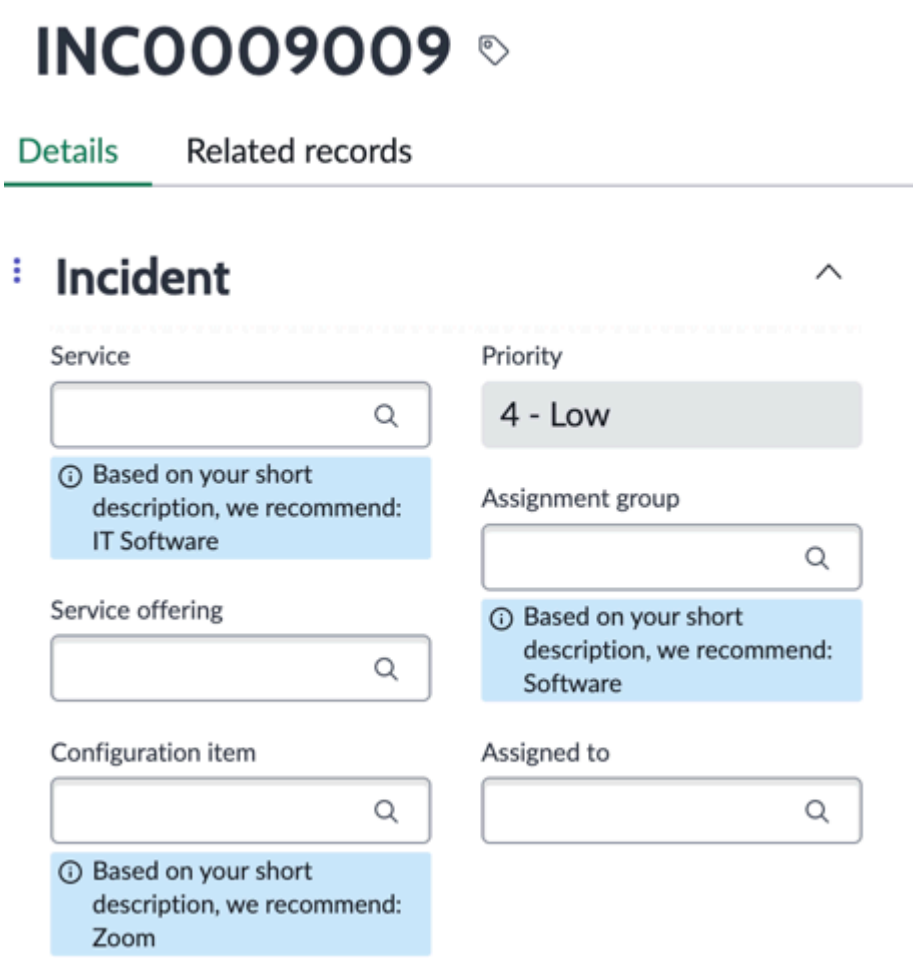
Note:
Based on the priority, the first card of the top card group is displayed as the top recommendation at the top of the **Recommendations** panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations at the field level

A predicted value is displayed at the field level based on the corresponding recommendation rule. For information about these rules for an incident, see Recommendation rules for an incident in Service Operations Workspace. When a threshold value is configured, the recommended value can be stamped or auto-populated as the field value. For information about these configurations for an incident, see Configure Recommendation Framework for an incident in Service Operations Workspace.

Recommendations at field level



Configuring Recommendation Framework

Set up Recommendation Framework so that users can review recommendations and perform an action in a configurable workspace.

For information about how Recommendation Framework can be set up in Service Operations Workspace, see Configuring Recommendation Framework in Service Operations Workspace.

Integrating Recommendation Framework with other applications

Recommendation Framework integrates with Service Operations Workspace to provide dynamic and contextual recommendations for an agent while working on an incident.

Recommendations are available in multiple areas for an incident in Service Operations Workspace. For more information about Recommendation Framework in Service Operations Workspace, see Recommendation Framework in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request Management

Request Management allows catalog items to be requested and fulfilled based on defined flows.

Related topics

- Exploring Service Catalog
- Catalog Builder

Exploring Request Management

Request Management allows catalog items to be requested and fulfilled based on defined flows.

Request Management architecture

Request Management allows catalog items to be requested and fulfilled based on defined flows.

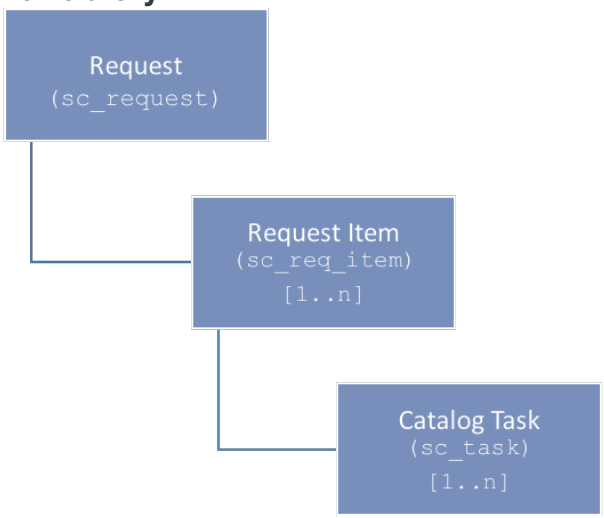
Request Management hierarchy

Service Catalog is the starting point of the request management process. The request management process is triggered only when a catalog item from the Catalog Item [sc_cat_item] table is requested.

When a user submits a request for a catalog item, records are generated in the following hierarchy.

Note:
Variables are associated only with the Requested Item [sc_req_item] table. Variables are not supported for extended tables.

Request Management hierarchy



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you configure Request Management:

- The data model does not support a record producer generating request management objects such as request, request item, and catalog task. Hence, do not use a record producer to insert records in the following request management tables or their extensions:
  - Request [sc_request]
  - Request Item [sc_req_item]
  - Catalog Task [sc_task]
- Do not write business rules with the `before` trigger for the following tables:
  - Request [sc_request]
  - Request Item [sc_req_item]
  - Cart [sc_cart]
  - Cart Item [sc_cart_item]

Request management process

Catalog item is ordered directly without adding it to the cart

When a catalog item is ordered or requested directly without adding it to the cart, the following steps are performed:

1. A temporary cart, sc_cart, is created.
2. The catalog item along with the variables (values entered by the user) is added to the temporary cart as a record in the Cart Item [sc_cart_item] table.
3. The variables are saved in the Options [sc_item_option] and Variable Ownership [sc_item_option_mtom] tables.
4. The temporary cart is checked out by performing these steps.
   a. A record in the Request [sc_request] table is initialized but not committed in the database.
   b. A record in Request Item [sc_req_item] table is initialized but not committed in the database.
   c. The request reference for the Request Item [sc_req_item] table record is updated with the Request [sc_request] table record.
   d. The variables record in the Options [sc_item_option] and Variable Ownership [sc_item_option_mtom] tables are updated based on the Request Item [sc_req_item] table record.
   e. The Request Item [sc_req_item] table record is committed in the database.
   f. The Request [sc_request] table record is committed in the database.

Request is submitted after adding the item to the cart

If a catalog item is added to the cart and the request is submitted using the checkout process, the default cart is checked out.

All steps mentioned in the preceding scenario, Catalog item is ordered directly without adding it to the cart, are applicable. However, if multiple catalog items are added to the cart, step b to step e are repeated for each item.

Request is submitted using an order guide

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a two-step order guide checkout, the temporary cart is used for all items. For a three-step order guide checkout, the default cart is used for the items.

All steps mentioned in the preceding scenario, Catalog item is ordered directly without adding it to the cart, are applicable.

Note:
The base system workflow attached to the request is demo data.

Create a catalog request in Agent Workspace

Create a request from Universal Request

Configuring Request Management

Configure Request Management to enable the agents to efficiently manage multiple incidents, catalog requests, and catalog tasks.

Request Management integration with Universal Request

Integration of Request Management with the Universal Request application extends the capabilities of Universal Request and enables your employees and agents to create a universal request by submitting a request from a catalog item or record producer. This integration provides a consistent ticketing experience and facilitate inter-department request transfers.

Note:
To use this capability, enable the *sn_uni_req.com.snc.ur.request_integration* property under Universal Request properties in the Universal Request application. For more information, see Universal Request properties.

Configure the catalog item or record producer to create a universal request. The associated requested item (for catalog item) or task-based record (for record producer) becomes the primary ticket for that universal request. For more information on Universal Request, see Exploring Universal Request

Benefits of integrating with Universal Request

The integration enables you to perform the following actions:

- Create a request directly from the Universal Request application using the **Create Request** option.
- Transfer a request to another department or back to the Universal Request queue by using the **Transfer** option.
- Configure a catalog item as Universal Request and automatically associate the request as a primary ticked for the universal request. For more information, see Configure a catalog item or record producer to create a universal request.
- View all the associated requests and request items as a related list for a universal request.
- Employees can view the details related to their Universal Request from Employee Center.

System requirements to integrate Request Management with Universal Request

Ensure that you have installed the Universal Request plugin (com.snc.universal_request) to create a universal request from a request item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the plugins are installed, in the Universal Request application properties, set the *sn_uni_req.com.snc.ur.request_integration* to true. For more information, see Universal Request properties.

Create a request from Universal Request

As a routing agent, create a request from a universal request and then assign it to the appropriate assignment group. The request manager handles the requested items and takes further actions to fulfill the request.

Before you begin

Ensure that you have the following plugins installed.

- Universal Request plugin (com.snc.universal_request)
- Request Management plugin (com.sn_cs_sm_request)

Note:
A request is associated with the parent Universal Request record only when you have the following conditions set:

- The *glide.sc.use_cart_layouts* system property is set to true.
- The **Use Cart Layout**" check box for an individual catalog item is selected.

Role required: routing agent

Procedure

1. Navigate to **Universal Request** > **All**.
2. Open the universal request record from which you want to create a request.
3. Select **Create Request**.

Result

A request is created and is automatically assigned to the appropriate assignment group. If required, you can also add more details on the Requested item form.

On the Requested item form, the universal request number that was used for creating the request is displayed. The request item number (RITM#) appears in the **Primary ticket** field on the Universal Request form and also under the Associated Requests related list.

Requested item state mapping

Map your requested items states to the universal request (UR) states to provide a better user experience during the requested item state transition and to track the progress of the request.

Before you begin

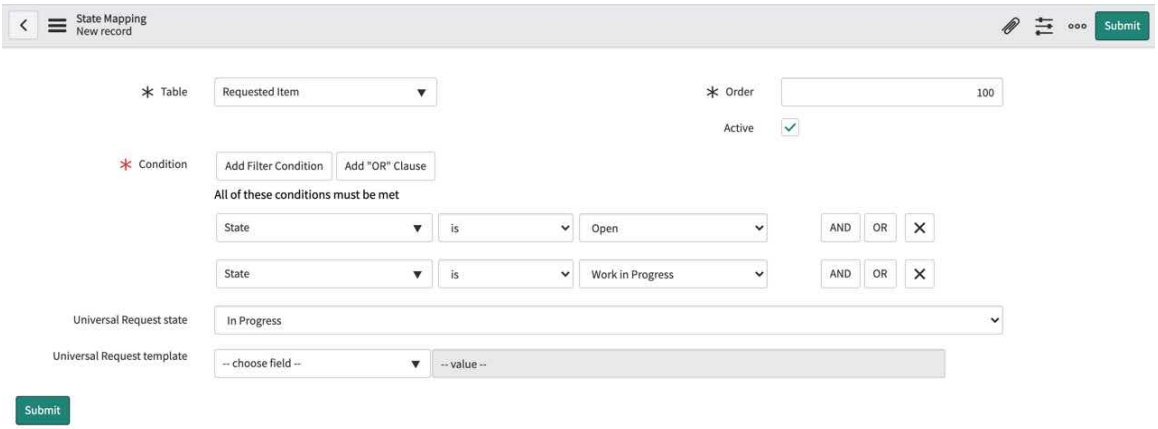
Role required: admin

About this task

Mapping the states of the requested item to the universal request state ensures that the status of request is also reflected on the state of universal request. As the request moves through different stages of the life cycle, the state of the universal request also gets updated to reflect the change.

For example, consider a universal request has a requested item as a primary ticket. When the state of the request changes from **Open** to **Work in Progress**, the universal request state changes from **New** to **In Progress**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The following table lists the default state mapping of requested item state with UR states.

Default state mapping of requested item state with UR states

Request item state	UR state
Open	In Progress
Work in Progress	In Progress
Pending	In Progress
Closed Complete	Closed
Closed Skipped	Closed
Closed Incomplete	Closed

If you change the state of the request to Close Incomplete, Closed Skipped, or Closed Complete without transferring the request back to the Universal Request queue or to another department, then one of the following action is performed:

- If the **Needs resolution review** option is selected on the Universal Request, then the state of the request changes to Close Incomplete, Closed Skipped, or Closed Complete and the UR state reason is changed to Confirm response.
- If the **Needs resolution review** option is not selected on the Universal Request, then the request is closed based on the state mapping.

Note:
By default, the **Needs resolution review** on the Universal Request is set to false.

Procedure

1. Navigate to **All** > **Universal Request** > **Administration** > **State Mapping**.
2. Click **New**.
3. On the form, fill in the fields.
   For more information, see State mapping form.

Transfer a request to another department

Transfer a request to another department with or without resolution to fulfill the request.

Before you begin

Role required: itil, routing agent, sn_request_write, or sn_hr_core_case_writer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the sn_uni_req.transfer_type property in the Universal Request properties page to determine how to handle the request transfers. For more information, see Universal Request properties.

The agent can transfer a request with one of the following reasons:

Transfer with resolution

The request is resolved and transferred back to UR, a specific department, or a service. Agents can select this option when another departments help is required to fulfill the request.

Transfer without resolution

The request isn't resolved or doesn't belong to the specific department and transferred back to UR, a specific department, or a service.

Procedure

1. Navigate to **All** > **Service Catalog** > **Open Records** > **Items**.
2. Select the request item that you want to transfer.
3. Click **Transfer**.

> **Note:**
> To transfer a request, either you must be part of the assignment group or the request must have been assigned to you.

4. In the **Transfer Ticket** dialog box, fill in the details.

Transfer ticket dialog

Field	Description
Department	Department that you want to transfer the request to.
Transfer reason	Reason why you are transferring the request to the department.
Transfer notes	Brief description on the reason for transferring the primary ticket. These notes are read by the UR Routing agent who handles universal requests.
Copy additional comments and attachments	Option to copy the comments and attachments of the request while transferring. The option is automatically selected. **Note:** Work notes are not copied while transfer.

5. Click **Transfer**.

Result

The request item is transferred to the selected department. The request is transferred based on the direct transfer mappings in mapping configuration and transfer type configurations. For more information on configuring routing, see Transfer configuration.

Agent Workspace for Request Management

Agent Workspace for Request Management integrates the platform functionality specific to tier 1 agents into an easy-to-navigate interface. This multi-tab interface helps the agents to

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

efficiently manage multiple incidents, catalog requests, and catalog tasks. The ITSM Workspace plugin (com.snc.agent_workspace.itsm) that automatically activates the Service Catalog - Workspace (com.glideapp.servicecatalog.workspace) plugin should be activated for the Request Management flows in workspace.

Request Management categories in workspace

- **Request**: Displays the active requests and requested items.
- **Catalog Task**: Displays the active tasks assigned to the current user, and to at least one of the assignment groups of the user.

Request Management forms in workspace

The form layouts, UI actions, UI policies, and client scripts that are available on the following Request Management forms in Platform are also available on the corresponding Workspace forms.

- Request
- Request Item
- Catalog Task

Note:
A variable editor is displayed as a pop-up window for request items and catalog tasks only if it is included in the Platform forms.

If you want to change the view of any workspace form, customize the workspace view from the corresponding request management form in the platform UI.

Create a catalog request in Agent Workspace

You can create a catalog request in Agent Workspace to join the Service Catalog flow from a different flow. For example, from an incident flow, you can create a request, and associate the request with the incident. It helps you in tracking the requests associated with an incident and vice versa.

Before you begin

Role required: itil

You can create a catalog request in Agent Workspace to join the Service Catalog flow from a different flow. For example, from an incident flow, you can create a request, and associate the request with the incident. It helps you in tracking the requests associated with an incident and vice versa.

- To associate a request with any parent table record, the corresponding mapping configuration should be available in the **Catalog Administration** > **Request Parent Mapping** submodule.
- To associate a record producer request with the parent table record, retrieve the *sysparm_parent_sys_id* and *sysparm_parent_table* parameters from the URL using the RP.getParameterValue() method in the **Script** field of the record producer.
- For the **Create Request** UI actions in workspace on the Interaction [interaction] table, the field values should be as follows:
  - **Workspace Client Script**:

```
function onClick() {
    var result = g_form.submit('sysverb_ws_save');
    if (!result) {
        // failed form submission
        return;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    }
    result.then(function () {
        var params = {};
        params.sysparm_parent_table = "interaction";
        params.sysparm_parent_sys_id =
 g_form.getUniqueValue();
        g_service_catalog.openCatalogItem('sc_cat_item',
 '-1', params);
    });
}
```

- For the **Create Request** UI actions in workspace on the Incident [incident] table, the field values should be as follows:
  - **Condition**: `current.incident_state != global.IncidentState.CLOSED && gs.hasRole("itil")`
  - **Workspace Client Script**:

```
function onClick() {
    g_form.submit('sysverb_ws_update').then(function () {
        var params = {};
        params.sysparm_parent_table = "incident";
        params.sysparm_parent_sys_id =
 g_form.getUniqueValue();
        g_service_catalog.openCatalogItem('sc_cat_item',
 '-1', params);
    });
}
```

Procedure

1. Initiate a catalog request using any of the following options.

2. Click **Order Now**.
   The Order Confirmation window is displayed.

   Note:
   The value in the **Request for** field is set by default depending on where the request is created:
   - If the request is created from an incident, the value is set to the person who called in the incident.
   - If the request was started from an interaction, the value is set to the person with whom the interaction is happening.

3. **Optional:** Specify the **Delivery Information** and **Special instructions**.
4. Click **Checkout**.
   The request is created and associated with the parent incident.
5. Click **Close**.
6. **Optional:** To view the created request, click **View Details**.

Domain separation in Request Management

This is an overview of domain separation in Request Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Activation information

The Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions.installer) should be activated to enable domain separation for Request Management. For information on how you can request for this plugin activation, see Request domain separation.

How domain separation works in Request Management

Fulfillers see only requests, requested items, and catalog tasks that have been created within the (tenant) domain for which the fulfiller has the visibility. For information on visibility in domain hierarchies, see Visibility domains and Contains domains.

Domain separated tables

- Request [sc_request]
- Requested Item [sc_req_item]
- Catalog Task [sc_task]

Use cases

- A user belonging to “Initech” domain, submits a request. Only those fulfillers belonging to “Initech” domain or global domain can see this request.
- A fulfiller belonging to a parent domain can see requests, requested items, and catalog tasks of all its child domains as well.
- A fulfiller belonging to a specific domain can create requests only on behalf of the domains that they have access to.
- If a user has access to multiple domains, the domain specified on the current record drives the functionality of that record and reference fields.

Request ITSM Roles - Request Management

Request the ITSM Roles plugin (com.snc.itsm.roles) to activate the ITSM Roles — Request Management plugin (com.snc.itsm.roles.request_management) to gain more control over the access that different service desk agents, technicians, and managers have within your Request Management process.

Before you begin

Role required: admin

About this task

The ITSM Roles plugin (com.snc.itsm.roles) includes an additional security model. The security model provides more granular roles across ITSM applications as well as within them, allowing you flexibility in setting up access controls. The ITSM Roles plugin is available by default in new instances. Users upgrading from Madrid or earlier versions must request the plugin.

Plugins for ITSM Roles

Plugin	Adds roles
Business Stakeholder [com.snc_business_stakeholder]	business_stakeholder **Note:** The business_stakeholder role contains the sn_incident_read, sn_problem_read, sn_change_read, sn_request_read, and approver_user roles.
ITSM Roles — Incident Management [com.snc.itsm.roles.incident_management]	• sn_incident_read • sn_incident_write
ITSM Roles — Problem Management [com.snc.itsm.roles.problem_management]	• sn_problem_read • sn_problem_write
ITSM Roles — Change Management [com.snc.itsm.roles.change_management]	• sn_change_read • sn_change_write
ITSM Roles — Request Management [com.snc.service_management.roles.request_management]	• sn_request_read • sn_request_write • sn_request_comment_write

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins for ITSM Roles (continued)

Plugin	Adds roles
	Note: The sn_request_comment_write role alone doesn't give access to comments write, you need write access for the table.

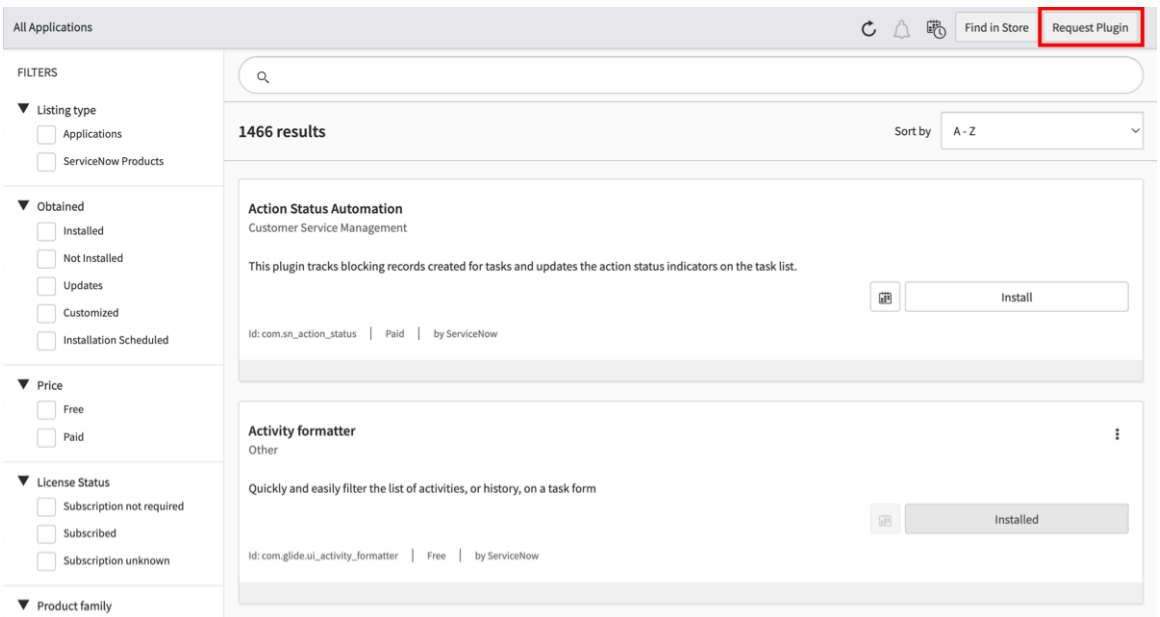
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

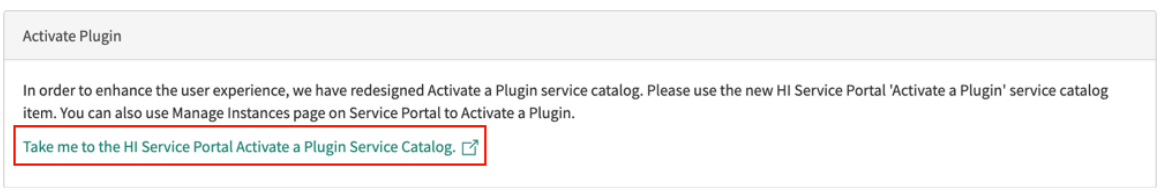
Note:
Activate the ITSM Roles plugin on a subproduction environment and test the functionality before requesting activation in the production environment. For assistance, contact the ServiceNow Professional Services team.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

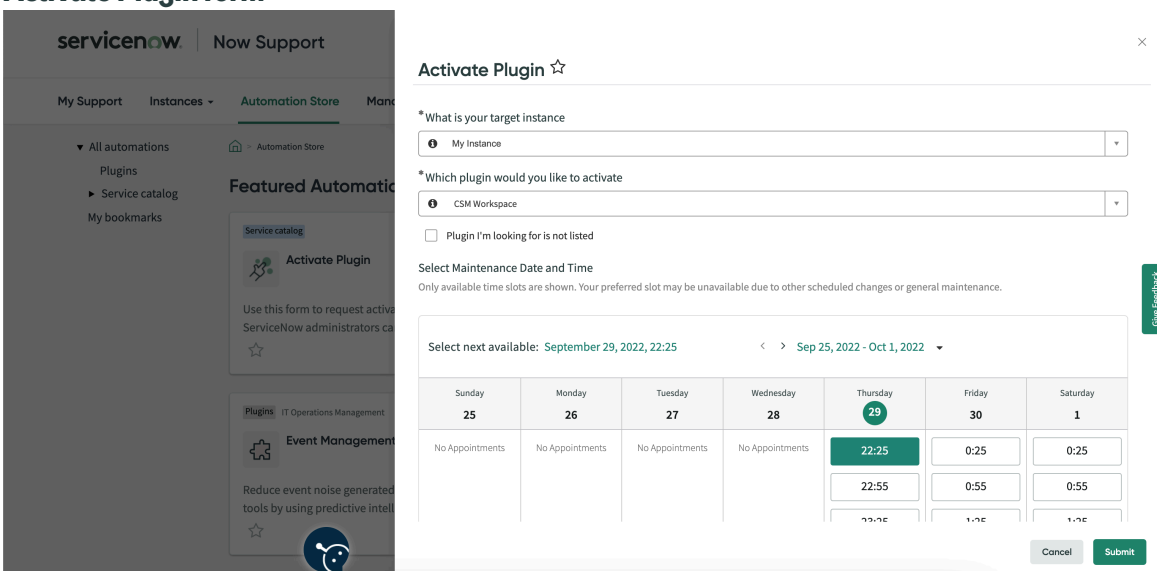
Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Components installed with ITSM Roles — Request Management

Several user roles are installed with the activation of the ITSM Roles - Request Management plugin (com.snc.itsm.roles.request_management).

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
sn_request_read	Read access to the Request (sc_request) or Requested Item (sc_req_item) only for a user who is also an approver of the request or requested item. **Note:** As there are future updates expected for the sn_request_read role, do not assign it to users without the business_stakeholder role.	NA
sn_request_write	Write access to the Request (sc_request) or Requested Item (sc_req_item).	• task_editor • dependency_views • agent_workspace_user • view_changer • cmdb_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
		• cmdb_query_builder_read • sn_request_read
sn_request_comment_write	Write access to the comments for the Requested Item (sc_req_item). **Note:** The sn_request_comment_write role alone does not give access to comments write, you will need write access for the table.	NA

Activate Business Stakeholder

Activate the Business Stakeholder plugin (com.snc.business_stakeholder) if you have an admin role. This plugin installs the Business Stakeholder role. Users with this role can view and approve records at all ITSM product levels.

Before you begin

Role required: admin

Note:
Ensure that ITSM Roles plugin (com.snc.itsm.roles) is activated before you activate the Business Stakeholder plugin. For more information to activate ITSM Roles plugin, refer Request ITSM Roles- Change Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

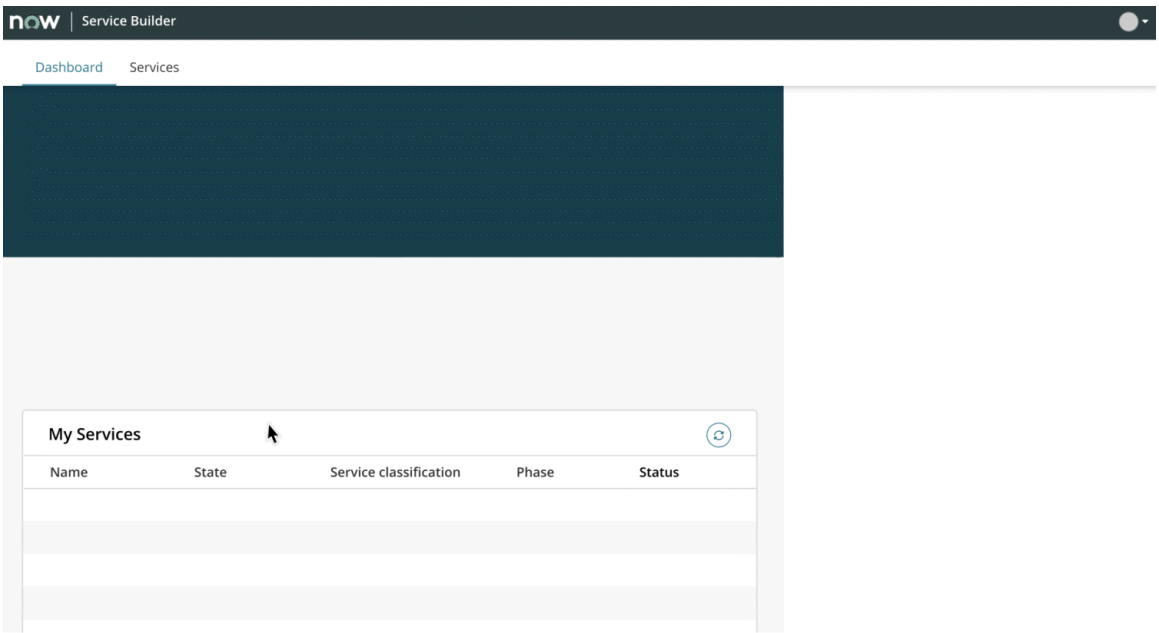
Roles installed

Role title [name]	Description	Contains roles
Business Stakeholder [business_stakeholde	Users with this role can view and approve records within all products of ITSM. **Note:** The business_stakeholder role contains the following ITSM roles sn_incident_read, sn_problem_read, sn_change_read, sn_request_read, and approver_user roles.	• pa_viewer.business_stakeholder • approver_user.business_stakeholder • cmdb_read.business_stakeholder

Service Builder

Create and edit services and service offerings using the ServiceNow® Service Builder application. Service Builder is an interactive, guided experience as you create and edit services and service offering details. Even though Service Builder is a feature of Service Portfolio Management, its plugin is part of the Digital Portfolio Management list of products in the ServiceNow Store.



Tip:
Refresh the browser to replay the demo video.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Builder overview

Create and maintain definitions of your business and technical services and offerings through a guided experience in Service Builder. You can edit service definitions anytime before you publish as well as update already-published services using version control.

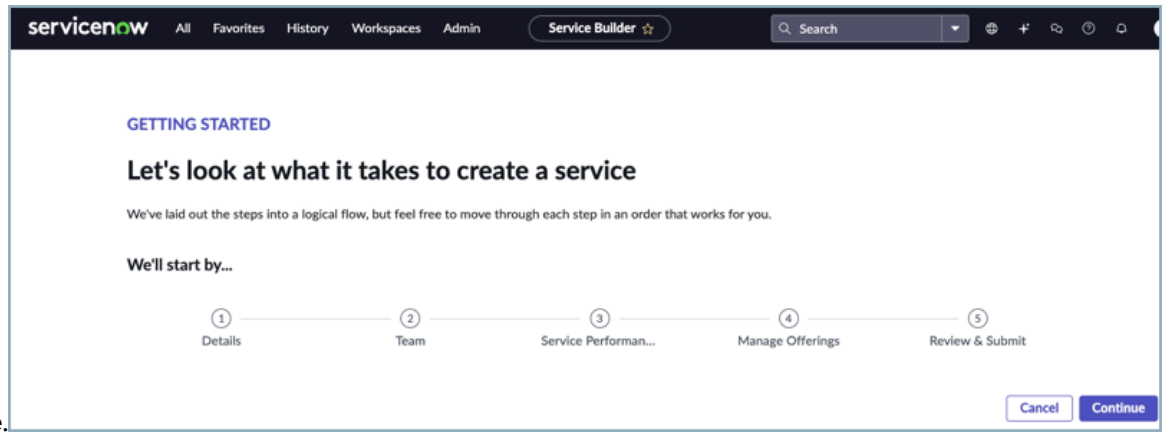
After your services and offerings are published, you can view and edit them in the **Services** tab of Service Builder or in its parent application Service Portfolio Management.

Walk-through experience with contextual guidance

Service Builder provides contextual guidance for each step tab as you create your services and service offerings. From the Service Builder **Dashboard** tab, create a service by selecting one of the two options:

- **Create a business service**
- **Create a technical service**

After you select an option, Service Builder provides an organizer for you to see the steps to create a service.



Selecting **Continue** takes you through each step, starting with the **Details** tab as described in the following Service Builder tabs table.

Service Builder tabs

Tab	Definition
Details	General information about the service such as name, type, and classification.
Team	Service team information including the owner, delegate, and business contacts.
Service Performance	Measurement criteria for the service performance.
Manage Offerings	General information about the service offering. This tab has its own set of tabs to enter or edit the offering's details, team, operations, financials, and performance criteria.
Review and Submit	Comprehensive view of the services and offerings you created. You can make changes, if necessary. After review, submit for publishing.

You can edit your services and offerings at any time. You can also duplicate them (create a copy) to edit services, as needed so that you can create other services and offerings quickly. The contextual guidance in the experience walks you through how to do these tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After you edit a service or an offering, the published version stays active until the draft that you're working on becomes the new published version. For more information, see Service Builder approval flow.

Service Builder home page tabs

Home page tab	Description
Dashboard	The default landing page where you can create a business service or a technical service. You can also view services that you interacted with in the last few days from the dashboard view.
Services	List of all services along with their state, classification, phase, status, and owner. If you have editing access to the services and service offerings, you can edit them from this tab.

Install Service Builder

You can install the Service Builder application (sn_service_builder) using the admin role. The application installs related plugins that aren't already installed. It also installs the Service Builder components plugin to enable UI components for the product.

Before you begin

Confirm that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Search for Service Builder.
3. Select **Install** and follow the onscreen instructions.

   If the application doesn't display in your search, then request it from the ServiceNow Store.

   - Visit the ServiceNow Store website.
   - Search for Service Builder.
   - Follow the online screen instructions to install the application.
     - If the **Compatibility** release differs from what you want, then select **Other App Versions**.
     - Open the version that you want, and then select **View Details**.
     - Select **Install** and follow the onscreen instructions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with Service Builder

Roles are added to Service Builder with the activation of ServiceNow® Service Portfolio Management.

Roles

Service Builder roles

Role	Description
Service admin	The service admin role can create services and edit any services, even services that they didn't create.
Service author	The service author role can create services and edit the services that they create.
Service editor	The service editor role can edit services that they own. They can't create services.

Service Builder is a feature of Service Portfolio Management. Its plugin (sn_service_builder) is activated from the base system and activates related plugins that aren’t already active.

Note:
Even though Service Builder is a feature of Service Portfolio Management, its plugin is part of the Digital Portfolio Management list of products in the ServiceNow Store.

Related topics

Installed with Service Portfolio Management

Service Builder approval flow

As you create and edit services and service offerings in Service Builder, various states get assigned and change on the services' way to being published (approved). Administrators enable the standard approval flow and can even customize it using the subflow option in Workflow Studio.

Standard approval flow

By default, the approval flow in Service Builder is set to approve services automatically.

When editing a service or offering in Service Builder, the standard approval flow is as follows:

- As you edit a service or offering, it's in a **Draft** state.
- After you submit your service or offering, it moves into the **Awaiting approval** state.
- After your service or offering is approved, it moves into the **Published** state.

You can edit (checkout) a service or a single offering, one at a time. You can also edit a service without checking out its child offerings — The offerings remain in the **Published** state until they’re separately checked out.

When you check out an offering to edit it, the offering and its parent service both get checked out. The rest of the child offerings of that parent service remain in the **Published** state. After you finish editing the offering, submit it to the parent service so the offering can be republished (offerings are published via the parent service).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service states

See the following table for each state in the standard service and service offering approval flow.

State	Description
Published	When a new service or offering is created and submitted in Service Builder, the item goes through an approval process before it's assigned to the **Published** state. The **Published** state indicates that the item is the version being used by the application and available for others. When you edit a published item, Service Builder automatically checks out the item for you and creates a copy for you to work on. The copy is set to the **Draft** state.

Draft	A service item is in the **Draft** state in one of these scenarios:
	• A new service or offering is being created in Service Builder and hasn't yet been submitted.
	• An existing published service or offering has been checked out for editing in Service Builder.
	  ○ When the item is being edited, Service Builder checks out the item and creates a copy of it and its related records (offerings and subscribers).
	  ○ The copy is in a **Draft** state.
	
	Note:
	In the **Draft** state (checked out), the item displays in both Service Builder and in Service Portfolio Management in one or more of the following ways:
	▪ The word [DRAFT] is in front of the checked out item name.
	▪ A red dot ( ) is next to the item, signifying that it's read only.
	▪ A clear triangle warning symbol ( ) is next to the item name, signifying it's the new copy (DRAFT) that's being worked on.
	
	  ○ The published item remains in the **Published** state and the **Checked out** field is set to **True**.
	  ○ After editing and submitting the item, the edits to the draft are merged with the related published item, and then the draft version is deleted.

Awaiting approval	After submitting your service or service offering, your submission goes through an approval process. Your organization's approval flow confirms that the service is created according to standards such as naming conventions, descriptions, proper use of commitments, and key performance indicators (KPIs). It also enables a quality check to confirm services aren't duplicative. The following lists the tasks for each persona in the approval flow:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Description
	• Service owners create or edit services and offerings in the **Draft** state and then submit them for approval. • Process owners and portfolio owners review and approve services and offerings before they approve them for publishing. • Process owners and admins can access the 'Service Builder publish' subflow in Workflow Studio to set up and modify the approval flow based on the organizations needs.

Important:

- You can only edit an item when it's in a **Draft** state. You can't edit a published item that has been checked out.
- An item in the **Draft** state is always inactive and doesn't show up in a search or when you're browsing.
- You can't change the **Active** flag of an item in the **Draft** state.
- The approval process is available starting with the Utah release and after. Depending on your organization, the approval process could take some time. Contact your administrator if you have questions about the approval process time.

Enable and customize an approval flow

Administrators enable the approval flow that comes with the base system by updating the 'Service Builder publish' subflow in Workflow Studio.

Administrators can also create a customized approval flow that best meets the organization's needs. See the following for more information about these tasks in Workflow Studio:

- Edit a flow
- Ask for Approval action
- Create a flow in Workflow Studio

Create a service in Service Builder

Create a service in Service Builder to model, map, and document your own business and technical services and offerings that relate to your data in Service Portfolio Management.

Before you begin

Role required: service_admin, service_author, portfolio_admin, or portfolio_editor

About this task

The Service Builder framework offers you the option to create a business service or a technical service. Once you select the type of service that you want to create, the workflow guides you through the process of adding information in a logical order:

1. **Details**
2. **Team**
3. **Manage Offerings**
4. **Review and Publish**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
You can cancel out of creating a service anytime by selecting the **Cancel** button (next to the **Save** button). Also, to return to the home page at any time while creating or editing a service, select .

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Builder**.
2. From the landing page, select the type of service that you want to create - **Business** or **Technical**.
3. Review the Getting Started screen, and then select **Continue**.
4. On the form, fill in the fields.

Tip:
When you check out a service that's already been created (to review or edit it), the word [DRAFT] displays in front of the service name. Once checked back in as saved, the service name doesn't have [DRAFT] in front of it.

Details form

Field	Description
Service name	Unique name that reflects the nature of the service. The name should be technology agnostic.
Consumer type	Definition of who the service is to be provided for.
Portfolio	A hierarchical categorization of services that enables you to organize your services and report on them at each level of the portfolio taxonomy.
Node	Taxonomy nodes enable you to organize and categorize services in your portfolio. Services can only be added to the lowest level taxonomy node of the portfolio.
Lifecycle status	The stage and status for the service that you're creating. If you have the CSDM Activation plugin installed [com.snc.cmdb.csdm.activation], then the CSDM compliant lifecycle fields display. If you don't have the plugin installed, then the legacy Service Portfolio Management phase and status fields display. For information on the different types of fields, see Apply the CSDM guidelines to Digital Portfolio Management.
Description	A concise description of your service to verify that it makes sense to the end user or consumer of the service.
Business criticality	Business criticality for the service: • **1 — most critical** • **2 — somewhat critical** • **3 — less critical** • **4 —not critical**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Business need	The business justification for the service. Some examples are how it reduces costs and how it increases employee productivity.

5. Select the **Team** tab or **Continue to Team**.
6. On the form, fill in the fields.

Team from

Field	Description
Owned by	Person accountable for the service and can edit this service at any time. This person is the service owner. Service owners must have the service_author role.
Delegate	Person that can edit this service and who can act on behalf of the service owner. Delegates must have the service_editor role.
Delivery manager	Person that has responsibility for the day-to-day management and delivery of this service.
Business relationship manager	Person that provides business requirements to the service owner. This person helps to define the vision, strategy, and desired outcomes for the service and works closely with the service owner.
Business contact	Person that contributes business requirements to the service, or who has a vested interest in the service performance.
Vendor	Vendor that may help deliver and support this service or may provide the required tooling or technology to deliver this service.
Stakeholders	Individuals that have a vested interest in this service.

7. Select the **Manage Offerings** tab or **Continue to Manage Offerings**.
   The **Manage Offerings tab** displays those offerings that this service is provided for and how it's provided to them. Here you can edit an offering or create a new offering. It contains tabs for the offering's details, team, operations, financials, and performance. A service must have at least one offering to be published. Select a tooltip ( ) to see a description for each tab's field entry.
8. Select **Continue to Review and Submit**.
9. Scroll down the page to review all your entries and if needed, make edits to any of your entries.
10. Select **Submit**.

Create a service offering in Service Builder

Create a service offering to define and view the products or applications that make up your service in Service Builder.

Before you begin

Role required: service_author or service_editor

About this task

A service offering represents how a service is provided and who it is for. A service must have at least one offering to be published. The workflow guides you to create a service offering in a logical order:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. **Details**
2. **Team**
3. **Operations**
4. **Financials**

Tip:
You can cancel out of creating a service anytime by selecting the **Cancel** button (next to the **Save** button). Also, to return to the home page at any time while creating or editing a service, select .

To create a service and service offering, you must be assigned the service_author role. To edit (not create) a service or service offering, you must be assigned the service_editor role.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Builder**.
2. To add or edit a service offering, select the service and then select the **Manage offerings** tab.
3. To add a new service offering, select **New**.
4. On the form, fill in the fields.

Details form

Field	Description
Offering name	Unique name for the offering that associates with the parent service.
Consumer type	The consumer type determines if the service is provided internally to the business or to the employees, or externally to customers, or to both. The options are: • Internal • External • Internal and External
Business criticality	Signifies the importance of this offering to business operations. The value of this field could be used to trigger business logic. For example, your most critical offerings may warrant special treatment for disaster recovery.
Phase	The phase for the offering: • **Pipeline**: The offering is being designed and a business case is being created. • **Catalog**: The offering has been approved and it is now being designed or is operational. • **Retired**: The offering is no longer in operation.
Status	Status enables a unique status workflow that enables you to track each step of the service offering life cycle.
Description	A concise description of the service offering to ensure that it makes sense to the end user or consumer of the service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the **Team** tab or click **Continue to Team**.
6. On the form, fill in the fields.

Team form

Field	Description
Owned by	Person accountable for the service offering and can edit the service at any time. This person is the service owner. Service owners must have the service_author role.
Delegate	Person that can edit the service offering and who can act on behalf of the service owner. Delegates must be assigned the service_editor role.
Delivery manager	Person responsible for the daily management and delivery of the service offering.
Support group	Group that provides expert support to the service offering. This group is usually a level 2 support team.
Change group	Team responsible for providing change management for the service offering.
Vendor	Vendor that may help deliver and support the service offering. This field helps show and track accountability for service offering delivery.
Stakeholders	Individuals that have a vested interest in the service offering.

7. Select the **Operations** tab or select **Continue to Operations**.
8. On the form, fill in the fields.

Operations from

Field	Description
Selected groups	Subscriber groups that have an interest in the service offering.
Selected departments	Departments that have an interest in the service offering.
Selected locations	Users by location.
Selected users	Individuals impacted by the service offering.
Selected companies	Individuals impacted by the service offering that are defined by the core company table. These individuals represent all users related to a given company. **Note:** You may need to scroll down to see the remaining fields on this form.
Selected commitments	Select commitments, for example, service level agreements and availability commitments. Commitments may be defined in a contract for the service offering or based on standards defined by your company.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service level requirements	Service level requirements for the service offering.
Active contract	Active contract to maintain awareness of the service commitments.
Additional contracts	Supporting, secondary, or past contracts related to the service offering.
Selected catalog items	Catalog item to track the request activity for all catalog items associated with this offering. A single offering can have multiple catalog items.
Offerings I depend on	Other service offerings that your service offering depends on. For example, if another offering experiences an outage, your offering availability may be impacted or degraded as a result.
Application services I depend on	Applies to business services. Application services that the service offering depends on.
Application services I contain	Applies to technical services. Application services that the offering supports.

9. Select the **Financials** tab or select **Continue to Financials**.
10. On the form, fill in the fields.

Financials form

Field	Description
Price model	How the service offering is to be priced. Your selection determines the next field to display.
Price unit	If the price model is set to **Per Unit**, then enter the price unit in this field. For example, license or subscription.
Price	If the price model is set to **Fixed**, then enter the price in this field. Be sure to enter the currency symbol as well (for example, $ for United States dollar).
Unit description	If the price model is set to **Per Unit**, then use this field to describe what is included in the unit.
The following fields appear conditionally according to the cost source selected in Service Portfolio Management. These fields are enabled as part of the financial optional plugin for Service Portfolio Management. For financial information, the required plugin is com.snc.financial_management_for_spm. For estimate spend information, the required plugin is com.snc.spm.spend. Both plugins require ITSM Pro SKU.	
Cost model	The cost model that determines how the estimated spend will be calculated.
Offering cost	If the cost model is set to **Fixed**, then the cost should represent the estimated cost of the offering per time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Time period	Interval that you want to track the estimated spend (**day**, **month**, **quarter**, **year**).
Cost Unit	If the cost model is set to **Per unit**, the cost should represent the cost per unit.
Units per period	The number of units per period.
Estimated spend	The estimated spend for this item.

11. Select **Save & Close**.

Service Operations Workspace for ITSM

ServiceNow® Service Operations Workspace is a configurable workspace that provides a unified experience for multiple IT Service Management and IT Operations Management workflows. Configure your agent experience using the easy-to-navigate interface of Service Operations Workspace for ITSM.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Contact Customer Service and Support

Exploring Service Operations Workspace for ITSM

You can manage the life cycle of task records such as incidents, requests, and walk-ups in IT Service Management workflows.

Key features

Landing page

Tailored landing page for your tier-1 and tier-2 agents. It provides an overview of outages, service announcements, and assignments to efficiently prioritize the work. Tier-1 agents can view and manage their performance and learning tasks assigned by their manager.

Incident management

Agents can manage incidents effectively with contextual information and targeted actions. Streamline investigations and accelerate incident resolution with the metrics data collected from Agent Client Collector (ACC).

Tailored recommendations

Agents can use information from similar incidents and knowledge articles to accelerate incident resolution.

Experts on-call

Agents can reach out to experts on-call for high-priority tasks.

Collaboration on incidents

Agents can collaborate with the requester and peers from the task using Microsoft Teams chat.

Request management

#Agents can create requests from incidents and interactions. Agents can also manage the entire life cycle of requests.

Walk-up experience

Agents and administrators can review and manage walk-up interactions, appointments, stockrooms, and kiosks at the walk-up service location.

Onboarding experience for logged-in users

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

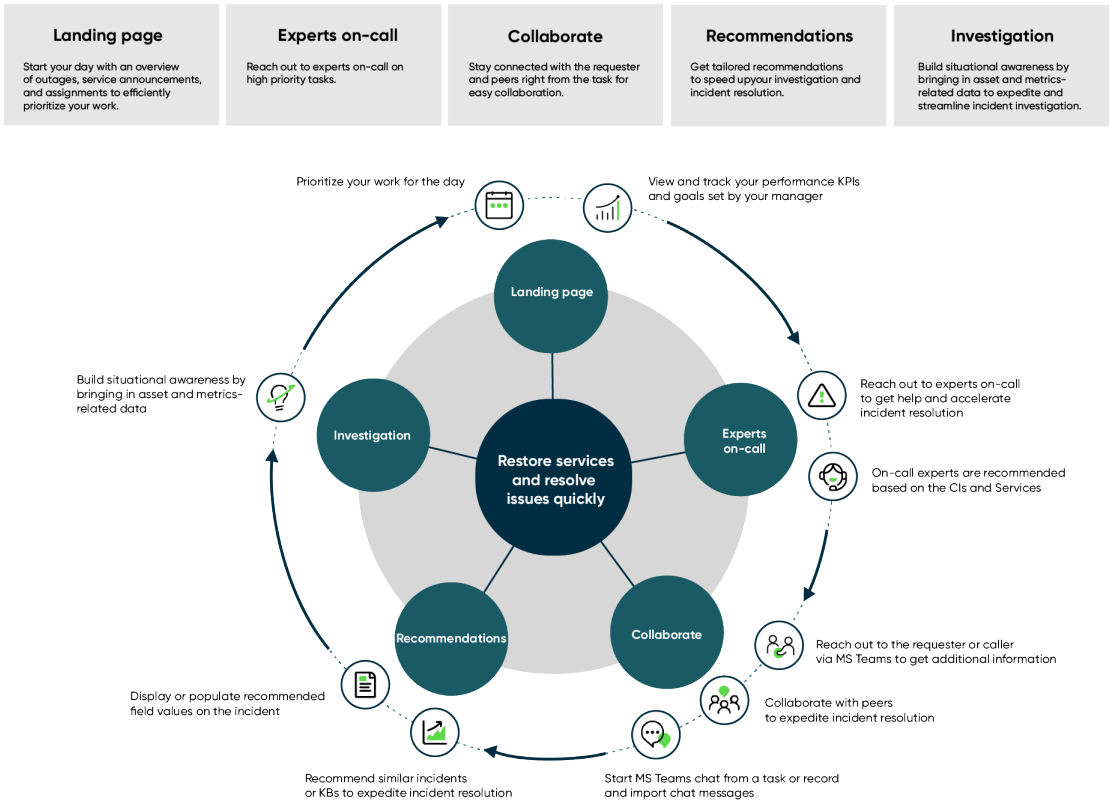
All logged-in users can view key features to get started with Service Operations Workspace for ITSM.

Guided setup

Administrators can have a guided experience for initial configuration of Service Operations Workspace for ITSM.

For information about key features in Service Operations Workspace for ITSM, see Exploring Service Operations Workspace for ITOM.

SOW workflow



Agent experience in Service Operations Workspace for ITSM

- An agent can start the day by looking at an overview of assignments, outages, service announcements, and assignments in Service Operations Workspace to prioritize work based on service level agreements (SLAs), priority level, and urgency.
- The agent can create an incident based on the issue reported. Since the agent has access to related incidents and recent interactions, better and faster support can be provided. Agent also has access to all related information from the incident record page.
- The agent can resolve the incident faster by using tailored recommendations.
- The agent can reach out to experts on-call for high-priority tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The agent can collaborate easily with the requester and peers right from the task.
- The agent can create a change request to fix the issue.

Using guided tours to learn about Service Operations Workspace for ITSM

Use a guided tour that is sequence of interactive steps to guide you through a specific process or task within SOW. To access guided tours, select the Show help icon in the navigation bar and scroll down to find the **Take a Tour** or **Select a Tour** option.

Important:

- A guided tour might break if you customize any of its associated UI elements in your instance, so ensure that you update your guided tours as well accordingly. For information on how to update guided tours, see Edit a guided tour.
- The **Take a Tour** or **Select a Tour** option is available only when a guided tour is available for that UI page.

Using guided setup to implement Service Operations Workspace for ITSM

Service Operations Workspace for ITSM guided setup provides a sequence of tasks that help you configure Service Operations Workspace for ITSM on your ServiceNow instance. To open Service Operations Workspace for ITSM guided setup, navigate to **All** > **Adoption Services** > **Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

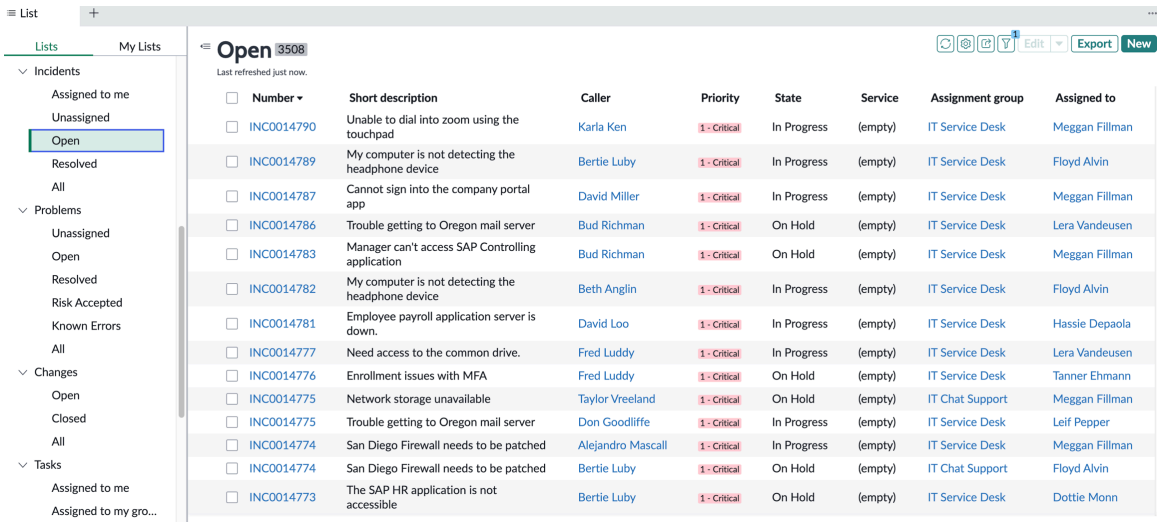
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

From the **My Lists** tab, an agent can create a separate list or a different version of the existing list. For information about creating a list, see Create a list in Service Operations Workspace.

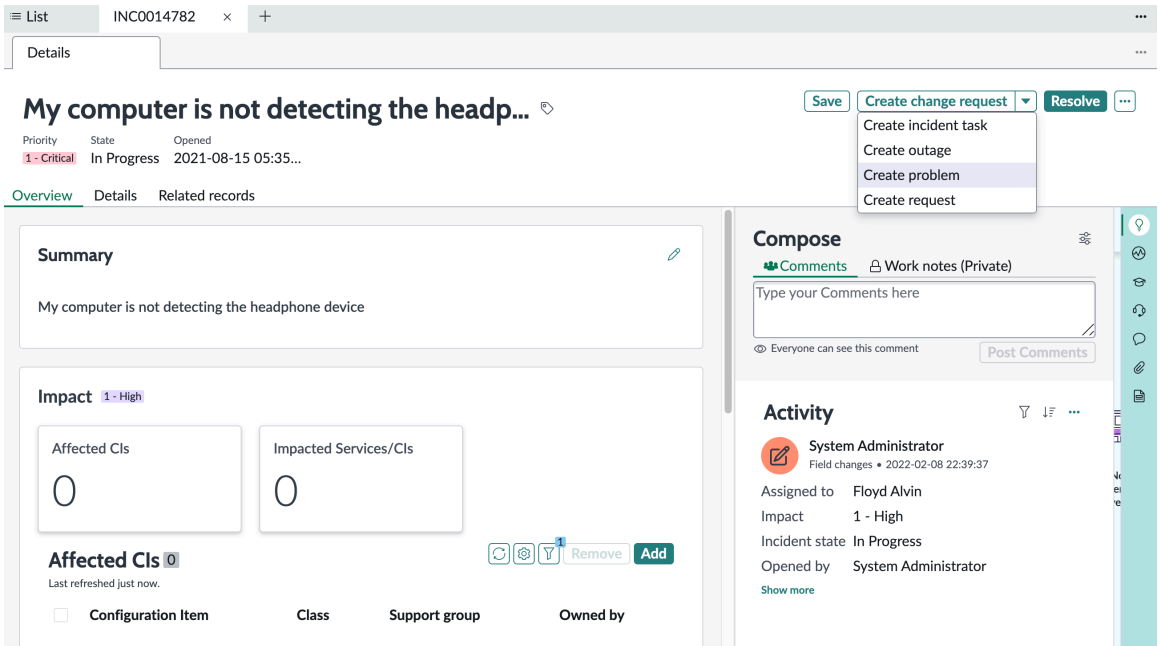
List tab



Record view

Open any task record to navigate to its record view.

Record view



Inbox

Agents can set the status to Available or Away to open or close the inbox for chat requests. When a requester initiates a chat conversation from any Service Portal page, the chat interaction appears in the inbox of all agents who are configured as group members for Agent Chat Queue. For information about inbox configuration, see Configure the inbox in Service Operations Workspace.

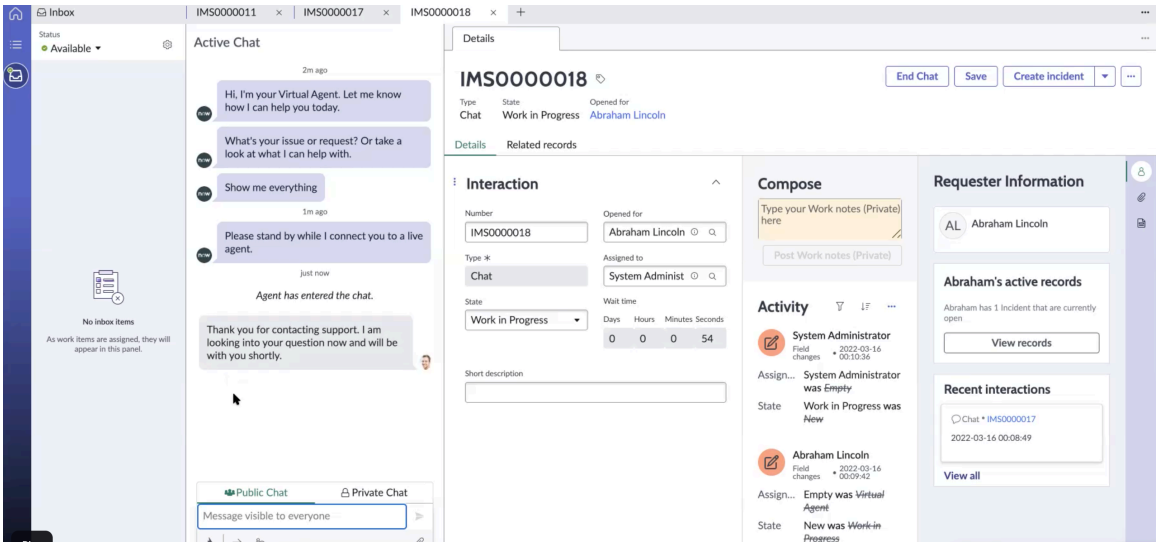
The following scenarios are possible for assignment of chat conversation to an agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the automatic assignment of chat conversations is enabled, the chat conversation is automatically assigned to the agent, an interaction record is created in Service Operations Workspace, and the agent can continue the chat conversation. Based on options selected in the Chat - Most Capacity assignment rule, the interactions can open as non-active tabs in the inbox. For information on enabling automatic assignment of chat conversations using this assignment rule, see Enable automatic assignment of interactions to an agent.
- When the automatic assignment of chat conversations is not enabled, the agent can then approve or reject the chat conversation. When the agent accepts the chat conversation, an interaction record is created in Service Operations Workspace and the agent can continue the chat conversation.

When the requester in Service Portal or the agent in Service Operations Workspace ends the chat conversation, the interaction is closed.

Inbox



Service Operations Workspace for ITSM landing page

An agent can get quick visibility into the work assigned, view announcements, and view upcoming tasks.

Required roles

A user should have the itil role to access the landing page. A tier-1 agent is an itil user who belongs to a service desk group. A tier-2 agent is an itil user who doesn't belong to a service desk group. For more information about redirection of tier-1 and tier-2 agents to the respective landing page, see Redirect non-admin users to Service Operations Workspace.

Use cases

For examples of how people in your organization can use this landing page, see these use cases. Unless specified otherwise, various sections of the landing page are available for both tier-1 and tier-2 agents.

Service Operations Workspace use cases

User	Use case
Tier-1 agent	• Get quick visibility into the work assigned to the agent or the agent's team before starting the day. • Analyze incidents and catalog tasks that need attention and navigate to the records on which action should be taken. • Monitor incidents with service level agreements (SLAs) that have been breached or at risk, open P1 incidents, or the ones not updated in 24 hours. To use the features in Workforce Optimization for ITSM, see the **Explore key features in** *`Workforce Optimization for ITSM`* section.
Tier-2 agent	• Get quick visibility into the work assigned to the agent and the agent's team before starting the day. • Analyze incidents, problems, change requests, and tasks that need attention and navigate to the records on which action should be taken. • View the upcoming tasks and announcements. • Access the recently viewed items.

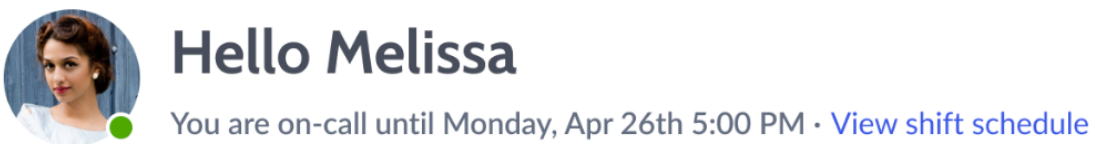
Header section

This section displays the greeting text and shift details of the agent. For information about how you can customize this section, see Configure the header message on the landing page.

Header section

Note:
A tier-1 agent with the sn_shift_planning.agent role can navigate to the shift schedule when the Shift Planning for Configurable Workspace application (sn_uib_agent_sp) is enabled.

Shift schedule of an agent



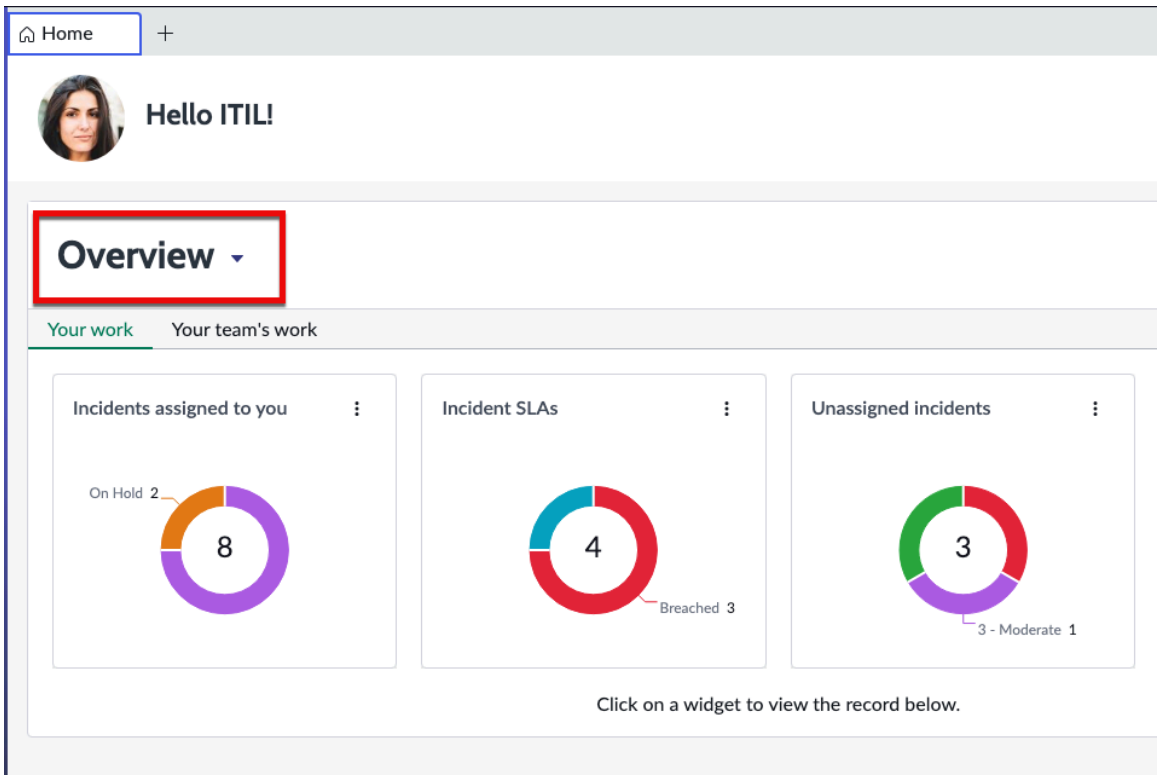
Overview section

From this section, an agent can get an overview of various assignments from the donuts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- A tier-1 agent can get an overview of catalog tasks and unresolved incidents assigned to the agent or the agent's group.
- A tier-2 agent can get an overview of problems, change requests, catalog tasks, and unresolved incidents assigned to the agent or the agent's group.
- A tier-1 or tier-2 agent can view tasks delegated to the agent by other users.



You can select the dashboard to view the data from the drop-down menu.

When an agent selects any part of the donut area, the associated records are displayed in the list view. When an agent selects the center of the donut area, all records associated with that card are displayed in a list view. From these list views, you can preview and update the record information in the workspace view for the following records by pointing to a record and selecting the preview icon (ⓘ):

- Incident
- Problem
- Interaction
- Change
- Request

For information about customizing this section, see Configure the donuts in the tier 1 landing page.

Announcements section

This section notifies an agent of any announcements. The agent can view them in a list view or grid view.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

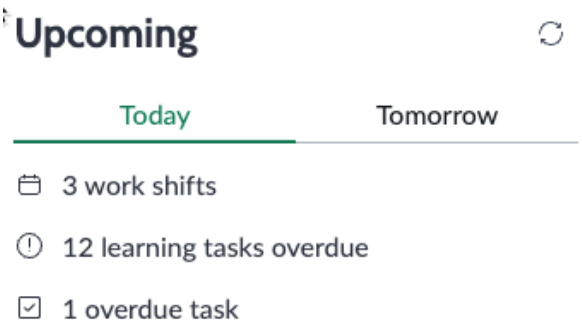
Workforce Optimization for ITSM Service Operations Workspace

If you're an agent using the Workforce Optimization for ITSM Service Operations Workspace, you can see links to your upcoming tasks at a glance in the **Upcoming**section.

- The **Today** tab shows tasks that you may want to attend to on the current day.
- The **Tomorrow** tab shows tasks coming up the day after the current day.

You can select the link to access the task.



The following table describes the tasks displayed in this section.

Tasks	Description
Events	Number of events such as training and time off that's related to your shifts. **Note:** If you have an upcoming PTO on the day after the current day, in the **Upcoming** section, the **Today** list will display that you have an upcoming PTO the next day. If you are on PTO the current day, this list does not display that you have a PTO.
Shifts	Number of work shifts.
Skill review requests	Number of requests from your manager to review your skills.
Shift sign-ups	Shifts that you can sign up for that are due on the current day and the day after the current day.

For more information on Workforce Optimization for ITSM in Service Operations Workspace, see Service Operations Workspace - Scheduling.

For information about how you can customize this section, see Configure the Upcoming section on the landing page.

Quick links section

This section displays the configured quick links. For information about how you can customize this section, see Add a user-specific quick link on the ITSM landing page.

Exploring Recommended Actions for ITSM in Service Operations Workspace

Recommended Actions for ITSM allows you to set up and apply real-time actionable recommendations for speeding up the triaging process and resolving issues quickly across various records in the Service Operations Workspace, including Incident, Incident task, Problem, Problem task, Change request, Change task, Interaction, and Request.

Recommended Actions for ITSM overview

There are two ways in which recommendations appear- as actionable real-time recommendations in the side panel and as field level recommendations while updating or creating the records in Service Operations Workspace.

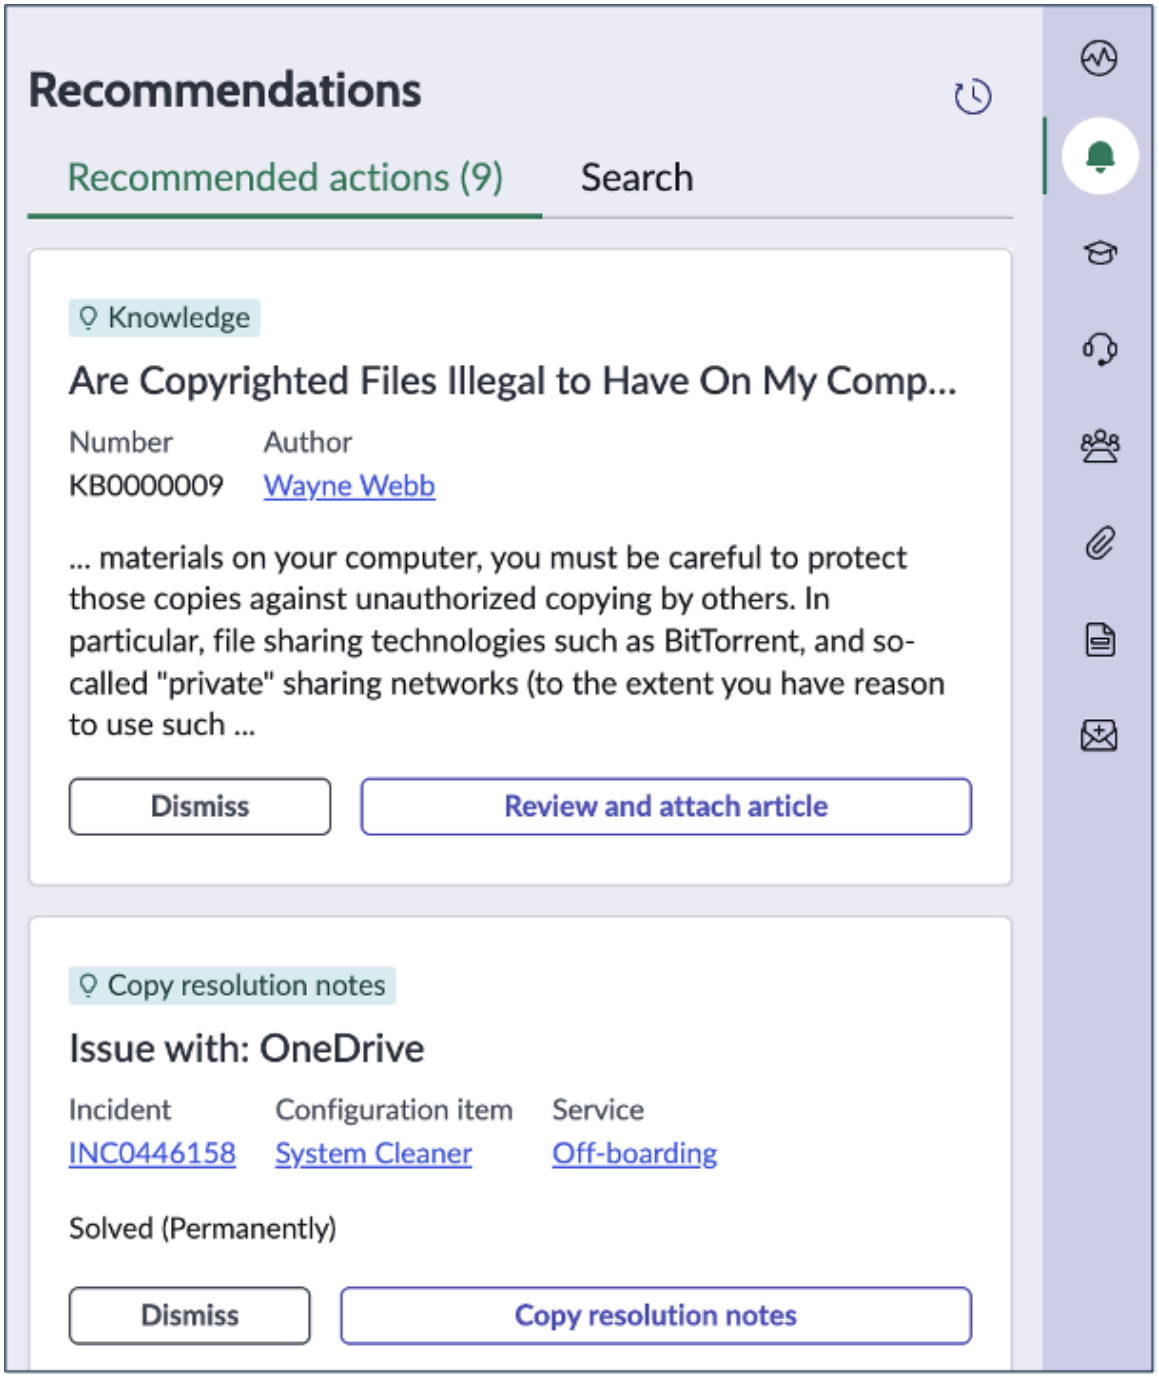
Note:
Field level recommendations are available only for Incidents in Service Operations Workspace.

Agents can access recommended actions in Service Operations Workspace by selecting the **Recommendations** icon ( ) in the side panel. They can also manually search for AI-powered recommendations to quickly find solutions. These search results are available in the following records:

- Incident
- Incident task
- Problem
- Problem task
- Change request
- Change task
- Interaction
- Request

For incident records, clicking the **Recommendations** icon ( ) displays the **Recommended actions** and **Search** sub-tabs, as shown in the following diagram.

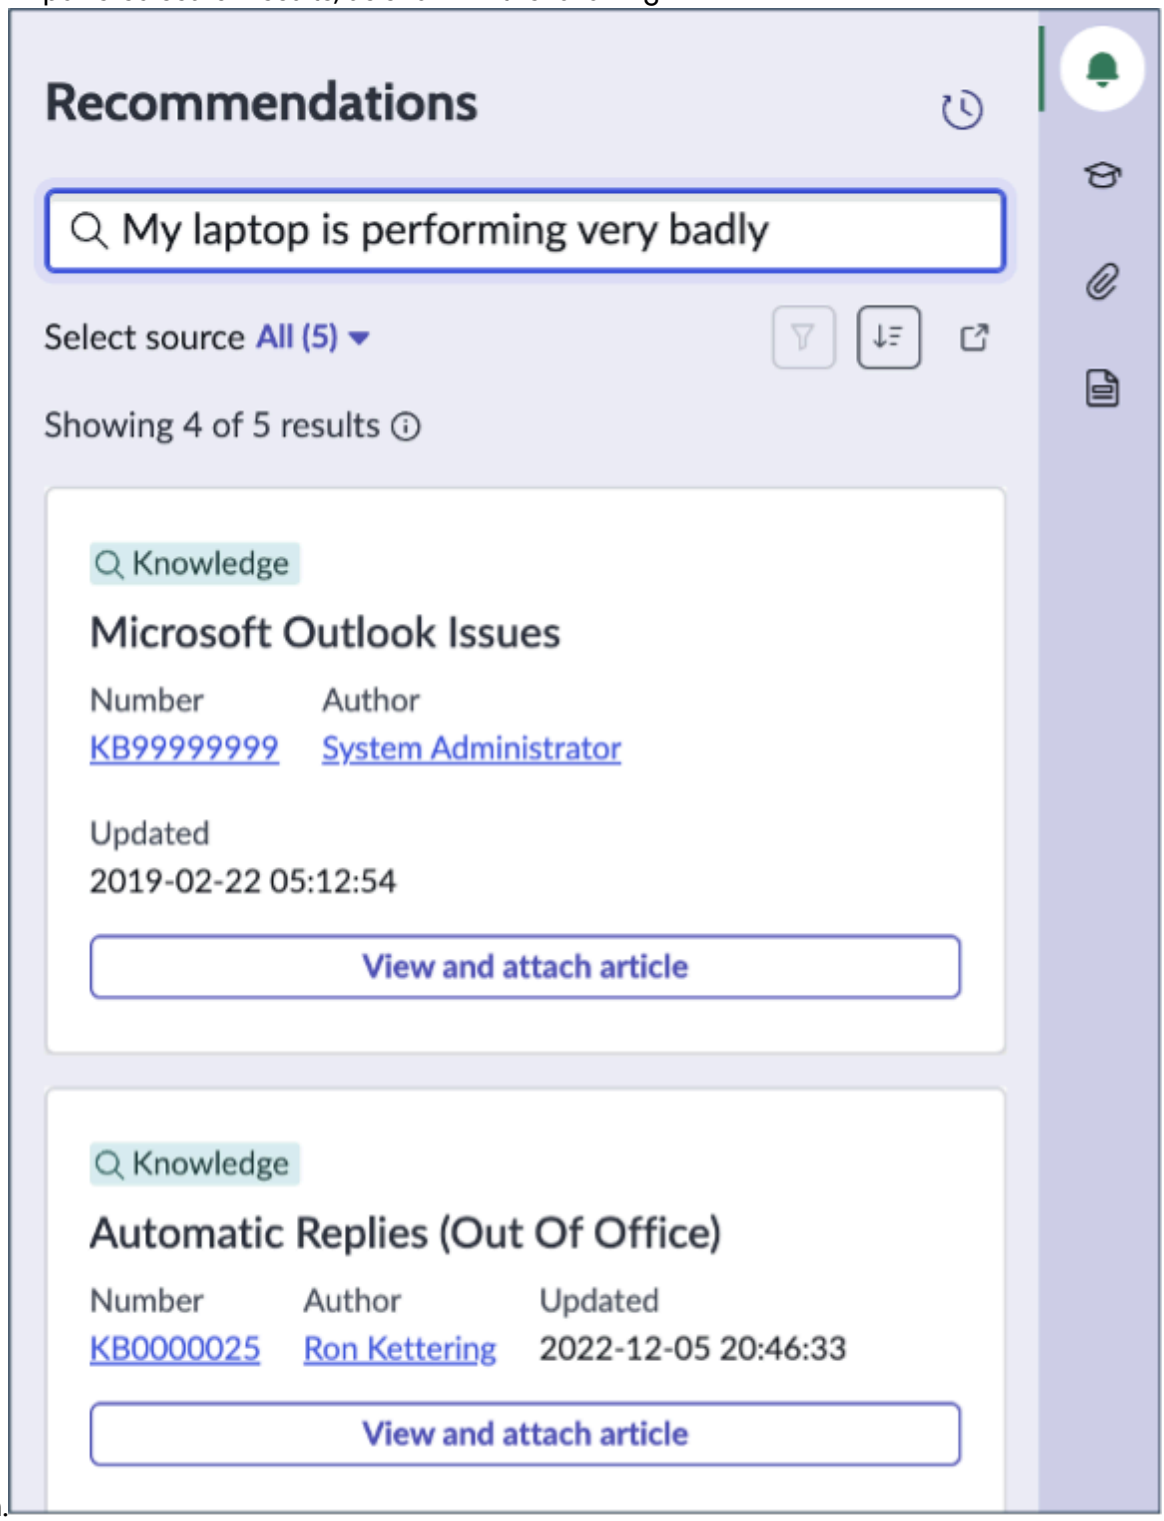
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
The **Search** sub-tab allows you to manually search for AI-powered recommendations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

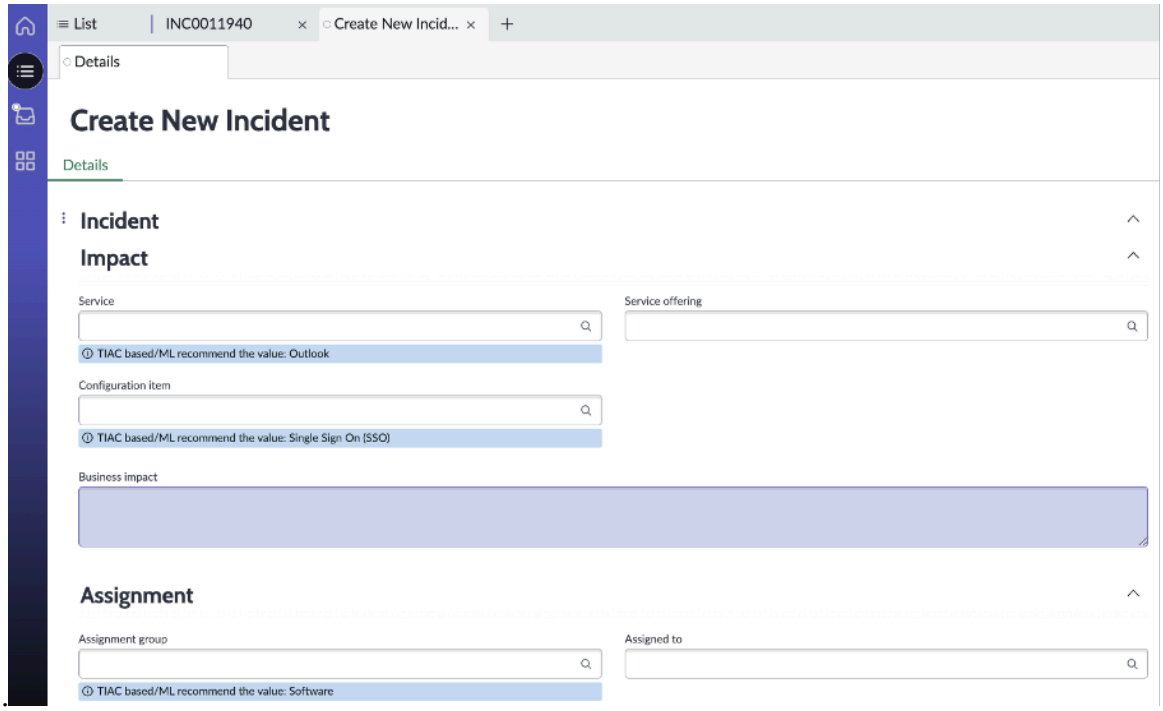
For other records, clicking the **Recommendations** icon ( ) displays only the AI-powered search results, as shown in the following diagram.



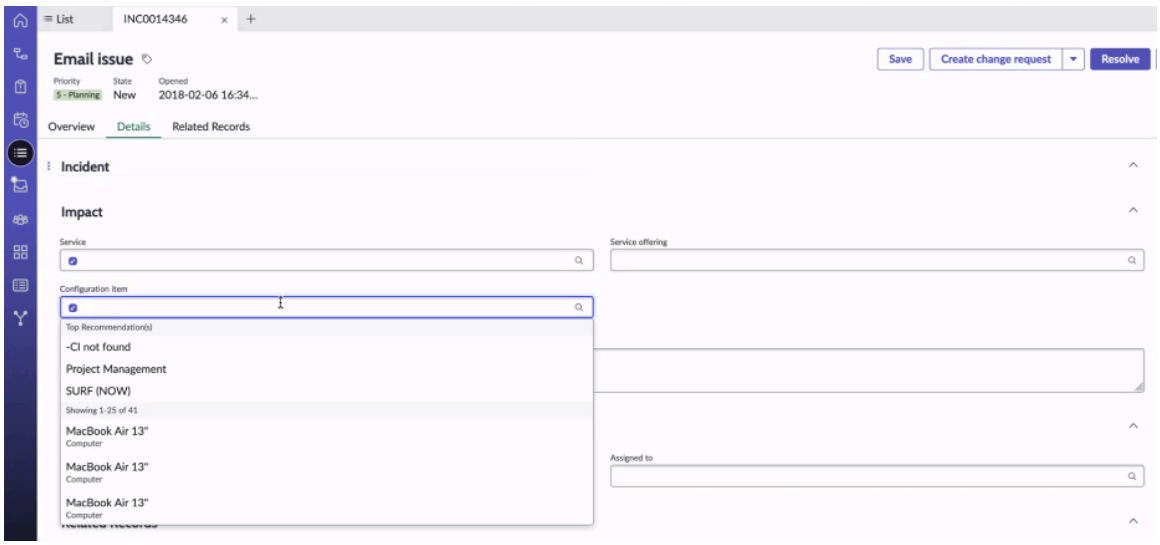
For more information, see Get Guidance based recommendations.

Agents can view field-level recommendations in the fields of an incident form in Service Operations Workspace. If you're on version prior to 4.2, the recommendations appeared as shown in the following diagram.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Starting from the version 4.2, field recommendations appear in a drop-down when you click in the field. For more information, see Get field recommendations.



Request apps on the Store

Visit the#ServiceNow Store #website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the#ServiceNow Store#version history release notes .

Application Details

There are two versions of Recommended Actions - Standard and Advanced.

The standard version of Recommended Actions for ITSM is provided as a new feature in Incident Management for the Service Operations Workspace application, which is a part of Service Operations Workspace 3.0.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Existing users that have upgraded to Service Operations Workspace 3.0 get the standard version of Recommended Actions for ITSM by default as a new feature. New users get the standard version of Recommended Actions after installing the Service Operations Workspace ITSM (sn_sow_itsm_cont) application from the ServiceNow Store.

Users on Service Operations Workspace 6.0 will receive the new standard plugin, Recommended Actions for ITSM (sn_itsm_ra), which includes all the standard features.

To get the advanced version, users must install the Advanced Recommended actions for ITSM (sn_sow_itsm_ra_advanced) plugin and must procure the ITSM Pro package subscription.

Note:
To get the advanced version, you can install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription. For more information, see Configuring Recommended Actions for ITSM in Service Operations Workspace.

Workflow

The workflow for Recommended Actions for ITSM includes the following:

1. Use Context: Use any of the following context to find and use the recommendations in Service Operations Workspace.
   - Incident
   - Incident task
   - Problem
   - Problem task
   - Change request
   - Change task
   - Interaction
   - Request

   Note:
   - For incidents, you can use guidance based recommendations in the **Recommended actions** sub- tab or manually search for AI-driven recommendations in the **Search** sub-tab.
   - AI-powered search results are available in the following eight record types: Incident, Incident task, Problem, Problem task, Change request, Change task, Interaction, and Request.

2. Set Rule: Configure the recommendations for required roles and conditions.
3. Create Recommendations: Create recommendations where you select a resource generator and action types.
   - Create Resource Generator: Resource generators provide information that you can use as inputs to actions such as recommendation guidance and field recommendations. The trained machine learning solution models configured in Predictive Intelligence or Task Intelligence for ITSM are used as solutions in the generator type to get the required recommendations for the incident forms in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The **Incident Fields value prediction (TI)**, **Similar Incidents (TI)**, **Similar Change Requests (TI)**, and **Similar Problems (TI)** are the only recommendations where the trained models comes from Task Intelligence for ITSM. For more information, see Task Intelligence for ITSM.

- All remaining recommendations use the trained model from Predictive Intelligence. For more information, see Predictive Intelligence for Incident Management.

- Create Action type: Configure the actions that an agent can perform for Recommended Actions guidance. Update the following:
  - Input: Select the input fields.
  - Output: Select the options to decide how the recommendations should look in the input fields.
  - Action: Select the actions that are presented to the agent to perform the guidance.

Note:
For more information, see Setting up Recommended Actions for ITSM.

4. Get guidance-based or field-level recommendations for records in Service Operations Workspace. For more information, see Recommended Actions for ITSM in Service Operations Workspace.

Recommended Actions for ITSM overview

IT Service Management (ITSM) includes the following base system components used to configure Recommended Actions for various records in the Service Operations Workspace, including Incident, Incident Tasks, Problem, Problem Tasks, Change Request, Change Request Task, Interaction, and Request.

Contexts in Recommended Actions for ITSM

#A context enables agents to see recommendations for a specific type of record when certain rules are met. These recommendations can help agents by suggesting actions to take based on the record context.#For more information, see Contexts in Recommended Actions.

The ITSM base system ships the following contexts:

- Incident
- Incident task
- Problem
- Problem task
- Change request
- Change task
- Interaction
- Request

For more information about the field description of this context, see Contexts in Recommended Actions for ITSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To create a context, see Create a context in Recommended Actions.

Rules in Recommended Actions for ITSM

A rule is a set of conditions that applies to a context. A rule shows recommendations to agents with certain roles for records that meet certain conditions. For more information, see Rules in Recommended Actions.

The ITSM base system includes the following rules:

- Active incident
- Active non-child non-MI Incident
- AI Search
- Major Incident with no Problem record

Note:
These rules are available only for the Incident context.

For more information about the field descriptions of these rules, see Rules in Recommended Actions for ITSM.

Note:
To create a rule, see Create a rule in Recommended Actions.

Recommendations in Recommended Actions for ITSM

A recommendation is a way to suggest a helpful action to an agent. A recommendation includes the action and any relevant resources and inputs. For more information, see Recommendations in Recommended Actions.

For more information about recommendation types, see Recommendations in Recommended Actions.

Note:
To create a recommendation, see Create a recommendation in Recommended Actions.

The ITSM base system includes Guidance-based recommendations and Field-level recommendation types.

Guidance-based recommendations

The ITSM base system includes these guidance-based recommendations:

- AI Search Recommendation
- Create Problem Record for a Major Incident
- Open incidents (CI & Service)
- Open PRBs (CI & Service)
- Similar Incidents (TI)
- Similar Change Requests (TI)
- Similar Problems (TI)
- Similar KB Articles (Similarity)
- Propose major incident (Trend)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Similar major incidents (Trend)
- Similar open Incidents (Similarity)
- Similar open PRBs (Similarity)
- Similar resolved incidents (CI & Service)
- Similar resolved incidents (Similarity)

For more information about the field descriptions of the guidance-based recommendations, see Guidance based recommendations in Recommended Actions for ITSM.

Field-level recommendations

The ITSM base system includes the following field-level recommendations:

- Predictive Intelligence -based recommendations:
  - Assignment Group (Classification)
  - Configuration Item (Classification)
  - Service (Classification)
- Task Intelligence for ITSM -based recommendation: Incident Fields value prediction (TI)

> **Note:**
> All Predictive Intelligence -based recommendations included in the ITSM base system are inactive by default. To activate them, navigate to the Recommendations screen, edit the corresponding Active column to the required recommendation of **true**, and select **Update**.

For more information about the field-level recommendations field descriptions, see Field level recommendations in Recommended Actions for ITSM.

> **Note:**
> To create a guidance and field recommendations, see Creating guidance and field recommendation in Recommended Actions.

Resource generators in Recommended Actions for ITSM

The ITSM base system includes the following resource generators:

- AI Search Resource Generator
- Assignment group using Classification.
- Configuration item using Classification
- Incident Fields predictions TI
- Similar Open Incidents with same CI & Service
- Open PRBs using CI & Service
- Propose major incident using trend
- Service using Classification
- Similar KBs using similarity
- Similar major incident using trend
- Similar open incidents using Similarity
- Similar open incidents with same CI & Service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Similar incidents using TI similarity
- Similar PRBs using similarity
- Resolved Incidents with same CI & Service
- Similar resolved incidents using similarity.

For more information about the field descriptions of resource generators, see Resource generators in Recommended Actions for ITSM.

For more information about the types of resource generator, see Resource generators in Recommended Actions.

Note:
To create a resource generator, see Create a resource generator in Recommended Actions.

Guidances

The ITSM base system includes the following guidance:

- Link to major incident
- Propose Major Incident
- Review and attach article for incident
- Show Change request [No Action]
- Show genius result [No Action]
- Show Problem [No Action]
- [Incident] Attach KB
- [Incident] Copy resolution
- [Incident] Link open incident
- [Incident] Link open problem
- [Interaction] Review and attach article
- [Non-ML] Copy resolution
- [Non-ML] Create Problem
- [Non-ML] Link open incident
- [Non-ML] Link open problem
- [Task] Link change request
- [Task] Link incident
- [Task] Link outage
- [Task] Link problem
- [Task] Order item

For more information about the field descriptions of the guidance, see Guidances in Recommended Actions for ITSM.

Note:
To create guidance, see Create a guidance in Recommended Actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Search result mappings

The search result mappings appear in AI search results for various records in the Service Operations Workspace, including Incident, Incident Tasks, Problem, Problem Tasks, Change Request, Change Request Task, Interaction, and Request.

The IT Service Management base system includes the following search result mappings based on context type:

- **Incident**: Outage [cmdb_ci_outage], Knowledge [kb_knowledge], Change Request [change_request], Incident [incident], Catalog item [sc_cat_item], Incident [incident]- Genius result for Pro plus users, Problem [problem]
- **Incident task**: Knowledge [kb_knowledge], Incident [incident], Catalog item [sc_cat_item], Problem [problem]
- **Problem**: Outage [cmdb_ci_outage], Knowledge [kb_knowledge], Change Request [change_request], Incident [incident], Catalog item [sc_cat_item], Problem [problem]
- **Problem task**: Knowledge [kb_knowledge]
- **Change request**: Knowledge [kb_knowledge], Change Request [change_request], Incident [incident], Catalog item [sc_cat_item], Problem [problem]
- **Change task**: Knowledge [kb_knowledge], Change Request [change_request], Incident [incident], Catalog item [sc_cat_item], Problem [problem]
- **Interaction**: Knowledge [kb_knowledge], Catalog item [sc_cat_item]
- **Request**: Knowledge [kb_knowledge], Catalog item [sc_cat_item]

Search Application Configuration

The IT Service Management base system includes the **[AIS] Recommended Actions for ITSM Search Config**. This application supports the AI search for various records in the Service Operations Workspace, including Incident, Incident Tasks, Problem, Problem Tasks, Change Request, Change Request Task, Interaction, and Request.

Exploring Password Reset

The Password Reset for Service Operations Workspace application enforces strong and secure passwords by enabling end users to reset or change their passwords either by using the self-service process or by requesting the service desk agent.

To configure service desk assisted password reset, see Setting up Service Desk assisted Password Reset in Service Operations Workspace.

Migration from ITSM Agent Workspace to Service Operations Workspace for ITSM

You can easily migrate common customizations and configurations for various features from ITSM Agent Workspace to Service Operations Workspace for ITSM using the on-screen migration utility. With this migration, you won't have to rebuild these features in Service Operations Workspace for ITSM. For these features, you can migrate any specific record types and elements or all of them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migration process

Important:
You should run the migration in your non-production instance. If the migration to SOW for ITSM works as expected in the non-production instance, you can move the migration changes to a production instance using an update set.

Perform the following steps in your non-production instance.

1. Install the Migration Utility for Service Operations Workspace application. See Install the Migration Utility for Service Operations Workspace.
2. If you have any custom ITSM table that should be migrated, specify the table in the *sn_sow_migration.itsm_aw_migration_tables* system property for migrating the associated list category and modules, list actions, related list actions and New record menu items from ITSM Agent Workspace to Service Operations Workspace for ITSM. See Configure the migration of a custom ITSM table from ITSM Agent Workspace to Service Operations Workspace for ITSM.
3. Create a basic authentication configuration (sys_auth_profile_basic) to authenticate the Table API that the migration utility uses to perform creation, updating, and deletion of records. See Create a basic authentication configuration to migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.
4. Create an update set to record any changes that are made to Service Operations Workspace for ITSM during the migration. See Create and select an update set as the current set.
5. Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM using the migration utility. See Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.
6. If the migration to Service Operations Workspace for ITSM is working as expected in your non-production instance, move your migration changes to a production instance using the update set.

Note:
The logged in admin user credentials must match the credential used to setup basic authentication to successfully perform the migration from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Admin Center in Service Operations Workspace for ITSM

Install the Migration Utility for Service Operations Workspace

You can install the Migration Utility for Service Operations Workspace application (sn_sow_migration) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Migration Utility for Service Operations Workspace application (sn_sow_migration) installs the on-screen migration utility that eases the migration process from ITSM Agent Workspace to Service Operations Workspace for ITSM.

The Agent Workspace Migration Request (sn_sow_migration_aw_migration_request) table is installed with Migration Utility for Service Operations Workspace. This tables stores the following migration request details:

- Customisations and configurations selected for various features
- Migration status (whether the migration is completed or in progress)
- Migration result (Customizations or configurations that are migrated successfully or failed)
- Any post migration message for the selected customizations or configurations

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Migration Utility for Service Operations Workspace application (sn_sow_migration) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Configure the migration of a custom ITSM table from ITSM Agent Workspace to Service Operations Workspace for ITSM

If you have a custom ITSM table that must be migrated, you must enable the migration of the associated list categories and modules, list actions, related list actions, and New record menu items from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Before you begin

Role required: admin

Procedure

1. From the **All** menu, in the navigation filter, enter **sys_properties.list**.
2. Search for the *sn_sow_migration.itsm_aw_migration_tables* system property.
3. In the **Value** field, add the custom ITSM table's id to the comma-separated list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the **Value** field contains all ITSM tables whose list categories and modules, list actions, related list actions, and New record menu items should be migrated from ITSM Agent Workspace to Service Operations Workspace for ITSM.

4. Select **Update**.

Create a basic authentication configuration to migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM

Authenticate the Table API that the migration utility uses to perform creation, updating, and deletion of records.

Before you begin

Role required: admin

About this task

This configuration must contain the credentials of the user who is logged in and has the admin role.

Procedure

1. From the **All** menu, in the navigation filter, enter **sys_auth_profile_basic.list**.
2. On the Basic Auth Configurations page, select **New**.
3. On the Basic Auth Configuration form, specify the name, user name, and password.
4. Select **Submit**.

Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM

Through a set of simple steps, quickly migrate your ITSM Agent Workspace features including configurations and customizations to Service Operations Workspace for ITSM.

Before you begin

Ensure that the scope is set to Service Operations Workspace Core.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview** > **Initial Setup** > **Migrate from ITSM Agent Workspace to SOW** if you're upgrading from AW 2.0 or higher.

   If you're installing the latest migration utility, navigate to **All** > **Service Operations Workspace** > **Migrate from ITSM Agent Workspace to SOW**.

2. On the Migration from ITSM Agent Workspace to SOW page, perform the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. **Optional:** If required, create a basic authentication configuration with existing or new user credentials by selecting **Create basic authentication configurations**.

> **Important:**
> - This configuration must contain the credentials of the user who is logged in and has the admin role.
> - Only after you create the basic authentication configuration, create an update set to record any changes that are made to Service Operations Workspace for ITSM in your non-production instance during the migration. See Create and select an update set as the current set.

b. From the **Select a basic auth configuration** drop-down, select the required configuration.

c. Select **Test the configuration**.

d. Review the mentioned guidelines.

e. Select **Start migration**.

> **Note:**
> In case your previous migration task is partially complete, you can select **Continue migration** on this page to resume the migration process.

3. On the Features to migrate from Agent Workspace page, for each feature, select the configurations and customizations to migrate.
   For information about configurations and customizations that can be migrated, see Configurations and customizations that can be migrated from ITSM Agent workspace to SOW for ITSM.
4. Select **Next**.
5. From the Migration confirmation page, review the selected features and select **Confirm the migration**.
   The migration can be fully or partially successful.
   - Full successful migration: All configurations and customizations of selected features are successfully migrated to Service Operations Workspace for ITSM and captured in the specified update sets in the non-production instance.
   - Partial migration: All successfully migrated configurations and customizations of selected features are captured in the specified update sets in Service Operations Workspace for ITSM in the non-production instance.
6. Select **View migration details** to review the migration information.

What to do next

Complete the post-migration tasks for each configuration or customization that you have migrated. For more information, see the following topics.

- Perform post-migration tasks for UI actions and layouts
- Perform post-migration tasks for ribbons
- Perform post-migration tasks for view rules
- Perform post-migration tasks for new records
- Perform post-migration tasks for highlighted fields in list and forms

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Perform post-migration tasks for list actions
- Perform post-migration tasks for list categories and modules
- Perform post-migration tasks for form headers
- Perform post-migration tasks for search configurations
- Perform post-migration tasks for Agent assist configuration
- Perform post-migration tasks for related list declarative form actions
- Perform post-migration tasks for field decorators form actions

Configurations and customizations that can be migrated from ITSM Agent workspace to SOW for ITSM

Several configurations and customizations related to various ITSM Agent Workspace features that can be migrated to SOW for ITSM.

Migration of UI actions and layouts from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration from ITSM Agent Workspace to Service Operations Workspace for ITSM includes identifying the required tables, identifying the eligible UI actions and layout records for migrations, and the migration process.

UI actions

UI actions appear either as form buttons or as list items in the UI action menu.

The form header shows a group of UI actions under a single menu button or a split button.

To group UI actions, a layout is required, which acts as a container to the group.

Tables used for migration

Table name	Description
UI Action [sys_ui_action]	Contains UI action and layouts configurations to migrate.
UI Action Layout [sys_aw_form_uiaction_layout]	Contains a set of records (base system or custom) associated with the agent workspace. The migration utility considers these records as eligible for migration. All the group UI actions specified in such UI Action Layout [sys_aw_form_uiaction_layout] record are migrated.

How the migration utility identifies UI actions and layouts for migration

The Service Operations Workspace migration utility identifies the eligible set of UI actions to migrate based on the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- UI Action [sys_ui_action] table records that are mapped to the UX Form Actions [sys_ux_form_action] table records.
- UX Form Actions Layout Item [sys_ux_form_action_layout_item] table records that are mapped to UX Form Actions [sys_ux_form_action] table records.
- UX Form Actions Layout [sys_ux_form_action_layout] table records that are mapped to the input table.

How the migration works

The Service Operations Workspace migration utility uses the following sequence to migrate the UI actions from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the utility.

1. Searches for UI Action Layout [sys_aw_form_uiaction_layout] table records that are mapped to UI Action Group [sys_aw_form_uiaction_group] records.
2. Searches for UX Form Actions Layout Group [sys_ux_form_action_layout_group] table records that are mapped to UI Action Layout [sys_aw_form_uiaction_layout] table records. The set of UI actions and the type of grouping must be the same for these records.
3. If a record isn't found, creates a UX Form Actions Layout Group [sys_ux_form_action_layout_group] table record.

The Service Operations Workspace migration utility uses the following sequence to migrate the layouts from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the system.

1. Searches for UI Action Group [sys_ux_form_action_layout_group] table records that are mapped to UX Form Actions Layout Group [sys_ux_form_action_layout_item] table records.
2. If a record isn't found, creates a UX Form Actions Layout Group [sys_ux_form_action_layout_item] table record and maps it to the UI Action Group [sys_ux_form_action_layout_group] table record.

The Service Operations Workspace migration utility uses the following sequence to migrate input tables from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the system.

1. Searches for a UX Form Actions Layout [sys_ux_form_action_layout] table record.
2. If a UX Form Actions Layout [sys_ux_form_action_layout] table record isn't found, completes the migration and shows grouped UI actions in the record page as ungrouped UI actions.

   Note:
   UI actions are grouped only if a UX Form Actions Layout [sys_ux_form_action_layout] table record is found.

3. If a record is found, performs the migration using the following sequence:
   a. Checks if the UX Form Actions Layout [sys_ux_form_action_layout] table record is unified.

      For unified records, the **use_layout_items_only** field is selected.

   b. Completes the migration if the record isn't unified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Searches for Sys Ux M2m Action Layout Item [sys_ux_m2m_action_layout_item] table records that are mapped to the UX Form Actions Layout [sys_ux_form_action_layout] table record.

d. If a mapped record isn't found, creates a Sys Ux M2m Action Layout Item [sys_ux_m2m_action_layout_item] table record.

Perform post-migration tasks for UI actions and layouts

Verify that the UI actions and layouts in Service Operations Workspace (SOW) are consistent with UI actions and layouts in ITSM Agent Workspace (ITSM AW) and are ready for use in SOW. You can update the migrated UI actions and layouts settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **UI actions and layouts** option for ITSM Agent Workspace features. For example, the **UI actions and layouts** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.

      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open a record in SOW that is corresponding to a table for which UI actions and layouts are migrated.
   For example: If you want to verify the UI actions and layouts migration status for an incident, navigate to **List** > **Incident** > **All** and then select any incident record.

   c. Review the UI actions and the layout that are migrated from ITSM Agent Workspace to SOW.

   d. If you want to rearrange the order of the UI actions layout, navigate to **All** > **sys_ux_form_action_layout.list**

   e. Search and select the table for which the UI actions and layout order must be changed. For example, Incident.

   f. Edit the record.

   g. Check whether the sys_ux_form_action_layout record is unified for the specified table.
   If the sys_ux_form_action_layout record is unified, **Unify action** button is not visible. If the sys_ux_form_action_layout record is not unified, select the **Unify action** option to unify the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

record. After the UI actions are unified, all the UI actions are displayed under UX Form Action Layout Items related list.

h. On the UX Form Action Layout Items related list, change the order of the UI actions as required to rearrange the layout on the record of the targeted table.

2. If the migration fails, perform the following steps.
   a. On the migration completion page in SOW Admin Center, select **View migration details**.
   b. Select the Go to system logs icon (⚠) icon.
   c. Review the logs to determine which items failed during migration.
   d. For each failed item, identify which step has failed and perform the steps mentioned in the How the migration works section.

Ribbons migration from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the ribbons from ITSM Agent Workspace to Service Operations Workspace for ITSM includes identifying the required tables, identifying ribbons records for migration, and the migration process.

Tables used for migration

Table name	Description
Ribbon Setting [sys_aw_ribbon_setting]	Contains all ribbon settings.
UX Ribbon Configuration [sys_ux_ribbon_config]	Contains the ribbon configuration that is mapped to a configurable workspace. The migration utility uses the Service Operations Workspace ribbon configuration.
Ribbon Configuration Setting [sys_ux_ribbon_config_setting]	Contains mapping information between the Ribbon Setting [sys_aw_ribbon_setting] and the UX Ribbon Configuration [sys_ux_ribbon_config] table records. This information helps define and identify ribbon settings that are applicable for the specified workspace.

Limitation

- The combined width of the ribbon widgets must be equal to or lower than 12 for the specified table and ribbon configuration.
- A record can't be created when:
  - The ribbon widgets are already configured for the specified table and ribbon configuration.
  - The width of the ribbon setting that is being mapped with the ribbon configuration plus the widths of the existing ribbon settings that are mapped to the same ribbon configuration is greater than 12.

How the migration utility identifies ribbons for migration

The migration utility searches all ribbon settings for which **workspace** is set to ITSM Agent Workspace in the Ribbon Setting [sys_aw_ribbon_setting] table. These ribbon settings are candidates for migration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How the migration works

The Service Operations Workspace migration utility uses the following sequence to migrate ribbons from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the utility.

1. Calculates the total width of existing ribbons that are mapped to Service Operations Workspace Ribbon Config plus ITSM Agent Workspace ribbons that must be migrated.
2. If the sum of widths is greater than 12, disables all existing ribbons that are mapped to the Service Operations Workspace ribbon configuration.

   Note:
   All ITSM Agent Workspace ribbons are migrated. The aim of the ITSM Agent Workspace migration utility is to prioritize migrating items from ITSM Agent Workspace to Service Operations Workspace for ITSM and so this trade-off is acceptable.

3. Creates a mapping between filtered ribbon settings and Service Operations Workspace ribbon configuration in the Ribbon Configuration Setting [sys_ux_ribbon_config_setting] table.

Perform post-migration tasks for ribbons

Verify that the ribbons in Service Operations Workspace (SOW) are consistent with the ribbons in ITSM Agent Workspace and the ribbons are ready for use in SOW. You can update the migrated ribbon settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Ribbons in the record form** option for ITSM Agent Workspace features. For example, the **Ribbons in the record form** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to confirm successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Select **Lists** from the navigation pane to open the **Lists** window in SOW and ITSM Agent Workspace.

   c. Open a record from the available lists to compare in both workspaces.
   For example, select an incident by navigating to the **Incidents** list in both workspaces.

   d. Compare the ribbons for that record in SOW and ITSM Agent Workspace records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. To modify any ribbon settings in SOW to match settings in **All** > **sys_ux_ribbon_config_setting.list**.

Note:
Preconfigured ribbon settings for SOW might get turned off after the migration.

2. If the migration fails, perform the following steps.
   a. On the migration completion page in SOW Admin Center, select **View migration details**.
   b. Select the **Go to system logs** (⚠) icon.
   c. Review the logs to determine which items failed during migration.
   d. For each failed item, identify which step has failed and perform the steps mentioned in the How the migration works section.

Migration of view rules from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of view rules from ITSM Agent Workspace to Service Operations Workspace for ITSM includes identifying the required tables, identifying the view rules for migrations, and the migration process.

View rules

For information about view rules, see https://www.servicenow.com/community/developer-blog/servicenow-view-and-view-rule-servicenow-tutorial-to-understand/ba-p/2333469 .

For information about creating a view rule, see Create a view rule .

Tables used for migration

Table name	Description
View Rule [sysrule_view_workspace]	Contains all view rules.
UX View Rules Configuration [sys_ux_view_rules_configuration]	Contains the view rule configuration that is mapped to the specified configurable workspace. The migration utility uses the Service Operations Workspace view rules configuration.
Sys Ux M2m Workspace View Rule Ux View Rule Config [sys_ux_m2m_workspace_view_rule_ux_view_rule_config]	Contains mapping information between view rules and the view rule configuration. This information helps define and identify rules that are applicable for a workspace.

How the migration utility identifies view rules for migration

The migration utility for Service Operations Workspace identifies the set of view rules to migrate by using the following information:

- View Rule [sysrule_view_workspace] table records for which *workspace* is ITSM Agent Workspace.
- All view rules specified by the View Rule [sysrule_view_workspace] table in the ITSM Agent Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How the migration works

The migration utility uses the following sequence to migrate the UI actions from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the utility.

1. Filters records from View Rule [sysrule_view_workspace] table for which *workspace* is ITSM Agent Workspace.
2. Imports all view rules specified by the View Rule [sysrule_view_workspace] table in the ITSM Agent Workspace.
3. Filters view rules that aren't mapped to any view rules configuration.
4. Creates an m2m mapping between filtered view rules and Service Operations Workspace view rules configurations so that the view rules are applied in Service Operations Workspace.
5. Creates a fallback view rule with the following field values while migrating view rules for the specified table.
   - *view* is *workspace*.
   - *order* is *99999999*.

   Note:
   The fallback view rule is created because, in the ITSM Agent Workspace, the default view for all tables is workspace

   If a view rule isn't configured for a table, the Service Operations Workspace view rule that is consistent with the ITSM Agent Workspace is migrated.

Perform post-migration tasks for view rules

Verify that the view rules in Service Operations Workspace (SOW) are consistent with the view rules in ITSM Agent Workspace and are ready for use in SOW. You can update the view rules settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Workspace views (form and related list) and view rules** option for ITSM Agent Workspace features. For example, the **Workspace views (form and related list) and view rules** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to confirm successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps.

   a. Open SOW and for ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open for ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Lists** from the navigation pane to open the **Lists** window in SOW and for ITSM Agent Workspace.

c. Open a record from the available lists to compare in both workspaces.
For example, select an incident by navigating to the **Incidents** list in both workspaces.

d. Compare the view of the record, form layout, related lists, and related lists layout SOW and ITSM Agent Workspace records.

e. Check that user interface (UI) policies and client scripts of the ITSM Agent Workspace record are working in the SOW record.

- UI policies and client scripts that are applicable for the for ITSM Agent Workspace record also work in the SOW record after the migration of views and view rules.
- SOW records open in the same view as ITSM Agent Workspace records.

f. To modify any view rule in SOW to match settings in **All** > **sysrule_view_workspace.list**.
For more information about configuring view rules, see Create a view rule.

Note:
Preconfigured view rules for SOW might get turned off after the migration.

2. If the migration fails, perform the following steps.
   a. On the migration completion page in SOW Admin Center, select **View migration details**.
   b. Select the **Go to system logs** (⚠) icon.
   c. Review the logs to determine which items failed during migration.
   d. For each failed item, identify which step has failed and perform the steps mentioned in the How the migration works section.

New record menu items migration from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the new record menu items from ITSM Agent Workspace to Service Operations Workspace for ITSM includes identifying the required tables, identifying new record menu items for migrations, and the migration process.

System property

`sys_property: sn_sow_migration.itsm_aw_migration_tables`

Records corresponding to only these tables are migrated from ITSM Agent Workspace to Service Operations Workspace.

Table used for migration

New Record Menu Item [sys_aw_new_menu_item]: Contains the active records to migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

How the migration utility identifies new record menu items for migration

The Service Operations Workspace migration utility identifies the new record menu items to migrate based on the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Active records of ITSM Agent Workspace table specified by the New Record Menu Item [sys_aw_new_menu_item] table.
- The records of a table already mentioned in the new record menu item configuration for Service Operations Workspace aren't migrated to avoid duplicates.

The utility migrates only a copy of an active record if duplicate active records are specified in the New Record Menu Item [sys_aw_new_menu_item] table.

How the migration works

The Service Operations Workspace migration utility uses the following sequence to migrate new record menu items from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the utility.

1. Searches for the current new record menu item configuration for Service Operations Workspace.

   Queries the UX Page Property [sys_ux_page_property] table for the following:

   - Service Operations Workspace page (*aa881cad73c4301045216238edf6a716* is the *sysId* for Service Operations Workspace page record).
   - *chrome_tab* (Name for UX page property record that stores a new record menu item for Service Operations Workspace)
2. Uses the record obtained from Step 1 to search for tables that are already part of the new record menu item for Service Operations Workspace.
3. Ignores the existing tables during migration to avoid duplicates.
4. Searches the records of the New Record Menu Item [sys_aw_new_menu_item] table whose field values are set as follows:

   - *active* is *true*
   - *workspace* is *Agent Workspace*
   - *table* is one of *sn_sow_migration.itsm_aw_migration_tables*.

   For each record, if the table name isn't a part of existing tables and if the same table name isn't processed earlier, then the migration utility creates a JSON object.
5. Creates a JSON object that contains data corresponding to each record as follows:

```
{
                    "label": {
                        "translatable": true,
                        "message": "New " + tableLabel
                    },
                    "routeInfo": {
                        "route": "record",
                        "fields": {
                            "table": table,
                            "sysId": "-1"
                        },
                        "multiInstField": "sysId"
                    },
                    "condition": {
                        "tableDescription": {
                            "table": table,
                            "canCreate": true
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                                }
                            }
};
```

6. Adds the code to the existing *chrome_tab* JSON value for the new record menu.

Perform post-migration tasks for new records

Verify that the new record menus in Service Operations Workspace (SOW) are consistent with the new record menus in ITSM Agent Workspace (ITSM AW) and they are ready for use in SOW. You can update the migrated new record menu settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **New Records** option for ITSM Agent Workspace features. For example, the **New Records** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps to verify the migration.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Verify that the menu items are available in the SOW.

      By default, order is same as available in the ITSM Agent Workspace except for some menu items that are available in the SOW out-of-the-box.

   c. To make any modifications in order in which the menu items appear on UI, navigate to **All** > **sys_ux_page_property.list**.

   d. Filter the **Name** with *chrome_tab* property.

   e. Select *chrome_tab* property for Service Operations Workspace.

   f. In the **Value** field, under the *newTabMenu*, order the JSON object for tables as required.

2. If the migration fails, perform the following steps.

   a. Navigate to **All** > **sys_ux_page_property.list**

   b. Filter the **Name** with *chrome_tab* property.

   c. Select *chrome_tab* property for Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Value** field, under the *newTabMenu*, add JSON object for tables that are required in SOW new record menu item in the specified format.

e. Select **Update**.

Migration of highlighted fields in lists and forms from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the highlighted fields in lists and forms from ITSM Agent Workspace to Service Operations Workspace for ITSM includes identifying the required tables, identifying eligible highlighted field records for migrations, and the migration process.

Highlighted fields in lists and forms

Use colors to highlight list and form fields to get the attention of an agent or user.

Table used for migration

The migration utility uses the Highlighted Value [sys_highlighted_value] table for migration.

How the migration utility identifies highlighted fields for migration

If the table contains a set of records (base system or custom) for the ITSM Agent Workspace, the migration utility considers the Highlighted Value [sys_highlighted_value] table for migration.

How the migration works

The Service Operations Workspace migration utility uses the following sequence to migrate the highlighted fields in lists and forms from ITSM Agent Workspace to Service Operations Workspace for ITSM. All these actions are done by the utility.

1. Searches for records in the Highlighted Value [sys_highlighted_value] table records that are mapped to Sys Ux M2m Highlighted Value Config [sys_ux_m2m_highlighted_value_config] table records.
2. If a Highlighted Value [sys_highlighted_value] table record isn't found, creates a Highlighted Value [sys_highlighted_value] table record.
3. Maps the Sys Ux M2m Highlighted Value Config [sys_ux_m2m_highlighted_value_config] table record.

Perform post-migration tasks for highlighted fields in list and forms

Verify that the highlighted fields in list and forms in Service Operations Workspace (SOW) are consistent with the highlighted fields in list and forms in ITSM Agent Workspace (ITSM AW) and are ready for use in SOW. You can update the migrated highlighted fields in list and forms settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Highlighted fields in list and forms** option for ITSM Agent Workspace features. For example, the **Highlighted fields in list and forms** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If the migration is successful, perform the following steps to verify the migration.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open a record in SOW that is corresponding to the table for which highlighted list and form field configurations are migrated.
   For example: If you want to verify the highlighted list and form field migration status for an incident, navigate to **List** > **Incident** > **All** and then select any incident record.

   c. Review the highlighted list and form fields for an incident list and record to ensure if the highlighted values are displayed as in ITSM Agent Workspace.

   d. If the highlighted values are not working as expected, navigate to **All** > **sys_highlighted_value.list**.

   e. Search the **Table** and **Field** record for which the issue exists.
   For example, table is Incident and field is Priority.

   f. If more than one record with the same **Table** and **Field** combination exist, open the records to check which records are mapped to the SOW Highlighted value config using the sys_ux_m2m_highlighted_value_config record in the UX Highlighted Values Configurations related list.

   g. If there is more than one sys_highlighted_value linked to SOW Highlighted value config for that Table and Field combination exist, review the order of the conditions in the Highlighted Value Condition(sys_highlighted_value_condition) related list record for each sys_highlighted_value.
   The sys_highlighted_value_condition record with lower order is given precedence when rendering the highlighted color for a field in UI.

2. If the migration fails, perform the following steps.

   a. On the migration completion page in SOW Admin Center, select **View migration details**.

   b. Select the **Go to system logs** (⚠) icon.

   c. Review the logs to determine which items failed during migration.

   d. For each failed item, identify which step has failed and perform the steps mentioned in the How the migration works section.

List actions migration from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the list actions from ITSM Agent Workspace to Service Operations Workspace for ITSM includes identifying the tables and the migration process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List declarative actions

The declarative action framework integrates core UI behaviors such as client actions or server scripts into workspace forms, fields, lists, and lists without editing the code.

For more information about types of declarative actions and how to create these actions, see https://www.servicenow.com/community/next-experience-articles/introduction-to-declarative-actions/ta-p/2332003 and https://www.servicenow.com/community/developer-blog/declarative-actions-in-servicenow-the-complete-guide/ba-p/2781607.

Table used for migration

Action Assignment [sys_declarative_action_assignment]: Contains all list action settings.

Conditions for migration

```
Conditions:
Action model = List
workspace = Agent Workspace
table = ITSM tables {ys_id of the supported ITSM tables:
 600f5e889f320210db9f618dfa0a1cbd} and Global table
view != sow and sow_new_record (As we are assuming sow related
 view isn't customized in ITSM Agent Workspace)
```

How the migration works

The following are the list actions available in ITSM Agent Workspace:

- Client script
- Server script
- Client action
- UI component

Migrate the client script from ITSM Agent Workspace to Service Operations Workspace for ITSM

Configure the client script to migrate list actions from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Before you begin

When performing the migration, you must have selected the **List actions** option for ITSM Agent Workspace features. For example, the **List actions** option for List. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to confirm successful migration of your configuration or customization.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **List actions**.
2. Filter the records based for **Implemented As** is set as **Client script**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Select and hold (or right-click) on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
9. Select **Save** to save the **Action configurations** list.
10. Select **Update**.

Migrate the server script from ITSM Agent Workspace to Service Operations Workspace for ITSM

Configure the server script to migrate list actions from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Before you begin

When performing the migration, you must have selected the **List actions** option for ITSM Agent Workspace features. For example, the **List actions** option for List. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to confirm successful migration of your configuration or customization.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **List actions**.
2. Filter the records based for **Implemented As** is set as **Server script**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the List Actions list.
4. Select the failed record with the corresponding sys_id.
5. Select and hold (or right-click) on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. In the Action configuration related list, select **Edit**, and then select **SOW Actions** from the Collection list to the Action configurations list.
9. Save the **Action configurations** list by selecting **Save**.
10. Select **Update**.

Migrate the client action from ITSM Agent Workspace to Service Operations Workspace for ITSM

Configure the client actions to migrate list actions from ITSM Agent Workspace to Service Operations Workspace for ITSM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

When performing the migration, you must have selected the **List actions** option for ITSM Agent Workspace features. For example, the **List actions** option for List. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to confirm successful migration of your configuration or customization.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **List actions**.
2. Filter the records based for **Implemented As** is set as **Client action**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the List Actions list.
4. Select the failed record with the corresponding sys_id.
5. Select and hold (or right-click) on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. Update the value in the **Implemented as** field as `UXF Client Action`.
9. In the Action configuration related list, select **Edit**, and then select **SOW Actions** from the Collection list to the Action configurations list.
10. Save the Action configurations list by selecting **Save**.
11. Select **Update**.
12. If the client action key is **ITEM_SELECTED** or **PREVIEW_RECORD**, create a CREATE_NEW_RECORD key with the code block payload for the Action Payload Definition [sys_declarative_action_payload_definition] table.

    This step is performed only once.

```
{
 "route": "record",
 "fields": {
 "table": "{{table}}",
 "sysId": "-1"
 },
 "params": {
 "query": "{{query}}",
 "parentTable": "{{parentTable}}",
 "parentRecordSysId": "{{parentRecordSysId}}"
 },
 "parent_table": "{{parentTable}}",
 "additional_data": {
 "query": "{{query}}"
 }
 }
```

13. Modify the client action created for **ITEM_SELECTED** and **PREVIEW_RECORD** list records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you modify the client action, the payload map in action attributes should be transformed based on the payload.

The following tables are used in the migration process:

- M2m Action Assig Ux Action Config [sys_ux_m2m_action_assignment_action_config]
- Action Payload Definition [sys_declarative_action_payload_definition]

Note:
The **ITEM_SELECTED** and **PREVIEW_RECORD** actions function in the ITSM Agent Workspace but not in SOW. Therefore, an action payload named CREATE_NEW_RECORD Is introduced in SOW. While there could be other action payloads that might not function properly, the base system client actions for the list continue to work effectively in SOW post-migration.

Migrate the UI component from ITSM Agent Workspace to Service Operations Workspace for ITSM

Configure the UI component to migrate list actions from ITSM Agent Workspace to Service Operations Workspace (SOW) for ITSM.

Before you begin

When performing the migration, you must have selected the **List actions** option for ITSM Agent Workspace features. For example, the **List actions** option for List. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to confirm successful migration of your configuration or customization.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **List actions**.
2. Filter the records based for **Implemented As** is set as **UI component**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the List Actions list.
4. Select the failed record with the corresponding sys_id.
5. Select and hold (or right-click) on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. Update the value in the **Implemented as** field as `UXF Client Action`.
9. In the Action configuration related list, select **Edit**, and then select **SOW Actions** from the **Collection** list to the Action configurations list.
10. Save the **Action configurations** list by selecting **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Adding Multiple Record Associator (MRA) or Interceptor to the list isn't a valid scenario. If you're migrating a customization with the MRA or Interceptor, you must verify the add-on event mapping for the base system records. In the base system, add-on event mappings for list declarative actions aren't specified.

11. Select **Update**.

    The migration utility supports MRA and interceptor declarative actions of UI component type only.

12. For MRA, create an action payload as mentioned in the code block, update the values in action attributes with component attributes of the ITSM Agent Workspace declarative action.

    If no value is filled in the ITSM Agent Workspace declarative action record, then fill the value with {{ key }}. For example, if the component attributes table is empty then in the payload the value should be {{table}}.

```
{
"label": "label",
 "extensionPoint": "extensionPoint",
 "userGivenTable": "userGivenTable",
 "hideSelectAll": "hideSelectAll",
 "parentRecordSysId": "parentRecordSysId",
 "table": "table",
 "referencedFieldName": "referencedFieldName",
 "type": "type",
 "parentFieldName": "parentFieldName",
 "columns": "columns",
 "view": "view",
 "relatedListName": "relatedListName"
 }
```

13. For Interceptor, create an action payload as mentioned in the code block in the Action Payload Definition [sys_declarative_action_payload_definition] table.

```
{
 "table": "target",
 "sysId": "-1",
 "parentTable": "{{parentTable}}",
 "parentSysId": "{{parentRecordSysId}}",
 "referencedFieldName": "",
 "pageTitle": "Create " + tableLabel,
 "pageSubTitle": "Choose one of the following " + tableLabel +
 " types",
 "useDomain": false
}
```

14. Add an add-on event mapping to the migrated declarative action.

    Find the matching declarative action in SOW and add all the add-on event mapping to the migrated declarative action. Use the following steps to find the equivalent declarative action in SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **sys_ux_addon_event_mapping.list**

b. Filter the table and using the migrated `tablename` and **Target Payload Mapping** contains `mra` or `interceptor route`.

c. If the record is found, return the declarative action sys_id.

   Iterate through all add-on event mappings of for the filtered declarative actions and add them to the migrated declarative actions.

d. If the record isn't found with the table, remove the table filter and search for `targetPayload contains route=mra or interceptor`.
   For **List** and **Field** decorator, you must add the MRA and interceptor add-on event mappings manually. For more information, see Create a UX add-on event mapping.

Note:

The Change Request [change_request] interceptor record in ITSM Agent Workspace exists in SOW.

Migrating workspace space record type selectors for the interceptor type of declarative action are:

- ITSM Agent Workspace table: Workspace Record Types Selector [aw_record_type_selector]
- SOW table: Record Type Selector [sn_sow_interceptor_record_type_selector]

For a Change Request [change_request] table that has a value as standard, Active is set as False when migrating the records from ITSM Agent Workspace to SOW.

Perform post-migration tasks for list actions

Verify that the list actions in Service Operations Workspace (SOW) are consistent with the list actions in ITSM Agent Workspace (ITSM AW) and they're ready for use in SOW. You can update the migrated list actions settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **List actions** option for ITSM Agent Workspace features. For example, the **List actions** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If the migration is successful, perform the following steps.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.

   - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
   - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open the forms in ITSM Agent Workspace and SOW.

   The migrated list actions are shown on the forms.

   Duplicate list actions might be displayed on the form when you don't migrate the view rule. So, SOW field declarative actions still show up even after migration if the view isn't changed.

   If the migration is successfully completed and not visible in the UI or not working properly the cross-check the conditions in Advance view.

2. If the migration fails, perform the following steps.

   a. On the migration completion page in SOW Admin Center, select **View migration details**.

   b. Select the **Go to system logs** (⚠) icon.

   c. Review the logs to determine which items failed during migration.

   d. For each failed item, identify which step has failed and perform the steps mentioned in the List actions migration from ITSM Agent Workspace to Service Operations Workspace for ITSM section.

List categories and modules migration from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration from ITSM Agent Workspace to Service Operations Workspace (SOW) for ITSM includes identifying the required tables, highlighted field records for migrations, and the migration process.

Associated system property

If ITSM Agent Workspace contains list modules that use group-based list applicabilities, then only enable the *glide.ux.user_criteria_enabled* property mentioned in the System Property [sys_properties] table.

How the migration utility identifies list categories and modules for migration

The Migration utility for SOW identifies the list categories and modules to migrate based on the type of migration.

Mapping list categories and modules

The migration utility maintains a mapping between base system ITSM Agent Workspace list categories and list modules and their corresponding records in the Service Operations Workspace. It identifies the mapping by checking the tables, conditions, and intuitiveness in names for similarity.

Migration criteria

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The migration utility uses different fields and values depending on the type of migration (list categories, list modules, list layout, list applicabilities, and list attributes).

- List categories using the Workspace List Category [sys_aw_list_category] and UX List Category [sys_ux_list_category] table records.
- List items and modules within each category using the Workspace List [sys_aw_list] and UX List [sys_ux_list] table records.
- Columnar layout of list modules
- List applicabilities
- List attributes

How the migration works

The migration utility uses different fields, values, and migration steps depending on the type of migration. All these actions are done by the utility.

Mapping and verification

1. Creates and verifies a comprehensive mapping between ITSM Agent Workspace list categories or modules and Service Operations Workspace list categories or modules.
2. Verifies the mapping based on table, conditions, and intuitiveness in the name of the base system list categories and modules in ITSM Agent Workspace and Service Operations Workspace.

Migrating list categories

1. Iterates over the Workspace List Category [sys_aw_list_category] table with filter condition of `workspace` = `Agent Workspace`.
2. Check for the mapping between ITSM Agent Workspace and Service Operations Workspace for each list item.
3. If a mapping is found, update the list categories by copying the following fields from the current ITSM Agent Workspace Workspace List Category [sys_aw_list_category] table record to the mapped Service Operations Workspace UX List Category [sys_ux_list_category] table record:
   - active
   - description
   - order
   - active
4. If a mapping isn't found, createss a record in the UX List Category [sys_ux_list_category] table.

   If the mapping isn't found, it means that the specified category exists in ITSM Agent Workspace but the category is missing in Service Operations Workspace (new category created by the user).

Migrating list items or modules for each category

1. Iterates over the Workspace List [sys_aw_list] table with the filter condition of the current list item or module and `workspace` = `Agent Workspace`.
2. Checks for the mapping between ITSM Agent Workspace and Service Operations Workspace for each list item.
3. If a mapping is found, updates the list items by copying the following fields from the current ITSM Agent Workspace Workspace List [sys_aw_list] record to the mapped Service Operations Workspace UX List [sys_ux_list] record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- title
- order
- active
- condition

4. If a mapping isn't found, creates a record in the UX List [sys_ux_list] table.

   If the mapping isn't found, it means that the list item exists in ITSM Agent Workspace, but the list item is missing in Service Operations Workspace. For such cases, the migration utility creates a record in the UX List [sys_ux_list] table by setting the following fields from the current ITSM Agent Workspace list record and (`category = current iterating category, configuration = Default - SOW, and view = sow`):

   - title
   - order
   - active
   - condition

5. Performs the following migration after the list item is migrated (if the mapping is found) or created (if the mapping isn't found):

   a. Migrates list applicability for the migrated or created list item:

      i. Creates a list applicability using the List Applicability [sys_ux_applicability_m2m_list] table and user criteria (if groups are specified in the list item) with the corresponding ITSM Agent Workspace list module, roles, and groups.

      ii. Attaches this newly created list applicability with the migrated or created Service Operations Workspace list item.

      The migration utility doesn't delete any existing list applicability associated with the migrated list.

   b. Migrates columnar layout for migrated or created list item:

      i. Unifies the columnar layout in Service Operations Workspace based on the layout of the list module with a lower-order list item in the specified ITSM Agent Workspace table.

      ii. Search for records with the following conditions in the List [sys_ui_list] table for setting columnar layout in Service Operations Workspace:

      - `conditions = table` (with which this list item is associated)
      - `parent list =null`

      For this record, the migration utility updates the List Element [sys_ui_list_element] table to insert or update the correct order and columns.

   c. Migrates list attributes for migrated or created list items:

      ITSM Agent Workspace uses *`Omit Count`* and *`Disable Highlighted Values`* list attributes. These attributes are associated with the Workspace List Attribute [sys_aw_list_attribute] table. For the current list item record, the migration utility:

      i. Iterates over the Workspace List Attribute [sys_aw_list_attribute_list] table to identify list attributes that are associated with the specified record.

      ii. Sets the corresponding attributes in the UX List [sys_ux_list] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Perform post-migration tasks for list categories and modules

Verify that the list categories and modules in Service Operations Workspace (SOW) are consistent with the list categories and modules in ITSM Agent Workspace (ITSM AW) and the list categories and modules are ready for use in SOW. You can update the migrated list categories and modules settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **List categories and modules** option for ITSM Agent Workspace features. For example, the **List categories and modules** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps to verify list categories and modules are similar in ITSM Agent Workspace and Service Operations Workspace.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Compare the list categories and modules in ITSM Agent Workspace and SOW.

      Ensure that the columnar layout and list applicabilities are correctly applied.

      The existing SOW list categories must be updated, and new categories must be created if ITSM Agent Workspace contains additional categories. The migration utility does not delete any existing or out-of-the-box categories from Service Operations Workspace.

2. If the migration fails, perform the following steps.
   a. On the migration completion page in SOW Admin Center, select **View migration details**.
   b. Select the **Go to system logs** (⚠) icon.
   c. Review the logs to determine which items failed during migration.
   d. For each failed item, identify which step has failed and perform the steps mentioned in the List categories and modules migration from ITSM Agent Workspace to Service Operations Workspace for ITSM section.

Migration of form headers from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the form headers from ITSM Agent Workspace to Service Operations Workspace (SOW) include identifying the required tables, eligible form header records for migrations and the migration process. Form headers provide an overview of the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables used for migration

Table Name	Description
sys_aw_form_header	Table that contains all the form headers.
sys_ux_header_config	Table that contains all the form header configurations mapped to a particular configurable workspace such as SOW Header Configuration.
sys_ux_m2m_workspace_header_ux_header_config	Table which contains the mapping information that exist between sys_aw_form_header and sys_ux_header_config tables. This enables you to define and identify which form headers are applicable to a particular workspace.

How the migration utility identifies form headers for migration

The SOW migration utility identifies the eligible set of form headers to be migrated based on the following sequence:

1. Filters all the form header records that have **Workspace** set to **Agent Workspace** from the sys_aw_form_header table.
2. Filters all the form header records that are mapped to the SOW Header Configuration record from the sys_ux_m2m_workspace_header_ux_header_config table.
3. Based on the above filtered records, all form header records that have **Workspace** set to **Agent Workspace** and are not mapped to SOW Header Configuration record is identified eligible for migration.

How the migration works

The SOW migration utility uses the following sequence to migrate the form headers from ITSM Agent Workspace to SOW:

1. Creates a mapping between the filtered form header records and the SOW Header Configuration record in the sys_ux_m2m_workspace_header_ux_header_config table.
2. Searches the form header with **Workspace** set as **Agent Workspace** and that has the least order value. The form header with the least order value is applied at the ITSM Agent Workspace runtime.
3. Searches the form header which is mapped to the SOW Header Configuration record and that has the least order value.
4. If order value of the form header that is mapped to SOW Header Configuration record is less than the order value of the form header with **Workspace** set as **Agent Workspace**, update the order value of the form header mapped with SOW Header Configuration record with a lesser order value (Example: Reduce the order value by 10).

   This ensures that the form header which is already applicable to ITSM Agent Workspace during runtime is applied to SOW as well.

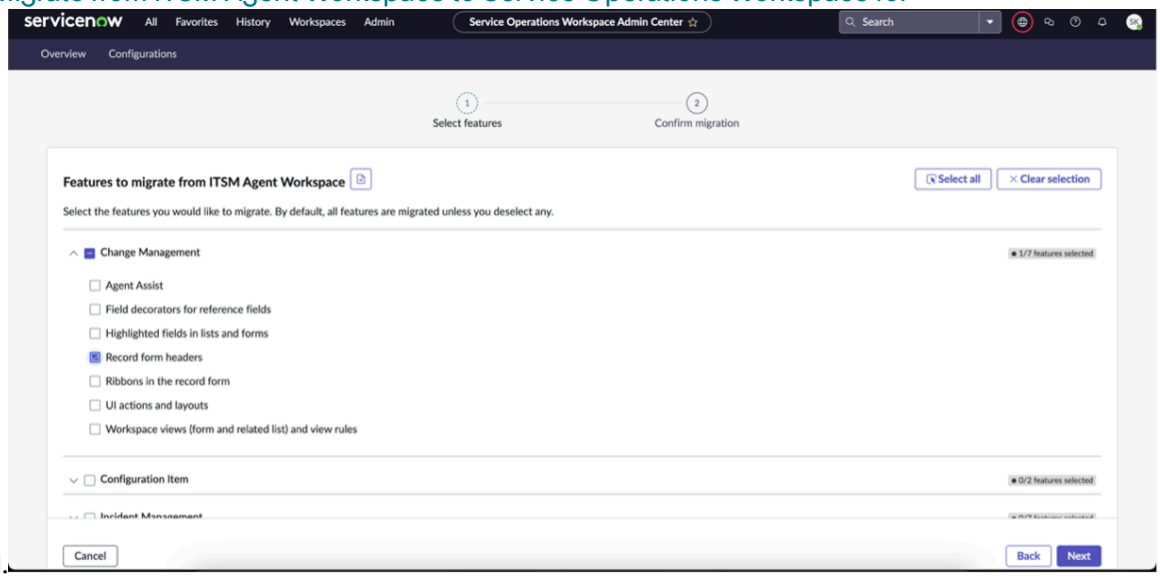
Perform post-migration tasks for form headers

Verify that the form header in Service Operations Workspace (SOW) are consistent with the form header in ITSM Agent Workspace (ITSM AW) and are ready for use in SOW. You can update the migrated form header settings in SOW based on your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

When performing the migration, you must have selected the **Record form headers** option for ITSM Agent Workspace features. For example, the **Record form headers** option for Change Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.



Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps to verify the migration.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.

   - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
   - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open a record in SOW that is corresponding to a table for which form header are migrated. For example: If you want to verify the form header migration status for an incident form header, navigate to **List** > **Incident** > **All** and then select any incident record.

   c. Review the form header on the record.

   You can also view the form header record in sys_aw_form_header and mapping data in the sys_ux_m2m_workspace_header_ux_header_config table to verify the migrated data.

   d. If the migration is successful and the form header that exist in ITSM Agent Workspace is not displayed in SOW record, verify the order value of the form header in the sys_aw_form_header table to ensure that it has the least order value.

2. If the migration fails, perform the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the migration completion page in SOW Admin Center, select **View migration details**.

b. Select the **Go to system logs** (⚠) icon.

c. Review the logs to determine which items failed during migration.

d. For each failed item, identify which step has failed and perform the steps mentioned in the How the migration works section.

Migration of search configurations from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the search configuration from ITSM Agent Workspace to Service Operations Workspace (SOW) include identifying the eligible form header records and the migration process.

How the migration utility identifies search configuration for migration

The migration utility in SOW identifies the eligible set of search configuration records to be migrated based on the following sequence:

1. Filters the application search sources records (sys_search_source) that are mapped to ITSM Agent Workspace master config record using the m2m_search_context_config_search_source table.
2. Checks the application search sources that are mapped to SOW context config record.
3. Searches each filtered record that are mapped to ITSM Agent Workspace master config record and checks if that record is not mapped to SOW context config record to identify the search sources which are unique to ITSM Agent Workspace only and not mapped to SOW context config record.
4. For all those unique search records that are mapped to ITSM Agent Workspace, the SOW migration utility creates similar mapping to SOW context config record at m2m_search_context_config_search_source table.
5. If common search sources mapped between ITSM Agent Workspace and SOW are found and the order of the mapping is differed in SOW from ITSM Agent Workspace, the SOW migration utility updates the order from ITSM Agent Workspace mapping to SOW mapping.
6. Migrates the values of ITSM Agent Workspace search view config record to SOW search view config record.
7. When both the search view config and the search sources are mapped to SOW from ITSM Agent Workspace, the SOW migration utility updates the *`globalSearchDataConfigIdSOW`* page property to reflect SOW context config record available in the base system.

How the migration works

The SOW migration utility uses the following sequence to migrate the search configuration records from ITSM Agent Workspace to SOW:

1. Searches the reference record for Global Search Data Config and Global Search View Config using the sys_aw_master_config table in ITSM Agent Workspace.
2. Determines the Search engine type in the Global Search Data Config record. If the search engine is zing then migration proceeds. Else, the migration process stops.
3. Using the Global Search Data Config record, a query is run on the Application Search Sources (m2m_search_context_config_search_source) table to retrieve all the search sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Using the SOW search context config available in the base system, a query is executed on the Application Search Sources (m2m_search_context_config_search_source) table to retrieve all the search sources.

   The SOW search context config exists as a record in the sys_search_context_config table and sys_id can be found at SOW page property called *globalSearchDataConfigId*.

5. Compares between the search sources by executing a query on the Application Search Sources (m2m_search_context_config_search_source) table using Global Search Data Config record (ITSM Agent Workspace search sources) and SOW search context config record (SOW search sources), to find unique search sources mapped to ITSM Agent Workspace but not SOW.
6. If the order value of a SOW search source is different than the order value of the ITSM Agent Workspace search source at the Application Search Sources table, the SOW migration utility updates the SOW search source with the same order value as in mapped in ITSM Agent Workspace.
7. Creates record in the Application Search Sources (m2m_search_context_config_search_source) table with SOW context config record that is available in the base system and searches the unique sources that are found by comparing the ITSM Agent Workspace search sources and SOW search sources.
8. Opens the Global Search View Config reference record that is retrieved using the sys_aw_master_config table in ITSM Agent Workspace and copy all the values to SOW view config record (SOW page property with name global_search_configurations). The SOW view config record is available in the base system.
9. Updates the SOW page property *globalSearchDataConfigId* to have OOB SOW context config record.

Perform post-migration tasks for search configurations

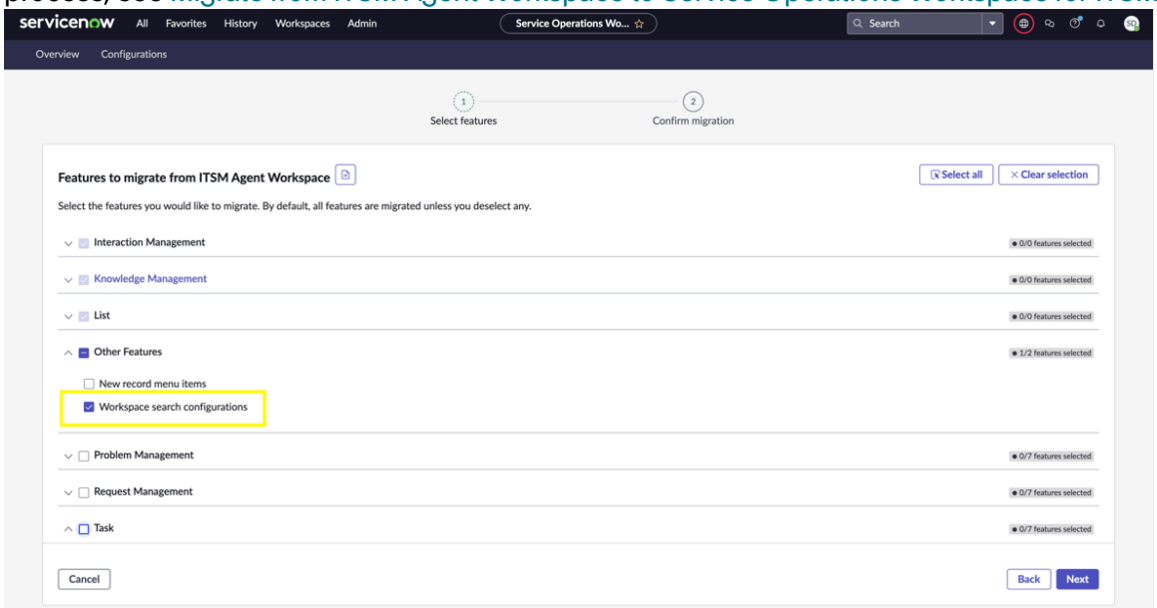
Verify that the search configurations in Service Operations Workspace (SOW) are consistent with the search configurations in ITSM Agent Workspace (ITSM AW) and are ready for use in SOW. You can update the migrated search configurations settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Workspace search configurations** option for ITSM Agent Workspace other features. For information about the migration

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.



Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

When migrating the search configuration from ITSM Agent Workspace to SOW, the *`globalSearchDataConfigId`* SOW page property is updated with SOW context config record sys_id that is available in the base system.

Procedure

1. If the migration is successful, perform the following steps to verify the migration data.

a. Open SOW for ITSM and ITSM Agent Workspace instances.

- To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
- To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

b. Use the Global search on the SOW landing (Home) page to search all the record types such as Incident, User, or Knowledge.

The search result displays the records in the order specified in the SOW search config table that contains all the application search

Migration of Agent assist from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the Agent assist from ITSM Agent Workspace to Service Operations Workspace (SOW) include identifying the required tables, eligible form header records for migrations and the migrations process.

Tables used for migration

Table name	Description
cxs_table_config	Table that contains all the Agent assist configurations in ITSM Agent Workspace and SOW.
declarative_action_assignment	Table that contains the sys_id of the cxs_table_config record in the component attributes with the cxsTableConfig key name in ITSM Agent Workspace.
sys_ux_screen	Tables that contains the sys_id of the cxs_table_config record in the **Macroponent Configuration** field of the Agent Assist SNC (468f70f443b47110cc25ff53e9b8f296) record. This record is available in the base system.

Limitations

When migrating agent assist configurations from ITSM Agent Workspace to SOW, you may encounter any of the following issues:

- If customer has configured more than one Agent assist configuration on the same table, the most recently updated configuration is migrated.
- The Agent assist migration from ITSM Agent Workspace overrides any pre-existing changes in SOW.

Configuring Agent assist in ITSM Agent Workspace and SOW

You can configure Agent assist in ITSM Agent Workspace and SOW using the following tables:

- For ITSM Agent Workspace, Agent Assist configuration data exist in the following tables where the configuration data is stored:
  - Agent assist is configured on a particular table using a declarative action with the UI component now-agent-assist.
  - Configuration is stored in the cxs_table_config table.
  - Declarative action on the table stores the sys_id of the cxs_table_config record in the component attributes with the cxsTableConfig key name.
- For SOW, Agent assist configuration data exist in the following tables:
  - The configuration record from cxs_table_config is stored in the Agent Assist SNC record from sys_ux_screen.
  - In SOW, a field named Macroponent Configuration contains the mapping of each individual table with its configured sys_id of cxs_table_config record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How the migration utility identifies Agent assist for migration

The SOW migration utility identifies the eligible agent assist configuration records for migration from ITSM Agent Workspace to SOW only if the configuration records meet the following conditions:

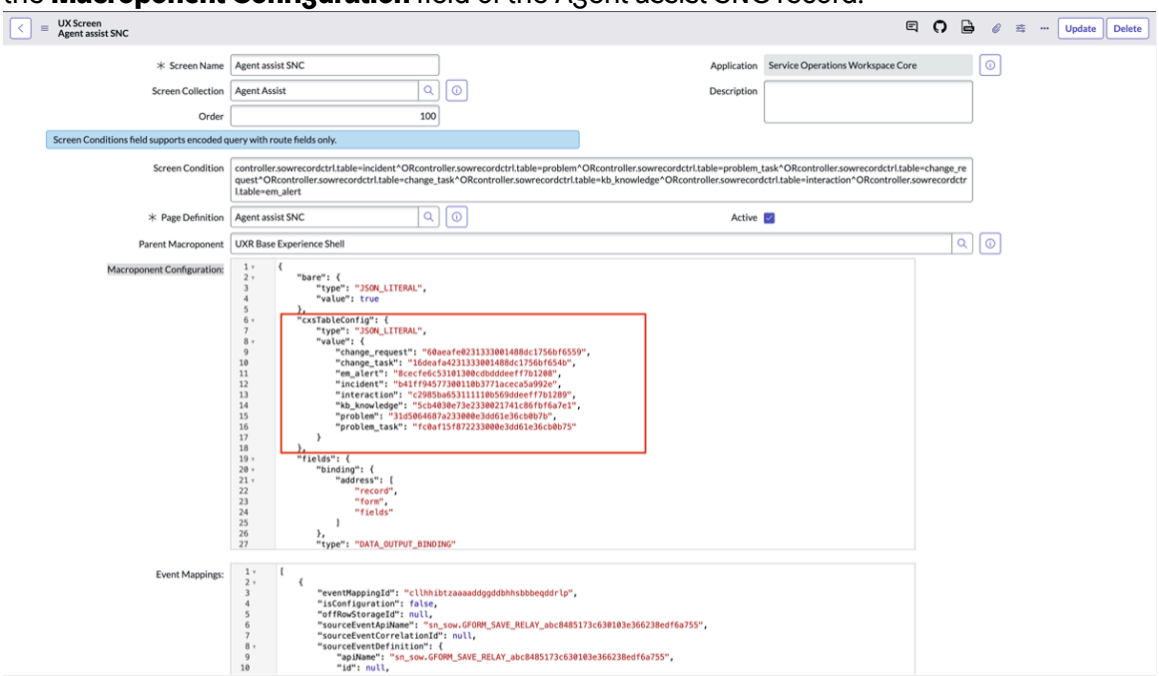
- The **Workspace** field is set to **Agent Workspace**.
- The **ui_component** field has the value **now-agent-assist**.
- The **Table** field is set to a value (table) for which migration must be done.
- The **Active** check box is selected.

How the migration works

The SOW migration utility uses the following sequence to migrate Agent assist from ITSM Agent Workspace to SOW:

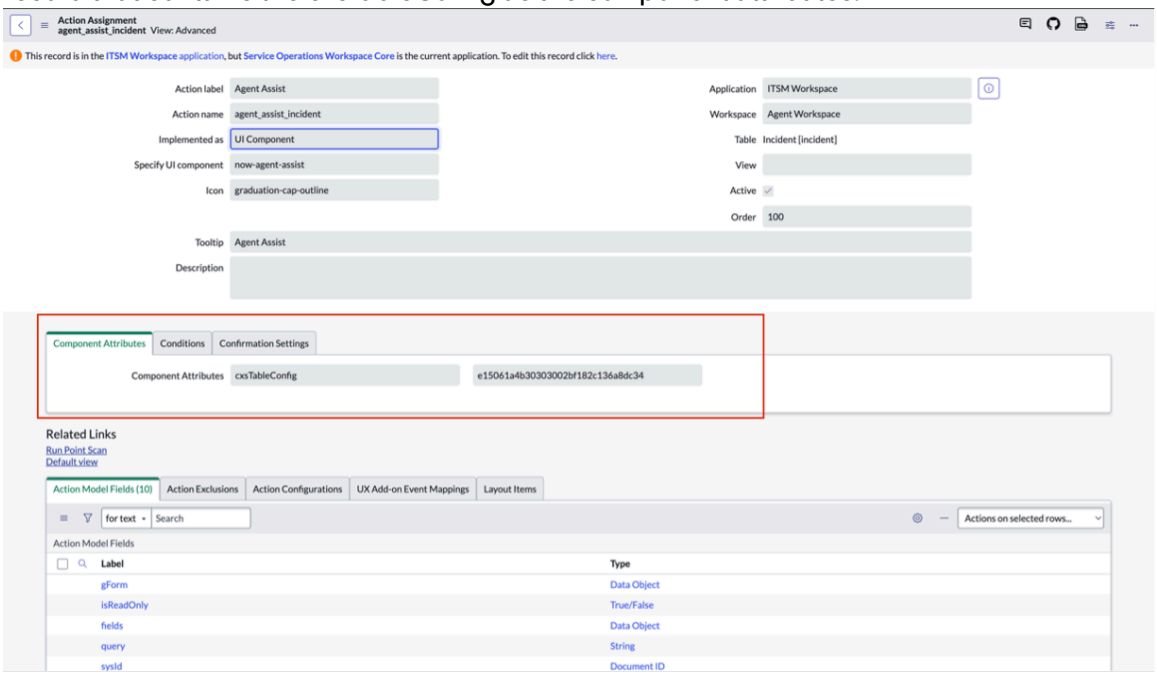
1. Searches the sys_declarative_action_assignment table with the following conditions and only retrieves the record which is recently updated.
   - The **Workspace** field is set to **Agent Workspace**.
   - The **ui_component** field has the value **now-agent-assist**.
   - The **Table** field is set to a value (table) for which migration must be done.
   - The **Active** check box is selected.
2. If the sys_declarative_action_assignment record is found with the conditions, then the value in the cxsTableConfig is copied to the Agent assist SNC record from the sys_ux_screen against its corresponding table key.

   The following screenshot depicts sys_id's of all the record types in the **Macroponent Configuration** field of the Agent assist SNC record.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following screenshot depicts the Agent assist for incident sys_id record that contains the cxsTableConfig as the component attributes.



3. If multiple configurations exist for same table, the SOW migration utility migrates the one that was most recently updated.
4. If an active configuration is not found in the table then the sow configuration remains same and is not updated.

Perform post-migration tasks for Agent assist configuration

Verify that the Agent assist configurations in Service Operations Workspace (SOW) are consistent with the Agent assist configurations in ITSM Agent Workspace (ITSM AW) and are ready for use in SOW. You can update the migrated Agent assist configuration settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Agent Assist Configuration** option for ITSM Agent Workspace features. For example, the **Agent Assist Configuration** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If the migration is successful, perform the following steps to verify the Agent assist configuration.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open a record in SOW that is corresponding to a table for which Agent assist configuration is migrated.
   For example: If you want to verify the Agent assist configuration migration status for an incident, navigate to **List** > **Incident** > **All** and then select any incident record.

   c. Select the **Agent Assist** ( ) icon from the Contextual side panel.

   d. Review the Agent assist side panel to verify that the Agent assist configurations for all selected tables are available in SOW same as in ITSM Agent Workspace.

   e. Navigate to **All** > **sys_ux_screen.list** and ensure that the Macroponent Configuration field and mappings are applied to Agent assist SNC record.

   f. Perform thorough testing to confirm that all migrated configurations function as expected in SOW.

2. If the migration fails, perform the following steps.
   a. On the migration completion page in SOW Admin Center, select **View migration details**.
   b. Select the **Go to system logs** (⚠) icon.
   c. Review the logs to determine which items failed during migration.
   d. For each failed item, identify which step has failed and perform the steps mentioned in the How the migration works.

Migration of Related list declarative actions from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the related list declarative actions from ITSM Agent Workspace to Service Operations Workspace that includes identifying the tables and the migration process.

The Declarative Action framework is used to integrate Core UI behaviors such as client actions or server scripts into Workspace forms, fields, lists, and related lists without the need to edit code.

Tables used for migration

Action Assignment [sys_declarative_action_assignment]: Contains all declarative settings.

Conditions for migration

```
Conditions:
Action model = Related List
workspace = Agent Workspace
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
table = {sys_id of the supported ITSM tables:
 600f5e889f320210db9f618dfa0a1cbd and <global table>}
//We support records which are mapped to ITSM tables and Global
 table. The mapping the related list to ITSM table can be found
 in sys_ui_related_list_entry.
view != sow and sow_new_record
//(Considering that sow related view isn't customized in ITSM
 Agent Workspace)
```

How the migration works

The SOW migration utility uses the following to migrate the related list declarative actions along with type available in ITSM Agent Workspace to SOW:

- Client Script
- Server Script
- Client Action
- UI Component

Migrate the client script from ITSM Agent Workspace to Service Operations Workspace

Configure the client script to migrate the related list declarative actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Related List actions**.
2. Filter the records based for **Implemented As** is set as **Client script**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
9. Select **Save** to save the **Action configurations** related list.
10. Select **Update**.

Migrate the server script from ITSM Agent Workspace to Service Operations Workspace

Configure the server script to migrate related list declarative actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Related List actions**.
2. Filter the records based for **Implemented As** is set as **Server script**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
9. Select **Save** to save the **Action configurations** related list.
10. Select **Update**.

Migrate the client action from ITSM Agent Workspace to Service Operations Workspace

Configure the client actions to migrate related list declarative actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Related List actions**.
2. Filter the records based for **Implemented As** is set as **Client action**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. Update the value in the **Implemented as** field as `UXF Client Action`.
9. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
10. Select **Save** to save the **Action configurations** related list.
11. Select **Update**.
12. If specify client action key is **ITEM_SELECTED** or **PREVIEW_RECORD**, create CREATE_NEW_RECORD key with the payload mentioned below in the code block in the sys_declarative_action_payload_definition table.

    This step is performed only once.

```
{
 "route": "record",
 "fields": {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"table": "{{table}}",
"sysId": "-1"
},
"params": {
"query": "{{query}}",
"parentTable": "{{parentTable}}",
"parentRecordSysId": "{{parentRecordSysId}}"
},
"parent_table": "{{parentTable}}",
"additional_data": {
"query": "{{query}}"
}
}
```

13. Modify the client action created for **ITEM_SELECTED** and **PREVIEW_RECORD** declarative actions records.

    When you modify the specific client action, then payload Map in action Attributes should be transformed based on the payload.

    The following tables are used in the migration process:

    - sys_ux_m2m_action_assignment_action_config
    - sys_declarative_action_payload_definition

    Note:
    The **ITEM_SELECTED** and **PREVIEW_RECORD** actions function in the ITSM Agent Workspace but not in SOW. Therefore, a new action payload named "CREATE_NEW_RECORD" Is introduced in SOW. While there could be other action payloads that might not function properly, the base system client actions for List continue to work effectively in SOW post-migration.

Migrate the UI component from ITSM Agent Workspace to Service Operations Workspace

Configure the UI component to migrate related list declarative actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Related List actions**.
2. Filter the records based for **Implemented As** is set as **UI component**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. Update the value in the **Implemented as** field as `UXF Client Action`.
9. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
10. Select **Save** to save the **Action configurations** related list.
11. Select **Update**.

    The migration utility supports MRA and interceptor declarative actions of UI Component type only.

12. For MRA, create an action payload as specified below, update the values in action attributes with component attributes of ITSM Agent Workspace declarative action.

    If no value is filled in the ITSM Agent Workspace declarative action record, then fill the value with {{ key }}. For example, if the component attributes table is empty then in the payload the value should {{table}}.

```
{
"label": "label",
 "extensionPoint": "extensionPoint",
 "userGivenTable": "userGivenTable",
 "hideSelectAll": "hideSelectAll",
 "parentRecordSysId": "parentRecordSysId",
 "table": "table",
 "referencedFieldName": "referencedFieldName",
 "type": "type",
 "parentFieldName": "parentFieldName",
 "columns": "columns",
 "view": "view",
 "relatedListName": "relatedListName"
 }
```

13. For Interceptor, create an action payload as specified below in the sys_declarative_action_payload_definition table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
{
 "table": "target",
 "sysId": "-1",
 "parentTable": "{{parentTable}}",
 "parentSysId": "{{parentRecordSysId}}",
 "referencedFieldName": "",
 "pageTitle": "Create " + tableLabel,
 "pageSubTitle": "Choose one of the following " + tableLabel +
 " types",
 "useDomain": false
}
```

14. Add an add-on event mapping to the migrated declarative action.

    Find the matching declarative action in SOW and add all the add-on event mapping to the migrated declarative action. Use the following steps to find the equivalent declarative action in SOW.

    a. Navigate to **All** > **sys_ux_addon_event_mapping.list**

    b. Filter the table and using the migrated `tablename` and **Target Payload Mapping** contains `mra` or `interceptor route`.

    c. If the record is found, return the declarative action sys_id.

    Iterate through all add-on event mappings of the found DA and add them to the migrated DA.

    d. If the record isn't found with the table, remove the table filter and search for targetPayload contains route=mra or interceptor.
    For **List** and **Field** decorator, you must add the MRA and interceptor add-on event mappings manually. For more information, see Create a UX add-on event mapping.

    Note:

    The Change_request interceptor record in ITSM Agent Workspace exists in SOW.

    Migrating workspace space record type selector for the interceptor type of declarative action are:

    - ITSM Agent Workspace table: aw_record_type_selector
    - SOW table: sn_sow_interceptor_record_type_selector

For a change_request table that has a value as standard, Active is set as False when migrating the records from ITSM Agent Workspace to SOW.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Perform post-migration tasks for related list declarative form actions

Verify that the related list declarative form actions in Service Operations Workspace (SOW) are consistent with the related list declarative form actions in ITSM Agent Workspace (ITSM AW) and they're ready for use in SOW. You can update the migrated related list declarative form actions settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Relative list declarative form actions** option for ITSM Agent Workspace features. For example, the **Relative list declarative form actions** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

Procedure

1. If the migration is successful, perform the following steps to verify the related list actions are visible on the forms.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.
      - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
      - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open the forms in ITSM Agent Workspace and SOW.

      The migrated related list actions are shown on the forms.

      Duplicate related list actions might be displayed on the form when you don't migrate the view rule. So, SOW field declarative actions still show up even after migration if the view isn't changed.

      If the migration is successfully completed and not visible in the UI or not working properly the cross-check the conditions in Advance view.

2. If the migration fails, perform the following steps.

   a. On the migration completion page in SOW Admin Center, select **View migration details**.

   b. Select the **Go to system logs** (⚠) icon.

   c. Review the logs to determine which items failed during migration.

   d. Based on each failed item, identify which step has failed and perform the steps mentioned in the following topics.
      - Migrate the client script from ITSM Agent Workspace to Service Operations Workspace
      - Migrate the server script from ITSM Agent Workspace to Service Operations Workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Migrate the client action from ITSM Agent Workspace to Service Operations Workspace
- Migrate the UI component from ITSM Agent Workspace to Service Operations Workspace

Migration of field decorators from ITSM Agent Workspace to Service Operations Workspace for ITSM

Migration of the field decorators actions from ITSM Agent Workspace to Service Operations Workspace that includes identifying the tables and the migration process.

The Declarative Action framework is used to integrate Core UI behaviors such as client actions or server scripts into Workspace forms, fields, lists, and related lists without the need to edit code.

Tables used for migration

Action Assignment [sys_declarative_action_assignment]: Contains all declarative settings.

Conditions for migration

```
Conditions:
Action model = Field
workspace = Agent Workspace
table = {sys_id of the supported ITSM tables:
 600f5e889f320210db9f618dfa0a1cbd and <global table>}
//We support records which are mapped to ITSM tables and Global
 table. The mapping the related list to ITSM table can be found
 in sys_ui_related_list_entry.
view != sow and sow_new_record
//(Considering that sow related view isn't customized in ITSM
 Agent Workspace)
```

How the migration works

The SOW migration utility uses the following to migrate the field decorator actions along with type available in ITSM Agent Workspace to SOW:

- Client Script
- Server Script
- Client Action
- UI Component

Migrate the client script from ITSM Agent Workspace to Service Operations Workspace for field decorators actions

Configure the client script to migrate field decorators actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Field Decorators**.
2. Filter the records based for **Implemented As** is set as **Client script**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
9. Select **Save** to save the **Action configurations** related list.
10. Select **Update**.

Migrate the server script from ITSM Agent Workspace to Service Operations Workspace for field decorators actions

Configure the server script to migrate field decorators actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Field Decorators**.
2. Filter the records based for **Implemented As** is set as **Server script**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
9. Select **Save** to save the **Action configurations** related list.
10. Select **Update**.

Migrate the client action from ITSM Agent Workspace to Service Operations Workspace for field decorators actions

Configure the client actions to migrate field decorators actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Field Decorators**.
2. Filter the records based for **Implemented As** is set as **Client action**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. Update the value in the **Implemented as** field as `UXF Client Action`.
9. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
10. Select **Save** to save the **Action configurations** related list.
11. Select **Update**.
12. If specify client action key is **ITEM_SELECTED** or **PREVIEW_RECORD**, create CREATE_NEW_RECORD key with the payload mentioned below in the code block in the sys_declarative_action_payload_definition table.

    This step is performed only once.

```
{
 "route": "record",
 "fields": {
 "table": "{{table}}",
 "sysId": "-1"
 },
 "params": {
 "query": "{{query}}",
 "parentTable": "{{parentTable}}",
 "parentRecordSysId": "{{parentRecordSysId}}"
 },
 "parent_table": "{{parentTable}}",
 "additional_data": {
 "query": "{{query}}"
 }
 }
```

13. Modify the client action created for **ITEM_SELECTED** and **PREVIEW_RECORD** declarative actions records.

    When you modify the client action, then the payload Map in action Attributes should be transformed based on the payload.

    The following tables are used in the migration process:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- sys_ux_m2m_action_assignment_action_config
- sys_declarative_action_payload_definition

> **Note:**
> The **ITEM_SELECTED** and **PREVIEW_RECORD** actions function in the ITSM Agent Workspace but not in SOW. Therefore, a new action payload named "CREATE_NEW_RECORD" Is introduced in SOW. While there could be other action payloads that might not function properly, the base system client actions for List continue to work effectively in SOW post-migration.

Migrate the UI component from ITSM Agent Workspace to Service Operations Workspace for field decorators actions

Configure the UI component to migrate field decorators actions from ITSM Agent Workspace to Service Operations Workspace.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Declarative Actions** > **Field Decorators**.
2. Filter the records based for **Implemented As** is set as **UI component**.
3. View the log in the failed record in the migration process and find the *sys_Id* of the record from the list of **Related List Actions**.
4. Select the failed record with the corresponding sys_id.
5. Right-click on the header, and select **Insert and Stay**.
6. Clear the **Workspace** and **View** fields.
7. Select the **Experience Restricted** check box.
8. Update the value in the **Implemented as** field as `UXF Client Action`.
9. In the **Action configuration** related list, select **Edit**, and then select **SOW Actions** from **Collection** to **Action configurations** list.
10. Select **Save** to save the **Action configurations** related list.

> **Note:**
> Adding MRA or Interceptor to the field isn't a valid scenario. If there is still a customization, you must verify add-on event mapping in the base system. In the base system, the add-on event mappings for field declarative action are unavailable.

11. Select **Update**.

    The migration utility supports MRA and interceptor declarative actions of UI Component type only.

12. For MRA, create an action payload as specified below, update the values in action attributes with component attributes of ITSM Agent Workspace declarative action.

    If no value is filled in the ITSM Agent Workspace declarative action record, then fill the value with {{ key }}. For example, if the component attributes table is empty then in the payload the value should {{table}}.

```
{
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"label": "label",
 "extensionPoint": "extensionPoint",
 "userGivenTable": "userGivenTable",
 "hideSelectAll": "hideSelectAll",
 "parentRecordSysId": "parentRecordSysId",
 "table": "table",
 "referencedFieldName": "referencedFieldName",
 "type": "type",
 "parentFieldName": "parentFieldName",
 "columns": "columns",
 "view": "view",
 "relatedListName": "relatedListName"
 }
```

13. For Interceptor, create an action payload as specified below in the sys_declarative_action_payload_definition table.

```
{
 "table": "target",
 "sysId": "-1",
 "parentTable": "{{parentTable}}",
 "parentSysId": "{{parentRecordSysId}}",
 "referencedFieldName": "",
 "pageTitle": "Create " + tableLabel,
 "pageSubTitle": "Choose one of the following " + tableLabel +
 " types",
 "useDomain": false
}
```

14. Add an add-on event mapping to the migrated declarative action.

    Find the matching declarative action in SOW and add all the add-on event mapping to the migrated declarative action. Use the following steps to find the equivalent declarative action in SOW.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **sys_ux_addon_event_mapping.list**

b. Filter the table and using the migrated `tablename` and **Target Payload Mapping** contains `mra` or `interceptor route`.

c. If the record is found, return the declarative action sys_id.
