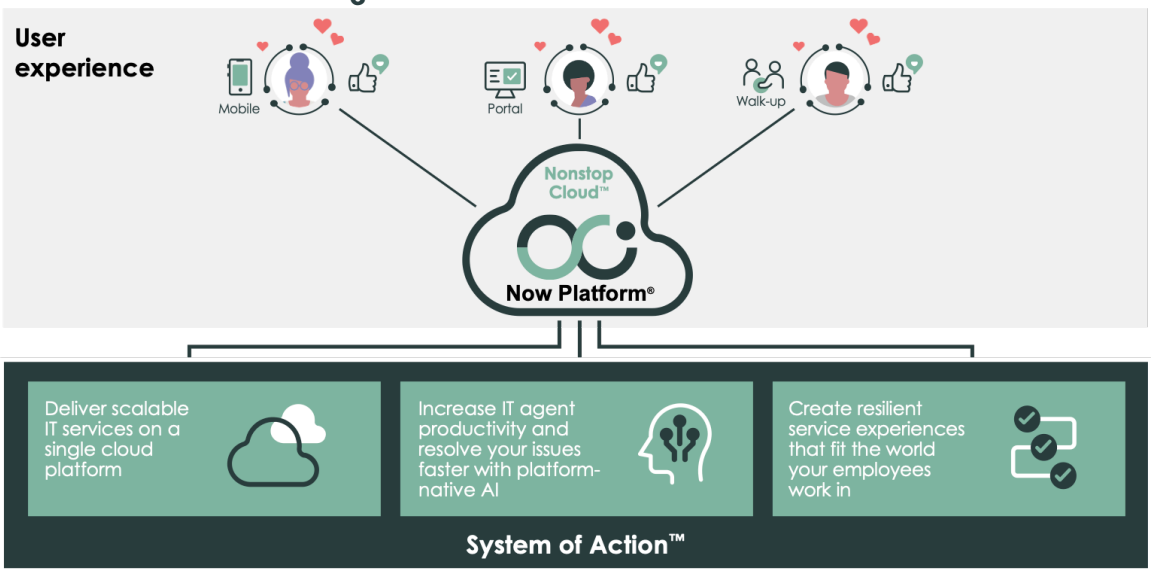
IT Service Management

The IT Service Management (ITSM) solution provides scalable workflows to manage and deliver IT services to your users all through a single cloud-based platform.

The ITSM solution can help increase your agents' productivity, resolve issues quickly, and improve user satisfaction. Also, powered by platform native AI, you can quickly accelerate technology changes and view recommended actions for incoming tickets or requests and drive self-service and automation through enterprise chatbot technology. The ServiceNow AI Platform® also provides users access to ITSM via mobile or web-portal interfaces.

ITSM is the foundation of digital transformation



Transform the impact, speed, and delivery of IT services

The ServiceNow AI Platform was built for the cloud and has its own shared data model, AI, and workflow automation that are leveraged by many IT applications. The combination of the ServiceNow platform and applications helps you increase productivity by automatically identifying and resolving issues, which reduces the negative business impacts of unplanned, non-strategic work.

Comparing a typical IT department with scattered tools to the ServiceNow AI Platform linking IT functions

View and download the full infocard for a highlight of ITSM features.

	Enhance the service experience Automate support for common requests with virtual agents powered by natural language understanding (NLU). Engage users with natural, human conversation to provide consistent good customer service experiences.
	Consolidate IT services Rapidly consolidate existing tools to a single system of action in the cloud.
	Improve IT productivity Use machine learning algorithms and virtual agents to automate routine tasks and increase the productivity of agents.
	Gain visibility into processes and services Get full visibility into any process or service with built-in dashboards and analytics providing real-time, actionable information to improve service quality.
	Provide mobile connectivity Enable employees to find answers and get work done from a modern mobile application.

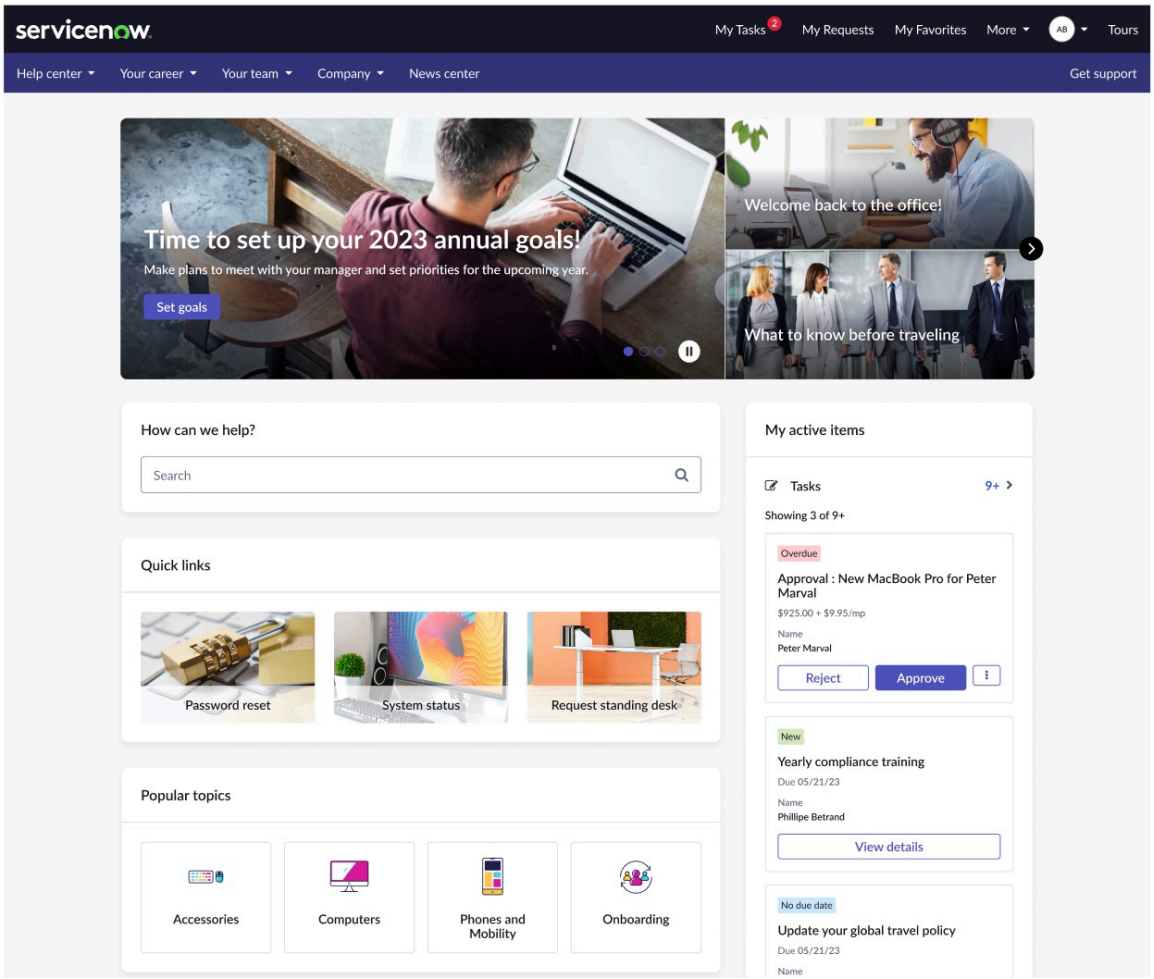
Enhance the service experience



Automate routine agent interactions and increase the speed of resolution from the Employee Center portal. With supervised machine learning, you can automate incident categorization and assignment and eliminate bottlenecks created by manual incident triaging. Meet increasing demands without further adding staff and empower existing IT staff to focus on more meaningful work. For more information on the Employee Center portal and the features, see .

Consolidate IT services

Consolidated IT services diagram

Reduce the number of separate tools your company uses to provide a consistent service experience regardless of the issue or the request. Consolidating IT services enables you to better manage and allocate resources and track performance. You can have a single reliable source of information where performance is monitored in real time and data is easy to capture and report.

Improve IT productivity

Accelerate resolution with built-in machine learning. Chatbots provide immediate resolution to common questions. With ITSM Virtual Agent in action, you can have employees with 24*7 support service. Service desk agents can take advantage of machine-learning automation to resolve incidents and recommend resolutions for agents based on similar incidents solved in the past.

Gain visibility into processes and services

Gain visibility into processes and services

Make smarter decisions with real-time analytics across the entire IT value chain. Get new insights into service performance using data trends and forecasts. With Performance Analytics, you can anticipate trends based on current conditions and past performance and identify areas where automation can increase efficiency.

Provide mobile connectivity

Stay connected and access information in real time using the ITSM mobile agent. You can access work assigned to you or your group, receive push notifications, and approve or reject change requests and requested items. The ITSM mobile agent is available on the iOS platform from the Apple App Store or on the Android platform from the Google Play Store.

Edge Encryption for ITSM Virtual Agent within ITSM

Edge encryption provides you with direct control over your data security. Encryption and key management are performed on your intranet between your browser and your ServiceNow instance.

See Understanding Edge Encryption.

Because edge encryption is enabled on a proxy server on your side of the network, there is significant planning, network administration and management, and setup required.

See Planning for Edge Encryption.

To install edge encryption, see Edge Encryption installation.

To configure edge encryption, see Edge Encryption configuration.

Note:
There are limitations when using edge encryption. See Edge Encryption limitations.

Get started

- Set up the service management module for a modern ITSM experience. To learn more, see Customer Success Center.
- Learn about the different ITSM packages that work for your business on the ServiceNow Products website.
- Take an ITSM course to manage and deliver services to your users. To sign up, go to ServiceNow training and certification.
- Read the product documentation, beginning with IT Service Management.

Learn

- What is a service desk?
- What is incident management?
- What is IT Support?
- What is an IT ticketing system?
- What is ITIL?
- What is ITSM?
- What is Workforce Optimization for ITSM?

Script includes and customization

Many Script Includes are provided by default with the ITSM products. You can call existing script includes from a script or create your own script includes.

You can find script includes by navigating to **Self Service** > **System Definition** or **Self Service** > **System UI**. To get the latest features and problem fixes without breaking the existing functionality during an upgrade, remember the following points:

To modify or customize an existing script include:

- Do not use the script includes that are suffixed by SNC. Those script includes are read-only and must not be customized. For example, the following script include must not be customized.

```
var ChangeProcessSNC = Class.create();
ChangeProcessSNC.prototype = {
    // SNC functions
    type: "
```

- Do not override methods that start with an underscore. Those methods indicate that the functions are private.

You can override the functions of the non-SNC script includes that extend the SNC scripts. For example, the following script include can be overridden.

```
var ChangeProcess = Class.create();
ChangeProcess.prototype = Object.extendsObject(ChangeProcessSNC,
{  // Customer overridden functions  type: "ChangeProcess" });
```

Machine learning solutions for IT Service Management

Machine learning in IT service management helps to enhance business scalability and improve business operations for organizations.

Organizations face challenges in deriving meaningful information and business insights from overwhelming volumes of data. Machine learning offers solutions that are trained on your instance's historical data, using your choice of algorithms. These solutions can be deployed in flows and scripts to automate categorization and assignment of tickets, for example.

Task Intelligence for ITSM

Request Predictive Intelligence for Incident Management

Activate Predictive Intelligence for Incident Management by requesting the Predictive Intelligence for Incident Management plugin (com.snc.incident.ml_solution) through the Now Support Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

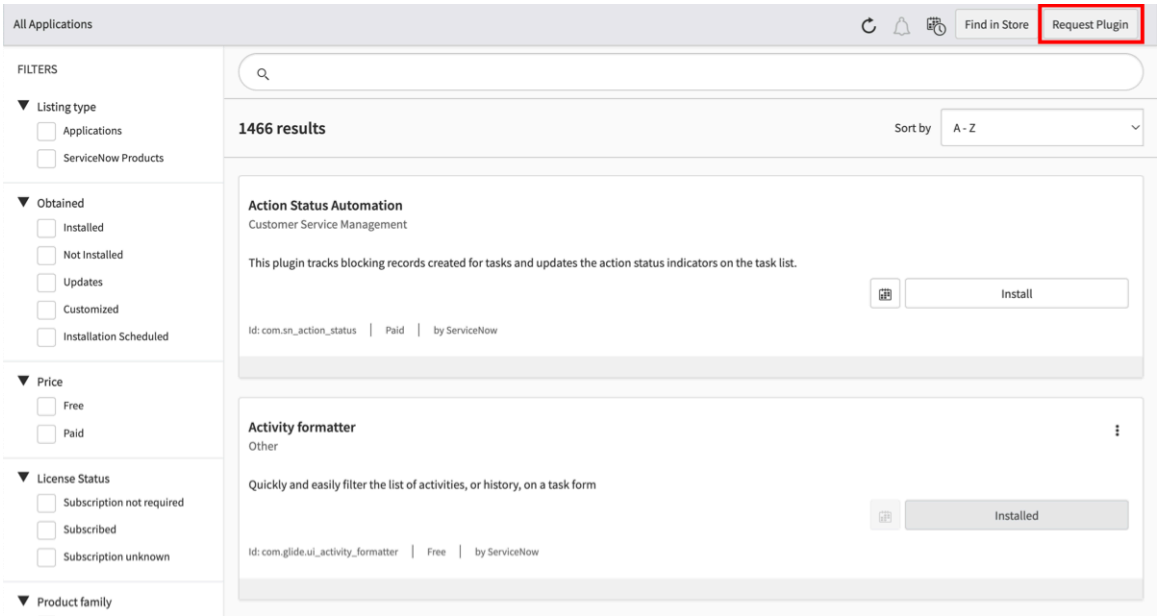
Predictive Intelligence for Incident Management requires a separate subscription from the rest of the ServiceNow AI Platform.

To purchase a subscription, contact your ServiceNow account manager. When you purchase a subscription, certain plugins are activated automatically. If a plugin doesn't appear in the instance, submit a request via the Now Support Service Catalog.

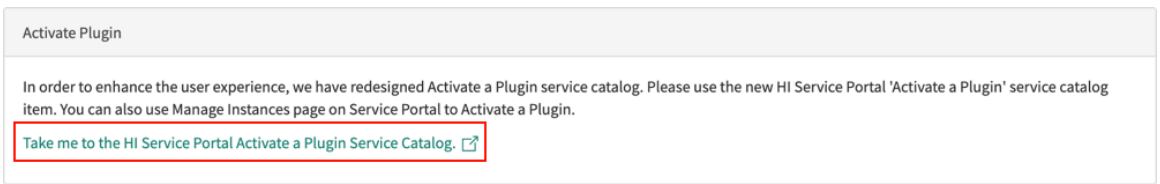
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. On the form, fill in the fields.

Activate Plugin request form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Plugin Name	Enter:
Select Maintenance Date and Time	The date and time to activate the plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Request Predictive Intelligence for Major Incident Management

Activate Predictive Intelligence for Major Incident Management by requesting the Predictive Intelligence for Major Incident Management plugin (com.snc.incident.mim.ml_solution) through the Now Support Service Catalog.

Before you begin

Predictive Intelligence for Major Incident Management requires a separate subscription from the rest of the ServiceNow AI Platform.

To purchase a subscription, contact your ServiceNow account manager. When you purchase a subscription, certain plugins are activated automatically. If a plugin doesn't appear in the instance, submit a request via the Now Support Service Catalog.

Role required: admin

About this task

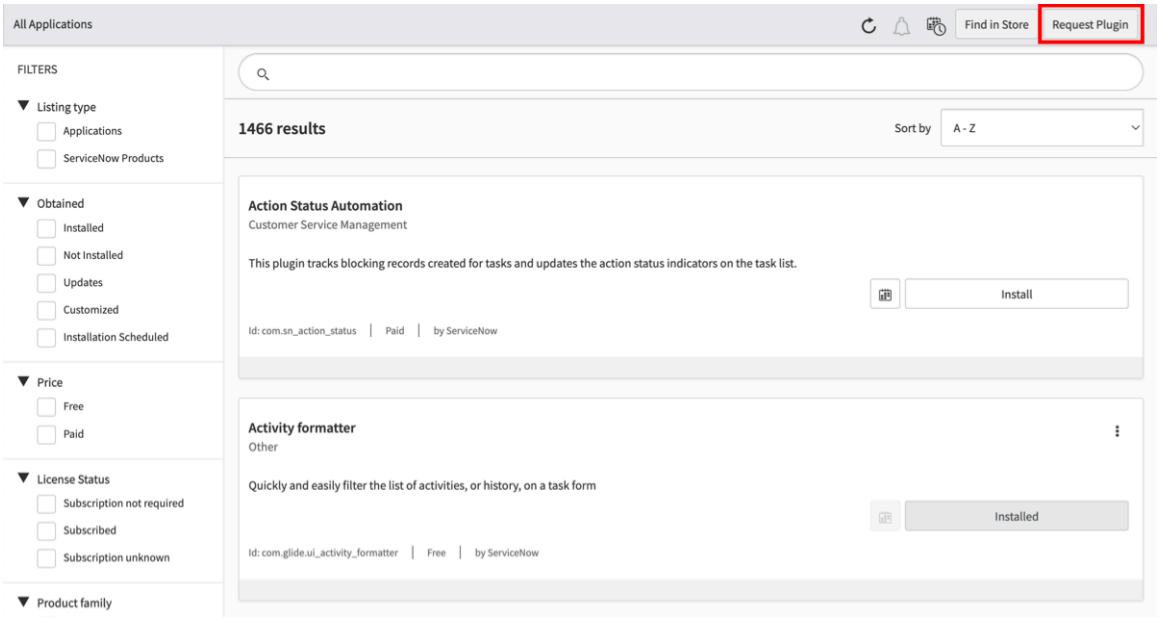
The following plugins are installed with Predictive Intelligence for Major Incident Management:

- Incident Management - Major Incident Management (com.snc.incident.mim)
- Predictive Intelligence for Incident Management (com.snc.incident.ml_solution)

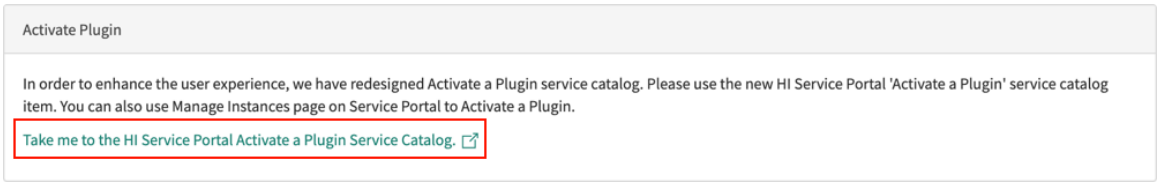
Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. On the form, fill in the fields.

Activate Plugin request form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Plugin Name	Enter:
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

5. Select **Submit**.
For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Predictive Intelligence for Incident Management

Use your instance records to build specific solutions for Incident Management.

Solution definitions

These solution definitions are available as templates on instances where both Predictive Intelligence and Incident Management are active. Create your own solution definition records to customize the behavior.

Solution Definitions for Incident Management

Solution Definition	Solution Type	Description
Incident Assignment	Classification	Predicts the **Assignment group** field from the **Short description**.
Incident Categorization	Classification	Predicts the **Category** field from the **Short description**.
Incident Service	Classification	Predicts the **Service** field from the **Short description**.
Incident Configuration Item	Classification	Predicts the **Configuration item** field from the **Short description**.
Major Incident Detection	Similarity	Recommends similar active major incidents which the current incident can be linked to. Recommends similar incidents to propose a major incident.
Similar Incidents (Major Incident Workbench)	Similarity	Recommends similar incidents that are not linked as child incidents to a major incident.
Similar Incidents	Similarity	Recommends similar incidents based on the **Short description** and **Description** fields, to help with incident investigation and resolution processes.
Similar Open Incidents	Similarity	Recommends similar open incidents based on the **Short description** and **Description** fields, that the current incident can be linked to.
Similar Closed Incidents	Similarity	Recommends similar closed incidents based on the **Short description** and **Description** fields, to help with incident

Solution Definitions for Incident Management (continued)

Solution Definition	Solution Type	Description
		investigation and resolution processes.
Similar Resolved Incidents	Similarity	Recommends similar resolved incidents to help with incident investigation and resolution processes.

Solution definitions and the required plugins are as follows:

Solution definitions and plugins

Solution definition	Plugins
• Incident Assignment • Incident Categorization • Incident Service • Incident Configuration Item	The plugins com.glide.platform_ml and com.snc.incident.ml_solution must be active.
Similar Incidents (MIM)	The plugins com.glide.platform_ml and com.snc.incident.mim.ml_solution must be active.
Major Incident Recommendation	The plugins com.snc.contextual_search_ml and com.snc.incident.mim.ml_solution must be active.
• Similar Open Incidents • Similar Resolved Incidents • Similar Incidents • Similar Knowledge Articles	The plugins com.snc.contextual_search_ml and com.snc.incident.mim.ml_solution must be active.

For more information on classification and similarity solution, refer to Create solution definition and Create similarity solution.

Business rule for classification solutions

This business rule applies only to the Incident Assignment and Incident Categorization solution definitions and is available only on instances where both Predictive Intelligence and Incident Management are active. Create your own business rules on the Incident table to customize prediction and reporting behaviors.

Business rule for Incident Management

Business rule	Table	Description
Update Prediction Results	Incident	Updates the solution precision and coverage statistics. Runs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule for Incident Management (continued)

Business rule	Table	Description
		when an incident record is closed.

For more flexibility with classification solutions, consider using ITSM Predictive Intelligence Workbench.

Upgrade Information

If your instance is running on the Kingston release and you are upgrading to the Xanadu release:

- In a global domain environment, use the new solutionNames array variable which requires that you explicitly provide the solutions that are called by the business rule.
- In a domain-separated environment, such as an MSP environment, refer to the commented code in the business rule template for easy customization.
- The business rule template now calls the applyPredictionForSolution() method to predict regardless of any changes to the default value.

Maintaining prediction accuracy

You can manage prediction drift by retraining, modifying, or creating new solutions to reflect changes in your business conditions. Test and modify your business rule over time to ensure it works as desired across multiple consumption points and user Personas.

Request Predictive Intelligence for Incident

To activate Predictive Intelligence for Incident, request the Predictive Intelligence for Incident plugin (com.snc.incident.ml) through the Now Support Customer Service system. This plugin activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

The Predictive Intelligence for Incident plugin activates these related plugins if they are not already active.

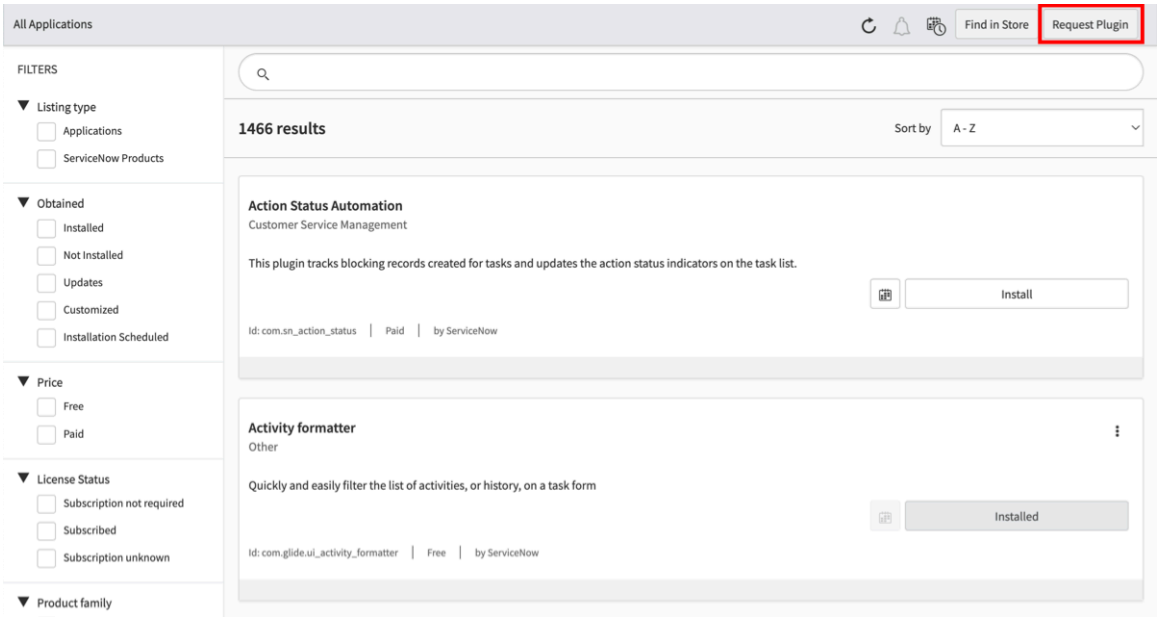
Plugins for Predictive Intelligence for Incident

Plugin	Description
Predictive Intelligence for Contextual Search [com.snc.contextual_search_ml]	Enables customers to leverage machine-learning algorithms for searching with Contextual Search. For example: Similar Open Incidents. Activation of this plugin on production instances may require a separate license. Contact ServiceNow for details.

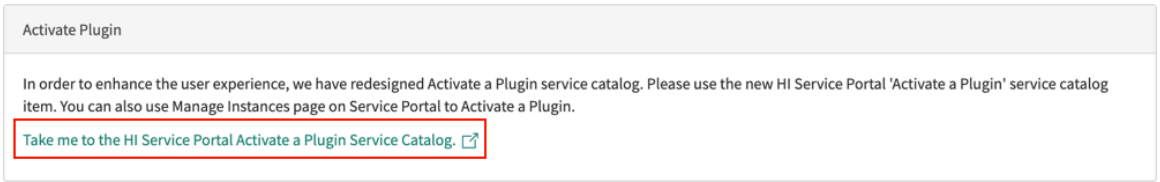
Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin.

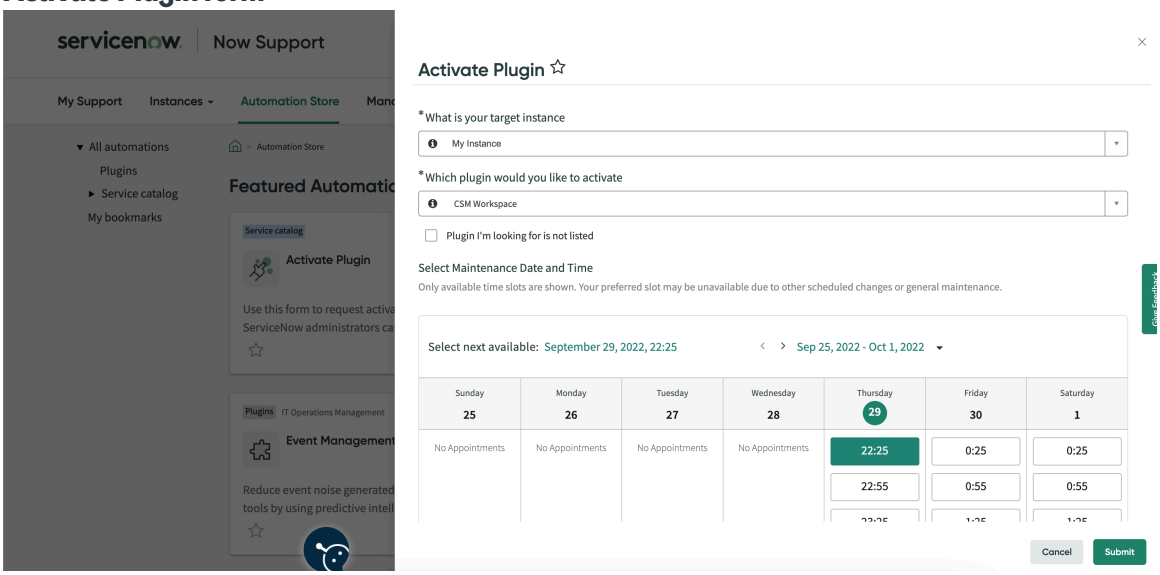
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

List of plugins (Xanadu)

Predictive Intelligence for Incident

Use your instance records to build Incident Management -specific solutions.

Solution definitions

The solution definitions are available when you have the Predictive Intelligence for Incident plugin (com.snc.incident.ml) activated in your system.

These solution definitions are available as templates on instances where both Predictive Intelligence and Incident Management are active. Create your own solution definition records to customize the behavior.

Solution Definitions for Incident Management

Solution Definition	Solution Type	Description
Similar Open Problems	Similarity	Recommends similar open problems that the current incident can be linked to. By default, the similarity is inactive.
Similar Open Change Requests	Similarity	Recommends similar open change requests that the current incident can be linked to as a request for change. By default, the similarity is inactive.

For more information on similarity solution, refer Create similarity solution.

Asset Management

The ServiceNow® Asset Management application integrates the physical, technological, contractual, and financial aspects of information technology assets.

Note:
Beginning with the ServiceNow AI Platform® Washington DC release, we will provide limited support for the Asset Management Core UI interface. While it remains active in your instance, including when you upgrade to a new ServiceNow AI Platform release, we encourage you to move to the new workspace experience. For more information, see KB1584548, Exploring Asset Management Workspace and Next Experience UI.

Asset management business practices have a common set of goals.

- Control inventory that is purchased and used.
- Reduce the cost of purchasing and managing assets.
- Select the proper tools for managing assets.
- Manage the asset life cycle from planning to disposal.
- Achieve compliance with relevant standards and regulations.
- Improve IT service to end users.
- Create standards and processes for managing assets.

Most successful ITAM programs involve various people and departments, including IT, finance, services, and end users.

Asset Management and the Configuration Management Database (CMDB) are related, but have different goals. Asset Management focuses on the financial tracking of company property. Configuration management focuses on building and maintaining elements that create an available network of services.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mobile app for Hardware Asset Management

Use the ServiceNow Mobile and ServiceNow Agent apps to manage your assets.

ServiceNow Agent app

Use the ServiceNow Agent app to create assets, look up assets, and receive assets from a purchase order.

Create an asset

Use the ServiceNow Agent app to create an asset record by scanning the asset.

Before you begin
Download the ServiceNow Agent app from Apple App Store or Google Play Store.

Role required: asset

The Procurement plugin (com.snc.procurement) must be installed to get the procurement features in ServiceNow Agent app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Asset** and tap **Create Asset**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Scan the asset serial number or asset tag, then tap **Search**.
   If the asset exists in your ServiceNow instance, an asset record is displayed. This information is to ensure that you don't create duplicate asset records.
3. **Optional:** To update an existing asset, select the asset and then tap **Update Asset**.
4. If no existing asset record is found, tap the action icon in the upper right and select **Create Asset**.
5. Scan or enter values for the **Asset Tag**, **Serial Number**, **Model** (non-software), **Stockroom**, **State**, and **Substate** fields.
6. Tap **Submit** to create the asset.

Asset lookup

Search for an asset record in your ServiceNow instance by scanning the asset.

Before you begin

Role required: asset

Procedure

1. Navigate to **Asset** and tap **Asset lookup**.
2. Scan the asset tag, then tap **Search**.
3. An asset record is displayed if the asset exists in your ServiceNow instance.
   You can select the existing asset to update it or to create an incident related to it.

Receive assets from a purchase order

Scan assets from a purchase order (PO) to verify that you received all assets from the order.

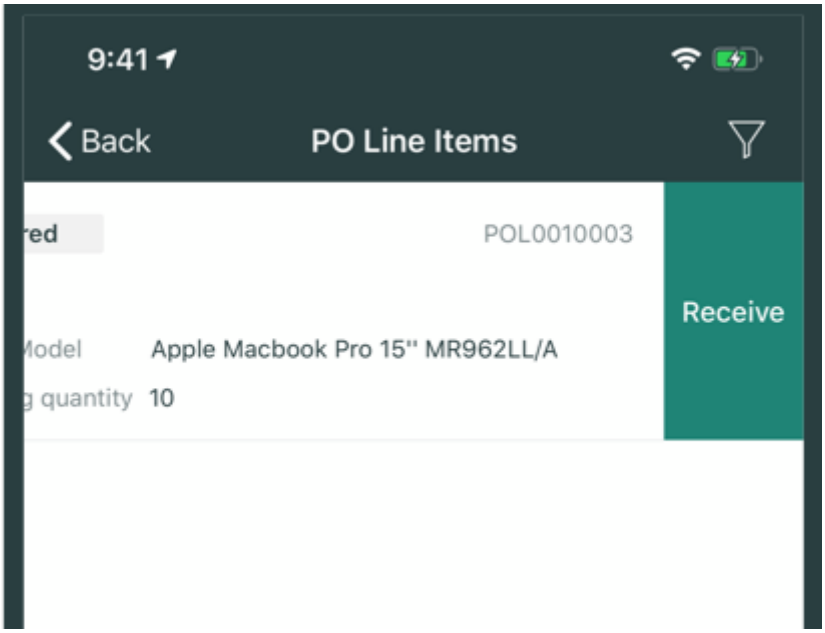
Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **Procurement** and tap **POs Next 30 Days**.
2. Select a purchase order.
3. Tap **Related list**.
4. Tap the **PO Line Items** asset that you ordered and swipe **Receive** to receive the asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. If you only need to receive a single purchase, on the Receive form, scan the QR code for either the asset tag or serial number.
6. If you need to receive multiple purchases, on the Receive form, tap **Scan next item** until you've scanned all of your purchases.
7. Tap **Submit**.

Result
The purchase order is marked as received.

Now Mobile app

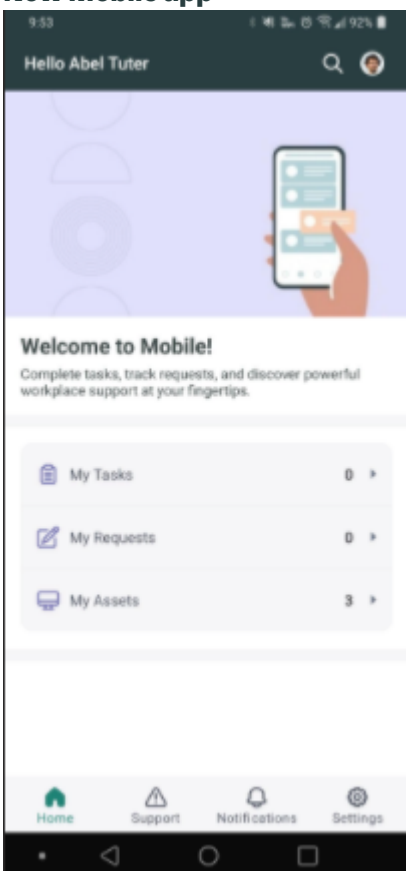
Use the Now Mobile app to view the assets that are assigned to you, to report any issues with your assets, and to remotely receive new assets. Create incidents to report any issues with your assets to your IT department.

Download the Now Mobile app from Apple App Store or Google Play Store.

The Now Mobile app provides different services for tasks and requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Now Mobile app



To view all the assets that are assigned to you, navigate to **My Items** > **My Assets** > **Hardware**. The tab shows the assets that have the State field set to In transit or In use, Sub-state set to Reserved, and the Reserved to field set to your name. You can create an incident for an asset that is in use.

When you are away from your office, you can remotely receive an asset that is in transit. Scan the QR code for the asset tag so that you can automatically notify the IT department that you have received the asset.

Asset and CI management

Asset and configuration item (CI) management refers to creating assets, setting appropriate states and substates, synchronizing assets and CIs, managing consumables, and retiring assets.

Relationship between asset and CI

It's important to manage the relationship between assets and associated CIs. Assets are tracked with the Asset Management application, which focuses on the financial aspects of owning property. Configuration items are stored in the CMDB, which is used to track items and make them available to users.

When an asset has a corresponding configuration item, the asset record and the configuration item record are kept synchronized with two business rules.

- *`Update CI fields on change`* (on the Asset [alm_asset] table)
- *`Update Asset fields on change`* (on the Configuration Item [cmdb_ci] table)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Assets and CIs can be synchronized only if they're logically mapped.

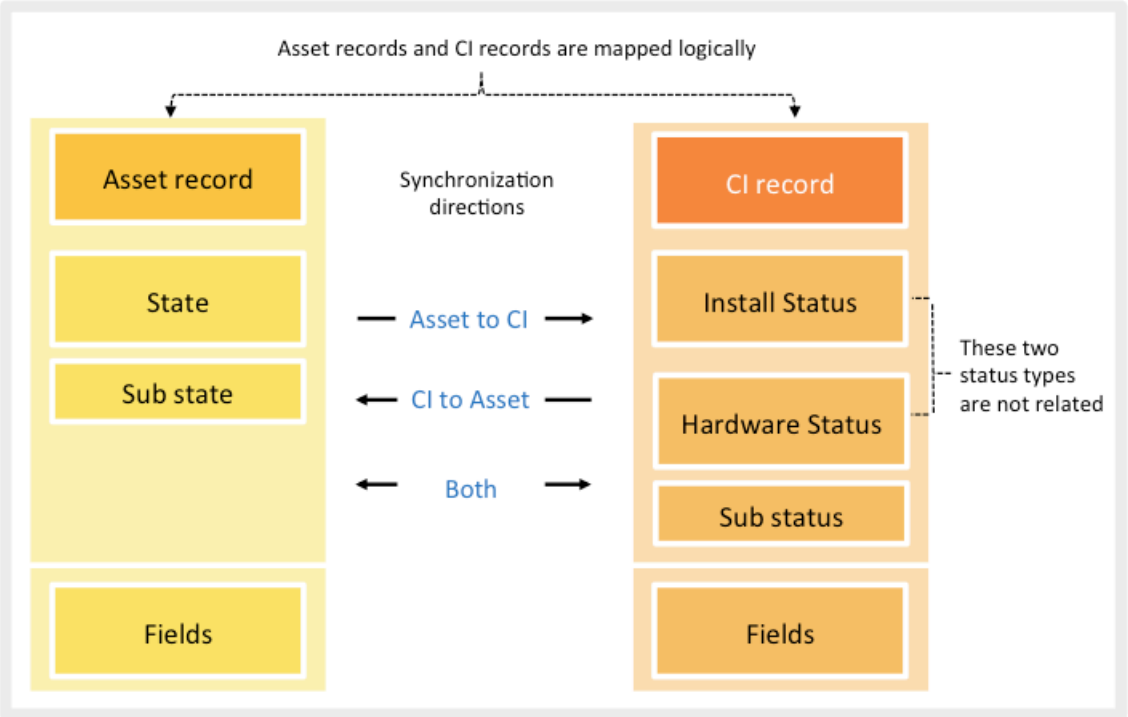
Asset-CI mapping and synchronization

The State field of asset record and Status field of CI record are synchronized so that changes made on one form trigger the same update on the corresponding form, ensuring consistent reporting.

Note:
The ServiceNow AI Platform synchronizes updates between assets and configuration items only if the asset and configuration item are pointed toward each other.

The following diagram illustrates the concept of Asset-CI mapping and synchronization.

Overview of Asset-CI mapping and synchronization



This synchronization and mapping is based on the following factors:

- Asset state and CI status aren't mapped on one-to-one basis. Rather they're mapped to the most logical counterpart on the other table. For example, for a hardware asset set to state **In Stock - Pending disposal**, the corresponding CI is set to **In Disposition** with no substate.
- This synchronization happens between the asset's State field and the following CI fields:
  - Install Status field: Install Status doesn't have a sub status and must be used for non-hardware CIs.
  - Hardware Status and Sub status field: Hardware Status is visible only for Hardware CI.
- Drive changes by updating the state on the Asset form. The Asset-CI synchronization can be driven in the following ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - Asset to CI synchronization: Change to the asset's status updates the logically mapped CI's Install Status or Hardware Status and sub status.
  - CI to Asset: Change to the CIs Install Status or Hardware Status updates the logically mapped asset's states and sub states.
- For a CMDB hardware CI, if both Hardware Status and Install Status is updated, the Hardware Status change is considered for mapping the corresponding state of the asset.
- CIs Install Status and Hardware Status work independently, so the two fields aren't related. CI's Hardware Status change doesn't change CIs Install Status and vice versa. To avoid confusion, keeping both status for CMDB CI Hardware isn't recommended.

List of the fields that get synced between Asset and CI

When changing any of the following fields on the asset or CI record, the same field on the corresponding record is automatically updated (except for the **Cost** field, which is informational-only on the CI record).

The following is a list of fields that are synchronized.

- Asset tag
- Assigned
- Assigned to
- Checked in
- Checked out
- Company
- Cost (synchronizes in only one direction: asset to CI)
- Cost center
- Delivery date
- Department
- Due in
- Due
- GL account
- Install date
- Invoice number
- Justification
- Lease id
- Location
- Managed by
- Model (model_id in CI)
- Order date
- Order received
- Ordered
- Owned by
- PO number

- Purchase date
- Purchased
- Serial number
- Support group
- Supported by
- Vendor
- Warranty expiration

Asset, CI, and IBI synchronization

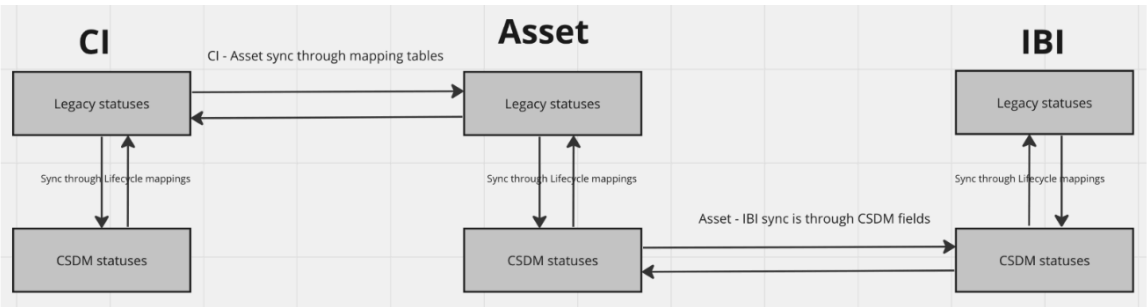
Any item that is provided as a service or sold to your customer is tracked as an Install Base Item (IBI). The Model category table associates Asset, CI, and Install Base Item (IBI). The synchronization between the asset and IBI is through the CSDM Life Cycle Stage and Status fields.

When the CSDM (csdm.lifecycle.migration.activated) plugin is activated on your ServiceNow instance, synchronization of the CSDM Lifecycle fields between the asset and CI depends on the *csdm.lifecycle.sync.between.ci.and.asset.activated* system property. If you are upgrading to the Xanadu release, this system property is set to **false** by default. Synchronization between the asset and CI happens in one of the following ways:

- When the system property is set to **false**, synchronization of the CSDM Lifecycle fields is through the legacy State and Substate fields.
- When the system property is set to **true**, the CSDM Life Cycle Stage and Status fields are directly synchronized.

Note:
If you are activating the CSDM (csdm.lifecycle.migration.activated) plugin on your ServiceNow instance for the first time, and you have custom States and Substates for the asset or CI, then make sure to configure mapping between the legacy fields and the CSDM Lifecycle fields. For more information, see Enabling CSDM life-cycle sync between legacy fields and related assets.

Asset, CI, and IBI synchronization when the csdm.lifecycle.sync.between.ci.and.asset.activated system property is set to false



Synchronization of updates from asset to IBI and CI

Updates made to the State or Substate field of an asset are synchronized with the associated IBI and CI. For example, when the State field of the asset is updated to In use, synchronization happens as follows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Life Cycle Stage and Life Cycle Stage Status of the asset are set to Operational and In use, these field values are then synchronized with Stage and Status fields of IBI asset.
- The Status and Substatus fields of the CI change to Installed and In use.

Synchronization of updates from IBI to asset and CI

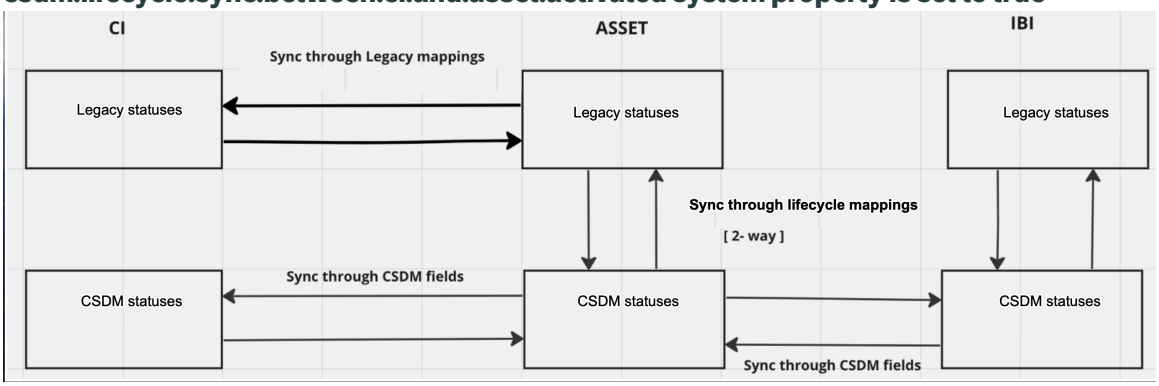
Updates made to the Life Cycle Stage and Life Cycle Stage Status fields of an IBI asset are synchronized with the legacy State and Substate fields of the asset through the CSDM fields. The legacy fields of the asset are then synchronized with the associated CI. For example, when the life Life Cycle Stage and Life Cycle Stage Status fields of an IBI asset are updated to Defective and In Stock, synchronization happens as follows.

1. The Life Cycle Stage and Life Cycle Stage Status of the asset change to In Stock and Defective. These field values are synchronized with the State and Substate fields of the asset.
2. The State and Substate fields of the asset are then synchronized with the corresponding fields of the associated CI.

Synchronization of updates from CI to asset and IBI

Updates made to the Status and Substatus fields of a CI are synchronized with the corresponding fields of the asset. The legacy fields of the asset are then synchronized with the Life Cycle Stage and Life Cycle Stage Status fields of the IBI asset through the CSDM fields. For example, when the Status and Substatus fields of a CI are updated to Retired and Donated, the corresponding fields of the asset change. The changes from the asset are synchronized with the IBI asset and the Life Cycle Stage and Life Cycle Stage Status fields change to End of Life and Retired.

Asset, CI, and IBI synchronization when the csdm.lifecycle.sync.between.ci.and.asset.activated system property is set to true



Synchronization of updates from asset to CI and IBI

Updates made to the legacy State and Substate fields of the asset are synchronized between the asset and CI as follows:

- The Life Cycle Stage and Life Cycle Stage Status fields of the asset are updated with values corresponding to the legacy State and Substate fields of the asset.
- The State and Substate fields of the asset are then directly synchronized with the corresponding legacy fields of the associated CI.
- The Life Cycle Stage and Life Cycle Stage Status fields of the asset are then directly synchronized with the corresponding CSDM fields of the associated CI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

However, synchronization of updates from asset to IBI is only through the CSDM Lifecycle fields.

Synchronization of updates from IBI to asset and CI

Updates made to the Life Cycle Stage and Life Cycle Stage Status fields of the IBI are synchronized as follows:

- The legacy State and Substate fields of the asset are synchronized through the CSDM fields.
- The legacy fields of the asset are synchronized with the legacy fields of the associated CI.
- The Life Cycle Stage and Status fields of the asset are directly synchronized with the corresponding CSDM fields of the associated CI.

Synchronization of updates from CI to asset and IBI

Updates made to the Life Cycle Stage and Status fields of a CI are synchronized as follows:

- The Life Cycle Stage and Status fields of the CI are directly synchronized with the corresponding CSDM fields of the asset.
- The legacy fields of the asset are then updated with the values corresponding to the CSDM fields.
- The legacy fields of the asset are then synchronized with the corresponding fields of the CI.
- The legacy fields of IBI are synchronized with the asset through the CSDM Lifecycle fields.

Asset and CI creation properties

glide.create_alm_asset.async

The system property *glide.create_alm_asset.async* controls whether assets are created immediately when a configuration item (CI) is created, or are created after a delay. A delay in asset creation enables large numbers of CIs to be created quickly. When this property is set to **true**, assets are created by the *Asset - Create asset delayed sync* scheduled job that runs every 15 minutes. View the status of the scheduled job in the Asset Job Log table [asset_job_log]. To view assets waiting to be created and asset creation errors, navigate to **Asset** > **Administration** > **Asset Creation Queue**. To reprocess an error, update the state from **Error** to **Ready**. The next time the scheduled job runs, it reattempts to create the asset.

When the *glide.create_alm_asset.async* property is set to **false**, assets are created immediately from CIs.

Note:
If you upgrade to Xanadu from Orlando or earlier, the default value of this property is **false**. Before updating this property, review your processes that depend on an asset value present on a CI and make any necessary changes to account for delayed asset creation.

glide.asset.create_ci_with_ire

The system property *glide.asset.create_ci_with_ire* enables CIs to be created from assets using the ServiceNow® Configuration Management Database (CMDB) Identification and Reconciliation engine (IRE). This property affects CI

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

classes that have an identification rule on serial number and have no dependent relationships with other CI classes.

Note:
This property is applicable to CI classes that are extended from the hardware CI class [cmdb_ci_hardware].

CIs created with the IRE are named using the format `Serial number - Model name` and the source is SNA`ssetManagement`. The **Serial number** field is required on assets with model categories that correspond to these CI classes. Asset creation fails if its serial number is present on an existing CI or asset. The **Serial number** field is also required to receive purchase order line items for model categories that correspond to these CI classes. The **Serial number** field isn't required to create pre-allocated assets, but the serial number must be provided when the asset is allocated.
The default value of this property is false if you upgrade to Xanadu from Orlando or earlier. Before updating this property, review the customizations on the Serial number field and any integrations or flows that use an existing serial number to create an asset.

Other Asset and CI system properties

sn_itam_enable_cache_for_asset_ci_mapping

The asset and CI fields are synchronized based on the mappings defined in the relevant mapping tables. Fetching these mappings on the update of an asset or CI has an impact on the performance. The *`sn_itam_enable_cache_for_asset_ci_mapping`* system property enables you to cache the following mappings:

- Asset and CI fields
- Asset state and CI install status
- Asset state and CI hardware status

Unless there isn't any change in the mapping tables, these cached mappings are fetched during the synchronization resulting in the improved system performance.

Create assets

Create hardware, software, consumable, bundle, pallet, mobile, and facility assets using the Core UI or the Hardware Asset Workspace.

Before you begin
Role required: asset

Procedure

1. Create an asset.
2. On the Asset record fields form, fill in the fields.

   For a description of the field values, see Asset record fields.
3. Submit or save the asset form.

Retire assets

You can retire an asset at any time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: asset

About this task
After you change the state of an asset to **Retired**, the **Substate** field is active. When you retire an asset, the status of related CIs also changes to **Retired**. Selecting a substate is not required, but can be helpful for tracking and reporting.

Note:
When you manually change the state of the asset from **Retired** to any other value such as **In use** the asset becomes active again.

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **All Assets**.
2. In **State**, select **Retired**.
3. **Optional:** In **Substate**, select **Disposed**, **Sold**, **Donated**, or **Vendor Credit**.
4. Click **Update**.

Delete assets

You can delete an asset at any time.

Before you begin

Note:
If an asset is a part of an asset bundle, the asset cannot be deleted.

Role required: asset

About this task
A confirmation must be accepted before the asset and components are permanently deleted. If a CI and asset are linked, deleting one also deletes the other.

Only delete an asset to clean up errors. For tracking purposes, the correct method for managing an asset that is no longer in use is to change the state of the asset to **Retired**.

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **All Assets**.
2. Select the check box to the left of the asset **Name**.
3. In the **Actions** choice list below the list, select **Delete**.

Map asset and CI fields

When you map the asset and CI fields, synchronization happens both ways. Changes to either the asset or CI record are updated to the logically mapped record. You can synchronize custom mappings and mappings provided with the base instance.

Before you begin
Role required: admin or asset

Note:
If you upgraded from a prior release and customized the `AssetAndCISynchronizer` script include before the upgrade, you must overwrite the customization and then recreate the custom mappings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can conditionally map the fields for synchronization. For example, you can map the Location field only for a hardware asset and not for a software asset. So when an asset is updated, the **Location** field is synchronized only for the hardware asset.

Note:
You can't map the asset and CI fields if the asset value is present only in the Hardware [alm_hardware] table and not in the Asset [alm_asset] table.

Procedure

1. Navigate to **All** > **Asset** > **Administration** > **Asset-CI Field Mapping** and click **New**.
2. From the **Asset field** list, select the field.
   This list refers to the alm_asset table.
3. Select the logically associated field from the **Configuration Item field**list that refers to the cmdb_ci table.
4. To create conditions for the mapping, click the **Advanced view** related link.
   - To specify conditions for synchronizing the asset field with the CI field, use the **Asset mapping condition** builder.
   - To specify conditions for synchronizing the CI field with the asset field, use the **Configuration Item mapping condition** builder.
5. Select the **Active** check box to activate the mapping.
6. Select **Submit**.

Map asset state and CI install status

Map the asset **State** and **Substate** fields to the **CI Install Status** field. The **Substatus** field of the **CI Install Status** field should not be used for hardware CIs.

Before you begin

Role required: admin or asset

Note:
If you upgraded from a prior release and customized the `AssetAndCISynchronizer` script include before the upgrade, you must overwrite the customization and then recreate the custom mappings.

About this task

Asset synchronization does not update this field when hardware assets are updated. When you create the mapping, you can set the synchronisation direction from Asset to CI, but not from CI to Asset. For non-Hardware CI classes, you can set the synchronisation in both the directions.

The hardware and consumable assets don't have the Build state and Design substate because they are already prepared. Therefore, the Asset CI install status mappings table doesn't have a mapping for the Build state. For more details on asset states, see Set asset states and substates.

Procedure

1. Navigate to **All** > **Asset** > **Administration** > **Asset-CI Install Status Mapping**.
   By default, only custom mappings display. The list of mappings uses the filter condition of **[Out of the box] [is] [False]**.
2. Click **New**.
3. From the **Asset State** list, select the state you want to map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** If available, select a substate from the **Asset Substate** list.
   Some of the asset states do not have a substate.
5. From the **Configuration Item Status** list, select the logically associated CI status you want to map.
6. From the **Sync direction** list, select the direction you want to drive the synchronization.
7. Select the **Active** check box to activate the mapping.
8. Click **Submit**.

Map asset state and CI hardware status

Map the asset **State** and **Substate** fields to the **CI Hardware Status** field. Don't use the **Substatus** field on hardware CIs because the CI synchronization does not update the field when assets are updated. When you create the mapping, you can set the synchronization direction from the asset, CI, or both.

Before you begin

Role required: admin or asset

Note:
If you upgraded from a prior release and you've customized the `AssetAndCISynchronizer` script before the upgrade, overwrite the customization and then recreate the custom mappings.

The hardware and consumable assets don't have the Build state and Design substate because they are already prepared. Therefore, the Asset CI hardware state mappings table doesn't have a mapping for the Build state. For more details on asset states, see Set asset states and substates.

About this task

The **Install Status** and **Hardware Status** fields of a CI are independent of each other. There is no correlation between them. A change to the **Hardware Status** field does not change the **CI Install Status** field and vice versa.

Procedure

1. Navigate to **All** > **Asset** > **Administration** > **Asset-CI Hardware Status Mapping**.
   By default, only custom mappings display. The list of mappings uses the filter condition of **[Out of the box] [is] [False]**.
2. Click **New**.
3. From the **Asset state** list, select the state you want to map.
4. **Optional:** If available, select a substate from the **Asset substate** list.
   Some of the asset states do not have a substate.
5. From the **Configuration Item status**list, select the logically associated CI state you want to map.
6. **Optional:** If available, select a substate from the **Configuration Item substatus** list.
   Some of the CI statuses do not have a substatus.
7. From the **Sync direction** list, select the direction you want to drive the synchronization.
8. Select the **Active** check box to activate the mapping.
9. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Manage various assets through asset classes

The default asset classes are Hardware, Software License, Consumable, Bundle, Software Entitlement, and Facility. These general classes can be used to manage various assets.

If the general classes that are provided aren't appropriate for a specific group of assets, consider creating a new asset class. For example, a fleet of cars could be tracked in a custom asset class named Vehicle. Before creating new asset classes, analyze business needs to see if the general classes can be used. Managing a lot of asset classes can be difficult to maintain.

Built-in functionality allows you to use asset classes for financial tracking, in a model bundle, and as a pre-allocated asset.

Create an asset class

Creating an asset class requires defining a new table and creating a corresponding application and module, then adding the new asset class to new or existing model categories. The default asset classes are Hardware, Software License, and Consumable. These general classes can be used to manage various assets.

Before you begin

Role required: asset or category_manager

About this task

If the general classes aren’t appropriate for a specific group of assets, consider creating an asset class. For example, a fleet of cars could be tracked in a custom asset class named Vehicle. Before creating asset classes, analyze business needs to see if the general classes can be used. A large number of asset classes can be difficult to maintain.

Built-in functionality allows you to use asset classes for financial tracking, in a model bundle, and as a pre-allocated asset.

Ensure that the model categories contain models. Use the Table form to extend an existing table.

Procedure

1. Navigate to **All** > **System Definition** > **Tables & Columns** > **Create Table** and fill out the Table form fields with information on the new table.

Field	Description
Label	Display name of table that can be localized. For example, a custom asset class to track a fleet of cars can be labeled as Vehicle.
Name	Internal name of table that can’t be changed later. For example, the Vehicle asset class can be named alm_u_vehicle.
Extends table	Table that new table inherits fields from. The Asset (alm_asset) table can be extended to create a custom asset class.
Application	Application that uses the record.
Create module	Check box for creating a module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Create mobile module	Check box for creating a mobile module.
Add module to menu	Menu that module displays.
New menu name	New menu name.

2. Click **Submit**.
3. Navigate to the new application (for example, **Asset** > **Vehicle**) and click **New**.
4. Configure the form to include **Model**, **Model Category**, and **Quantity**.
5. Create a model category and add the asset class you created to the **Asset class** field.
6. Create models and add them to the model category.

What to do next
Now that the model category (associated with the new asset class) and the models are created, manage the models as assets. For example, use the model in a bundle.

Add depreciation to an asset

Depreciation is the reduction in the value of an asset over time.

Before you begin
Role required: asset

About this task
A depreciation schedule can be added to hardware assets. Based on the information specified in the asset record, the ServiceNow AI Platform calculates the depreciation amount using the **Calculate Depreciation** scheduled job. The following system properties determine when the **Calculate Depreciation** scheduled job should be triggered to calculate the depreciation amount:

- The *sn_itam_depreciation_job_last_run* system property stores the date on which the **Calculate Depreciation** scheduled job was last run.
- The *sn_itam_trigger_depreciation_job_after_days* system property determines the frequency (in days) at which the **Calculate Depreciation** scheduled job should be triggered.

> **Note:**
> By default, this system property is set to **7**. Therefore, the **Calculate Depreciation** scheduled job runs weekly to calculate depreciation amount.

The ServiceNow AI Platform calculates the read-only **Residual date** and **Residual value** fields based on the **Cost**, **Depreciation**, and **Depreciation effective date** fields. For example, if the asset **Cost** is $1000.00, the **Straight Line** depreciation method is selected, and exactly two years have passed, the **Residual value** would be $500.00.

When an asset is in the **In Use** state, the asset form populates a Deprecation effective date.

For more information about fixed assets and depreciation, see Using Depreciation with Fixed Assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **Hardware Assets**.
2. Select an asset.
3. Fill in the **Depreciation**, **Depreciation effective date**, **Salvage Value**, and **Covered by fixed asset** fields as described in Create assets.
   Consider these points.
   - If the depreciation effective date is in the future, depreciation is 0 and the current residual value is the original purchase price. The system doesn't begin to calculate depreciation until the effective date is reached.
   - The salvage value must be less than or equal to the asset cost. If a salvage value greater than the cost is entered, a warning message appears and the record can't be saved.
4. Select and hold (or right-click) the header and select **Save**.
5. Select **Calculate Depreciation**.
   The **Residual date**, **Residual value**, and **Depreciated amount** fields are automatically calculated.

> **Important:**
> The **Calculate Depreciation** scheduled job calculates the depreciation amount weekly. If you perform this step before the next run date of the scheduled job, the recently calculated depreciation amount is displayed.

Create license assets

You can manage your organization's software license assets.

Before you begin
Role required: sam

About this task
Examples include a license to use a single copy of a desktop software program and an enterprise license to install a software program on multiple computers.

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **License Assets** and click **New**.
2. In the **Rights** field, type the number of entitlements to be granted by this license.
3. Complete the form as described in Create assets.

Set asset states and substates

Use asset states and substates to track assets accurately and at a detailed level.

Before you begin
Role required: asset

About this task
Good asset information helps you with reporting, controlling assets, and lowering costs. For example, recording missing items using the **State** and **Substates** fields enables you to run reports and analyze the information. You can use this information to lower costs.

> **Tip:**
> You shouldn't modify state values. If the state values are supported and defined by the process, you can modify substates.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Some of the substate values are available with more than one state. For example, the substate **Pending disposal** is available with the state **In stock**, **In transit**, and **Retired**. The combination of the **State** and the **Substate** fields provide the correct asset tracking information. For example, an asset that is **In stock** and **Pending disposal** indicates that the asset is no longer used and is in the stockroom waiting to be disposed of.

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **All Assets**.
2. Select an asset.
3. Edit the **State** and **Substate** fields.

Asset states and substates definitions

State	Available substates	Notes
On order	None	Asset is ordered but isn't received.
In stock	○ Available: Asset is available for use. ○ Reserved: Asset is reserved for a user who requested it through a sourcing request. ○ Defective: Asset is faulty or inoperative. ○ Pending repair: Defective asset is marked for repair by the vendor. ○ Pending install: Asset is yet to be installed. ○ Pending donation: Asset is marked for donation because it's no longer required in your stockroom. ○ Pending disposal: Asset is marked for disposal because it's no longer required in the stockroom. ○ Pending transfer: Asset is being planned to be transferred through a transfer order. ○ Pre-allocated: Asset is ready to be allocated but isn't a financial liability until it's allocated to a user. ○ On hold: Asset isn't ready to be used because it's awaiting something. For example, necessary documentation is pending. ○ Legal hold: Asset is kept on hold because of some legal reasons. ○ Quarantine: Asset is kept in isolation in the stockroom. ○ Pending certificate: Asset is awaiting certificate for disposal.	Asset is stored in a stockroom. Substate indicates if the asset can be put to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Available substates	Notes
	○ Pending return: Asset that is leased is yet to be returned. ○ Test: Asset is in the testing phase and not yet operational. ○ Pending resale: Asset is awaiting resale. ○ Pending evaluation: Asset is yet to be evaluated or assessed to confirm if it can be used.	
In transit	○ Available: Asset is available for use. ○ Reserved: Asset is reserved for a user who requested it through a sourcing request. ○ Defective: Asset is faulty or inoperative. ○ Pending install: Asset is yet to be installed. ○ Pending disposal: Asset is marked for disposal because it's no longer required in your stockroom. ○ Pending donation: Asset is marked for donation because it's no longer required in your stockroom. ○ Pre-allocated: Asset is ready to be allocated but isn't a financial liability until it's allocated to a user. ○ Pending resale: Asset is awaiting resale.	Asset is being transported.
In use	○ Pending fulfillment: Asset is functional but awaiting business conditions such as billing and signoff. ○ End of support: Asset isn't provided any support services through incidents or contracts. ○ Pending retirement: Asset is marked for retirement because it's no longer in service. Asset has reached the end of life and can be sold, disposed, or donated. ○ None	Asset is in use. This option is available for non-consumables only.
In maintenance	None	Asset is being repaired or undergoing maintenance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Available substates	Notes
Retired	○ Disposed: Asset is disposed because it has reached end of life. ○ Pending disposal: Asset is marked for disposal because it's nearing the end of life. ○ Sold: Asset is sold. ○ Donated: Asset is donated to charity organization through asset donation orders. ○ Vendor credit: Old faulty asset is returned to the vendor for a replacement asset through Return Merchandise Authorization (RMA). ○ Lease return: Leased hardware asset is returned before the expiry of contract. ○ Obsolete: Asset is obsolete and should be disposed. ○ RMA: Faulty asset is returned to or replaced by the vendor through Return Merchandise Authorization (RMA). ○ Buy out: Leased hardware asset is bought before the expiry of contract. ○ Pending resale: Asset is awaiting resale.	Set the asset to a Retired state when the asset has reached the end of life. Only delete asset records if they were created erroneously.
Missing	○ Lost ○ Stolen	An asset that is missing or lost.
Build	None	Asset is being prepared. This state is used during the creation of an asset bundle. **Note:** Hardware and consumables don't have a Build state.

Create fixed assets

Fixed assets are containers that can hold multiple assets. Fixed assets are commonly tracked at the corporate level by a finance or accounting department, but may contain IT assets such as hardware and software.

The **Fixed Asset** option in the Cost application shows the IT assets related to a fixed asset record. This link can help IT stay coordinated with the corporate asset system. Users with the financial_mgmt_admin and financial_mgmt_user roles can create fixed assets. After creating a fixed asset and adding assets, the residual value can be automatically calculated.

To create a fixed asset:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **Cost** > **Fixed Assets**.
2. Click **New**.
3. Enter a name for the fixed asset.
4. Click **Submit**.

To add assets to a fixed asset:

1. Navigate to **Cost** > **Fixed Assets**.
2. Click a fixed asset.
3. In the **Covered assets** related list, click **Edit**.
4. In the **Collection** list, double-click an asset to add it to the **Covers Assets List**.
5. Click **Save**.

To sum the residual values of all assets in a fixed asset:

1. Navigate to **Cost** > **Fixed Assets**.
2. Click a fixed asset.
3. Click **Sum Residual Value**.

   The ServiceNow platform calculates the**Residual Value**, **Total cost,** and **Total depreciation** based on information in the **Financial** and **Depreciation** sections on the individual asset records.

Use depreciation with fixed assets

You can calculate depreciation for a fixed asset using a choice of depreciation schedules. Calculating depreciation for a fixed asset can help IT coordinate with the corporate fixed asset system to report correct valuation and book value.

Before you begin

Role required: financial_mgmt_admin or financial_mgmt

About this task

When creating a new depreciation schedule, select the **Declining Balance** or **Straight Line** depreciation **Category**. The two categories depreciate an asset by the same overall amount during the asset life cycle, but do so on different schedules.

- **Declining Balance**: depreciates an asset by a greater amount in earlier accounting periods than in later periods.
- **Straight Line**: depreciates an asset by an equal amount each accounting period.

The following example shows depreciated value on a $10,000.00 asset over five years using the two different methods.

Using depreciation with fixed assets

Year	Declining balance	Straight line
1	$5000.00	$8000.00
2	$2500.00	$6000.00
3	$1250.00	$4000.00
4	$625.00	$2000.00

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

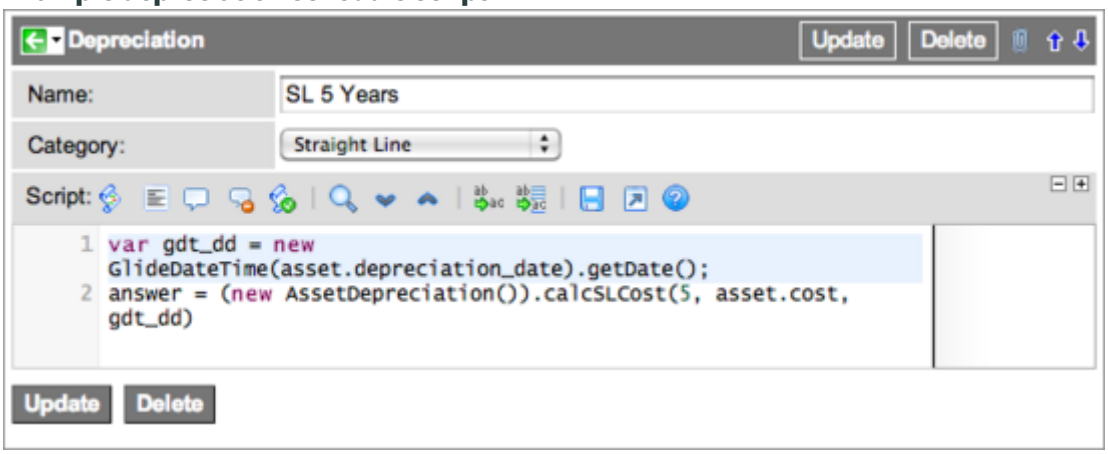
Using depreciation with fixed assets (continued)

Year	Declining balance	Straight line
5	$0	$0

Procedure

1. To view a depreciation schedule, navigate to **Financial Management** > **Depreciation** and click the **Category**.
2. To create a new depreciation schedule, click **New**.
3. Enter a **Name**.
4. Select a **Category**.
5. Add a **Script** to calculate depreciation value.

Example depreciation schedule script



6. Click **Submit**.
   The depreciation schedule is now available in the **Depreciation** field on the asset record.

Consumables life cycle

Consumables are assets that are not tracked individually, but as a group of the same model.

The group of consumables has one or more of the following traits.

- Same location
- Same state
- Consumed by the same asset, typically as accessories or parts

Some common consumable assets include mouse devices, computer keyboards, and pencils. The base ServiceNow system includes the **Consumable** model category. The first step in working with models is to create a model within the model category for an individual consumable asset. Items such as monitors, keyboards, and mouse devices are often tracked as consumables. Consumables cannot be pre-allocated.

Consumable assets are stored in the Consumable [alm_consumable] table. Consumables follow a slightly different life cycle from other assets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stages of consumables

The consumable lifecycle stages are as follows.

- On order
- In stock
- In transit
- Consumed
- In maintenance
- Retired
- Missing

View consumable assets

Consumables are tracked as a group of the same model, but you can view individual consumables in the consumable model record.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Consumable Models**.
2. Open a consumable model record.
3. View individual consumables in the **Consumables** related list.

Create consumable assets

Create a consumable to track an asset as a group of the same model.

Before you begin

Role required: asset

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **Consumables** and create a new record (see table for field descriptions).

Consumable record form

Field	Description
Display name	Name of the asset.
Model category	Model category that controls if an asset is linked to a CI.
Model	Product model of the asset.
Quantity	Amount of items the asset represents.
General	
State	State of the asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent	Parent asset. When a parent asset is defined, the **Assignment** and **State** fields of the child asset are automatically populated based on the **Assignment** and **State** fields of the parent asset and are read-only.
Class	Type of asset. The system automatically sets the **Class** to **Consumable**.
Expenditure type	The type of expenditure. Choose from the following options: ○ **Capex**: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. ○ **Opex**: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Substate	Substate of the asset.
Location	Location of the asset.
Cost	Price that the asset was purchased for.
Cost Center	Cost center financially responsible for the asset.
Disposal	
Disposal order number	A unique number assigned to the asset disposal order. **Note:** This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.
Disposal vendor	The vendor assigned to carry out the asset disposal order. **Note:** This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.
Vendor disposal order ID	Order number assigned by the vendor assigned to carry out the asset disposal order. **Note:** This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.
Disposal date	The date when the asset disposal order process is completed. **Note:** This field appears only if you have installed Hardware Asset Management from the ServiceNow Store.
Disposal reason	Text explaining why the asset is being retired.
Beneficiary	Organization that receives the asset when it is retired.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Resale price	Value of the asset when it is retired. For example, if the asset is donated, the value used when reporting taxes.
Scheduled retirement	Scheduled date on which the asset is retired.
Retired date	Actual date on which the asset was retired.
Activities	
Work Notes	Work notes related to the asset.

2. Click **Submit**.

Consume consumable assets

To consume consumable assets, they must have a state of **In Stock** and a substate of **Available**.

Before you begin
Role required: asset

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **Consumables**.
2. Click the **Display Name** of a consumable asset with a state of **In Stock** and a substate of **Available**.
3. Click **Consume**.
4. Enter the **Quantity** to consume.
5. In **Asset**, click the lookup icon and select the asset associated with the consumable.

   Example
   For example, a mouse tracked as a consumable asset can be associated with a non-consumable asset such as a computer.
6. In **User**, click the lookup icon and select a user associated with the consumable.
7. Click **OK**.
   On the **Consumable** form, the **Quantity** field shows the reduced number. The Consumables list contains two records for the consumable in the specific stockroom: one with a state and substate of **In Stock** and **Available** (if you did not consume the entire quantity), and one with a state of **Consumed**. If a consumable is not in the process of being transferred to a different stockroom and information in the data record is the same, similar records merge automatically. After a consumable is consumed, the record remains in the system for reporting purposes.

Create pre-allocated assets

Create a pre-allocated asset that physically exists, but isn't yet a financial liability.

Before you begin
Role required: asset

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Procedure

1. Navigate to **All** > **Asset** > **Portfolios** > **All Assets** and create a record (see table for field descriptions).

Note:
Category must have the **Allow pre-allocated** option selected.

Consumable record form

Field	Description
Display name	Name of the asset.
Model category	Model category that controls whether an asset is linked to a CI.
Model	Product model of the asset.
Quantity	Number of items the asset represents.
General	
State	State of the asset.
Stockroom	Stockroom of the asset. This field is only available if the State field is set to **In stock**.
Parent	Parent asset. When a parent asset is defined, the **Assignment** and **State** fields of the child asset are automatically populated based on the **Assignment** and **State** fields of the parent asset and are read-only.
Class	Type of asset. The system automatically sets the **Class** to **Consumable**.
Expenditure type	The type of expenditure. Choose from the following: ○ **Capex**: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. ○ **Opex**: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Substate	Substate of the asset.
Location	Location of the asset.
Cost	Price that the asset was purchased for.
Cost Center	Cost center financially responsible for the asset.
Activities	
Work Notes	Work notes related to the asset.

2. Select **Submit**.

Allocate a pre-allocated asset

Assets can be allocated from pre-allocated asset records, which creates new asset records and reduces the **Quantity** in the original pre-allocated asset record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: asset

About this task
Allocating an asset makes it a financial liability. After all pre-allocated assets have been allocated, the pre-allocated asset record is removed from the asset list.

Procedure
1. Navigate to **All** > **Asset** > **Portfolios** > **All Assets**.
2. Filter the **Substate** column to show only **Pre-allocated** assets.
3. Select the reference icon in the row containing the asset to allocate.
4. Select **Allocate** at the bottom of the form.

> **Note:**
> If the *glide.asset.create_ci_with_ire* property is set to `true`, a form appears when you click **Allocate**. On the form, fill in the **Asset tag**, **Serial number**, and **Reserved for** fields, then click **OK**.

Result
The system creates and navigates to a new asset record, which has the same model and parent information as the pre-allocated asset. The new asset has a **Quantity** of one, while the pre-allocated asset's **Quantity** is reduced by one.

Split a pre-allocated asset

You can split a pre-allocated asset to create a group that can be moved to a different stockroom.

Before you begin
Role required: asset

About this task
For example, a group of 100 pre-allocated computers is in Stockroom A. Split the group into two groups of 50 and move one group to Stockroom B. Allocate the computers from the two different stockrooms.

Procedure
1. Navigate to **All** > **Asset** > **Portfolios** > **All Assets**.
2. Filter the **Substate** column to show only **Pre-allocated** assets.
3. Select the reference icon in the row containing the asset to split.
4. Select **Split**.
5. Enter a **Quantity to Split** and select **OK**.
   The pre-allocated asset is split into two groups and the **Quantity** field on each record indicates the number in each group.

Stockrooms

Stockrooms are places to which assets are assigned.

When stock is low on a particular asset, stock rules can either notify an asset manager or automatically transfer inventory from one stockroom to another.

Stockrooms are separate, standalone entities in the Asset Management application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a stockroom

You can create a stockroom.

Before you begin
Role required: inventory_admin

Procedure

1. Navigate to **All** > **Inventory** > **Stock** > **Stockrooms** and create a new record (see table for field descriptions).

Fields	Description
Name	Display name and identifier of the stockroom.
Assignment group	Group that primarily uses the stockroom.
External	Whether this stockroom is managed internally (check box is cleared) or is managed externally by a third party (check box is selected).
Location	Physical location of the stockroom.
Type	Type of stockroom, such as Field Agent or On site.
Manager	Person in charge of the stockroom. Receives restocking notifications and requests for the stockroom's stock rules.

2. Click **Submit**.

Delete a stockroom with assets

You can delete a stockroom. If the stock room has assets, you must remove the assets from the stockroom first.

Before you begin
Role required: inventory_admin

Procedure

1. Navigate to **All** > **Asset** > **All Assets**.
2. Personalize the list to add the **Stockroom** column.
3. Filter the list to show only the assets in the stockroom that you want to delete.
4. Change or remove the stockroom for all of the asset records.
5. After removing assets from the stockroom you want to delete, continue with the instructions for deleting a stockroom with no assets.

Delete a stockroom with no assets

You can delete a stockroom that has no assets.

Before you begin
Incomplete transfer orders must be deleted before you delete the stockroom.

Role required: inventory_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Inventory** > **Stock** > **Stockrooms**.
2. Select the check box beside the stockroom name.
3. In the **Actions** list, select **Delete**.

> **Note:**
> Transfer order history is deleted when you delete the stockroom.

Stockroom types

Stockroom types are categories of stockrooms.

The stockroom type has two significant characteristics.

- **Priority**: Order of stockrooms the parts should be sourced from. For example, if a personal stockroom (priority 2) contains the required part, the personal stockroom receives priority over the Central Stockroom (priority 7) because the part in the personal stockroom doesn't require delivery.
- **Shipment Required**: Informs the system if a transfer order must be created when the part is sourced from a stockroom of the given type. For example, a part in a personal stockroom doesn't require shipment, so no transfer order is needed.

Stockroom types defined in the base system

Value	Name	Priority	Shipment Required	Description	Comment
on_site	On Site	1	False	Stockroom at the customer site.	Close to the users and doesn't require shipping.
field_agent	Field Agent	2	False	Virtual, personal stockroom linked with a field service agent (FSA) directly, used for delivery.	Used to indicate to the system that the part has been delivered and is with the FSA.
fsl	FSL	4	True	Forward Shipping Location.	Small stockrooms where the parts can typically be shipped via overnight delivery.
pudo	PUDO	5	True	Pick Up/Drop out location.	This type is sometimes called a by-box. Can be a postal box that can receive new and returned parts that are often near major customer sites.
stockroom	Warehouse	6	True		A regional stockroom.
central_stockroom	Central Warehouse	7	True		A central stockroom, usually a large facility

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stockroom types defined in the base system (continued)

Value	Name	Priority	Shipment Required	Description	Comment
					from which most parts are shipped.

Create a new stockroom type

If you need stockroom types that are not included in the base system, you can create a custom stockroom type.

Before you begin

Role required: inventory_admin

About this task

Check the priority level of the stockroom types provided in the base instance to ensure that you assign the correct priority level to any new stockroom types you create. You can also modify the stockroom types included in the base system.

Procedure

1. Navigate to **All** > **Inventory** > **Stock** > **Stockroom Types** and create a new record (see table for field descriptions).

Field	Description
Name	Display name of the stockroom type.
Description	General information about the stockroom type.
External stockroom	Whether stockrooms of this type are managed internally (check box cleared) or managed externally by a third party (check box selected).
Priority	Level of precedence for this type of stockroom.
Shipment required	Option that determines if stockrooms of this type require shipment by default.
Value	Internal identifier of the stockroom type.

2. Click **Submit**.

Stock rules

Stock rules are defined criteria stating that when the inventory of a particular asset in a particular stockroom reaches a specified threshold, a certain number should either be transferred from another stockroom or ordered from a vendor.

For example, a specific model of computer keyboard reaches an inventory of 10 in a particular stockroom and, because a stock rule is in place, a transfer order is automatically created to transfer 50 from a different stockroom. Because there can be multiple assets of a model within a stockroom, stock rules enable you to check all assets fitting the criteria and view a total count.

There are two restocking options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Email notifications can be sent to the stockroom manager (specified in the **Manager** field on the stockroom record) through the **Asset Restocking** email action when the inventory of a particular asset in the stockroom reaches a specified threshold. You can customize this email notification by updating the details in the following tabs:
  - **When to send**: Set the conditions under which the email should be triggered.
  - **Who will receive**: Specify the recipients of the email.
  - **What it will contain**: Define the content and information included in the email.

  A task is automatically created for the stockroom manager or, if Procurement is active, a purchase order and a purchase order line item are created.
- A transfer order can be generated automatically to restock the item from another stockroom.

Stock Rule Runner job

The Stock Rule Runner job runs everyday to check if the inventory in the stockroom has reached the threshold set by the stock rule. The job then triggers tasks or workflows to restock the inventory. This job creates tasks for stockroom managers and also sends email notifications to them.

Important:
If restocking is in progress, the system doesn't create duplicate email messages or duplicate transfer orders. It's important to act on it promptly.

By default, the *glide.sc.checkout.twostep* system property that's set to **false**, results in the automatic submission of requests when items are added to the Service Catalog cart. Also, with this setting of the system property, the Stock Rule Runner job triggers the creation of tasks, purchase orders, transfer orders, and Service Catalog requests.

If the value of the *glide.sc.checkout.twostep* system property is set to **true**, then the *CartJS* API adds items to the cart but the requests aren't submitted automatically. Instead, the request submission requires additional actions to be performed, affecting the automatic flow of the Stock Rule Runner job.

The **pending_delivery** is used to indicate whether a stock rule is awaiting fulfillment or delivery. The pending_delivery can be set to any of the following values:

- When this flag is set to **true**, the stock rule is in progress, and the system doesn't generate duplicate tasks or orders for the same item.
- When this flag is set to **false**, the system reprocesses the stock rule and triggers the creation of tasks and orders again.

Note:
Make sure that the pending_delivery flag is updated to false when a stock rule has been processed, enabling the Stock Rule Runner job to run without redundancy.

Based on the Stock rule type and the plugin activated on your ServiceNow instance, the Stock Rule Runner job creates purchase orders, transfer orders, Service Catalog requests, or tasks.

Important:

If the Procurement plugin and the Hardware Asset Management application aren't activated, the Stock Rule Runner job creates a task instead of a purchase order or a Service Catalog request. This task prompts the stockroom manager to take the necessary actions to replenish the inventory.

Stock Rule Runner job behavior

Stock rule type	Orders/Requests created
Stockroom	A transfer order is created automatically when the inventory in a stockroom reaches the threshold set by the stock rule. The transfer order is created to transfer stock from another stockroom to replenish the inventory. **Note:** If a transfer order is already in progress, then additional transfer orders aren't created.
Vendor	When the Procurement plugin (com.snc.procurement) is activated, a purchase order and corresponding purchase order line items are created. Purchase orders and purchase order line items are created when the inventory in a stockroom reaches the defined threshold and needs replenishment directly from the vendor. **Note:** You must have a procurement_user role to access the purchase order and purchase order line item.
Vendor or Service Catalog	When the Hardware Asset Management application is installed and the stock rule is set to Vendor or Service Catalog, then note the following points: • The Stock Rule Runner job submits a Service Catalog request instead of creating a purchase order. • The Service Catalog request is automatically submitted for stock replenishment through the Service Catalog. The items are added to the Service Catalog cart for the Stockroom manager to review and approve. • The pending_delivery flag is used to track the status of the Service Catalog requests. This flag guarantees that the Service Catalog requests are processed correctly, avoiding duplicate actions.

Related topics

Create a stock rule

Create a stock rule

Create a stock rule to control what happens when the inventory of a particular asset in a particular stockroom reaches a specified threshold.

Before you begin

Role required: inventory_admin

Procedure

1. Create a stock rule.

2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Stock Rule form

Field	Description
Model	Product model to which the rule applies.
Threshold	Quantity that the stock must reach to trigger restocking. For example, enter a threshold of 10 for a laptop computer that should be restocked when inventory drops below 10 in the specified stockroom. **Note:** If a stock rule is created for a hardware or software model reaches the threshold limit, a notification is sent to the stockroom manager and a stock order request is automatically created.
Restocking option	Location where additional supplies should come from. If Procurement isn't active, then restocking option is **Stockroom** only. Otherwise, select one of the following: ○ **Stockroom**: Creates a transfer order to obtain the asset from another stockroom. ○ **Vendor**: Sends an email to the stockroom manager to order from a vendor. In addition to the email notification, a purchase order and purchase order line item are created. **Important:** Once a transfer order, purchase order, or purchase order line item is created, it's important to act on it promptly. Any email notifications or reminders won't be sent for these actions.
Active	Option for enabling the stock rule for restocking automatically.
Stockroom	Current physical location of the asset.
Order size	Minimum order quantity for stockroom transfers or vendor purchases. ServiceNow calculates the smallest multiple of the order size needed to restock the item above the threshold. For example, there are 3 laptops in stock with a threshold of 10 and the **Stockroom** option selected. If the order size is set to 4, the system creates a transfer order for 8 laptops to exceed the threshold and satisfy the rule (3 in stock + 8 ordered = 11). When restocking from a vendor, ServiceNow sends an email to the stockroom manager showing the total number of items to order, as multiples of the order size.

3. Select **Submit** or **Save**.

Result

- The stock rule that you created appears in the **Stock rules** tab.
- If the restocking option was set to **Vendor**, the **Stock orders** tab will be displayed. All the stock orders that are created using this stock rule are listed under the Stock orders tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The Stock orders tab is available with Hardware Asset Management version 13.0.0 and later.

- If the restocking option was set to **Stockroom**, the **Transfer orders** tab will be displayed. All the transfers orders created using this stock rule are listed under the **Transfer orders** tab.

Important:
The Transfer orders tab is available with Hardware Asset Management version 13.0.0 and later.

For stock orders created through the restocking by a vendor, the stock order tab shows all stock orders generated by that stock rule. But for transfer orders, the tab only displays transfer orders after the upgrade.

Transfer orders for Asset Management

Transfer orders move assets between company stockrooms.

The Asset Management application enables asset managers to create transfer orders for moving assets between company stockrooms.

Consumable assets and non-consumable assets can be transferred as follows:

- If an asset is consumable, it can be transferred and the quantity can be greater than one. Consumable parts are tracked by the system qualitatively.
- If an asset is non-consumable, it must be transferred as a single entity with a quantity of one. Non-consumable parts correspond to assets defined in the system.

Important:
The Transfer Order Line workflow in the Asset Management application handles the processing of transfer order lines. However, if the Service Management Core plugin is also activated on your ServiceNow instance, the Transfer Order Line SM core workflow will process the transfer order lines instead. For more information, see Move an asset through the transfer process.

Transfer order lines

Transfer Order Lines is a new module under Inventory with Template Tasks and Template Subtasks as the sub modules. Transfer order lines allow the transfer of multiple assets on one transfer order. Actions such as shipment preparation can take place at the transfer order line level. Pre-allocated assets can be included in a transfer order line, but can only be transferred in their full quantity. A business rule prevents the same asset from being transferred on two different transfer orders at the same time.

Note:
The Transfer Order and the Transfer Order Line workflows have moved from the Procurement plugin to the Asset Management plugin. The Transfer Order Line workflow runs only if no other workflows are matched or running on a specific record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transfer order line tasks

When you create a transfer order line, based on the model category specified in the asset, a transfer order line task is automatically created. Transfer order line tasks are created to move transfer order lines from one stage to the other. Transfer order line tasks also help you to track service levels and the time frame needed to complete a transfer order.

Default template tasks are available with the Asset Management application. The template tasks are based on model categories. Default template tasks cannot be deleted or modified. If required, you can also create your own customized template tasks. For more information, see Create a customized template task. When you create a transfer order line and select an asset, that asset corresponds to a model category. If a customized template task exists for that model category then that template task is added to the transfer order line as a transfer order line task. If no customized template task match is found for the asset you selected, then the default template task is added as a transfer order line task.

Closing a transfer order line task completes the task and creates the next task in the process. For example, once you close the Ready for fulfillment task, the state for this task appears as **Closed Complete** and a new task is opened for the next stage, Ready for Shipment. This process continues till you close all the tasks required for completing the transfer order line. As you close a task and as a task moves from one stage to the next, the asset gets automatically updated too. For example, when the transfer order line moves from Ready to Fulfillment to Prepare for Shipment, the asset's status also moves from available to reserved.

Note:

If you skip a transfer order line task and select **Closed Skipped**, the asset is not updated automatically. Once the asset is received or delivered, you can make the update manually.

If you are upgrading from any previous release to the New York release, and you have an open transfer order line that is still being processed, all the transfer order line tasks associated with that transfer order line are simultaneously created and displayed in the transfer order line form layout. Based on the stage of the transfer order line, the tasks that still need to be processed will be open; all the other tasks that have already been completed will be closed. Based on the order, if you close a later transfer order line task, all the previous tasks, which are currently open, automatically will be **Closed Skipped**.

Transfer order line subtasks

To further add granularity and efficiency to the process, you can also create subtasks for each transfer order line task. Each transfer order line task can have multiple subtasks. For example, before preparing for shipment, for a computer, you may want to create subtasks for imaging the computer or adding additional software. If subtasks have been defined for a particular transfer order line task, then the subtasks are automatically added to the transfer order line task. Once all the subtasks are closed, the transfer order line task is automatically closed. For more information, see Create a template subtask.

Transfer assets using transfer orders

Transfer assets from one location to the other by moving the assets through the transfer order process. You create a transfer order and move it from its initial **Draft** status to the final **Received** status.

Before you begin

Role required: inventory_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports. You must activate the Procurement (com.snc.procurement) plugin for the inventory_user, asset, and procurement_user roles.

Procedure

1. Navigate to **All** > **Inventory** > **Transfer Orders** > **Create Transfer Order**.
2. In the **From Stockroom** list, select a stockroom from which you want to ship the items.
3. In the **To Stockroom** list, select a stockroom where you want to ship the items.

   Note:
   If you select the same stockroom in both the From Stockroom and To Stockroom fields, the transfer order automatically moves from **Draft** to **Received** when a transfer order line is added.

4. Select a date and time for the delivery from the **Delivery by date** date picker.
5. Select **Submit**.
6. Open the transfer order.
7. Next to **Transfer Order Lines**, click **New**.
8. Select a model for the transfer order line.
9. If the model is a consumable, specify a quantity in **Quantity Requested**.
10. Click **Submit**.
    After creating transfer order lines, the transfer order and all the transfer order lines are in the draft stage. While a transfer order or a transfer order line is in the draft stage, it can be deleted.

    Note:
    When an asset is part of a transfer order set to **Draft**, the asset record updates to show the asset as reserved. You can't request or transfer the asset while it's reserved.

    When you create a transfer order line, based on the model category specified in the asset, a transfer order line task is automatically created. The transfer order line task helps you to progress through the various stages of the transfer order line. Each transfer order line task represents a particular stage in the transfer process. As you close a task, a new task is created and the transfer process moves to the next stage.
11. Open the transfer order line task and click **Close Task**.
    The transfer order line task is completed and a new transfer order line task is opened.

What to do next

Keep closing each task until you reach the last stage (Received). After you close the task for the Received stage, the transfer order line is completed and closed. All transfer order lines and the transfer order are marked **Delivered**.

Summary of transfer order line tasks

As assets move through the transfer process, the stage of a transfer order is always based on the individual transfer order lines tasks.

© 2026 ServiceNow, Inc. All rights reserved.

Transfer order line tasks

Transfer order line stages	Description
Draft	When a transfer order line is created for the asset. On the asset form, the **State** field value remains **In stock**, and the **Substate** field value is updated to **Pending transfer**.
Requested	This task is created first for the transfer order line. On the asset form, the **State** field value remains **In stock**, and the **Substate** field value remains **Pending transfer**.
Shipment Preparation	After the **Requested** task is closed, this task is created. This task deals with preparing the transfer order line for shipment. Specify the values for the shipment tracking fields such as **Shipping carrier**, **Vendor**, **Tracking number**, and **Ship date**. On the asset form, the **State** field value remains **In stock**, and the **Substate** field value remains **Pending transfer**.
In Transit	After the **Shipment Preparation** task is closed, this task is created. On the asset form, the **State** field value changes to **In transit**, and the **Substate** field value is updated to **Reserved**.
Received	After the **In Transit** task is closed, this task is created. On the asset form, the **State** field value changes to **In stock**, and the **Substate** field value is updated to **Available**. The **Stockroom** field value is updated as the asset is received in the destination stockroom.
Delivered	After the **Received** task is closed, this task is created. After you close the **Delivered** task, the transfer order line is completed. On the asset form, the **State** field value remains **In stock** and the **Substate** field value is updated to **Reserved**.

Delete a transfer order

You can delete a transfer order only if the transfer order is still in the draft stage.

Before you begin

Role required: inventory_user

The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports. You must install the Procurement (com.snc.procurement) plugin for the inventory_user, asset, and procurement_user roles.

Procedure

1. Navigate to **All** > **Inventory Management** > **Transfer Orders** > **Transfer Orders**
2. Select the check box beside a transfer order.
3. From the Actions on the selected rows menu at the bottom of the list, select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Delete a transfer order line

Return items received in a transfer order

Delete a transfer order line

You can delete a transfer order line only if it's still in the draft stage.

Before you begin

Role required: inventory_user

The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports. You must install the Procurement (com.snc.procurement) plugin for the inventory_user, asset, and procurement_user roles.

Procedure

1. Open a transfer order.
2. Select the check box beside a transfer order line.
3. From the Actions on the selected rows menu at the bottom of the list, select **Delete**.

   Alternatively, you can cancel a transfer order or a transfer order line while it is in **Requested** or **Shipment Preparation** stage. Once all the lines are canceled, the transfer order is automatically canceled.

Related topics

Delete a transfer order

Return items received in a transfer order

Return items received in a transfer order

When you receive a transfer order and if there's a problem with all or some of the items, you can return the transfer order.

Before you begin

Role required: inventory_user

The inventory_user, asset, or procurement_user role can only access the Transfer Order [alm_transfer_order] reports. You must activate the Procurement (com.snc.procurement) plugin for the inventory_user, asset, and procurement_user roles.

About this task

Items in a transfer order must be received before they can be returned.

Procedure

1. Navigate to **All** > **Inventory Management** > **Transfer Orders**.
2. Select a transfer order that is in the **Received** stage.
3. Click the transfer order line **Number** of the item to return.
4. Click **Return**.
5. Enter a quantity to return.
6. Enter a reason for the return.
7. Select the **Defective** check box to return items that are broken.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Defective items are returned to the stockroom from which they were delivered, but aren't added to available stock. Instead, they're tracked in the separate category named "Defective" so they can't be requested or transferred again.

8. Click **OK**.
9. Click **Update**.

   A new transfer order line is automatically created.

   A new corresponding parent transfer order is also automatically created with the new transfer order line on it.

10. If you're returning a consumable, navigate to the transfer order line record, and click the model name to open the model record.

    The model record shows which stockrooms contain the model. The one defective model is listed.

    Note:
    The defective model is still at the stockroom to which it was delivered. The defective model must be transferred back to the stockroom where it originated.

11. Move the new transfer order through the regular transfer order process.
    Items are automatically returned to the stockroom from which they were delivered. A transfer order line item that has been returned can't be delivered later.

    If you return another defective model from the same, original order, the two defective returns are merged into one line item.

Create a transfer order for Asset Management

Create a transfer order in order to transfer assets from one location to the other.

Before you begin
Role required: inventory_user

Procedure

1. Navigate to **All** > **Inventory Management** > **Transfer Orders** > **Create Transfer Order**.
2. Click the **From stockroom** list to select a stockroom from which the item(s) is to be shipped.
3. Click the **To stockroom** list to select a stockroom where the item(s) is to be shipped.
4. Click **Submit**.
   Once the transfer order is created, you can create transfer order lines to specify the items that the transfer order comprises of. See Create a transfer order line .

Create a transfer order line

Transfer order lines specify the exact items that comprise a transfer order.

Before you begin
Role required: inventory_user

About this task
A transfer order can contain one or more transfer order lines. Under a single transfer order, all transfer order lines will have the same From location and To location. Each line contains an asset

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to transfer and the quantity to transfer. The item to transfer is identified by asset name and model name. A transfer order line can involve one quantity of a non-consumable asset or multiple quantities of a consumable asset. A bundled model can be transferred.

Procedure

After creating a transfer order, click **New** in the **Transfer Order Lines** related list and fill in the fields as appropriate.

Field	Description
Number	Internal unique number identifying the transfer order line.
Transfer Order	The transfer order to which the transfer order line belongs.
Model	Model of the items requested by the transfer order line. For example, a printer. If the Asset field is filled out first, the Model field is automatically filled in with the model corresponding to the asset.
Quantity requested	Number of items requested by the transfer order line. For example, 3 computers are requested to be transferred.
Quantity received	Number of items already received. For example, 3 keyboards are transferred, 2 are received.
Stage	Current stage of the transfer order. Transfer order lines can only be created when a transfer order is in **Draft** stage.
Request line	Requested item to associate with the transfer order line.
Asset	Asset requested by the transfer order line. For example, a specific printer. The asset can filter on stockrooms.
Quantity remaining	Number of items yet to be received. For example, 3 keyboards had been requested, 2 are received, 1 is remaining.
Quantity returned	Number of items that already needed to be returned.

Create a customized template task

Create customized template tasks to configure your specific task workflow for transfer order lines. Default template tasks are available with the Asset Management application. You can't modify or delete a default template task.

Before you begin

Role required: inventory_user

About this task

Template tasks help you progress through the various stages of the transfer order line. Custom template tasks are stored in the Custom Template Task [alm_custom_template_task] table. The template tasks are based on model categories. For example, when you create a customized template task for the Application model category, whenever a transfer order line is created for the Application model category, the template tasks associated with the Application model category are used as transfer order line tasks. When you create customized template tasks, make a copy of the Transfer Order Line workflow and update the workflow accordingly. For example, if you need only four tasks out of five, you can delete the additional task from the workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Two template tasks can't be created when they're based on the same model category, the same order number and the same stage. The model category, the order, and the stage have to be unique for each template task. For example, you can't create two template tasks for Prepare for Shipment, based on the Application model category, order number 200, and the stage as Requested. If you try to create an identical template task as mentioned in the example, an error message is displayed.

Procedure

1. Navigate to **All** > **Inventory** > **Transfer Order Lines** > **Template Tasks**.
   All the default template tasks that are available with the Asset Management application are listed.
2. Click **New**.
   You can also customize a template task by copying a default template task. Click **Copy Default Template** and select a model category.
3. Fill out the form fields (as shown in the table).

Field	Description
Task name	Name of the template task
Model category	Model category this template task is based on.
Order	Order in which the template task is added to the transfer order line.
Short description	Brief description about this template task.
Next stage	Stage that this template task gets executed.

4. Click **Submit**.

Create a template subtask

Create template subtasks to add granularity to the transfer order line tasks. For example, before preparing for shipment, for a computer, you may want to create sub tasks for imaging the computer or adding additional software.

Before you begin
Role required: inventory_user

About this task
The template subtasks that you create are stored in the Template Subtask [alm_template_subtask] table. When a transfer order line task is created and if subtasks are defined for that transfer order line task, then the subtasks are automatically added to the transfer order line task.

Procedure

1. Navigate to **All** > **Inventory** > **Transfer Order Lines** > **Template Subtasks**.
2. Click **New** and fill out the form fields (as shown in the table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Short Description	A brief description of the subtask.
Subtask name	A name for the subtask.
Task	The task that this subtask is associated to.

3. Click **Submit**.

Perform bulk updates for transfer order lines

Update tasks for multiple transfer order lines at one go to streamline the transfer order process.

Before you begin

Transfer order lines enable the transfer of multiple assets on a transfer order. When you create a transfer order line, a transfer order line task is automatically created. Transfer order line tasks are created to move transfer order lines from one stage to the other. Each transfer order line can have multiple tasks such as **Requested**, **Shipment Preparation**, **In Transit**. For information on the stages of a transfer order line task, see Summary of transfer order line tasks.

Role required: inventory_user

Procedure

1. Navigate to **All** > **Inventory** > **Transfer Order**.
2. Select **Bulk Update** next to the Transfer Order Lines related list.
   The system property *sn_itam_tol_bulk_update_max_count* determines the maximum count of transfer order lines that would be processed during a single bulk update operation.
   The Bulk Update - Transfer Order Line dialog box appears.
3. In the **Select a stage** field, select the stage that you want to move this task to.
   For example, if all the transfer order lines are currently in the **Draft** stage and you want to move them to the next stage, which is **Requested**, select **Requested** in the **Select a stage** field.
   All transfer order lines, along with the asset display names that are eligible to move to the selected stage appear in the **Available** box.
4. In the **Assigned to** field, select the person you want to assign this task to.
   The **Assigned to** field defaults to the logged-in user.
5. Select the transfer order lines in the **Available** box and move them to the **Selected** box.
   When you select the transfer order lines, you can view the model and asset display names for hardware and consumable assets. For consumable assets, you can view additional details such as quantity requested and quantity received.
6. Select **Update**.
   All the selected transfer order line tasks and associated subtasks for the selected stage are closed and the next task in the process is created. For example, all the transfer order line tasks in the **Requested** stage are closed and the next task in the process **Shipment Preparation**, is created.
7. Return to the Bulk Update - Transfer Order Line dialog box to continue this process until you close all the tasks required for completing the transfer order line.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Transfer order line asset tracking

As transfer order line actions are triggered, the stock information and states of any affected assets are updated. Consumables and non-consumables are tracked differently.

When an asset is included in a transfer order line, the following takes place:

- A substate field on the asset form changes to reflect the transfer order line states
- The Active TO option on the asset form is automatically selected to show that the asset is part of a transfer order and cannot be added to multiple transfer orders
- The asset is removed from the pool of available assets and changed to a state of *In Stock Pending Transfer*

Related topics

Delete a transfer order line

Return items received in a transfer order

Transfer order line asset tracking of non-consumables

When transfer order line stages change for non-consumables, it affects asset substates.

Transfer order line stage	Affect on asset substate
Draft	Asset moves to **In Stock** > **Pending Transfer** (from the current stockroom). If the asset is a consumable, the quantity can be edited.
Requested	Asset stays in **In Stock** > **Pending Transfer**.
Shipment Preparation	Asset stays in **In Stock** > **Pending transfer**.
In Transit	Asset moves to **In Transit** > **Reserved**.
Received	Asset moves to **In Stock** > **Available** (in the destination stockroom).
Delivered	Asset moves to **In Stock** > **Reserved**.

Delete a transfer order line

Return items received in a transfer order

Transfer order line asset tracking consumables

When a consumable is added to a transfer order line, the stock for the consumable is split into two records and the transfer order links to the newly created stock line.

For example:

1. Stockroom A has ten keyboards in stock.
2. A transfer order line named TOL1 transfers three keyboards from stockroom A to stockroom B.
3. The stock of ten keyboards in A is split into two records: seven shown as **In stock** > **Available** and three shown as **In Stock** > **Pending Transfer**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Another transfer order is created with a transfer order line named TOL2 that transfers two keyboards from stockroom A to stockroom B.

5. The seven remaining keyboards are split into another two lines: five **In stock** > **Available** and two **In stock** > **Pending Transfer**.

   Note:
   The three **In Stock** > **Pending Transfer** and the two **In Stock** > **Pending Transfer** are not merged together because they are not part of the same transfer order line and not necessarily from the same person.

6. As TOL2 for two keyboards moves from *Draft* to *Requested* to *Shipment Preparation*, TOL1 for the three keyboards remains **In Stock** > **Pending Transfer**.
7. When TOL1 for the three keyboards moves to the *In Transit* stage, the three keyboards are changed to the **In Transit** > **Reserved** stage. The same happens for TOL2 with two keyboards.
8. When TOL1 is *Received*, the three keyboards move to **In stock** > **Available** in stockroom B.
9. When TOL2 is received in stockroom B, the two keyboards move to **In stock** > **Available** and are merged with the three keyboards that are also **In Stock** > **Available** in B.
10. At the end, stockroom B shows five keyboards are **In Stock** > **Available**.

Example Asset Management process

The best method for managing assets depends on business needs and how your business is organized.

Before you begin

Role required: asset

About this task

These steps are one possible process for getting started with Asset Management.

Procedure

1. Identify assets in your system.

   A key component of asset management is the initial and ongoing inventory or discovery of what you own. The ServiceNow platform provides the following options for asset discovery.

   - The separate, robust Discovery tool.
   - For organizations that want to use the discovery technologies they have deployed already, such as SMS, Tally NetCensus, LanDesk, or others, ServiceNow can support integration to those technologies via web services. Scanned data can be mapped directly into the Configuration Management Database (CMDB).

2. Clean up information in the CMDB.
   Remove information that is obsolete or invalid. Ensure that all remaining information is accurate and complete. Add any necessary information.
3. Create categories of asset models such as computers, servers, printers, and software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create asset models.
   Models are specific versions or various configurations of an asset, such as a MacBook Pro 17".
5. Create individual assets, such as hardware, consumables, and software licenses.
   If you used a discovery tool, you may already have many assets identified accurately.
6. Manage assets by counting software licenses, viewing assets that are in stock, setting asset states and substates, and analyzing unallocated software.

CSDM framework for HAM

Common Service Data Model (CSDM) is a standard and consistent set of terms and definitions to adopt across all ServiceNow products on the ServiceNow AI Platform.

Using CSDM standard and consistent set of terms and definitions helps to effectively track assets through their life cycle transitions. To know more about CSDM, see Common Service Data Model.

To set up CSDM environment for HAM, see Set up the CSDM environment.

Note:
It is optional to adopt CSDM. You can either adopt CSDM or continue using the existing model.

ITSM Software Asset Management

The software asset management features of the ITSM suite can be activated using one of the plugins in the feature table.

Note:
These features support IT service management processes related to software assets.

For the Software Asset Management product (requires a separate subscription), see Software Asset Management.

Note:
The Software Asset Management product is a standalone application supporting advanced use cases for software asset management.

ITSM Software Asset Management feature plugins

Release	Plugin	Description
• Activation: Kingston • Introduced: Kingston	Software Asset Management Foundation plugin	Manage your software assets using manual normalization and reconciliation to determine software compliance.
• Activation: Jakarta and earlier • Introduced: Berlin	Legacy Software Asset Management plugin	Manage your software licenses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ITSM Software Asset Management feature plugins (continued)

Release	Plugin	Description
Note: Customers who have the Software Asset Management plugin enabled on a release prior to Kingston can continue to use the Software Asset Management plugin.		

Legacy Software Asset Management plugin

The legacy Software Asset Management (com.snc.software_asset_management) plugin activates the legacy ITSM Software Asset Management feature that is provided with the Asset Management application.

Important:
The legacy Software Asset Management (com.snc.software_asset_management) plugin is supported only in the Jakarta and earlier releases. Although this legacy plugin can no longer be activated upon request, you can continue to use it if it has already been activated on a ServiceNow instance running the Jakarta or earlier releases.

If your ServiceNow instance is running the Kingston or later releases, you must request and activate the Software Asset Management Foundation plugin instead.

A strong software asset management (SAM) program can help an organization reduce software costs, improve compliance, and simplify or develop processes for employee software requests. SAM programs can also help control inventory through accurate databases, which in turn helps identify organizational software needs, identify unused software that can be deleted, as well as reduce or consolidate the number of software vendors used.

Legacy Software Asset Management plugin Overview module

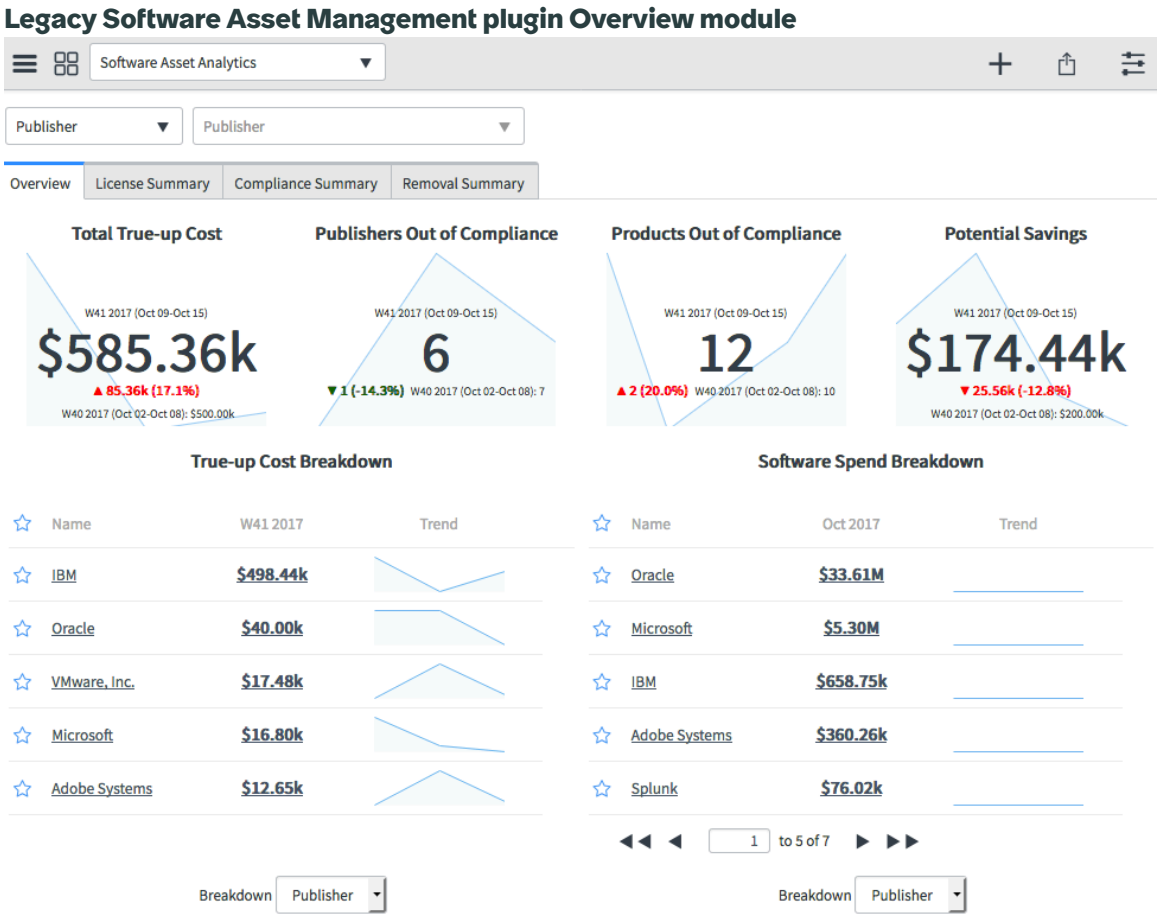
The Overview module for the legacy Software Asset Management (com.snc.software_asset_management) plugin is a homepage that displays various software asset management reports.

Use the legacy Software Asset Management plugin Overview module

The Overview module is a homepage that displays charts and graphs to help you manage software assets in the organization.

To use the Overview module for the legacy Software Asset Management (com.snc.software_asset_management) plugin, navigate to **Software Asset Management** > **Overview**. Click an element within a report to see more information or add and move widgets as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The overview shows the following compliance types:

- Immediate Compliance: number of licenses that should be purchased in order to be compliant immediately. Compliance is based on grouping. When tracking software licenses at a high level without any grouping, you are more likely to be compliant. With grouping, you are more likely to be out of compliance. For example, if grouping regionally by location, your organization can be globally compliant, but regionally non-compliant.
- Planned Compliance: based on the number of licenses you plan to allocate and the number installed.

The graphs show important statistics about the software being tracked, including software that has been entitled but is not being used and the total number of unallocated licenses.

Legacy Software Asset Management plugin roles

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following user role.

Roles

Role Title	Contains Role Names	Description
sam	inventory_user category_manager contract_manager	Can create, edit, change, and manage software licenses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles (continued)

Role Title	Contains Role Names	Description
	financial_mgmt_user	

Users with the sam or admin role can view the overview page and refresh, add, delete, and rearrange reports and other widgets.

Installed with the legacy Software Asset Management plugin

A number of tables, properties, user roles, script includes, client scripts, UI policies, and business rules are installed with the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Note:
Demo data is available with the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Tables

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following tables.

Legacy Software Asset Management plugin tables

Table	Description
Processor Definition [cmdb_processor_definition]	Describes a computer in terms of the attributes IBM uses for its PVU licensing model. If they are all identical in terms of the attributes used for PVU licensing, a row can be associated with one or more discovered computers.
Processor Mapping [sam_processor_mapping]	Encodes the information specified by the IBM Table of Processor Value Units per core and is used in matching a computer's processor definition to a PVU cost for that computer. Each row in this table is a mapping between a set of processors and the associated PVU cost (per core).
Software Counter [sam_sw_counter]	Configures license counting options for software models.
Software Counter Compliance Violations [sam_sw_counter_violation]	Stores records of software counter compliance issues that are due to violations other than installs exceeding rights, such as: • Maximum CPU/user count exceeded, based on model limits. • Maximum or minimum rights rules not followed, based on model limits. • Options installed on a server with a license that does not support options (Oracle).
Software Counter Detail [sam_sw_counter_detail]	Reconciles a software installation or usage with its corresponding software license and entitlement. The software counting logic automatically generates and maintains these records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Software Asset Management plugin tables (continued)

Table	Description
Software Counter History [sam_sw_counter_history]	Stores read-only copies of software counter records, which the system generates automatically each time a software counter finishes counting licenses.
Software Counter Result [sam_sw_counter_result]	Records all software counter results. Organizes the results based on the Grouping field (such as Company, Department, or Location) on the Software Counter record.
Software Counter Summary [sam_sw_counter_summary]	Aggregates all the software counter details for a given allocation state, a given group, and a given software counter. The software counting logic automatically generates and maintains these records.
Software Discovery Model [cmdb_sam_sw_discovery_model]	Stores a unique and definitive list of all software found by a discovery tool.
Software Installation [cmdb_sam_sw_install]	Associates software discovery models and the hardware on which they are installed.
Software Usage [cmdb_sam_sw_usage]	Associates software discovery models and the hardware that uses the models. ServiceNow Discovery does not populate the Software Usage [cmdb_sam_sw_usage] table. Use a third-party tool to add information about software assets to the Software Usage table.

Properties

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following system properties.

Legacy Software Asset Management plugin properties

Name	Description
sam.install_deletion_deadline	Defines the number of days after which a software install is deleted if not discovered with the configuration item. Use a value that is greater than the number of days between consecutive discovery runs. • Type: integer • Default value: 7 • Location: System Properties [sys_properties] table

User roles

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following user roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Software Asset Management plugin user roles

Role	Contains roles	Description
sam	inventory_user contract_manager category_manager financial_mgmt_user	Can create, edit, change, and manage software licenses. Can edit the Software model field on a Discovery model. Can approve a model. Has full control of the Legacy Software Asset Management plugin. Controls the legacy IBM PVU Process Pack, if activated.

Script includes

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following script includes.

Legacy Software Asset Management plugin script includes

Name	Description
DiscoveryModelMatcher	Matches a discovery model with a software product model.
ProcessorDefinitionsUtils	Contains utilities for managing the Processor Definition [cmdb_processor_definition] table.
ProcessorValueUnitsUtils	Contains logic that determines the IBM PVU pricing associated with a given processor. Also generates an event when a processor mapping is not found.
SAMMigration	Deprecated. Used by the fix job that migrates software license management data to the legacy Software Asset Management (com.snc.software_asset_management) plugin.
SAMSuiteEngine	Contains functions for handling suite inference on software installations.
SAMUtil	Generates models and counters for the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Client scripts

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following client scripts.

Legacy Software Asset Management plugin client scripts

Name	Table	Description
Clean up Counter	Software Counter [sam_sw_counter]	Ensures integrity between the various counting options of a software counter.
Deactivate automatched checkbox	Software Discovery Model [cmdb_sam_sw_discovery_model]	Deactivates the automatically matched check box when a user edits the software model.
Notify if counter in progress	Software Counter [sam_sw_counter]	Displays a message if the counter is currently running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI policies

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following UI policies.

Legacy Software Asset Management plugin UI policies

Name	Table	Description
Enforce Installs per license	Software Counter [sam_sw_counter]	Makes the Installs per license field mandatory when the software counter License type is By number of users.
Handle custom counts	License Calculation [sam_sw_license_calculation]	Displays the fields for entitlement type and valuation script when Count by is set to custom.
Hide condition fields	Software Counter [sam_sw_counter]	Hides the Software usage condition field if the license calculation query table is set to Software install and hides the Software install condition field if the license calculation query table is set to Software usage.
Hide query table	Software Counter [sam_sw_counter]	Hides the Query table field on the Software Counter form.

Business rules

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following business rules.

Legacy Software Asset Management plugin business rules

Name	Table	Description
assign processor	Computer [cmdb_ci_computer]	Attempts to match a processor with a processor definition.
Build Primary Key	Software Installation [cmdb_sam_sw_install]	Sets the primary key for the record to the serial number on the [cmdb_sam_sw_install] table. If the serial number is empty, the rule creates one based on the publisher, display name, product ID, version, and revision.
Build Primary Key	Software Usage [cmdb_sam_sw_usage]	Creates the primary key for the record from the publisher, name, product ID, and version number on the [cmdb_sam_sw_usage] table.
Check for software suite	Software Installation [cmdb_sam_sw_install]	Checks if the current software install is part of a software suite.
Check for suite omission	Software Installation [cmdb_sam_sw_install]	Checks if the current software install should be omitted from any suites.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Software Asset Management plugin business rules (continued)

Name	Table	Description
Clean up Cache	Software License [alm_license]	Removes the cache for the counter of the software license record when a software license is deleted.
Clean up software normalization	Software Installation [cmdb_sam_sw_install]	Deletes the discovery model if the discovery model is changed and it is not used by other software installs. This rule is not enabled by default.
Clear install and usage records	Software Counter Summary [sam_sw_counter_summary]	Uncaches all related install and usage records when a software counter summary is deleted.
Clear normalized flag	Software Usage [cmdb_sam_sw_usage]	Clears normalized flag on certain field changes.
Clear normalized flag	Software Installation [cmdb_sam_sw_install]	Clears the is_normalized check box when a field value is changed from a normalized value.
CPU/Core count change	Computer [cmdb_ci_computer]	Clears the Cached check box on related software installs when the CPU count or CPU core count changes.
Create a Software Normalization	Software Installation [cmdb_sam_sw_install]	Links the record to the discovery model with that primary key on the [cmdb_sam_sw_install] table if the primary key changes. The business rule creates a discovery model if none exist for that primary key.
Create a Software Normalization	Software Usage [cmdb_sam_sw_usage]	Links the record to the discovery model with that primary key on the [cmdb_sam_sw_usage] table if the primary key changes. The business rule creates a discovery model if none exist for that primary key.
Delete cached count results	Software License [alm_license]	Marks the software counter results to be recounted when one or more fields on a license have changed. This script runs after a change to a field that a counter can be grouped on, such as location, department, company, cost_center, entitlement_condition, or assigned_condition. If one or more of these fields changes, then the script sets the Recount field to true on any cached counter results matching the previous value. When the counter runs, the results with Recount set to true are treated as non-cached results and are recounted. For example, if Location on a license was Americas and changes to EMEA, cached results for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Software Asset Management plugin business rules (continued)

Name	Table	Description
		Americas will have Recount set to true for the next count.
Delete Cached row entry	License Entitlement [alm_entitlement]	When an entitlement is deleted: • Deletes all related software counter details. • Clears the Cached check box on the related software install.
Drop counter Cache	Software Counter [sam_sw_counter]	Clears the Cached check box for the software counter if the grouping, license type, contract, or installs per license change in a software counter. Added enforce field changes to the conditions
Flag counter to reprocess	Software Upgrade and Downgrades [cmdb_m2m_downgrade_model]	Clears the Cached check box for all related software counters if the upgrade parent or downgrade child values are changed or deleted.
Flag counter to reprocess	Software Suite [cmdb_m2m_suite_model]	Clears the Cached check box for all related software counters if the suite parent or suite child values are changed or deleted.
invalidate sw install cache	Computer [cmdb_ci_computer]	Uncaches all install and usage records referencing a computer when the computer's processor field is changed.
Limit license metric	License [alm_license]	Limits software licenses to a single license metric value.
Limit license metric combinations	Hardware [cmdb_ci_hardware]	Rejects license metric combinations of the same type, such as CAL (user) and CAL (devices).
Link to Model	Software Discovery Model [cmdb_sam_sw_discovery_model]	Finds and sets the model field to the model that best corresponds to the record when a software discovery model is created.
Mark install for suite omission	License Entitlement [alm_entitlement]	Searches for any matching installs and marks them for suite omission.
One and only one default mapping	Processor Mapping [sam_processor_mapping]	Ensures only one default mapping by resetting the last resort flag for modified records and setting it to false for new records.
Process cache reset	Software Installation [cmdb_sam_sw_install]	Resets the install of any counter information when it becomes uncached.
Process suite component deletion	Software Installation [cmdb_sam_sw_install]	Updates all other members of an install's suite if the install is deleted.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Software Asset Management plugin business rules (continued)

Name	Table	Description
rebind processor definitions	Processor Mapping [sam_processor_mapping]	Refreshes processor definitions when a processor mapping changes.
Rebuild Cache	Software Discovery Model [cmdb_sam_sw_discovery_model]	Clears the Cached field on the software counter if the associated software model is modified on the software discovery model record.
Rebuild inferred suite and cached	Software Discovery Model [cmdb_sam_sw_discovery_model]	Clears the cached flag and inferred suite field on records referencing this discovery model, when the matched model changes.
Remove cached flag	Software Installation [cmdb_sam_sw_install]	Clears the corresponding cached software counter details if a software installation is deleted or if the configuration item on which it is installed changes.
Remove cached flag	Software Usage [cmdb_sam_sw_usage]	Clears the corresponding cached software counter details if a software usage record is deleted or if the configuration item from which the software is accessed changes.
Remove caches from detail	Software Counter Detail [sam_sw_counter_detail]	Clears the Cached check box on the related entitlement, installation, and usage records if they exist.
Reset counter info on suite change	Software Installation [cmdb_sam_sw_install]	Uncaches and resets counter information on the install if its inferred suite changes.
Reset Installs per License	Software Counter [sam_sw_counter]	Clears the Installations per license fields if the counter license type is not per user.
Retrieve PVU Mapping	Processor Definition [cmdb_processor_definition]	Finds a matching processor mapping based on the information of the processor definition.
SAM: Core Process	Global [global]	Not used for any processing.
Set Display name	Software Counter Result [sam_sw_counter_result]	Sets the display name of the counter result to the counter name with the grouping type.
Set normalized fields	Software Usage [cmdb_sam_sw_usage]	Sets normalized fields on insert to be copies of discovered fields.
Set normalized fields	Software Installation [cmdb_sam_sw_install]	Copies the given values as their normalized values when a software install is inserted.
Sync Software Package	Software Discovery Model [cmdb_sam_sw_discovery_model]	Creates a row in the package table to reflect the row in the discovery model table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy Software Asset Management plugin business rules (continued)

Name	Table	Description
Update Cache	Software Installation [cmdb_sam_sw_install]	Updates all corresponding cached software counter details if usage metrics for this installation change.
Update Cache	Software Usage [cmdb_sam_sw_usage]	Updates all corresponding cached software counter details if usage metrics for this software usage change.

References

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds the following references.

Legacy Software Asset Management plugin references

Name	Description
Processor Definition	If you activated the legacy IBM PVU Process Pack after activating the legacy Software Asset Management (com.snc.software_asset_management) plugin, a reference to the processor definition is added to the Hardware [cmdb_ci_hardware] table.

Legacy Software Asset Management plugin setup process

To get started with the legacy Software Asset Management (com.snc.software_asset_management) plugin, you need to identify and discover software owned, create software models, create license records, and configure software counters.

To get started with the legacy Software Asset Management (com.snc.software_asset_management) plugin, perform the following:

- Identify the software that your organization owns using one of the following methods:
  - Use Discovery to identify currently owned software and begin working with the legacy Software Asset Management (com.snc.software_asset_management) plugin.
  - Identify and add the software manually or with a third-party tool.
- Make the Configuration Management Database (CMDB) accurate.

  Clean up information in CMDB. At first, focus on your top 10-20 software vendors.
- Create software models.

  Create software models for all of the software that your organization wants to monitor. Software models can also be imported from another source, such as a Discovery application, an existing data set of software licenses, or a third-party source.
- Create software license records.

  Create software license records for all of the software that your organization owns. This information can also be based on information from a purchasing source or imported as a spreadsheet.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Configure software counters.

  Configure software counters to view your organization's software compliance levels for all of your software.

Determine where software is installed using the legacy Software Asset Management plugin

When using the legacy Software Asset Management (com.snc.software_asset_management) plugin to determine where your software is installed, you must keep the following points in mind.

- The software instance no longer contains discovered information. The information previously went to the Software Instance [cmdb_software_instance] table, but now goes to the Software Installation [cmdb_sam_sw_install] table. Because the table has changed, you must change your transform maps to point to the new table.
- Models identified by a discovery tool are linked to software models.
- Use grouping to obtain more specific information from a software counter.
- Software installations link a computer with a software model (via a discovery model).

A discovery tool places the data it obtains into the Software Installation [cmdb_sam_sw_install] table. All of the information can be seen in the Software Installations list and the individual Software Installation forms. When a record is created, the system analyzes the Discovery Model table and identifies five key points.

- Publisher
- Display name
- Prod ID
- Version
- Revision

Find software on the network using the legacy Software Asset Management plugin

After using a discovery tool, you can find a definitive list of all the software found on the network using the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: sam

About this task

Note:
A user with the Asset role can delete software installations, but it is not recommended. As an alternative, archive software installation information.

Procedure

1. Navigate to **All** > **Software Asset** > **Discovery** > **Discovery Models**.
   A software administrator can, for example, look at the list and see that Adobe Acrobat 9.0, 9.2, 9.3, and 9.5 were found. Then, the administrator can edit software discovery models so all the dot versions are considered version 9.0 when doing reconciliation.
2. Click a **Display Name** in a row.
   All installations that map to an individual software discovery model are displayed.

   All fields on the form are read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software installation fields

Field	Description
Display name	Name of the software installation as it appears in record lists.
Publisher	Publisher of the software.
Version	Version of the software.
Discovery model	Software discovery model that represents the installed software.
Prod id	Number created by the publisher to identify the software.
Install location	Path under which the software is installed.
Install date	Date on which the software was installed.
Revision	Revision of the software.
Instance key	Encrypted credentials for the software installation.
Installed on	Hardware on which the software is installed.
Uninstall string	Identifier used to uninstall the software.
ISO serial number	ISO number of the software.
Foreground	Duration of foreground usage of the software.
Background	Duration of background usage of the software.
Last scanned	Date and time on which the software was last discovered on this hardware.
Last used	Date and time on which the software was last used on this hardware.
Counted by	The counter summary name that the installation is counted on.
Entitlement	Entitlement that is associated with the software installation.
Inferred suite	Software suite inferred by the inference parameters.
Valuation	Indicates the number of rights the install has.
Cached	If checked, the license installation has already been counted.
Omit from suites	If checked, the license is ignored for any suite calculations. This box is automatically checked if the install finds a possible entitlement of the exact software model for this configuration item.

Note:
Third-party discovery tools can use software normalization to more effectively manage the software installation database. Software normalization allows you to standardize your software installation data, such as the display name, publisher, revision, and version. You can personalize the software installation form to include these normalization fields. For more information, see Personalize a form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scan software installations with the system scheduler

The legacy Software Asset Management (com.snc.software_asset_management) plugin adds a scheduled job for scanning software installations named **SAM License Counters** in **System Scheduler** > **Scheduled Jobs**.

The **SAM License Counters** job occurs at 2:00am (local time) every morning. The job queries the Software Installation [cmdb_sam_sw_install] table and captures any installations that have not been scanned in the past 7 days.

Software licenses in the legacy Software Asset Management plugin

Software licenses are based on models that are defined through the legacy Software Asset Management (com.snc.software_asset_management) plugin.

You can create the models to organize software licenses in any way that makes sense for your organization. Common methods of defining models and licenses include by department or by region.

Licenses can be associated with a contract. For more information, see the Contract Management application.

Licensing types

The following license types are available in the legacy Software Asset Management (com.snc.software_asset_management) plugin:

- By CPU
  - By CPU cores
  - By number of CPUs
- By number of points: Per installation - IBM PVU
- By user
  - Number of installs per user
  - Per named user
- By utilization
  - Usage (CPU)
  - Usage (User)
- By workstation: Per workstation

Supported license models

Model	Description
Individual	Given to individuals.
Bulk allocated	Allocated to users via entitlements.
Bulk not allocated	Given to users with details, such as who has a license or where the license is located, not tracked.

License management with the legacy Software Asset Management plugin

The legacy Software Asset Management (com.snc.software_asset_management) plugin allows asset managers to track and organize the number of licenses available to the organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software licenses are based on models that you create to organize software licenses in meaningful ways. Different license calculation types determine how software is counted.

Software licenses can also be associated with a contract which enables a company to cover software licenses for multiple assets or users. You can manage and track software contracts using the Contract Management application.

Add a software license using the legacy Software Asset Management plugin

You can add a new software license using the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Click **New**.
3. Complete the form.

Field	Description
Display name	Read-only. Name of the software license. Created automatically.
Model category	Model category for the software license. **Software License** is selected by default.
Model	Software model of the license you are matching to. For example, Microsoft Excel.
Rights	Number of entitlements to be granted by this license. If an enterprise contract is attached to the license, the Rights field does not display.
General	
Asset tag	Number from the asset tag. The tag contains the serial number and bar code for tracking the software license.
State	Current status of the software license, such as **On order** or **In use**.
Assigned to	User currently assigned to this software license.
Managed by	User or department that maintains the software license. Can be different than the owner. For example, a specified user can own a software license, but the IT department manages it.
Owned by	User or department with financial ownership of the software license. Can be different than the manager.
Parent	Parent asset of the software license, if any. For example, the parent asset of Microsoft Word software is often the Microsoft Office suite.
Class	[Read-only] Automatically created as Software License.
License metric	[Optional] A single metric which the software license is counted against.
Serial number	Unique number assigned for identification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Substate	More details about the software license stage. The available substate settings depend on the **State** selected. For example, if you select the **Retired** state, the substate options available are **Disposed**, **Sold**, **Donated**, and **Vendor credit**.
Location	Where the license will be used. For example, a specific site, country, or region.
Department	Department of the person **Assigned to** this software license.
Company	Company that created the software.
Assigned	Date on which the software license was assigned.
Installed	Date on which the software license was installed.
Comments	Information about the software license that would be helpful for others to know.

For information about the fields in the **Financial** and **Contracts** sections of the form, see Create assets.

4. Click **Submit**.

Create and manage an enterprise license using the legacy Software Asset Management plugin

Enterprise licenses are typically for large customers and provide some flexibility, an agreed upon discount price, and a mechanism for easy administration.

Before you begin
Role required: contract_manager

About this task
Use the Contract Management application to set a software license as enterprise or subscription for the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Procedure
1. Navigate to **All** > **Contract** > **Software Licenses**.
2. Click **New**.
3. Select a **License type** of **Enterprise**.
4. Fill in as many of the remaining fields on the Contract form as you can, and click **Submit**.
5. Reopen the contract.
6. In the Assets Covered related list, click **New**.
7. In **Asset**, select the software covered by the contract.
8. In **Date added**, select the date the software license was added to the contract.
   The date can be in the past, the present, or the future.
9. **Optional:** In **Date removed**, select the date asset was, or will be, removed from the contract.
10. Click **Submit**.
11. Navigate to **Software Asset** > **Reconciliation** > **Software Counters**.
12. Click the software you specified.
13. Click **Count Licenses**.

    The licenses are listed under **Software Counter Results**. The licenses display as 0, but you are not out of compliance because you have an enterprise license with an enterprise contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once an enterprise contract is associated with software, all users are entitled when the licenses are counted.

Note:
In the Software Licenses list, enterprise licenses display **0** in the **Rights** column. The concept of rights is not used with enterprise licenses.

Create and manage a subscription license using the legacy Software Asset Management plugin

Use the legacy Software Asset Management (com.snc.software_asset_management) plugin to create subscription licenses and manage the information as it changes.

Before you begin
Role required: contract_manager

Procedure

1. Navigate to **All** > **Contract** > **Contracts** > **Software Licenses** and click **New**.
2. Select **Subscription** from the **Agreement type** list.
3. Complete the **Contract** form, right-click the header, and select **Save**.
4. In the **Assets Covered** related list, click **New**.
5. In **Asset**, select the software covered by the contract.
6. In **Date added**, select the date the software license was added to the contract.
   The date can be in the past, the present, or the future.
7. **Optional:** In **Date removed**, select the date asset was, or will be, removed from the contract.
8. Click **Submit**.
9. Navigate to **All** > **Software Asset** > **Reconciliation** > **Software Counters**.
10. Click the software specified in step 5.
11. Click **Count Licenses**.
    The licenses are listed under **Software Counter Results**.

Software license entitlements for the legacy Software Asset Management plugin

Software entitlements enable you to define the people or machines to which a specific, purchased software license is assigned.

Before you begin
Role required: asset

About this task
Asset managers allocate a license to entitle a user or machine to use the license. For example, a company purchases a software license for 100 rights. The software entitlement specifies the 100 employees or machines that are rightfully assigned a license. If the ServiceNow Discovery tool is used and it finds the software installed on 200 machines, the asset manager can identify the employees or computers that have the software installed without a license. The asset manager can ask users to remove the software from their computers.

Built-in rules prevent entitling more licenses than have been purchased. License entitlements use specific software license asset tags. In addition to the mandatory asset tag, an individual person and a specific configuration item can be assigned.

The benefits of using software entitlements include the following.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the overall license entitlement is exceeded, the asset manager can rapidly address the problem and return to compliant status by either removing unauthorized software or ordering more licenses.
- If the license entitlement is not being used completely, the asset manager can respond by lowering the number of licenses purchased in the future.

Procedure

1. Navigate to **All** > **Asset** > **Software** > **Asset License Entitlements** and create a new record (see table for field descriptions).

Field	Description
Display name	Name used in record lists.
Allocated to	The configuration item consuming the license token.
Licensed by	License granting this token.
Cached	Internal flag set and used by software counters logic.

2. Click **Submit**.

Create an entitlement for the legacy Software Asset Management plugin

You create software entitlements for both CIs and users from the same License Entitlement form.

Before you begin

Role required: asset

About this task

You can create these entitlements from the Asset Management application. Navigate to one of these locations and click **New**:

- **Asset** > **Software** > **Asset License Entitlements**
- **Asset** > **Software** > **User License Entitlements**

Procedure

1. Navigate to **Software Asset** > **Software Licenses**.
2. Click an **Asset tag**.
3. Click **Add Entitlement** and complete the License Entitlement form using the fields in the table.
4. Click **Submit**.

   The view returns to the Software License form.

5. **Optional:** Set a condition in the **Allocated conditions** section.

   (Optional) The configuration items given this license must meet the specified conditions. For example, you might set a condition that allocates this software license to CIs in a certain department only.

6. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License entitlement

Field	Description
Display name	Name used in record lists.
Assigned to	User of the entitlement token.
Allocated to	The configuration item consuming the license token.
Licensed by	License granting this token.
Cached	Internal flag set and used by software counters.

Create a software user license entitlement for the legacy Software Asset Management plugin

You can entitle a user to use one of your software licenses.

Before you begin

Role required: asset

Procedure

1. Navigate to **All** > **Asset** > **Software** > **User License Entitlements** and create a new record (see table for field descriptions).

Field	Description
Display name	Read-only. Name used in record lists.
Assigned to	User of the entitlement token.
Licensed by	License granting this token.
Cached	Read-only. Internal flag set and used by software counters logic.

2. Click **Submit**.

Entitle a license to a configuration item using the legacy Software Asset Management plugin

Use the legacy Software Asset Management (com.snc.software_asset_management) plugin to entitle a license to a configuration item, such as a computer or server, or a location, such as a city of building.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Click an **Asset tag**, or click **New** to create a new software license.
3. In the **Asset Entitlements** related list, perform one of the following actions.
   - Double-click in **Allocated to** to entitle the license to a specific configuration item, such as a computer or server.
   - Double-click in **Location** to entitle the license to a specific location, such as a city or building.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Optional:** Set the **Allocated conditions** condition to the configuration items given this license must meet the specified conditions

   Example
   For example, only configuration items in a certain department can be allocated this software license.

5. Click **Update**.

Entitle a license to a user or location using the legacy Software Asset Management plugin

Use the legacy Software Asset Management (com.snc.software_asset_management) plugin to entitle a license to an individual user.

Before you begin
Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Click an **Asset tag**, or click **New** to create a new software license.
3. In the **User Entitlements** related list, perform one of the following actions.
   - Double-click in **Assigned to** to entitle the license to a specific user.
   - Double-click in **Location** to entitle the license to a specific location, such as a city or building.
4. **Optional:** Set the **Assigned to condition** to require that every user given this license meets the specified conditions.

   Example
   Only people in a certain region can be assigned this software license

5. Click **Update**.

License upgrade and downgrade with the legacy Software Asset Management plugin

The concept of upgrading and downgrading licenses is built in to the legacy Software Asset Management (com.snc.software_asset_management) plugin.

This is helpful when reconciling licenses. Downgrading a license is the process of purchasing a license, but using an earlier version. Upgrading a license occurs when a newer version of a license is not purchased, but you are allowed to use the newer version. Downgrading is more common than upgrading.

Any version defined as a downgrade child that does not have entitlements and a license can be counted as an installation of the upgrade parent. Use this method to avoid having to uninstall unlicensed versions of software running in your environment. When you define an unlicensed version as a downgrade child of a licensed version, the system creates a software model record for the unlicensed version with an upgrade path to the licensed version. If you delete the downgrade child from the licensed version's record, it is automatically deleted from the Software Model record for the unlicensed version.

Note:
If the downgrade child has either a license or an entitlement, it must also have a counter, which counts all installations of the downgrade child against its own license.

For example, you have licenses for the software model Microsoft Word 2010, but no licenses or entitlements for Word 2007. Discovery finds installations of Word 2007 being used in your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

organization. Rather than force users to uninstall all instances of this unlicensed version, you decide to count installations of Word 2007 against your Word 2010 license. To do this, you configure Word 2007 as a downgrade child in the Word 2010 Software Model record. A Software Model record is automatically created for Word 2007 which specifies Word 2010 as the upgrade parent.

If a software version has a downgrade child or an upgrade version that can be counted against the parent, the number of installs counted is restricted to the number of available rights of the parent. For example, Microsoft Word 2010 has a downgrade to Word 2007. Both versions have an active counter. Microsoft Word 2010 finds all entitled copies of Word 2007, and also takes out of compliance any installs from that downgrade counter until the available downgrade rights are used. However, if Microsoft Word 2010 only has 100 rights, then the maximum number of rights to be taken from the downgrade counter is 100.

You can set the start and end dates for a software upgrade parent and downgrade child to be valid. The software counter counts the upgrade and downgrade licenses within the selected dates. If the software counter runs outside of the date range, the upgrade and downgrade licenses are not counted.

Note:
If an upgrade parent or downgrade child is set on the software model, it applies to all licenses of that model. If set on the software license, it applies specifically to that license.

Upgrade a license using the legacy Software Asset Management plugin

Use the legacy Software Asset Management (com.snc.software_asset_management) plugin to upgrade a software license through one of two methods: through a software license record or through a software model record.

Before you begin
Role required: sam

Procedure

1. Complete the following steps to identify an upgrade parent from a software license record.

   a. Navigate to **Software Asset** > **Software Licenses** and select a software license.

   b. Click the **Software Upgrade and Downgrade** tab and click **New**.

   c. Complete the form.

   Software Upgrade and Downgrades form

Field	Description
License	Name and asset number of the software license.
Downgrade Child	Lower version of the software license.
Upgrade parent	Higher version of the software license.
Start date	Start date of the upgrade.
End date	End date of the upgrade.

   d. Click **Submit**.
   The software upgrade displays in the Software Upgrade and Downgrades section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select the software upgrade check box and click **Update**.
The software license is updated in the Software License list.

2. Complete the following steps to identify an upgrade parent from a software model record.

a. Navigate to **Software Asset** > **Software Models**.

b. Select a model.

c. In the **Upgrade** section, double-click under the **Upgrade parent** column heading.

d. Select a software model from the list.

e. Click the green check mark and click **Update**.
The Software Model form is updated.

Downgrade a license using the legacy Software Asset Management plugin

Use the legacy Software Asset Management (com.snc.software_asset_management) plugin to downgrade a software license through one of two methods: through a software model record or through a software license record.

Before you begin
Role required: sam

About this task
Note:
Downgrade children set on the software license applies specifically to that license. If a downgrade child is set on the software model, it applies to all licenses of that model.

Procedure
1. Complete the following steps to downgrade a license from a software model record.
   a. Navigate to **Software Asset** > **Software Models**.
   b. Select a model.
   c. In the **Downgrade** section, double-click under the **Downgrade child** column heading.
   d. Select a software model from the list.
   e. Click the green check mark.
2. Complete the following steps to downgrade a license from a software license record.
   a. Navigate to **Software Asset** > **Software Licenses**.
   b. Select a license.
   c. Click **New** in the Software Upgrade and Downgrades related list.
   d. Select a software model from the list.
   e. Select the **Start** and **End** dates.
   f. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Identify a downgrade child from a software license record using the legacy Software Asset Management plugin

Use the legacy Software Asset Management (com.snc.software_asset_management) plugin to identify a downgrade child from a software license record.

Before you begin
Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Select a license.
3. Click **New** in the **Software Upgrade and Downgrades** related list.
4. Select a software model from the list.
5. Select the Start and End dates.
6. Click **Submit**.

> **Note:**
> Downgrade children set on the software license applies specifically to that license. If a downgrade child is set on the software model, it applies to all licenses of that model.

View a list of unallocated software licenses for the legacy Software Asset Management plugin

Managing software licenses includes knowing what licenses are owned by your organization, but are not allocated.

Before you begin
Role required: sam

About this task
You can allocate the licenses to users or devices. If no one needs the unallocated licenses, this can be noted so that fewer licenses are purchased in the future.

Procedure

1. Navigate to **All** > **Asset** > **Software** > **Unallocated Licenses**.
2. View the **Software Counter Details** list (**Unallocated License** view).
   The **Valuation** column lists the number of unallocated licenses for the given software model.
3. Click a name in the **Model** column for detailed information about a specific license.
   View the **Software Model** list in the **Unallocated License** view.

Merge software licenses using the legacy Software Asset Management plugin

If you have multiple software licenses that are linked to the same model, you can merge the individual licenses into a consolidated license using the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin
Role required: sam

About this task
To be merged, the individual licenses must meet the following requirements:

- The licenses cannot already be merged into another consolidated license.
- The information in the following fields must match for each license:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Model
- Allocated condition
- Assigned condition
- Company
- Location
- Department
- Cost center
- State

- The licenses must have the same set of software upgrades and downgrades and the same set of assets covered. To verify this information, go to **Software Asset** > **Software Licenses** and select a license.
  - For upgrades and downgrades, go to the **Software Upgrade and Downgrades** related list.
  - For assets covered, go to the **Assets Covered** embedded list in the Contracts related list.

If a license can be merged, **Merge with similar licenses** appears under **Related Links** on the Software License form.

To merge a license:

Procedure

1. Open a license.
2. Click the **Merge with similar licenses** link.

   Displays a dialog box with a message stating that the merge process is irreversible and that license keys are not merged.
3. Click **OK**.

   All qualifying licenses, including the current license, are merged into a new consolidated license. An informational message appears until the user is redirected to the newly merged license.

   All qualifying licenses are merged into a new consolidated license unless they can be matched to an existing consolidated license. If they are merged into a new consolidated license, the **Asset tag** field is cleared. After merging, the merged license is marked as **Is merged license** (field = true) and the **Merged into** field is set to this license for the consolidated licenses.

   Note:
   Licenses that are marked as merged are not counted.

   For the consolidated licenses:
   - The number of rights are summed up into a new count.
   - The asset and user entitlements are transferred to the new license.
   - The expense lines and assets on contract rate cards are transferred to the new license.
   - The set of software upgrades and downgrades, as well as the set of assets covered, are copied to the new license.
   - The cost of each individual license is summed up into the new license using the system base currency.
   - A history of the consolidated licenses and where they went is maintained.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License management with the legacy Software Asset Management plugin

Manage software models using the legacy Software Asset Management plugin

The legacy Software Asset Management (com.snc.software_asset_management) plugin uses software models to manage licenses, specifically in software counters and license restrictions, and to track upgrade and downgrade licenses.

Before you begin

Role required: sam or model_manager

About this task

Create software models for all of the software your organization wants to monitor. Software models can also be imported from another source such as the Discovery application.

Note:
Software does not create configuration items. If the discovery tool you use supports and finds ISO information, details such as ISO ID and ISO serial number are added to the Software Model form for compliance purposes.

Procedure

1. Navigate to **All** > **Software Asset** > **Software Models**.
   Users with the model_manager role can navigate to **Product Catalog** > **Product Model** > **Software Models**, but cannot administer all aspects of software models.
2. Click **New**.
3. Complete the form.

Software model fields

Field	Description
Display name	[Read-only] Name of the model. A system property called *glide.cmdb_model.display_name.shorten* controls how software model display names are generated. Administrators can configure the property.
Manufacturer	The company that built the model.
Name	The manufacturer-assigned name of the model or an abstract name specified by the model manager, such as Field Agent Laptop.
Edition	The edition of the software model, such as Professional.
General	
Short description	A brief description of the model.
Model categories	[Read-only] The category the model is assigned to. The system automatically sets the value to **Software License**. This field is a glide list.
Asset tracking strategy	The process the model should be tracked by. Choose from the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Leave to Category**: model is transparent and the asset class is defined solely by the category. ○ **Create Consumable Asset**: model forces the asset class to be consumable, regardless of what the category defines as the asset class. ○ **Don't create assets**: model blocks asset instantiation, regardless of what the category defines as the asset class.
Acquisition method	The method for purchasing the model. Options are **Both**, **Buy**, and **Lease**.
Cost	The cost a single unit of the model.
Depreciation	The depreciation scheme for the model.
Model number	The specific model number assigned to the item by the manufacturer.
Barcode	The barcode number assigned to the model. Barcodes are usually assigned by the manufacturer.
Owner	The person responsible for the model.
Status	The current status of the model. Options are **In Production**, **Retired**, and **Sold**.
Certified	The option that determines whether the model is approved for use.
Comments	Information about the model that would be helpful for others to know.
License	
Version	The exact version of the software. For example, Version 2.
Major	The ISO major version number of the software.
Minor	The ISO minor version number of the software.
Build	The build number of the software.
Software category	A category name for grouping software with similar characteristics.
Single or multi license	Defines whether this model uses a single license or multiple licenses.
Maximum socket count	Maximum number of CPU sockets that a computer must have for the software to be installed.
License type	The tracking type for the license. For example, by number of users, per workstation, per installation with IBM PVU or per Oracle processors. If you select the **By number of users** option, you can create a software counter and specify the number of installations per license.
Activation status	The activation state of the software model. Options are **None** and **Activated**.
ISO id	The unique ISO identification number of the software product.
ISO serial number	The serial number issued by ISO for the software.
Application model	Application associated with this software.
Rights	Number of licenses granted to this software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Minimum users	Minimum number of user licenses required for this software.
Maximum users	Maximum number of user licenses required for this software.
Suite Components	
Inference percent	The percentage of suite components that need to be present on a system to count as a suite. Used for suite management. For example, Suite A consists of 5 products. If the inference percent is set to 60% and a discovery tool finds three of the products on the system, the software is flagged for possible purchase as a suite.
Components	The child product or products of the suite. For example, Microsoft Word and Microsoft Excel are child products of Microsoft Office.
Suite Parents	
Parents	The parent suites to which the software is assigned. For example, the parent suite for several common Microsoft products is a version of Microsoft Office.
Upgrade	
Upgrades	An alternative version license to which you have rights. For example, if you purchase version 4 of a software product shortly before version 5 is released, your version 4 license may include a free upgrade to version 5 when it is released.
Downgrade	
Downgrades	An alternative version license to which you have rights. For example, if you purchase version 4 of a software product, your version 4 license may include downgrade rights to version 3.
Licenses	
Software Licenses	The software licenses that should be created automatically from this model. **Note:** This embedded list shows all assets created from this model, whether or not they are software licenses, in versions prior to this release.
Catalog Item	
Product Catalog	The information about the model as it appears in the product catalog and service catalog. Information only appears if the model has been published to the product catalog.
Description	Description of the software model as it appears in the product catalog.
Picture	An image of the software logo.

Any software licenses you create and assign to the new model are displayed in the **Licenses** embedded list on the Software Model form.

Create and manage software suites using the legacy Software Asset Management plugin

Software uses the concept of suites instead of bundles.

A software suite is a group of related software offered as one unit. An example is the Microsoft Office Professional suite of office productivity software tools that includes Powerpoint, Word, Excel, Outlook, and Access. You can use the legacy Software Asset Management

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(com.snc.software_asset_management) plugin to create suites and add components to the suite so that the licenses your organization own are counted accurately.

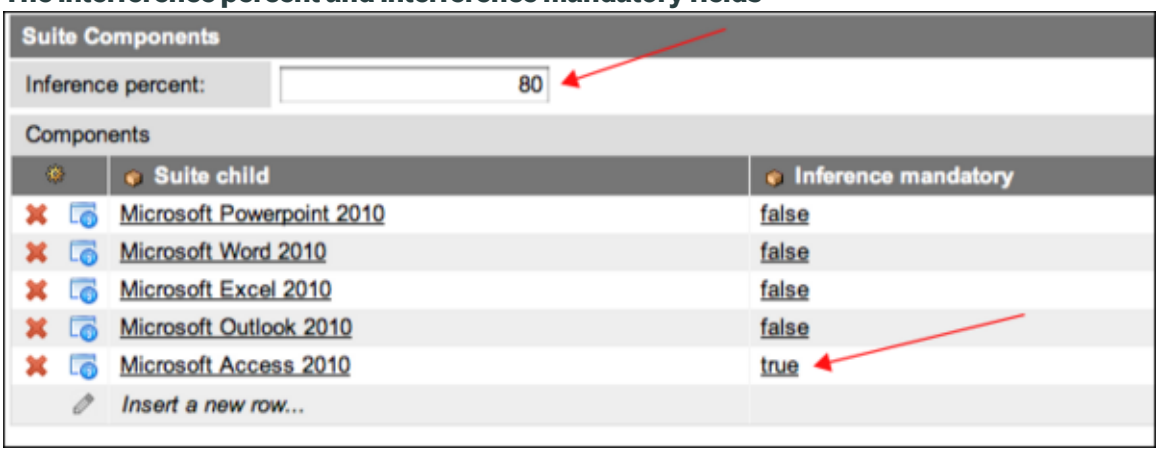
For any software model, you have the option to specify whether the model is a suite (parent) or a component (child). A software model can be a component in multiple suites. For example, Microsoft Word is a component in Microsoft Office Standard and Microsoft Office Professional. Although you can set a single software model as both a suite and a component, software is not typically sold as nested suites.

Use the **Inference percent** and **Inference mandatory** options for even greater control of suites.

- **Inference percent**: specifies what percentage of the components in the suite must be installed for the software to be identified as a suite.
- **Inference mandatory**: enforces that a specific component in a suite must be installed to infer that the suite is installed.

For example, specify the **Inference percent** as 80% and set the **Inference mandatory** option to **true** on Microsoft Access. These settings specify that Microsoft Access must be installed, along with 3 out of 4 other products (Microsoft Word, Microsoft Excel, Microsoft PowerPoint, and Microsoft Outlook) to infer that Microsoft Office Professional is installed.

The interference percent and interference mandatory fields

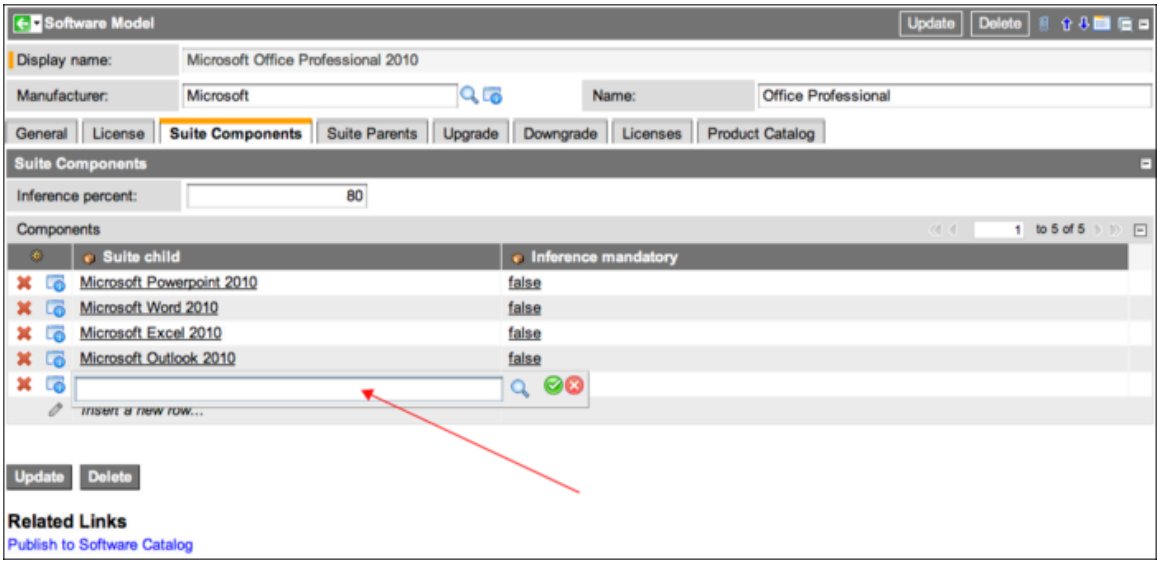


To make the new software model record a parent record in a suite:

1. Open a software model record.
2. In the Suite Components section, double-click an empty row under **Suite child**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Suite child

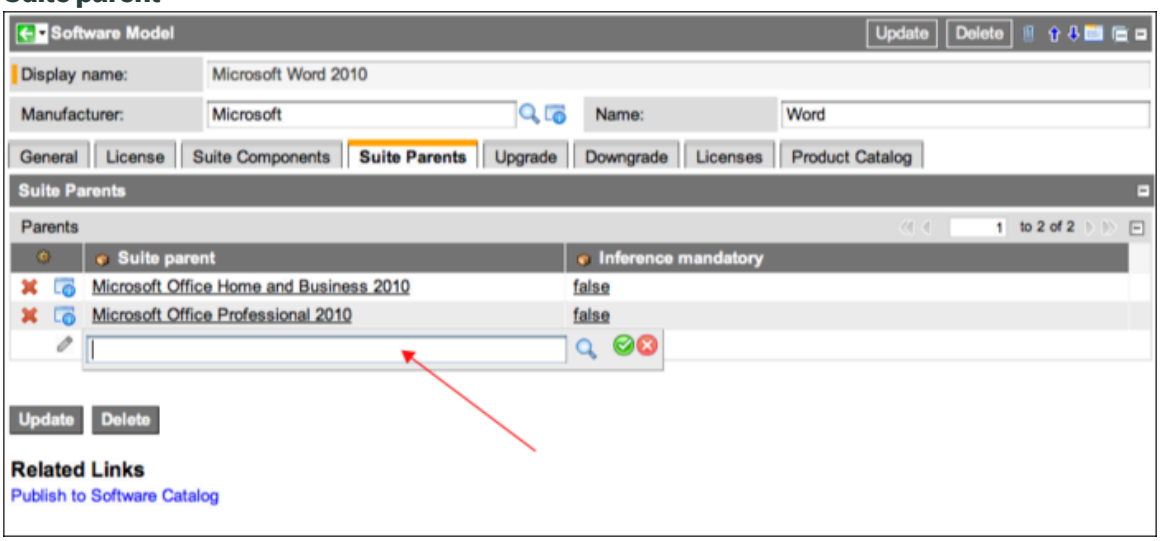


3. Add the software to include in the suite.
4. [Optional] Set the **Inference mandatory** option to **true** if the software must be installed to count the model as a suite.
5. Repeat as necessary.

To make the new software record a child item:

1. Open a software model record.
2. In the Suite Parents section, double-click an empty row under **Suite parent**.

Suite parent



3. Add the suite to which this software model should belong.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Repeat as necessary.

Note:
When a change is made to a suite, a scheduled job called *`Calculate suites [Software Suite Model]`* is created. The job runs instantly, calculates any suites, and then deletes itself. The calculations are stored in the cmdb_sam_sw_install table under inferred suite.

License calculations with the legacy Software Asset Management plugin

Software license calculations with the legacy Software Asset Management (com.snc.software_asset_management) plugin count the number of licenses that exist in your network environment.

Users with the sam role can choose to count software licenses using a variety of license calculation types, such as counting by the number of users, the number of workstations, the number of CPUs, and others. For example, you can count the number of Adobe Acrobat 9.0 licenses based on the number of users that have the software installed in the organization.

Calculate software licenses using the legacy Software Asset Management plugin

Software calculations use license calculation types to determine how software licenses are counted in your organization.

You can use the default license types provided by the legacy Software Asset Management (com.snc.software_asset_management) plugin or create new ones. To view the default types, navigate to **Software Asset** > **Reconciliation** > **License Calculations** and select a type. All fields in the default records are read-only.

License calculation details

Field	Description
Name	The name of the license type.
Query table	The table that is being used for data. Possible values are Software install and Software usage.
Count by	The calculation type by which the license calculation type counts software licenses.

License calculation types supported by the legacy Software Asset Management plugin

Default license calculation types are available with the legacy Software Asset Management (com.snc.software_asset_management) plugin.

These license types cannot be deleted.

License calculation types

Category	License type
By CPU	• **By CPU cores**: The counter adds up the total license rights for all software license records of this model. The **CPU Core Count** field on the hardware configuration item determines the number of rights consumed by any software installation located on the configuration item. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software installation data and hardware configuration items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License calculation types (continued)

Category	License type
	• **By number of CPUs**: The counter adds up the total license rights for all software license records of this model. The **CPU Count field** on the hardware configuration item determines the number of rights consumed by any software installation located on the configuration item. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software installation data and hardware configuration items.
By number of points	**Per installation - IBM PVU**: The counter adds up the total license rights for all software license records of this model. The installation count for every hardware configuration item that has IBM PVU software is a point calculation. The CPU type determines the PVU per-core multiplier based on the IBM PVU mapping table. The total number of cores on the configuration item is multiplied with this per-core multiplier to determine how many rights are used by an installation on this configuration item. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software installation data and hardware configuration items. This license type is present but does not work until the Software Asset Management plugin IBM PVU Process Pack is active.
By Client Access License (CAL)	• **CAL (Device)**: The counter adds up the total license rights for all software license records of this model. Usage is counted as one installation for every unique configuration item (device). For each installation, the counter checks for a valid entitlement record on any of the software license records. The Software Usage [ast_usage] table is used for counting. • **CAL (User)**: The counter adds up the total license rights for all software license records of this model. Usage is counted as one installation for every unique user. For that installation, the counter checks for a valid entitlement record on any of the software license records. The Software Usage [ast_usage] table is used for counting.
By user	• **Number of installs per user**: The counter adds up the total license rights for all software license records of this model. It counts an installation when one software installation matches the discovery models that are mapped to this software model for any hardware used by a user. It counts up to the specified amount. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software installation data and hardware configuration items. • **Per named user**: The counter adds up the total license rights for all software license records of this model. It counts an installation when there is at least one software installation that matches the discovery models that are mapped to this software model for any hardware used by a unique user. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software installation data and hardware configuration items. • **No license needed (User)**: The counter adds up the total number of users of this model. It counts an installation when there is at least one software installation that matches the discovery models that are mapped to this software

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License calculation types (continued)

Category	License type
	model for any hardware used by a unique user. It applies to software installation data and hardware configuration items. This license type is used for software installations where no license is required, such as open source applications. To compare **Number of installs per user** and **Per named user**: • **Number of installs per user** counts the number of installs the user has and assigns license cost based on installs per license. For example, UserA has three installs. One license is used by each install, for a total of three licenses. • For **Per named user**, there is no install limit for a particular user. For example, UserB, who has three installs, needs only one license for the three installs.
By utilization	• **Usage (CPU)**: The counter adds up the total license rights for all software license records of this model. The counter looks at all of the software usage data mapped to any of the discovery model records of the counter's software model. It counts one installation for every unique configuration item. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software usage data. • **Usage (User)**: The counter adds up the total license rights for all software license records of this model. The counter looks at all of the software usage data mapped to any of the discovery model records of the counter's software model. It counts one installation for every unique user Accessed From hardware configuration item. For that installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software usage data.
By workstation	• **Per workstation**: The counter adds up the total number of license rights for all software license records of this model. It counts an installation when there is at least one software installation on a hardware configuration item that matches the discovery models that are mapped to this software model. For each installation, the counter checks for a valid entitlement record on any of the software license records. Applies to software installation data and hardware configuration items. • **No license needed (Workstation)**This license type is used for software installations where no license is required, such as open source applications.
By Oracle install	• **Oracle Named User**: Oracle licensing scheme that counts by the number of unique users. • **Oracle Named User Plus**: Oracle licensing scheme that counts by the number of unique users and accounts. • **Oracle Processor**: Oracle licensing scheme that counts by the number of processors on a server. This category and its license types are available when the Oracle Process Pack is activated.

Create a custom license type for the legacy Software Asset Management plugin

Custom license types in the legacy Software Asset Management (com.snc.software_asset_management) plugin allow you to create a license type with special conditions.

Before you begin
Role required: sam

About this task
A custom script can provide detailed information about the number of rights a software install or usage consumes.

Procedure
1. Navigate to **All** > **Software Asset** > **Reconciliation** > **License Calculations**.
2. Click **New**.
3. Complete the form.

New license calculations

Field	Description
Name	Name of the software license type.
Query table	The value that is used for queries. This can be either **Software install** to count the number of installations or **Software usage** to count the number of times the software is used.
Count by	The calculation type by which the license type counts software licenses. Make sure this value is set to **Custom** to create a new calculation type.
Entitlement type	The entitlement type of the license, either **Workstation** or **User**. This field is available only when the **Count by** field is set to **Custom**.
Script	The script used for custom license types. This field is available only when the **Count by** field is set to **Custom**.

4. Click **Submit**.

Create a custom script for a legacy Software Asset Management plugin license type

By default, the **Script** field in the legacy Software Asset Management (com.snc.software_asset_management) plugin Software License Calculation form contains information about available variables and an example script.

You can use the example as the basis of the custom script or replace the example entirely.

You can use the following variables in the custom script.

Custom script variables

Variable	Description
found	Contains a GlideRecord of the software install or software usage record currently being evaluated.
workstation	Contains a GlideRecord of the workstation referenced by the found record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom script variables (continued)

Variable	Description
user	Contains a GlideRecord of the user referenced by the found record. Can be null if no user is assigned.
counter_id	Contains the sys_id of the counter running the script.
query_table	Identifies the table currently being queried, either Software Installation or Software Usage.
valuation	Identifies the value in rights that is given to this software install or software usage record.

The following functions are available as part of the *SAMUtil* script include and can be used in custom scripts.

Note:
All of these functions utilize and depend on the variables mentioned above.

Custom script functions

Functions	Description
getWorkstationInstallsOrUsages	Returns a list of other installs on the given workstation.
getUserInstallsOrUsages	Returns a list of all other installs belonging to the user.
createCounterViolation	Returns insert a counter violation for the current counter with the given cause.

Example:

The following script uses the number of rights equal to the number of CPU sockets on the machine the script is installed on. The *workstation* variable is used to identify any workstation that is in the development environment. If such a workstation is found, the script then assigns a *valuation* equal to the number of CPU sockets on the machine. Otherwise, if the workstation is not in the development environment, then no rights are assigned.

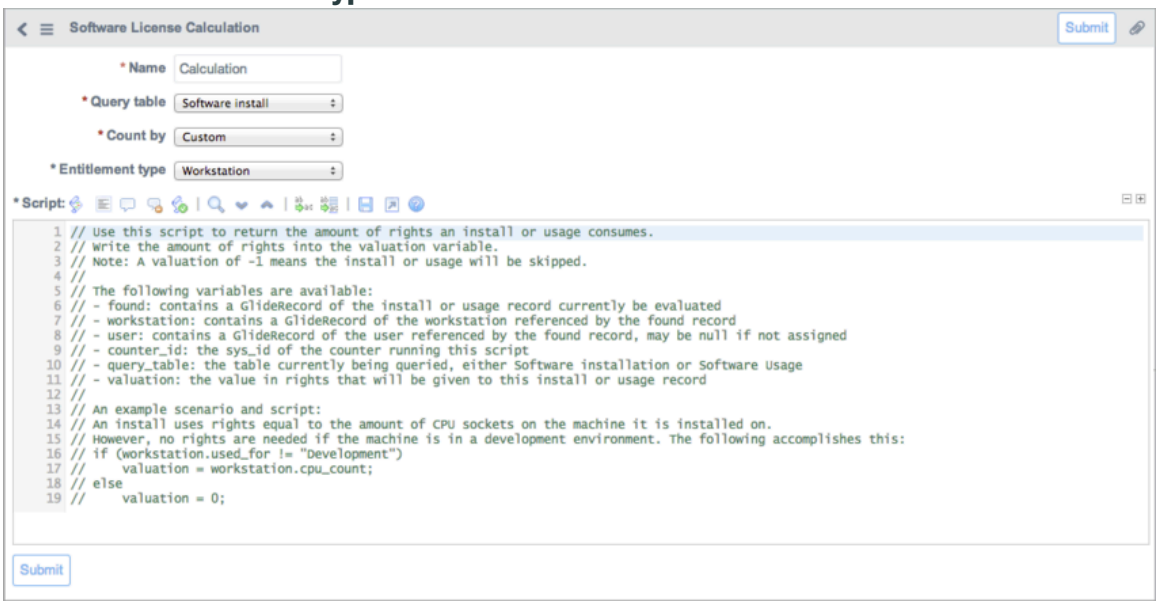
SAM custom calculation type



Software discovery models in the legacy Software Asset Management plugin

Software discovery models in the legacy Software Asset Management (com.snc.software_asset_management) plugin can be used to help normalize the software you own by analyzing and classifying models to reduce duplication.

Software discovery models are stored in the Software Discovery Model [cmdb_sam_sw_discovery_model] table. There is a distinct difference between software models and software discovery models.

- A software model is a specific version or configuration of software.
- A software discovery model is a model created when Discovery runs and identifies software.

Software discovery models cannot be created manually. The ServiceNow platform uses any of the following field combinations to match the new software discovery model to an existing software model.

- **Display Name**, **Publisher**, and **Version**
- **Display Name** and **Version** if the **Publisher** field is empty
- **Display Name** only if the **Publisher** and **Version** fields are empty

When analyzing version numbers, the ServiceNow platform always searches for an exact match first, but rounds down to a major version number if an exact match is not found. For example, if no match is found for version number 8.0.4, but version 8.0 is found, then version 8.0 is used in the **Software model** field.

Edit a software discovery model using the legacy Software Asset Management plugin

You can edit only the **Software model** field and **Approved** check box on the legacy Software Asset Management (com.snc.software_asset_management) plugin Software Discovery Models form.

Before you begin

Role required: sam

About this task

If the information automatically added to the **Software model** field is incorrect, you can change to an existing model or create a new one.

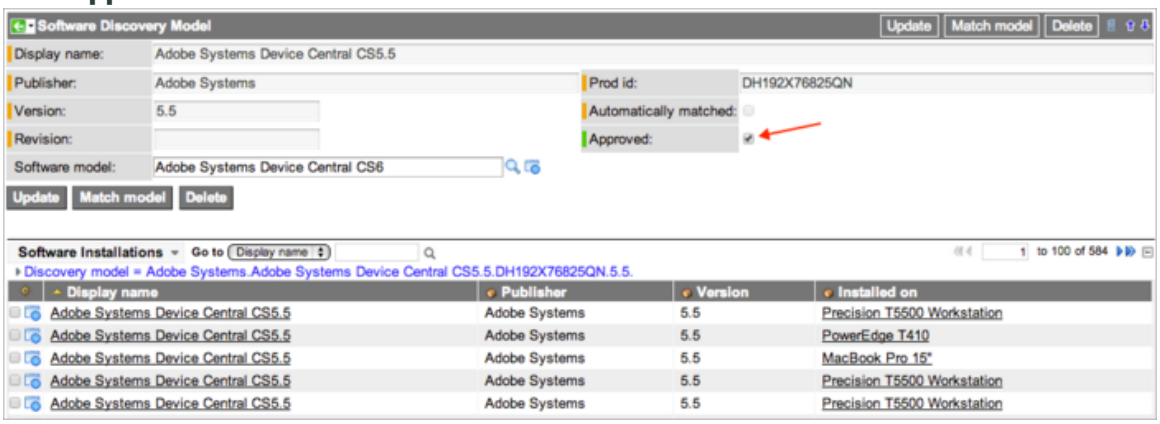
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

None of the software discovery model records are approved when they are created. You must approve them manually after you have reviewed them for accuracy or normalized them. If the automatically generated software model is correct, approve the model.

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Discovery models**.
2. Click an entry in the **Publisher** column.
3. Select **Approved**.

SAM approval



Automatically match to an existing model using the legacy Software Asset Management plugin

The automatic matching feature in the legacy Software Asset Management (com.snc.software_asset_management) plugin allows you to match a software discovery model to an existing software model.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Discovery models** and open a model.
2. Clear the **Software model** field.
3. Click an entry in the **Publisher** column.
4. Click **Match model**.
   The system searches for the best match from existing models. If a match is found, the system automatically adds the name to the **Software model** field and selects the **Automatically matched** check box. If a match is not found, a **No match found** message is displayed, and two related links appear, allowing you to create a new model. No change occurs if the system has already made a match.
5. If no match is found, create a new model.
   If a model is already matched, then the automatic matching feature does not run.

   The automatic matching feature can also be used when you insert a new discovery model record or if you modify and update an existing discovery model. If automatic matching is run, all software installations and usages that reference the discovery model will have their **Inferred suite** and **Cached** fields cleared.

   For more information on software installation and usage records, see Determine where software is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create new models using the legacy Software Asset Management plugin

If the automatically generated software model is not correct or if the system cannot find a match from existing models, you can create a new model using the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Discovery models** and open a model.
2. Clear the **Software model** field.
3. Save the record.
   Two related links appear for creating software models.
4. Select one of these related links to create a new model, which are available only if no **Software model** is specified.
   - **Create Software Model**: Creates a new software model for this record if a suitable one does not already exist. You can create a new software model for multiple records in the Discovery Models list view. Select one or more records and then click the link in the **Actions** choice list.
   - **Create Software Model and Counter**: Creates a new software model and a new software counter for this record. The system creates the software model automatically using the value in the **Display name** field, and then opens a new Software Counter form. In the Discovery Model list view, you can select multiple records and choose this option from the **Actions** choice list.
5. Complete the form.

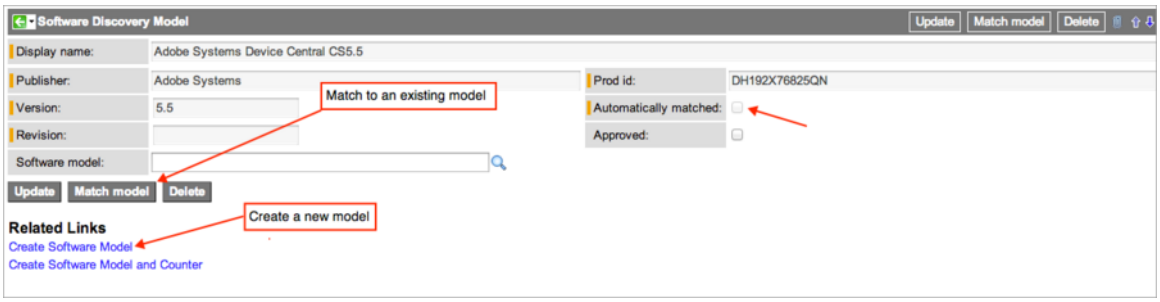
Model fields

Field	Description
Display name	[Read-only] Name of the discovery model as it appears in record lists.
Publisher	[Read-only] Publisher of the software.
Version	[Read-only] Specific version of the software.
Revision	[Read-only] Revision number of the software.
Software model	Software product model to which the discovery model maps. Click the reference lookup icon and use the lookup list to find the software model to associate with this software discovery model.
Prod id	[Read-only] Product ID code for the software, as reported through the discovery process.
Automatically matched	[Read-only] Check box that indicates whether the discovery tool used the **Display Name**, **Publisher**, and **Version** fields to determine the **Software model**.
Approved	Check box that indicates whether the mapping to software model has been reviewed and approved.
Low confidence	[Read-only] Check box that indicates whether the automatically matched software model is not a close match. If selected, and if after reviewing the item it is determined that it's the correct software model, click **Confirm Mapping** to match the discovery model to the software model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Approved**.

SAM match model



7. Click **Submit**.

Legacy Software License Compliance Checker

The Software License Compliance Checker that is included in the legacy Software Asset Management (com.snc.software_asset_management) plugin is a fast way to see if the software licenses used in your organization are compliant based on number of rights purchased and number of installations.

For example, if there are 100 licenses for a software program, the legacy Software License Compliance Checker can show if the software has been installed more than 100 times. The legacy Software Compliance Checker uses information found by a discovery tool such as Discovery or third-party technologies, to analyze the software installed on your network.

Check your software license compliance using the legacy Software License Compliance Checker

You can check your software license compliance using the Software License Compliance Checker that is included in the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **System** > **Check License Compliance**.
2. Click **Proceed**.
   Your organization's network is analyzed for name, software model, rights, installs, license type, and active status.
3. View the results.
   The Software Counters list is color coded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Green - in compliance
- Orange - within 5% of being out of compliance
- Red - not compliant

Software license reconciliation counters for the legacy Software Asset Management plugin

Software counters for the legacy Software Asset Management (com.snc.software_asset_management) plugin reconcile software rights with software installations to verify compliance.

For asset managers, software counters answer the question: Is my number of installations equal to or lower than the number of rights purchased? Counters are useful for software that must be tracked; some software may not need to be tracked closely. Grouping—such as location, company, department, cost center, entitlement workstation and entitlement user—or no grouping can be used with software counters.

In addition to software counters, the legacy Software Asset Management (com.snc.software_asset_management) plugin offers usage counters that track a license based on use by a workstation or user.

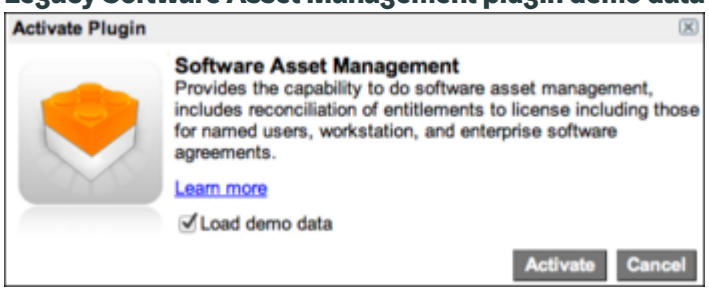
The software counter cache is used to increase the speed of counting software licenses. If there is a large number of software license records, the first time software is counted takes several minutes. After the first count, only changes are processed so the procedure is faster.

Get started with software counters for the legacy Software Asset Management plugin

A good way to see how software counters work is to use the demo data provided with the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Load the demo data on a non-production instance.

Legacy Software Asset Management plugin demo data



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the demo data, try some of the procedures on this page, such as Use the Software Counter and View a Usage Counter Result.

To use software counters with your own information, follow the steps in the Legacy Software Asset Management plugin setup process. ServiceNow Discovery does not populate the Software Usage (*cmdb_sam_sw_usage*) table. Use a third party tool such as Microsoft's System Center Configuration Manager to add information about software assets to the Software Usage table.

Schedule a software count for the legacy Software Asset Management plugin

How to schedule a software count for the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: sam

About this task

The SAM License Counters scheduled job scans your instance for software installations. The SAM License Counters job occurs at 2:00am local time every morning. The job queries the Software Installation [cmdb_sam_sw_install] table and captures any installations that have not been scanned in the past 7 days. The job runs a join query on hardware that has been scanned within the last day and software installations that have not been scanned in the last 7 days.

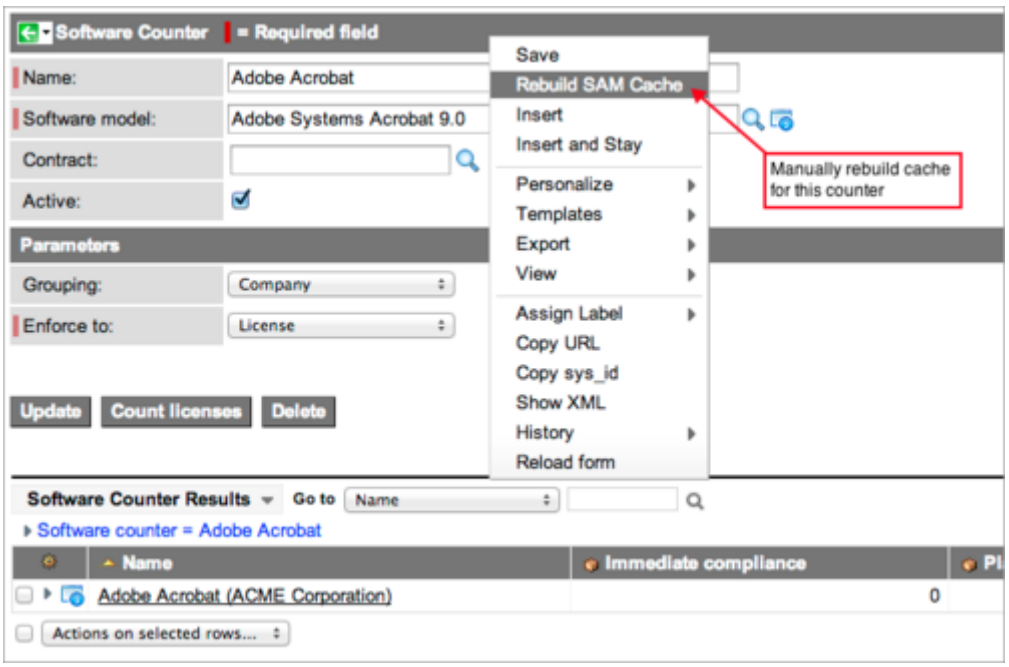
The SAM License Counters scheduled job runs all software counters at once.

To refresh the cache manually for a specific counter:

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Software Counters**.
2. Select a counter whose cache you want to refresh.
3. Right-click in the header bar of the Software Counter record and select **Rebuild SAM Cache** from the context menu.

SAM rebuild cache



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use a software counter for the legacy Software Asset Management plugin

Use a software counter for the legacy Software Asset Management (com.snc.software_asset_management) plugin to count the licenses for a specific version of software and receive summary or detailed results.

When a software counter runs for the first time, it can take several minutes to process records. The license counts are cached so that on subsequent runs, the counter processes only changed records, both those from Discovery or altered entitlements, making it faster. The Software Counter form contains check boxes to enable faster counting through the use of quick counters. For more information on using quick counters, see Setting Up Quick Counters.

Use a software counter to count the licenses for a specific version of software and receive summary or detailed results. For example, an asset manager can look at summary information to discover which departments are not in compliance. Then, department managers can look at detailed information to determine the people or individual computers that are not in compliance.

Software counters return results by *Licensing Type*:

- *Entitled in use*: Number of people who have been allocated a license and installed the software.
- *Entitled not in use*: Number of people who have been allocated a license but did not install the software.
- *Not entitled*: Number of people using an unauthorized copy of the software.
- *Not allocated*: Number of licenses not assigned.

Note:
For information about the scheduled job that runs all counters each day or the steps to run all counters manually, see Scheduling Software Counts.

The Software Counters list is color coded:

- Green - in compliance
- Orange - within 5% of being out of compliance
- Red - not compliant

Before you begin
Role required: sam

About this task
Depending on the license type you select for a counter, multiple installations can count as a single license, such as when using the per user license type. This licensing concept is used on occasion by companies like Microsoft and Adobe. It grants users the right to install software on multiple machines if those users already have rights to install the software.

Note:
You can create new counters from Discovery model records or from the list view.

To manage multiple versions of software from a single licensing perspective for the parent software model:

- The downgrade child software models that are licensed under the parent software model should all be related to a the single parent software model.
- The downgrade child software models should not have any software counters associated with them.
- The software counter should be associated only with the licensed parent software model, otherwise misleading results for the counter will be reported

To create a software counter:

Procedure
1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Software Counters**.
2. Click **New**.
3. Fill in the fields on the Software Counter form (see table).
4. Click **Submit**.
5. Reopen the new counter and click **Count Licenses**.
6. Reload the form to view the counter results.

Software counter form

Field	Description
Name	[Required] Enter the name of the software counter as it appears in record lists.
Software model	[Required] Click the reference lookup icon and select the software model for which the counter will check compliance.
Contract	Select the contract that you want to use to limit the license. Used for enterprise and subscription-based licenses. Also restricts how counters retrieve licenses for the given counter. If left empty, all licenses for the model are counted.
Active	Select the check box to have the scheduler run the counter.
Rights Owned	[Read-Only] Displays a summation if a contract is specified. The total sum is the license rights provided by all the licenses for the software model (of the counter) under the specified contract. If no contract is specified, this field is a count of all licenses of this model.
Rights Used	[Read-Only] Displays the number of rights used by all installs, whether a contract is specified or not.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Immediate compliance	[Read-Only] Displays the number of additional rights needed to achieve compliance based on installations.
Parameters	
Grouping	Select the field for grouping data: ○ Location: group by the geographic location set in the license record. ○ Company: group by the company set in the license record. ○ Department: group by the department set in the license record. ○ Cost Center: group by the cost center set in the license record. ○ Entitlement (CPU): group by the condition defined in the Allocated condition field of the license record. ○ Entitlement (User): group by the condition defined in the Assigned condition field of the license record. The software counter results also displays counts for licenses that do not match the grouping parameter.
Enforce to	[Required] Select the level of adherence to the license: ○ License: counts all existing entitlements for the installations or usage you are analyzing regardless of the grouping parameter selected. ○ Strict: counts the license and entitlement as valid only if the license also matches the grouping category. For example, a license is assigned to a specific location, such as Americas. With strict enforcement enabled, the user and the machine on which the license is installed must be in the Americas group. If the person and their license assigned to the Americas group moves to the United Kingdom, the license is still valid, but strict enforcement flags the user as unauthorized to use that license. The license will be counted as valid, but will also show up as not entitled in the summary.
Verify entitlements	Select the check box to view the software entitlement details for the software counter. Results include the number of installations of all types: not entitled, entitled in use, entitled not in use, and not allocated. For more information, see Setting Up Quick Counters.
Generate details	Select the check box to generate the details of the entitlement records. For more information, see Setting Up Quick Counters.
License type	[Required] Select the method for counting licenses. For example, Per named user or Per workstation. For more information, see License Calculation Types.
Installs per license	Enter the number of installations allowed (one or more) per license for each user if the License type is set to By number of users. You can allow more than two installations per license. For all other license types this field is set to 1 install per license.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Cached	[Read-Only] Shows whether this option is selected. If selected, only changed information is counted, reducing the amount of time it takes to count the licenses.
License condition	Specify the condition a license should satisfy in order to be counted.
Software install condition	Specify the condition an install record should satisfy in order to be counted. This field appears depending on the value of the License type field.
Software usage condition	Specify the condition a usage record should satisfy in order to be counted. This field appears depending on the value of the License type field.
Related Lists	
Software Counter Results	Displays all results for this software counter.
Software Counter Compliance Violations	Displays all records of compliance violations for this software counter.
Software Counter Histories	Displays all software counter history records for this software counter. Each time a count is completed, the system automatically generates a software counter history record, which is a read-only copy of the software counter record.

Note:
A message is displayed at top of the software counter form indicating if a license count is in progress. Reload the form to view the counter results.

Set up quick counters for the legacy Software Asset Management plugin

Quick counter settings can help speed up the software counting process that is used by the legacy Software Asset Management (com.snc.software_asset_management) plugin.

The following check boxes are available in the Parameters section of the Software Counter form:

- *Verify entitlements*: When this check box is selected, the software counter will generate entitlement details in the software counter summaries, displaying the number of entitlements in use and entitlements not in use. If the check box is cleared, the software counter will display *Entitlement not known* with a count of total installs. The counter will not check for entitlements.
- *Generate details*: When this check box is selected, the software counter will generate software counter detailsfor each software counter result type. If the check box is cleared, no details will be available.

Clearing these check boxes in addition to setting the *Grouping* parameter to *None* will enable software counters to run more quickly.

View software counter results for the legacy Software Asset Management plugin

Software counter results provide detailed information about each grouping that is formed through the legacy Software Asset Management (com.snc.software_asset_management) plugin.

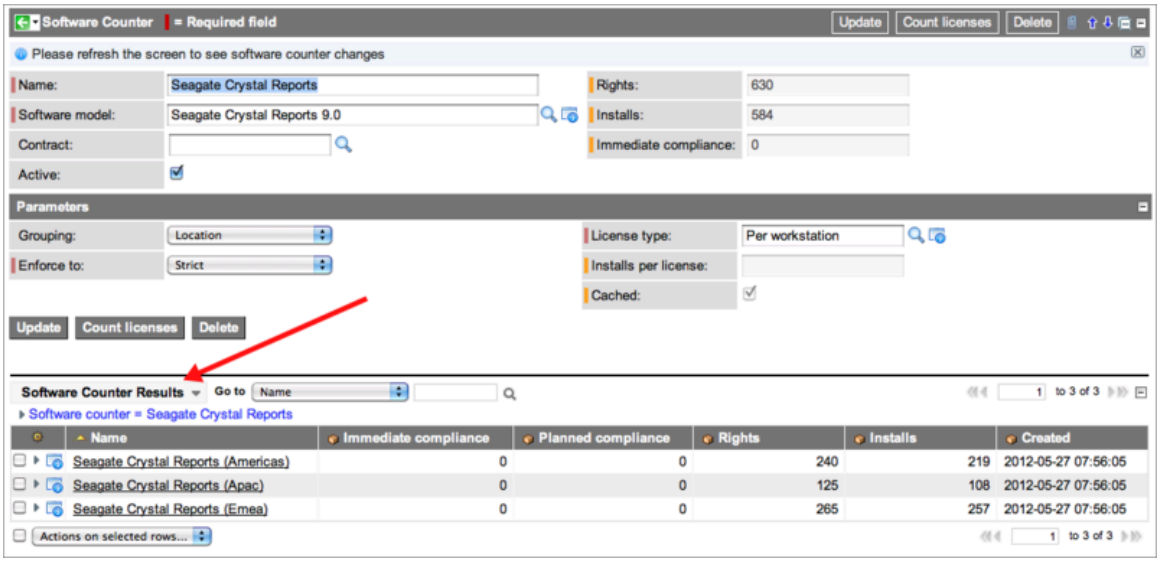
Before you begin

Role required: sam

Procedure

1. On the Software Counter form, click a name in the **Software Counter Results** related list.

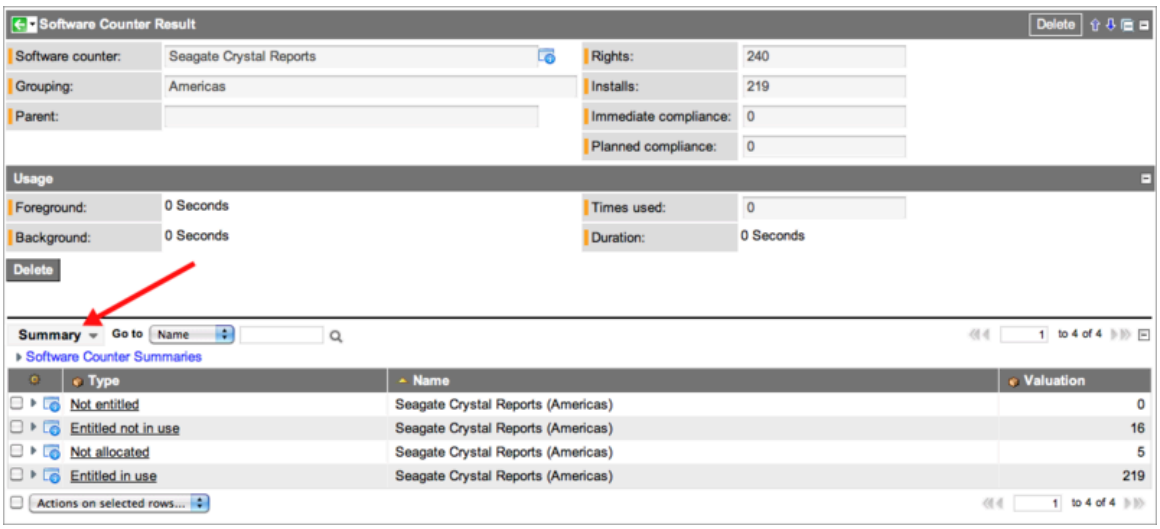
SAM software counter results 2



2. View the Software Counter Result form (see table).

   All fields on the form are read-only.

SAM software counter results 3



Software counter result form

Field	Description
Software counter	Name of the software counter whose results are displayed.
Grouping	Grouping this software belongs to.
Parent	Name of the parent software, if one exists, assigned to this software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Rights	Number of rights available in the group.
Installs	Number of rights used by installations of the software in the group.
Immediate compliance	Number of additional rights needed for the group to achieve compliance based on installations.
Planned compliance	Number of additional rights needed for the group to achieve compliance based on installations and number of unused entitlements available.
Usage Section	
Foreground	Total duration of foreground usage of the software, based on all the installations for the group.
Background	Total duration of background usage of the software, based on all the installations for the group.
Times used	Total number of times the software was used, based on software usage records for the group.
Duration	Total duration of software usage, based on software usage records for the group. (Not the sum of Foreground and Background.)
Related List	
Summary	Breakdown of software counter results bytype. Click a type to view a detailed summary.

View software counter summaries for the legacy Software Asset Management plugin

Software counter summaries provide information about each software counter type that is supported by the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

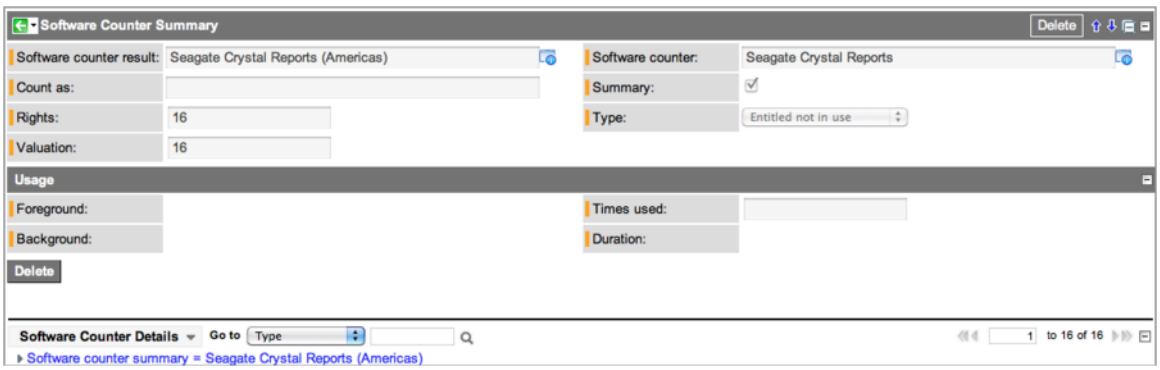
Role required: sam

Procedure

1. On the Software Counter Result form, click a type in the **Summary** related list.
2. View the Software Counter Summary form (see table).

   All fields on the form are read-only.

SAM software counter results



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software counter summary

Field	Description
Software counter result	Name of the software counter result for which the summary is displayed.
Count as	The software model being counted.
Rights	Number of rights that have been used.
Valuation	How software is counted during the reconciliation process.
Software counter	Name of the software counter.
Summary	Check box that indicates whether the form displays summary information (selected) or detailed information (cleared).
Type	Type of license counted.
Usage Section	
Foreground	Total duration of foreground usage of the software, based on all the installations for the grouping.
Background	Total duration of background usage of the software, based on all the installations for the grouping.
Times used	Total number of times the software was used, based on software usage records for the grouping.
Duration	Total duration of software usage, based on software usage records for the group. (Not the sum of Foreground and Background.)
Related List	
Software Counter Details	Shows every entitlement, software install, and software usage for the software. The related list also shows the Workstation and User, if applicable, for each software counter detail. A software asset manager can, for example, identify people who are using the license but are not entitled. The software can then be uninstalled from machines that are not in compliance or people can be entitled a license to meet compliance rules. Click a type to view the software counter detail.

View software counter details for the legacy Software Asset Management plugin

Software counter details provide information about a specific software counter summary for the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: sam

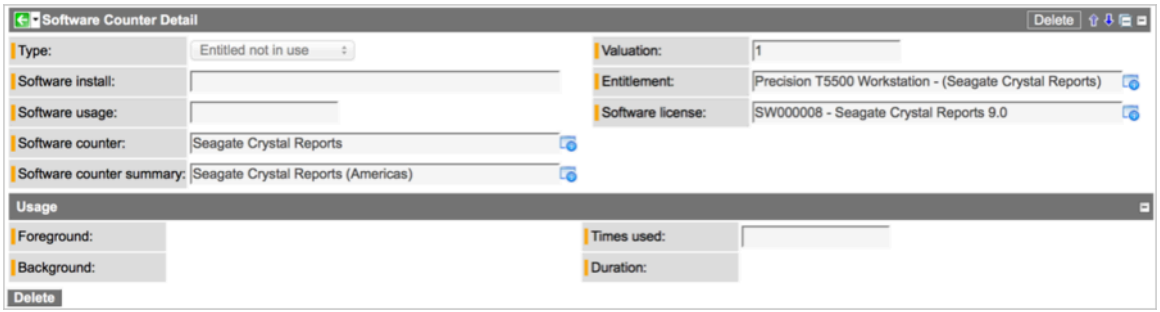
Procedure

1. On the Software Counter Summary form, click a type in the **Software Counter Details** related list.
2. View the Software Counter Detail form (see table).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All fields on the form are read-only.

Software counter detail form



Software counter detail

Field	Description
Type	Type of the counter detail.
Software install	Name of the related software install record, if applicable. This field is blank if the type is Entitled not in use or Not allocated.
Software usage	Name of the related software usage record, if applicable.
Software counter	Name of the related software counter.
Software counter summary	Name of the related software counter summary.
Valuation	A valuation of 1 indicates that the license right is being used. A valuation of 0 indicates that the license right is part of a software suite, or that the license allows more than one installation per right. The 0 indicates that this installation does not count against the license.
Entitlement	Name of the related software license entitlement, if applicable. This field is blank if the type is Not entitled or Not allocated.
Software license	Name of the related software license, if applicable. This field is blank if the type is Not entitled.
Usage Section	
Foreground	Total duration of foreground usage of the software, based on the related software install record.
Background	Total duration of background usage of the software, based on the related software install record.
Times used	Total number of times the software was used, based on the related software usage record.
Duration	Total duration of foreground and background software usage, based the related software usage record.

View usage counter results for the legacy Software Asset Management plugin

Usage counters for the legacy Software Asset Management (com.snc.software_asset_management) plugin track licenses based on how often those licenses are actually used either by a workstation or a user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

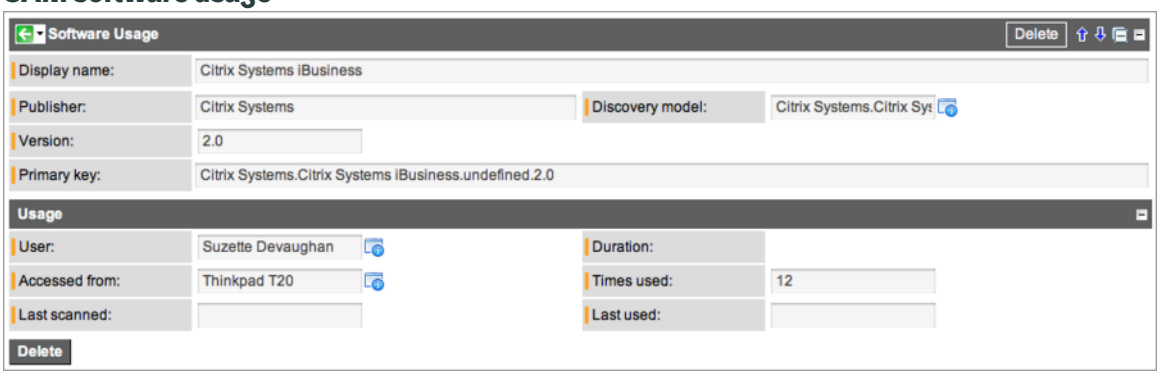
Before you begin
Role required: sam

About this task
A usage counter tracks a license based on how often the license is actually used either by a workstation or a user. For example, an asset manager can use a usage counter to determine who is actually using the software they have been entitled. If an individual is not using the software at all or very infrequently, the software can be uninstalled and given to an individual who will use it more often. If you have a way of capturing information, for example a proxy server or gateway, you can capture the IP address and the name of the user accessing the license. The captured data can be added directly into the Software Usages list.

Procedure
1. Navigate to **All** > **Software Asset** > **Discovery** > **Software Usages**.
2. Click the **Display Name** in the row containing the software and user to check.
3. View the **Software Usage** form (see table).

All fields on the form are read-only.

SAM software usage



Software usage form

Field	Description
Display name	Name of the software usage record.
Publisher	Publisher of the software.
Version	Version of the software.
Discovery model	Software discovery model associated with the installed software.
Primary key	Unique identifier for table row.
Usage	
User	User who accessed the software.
Accessed from	Hardware configuration item from which the software was accessed.
Last scanned	Date and time when the software was last discovered on this hardware.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Duration	Duration of all usage.
Times used	Number of times the software was accessed from this hardware.
Last used	Date and time when the software was last used on this hardware.
Software counter	
Counted by	The software counter summary record in the Software Counter Summary [sam_sw_counter_summary] table on which this usage is counted.
Entitlement	The entitlement rights of the software.
Valuation	Number of license rights used by this software usage.
Cached	If selected, indicates that a software count has already been cached.

Legacy IBM PVU Process Pack

Processor Value Unit (PVU) is a unit of measurement defined by IBM to determine software licensing costs based on processor or server model.

A processor is defined as each core on a socket. Each software package has a price defined as number of points or PVUs per core. For a complete explanation of IBM PVU licensing for distributed software, see Processor Value Unit [PVU] licensing for Distributed Software on the IBM website.

In the ServiceNow AI Platform, the concept of PVU is used by the legacy IBM PVU Process Pack, which is an add-on to the legacy Software Asset Management (com.snc.software_asset_management) plugin. This legacy process pack provides the ability to manage software licensed under the IBM Processor Value Units licensing model.

Important:
The legacy IBM PVU Process Pack is not required for tracking and managing IBM PVU licenses through the Software Asset Management publisher pack for IBM, which is available as part of the Software Asset Management Professional (com.snc.samp) plugin. The IBM publisher pack includes all capabilities that are required for tracking and managing both full capacity and sub-capacity PVU and RVU licenses for your IBM products. See Software Asset Management publisher pack for IBM for more information on the IBM publisher pack.

The legacy Software Asset Management (com.snc.software_asset_management) plugin Processor Definition Extension is automatically activated when the legacy IBM PVU Process Pack is activated. It provides data model support for processor definitions and is required by all legacy Software Asset Management (com.snc.software_asset_management) plugin process packs.

Note:
Oracle and Microsoft also use the concept of PVU, but have slightly different definitions.

Activate the legacy IBM PVU Process Pack

The legacy Software Asset Management - IBM PVU Process Pack (com.snc.sam.ibmpvu.pp) plugin can no longer be activated upon request. If the legacy plugin has already been activated on your ServiceNow instance, you can continue to use the legacy IBM PVU Process Pack.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, click **Request Plugin** to open the Request form on HI.
3. On Now Support, click the **Take me to the Hi Service Portal Active a Plugin Service Catalog** link to access the Now Support Service Portal Service Catalog.
4. On the form, fill in the fields.

Activate Plugin Request form

Field	Description
Target Instance	Instance on which to activate the plugin.
Plugin Name	Name of the plugin to activate.
Specify the date and time you would like this plugin to be enabled	The date and time must be at least two business days from the current time. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.
Reason/Comments	Information that would be helpful for the ServiceNow personnel who are activating the plugin. For example, if you need the plugin activated at a specific time instead of during one of the default activation windows, specify that in the comments.

5. Click **Submit**.

Validate legacy IBM PVU Process Pack requirements for associating software installations with PVU mappings

Meet the recommended requirements to ensure that you receive the highest quality results with PVU mapping.

Before you begin

Role required: admin

Procedure

1. Use a discovery tool, such as ServiceNow Discovery, to identify hardware and populate the configuration management database (CMDB) with the configuration items you want to manage with IBM PVU licensing.
2. Use a discovery tool, such as ServiceNow Discovery, to identify software installations. Check that the added CPU information is correct.
3. Activate the Software Asset Management plugin - IBM PVU Process Pack plugin. This also activates the Software Asset Management plugin if it is not already active.
4. Refresh processor definitions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Ensure that the software models you want to manage with IBM PVU licensing have the correct license type: **Per installation - IBM PVU**.
6. Create software counters to calculate IBM PVU licenses.
7. Count licenses to determine compliance with IBM PVU guidelines.

IBM PVU mapping preparation for the legacy IBM PVU Process Pack

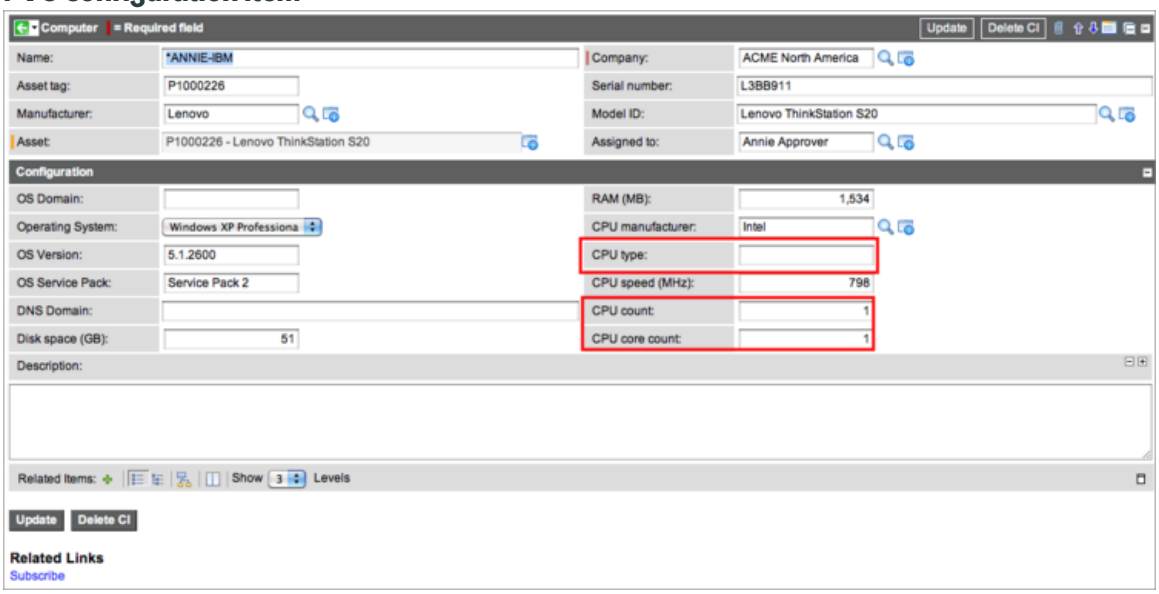
Most IBM PVU mapping and license checking for the legacy IBM PVU Process Pack is managed automatically.

For the automatic calculations to be as accurate as possible, it is important that configuration item and software model information be accurate.

The important fields describing the processor on the configuration item form are:

- CPU type
- CPU count
- CPU core count

PVU configuration item



This CPU data is often added accurately when the CMDB is populated with information. If the fields contain incorrect information, manually edit the fields on the configuration item form.

The mapping between the configuration item form fields and processor definition fields is as follows.

Preparing for IBM PVU mapping

Configuration Item Form Field	Processor Definition Form Field	Definition
CPU type	Processor name, Server model number,	Combination of processor name, server model number, and processor model number. The *CPU type* field is created as part of the general process described in Populating the CMDB. Some discovery tools fill in the *CPU name* instead of *CPU type*. If the *CPU type* field is empty, the CPU name field is used for mapping instead. (You can

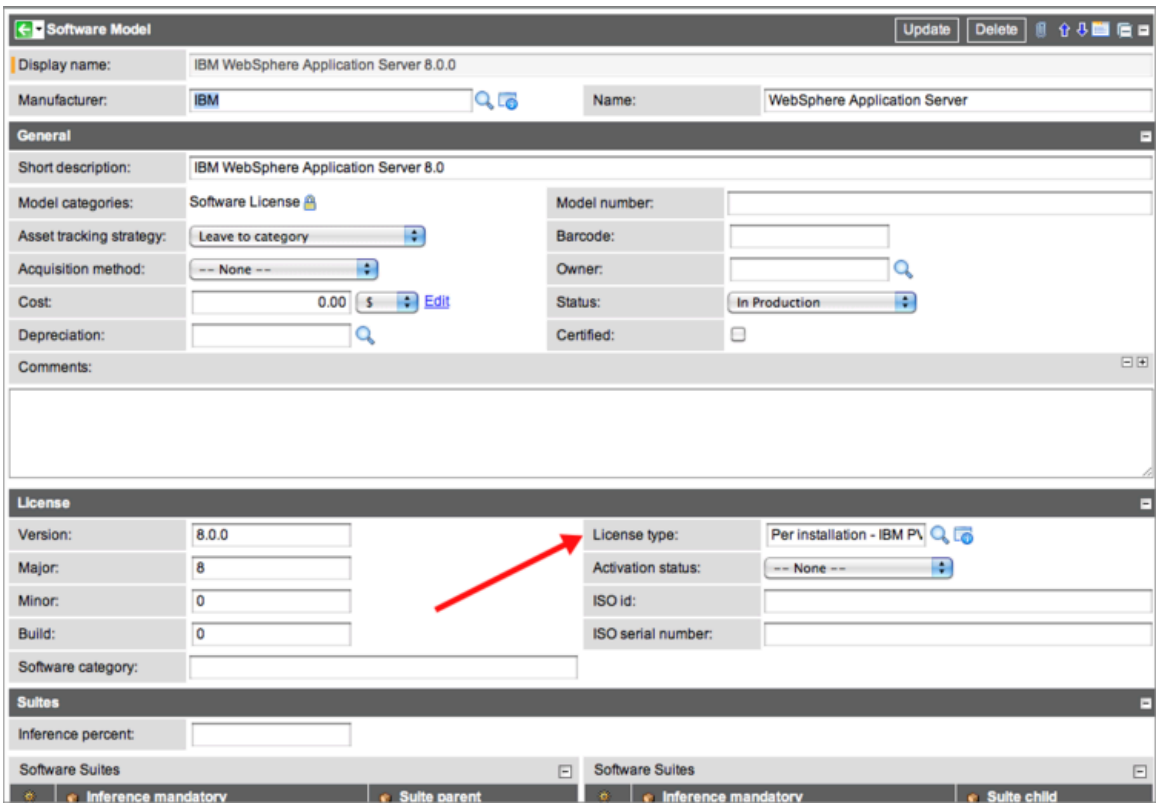
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Preparing for IBM PVU mapping (continued)

Configuration Item Form Field	Processor Definition Form Field	Definition
	and Processor model number	configure the form to display the *CPU name*, if needed.) If the CPU type field and the CPU name field are both empty, no mapping is done.
CPU count	Number of sockets	Number of sockets.
CPU core count	Cores per socket	Cores per socket

The key field on the Software Model form is **License type**. For any software licenses you want to track with IBM PVU, open the corresponding software model form and select the **Per installation - IBM PVU** license type.

PVU software model



Refresh your legacy Software Asset Management plugin processor definitions

After activating the legacy IBM PVU Process Pack, use the Refresh Processor Definitions module in the legacy Software Asset Management (com.snc.software_asset_management) plugin to create process definitions for existing computers in the Computer [cmdb_ci_computer] table.

Before you begin

Role required: sam

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

After this step, business rules in SAM update the Processor Definition [CMDB_processor_definition] table automatically when changes are made to computers or when new computers are added. You should not need to use the Refresh Processor Definitions module a second time, but it is always available if you make significant changes to the Computer [cmdb_ci_computer] table.

Procedure

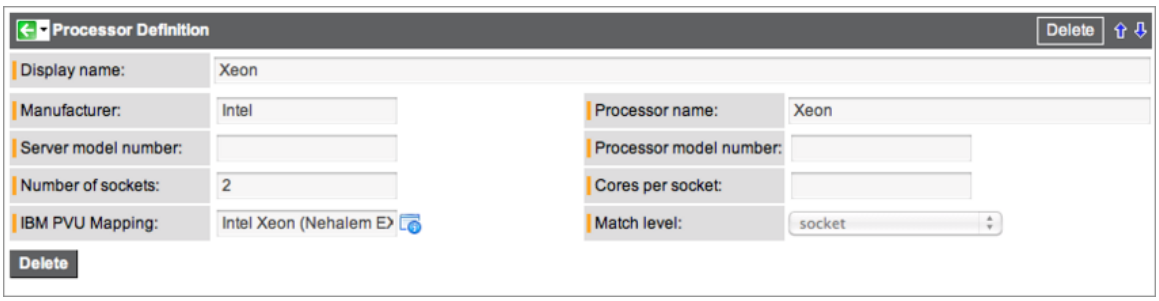
1. Navigate to **All** > **Software Asset** > **System** > **Refresh Processor Definitions**.
2. Click **Proceed**.

Legacy Software Asset Management plugin processor definitions

Processor definitions for the legacy Software Asset Management (com.snc.software_asset_management) plugin are automatically derived from the information in the configuration item form for an item such as a computer or server.

To view a processor definition, navigate to **Software Asset** > **Reconciliation** > **Processor Definitions** and click an item.

Processor definition



The following read-only fields are listed.

Processor definitions

Field	Description
Display name	Name of the processor as it should appear in the processor list.
Manufacturer	Company that built the processor.
Server model number	Number assigned to the model by the server manufacturer.
Number of sockets	Number of dies on the computer motherboard. The number of CPUs per die is specified by **Cores per socket**.
IBM PVU Mapping	The IBM PVU mapping to which this processor is associated. The information in this field is automatically calculated from the server model number, number of sockets, processor name, and processor model number, based on the rules defined in the IBM PVU Table.
Processor name	Name assigned to the processor by the manufacturer.
Processor model number	Number assigned to the model by the processor manufacturer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Processor definitions (continued)

Field	Description
Cores per socket	Number of cores (functional unit needed to execute programs) on each physical connection (socket) on the motherboard.
Match level	Accuracy level of the association between processor and PVU mapping. Automatically set when association is inferred.

View IBM PVU mappings for the legacy IBM PVU Process Pack

Every rule listed in the IBM PVU Table is represented by one PVU mapping record in the legacy Software Asset Management (com.snc.software_asset_management) plugin.

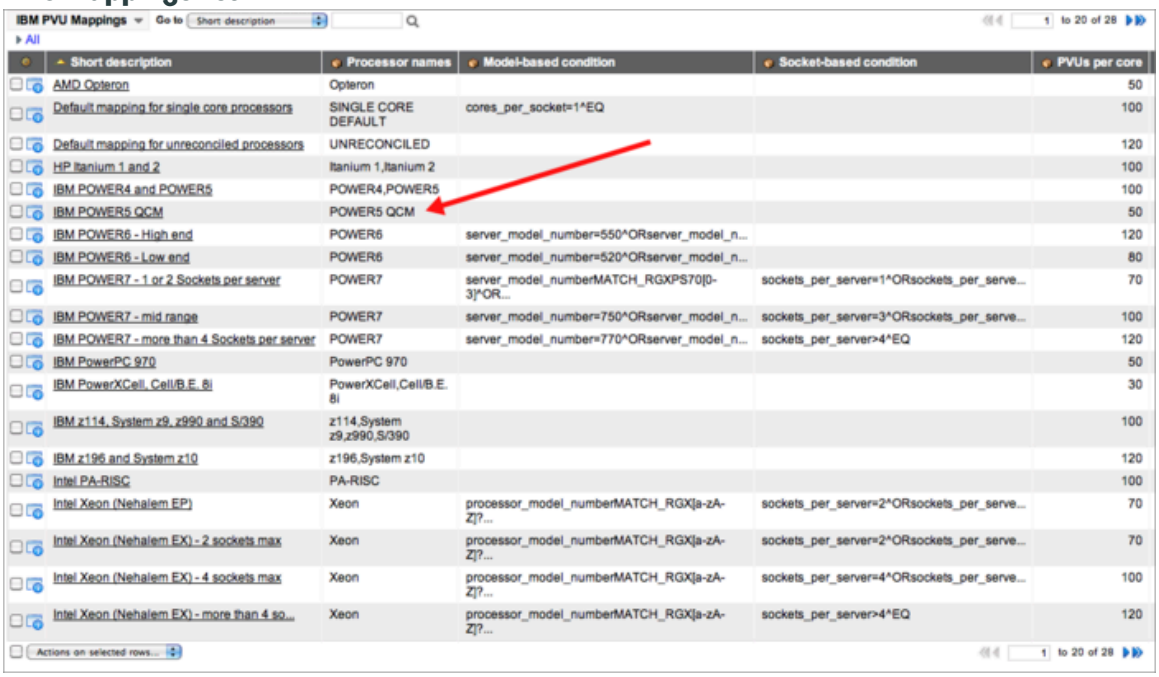
Before you begin

Role required: sam

About this task

For example, in the IBM PVU Table there is one line with processor name POWER5 QCM and in IBM PVU mappings there is a line representing POWER5 QCM.

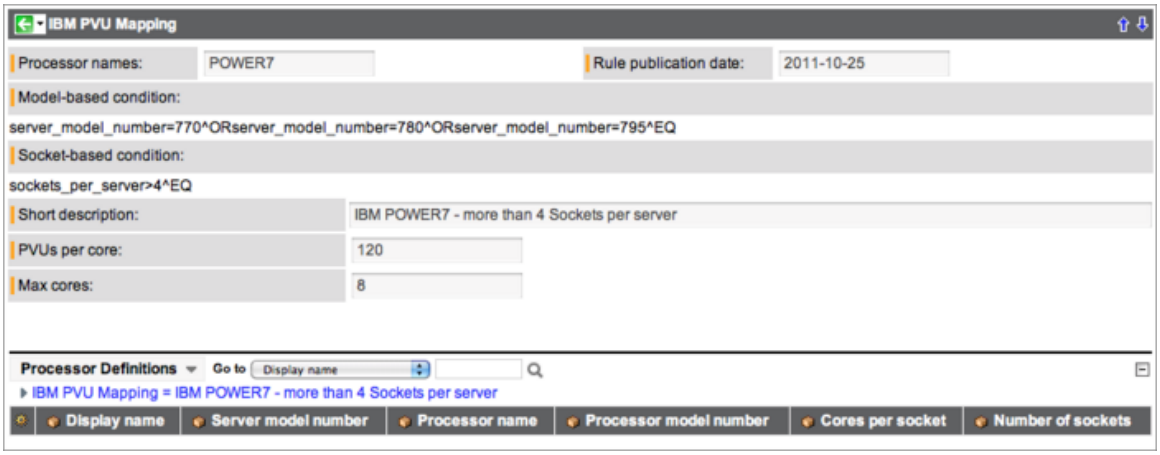
PVU mappings list



Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **IBM PVU Mappings**.
2. Click a **Short Description** for detailed information about the mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The fields are for information only and cannot be edited.

IBM PVU mappings

Field	Description
Processor names	Names of running processors. Processor names are separated by commas.
Model-based condition	Regular expression used to determine whether the server model number of a computer's processor definition matches that of the PVU entry.
Socket-based condition	Regular expression used to determine whether the number of sockets of a computer's processor definition matches that of the PVU entry.
Short description	A short description of this PVU mapping.
PVUs per core	Number of processor value units consumed (according to the IBM PVU chart) by each core.
Max cores	Maximum number of cores on the processor family, as shown in the IBM PVU Table (rightmost column under cores per socket).
Rule publication date	Date published by IBM on the PVU Rules table.

Use software counters with the legacy IBM PVU Process Pack

To calculate IBM PVU licenses through the legacy IBM PVU Process Pack, you can create a software counter with the IBM PVU license type. For a given PVU software package, you only need to create the counter once and then it can be reused.

Before you begin

Role required: sam

About this task

Processor definitions are searched as licenses are counted. If a processor definition is found, but no PVU mapping link exists for the processor, the system automatically does the following to obtain a PVU mapping link.

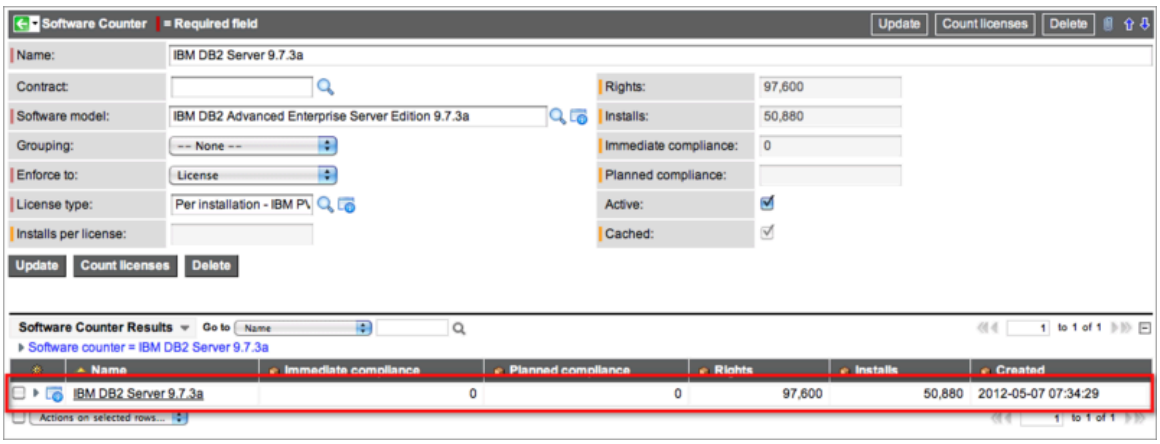
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Pre-filtering based on processor name.
- Advanced filtering based on PVU mapping records' condition field.
- If no exact match is found, the most expensive mapping is used to increase the chance of being compliant.

Procedure

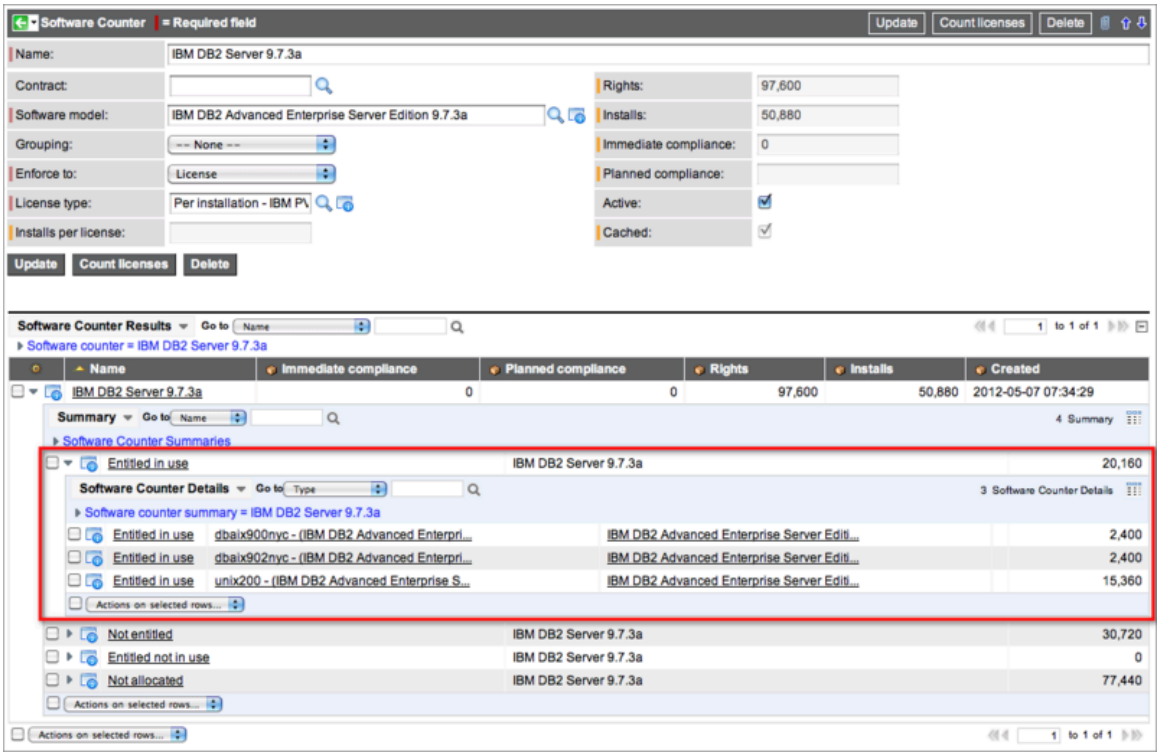
1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Software Counters**.
2. Click **New**.
3. Enter a **Name**.
4. Select a **Software Model**.
5. Select a level of adherence to the license in the **Enforce to** field.
6. For **License type**, select **Per Installation - IBM PVU**.

7. Add information to other fields as necessary.
8. Right-click the header bar and select **Save**.
9. Click **Count licenses**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. In the **Software Counter Results** list, drill down to obtain summary and detailed information.



Installed with the legacy IBM PVU Process Pack

The following tables, fields, script includes, and business rules are installed with the legacy IBM PVU process pack.

Tables

Table	Description
Processor Definition [cmdb_processor_definition]	Each row in this table describes a computer in terms of the attributes IBM uses for its PVU licensing model. A row can be associated with one or more (if they are all identical in terms of the attributes used for PVU licensing) discovered computers.

Fields

Field	Table	Description
ibm_pvu_mapping	Hardware [cmdb_ci_hardware]	PVU rule that applies to the software installation. Used for IBM PVU-based license counting.
ibm_pvu_mapping	Software Installation [cmdb_sam_sw_install]	PVU rule that applies to the software installation. Used for IBM PVU-based license counting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes

Name	Description
ProcessorDefinitionsUtils	Contains utilities for managing the Processor Definition [cmdb_processor_definition] table.
ProcessorValueUnitsUtils	Contains logic that determines the IBM PVU pricing associated with a given processor.

Business rules

Name	Description
One and only one default mapping `[sam_ibm_pvu_mapping]`	Ensures only one default mapping by resetting the last resort flag for modified records and setting it to false for new records.

Software contracts for the legacy Software Asset Management plugin

A software contract is a binding agreement between the owner of a software product and a buyer. The contract enables the buyer to use the software legally.

You can use the Contract Management application to create contracts for software that is tracked and managed through the legacy Software Asset Management (com.snc.software_asset_management) plugin. When you create a new software contract, you can specify that the contract is an enterprise or subscription license.

Create software contracts for the legacy Software Asset Management plugin

You can create binding agreements that enable buyers to legally use software that is tracked and managed through the legacy Software Asset Management (com.snc.software_asset_management) plugin.

Before you begin

Role required: contract_manager

Procedure

1. Navigate to **All** > **Contract** > **Software License**.
2. Click **New**.
3. Complete the form.
4. Add the software license to the contract.
   Be sure to use the **Software License** option. The **License Bundle** and **Software License Contracts** options are deprecated.

Contract Management

Legacy Oracle process pack

The legacy Oracle process pack is an add-on to the legacy Software Asset Management (com.snc.software_asset_management) plugin that provides the ability to manage software licensed under the Oracle licensing model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The legacy Oracle Process Pack is not required for tracking and managing Oracle licenses through the Software Asset Management publisher pack for Oracle, which is available as part of the Software Asset Management Professional (com.snc.samp) plugin. The Oracle publisher pack includes all capabilities that are required for tracking and managing Oracle licenses. See Software Asset Management publisher pack for Oracle for more information on the Oracle publisher pack.

Administrators can use this feature to perform the following functions.

- Identify the software packs installed on Oracle database servers.
- See the software packs that are currently in use.
- List which options are installed and in use.

Using software counters with the legacy Oracle Process Pack

There are two distinct ways to count Oracle software through the legacy Oracle Process Pack. Be sure that your Oracle models are set up accurately.

Note:
Oracle license calculation types are available in the Software Counter form after you activate the legacy Oracle process pack.

Oracle software that uses the **Oracle Processor** license calculation type counts by the number of processors on a server. This license calculation type must exist in the Software Installation [cmdb_sam_sw_install] table. A software installation record must be inserted with a discovery model that matches the correct Oracle software. For an install to be counted by an Oracle processor counter, the **Installed on** field on the Software Installation form should reference a configuration item with a **Metric type** of **Oracle Processor**.

Oracle software that uses the **Oracle Named User** or **Oracle Named User Plus** license calculation types count by number of unique users or number of unique users plus devices. This license calculation type must exist in the Software Usage [cmdb_sam_sw_usage] table. A software installation record must be inserted with a discovery model that matches the correct Oracle software. For a usage to be counted by an Oracle New User or Oracle New User Plus counter, the **Target host** field on the Software Usage [cmdb_sam_sw_usage] table should reference a configuration item with a **Metric type** of **Oracle NU** or **Oracle NUP**.

Software models for the legacy Oracle Process Pack

In order to count Oracle software licenses, you must create software models for your Oracle software.

For more information, see Manage software models.

Request the legacy Oracle Process Pack

The legacy Software Asset Management - Oracle Process Pack (com.snc.sam.oracle.pp) plugin can no longer be activated upon request. If the legacy plugin has already been activated on your ServiceNow instance, you can continue to use the legacy Oracle Process Pack.

Before you begin

Role required: admin

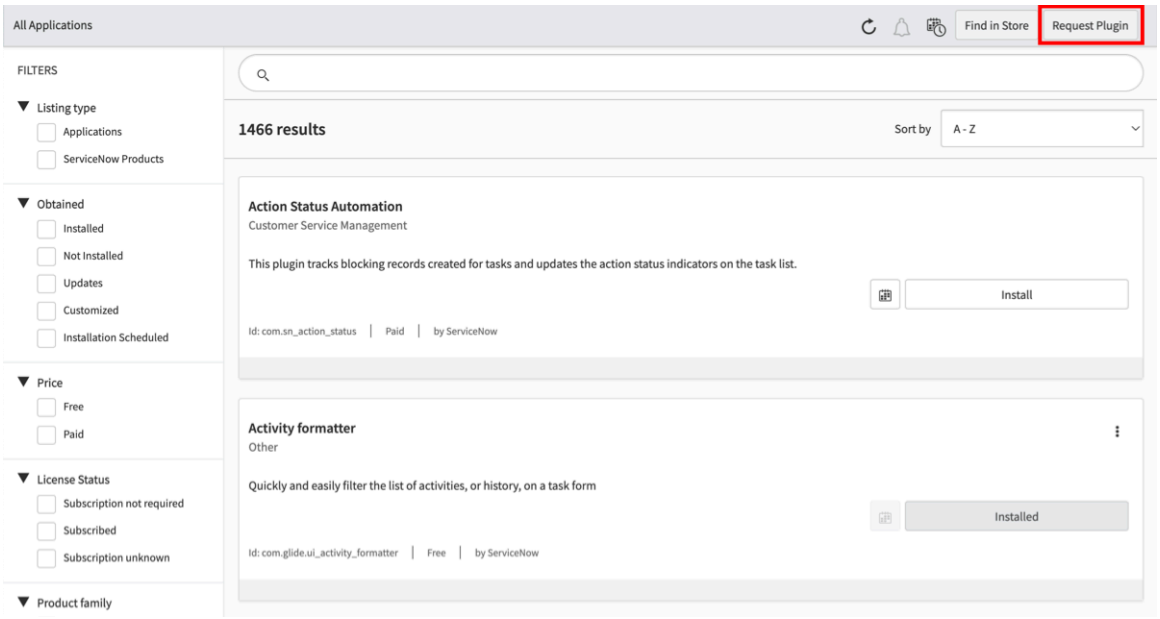
About this task

The legacy Software Asset Management (com.snc.software_asset_management) plugin activates all related plugins.

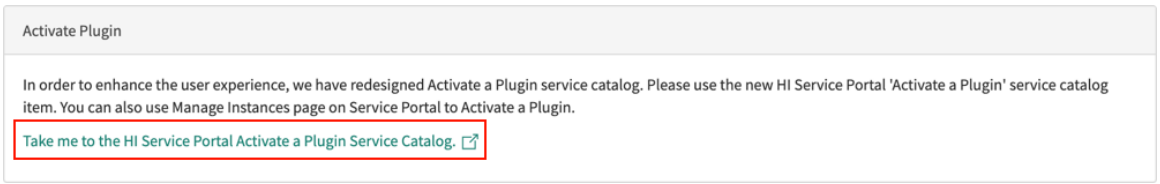
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.

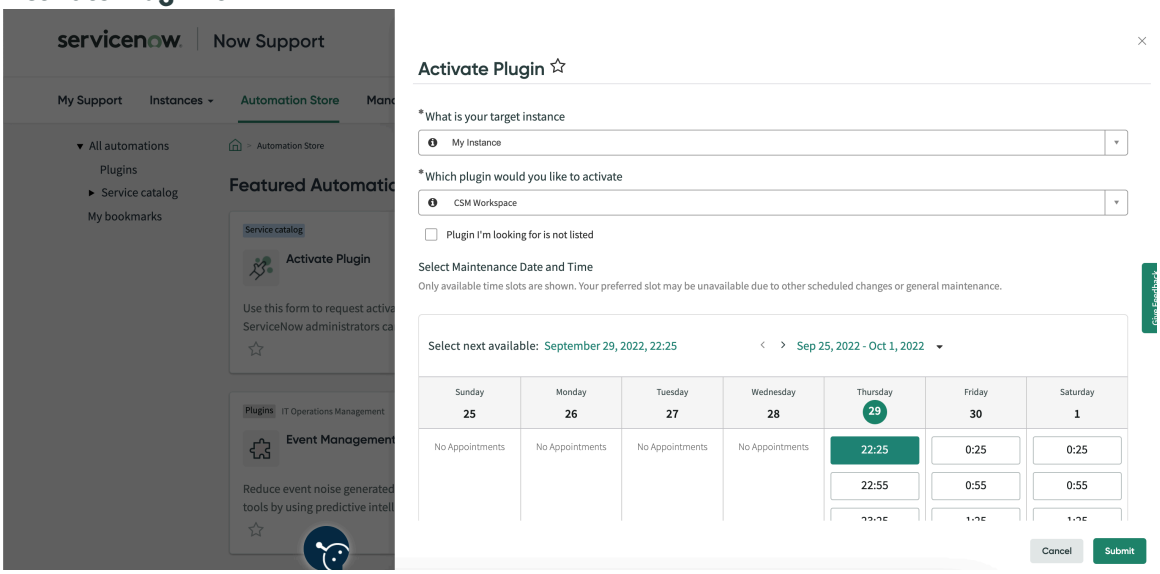
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

List of plugins (Xanadu)

Installed with the legacy Oracle Process Pack

The following tables, fields, and license calculation types are installed with the legacy Oracle process pack.

The information from this table appears in the Software Counter Compliance Violations section of the Software Model form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software counter compliance violations table

Table	Description
Software Counter Compliance Violations [sam_sw_counter_violation]	Used to store counter violations that are due to violations other than installs exceeding rights, such as: • Maximum CPU/user count exceeded (based on model limits) • Maximum or minimum rights rules not followed (based on model limits) • Option installed on a server with a non-option-supporting license (Oracle)

Fields

Field	Table	Description
Software counter [counter]	Software Counter Compliance Violations [sam_sw_counter_violation]	References the software counter that this violation belongs to. (Reference field to Software Counter table [sam_sw_counter].)
Cause [name]	Software Counter Compliance Violations [sam_sw_counter_violation]	An explanation of the violation.
Is an option (is_option)	Software Model [cmdb_software_product_model]	Indicates if the software model is an option or pack for some other software, such as Active Data Guard or Data Mining options for Oracle Enterprise Edition. This field only appears if the manufacturer is Oracle.
License metric (metric_type)	Software License [alm_license]	A glide list reference to the License Calculation [cmdb_sw_license_calculation] table. This list contains all of the license calculations that apply to this license and identifies the preferred metric types to use when running software counters.
License metric (metric_type)	Hardware [cmdb_ci_hardware]	A glide list reference to the License Calculation [cmdb_sw_license_calculation] table. This list contains all of the license calculations that apply to this license. and identifies the preferred metric types to use when running software counters. This field does not appear on the form by default.

The Oracle Process Pack adds the following license calculation types.

Oracle license calculation types

Name	Description
Oracle Named User	Oracle licensing scheme that counts by the number of unique users.
Oracle Named User Plus	Oracle licensing scheme that counts by the number of unique users and devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Oracle license calculation types (continued)

Name	Description
Oracle Processor	Oracle licensing scheme that counts by the number of processors on a server.

Create an Oracle software license for the legacy Oracle Process Pack

To use the legacy Oracle process pack, you must create an Oracle software license.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Software Licenses**.
2. Click **New**.
3. Select **Software License** in the **Model category** field.
4. Select an Oracle model in the **Model** field.

   The Oracle models in this list are created by the user. For more information, see Manage software models.
5. Ensure that the **License metric** field specifies the correct license calculation type.
6. Fill in the remaining fields, as appropriate.
7. Click **Submit**.

Validate legacy Oracle Process Pack requirements for associating software installations with Oracle mappings

Meet the recommended requirements to ensure that you receive the highest quality results with Oracle mapping.

Before you begin

Role required: admin

Procedure

1. Use a discovery tool (such as ServiceNow Discovery) to identify software installations.
   Check that the added CPU information is correct.
2. Activate the legacy Software Asset Management - Oracle Process Pack (com.snc.sam.oracle.pp) plugin.
   This also activates the legacy Software Asset Management (com.snc.software_asset_management) plugin if it is not already active.
3. Refresh processor definitions by navigating to **Software Asset** > **System** and clicking **Refresh Processor Definitions**.
4. Ensure that the software models that you want to manage with Oracle licensing are set up accurately.
   See Creating a software model.
5. Create a software license for your Oracle software.
   Ensure that the license is given the correct license metric.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **License metric** (metric_type) field on the Software License table is a reference field to the License Calculation table.

6. Create a software counter to calculate Oracle licenses with the matching license type.
7. Count licenses to determine compliance with Oracle guidelines.

Run the Oracle software counter for the legacy Oracle Process Pack

Running the Oracle software counter is a requirement to associate a software installation with an Oracle mapping.

Before you begin

Role required: sam

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Software Counters**.
2. Click the name of the counter.
3. Click **Count Licenses**.
   You can view different types of software counter results.

Software Asset Management Foundation plugin

The Software Asset Management Foundation plugin activates the ITSM Software Asset Management feature provided with the Asset Management application.

For documentation on the full fledged Software Asset Management product (also known as Software Asset Management professional), see Software Asset Management.

Software Asset Management Foundation plugin systematically tracks, evaluates, and manages software licenses and compliance. Functionality consists of these main features.

Feature area	Description
Dashboard	The Software Asset Management Foundation dashboard shows software installation results for your environment in the form of statistics and charts.
Licensing	Software models created for all installed software products are used to tie software installations (software being used) with entitlements (software owned). Entitlements define license details and are assigned to software models.
Discovery and normalization	A discovery process, such as ServiceNow Discovery or Microsoft SCCM, can be used to discover the software installed in your environment. An Out Of the Box (OOB) Normalization library contains publisher and product content. Custom products can be created if a software product does not exist in the Software Library. Discovered software can be manually normalized for reconciliation.
Reconciliation	The reconciliation process calculates the compliance status of software products with respect to discovery and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Feature area	Description
	entitlements. Remediation options are created to resolve compliance issues.

Exploring Software Asset Management Foundation plugin

Starting with the Xanadu release, we have enhanced the Software Asset Management Foundation plugin application's user interface to make it more user-friendly and intuitive, allowing you to better manage your software installations.

You can use the new Software Asset Management Foundation plugin user interface, referred to as Software Asset Workspace or continue using the classic Software Asset Management Foundation plugin framework.

The Software Asset Management Foundation plugin application's core functionality remains the same in both the user interfaces.

Using the Software Asset Workspace

Once you request and activate the Software Asset Management Foundation plugin (com.snc.sams), you need to activate the Software Asset Workspace (com.sn_sam_workspace) plugin too.

Note:
Once you activate the workspace plugin, you cannot revert to the classic Software Asset Management Foundation plugin application.

For detailed information on configuring and using the Software Asset workspace, refer to Configuring Software Asset Management Foundation plugin workspace and Using Software Asset Management Foundation plugin workspace.

Using the classic Software Asset Management Foundation plugin application

To continue using the classic Software Asset Management Foundation plugin application, just activate the Software Asset Management Foundation plugin (com.snc.sams) plugin.

If you later decide to use the Software Asset Workspace, you need to activate the Software Asset Workspace (com.sn_sam_workspace) plugin.

For detailed information on configuring and using the classic Software Asset Management Foundation plugin application, refer to Configuring Software Asset Management Foundation plugin classic and Using Software Asset Management classic.

Software Asset Management Foundation plugin roles

Software Asset Management Foundation plugin adds the following roles.

Roles

Role	Description
sam_admin	Inherits the sam_user role and has permission to run reconciliation and manage reclamation rules.
sam_user	Able to access all features except administrative.

Users with the sam_user or sam_admin role can view and refresh the overview page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software Asset Management Foundation plugin software discovery and normalization

ServiceNow Discovery is used to automatically populate the Software Installations table so the software can be manually normalized and reconciled.

The discovery process consists of automatically discovering software used at your organization, which can be done either using ServiceNow Discovery, or using SCCM integration.

For more information, see Collect software data with either SCCM or Discovery and Discovery with Software Asset Management.

Note:
To use Discovery, the Request Discovery must be activated.

Discovery uses patterns in the discovery process that can be created or customized. The base system contains a wide range of patterns that cover most industry standard network devices and applications. Software Asset Management Foundation plugin automatically leverages SQL Server, Exchange Server, and Oracle Database Server specifically, but other patterns can be customized for use by Software Asset Management Foundation plugin, if needed.

Discovered software is stored in the Software Installations [cmdb_sam_sw_install] table.

Note:
If you are already running Discovery but have not used a version of ITSM Software Asset Management previously, run the Migrate Software Asset Management Foundation plugin software installations script to copy records from the [cmdb_ci_spkg] table to the [cmdb_sam_sw_install] table, so that any previously discovered software installs are utilized by Software Asset Management Foundation plugin.

When software install records are written to the Software Installations table, a business rule verifies whether the unique combination of the discovered publisher, discovered product, and discovered version already exist in the Discovery Model table.

- If so, the reference to the discovery model is set in the Software Installations table.
- If not, a new record is created in the Discovery Model table, and that discovery model reference is set in the Software Installations table.

After discovery, you can manually normalize the software discovery model for reconciliation. Normalization status can have two different results:

Normalization status

Status	Description
Manually Normalized	A discovery model is manually normalized when key fields in the discovery model are filled in manually.
New	The software discovery model has not yet been manually normalized.

Software Asset Management Foundation plugin discovery models and software installations

Software discovery models are automatically created during discovery so you can manually normalize the software installed in your environment.

Software discovery models are stored in the Software Discovery Model [cmdb_sam_sw_discovery_model] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There is a difference between software models and software discovery models.

- A software model is a specific version or configuration of software that is purchased and/or available to users.
- A software discovery model is a model created when a version of software is discovered in a network environment.

Multiple software discovery models can be associated to one software model. For example, a software model can be defined as follows:

- Publisher = X
- Product = Y
- Version = Starts with 10

If there are two separate installs of this product (version 10.1 and version 10.2), two discovery models are created. One of the discovery models has the discovered version set to 10.1, and the other discovery model has the discovered version set to 10.2. The reconciliation process associates both of these discovery models to the same software model since they both meet the version criterion of `Starts with 10`.

Discovery Models

Software discovery models cannot be created manually. The following field combination, called the primary key, is used to match new software installations to a new or existing software discovery model.

Primary key: **Publisher**, **Display Name**, and **Version**

Note:
When analyzing version numbers, an exact match is always searched for first, but rounds down to a major version number when an exact match is not found.

For example, if no match is found for version number 8.0.4, but version 8.0 is found, then version 8.0 is used in the **Software model** field.

Discovery Models form

Field	Description
Display name	Name of the discovery model as it appears in record lists. This value is generated automatically using the discovered publisher, discovered product, and discovered version.
Normalization status	Status of the normalization process: • Manually Normalized • New
Publisher	Publisher of the software.
Product	Product name of the software.
Version	Version of the software product.
Discovered publisher	Discovered publisher of the software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery Models form (continued)

Field	Description
Discovered product	Discovered name of the software.
Discovered version	Discovered version of the software.
Additional Information	
Product type	• Child: A subcomponent of main software (not licensable). • Driver: A software product that controls a device. • Licensable: A software product that is licensable. • Not Licensable: A software product that is not licensable. • Patch: A software product designed to update, fix, or improve an existing computer program. • Unknown: Not discovered. For unknown product types, the product type can be changed to another value. When the product type is changed, the normalization status of the discovery model is updated to Manually Normalized. The reconciliation process only considers software discovery models that are licensable.
Platform	Platforms include: • Windows • Mac • Unix
Language	• Dutch • English • French • German • Italian • Spanish Additional languages are generated if discovered.
Edition	Edition of the software.
Full version	Full version of the software.

Note:
If a normalized discovery model has a missing version, edition, language, or platform value, those field values can be set by the user. Once a new value is set, the normalization status changes form New to Manually Normalized.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software Installations

The Software Installations list contains the software installed in your organization and is automatically populated by discovery.

Installed software is placed in the Software Installation [cmdb_sam_sw_install] table by Discovery, and a primary key is built (using **Publisher**, **Display Name**, and **Version** fields).

Discovery automatically matches the discovered software installation with a new or existing software discovery model using the primary key.

Software Installations form

Field	Description
Display name.	Name of the software installation as it appears in the record lists. Can be a combination of the discovered product name and edition.
Discovery model	Software discovery model that represents the installed software.
Publisher	Publisher of the software.
Version	Version of the software.
Edition Override	Override of the software edition setting. If the edition for the software was not discovered, you can edit this field to set the edition, if known, so reconciliation can be performed successfully. For more information, see Manually override SAM Foundation edition value in classic.
Installation	
Prod id	Unique ID for the product assigned by the manufacturer. Found through discovery.
Install location	Path under which the software is installed.
Install date	Date that the software was installed.
Revision	Revision of the software.
Instance key	Unique ID for the instantiation of the software. Automatically generated when the software is installed.
Installed on	Hardware on which the software is installed.
Uninstall string	Identifier used to uninstall the software.
ISO serial number	ISO number of the software.
Reconciliation	
Entitlement	The entitlement found to use with this installation.
Inferred suite	The inferred suite model this installation belongs to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software Installations form (continued)

Field	Description
Omit from suites	Check box for not counting the software install as a component of a suite during reconciliation.

Software Asset Management Foundation plugin software reconciliation for compliance

Automated license reconciliation keeps license positions accurate and up to date without manual calculations. Reconciliation runs weekly or on demand.

Reconciliation is a scheduled job that is run at a specified frequency (default is weekly). It can also be run on demand for specific or all publishers. For details on running software reconciliation in workspace, see Run Software Asset Management Foundation plugin software reconciliation in workspace. For details on running software reconciliation in the classic Software Asset Management Foundation plugin framework, see Run Software Asset Management Foundation plugin software reconciliation in classic.

When reconciliation is run, a list of reconciliation results is created that shows the compliance status of software products with respect to discovery and entitlements. Users with the sam_user role can view reconciliation results.

Remediation options include rights not in use, rights not allocated, rights needed, reclaimable rights, and unlicensed rights.

Setting up Software Asset Management Foundation plugin

Set up Software Asset Management Foundation plugin before configuration.

Before you begin

Role required: sam_admin

About this task

Once you have requested Software Asset Management Foundation plugin and it has been activated from ServiceNow personnel, complete these steps to set up Software Asset Management Foundation plugin before you begin to use it.

Procedure

1. Determine whether you are currently running the ITSM Software Asset Management feature of Asset Management using the Legacy Software Asset Management plugin.
   Check the list of plugins to see if the Software Asset Management (com.snc.software_asset_management) plugin is active.
   - If so, complete the Software Asset Management Foundation plugin migration procedure.

     This step automatically converts and adds new tables, forms and lists, fields and values, and disables deprecated functionality. It also contains manual procedures for you to complete for successful migration.

   - If not, proceed to the next step.
2. Determine whether Discovery is activated (see Request Discovery).
   Check the list of plugins to see if the Discovery plugin is active.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If so, run the Migrate Software Asset Management Foundation plugin software installations script.

  This step copies records from the [cmdb_ci_spkg] table to the [cmdb_sam_sw_install] table, so that any previously discovered software installs are utilized by the Software Asset Management Foundation plugin.

- If not, activate and configure Discovery.

  For more information, see Discovery.

3. Proceed to Get started with Software Asset Management Foundation plugin to begin using the Software Asset Management Foundation plugin in your environment.

Request Software Asset Management Foundation plugin

The Software Asset Management Foundation (com.snc.sams) plugin must be activated by ServiceNow personnel. This plugin includes demo data.

Before you begin

Role required: admin

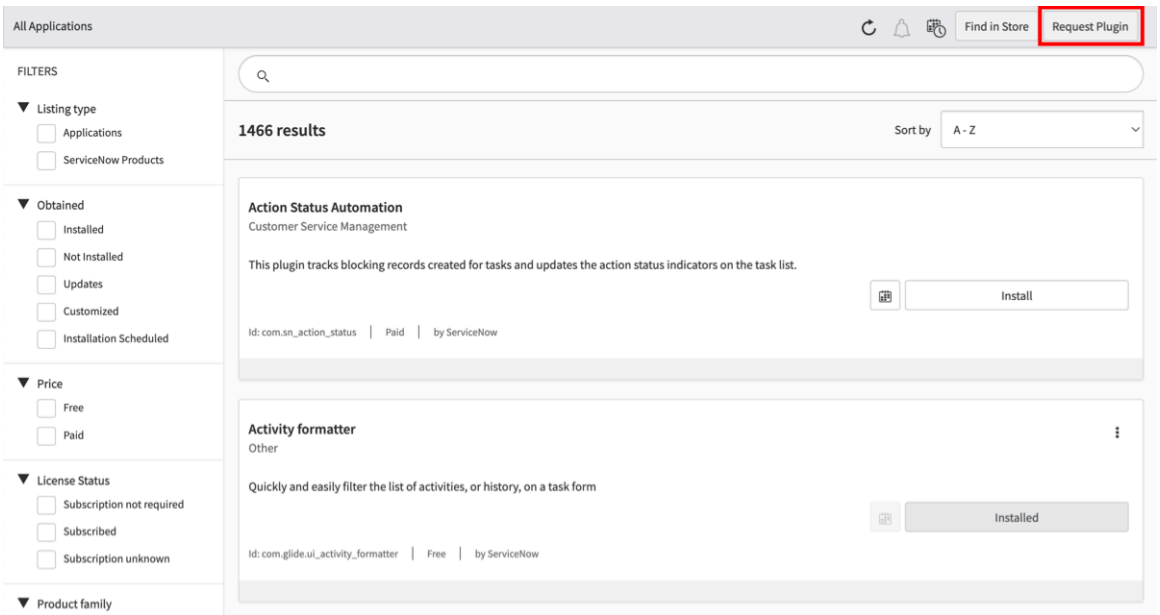
About this task

There are two ways to request a plugin:

- Access the Now Support Service Catalog directly by selecting **Automation Store** > **Service Catalog** > **Activate Plugin** on Now Support.
- Access the Now Support Service Catalog through the All Applications page on your instance by following these steps.

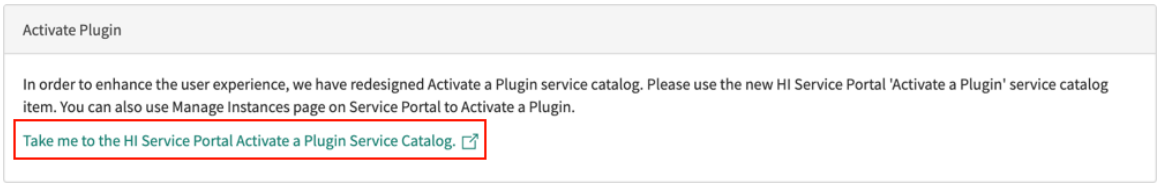
Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

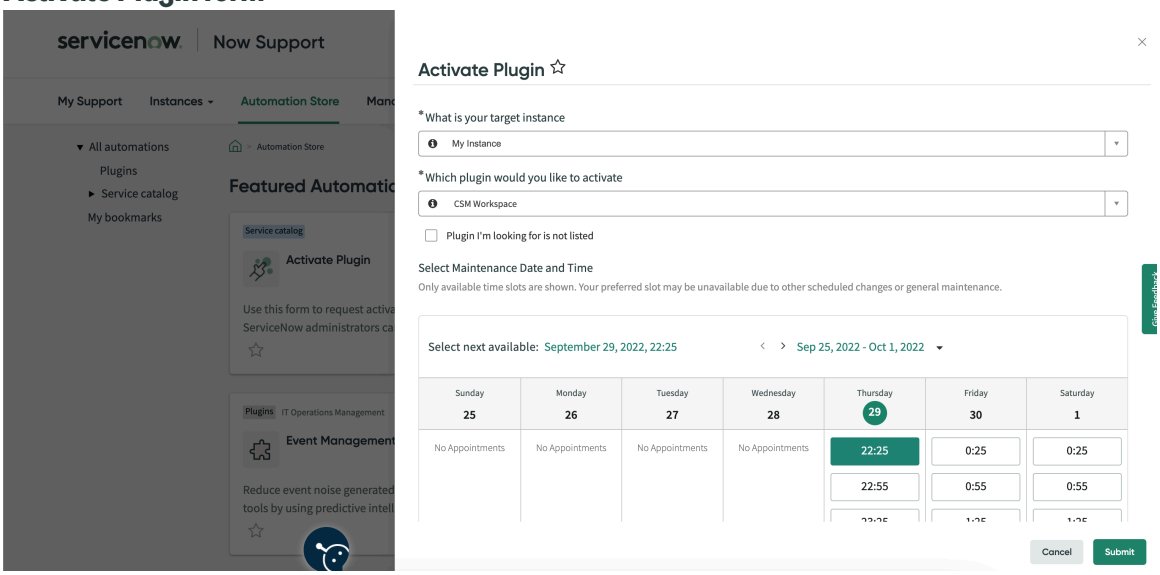
Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Manage a SAM Foundation software suite

Create a suite and add the corresponding components to the suite so the rights that your organization owns are counted accurately during reconciliation.

A software suite is a group of related software offered as one unit. An example is the Microsoft Office Professional suite of office productivity software tools that includes PowerPoint, Word, Excel, Outlook, and Access.

For any software model, you have the option to specify whether the model is a suite (parent) or a component (child). A software model can be a component in multiple suites. For example, Microsoft Word is a component in Microsoft Office Standard and Microsoft Office Professional. Although you can set a single software model as both a suite and a component, software is not typically sold as nested suites.

Use the **Inference percent** and **Mandatory** fields when the suite parent is not defined in the install table.

- **Inference percent**: Specifies what percentage of the components in the suite must be installed for the software to be identified as a suite.
- **Mandatory**: Enforces whether a specific component in a suite must be installed to infer that the suite is installed. Choices are: Optional, Always Mandatory, Mandatory Group.

For example, say you specify the **Inference percent** as 80% and set the **Mandatory** field to **Always Mandatory** on Microsoft Access. These settings specify that Microsoft Access must be installed, along with three out of four other products (Microsoft Word, Microsoft Excel, Microsoft PowerPoint, and Microsoft Outlook) to infer that Microsoft Office Professional is installed on a device.

When a suite parent is detected during reconciliation, the suite components do not count for the individual license.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Users with the model_manager role can navigate to **Product Catalog** > **Product Model** > **Software Models**, but cannot administer all aspects of software models.

Customize a Discovery pattern for Software Asset Management Foundation plugin

Software Asset Management Foundation plugin automatically leverages SQL Server, Exchange, and Oracle Database Discovery patterns, but you can perform steps for Software Asset Management Foundation plugin to utilize additional Discovery patterns, if needed.

Before you begin
Role required: sam_admin

About this task
Discovery uses a series of scripts and operations (probes, sensors, and patterns) with the base system to collect data, process it, and update the CMDB. Although Software Asset Management Foundation plugin is already set up to utilize three common patterns (MSSQL server discovery, Exchange MailBox discovery, and Oracle database discovery), you can perform a configuration procedure to include additional patterns.

This customization automatically copies the records from the discovered pattern to the Software Installation [cmdb_sam_sw_install] table so Software Asset Management Foundation plugin can utilize this data for reconciliation.

For more information on pattern customization, see Discovery patterns used by ITOM Visibility.

Procedure
1. Configure a post processing step in the discovery pattern.
   a. Navigate to **Pattern Designer** > **Discovery Patterns**.
   b. Open the pattern record from which you would like to collect data for Software Asset Management (for example, the discovery pattern for MySQL).
   c. Select and copy the **Class Name** field value.
   You will need to paste this class name value into a record field in the Software Installation Name Mapping [cmdb_sam_sw_name_mapping] table as part of this configuration procedure.
   d. Click the **Pre/Post Processing** related link.
   e. In the Sync Installed Software section, select the desired software from the list to add it (for example, MySQL).
   Data discovered relating to the software you select is automatically copied into the Software Installation [cmdb_sam_sw_install] table as part of the discovery process.
   f. Click **Update**.
2. Add the pattern data to a new record in the Software Installation Name Mapping [cmdb_sam_sw_name_mapping] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Create a new record (see table for field descriptions).

Field	Description
Class name	Class name of the discovery pattern. Paste the value that you copied from the class field in discovery pattern.
Publisher	Publisher of the product (for example, Oracle).
Product	Product name (for example, MySQL).

b. Click **Submit**.

When discovery is run, the records for the software product relating to the customized discovery pattern are utilized by Software Asset Management.

No further configuration is needed unless you know the software product consists of an edition that is not being discovered automatically.

What to do next

If the software product has an edition that is not being discovered, Manually override SAM Foundation edition value in classic so the software can be successfully reconciled.

Get started with Software Asset Management Foundation plugin

Get started with Software Asset Management Foundation plugin to optimize management of software installations in your environment.

Before you begin

Role required: sam_admin

About this task

After you have Setting up Software Asset Management Foundation plugin, get started by completing these steps for basic configuration.

Procedure

1. Create a software model for common software, such as Microsoft Office 2013.
2. Create a basic per-user or per-device entitlement for the software.
3. After discovery of software installed, run reconciliation to reconcile software rights owned against software installed, with respect to discovery and software entitlements.
4. View reconciliation results that show the compliance status of your software products.

What to do next

Depending on the compliance status of your software installations, you can choose to optimize your environment further.

Configuring Software Asset Management Foundation plugin workspace

Once you have finished setting up the Software Asset Management Foundation plugin and the Software Asset Workspace plugin applications, you need to configure the Software Asset Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you have multiple entitlements, you can import them at one go using a Microsoft Excel spreadsheet template.

If software models haven't automatically been created, you need to manually create software models. For information on creating software models, see Create a Software Asset Management Foundation software model in workspace

Create a Software Asset Management Foundation entitlement in workspace

Create entitlements in the Software Asset Workspace to enter your license details and allocate purchased software rights to users or devices.

Before you begin
Role required: sam_admin or sam_user.

About this task
These instructions are for using the standard form for creating software entitlements one at a time. If you already have software entitlement details entered in a spreadsheet, you can also Import them using the bulk import functionality.

When you start creating the entitlement it is in the build status. Once you publish the entitlement, the status changes to in use and makes the entitlement eligible to be included in the reconciliation process.

Procedure

1. Navigate to **All** > **Software asset** > **Software Asset Workspace**.
2. Click **New** to open the Create new entitlement dialog box.
3. Select **Fill out the details in a standard form** and then click **Next**.
4. In the Create New Software Entitlement page, fill in the fields.
   For a detailed description of the fields, see Create a Software Asset Management Foundation plugin entitlement in classic.

Create a Software Asset Management Foundation software model in workspace

Create a software model in the Software Asset Workspace to add product details that are used to connect software rights you purchased with software installations discovered on your system.

Before you begin
Role required: sam_user, sam_admin, or model_manager

Procedure

1. Navigate to **All** > **Software asset** > **Software Asset Workspace**.
2. Click **License operations** view on the left bar.
3. Under **Licensing**, click **software models**.
4. Click **New**.
5. On the form, fill in the fields.

Software Model form

Field	Description
Display name	[Read-only] Name of the model. The system property `glide.cmdb_model.display_name.shorten`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	controls how software model display names are generated. System administrators can configure this property. Default format is publisher + product + version + edition.
Publisher	Publisher of the software. You can use the lookup list provided. **Note:** Publisher is a reference to the company [core_company]. Only companies you are using internally are shown. If the publisher and product do not exist, you can Add a Software Asset Management Foundation plugin custom license metric.
Product	Software product name. The same lookup list provided on the Software Discovery Models form. **Note:** If the relationship between the software publisher [samp_sw_publisher] and company [core_company] is not correct, products for that publisher may not be shown.
Product classification	The official UNSPSC classification of the product.
Product type	○ Child: A subcomponent of main software (not licensable). ○ Driver: A software product that controls a device. ○ Licensable: A software product that is licensable. ○ Not Licensable: A software product that is not licensable. ○ Patch: A software product designed to update, fix, or improve an existing computer program. ○ Unknown: Not discovered.
General	
Short description	A brief description of the model.
Cost	The cost of a single unit of the software.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Next version	Reference to another software model of the same manufacturer which represents the next version of the product.
Owner	The person responsible for the model.
Status	The current status of the model. Options are **In Production**, **Retired**, and **Sold**.
Certified	Check box for indicating the software model has been approved for use.
Discovery Mapping	
Version condition	Condition qualifier for the **Version** field. ○ starts with ○ is ○ is anything Default is **is anything**.
Version	Version of the software product. Required if version condition value is **starts with** or **is**.
Edition condition	Condition qualifier for the **Edition** field. ○ starts with ○ is ○ is anything Default is **is anything**.
Edition	Edition of the software product to use when searching for the normalized discovery model. Required if edition condition value is **starts with** or **is**.
Platform	Platform of the software product to use when searching for the normalized discovery model. Default is **--Anything--** for Windows, Mac, Unix.
Language	Language of the software product to use when searching for the normalized discovery model, which is populated once it has been normalized or added manually. Default is **--Anything--**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Software installation condition	Only software installations that meet this software discovery map condition are counted during reconciliation. If needed, specify a subset of software installations that should be counted during reconciliation.
Product Catalog	
Catalog Item	The information about the model as it appears in the product catalog and service catalog. Information only appears if the model has been published to the product catalog.
Description	Description of the software model as it appears in the product catalog.
Picture	An image of the software logo can be added. This logo appears in the Service Catalog if the software model is published.

The Suite Components and Suite Parents related lists consist of parent and child configuration.

Note:
If you've added a discovery map to your product details, predefined suites are used and suite components are created automatically for known suite parent.

6. To publish the software model to the product catalog, under **Related Links**, click **Publish to Software Catalog** and select a category for the software model.
The values set in the Product Catalog related list are published.
7. To show the list of discovery models that match the software publisher and product fields of the software model, under **Related Links**, click **Show Matching Discovery Models**.
The Discovery Models list is opened in a new browser tab for your reference.
8. To perform additional configuration, select the new software model record in the Software Models list.

   a. In the Software Model Lifecycles related list, create a new record (see table for field descriptions).

Software Model Lifecycle form

Field	Description
Software model	[Read-only] Name of software model.
Lifecycle type	▪ Internal ▪ Publisher
Lifecycle phase	▪ Pre Release ▪ General Availability

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Date the software became generally available to the market. ▪ Upgrade Only shown when the **Lifecycle type** field is Internal. ▪ End of Life Date the software was no longer supported by the publisher. ▪ End of Support ▪ End of Extended Support
Source	[Read-only] Internal (for new records created manually), or ServiceNow (when created automatically).
Description	Description of the software model lifecycle.
Phase start date	Date the lifecycle phase starts.
Phase end date	Date the lifecycle phase ends.
Risk	▪ Very High ▪ High ▪ Moderate ▪ Low ▪ None

b. Create a Software Asset Management Foundation plugin entitlement in classic.

c. View Software Asset Management Foundation plugin software model results in classic.
The latest software model results are shown in the Software Model Results related list.

d. In the Metric Attributes related list, click a metric attribute to set the attribute value field (see table for field descriptions).
The Metric Attributes related list contains metric values set in Create a Software Asset Management Foundation plugin entitlement in classic and is used for reconciliation (metric group, license metric, and software model combination).

Metric Attributes form

Field	Description
Software model	Software model associated with the metric attributes.
Metric group	Grouping for the software metric (Common).
License metric	The license metric that the software license is counted against when reconciliation is run (per user, per device, for example).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Attribute type description that is based on license metric value.
Attribute	Attribute type for reconciling entitlements license metric. ▪ Maximum active OSEs per server ▪ Maximum installs per OSE ▪ Maximum installs per right: For Per User, Per Device, Per Named User, and Per Named Device. ▪ Maximum processors per right ▪ Minimum users per processor ▪ Minimum cores per processor ▪ Minimum cores per server
Attribute value	Value of the attribute (integer).
Attribute value is unlimited	Check box for setting the attribute as unlimited.

e. Create a vendor catalog item.

Configuring Software Asset Management Foundation plugin classic

Configure Software Asset Management Foundation plugin if you prefer to continue using the classic version.

Create a Software Asset Management Foundation plugin entitlement in classic

Software entitlements enable you to define license details that are matched to software models.

Before you begin
Role required: sam_user

About this task
Software entitlements are stored in the Software Entitlement [alm_license] table.

Note:
Entitlements are assigned to Create a Software Asset Management Foundation plugin software model in classic, which are different than software discovery models.

Procedure

1. Navigate to **All** > **Software Asset** > **Licensing** > **Software Entitlements** and create a new record (see table for field descriptions).

Software Entitlement form

Field	Description
Display name	Automatically generated name based on asset tag and model.
Asset tag	Specify the serial number and the bar code for tracking the asset.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Software model	Select the software model to match the entitlement.
License type	Specify the license type. Whether the rights grant full access to the software or if they are being upgraded from a previous version of the software. ○ Full: The rights grant full access to the software. ○ Upgrade: The rights are being upgraded from a previous version of the software. When upgrade is selected, the Upgraded Entitlements related list is shown, which is used to specify the entitlements you are upgrading from. This field becomes read-only after the form has been submitted.
License duration	Length of time the license is valid. Default value is Perpetual. ○ Perpetual: Duration is continuous. ○ Subscription: Duration is for a specified length of time. Duration dates: ▪ Start date: Required. ▪ End date: If empty, subscription does not expire. State is automatically set to In Use when current date is between start and end dates. State is automatically set to Retired when current date is past the end date and active rights is 0. State is automatically set to On Order when the start date is in the future and active rights is 0.
Metric group	Select the metric group for the software. Each metric group has a set of license metrics that are specific to the publisher. ○ Common ○ Add a custom license metric
License metric	Select the license metric for the license group that the software license is counted against when reconciliation is run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Point to the reference field icon to view the license calculation. ○ Common: ▪ Per Device: Licenses a device for a number of installations of software. ▪ Per Named Device: Licenses a specific device for a number of installations of software. ▪ Per Named User: Licenses a specific user for a number of installations of software. ▪ Per User: Licenses a user for a number of installations of software. ○ Custom: Custom license metrics configured, if any.
Agreement type	Select the agreement type. ○ Generic ○ Enterprise Level Agreement (ELA)
Purchased rights	Specify the number of rights that you are purchasing. The number of purchased rights for the new entitlement gets set in the **Active rights** field.
Active rights	[Read-only] Specifies the number of entitlements to be granted for this license. **Note:** If an enterprise contract is attached to the license, the **Active rights** field is not shown.
Allocations available	[Read-only] Specifies the number of user or device allocations that have not been created for an entitlement. Allocations available = (number of active rights) - (sum of all allocation quantities)
General	
Serial number	Unique number assigned for identification of the asset.
Owned by	User or department with financial ownership of the asset. Can be different than the manager.
State	Current state of the asset. Values include On order, In stock, In transit, In use, Consumed, In maintenance, Retired, and Missing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If the state is Retired, the **Active rights** field is set to 0.
Substate	More details about the software license stage. The available substate settings depend on the **State** selected. For example, if you select the **Retired** state, the substate options available are **Disposed**, **Sold**, **Donated**, and **Vendor credit**.
Company	Company to which this asset belongs.
Location	Where the license is used. For example, a specific site, country, or region.
Department	Department of the person **Assigned to** this software license.
Financial	
Cost	Cost of the software. **Note:** Required for total cost and savings calculations on the Software Asset Management Foundation dashboard.
Upgraded Entitlements	
From Entitlement	The entitlement from which rights are upgrading. Multiple upgrade entitlements are supported. You can upgrade previously owned rights for a particular version of software to a newer version (for example, Office Professional Plus 2013 to Office Professional Plus 2016). **Note:** This field is shown only when the License type is Upgrade. The rights from entitlements that you are upgrading from get deactivated when you upgrade because they are moved to the new entitlement.
Number of rights	Number of rights to upgrade.

The Contracts related list contains contract details.

The User or Device Allocations related list contains entitlement allocations.

Note:
This related list is only shown when the **License Metric** field is Per User or Per Device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Activities related list contains work notes for the asset.

2. To perform additional configuration, select the new software entitlement record in the Software Entitlements list.

   a. To set upgrade and downgrade entitlements, in the Downgrades/Upgrades related list, create a new record to specify which software models to which you have upgrade or downgrade rights (see table for field descriptions).
   This allows you to set entitlement to previous or future versions of software (for example, the purchase of Office Professional Plus 2016 rights entitles you to Office Professional Plus 2013 as well).

   Downgrades/Upgrades form

Field	Description
Software entitlement	Software entitlement with which the upgrade/downgrade is associated.
Software model	Software model of the entitlement.
Order	Order of the upgrade/downgrade.
Start date	Start date of the upgrade/downgrade.
End date	End date of the upgrade/downgrade.

   b. To set up cost-tracking details, configure Expense Lines.

   c. To manage license keys, in the License Keys related list, create a new record to specify the licenses keys allocated to entitlements (see table for field descriptions).

   License Key form

Field	Description
Is allocated	Check box indicating that the license key has been allocated.
License key	License key value. Must be unique per entitlement.
Software entitlement	Software entitlement associated with the license key.

Create a Software Asset Management Foundation plugin entitlement allocation in classic

A user or device allocation can be added to a software entitlement to specify a user or device to which rights have been allocated.

Before you begin
Role required: sam_user

About this task
User allocations are stored in the User Allocations [alm_entitlement_user] table. Device allocations are stored in the Device Allocations [alm_entitlement_asset] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The total of all allocation quantities cannot exceed the total number of rights for the entitlement.

Procedure

1. Navigate to **All** > **Software Asset** > **Licensing** > **Software Entitlements** and open the software entitlement record to add allocations to.
2. Click the applicable allocations related list (**User Allocations** or **Device Allocations**) to configure (see table for field descriptions).

Note:
The allocations related list that is shown pertains to the license metric that you chose. Only one related list for allocations is shown.

Allocations

Field	Description
User Allocations	
Assigned to	The user to which the license is allocated.
Software Model	Automatically set based on entitlements software model.
Quantity	Quantity of rights allocated to this user. Default is 1. Multiple rights come into play in the case where many rights are needed to fully license a device or user, such as with per core.
License Key	License key of the software.
Device Allocations	
Assigned to	The device to which the license is allocated.
Software Model	Automatically set based on entitlements software model.
Quantity	Quantity of licenses allocated to this user. Default is 1. Multiple licenses come into play in the case where licenses are allocated per core and multiple core rights are needed.
License Key	License key of the software.

Create a Software Asset Management Foundation plugin software model in classic

Software models are used to connect purchased software rights with discovered software installations. Additionally, software models can be used to manage suites of software as well as to publish requestable software to the Service Catalog.

Before you begin

Role required: sam_user or model_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Manage software available and tie software installations (software being used) with entitlements (software owned) using software models. Create software models for all software to be monitored.

Note:
Users with the model_manager role can navigate to **Product Catalog** > **Product Model** > **Software Models**, but cannot administer all aspects of software models.

Predefined suites are used so suite components are automatically created for known suite parent software models. Discovery maps indicate whether a suite is defined for the product.

You can also track a software model lifecycle phase for use with the Technology Portfolio Management.

Procedure

1. Navigate to **Software Asset** > **Licensing** > **Software Models** and create a new record (see table for field descriptions).

Software Model form

Field	Description
Display name	[Read-only] Name of the model. The system property *glide.cmdb_model.display_name.shorten* controls how software model display names are generated. System administrators can configure this property. Default format is publisher + product + version + edition.
Publisher	Publisher of the software. You can use the lookup list provided. **Note:** Publisher is a reference to the company [core_company]. Only companies you are using internally are shown. If the publisher and product do not exist, you can Add a Software Asset Management Foundation plugin custom license metric.
Product	Software product name. The same lookup list provided on the Software Discovery Models form. **Note:** If the relationship between the software publisher [samp_sw_publisher] and company [core_company] is not correct, products for that publisher may not be shown.
Product classification	The official UNSPSC classification of the product.
Product type	○ Child: A subcomponent of main software (not licensable). ○ Driver: A software product that controls a device. ○ Licensable: A software product that is licensable. ○ Not Licensable: A software product that is not licensable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Patch: A software product designed to update, fix, or improve an existing computer program. ○ Unknown: Not discovered.
General	
Short description	A brief description of the model.
Cost	The cost of a single unit of the software.
Next version	Reference to another software model of the same manufacturer which represents the next version of the product.
Owner	The person responsible for the model.
Status	The current status of the model. Options are **In Production**, **Retired**, and **Sold**.
Certified	Check box for indicating the software model has been approved for use.
Discovery Mapping	
Version condition	Condition qualifier for the **Version** field. ○ starts with ○ is ○ is anything Default is **is anything**.
Version	Version of the software product. Required if version condition value is **starts with** or **is**.
Edition condition	Condition qualifier for the **Edition** field. ○ starts with ○ is ○ is anything Default is **is anything**.
Edition	Edition of the software product to use when searching for the normalized discovery model. Required if edition condition value is **starts with** or **is**.
Platform	Platform of the software product to use when searching for the normalized discovery model. Default is **--Anything--** for Windows, Mac, Unix.
Language	Language of the software product to use when searching for the normalized discovery model, which is populated once it has been normalized or added manually. Default is **--Anything--**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Software installation condition	Only software installations that meet this software discovery map condition are counted during reconciliation. If needed, specify a subset of software installations that should be counted during reconciliation.
Product Catalog	
Catalog Item	The information about the model as it appears in the product catalog and service catalog. Information only appears if the model has been published to the product catalog.
Description	Description of the software model as it appears in the product catalog.
Picture	An image of the software logo can be added. This logo appears in the Service Catalog if the software model is published.

The Suite Components and Suite Parents related lists consist of parent and child configuration.

2. To publish the software model to the product catalog, under **Related Links**, click **Publish to Software Catalog** and select a category for the software model.
   The values set in the Product Catalog related list are published.
3. To show the list of discovery models that match the software publisher and product fields of the software model, under **Related Links**, click **Show Matching Discovery Models**.
   The Discovery Models list is opened in a new browser tab for your reference.
4. To perform additional configuration, select the new software model record in the Software Models list.

   a. In the Software Model Lifecycles related list, create a new record (see table for field descriptions).

Software Model Lifecycle form

Field	Description
Software model	[Read-only] Name of software model.
Lifecycle type	▪ Internal ▪ Publisher
Lifecycle phase	▪ Pre Release ▪ General Availability Date the software became generally available to the market. ▪ Upgrade Only shown when the **Lifecycle type** field is Internal. ▪ End of Life

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Date the software was no longer supported by the publisher. ▪ End of Support ▪ End of Extended Support
Source	[Read-only] Internal (for new records created manually), or ServiceNow (when created automatically).
Description	Description of the software model lifecycle.
Phase start date	Date the lifecycle phase starts.
Phase end date	Date the lifecycle phase ends.
Risk	▪ Very High ▪ High ▪ Moderate ▪ Low ▪ None

b. Create a Software Asset Management Foundation plugin entitlement in classic.

c. View Software Asset Management Foundation plugin software model results in classic.
The latest software model results are shown in the Software Model Results related list.

d. In the Metric Attributes related list, click a metric attribute to set the attribute value field (see table for field descriptions).
The Metric Attributes related list contains metric values set in software entitlements and is used for reconciliation (metric group, license metric, and software model combination).

Metric Attributes form

Field	Description
Software model	Software model associated with the metric attributes.
Metric group	Grouping for the software metric (Common).
License metric	The license metric that the software license is counted against when reconciliation is run (per user, per device, for example).
Description	Attribute type description that is based on license metric value.
Attribute	Attribute type for reconciling entitlements license metric. ▪ Maximum active OSEs per server ▪ Maximum installs per OSE

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Maximum installs per right: For Per User, Per Device, Per Named User, and Per Named Device. ▪ Maximum processors per right ▪ Minimum users per processor ▪ Minimum cores per processor ▪ Minimum cores per server
Attribute value	Value of the attribute (integer).
Attribute value is unlimited	Check box for setting the attribute as unlimited.

e. Create a vendor catalog item.

Manually normalize a SAM Foundation software discovery model in classic

You can edit a software discovery model to manually normalize discovered software on the Software Discovery Models form so that it can be reconciled.

Before you begin
Role required: sam_user

About this task
If the information automatically added to the software discovery model is incomplete, you can add the missing fields to manually normalize the software discovery model.

Procedure
1. Navigate to **All** > **Software Asset** > **Discovery** > **Discovery models** and open a discovery model record.
2. Fill in the **Publisher**, **Product**, and **Version** fields, as appropriate.
3. Click **Normalize**.
   The normalization status is set to Manually Normalized.

Manually override SAM Foundation edition value in classic

When the edition of a software install is not automatically discovered, you can specify the edition on the Software Installation form with the correct value (if known) so the software can be successfully reconciled.

Before you begin
Role required: sam_admin

About this task
For reconciliation to run successfully, the publisher, product, version, and edition fields of the software must be set. When the edition is not discovered automatically (edition value is not included as part of the **Display name** field) but you know the edition, you can manually set it to the correct value (`Enterprise`, for example).

Once the edition value is set, the discovery model for the software install is automatically reset. If the appropriate discovery model does not exist, a new one is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Not all software products consist of an edition. Of the software products consisting of an edition, not all edition values are automatically discoverable.

Procedure

1. Navigate to **All** > **Software Asset** > **Discovery** > **Software Installations** and open the software installation record for which to set the edition value.
2. Fill in the **Edition override** field, as appropriate.

   Note:
   The **Edition override** field is a free-form field (no lookup list) therefore, since this field is used as a key, the value entered must be exact.

3. Click **Update**.
   The software installation is associated to different discovery model containing the edition value as part of the primary key. If the appropriate discovery model does not exist, a new one is created.

Using Software Asset Management Foundation plugin workspace

Use the Software Asset Workspace, the intuitive and streamlined user interface of the Software Asset Management Foundation plugin application.

The Software Asset Management Foundation plugin views let you create entitlements, software models, run and review reconciliation results, give visibility into your software assets, and provides access to analytics via dashboards.

The Software Asset workspace contains the following views:

- Software asset overview: the landing page of the Software Asset Workspace. You can create entitlements, run reconciliation, view key metrics and get time sensitive alerts and notifications regarding your software assets.
- License usage: You can view the compliance status of all your publishers, review reconciliation results, and view and run reports.
- License operations: lists all the entitlements, software models, import entitlement errors, discovery models.

Software asset overview for Software Asset Management Foundation plugin dashboard

Enhance your Software Asset Management Foundation plugin experience by using the modernized and user-friendly software asset overview dashboard. The software asset overview is a simplified and intuitive environment that helps you use the application more effectively by reducing complexity.

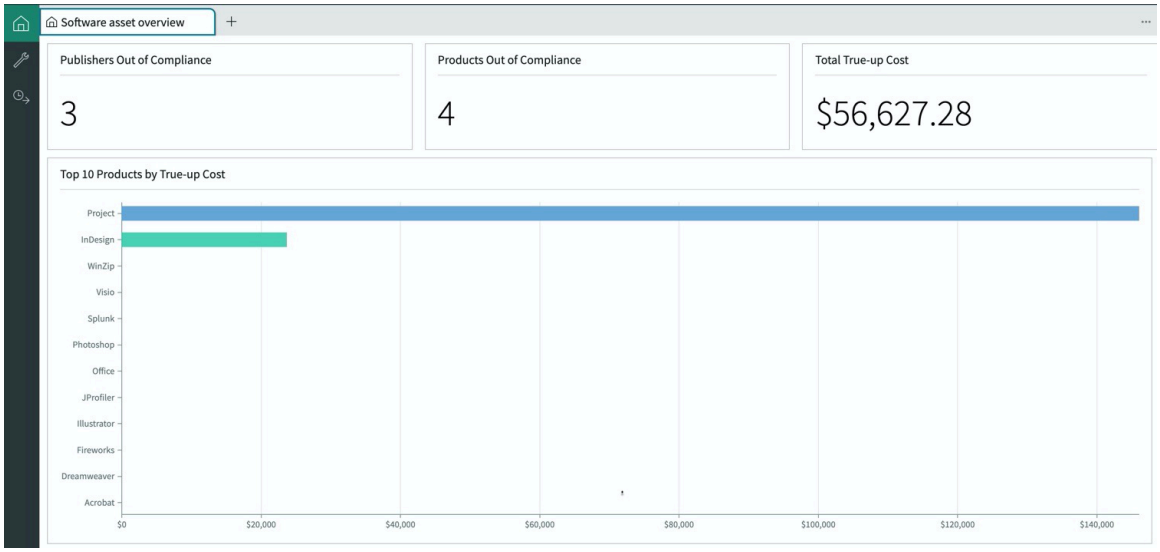
Use the software asset overview view to:

- Gain insights into key metrics such as compliance trends and true-up costs.
- Execute routine tasks such as running reconciliation or creating entitlements.

Click any widget to view detailed information. All the widgets are updated whenever a new reconciliation result is available.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software asset overview dashboard



Report	Source	Description
Publishers out of compliance	Product Results [samp_product_result]	Number of publishers that have at least one software model out of compliance. Click the report to view the results in the License usage view.
Products out of compliance	Product Results [samp_product_result]	Number of products that have at least one software model out of compliance. Click the report to view the results in the License usage view.
Total true-up Cost	Product Results [samp_product_result]	Cost to be compliant based on the average prices in entitlements for the rights by publisher.

License usage view for Software Asset Management Foundation plugin

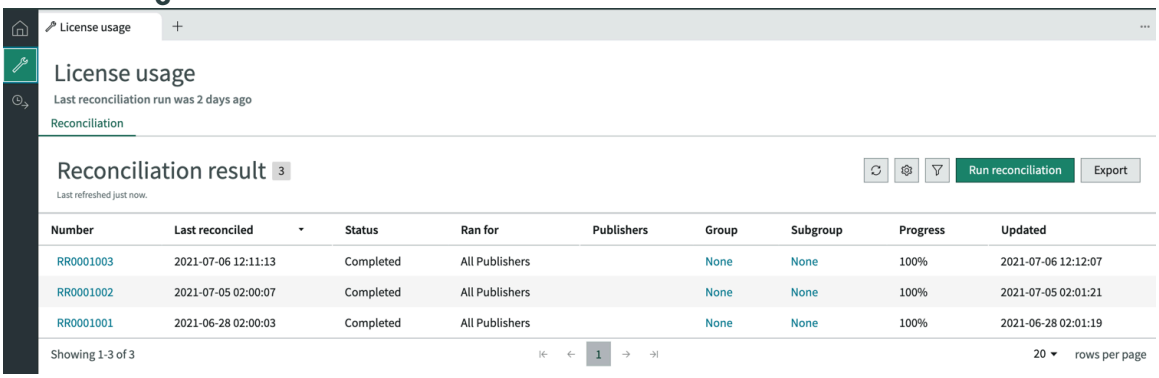
Use the license usage view as a single plane to understand the license position of all software products, remediate non compliance, and view reconciliation results.

The License usage view lets your organizations license usage trends and helps forecast the needs of your organization by trending the number of licenses required against the number of licenses purchased. Stay in compliance by purchasing additional rights before software consumption surpasses the number of rights owned.

You can access the License usage view by navigating to **Software asset** > **Software Asset Workspace** > **License usage**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License usage



Use the License usage view to:

- filter by domain and compliance status.
- sort by True-up cost, over-licensed amount, and potential savings.
- run reconciliation and view its results.
- be informed about the last reconciliation run.
- view and export reports.

Run Software Asset Management Foundation plugin software reconciliation in workspace

Reconciliation is run as a scheduled job (default is weekly), but you can also run reconciliation manually to reconcile software products in the Software Asset Workspace environment on-demand.

Before you begin

Reconciliation is run for products that have software entitlements or software installs. Grouping and subgrouping are supported so you can narrow the compliance results.

When running reconciliation manually, allow enough time for the process to complete. For faster results, narrow the scope by selecting specific publishers.

Role required: sam_user or sam_admin

Procedure

1. Navigate to the Run Reconciliation dialog box from either of the two ways:
   - **Software asset** > **Software asset workspace** > **Run Reconciliation**
   - **Software asset** > **Software Asset Workspace** > **License workbench** > **Run Reconciliation**
2. Select a particular publisher for which compliance should be calculated.
   You can also select all publishers.
3. To narrow results further, select a group or subgroup.
   Available group and subgroup values include None, Country, Department, Company, Region, and Cost Center.
4. Click **Run Reconciliation**.

   The reconciliation process may take some amount of time to complete. Once reconciliation is complete, the reconciliation results are shown in the **Reconciliation** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reconciliation results

Field	Description
Number	Unique identifying number that is generated during the reconciliation process.
Last reconciled	Date of last reconciliation run.
Status	Status of the reconciliation. ○ Completed ○ In Progress ○ Failed
Ran for	All publishers, or specific publishers.
Publishers	Only shown if publishers were specified on which to run reconciliation.
Group	Group specified on which to run reconciliation. Values include **None**, **Country**, **Department**, **Company**, **Region**, and **Cost Center**.
Subgroup	Subgroup specified on which to run reconciliation. Values include **None**, **Country**, **Department**, **Company**, **Region**, and **Cost Center**.
Progress	Percent complete and progress bar for the reconciliation run.
Progress summary	Specific step within the reconciliation process. **Note:** This list column is not shown by default. You can personalize your list column settings to add it, if desired.
Updated	The date and time when the particular reconciliation process was completed.

License Operation view for Software Asset Management Foundation plugin

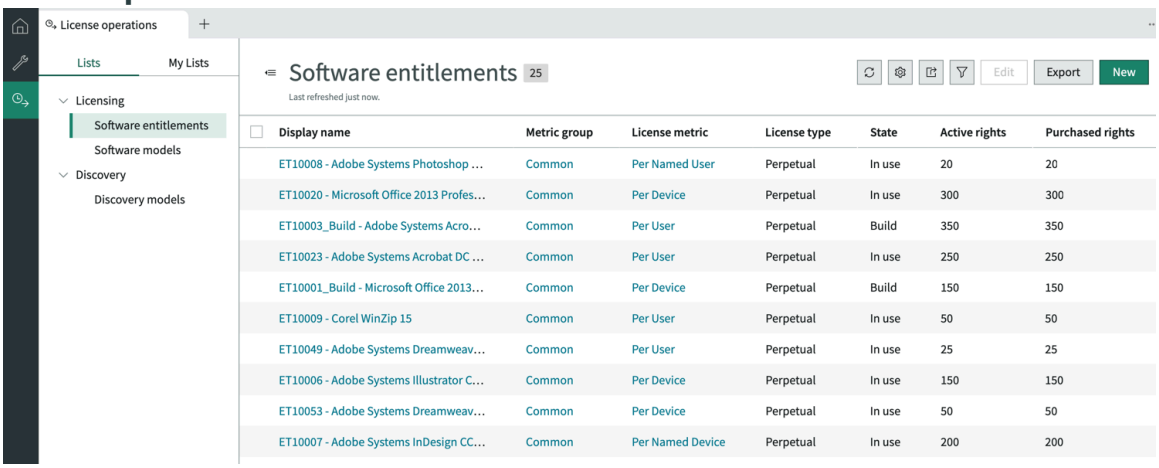
Use the License operations view in the Software Asset Workspace to view all your licenses and discovery models that are managed by the Software Asset Management Foundation plugin application.

View all details related to entitlements and software models in the License operations view. You can also create, edit, and delete entitlements and software models.

You can access the License operations view by navigating to **Software asset** > **Software Asset Workspace** > **License operations**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

License operations



The License operations view also lets you view:

- all the discovered software for your engineering applications.
- engineering license servers.
- discovery models.
- license consumption.

View discovery models in workspace

View a list of all the discovered software for your engineering applications in the Software Asset Workspace.

Before you begin

Role required: sam_admin or sam_user

Procedure

1. Navigate to **All** > **Software Asset** > **Software Asset Workspace** > **License Operations**
2. Click **Discovered engineering license** from the Discovery list view.
3. You can click a record to view additional details.
   Clicking a record takes you to the Company page in the classic view.

Using Software Asset Management Foundation plugin classic

Using Software Asset Management Foundation plugin classic.

Software Asset Management Foundation dashboard

View compliance and true-up cost trend charts on the Software Asset Management Foundation dashboard.

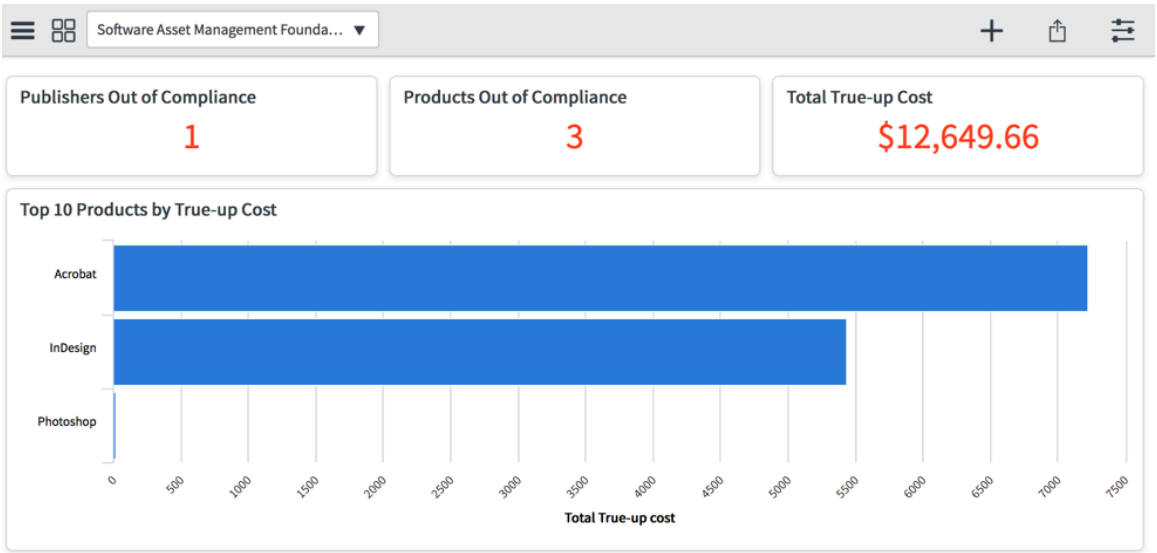
Note:
The Software Asset Management Foundation dashboard is no longer available for new Xanadu users who have activated the Software Asset Management Professional (com.snc.samp) plugin or upgraded to Xanadu without activating the Software Asset Management Professional (com.snc.samp) plugin prior to Xanadu. If you activated the Software Asset Management Professional (com.snc.samp) plugin prior to Xanadu but didn't activate the Workspace plugin (com.sn_sam_workspace), you have access to this dashboard. If you activated the workspace plugin (before or after upgrading to Xanadu, you won't be able to access this dashboard from the **Software Asset** navigation menu in your instance. You can however access this dashboard from the **Dashboards** navigation menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Software Asset Management Foundation dashboard is accessed by navigating to **Software Asset** > **Overview**. Click an element within a report to see more information, or add and move widgets as needed.

Results are updated daily, or whenever a new reconciliation result is available, and can be refreshed by clicking the **Refresh** icon for each result. You can also save charts in PNG or JPG formats.

The source for overview data is the Product Result [samp_product_result] table.



Report	Description
Publishers out of Compliance	Number of publishers that have at least one software model out of compliance.
Products out of Compliance	Number of products that have at least one software model out of compliance.
Total True-up Cost	Cost to be compliant based on the average prices in entitlements for the rights.
Top 10 Products by True-up Cost	Top 10 products graphed in order of true-up cost.

Run Software Asset Management Foundation plugin software reconciliation in classic

Reconciliation is run as a scheduled job (default is weekly), but you can also run reconciliation manually to reconcile software products in your environment on demand.

Before you begin

Role required: sam_admin

About this task

Reconciliation is run for products that have entitlements.

When running reconciliation manually, allow enough time for the process to complete. For faster results, narrow the scope by selecting specific publishers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Run Reconciliation** and select a publisher for which compliance should be calculated, or select all publishers.
2. Click **Continue**.
   The reconciliation process may take an extended amount of time to complete.
   The Reconciliation Results list is shown.

View Software Asset Management Foundation plugin software model results in classic

View compliance information for software model results from the Product Results list after reconciliation is run.

Before you begin

Role required: sam_user

About this task

You can view License Metric Results, Remediation Options, and Unlicensed Installs related lists for a software model result from a Product Result record.

For example, if the status of a product result shows that it is not compliant, you can drill down on the product result to view software model details, such as the number of unlicensed installs and the true-up cost to become compliant. Further, you can drill down on the software model result to view the license metric result, which is based on the entitlements for the product.

License metric result information includes rights owned and rights used as well as the license allocation breakdown so you can determine your options to become compliant. The Remediation Options related list shows the number of rights needed and calculates the cost of those rights for you, based on the license metric.

Procedure

1. Navigate to **All** > **Software Asset** > **Reconciliation** > **Product Results** and open a record to view product results details.
2. In the Software Model Results related list, open a record to view the details (see table for field descriptions).

Software Model Results form

Field	Description
Software model	Software model associated with the product. Drill down on the software model to see the software model result.
Product result	Unique product result number generated during the reconciliation process.
Latest	Indicates whether this software model result is from the most recent reconciliation run.
Status	Status of the software model. ○ Compliant ○ Not Compliant
Agreement type	Common: Generic, Enterprise License Agreement (ELA)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the agreement type is Enterprise Level Agreement, the **Status** is Compliant even if there are unlicensed installations.
Unlicensed installs	Number of unlicensed software installations that are not covered by any entitlements.
True-up cost	Estimated cost of remediating non-compliance based on the least number of rights needed (rights needed * average price per right from entitlements). The lowest cost from Purchase Rights remediation options.
Over-licensed amount	Estimated cost of rights not being used. The sum of the Over Licensed amount from the True-up value costs.
License Metric Results	
License metric	License metric that the software license is counted against when reconciliation is run.
Software model result	Software model with which the result is associated.
Rights owned	Sum of all active rights from entitlements that share a license metric.
Rights used	Sum of rights used during reconciliation (allocated + not allocated and installed).
Unused rights	Sum of rights not used during reconciliation (rights owned - rights used).
Over-licensed amount	Estimated cost of unused rights.
Right Allocations	
Allocated in use	Rights that are allocated and are used to license installations.
Not allocated in use	Number of rights that are used to license installations, but not allocated. When this value is greater than 0, two remediation options (Create Allocations and Remove Unallocated Installs) are automatically created for each unique license metric in the software model that meets this requirement, except User CAL and Device CAL.
Allocated not in use	Rights that are allocated but are not being used to license any installations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: **Allocated not in use** reflects rights that are wasted because the user or device for which these rights have been allocated do not have the software installed. When this value is greater than 0, a Remove Allocations remediation option is automatically created for each unique license metric in the software model that meets this requirement.
Not allocated	Number of rights that have not been allocated (rights owned - allocated regardless of whether installed or not).
Allocations needed	Number of allocations needed for compliance. Only used for Per Named User and Per Named Device license metrics.
Remediation Options	
Remediation action	Action to take to for compliance of Purchase Rights.
Affects compliance	Specifies whether compliance is affected by the remediation option.
License metric	Specific license metric of the software model result.
Software model result	Specific software model result pertaining to the remediation option.
Status	Status of the remediation option. ○ New (blue) ○ Complete (green) ○ Void (red) ○ In Progress (yellow) In Progress state indicates that removal candidates were created for the installs.
Rights needed	**Purchase Rights** shows Rights needed.
Actionable rights	Total rights affected by the action.
True-up cost	Estimated cost of remediating non-compliance based on the least number of rights needed.

The Unlicensed Installs related list contains the software installations that are unlicensed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software Asset Management Foundation plugin Administration

Software Asset Management Foundation plugin administration tasks include adding custom product records, creating custom license metrics, and setting properties. You can also refresh processor definitions, and migrate software installations.

The sam_admin role is required to configure administrative tasks. However, the sam_user role can view and read configurations.

Add a Software Asset Management Foundation plugin custom software product

You can add a custom product if a software product does not exist in the Software Library. Custom products enable you to normalize and account for homegrown software, or software that is not yet part of the Software Library.

Before you begin

Role required: sam_admin

About this task

The product and publisher combination is used during discovery model normalization. If the custom product already exists, a message is shown.

Procedure

Navigate to **All** > **Software Asset** > **Administration** > **Custom Software Products** and create a new record (see table for field descriptions).

Custom Software Product form

Field	Description
Publisher	Publisher of the custom software product. If it does not exist, a new one can be created on the Publisher field Companies lookup list.
Product	Name of the custom software product.
Product type	Product type of the custom software product. • Child: A subcomponent of main software (not licensable). • Driver: A software product that controls a device. • Licensable: A software product that is licensable. • Not Licensable: A software product that is not licensable. • Patch: A software product designed to update, fix, or improve an existing computer program. • Unknown: A software product that is unknown.
Product classification	Official UNSPSC classification.
Active	Check box for activating the rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a Software Asset Management Foundation plugin custom license metric

You can add a custom license metric to modify the default reconciliation process.

Before you begin

Role required: sam_admin to read the custom metric script.

About this task

Custom license metrics can be created to define specific software calculations not included in the predefined license metrics list. Custom license metrics are useful so reconciliation can calculate rights per user or device for certain software products and bundles of lesser-known software publishers.

For example, you can create a custom metric to avoid over counting installs for products that are part of an unrecognized bundle.

Custom metrics can be disabled using the custom license metric property. This feature is enabled by default.

Procedure

Navigate to **All** > **Software Asset** > **Administration** > **Custom License Metrics** and create a new record (see table for field descriptions).

Custom License Metric form

Field	Description
License metric	Name of the custom license metric. This name is shown in the **License Metric** field of software entitlements, and in the license metric results for the software model.
Metric group	[Read-only] Custom license metric.
Allocation type	Allocation type of the metric license, per device or per user. • Device • User
Description	Description of the custom license metric.
Reconciliation order - allocated	Reconciliation metric rank priority for allocated licenses. Lower rank value takes precedence.
Reconciliation order - unallocated	Reconciliation metric rank priority for unallocated licenses. Lower rank value takes precedence.
Calculation	
Calculation Script	The calculation method for the license metric is script. Specify the reconciliation script.

Migrate Software Asset Management Foundation plugin software installations

If you are using Discovery, run this script after installing Software Asset Management Foundation plugin to copy previously discovered software installation records from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

[cmdb_software_instance] table to the [cmdb_sam_sw_install] table, which is used by Software Asset Management Foundation plugin to store software installation records.

Before you begin
Role required: sam_admin

About this task
If you are running Discovery and have used a version of ITSM Software Asset Management previously, there is no need to run this script. Additionally, if the [cmdb_sam_sw_install] table is already populated with software installation records, this script is disabled. You can run Discovery again to repopulate the table.

When running the Migrate Software Installs script, allow enough time for the process to complete.

Procedure

Navigate to **All** > **Software Asset** > **Administration** > **Migrate Software Installs** and click **Procced**.
The Software Installations list is shown. If the data has already been migrated, a message is shown.

Software Asset Management Foundation plugin properties

You can set default reconciliation properties such as reconciliation run with custom license metrics, and reconciliation debugging settings.

These properties are available for Software Asset Management Foundation plugin.

To access these properties, navigate to **Software Asset** > **Administration** > **Properties**.

Properties for Software Asset Management Foundation plugin

Property	Description
Run reconciliation with all available custom license metrics com.snc.samp.recon.enablecustommetrics	Enable custom license metrics when running reconciliation. If you have a custom license metric configured, it is not applied when this property is set to **No**. • **Type**: Reconciliation • **Default value**: Yes
Enable debugging of reconciliation results com.snc.samp.debug	Enable debugging of reconciliation results to troubleshoot a result. **Note:** Enabling debugging may have an impact on performance. • **Type**: Reconciliation • **Default value**: No

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Software Asset Management Foundation plugin migration

Migrate from the Software Asset Management plugin to the Software Asset Management Foundation plugin to take advantage of more powerful features. Manual actions by the customer are required after plugin activation.

After automatic changes are performed during plugin activation, successful migration from the Software Asset Management (com.snc.software_asset_management) plugin to the Software Asset Management Foundation (com.snc.sams) plugin requires a Overwrite customizations for Software Asset Management migration to be performed by the customer.

Customizations to forms and lists may need to be manually overwritten by the customer after plugin activation. In addition, certain fields in software models, software entitlements, user/device allocations forms require manual configuration by the customer after plugin activation.

Automatic changes

The Software Asset Management Foundation (com.snc.sams) plugin performs these automatic changes:

- Tables
  - Table labels renamed

Table	Original Label	New Label
[alm_license]	Software License	Software Entitlement
[alm_entitlement_user]	User Entitlement	User Allocations
[alm_entitlement_asset]	Device Entitlement	Device Allocations

  - Adds new tables and script includes.
  - Adds any string value in the Software Entitlements **License key** field to the License Key [samp_sw_license_key] table
- Field names and values
  - **Inference mandatory** field

    For software models that have suite components (to bundle software models), the **Inference mandatory** field value in the Software Suite [cmdb_m2m_suite_model] table is transferred to a new **Mandatory** field

  - **Rights** field

    The Software Entitlements (formerly Software Licenses) **Rights** field value in the License Entitlements [alm_entitlement] table is transferred to a new **Purchased rights** field, and name changed from **Rights** to **Active rights**

  - The **Software model** field for a software entitlement allocation (Software Entitlement [alm_license] table) is automatically set to the software model on the entitlement (License Entitlements [alm_entitlement] table)
  - The quantity for a software entitlement allocation (License Entitlements [alm_entitlement] table) is set to 1 unless there are multiple allocations

    If there are multiple software entitlement allocations for the same user or device, the allocations are aggregated into one record, the quantity is set to the count of aggregated records, and duplicate allocations are not allowed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Forms and lists

  Software Models, Entitlements (formerly Software License), Discovery Models, and Software Installations form and list layouts are modified to fit the new application

  Note:
  Any customizations to these forms and lists must be manually overwritten after plugin activation.

- Functionality

  Functionality disabled

Functionality	Description
License and software counters	The scheduled job trigger for SAM License Counters is changed to None so that it is deactivated, and software counters are disabled.
Auto-match functionality	The auto-match functionality, which attempts to match a discovery model to a corresponding software model, is deactivated.
Navigation menu	The navigation menu for the Software Asset Management plugin is deactivated and renamed.
Business rules	Legacy business rules applied to discovery models are disabled.

Overwrite customizations for Software Asset Management Foundation plugin migration

When migrating from the Software Asset Management plugin to the Software Asset Management Foundation plugin, further actions are required by the customer after plugin activation to ensure successful migration of customized forms and lists.

Before you begin
Role required: admin

About this task
If these lists and forms have been customized before the migration, they may have been skipped during plugin activation and, in that case, require further action.

- Software Entitlements (formerly Software Licenses)
- Software Allocations (formerly Software Entitlements)
- Software Models
- Discovery Models
- Software Installations

You can review plugin activation changes in the Upgrade History module to determine what changes have automatically been skipped so you can resolve the skipped update, if needed.

Certain fields added by the migration also must be configured to take advantage of the new features offered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Diagnostics** > **Upgrade History**.
2. Identify the records that correspond to the upgrade history for the activation of the Software Asset Management Foundation plugin.
   The records in System Upgrades list that represent plugin activation contain the value **n/a** in the **From** field, and plugin name in the **To** field (such as com.snc.samp, com.snc.samp.core, com.snc.sam.core, com.glide.data_services_canonicalization.client, com.snc.asset_management, com.snc.model, com.snc.procurement).

   You can determine the list of related plugins based on the time stamp of when the Software Asset Management plugin was activated by sorting on the **Upgrade started** column.
3. Open a Software Asset Management Foundation plugin upgrade record that has changes skipped.
4. In the **Upgrade Details** related list, open an Upgraded Details record, and then click **Resolve Conflicts** to view a side-by-side comparison of the base system file with the customized file.
5. Click **Revert to Base System** to overwrite the skipped change if it applies to form or list customization, and note down the changes.
6. Repeat these steps for all upgrade entries with skipped changes relating to customizations.
7. In Software Asset Management Foundation plugin configuration, manually reconfigure your original form and list customizations.
8. In Software Asset Management Foundation plugin configuration, set new field values (added as part of the automatic changes performed by plugin activation) to take advantage of the new features offered.

   a. Navigate to **Software Asset** > **Licensing** > **Software Models**.
      - Select the software product in the **Product** reference field.
      - Select a discovery map, or clear the **Discovery Map** field and set the discovery conditions to find all discovery models that correspond to the software model.

   b. Navigate to **Software Asset** > **Licensing** > **Software Entitlements** (formerly Software Licenses).
      - Navigate to **Software Asset** > **Licensing** > **Software Entitlements** (formerly Software Licenses).
      - Select the **License Metric** that the software license is counted against when reconciliation is run.
      - Define the upgrade and downgrade scenarios covered by certain rights.

   c. In the **User Allocations** and **Device Allocations** related lists (formerly User/Device Entitlements), verify that the number of allocated rights are not more than rights owned. If so, delete allocations so that the number of allocations does not exceed the number of rights owned.
9. If you have entitlements that require management of license keys, you can create multiple license keys associated to the same entitlement, as well as allocate these license keys to a user or device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Organization Management

The Organization Management application provides an easy way to perform such asset management tasks as updating users and adding vendors.

It includes managing your vendors and manufacturers, as well as managing locations.

Create a new vendor or manufacturer

You can create a new vendor, which is a company that sells assets or services that your organization purchases. You can also create a new manufacturer, which is a company that builds assets that your organization purchases.

Before you begin

Role required: user_admin and asset

Procedure

1. Navigate to one of the following:
   - **Organization** > **Vendors**
   - **Organization** > **Manufacturers**
   - **Organization** > **Companies**
2. Click **New** and create a new record.
3. Complete the form and select either **Manufacturer** or **Vendor**.

   Note:
   A company can be considered both a vendor and a manufacturer.

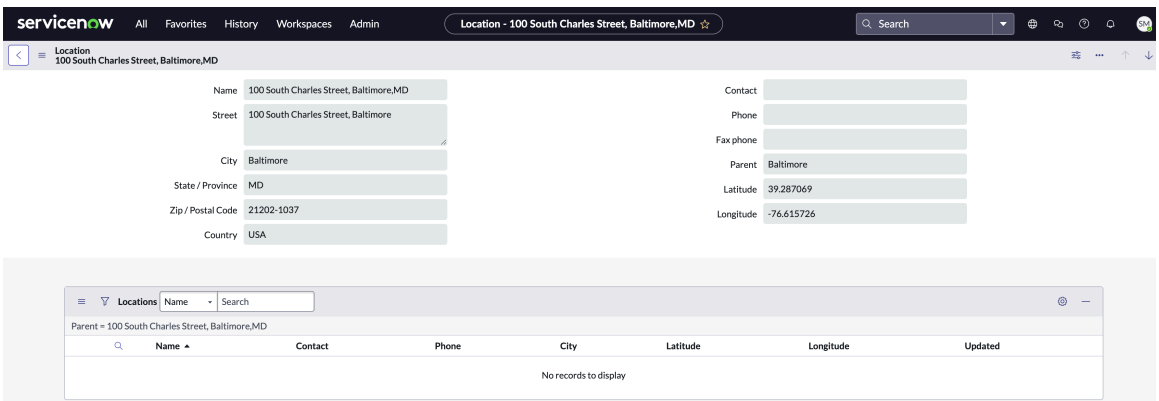
4. Click **Submit**.

Locations module

The Locations module is the Asset view of the Location table [cmn_location].

In addition to the physical specifics for the location, the Asset view includes the **Stock room** designation and a list of configuration items (CI) in stock at that location.

Asset location



Installed with Model Management

Several types of components are installed with Model Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Demo data is available with Model Management.

Business rules installed with Model Management

Model Management uses a number of business rules.

Name	Table	Description
Abort action if no license type	[cmdb_software_product_model]	Ensures that a license type (not a license type group that cannot be handled by counters) has been selected.
Calculate display_name	Product Model [cmdb_model]	Sets the **Display name** field when any of the following field values change: **Manufacturer**, **Name**, **Version**, **Edition**. The display name differs depending on whether the *glide.cmdb_model.display_name.shorten* property is set to **true** or **false**.
Date validation	[cmdb_m2m_downgrade_model]	Ensures that the Start date is before the End date.
Enforce CI Rules	[cmdb_model_category]	Ensures that categories that track assets as consumables or software licenses do not have a CI class.
Flag parent as bundle on creation	[cmdb_m2m_model_component]	Flags a model that has components as a bundle.
License Type - Fullname	[cmdb_sw_license_calculation]	Computes the full name of the license type.
License validation	Software Upgrade and Downgrades [cmdb_m2m_downgrade_model]	Prevents software upgrades and downgrades from being duplicated and prevents having duplicate upgrades and downgrades for the same license where duplication also involves having the same dates. Also ensures that both the **Upgrade parent** and **Downgrade child** fields are mandatory and that if the **License** field is not empty, either **Upgrade parent** or **Downgrade child** must be equal to the license.model.
Protect cmdb_ci_class	[cmdb_model_category]	Prevents CI class from being changed after creation.
Protect cmdb_ci_class on insert	[cmdb_model_category]	Prevents creation of a category if another category already exists for the chosen CI class.
Protect Contract	[cmdb_model_category]	Prevents changes to the Contract model category record.
Set parent's main component link	[cmdb_m2m_model_component]	Populates a read-only reference from the bundle to the component when a bundle component is selected as the main component.
Unflag parent on last delete	[cmdb_m2m_model_component]	Removes the bundle flag from a model when the last component is deleted from the bundle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Description
Update model category	[cmdb_ci]	Updates the model categories for the associated model if the model is not already associated with the CI's model category.
Validate record before creation	[cmdb_m2m_model_component]	Ensures that a component is not already in a bundle when an attempt is made to add the component to a bundle.

Client scripts installed with Model Management

Model Management includes a number of client scripts.

Name	Table	Description
Clear models not matching license	[cmdb_m2m_downgrade_model]	Clears the **Upgrade parent** and **Downgrade child** fields when the **License** field is changed to a license and neither the upgrade or downgrade fields match the license model.
Constraints based on asset class	[cmdb_model_category]	Enables or disables bundling options based on the asset class of the category.
Hide sections when needed	[cmdb_model]	Shows and hides sections according to what is relevant for a given model.
model_category change	[cmdb_model]	Ensures compatibility of classes between the several categories referenced by the same model (client part).
Populate downgrade from license	[cmdb_m2m_downgrade_model]	Sets the downgrade child to the software model on the referenced license when an upgrade is selected. Only sets the downgrade to the license if the license is not empty.
Populate upgrade from license	[cmdb_m2m_downgrade_model]	Sets the upgrade parent to the software model on the referenced license when a downgrade is selected. Only sets the upgrade to the license if the license is not empty.

Properties installed with Model Management

Model Management includes the property *`glide.cmdb_model.display_name.shorten`*.

Name	Description
`glide.cmdb_model.display_name.shorten`	When set to **true**, generates shorter display names for models by eliminating duplication of the manufacturer name. Consider the following model, for which **Manufacturer** is set to **Spotify** and **Name** is set to **Spotify Premium**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	The **Display name** field is set as follows, based on the property setting. • false: Display name is Spotify Spotify Premium • true: Display name is Spotify Premium For software models, the edition and version are also included in the name, if they are specified. • Type: true | false • Default value: false • Location: System Properties [sys_properties] table

Script includes installed with Model Management

Model Management includes script includes.

Name	Description
ModelAndCategoryFilters	Refines reference qualifiers for models and model categories based on class.
ModelCategoryCheck	Ensures compatibility of classes between the several categories referenced by the same model.

Tables installed with Model Management

Model Management includes numerous tables.

Table	Description
Application Model [cmdb_application_product_model]	Stores models used to describe software application products.
Consumable Model [cmdb_consumable_product_model]	Describes consumable product models.
Contract Model [cmdb_contract_product_model]	Stores all contract models.
Depreciation [cmdb_depreciation]	Stores asset depreciation patterns.
Hardware Model [cmdb_hardware_product_model]	Describes hardware product models.
Model Category [cmdb_model_category]	Defines groups of assets, consumables, product bundles, and configuration items.
Model Compatibility [cmdb_m2m_model_compatibility]	Stores many-to-many relationship between two models signifying their compatibility with one another.
Model Component [cmdb_m2m_model_component]	Stores many-to-many relationship between two models signifying that they form a bundle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Product model [cmdb_model]	Describes all kinds of product models.
Software License Calculation [cmdb_sw_license_calculation]	Defines commonly used software licensing patterns.
Software Model [cmdb_software_product_model]	Describes software product models.
Software Suite [cmdb_m2m_suite_model]	Stores many-to-many relationship between two models that defines elements of a software suite.
Software Upgrade and Downgrades [cmdb_m2m_downgrade_model]	Stores many-to-many relationship between two models signifying that being licensed for one model grants rights to the other as well.

UI policies installed with Model Management

Model Management includes UI policies.

Name	Table	Description
Hide unverified	Model Category [cmdb_model_category]	Shows the **Enforce CI verification** field if the **Asset class** and **CI class** fields are not empty.
Lock fields for Contract and Work Lock fields for Contract	Model Category [cmdb_model_category]	Sets all fields on the Model Category form to read-only if the **Name** is **Contract** or, **Work Order** or **Work Task**.
Protect model category	Product Model [cmdb_model]	Makes the **Model categories** field mandatory and read-only if it contains any of the following values: **Software License**, **Contract**, **Work Order**, **Work Task**.
Show is an option if Oracle	Software Model [cmdb_software_product_model]	Shows the **Is an option** field if the selected **Manufacturer** name starts with **Oracle**.

User roles installed with Model Management

Model Management includes user roles.

Role	Contains Roles	Description
category_manager	model manager	Can create, edit, and delete model categories.
model_manager	none	Can create new CMDB models. The model manager role can control the base models and any model extensions that are not hardware, software, or consumables. Hardware and consumable models are controlled by the asset manager (asset) role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Contains Roles	Description
		Software models are controlled by the software asset manager (sam) role.

Installed with Asset Management

Several tables, user roles, UI policies, script includes, client scripts, and business rules are installed with Asset Management.

Demo data is available with asset management. The demo data provides information such as users, assets, and individual stockrooms.

Tables

Asset Management includes the following tables.

Asset Management tables

Table	Description
Asset [alm_asset]	Stores general, financial, and contractual information about assets.
Asset Entitlement [alm_entitlement_asset]	Enables ServiceNow to categorize the Asset Entitlement table and enforce how entitlements behave.
Consumable [alm_consumable]	Stores data about consumable assets (previously known as parts).
Default Stockroom [alm_user_stockroom]	Stores the relationship between a user and their default stockroom.
Fixed Assets [alm_fixed_assets]	Stores fixed assets, which are containers that can hold multiple assets.
Fixed asset to asset [m2m_fixed_asset_to_asset]	Stores associations between fixed assets and assets.
Hardware [alm_hardware]	Stores general, financial, and contractual information about hardware assets.
License Entitlement [alm_entitlement]	Stores entitlements that permit users or machines to use a software license.
Software License [alm_license]	Stores general, financial, and contractual information about software license assets.
Stock Rule [alm_stock_rule]	Transfers stock or sends an email message to the asset manager when a specified asset drops below a set threshold.
Stockroom [alm_stockroom]	Stores information about stockrooms.
Stockroom Model [alm_m2m_stockroom_model]	Tracks all models that have ever been stocked in a stockroom. This table is automatically populated.
Stockroom Type [alm_stockroom_type]	Stores general information about stockroom types.
Transfer Order [alm_transfer_order]	Contains data about transfer orders, including the state and stockrooms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset Management tables (continued)

Table	Description
	Note: The inventory_user, asset, or procurement_user role can only access the reports. You must activate the Procurement (com.snc.procurement) plugin for the inventory_user, asset, and procurement_user roles.
Transfer Order Line [alm_transfer_order_line]	Contains data about individual assets being shipped with a transfer order.
User Entitlement [alm_entitlement_user]	Enables ServiceNow to categorize the User Entitlement table and enforce how entitlements behave.

User roles

Asset Management includes the following user roles.

Asset Management user roles

Role	Contains roles	Tasks
asset (Asset Manager)	• category manager • contract manager • financial mgmt user • inventory user • procurement user	• Manage hardware and consumable assets ([alm_hardware] and [alm_consumable]). • Asset manager can't edit asset records that are created and updated automatically, but can read and delete the asset records when needed. • Create requests. • Create and delete stock information. • Access to requests, purchase orders, and base system catalog tasks.
inventory_admin	inventory user	• Create and delete stock information. • Edit stock rules, stockrooms, and stockroom types.
inventory_user	none	• Access stock information. • Create and manage transfer orders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset Management user roles (continued)

Role	Contains roles	Tasks
sam	• contract manager • model manager • financial mgmt user	• Create, edit, change, and manage software licenses. • Edit the Software model field on a Discovery models and software installations. • Approve a model. Has full control of the Software Asset Management application. • Controls the Software Asset Management IBM PVU Process Pack, if activated.

UI policies

Asset Management includes the following UI policies.

Asset Management UI policies

Name	Table	Description
Hide asset tag and serial num	[alm_asset]	Hides the asset tag when the asset is pre-allocated and the quantity is greater than 1.
Hide/show parent stockroom on Stockroom Replenish	[alm_stock_rule]	Shows the Parent stockroom field only when the Restocking option field is set to Stockroom.
Make allocated to and assigned to required.	License Entitlement [alm_entitlement]	Makes the Allocated to and Assigned to fields required.
Make substatus read-only when not required	[alm_asset]	Sets the Substatus to read-only if the State is On order, In use, Consumed, or In maintenance.
Model bundle field hidden but present for UI Policy conditions purposes	[alm_asset]	Hides the Model Bundle field. Exists on page only for use by UI policies and client scripts.
Pre-allocated constraints	[alm_asset]	Hides unneeded fields and related lists when the asset is pre-allocated.
Quantity readonly until model and category qualify the asset and are not bundle	[alm_asset]	Sets the Quantity field to read-only for assets that aren't consumable, software, or pre-allocated. Quantity is also read-only if the model or model category fields are empty.
Show 'Assigned to'	[alm_asset]	Shows the Assigned to field if the State field is notOn order, In stock, or In transit.
Show 'Reserved for'	[alm_asset]	Shows the Reserved for field if the State field is On order, In stock, or In transit.
Show 'Stockroom'	[alm_asset]	Shows the Stockroom field if either of the following conditions is true:

Asset Management UI policies (continued)

Name	Table	Description
		• The State field is In stock and Substate isn't Pre-allocated. • The Substate is Pre-allocated and Parent is empty.

Script includes

Asset Management includes the following script includes.

Asset Management script includes

Name	Description
AssetandCI	Code for creating and managing the relationship between asset and CI records.
AssetAndCISynchronizer	Synchronization code between asset and CI records.
AssetUtils	Utility functions for asset management. Also checks if a license can be merged and then merges licenses if requirements are met.
AssetUtilsAJAX	AJAX-based utility functions for asset management. Call the AssetUtils script include from a client-side UI action.
Consumables	Code to change (for example, consume, split, and merge) consumables.
FixedAssetUtils	Methods for rolling up fixed asset costs.
PortalFilters	Filters used in the My Assets portal.
PreAllocatedAssets	Code to change pre-allocated assets.
StockRuleFilters	Reference qualifier code for filtering options on reference fields on stock rules.
StockRuleTransfer	Transfer order creation code for when stock rules are triggered.
TransferOrderDateTimeAjax	Date comparison utility for transfer orders.
TransferOrderFilters	Reference qualifier code for reference field filtering options on transfer orders.
TransferOrderFinder	Finds an appropriate transfer order to put a transfer order line into.
TransferOrderHelper	Function that checks if a transfer order has multiple transfer order lines.
TransferOrderLineFilters	Reference qualifier code for reference field filtering options on transfer order lines.
TransferOrderReceiver	Code for receiving a transfer order line.
TransferOrderReturn	Code for returning a transfer order line.
TransferOrderStageHandler	Code for changing transfer order stages and transfer order line stages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset Management script includes (continued)

Name	Description
TransferOrderStageHelper	Helper method to get numeric stages for transfer orders and transfer order lines.

Client scripts

Asset Management includes the following client scripts.

Asset Management client scripts

Name	Table	Description
Correct substatus	[alm_asset]	Updates the Substatus field when the Status field is modified.
Ensure no negative quantity	[alm_asset]	Clears the Quantity field when set to less than 1.
Error on pre-allocated substatus	[alm_consumable]	Prevents Substatus field from being set to be Pre-allocated for consumable assets. Also displays an error message.
Error on pre-allocated substatus	[alm_license]	Prevents Substatus field from being set to be Pre-allocated for license assets. Also displays an error message.
Null out allocated_to	[alm_entitlement]	Does the following when the Assigned to field is set: • Clears the Allocated to field and makes it not required. • Makes the Assigned to field required.
Null out assigned_to	[alm_entitlement]	Does the following when the Allocated to field is set: • Clears the Assigned to field and makes it not required. • Makes the Allocated to field required.
Salvage must be less than cost	[alm_asset]	Displays a warning if a salvage value greater than the cost of an asset is entered.
Set Cost of the Asset	[alm_asset]	Populates the Cost field when the Model field is set.
Set Loc/ CC/Dep/Com from assigned to	[alm_asset]	Populates the Location, Cost center, Department, and Company fields when the Assigned to field is set.
Set Location from stockroom	[alm_asset]	Populates the Location field when the Stockroom field is set.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset Management client scripts (continued)

Name	Table	Description
Update From Location from Stockroom	[alm_transfer_order]	Populates the From location field when the From stockroom field is set.
Update Model and Quantity based on Asset	[alm_transfer_order_line]	Populates the Model field when the Asset field is set. If the asset is a pre-allocated asset, this client script also populates the Quantity field.
Update To Location from Stockroom	[alm_transfer_order]	Populates the To location field when the To stockroom field is set.
Update UI on load and model change	[alm_transfer_order_line]	Runs checks, and updates the user interface, when the transfer order line form is loaded and when a model is selected.
Validate Delivery by Date	[alm_transfer_order]	Validates that the delivery date is in the future.
Verify Stock Available	[alm_transfer_order_line]	Verifies that stock exists to fulfill the quantity requested.
Verify Stock Available (Stockroom)	[alm_transfer_order_line]	Verifies that stock exists to fulfill the quantity requested when the From stockroom value changes.

Business rules

Asset Management includes the following business rules.

Asset Management business rules

Name	Table	Description
Allocated more licenses than rights	Software License [alm_license]	Prevents creation or update of a license if the number of licenses allocated is larger than the total rights.
Asset Retirement	Asset [alm_asset]	Clears the Assigned to, Stockroom, and Reserved for fields and sets the retirement date to the current time when the asset is retired.
Automatically Change TOL State	Transfer Order Line [alm_transfer_order_line]	If a transfer order has the same From stockroom and To stockroom and it's a personal stockroom, this business rule: • Sets the transfer order line Stage to Delivered. • Sets the asset Substate to Reserved. If a transfer order has the same From stockroom and To stockroom and it isn't a personal stockroom, this business rule: • Sets the transfer order Stage to Received. • Sets the asset Substate to Pending transfer.

Asset Management business rules (continued)

Name	Table	Description
Build bundle components on Insert	Asset [alm_asset]	Creates assets for the components related to a bundle if the model of the created asset is a bundle.
Clear Assigned To on update	Asset [alm_asset]	Clears the Assigned to field if the State field changes to On order, In stock, or In transit.
Clear fields irrelevant for preallocated	Asset [alm_asset]	Clears the value of fields that are irrelevant for pre-allocated assets.
Create Asset on insert	Configuration Items [cmdb_ci]	Creates a corresponding asset when a new configuration item with no asset is created.
Create asset on model change	Configuration Items [cmdb_ci]	Creates a new associated asset when the Model ID field changes.
Create CI on insert	Asset [alm_asset]	Creates a corresponding configuration item when a new asset with no configuration item is created.
Create Stockroom Model Relation	Asset [alm_asset]	Creates a record (if none exists) in the Stockroom Model table indicating the stockroom that holds the model when an asset is created or updated.
Delete all Transfer Order Lines	Transfer Order [alm_transfer_order]	Deletes all related transfer order lines when a transfer order is deleted.
Ensure Entitlements do not exceed rights	License Entitlement [alm_entitlement]	Checks that the total number of entitlements for the related license doesn't exceed the number of rights given by the license when an entitlement is created.
GenerateAssets	Model Categories [cmdb_model_category]	Executes a scheduled script job to create assets for configuration items.
Inherit information from parent	Asset [alm_asset]	Assigns some parent values to the asset when assigning a new parent to an asset.
Managed Stockroom for Vendor	Stock Rule [alm_stock_rule]	Validates that a vendor replenishing stock rule has a stockroom selected and the stockroom has an related manager with a valid email address.
Mandate allocated to or assigned to	License Entitlement [alm_entitlement]	Makes a value in either the Allocated to field or the Assigned to field required.
Merge Records	Consumable [alm_consumable]	Merges consumables that have matching fields and aren't In Transit into one record containing the total count.
Null out asset on insert and stay	Configuration Items [cmdb_ci]	Clears the Asset field on insert when the field includes an asset that has a CI.
Null out Ci on insert and stay	Asset [alm_asset]	Nulls out the asset field so a new asset is created for the CI when an insert is performed on an existing CI.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Asset Management business rules (continued)

Name	Table	Description
Populate reserved for field	Transfer Order Line [alm_transfer_order_line]	If the transfer order line has an related request line, this business rule populates the related asset's Reserved for field with the appropriate information from the request line.
Push Status to Asset/ Consumable	Transfer Order Line [alm_transfer_order_line]	Changes the corresponding asset to reflect the current state of transit when a transfer order line moves to another state.
Release Asset on TOL cancel/ delete	Transfer Order Line [alm_transfer_order_line]	Places the corresponding asset back into stock and unsources the part requirement when a transfer order line in the draft state is canceled or deleted.
Rollup TOL cancellation to TO	Transfer Order Line [alm_transfer_order_line]	Signals to the corresponding transfer order that the transfer order line has been canceled.
Salvage value must be less than cost	Asset [alm_asset]	Prevents saving an asset record if the salvage value is greater than the cost.
Sanity check on pre-allocated	Asset [alm_asset]	Prevents creation or update of pre-allocated assets if they don't satisfy the conditions to be pre-allocated.
Set Class	License Entitlement [alm_entitlement]	Sets the class for this entitlement depending on the entitlement is assigned or allocated.
Set Transfer Order Type	Transfer Order [alm_transfer_order]	Sets the type of the transfer order depending on whether there's a related service order or work order task.
Sync model category	Product Models [cmdb_model]	When the model category changes, this business rule creates assets if they didn't previously exist for configuration items associated with the model.
Transfer Order Stockroom Rules	Transfer Order [alm_transfer_order]	Prevents the From stockroom field from being changed if the transfer order has multiple transfer order lines.
Transition reserved to assigned	Asset [alm_asset]	Populates the Assigned to field with the value from the Reserved for field when the asset is in the appropriate state.
Trickle information down to components	Asset [alm_asset]	Updates components of an asset to reflect any changes that have been made to the asset record.
Update Asset fields on change	Configuration Items [cmdb_ci]	Synchronizes fields so changes made on the Configuration Item form trigger the same update on the corresponding Asset form, ensuring consistent reporting. You must update statuses on the Asset form.
Update CI fields on change	Asset [alm_asset]	Synchronizes fields so changes made on the Asset form trigger the same update on the

Asset Management business rules (continued)

Name	Table	Description
		corresponding Configuration Item form, ensuring consistent reporting.
Update location as needed	Asset [alm_asset]	Updates the location of the asset, if the asset is set to a new stockroom or assigned to a new user.
Validate Field Agent Type	Stockroom [alm_stockroom]	Ensures that you don't create a stockroom of the type Field Agent without Work Management or Field Service Management activated. Allows for only one personal stockroom per user.
Validate TOL and check availability	Transfer Order Line [alm_transfer_order_line]	Validates changes made to the transfer order line and checks the availability of the assets to be transferred in the specified stockroom.
Validate transfer order	Transfer Order [alm_transfer_order]	Validates that the Delivery by date isn't earlier than the current date.
Validate Unique Users	Default Stockroom [alm_user_stockroom]	Prevents the creation of multiple records with the same user.
Verify Entitlement (Allocated)	License Entitlement [alm_entitlement]	Ensures that the allocation of the entitlement follows the allocation condition on the license when a condition exists.
Verify Entitlement (Assigned)	License Entitlement [alm_entitlement]	Ensures that the assignee of the entitlement follows the assignment condition on the license when a condition exists.
Verify Entitlements (Allocated)	Software License [alm_license]	Ensures that the allocations of all the license's entitlements follow the allocation condition on the license when a condition exists.
Verify Entitlements (Assigned)	Software License [alm_license]	Ensures that the assignees of all the license's entitlements follow the assignment condition on the license when a condition exists.
Verify Not Field Agent	Default Stockroom [alm_user_stockroom]	Verifies that the selected default stockroom isn't of the Field Agent type.

Domain separation and Asset Management

Domain separation is supported in Asset Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Related topics

Domain separation for service providers

Domain separation and lifecycle reports

There are certain domain separation aspects to consider when running software lifecycle reports.

Software Asset Management overview

In a domain-separated environment, the software lifecycle report is generated at the level at which the Service Provider (SP) is managing compliance for their customers' environment. Typically, the level at which reconciliation is run indicates such compliance, and the software lifecycle report is generated at the same level.

The following table shows how the reconciliation should behave. In this example:

- The SP is managing Cisco's software asset management (SAM) program at the Cisco corporate level. That means the lifecycle report must run at the Cisco corporate level.
- The SP is managing Walmart's SAM program for each Walmart division (US and Mexico). That means the lifecycle report must run at the Walmart division level.

Here is the SP hierarchy:

- Cisco Corporate
  - Cisco USA
  - Cisco Mexico
- Walmart Corporate
  - Walmart USA
  - Walmart Mexico

Domain settings (reconciliation/ normalization)	Compliance reporting	Lifecycle report level
TOP/Cisco	True	Yes
TOP/Cisco/US	False	
TOP/Cisco/Mexico	False	
TOP/Cisco/Germany	False	
TOP/Walmart	False	
TOP/Walmart/US	True	Yes
TOP/Walmart/Mexico	True	Yes

If the SP sets up software models for Cisco corporate as well as Cisco Mexico, even though their intent is to manage compliance for Cisco at the Cisco Corporate level, the lifecycle report may show duplicate lifecycle records with the same install count.

Lifecycle report

Model domain		Date		Software Model	Domain
Cisco	SQL Server 2012	2014	10	SQL Server 2012	Cisco
Cisco Mexico	SQL Server 2012	2014	10	SQL Server 2012	Cisco
Walmart USA	SQL Server 2012	2014	5		
Walmart Mexico	SQL Server 2012	2014	20		

To learn more about software lifecycles, see Create software models in Software Asset Management classic. To learn about domain separation path setup, see Domain separation setup and administration.

Quick start test for Asset Management

Validate that Asset Management still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Asset Management

Asset Management quick start tests requires the Asset Management plugin (com.snc.asset_management).

Asset Management test

Name	Description	Release version
Asset Sourcing - Consume local asset stock	Validates the consume local asset stock flow.	Xanadu

Quick start tests

Contract Management

Manage and track contracts with the ServiceNow® Contract Management application.

A contract is a binding agreement between two parties. In the ServiceNow platform, contracts contain detailed information such as the following:

- Contract number
- Contract start and end dates
- Active status
- Terms and conditions statements
- Documents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Renewal information
- Financial terms

Contract Management is active by default. If the Cost Management plugin is activated, the Contract Management application integrates with the Cost Management plugin to associate contracts with costs and determine the total cost of ownership. You can track recurring expenses with expense lines. An administrator can activate the Cost Management plugin.

If you are using the Software Asset Management plugin, use the Software Licenses option.

Related topics

Create a new expense line

Software Asset Management

Use the Asset Contract Overview module

You can view information about your contract status in the Contract Management Overview module.

Before you begin

Role required: asset, contract_manager

About this task

Because the Contract Management Overview module is a type of homepage, you can add, delete, and rearrange reports on the page.

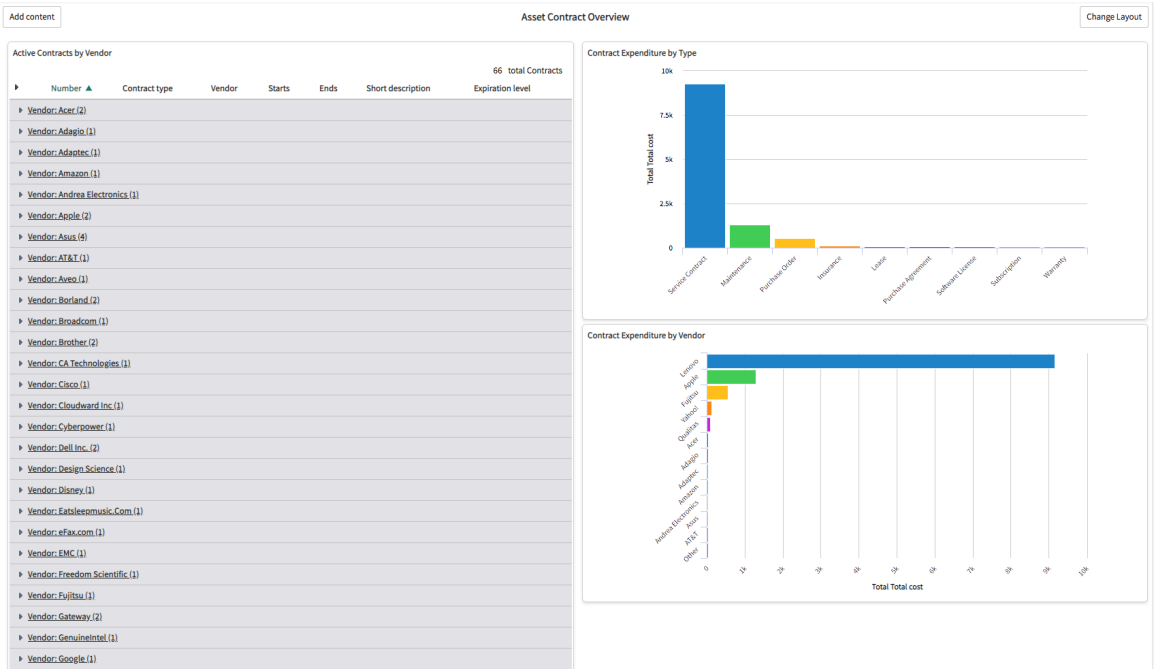
Procedure

1. Navigate to **All** > **Contract** > **Overview**.
2. Click elements within the reports to obtain more information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example

For example, click any of the colored bars in the **Contract Expenditure by Type** bar chart to see detailed information.



Components installed with Contract Management

Several types of components are installed with Contract Management.

Demo data is available.

Tables installed with Contract Management

Tables are added with Contract Management.

Table	Description
Asset Covered [clm_m2m_contract_asset]	Lists the assets covered by a contract. An asset can be covered by multiple contracts and a contract can have multiple assets. **Note:** The contract_manager, itil, inventory_admin, or procurement_user role can only access the reports. You must activate the Procurement (com.snc.procurement) plugin for the procurement_user role and the Hardware Asset Management Professional (com.sn_hamp) plugin for the itil and inventory_admin roles.
Asset Covered [clm_m2m_rate_card_asset]	Lists the rate cards that apply to an asset.
Condition [clm_condition_checker]	Lists the conditions and values for each condition checker.
Condition Checks [clm_condition_check]	Stores conditions and values that modify specified condition fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Contract [ast_contract]	Stores contract information.
Contract History [clm_contract_history]	Stores a copy of the contract when the start date, end date, or terms and conditions change.
Terms and Conditions [clm_terms_and_conditions]	Lists the terms and conditions used by contracts.
Terms and Conditions [clm_m2m_contract_and_terms]	Lists all terms and conditions available for use with contracts.
Users Covered [clm_m2m_contract_user]	Lists the users covered by contracts.

User roles installed with Contract Management

A user role is added with Contract Management.

Role	Contains Role	Description
contract_manager	financial_mgmt_user	Manages the contract life cycle. Can create, edit, and delete contracts.

Script includes installed with Contract Management

Script includes are added with Contract Management.

Name	Description
ConditionChecks	Checks for matching conditions, such as for contract expirations and license compliance, defined in the Condition Checks [clm_condition_check] table.
ContractManagementUtils	Utilities that manage contract management actions, such as state transitions.

Client scripts installed with Contract Management

Client scripts are added with Contract Management.

Name	Table	Description
Calculate Tax Cost - Base cost	Contract [ast_contract]	Calculates the **Tax cost** field and the **Total cost** field on the Contract form when the **Payment amount** field changes.
Calculate Tax Cost - Sales tax	Contract [ast_contract]	Calculates the **Tax cost** field and the **Total cost** field on the Contract form when the **Sales tax** field changes.
Calculate Tax Cost - Tax rate	Contract [ast_contract]	Calculates the **Tax cost** field and the **Total cost** field on the Contract form when the **Tax rate** field changes.
Ensure discount is valid percent	Contract [ast_contract]	Ensures that the **Discount** field does not contain a value less than zero or greater than 99.
Renew Cost Adjustment	Contract [ast_contract]	Sets the **Percentage** field on the Contract form to zero if the user sets a dollar amount for the cost adjustment.
Renew Cost Percentage	Contract [ast_contract]	Sets the **Amount** field on the Contract form to zero if the user enters a percentage for the cost adjustment.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Table	Description
Tax exempt/ rate	Contract [ast_contract]	Changes all tax-related fields on the Contract form to read-only if the **Tax Exempt** check box is selected.
Tax rate/exempt	Contract [ast_contract]	Changes all tax-related fields on the Contract form to writeable if the **Sales Tax** check box is selected.

Business rules installed with Contract Management

Business rules are added with Contract Management.

Name	Table	Description
Calculate projected costs (Reports)	Contract [ast_contract]	Calculates the projected monthly and annual costs for a contract when costs or payment schedule changes.
Calculate totals with tax	Contract [ast_contract]	Calculates the **Tax cost** and **Total cost** fields for a contract when the contract is created or updated.
Contract history	Contract [ast_contract]	Stores history when the start, end, or terms and conditions of a contract change.
Create approval record	Contract [ast_contract]	Updates contract **Terms and Conditions** and starts the contract approval workflow when a contract is sent for review.
Flag terms and conditions	Terms and Conditions [clm_m2m_contract_and_terms]	Sets the **Use** flag on a Terms and Conditions record to **true** after the record is associated with a contract or to **false** after the record is disassociated from a contract.
Activate count for manual licenses	Software License Instance [ast_license_software_instance]	Calculates and updates the number of computers a particular license is installed on when a software license instance is created or deleted.
Manage contract lifecycle	Contract [ast_contract]	This business rule: • Updates the end date of a contract when a contract extension has been approved. • Renews the contract, updating its start date, end date, and base cost (if cost adjustments must be applied) when a contract renewal has been approved and the renewal has reached its start date. • Runs the condition checks to evaluate if dates need to be changed when a contract is approved, or an extension or renewal is approved, or the start or end dates have changed.
Post outage to news	Service [cmdb_ci_service]	Posts a news article on the knowledge table when there is an outage.

Name	Table	Description
Update contract cost per asset	Asset Covered [clm_m2m_contract_asset]	Updates the cost per unit value based on the total cost and number of assets associated to the contract.
Update contract lifetime cost	Contract Rate Card [fm_contract_rate_card]	Calculates the lifetime cost of the contract by calculating the sum of the contract expense lines.
Updates after contract dates change	Contract [ast_contract]	Updates the **Date added** and **Date removed** fields for all assets and users associated with a contract if the contract end date changes.
Updates after rate card dates change	Contract Rate Card [fm_contract_rate_card]	Updates the related contract assets and users linked to the rate card when the end date is changed.
Verify contract's start and end dates	Contract [ast_contract]	Validates contract start and end dates and contract renewal start and end dates.
Verify purchase agreement discount price	Contract [ast_contract]	For contracts with the contract model **Purchase Agreement**, the business rule validates that the **Discount** field does not contain a value less than zero or greater than 99.

Contract renewal workflow

Use the contract renewal workflow to renew contracts that are nearing their expiry date or are already expired. This workflow enables you to renew contracts through a streamlined and managed process.

Renew your contracts by creating, validating, approving, and activating a contract record that references the original contract. This workflow enables you to manage related entities like hardware assets, software entitlements, terms and conditions, and rate cards.

Note:
The contract renewal workflow supports Software license, Subscription contract, Maintenance, and Warranty contract models.

Complete the following tasks in the contract renewal workflow to renew your contracts:

1. Contract renewal request: Create a contract renewal request for contracts that are nearing their expiry date or are already expired.
2. Contract selection: Renew multiple child contracts under the parent contract.
3. Build renewal: Supply the contract renewal information.
4. Asset selection: Add or remove hardware or enterprise assets from the contract renewal process, and view the assets carried over to the new contract.
5. Software assets selection: Add or remove software entitlements that you want to include in the contract renewal process, and view the entitlements carried over to the new contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Terms and conditions: Update the terms and conditions in your new contract, and view the terms and conditions carried over to the new contract.
7. Rate cards: Add rate card details to the new contract to track contract expenses.
8. Renewal confirmation: Review the renewal details after completing all the details of a contract.
9. Renewal approval: Approve or reject a contract renewal request for all Contract Renewal Request Lines.
10. Renewal purchase order: Receive the purchase order for assets covered in the contract.

Note:

- You can't edit a task after you close it.
- You can cancel a contract renewal process for a Contract, Contract Renewal Request, Contract Renewal Request Lines, and Contract Renewal tasks. For more information, see Results of canceling a contract renewal process.

Prerequisites

Before using the contract renewal workflow, you must complete the following prerequisites:

- Activate the Software Asset Management Professional (com.snc.samp) plugin on your ServiceNow instance.

  If you want to manage hardware or enterprise asset contracts, request and install the Hardware Asset Management or Enterprise Asset Management application from the ServiceNow Store instead.

- Enable the *sn_contract_enable_renewal_flow* system property.

  Note:
  If you're already using Software Asset Management, Hardware Asset Management, or both, this system property is set to false. If you're a new user, this system property is set to true.

Domain separation

Domain separation with data separation is supported for the contract renewal workflow with the following requirements:

- The request is created in the domain of the contract that initiated the renewal process.
- Request lines are in the domain of the contract of the request line.
- Tasks are created in the domain of the contract being renewed.

The *sn_contract_enable_renewal_flow* system property also supports domain separation.

Create a contract renewal request

Create a contract renewal request for contracts that are nearing their expiry date or are already expired.

Before you begin
Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can create a renewal request only for Maintenance, Warranties, Subscriptions, and Software Licenses. If you have installed only the Software Asset Management application, you can renew Subscriptions, Maintenance, and Software Licenses contracts. If you have installed only the Hardware Asset Management application, you can renew Maintenance and Warranties contracts. If you have installed only the Enterprise Asset Management application, you can renew Maintenance and Warranties contracts.

Procedure

1. Open the list of contracts that you want to renew.
   - If you are using the core UI, navigate to **All** > **Contracts** > **Contract Renewal**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **Overview** tab. In the Contract overview section, locate the Expiring contract widget.

     Alternatively, open the Contract management view and then select a tab for a contract type, such as **All** or **Maintenance**.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **Overview** tab. In the Contract overview section, locate the Expiring contract widget.

     Alternatively, open the Contract and lease management view and then select a tab for a contract type, such as **All** or **Maintenance**.
2. Select the contract that you want to renew with a type of either Maintenance, Warranties, Subscriptions, Software Licenses, or Service.
3. Click **Renew** for the selected contract.
4. Submit the contract renewal request.
   - If you are using the core UI or Hardware Asset Workspace, click **OK**.

     The contract renewal request includes the following information:
     - An auto-generated unique number
     - The Stage indicating the type of task in the contract renewal process
     - Reference to the contract for which you have requested the renewal
     - Date and time when the request was created
   - If you are using the Enterprise Asset Workspace, the Renew the Contract dialog box appears. In the dialog box, fill in the fields and then click **Submit for review**.

Renew the Contract dialog box

Field	Description
Approver	User who approves or rejects the contract renewal request.
Options	Duration of the contract renewal.
Renewal start date	Date on which the contract renewal begins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Renewal end date	Date on which the contract renewal ends.
Cost adjustment type	Type of cost adjustment that is applied to the contract. The options are **Fixed**, **Manual**, and **CPI** (consumer price index).
Cost adjustment percentage	Percentage increase or decrease in the contract price. To indicate a decrease in price, enter a negative percentage. **Note:** You can specify either a cost adjustment percentage or cost adjustment amount on a contract renewal request. You cannot specify both.
Cost adjustment amount	Numerical increase or decrease in the contract price. To indicate a decrease in price, enter a negative number. **Note:** You can specify either a cost adjustment percentage or cost adjustment amount on a contract renewal request. You cannot specify both.

5. **Optional:** Select the **Contract Renewal Request Lines** tab to view the parent Contract Renewal Request Line or existing and valid child contracts under the parent contract. A contract renewal request line is created for each contract that is being renewed.
6. **Optional:** View all open contract renewal flow tasks and the details of each contract renewal task by selecting the **Open Tasks** tab.
7. **Optional:** View all contract renewal flow tasks and the details of each contract renewal task by selecting the **All Tasks** tab.

Result
The substate of the contract that is being renewed is set to **Renewal in process**.

What to do next
If the parent contract doesn't have child contracts, select the Build renewal task.

If the parent contract has child contracts, select the Contract selection task.

Renew multiple child contracts

Renew multiple child contracts under the parent contract by using the Contract selection task.

Before you begin
Role required: asset, contract_manager

About this task
This task is created only when the contract that you want to renew has valid child contracts supported by the contract renewal workflow that are not already renewed or in draft state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On the Contract form, select the **Contract Renewal Requests** tab in the Related Links section to view the list of contract renewal requests.
2. Select a renewal request.
3. View all the child contracts linked to the selected contract by selecting the **Renewal contracts** tab on the Contract Renewal Task form.
4. Indicate the child contracts you want to renew.

   a. Open the record by selecting the preview icon ⓘ besides a child contract.

   b. Choose whether to include child contracts for renewal by entering Yes or No in the **Renewal Decision** field.
   You must provide a value for the **Renewal decision** field for each child contract.

5. Select **Update**.
   The Renewal decision column in the **Renewal contracts** tab displays your decision.
6. Select **Close Task**.

Result
The contract renewal request lines for parent and child contracts are listed in the Contract Renewal Request Lines tab. Each contract request line has its own flow of tasks.

What to do next
Supply contract renewal information

Supply contract renewal information

Supply the contract renewal information by completing the Build renewal task.

Before you begin
Role required: asset, contract_manager

About this task
Each contract renewal request line has its own flow of tasks.

Procedure

1. On the Contract Renewal Request Line form, select the Build renewal task number.
2. On the Contract Renewal Task form, select the **Renewal contract details** tab.
3. Provide the contract renewal information.

   You must fill in all the required fields before you close the task. If you are renewing the child contract, you must provide the end date and start date within the range of the start date and end date of the parent contract.

   Note:
   The Contract approver field is displayed only for the parent contract. The same Contract approver value is filled in automatically for any child contracts.

4. Select **Close Task**.

Result
New draft contracts are created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

Add or remove assets for a contract renewal

Add or remove assets for a contract renewal

Add or remove hardware or enterprise assets from the contract renewal process. You can also view the hardware or enterprise assets carried over to the new contract.

Before you begin

To add or remove hardware assets from the contract renewal process, request the Hardware Asset Management application from the ServiceNow Store. To add or remove enterprise assets from the contract renewal process, request the Enterprise Asset Management application from the ServiceNow Store.

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

The active and valid assets from the contract that are being renewed are carried over to the new contract, and are listed in the Assets Covered tab. Valid hardware and enterprise assets are the assets that are not removed from the contract before the end date, and are in the following states or substates:

- State
  - In stock
  - In transit
  - In maintenance
  - In use
- Substate
  - Available
  - Reserved
  - Pending transfer
  - None
  - Pending repair
  - Pending install

Invalid assets are not carried over to the draft contract and you must add them manually.

Procedure

1. Open the assets selection task or contract for which you want to add assets.
   - If you are using the core UI or Hardware Asset Workspace, select the assets selection task number on the Contract Renewal Request Line form.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view. Select the **All contracts** tab and then open the contract that you want to add assets to.
2. Select the **Assets Covered** tab.
3. If you are using the core UI or Hardware Asset Workspace, click **Edit**.
4. Update the hardware or enterprise assets in the contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Save**.
6. Edit the renewal cost of the assets.

> **Note:**
> This step is applicable only if you are using the core UI or Hardware Asset Workspace.

   a. Select the asset that you want to update the renewal cost for.
   b. In the **Renewal cost** field, update the renewal cost of the asset.
   c. Click **Update**.
7. Click **Save**.
8. If you are adding assets through the asset selection task on the Contract Renewal Request Line form, click **Close Task**.

Result
The Payment amount field in the Financial tab of the draft contract shows the total renewal cost of the hardware or enterprise assets you selected.

What to do next
Add or remove entitlements for a contract renewal

Add or remove entitlements for a contract renewal

Add or remove software entitlements that you want to include in the contract renewal process by using the Software assets selection task. You can also view the entitlements carried over to the new contract.

Before you begin
The Software Asset Management Professional (com.snc.samp) plugin must be activated.

Role required: sam_user, contract_manager

About this task
The entitlements with the following license types are carried over to the new contract:

- Perpetual and maintenance
- Perpetual and software assurance
- Only perpetual

Procedure
1. On the Contract Renewal Request Line form, select the Software assets selection task number.
2. Create an entitlement if you don't have any entitlements carried over to the draft contract.

   a. On the Contract Renewal Task form, select **Create Entitlement** in the **Planned Entitlements** tab.

   b. On the Software Entitlement form, fill in the required fields.

      For more information, see Software entitlement fields.

   c. Select **Save**.

      You can publish this entitlement after you complete the renewal request because this entitlement is associated with an existing renewal process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The entitlement is now listed in the Planned Entitlements list.

3. **Optional:** Update the existing entitlements for the draft contract.

4. Select **Save**.
5. Select **Close Task**.

What to do next
Update terms and conditions

Update terms and conditions

Update the terms and conditions in your new contract. You can also view the terms and conditions carried over to the new contract.

Before you begin
Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the task or contract for which you want to add terms and conditions.
   - If you are using the core UI or Hardware Asset Workspace, select the Terms and conditions task number on the Contract Renewal Request Line form. Select the **Renewal contracts terms** tab and then click **Edit**.
   - If you are using the Enterprise Asset Workspace, navigate to the Contract and lease management view and then select the **All contracts** tab. Open the enterprise asset contract that you want to add terms and conditions to and then select the **Terms and Conditions** tab.
2. Update the terms and conditions in the contract.

3. Select **Save**.
4. If you are adding terms and conditions through the Terms and conditions task on the Contract Renewal Request Line form, click **Close Task**.

Result
Multiple terms and conditions are displayed in the **Terms and Conditions** tab of the contract.

What to do next
Add rate cards to the new contract

Add rate cards to the new contract

Add rate card details to the new contract by using the Rate cards task to track contract expenses.

Before you begin
The Cost Management (com.snc.cost_management) plugin must be active.

Role required: asset, contract_manager

About this task
The rate card details aren't carried over to the new contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adding rate card details to a contract isn't a required procedure. You can close this task if you do not need to add a rate card to the draft contract.

Procedure

1. On the Contract Renewal Request Line form, select the Rate cards task number.
2. On the Contract Renewal Task form, select the **Renewal rate cards** tab.
3. Select **New**.
4. On the Contract Rate Card form, fill in the financial details.
   For a description of the field values, see Contract Rate Card form.
5. Select **Submit**.
6. Select **Close Task**.

Result
The rate card is attached to the draft contract.

What to do next
Review contract renewal details

Review contract renewal details

Review the renewal details after completing all the details of a contract by using the Renewal confirmation task. You can then either approve them or mark the details for further review.

Before you begin
Role required: asset, contract_manager

About this task
This task must be completed before the contract renewal request is eligible for approval.

Procedure

1. On the Contract Renewal Request Line form, select the Renewal confirmation task number.
2. On the Contract Renewal Task form, verify the renewal details.
3. **Optional:** Review the list of entitlements in the draft contract by accessing the **Planned Entitlements** tab.
4. Determine whether to close this task.

5. Select **Close Task**.

Result
When you have closed the task, the Contract Renewal Request Line processing is complete because all the contract renewal tasks are closed. The stage of the Contract Renewal Request Line is set to Awaiting approval. After all the Contract Renewal Request Lines are processed for a contract renewal request, the Approval task is created under Contract Renewal Requests.

What to do next
Approve or reject a contract renewal request

Approve or reject a contract renewal request

Approve or reject a contract renewal request for all Contract Renewal Request Lines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

The Renewal approver field must contain a value. If you need to change the approver, navigate to the parent contract and adjust the value there.

Role required: asset_manager (core UI and Hardware Asset Workspace only), contract_manager (core UI or Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Verify your contract renewal details.
   - If you are using the core UI or Hardware Asset Workspace, select the **Open Tasks** tab on the Contract Renewal Request form. Select the contract renewal request number to view the contract renewal details and then click **Close Task**.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view. Select the **All contracts** tab and then open the enterprise asset contract that you want to renew. View the contract renewal details in the Renewal section of the **Details** tab.

   An approval request is triggered and the substate of the draft contract changes to Under review.
2. Open the list of contract and contract renewal requests.
   - If you are using the core UI or Hardware Asset Workspace, navigate to **All** > **Contract** > **My Approvals**.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **My contract approvals** tab.
3. Select the contract renewal request waiting for approval.
4. Evaluate any contract renewal request lines and contract renewal tasks.
5. Either approve or reject the contract renewal request.
6. **Optional:** Go to the **Approval History** tab to view the approval or rejection history of the contract and child contracts.

What to do next

Receive a purchase order for contract assets

Receive a purchase order for contract assets

Receive the purchase order for assets covered in the contract by using the Renewal purchase order task. This task is available if you have added at least one hardware asset, created an entitlement, or selected an existing entitlement that is in the Build state.

Before you begin

This task is not created if you haven't selected or added any hardware assets or entitlements or the Procurement plugin (com.snc.procurement) is not active. You must instead manually track the financial expenses.

Role required: procurement_user

Procedure

1. On the Contract Renewal Request form, select the **Open Tasks** tab.
2. Select the contract renewal request number.
3. Select the **Purchase orders** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the purchase order number to capture the financial transactions of the contract.

   For every asset record covered under a contract, a purchase order line item is created. The cost of each purchase order is the renewal cost of each asset covered.

   The purchase order line items are created for the entitlements that are in the Build state. Each entitlement added in the Planned Entitlements tab corresponds to a unique purchase order line.

5. Select **Order**.
6. Select **Receive** to receive the purchase order for assets covered by the contract.
   Receiving the purchase order only updates the assets and does not create an entitlement.

Result

The draft entitlement is published and the status is set to In use.

The purchase order receipt is listed in the **Receiving Slips** tab.

The status of the purchase order and purchase order line items shows as Received. The state of the Renewal purchase order task automatically changes to Closed Complete. The contract renewal request flow is complete.

The substate of the old contract is set to Renewed. A contract history record is created that displays the start and end dates of the old contract and the renewed contract, and the renewal date. You can view the entire history of the contract by selecting the Contract History tab in the Related Links section.

After you receive the purchase order, the state of the renewal contract is no longer Draft and the contract becomes active. If the start date of the renewed contract has been reached but the purchase order has not been received, the status of the contract renewal request remains set to Draft. After the new contract becomes active, the old contract becomes expired and the covered assets have an end date.

Results of canceling a contract renewal process

Cancelling a contract renewal process results in a change in the state of Contract, Contract Renewal Request, Contract Renewal Request Lines, and Contract Renewal tasks.

Contract cancellation results

Canceled item	Result
Contract Renewal Request	• The entire renewal request is canceled. • The substate of the contract that is being renewed is cleared. • All the draft contracts are canceled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contract cancellation results (continued)

Canceled item	Result
Contract Renewal Request Line	• The Contract Renewal Request Line is canceled. • When all Contract Renewal Request Lines are canceled, the Contract Renewal Request is canceled. • The renewal of immediate child draft contracts is canceled.

Contract Renewal Task	• The Contract Renewal Task and the Contract Renewal Request Line are canceled.
	  ○ If the Contract Renewal Request has only one Contract Renewal Request Line, the stage of the Contract Renewal Request changes to Canceled.
	  ○ If the Contract Renewal Request has multiple Contract Renewal Request Lines, the stage of the Contract Renewal Request doesn't change.
	• The renewal of immediate child draft contracts is canceled.
	• The state of the draft contract changes to Canceled.
	• The state of the tasks that are already closed does not change.
	• The state of the open tasks changes to Closed Incomplete.
	• Rate cards are attached to the draft contract become inactive.
	• The state of the contract that was being renewed moves to the original state and the substate is cleared.
	• The associated entitlements with the Contract Renewal Task are removed.

Contract	• The renewal of immediate child contracts is canceled when child contracts are included in the Contract Renewal Request. • The Contract Renewal Request Line is canceled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contract cancellation results (continued)

Canceled item	Result
	• Any initiated Contract Renewal Request by this contract is canceled. • The purchase order of the contract and immediate child contracts is canceled.

Contract Management use

Users with the contract_manager role can use the Contract Management application to create various types of contracts, such as leases, warranties, maintenance, and service.

You can add the following information to contracts.

- Assets covered by the contract
- Users covered by the contract
- Terms and conditions associated with the contract
- Other documents related to the contract

Track the various stages of a contract from draft to closure by viewing contract history and running reports. Adjust, extend, and renew active contracts.

Contract life cycle

From creation until closure, contracts follow a life cycle that determines which fields can be edited.

When a contract is in **Draft** state, almost all fields on the contract record can be edited. After a contract moves past the **Draft** state, certain date, renewal, extension, and financial fields become read-only. The **State** field and **Substate** field are read-only.

The **Contract Compliance Checks** schedule job runs on the Contract [ast_contract] table automatically each night. For more information about the scheduled job, see Use Condition Check Definitions. The scheduled job performs the following actions:

- Changes the contract state to **Active** if the contract is approved and reaches the specified start date.
- Renews the contract if the contract is approved for renewal and reaches the specified start date.
- Changes the contract state to **Expired** if the contract state is **Active** and reaches the end date.

The system property *contract_compliance_check_job.enable_override* enables the Contract Compliance Checks job to override checks in a hierarchy. By default, this system property is set to **True**. When checks are defined on the same field of the parent and child tables, the Contract Compliance Checks job performs the following:

- For the records on the parent table, the condition check on the table sets the field with the value specified in the condition.
- For the records on the child table, the condition check on the child table overrides the parent table condition and sets the field value on the child table accordingly.

For example, when a check is defined on the Description field of the Contract (parent) and Lease (child) tables, the field on the Lease table is set to the value specified in the child table

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

condition. To disable the contract compliance check override functionality, set the system property contract_compliance_check_job.enable_override to **False**.

Expense lines are only generated from contracts that are active or expired.

Contract states

State	Description
Draft	User adds information about the contract and specifies an approver.
Active	Contract was approved and has reached the specified start date.
Expired	Contract reached the specified end date. Expired contracts with an active renewal workflow that are waiting for approval have a substate of **Awaiting Review**. Expired contracts with an active renewal workflow where the renewal was approved, but the renewal date hasn't yet passed, have a substate of **Renewal Approved**. Expired contracts with no active renewal or extension pending workflow have an empty substate.
Canceled	Contract was discontinued and is no longer active.

In addition to a state, a contract can also have a substate.

Contract substates

Substate	Description
Awaiting Review	Contract is being prepared for review.
Under Review	Contract sent to the approver and the approver is reviewing the contract.
Approved	Contract reviewed and accepted by the approver.
Rejected	Contract reviewed and declined by the approver.
Renewal Approved	Contract renewal approved by the approver.
Renewal Rejected	Contract renewal rejected by the approver.
Renewal in process	Contract renewal is in progress through the contract renewal workflow.
Renewed	Contract renewal is complete through the contract renewal workflow.
Extension Approved	Contract extension approved by the approver.
Extension Rejected	Contract extension rejected by the approver.
None	No substate is specified.

Contracts

A contract is a binding agreement between two parties.

In the ServiceNow AI Platform, contracts contain detailed information such as contract number, start and end dates, active status, terms and conditions statements, documents, renewal information, and financial terms.

Working with contracts includes the following tasks and processes.

Create a contract

Create a contract with various contract models, which would act as a binding agreement between the two parties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required:

- For Core UI and Hardware Asset Workspace: admin, contract_manager
- For Enterprise Asset Workspace: sn_eam.enterprise_admin, sn_eam.enterprise_asset_manager
- For Software Asset Workspace: sam_admin, sam_user

About this task
If a contract has one or more associated rate cards, the fields on the Contract form can't be edited.

Procedure
1. Open the list of contracts that are used across your deployment.
   - If you're using the Core UI, navigate to **All** > **Contract** and select a contract type, such as **Insurance**, **Maintenance**, or **Service**, or select **All**.
   - If you're using Hardware Asset Workspace, navigate to the **Contract management** view and then select the **All contracts** tab.
   - If you're using Enterprise Asset Workspace, open the **Contract and lease management** view and then select the **All contracts** tab.
   - If you're using Software Asset Workspace, navigate to **License operations** > **Contracts** > **Software contracts** and select **New**.
2. Select **New**.
3. On the form, fill in the fields.
   Not all fields appear on all contract type forms.

Contract or Create New Contract form

Field	Description
Contract model	Model the contract is assigned to. For example **Lease**, **Maintenance**, **Warranty**, **Service Contract Software License**, or **Subscription**.
Vendor	Vendor responsible for the contract. This field is required when **Purchase Agreement** or **NDA** is selected from **Contract model**.
Contract number	Number assigned to the contract by the vendor (required).
Name	Name of the contract.
Parent contract	Parent contract of the new contract, if applicable. You can select a parent contract from the contract lookup list.
Start date	Date on which the contract takes effect. This field is required when **Purchase Agreement** or **NDA** is selected from **Contract model**.
End date	Date on which the contract expires. Leave the end date empty to create an open-ended contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field is required when **Purchase Agreement** or **NDA** is selected from **Contract model**.
State	Current state of the contract. ○ Draft ○ Active ○ Expired ○ Canceled
Substate	Current substate of the contract. ○ Awaiting Review ○ Under Review ○ Approved ○ Rejected
Contract administrator	Person responsible for managing the contract and interacting with the vendor.
Approver	User who approves or rejects the contract. This list is filtered to only show users with the itil role.
Business owner	User who manages the contract from a business perspective.
Agreement type	Agreement type of license: ○ Enterprise ○ SaaS ○ Subscription This field appears only when **Maintenance** and **Software License** is selected from **Contract model**.
Commitment	Amount committed to spend with this vendor during this time period, from the start to the end of the contract. This field appears only when **Purchase Agreement** is selected from **Contract model**.
Discount	Discount the vendor has agreed to provide. This field appears only when **Purchase Agreement** is selected from **Contract model**.
Process non-contractual SLAs	Option to process both contractual and non-contractual Service Level Agreements (SLAs). This field appears only when **Service Contract** is selected from **Contract model**.
Description	Detailed description of the contract.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Financial section	
Invoice payment terms	Terms that explain how to pay the contract. For example, **Net Monthly Account** or **Net 30**.
Payment schedule	Schedule that defines when to make payments. For example, **Monthly** or **Annually**.
Payment amount	Amount that has been paid on the contract to date.
Applicable taxes	Indicates if the contract is exempt from taxes or subject to sales tax.
Effective tax rate	Effective tax rate to apply to the total cost, if applicable. Effective tax rate is usually the average tax rate charged. This field appears only when **Sales** is selected from **Applicable taxes**.
Tax cost	Total cost of the tax. This field appears only when **Sales** is selected from **Applicable taxes**.
Total cost	Final cost of the contract after adjustments have been applied. If a contract has one or more rate cards, this field shows the combined value of all rate cards. This field appears only when **Sales** is selected from **Applicable taxes**.
Vendor account	Vendor account associated with the contract.
PO Number	Purchase order number assigned to the contract.
Cost center	Cost center that is financially responsible for the asset.
Has rate card	Check box to indicate whether the contract has an associated rate card.
Renewal section	
Automatically renew	Indicates if the contract can be renewed or extended at the end of its term.
Options	Duration of the contract renewal or extension. For example, 1 year.
Renewal start date	Date on which the contract renewal or extension takes effect.
Renewal end date	Date on which the contract renewal or extension ends.
Cost adjustment type	Type of cost adjustment applied to the contract. ○ Fixed ○ Manual ○ CPI (Consumer Price Index)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Cost adjustment amount	Numerical increase or decrease in price of contract. To indicate a decrease in price, enter a negative number. Either a **Cost adjustment** or **Cost adjustment percentage** can be specified, but not both.
Cost adjustment percentage	Percentage increase or decrease in price of contract. To indicate a decrease in price, enter a negative percentage. Either a **Cost adjustment** or **Cost adjustment percentage** can be specified, but not both.
Terms and Conditions section	
Terms and conditions	Specific legal information in the contract.

4. Save the form.
   - If you're using Core UI, right-click the form header and select **Save**.
   - If you're using Hardware Asset Workspace, Software Asset Workspace, or Enterprise Asset Workspace, select **Save**.
5. Continue entering information in the related lists or tabs that appear.

Contract form related lists or tabs

Related list or tab	Description
Assets Covered	Lists all assets covered by this contract.
Users Covered	Lists all users covered by this contract.
Contract used by	Lists all configuration items (CI) used in this contract.
Terms and Conditions	Lists all terms and conditions of this contract.
Expense Lines	Lists all expense lines in this contract.
Contract History	Displays the changes to the start and end dates of this contract and changes to the terms and conditions.
Approval History	Lists all approvals for this contract.
Service Offerings	Lists all service offerings from this vendor. Activate Service Portfolio Management to see this related list.
Service Commitments for Contracts	Lists all service commitments for this vendor's offerings. Activate Service Portfolio Management to see this related list.

6. Perform one of the following actions.
   - Select **Update** to save and exit the contract.
   - Select **Submit for Review** to send a notification to the approver.

Contracts

Create a software maintenance contract example

One common use case for the Contract Management application is creating a contract to track maintenance payments for enterprise software. You can use this example to learn how to create a software maintenance contract.

Before you begin

Role required: contract_manager or admin

About this task

The goal of this example is to create a contract that shows the total amount of maintenance that must be paid for the software application, independent of different license purchases made over time. The Software Asset Management plugin must be activated to use this example.

Procedure

1. Create an application model, adding a **Name** and specifying **Software License** in **Model categories**.
2. Create a software model, adding a **Name** and **Model Number**, and selecting the application model created in step 1.
3. Create a new software entitlement by selecting the software model created in step 2.
4. Navigate to **Contract** > **Contracts** > **Maintenance**.
5. Click **New** and enter the following information.

Option	Description
Agreement Type	Select **Enterprise**.
Application Model	Select the application model created in step 1.

6. Right-click the form header and click **Save**.
   A number of related lists and sections appear.
7. In the **Asset Covered** related list, click **New** and enter the following information.

Option	Description
Asset	Select the software license created in step 3.
Date added	Enter the value.

8. Click **Submit**.
9. Continue completing the form with the following information.

Option	Description
Payment schedule	Select **Annually**.
Payment amount	Enter the value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Complete the other fields as appropriate.
11. Click **Update**.
12. Submit the contract for review.

Software Asset Management

Add an asset to a contract

You can associate contracts with specific assets, including software licenses.

Before you begin
Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task
Linking a contract with assets clarifies what the contract legally covers.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract Management** > **Contract** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add assets to the contract.
   - If you are using the core UI, use the following steps:
     a. In the **Assets Covered** related list, click **New**.
     b. In the **Asset** field, select a specific asset that is covered by the contract.
     c. In the **Date added** field, select the date the asset was added to the contract.

        The date can be in the past, the present, or the future.
     d. (Optional) In the **Date removed** field, select the date the asset was, or will be, removed from the contract.

        Specifying the **Date added** and **Date removed** fields is useful for reporting.
     e. Click **Submit**.
   - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, use the following steps:
     a. In the **Assets Covered** tab, click **New**.
     b. In the dialog box, select the check box for each asset that you want to add to the contract.
     c. Click **Add**.

Add a user to a contract

A contract can cover specific users. For example, you may use a contract to hire a group of temporary workers.

Before you begin

Role required: contract_manager or admin

Procedure

1. Navigate to **Contract Management** > **Contract** > **All**.
2. Select a contract.
3. In the **Users Covered** related list, click **New**.
4. In the **User** field, select a specific user covered by the contract.
5. In the **Date added** field, select the date the user was added to the contract.
   The date can be in the past, the present, or the future.
6. **Optional:** In the **Date removed** field, select the date the user was, or will be, removed from the contract.
   Specifying the **Date added** and **Date removed** fields can be useful for reporting.
7. Click **Submit**.

Add a configuration item to a contract

Contracts can be associated with configuration items. You can link a contract with configuration items to clarify what the contract legally covers.

Before you begin

Role required: admin or contract_manager

Procedure

1. Navigate to **Contracts** > **All**.
2. Select a contract.
3. **Optional:** In the **CIs Covered** related list, select **New** to create a configuration item.
4. In the **CIs Covered** related list, select **Edit**.
5. In the **Collection** configuration items list on the left, double-click a configuration item name.
   The item is added to the **CIs Covered List** on the right.
6. Select **Save**.

Add a document to a contract

Contracts can be associated with documents. Linking a contract to related documents helps keep all relevant information about a contract together and easily accessible.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **All** > **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add a document to the contract.
   - If you are using the core UI, use the following steps:
     a. Click the Manage Attachments ( ) icon on the form header.
     b. In the Attachments dialog box, click **Choose file** to search for and select the document that you want to add to the contract.
   - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, use the following steps:
     a. Click the Attachment ( ) icon on the sidebar of the contract record.
     b. In the Attachments window, click **Select** to search for and select the document that you want to add to the contract.

Adjust a contract

After creating a contract, you can change the start date, end date, or payment amount for a contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

To adjust a contract, the **State** should be **Active**. If the end date of a contract changes, the end date of any associated assets changes to match the new end date.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract in the **Active** state.
3. Click **Adjust**.
4. In the Adjust the Contract dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Adjust the contract fields

Field	Description
Contract Start Date	Date on which the contract takes effect.
Contract End Date	Date on which the contract expires.
Contract Payment Amount	Total amount paid for the contract. If the contract has one or more rate cards, this field shows the total of all rate card base costs.

5. Click **Submit Adjustments**.

Renew a contract

After you have created a contract or the contract has expired, you can renew the contract.

Before you begin

Role required: admin, contract_manager (core UI or Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

- When a contract is renewed, a new contract isn't created. Instead, the same contract is updated with renewal information.
- The changes to the start date and end date of a contract is captured in the Contract History tab.
- Contract information and history is retained when a contract is renewed. If the end date of the contract changes, the end date of any associated assets changes to match. You can renew a contract that meets the following conditions.
  - **State** is **Active** or **Expired**
  - **Substate** is **None** or **Rejected**
- If the system property *sn_contract_enable_renewal_flow* is enabled, the contract renewal workflow is available for maintenance & warranty contracts. For more information, see Contract renewal workflow.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.

     Alternatively, select the **Overview** tab of the Contract management view. In the Contract overview section, locate the Expiring contract widget to view the list of contracts that are expiring.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.

  Alternatively, select the **Overview** tab of the Contract and lease management view. In the Contract overview section, locate the Expiring contract widget to view the list of contracts that are expiring.

2. Select a contract in the **Active** or **Expired** state.
3. Click **Renew**.
4. On the Renew the Contract form (core UI) or dialog box (Hardware Asset Workspace and Enterprise Asset Workspace), fill in the fields.

Renew the Contract fields

Field	Descriptions
Approver	User who approves or rejects the contract.
Options	Length of time for the renewal, in years.
Renewal start date	Date on which the renewed contract takes effect.
Renewal end date	Date on which the renewed contract expires.
Cost adjustment type	Type of cost adjustment applied to the renewed contract: **None**, **Fixed**, **Manual**, or **CPI**.
Cost adjustment percentage	Percentage increase or decrease in price of the renewed contract. To indicate a decrease in price, enter a negative percentage. A **Cost adjustment amount** or **Cost adjustment percentage** can be specified, but not both.
Cost adjustment amount	Numerical increase or decrease in price of the renewed contract. To indicate a decrease in price, enter a negative number. A **Cost adjustment amount** or **Cost adjustment percentage** can be specified, but not both.

5. Perform one of the following steps.
   - To save all entered data and change the substate to **Under Review**, click **Submit for Review**. The contract is sent to the specified **Approver**.
   - To save all entered data and change the substate to **Awaiting Review**, click **Save**. The **Renew** button is available to submit the renewed contract for review later.
6. Change any information on the **Contract** form, as necessary.
7. Click **Update**.

What to do next

If you selected the **Save** option, ensure that you click **Renew** when you are ready to submit the contract renewal for approval.

Cancel a contract

You can cancel a contract when the **State** is **Active**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

After a contract is canceled, the following process occurs.

- The contract **State** changes to **Canceled**.
- Condition checkers are changed to inactive.
- **Renew** and **Extend** buttons become inactive.
- Contract rate cards become inactive.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Click **Cancel Contract**.
4. Click **Yes** to confirm the contract cancellation.

Verify contract administrator assignment for notification

An event runs automatically each night to send reminders to contract administrators about contract expiration dates so they can renew or renegotiate the contract. You can verify that the right contract administrator is assigned to the contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

When the contract.expiration event runs on the Contract [ast.contract] table each night, an email message is sent to the person identified as the contract administrator. This email is sent at the following times.

- 90 days ahead of the contract expiration date
- 60 days ahead of the contract expiration date
- 30 days ahead of the contract expiration date
- On the contract expiration date

A user with the admin role can edit the contract.expiration condition check that processes contract notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Check that the **Contract administrator** field contains the correct name.
   A single name can be specified.

Email and SMS notifications

Send the contract for approval

You can send a contract that is in **Draft** state for approval.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract in the **Draft** state and **Awaiting Review** substate.
3. Select an **Approver** for the contract.
4. Click **Submit For Review**.
   An email message is sent to the selected approver and the contract **Substate** changes to **Under Review**.

Approve or reject a contract

If you are the contract manager, you can approve or reject a contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the list of contract and contract renewal requests.
   - If you are using the core UI, navigate to **All** > **Contract** > **My Approvals**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **My approvals** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **My contract approvals** tab.
2. Select a contract in the **Requested** state.
3. Approve or reject the contract.
   - Approve the contract.
     - To approve the contract in the core UI, click **Approve**. The contract **Substate** changes to **Approved**.
     - To approve the contract in the Hardware Asset Workspace or Enterprise Asset Workspace, set the **State** field to **Approved**.
   - Reject the contract.
     - To reject the contract in the core UI, click **Reject** and enter a rejection reason in the **Comments** field. The contract **Substate** changes to **Rejected**.
     - To reject the contract in the Hardware Asset Workspace or Enterprise Asset Workspace, set the **State** field to **Rejected**.
4. Click **Update** (core UI) or **Save** (Hardware Asset Workspace and Enterprise Asset Workspace).
   - A contract with the state set to **Draft** and a start date set in the future is kept in **Draft** until the start date is reached. If the contract has a **Substate** of **Approved**, the system changes the **State** to **Active** and removes the **Substate** value.
   - When a contract with a **State** of **Draft** and a **Start Date** set to a date in the past is approved, the contract **State** is automatically set to **Active** and **Substate** is left blank.

View approval history on contracts

You can view the approval history for a contract in the Approval History related list on the Contract form.

Before you begin

Role required: workflow_admin, admin, or sn_eam.enterprise_admin (Enterprise Asset Workspace only)

About this task

After a contract is sent to an approver for review, the approver name cannot be changed. If the approver rejects a contract, the same approver or a different approver can be specified before the contract is sent for approval again. Once the contract has been reviewed and approved, approval history records are automatically listed in the Approval History related list on the Contract form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Select the **Approval History** tab.
4. Click a record to view the approval details.

Terms and conditions

You can add terms and conditions to a contract to keep all documentation that is relevant to a contract in one location.

The terms and conditions can be searched and used in reports. If multiple terms and conditions records are added to a single contract, set an order for the records so they appear in a specific sequence. The terms and conditions fields become read-only after a contract is sent for approval.

Users with the contract_manager role can read contract history and add terms and conditions.

There are three procedures involved in adding terms and conditions to a contract:

Create a terms and conditions record

You can create a terms and conditions record to add to a contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of terms and conditions for your contracts.
   - If you are using the core UI, navigate to **All** > **Contract** > **Contracts** > **Terms & Conditions**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **Terms and conditions** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **Terms and conditions** tab.
2. Click **New**.
3. On the Terms and Conditions form (core UI) or Create New Terms and Conditions form (Hardware Asset Workspace and Enterprise Asset Workspace), fill in the fields.

Terms and Conditions or Create New Terms and Conditions form

Field	Description
Number	Unique ID used for the terms and conditions. This field is automatically generated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Name	Name for the terms and conditions.
Contract	Link to the contract.
Used	Check box to indicate if the terms and conditions are associated with contract.
Description	Details of the terms and conditions.

4. Click **Submit** (core UI) or **Save** (Hardware Asset Workspace and Enterprise Asset Workspace).

Add terms and conditions to a contract

After you create a terms and conditions record, add the record to a contract that is in the Awaiting Review, Rejected, Renewal Rejected, or Extension Rejected substate.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

Terms and Conditions can only be added to a contract when it is being created. After the contract is approved, the terms and conditions cannot be changed.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add terms and conditions to the contract.
   - If you are using the core UI, use the following steps:
     a. In the **Terms and Conditions** related list, double-click **Insert a new row**.
     b. Click the reference lookup icon and select a terms and conditions record from the list.
     c. (Optional) Enter a number in **Order** to specify the sequence in which the record should appear in the terms and condition document.

     Note:
     If you attempt to enter a duplicate terms and conditions record for a contract and save the record, an error message appears and the new duplicate record is not added.

   - If you are using the Hardware Asset Workspace, use the following steps:
     a. On the **Terms and Conditions** tab, click **Add**.
     b. When prompted, provide the required information.
   - If you are using the Enterprise Asset Workspace, use the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the **Terms and Conditions** tab, click **Add**.

b. In the dialog box, select the check box for each term and condition that you want to add.

c. Click **Add**.

Build a terms and conditions document within a contract

After adding one or more terms and conditions records to a contract, you can build a terms and conditions document within the contract.

Before you begin

Role required: admin, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

The terms and conditions records are added in the sequence specified in the **Order** field.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract Management** > **Contract** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Verify that one or more terms and conditions records have been added to the **Terms and Conditions** tab.
4. On the **Terms and Conditions** tab, build the terms and conditions for the contract.
   - If you are using the core UI, click the **Build Terms and Conditions** related link.
   - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, click **Build Terms and Conditions**.

   All records from the Terms and Conditions list are added to the Terms and Conditions for the contract.
5. Click **Update**.

Create a contract rate card

You can create rate cards to track contract expenses. Rate cards help to record and allocate costs.

Before you begin

You must activate the Cost Management plugin to use rate cards.
Role required: financial_mgmt_user, asset, or contract_manager

About this task

A contract rate card provides detailed price information for a contract and enables you to generate expense lines for recurring expenses automatically. There can be multiple rate cards for the same contract.

Consider the following case: an organization has a contract with a third-party company, which oversees technical operations in the organization's data centers. The contract costs to use a

specific server model in the New York data center are different from using the same server model in the Madrid data center. There are two rate cards to detail these costs separately.

Procedure

1. Navigate to **Contract Management** > **Contract** > **All**.
2. Select a contract.
3. In the **Contract Rate Cards** related list, click **New**.
4. On the Contract Rate Card form, fill in the fields.
   For a description of the field values, see Contract Rate Card form.
5. Click **Submit**.

Contract Rate Card form

The Contract rate card form enables you to generate expense lines for recurring expenses automatically by providing detailed price information for a contract. There can be multiple rate cards for the same contract.

Field	Description
Number	Contract rate card number.
Contract	Internal contract number.
Summary type	Contract rate card type. Categorizing rate cards can be useful for reporting. Select **Grow Business**, **Run Business**, or **Transform Business**.
Name	Descriptive name for the contract rate card.
Active	Option that indicates whether the rate card is available for use.
Short description	Brief description of the contract rate card.
Start date	Date on which the contract rate card becomes active. Expense lines are generated for the costs incurred beginning on the date specified. For financial calculations to work, the date cannot be before the start date of the contract.
End date	Date on which the contract rate card becomes inactive. For financial calculations to work, the date cannot be after the end date of the contract. If no value is entered, the date is automatically set to the end date of the contract if the contract has an end date. No expense lines are generated for costs incurred after the end date.
Interval	The amount of time between rate card charges. For example, **Monthly**, **Quarterly**, or **Annually**.
Cost center	The cost center financially responsible for the rate card.
Last processed	The most recent date on which the rate card was charged.
Next process	The next date on which the rate card will be charged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Detailed information about the rate card.
Sales tax	Option that indicates whether to apply sales tax to the total cost.
Tax rate	The effective tax rate to apply to the total cost. This tax rate is usually the average tax rate charged.
Distribute cost	The method for distributing the amount listed in the **Base cost** field and generating expense lines.
Value	Type of value to use when **Allocate and distribute cost based on value** is selected in the **Distribute cost** field.
Base cost	The amount that must be paid before taxes.
Tax cost	Total cost of the tax.
Total cost	Final cost of the rate card after adjustments such as taxes have been applied.

Create a new expense line

Typically, expense lines are automatically generated based on assets or users, but you can create a new expense line manually if needed.

Before you begin

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract Management** > **Contract** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. In the **Expense Lines** related list (core UI) or tab (Hardware Asset Workspace and Enterprise Asset Workspace), click **New**.
4. Complete the form.

Expense line table

Field	Description
Number	The unique number identifying the expense line.
Date	The date on which the expense line was created.
Rate Card	The identification number of the rate card to which the expense line is associated.
Rate type	The rate type that is considered during the expense line generation. This field is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source ID	The identification number of the item associated with the expense line. If this field is filled in, corresponding information is automatically added to the **Source** fields on this form.
Amount	The monetary value of the item specified in the **Source ID** field. Enter a negative value to indicate a credit.
Process date	The date the expense line is processed.
Inherited	Check box that indicates whether the expense line is on another expense line.
State	The current state of the expense line, either **Pending** or **Processed**.
Summary type	The expense line category: **Grow Business**, **Run Business**, or **Transform Business**. Categorizing expense lines can be useful for reporting.
Short description	A brief description of the expense line.
Asset	The identification number of the asset associated with the expense line, if any.
Fixed asset	Fixed asset that contains the asset in this expense line. A fixed asset is a container that holds one or more individual assets, including hardware or software assets. The system auto-populates this field with the appropriate fixed asset if the named **Asset** is contained within that fixed asset.
Contract	The identification number (not the contract number) of the contract associated with the **Asset**, if any.
User	The name of the user associated with the **Asset**, if any.
Configuration Item	The name of the configuration item associated with the expense line, if any.
Task	The identification number of the task associated with the expense line, if any.
Cost center	The cost center financially responsible for the item identified in **Source ID**, if any.

5. Click **Submit** (core UI) or **Save** (Hardware Asset Workspace and Enterprise Asset Workspace).

Generating expense lines based on assets or users

An expense line is an expense amount at a given point in time and the record that incurred or generated the expense. You can generate expense lines based on assets or users assigned to the contract.

Before you begin
Role required: financial_mgmt_user, asset, or contract_manager

About this task
Generating expense lines is a three-step procedure.

Procedure

Add a user or asset to a contract

You can add a user or asset to a contract to generate expense lines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: asset, financial_mgmt_user (core UI and Hardware Asset Workspace only), contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract Management** > **Contract** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Add assets or users to the contract.
   - If you are using the core UI, use the following steps:
     a. In the **Assets Covered** or **Users Covered** related list, click **New**.
     b. Specify an **Asset** or **User**.
     c. Specify a **Date Added**.
     d. Click **Submit**.
     e. (Optional) Repeat the previous steps to add more assets or users to the contract.
   - If you are using the Hardware Asset Workspace or Enterprise Asset Workspace, use the following steps:

     Note:
     You cannot add users to a contract in the Enterprise Asset Workspace.

     a. In the **Assets Covered** or **Users Covered** tab, click **New**.
     b. In the dialog box, select the check box for each asset or user that you want to add to the contract.
     c. Click **Add**.

Create a rate card and assign a user or asset

You can assign a user or asset when you create a rate card. You can only assign the user or asset that is assigned to the contract.

Before you begin

Role required: financial_mgmt_user, asset, or contract_manager

Procedure

1. Navigate to **Contract Management** > **Contract** > **All**.
2. Select a contract with an assigned user or asset.
3. In the **Contract Rate Cards** related list, click **New**.
4. Specify a **Start date**.
   For financial calculations to work, the date cannot be before the start date of the contract.
5. Right-click the header bar and select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the **Asset Covered** or **Rate Card Users** related list, click **New**.
7. Select the **Asset** or **User** who is assigned to the contract.
   Only assets and users associated with the parent contract are listed.
8. Specify a **Date Added**.
9. Click **Submit**.

Configure rate card expense generation

After assets or users are added to the rate card, you can use the **Distribute cost** field in the Financial section of the contract to generate rate card expenses.

Before you begin

Role required: financial_mgmt_user, asset, or contract_manager

Procedure

1. Navigate to **Contract** > **Contracts** > **All**.
2. Select the contract to generate expenses.
3. In the **Contract Rate Card** related list, select a rate card.
4. In **Distribute cost**, select one of the following options to distribute the amount listed in **Base cost**.

Option	Description
Split expense lines evenly across assets	Select **Allocate and distribute cost per asset**. For example, with a $100 **Base cost** and two assets, two expense lines for $50 are creat ed.
Split expense lines across assets based on asset value	Select **Allocate and distribute cost based on value:**. The **Value** field displays with **Cost** and **Resid ual Cost** options. The cost is derived from the **Cost** or **Residual Cost** field on an asset record. If there are multiple assets on the rate card, the cost or residual cost is distributed based on the value of the assets. For example, if you select the **Cost** option with a $100.00 **Base cost**, one asset worth $70, and one asset worth $30, two expense lines are created, one for $70 and one for $30.
Split expense lines evenly across users	Select **Allocate and distribute cost per user**. For example, with a $100 **Base cost** and two users on the contract, two expense lines for $50 are created.
Allocate the cost to the contract instead of the individual assets	Select **Allocate cost to contract**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Update**.
   Expense lines are automatically generated by a scheduled job for costs incurred between the rate card **Start date** and **End date**. The scheduled job, *Process FM Costs*, runs on the Contract [ast_contract] table once per day. This scheduled job runs forward and generates additional records from the Next Process [next_process] time. Expense lines are only generated from contracts with the **Active** or **Expired** state. You may want to generate expense lines for expired contracts to track previous expenses.

Contract life cycle

View contract expense lines

Use the **Expense Lines** related list or tab to view and audit all the expenses recorded for a given contract.

Before you begin

Role required: asset, financial_mgmt_user (core UI and Hardware Asset Workspace only), contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. Select the **Expense Lines** related list (core UI) or tab (Hardware Asset Workspace and Enterprise Asset Workspace).
4. Select an expense line record to view.
   Information such as expense line details, total cost of the contract, and the contract current value is listed.

Monitor a contract

You can monitor contracts by viewing contract history and creating contract reports.

Before you begin

Role required: asset, contract_manager (core UI and Hardware Asset Workspace only), sn_eam.enterprise_admin (Enterprise Asset Workspace only), or sn_eam.enterprise_asset_manager (Enterprise Asset Workspace only)

About this task

If changes are made to a contract start date, end date, or terms and conditions, a copy of the contract is automatically saved and placed in contract history. This is useful for tracking changes to a contract and keeping an audit trail. Configure the **Contract History** related list or tab to include columns for creation and update so you can easily see who edited the contract.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the list of contracts that are used across your deployment.
   - If you are using the core UI, navigate to **Contract** > **Contracts** > **All**.
   - If you are using the Hardware Asset Workspace, open the Contract management view and then select the **All contracts** tab.
   - If you are using the Enterprise Asset Workspace, open the Contract and lease management view and then select the **All contracts** tab.
2. Select a contract.
3. View the **Contract History** related list (core UI) or tab (Hardware Asset Workspace and Enterprise Asset Workspace) and perform one of the following actions.
   - If earlier versions of the contract exist, click a date in the **Contract Starts** column to view a version.
   - If an earlier version of the contract does not exist, change the contract's **Start date** or **End date**. Right-click in the header bar and select **Save**. In the **Contract History** related list, click a date in the **Contract Starts** column to view the earlier version.

Run a contract report

A variety of contract reports are available to help track and manage contracts.

Before you begin

Role required: contract_manager or admin

Procedure

1. Navigate to **All** > **Reports** > **View / Run**.
2. Select one of the following reports to run.

Contract reports

Report	Description
Active Contracts by Cost Per Unit	All active contracts grouped in ascending order by average cost per unit.
Active Contracts by Lifetime Cost	All active contracts with an associated rate card grouped in ascending order by total cost. Total cost is measured from the beginning of the contract to the report run date.
Active Contracts by Monthly Cost	All active contracts grouped in ascending order by cost per month.
Active Contracts by Vendor	All active contracts alphabetically by vendor.
Active Contracts by Yearly Cost	All active contracts grouped in ascending order by cost per year.
All Contracts by State	Contracts grouped by state, such as **Draft**, **Active**, or **Expired**, in bar chart format

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report	Description
Asset Contracts by Type	All active contracts for assets grouped by type, in pie chart format.
Asset Contracts List	All active contracts for assets by contract number.
Contract Expenditure by Type	Total contract expenses by type, such as lease, maintenance, or warranty, in bar chart format.
Contract Expenditure by Vendor	Total costs of all contracts associated with a specific vendor, in bar chart format.
Contract Pipeline Report	All contracts with a state of **Draft**, **Active**, or **Expired** and a substate of **Awaiting Review** or **Under Review**, in bar chart format.
Expiring Contracts	All contracts expiring in the next 90 days.

Condition check definitions

Condition check definitions enable you to define logical conditions that indicate when to change a field value in a record.

A scheduled job, called *Contract Compliance Checks* in **System Scheduler** > **Scheduled Jobs**, evaluates these condition check definitions daily by running the condition checker. When this job is run, the ConditionChecks Script Include is triggered that runs the Condition Check Definitions. Use this condition checker to check start dates and end dates and to set expiration levels for contracts.

For example, a contract has a start date of March 1. When the condition checker runs on March 1, it verifies that the contract **Substate** is **Approved** and sets the contract **State** to **Active** based on the **Start Date** field.

The daily condition checker sets the appropriate expiration level for active contracts based on the contract **End Date**. The expiration level can be viewed in the Contracts list. Knowing the expiration level can help contract managers renew or extend a contract before it expires.

Define a condition check

You can define a condition check to change values in a contract when the *Contract Compliance Checks* scheduled job runs each night.

Before you begin

Role required: contract_manager or admin

Procedure

1. Navigate to **All** > **Contract** > **Administration** > **Condition Check Definitions**.
2. Click **New**.
3. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Condition check definition fields

Field	Description
Table	The table to which the condition applies. For a contract check definition, select **Contract [ast.contract]**.
Category	The category for the condition check. Select **Contract** or **None**. The category is used for organizing information and reporting.
Condition field	The field to be updated, typically **Expiration level** or **State**.
Event name	The name for the event to be fired when this condition changes the value of the field. Create a name using this syntax: <table_name>.<condition_field>, for example, `contract.validation`.
Order	The order in which the conditions are evaluated.

4. Right-click the header bar and click **Save**.
   The **Conditions** related list appears.
5. In the **Conditions** related list, click **New**.
6. Complete the form.

Conditions fields

Field	Description
Name	The value the field is set to, if the expiration conditions are met.
Condition check	The associated condition check.
Table	The table associated with the condition check.
Event name	The name of the event this condition triggers.
Expiration Condition	The condition that must be true for the **Condition check** field to be set to this value (the **Name**). Add as many conditions as are needed.
Compliant state	System field. Do not use.
Order	The order in which the conditions are evaluated. The first condition that is found to match, where the Expiration Condition is true, is used, and no others are checked.

7. Click **Submit.**
   The Condition Checks form reopens with the new condition listed in the related list.
8. **Optional:** Continue adding conditions as needed, following the steps above.

Domain separation and Contract Management

Domain separation is unsupported in Contract Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Procurement

Procurement managers can use the ServiceNow® Procurement application to create purchase orders and to obtain items for fulfilling service catalog requests.

Procurement offers the ability to perform the following functions.

- Track service catalog requests
- Create and manage purchase orders
- Create and manage transfer orders
- Receive assets

Procurement roles

The Procurement application uses the following roles.

Role	Contains roles	Description
procurement_admin	procurement_user	Can create purchase orders without a request. Can view requests and requested items. Can view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can refresh, add, delete, and rearrange gauges in the Procurement Overview module.
procurement_user	financial_mgmt_user, model_manager	Can create purchase orders without a request. Can view requests and requested items. Can view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can view and refresh gauges in the Procurement Overview module.

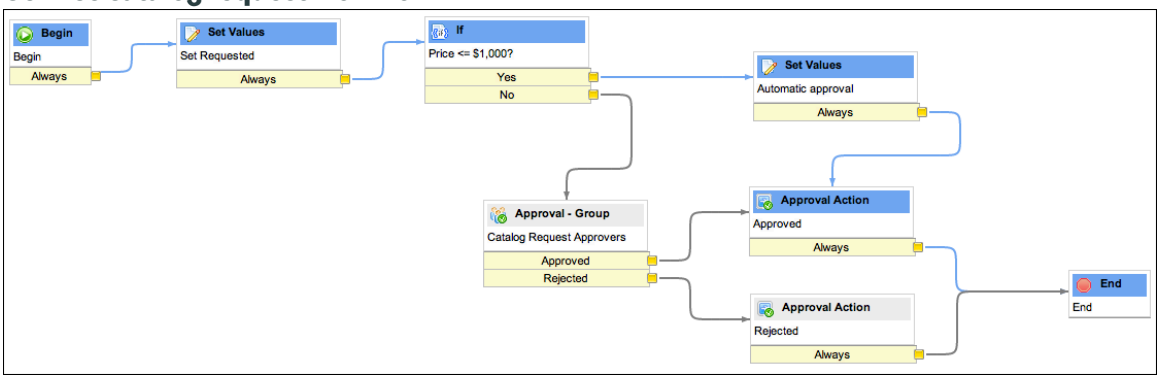
Procurement workflows

Procurement uses the following workflows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

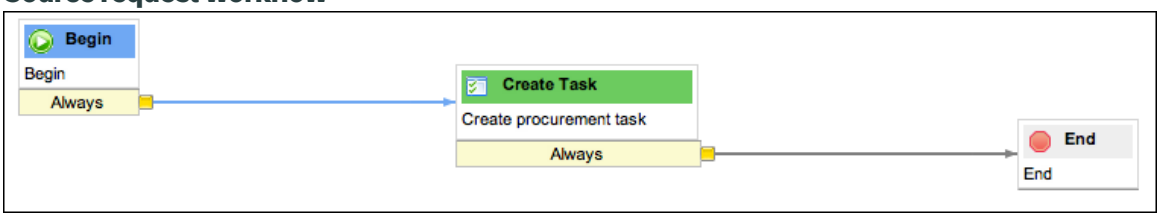
- In the Service Catalog Request workflow, items ordered from the service catalog that cost over one thousand dollars require approval.

Service catalog request workflow



- In the Source Request workflow, catalog tasks are created so that a procurement manager can source the item by creating a transfer order or purchase order.

Source request workflow



These workflows are provided in the base system. You can edit these workflows in the graphical Workflow Editor or create a workflow to better fit your organization's procurement needs.

Related topics

Workflows

Use the Procurement Overview module

Use the gauges on the Procurement Overview homepage to help you track and manage requests, purchase orders, and other important aspects of the procurement process.

Before you begin

Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All** > **Procurement** > **Overview**.
2. Click elements within the gauges to obtain more information.

Example

For example, click a request number to view the request record.

Activate Procurement

You can activate the Procurement plugin that provides core procurement capabilities.

Before you begin

Role required: procurement_admin, procurement_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Procurement plugin (com.snc.procurement) using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Components installed with Procurement

Several types of components are installed with Procurement.

Demo data is available with Procurement. The demo data provides sample requests, purchase orders, purchase order line items, and receiving slips.

Business rules installed with Procurement

Procurement plugin adds the following business rules.

Business rule	Table	Description
Adjust remaining quantity	Purchase order line items [proc_po_item]	Calculates the remaining quantity of items ordered on a purchase order line items by subtracting the amount received from the amount ordered.
Can request be sourced	Request [sc_request]	Checks if a request can be sourced.
Cancel Procurement Orders	Request [sc_request]	Cancels all unreceived purchase orders and unshipped transfer order lines associated with the request's items if the request state changes to **Closed Cancelled**.
Check if req item is sourced	Requested Item [sc_req_item]	Sets the **Sourced** field on the parent request to **true** if all requested items have been sourced.
Check if request is sourceable	Requested Item [sc_req_item]	Checks if the request associated with a requested item can be sourced (obtained from a transfer order or by creating a purchase order to a vendor).
Create Assets	Receiving Slip Line [proc_rec_slip_item]	If the purchase order line item is available, creates the assets for a receiving slip line when the slip line assets are received.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Handle roll up states and assets removal	Purchase order line items [proc_po_item]	Manages purchase order line items if they are canceled or received. If a purchase order line is canceled, this business rule deletes any pre-created assets. This business rule also checks the status of other purchase order lines that share the same purchase order and, if necessary, updates the status of the purchase order. For example, when the last purchase order line is received, the status of the purchase order changes to **Received**.
Redirect TOL to existing TO-Procurement	Transfer Order Line [alm_transfer_order_line]	Attaches a transfer order line to an existing transfer order if the transfer order is in the **Draft** stage and has the same **From stockroom** and **To stockroom** values as the transfer order line.
Shipping Cost Changes	Purchase Order [proc_po]	Recalculates the total cost of the purchase order if the shipping rate changes.
State Change	Transfer Order Line [alm_transfer_order_line]	Marks the requested item as **Received** if the state of the associated transfer order line changes to **Received**.
State Change	Purchase order line items [proc_po_item]	Sets the time at which the purchase order line item is ordered and updates the original requested item when the purchase order line item is received.
State Change PO	Purchase Order [proc_po]	Changes the purchase order line item status when the status of the associated purchase order changes.
Total Cost	Purchase order line items [proc_po_item]	Calculates the total order cost based on the cost of individual items and the quantity ordered. When you receive a purchase order line item, this business rule also takes the following steps. • Populates the **List price** field with the value from the **Cost** field unless you enter a different value. • Calculates the **Total list price** field value by multiplying the **List price** and **Ordered quantity** values.
Update expected delivery date for PO	Purchase order line items [proc_po_item]	Sets the **Expected delivery date** for purchase orders to the latest purchase order line **Expected delivery date**.
Update expected delivery date for POLs	Purchase Order [proc_po]	Sets the **Expected delivery date** of associated purchase order lines to the purchase order's **Expected delivery date** if at least one of the following conditions is true.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
		• The purchase order line has no expected delivery date. • The purchase order line's expected delivery date is later than the purchase order's expected delivery date. • The purchase order line's expected delivery date is the same as the purchase order's previous delivery date.
Update Ordered Date	Purchase Order [proc_po]	Sets the **Ordered date** field to the date and time at which the status of the purchase order is set to **Ordered**.
Update PO	Purchase order line items [proc_po_item]	Updates the purchase order if the cost of any purchase order line item changes.
Update Purchase Order Line	Receiving Slip Line [proc_rec_slip_item]	Updates the **Quantity received** field on the associated purchase order line item when a receiving slip item is received.
Update Request Item CI	Hardware [alm_hardware]	Sets the **Configuration item** field on the catalog task and requested item to the related hardware CI created during the procurement process.

Script include	Description
ProcurementUtils	Provides utilities for Procurement.

Tables installed with Procurement

Procurement plugin adds the following tables.

Table	Description
Purchase Order [proc_po]	Stores information about items ordered, cost of items ordered, and users that require the items for orders placed with a vendor. **Note:** The asset, procurement_user, inventory_admin, or contract_manager role can only access the reports. You must activate the Hardware Asset Management Professional (com.sn_hamp) plugin for the contract_manager and inventory_admin role.
Purchase order line items [proc_po_item]	Stores information about items and quantity ordered on purchases orders. **Note:** The asset, procurement_user, inventory_admin, or contract_manager role can only access the reports. You must activate the Hardware Asset Management Professional (com.sn_hamp) plugin for the contract_manager and inventory_admin roles.
Receiving Slip [proc_rec_slip]	Stores receiving information for items ordered with a purchase order. Can reference multiple receiving slip lines.
Receiving Slip Line [proc_rec_slip_item]	Stores receiving information for items ordered on a specific purchase order line, such as the items ordered, quantity ordered, and who ordered them.

User roles installed with Procurement

Procurement plugin adds the following user roles.

Role	Contains roles	Description
procurement_admin	procurement_user	Can create purchase orders without a request. Can view requests and requested items. Can view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can refresh, add, delete, and rearrange gauges in the Procurement Overview module.
procurement_user	financial_mgmt_user, model_manager	Can create purchase orders without a request. Can view requests and requested items. Can

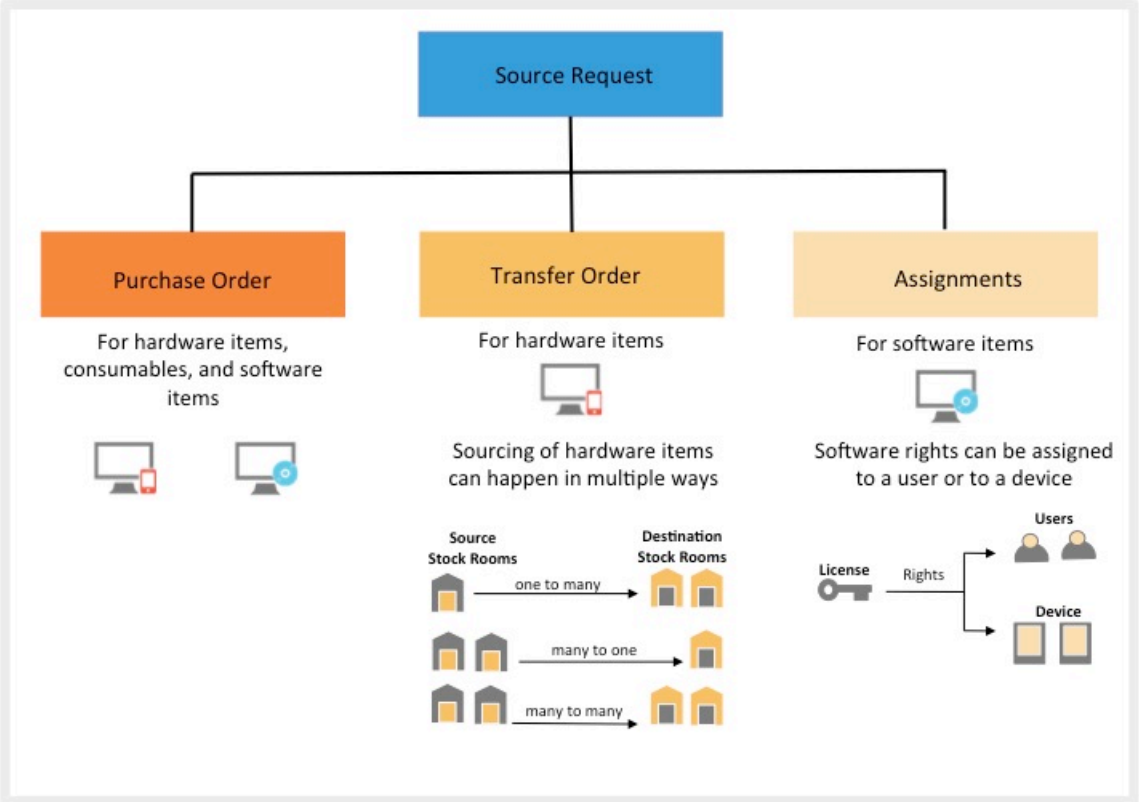
Role	Contains roles	Description
		view transfer orders. Can create a purchase order or transfer order when sourcing items for a request. Can view the vendor catalog. Can view and refresh gauges in the Procurement Overview module.

Sourcing items in a service catalog request

A service catalog request can contain multiple items that must be sourced.

Methods of sourcing requested items



Note:
Only items with an assigned model can be sourced. You can't source bundles.

Sourcing requested items from local stockrooms

You can use the assets available in the requester's local stockroom to fulfill a service catalog request. The assets that are in stock are reserved and a fulfillment task is created to source and fulfill the request.

Sourcing requested items from other stockrooms

When the requested items aren't in stock, you can create a purchase order to deliver the items from other source stockrooms to your local stockroom. You can request multiple items in a purchase order.

After creating a purchase order, you can create hardware assets and reserve it for the requester either before or after you receive the requested items. You can't create or assign software licenses to the requester before you receive the software licenses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sourcing requested hardware items

You can source requested hardware items by creating a transfer order. You can transfer hardware assets from a source stockroom to multiple destination stockrooms.

When a source stockroom doesn't have enough items in stock, you can specify multiple source stockrooms in the transfer order so that the hardware items can be transferred to the destination stockrooms.

Important:
If the Field Service Management application is also activated on your ServiceNow instance, then a workflow in this application processes the transfer orders. For more information, see Move an asset through the transfer process.

Sourcing requested software licenses

To source a requested software license, you must assign the rights of the software license to a user or a device so that they're authorized to use the software.

Related topics

Create a purchase order from a request

You can create a purchase order directly from a request. This enables procurement managers to obtain items and fulfill requests from the Service Catalog. You can create multiple purchase orders from a request.

Before you begin
Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All** > **Procurement** > **Requests** > **Requests**.
2. Select the **Number** of a request that has been approved but not sourced.
   Look in the **Request State** and **Sourced** columns.
3. In the **Catalog Tasks** related list, select a Source Request Items number.
4. Select **Source Request**.
   The Source Request screen is displayed with a list of all the requested items.
5. Select **Purchase** in the requested item section.
6. In the **Vendor** list, select the vendor from which the requested item or items should be delivered.
7. Verify if the **Out of Stock** field is set to **false**.
   If the vendor doesn't have stock, the field value will be **true**.
8. In the **Quantity** field, specify the quantity you want to order.
9. In the **Destination Stockroom** list, select the destination to which the requested item or items should be delivered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. **Optional:** Select the **Consolidate PO** check box to combine the listed items with existing purchase orders.

    (Optional) When you check Consolidate Purchase Orders, all items sourced from the same vendor on the same request are placed on the same purchase order. When you select a vendor, the system automatically searches for purchase orders that have been created for the same request, have the same **Vendor** selected, and have the **Requested** status. If the system finds a match, all items are placed on the same purchase order and can be ordered together. If the system does not find a match, a new purchase order is created.

    For example, if you are purchasing 25 phones from Apple and an open purchase order already exists for Apple, the 25 phones are added to the open purchase order. If there are no open purchase orders for the selected vendors, new purchase orders are created. Items ordered from the same vendor are grouped together. Different items are shown on separate lines on the purchase order.

11. Select **Submit**.

Result

- Purchase order is created.
- On the request, the **Sourced** check box is selected

Create a transfer order from a request

You can create a transfer order directly from a request to source hardware items and consumables from stockrooms.

Before you begin

Role required: procurement_admin or procurement_user

Important:
If the Field Service Management application is also activated on your ServiceNow instance, then a workflow in this application processes the transfer orders. For more information, see Move an asset through the transfer process.

Procedure

1. View procurement requests.

2. Select a request that has been approved but not sourced.
   Check the **Request State** and **Sourced** columns.
3. In the **Catalog Tasks** related list, select a sourcing task.
4. Select **Source Request**.
   The Source Request or Sourcing page appears with a list of all the requested items.
5. Create a transfer order.

6. **Optional:** On the Sourcing page of the Hardware Asset Workspace, select the **Source through distribution channel** check box to source the assets from the inbound distribution channels that support the destination stockrooms.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Source through distribution channel** check box that enables you to source through a distribution channel for Transfer orders appears only in the Hardware Asset Workspace. Your preference of selecting or clearing this check box is saved and is shown when you open the Sourcing page again.

You can associate the location of the requester as a service location with multiple stockrooms for better location coverage. Also, these stockrooms can be associated with multiple inbound stockrooms or distribution channels for optimized transfer of assets between the stockrooms. Distribution channels enable you to source the assets from the stockrooms that you prefer for sourcing based on the rank that you provide to the stockrooms.

For more information, see Associate a stockroom with service locations and Link stockrooms into a distribution channel.

7. In the **Source stockroom** list, select a stockroom from which the hardware item should be sourced.

   Note:
   In the Hardware Asset Workspace, the Source stockroom list shows only the inbound distribution channels of the stockrooms that support the location of the requester under the following conditions:

   a. When you've selected the **Source through distribution channel** option.

   b. When the inbound distribution channels are added to the stockrooms that support the location of the requester.

8. In the **Transfer Quantity** field, specify the quantity you want to transfer.
   The **In stock** column, displays the total stock available with the selected source stockroom.
9. In the **Destination stockroom** list, select the destination to which the requested item or items should be delivered.

   Note:
   In the Hardware Asset Workspace, the Destination stockroom list shows only the stockroom that supports the location of the requester under the following conditions:

   a. When you've selected the **Source through distribution channel** option.

   b. When the location of the requester is added as a service location of one or more stockrooms.

10. Select **Submit**.
    A transfer order is created to move the item or items from the **Source stockroom** location to the **Destination stockroom** location. When you view the request, the **Sourced** check box is selected.

Source requests from local stockrooms

Get visibility into local stockrooms at the time of sourcing requests.

Before you begin

You can source a request by using assets from the requester's local stockroom.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If stock is available in the local stockroom, the asset is reserved and follows the fulfillment task to source the request.
- If the requester's location is supported by another stockroom as part of service locations, the asset can also be sourced from this stockroom.
- If stock in the local stockroom is unavailable, you can get the assets transferred from other stockrooms or create a purchase order.

The Workflow Studio application is used to create the Asset Local Stock subflow to take you through the process of using assets from your local stockroom to source your request. As the subflow takes you through the various stages, the asset details are automatically updated. You can open the Asset Local Stock subflow to view the status of the stages in the subflow.

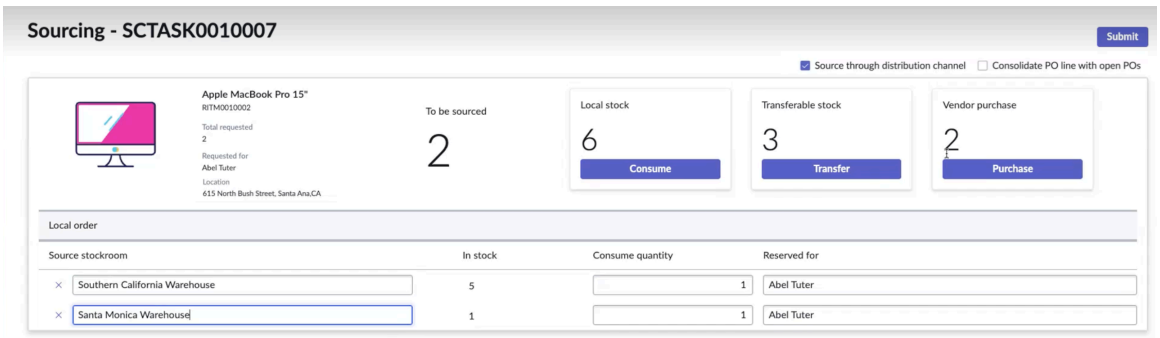
Note:
Use decision tables to customize the Asset Local Stock subflow. For more details, see Hardware Asset Management flow customization.

Role required:

- procurement_user or procurement_admin
- inventory_user or inventory_admin

Procedure

1. Log in with credentials for the role of procurement_user or procurement_admin.
2. Navigate to **All** > **Service Catalog** and select **Hardware**.
3. Select the hardware item that you want to source and select **Order Now**
   Your request is submitted and the Order Status form layout appears.
4. Select the request number.
5. On the Request form layout, select the **Catalog Tasks** related list to view the sourcing task for the request.
6. Select the sourcing task and select **Source Request**.



The Sourcing form shows the following hardware sourcing request details:

- **Total requested**- Quantity of the hardware requested.
- **Requested for**- Name of the person for whom the hardware is requested.
- Location- Place where the hardware should be deployed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Trouble?
If the Source Request functionality or button isn't functioning as expected, confirm that the catalog task has both the **Parent** and **Request** fields populated. For more information, see View and edit a catalog task. The Request ID, which is required for the Source Request page to function correctly is derived from the Parent field of the catalog task. If the Parent field is missing and the catalog task was created using Flow Designer, refer to the relevant Set Parent field when creating Catalog Task from Flow Designer for further details.

7. Select **Consume** to source the available stock from the local stockroom and from the stockroom that supports your location.
   If stock isn't available in your local stockroom and the stockroom that supports your location, select **Transfer** or **Purchase** to source the request via a transfer order or a purchase order. If you create a transfer order and want the local stockroom to be included in the list of stockrooms to choose from, the admin must turn on the `glide.asset.procurement.sourcing.local_stock_transfer` property.
8. Select **Source Stockroom** to select the stockroom from where you want to source the assets. If your location is associated with a stockroom as a service location, you can source from this stockroom along with the local stockroom. Service location capabilities enable a single stockroom to support multiple locations and consume the local stock efficiently. For more information on Service locations, see Associate a stockroom with service locations.

   If the Asset pick task is enabled for the source stockroom, then this task is added to the Hardware Asset Refresh Request and Hardware Asset Request flows.
9. In the **Consume Quantity** field, specify the quantity of assets that you want to consume from the stockroom that you selected.
10. Select **Reserved for** to specify a user for whom you want to source the request.
11. To source from multiple stockrooms, repeat steps 7–9.
12. Select **Submit**.
    A consume asset task is created. Assets are selected from the stockrooms and are reserved for the user who you selected in the **Reserved for** list. The state of the selected asset moves to in stock and the substate to reserved.
13. Log in with credentials for the role of inventory_admin or inventory_user.
14. Select the **Requested Items** related list and then select the request item.
15. Select the **Asset Tasks** related list and then select a task to select and assign an asset to the sourcing task.
    The Consume Asset Task form layout appears in the Asset Tasks module. Based on the type of asset (hardware or consumable) that is being sourced, fields in the form layout differ. The Assets Tasks module lists all the asset task records.
16. Change that you need and then close the task when you're done.
    - For hardware assets: Assets are auto-assigned to sourcing tasks but you can change an asset by selecting the **Asset** list. After you're done, select **Close Task**.
    - For consumable assets: The model for the asset appears on the form layout instead of the asset. Select **Close Task** or **Consume and Close**. If you select **Consume and Close**, the reserved asset is automatically picked up and assigned to the user. If you select **Close Task**, you must go to the Consumable form layout and assign an asset to the user manually.

Add an assignment from a request

You can add assignments directly from a request to source rights from software licenses.

Before you begin

Role required: procurement_admin or procurement_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Procurement** > **Requests** > **Requests**.
2. Select the request that has been approved but not sourced.
   Check the **Request State** and **Sourced** columns.
3. In the **Catalog Tasks** related list, select a number.
4. Select **Source Request**.
5. Select **Add assignments** in the requested software item section.
6. In the **License Name** list, select a license from which the software rights should be sourced.
   The **Available Rights** column, displays the total rights available with the selected license.
7. In the **Rights** field, specify the rights you want to assign.
8. From the **Type** list, select whether to assign the rights to a user or device.
9. In the **Assigned\Allocated** list, select the user or device to whom the requested item should be assigned.
10. Select **Submit**.
    An assignment is created to assign rights from the **License Name** location to the **Assigned \Allocated** user or device. When you view the request, the **Sourced** check box is selected.
11. Run the conuter to make sure that you are in compliance.
    You are prompted to run the software counter if the Software Asset Management is active.
12. Select **OK**.
    For auditing, the **Assigned Licences** related list in the Request form will provide the details of all the assignments done as part of this request.

Procurement purchase order management for assets

Accurate purchase order information is important for invoice tracking, receiving, and reporting in the ServiceNow platform.

The Procurement application enables users with an appropriate procurement role to manage purchase order information for assets. It also provides direct access to service catalog requests. You can create purchase orders and transfer orders directly from requests.

Before using the Procurement application, create assignment groups for catalog tasks. Assignment groups are sets of users, filtered by location, who can perform catalog tasks.

Create a group

Consumable assets

A consumable asset is one that is purchased in quantity and distributed. It is assigned to the consumable model category, and the asset record tracks the quantity that is available and total cost. When consumable assets are received, they are merged into an existing consumable record, if available.

For the records to merge, the consumable cannot be listed on an active transfer order and the **Model**, **Location**, **Model Category**, **Stockroom**, **Status**, and **Substatus** fields on the asset record must match.

If consumables are merged into an existing consumable record, the cost of the additional consumables received is added to that of the existing consumables in the record. For example, if 50 computer keyboards arrive and 20 keyboards of the same model exists in the receiving

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

stockroom, the two records are merged showing 70 keyboards in the stockroom with a combined total cost.

If no matching consumable record exists in the receiving stockroom, a record is created. After the consumables are received, the quantity is updated, but individual consumables are no longer tracked within the Procurement application and are not displayed on receiving slip lines.

Note:
The related list of a purchase order doesn't display consumable asset details. This means that you can't track consumables through a purchase order.

For more details on creating consumable assets, see Create consumable assets.

Track a request from the service catalog

The Procurement application lets you track a request that was ordered from the service catalog.

Before you begin
Role required: procurement_admin or procurement_user

About this task
When a user places an order from the service catalog, a request record is created to track the order. Each ordered item becomes a requested item that is listed on the request record. For example, a single request for one laptop, two monitors, and one keyboard creates the following records.

Request REQ0000001: 4 items

- Requested Item RITM0000001: 1 laptop
- Requested Item RITM0000002: 2 monitors
- Requested Item RITM0000003: 1 keyboard

Procedure

1. Navigate to **All** > **Procurement** > **Requests** > **Requests**.
2. Click a request **Number**.
   The **Requested Items** related list displays the items that were ordered. You can view the requested item, or view associated **Purchase Orders**, **Transfer Orders**, and **Assignments** on other related lists. A catalog task is automatically generated for each requested item to identify the source of the item, whether it must be purchased or transferred from a stockroom.

Cancel a request from the service catalog

You can cancel a request from the service catalog if, for example, the item is no longer needed or the request was not approved.

Before you begin
Role required: catalog_admin, procurement_admin, or procurement_user

About this task
When a service catalog request is canceled, the following actions occur automatically.

- Associated purchase orders that have not been received are canceled.
- All procurement tasks are canceled.
- Associated transfer orders are canceled, if all transfer order lines related to the transfer order are also associated with the service catalog request and the transfer order lines have all been canceled. If the transfer order contains transfer order lines that are not related to the service catalog request and those lines have not been canceled, the transfer order is not canceled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associated transfer order lines that are in the **In Transit** or **Delivered** stages are not canceled.

Procedure

1. Navigate to **All** > **Procurement** > **Requests** > **Requests**.
2. Click a request **Number**.
3. Click **Cancel Request**.

View and edit a catalog task

Catalog tasks are used to source items and fulfill requests. You can view and edit catalog tasks from a request.

Before you begin

Role required: procurement_admin or procurement_user

About this task

If a request requires approval, a catalog task is created automatically when the request is approved. If a request doesn't require approval, a catalog task is created automatically when the request is created.

Note:
If a request contains one requested item and the item has no model specified, a catalog task isn't created automatically. If a request includes multiple items and only some have a specified model, catalog tasks are automatically created, but only for those items with a model.

Procedure

1. Navigate to **All** > **Procurement** > **Requests** > **Tasks**.
2. Open a catalog task.
3. Edit the fields as necessary.

Catalog task fields

Field	Description
Number	The unique number identifying the catalog task.
Request	The number of the request to which the catalog task is associated. The information in this field is derived from the **Number** field on the Request form.
Request item	The number of the requested item to which the catalog task is associated. The information in this field is derived from the **Number** field on the Requested Item form.
Requested for	The name of the person for whom the associated item was requested. The information in this field is derived from the **Request** or **Request item** field.
Due date	The date by which the catalog task should be completed.
Configuration item	The configuration item associated with the **Request Item**.
Approval	The status of catalog task approval: **Not Yet Requested**, **Requested**, **Approved**, or **Rejected**.
State	The current state of the catalog task: **Pending**, **Open**, **Work in Progress**, **Closed Complete**, **Closed Incomplete**, or **Closed Skipped**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Assignment group	The group from which an individual is selected to complete the catalog task.
Assigned to	The individual assigned to complete the catalog task is selected from the **Assignment group**.
Work notes list	The list of users to receive email notifications when the work notes on the catalog task are updated.
Short description	A brief description of the catalog task.
Description	A detailed description of the catalog task.
Work notes	Information about how the catalog task is resolved.
Parent	The parent record associated with the task.
Additional comments	Additional information about the catalog task.

4. Select **Update**.

Related topics

Models

Create a purchase order

You can create a purchase order. Purchase orders specify assets to order from a single vendor.

Before you begin

Role required: procurement_admin or procurement_user

About this task

For example, an organization can create a purchase order to buy 20 laptop computers or 10 servers. Information on a purchase order enables physical and financial tracking of the assets that were ordered.

You can also use a transfer order if an asset is already owned by an organization. A transfer order is used to internally transfer assets from one stockroom to another instead of purchasing the assets. For example, a company stockroom in New York has five laptops that are needed in Boston. You create a transfer order to move the laptops from the New York stockroom to the Boston stockroom.

After you create a purchase order, the **Receiving Slip** related list is available on the Purchase Order form. A receiving slip is created manually or automatically when the item is received. The **Receiving Slip** related list shows all receiving slips related to the purchase order. After a receiving slip is added to a purchase order, all fields on the purchase order record become read-only.

Procedure

1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Click **New**.
3. Complete the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Purchase order fields

Field	Description
Number	The unique number identifying the purchase order.
Due by	The date by which the purchase order **Total cost** must be paid.
Vendor	The supplier to which the purchase order was issued.
Ship to	The stockroom to which the items on the purchase order should be shipped. **Note:** This field is required but doesn't affect creating requisitions for software on Coupa.
PO date	The date on which the purchase order was created.
Status	The status of the purchase order: **Canceled**, **Ordered**, **Received**, **Requested**, or **Suspended**.
Assigned to	The user to whom the purchase order is assigned.
Bill to	The location responsible for paying the purchase order **Total cost**.
Short description	A brief description of the purchase order.
General section	
Shipping	The delivery method to be used when shipping the items on the purchase order.
Terms	The purchase order payment terms: **Credit**, **Net 30 days**, or **Net 90 days**.
Ship rate	The amount that must be paid for the delivery method specified in the **Shipping** field.
Total cost	The sum of all item costs on the purchase order and the shipping costs.
Description	A full description of the purchase order contents.
Details section	
Initial request	The record number of the request that requires the items on the purchase order.
Requested by	The user requesting the items on the purchase order. **Note:** The email ID or email address of the user requesting the items on the purchase order must be the same on both Coupa and ServiceNow ServiceNow application.
Requested	The date the user in the **Requested by** field requested the items on the purchase order.
Ordered	The date and time of clicking the **Order** button on the Purchase Order form.
Expected delivery	The date the items associated with the purchase order are expected to arrive in the stockroom identified in the **Ship to** field. This field can’t be edited when the

Field	Description
	purchase order has a **Status** of **Received** or **Canceled**. (For more information about this field, seePurchase order expected delivery date .)
Received	The date and time at which the purchase order status changed to **Received**.
Contract	The record number of the contract with the vendor from which the items on the purchase order are ordered.
Department	The department responsible for paying for the purchase order.
Budget number	The budget number related with the purchase order.
Vendor account	The vendor account related with the purchase order.

4. Click **Submit**.

What to do next
Add purchase order line items to specify what you are ordering from this vendor.

Related topics
Manage transfer orders

Create a purchase order line item

After you save a new purchase order, you create purchase order line item records to specify the individual items to order.

Before you begin
Role required: procurement_admin or procurement_user

Procedure
1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Open a purchase order.
3. In the **Purchase order line items** related list, click **New**.
4. Complete the form.

Purchase order line item fields

Field	Description
Number	The unique number identifying the purchase order line item.
Vendor	The supplier from which this product should be ordered.
Product Model	The model of the purchase order line item.
Product Catalog	The product catalog category to which the product model is assigned. For example, **Hardware**, **Software**, or **Supplies**.
Part number	The identification number assigned to the product model.
Metric group	Each metric group has a set of license metrics that are specific to the software publisher.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If you select only a software model in the Product model field, this field gets displayed on the form.
License metric	License metric for the license group that the software license is counted against when reconciliation is run. The options for license metric change based on the **Metric group** field. **Note:** ○ If you select only a software model in the Product model field, this field gets displayed on the form. ○ If you choose a license metric that isn't available on Coupa, the license metric value is defaulted as **each**.
Request line	The identification number of the requested item record associated with this purchase order line item.
Ordered	The date and time at which this purchase order line item was ordered.
Expected delivery	The date the purchase order line item is expected to arrive in the stockroom identified in the **Ship to** field on the purchase order record. This field is automatically filled with the value in the **Expected delivery** field on the purchase order record. This field can be edited when the purchase order line item has a **Status** of **Requested**. For more information about this field, see Purchase order expected delivery date.
Received	The date and time at which the purchase order line item status was changed to **Received**.
Purchase order	The purchase order record number associated with this purchase order line item.
Rights per license pack	Rights associated with each pack that is purchased for Microsoft Per Core or Microsoft Per Core with CAL licenses.
Number of packs	Number of packs for Microsoft Per Core or Microsoft Per Core with CAL licenses.
Status	The current status of the purchase order line item: **Canceled**, **Ordered**, **Pending Delivery**, **Received**, or **Requested**.
Ordered quantity	The number of product models that were ordered.
Received quantity	The number of product models that were shipped and received. The vendor may have sent multiple shipments. The received quantity can be larger or smaller than the **Ordered** quantity. For example, you may have ordered five laptops but the vendor sent six.
Remaining quantity	The number of product models that still need to be received to fulfill the **Ordered** quantity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
List price	The price at which the item retails, not including discounts. If the system creates the purchase order from the service catalog ordering process, the purchase order line item inherits the list price from the associated vendor catalog item. If the vendor catalog item does not have a list price value and you have not entered a value, this field is automatically populated with the value from the **Cost** field.
Cost	The cost of a single product model, including discounts. If the system creates the purchase order from the service catalog ordering process, the purchase order line item inherits the cost from the associated vendor catalog item **Vendor Price**.
Total cost	The cost of a single product model multiplied by the value specified in **Quantity**.
Non-catalog request	Select this check box to create a requisition for an item that is not present in the product catalog of the organization. **Note:** ○ This field isn't visible on the form if you haven't published a procurement integration profile. For more information, see Integrating with external procurement applications. ○ If you select only a software model in the Product model field, this check box gets displayed on the form. ○ If you select an item in the Product Catalog field, the check box gets automatically unchecked. ○ If you haven't selected any item in the Product Catalog field, this check box is automatically checked, which indicates you are submitting a non-catalog request.
Stock Order	Read only and selected if the related request is using the bulk stock order workflow. **Note:** Appears for all purchase order line items when the Hardware Asset Management application is installed from ServiceNow Store.
Short description	A few words or short phrase describing the purchase order line item.

5. Click **Submit**.
   The purchase order reopens with the line item listed. The purchase order and line item are in **Requested**s status.
6. **Optional:** Continue adding purchase order line items for this vendor, as needed.
7. After you initiate the order with the vendor and are ready to show that the order was placed, click **Order**.
   The status of the purchase order and line items change to **Ordered**.

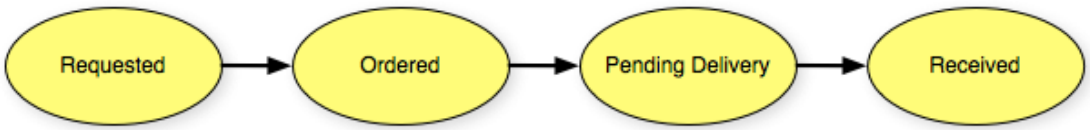
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Purchase order status

Purchase orders follow a specific life cycle. The **Status** field on the purchase order record is always read-only.

Purchase order status



Status life cycle

Status	Description
Requested	The status is **Requested** when you create a purchase order.
Ordered	The status changes to **Ordered** when you add purchase order line items, and click **Order**.
Pending Delivery	When you create assets before receiving them as a purchase order line item, the status of purchase orders and purchase order line items changes to **Pending Delivery** status.
Received	When ordered assets arrive in the specified stockroom and you click **Receive**, the status of purchase orders and purchase order line items changes to **Received**.
Canceled	You can cancel a purchase order if its status is **Requested**, **Ordered**, or **Pending Delivery**. For more information, see Cancel a purchase order.

Purchase order expected delivery date

The purchase order record and the purchase order line item record both contain the **Expected delivery** date field.

The **Expected delivery** field can be edited on both records. Editing the field on one record can change the field on the other record.

- If you add an expected delivery date to the purchase order and the expected delivery date field on the purchase order line item is blank, the date on the purchase order is added automatically to the purchase order line item.
- If you add an expected delivery date on the purchase order line item and the expected delivery date field on the purchase order is blank, the date on the purchase order line item is added automatically to the purchase order.
- If the purchase order and the purchase order line item have the same expected delivery date and you change the date on the purchase order, the date is changed automatically on the purchase order line item.
- If you change the date on the purchase order line item to a date that is later than the one specified on the purchase order, the date on the purchase order is changed to the new date. The expected delivery date of a purchase order line item cannot be later than the expected delivery date on the associated purchase order.
- If you change the date on the purchase order line item to a date that is earlier than the date specified on the purchase order, the date on the purchase order remains the same.

Cancel a purchase order

You can cancel purchase orders with a status of **Requested**, **Ordered**, or **Pending Delivery**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: procurement_admin or procurement_user

About this task
Purchase order line items can also be canceled from a purchase order.

Procedure
1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Open a purchase order to cancel.
3. Click **Cancel**.
   All associated purchase order line items that have not been received are canceled. Any assets created for the purchase order are deleted.

Cancel a purchase order line item

You can cancel a purchase order line items with a status of **Requested**, **Ordered**, or **Pending Delivery**.

Before you begin
Role required: procurement_admin or procurement_user

About this task
Keep the following in mind when you cancel a purchase order line item.

- When a purchase order line item is canceled, if all other line items are also canceled, the purchase order is canceled.
- After a purchase order line item is canceled, it can be reordered if the associated purchase order has not been canceled or received.
- If you cancel a purchase order line item for which assets were created, the assets are deleted from the system and removed from the purchase order.
- If you reorder the same purchase order line item, the assets are recreated for that line if the line has a status of **Pending Delivery**.

Procedure
1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Open a purchase order.
3. In the **Purchase order line items** related list, select a line item to cancel.
4. Click **Cancel**.

Reorder a purchase order

You can reorder a purchase order that was canceled.

Before you begin
Role required: procurement_admin or procurement_user

Procedure
1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Open a purchase order with a status of **Canceled**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **Order**.
   The status changes to **Ordered** for the purchase order and all associated purchase order line items.

Reorder a purchase order line item

You can reorder a purchase order line item that was canceled.

Before you begin
Role required: procurement_admin or procurement_user

Procedure

1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Open a purchase order.
3. In the **Purchase order line items** related list, select a line item with a status of **Canceled**.
4. Click **Order**.
   The purchase order line item **Status** field changes based on the **Status** field of the associated purchase order. For example, if the purchase order has a status of **Pending Delivery**, the purchase order line item status changes to **Pending Delivery** and the assets for the purchase order line item are created automatically.

Create an asset and reserve it for the requester

Create the asset before they're delivered so that you can create the asset record with an asset tag and serial number early in the process and reserve the asset for the user who requested it. The receiver can only select the assets to be received as assets are pre-created.

Before you begin
Role required: procurement_admin or procurement_user

About this task
Some requests must be approved before items on the request can be sourced. In the base system, requests over $1,000 require approval. To change the $1,000 approval threshold and other workflow attributes, edit the Service Catalog Request workflow.

When the asset state is **In stock**, the **Reserved for** field is maintained as the asset is received and placed in a stockroom. When the asset state changes to **In use**, the **Reserved for** field is relabeled **Assigned to**. If there is a name in the **Reserved for** field, the name is retained when the field is relabeled. A user with the asset role can change the name in the **Assigned to** field. Changing the name is helpful, for example, if an IT technician orders 10 laptops and must assign them to individual users.

Note:
If assets are not created prior to delivery, they are automatically created from line items when purchase orders are received. Also you can enter the asset details and receive them when the purchase orders are received.

Procedure

1. Navigate to **All** > **Procurement** > **Requests** > **Tasks**.
2. Open a task with a **State** of **Open** and a **Short description** of **Source Request Items**.
3. Click **Source Request**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the request is already fulfilled or the items in the request are not sourceable, the **Source Request** button is hidden.
- If the requested item does not have an assigned model, the item is not listed on the Source the Request dialog box.
- Any items on the purchase order that have a remaining quantity of **0** are not listed on the Source the Request dialog box.

4. Select a **Destination Stockroom**.
5. Select the **Create PO** option for one or more listed items.
6. For each item requiring a purchase order, select a **Vendor**.
7. Click **OK**.
8. Navigate to **Procurement** > **Orders** > **Purchase Orders**.
9. Open the purchase order you just created.
   If you created a purchase order for more than one item, multiple purchase orders may have been created.
10. Select **Order**.
    After the items are ordered, no additional purchase order line items can be added to the purchase order.
    The status of all purchase order line items changes to **Ordered**.
11. Click the **Create hardware assets prior to delivery** related link to automatically create hardware assets for all purchase order line items.
    Hardware assets are listed in the **Assets** related list. Click an asset in the list to view the asset record. Except for consumables, the **Reserved for** field contains the name of the user who made the original request.

    You can also create assets for individual purchase order line items. On a purchase order, go to the **Purchase order line items** related list and click a specific purchase order line item number. Then, click the **Create hardware assets prior to delivery** related link. Only the hardware assets included on the purchase order line item are created.

Set asset states and substates

Models

Receive assets

Assets can be received and added to the system when they are delivered to a stockroom.

Users with an appropriate procurement role can receive assets. If one purchase order contains multiple purchase order lines, the lines can be received at different times. This is useful if items arrive at the stockroom in different shipments. The purchase order status does not change to **Received** until all purchase order lines are received.

As an alternative to receiving assets when they arrive, you can create assets before they arrive and reserve them for the requester.

Receive an asset

When assets are received and delivered to a stockroom, they're added to the system.

Before you begin
Role required: procurement_admin or procurement_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you receive assets:

- If you haven't pre-created hardware assets, you can enter asset details and reserve them for users.
- You can over receive an order wherein, the received quantity can be higher than the ordered quantity.
- If you have ordered multiple items with different receiving stockrooms, you can receive them at the same time.

Procedure

1. View purchase orders.
2. Select a purchase order with a **Status** of **Ordered** or **Pending Delivery**.
3. Select **Receive**.
   The Receive Purchase Order screen appears with the list of the products ordered.
4. Select the **Received** check box for the line items that you're receiving.
5. To receive software assets:
   a. Edit the **Receiving Stockroom** if the items arrived at a different stockroom than the one specified on the purchase order.
   b. Edit the **Receiving Quantity** if the number of items delivered doesn't match the number ordered.
   c. Edit the **Unit Cost** if the price changed between the time the item was ordered and the time it arrived at the stockroom.
   Enter a number. The number can include decimals.
   d. Select **Capture Asset tags** to enter asset details.
   You can't enter details for assets more than the received rights.
   e. In the **Capture Asset Tag** dialog box, select **Insert a new row**.
   f. Enter the asset tag, serial number, rights, and License key.
6. To receive hardware and consumables assets:
   a. Edit the **Receiving Stockroom** if the items arrived at a different stockroom than the one specified on the purchase order.

      Note:
      The asset bundle when received creates the asset bundle with the status as **Bundle**.
      You must add the individual assets under the asset bundle.

   b. Edit the **Receiving Quantity** if the number of items delivered doesn't match the number ordered.
   c. Select the **Reserve** toggle button to reserve the item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a reserved item is received, the **State** and **Substate** fields on the corresponding asset record are automatically set to **In stock** and **Reserved**, respectively. If the **Reserve** button isn't selected for an item, the **State** and **Substate** fields on the corresponding asset record are set to **In stock** and **Available**.

Note:
You can't reserve consumables.

d. From the **Reserved for** list, select a user you want reserve the asset for.

If a name was specified in the **Requested for** field on the Purchase order line item form, the name is added automatically but can be changed.

You can add multiple users in the **Capture Asset tags** dialog box.

e. Select **Capture Asset tags** to enter asset details.

You can't enter details for assets more than the received quantity. You can also reserve assets for a user.

Note:
If you've pre-created the assets, you must select the ones you want to receive.

f. On the **Capture Asset Tag** dialog box, select **Insert a new row**.

g. Enter the asset tag and serial number.

h. From the **Reserved for** list, select the user for whom the item was ordered.
If a name was specified in the **Requested for** field on the Purchase order line item form, the name is added automatically, but you can change it.

i. Edit the **Unit Cost** if the price changed between the time the item was ordered and the time it arrived at the stockroom.
Enter a number. The number can include decimals.

7. Select **Submit**.
A confirmation message displays with the details of assets received.
8. Select **OK**.

A receiving slip is automatically created and can be viewed in the **Receiving Slips** related list. If items on a purchase order are received at different times, a new receiving slip is created each time any item on the purchase order is received. For example, if 30 laptop computers were ordered and arrived in three separate shipments, three receiving slips are created.

Different assets are created for each hardware item. If it's a software asset, one single asset is created for each license if you don't split the rights. For consumables, if an asset exists, it's updated, or else, new assets are created.

Create a receiving slip

Receiving slips are created automatically during the process of receiving assets. You can also create receiving slips manually.

Before you begin

Role required: procurement_admin or procurement_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
After a receiving slip has been created for a purchase order, all fields on the purchase order record are changed to read-only.

Procedure
1. Navigate to **All** > **Procurement** > **Receiving** > **Receiving Slips**.
2. Click **New**.

   A **Number** is assigned automatically. The current date and time is added automatically to the **Received** field.

3. Select a **Purchase Order**.
   Only purchase orders with a status of **Ordered**, **Pending Delivery**, or **Requested** are listed in the selection window. The **Vendor** column lists the vendor specified on the purchase order. The **Ship to** column lists the destination stockroom specified on the purchase order.
4. Select a **Receiving Stockroom**.
5. Click **Submit**.

What to do next
Add a receiving slip line to the receiving slip to identify the items from the purchase order that were received.

Create a receiving slip line

When assets arrive at a stockroom and you receive them, a receiving slip is created on the purchase order. You create a receiving slip line to identify the specific assets and quantities that were received.

Before you begin
Role required: procurement_admin or procurement_user

About this task
If the asset already exists, the asset record is updated when you save the receiving slip line. If the asset does not already exist, a new hardware or software asset record is created. The **Model category** and **Configuration item** fields are automatically filled in on the new asset record based on information in the request, purchase order, or receiving slip. If **Asset Tag** and **Serial Number** information exists, it is not overwritten.

Procedure
1. Navigate to **All** > **Procurement** > **Receiving** > **Receiving Slips** and open a receiving slip.
2. In the **Receiving Slip Lines** related list, select **New**.
   The following fields are completed automatically.

   - A **Number** is assigned.
   - In **Received**, the current date and time are added.
   - In **Received by**, the currently logged in user is added.

3. In **Purchase Order Line**, select the reference lookup icon and select a purchase order line.
   The **Purchase Order Line** field is required if the parent receiving slip has an associated purchase order. Only purchase order lines that are associated with the same purchase order linked to the parent receiving slip are available for selection.
4. In **Quantity**, enter the number of items received.
   For example, five items were ordered, but only two are being received.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** Edit the **Received by**, **Requested for**, and **Unit cost** fields, as needed.
6. Select **Submit**.

Result
The **Receiving stockroom** field on the Receiving Slip record becomes read-only.

Integrating with external procurement applications

Manage an end-to-end procurement process by integrating external procurement applications with Software Asset Management and create software requisitions directly on the external procurement applications. Software Asset Management tracks these requisitions and automatically generates entitlements or entitlement import errors after these requisitions are received on the external procurement application.

Integrating Software Asset Management with external procurement applications help you to:

- Gain end-to-end visibility of the entire purchase request to entitlement creation.
- Automate the complete process of creating software requisitions to entitlement creation.
- Reduce errors in entitlement creation.

Before you begin

- Activate the Procurement plugin (com.snc.procurement). For more information, see Activate Procurement.
- Install the Asset Management - Procurement Integration (app-itam-procurement-integration) store application from ServiceNow Store. For more information, see Install Asset Management - Procurement Integration.

Install Asset Management - Procurement Integration

You can install the Asset Management - Procurement Integration application (app-itam-procurement-integration) from the ServiceNow Store.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Asset Management - Procurement Integration application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: Now Support

After the Asset Management - Procurement Integration has been entitled, you can reach out to Now Support to install this application.

About this task
Scheduled jobs and tables are installed with Asset Management - Procurement Integration:

For more information, see Components installed with Asset Management - Procurement Integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Asset Management - Procurement Integration application (app-itam-procurement-integration) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In a list next to the **Install** button, you see the versions that are available to you.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Components installed with Asset Management - Procurement Integration

Several types of components are installed with activation of the Asset Management - Procurement Integration application, such as tables and scheduled jobs.

Scheduled jobs installed

Scheduled job	Description
ITAM - Sync <procurement_integration_profile_name> purchase orders	Fetches the status of the already created requisitions daily. This scheduled job is automatically created when you publish the integration profile.

Tables installed

Table	Description
Procurement Integration Profile [itam_procurement_integration_profile]	Includes the details of the third-party procurement integrations that are connected to the Procurement application in ServiceNow.
Procurement Integration Jobs [itam_procurement_integration_job]	Includes the mapping information of a procurement integration profile with its associated scheduled jobs.
Integration Scheduled Job Results [itam_procurement_integration_job_log]	Includes the details of the failure of the scheduled job execution.

Domain separation and Asset Management - Procurement Integration

Domain separation is supported for Asset Management - Procurement Integration. Domain separation enables you to separate data, processes, and administrative tasks into logical

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Enhanced

- Includes **Basic** and **Standard** levels.
- Data-driven process enables service provider customers to modify business logic that is based on defined use cases. These configurations are UI-based and fail-safe so that configurations by one customer can't affect another.
- Tenants of the instance must be able to configure minimum viable product (MVP) business logic and data parameters for themselves. This logic and parameters would be expected for the application's normal function.

Sample use case: Tenant-customers of a shared environment must be able to change the impact, urgency, or priority matrix to set priority within their domain.

For more information on support levels, see Application support for domain separation.

Asset Management - Procurement integration overview

Domain separation is present in all aspects of the Asset Management - Procurement Integration application.

How domain separation works in Asset Management - Procurement Integration

- You can create multiple procurement integration profiles in each domain. You must have only one published and active profile in each domain, including the parent domain.
- For the Purchase Order to create a requisition in your external purchasing application, a published procurement integration profile must exist in the domain of the purchase order.
- All Purchase Orders, Purchase Order Lines, Receiving Slips, Receiving Slip Lines, entitlements, entitlement import errors, and expense line records that you created are stamped with the respective domain of the purchase order.

The Procurement Integration Job [itam_procurement_integration_job] table isn't domain separated.

However, each procurement integration job is associated with a procurement integration profile. The job execution only synchronizes the updates from the external purchasing application to the purchase orders that are stamped with the corresponding procurement integration profile.

Domain separated tables

- Procurement Integration Profile [itam_procurement_integration_profile]
- Procurement Integration Job Log [itam_procurement_integration_job_log]

Required plugins

- Domain separation extension (com.glide.domain.msp_extensions.installer)
- SAMP (com.sn_samp_master)
- Procurement (com.snc.procurement)

Other supported plugins

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog – Domain Separation (com.glideapp.servicecatalog.domain_separation)

Integrating with Coupa

Integrating Coupa with Software Asset Management helps you create software requisitions directly on Coupa. Software Asset Management tracks these requisitions and automatically generates entitlements or entitlement import errors after these requisitions are received on Coupa.

Note:
This integration doesn't pull requisitions created on Coupa to Software Asset Management.

Before you begin

- Install the Asset Management - Procurement Integration (app-itam-procurement-integration) store application from ServiceNow Store. For more information, see Install Asset Management - Procurement Integration.
- You must have the Software Asset Management Enterprise license.
- Activate the Coupa spoke. For more information, see Coupa Spoke.
- Activate the Procurement plugin (com.snc.procurement). For more information, see Activate Procurement.

Synchronize reference data

Both ServiceNow Procurement and Coupa have theirs own set of tables and reference data types. For a smooth and successful integration, you must synchronize the data you would refer. For more information, see Reference data synchronization.

Warning:
If you don't synchronize data, you might encounter a few issues while creating a requisition on Coupa.

Create a Coupa integration profile

Create a Coupa integration profile to verify the status of the procurement-scheduled jobs, entitlements, and entitlement import errors created through this profile.

Before you begin
Role required: sam_admin

Create an OAuth 2.0 connection with Coupa to get the Client ID and Client Secret. For more information, see OAuth 2.0 Getting Started with Coupa API. Save the Client ID and Client Secret in a secure location for later use.

You must set the following scopes while creating an OAuth 2.0 connection with Coupa.

- core.approval.configuration.read
- core.approval.read
- core.approval.write
- core.catalog.read
- core.common.read
- core.contract.read
- core.contract.write
- core.inventory.adjustment.read

- core.inventory.adjustment.write
- core.inventory.asn.read
- core.inventory.common.write
- core.inventory.consumption.read
- core.inventory.consumption.write
- core.inventory.receiving.read
- core.inventory.receiving.write
- core.inventory.return_to_supplier.read
- core.inventory.transfer.read
- core.inventory.transfer.write
- core.invoice.delete
- core.invoice.read
- core.invoice.write
- core.item.read
- core.item.write
- core.legal_entity.read
- core.purchase_order.read
- core.purchase_order.write
- core.requisition.read
- core.requisition.write
- core.sourcing.pending_supplier.read
- core.sourcing.pending_supplier.write
- core.sourcing.read
- core.sourcing.response.award.write
- core.sourcing.response.read
- core.sourcing.response.write
- core.sourcing.write
- core.supplier.read
- core.supplier.write
- core.user.read
- core.user.write

Note:
If these scopes aren't associated with the Client ID and Client Secret, the OAuth token flow fails on ServiceNow.

Procedure

1. Navigate to **Software Asset Workspace** > **License operations** > **Purchasing** > **Procurement integrations**.
2. Select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the form, fill in the fields.

Create New Procurement Integration Profile

Field	Description
Display name	Name of the procurement integration profile. For example, `Coupa integration`.
Connection & Credentials	Connection and credential alias for Coupa. This field gets automatically populated to **sn_coupa_spoke.Coupa_OAuth**.
Profile type	Type of integration profile. Select **Coupa integration**.
Status	Status of the integration profile. ○ If you haven't published the integration profile, this field is automatically set to Draft. ○ If you've already published the integration profile, this field is automatically set to Published.
Active	This field is visible and set to true only when the integration profile is published. If you set this field to false, the associated requisitions with this integration profile aren't created and tracked.

4. Select **Save**.
5. Select the Preview icon ⓘ next to the Connection & Credentials field.
   You get redirected to the Connection & Credential Aliases form.
6. Select **Create New Connection & Credential** in the Related Links section to create connection credential.
7. In the dialog box, fill in the fields.

Create Connection and Credential

Field	Description
Name (Connection)	Name to identify the connection uniquely. For example, `Coupa OAuth connnection`.
Connection URL	URL to make a connection to Coupa. Use the `https://<coupa-instance-url>` format. ○ For customer instances, use the `https://{organization_name}.coupahost.com` format.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ For partner and demo instances, use the `https://{organization_name}.coupacloud.com` format.
Name (Credential)	Name to identify the credential uniquely. For example, `Coupa OAuth credential`.
Token URL	URL used to generate OAuth token. Use the `https://<coupa-instance-url>/oauth2/token` format.
OAuth Client ID	Identifier (Client ID) generated in Coupa.
OAuth Client Secret	Secret (Client Secret) generated in Coupa.

8. Select **Create and Get OAuth Token**.
   Your ServiceNow instance creates an OAuth for Coupa and then automatically returns you to the Integration Profile form.
9. **Optional:** Create a child alias that can uniquely identify the connection and credentials for this integration profile.
   The first Coupa integration profile that you create uses the default (parent) connection and credential alias for Coupa. Each additional Coupa integration profile that you create needs a unique child alias that helps differentiate the connection and credentials between each integration profile.
   a. On the Connection & Credential Aliases form, select the link under **Child Aliases > Parentalias=*** ** to add child aliases.
   b. Select **New**.
   c. Enter a name for the child alias in the Name field.
   d. Right-click the form header and then select **Save**.
   e. After the form reloads, select the **Create New Connection & Credential** related link.
   f. Repeat steps 7 and 8.
   g. In the Connection & Credential field of the Integration Profile form, select the lookup icon to locate and select the child alias that you created.
   Selecting the child alias associates the alias with the integration profile. Your ServiceNow instance uses this alias to identify the connection and credentials for this integration profile.
10. Select **Publish**.

Result

After you publish the integration profile, the scheduled job *`ITAM - Sync Coupa purchase orders`* runs daily and fetches the status of the already created requisitions.

Note:
If you haven't created any requisition, the scheduled job doesn't run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view this information by clicking the **Procurement Integration Jobs** tab.

What to do next

Verify if the scheduled job *ITAM - Sync Coupa purchase orders* has run successfully by selecting the **Integration Scheduled Job Results** tab. If the job has failed, you can view the list of errors by following these steps:

1. On the Procurement integration profile form, select the **Procurement Integration Job Log** related list.
2. Open the job log record where the displayed status shows as failed.
3. Select the related list **Asset Job Log Details** to find out the reason for the job failure.

Create software requisitions directly on Coupa through the ServiceNow Procurement application to purchase software.

If you want to delete the Coupa integration profile, see Deleting an external procurement application integration profile.

Create a requisition on Coupa through Procurement application

Create software requisitions directly on Coupa through the ServiceNow Procurement application to purchase software.

Before you begin

To create a requisition on Coupa through ServiceNow Procurement application, you must perform the following tasks.

- Create and publish a Coupa integration profile. For more information see, Create a Coupa integration profile.
- Ensure that the Purchase Order you create has at least one Purchase Order Line, and all Purchase Order Lines must be for software products.
- Synchronize reference data types on both ServiceNow Procurement and Coupa applications. For more information, see Reference data synchronization.

If all these conditions are met, you can create a requisition in Coupa.

If the conditions aren't met, requisitions aren't created on Coupa, and the legacy procurement flow continues on the Procurement application.

Role required: sam_admin and procurement_integrator

Note:
The procurement_integrator role is added to the sam_admin role. The procurement_integrator role enables the SAM admin to view the connections and aliases.

About this task

You can create a requisition on Coupa through the following ways:

- When a user requests software through Service Catalog. For more information, see Request a catalog item from Service Portal.
- If a procurement_user or sam_admin directly creates a Purchase Order on the Procurement application. For more information, see Create a Purchase Order.
- When a sam_user creates a Purchase Order directly from the Remediation Options form. For more information, see View software model results.

Requisitions are of the following types:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Catalog request**: A requisition created for an item that is already present in the external purchasing application.
- **Non catalog request**: A requisition created for an item that isn't present in the product catalog of the organization.

For more information about creating a Purchase Order, see Create a purchase order.

Procedure

1. Navigate to **All** > **Procurement** > **Orders** > **Purchase Orders**.
2. Select **New**.
3. On the form, fill in the fields.

Purchase order fields

Field	Description
Number	The unique number identifying the purchase order.
Due by	The date by which the purchase order **Total cost** must be paid.
Vendor	The supplier to which the purchase order was issued.
Ship to	The stockroom to which the items on the purchase order should be shipped. **Note:** This field is required but doesn't affect creating requisitions for software on Coupa.
PO date	The date on which the purchase order was created.
Status	The status of the purchase order: **Canceled**, **Ordered**, **Received**, **Requested**, or **Suspended**.
Assigned to	The user to whom the purchase order is assigned.
Bill to	The location responsible for paying the purchase order **Total cost**.
Short description	A brief description of the purchase order.
General section	
Shipping	The delivery method to be used when shipping the items on the purchase order.
Terms	The purchase order payment terms: **Credit**, **Net 30 days**, or **Net 90 days**.
Ship rate	The amount that must be paid for the delivery method specified in the **Shipping** field.
Total cost	The sum of all item costs on the purchase order and the shipping costs.
Description	A full description of the purchase order contents.
Details section	
Initial request	The record number of the request that requires the items on the purchase order.
Requested by	The user requesting the items on the purchase order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The email ID or email address of the user requesting the items on the purchase order must be the same on both Coupa and ServiceNow ServiceNow application.
Requested	The date the user in the **Requested by** field requested the items on the purchase order.
Ordered	The date and time of clicking the **Order** button on the Purchase Order form.
Expected delivery	The date the items associated with the purchase order are expected to arrive in the stockroom identified in the **Ship to** field. This field can't be edited when the purchase order has a **Status** of **Received** or **Canceled**. (For more information about this field, seePurchase order expected delivery date .)
Received	The date and time at which the purchase order status changed to **Received**.
Contract	The record number of the contract with the vendor from which the items on the purchase order are ordered.
Department	The department responsible for paying for the purchase order.
Budget number	The budget number related with the purchase order.
Vendor account	The vendor account related with the purchase order.

4. Right-click on the form and select **Save**.
   You can add purchase order line items to specify what you are ordering from this vendor. For more information about creating a purchase order line item, see Create a purchase order line item. A requisition line is created with a unique ID in Coupa.
5. After you've added at least one purchase order line item, select **Order**.
   A requisition ID is displayed on your Purchase Order and the corresponding requisition line IDs are displayed on your Purchase Order Lines.

   Note:
   Wait for some time and then reload the Purchase Order form to view the generated IDs or errors.

Result

After the status of the Purchase Order is **Received** on Coupa, the following activities occur:

- **Assets** and **Receiving Slips** get created and you can find the **Purchase Order Number** on the Purchase Order form.
- The Asset Management - Procurement Integration application automatically generates entitlements.
- On receipt of the assets, the scheduled job *ITAM - Sync Coupa purchase orders* creates a Receiving Slip and Receiving Slip Lines on the ServiceNow Procurement application. This job also pulls the Coupa fields such as Manufacturer part number, Status, and Receiving quantity. The values returned from Coupa through the receiving transactions are used to populate the created entitlements. However, if these values are not available from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

receiving slips, then the Asset Management - Procurement Integration application uses the values populated in the Purchase Order of the Procurement application.

- If any discrepancy exists on the Purchase Order, Asset Management - Procurement Integration creates entitlement import errors. You can view the errors by selecting the **Entitlement Import Errors** tab under a Purchase Order, Purchase Order Line item, and Receiving Slip line.

Reference data synchronization

For a successful integration of Coupa with Software Asset Management, you must synchronize the following reference data types on both the ServiceNow Procurement application and Coupa.

Requisition or Purchase Order form

Coupa Requisition field	ServiceNow Procurement Purchase Order field	Description
Requested by	Requested by	The email address that is associated with the Requested by record is used to find the corresponding reference record in Coupa.

Requisition Line or Purchase Order Line Item fields

Coupa Requisition Line fields	ServiceNow Procurement Purchase Order Line Item fields	Description
Supplier	Vendor	The supplier or vendor from which the software product should be ordered.
unit-price	Cost	The cost or price of a single product model, including discounts.
Currency	Cost	Currency is a reference field on Coupa. For a successful integration, verify that the currency codes on Coupa and ServiceNow match.
Item	Catalog Item	The Coupa items and ServiceNow Procurement catalog items must share the same display name. **Note:** This field is only used for catalog requests.
Description	Product Model	The model of the purchase order line item. **Note:** This field is only used for non-catalog requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deleting an external procurement application integration profile

If you want to stop using an external procurement application for creating software requisitions through Software Asset Management, you can delete the integration profile.

A sam_admin can delete an integration profile by selecting **Delete** on the integration profile record.

When you delete a direct integration profile, all scheduled jobs and the job results associated with the profile gets deleted. The integration profile references are also removed from the Purchase Order records on ServiceNow.

After you delete the integration profile, Software Asset Management doesn't consider any in progress requests. Ensure that all the requests in progress are completed before you delete the integration profile.

Domain separation and Procurement

Domain separation is supported in Procurement processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard*

The support level is Standard but has some exceptions or special conditions.

- Includes all aspects of **Basic** level support.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must be able to configure minimum viable product (MVP) business logic and data parameters. This configuration is done per tenant, as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

How domain separation works in Procurement

To create or edit Purchase Orders (POs) or PO line items that distinguish the domain, customers must be working in the proper domain. When adjusting any configuration, you should be in the domain where you're doing the work. Use the domain picker to choose the correct domain to work in.

Related topics

Domain separation for service providers

Product Catalog

The product catalog is a set of information about individual models. Models are specific versions or various configurations of an asset. Asset managers use the product catalog as a centralized repository for model information.

A detailed and well-maintained product catalog can coordinate with service catalog, asset, procurement, request, contract, and vendor information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Models published to the product catalog are automatically published to the Service Catalog. The service catalog includes information about goods (models) and services. If the model is available from multiple vendors, a model can be listed more than once. Models are included with the Asset Management application.

Keep the following in mind when working with the product catalog.

- A product catalog item can be linked to multiple vendor catalog items or to a single model.
- A model can only have one product catalog item.
- A vendor catalog item can only have a single product catalog item.

Components installed with Product Catalog

The following components are installed with the Product Catalog plugin.

Demo data is available with the product catalog. The demo data provides various models, model categories, product catalog items, vendor catalog items, and vendors.

Tables installed with Product Catalog

Product Catalog plugin adds the following tables.

Table	Description
Hardware Catalog [pc_hardware_cat_item]	Stores all hardware catalog items that have been published from the Product Model [cmdb_model] base table. Extends the Product Catalog Item [pc_product_cat_item] table.
Product Catalog Item [pc_product_cat_item]	Stores all information for the product catalog. This table extends the Catalog Item [sc_cat_item] table.
Software Catalog [pc_software_cat_item]	Stores all software catalog items that have been published from the Product Model [cmdb_model] base table. Extends the Product Catalog Item [pc_product_cat_item] table.
Vendor Catalog Item [pc_vendor_cat_item]	Stores all vendor catalog item information.

Roles installed with Product Catalog

Product Catalog plugin adds the following roles.

Role	Description	Contains roles
model_manager	Can create CMDB models.	none
category_manager	Can do everything that model managers can do and can administer model categories.	model_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script includes installed with Product Catalog

Product Catalog plugin adds the following script include.

Table	Description
ProductCatalogUtils	Utilities for creating and maintaining product catalog items derived from vendor catalog items and models.

Client scripts installed with Product Catalog

Product Catalog plugin adds the following client script.

Client script	Table	Script contents
Set Model Fields	[pc_vendor_cat_item]	Adds the description and price, if they do not exist, when a vendor catalog item is added to the product catalog.

Related topics

Client scripts

Business rules installed with Product Catalog

Product Catalog plugin adds the following business rules.

Business rule	Table	Description
Clear model	[pc_product_cat_item]	Clears the link on a model when the link is cleared from the product catalog.
Create child product catalog entries	[cmdb_hardware_product_model]	Creates entries in the product catalog for all items in a bundled model when the bundled model is created.
Sync to Product catalog item	[pc_vendor_cat_item]	Updates the corresponding field in the product catalog when a field is updated.
Sync to Product catalog item	[cmdb_model]	Updates the corresponding field in the product catalog when a field is updated.

Business rules

Models

Models are specific versions or various configurations of an asset. Models are used for managing and tracking assets through various ServiceNow platform asset applications, including Product Catalog, Asset Management, and Procurement.

Model definitions can be based on vendor-provided criteria, for example, the manufacturer name Apple MacBook Pro, or on a custom abstraction, for example, Graphic Designer Workstation. All model information is located in the Product Catalog application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A model can be in one or more model categories. For example, a laptop can be a computer and a server. Model definitions specify whether the model creates an asset, a configuration item, or both. On a hardware model record, compatible hardware models can be added.

Unless otherwise noted, working with product models requires the model_manager role. This role is contained by other roles, such as sam, category_manager, and asset.

Creating models

Models are created in the **Product Catalog** > **Product Model** > **All Models** module.

See Model form fields for a list of the fields that appear on all models, regardless of the type of model.

Related topics

Asset Management

Procurement

Model form fields

There are fields on the Model form that apply to all types of models.

Field	Description
Display name	Name of the model. A system property called *glide.cmdb_model.display_name.shorten* controls how software model display names are generated.
Manufacturer	The company that built the model.
Name	Field that Discovery uses to create a model with the value discovered. Model managers can specify a name of their choice when creating a model and can also edit the name of an existing model.
Edition	The edition of the software model, such as **Professional**.
Short description	A brief description of the model.
Model categories	The categories to which the model is assigned. This field is a glide list and cannot be used to create reports.
Asset tracking strategy	The process by which the model can be tracked. Choose from the following: • **Leave to Category:** model is transparent and the category defines the asset class. • **Create Consumable Asset:** model forces the asset class to be consumable, regardless of what the category defines as the asset class. • **Don't create assets:** model blocks asset instantiation, regardless of what the category defines as the asset class.
Acquisition method	The method for purchasing the model. Options are **Both**, **Buy**, or **Lease**.
Cost	The cost of a single unit of the model.
Depreciation	The depreciation scheme for the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Salvage value	The estimated value that an asset realizes upon its sale at the end of its useful life. This value must be less than or equal to the cost of the asset.
Model number	The specific model number assigned to the item by the manufacturer. Setting the system property *glide.cmdb.makeandmodel.use_model_number_lookup* to true enables you to lookup the model number of hardware models through the MakeAndModelJS script.
Barcode	The barcode number assigned to the model. Barcodes are assigned by the manufacturer.
Owner	The person responsible for the model.
Status	The status of the model. Options are **In Production**, **Retired**, and **Sold**.
Expenditure type	The type of expenditure. Choose from the following: • **Capex**: Capital expenditure is a one-time expenditure, where the value is realized over the years. For example, a photocopier. • **Opex**: Operational expenditure is an on-going expenditure. For example, toners for the photocopier.
Certified	The option that determines whether the model is approved for use.
Comments	Information about the model that would be helpful for others to know.
Assets	The assets created from this model. This creation can have any combination of assets and configuration items. For example, with a single hardware model you can have assets and no configuration items, configuration items and no assets, or have both.
Configuration Items	The configuration items created from this model. Can have any combination of assets and configuration items.
Product Catalog	The information about the model as it appears in the product catalog and service catalog. Information only appears if the model has been published to the product catalog.

Create hardware models

Use hardware models to track equipment assets such as servers and racks. You can create a new hardware model.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Hardware Models**.
2. Click **New**.
3. Complete the form.
   For general field descriptions, see Model form fields. The hardware model fields listed are found in the Information section of the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model form fields for hardware models

Field	Description
Height (U)	The total height of the hardware item, in inches.
Flow Rate (cfm)	The flow rate of the hardware model, expressed in cubic feet per minute.
Sound Power (bels)	The noise measurement, in bels (1 bel=10 decibels).

4. Click **Update**.

Add compatible models to a hardware model

On a hardware model record, you can add compatible hardware models, giving you a good method for tracking hardware assets that can work together.

Before you begin

Role required: model_manager

About this task

Note:
Hardware models included in bundled models cannot be added as compatibles.

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Hardware Models**.
2. Click a hardware model **Name**.
3. Click **Add Compatible**.
4. Select a compatible model.
5. Click **Submit**.
   The selected model is listed in the **Compatibles** related list.

Related topics

Bundled models

Add substitute models to a hardware model

On a hardware model record, you can add substitutes to track what hardware models can be substituted for another hardware model.

Before you begin

Role required: model_manager

About this task

For example, a 19" monitor can be a valid substitute for a 17" monitor. Note that substitutions are directional so, in this case, a 17" monitor is not a substitution for a 19" monitor. Information about valid substitute models is useful when you select models while creating transfer orders.

When you select substitute models, note the following conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Substitute models can be used with work management transfer orders. Substitute models are not used in procurement part sourcing.
- Hardware models included in bundled models cannot be added as substitutes.

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Hardware Models**.
2. Click a hardware model **Name**.
3. Click **Add Substitution**.
4. In the **Collection** list on the left, double-click a hardware model.
   The hardware model is added to the **List** on the right.
5. Click **Save**.
   The model is listed in the **Substitutes** related list.

Procurement

Create consumable models

Consumables are items that are tracked as a group, not individually. An example of consumable items is computer keyboards.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Consumable Models**.
2. Click **New**.
3. Complete the form.
   For general field descriptions, see Model form fields. There are no fields specific to consumable models.
   Any consumable assets you create and assign to the new model are displayed in the **Consumables** related list on the model record.
4. Click **Submit**.

Bundled models

A bundled model is a single model comprised of individual models. For example, a laptop, printer, keyboard, and mouse can be combined into a single bundled model. If you assign any one asset from the bundled model to an individual, that person receives all the components in the bundle.

Bundled model is a template to define the kind of assets that would be a part of asset bundles. To maintain the integrity between asset bundles and bundled models, select the **Bundle assets** check box in the Product Model form layout. Once you select the check box, the status of the bundled model defaults to **Build**. While the status is in build, you can add make changes to the bundled model. Once you change the status to **In Production**, no changes can be made to the bundled model. Now that the bundled model is read-only, you can create asset bundles out of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

this bundled model. You can change the status of the bundled model back to **Build** only if there are no asset bundles associated with the bundled model.

Note:
The **Bundle assets** check box functionality is available only with the Hardware Asset Management licensable application. Hardware Asset Management is available in the ServiceNow Store. To view more information on the asset bundle functionality, see asset bundles.

Bundled models can be abstract or concrete.

Abstract

Permits use of one model in multiple bundles. The abstract bundle is created as a container. One asset in the bundle is specified as the main component. Model categories define which assets can be included in a bundle. Model categories also define what can be the main component of a bundle.

Add a main component to make it easier to track the bundle components. For example, create an abstract bundle adding a computer as the main component and a mouse and keyboard as additional components. When the bundle is assigned to a user, the asset record for the computer shows the computer, mouse, and keyboard all assigned to the user. Abstract bundles are used more often than concrete bundles.

Concrete

Is a fixed bundle where the main component is an asset. Specify the main component and the other components to create an exact bundle. Concrete bundles do not allow for a many-to-many relationship with models.

Keep the following tips in mind when creating and using bundled models.

- Bundles can be nested inside bundles.
- Any type of model can be used in a bundle.
- When a parent link is defined, the fields related to assignment and state of the child assets are read-only. They are populated based on the parent's assignment and state fields.
- If you make a change to the parent bundle, the children in the bundle are affected. For example, if you assign a bundle to an individual, all child asset records show that same individual as the person assigned.
- You cannot pre-allocate bundles.
- In a bundle, consumables are consumed and assets are set to the same state as the main component.
- Only the bundle, not individual components, can be part of a transfer order.
- You control what can go into a bundle through the model category. For example, the model category **Servers** could be set to never allow servers in bundles.
- To create a collection of software, you must create a suite instead of a bundled model.
- A software license cannot be the main component of a bundle.

To create an abstract model, set the model category to **Bundle** and add the components. To create a concrete model, create a model in the **Product Catalog** > **Product Model** > **Bundled Models** module and add components.

Add model components to a bundle

Add model components to a model as needed, for example, when you upgrade a bundle to include additional assets.

Before you begin

Role required: model_manager and asset

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Bundled Models**.
2. Open a bundle record.
3. In the **Model Components** related list, click **New**.
4. Select the **Model category** of the component, such as **Computer**.
5. Select the **Component**, such as **Apple Computer MacBook Pro 17"**.
6. Select the **Is main component** check box if this component is the one that other components are attached to.
7. Click **Submit**.
8. Repeat steps 3–7 to add more components to the bundle.

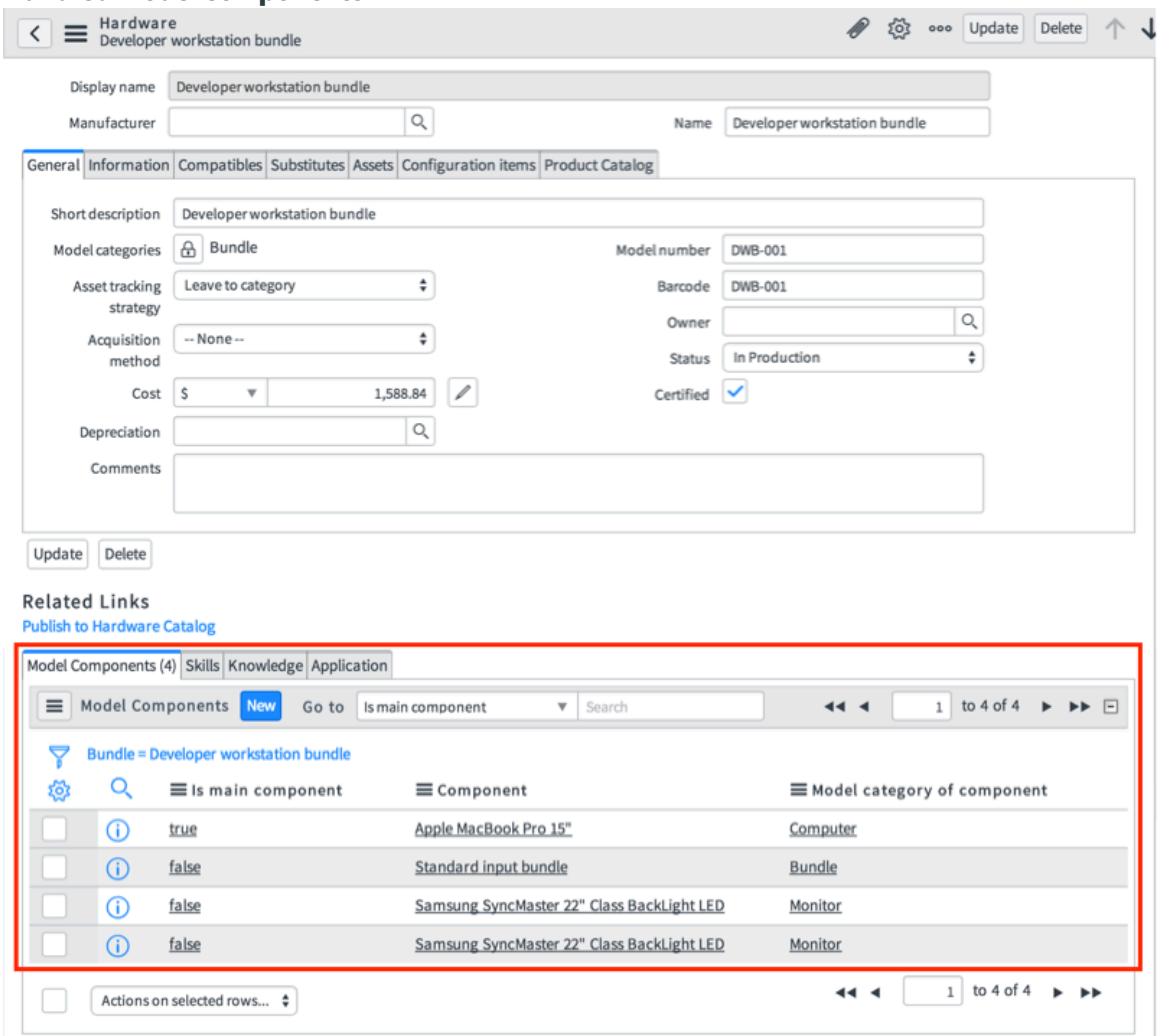
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Any components you add to the bundled model are displayed in the **Model Components** related list.

Bundled model components



Related topics

Models

Remove model components from a bundle

Remove a component from a bundled model, for example, when you want to replace it with a different component.

Before you begin

Role required: model_manager

About this task

No component history is retained. If you remove a component from a bundled model, no record is saved showing that the component was ever part of a bundle.

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Bundled Models**.
2. Open a bundle record.
3. In the **Model Components** related list, select the component you want to remove.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Actions** choice list below the list, select **Delete**.
5. Click **OK**.

Publish bundled models to product catalog

You can publish bundled models to the product catalog to make the bundled models available in the service catalog.

Before you begin

Role required: catalog_admin or catalog_manager

About this task

You can publish a bundled model only under the following conditions:

- The model should be created in the cmdb_model table.
- The model shouldn't have an existing catalog item.

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Models** > **Bundled Models**.
2. Open a product model.
3. In **Related Links**, select **Publish to product catalog**.
4. Select a category.
5. Select **OK**.

Software models

Software models are created as part of the asset management process. You can create product models for software from the product catalog, but you cannot administer all aspects of the software models.

Software models are used in software counters. For more information about creating software model, see Create software models.

Create application models

You can create application models that can be managed and tracked within a Scrum development process.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Application Models**.
2. Click **New**.
3. Complete the form.
   For general field descriptions, see Model form fields. There are no fields specific to application models.
4. Click **Submit**.

Work order models

When work management is activated, the ServiceNow platform adds the Work Order Models and Work Task Models modules to the product catalog.

Users with the wm_admin role can define new model records, which can be used as templates to create work orders for common procedures.

Models created for VMware support and Amazon EC2

When you activate Orchestration for VMware and Amazon EC2, the system creates models automatically.

The system creates the following models:

- A vmware instance for VMware
- An ec2 instance for Amazon

When the virtual machine is terminated, the asset state changes to **Retired**.

Add skills to a model

You can associate skills with any model. Creating associations between skills and models is helpful if you are using work management and want to assign tasks to agents based on their skills with specific models.

Before you begin

Role required: skill_admin or model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **All Models**.
2. Open a product model.
3. In the **Skills** related list, click **Edit**.
4. Add items from the **Collection** list to the **Skills List**.
5. Click **Save**.

Publish models to the hardware or software catalog

You can publish models to the hardware or software catalog to make the models available in the service catalog.

Before you begin

Role required: catalog_admin

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **All Models**.
2. Open a product model.
   When you publish a catalog item from a model, the property *glide.model.catalog_item_currency* decides the currency on the catalog item. This property is set to false by default and the value is set to user session currency. If you set this property to true, the value is set to model currency.
3. In **Related Links**, click **Publish to Hardware** or **Publish to Software Catalog**.
4. Select a category.
5. Click **OK**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete models

If a model is no longer needed, you can delete it as long as no assets or configuration items use the model.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **All Models**.
2. Select the check box beside the product model.
3. From the **Actions** choice list below the list, select **Delete**.
4. Click **OK**.

Vendor catalog items

The vendor catalog is a list of goods available from different vendors.

An accurate and complete vendor catalog can make it easier to keep items in stock at the best possible price.

You can link multiple vendor catalog items to a single product catalog item, which allows you to track information about a single item at different vendors.

For example, for an iPhone 5 product catalog item, you can create separate vendor catalog items from Apple and from Amazon. Select the vendor with the best price when you source an item. Users need the model_manager role to work with vendor catalog items.

Synchronize information

Certain information is synchronized between models, product catalog items, and vendor catalog items.

When working with models, product catalog items, and vendor catalog items, keep the following in mind:

- Changes to model record update vendor catalog items automatically only if the vendor catalog items are published, not linked.
- If a model is linked to a vendor catalog item, any changes to the model do not update the vendor catalog item.
- After publishing a vendor catalog item or model to the hardware or software catalog, some fields become read-only on the vendor catalog item or product catalog item record. Information can only be updated on the model record.

List of synchronized fields:

- Description
- Short description
- Name
- Product ID
- Price
- Vendor
- Specs
- Features

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Model
- UPC
- Model number
- Cost
- Manufacturer

Create a vendor catalog item

Create a vendor catalog item to associate product models with a vendor.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Vendor Items**.
2. Click **New**.
3. Complete the form.

Vendor Catalog Item fields

Field	Description
Name	The name of the item is built from information in the **Product Model**, **Vendor**, and **Product ID** fields.
Vendor	The supplier that provides the item.
Product model	The specific version or configuration of the item.
Out of stock	The option that indicates whether the item is unavailable for order. This field is important if you are sourcing request items. Clear this check box if the item is available to order.
Product ID	The item identification number assigned by your organization.
List price	The price at which the item retails, excluding vendor discounts.
Vendor price	The price at which the item is available in the vendor catalog. If the vendor offers a discount, the vendor price reflects the discounted price.
Rank tier	Displays the overall ranking for this vendor's products and services, such as Valued Partner or Tactical Supplier. Rank tier expresses your organization's opinion of this vendor's performance. It can be used to decide if the vendor's products should be promoted or discontinued. Users with the vendor_manager role can edit this field.
Short description	A brief description of the item.
General section	
Product catalog item	Name of the product catalog item, if the item has been added to the product catalog. Leave this field empty if you are going to link a vendor catalog item to the hardware catalog.
UPC	The barcode number used to uniquely identify and track items for sale.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Select the check box to list the item in the vendor catalog. Clear this check box to hide the item in the vendor catalog.
Description	A detailed description of the item.
Information section	
Specifications	Facts about the item such as size, weight, version, or speed.
Features	Distinct properties or distinguishing characteristics of the item.

4. Click **Submit**.

Link an item to the hardware catalog

After you create a vendor catalog item, link the item to the hardware catalog for viewing.

Before you begin
Role required: model_manager

About this task
To see the **Link to Hardware Catalog Item** related link on the Vendor Catalog Item form, add a hardware model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

Procedure
1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Vendor Items**.
2. Open a vendor catalog item.
3. In **Related Links**, click **Link to Hardware Catalog Item**.
4. Select a **Catalog Item**.
5. Click **OK**.
   The page refreshes to the selected hardware catalog item. The vendor catalog item is listed in the **Vendor Catalog Items** related list.

Link an item to the software catalog

After you create a vendor catalog item, link the item to the software catalog for viewing.

Before you begin
Role required: model_manager

About this task
To see the **Link to Software Catalog Item** related link on the Vendor Catalog Item form, add a software model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

Procedure
1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Vendor Items**.
2. Open a vendor catalog item.
3. In **Related Links**, click **Link to Software Catalog Item**.
4. Select a **Catalog Item**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **OK**.
   The page refreshes to the selected software catalog item. The vendor catalog item is listed in the **Vendor Catalog Items** related list.

Publish an item to the hardware catalog

After you create a hardware item for the vendor catalog, publish it to the hardware catalog for viewing. The hardware catalog is a section within the service catalog.

Before you begin
Role required: catalog_admin

About this task
To see the **Publish to Hardware Catalog Item** related link on the Vendor Catalog Item form, add a hardware model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

After you publish a vendor catalog item to the hardware catalog, the **Publish to Hardware Catalog** related link is no longer available. Any changes made on the vendor catalog item record are synchronized with the information in the hardware catalog.

Procedure

1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Vendor Items**.
2. Open a vendor catalog item.
3. In **Related Links**, click **Publish to Hardware Catalog**.
4. Select a **Category**.
5. Select **OK**.
   The published item is listed in the **Vendor catalog Items** related list of the Hardware Catalog form.

Publish an item to the software catalog

After you create a software item for the vendor catalog, publish it to the software catalog for viewing. The software catalog is a section within the service catalog.

Before you begin
Role required: model_manager

About this task
To see the **Publish to Software Catalog Item** related link on the Vendor Catalog Item form, add a software model or a consumable model to the **Product Model** field, and leave the **Product Catalog Item** field blank.

After you publish a vendor catalog item to the software catalog, the **Publish to Software Catalog** related link is no longer available. Any changes made on the vendor catalog item record are synchronized with the information in the software catalog.

Procedure

1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Vendor Items**.
2. Open a vendor catalog item.
3. In **Related Links**, select **Publish to Software Catalog**.
4. Select a **Category**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **OK**.
   The published item is listed in the **Vendor catalog Items** related list of the Software Catalog form.

View a vendor list

You can view a list of vendors from the product catalog.

Before you begin
Role required: model_manager

About this task
The list includes every company that has the **Vendor** option selected on its record.

Procedure
1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Vendors**.
2. Click any vendor **Name** for more information.

Product catalog items

Product catalog items are hardware and software that you can track and offer in the service catalog.

The product catalog is an extension of the Service Catalog that contains a list of available Models. Users with the catalog_admin role can create, activate, and deactivate product catalog items.

Create a product catalog item

Create hardware and software product catalog items to include in the product catalog and the service catalog.

Before you begin
Role required: catalog_admin

About this task
You must activate the items separately before they appear in the product catalog or service catalog.

Procedure
1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Hardware & Software Items**.
2. Select **New**.
3. Complete the form.
   Some of the fields listed do not appear until you save the product catalog item.

Product catalog item fields

Field	Description
Name	Name of the item as you want it displayed in the product catalog.
Catalogs	Catalog this item is listed in.
Vendor	Vendor that supplies the item. If the item is purchased from multiple vendors, use the vendor catalog and leave this field empty.

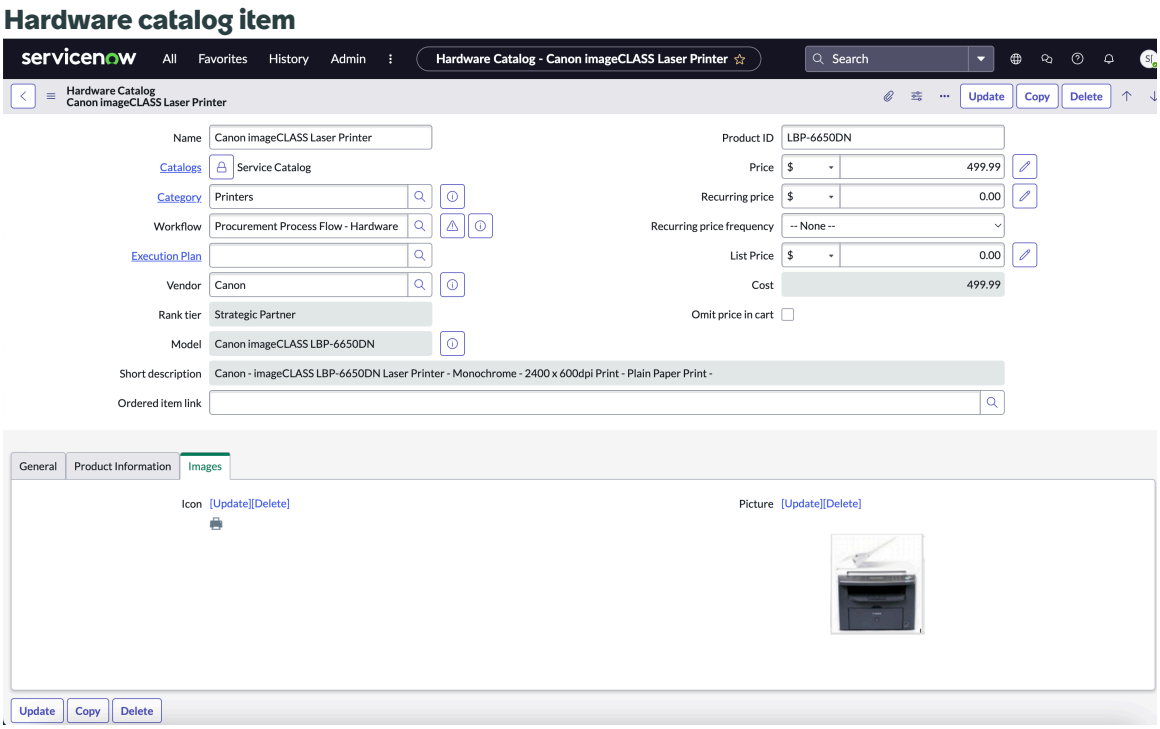
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Rank tier	Overall ranking for the selected vendor's products and services. This field is shown in a Product Catalog Item record when the CI class is **Hardware Catalog** or **Software Catalog**.
Model	Specific version or configuration of the item.
Product ID	Item identification number assigned by your organization.
Price	Price at which the item is available in the product catalog. Enter a numerical value and select the appropriate currency.
Recurring price	Item's recurring price. For example, a subscription to a mobile phone contract could cost $500.00, with an $30.00 monthly recurring price.
Recurring price frequency	Interval at which the recurring price is accrued.
List Price	Price at which the item retails. This field is shown only when the **Class** is **Hardware Catalog** or **Software Catalog**.
Cost	Price at which the item was purchased from the vendor. The cost could be less than the **List Price** if your organization received a discount from the vendor. This field is shown in a product catalog item record only when the CI class is **Hardware Catalog** or **Software Catalog**.
Omit price in cart	When selected, hides the price when the item is displayed in the service catalog. Clear the check box to show the price in the service catalog. This field is only visible in a product catalog item record when the CI class is **Hardware Catalog**.
Workflow	Workflow associated with this item. You can view the activities, the conditions, and the stages associated with the workflow by selecting **Show Workflow**.
Execution plan	Execution plan associated with this item.
Short description	Brief description of the item.
Ordered item link	List of links containing more information about items. The links can be reused across multiple items.
Class	Catalog item class this item belongs to. Select **Hardware Catalog** or **Software Catalog**. This field is visible by default. When you save the record as a hardware or software catalog item, the form is retitled Hardware Catalog or Software, respectively.
General section	
Category	Named group of items to which the item belongs.
Delivery time	Amount of time it takes to deliver the item, starting from when it is ordered from the product catalog.
UPC	Barcode number used to identify and track items.
Description	Detailed description of the item. The description is displayed in the product catalog listing.
Product Information section	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Cost	Price at which the item was purchased from the vendor. This field is only visible when the **Class** is **Software Catalog**.
Specifications	Facts about the item, such as size, weight, version, or speed.
Features	Distinct properties or distinguishing characteristics of the item.
Images section	
Icon	Small image that appears next to the name when the item is displayed in the service catalog. Supported file types are `jpg`, `png`, `bmp`, `gif`, and `jpeg`.
Picture	An image showing the item. Supported file types are `jpg`, `png`, `bmp`, `gif`, and `jpeg`.
Related lists	
Includes	More catalog items provided with this item. This related list is for informational purposes only.
Variables	Service catalog variables associated with this item. A service catalog variable captures and passes on information about choices a customer makes when ordering an item from the service catalog.
Vendor Catalog Items	Vendor catalog items associated with this item. Vendor catalog items allow you to track information about this item by its specifications for each vendor.

Example
Hardware catalog item record with an icon and picture of the item.



4. **Optional:** Select **Try It** to preview the item as it appears in the service catalog.
5. Select **Submit** or **Update**.

Activate a product catalog item

Activate a product catalog item to make it available in the product catalog and the service catalog.

Before you begin
Role required: catalog_admin

About this task
You can activate the item from either the list view or the record.

Procedure

1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Hardware & Software Items**.
2. Complete one of the following actions.

Option	Description
Activate one or more items from the list view	Select the check box next to one or more items in the record list and select **Activate** be low the list.
Activate from the record	Select **Activate** under **Related Links**.

Deactivate a product catalog item

Deactivate a product catalog item to remove it from the product catalog and the service catalog.

Before you begin
Role required: catalog_admin

About this task
You can deactivate the item from either the list view or the record.

Procedure

1. Navigate to **All** > **Product Catalog** > **Catalog Definition** > **Hardware & Software Items**.
2. Complete one of the following steps.

Option	Description
Deactivate from the list view	Select the check box next to one or more items in the record list and click **Deactivate** below the list.
Deactivate from the record	Select **Deactivate** under **Related Links**.

Import a Product Catalog item

Import a hardware and software product catalog item from one ServiceNow instance to another ServiceNow instance to include it in the product catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
To import hardware or software product catalog items from one ServiceNow instance to another, use the product model and update sets XML file exported from the source ServiceNow instance.

Note:
Product model records aren't included in update sets. When you import an update set into the target instance, only the catalog item records are transferred. To avoid validation errors, first import the product model records, and then import the catalog item's update set into the target ServiceNow instance.

Procedure
1. In the source ServiceNow instance, export the hardware or software product model record XML file.

2. In the source ServiceNow instance, perform these steps to export the local update set containing the catalog item.
   a. Navigate to **All** > **System Update Sets** > **Local Update Sets**.
   b. Select the local update set name to open the update set record.
   c. In the Related Links section, select **Export to XML**.
   d. Save the exported update set XML file on your local system.
3. In the target ServiceNow instance, import the hardware or software product model record XML file.
   The product model has been successfully imported into the target ServiceNow instance and appears on the models page.
4. In the target ServiceNow instance, perform these steps to import the update set XML file that contains the catalog item.

   a. Navigate to **System Update Sets** > **Retrieved Update Sets**.

   b. In the Related Links section, select **Import Update Set from XML**.

   c. Select **Choose File** and select the update set XML file saved previously in Step 2.

   d. Select **Upload**.
   The imported update set record is available as a retrieved update set with state **Loaded**.

   e. Open the retrieved update set and select **Preview Update Set**.
   Review updates and resolve any errors.

Result
The catalog items are imported into the target ServiceNow instance.

What to do next
Navigate to the Hardware Models or Software Models page in the target ServiceNow instance, View the imported hardware or software model record, along with its catalog items that are published.

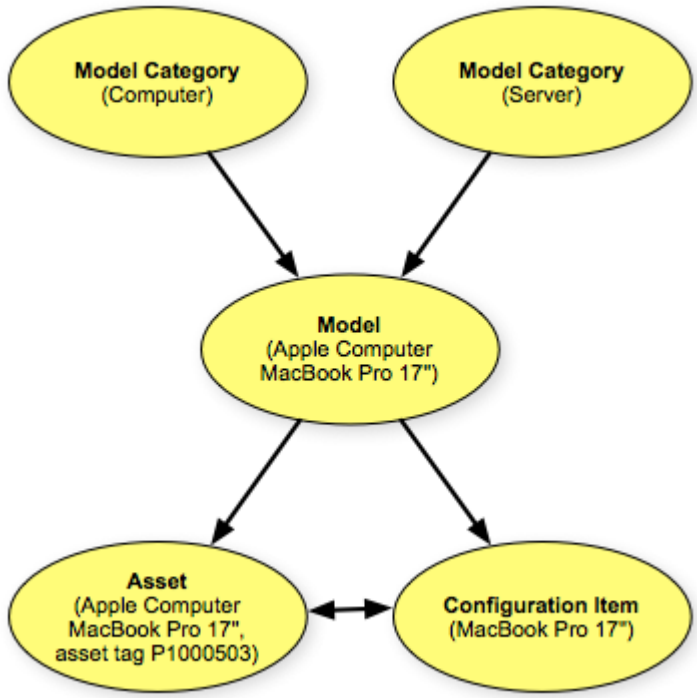
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model categories

Model categories associate CI classes with asset classes. Model categories are part of the Product Catalog application.

The model category configuration determines if the ServiceNow platform creates an asset from a CI, and, if so, what class of asset. Asset classes in the base system are **Hardware**, **Software License**, and **Consumable**. You can associate a model category to many models and a model to many model categories. For example, a specific model of a computer can be a **Computer** and a **Server**.

Models diagram



Any item that is provided as a service or sold to your customer is tracked as an Install Base Item (IBI). The Model category table associates Asset class, CI class, and Install Base Item (IBI) class.

Note:
The Install Base Item class field is available on the Model category form only when the Customer Service Install Base Management [com.snc.install_base] plugin is installed. Currently, only the Medical device install base item [sn_hcls_medical_device_install_base_item] is supported when the Healthcare and Life Sciences Service Management Core application is installed. For more details, see Medical device install base item table. When an IBI class is created, it associates with an asset when the asset exists, otherwise an asset is created.

The fields in the Asset class and the IBI class are synchronized as follows:

1. When an IBI class is updated, the Account, Consumer, Location, and Install date field changes are synchronized with the corresponding fields of the Asset class.
2. When an Asset class is updated, the Location and Install date field changes are synchronized with the corresponding fields of the IBI class.

CMDB classifications and class dependency

Create an asset class

View model categories

Default model categories are included with product catalog. You can view a list of default categories and the categories that you created.

Before you begin

Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Model Categories**.
2. Open a model category to view its details.

Create model categories

You can add custom model categories for your instance.

Before you begin

Role required: model_manager

About this task

When you create model categories, keep the following in mind:

- The base system provides a model category for each CI class in the CMDB. As you create *cmdb_ci* classes, create a corresponding row in the model category table for the model table to be used.
- If you select an **Asset class** on any existing model category, the system automatically creates assets for all configuration items associated with the model category, if configured to do so. If an asset is not created automatically, you can create the asset manually. After an asset class is selected for a model category, the asset class cannot be changed.
- The **Allow pre-allocated**, **Allow in bundle**, and **Allow as main** options are only available if an asset class is specified for the model category.
- If you select **Consumable** or **Software License** for the asset class, the **Allow in bundle** option is available, but not **Allow pre-allocation** or **Allow as main**.
- When a CI is created from a model category that requires asset tracking, the system automatically creates an asset record for the asset class specified in the model category. It then links that asset record to the CI. If a model is specified, the model category of the CI is determined by a combination of the CI class and the list of categories supported by the model. Asset tracking is specified on the model record.
- When an asset is created from a model category that requires CI tracking, the system automatically creates a CI record of the class specified by the category and links it to the asset.
- The Model Categories list (**Product Catalog** > **Product Model** > **Model Categories**) shows all the CI classes and what asset class is generated on the asset side.

Procedure

1. Navigate to **Product Catalog** > **Product Model** > **Model Categories** and select **New**.
2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model Category fields

Field	Description
Name	A descriptive name for this category.
CI class	If a CI class is needed, it must be specified when you create the model category. You can't add the CI class the model category later.
Asset class	Default options and any new asset classes you've created. Setting the asset class triggers the creation of assets depending on the model category selected. You can add an asset class to the model category later, but can't be changed after it's added. If you select **Consumable** or **Software License**, the **CI class** field becomes read-only because consumables and software licenses don't create CIs. If you specify a CI class and then select **Consumable** or **Software License**, the**CI class** field is changed to **None** automatically. ○ Asset: An item that can be tracked individually. ○ Consumable: An asset not tracked individually, such as keyboards. ○ Hardware: A physical piece of computer equipment, such as a laptop or server. ○ Software License: A legal statement defining the uses of software, such as the number of installations allowed or the terms of distribution.
Install base item class	Class to track the asset as an Install base item. **Note:** This field is available only when the Customer Service Install Base Management [com.snc.install_base] plugin is installed. Also, currently, only the Medical device install base item [sn_hcls_medical_device_install_base_item] is available when the Healthcare and Life Sciences Service Management Core application is installed.
Product model class	Class table where the models are stored. The default values are: ○ Application ○ Consumable ○ Contract ○ Facility ○ Hardware ○ Service ○ Software After you select a value, the table content, form views, and overall functionality of the models created in the model category gets impacted.
Is product instance	Identifies whether the model category is associated with Product Instance, which is a logical grouping of asset, CI, and IBI class.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This check box is read-only and is supported only for Medical device model category. After you select this option, Product Instance Identifier (PID), a unique identifier for asset, CI, and IBI class is generated whenever you create an asset of that model category. However, for the existing assets, the PID is generated only when any of the asset fields such as Serial number, Model component ID, or Parent is updated.
Allow pre-allocation	Add and track items in this category as pre-allocated assets.
Allow in bundle	Use items in this category in bundles.
Allow as main	Use items in this category as the main component in a bundle.
Enforce CI verification	Prevents the system from automatically creating assets in a specific model category when CIs are added manually or found with Discovery. This option enables an administrator to review and verify new CIs before adding them as assets.

3. Select **Submit**.

Related topics

Discovery

Create assets manually

The ServiceNow AI Platform does not create an asset automatically under certain conditions. You can create an asset manually as needed.

Before you begin

Role required: model_manager

About this task

The conditions under which an asset is not automatically created include the following.

- Forced CI verification: If you select the **Enforce CI verification** check box in the **Model Category** form, the system does not create an asset automatically when a CI is created or discovered. When **Enforce CI verification** is enabled, newly created CIs do not trigger an automatic creation of an asset. Instead, these newly created CIs have their **Requires verification** field automatically set to true, which displays the following UI actions for the CI:
  - *`Create Asset`*: Creates an asset and sets *`Requires verification`* to false.
  - *`Merge CI`*: Merges duplicates of a CI. This action is useful if an asset for the CI was created in a separate process, which created an associated CI. Then a second CI was created either manually or via the discovery source - and the duplicate CIs did not properly coalesce.
- Configuration errors: In rare cases, the system can fail to create the asset automatically. This failure can occur if you assign the model and model category to the CI in the wrong sequence.

Follow these steps to create an asset manually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Model Categories**.
2. Open a model category that has no assigned CI class.
3. Click **Create Assets**.
   This action creates assets from all CIs deferred for verification in this model category. This option is only available for users with the admin role.

Edit model categories

All default model categories can be edited, except for the Contract model category. You can edit any custom model categories that you created at any time.

Before you begin
Role required: model_manager

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Model Categories**.
2. Open a model category record.
3. Edit the fields as needed.

   Note:
   If a CI class is needed, you must specify it when you create the model category. You can't add the CI class to the model category later.

4. Click **Update**.

Delete model categories

If a model category is no longer needed, you can delete it.

Before you begin
Role required: model_manager

About this task
Only model categories that are not referenced by any models can be deleted.

Procedure

1. Navigate to **All** > **Product Catalog** > **Product Model** > **Model Categories**.
2. Select the check box beside the model category **Name**.
3. From the **Actions on Selected Rows** menu below the list, click **Delete**.
4. Click **Delete**.

Domain separation and Product Catalog

Domain separation is supported in the Product Catalog. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

How domain separation works in Product Catalog

The domain owner's employees and tenants can use the same processes if the work is done in the correct domain. When adjusting any configuration, you should be in the domain where you're doing the work. Use the domain picker to select the correct domain to work in.

Benchmarks overview

The ServiceNow Benchmarks application securely collects daily data on your instance and then aggregates the data into monthly global benchmark reports.

This video provides an overview of how you can get started with Benchmarks.

Getting started with Benchmarks

Performance Analytics collects daily data on customer instances. The data from the previous month is uploaded at the beginning of the following month via a scheduled job. If there are any errors, there are multiple retries.

During the month the data is uploaded, the data is aggregated and monthly results (your instance results, global results, and your ranking) are downloaded to the customer instance mid month. Monthly recommendation candidates are provided that you can implement to help improve your KPI performance. An email notification is sent when the global data is available.

ServiceNow has over 2850 customers that have opted into the Benchmarks program. All ServiceNow customers are allowed to participate in the Benchmarks program by opting in from their ServiceNow production instance, except:

- Express customers
- Federal customers
- Customers with on-premise instances

Note:
You must have a production instance to opt into the Benchmarks program.

Managed Service Providers (MSPs) and MSP-managed instances are supported and have exclusive access to global MSP aggregate score data. All instances will support the following benchmarks that can be downloaded for comparison in the Benchmarks dashboard:

- Global, which applies to all customers
- Industry category
- User size, based on active user count
- Companies in your industry category and those that are of similar size to your company
- Geographical regions

Note:

- These benchmarks aren't calculated using MSP data.
- Along with the above Benchmarks, you will also receive the top performers in each of these categories.

Changing KPI configuration within the month requires one to two months of data collection before your monthly values reflect that change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Benchmark Scheduler (bm.scheduler) user is added with Benchmarks. It's required for Benchmarks data collection.

Key features

- Available KPIs from other ServiceNow applications such as ITSM, ITOM, Security Operations. For more information, see Benchmark KPIs.
- Ability to change KPI definitions to match customizations.
- Benchmarks dashboard in Service Portal (mobile friendly).
- Ability to download KPI reports.
- Ability to filter data based on the following parameters:
  - Industry, number of users, or geographical region.
  - Companies in your industry category and of similar user size.
- Email notification when new aggregate monthly data is available.
- Percentile ranking to indicate your standing within your participating peer group.
- Recommendation candidates with guided setup to help improve KPI performance.
- Product category-based roles to limit data access.
- Integration with Performance Analytics for daily data collection and drill-down on KPI data.

Benchmarks dashboard

Benefits

Benefit	Description
Global anonymity	Viewers in your organization have access benchmarks for your organization, however the global benchmarks are anonymous, and don't include any company information.
Industry comparison	Using the **Compare with** drop-down in the Benchmarks dashboard, you can filter the benchmarks results by industry, ServiceNow user size, or geographical region to make the results more relevant to your organization. • Industry is determined based on the standard industry code in the account record for the company. • Number of users is determined by the number of ServiceNow active users within the company, so you can compare your company to similar-sized ServiceNow implementations to gain insight about your company. • Region is determined based on the **Region** field in the company table. If a filter category includes fewer than 20 participants, the corresponding data is shown in the **Other** category.
Trends	You can see the results of all published KPIs as well as the previous six months of history. You can then use the trend data to measure and report on service delivery progress over a period of time to determine what is working well and what needs improvement.
Recommendations	Data is analyzed and recommendation candidates are provided to help improve the performance of your KPIs. All recommendations are dynamic and are updated monthly, based on data from the previous month.
Reports	Benchmarks reports get refreshed monthly, which can be downloaded in PDF format. An email notification is sent to the customer when new data is available.

Email notification

Users with the Benchmarks admin (sn_bm_client.benchmark_admin) and Benchmarks data viewer (sn_bm_client.benchmark_data_viewer) roles automatically receive email notification regarding availability of monthly scores, historical data recalculation, and new KPIs. You must have system admin (admin) role to modify the email recipient list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An email containing notification information is sent when the monthly global data is available. Monthly results (your instance results, and global results) are downloaded to the customer instance mid month.
  - Subject: New Monthly Benchmarks report is available now
  - Body: ServiceNow Benchmarks has been updated with <month> data. You can see the updated Benchmarks by viewing the Benchmarks Dashboard <Benchmarks Dashboard Portal link>.
- An email containing notification information is sent when historical data for the past six months is recalculated.
  - Subject: Historical Global Benchmarks scores have been refreshed
  - Body: The global Benchmarks scores of last six months have been recalculated with improved data quality. You can see the updated Benchmarks by visiting Benchmarks Dashboard <Benchmark Dashboard Portal Link>.
- An email containing notification information is sent when an updated KPI version is introduced (with some fixes, for example).
  - Subject: One or more Benchmarks KPI versions have changed
  - Body: The latest Benchmarks scores have a new version of following KPIs with improved data quality.

    < KPI name>.

    You can see the updated Benchmarks by visiting Benchmarks Dashboard <Benchmark Dashboard Portal Link>.

Benchmarks notification emails are accessed using the **System Settings** > **Notifications** navigation menu.

Benchmarks data transfer

Your Benchmarks score data is automatically uploaded to ServiceNow on the third day of the month. Global scores are automatically downloaded to your instance on the 11th day of the month.

You can manually upload or download scores beyond those days of the month (on demand) by executing the Benchmarks scores scheduled jobs through the **System Definition** > **Scheduled Jobs** navigation item.

- Upload the benchmark scores (automatically runs on the first day of the month)
- Download the benchmark scores (automatically runs on the ninth day of the month)

These on-demand scheduled jobs are useful if, for any reason, there was a failure in the automatic upload or download scores process and it is after the cutoff dates. You can also run a scheduled job to generate six months of historical data.

Benchmarks KPI categories

Benchmarks supports KPIs from other ServiceNow applications such as ITSM, ITOM, Security Operations, Conversational Interfaces, Success Dashboard, and Strategic Portfolio Management. For more information, see Benchmark KPIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The categories do not display on the Benchmarks dashboard unless, any KPI is opted in for tracking the metrics in Benchmarks.

Benchmarks roles

These roles are introduced with Benchmarks.

An overview of the Benchmarks feature in ServiceNow, including opting in, setting up Benchmarks, reading the KPI dashboard, reading KPI cards, recommendations and implementing them.

Roles

Role	Capabilities	Roles inherited
sn_bm_client.benchmark_admin	• Set up Benchmarks from an instance • Opt in or out of the Benchmarks program • Enable, disable, or modify indicators (including changing Performance Analytics indicator source, script, and conditions for those KPIs not requiring application-specific roles) • Receive email notification when new aggregate monthly data is available • All functions of the Benchmarks viewer and Benchmarks recommendations roles	
sn_bm_client.benchmark_data_viewer	• View full benchmark reports in Service Portal • View data visualizations and drill-downs for analyzing trends (not PA scorecards) • Download visualizations • View industry category or size comparisons	
sn_bm_client.benchmark_recommendation_viewer	View benchmark KPI recommendation candidates.	sn_process_optimization_viewer

Enable Benchmarks

Configure the Benchmarks application for your company to enable your company to compare performance with industry peers. You can opt out of Benchmarks at any time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

To keep the Benchmarks comparison data clean, you can opt in to Benchmarks only from your production instance.

Role required: sn_bm_client.benchmark_admin

About this task

Benchmarks is installed on your instance by default. It is also installed with the ITSM Success Dashboard application. Enable Benchmarks by opting in to the application.

Six months of global data is available after opting in. If available, the corresponding data for your instance is also included.

Note:
Past data for your instance is only available for Benchmarks users upgrading from a previous release.

Procedure

1. Opt in to Benchmarks by using the guided setup or by using the Success Dashboard.
2. In the Opt-in to Benchmarks section on the Benchmarks configuration page, select the **Opt-in Agreement** link.
3. Read the Opt-in agreement and then select **Okay**.
4. Acknowledge the Opt-in agreement by selecting the **Yes, I agree/accept the Opt-In Agreement** check box.
5. Select **Opt-in**.
   The Benchmarks configuration page appears and Benchmarks is enabled on your instance.

What to do next

1. Assign roles for Benchmarks users
2. Configure KPI participation

   For information about the Benchmarks KPIs available for each category, see Benchmark KPIs.

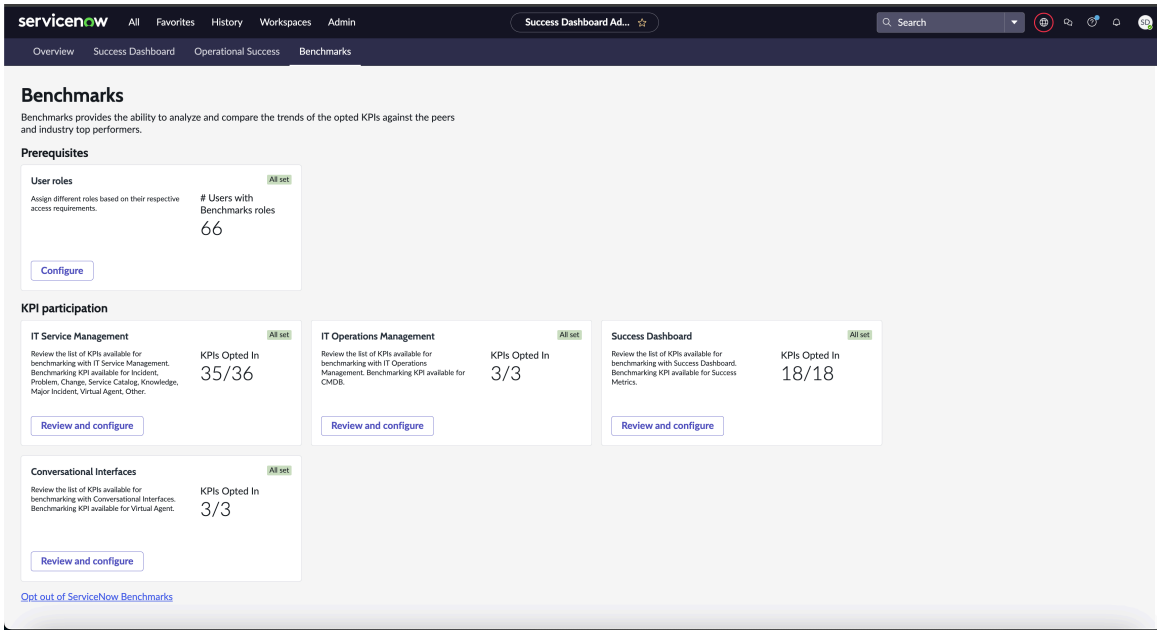
Getting started with the ITSM Success Dashboard admin console

With the new ITSM Success Dashboard admin console, you can access the Benchmarks application.

The admin console displays the required updates or plugins for Benchmarks that help in optimizing the performance of the selected KPIs. It also helps you configure Benchmarks and customize the KPIs and trends according to your organizational requirements.For more information on Admin Console, see ITSM Success Dashboard Admin console.

- User Roles: You can assign different roles based on specific access requirements.
- KPI participation: You can review and configure the KPIs opted in for the ITSM, ITOM, and Success dashboard categories.
- Opt out: You can opt out of Benchmarks at any time. If you opt out, your company usage data is no longer included in the Benchmarks data set, and you no longer see aggregate metrics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



https://player.vimeo.com/video/1013200251?badge=0&autopause=0&player_id=0&app_id=58479

Assign roles for Benchmarks users

Assign roles for Benchmarks users based on their access requirements.

Before you begin

Role required: sn_bm_client.benchmark_admin

Procedure

1. Opt in for the Benchmarks application.
   For more information, see Enable Benchmarks.
2. On the Benchmarks configuration page, locate the User roles section and select **Configure**.
3. On the User roles page, select a role from the **Select role** drop-down list.
   A list of users currently assigned the selected role and a graph showing the distribution of users in different roles are displayed.

   For information about Benchmarks roles, see Benchmarks roles.
4. Add users to a role list.
   a. Select **Add User**.
   b. Start typing the user name and select from the drop-down list.
   c. Select **Save**.
5. Remove users from a role list.
   a. Select the check box next to the user name you want to remove.
   b. Select **Remove user**.

Opt out of Benchmarks

You can opt out of Benchmarks at any time. If you opt out, your company usage data is no longer included in the Benchmarks data set, and you no longer see aggregate metrics.

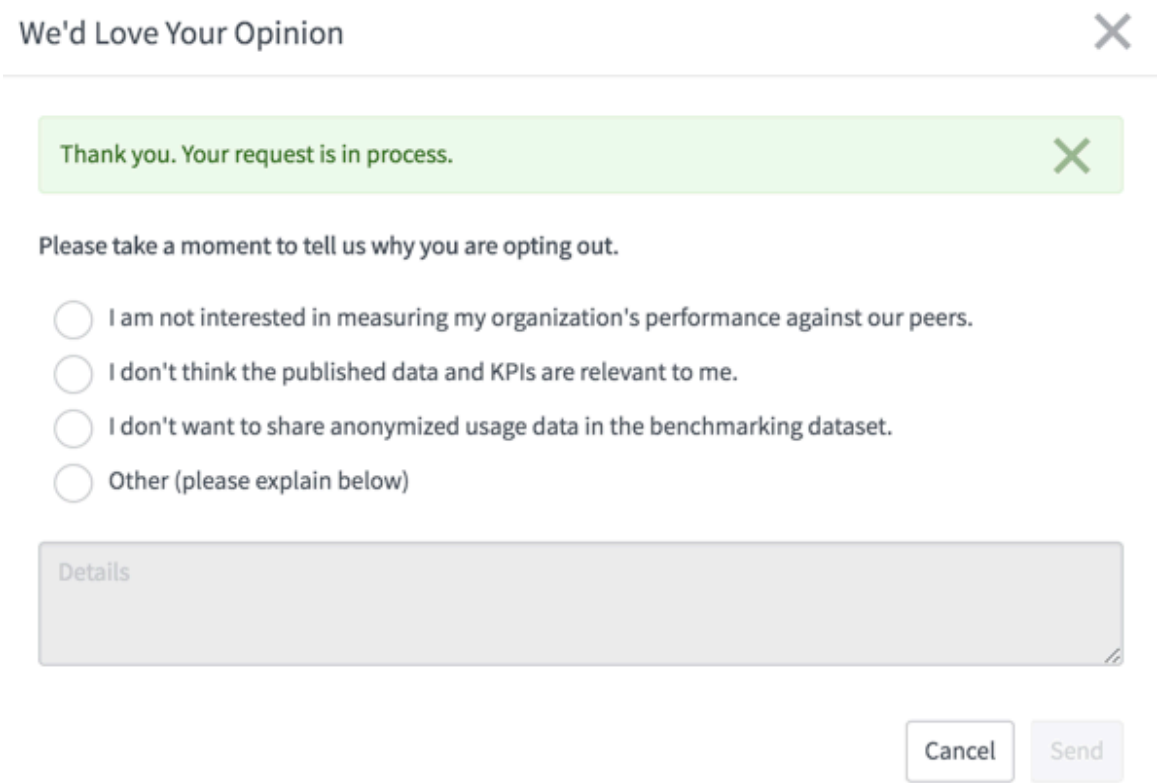
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_bm_client.benchmark_admin

About this task
When you opt out of the Benchmarks forum, it means that you no longer have access to benchmarking information for your organization. Your usage data is also removed from the Benchmarks data set going forward. However, your company can rejoin the Benchmarks program at any time.

Note:
It may take up to two monthly refresh cycles for the request to be processed.

Procedure
1. Navigate to **All** > **Benchmarks** > **Setup**.
2. Click **Opt-out of ServiceNow Benchmarks**.
3. Click **Opt-Out**.
4. **Optional:** To send your feedback, provide the relevant information and click **Send**. Otherwise, click **Cancel** to skip the survey.



The opt-out confirmation is shown. You can opt back in at any time.

Benchmark KPIs

You can enable or disable a benchmark KPI, and customize KPI conditions. Integration with Performance Analytics provides daily data collection and drill down capabilities on KPI data.

Benchmarks offers ITSM, ITOM, Virtual Agent, Security Operations KPIs, Success Dashboard, and Strategic Portfolio Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Upgrading Benchmarks does not change KPI status or configuration from the previous release. New KPIs are enabled by default.

Benchmarks uses anonymous, aggregated usage data from customers who have opted in to calculate global and industry benchmarks. The KPIs in the Benchmarks application are performance analytics indicators that only collect the usage count data, for example, the total number of incidents in a month, based on the monthly aggregates. During data collection, the Benchmarks application does not consider any other details such as description of incidents, or information about requests, changes, or applications.

The participating customer count for each cohort bucket in Industry Category, User Size, and Three geo regions aggregates are large enough to calculate monthly benchmarks values and to maintain full anonymity. To further ensure data anonymity, the Benchmarks user interface allows you to use only one filter at a time.

ITSM KPIs

Incident

KPI	Description
Note: In some environments, KPIs involving resolved incidents may require further configuration to retrieve resolved incident data.	
% of high priority incidents resolved	[Number of priority 1 (P1) and priority 2 (P2) incidents resolved during the month] / [Total number of incidents resolved during the same month] Incident count is generated from the Incident table. **Note:** The definition of P1 and P2 incidents is likely to vary per participant. Your P1 and P2 incidents may or may not be similar to the incidents of others. For comparison, the metrics provided in this report represent the average of all participants.
% of incidents resolved on first assignment	[Number of incidents resolved on first assignment during the month] / [Total number of incidents resolved during the same month] First assignment is when the **Reassignment Count** field is 0 for the incident.
% of incidents resolved within SLA	[Number of incidents with met SLAs resolved during the month] / [Total number of incidents resolved during the same month]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident (continued)

KPI	Description
	Met SLAs are calculated from the task_sla table for incidents resolved during the month.
% of reopened incidents	[Number of incidents resolved during the month that were reopened] / [Total number of incidents resolved during the same month]. Reopened is when the **Reopen Count** field is greater than 0 for the incident.
Average time to resolve a high priority incident	[Sum of the duration of all high priority incidents resolved during the month] / [Total number of high priority incidents resolved during the same month] • Duration is the length of time from creation to resolution. • High priority incidents include priority 1 (P1) and priority 2 (P2).
Average time to resolve an incident	[Sum of the duration of all incidents resolved during the month] / [Total number of incidents resolved during the same month] Duration is the length of time from creation to resolution.
Number of incidents created per user	Number of incidents per user created during the month. Global value is the average of all participating customers per user.

Problem

KPI	Description
% of high priority problems	[Number of high priority problems closed during the month] / [Total number of problems closed during the same month] High priority problems include priority 1 (P1) and priority 2 (P2).
% of incidents resolved by problem	[Number of incidents resolved during the month that are associated with a problem] /

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem (continued)

KPI	Description
	[Total number of incidents resolved during the same month]
Average time to close a problem	[Sum of the duration of all problems closed during the month] / [Total number of problems closed during the same month] • Duration is the length of time from creating to closure. • Problems include priority 1 (P1) through priority 5 (P5).

Change

KPI	Description
% of emergency changes	[Number of emergency changes closed during the month] / [Total number of all changes closed during the same month] All changes include standard, normal, and emergency.
% of failed changes	[Number of unsuccessful changes during the month] / [Total number of all changes closed during the same month]
Average time to close a change	[Sum of the duration of all changes closed during the month] / [Total number of all changes closed during the same month] • Duration is the length of time from creation to closure. • All changes include standard, normal, and emergency.

Service Catalog

KPI	Description
% of closed requests with breached SLAs	[Number of closed requests with breached SLAs during the month] / [Total number of closed requests during the same month]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog (continued)

KPI	Description
	Breached SLAs are calculated from the task_sla table for requests closed during the month.
Average time to fulfill a request	[Sum of the duration for Service Catalog requests fulfilled during the month] / [Total number of Service Catalog requests fulfilled in the same month] • **Duration** is the length of time from creation to closure. • **Number of Service Catalog requests fulfilled** is the count of the number of records in the sc_req_item table, which were closed within a month.
Number of requests created per user	Number of requests per user created during the month.

Knowledge

KPI	Description
% of incidents resolved using KB articles	[Number of incidents with KB articles resolved during the month] / [Total number of incidents resolved during the same month]
Number of knowledge articles views per user	Number of knowledge article views per user during the month. • **Knowledge base views** are generated from the kb_use table. • **Global** value is the average of all participating customers per user.

ITSM Virtual Agent

KPI	Description
% call deflection	[The number of incidents and requests created using Virtual Agent] / [Total numbers of incidents and requests created] The number of times, in percentage, the incident, or request was submitted using Virtual Agent. This is determined by the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ITSM Virtual Agent (continued)

KPI	Description
	deflection pattern added in the Virtual Agent topic.
% of incidents auto-resolved	[The number of incidents auto-resolved by Virtual Agent] / [Total number of incidents resolved] The number of times, in percentage, incidents were automatically resolved using automated workflows or by Issue Auto Resolution.

Other

KPI	Description
Average customer satisfaction	[Sum of normalized metric values of all survey instances taken during the month] / [Total number of survey instances taken during the same month] • Table: asmt_metric_results. • Survey: Customer Satisfaction Survey. • Metric value is normalized as per category weights. **Note:** This KPI uses the base system Customer Satisfaction Survey. If you're using a different survey to collect user feedback, you can customize the KPI definition.
Number of requests per fulfiller	[Number of active requester (non-ITIL) users during the month] / [Total number of active ITIL users during the same month]

ITOM KPIs

CMDB

KPI	Description
% of duplicate CIs	Average % of duplicate CIs during the month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CMDB (continued)

KPI	Description
	Duplicate CIs are calculated using the cmdb_health_scorecard table. **Note:** The definition of duplicate CIs is likely to vary per participant. Your duplicate CIs definition may or may not be similar to the definitions of others. For comparison, the metrics provided in this report represent the average of all participants.
% of non-compliant CIs	Average % of non-compliant CIs during the month. Non-compliant CIs are calculated using the cmdb_health_scorecard table. **Note:** The definition of CI compliance audits is likely to vary per participant. Your CI compliance audit definition may or may not be similar to the definitions of others. For comparison, the metrics provided in this report represent the average of all participants.
% of stale CIs	Average % of stale CIs during the month. Stale CIs are calculated using the cmdb_health_scorecard table. **Note:** The definition of stale CIs is likely to vary per participant. Your stale CIs definition may or may not be similar to the definitions of others. For comparison, the metrics provided in this report represent the average of all participants.

Conversational Interfaces KPIs

Virtual Agent

KPI	Description
% of users using Virtual Agent	[Total number of users using Virtual Agent] / [Total number of active users] Percentage of unique users who are using Virtual Agent to handle everyday tasks and requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Virtual Agent (continued)

KPI	Description
% conversation handed over to a live agent	[Number of conversations assigned to a live agent] / [Total number of conversations] The percentage of virtual agent conversations that were redirected to handle everyday tasks and requests.
Virtual Agent CSAT score	Uses the daily average score of the surveys conducted to analyze the quality of user interactions with Virtual Agent conversations.

Security Operations KPIs

Security Incident Response

KPI	Description
% of critical and high priority security incidents	[Number of critical and high priority security incidents created during the month] / [Total number of all security incidents created during the same month]

Vulnerability Response

KPI	Description
Average critical vulnerability age	[Summed age of critical vulnerable items] / [Number of critical vulnerable items]
Average vulnerability age	[Summed age of vulnerable items] / [Number of vulnerable items]
Average vulnerability per asset	[Sum of active vulnerable items] / [Total number of scanned configuration items]
VI mean time to remediate (MTTR)	[Sum of duration of closed vulnerable items] / [Total number of closed vulnerable items displayed as a 30-day running average]
% of remediation efficiency	[Number of vulnerable Items items closed during a month] / [Number of new or reopened vulnerable items in the same month]

© 2026 ServiceNow, Inc. All rights reserved.

Success Dashboard KPIs

KPI	Formula	Description
Self-solved %	[Self-solved (VA, KB, QnA, Proactive Engagement) + Automated resolutions] / [Total Tickets Resolution + Self-solved (VA, KB, QnA, Proactive Engagement) + Self service using Password Reset apps]*100	Self-solved percentage is calculated based on the daily average number of times your users achieved resolution without agent intervention. It includes numbers from the following items: • Self-solved using Virtual Agent. • Self-solved using Knowledge articles. • Self-solved using QnA. • Self-solved using PE • Automated resolutions. This could be, for example, incidents that were auto-resolved using Virtual Agent.
Call deflection %	[Catalog ticket submissions + VA ticket submissions + Self-solved (VA, KB, QnA and Proactive Engagement) + Self service using Password Reset apps] / [Total tickets submitted + Self-solved (VA, KB, QnA and Proactive Engagement) + Self service using Password Reset apps]*100	Call deflection is calculated per day based on the number of times requestors performed the following actions without Tier 1 agent intervention: • Ticket submissions using Service Catalog • Ticket submissions using Virtual Agent • Self-solved using Virtual Agent • Self-solved using Knowledge articles
Structured tickets %	[Structured tickets completed]/[Total Ticket resolutions]*100	Count percentage of tickets that were completed and were structured. This could be, for example, a requested item fulfillment or an HR Case where payroll ambiguity was resolved.
Average CSAT (Customer satisfaction survey) scores	[ITSM Customer Satisfaction Score] + [Virtual agent Customer Satisfaction score]	Average of customer satisfaction scores based on the surveys conducted after the issue was resolved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPI	Formula	Description
		Note: Both ITSM Customer Satisfaction score and VA Customer Satisfaction score are normalized with the base as 10.
MTTR – Average mean time to resolution	[Time to resolve]/[Issues resolved]/24	Mean time to resolve (MTTR) is calculated from daily average of the time between the ticket creation and ticket closure. Card displays average MTTR for the report range.
Breached SLA %	[Issues resolved with breached SLAs]/[Issues resolved]*100	Breached Service Level Agreement (SLA) percentage is calculated from the daily average number of issues that were closed after having breached an SLA.
First assignment resolution	[Tickets resolved without reassignment]/[Issues resolved]*100	Tickets resolved without having to reassign to an agent.
% Automated resolutions	([[Automated resolutions]]/[[Self solved - percentage (denominator)]])*100	Total number of tickets successfully completed and closed using the automated workflows, or by Issue Auto Resolution, or by Password Reset web/windows application.
% KB - Self-solved (count)	([[KB - Self-solved (count)]]/[[Self solved - percentage (denominator)]])*100	Total number of tickets successfully completed and closed by reading the knowledge articles. This is determined when users read knowledge article(s) and do not create a ticket in a 24-hour window.
% VA - Self-solved (count)	([[VA - Self-solved (count)]]/[[Self solved - percentage (denominator)]])*100	Total number of automated conversations that resolved the issue. This is determined by the deflection node instrumented in the Virtual Agent topic.
% Call deflection when self-solved (count)	([[Call deflection when self-solved (count)]]/[[Call deflection - percentage (denominator)]])*100	Total number of issues or requests solved using the Virtual Agent and Knowledge Base articles that resulted in call deflection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPI	Formula	Description
% VA ticket submissions (count)	([[VA ticket submissions (count)]]/[[Call deflection - percentage (denominator)]])*100	Total number of times the ticket was submitted using the Virtual Agent. This is determined by the deflection node instrumented in the Virtual Agent topic.
% Catalog ticket submissions (count)	([[Catalog ticket submissions (count)]]/[[Call deflection - percentage (denominator)]])*100	Total number of tickets (cases, incidents, requested items and so on) submitted using the Service Catalog in Service Portal or NOW mobile.
Productivity moments	[[Productivity in search (count)]] + [[Productivity in routing (count)]] + [[Productivity in fulfilment (count)]] / [[Average number of active users]]	Instances where ServiceNow capabilities like NLU, LLM, Knowledge Article, Walk-up experience etc, helped either the agent or requestor in improving their productivity. • Productivity in search per user • Productivity in routing per user • Productivity in fulfilment per user

For more information on Success Dashboard KPI definitions and formulas, see ITSM Success Dashboard indicators KPI definitions and formulas

Strategic Portfolio Management KPIs

Benchmarks supports Strategic Portfolio Management KPIs. For more information, see SPM Benchmarking KPIs.

Configure KPI participation

Review and configure Benchmarks KPI participation by opting in or out of categorized KPIs.

Before you begin

Role required: sn_bm_client.benchmark_admin

Procedure

1. Opt in for Benchmarks.
   For more information, see Enable Benchmarks.
2. On the Benchmarks configuration page, view the KPI categories in the KPI participation section.
3. Select a category for which you want to view KPI details and select **Review and configure**.
   On the respective category page, a summary of KPIs, current participation status, descriptions, formulas for KPI calculation, and conditions for contributing indicators are displayed.
4. Opt in for KPI participation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the vertical ellipsis next to the KPI that you want to opt in to.

b. Select **Opt in**.

5. Opt out of KPI participation.

a. Select the vertical ellipsis next to the KPI that you want to opt out of.

b. Select **Opt out**.

6. Modify KPI details.

a. Select the vertical ellipsis next to the KPI that you want to modify.

b. Select **Modify**.

c. Modify KPI details such as the description, formula for KPI calculation, and conditions for contributing indicators.

7. Create or schedule a Benchmarks historical data collection job for a newly enabled KPI.
For information about how to create or schedule a data collection job, see Create or schedule a data collection job. The recommended time interval to collect data for a new KPI is 60 days.

8. Execute the Benchmarks historical data collection job to collect data for the new KPI.

a. Navigate to **Platform Analytics** > **Data Collector** > **Jobs**.

b. Find and open the historical data collection job that you created.

c. Select **Execute**.
The collected data scores are stored in the Platform Analytics Score (pa_scores) table.

9. Upload the collected data to the centralized Benchmarks instance.

a. In the Benchmarks historical data collection job, navigate to the **Job Logs** related list.

b. Make sure that the state for the historical data collection job is **Collected**.
This state indicates that the job is complete and all data for the set period is collected.

c. Navigate to **System Definition** > **Scheduled Jobs**.

d. Find and open the **Copy historical scores from PA to Benchmarks table** job.

e. Select **Execute Now**.

10. **Optional:** Download the Benchmarks scores manually to your instance to view the scores before they are automatically downloaded.

a. Navigate to **System Definition** > **Scheduled Jobs**.

b. Find and open the **Download the benchmark scores** job.

c. Select **Execute Now**.

Configure resolved incident Benchmarks KPIs

The source for the KPIs containing resolved incident data is the **resolved_at** field in the Incident [incident] table, which may not exist in some environments. In this case, additional configuration is required to use these KPIs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Note:
If you have never tracked resolved incidents in your environment before, install the Incident Resolution Fields (com.snc.incident_resolution_fields) plugin, which automatically adds the **resolved_at** field to the Incident table. No further steps are required.

Role required: sn_bm_client.benchmark_admin

About this task

If you are receiving errors in the Benchmarks Data Collection job log for resolved incident KPIs because you are using a custom (user-created) field to track resolved incidents, the following procedure is required for successful data retrieval using these Benchmarks KPIs.

- % of high priority incidents resolved
- % of incidents resolved on first assignment
- % of incidents resolved within SLA
- % of reopened incidents
- Average time to resolve a high priority incident
- Average time to resolve an incident
- Number of incidents created per user

Configure the KPI conditions and script to use your custom field (instead of the default **resolved_at** field) for resolved incident Benchmarks KPIs.

Procedure

1. Configure the Benchmark.Incidents.Resolved indicator source condition with your custom field.
   a. Navigate to **Performance Analytics** > **Sources** > **Indicator Sources**.
   b. Select the **Benchmark.Incidents.Resolved** indicator source and enter edit mode.
   c. In the Conditions section, select your custom field from the list (custom field names are typically preceded by `u_`).
   d. Click **Update**.
2. Configure the Benchmark.Incident.ResolvedTime.Hours script with your custom field name.
   a. Navigate to **Performance Analytics** > **Automation** > **Scripts**.
   b. Select the **Benchmark.Incident.ResolveTime.Hours** script and enter edit mode.
   c. Replace the `resolved_at` field name occurrence within the script with the name of your custom field (custom field names are typically preceded by `u_`).
   d. Click **Update**.
3. Verify that you are no longer receiving errors in the Benchmarks Data Collection job log.

Link or customize a benchmark KPI

You can customize KPI conditions to fit the needs of your organization better.

Before you begin

The Benchmarks admin role does not provide application-specific roles. Therefore, although a Benchmarks admin can access a KPI through the Benchmarks application, changes to KPI conditions require the role specific to the KPI application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, a Benchmarks admin cannot modify conditions for the knowledge base KPI (Knowledge Use [kb_use] table), SLA KPI (Task SLA [task_sla] table), ITOM KPIs (CMDB Health Scorecard [cmdb_health_scorecard] table), Security Operations KPIs (Vulnerable Item [sn_vul_vulnerable_item], or Security Incident [sn_si_incident] tables) from within Benchmarks without specific access granted to those tables (knowledge_admin, sla_admin, asset, or sn_si.special_access roles).

Role required: sn_bm_client.benchmark_admin

About this task

Customizing KPI conditions is useful to adjust the criteria to more accurately represent the data that your company is interested in.

For example, if your implementation does not use priority 1 incidents, you can change the criteria for high priority KPIs from 1 to 0, which returns more accurate data for your organization.

Note:
It takes one to two months for aggregate monthly data to accurately reflect changes made to KPI conditions. For example, changes made within the month include a combination of data:

- Data for the previous condition (up until the date the condition was changed)
- Data for the new condition from that date forward

For further analysis, you can link a Performance Analytics indicator that you are already using to the corresponding Benchmarks indicator to see breakdowns, in addition to individual scores, when drilling down on KPI data.

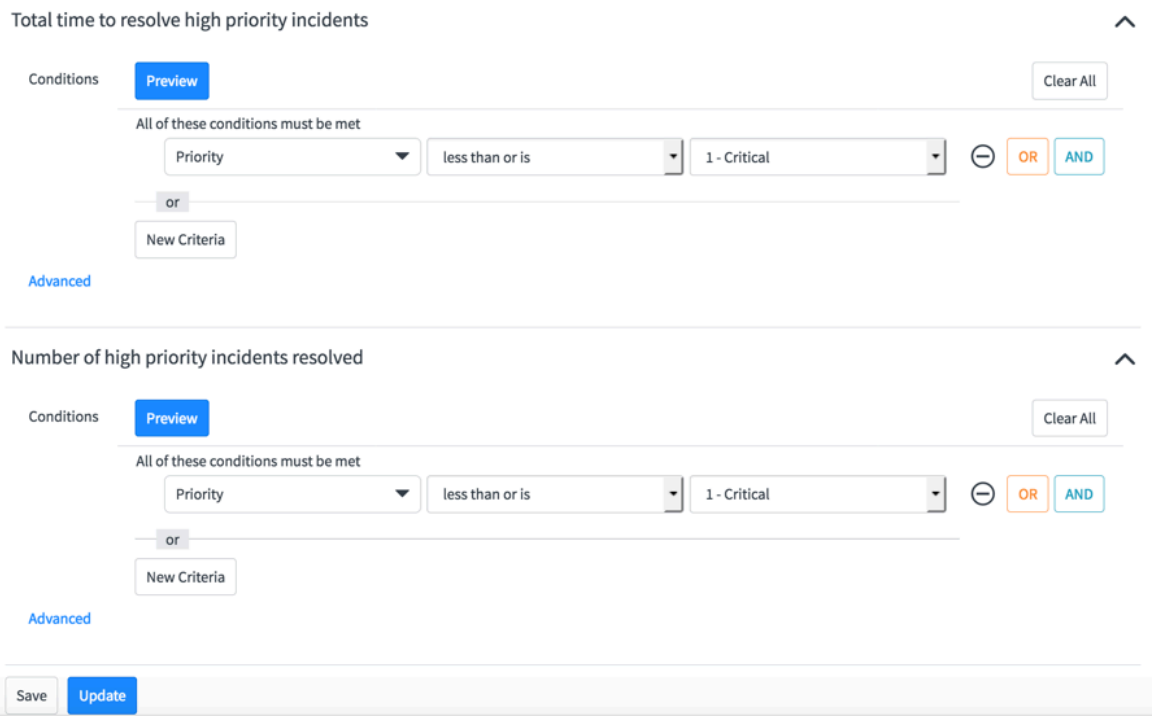
For example, link **Number of resolved incidents by first assigned group** to **Benchmark: Number of incidents resolved on first assignment** to view breakdown values by priority, assignment group, and category.

Note:
Individual scores are shown by default but you must have Performance Analytics to use linking to show breakdowns.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Benchmarks** > **Setup** and click a KPI to access the KPI conditions.



2. Change the conditions, as appropriate.
3. To link a Performance Analytics indicator to a Benchmarks indicator, follow the procedure in Link an automated indicator to a benchmark.

Use Benchmarks data for value management analysis

Manually collect historical Benchmarks data to analyze the benefits of year-over-year growth when you use the ServiceNow Benchmarks application.

Before you begin

Role required: sn_bm_client.benchmark_admin, pa_data_collector, or admin

About this task

If you want to analyze year-over-year performance, you must collect at least 24 months of Benchmarks data. Use the **sn_bm_client.months_copy_historical_pa_bm** system property to set the number of months from the current month for which you want to collect Benchmarks historical data.

Procedure

1. Set up Benchmarks historical data collection.

   a. Navigate to **Performance Analytics** > **Data Collection** > **Jobs**.

   b. Select the *Benchmarks Historical Data Collection* job.

   c. In the **Relative start** field, enter the period of time for which you want to collect the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Relative start interval** field, select the length of the time period to collect the data. Recommended interval is 24 months.

e. Click **Execute**.
For detailed information on scheduling a data collection job, refer to Create or schedule a data collection job.

2. Upload the collected data to the centralized Benchmarks instance.

a. In the *Benchmarks Historical Data Collection* job, navigate to the **Job Logs** related list.

b. Make sure that the state for the historical data collection job is **Collected**.
This state indicates that all data for the job has successfully run and all data has been gathered for the set time period.

c. Navigate to **System Definition** > **Scheduled Jobs**.

d. Select the *Copy historical scores from PA to Benchmarks table*.

e. Click **Execute Now**.

The data is automatically sent for value management analysis. Connect with your account representative to receive the report and discuss the benefits for your organization's value management.

Deprecated Benchmarks dashboard

The Benchmarks dashboard shows KPI data, performance trends, and indicator scorecards.

Note:

For information about the new Benchmarks dashboard, see New Benchmarks Dashboard.

The Benchmarks KPI dashboard view displays all the KPIs and can be accessed through Service Portal.

Features include:

- Ability to show KPIs in either list or card view.
- Downloadable reports of KPI list and all charts in PDF format.
- Ability to filter data by type of industry, number of users, MSPs, or geographic region (the filter is retained when switching between KPI view and trend view).

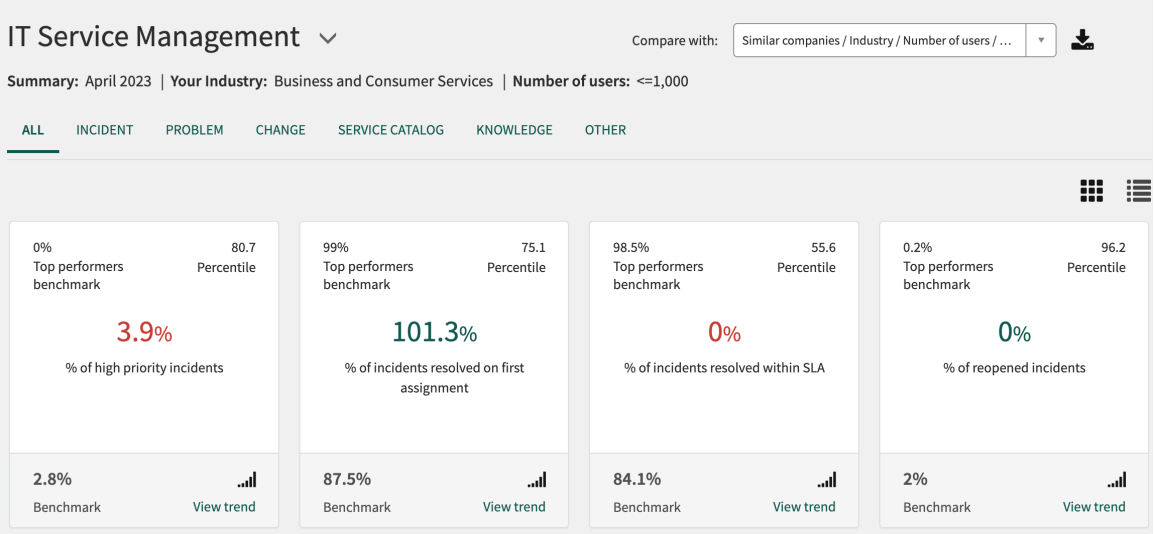
  Note:
  Only Managed Service Providers (MSP) can view the global MSP aggregate score data.

- Color-coded KPI data (the favorable comparison results for your instance are in green, while red favors global data).
- Monthly change percentage calculation of your instance from the previous month.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ability to view six months of historical KPI data.
- Ability to display time values in hours or days (using the *sn_bm_client.dashboard_display_unit* system property).

Note:
Service Portal must be installed to view the Benchmarks dashboard.



Percentile rank

The exact standing of the KPI for your company within your participating peer group is indicated by percentile rank. A KPI percentile rank of 90% indicates that your instance outperforms 90% of the instances participating in that KPI group.

Note:
A high percentile rank does not always indicate a desirable result.

For certain KPIs a higher ranking is preferred (% of incidents resolved using KB articles), but for others it is not (% of emergency changes). The meaning of your percentile ranking should be interpreted based on the direction of the KPI being analyzed.

View benchmark KPI data (deprecated)

Benchmarks KPI data is shown in Service Portal. Data includes values for your company instance, and for global data.

Before you begin

Role required: sn_bm_client.benchmark_data_viewer

Procedure

1. Navigate to **All** > **Benchmarks** > **Dashboard**.
2. Select one of the **KPI categories** from the KPI list.
3. To view the corresponding group of KPIs, click a tab.

   Note:
   If the data seems incomplete or incorrect, you can investigate the KPI definition and conditions in **Performance Analytics** > **Sources** > **Indicator Sources**.

4. To filter results, select either an industry, number of users, or region in the **Compare with:** list. The data is automatically updated when you select a filter.

   Note:
   If a filter category contains fewer than 20 participants, the corresponding data is shown in the **Other** category.

5. For choice of view, click either the list icon or the card-view icon.
   In card view, clicking a KPI displays the six-month KPI performance trend chart.
6. To download a report to a PDF file, click the arrow icon ( ).

What to do next

Click a KPI to view Benchmarks KPI performance trend and recommendations (deprecated).

Benchmarks KPI performance trend and recommendations (deprecated)

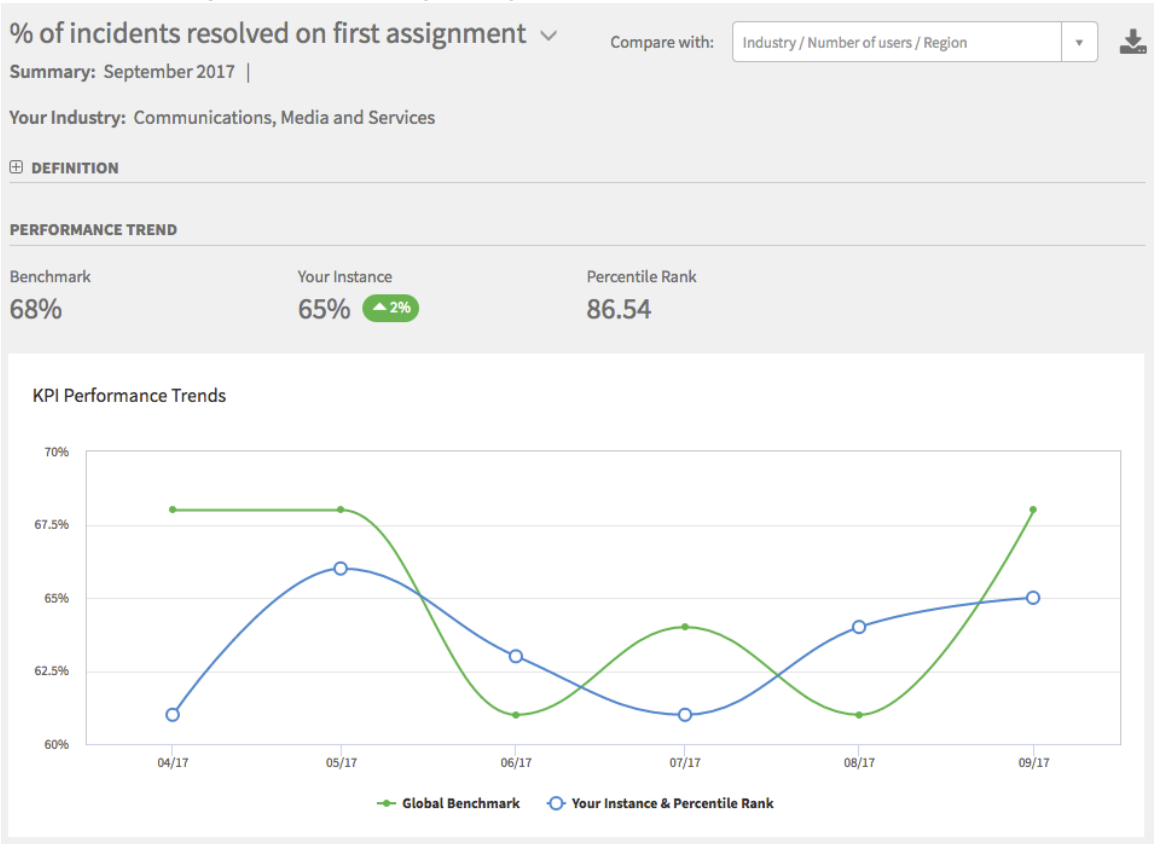
The Benchmarks KPI performance chart trend view shows your KPI performance comparison with global data, and provides recommendations to implement for improved performance of your KPI.

The KPI Performance Trends chart section is shown only for users with the Benchmarks viewer role (sn_bm_client.benchmark_data_viewer).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPI Performance Trends chart

6-month monthly data mapped against global data



Your 6-month monthly data is mapped against global data, and your percentile rank indicating your standing within the participating peer group is shown.

Functionality of the performance trend chart view includes:

- Switching between KPIs in the same category using the KPI list.
- Viewing your instance and global data for a certain month by hovering over a point on the graph.
- Accessing the Performance Analytics scorecard for a data point in your instance.
- Downloading KPI chart reports.
- Filtering data by type of industry, number of users, or geographic region.

Recommendations

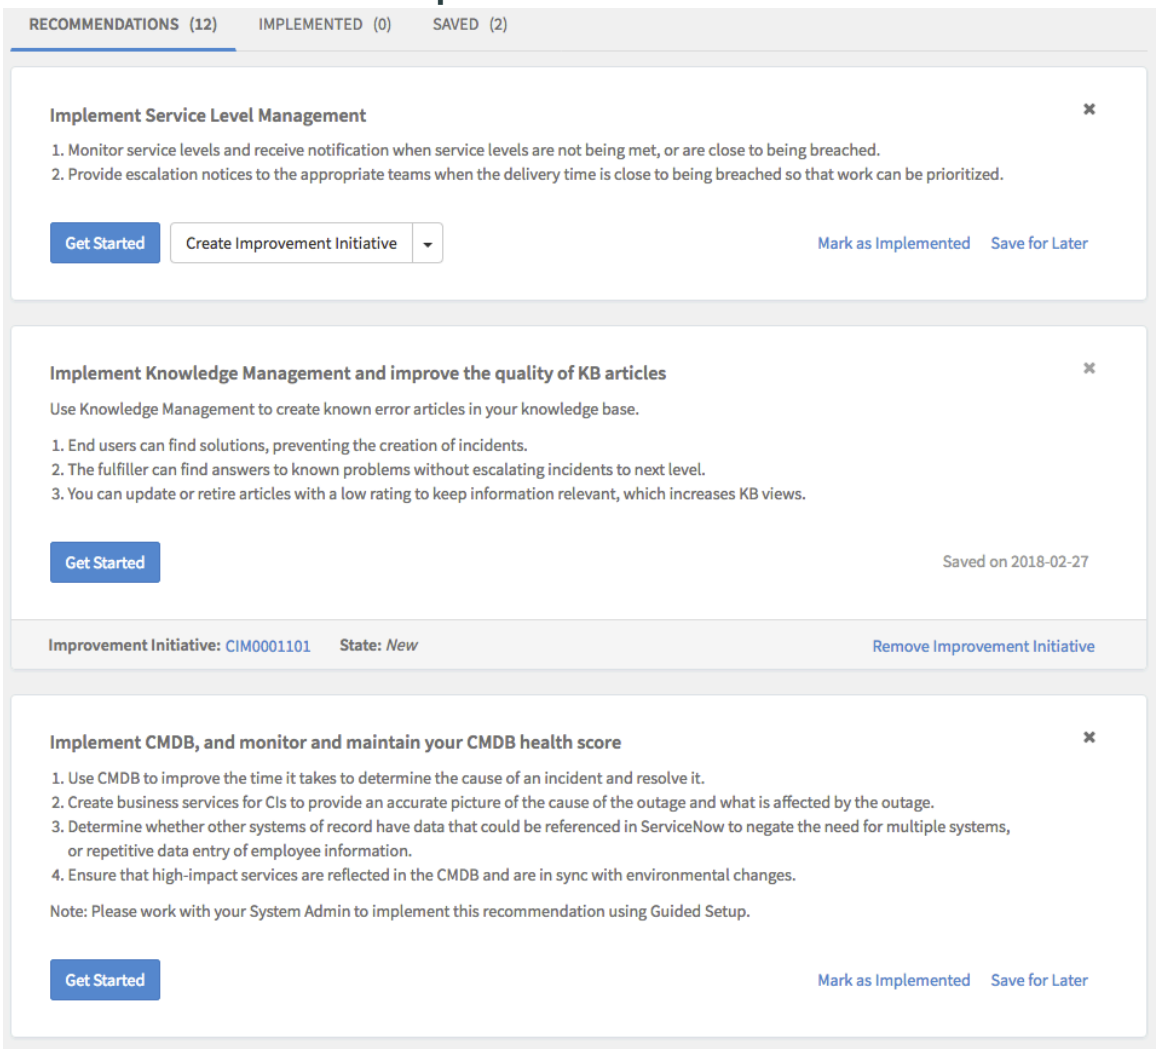
The Recommendations section is shown only for users with the Benchmarks recommendation role (sn_bm_client.benchmark_recommendation_viewer).

Recommendation candidates are provided in the performance trend view to help improve the performance of your KPIs. All recommendations are dynamic and are updated monthly, based on data analyzed from the previous month. Recommendation candidates are listed by rank.

Note:
Some KPI recommendations that use guided setup require system admin permission. Work with your system administrator to implement these recommendations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations filtered into Implemented or Saved tabs



Actions are available for each recommendation candidate. Based on the action, recommendations get filtered into the appropriate group tab (Implemented or Saved). Closing out the recommendation removes the recommendation candidate from the list.

- **Get Started**: Executes Guided Setup, if available, otherwise opens documentation containing information regarding the improvement.
- **Mark as Implemented**: Moves the recommendation candidate to the Implemented tab. This action is no longer available when a CIM improvement initiative is associated with the recommendation candidate.
- **Save for Later**: Moves the recommendation candidate to the Saved tab to be implemented at a later time.
- **Improvement Initiative** section:
  - **Create Improvement Initiative**: Creates a CIM improvement initiative, which contains phases and tasks to improve the KPI. Once the CIM improvement initiative is created, the recommendation candidate is moved to Saved tab.

    CIM fields automatically populated:

    - Short description: Recommendation candidate name.
    - Description: Recommendation candidate content and action URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Select Improvement Initiative**: Associates an existing CIM improvement initiative. The state of the recommendation candidate is set to the state of the associated CIM improvement initiative.

  Note:
  CIM **Short description** and **Description** fields are populated automatically from the recommendation candidate content only when the CIM improvement initiative is initially created from a recommendation candidate, not when associating afterward.

- **Improvement Initiative** related link: Links to the associated CIM improvement initiative. Click the related link to view the CIM improvement initiative in Continual Improvement Management.
- **Remove Improvement Initiative**: Removes the associated CIM improvement initiative from the item in the Recommendations list.

  When the CIM improvement initiative is closed, the recommendation candidate is moved to the Implemented tab. If the CIM improvement initiative is canceled, the recommendation candidate remains in the Saved tab. The associated CIM improvement initiative can always be removed, and another can be selected.

Tabs for recommendation candidates:

Recommendations

Lists all recommendation candidates based on the analysis of the monthly data. This list gets refreshed monthly.

Implemented

Lists all recommendation candidates that you have implemented. Recommendation candidates that were implemented the previous month include tracking information on the trend chart so you can determine the impact of the change. Hovering over the implementation point shows the recommendation implemented.

Note:
Recommendation candidates implemented in the current month do not have tracking data points on the chart until the following month.

Saved

Lists all recommendation candidates that have been saved to implement later.

Drill down within benchmark KPI data (deprecated)

You can drill down within benchmark KPI data for further analysis within Performance Analytics.

Before you begin

Note:
When drilling down on a benchmark value, Benchmarks viewers must have the pa_viewer role to view Performance Analytics scorecards.

Role required: sn_bm_client.benchmark_admin or sn_bm_client.benchmark_data_viewer with pa_viewer role

About this task

You can drill down on a benchmark value from the KPI performance trends chart to view individual data that makes up that value. For example, you may want to drill down and investigate data that is presented as a value in red (lower performance) on the chart.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can only drill down within KPI data from the KPI performance trends chart. You can only drill down on scores generated using Performance Analytics.

Procedure

1. Navigate to **All** > **Benchmarks** > **Dashboard**.
2. To view the KPI definition and performance trend, click a KPI.
3. To drill down further into the Performance Analytics scorecard, click a value in your benchmark data on the performance trends chart.

Note:
For additional analysis on **Chart**, **Scores**, **Comments**, or **More info**, see Performance Analytics.

New Benchmarks Dashboard

The Benchmarks dashboard displays KPI data, performance trends, and indicator scorecards.

The Benchmarks KPI dashboard view displays all the KPIs and can be accessed through Service Portal.

The dashboard features include the following:

- KPIs are shown in either the list or card view.
- Downloadable reports of the KPI list are available in PDF format.
- Data is filtered by type of industry, number of users, Managed Service Providers (MSPs), or geographic region (the filter is retained when switching between the KPI view and trend view).

Note:
Only MSPs can view the global MSP aggregate score data.

- The performance against the global data is shown with a thumbs up or thumbs down representation.
- Depending on the subscription, six months to two years of historical KPI data can be viewed.
- Time values can be displayed in hours or days using the *sn_bm_client.dashboard_display_unit* system property.

Note:
The new Benchmarks dashboard is available from the ServiceNow store.

Percentile rank

The exact standing of the KPI for your company within your participating peer group is indicated by percentile rank. A KPI percentile rank of 90% indicates that your instance standing for that KPI is greater than 90% of the instances participating in that group.

View benchmark KPI data

Benchmarks KPI data is shown in Benchmarks dashboard built in Next Experience UI. Data includes values for your company instance, and for global data.

Before you begin

Role required: sn_bm_client.benchmark_data_viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Benchmarks** > **Dashboard**.
2. Select one of the **KPI categories** from the KPI list.
3. To view the corresponding group of KPIs, click a tab.

   Note:
   If the data seems incomplete or incorrect, you can investigate the KPI definition and conditions in **Performance Analytics** > **Sources** > **Indicator Sources**.

4. To filter results, select either an industry, number of users, or region in the **Compare with:** list. The data is automatically updated when you select a filter.

   Note:
   If a filter category contains fewer than 20 participants, the corresponding data is shown in the **Other** category.

5. For choice of view, click either the list icon or the card-view icon.
   In card view, clicking a KPI displays the six-month KPI performance trend chart.
6. To download a report to a PDF file, click the **Download** button.

What to do next

Click a KPI to view Benchmarks KPI performance trend.

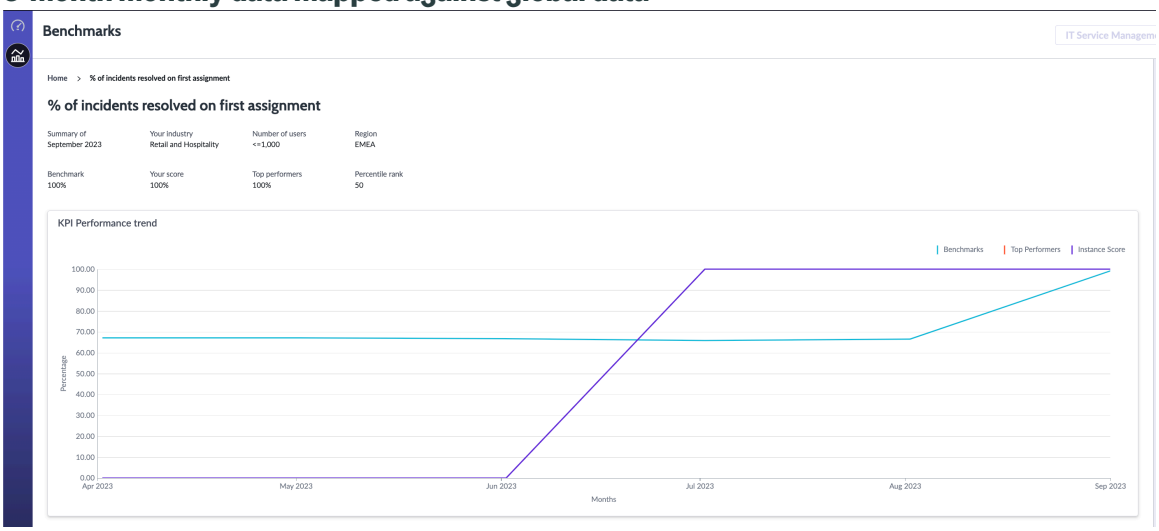
Benchmarks KPI performance trend

The Benchmarks KPI performance chart trend view shows your KPI performance comparison with global data, and provides details about the KPI on the contextual side panel.

The KPI Performance Trends chart section is shown only for users with the Benchmarks viewer role (sn_bm_client.benchmark_data_viewer).

KPI Performance Trends chart

6-month monthly data mapped against global data



Your 6-month monthly data is mapped against global data, and your percentile rank indicating your standing within the participating peer group is shown.

Functionality of the performance trend chart view includes:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Viewing your instance and global data for a certain month by hovering over a point on the graph.
- Accessing the Performance Analytics scorecard for a data point in your instance.
- Filtering data by type of industry, number of users, or geographic region.

Troubleshooting Benchmarks errors

Troubleshoot and resolve common errors when setting up or running Benchmarks.

Data Error Scenarios

Scenario	Reason	Action
No data in dashboard after opting in.	The download REST API for six months failed or there is a connection failure.	Verify in the sysevent table that the sn_bm_client.download.scores.6months event is processed.
No instance data is shown in the dashboard for the last month.	PA data collection or scorecards API failure.	• Make sure the condition in the indicator source, script field in the indicator, and additional conditions in the indicator are correct. • Verify that historical data of the last month for the KPI is collected. 1. Navigate to **Platform Analytics** > **Data Collector** > **Jobs**. 2. Find and open the historical data collection job for the KPI. 3. Navigate to the **Job Logs** related list. 4. Make sure that the state for the historical data collection job is **Collected**.
No global or cohort benchmark scores in dashboard for the last month.	• The download REST API failed or there is a connection failure. • The minimum data required to generate global or cohort scores for a KPI isn't available due to insufficient customer participation in a cohort or peer group segment.	• Verify in the sysevent table that the sn_bm_client.download.scores event is processed. • Make sure that each cohort has a minimum of 10 participating customers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Error Scenarios (continued)

Scenario	Reason	Action
Opt-in process fails.	Authentication failed or the instance type is not supported.	Contact Customer Service and Support team.
Incorrect or no KPI data in the Benchmarks dashboard.	• KPI condition configuration • The minimum historical data scores for KPIs are not available.	• Verify the KPI definition and conditions in **Performance Analytics** > **Sources** > **Indicator Sources**. • Make sure that a minimum of one to two months of aggregate monthly historical data for a KPI is available. The recommended time interval is 60 days.
No data in Percentile Rank list view.	Percentile Rank shows N/A due to the following reasons. • You are viewing an industry that you are not a part of. • The minimum data required to generate global or cohort scores for a KPI isn't available due to insufficient customer participation in a cohort or peer group segment.	• View the industry in which your scores are included. • Make sure that each cohort has a minimum of 10 participating customers.
No data in Top Performer score.	Top Performer score shows N/A if the minimum historical data scores for KPIs are not available.	Make sure that a minimum of one to two months of aggregate monthly historical data for a KPI is available. The recommended time interval is 60 days.

Domain separation and Benchmarks

Domain separation is unsupported in the Benchmarks application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Domain separation for service providers

Change Management

The ServiceNow® Change Management application provides a systematic approach to control the life cycle of all changes, facilitating beneficial changes to be made with minimum disruption to IT services.

ServiceNow Change Management integrates with the Vulnerability response plugin to introduce extra functionality within Change Management.

Get started

Explore Learn about Change Management concepts and features.	Configure Configure environment, tools, and user access.
Use Learn how you can use Change Management.	Reference Get details about Change Management components such as roles and dependent applications.

Exploring Change Management

The Change Management processes for a change request are controlled by workflows defined for a specific change request type.

Change models

Change managers can use the Change models feature to conveniently tailor change activities and flows for specific use cases.

This feature is an extension to the existing IT Infrastructure Library (ITIL) OOB Change types and workflows. You can use it to transit to fit-for-purpose models and ServiceNow® *Workflow Studio* without compromising on existing capabilities.

Change models enable you to define:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Fit-for-purpose state models
- State transitions
- State transition conditions

By default, the following models are provided as examples for ITIL mode 1 and mode 2 processes. These models are available with the activation of the Change Management - Change Model Foundation Data (com.snc.change_management.change_model.foundation) plugin.

- ITIL mode 1 - This is a traditional and sequential approach to process the Change Requests. This mode goes through a sequential process defined to complete a change successfully.
- ITIL mode 2 - This is an adaptable approach to expedite the change request. This mode supports the right process for a give change to ensure a Change isn't a blocker to another change.

Change models

Change model	Description
Normal	Change model used for ITIL mode 1 Normal changes.
Emergency	Change model used for ITIL mode 1 Emergency changes.
Standard	Change model used for ITIL mode 1 Standard changes.
Change Registration	Change model used to capture change requests in an external system. There are no approvals associated with this model.
Cloud Infrastructure	Change model used for change requests that commission and decommission Cloud infrastructure services.
Site Reliability Ops	Change model used for site reliability operations.
Unauthorized Change	Change model used for change requests that are created from the unauthorized change events.
DevOps	Change model used for DevOps change requests. For more information, see DevOps change models.

Change Models properties

Configure the Change Models properties to access the Change models capabilities when creating a Change request.

The following properties enable you to access the Change Models features. For upgrade users, these properties are set to **true**.

Enter `sys_properties.list` in the navigation filter and enter `*change_model` in the Search panel to view and edit the properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change Models Properties

Property	Description
com.snc.change_management.change_model.hide	Hides the Change models feature when the *com.snc.change_management.change_model.type* property is enabled. When creating a new change, you do not have the option to choose a model, and the **Model** field is not available on the Change request form.
com.snc.change_management.change_model.manage_workflow	Enables workflow management support for ChangeRequest API if the *com.snc.change_management.state_model* plugin is installed. This will call the 'deleteDefaultWorkflowContext' method to be called on specific state and type changes.
com.snc.change_management.change_model.type_bcompatibility	Enables Change Type Compatibility for Change models if the *com.snc.change_management.state_model* plugin is installed. When true allows changes to be created with both the type based workflow and Change models.

Create a user criteria record for Change Management

Create a user criteria record to control user access to widgets.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Change Models**.
2. Select a change model.
3. Select **Advanced Security**.
4. In the related list at the bottom of the record, select **Available For** to manage access to the widgets.
5. On the form, fill the fields.

User Criteria record

Field	Description
Name	Unique name for the user criteria record.
Active	Option to make the condition active.
Users	Users to be granted access.
Groups	Groups to be granted access.
Roles	Roles to be granted access.
Companies	Companies to be granted access.
Locations	Locations to be granted access.
Departments	Departments to be granted access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Match All	Determines whether all elements from each populated criteria field must match. If selected, only users who match all criteria are given access. If cleared, the user must meet one or more of the set criteria to be given access. By default, this check box is cleared so that any condition met provides a match.
Advanced	Displays or hides the **Script** field.
Script	Defines any additional criteria, and returns true or false. This field is available only if **Advanced** is selected.

6. Select **Submit**.

Change types

Change Management supports the three types of service changes ITIL describes — standard, emergency, and normal. The change type determines which state model is invoked and the change process that must be followed.

Watch this eight-minute video for an overview of Change Management in ITSM. Introduction to change management; types of change; creating and working change requests; improving efficiency through standard changes.

Standard change

A standard change is a pre-authorized change that is low risk, relatively common and follows a specified procedure or work instruction.

A standard change is one that is frequently implemented, has repeatable implementation steps, and has a proven history of success. As Standard changes are pre-approved, they follow a stream lined process in which group level or peer approval and CAB authorization steps are not required.

Approved standard change requests can be predefined in a catalog of templates to make accessing and requesting a standard change more efficient. This ability also enables the Change Management team to control the changes that are authorized as standard.

Emergency change

A change that must be implemented as soon as possible, for example to resolve a major incident or implement a security patch. This change is of such a high priority that it bypasses group and peer review and approval and goes straight to the Authorization state for approval by the CAB approval group.

Emergency changes cover the following types of emergencies:

- Fix on fail or retroactive situations where the impact to service has already been experienced.
- Fail or fail situations where the impact to service is imminent if action is not taken.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These changes do not follow the complete life cycle of a normal change due to the speed with which they must be authorized. Therefore, they progress directly to the **Authorize** state for approval from the CAB Approval group.

During an emergency change, there are chances that an unplanned CI change activity occurs. During such a case, an unauthorized change request is created and sent for approvals. For more information, see Unauthorized change request.

Normal change

Any service change that is not a standard change or an emergency change.

Normal change requests follow a prescriptive process which requires two levels of approval before being implemented, reviewed, and closed. These changes require a full range of assessments and authorizations such as peer or technical approval, change management, and Change Advisory Board (CAB) authorization, to ensure completeness, accuracy, and the least possible disruption to service. These changes are most often scheduled outside of defined change blackout windows or during defined maintenance windows. The normal type is used to implement beneficial change for any change to a service that is not a standard or emergency change.

Modify the email notification for change request state changes

There is a change request email notification, which, if active, sends a notification to the user when the state progresses to **Scheduled**, **Implement**, **Review**, or **Canceled**. You can modify the change request notification to specify when to send it, who receives it, and what it contains.

Before you begin

Role required: admin

About this task

By default, the notification is sent to the user who originally requested the change. Notifications are not sent to the user who updated the state on the change request.

Procedure

1. Navigate to **All** > **System Notification** > **Email** > **Notifications**.
2. Locate and open **Change request state change notification**.
3. On the form, modify information in the following form sections: **When to send**, **Who will receive**, **What it will contain**.
   For more information about email notifications and the fields in the form, see Create an email notification.
4. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change approval policies

In Change approval policies, approval definitions are used to generate approvals according to your business requirements.

A change approval policy is a course of action that can be applied to a change request. It uses a set of variable inputs to evaluate the decisions that are associated with it. For each matching decision, the associated approval definition is applied.

An approval policy can contain multiple decisions allowing a single policy to handle every approval required for a change type. When a decision condition matches, the related approval definition is evaluated. If one or more decisions match, all the related approval definitions are evaluated.

Use the **Change Approval Policy** workflow activity instead of the **User** and **Group Approval** workflow activities to manage the approvals at a particular stage of the workflow. For more information, see Change Approval Policy workflow activity

Note:
To use the change approval policies after you upgrade:

1. Configure the approval policies as needed.
2. Replace the **User** and **Group Approval** activities with the **Change Approval Policy** activity in the workflow.

A change approval policy consists of three components:

- **Policy inputs**: The variable sources evaluated within the condition defined on a decision.
- **Decisions**: Based on the conditions, determines whether the associated Change approval definition applies.
- **Approval definitions**: Defines the type of approval that can applied.

Change Advisory Board (CAB) workbench

The Change Advisory Board (CAB) workbench enables a CAB manager to schedule, plan, and manage CAB meetings.

CAB meetings are typically intended to review and authorize change requests and review recently implemented changes. A standard agenda with the relevant change request details enables the CAB members to conduct risk and impact analysis prior to the CAB meeting.

Overview of the CAB Workbench. This video covers: What is the CAB Workbench, CAB Manager, Benefits of the CAB Workbench, Key Structures of the CAB Workbench.

The CAB workbench assists you in managing CAB meetings in the following ways:

Define a schedule for CAB meetings

Schedule a recurring series of CAB meetings for CAB members to assess the impact and risk of change requests prior to the meetings.

Define CAB meeting attendees

Define members who attend this CAB meeting series for each occurrence. For example, define the CAB board members or any delegates who can substitute if the CAB manager cannot attend.

Define CAB meeting agenda

Define filter criteria that determines which change requests are included in any occurrence of a CAB meeting. If a change request is included in an agenda, the change requester is notified of the CAB meeting in which the change request

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

is discussed. The change requester can attend and present the reasons for the proposed change, and explain the intended outcomes and potential risks of the change.

View change calendar

Schedule changes by displaying existing planned changes in a change calendar in daily, weekly, and monthly view. The calendar view also lists maintenance windows and blackout schedules, if any.

Approve or reject a change request

Approve or reject a change request based on the decision taken in the CAB meeting.

View and record meeting notes

Record meeting notes from a specific CAB meeting and share these notes with other meeting attendees.

The CAB Definition (cab_definition) table inherits the domain properties from the Schedule (cmn_schedule) table which has the Domain and Domain path columns. As the CAB Definition table makes use of the same Child Schedule and Schedule Entry tables as the Schedule table, domain support is identical, where the domain_master attribute is used to derive Domain from a parent record. For more information, refer Domain support for schedules .

Upgrade Change Management

Follow these instructions to upgrade your Change Management system.

Before you begin

Prior to Geneva, Change Request installed the Conflict Detection, Best Practice Change Risk Calculator, Change Risk Assessment, and Bulk CI Changes plugins by default.

For new instances from Geneva onwards, the Standard change catalog, State Model, and Mass updates CI plugins are also installed by default.

Role required: admin

Procedure

Choose one of the following options.

- If you are upgrading from a release prior to Geneva, you can choose to activate Change Management core, State Model, Standard change catalog, and Mass updates CI plugins. The State Model, and Standard change catalog plugins are dependent on the Change Management core plugin. Hence, activating either the State model or the Standard change catalog plugins results in the activation of the Change Management core plugin.

  Also consider the following consequences of activating Change Management core and the subsequent changes you might need to make to best suit your organization's requirements:

  - The previous change types are updated from routine, comprehensive, and emergency to standard, normal, and emergency respectively. Analyze customizations that you may have performed that reference old change type values since they are affected and require updating.
  - When Change management core is activated, the change types are updated.

- Perform the following tasks after you activate Change management core to ensure that change types and customizations are updated if you already upgraded from a release prior to Geneva.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you had created newer change types in addition to the default change types, then you must customize them based on the new change types being introduced.
- Modify the customizations that are affected to use the new change type values.
- A new ACL, *change_request.type*, prevents users from updating the change type. If you allow any roles to update the type of a change request, for example, from **Normal** to **Emergency**, modify the ACL. Remove **nobody** from the **Requires role** list and add the roles allowed to update the change type.
- If you had the Bulk CI plugin installed, then install the Mass updates CI plugin for enhanced user experience and alignment with the new plugins.

Configuring Change Management

You can configure various aspects of Change Management based on the specific requirements of your organization.

The ITSM guided setup provides a sequence of tasks that help you configure Change Management on your ServiceNow instance. To open ITSM guided setup, navigate to **Guided Setup** > **ITSM Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Change Management plugins

You can activate one or more of the Change Management plugins if they are not already active. Some plugins include demo data.

Many of the following Change Management plugins are activated in the base system. Others can be activated when you are ready to use them. The Change Management plugins that are inactive in the base system include the following.

- Change Management mass update CI (com.snc.change_management.mass_update_ci)
- Change Management risk assessment (com.snc.change_management.risk_assessment)
- Best practice - bulk CI changes (com.snc.bestpractice.bulkchange)

You can activate one or more of the following Change Management plugins.

Request ITSM Roles- Change Management

Request the ITSM Roles plugin (com.snc.itsm.roles) to activate the ITSM Roles — Change Management plugin (com.snc.itsm.roles.change_management) to gain more control over the access that different change agents, technicians, and managers have within your Change Management process.

Before you begin
Role required: admin

About this task
The ITSM Roles plugin activates several related plugins such as Business Stakeholder (com.snc_business_stakeholder), ITSM Roles — Incident Management (com.snc.itsm.roles.incident_management), ITSM Roles — Problem Management (com.snc.itsm.roles.problem_management), ITSM Roles — Change Management (com.snc.itsm.roles.change_management), and ITSM Roles — Request Management (com.snc.service_management.roles.request_management). The related plugins updates the security model and introduces roles for respective products.

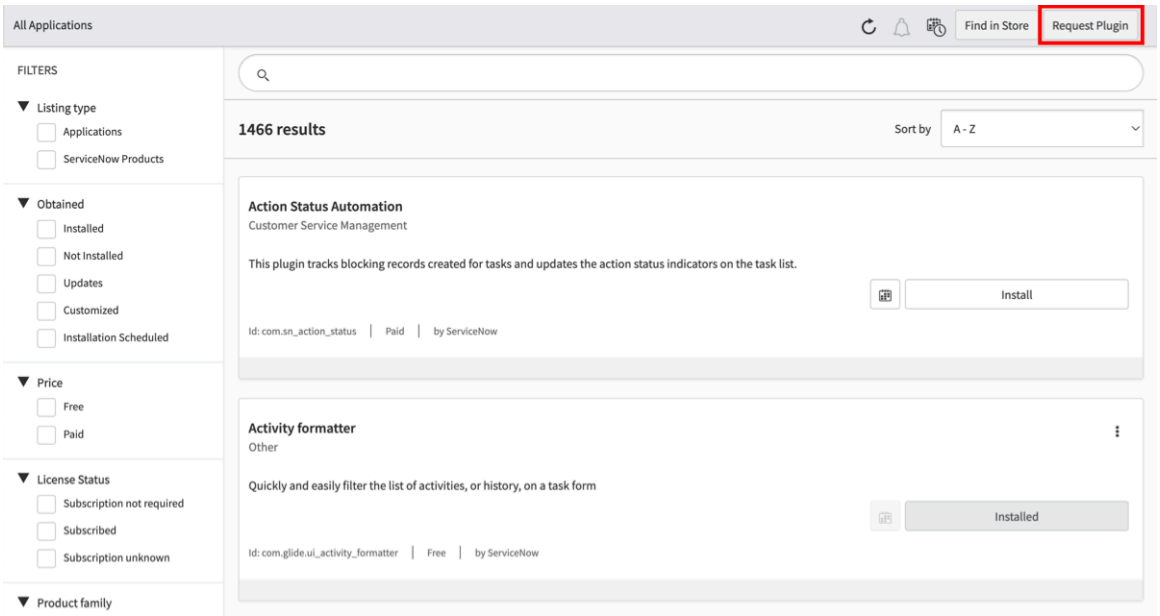
With the introduction of the new roles, ITSM provides more control over the access that users have within the process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

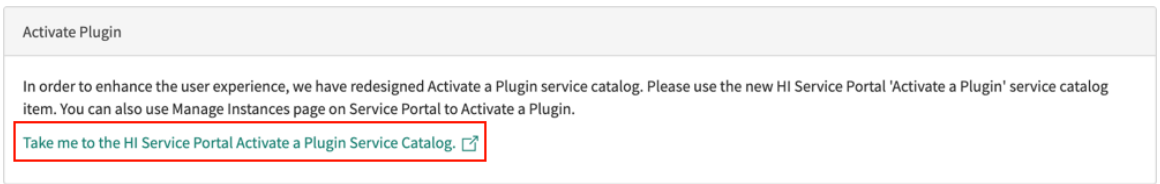
By default, this feature is activated only in new instances created in New York or the above releases. It is not automatically activated when upgrading to New York or newer releases from a version prior to New York.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate.

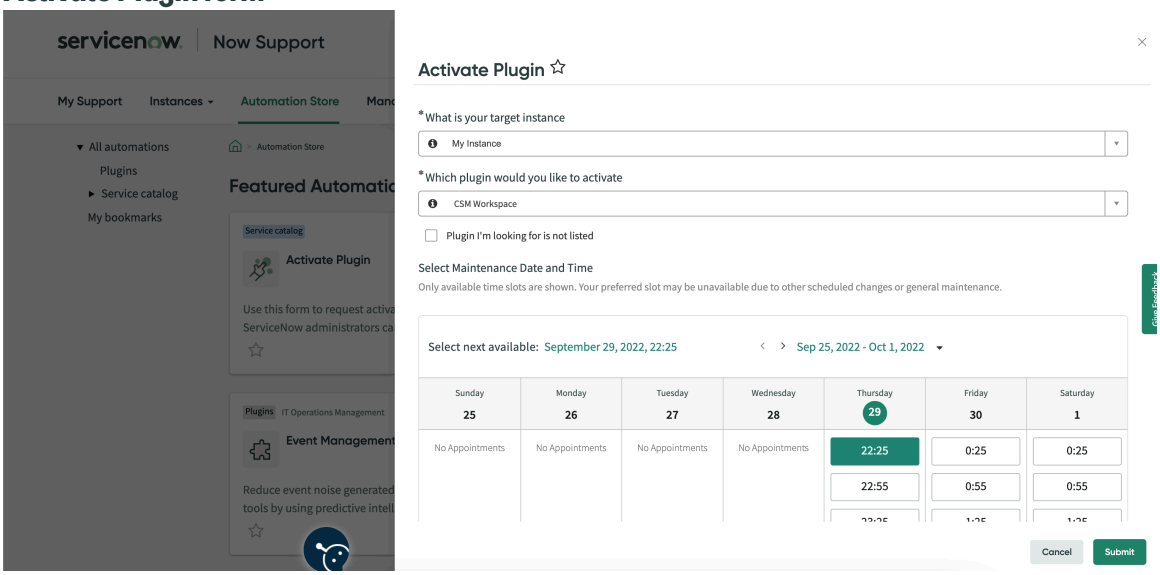
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Components installed with ITSM Roles - Change Management

Several user roles are installed with the activation of the ITSM Roles — Change Management plugin (com.snc.itsm.roles.change_management). Security ACLs to support the security model for Change Management and related functionality are also installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you install the ITSM Roles — Change Management plugin (com.snc.itsm.roles.change_management), the plugin updates the Security Access Control Lists (ACLs), integrating revised scripts, and other files to overhaul the security model for these applications.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Change read [sn_change_read]	Read access to the Change Management application and related records. **Note:** A user with the sn_change_read role can view all change requests as well as the CAB workbench.	• sn_cmdb_user • dependency_views • view_changer • cmdb_read • app_service_user • cmdb_query_builder_read
Change write [sn_change_write]	Write access to the Change Management application and related records.	• sn_change_read • template_editor • cmdb_query_builder
Incident read [sn_incident_read]	Read access to the Incident Management application and related records. **Note:** An ESS user (user with no role) can view only those incidents that they create or someone else creates on their behalf. A user with the sn_incident_read role can view all incidents as well as the major incident workbench.	• dependency_views • agent_workspace_user • view_changer • cmdb_read • cmdb_query_builder_read
Incident write [sn_incident_write]	Write access to the Incident Management application and related records.	• sn_incident_read • template_editor
Problem read [sn_problem_read]	Read access to the Problem Management application and related records.	NA
Problem write [sn_problem_write]	Write access to the Problem Management application and related records.	• sn_problem_read • template_editor

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
sn_request_read	Read access to the Request (sc_request) or Requested Item (sc_req_item) only for a user who is also an approver of the request or requested item. **Note:** As there are future updates expected for the sn_request_read role, do not assign it to users without the business_stakeholder role.	NA
sn_request_write	Write access to the Request (sc_request) or Requested Item (sc_req_item).	• task_editor • dependency_views • agent_workspace_user • view_changer • cmdb_read • cmdb_query_builder_read • sn_request_read
sn_request_comment_write	Write access to the comments for the Requested Item (sc_req_item). **Note:** The sn_request_comment_write role alone does not give access to comments write, you will need write access for the table.	NA

Activate Business Stakeholder

Activate the Business Stakeholder plugin (com.snc.business_stakeholder) if you have an admin role. This plugin installs the Business Stakeholder role. Users with this role can view and approve records at all ITSM product levels.

Before you begin

Role required: admin

Note:
Ensure that ITSM Roles plugin (com.snc.itsm.roles) is activated before you activate the Business Stakeholder plugin. For more information to activate ITSM Roles plugin, refer Request ITSM Roles- Change Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed with Business Stakeholder

The Business Stakeholder plugin (com.snc.business_stakeholder) installs the Business Stakeholder role when activated.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Business Stakeholder [business_stakeholde	Users with this role can view and approve records within all products of ITSM. **Note:** The business_stakeholder role contains the following ITSM roles sn_incident_read, sn_problem_read, sn_change_read, sn_request_read, and approver_user roles.	• pa_viewer.business_stakeholder • approver_user.business_stakeholder • cmdb_read.business_stakeholder

Activate Change Management - State Model

You can activate the Change Management - State Model plugin (com.snc.change_management.state_model) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
State Model activates the following related plugin if it is not already active.

Plugin	Description
Change Management - Core [com.snc.change_management]	Change management is used to create and manage change requests. Once this is activated, the values for the **Type** field on the change request are updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you install the Change Management - Core plugin (com.snc.change_management), the Change Management - State Model plugin (com.snc.change_management.state_model) doesn't function as expected. You must not install Change Management - State Model plugin (com.snc.change_management.state_model) plugin if you install Change Management - Core plugin (com.snc.change_management).

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next
If you upgraded from a release prior to Geneva, you must update old state labels to new state labels.

Related topics
List of plugins (Xanadu)

Update change request states

If you upgraded from a release prior to Geneva, you must update old state labels to new state labels after you activate the Change Management state model.

Before you begin
Role required: admin

About this task
State values for current change records are not modified when you activate the Change Management state model. However, your current change records display the new state labels in the state field.

State value	New state label	Old state label
-5	New	Pending
-4	Assess	(Not used)
-3	Authorize	(Not used)
-2	Scheduled	(Not used)
-1	Implement	(Not used)
0	Review	(Not used)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State value	New state label	Old state label
1	(Not used)	Open
2	(Not used)	Work in Progress
3	Closed	Closed Complete
4	Canceled	Closed Incomplete
7	(Not used)	Closed Skipped

For example, records with a state value of -5 have the **Pending** state label before the Change Management state model is activated. After the state model is activated, these records retain the state value of -5 but have the **New** label. To use your organization's required change management process with the state model, you must update state values to the new labels in your existing change records as appropriate, either manually or by script.

You must also update any reports that run queries based on old state labels to reflect the new state labels.

Procedure

1. To automatically update the state field values from old state labels to new state labels, customize and then run the following sample script:

```
updateStates();

function updateStates() {

  function hasApprovers(changeGr) {
    var approverGr = new GlideRecord("sysapproval_approver");
    approverGr.addQuery('sysapproval',
 changeGr.getUniqueValue());
    approverGr.query();
    return approverGr.getRowCount() > 0;
  }

  function hasRunningWorkflows(changeGr) {
    var workflow = new Workflow();
    var workflowGr = workflow.getRunningFlows(changeGr);
    var hasRunningFlows = workflowGr.getRowCount() > 0;
    return hasRunningFlows;
  }

  // Old State Model
  var PENDING = '-5';
  var OPEN = '1';
  var CLOSED_COMPLETE = '3';
  var CLOSED_INCOMPLETE = '4';
  var CLOSED_SKIPPED = '7';

  // New State Model
  var NEW = '-5';
  var ASSESS = '-4';
  var AUTHORIZE = '-3';
  var SCHEDULED = '-2';
  var IMPLEMENT = '-1';
  var REVIEW = '0';
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  var CLOSED = '3';
  var CANCELLED = '4';

  // Find all change requests
  var record = new GlideRecord('change_request');
  record.query();

  // Update state from old value to new value
  while (record.next()) {
    switch(record.getValue('state')) {
      case OPEN:
        if (!hasRunningWorkflows(record)
&& !hasApprovers(record))
          record.state = NEW;
        break;
      case CLOSED_COMPLETE:
        record.state = CLOSED;
        record.close_code = "successful";
        break;
      case CLOSED_SKIPPED:
        record.state = CANCELLED;
        record.close_code = "unsuccessful";
        break;
      case CLOSED_INCOMPLETE:
        record.state = CLOSED;
        record.close_code = "successful_issues";
        break;
    }
    record.autoSysFields(false);
    record.setWorkflow(false);
    record.update();
  }

}
```

2. Verify that the state labels have changed in existing change request records.

Installed with Change Management - State Model

Several types of components are installed with the Change Management - State Model.

Table modified with Change Management - State Model

Change Management - State Model modifies the list view of the following table.

Table	Description
Change Request [change_request]	Sets the column order in the list of change requests.

Activate Change Management - Collision Detector

You can activate the Change Management - Collision Detector plugin (com.snc.change.collision) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Role title [name]	Description
[sn_chg_soc.change_soc_admin]	This role has full administrative rights to Change Schedule pages.

Tables installed with Change Management - Change Schedule

Tables are added with activation of Change Management - Change Schedule.

Change Management - Change Schedule adds the following tables.

Table	Description
Style Rule [chg_soc_style_rule]	Define a default style rule that is applied to all Change Schedule definitions for each Change record displayed on the page
Style Rule [chg_soc_definition_style_rule]	Define a style rule for each Change record displayed on the Change Schedule page
Style Rule [chg_soc_def_child_style_rule]	Define a style rule for each related record displayed on the Change Schedule page
Change Schedule Definition [chg_soc_definition]	Define a Change Schedule page
Change Schedule Definition Core [chg_soc_definition_child]	Define related records for each Change record that is presented on the Change Schedule page

Properties installed with Change Management - Change Schedule

Properties are added with activation of Change Management - Change Schedule.

Change schedules are loaded on the timeline page on the client side in batches of 20. You can load a maximum of 1000 records. These numbers can be modified using the following properties from the System Properties [sys_properties] table. To open the System Property table, enter `sys_properties.list` in the navigation filter.

Property	Usage
sn_chg_soc.change_soc_initial_limit	Define the number of change_request records to display on load of the Change Schedule. • **Type**: Integer • **Default value**: 40 • **Location**: System Property [sys_properties] table
sn_chg_soc.change_soc_scroll_load_limit	Define the number of change_request records to display as the Change Schedule is scrolled.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Usage
	• **Type**: Integer • **Default value**: 20 • **Location**: System Property [sys_properties] table
sn_chg_soc.change_soc_total_limit	Define the total number of change_request records that can be displayed on a Change Schedule. • **Type**: Integer • **Default value**: 1000 • **Location**: System Property [sys_properties] table
sn_chg_soc.landing_page.pinned_notification	Show a message when pin or unpin a change schedule. • **Type**: String • **Default value**: true • **Location**: System Property [sys_properties] table
sn_chg_soc.schedule_window_days	Define the number of days to be factored before and after the respective start/end of a change_request record when displaying blackout and maintenance window spans on the Change Schedule page. • **Type**: Integer • **Default value**: 30 • **Location**: System Property [sys_properties] table

Business rules installed with Change Management - Change Schedule

Business rules are added with activation of Change Management - Change Schedule.

Business rule	Table	Description
Create default style rule	Related Definition [chg_soc_definition_child]	Defines a standard style rule with a high order for the related records.
Different start and end fields	Change Schedule Definition [chg_soc_definition]	Ensures that the start and end fields are different by aborting an insert or save when this is the case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Flush share lists when ShareWith is none	Change Schedule Definition [chg_soc_definition]	Empties shared with lists when share with none is set.
Flush shareWith to match empty lists	Change Schedule Definition [chg_soc_definition]	Ensures shared with is updated to reflect the selected share options such as groups, roles, users.
Update style field	Style Rule Core [chg_soc_style_rule_core]	Updates the stylesheet defined in the style field when one of the conditions is met: • Label color changes • Label weight changes • Event color changes Providing Advanced is not true.

UI policies installed with Change Management - Change Schedule

UI policies are added with activation of Change Management - Change Schedule.

UI Policy	Table	Description
Show maintenance color	Change Schedule Definition [chg_soc_definition]	Only show the maintenance color field if Show maintenance has been enabled.
Switch between Basic and Advanced	Style Rule Core [chg_soc_style_rule_core]	Only show label and event options if the style rule advanced option is false. When advanced is specified only the style field is presented.
Hide share users, groups and roles if share with everyone	Change Schedule Definition [chg_soc_definition]	If sharing with everyone then the other share options are hidden.
Show blackout color	Change Schedule Definition [chg_soc_definition]	Only show the Blackout color field if Show blackout has been enabled.
Hide table name	Style Rule Core [chg_soc_style_rule_core]	Condition builder requires a table field to be present on the form, but it is not necessary to present this so it is hidden.
Hide table name	Change Schedule Definition [chg_soc_definition]	Condition builder requires a table field to be present on the form, but it is not necessary to present this so it is hidden.

SoCLandingModelBuilderSNC	Builds the change schedule definition model used by the Change Schedule landing page
SoCModelBuilder	Extends SoCModelBuilderSNC and can be used to overwrite functionality defined therein
SoCModelBuilderSNC	Builds the change schedule model used by the change schedule page
SoCRefFieldsList	Field choice list processor. Return the fields on the current table which reference the parent table
SoCRefTablesList	Field Choice List Processor. Return the tables referencing the provided table name.
SoCStyleRule	Extends SoCStyleRuleSNC and can be used to overwrite functionality defined therein
SoCStyleRuleSNC	Provides utilities for style rules

UI scripts installed with Change Management - Change Schedule

UI scripts are added with activation of Change Management - Change Schedule.

UI Scripts	Description
sn_chg_soc.change_soc	Angular module for the change schedule, which includes all of the angular applications dependencies

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Scripts	Description
sn_chg_soc.change_soc_filter	Angular module for text filtering on the change schedule page
sn_chg_soc.config	Angular module for the configuration panel on the change schedule page
sn_chg_soc.context_menu	Angular module for the context menu on the change schedule page
sn_chg_soc.data	Angular module for the data model on the change schedule page
sn_chg_soc.duration	Angular module for a duration calculation utility
sn_chg_soc.filter_control	Angular module implementation of the filter widget
sn_chg_soc.filter_widget	Angular module that provides a filter control similar to a condition builder
sn_chg_soc.gantt	Angular module that maintains instances of gantt objects and handles the definition of the gantt scale
sn_chg_soc.keyboard	Angular module for the keyboard panel on the change schedule page
sn_chg_soc.landing.app	Angular module for the change schedule landing page, which includes all of the angular applications dependencies
sn_chg_soc.landing_accessibility	Angular module for acceissbility support on the change schedule landing page
sn_chg_soc.landing_card	Angular module defines a directive for a change schedule definition card
sn_chg_soc.landing_decoration	Angular module defines a directive that provides styling
sn_chg_soc.landing_notifications	Angular module for displaying notifications
sn_chg_soc.landing_page_header	Angular module provides header for change schedule landing page
sn_chg_soc.landing_sort	Angular module provides utility for sorting cards on the change schedule landing page
sn_chg_soc.landing_splash_screens	Angular module provides splash screen when no change schedule definitions are present in a tab on the change schedule landing page
sn_chg_soc.landing_tabs	Angular module provides tabs for the change schedule landing page
sn_chg_soc.landing_wizard	Angular module defines the creation of a new change schedule definition from the landing page
sn_chg_soc.loading	Angular module defines when the change schedule page is loading by listening to requests
sn_chg_soc.mousedown	Angular module that makes a button execute multiple times when holding mouse down

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI Scripts	Description
sn_chg_soc.notification	Angular module used to display messages on the change schedule page
sn_chg_soc.popover	Angular module used for accessibility support for the popover that is displayed on the change schedule page
sn_chg_soc.share	Angular module for the share panel on the change schedule page
sn_chg_soc.sn.app_itsm.now.iscroll	Angular module that supports scrolling to load more content on the change schedule landing page
sn_chg_soc.snCreateNewInvite	Angular module for the share panel component that adds elements to the shared with field for the change schedule
sn_chg_soc.sn_soc_now.scheduleService	Angular module for the change schedule landing page that is used to retrieve change schedule definitions from the server
sn_chg_soc.style	Angular module for the style panel on the change schedule page

Activate Change Management - Risk Assessment

You can activate the Change Management - Risk Assessment plugin (com.snc.change_management.risk_assessment) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Change Management - Risk Assessment activates these related plugins if they are not already active.

Plugins for Change Management - Risk Assessment

Plugin	Description
Assessment Components [com.snc.assessment]	Provides the core components required for legacy surveys.
Best Practice - Change Risk Calculator [com.snc.bestpractice.change_risk]	Provides simple risk and impact calculations for change management.
Assessment Designer [com.glide.assessment_designer]	Provides an interface to create and edit the Change Risk Assessment form that is required to collect user information on risk of the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

What to do next
You can define risk assessment conditions for change requests.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Scheduled job	Description
Change success score metrics (Daily)	Collects individual metrics for changes completed and incidents raised the previous day. This job runs on a daily basis at 02.00 UTC. When this job is completed, the Daily change success score script action is executed. This action triggers the calculation of the adjustment formula indicators, and store the new score in the metric table.
Change success score for today	Reads scores from metric table and calculates the daily averages for the past 30 days.
Change success score metrics (Historical data)	Gathers individual metrics daily for the past 30 days. This result overrides what is already stored in PA, that is not more than 30 days old. When this job is completed, the Historical change success scores script action is executed. The functionality of this script action is similar to that of the Daily change success score. Additionally, creating a new historic metric record for each day of the past 30 days.
Change success score (Historical data)	Reads scores from the metric table and calculates the daily average for the past 30 days≥

Note:

Historical calculations are useful you decide to change the overall formula or multipliers for individual metrics later on. You can run Change success score metrics (Historical data) to recalculate metrics and score for the past 30 days creating a new history record.

Tables installed

Table	Description
Change Success Score Rating [chg_success_score_rating]	Defines the record that associates a rating choice and color with a Change Success Score range, such as, 0 to 499.

Activate Change Management - Mass Update CI

You can activate the Change Management - Mass Update CI plugin (com.snc.change_management.mass_update_ci) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

Activate Change Management - Change Flows

You can activate the Change Management - Change Model Foundation Data (com.snc.change_management.change_model.foundation) plugin if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Change Management - Change Velocity dashboard

You can activate the Performance Analytics - Content Pack - Change Management (com.snc.pa.change) and Process Optimization (com.sn_process_optimization) plugins if you have the admin role. These plugins include demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Change Management - Change Models

You can activate the Change Management - Change Model Foundation Data plugin (com.snc.change_management.change_model.foundation) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Change Management Success Probability

You can activate the Change Management - Success Probability plugin (com.snc.change_management.success_probability) if you have the admin role.

Before you begin
Role required: admin

About this task
Activate the Change Management Success Probability (com.snc.change_management.success_probability) plugin to calculate the probability of success of a change request.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Activate Change Management - Data Archiving

You can activate the Change Management - Data Archiving plugin (com.glide.auxdb) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
The Change Management - Data Archiving plugin (com.glide.auxdb) enables to move a subset of data from large tables into the data archive.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Standard change catalog

Standard changes are pre-approved, low risk changes with a proven history of success. The standard change catalog contains the changes that have been approved by the Change Management application as standard changes.

Users with the ITIL role can view the list of available standard changes and submit change requests.

A property controls whether the selection of a standard change request from the catalog inserts the change request record into the database. An administrator can select the **Two step** check box in Standard Change Properties. This property requires the requester to click **Submit** to insert the change request record.

Standard changes are logically grouped under specific categories. The Change Management application uses a proposal process to control which changes become available in the standard change catalog.

The standard change catalog enables you to perform the following activities:

- Request, review, and approve standard change templates.
- Request preapproved standard changes.
- Determine access to standard change templates at the user level.

You can propose, modify, and retire standard change templates based on the requirements of your organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pre-approved standard changes

Submitting a change request from a standard change template ensures that pre-approved information is automatically populated in the necessary fields. Standard changes are submitted more quickly and fulfillment can be expedited.

Note:
You cannot mass-update a set of Configuration Items (CIs) in standard changes. However, you can propose individual changes.

Determine access to standard change templates at the user level

Standard change templates are logically grouped under specific categories. These categories are displayed to users based on user criteria such as user role, geographical location, and department.

Configure standard change catalog properties

Configure the standard change catalog through the standard change properties.

Before you begin

The Change Management - Standard Change Catalog [com.snc.change_management.standard_change_catalog] plugin must be activated.

Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Standard Change Properties**.
2. On the form, fill in the fields.

Standard change properties form

Field	Description
Catalog	Select the service catalog to add the generated standard change template to.
Category	Select the service catalog category to add the generated standard change template to. You can also choose the category or any child categories of the selected catalog. **Note:** This value is not set automatically on the Proposal form, but must be specified before it is approved.
Two step	Check box to make the request of a standard change a two-step process. The process redirects the requester from a standard change template to a change request that can be reviewed before submitting. This option is enabled by default on instances provisioned on Jakarta. Customers upgrading from prior releases must enable the **Two step** property.
Mandatory Change Request values	Specify a list of mandatory fields that require values when you propose a new standard change template or a modification to a standard change template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This configuration ensures that when a standard change request is created from a standard change template, one or more fields on the Change Request form contain preset values.
Default Change Request values	Specify default values for common fields on the Change Request form.
Restricted Change Request values	Specify the list of fields that end users are not allowed to provide any value for when making a proposal. **Note:** Ensure that internal columns, such as **Updates**, **Updated**, **Updated by**, **Domain**, **Created**, **Created by** are restricted.
Read-only fields	Specify the fields that end users are not allowed to provide any value for in the created standard change request. **Note:** This configuration ensures that for the specified fields, the values approved in the standard change template do not change when the standard change request is submitted.
Fields to copy	Specify the fields whose values are copied to the **Propose a New Standard Change Template** record producer from a non-standard change request. **Note:** If any fields not specified in this list have default values specified, the default values are copied to the record producer.
Change Task properties	
Mandatory Change Task fields	Specify a list of mandatory fields. Enter values for these fields when proposing a new change task template or modifying a change task template.
Default Change Task values	Specify default values for fields on the Change Task form when creating a change task template.
Restricted Change Task fields	Specify the list of change request fields that end users are not allowed to provide any value for when creating a change task template.
Read-only Change Task fields	Specify the fields that end users are not allowed to alter any value for in the change task. **Note:** This configuration ensures that for the specified fields, the values approved in the change task template do not change when the change task is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Change Task Fields to copy	Specify the fields whose values are copied to one or more change task templates when proposing a new standard change template from an existing change request.

3. Select **Update**.

What to do next

You can create a standard change catalog. By default, the basic Standard Change Proposal workflow sends approval records to members of the Change Management group and the members should verify and modify the records, as appropriate.

Create a standard change task template

You can create a change task template to add to a standard change proposal. If the standard change proposal is approved, the related change tasks are created when the standard change request is created.

Before you begin

Role required: itil, change_manager, or sn_change_write

Procedure

1. Navigate to **All** > **Standard Change** > **Open Proposals**.

Note:
You can add standard change tasks to a standard change proposal only when the proposal is in the **New** state. Once you submit a standard change task for approval, you cannot add additional tasks.

2. Click the **Change Task Templates** tab, and then click **New**.
3. On the form, fill in the fields.

Change task template form

Field	Description
Name	Unique name for the change task.
Std change proposal	Name of the standard change proposal for which you want to create the change task template.
Order	Order in which change tasks are created in the change request. The **Order** field determines the order in which you add the change tasks to the change request when you select it from the standard change catalog.
Short description	Brief description of the change task template.
Change Task values	Field values that are populated on the change task created as part of the standard change.

4. Click **Submit**.

Note:
Standard change catalog templates are not supported on Service Portal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Propose a standard change template

Propose a new standard change template when you identify a need while creating a change request.

Before you begin

Role required: itil, admin

About this task

As an IT technician, you can propose a new change template for a change request that you frequently create. This new template is later sent for approval to the change management team, which reviews the request and approves the template as part of the approval process.

Procedure

1. You can propose a standard change template by navigating to **Change** > **Standard Change** > **Standard Change Catalog** > **Template Management** > **Propose a new Standard Change Template** and filling in the fields on the form.

Standard Change Proposal form

Field	Description
Short description	Short description of the standard change proposal template.
Category	Category under which the template is published. For example, Server Standard Changes.
Sample Change Requests	Change requests that are available as samples for the change that you propose. The Change Management team reviews the requests as a part of the approval process.
Change Request values	Text which appears as default text in the standard change proposal template.

2. Click **Save**.
   The proposal is created with the status **New**.
3. Click **Request Approval**.
   The proposal is created with the status **In Progress**.
4. **Optional:** Create a standard change template from a change that exists by completing the following steps.
   a. Navigate to **Change** > **Open** and click the change whose information you want to use in the standard change template.
   b. Open the form context menu and click **Propose a Standard Change Template**.

Note:

- Any change tasks that are included with the change also get copied to the new standard change proposal. The fields copied from both the change and change tasks are defined in the Standard Change Properties.
- By default, approval records are created for members of the Change Management group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, as a change manager, create and submit a standard change proposal that can be utilized as a template to draft a standard change request that occurs frequently and is of low risk. By default, the basic standard change proposal workflow sends approval records to members of the change management group where the members verify and modify the records, as appropriate. Navigate to **Change** > **Standard Change** > **My Proposals**. Click **New**, fill the form, and then click **Submit**.

Result
A new template record is created for use.

Attach files to a standard change template

Attach files, such as documents, spreadsheet, and images to a standard change proposal. Standard change templates copy any file attached to the template to a change request that the template creates.

Before you begin
Role required: itil, admin

Procedure

1. Navigate to **All** > **Change** > **Standard Change** > **My Proposals**.
2. Open the proposal to which you want to add the attachment to.
3. Click the icon to browse and select the file.

   The attached file appears at the top of the proposal.

   Note:
   You can add more than one file as an attachment.

4. Click **Update** and request approval for the proposal.

Result
Any attachment associated with a standard change proposal gets copied to the standard change template that is created when the proposal is approved. When that template is used to create a standard change, any attachment associated to it is also copied to those standard change requests.

Modify or retire a standard change template

You can modify and retire standard change templates based on your organization's requirements.

Before you begin
Role required: admin, change_manager, sn_change_writeor itil

Procedure

1. Navigate to **All** > **Change** > **Standard Change** > **All Templates**.
2. Select the template you want to modify or retire and perform one of the following steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Modify a standard change template	**a.** Click **Modify Template** under **Related Links**. **b.** Enter your modifications in the **Modify a Standard Change Template** form. **Note:** A new version of the standard change template is created after saving the mod ifications. Change requests created from the modified standard change tem plate reflects the modifications made.
Retire a standard change template	**a.** Click **Retire Template** under **Related Links**. **b.** Enter your business justification to retire the specific template in the **Retire a Stan dard Change Template** form. **Note:** The standard change template is deacti vated, and it is no longer be available for creating new change requests.

3. Perform one of the following actions:
   - Click **Save**. The modifications are saved but not sent for approval.
   - Click **Request Approval**. The template is sent for approval to the change management team.

Change schedules

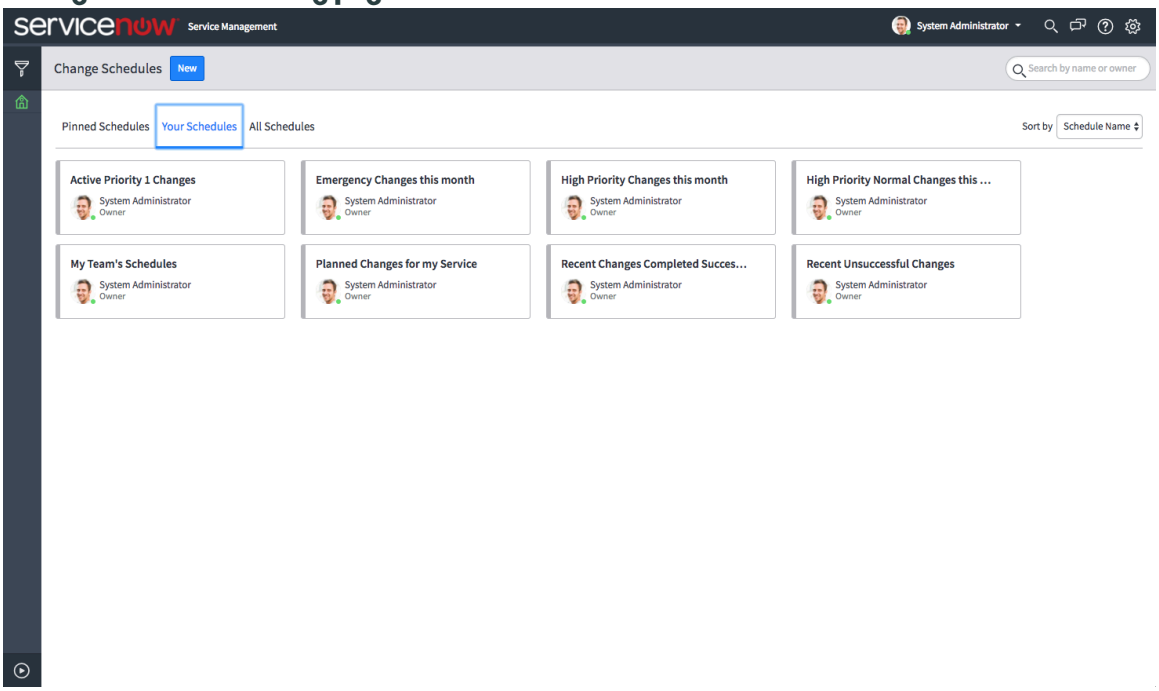
The Change Schedules landing page provides a view of schedules that are categorized under **Pinned Schedules**, **Your Schedules**, and **All Schedules**. The grouping of schedules provides easy access to your most required schedules and saves your time from searching through all the schedules in the system.

To access Change Schedules, navigate to **Change** > **Schedule** > **Change Schedules**.

Note:
To view the Change Schedules page, you must activate Change Management - Change Schedule plugin (com.snc.change_management.soc).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change schedule landing page



You can find schedules arranged under three categories as follows:

- **Pinned Schedules**: Includes all change schedules you have previously chosen to pin for quick access.
- **Your Schedules**: Includes all change schedules you own or are a member of the group that owns the schedule.
- **All Schedules**: Includes all change schedules you have access to.

To pin a schedule, hover over the schedule tile and click the pin icon ( ). The schedule appears under **Pinned Schedules**. To unpin a tile, click the pin icon again.

Note:
The **Show an information message when a change schedule is pinned** property in Change Properties controls whether you see an informational message confirming the pinning or unpinning of the schedule.

Click a tab to view a Change Schedule. For more information, refer Change schedules view.

Change schedules view

The Change Schedules module provides a Gantt or timeline view of change requests based on criteria defined within a Change Schedule Definition.

The change schedule provides detailed insight to change requests that are included based on the change schedule definition. The change requests can include change timing, duration, related change tasks, blackout periods, and maintenance windows for any given date, week or month.

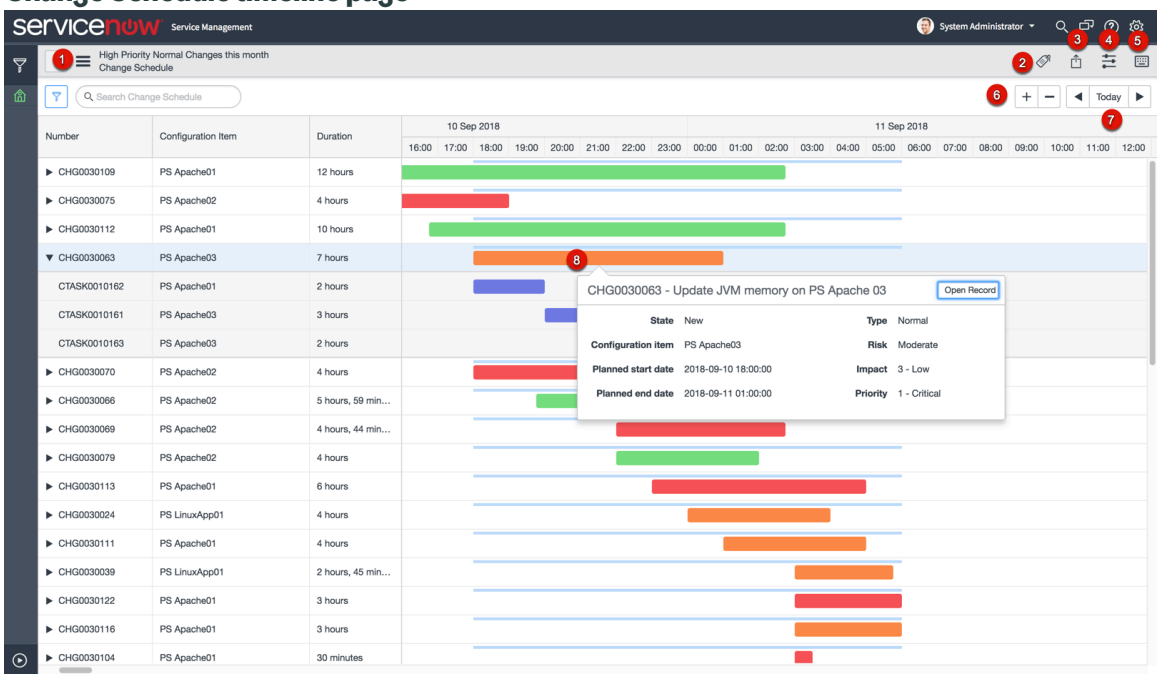
To view the Change Schedules page, you must activate Change Management - Change Schedule plugin (com.snc.change_management.soc).

Change requests are represented by a span. The duration of the span is defined by the start and end date fields defined in the Change Schedule definition. The Change Schedules page allows conditions to be defined using the condition builder. The condition builder determines which change requests are displayed and sorted in a change schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To show the blackout and maintenance windows of the change in the calendar view, the **Affected CI** field for the change must be configured.

Change Schedule timeline page



SI #	UI Component	Description
1	Context Menu	Option to do the following: • Create new schedule: You can create a new schedule from a simplified wizard. • Edit a schedule: Allows the modification of change schedules you own and any changes made are saved to the related Change Schedule Definition record. • Copy a schedule: If you are the owner of the change schedule that you want to copy, then a copy of the change schedule is created. If you want to copy a change schedule that is owned by any other user, then you become the owner of the copied schedule and the new schedule is fully editable by you. • View schedule definition: You can view the change schedule definition and the related fields associated with it. • Delete: Allows users, who own a change schedule, to delete the schedule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SI #	UI Component	Description
		Note: • A user who only possesses the ITIL role and is not the owner of a change schedule can only create a schedule, copy a schedule, or view an existing schedule definition. • You become the owner of any schedule that you create. The new schedule that you create appears in the Change Schedule page in a tile form under the **Your Schedules** tab.
2	Span styles	Defined span color based on conditions you specify. You can add new span styles by clicking **Add Span Styles**. You can also edit an existing style rule, apply filters to a style rule, or remove a style rule. **Note:** By default, span styles are based on the Risk value of a change. • Risk = High – Span style is Red • Risk = Moderate – Span style is Orange • Risk = Low – Span style is green
3	Share	Schedules to be shared to other users by user name, group, or role. The share pane also provides a check box to share a change schedule with everybody. If change schedules are not shared with anyone, then only the owner, owner group, and administrator can see them. If a change schedule is shared with other users, an option is available to send an email notification to inform them of their access.
4	Configuration	Components of the change schedule including the configuration item, duration, or any related tasks can be hidden or exposed.
5	Keyboard shortcuts	List of available keyboard shortcuts to help you navigate quickly and to provide accessibility to users. The list of navigation shortcuts appears when you click
6	Zoom	Zoom levels to control change schedule zoom resolution. The range can vary from hours to a yearly view of change schedules.
7	Arrow keys	Option to navigate forward or back in time in the change schedule based on the current zoom level. Click **Today** to navigate back to the current day and time in a single click.
8	Change record	Summary of the change record when you click any span. Use **Open Record** in the header of the summary to open the change request in the form view. In the form, you can view the entire change request record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SI #	UI Component	Description
		Note: You can specify the fields that are displayed in this window. On the Change Schedule Definition form, under the **Record Summary** tab, specify required fields on **Left column fields** and **Right column fields**.

Note:
Change schedules are loaded on the timeline page on the client side in batches of 20. You can load a maximum of 1000 records. These numbers can be modified by system administrator. For more information, refer the properties at Installed with Change Management - Change Schedule.

Create a change schedule from the Change Schedules page

You can create a change schedule to view all scheduled changes, change tasks, blackout periods, maintenance windows for any given date, week, month, or year.

Before you begin

- You have activated Change Management - Change Schedule plugin (com.snc.change_management.soc).
- Role required: itil, sn_chg_soc.change_soc_admin, sn_change_role, sn_change_write roles, sn_change_write, or admin

Note:

- A user with an ITIL role can create a Change Schedule definition and view the schedule definition that they have created.
- An admin or a change schedule administrator can read or edit all Change Schedule definitions.

Procedure

1. Navigate to **All** > **Change** > **Schedules** > **Change Schedules** and click **New**.
2. On the form, fill in the fields.

New Change Schedule form

Field	Description
Name	Name of the change schedule.
Start date field	Field from the change request form that indicates the start date as an example planned start date.
End date field	Field from the change request form that indicates the end date as an example planned end date.
Condition	Conditions that determine which change requests display in the Change Schedule interface and the order in which those change requests are sorted.

3. Click **Submit**.
   The change schedule is displayed in the timeline view.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a change schedule from the change schedule definition

You can define a change schedule from a change schedule definition record. Change schedule definitions help you to define the content that displays in the change summary popover, the users, groups or roles with whom a schedule is to be shared, and related span style colors.

Before you begin

- You have activated Change Management - Change Schedule plugin (com.snc.change_management.soc).
- Role required: itil, sn_chg_soc.change_soc_admin, sn_change_role, sn_change_write roles, sn_change_write, or admin

About this task

To create a new Change Schedule, specify the start and end date fields that you want to be represented in the user interface and also specify the conditions to determine which change requests to display.

Procedure

1. Navigate to **All** > **Change** > **Schedules** > **Change Schedule Definitions** and click **New**.
2. On the form, fill in the fields.

Change Schedule Definition form

Field	Description
Name	Name of the change schedule.
Active	Check box to select if a schedule is active.
Changes	
Start date field	Field from the change request form that determines the start date of the span.
End date field	Field from the change request form that determines the end date of the span.
Condition	Conditions which determine which change requests display in the Change Schedule interface and the order those change requests are sorted.
Record Summary	
Left column fields	List of fields which appear on the left column of the record summary pop-up. The record summary pop-up appears when you click any span on the change schedule timeline.
Right column fields	List of fields that appear on the right of the window when you click any span on the change schedule timeline. The record summary pop-up appears when you click any span on the change schedule timeline.
Blackout and Maintenance	
Show blackout window	Check box to select if blackout window associated to a change request appears in the change schedule timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Blackout window color	Color to represent blackout window in the change schedule timeline.
Show maintenance window	Check box to select if maintenance window associated to a change request appears in the change schedule.
Maintenance window color	Color to represent maintenance window in the change schedule timeline.
Sharing	
Share with	Option to share the schedule with everyone associated with the change or with specific users and groups.
Owner	Owner of the change schedule.
Group Owner	Group that owns a change schedule and has administrative rights to the change schedule.
Related Link	
Show Schedule	Link to the change schedule that you have defined.
Related Lists	
Related Definitions	Details of related child schedules
Style Rules	Options to define style conditions to determine the color of a span using a condition builder. For example, if you want all changes of type Emergency to show as a red span, a span style can be defined for that condition.

3. Click **Submit**.

Add related tasks to a change schedule

Create related definitions to present related tasks for change requests in the change schedule. For example, to view the change tasks associated with a change request, you need to define a related definition. You can also add style rules specific to a related task.

Before you begin

- You have activated Change Management - Change Schedule plugin (com.snc.change_management.soc).
- Parent change schedule is defined.
- Role required: itil, sn_chg_soc.change_soc_admin, sn_change_role, sn_change_write roles, sn_change_write, or admin

Procedure

1. Navigate to **All** > **Schedules** > **Change Schedule Definitions**.
2. Select a Change schedule definition.
3. Select **New** in **Related Definition** tab.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Definition form

Field	Description
Name	Name of the related definition.
Change schedule definition	Reference for the parent change schedule.
Active	Check box to select whether the child schedule is active.
Related Records	
Table name	Choice list to select the table on which the Related Definition is based.
Reference field	Reference the Related Definition is based on, for example, change request.
Start date field	Start date field from the related record.
End date field	End date field from the related record.
Condition	Conditions included in the change schedule and the associated ordering of the conditions.
Record Summary **Note:** The record summary pop-up appears when you click any span on the change schedule timeline.	
Left column fields	List of fields that appear on the left column of the record summary pop-up. The record summary pop-up appears when you click any span on the change schedule timeline.
Right column fields	List of fields that appear on the right column of the record summary pop-up. The record summary pop-up appears when you click any span on the change schedule timeline.

5. Click **Submit**.

Style rules definition

You can create a style span to specify the color for different events in a change schedule. Style spans in a schedule help to quickly identify characteristics of a change based on a field value from the Change Request.

Change Schedules includes several base styles to ensure every schedule has span styles to begin with. By default, Blackout Schedules are represented by a gray color, Maintenance schedules are represented by a light blue color and change requests are represented by either red (risk = High), orange (risk = moderate), or green (risk = low).

To define style rules, you must activate Change Management - Change Schedule plugin (com.snc.change_management.soc).

You can define styles in multiple ways, such as from the Default Style Rules, Change Schedule definitions, or from the Span Style window in the Change Schedule timeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
All style rule tables extend the Style Rule Core table [chg_soc_style_rule_core].

Define default style rules

You can define style rules from the Default Style Rules module when you want the style rules to be used by change schedules globally and not for any specific application.

Before you begin

Role required: itil, sn_chg_soc.change_soc_admin, sn_change_role, sn_change_write roles, sn_change_write, or admin

Procedure

1. Navigate to **All** > **Change** > **Schedule** > **Default Style Rules**.
2. On the Style Rule page, click **New**.
3. On the form, fill in the fields.

Style Rule form

Field	Description
Name	Name of the style rule.
Conditions	Conditions which dictate the style rule. For example, risk = High = red.
Active	Check box to determine whether the style rule is active.
Styling	
Advanced	Check box to write script to set the value of label color, label weight, and event color. If you do not select the check box, the **Label color**, **Label weight**, and the **Event color** fields appear.
Label color	Color of the text that is displayed for each record on the timeline that matches the style rule.
Label weight	Thickness of the label such as normal or bold.
Event color	Color of the schedule span displayed for each record on the timeline that matches the style rule.

4. Click **Save**.

Define style rules from Change Schedule Definitions

You can define style rules from change schedule definitions when you want the style rules to be applied to the change schedule related to the change schedule definition.

Before you begin

Role required: itil, sn_chg_soc.change_soc_admin, sn_change_role, sn_change_write roles, sn_change_write, or admin

Procedure

1. Navigate to **All** > **Change** > **Schedules** > **Change Schedule Definitions**.
2. Open the definition for which you want to define or edit a style rule.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click the Style Rules related list and click **New**.
4. On the form, fill in the fields.

Style Rule form

Field	Description
Name	Name for the style rule.
Conditions	Conditions which dictate the style rule. For example, risk = High = red.
Active	Check box to determine whether the style rule is active.
Styling	
Advanced	Check box to write a script to set the value of label color, label weight and event color. If you do not select the check box, the **Label color**, **Label weight**, and the **Event color** fields appear.
Label color	Color of the text that is displayed for each record on the timeline that matches the style rule.
Label weight	Thickness of the label such as normal or bold.
Event color	Color of the schedule span displayed for each record on the timeline that matches the style rule.

5. Click **Save**.

Note:
Style rules that you create from a change schedule definition take precedence over the style rules that exist in the base style rule table [chg_soc_style_rule].

Define style rules from Change Schedules View

You can create style rules from the change schedules view when you want the style rules to be applied to the specific change schedule where it is defined.

Before you begin

Role required: sn_chg_soc.change_soc_admin, sn_change_role, sn_change_write, or admin

Procedure

1. Navigate to **All** > **Change** > **Schedule** > **Change Schedules**.
2. Click a tile to view the Change Schedule page.
3. Click the style icon ( ).
4. Do any one of the following actions.
5. Click **Save**.

Configure ability to copy a change request

You can configure the ability to copy a change request record and its details using system properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
You can configure the following functionality.

- Disable the ability to copy a change request.
- Disable the ability to copy attachments.
- Determine the components of the source change request that are copied.

Procedure
1. Navigate to **All** > **Change** > **Administration** > **Change Properties**.
   Some properties are found by entering `sys_properties.list` in the application navigator, as noted.
2. Set the following properties as desired.

Option	Description
Disable the ability to copy a change request	Set **Enable Copy Change feature** (*com.snc.change_request.enable_copy*) to `false`.
Disable the ability to copy an attachment	Set **Copy attachments from originating change** (*com.snc.change_request.attach.enable_copy*) to `false`.
Disable the ability to copy the attachments from the change task	This system property is located in the [sys_properties] table. Set the **Enable copying of attachments from the originating change's related change tasks** (*com.snc.change_request.rl.change_task.atta* system property to `false`. **Note:** If the ability to copy attachments is enabled, the attachment appears on the copy of the change request only after it is saved.
Configure attributes to be copied	Edit the list of values in **List of attributes (comma-separated) that will be copied from the originating change** (*com.snc.change_request.copy.attributes*) to remove or add more attributes. For example, to prevent the **Assigned to** attribute from being copied, remove the `assigned_to` value from the list of attributes in the property text box.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Configure related lists to be copied	This system property is located in the [sys_properties] table. The following related lists are copied by default: ○ **Affected CIs** ○ **Impacted Services/CIs** ○ **Change Tasks** Edit the list of values in **Related lists (comma-separated) that will be copied from the originating change** (*com.snc.change_request.copy.related_lists*). For example, if you do not want to copy the **Change Tasks** related list, remove the `change_task` value from the list of related lists in the property text box. **Note:** You can configure this property to control the copy functionality of the **Affected CIs**, **Impacted Services/CIs**, and **Change Tasks** related lists. You cannot add any other related list to this property.
Configure attributes of the default related lists to be copied	These system properties are located in the [sys_properties] table. Navigate to the appropriate system property for one of the default related lists to configure the attributes to copy. **System properties for related list attributes** Related list: Change Tasks — System property: *com.snc.change_request.copy.rl.ch* Related list: Affected CIs — System property: *com.snc.change_request.copy.rl.ta* Related list: Impacted Services/CIs — System property: *com.snc.change_request.copy.rl.ta*

3. Complete the following steps to further customize the ability to copy a change request by modifying a script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **System Definition** > **Script Includes**.

b. Modify the `ChangeUtils` script include.

Example
For example, the ability to copy a change request is not available by default for standard changes. However, you can provide your own implementation of the `isCopyRulesValid` function in the `ChangeUtils` script include to override the default.

Related topics

Copy a change request

Create a change request template

You can create a template that can be used to create change requests with pre-defined supporting tasks. Templates simplify the process of submitting new records by populating fields automatically.

Before you begin

Role required: admin

The administrator must configure the form layout to add these fields: **Next Related Template**, **Next Related Child Template**, **Link element**

About this task

There are two change request template configuration items.

- **Change_request**: This object does not have a link element, because it is at root level.
- **Change_task**: This task object is one level below root level, so it uses the parent table as a link element.

Procedure

1. Navigate to **All** > **System Definition** > **Templates**.
2. Click **New**.
3. Complete the form as described in Create a template using the Template form.
4. Complete the remaining fields, as appropriate.

Field	Description
Next Related Template	A template at the same hierarchical level as the current template (sibling). Use this field on a child template to specify an extra child template under the same parent template. For example, you can use child templates to create multiple change tasks for a change request template and specify sibling child templates. This field is not supported on top-level templates.
Next Related Child Template	A template at the hierarchical level below the current template (child). You can assign a child template to a child template.
Link element	Specifies a link to a record created from a child template to the record created from the parent template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The template script chooses the first valid reference field that can link to the parent record when this field is left blank.

5. Click **Submit**.

Create a change request assignment rule

You can define assignment rules to automate the process of assigning change requests to the appropriate group or individual.

Before you begin

Role required: admin

About this task

You can define an assignment rule either for the change request or for the change tasks that are generated for change requests. In the following example, you create an assignment rule to assign change requests for configuration items in the database class to the **Database** group.

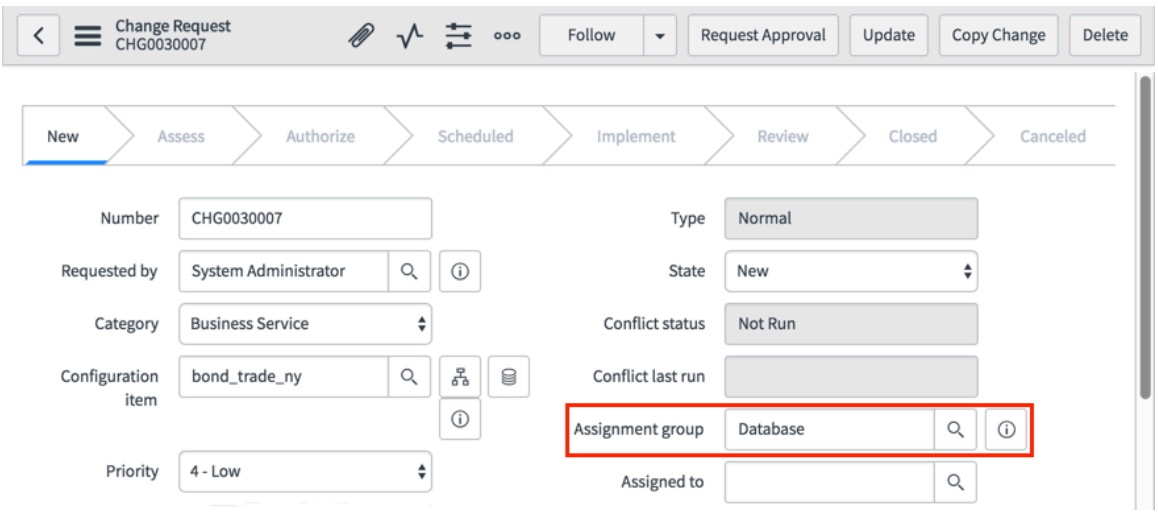
Procedure

1. Navigate to **All** > **System Policy** > **Assignment**, and then click **New**.
2. Enter the name: `Database Change`.
3. In the Applies To form section, select the table **Change Request [change_request]** and add a condition **[Configuration Item.Class] [is] [Database]**.
4. In the Assign To section, select the group **Database**.
5. Click **Submit**.

What to do next

To test the assignment rule, navigate to **Change** > **Create New** and enter a Normal change. Complete the form, selecting **bond_trade_ny**, or another CI in the database class, in the **Configuration Item** field.

Save the change and see that it was automatically assigned to the **Database** group.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add a new change request type

You can add a new change type to your change process. There are several processes involved with adding a change type. These processes include managing script includes and workflows.

Before you begin

Role required: admin

About this task

In addition to the three types of change available by default, you can add new change types based on your organization requirements. For example, you can create a change type **Expedited** for changes that you require to be processed immediately.

Procedure

1. Complete the following steps to add a new choice to the **Type** field.

a. Open an existing change request.

b. Right-click the **Type** field and select **Show Choice List**.

c. Click **New** and fill in the following fields.

Field Name	Description
Table	Select the **Change Request** table.
Label	Enter a value for the new change type. For example, `Expedited`.
Value	Enter a value for the new change type. For example, `expedited`.
Sequence	Enter a sequence for the change type. For example, `4`.

d. Submit the form.

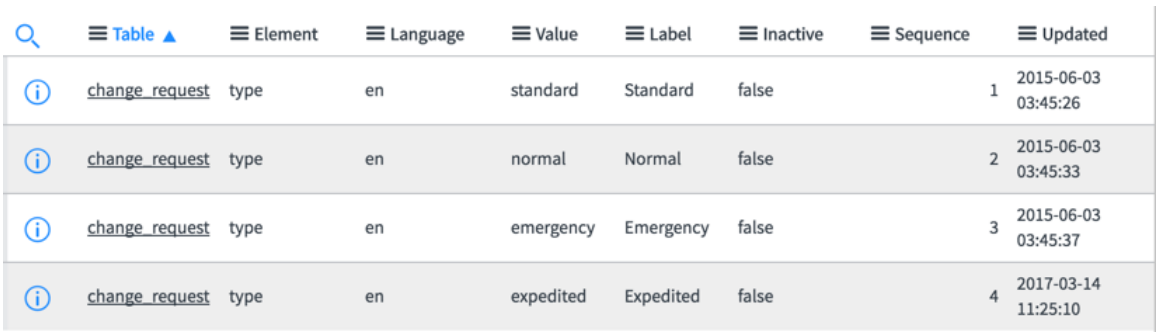


Table ▲	Element	Language	Value	Label	Inactive	Sequence	Updated
change_request	type	en	standard	Standard	false	1	2015-06-03 03:45:26
change_request	type	en	normal	Normal	false	2	2015-06-03 03:45:33
change_request	type	en	emergency	Emergency	false	3	2015-06-03 03:45:37
change_request	type	en	expedited	Expedited	false	4	2017-03-14 11:25:10

2. Complete the following steps to add the new change type to the change request interceptor.

a. Navigate to **System Definition** > **Interceptors**.

b. Open the **Change Request** interceptor.

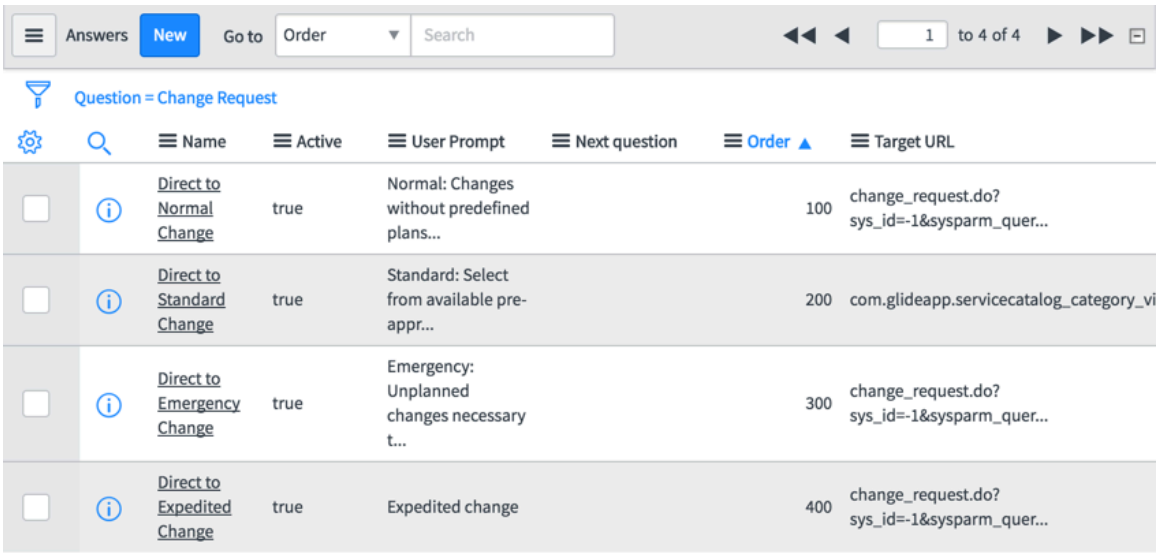
c. Click **New** in the **Answers** related list.

d. Complete the form, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Question	Change Request
Name	Enter a name for the new change type. For example, `Direct to Expedited Change`.
User Prompt	Enter a description that is displayed to the end user when they click **Create New** under **Change**.
Target URL	Set the appropriate target URL. For example, `change_request.do?sys_id=-1&sysparm_query=type=expedited`.
Order	Set the appropriate order level for the change type. For example, 400.

e. Submit the form.



3. Complete the following steps to create the script include for the new change type.

a. Navigate to **System Definition** > **Script Includes**.

b. Search for a change type script include on which to base the workflow for the new change type.
For example, to base it on Emergency change type, search for *`ChangeRequestStateModelSNC_emergency`* and open the script include.

c. Copy the script of the *`ChangeRequestStateModelSNC_emergency`* script include from the **Script** field.

d. Navigate to **System Definition** > **Script Includes** and click **New**.

e. Name the new script include to match the value of the new type.
For example, *`ChangeRequestStateModelCust_expedited`*.

f. Paste the copied script in the **Script** field of the new script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Update any references in the pasted script include from *ChangeRequestStateModelSNC_emergency* to *ChangeRequestStateModelCust_expedited*.

h. Click **Submit**.

Note:
An existing script include contains the implementation for all the *moving* and *canMove* functions. The *moving* function is used to pre-populate any fields that are required for the new state. The *canMove* function is used to check for any additional requirements and to validate whether a task can move to the next state.

4. Complete the following steps to create the script include to define state transitions and control the transitioning between states for the new change type.

a. Navigate to **System Definition** > **Script Includes**.

b. Search for change type script include on which to base the transitioning controls for the new change type on.

For example, to base it on Emergency change type, search for *ChangeRequestStateModel_emergency* and open the script include.

c. Update the name of the script include to match the value of the new type.

For example, *ChangeRequestStateModel_expedited*.

d. Update the reference to the base script include for the new change type as created in step 3.

Change the extended Object in line 2 to the base script include name. For example, *ChangeRequestStateModelCust_expedited*, so the reference is similar to the following string.

```
ChangeRequestStateModel_expedited.prototype =
Object.extendsObject(ChangeRequestStateModelCust_expedited,
```

Ensure that the reference of the type is similar to the script include that is created. For example, `type:"ChangeRequestStateModel_expedited"});`. The type is present at the bottom of the script.

e. Click **Insert and Stay** create a copy of the script include *ChangeRequestStateModel_emergency* with the new name *ChangeRequestStateModel_expedited*.

5. Complete the following steps to modify the script include that controls the transition between states using one of the defined models for the new change type.

a. Navigate to **System Definition** > **Script Includes**.

b. Search for and open the *ChangeRequestStateHandler* script include, which controls the transitioning between states using one of the defined models.

c. Create a property to reference the new change request type value.
For example, *EXPEDITED:"expedited"*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Override the base method `_resetModel` to be able to include the new model.

For example, if the change request type is `expedited`, then the new state model `ChangeRequestStateModel_expedited` is included. You must include the string `EXPEDITED:"expedited"` after `initialize: function(changeRequestGr) {` as shown in the screen.

```
13  ChangeRequestStateHandler.prototype = Object.extendsObject(ChangeRequestStateHandlerSNC, {
14      initialize: function(changeRequestGr) {
15          ChangeRequestStateHandlerSNC.prototype.initialize.call(this, changeRequestGr);
16      },
17      EXPEDITED:"expedited",
18      type: "ChangeRequestStateHandler"
19  });
```

e. Save the script include.

6. Complete the following steps to create a workflow for the new change request type.

a. Navigate to **Workflow** > **Workflow Editor**.

b. Open an existing change request workflow.
For example, **Change Request – Emergency**.

c. Select **Copy** from the **Actions** menu to copy the workflow and name the new workflow.
For example, `Change Request - Expedited`.

d. Select **Properties** from the **Actions** menu to update the condition under which the new workflow executes.
For example, **[Type] [is] [Expedited]** in the condition.

e. Open the matching change tasks workflow that is called by the main workflow.
For example, **Change Request - Emergency change tasks**.

f. Select **Copy** from the **Actions** menu to copy the workflow and name the new workflow.
For example, `Change Request - Expedited change tasks`.

g. Select **Publish** from the **Actions** menu to publish the new change tasks workflow and make it available for use.

h. Go back to the first workflow you created and update the Workflow activity to reference the new change tasks workflow.
For example, **Change Request - Expedited change tasks**.

i. Select **Publish** from the **Actions** menu to publish the new workflow and make it available for use.

Change types

Add a state to the state model

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Extend or disable multiple CI association

The ability to associate multiple CIs to a task can be extended to other types of tasks. You can also disable multiple CI association from the related lists on change request records.

Before you begin

Role required: admin

Procedure

1. In the navigation filter, enter `sys_properties.list` to open the System Property [sys_properties] table.
2. Open the **List of all the task types where user wants to associate CIs using a List** (*com.snc.task.associate_ci*) system property.
   The value of this property is set to change_request, incident by default to enable association of multiple CIs to change requests.
3. To enable multiple CI association to other types of task, add the required table as a value.
   For example, to enable multiple CI association for problem records, add `problem` as a value, separated by a comma.
4. Click **Update** to save and update the property.
5. **Optional:** Complete the following steps to disable multiple CI association for the Change Request form.

   a. Remove the **change_request** value from the **List of all the task types where user wants to associate CIs using a List** (*com.snc.task.associate_ci*) system property.

   b. Navigate to **System UI** > **List control**.

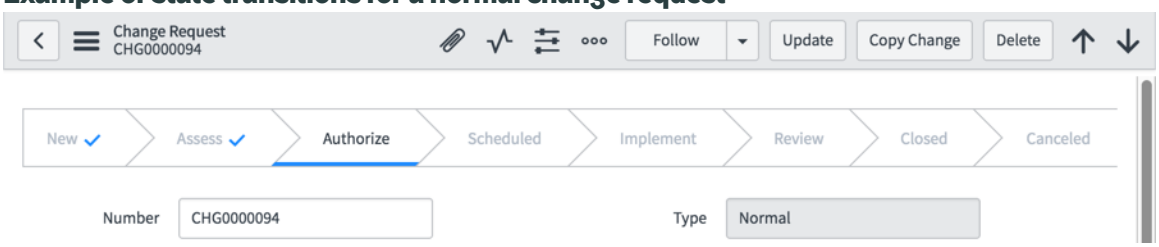
   c. Perform one or both of the following tasks to disable multiple CI association for the related lists.

Associated CIs	Open the entry with the **task_ci.task** related list and clear the **Omit edit** check box.
Impacted Services/CIs	Open the entry with the **task_cmdb_ci_service.task** related list and clear the **Omit edit** check box.

State model and transitions

Change Management offers a state model to move and track change requests through several states.

Example of state transitions for a normal change request



The following table provides a list of all the states that a change request can progress through. Email notifications can be sent to the user who requested the change when it progresses to the following states: **Scheduled**, **Implement**, **Review**, and **Canceled**.

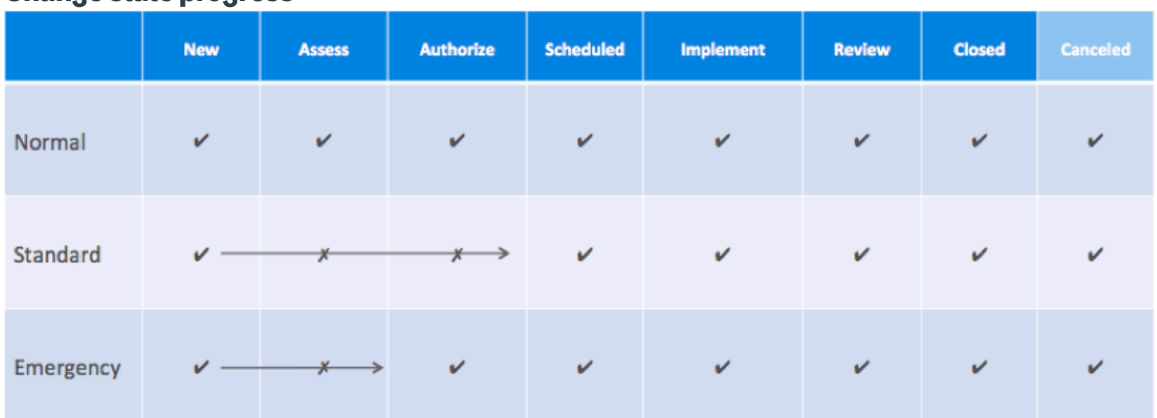
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change states

State	Description	State value
New	Change request is not yet submitted for review and authorization. A change requester can save a change request as many times as necessary while building out the details of the change prior to submission.	-5
Assess	Peer review and technical approval of the change details are performed during this state.	-4
Authorize	Change Management and the CAB schedule the change and provide final authorization to proceed.	-3
Scheduled	The change is fully scheduled and authorized, and is waiting for the planned start date. An email notification is sent to the user who requested the change.	-2
Implement	The planned start date has approached and the actual work to implement the change is being conducted. An email notification is sent to the user, who requested the change.	-1
Review	The work has been completed. The change requester determines whether the change was successful. A post-implementation review can be conducted during this state. An email notification is sent to the user who requested the change. **Note:** You cannot cancel the change request if it is in the Review state.	0
Closed	All review work is complete. The change is closed with no further action required.	3
Canceled	A change can be canceled at any point when it is no longer required. However, a change cannot be canceled from a **Closed** state. An email notification is sent to the user who requested the change.	4

Normal, standard, and emergency changes progress through states in different ways.

Change state progress



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State progress for different changes

- Normal changes progress through all states.
- Standard changes are considered to be pre-authorized, so they bypass the **Assess** and **Authorize** states that trigger approval records. Approving these changes progress the change to the next appropriate state. Rejecting these changes send them back to **New** state.
- Emergency changes are similar to standard changes, except that they must be authorized.

Revert a change request to a New change

Change Management allows the Emergency and Normal change types to be reverted to the new state which is the first approval state using the **Revert to New** action from the **Context** Menu. This action is performed if the approval was requested and the submitter recognizes that not all configuration item in the scope of the change is included before submitting for approval.

- To modify the Normal change request to the New state, modify the state of a change request from **Assess** state to **New** state by clicking **Revert to New** from the Context menu.
- To modify the Emergency change request to the New state, modify the state of a change request from **Authorized** state to **New** state by clicking **Revert to New** from the Context menu.

> **Note:**
> When you revert to **New** from the **Assess** state or the **Authorized** state, the workflow is restarted and all pending approvals are cancelled.

Modify change request type

- A new ACL for change_request.type has been added that allows modification of the **Type** field in change request when the change request is in a **New** state and no approvals have been generated yet for it.
- In case of **Standard** change request, you can modify the type of the change request from Standard to **Normal** or **Emergency**, if the state of a change request is **New**.
- In case of **Normal** or **Emergency** change request, you can modify the type of the change request from **Normal** to **Emergency** or vice versa if the state of a change request is **New**.
- If a **Normal** or **Emergency** change request is rejected, the state of the change request is set to **New**. As the state of the change request is **New**, you can modify the type of the change request again. For example, if your **Emergency** change request is rejected on the grounds that the change request is **Normal**, you can modify the **Type** of the change request to **Normal** and resubmit the change request.

Disabled Cancel change action

The Cancel option for a change request in the Review state is disabled. This restricts cancelling the request when the work is complete and is waiting for review.

Change model attributes

The Change Manager has the option to mandate specific actions when a Change Request is moved to a specific state. Attributes assigned to that state determine what actions can take place.

By default, there are two attributes to manage a change request:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `allow_ci_modification` – Allows to modify the CI. Attributes are only considered if they are included in a model. If the `allow_ci_modification` attribute is not added to a model, it defaults to its initial state.
- `allow_implementation` – Indicates that the change will be implemented. By enabling `allow_implementation`, this feature replaces the implementation states field currently present on the Change model. Both the states listed in the implementation states field and the attribute will be respected.

Add a state to the state model

You can add a new state to the existing state model for different change types based on the requirements of your organization.

Before you begin

Role required: script_include_admin, ui_policy_admin, ui_action_admin, or admin

About this task

The State model plugin is activated by default. For more information about base system states for change requests, see State model and transitions.

Procedure

1. Navigate to **All** > **Change** > **Create New** and complete the following steps to add a choice to the choice list.

   a. Right-click the **State** field and click **Configure dictionary**.

   b. In the **Choices** related list, run a filter for **[Table] [is] [change_request]**.

   c. Click **New** and add the new state with the following information.

      - **Table**: Change Request [change_request]
      - **Label**: name of your new state
      - **Value**: numerical value that is not already assigned to an existing state choice
      - **Sequence**: number corresponding to the location for it to appear in the list of states. If you assign it the same sequence number as another choice, it appears below the other choice.

   d. Click **Submit**.

2. Navigate to **System definition** > **Script includes**.
   Script include records that contain *SNC* in the name are read-only. As you complete the following steps, ensure that you are selecting the correct script include to modify. For example, modify *`ChangeRequestStateHandler`* not *`ChangeRequestStateHandlerSNC`*.

   Note:
   Extended script includes (without *SNC*) include all of the functionality of their SNC counterparts. If you modify a base script include (appended with *SNC*), it is no longer updated during system upgrades.

3. Open the *`ChangeRequestStateHandler`* script to perform the following edits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Update the **statehandler constants** section at the start of this script include to include values for the newly added state. For example:

```
ChangeRequestStateHandler.MY_NEW_STATE = "mynewstate";
```

- Update the **STATE_NAMES** map at the end of the initialize function to include the numeric value for the newly added state. For example:

```
this.STATE_NAMES["-6"] =
 ChangeRequestStateHandler.MY_NEW_STATE;
```

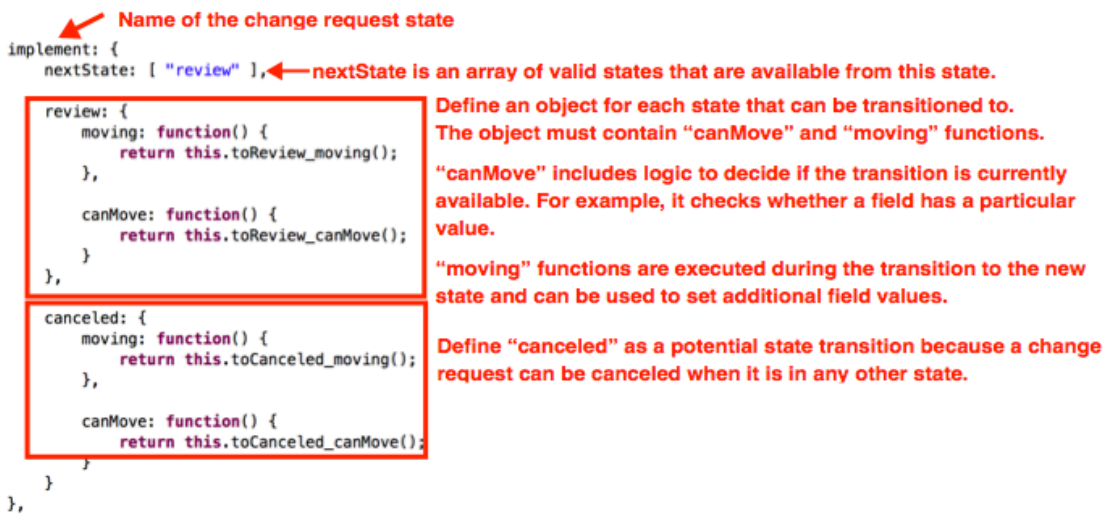
Note:
The **STATE_NAMES** map provides a mapping between the numeric values that are stored in the **State** field on a change request under a memorable name. This mapping enables the memorable name to be used in the state model script includes.

4. Edit the appropriate script include to incorporate the new states into the model for the relevant change request types.
   Each type of change request has a corresponding script include named *ChangeRequestStateModel_<type>* where *<type>* is the value of the change request type. For example, *ChangeRequestStateModel_normal* defines the state model for change requests with a type of normal.

   Each state model script include defines objects that specify the following information.

   - Which states are available.
   - The next state or states for each available state.
   - Functions for each state transition to decide whether that transition is available (`canMove`) along with a function to be executed as part of moving to that state (`moving`).

   The following example is from the *ChangeRequestStateModel_normal* script include.



5. Create a UI action to provide a button to progress the change request to the new state.

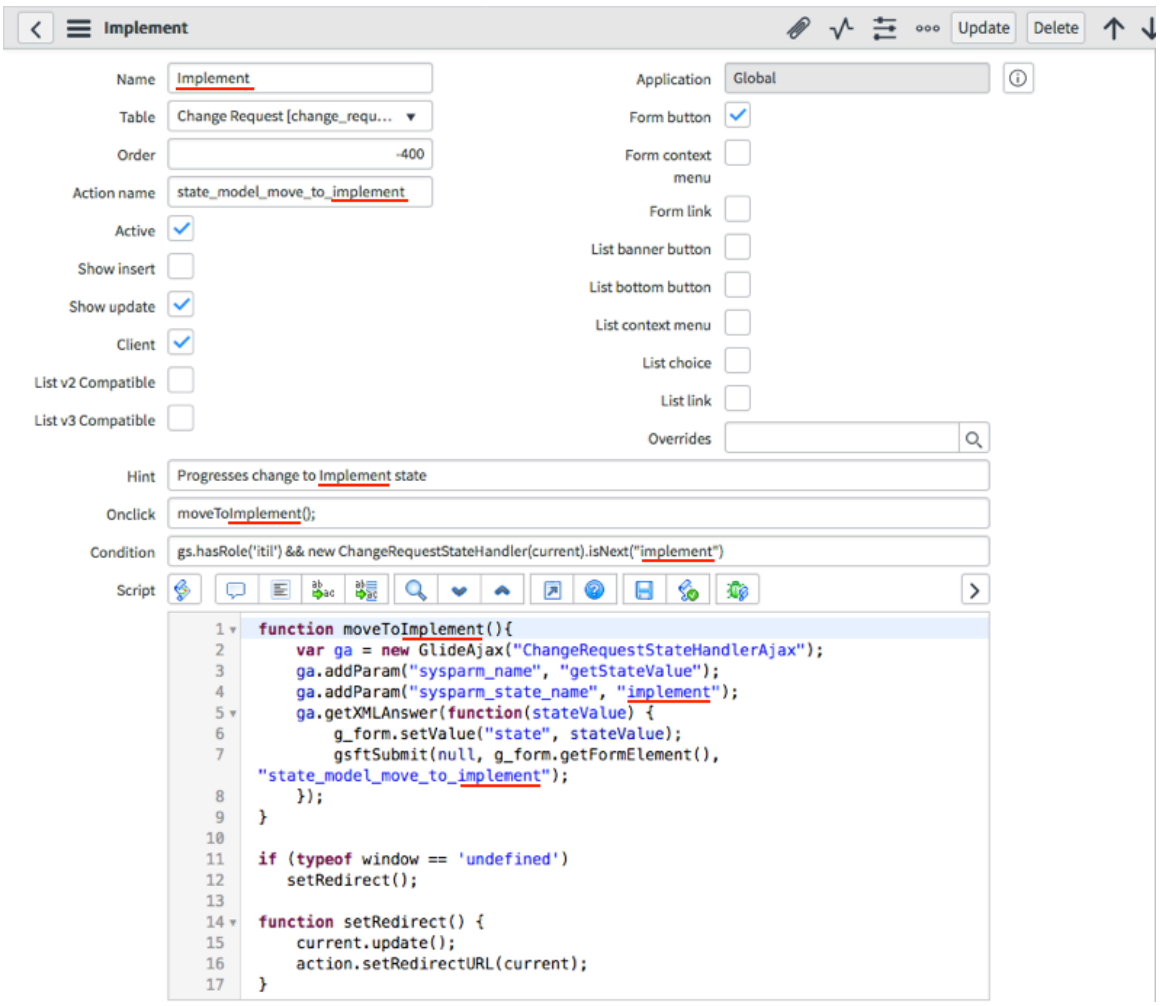
   a. Use **Insert and Stay** to make a copy of one of the default UI actions, such as **implement**.

   b. Update the following fields on the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field name	Update
Name	Update to match the name of the new state.
Action name	Replace the state at the end of the name with the new state.
Hint	Update the text to refer to the new state.
Onclick	Rename the function to match the new state.
Condition	Update the call to the `isNext` function with the new state.
Script	▪ Update the function name to match the one specified in the **Onclick** field. ▪ Update the line that starts with `ga.addParam("sysparm_state_name",...` to enter the name of the new state as the second parameter of the `addParam` function. ▪ Update the line starts with `gsftSubmit` and modify the third parameter of this function call to match the value entered in the **Action name** field.

The following example uses the **Implement** UI action to show the values to update.



The *ChangeRequestStateHandler* script include contains two functions that are used to determine if a UI action is displayed based on the current state of the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `isNext(stateName)`: This function only checks if the *`stateName`* passed as a parameter is available as a next state for the current state of the change request.
- `canMoveTo(stateName)`: This function performs the same check as the *`isNext`* function. However, it also checks the result of calling the appropriate *`canMoveTo`* function for the transition from the current state to the *`stateName`* passed as a parameter. This function is used if there are additional checks in the *`canMove`* functions such as checking that a field contains a particular value.

6. Complete the following steps to update the process flow configuration to incorporate the new change state.
   The process flow is displayed at the top of the Change Request form and is configured in various process flow records.

   a. Navigate to **System UI** > **Process Flow** module and filter for **[Table] [is] [change_request]**.

   b. Open a record and use **Insert and Stay** to make a copy.

   c. Update the following fields on the form.

Field name	Update
Name	Update to match the name of the new state.
Label	Update to match the name of the new state. This value is included in the process flow at the top of the Change Request form.
Order	Update this number so that the new state is in the correct sequence with the existing process flow records for other states.
Condition	Update the filter to match the new state.

   d. Click **Update**.

What to do next

To ensure that the new state works as expected, review the default workflows. Add the new state to the workflow as necessary.

Review default workflows

Any modification to the state model may impact the default workflows for change requests.

Before you begin

Role required: admin

About this task
Each change type has a default workflow. To ensure that any change to the state model has not adversely impacted workflows, you must review each of the default workflows.

Procedure

Review the workflow for each `ChangeRequestStateModel_<type>` script include that has been modified.

Change request default workflows

Change type	Script include name	Workflow
Normal	ChangeRequestStateModel_normal	Change Request - Normal
Standard	ChangeRequestStateModel_standard	Change Request - Standard
Emergency	ChangeRequestStateModel_emergency	Change Request - Emergency

Modifications to the default workflow for each change type depend on where the new state is added in the sequences of states.

Configure state model transitions

You can use script includes or UI policies to configure state models and the criteria for moving change requests from one state to another.

Before you begin
Role required: script_include_admin, ui_policy_admin, or admin

Procedure
1. Complete the following steps to add state change criteria in a script include that enables a state transition.

   a. Navigate to **System Definitions** > **Script Includes**.

   b. Open the script include for the state transition model that you want to edit.

State transition model	Script include
Normal	ChangeRequestStateModel_normal
Standard	ChangeRequestStateModel_standard
Emergency	ChangeRequestStateModel_emergency

   c. Modify the appropriate method *`canMove`* method in the script include.

   Example
   For example, to add a condition for a normal change to transition from the New state to the Authorized state, modify the *`draft.authorized.canMove()`* method in the *`ChangeRequestStateModel_normal`* script include. In the script, the GlideRecord you are acting on can be referenced using the *`this._gr`* variable.

   The *`canMove`* method is part of a structure that defines the transitions available to the change type. The *`canMove`* method is contained in the *`currentState.nextState.canMove()`* structure.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Complete the following steps to use a UI policy to add new criteria for state transitions.

   a. Navigate to **System UI** > **UI Policies**.

   b. Open a default UI policy to edit or click **New** to create a new policy.
   The following are the default UI policies.

UI Policy	Description
Show	CAB fields for normal and emergency changes from the **Authorize** state and onwards.
Mandatory	**Assignment Group** field.
Mandatory	**Close notes** and **Code** fields when in the **Closed** state.

> **Note:**
> In both of the mandatory UI policies, the state of the change request determines the mandatory fields. For **Show - CAB** fields, the type of change is also taken into account because standard changes do not require approval.

   c. Complete and save the UI policy.

Create a Change model

Depending on your requirements, you can create a Change model and configure the states and transitions for a specific use case.

Before you begin

Role required: change_manager

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Change Models**.
2. Click **New**.
3. On the form, fill in the fields.

Change Model form

Field	Description
Name	Unique name for the Change model.
Default Change Model	Option for enabling the Change model as a default model on the Change request form.
Active	Option for enabling that this model is available for selection when creating a Change request.
Color	Color that appears on the left side of the Change model bar on the **Models** tab in the Change landing page.
Available in 'Create New'	Option for enabling that this model is available for selection on the **Models** tab on the Change landing page. Also, the model will

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	be available to select in the **Model** field on the Change request form.
Description	Detailed description of the Change model.
Implementation states	Implementation state for the Change model. For more information on states, see State model and transitions. If you are using Mass CI Update with Change Models ensure the Implementation states field in the model is set to the state in which you want the changes to take effect.
Record Preset	Preset values for all changes using this model.
Advanced Security	Option to enable role-based access controls and user criteria to tailor the Change creation landing page views. When you enable Advanced Security, **Available For**, **Not Available For**, and **Can write** tabs appear next to **Model States** tab.
Read Roles	Option to define the roles to view the Change model.
Write Roles	Option to define the roles to edit the Change model.

4. Click the form context menu icon ( ) and select **Save**.
   The Model States context menu appears. You can select the states for your Change model.
5. Click **New**.
6. On the form, fill in the fields.

Model State form

Field	Description
State	State that you want to include in your model.
Initial State	Option to enable this state as the initial state for your model. This field is automatically selected when you add the first state to your model.

7. To save the state and return to the Change Model form, click **Submit**.
8. To add a transition between the states, click the display/hide hierarchical lists icon ( ) for the model state that you want to apply the transition to.
   The Model State Transitions context menu appears.
9. Click **New**.
10. On the form, fill in the fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model State form

Field	Description
From	State that the Change request is moving from.
To	State that the Change request is moving to.
Automatic Transition	Option for enabling automatic transition to the Change request when the defined conditions are met. Selecting this option also prevents you from manually selecting the **State** field on the Change request form.

11. Click the form context menu icon ( ) and click **Save**.
    The Model State Transition Condition context menu appears.
12. Click **New**.
13. On the form, fill in the fields.

Model State Transition Condition form

Field	Description
Name	Unique name for the condition.
State Transition	State that you're applying the transition condition to. This field is automatically set with the state that you're applying the condition to.
Description	Detailed description of the condition.
Requires	Condition for your transition. You can select a pre-defined condition or select **Transition Condition** to define a condition. To create pre-defined conditions, see Create predefined conditions.
Condition (condition builder)	Condition on the Change request that must be fulfilled to enable the transition.
Condition (script)	Script that must be fulfilled to enable the transition. The script returns a value of **True** when passed.
Active	Option to make the condition active.

14. Click **Submit**.
15. Select **Available For** tab.
16. Select **New** to add the list of users who can access the Change model
17. On the form, fill the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User Criteria record

Field	Description
Name	Unique name for the user criteria record.
Active	Option to make the condition active.
Users	Option to select the users who can access the Change model.
Groups	Option to select the groups who can access the Change model.
Roles	Option to select the role who can access the Change model.
Companies	Option to select the companies who can access the Change model.
Locations	Option to select the location of the company who can access the Change model.
Departments	Option to select the departments who can access the Change model.
Match All	Option to use the Change model if it meets all conditions in the user criteria.
Advanced	Option to create a script to meet the condition for user criteria.

18. Select **Submit**.
19. Manage the users to access the change model by providing the user access in **Not Available For**, **Available For**, and **Can Write** tabs:
    - **Available For** – Provides the access for the change model
    - **Not Available For** – Doesn't provide the access for the change model
    - **Can Write** – Provides the editable access to the change model

    For more information on user access, refer Create a user criteria record for Change Management.
20. Select **Submit**.

Create predefined transition condition types

Create predefined transition conditions to reuse the conditions for your Change models.

Before you begin

Role required: change_manager

Procedure

1. Navigate to **All** > **Application** > **Module** > **Change Model Condition Types**.
   A list of transition conditions for Change requests appears.
2. Click **New**.
3. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Model State form

Field	Description
Name	Unique name for the condition type. This name is displayed in the **Requires** field on the Model State Transition Condition form.
Description	Detailed description of the condition type.
Condition Type	Type of condition that is either **condition** or **script**.
Table name	Table name that the condition is based on.
Condition (Condition builder)	Conditions that must be fulfilled for processing the transition.
Condition (Script)	Script that must be fulfilled for processing the transition. If passed, it returns a value of **true**.

4. Click **Submit**.

Attach a process for Change model states

You can attach a process with defined conditions to the Change model states to enable state transitions.

This process can be done by using one of the following methods:

- ServiceNow® Workflow Studio :See Flow Designer.
- Business Rules: See Business rules.
- Workflow: See Workflow.

Change flows for default Change models are available in Workflow Studio . For more information on default Change flows, see Change flows.

Evaluating a Change model

When your flow is completed, you can evaluate the Change model to process any automated transitions. In Workflow Studio , the **Evaluate Change Model** action is used to evaluate the Change model.

When using Business Rules or Workflow, you can use the script to evaluate the Change model. For example, see the *`Change Registration: Auto State Change`* business rule on the change_request table.

You can also evaluate a Change model for a specific Change request using this event:

Event to evaluate Change model

Event name	Parameter	Description
change_model.evaluate	Change Request sys_id	Process that may affect the state of the Change request but doesn't change the Change request record.

© 2026 ServiceNow, Inc. All rights reserved.

Conflict detection

Conflict detection identifies potential scheduling conflicts for a change request based on the configuration items (CIs), planned start date, and the planned end date in scope for the change. If a scheduling conflict exists, conflict detection also checks any related blackout or maintenance schedules and other active change requests to determine the scheduling conflict.

Conflict detection identifies conflicts for any of the following reasons:

- The CIs are already scheduled at the given date and time.
- A parent of the CI is already scheduled at the given date and time.
- A child of the CI is already scheduled at the given date and time.
- The CI is not in the maintenance window.
- A parent of the CI is not in the maintenance window.
- A child of the CI is not in the maintenance window.
- The CI is in a blackout window.
- A parent of the CI is in a blackout window.
- A child of the CI is in a blackout window.
- The assigned to person is already scheduled at the given date and time.

If conflicts are identified, the **Conflict status** field is updated to reflect a conflict and an error message directs you to the Conflict form section of the Change request record to review conflicts. When you create a change request and provide a CI, planned start date, and planned end date, or update any of these values, conflict detection is executed automatically.

You can choose to show or hide the conflict error message by using the **Enable/Disable Scheduling Conflict Message** menu item from the context menu. As an admin, you can configure the message display setting using the *change.conflict.show_conflict_message* property. For more information on the property, see Conflict analysis properties.

You can manually execute conflict detection. For more information, see Detect conflicts manually and review conflict details.

The Conflicts form section lists specific conflict details including the type of conflict, conflicting schedule, or conflicting change request. If a conflict must be resolved before requesting approval, modify the **Planned start date** and **Planned end date** fields in the Schedule form section.

Conflict Calendar

You can also use the Conflict calendar to visually display any scheduling conflicts identified. To reschedule the change request, click the change request record or drag the change request to another time within the calender.

Configure conflict analysis properties

Configure Change Management conflict analysis properties to detect change conflicts. Use the relevant information to calculate conflicts for change requests and review and modify the change to eliminate conflicts.

Before you begin
Role required: admin

About this task

By default, not all properties are selected in the Change Management Conflict Analysis Properties page. Modify or customize conflict detection capabilities to meet the needs of your organization.

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Conflict Properties**.
2. In the Change Management Conflict Analysis Properties page, enter the roles that have access to the conflict detection feature.
3. Configure the remaining customization properties as required.
4. Click **Save**.

Change Management conflict analysis properties (continued)

Property	Property name	Description
Handle contiguous change request that has overlapping schedules that results in conflicts.	*change.conflict.allow_contiguous_changes*	This property is enabled by default.
Show message when scheduling conflict is detected.	*change.conflict.show_conflict_message*	Shows a message when scheduling conflict is detected. Choose any of the given options to configure the display of the conflict message. • **User Preference**: Displays a UI menu option where the user can toggle to show or hide the conflict message. • **Always**: Always displays the conflict message. • **Never**: The conflict message is not displayed unless the property is changed to either **User Preference** or **Always**. By default, **User Preference** is selected.
Consolidate conflicts so a conflict is only registered for each unique combination of conflict type and schedule or conflicting-change.	change.conflict.consolidated_conflicts	Displays only the conflicts that results from a unique combination of the conflict type and schedule or conflict type and conflicting-change. By default, the property is enabled.

Create blackout and maintenance schedules in Change Management

Use the Blackout and Maintenance windows to schedule a change. Blackout windows specify times during which normal change activity should not be scheduled. Maintenance windows specify times during which change requests should be scheduled. For example, create a blackout schedule for code freezes at the end of the year. blackout-maintenance-schedule

Before you begin

Role required: itil_admin or admin

Ensure that the Change Management - Collision Detector (com.snc.change.collision) plugin is activated.

About this task

Conflict detection uses blackout and maintenance schedules to find potential scheduling conflicts for the configuration items (CIs) associated with a change request. When conflict

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

detection runs, either automatically or by manual request, conflict detection determines if either type of defined schedule applies to the change request. If a potential conflict is identified, a warning message appears and conflicts are listed within the Conflict form section. View conflicts in the Conflict calendar.

Note:
To use the business service as the source for a blackout or maintenance schedule, the business service must be converted to an application service. For instructions, see Convert business services to application services. For information about application services, see Application services.

Procedure

1. Create a blackout or maintenance schedule.

Option	Description
Create a blackout schedule	**a.** Navigate to **Change** > **Schedules** > **Black out Schedules**. **b.** Click **New**.
Create a maintenance schedule	**a.** Navigate to **Change** > **Schedules** > **Mainte nance Schedules**. **b.** Click **New**.

2. On the form, fill in the fields.

Blackout and Maintenance schedule form

Field	Description
Name	Unique name for the schedule.
Description	Short description about the schedule.
Time zone	Time zone for the schedule. Select **Floating** to evaluate planned start and end dates on the Change Request form for the logged-in user.
Source	Source of the blackout or maintenance schedule. The available options are **Service**, **Change Request**, and **CI Class**. **Note:** When you select **Service** or **Change Request** from the Source list, the **Applies to** field does not appear. The **Applies to** field appears if you select **CI Class** as the Source, which in turn enables the selection of a **CI Class**.
Applies to	The class of CI that this schedule applies to. Specifying CI [cmdb_ci] indicates that this schedule is applicable to all CIs in this class and any children of this class. Conflict detection evaluates whether the schedule applies to a given change request, service, or CI, and the condition defined on the schedule.
Condition	Conditions to specify the CIs that the schedule applies to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field does not appear when the **Applies to** field is set to **None**. **Note:** Related fields used in conditions are not evaluated for blackout or maintenance schedules. Condition on the schedule can only apply to one table at a time.

3. Open the form context menu and click **Save**.
   A blackout or maintenance schedule is created and the Schedule Entries, Child Schedules, and Referenced By related lists appear in the change.

   Note:

   The Blackout Schedule [cmn_schedule_blackout] table extends the Condition Schedule [cmn_schedule_condition] table, which in turn extends the Schedule [cmn_schedule] table. The Blackout Schedule table inherits the domain properties from the Schedule table which has the Domain and Domain path columns.

   Because the Blackout schedule table uses the same Child Schedule and Schedule Entry tables as the Schedule table uses, the domain support is identical. The *domain_master* attribute is used to derive the domain from a parent record. For more information, see Domain support for schedules.

4. Create one or more schedule entries by completing the following steps:

   a. In the Schedule Entries related list of the new maintenance schedule, click **New**.

   b. Enter a unique name and define the time during which you want to schedule the maintenance.
   For more information about the schedule entries field, see Schedule entry fields.

Result
A blackout or maintenance schedule is created.

What to do next
Associate the configuration item with the maintenance schedule that is used in the change request.

Related topics

Define a schedule

Schedule entry fields

Parent and child schedules

Assign a maintenance schedule to configuration items

You can review and determine the conflicts in a change schedule by assigning the maintenance schedules to configuration items (CI). After you assign a maintenance schedules to the CI, add the CI to the change request.

Before you begin
Role required: itil

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
When the configuration item with an assigned maintenance schedule is used in the change request, the conflict detection determines the schedule change outside the maintenance window and displays a conflict error message.

Procedure
1. Navigate to **All** > **Configuration** > **Application Servers**.
2. From the list of servers, select the server that you want to add the maintenance schedule to.

   Note:
   If you don't see the **Maintenance schedule** field on the record, click the personalize list icon ( ) and modify the Personalize List settings to add this field.

3. Double-click the **Maintenance schedule** field and use the search icon to select a schedule and assign it to the server.

Result
The selected maintenance schedule is assigned to the server.

Configure a change request to monitor outside maintenance schedule conflicts

When a change request is configured to display the conflicts that are outside the maintenance schedule, conflict detection indicates whether the planned start and end dates occur outside the maintenance window or not. By reviewing the conflicts that are detected, you can modify the change schedule.

Before you begin
Role required: personalize_ui or admin

About this task
The Outside maintenance schedule check box is informational and the instance sets this value and disregards any changes that you make to this check box. The check box is selected by default if either of the following actions occur.

- The planned start and end dates in the change request with an associated configuration item (CI) are compared to the maintenance schedule and are determined to be outside the schedule.
- Affected CIs associated with the change request are checked against their assigned maintenance schedules, if any.

Note:
Only the maintenance window for the primary CI or affected CIs is checked; the upstream and downstream items are not checked.

Procedure
1. Navigate to **All** > **Change** > **Open** and select an existing change request.
2. If the **Outside maintenance schedule** field does not appear, add the field to the form.
   a. Click the context menu icon and then click **Additional actions** > **Configure** > **Form Layout**.
   b. Move **Outside maintenance schedule** to the Selected list.
   c. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

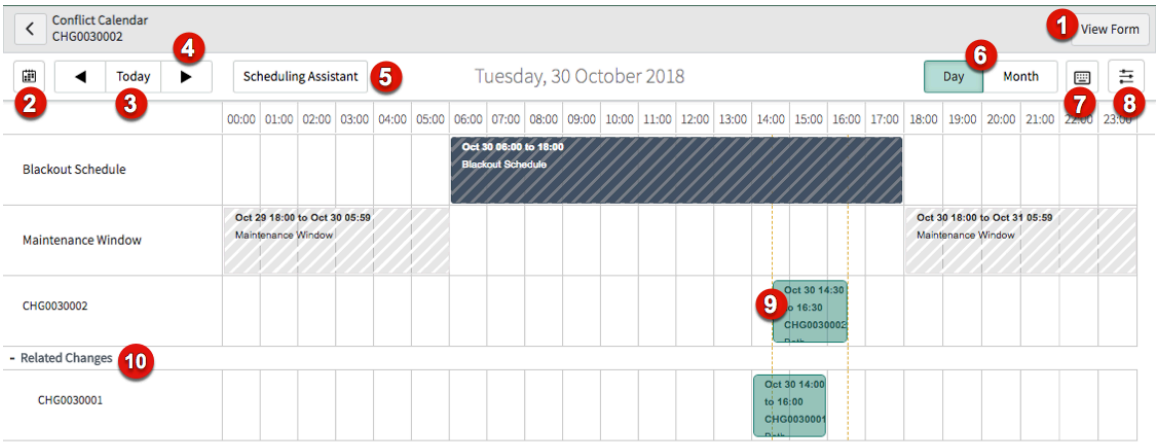
Result

When you save a change request that is outside the maintenance schedule, a warning appears for each item (primary or affected). This warning also displays the planned dates that fall outside the maintenance window.

Conflict calendar

The conflict calendar graphically represents the potential scheduling conflicts for a change request. Conflicts are identified as active change requests, blackout schedules, and changes scheduled outside maintenance schedules. Use the **Scheduling Assistant** to resolve any schedule conflicts.

Conflict calendar



Sl #	UI Component	Description
1	View Form	Returns you to the Change Request form.
2	Calendar	Enables you to choose a date. When you select a date, you can view the schedule details of that day.
3	Current day or month	Enables you to view the schedule of the current day or month when you click **Today**.
4	Navigating dates	Enables you to navigate to the previous day, the next day, or month, depending on the view type when you click the arrow buttons.
5	Scheduling Assistant	Enables you to choose from the list of available time slots to resolve conflicts. For more information on resolving conflicts, see Manage your change schedules and resolve conflicts.
6	Day or Month view	Enables you to change the calendar view to a day view or month view.
7	Keyboard Shortcuts	Provides you with keyboard shortcuts for quick navigation.
8	Options	Enables you to control the view of the calender, customize settings, or set the configuration filters using the **Settings** tab and the **Configuration** tab. From the configuration filters you can select and display the **Assigned to**, **Assignment group**, **Configuration item**, or **Show all** options in the Related Changes section. This section has the same value of the option selected for the current change.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sl #	UI Component	Description
9	Change request block	Enables you to view the details of the change request.
10	Related Changes	Helps you to detect other scheduled changes that potentially conflict with the change based on a schedule or assignment. For example, if the same person is assigned to two or more changes at the same date and time, you can visually see the conflict and update one of the scheduled changes, as appropriate.

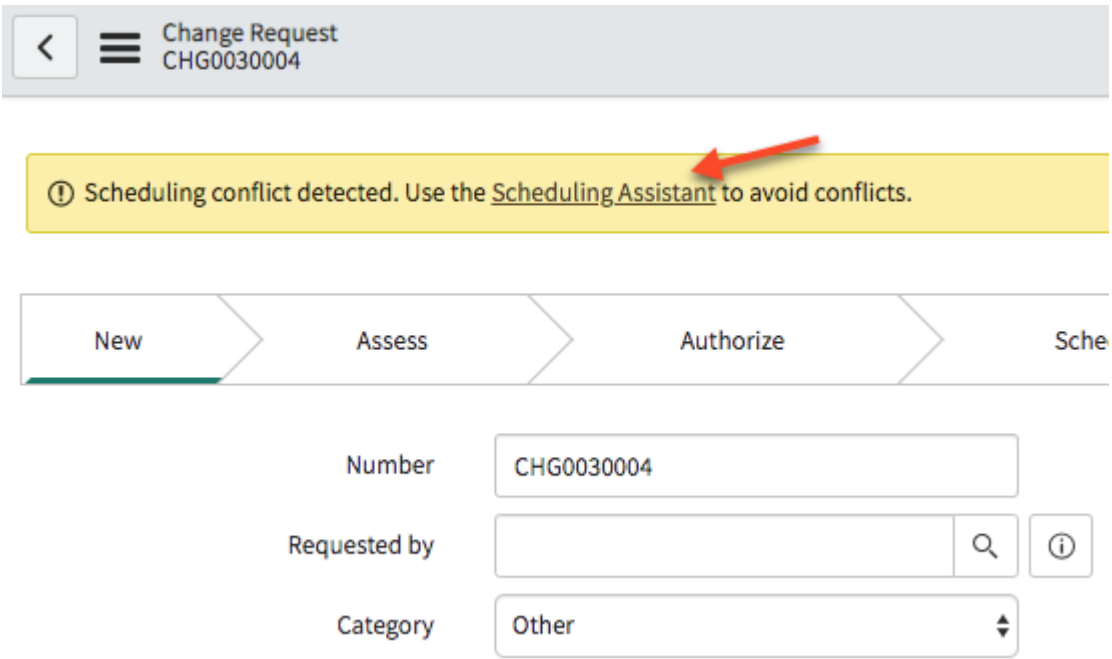
Manage your change schedules and resolve conflicts

Prevent schedule conflicts by using the conflict calendar to manage your change schedule details, customize views, and resolve conflicts.

Before you begin
Role required: admin

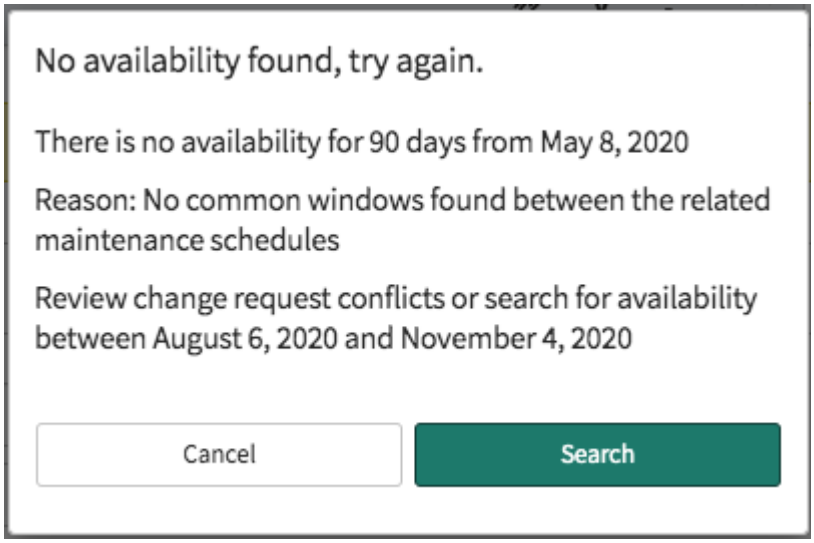
Note:
Users with the admin role must activate the Change Request Calendar (com.snc.change_request_calendar) plugin for the **Conflict Calendar** button to appear.

About this task
When there is a conflict, you can use **Scheduling Assistant** link in the change form to find the next available slot.



When there are no available slots for the next 90 days, then an actionable message is displayed with the reason why the assistant was not able to find a slot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Alternatively, you can resolve conflicts by moving the change request to be within a maintenance window in the conflict calendar. The **Conflict Calendar** button appears in the header of the change form once the **Planned start date**, **Planned end date**, and the **Configuration items** fields are added and the record is saved.

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Open your required change request.
3. Click **Conflict Calendar**.
4. Click **Scheduling Assistant**.
   The scheduling assistant dialog box displays the next available times to choose to resolve the conflict. The number of days factored after the planned start and end dates and the number of suggestions calculated for the next available time are configured under **Conflict properties**. For more information, see Configure conflict analysis properties form.
5. Select the time from the available time slots.
6. Click **Select Available Time**.
   The planned start date and end date are updated with the new time, and the conflict is resolved.
7. To select another day from the calendar, click the calendar icon ( ) and select the date.

Result

The conflicts are reviewed and resolved.

Enable automatic change conflict detection

Automate conflict detection to run at specific intervals or when a change request is updated to immediately review the conflicts when the schedule dates are updated.

Before you begin

Prior to running conflict detection, consider the following scenarios unique to your organization.

CMDB list size and relationship complexities

If you have a large organization with a large CMDB, conflict detection can take longer to complete.

Inactive changes are not evaluated

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Conflict detection does not evaluate inactive changes when determining conflicting changes.

Advanced mode conflict checking is disabled by default

When you upgrade the application, advanced mode conflict checking is disabled by default and affected CIs are not considered during conflict detection. To evaluate all the CIs, set the mode to **Advanced**.

Role required: change_manager or admin

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Conflict Properties**.
2. Select one of the following options.

Option	Description
Run conflict detection automatically after changes to Configuration item, Planned start date, Planned end date, or State when a change request is updated	When selected, runs conflict detection auto matically when a change to one or more of the following fields on the change request record is saved. ○ **Configuration item** ○ **Planned start date** ○ **Planned end date** ○ **State**
Enable the scheduled change conflict check er	When selected, runs the following conflict de tection scheduled jobs at these intervals: *`Change Conflict Detection < 1 Week Away`* is scheduled every day. *`Change Conflict Detection < 1 Month Away`* is scheduled every two days. *`Change Conflict Detection >=1 Month Away`* is scheduled every seven days.

3. Click **Save**.
   You can view the conflicts on the **Conflicts** tab on the change request record.

Detect conflicts manually and review conflict details

Run conflict detection manually for a change request and cancel conflict detection before it completes. Review the conflicts detected either automatically or manually and resolve them by changing the schedules.

Before you begin

Before you can run conflict detection for a change request, the following fields must be completed in the change record.

- **Configuration item**, except in advanced mode. In advanced mode, the **Affected CIs** field is required instead.
- **Planned start date** of the change request.
- **Planned end date** of the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about running conflict detection automatically, see Enable automatic change conflict detection.

Prior to running conflict detection, consider the following scenarios unique to your organization.

CMDB list size and relationship complexities

If you have a large organization with a large CMDB, conflict detection can take longer to complete.

Inactive changes are not evaluated

Conflict detection does not evaluate inactive changes when determining conflicting changes.

Advanced mode conflict checking is disabled by default

When you upgrade the application, advanced mode conflict checking is disabled by default and affected CIs are not considered during conflict detection. To evaluate all the CIs, set the mode to **Advanced**.

Role required: itil or sn_change_write

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. From the list of change requests, open the desired change request.
3. Click the **Conflicts** tab or scroll to the bottom the form to find the **Conflicts** tab.
4. Click **Check Conflicts**.
5. When the conflict detection is completed, click **Close** in the pop-up window.
   Conflicts appear in the Conflicts Detected list on the **Conflicts** tab. The **Conflict status** and **Conflict last run** fields on the change request record are also updated.
6. In the Conflicts Detected list, review the list of conflicts that appear.

Conflicts Detected List columns

Field	Description
Conflicting change	The change that is in conflict with the scheduled change, if any.
Affected CI	The affected CI associated with the change.
Last Checked	The last time the conflicts were checked. The **Last Checked** field is automatically updated.
Related CI	The parent CI or child CI of the current CI, if the CI has caused a conflict.
Schedule	The name of the maintenance window or blackout window that is causing the conflict, if any.
Type	The issue that caused the conflict. ○ **CI Already Scheduled** ○ **Parent CI Already Scheduled** ○ **Child CI Already Scheduled** ○ **Not in Maintenance Window** ○ **Parent Not In Maintenance Window**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Child Not In Maintenance Window** ○ **Blackout**

Result
You can review the conflicts and the affected CIs in the Conflicts Detected list and reschedule the change to resolve the conflicts.

Cancel conflict detection manually

Cancel any conflict detection jobs that are actively running for a change request if you want to make any modifications to the schedules. After modifying the schedules, you can rerun the check conflicts action again to identify potential conflicts.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Open the change request that you want to cancel conflict checking for.
3. Click the **Conflicts** tab.
4. Click **Check Conflicts**.
   The Checking conflicts progress status pop-up window appears.
5. To cancel conflict detection, click **Cancel**.
   The active conflict detection job is canceled and all conflicts displayed in the Conflicts section are cleared. The **Conflict Status** field displays a **Not Run** status.

> **Note:**
> If you set conflict detection to run automatically or on a scheduled basis, the future executions of conflict detection against the same change request record are not canceled.

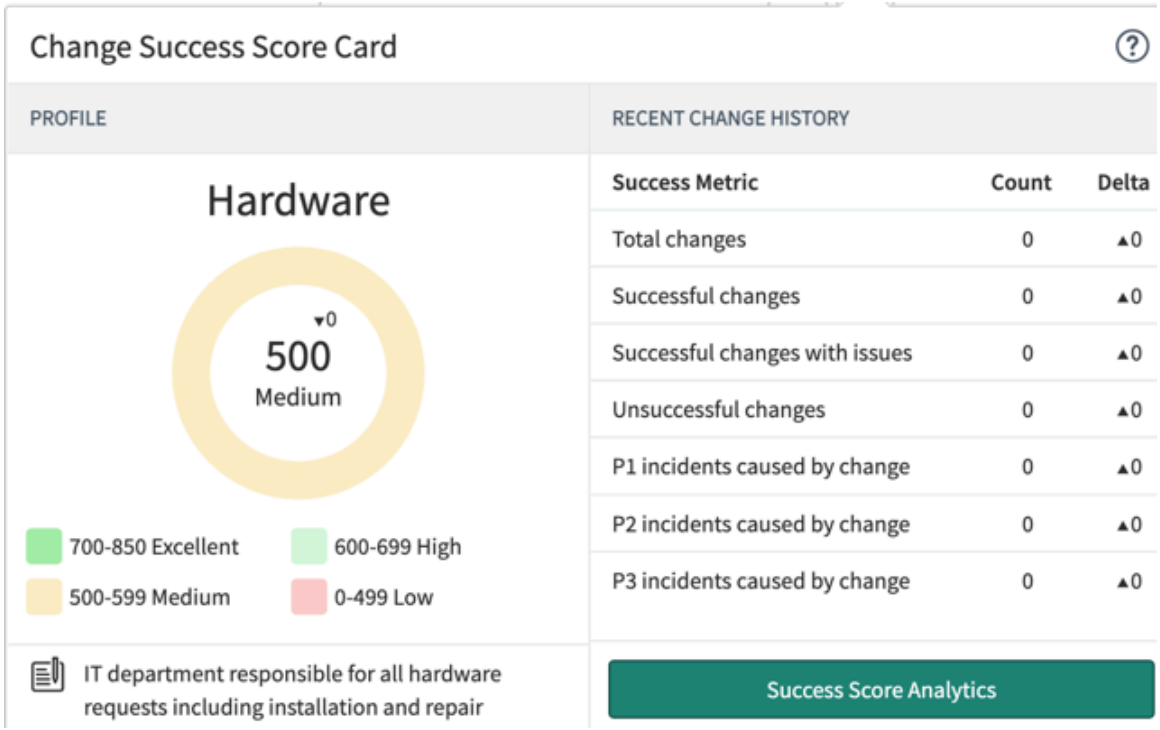
Change success score

Use team historical data for insights into team performance. The score value helps you to determine how likely the team is to complete your change request without issues.

> **Note:**
> The change success score feature is installed after you activate the Change Management - change success score plugin available with the ITSM Professional subscription only. Contact your account manager for more information.

The change success score can help you evaluate a team's success in handling prior change requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



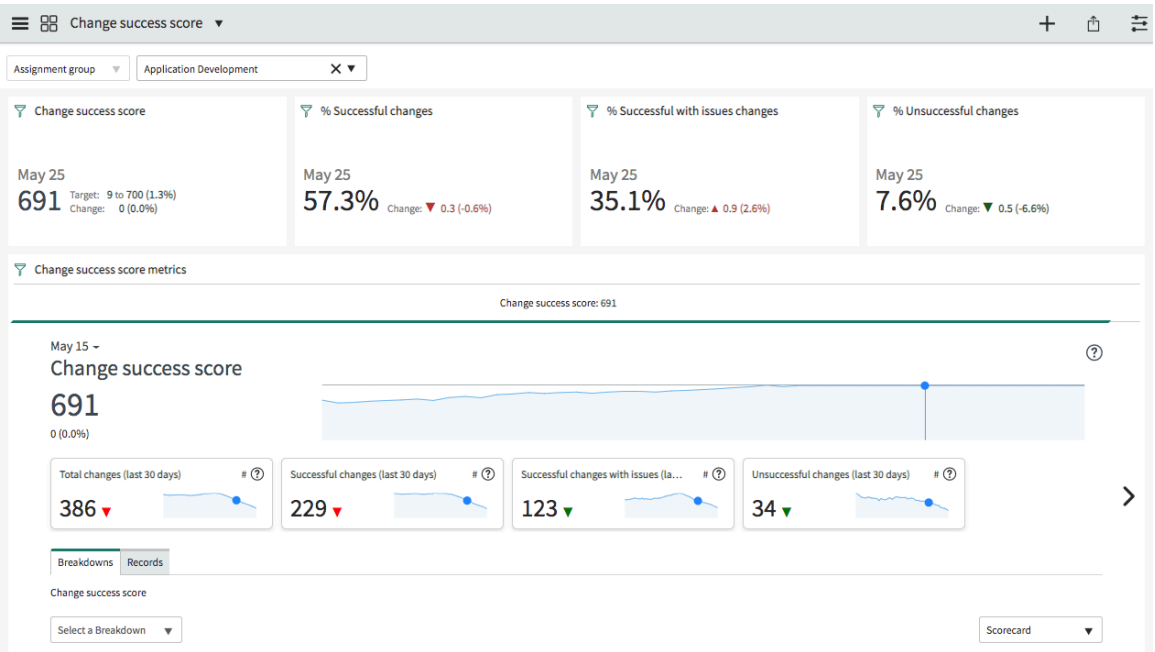
When the Change Management - Change success score plugin is activated, a *`Change success score metrics (Daily)`* performance analytic (PA) job is added. The PA job is a daily job that collects the first set of change success scores until the next job run time that is 02.00 UTC. After the first job run, a **Change Success Score** card icon appears next to the **Assignment group** field on the change request form. On a click of this icon, you can view the score card details of the assignment group.

Change Success Score dashboard

Use the data on this dashboard to see trends in the resolution efficiency of a team over time based on the same parameters used to calculate the overall score. To view the trends of all the assignment groups, clear the selected element.

Navigate to **Change** > **Change Analytics** to access the **Change Success Score**, **Change Type Success**, and **Change Model Success** dashboards.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information on the indicators, see Success score indicators.

Change Type Success dashboard

This dashboard displays trends in the resolution efficiency for change types. To view the trends of all the change types, clear the selected type.

Change Model Success dashboard

This dashboard displays trends in the resolution efficiency for the change model over time based on the same parameters used to calculate the overall score. To view the trends of all the change model, clear the selected model.

Success score indicators

Change Success score uses Performance Analytics indicators for data collection. Indicators define a performance measurement taken at regular intervals of a business service, an activity, or organizational behavior. These performance measurements result in a series of indicator scores over time.

The following are the Change Success Score indicators that are used to collect data daily for the changes completed on the previous day.

Total Changes

The total number of change requests addressed during the time.

Successful changes

The number of successfully resolved change requests.

Unsuccessful changes

The number of change requests that was not resolved.

Successful changes with issues

The number of change requests that was resolved, but had other defects that were not addressed.

P1 incidents caused by change

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The total number of P1 incidents that were reported as caused by one of the changes completed by the team.

P2 incidents caused by change

The total number of P2 incidents that were reported as caused by one of the changes completed by the team.

P3 incidents caused by change

The total number of P3 incidents that were reported as caused by one of the changes completed by the team.

For more information on the PA indicators including how to configure Change Management Performance Analytics indicators, see Performance Analytics indicators

Success score calculation

To calculate the success score, formula indicators are provided. These indicators apply the multiplication operation to the data collected by the automated indicators to arrive at the final score.

You can view the Change success score formula indicators in Performance Analytics under the indicator group *`Change success score - multipliers`*.

Review the following table to understand the default multipliers used in success score calculation.

Default multipliers

Automated indicator	Multiplier applied by formula indicator
Successful changes	3
Successful changes with issues	-2
Unsuccessful changes	-5
P1 incident caused by change	-10
P2 incident caused by change	-5
P3 incident caused by change	-2

Modify score calculation

Modify the multiplier values in the formula indicators to calculate the final success score.

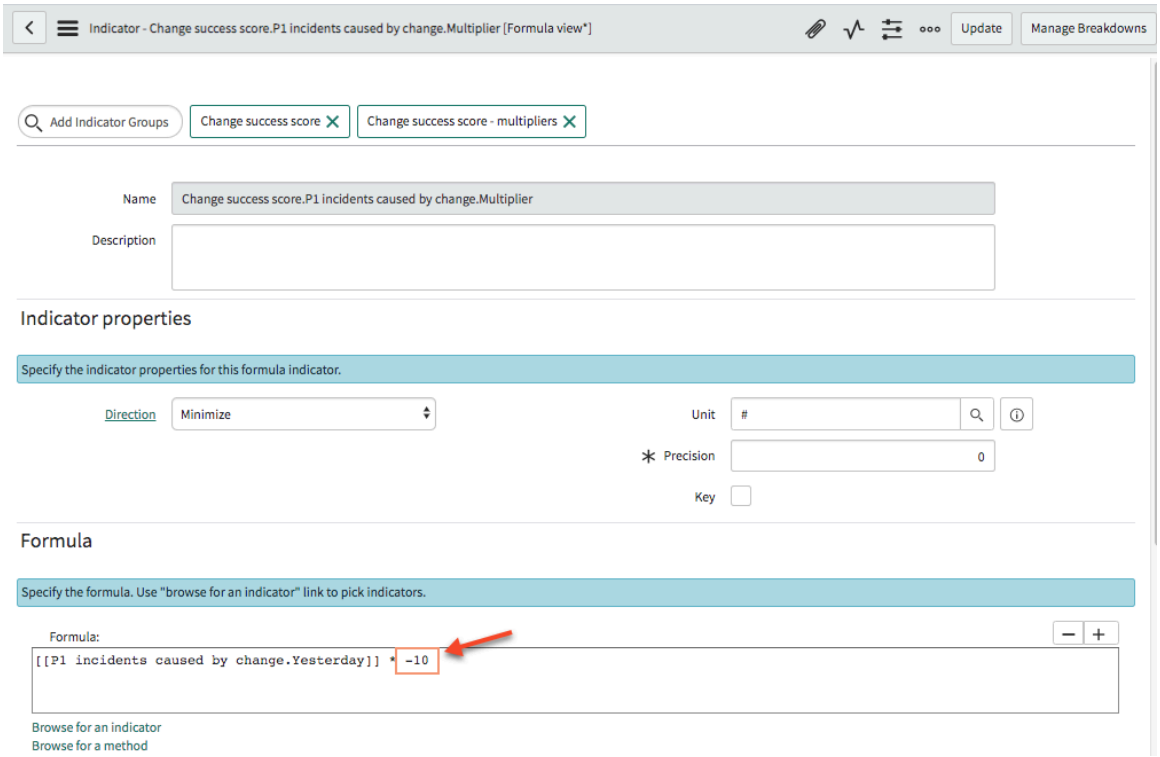
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Performance Analytics** > **Indicator Groups** > **Change success score - multipliers**.
2. Open the indicator that you want to modify.
3. In the formula, change the multiplier value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Click **Update**.

Success score rating

Based on the change success score rating, a color and text is associated that is displayed as part of the Change Success Score card. By default, four success score ratings are available with a specific score range.

Before you begin

Role required: admin

The following default ratings available.

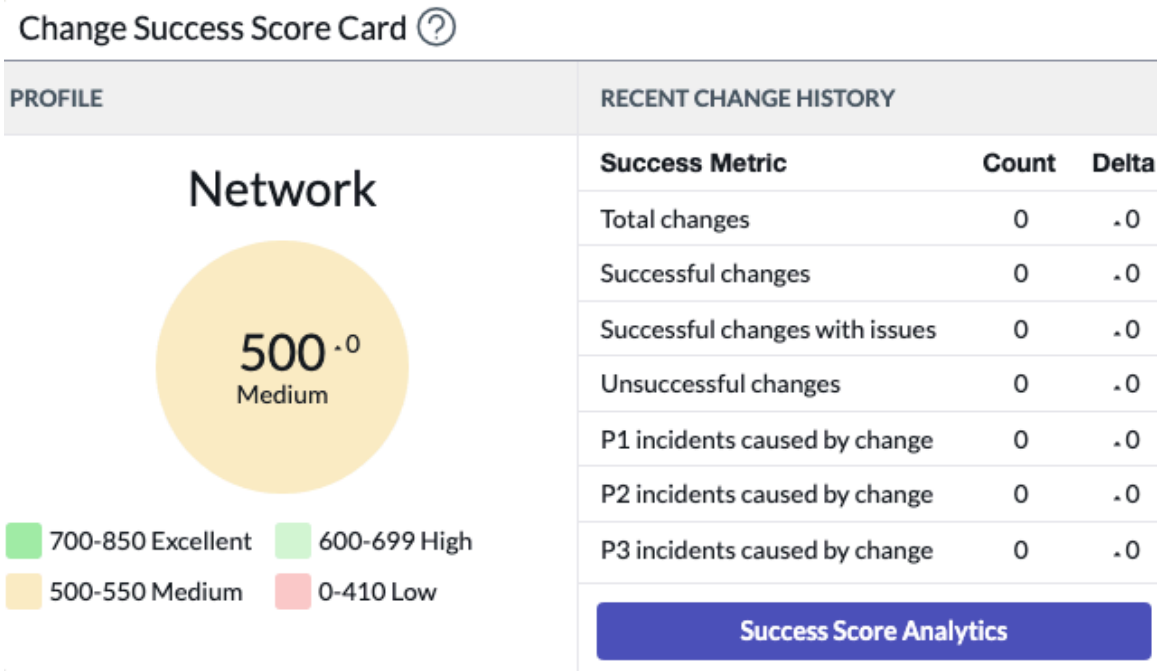
- Low
- Medium
- High
- Excellent

Each rating is associated with a default range and color.

The Change Success Score Ratings table is used to hold the records of the text and a color associated with the success score range.

You can choose to modify the score range, color, introduce, or modify new rating values. The values defined here can be viewed in the **Change Success Score card** on the change Request form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Procedure

1. Navigate to **All** > **Change** > **Administration** > **Change Success Score Ratings**.
2. Perform the given action based on your requirements.
3. Click **Update**.

Predictive Intelligence for Change Management

The Predictive Intelligence for Change Management capability uses machine-learning algorithms to suggest standard templates, identify similar incidents, and enhance risk assessment for the change.

Predictive Intelligence for Change Management delivers the following benefits:

- Enhanced change risk calculation using machine-learning algorithms to assess change risk.
- Uses Predictive Intelligence clustering capability to identify and suggest Standard Change templates to create a change.

Solution definitions for Predictive Intelligence for Change Management

The Solutions definitions for Predictive Intelligence for Change Management capability are available after you activate the following plugins:

- Change Management - Risk Intelligence plugin (com.snc.change_management.ml.risk)
- Change Management - Standard Change Template Intelligence plugin (com.snc.change_management.ml.sctp)

Note:
Predictive intelligent for Change Management plugins can be requested through the Now Support Customer Service system.

For more information, see Change Management plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Solution definitions for Change Management

Solution definition	Solution type	Description
Risk for proposed change	Similarity and Categorization	Provides insight into the potential risk of the change activity and facilitates intelligent approval decisions. The info message puts all the risk related information to easily compare the returned value. This prediction helps in reducing approval friction and time. For example, when risk = low, you can use Change Approval Policies to automatically approve this low risk activity.
Standard change candidates	Clustering	Analyzes and suggests opportunities for Standard Change proposal templates that can be used for automatically creating a change. This solution uses similarity and clustering solution type to identify the common fields in the records and make it a template.

Intelligent solutions configurations

Administrators can configure the Change Management Intelligent solutions properties to use predictive intelligence (PI) capabilities.

By configuring these properties, you enable the Change Management application to:

- Predict the risk of the proposed change.
- Use similarity and clustering to identify and suggest potential standard change templates.

Navigate to **Change** > **Intelligent Solution Configuration** to view and edit the properties.

Risk Intelligence Properties

Risk Intelligence properties

Property	Description
Solution type [chg_ml_prop_risk.model_type]	The type of PI solutions used for risk prediction. • Similarity: Uses machine-learning solution to collect and compare your existing records to new similar records. This solution type uses the following risk calculation method:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk Intelligence properties (continued)

Property	Description
	○ Use count of records: Risk of the group that has highest count is used. ○ Use confidence of records: Risk of the group that has highest total number of confidence is used. If the risk have same count or confidence, then the higher risk is considered. • Classification: Uses machine-learning algorithms to set field values during record creation, such as setting the risk category based on previous data.
Predicted value usage [chg_ml_prop_risk.usage]	Determines how the predictive value must be used. • View risk value • Set risk value
Solution enabled [chg_ml_prop_risk.solution_enabled]	Identifies if the solution is enabled or not.
Threshold [chg_ml_prop_risk.classification_confidence_threshold]	The minimum confidence value for the returned results.

Standard Change Proposal Properties

Standard Change proposal properties

Property	Description
Minimum quality level [chg_ml_prop_sctp.quality]	Minimum cluster quality to use for Standard Change candidate.

Train the Risk Intelligence solution

Create Risk categorization or similarity solution definitions to use the predictive intelligence that helps in accessing change risk.

Before you begin

Ensure that Change Management - Risk Assessment (com.snc.change_management.ml.risk) plugin is activated.

Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Intelligent Solution Configuration** > **Risk Intelligence**.
2. Select the **Solution type**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the **Solution type** is `Similarity`, then you can see the default, **Change Risk Similarity Definition** solution.
- If the **Solution type** is `Classification`, you can see the default, **Change Risk** solution.

3. Customize the default solution.
   For more information, see Create and train a similarity solution and Create and train a classification solution.
4. Click **Update**.

Train the clustering solution for Standard change proposal

Train the Standard change proposal solution definition to use clustering capabilities to identify and suggest Standard Change templates to create a change.

Before you begin

Ensure that Change Management - Standard Change Template Intelligence (com.snc.change_management.ml.sctp) plugin is activated.

Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Intelligent Solution Configuration** > **Standard Change Proposal**.
2. Customize the default solution definition to train the solution.
   By default, the **Std Change Template Candidates** is the solution definition provided. To generate records in the *`std_change_template_candidate`* list, execute the scheduled job Update Standard Change Cluster Candidates. You can also configure the scheduled job to run at specific periods by selecting the required option in the Run field in the **Scheduled Script Execution** page. You can then create standard change templates from the clusters generated.

   By default, the **Std Change Template Candidates** is the solution definition provided. For more information on creating and training the solutions, see Create and train a clustering solution.
3. Click **Update**.

Applying CSDM guidelines to Change Management

Change Management lets you control every aspect of the IT change process from creation to approval. When you have accurate information, you can minimize risks to your business and avoid conflicts with scheduling. The goal of this product view is to help you to understand how Change Management key entities work with the core CSDM framework.

Change Management

Change Management includes the following features:

- Manage changes more quickly by using the Change Advisory Board (CAB) Workbench to schedule, plan, and manage CAB meetings from one interface.
- The Change Management backlog analysis dashboard provides increased visibility into any changes.
- Service Maps let you see the change impacts at-a-glance.
- The change approval policies increase DevOps velocity and remove IT friction.

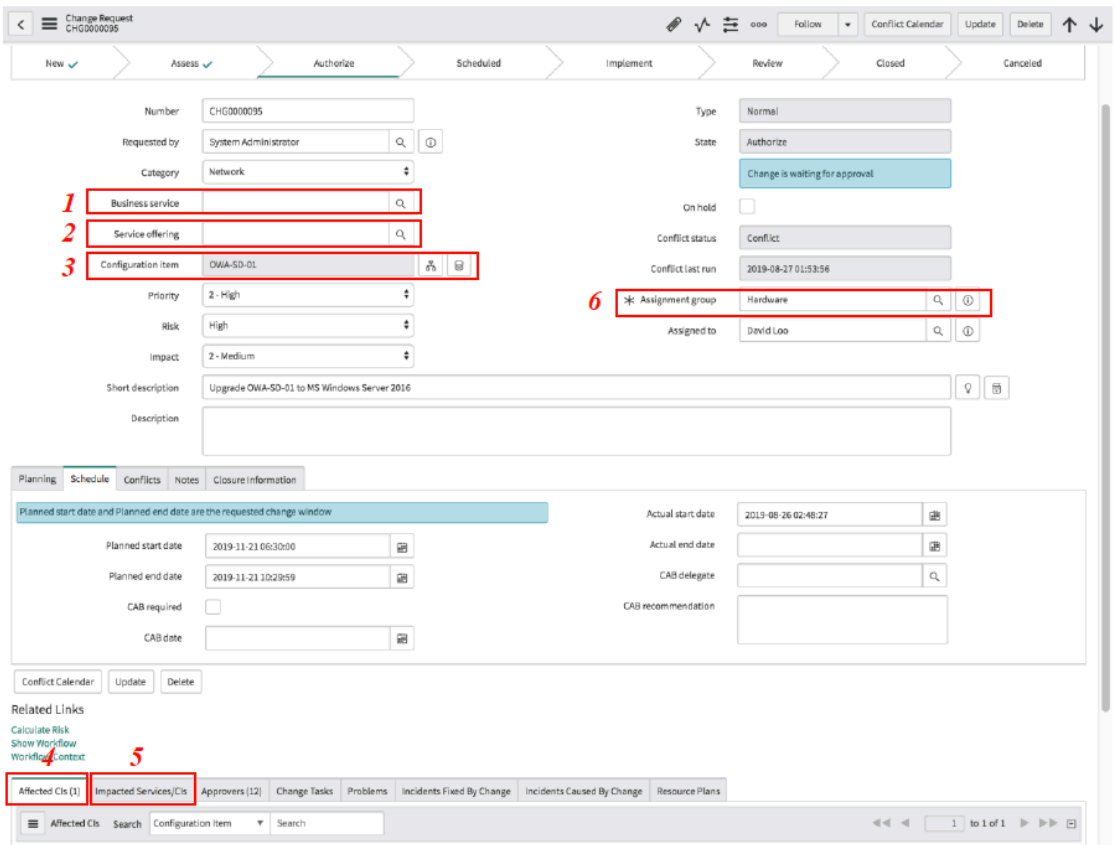
For details on implementing the CSDM framework, see Implementing the CSDM framework in stages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change Request form

The Change Request form references the following attributes and related lists.

1 Service (Business Service)	References the [cmdb_ci_service_business] table. **Note:** Earlier platform releases labeled this attribute **Business Service**.
2 Service Offering	References the [service_offering] table where the offering has a parent service.
3 Configuration Items	References the [cmdb_ci] table.
4 Affected/Causal CIs	Related list [task_ci] table.
5 Impacted Services	Related list [task_cmdb_ci_service] table.
6 Assignment Group	References the Group attribute. **Note:** You can populate the Group attribute by using the Assignment Group for the relevant CI.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information

For additional details on Change Management, see Change Management.

See the video: How Change Management leverages the CSDM

Change Management and CSDM tables

Change Management manages and uses CSDM tables. Several ServiceNow products benefit from and add value to Change Management.

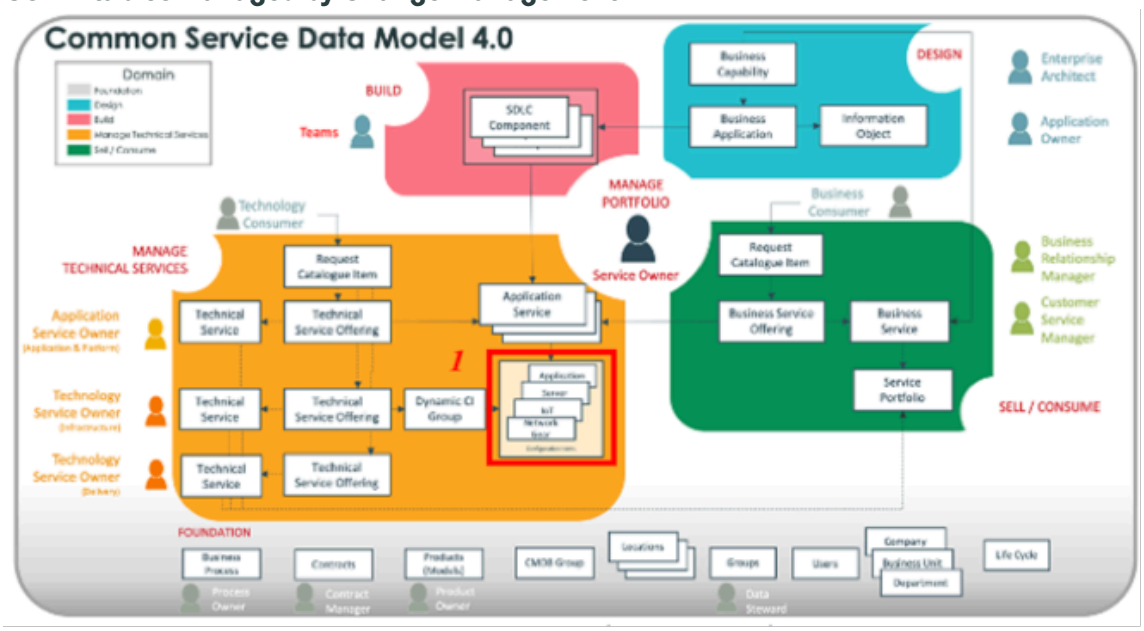
CSDM tables managed by Change Management

Configuration items (CIs) tables [cmdb_ci_*]:

- Application table [cmdb_ci_appl]
- Server table [cmdb_ci_server]
- Virtual machines table [cmdb_ci_vm_instance]
- Load balancer table [cmdb_ci_lb]
- Network gear table [cmdb_ci_netgear]

The following figure highlights the CSDM tables managed by Change Management.

CSDM tables managed by Change Management

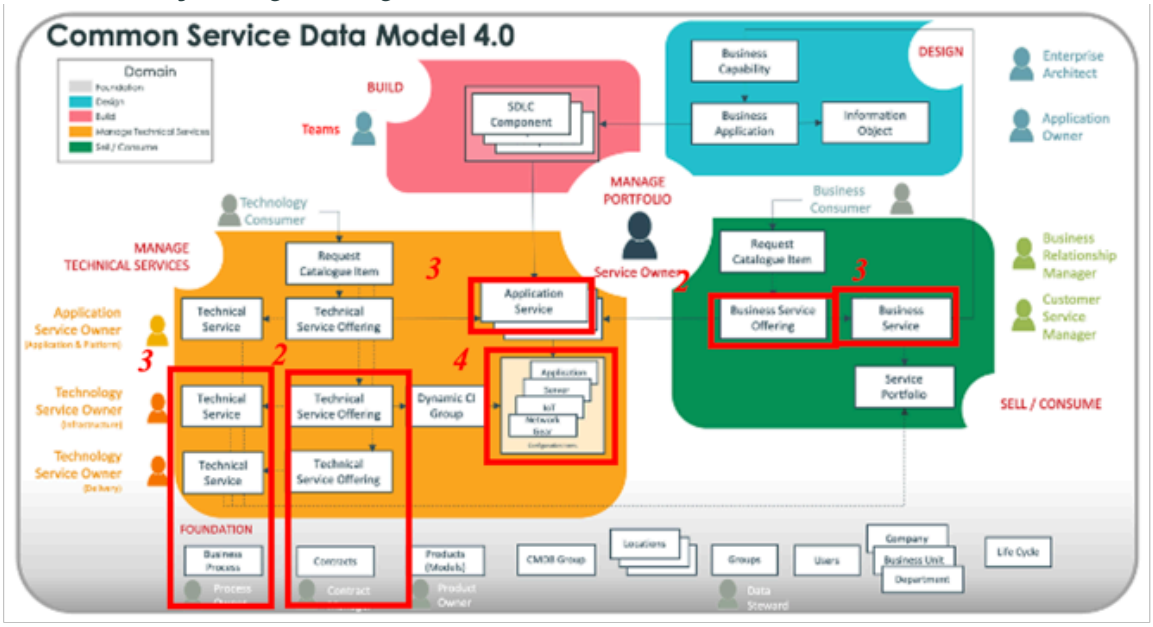


CSDM tables used by Change Management

1. Application Service table [cmdb_ci_service_discovered] or any infrastructure CI.
2. Configuration Item tables [cmdb_ci*]
3. Business Service [cmdb_ci_service_business] table and Technical service [cmdb_ci_service_technical] table: Uses the service classification attribute to identify business services, technical services, and application services as types of services.
4. Service Offering [service_offering] table: Uses the service classification attribute to identify business services, technical services, and application services as types of service offerings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables used by Change Management



Products that add value to Change Management

When you use Change Management with other ServiceNow products, you increase the value you get from Change Management. These other ServiceNow products include:

Discovery

Discovery provides details about the hardware and software CIs you are using.

Service Mapping

Service Mapping provides details about the application instance service in the Mapped Application Service [cmdb_ci_service_discovered] table, relating infrastructure and application [cmdb_ci_appl] CIs.

Products that benefit from Change Management

Service Portfolio Management (Service Portfolio Management)

Services have the context of the business and applications, along with the information and technologies that underpin them.

IT Service Management (ITSM)

Incidents caused by, impacted by, or fixed by Change Management.

Asset Management

Updates assets.

Information Technology Operations Management

Updates CIs using a controlled process.

DevOps

Provides Change Management governance for pipeline tool chains.

For more information

See the video: How Change Management leverages the CSDM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

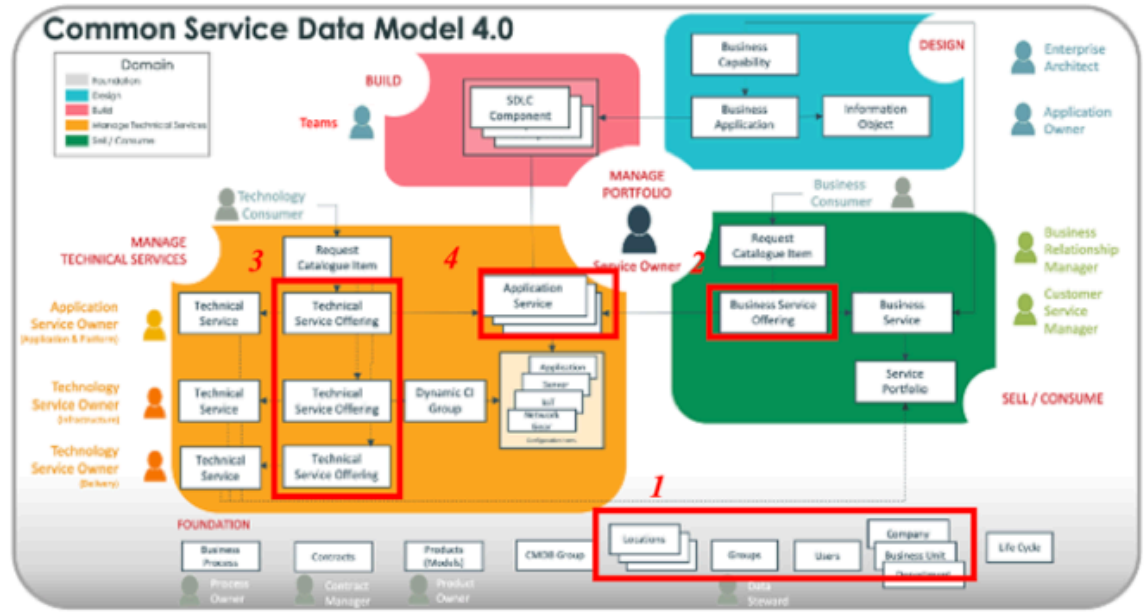
Change Management use case

For ITSM, specifically incident and change, identifying the location of critical data can help reduce mean time to resolve incidents and eliminate outages caused by change.

Key features of the Change Management use case

Applying the CSDM framework provides value to Change Management in the following ways:

- Enables users to understand the impact of a change on services and service offerings.
- Changes are dynamically routed.
- Change Management identifies and notifies all affected services to support the approval decision.



1. Subscription: Related lists on service offerings that identify who has access to the offering and thus may be impacted in an outage. An incident or change can identify impact using the subscribed by tables. The related lists are as follows:
   - Service Subscriptions by Company [service_subscribe_company]
   - Service Subscriptions by Department [service_subscribe_department]
   - Service Subscriptions by Group [service_subscribe_sys_user_grp]
   - Service Subscriptions by Location [service_subscribe_location]
   - Service Subscriptions by User [service_subscribe_sys_user]
2. Business service offering may be used to provide the business approver based on approval_group and business_criticality. A business service may have multiple offerings, each with a different criticality.
3. Technical service offering may be used to provide the technical approver approval_group and technical assignment group on the attribute assignment_group. May be used by change for routing of change and change tasks. May be synchronized onto the CI's that the offerings manage thus reducing the manual overhead of maintaining manual data on thousands/ millions of CI's.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Application service may be used to provide prod and non-prod (DEV, QA, UAT, etc.) environments. Non-prod environments may be filtered out if desired. The legacy **used_for** attribute maps to the **environment** attribute. You should use the **environment** attribute.

   Note:
   Some service offerings may identify the **environment** of the offering as well.

Results of the Change Management use case

The CSDM framework provides context for the changes. The context includes the CIs involved in the change and the services affected.

Use the Change Request form to see the impact of the change. Complete the following steps:

1. Populate the Configuration Item attribute [configuration_item] with the target CI for the change activity. You can then use this CI to identify details for change routing. For example, you can use the CI data, such as “Assignment Group” or "Approval Group," and provide information about the service impact by using dependency relationships.
2. Populate the Impacted Services related list [task_cmdb_ci_service] with the services that are related to the populated CI. These may include services and service offerings.
3. (Optional) Use the Service and Service Offering attributes to identify the provider services responsible for managing the selected CIs.
4. (Optional) Use the Affected CI related list [task_ci] to identify the CIs that may have caused the change. These CIs are in addition to the CIs previously populated. The [task_ci] table can be populated dynamically or manually.

   Note:
   Dynamic population is not part of the base system. To use dynamic population, you need to configure the Change Request form.

For more information

See the video: How Change Management leverages the CSDM

Change Management considerations

Consider these points while implementing the CSDM framework.

- Business applications not referenced in the Change Management use case: Business applications are portfolio objects you can use for designing and planning an Enterprise Architecture. Business application portfolio objects don't contain version, environment, and localization details for deployments using one or more applications.
- Change approval process: It depends on how you implement Change Management. After you populate the CIs on the Change form (if there's a relationship between the CI and the impacted services and service offerings), the Approval group approves the change.
- CI attributes used for routing changes: If you are initiating the change or the change task, use the Assignment Group attribute CI. If you are using build run teams, you could use the Support Group attribute CI for the team assignments.

For more information

See the video: How Change Management leverages the CSDM

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using Change Management

Work on a change request seamlessly and create the approval policies as required to meet your organizational needs.

Create a change request

Create a change request to implement a controlled process for modifying approved and supported configuration items (CIs).

Before you begin

Role required: itil, admin, or sn_change_write

About this task

A change request records the detailed information about the change, such as the reason of the change, the priority, the risk, the type of change, and the change category.

If you use conflict detection, the planned start and end dates and the configuration item (CI) are required.

Procedure

1. Create the change request with one of these options.

Option	Description
From the Change module	You can create all three types of change from the **Change** module. **a.** Navigate to **All** > **Change** > **Create New**. **b.** Select **Normal**, **Emergency**, or **Standard** changes. If you are an upgrade customer and willing to use change models, you must enable the change model properties. For information on change models and its properties, see Change models. When you enable the change model properties, you see the following tabs when you navigate to **All** > **Change** > **Create New**. ○ **Models**: Shows all the available models available to select. ○ **Preapproved**: List of preapproved models to select. ○ **Pinned**: Models that you have pinned from the **Models** and **Preap proved** tabs. ○ **All**: All models are available to select.
From an incident or a problem	As a user with the sn_change_write role, you can create a standard, nor mal, or an emergency change from an incident or a problem. **a.** Open the incident or problem. **b.** Right-click the form header and select **Create Normal Change**, **Create Standard Change**, or **Create Emergency Change**.
From an existing change record	If the administrator enabled the change request copy option, you can create a new change by copying an existing change record. **a.** Open the change record that you want to copy. **b.** Click **Copy Change**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: If the create task workflow sets the **create_from** field in the [change_task] table to **workflow**, manually created tasks from the existing change record are copied.

2. On the form, fill in the fields.

Change Request form

Field	Definition
Number	Change request number.
Requested by	User who requested the change. This field is available in the **Change Requests** list view, so that you can see who requested a particular change.
Category	Category of the change, for example, **Hardware**, **Network**, **Software**.
Service	Business service that you want to make available for the change request. **Note:** If you select a business service as the configuration item and that business service is also listed as the configuration item in any other active task, the active tasks icon ( ) appears. Click this icon to view the list of all the other active tasks that are affecting the business service. You can view the BSM map (dependency view) of the selected business service by clicking the dependency icon ( ).
Service Offerings	Consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. You can choose to receive different levels of performance and features for a given service through service offerings. You must select a service to filter the available service offerings.
Configuration item	Select **Add** to add a CI for the change. You can add a CI for a change in **New** state only. CI that the change applies to. Change requests can be associated with any type of CI, including service offerings, providing detailed access to SLA and availability requirements. When you select a dynamic CI group, all the configuration items related to the selected dynamic group will be populated in the Affected CIs related list. In the Affected CIs related list, you can also manually add and delete the dynamic CI groups. When you add a dynamic CI group, all the related CIs are added, and when you remove a dynamic CI group, the related CIs are removed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
	After selecting a CI, you can click the health dashboard icon ( ) to view the CI health details. **Note:** By default, Service Offering is filtered out and CIs with Principal Class are selected. The Principal Class filter functionality is applicable to new customers starting the Paris release. See Refresh impacted services properties
Priority	Priority is based on impact and urgency, and it identifies how quickly the service desk should address the task.
Risk	Risk level for the change. The risk of a change can be defined manually as **High**, **Moderate**, or **Low**. You can also use Risk Calculation and Risk Assessment to drive the risk value of the change.
Impact	Impact is a measure of the effect of an incident, problem, or change on business processes.
Type	Type of change request. This field is read-only.
State	State of the change request. The default state is New.
Conflict status	Status that indicates whether there is a conflict for this change or the conflict is not run.
Conflict last run	Date and the time when the conflict was last run.
Assignment group	Group who will work on the change request. The business rule *Populate Assignment Group based on CI/SO* populates the **Assignment group** field available for the CI or the service offering consecutively. **Note:** The business rule is triggered when a change request is created or updated and when the **Assignment group** and the **Assigned to** fields are empty. If you want to override the default value, you need to create new properties and provide the field in the property value that must be used to populate the **Assignment group** field. Create the properties in the following order of preference: ○ *com.snc.change_request.ci_assignment_group.field_name*: Identifies which CI field populates the **Assignment group** field. ○ *com.snc.change_request.service_offering_assignment_group* Identifies which service offering field populates the **Assignment group** field.
Assigned to	User that the change is assigned to. If an assignment rule applies, the change is automatically assigned to the appropriate user or group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Definition
Short description	Summary of the change.
Description	Detailed description of the change.

3. To plan the change, click the **Planning** tab and enter information.
   This information is critical for change approvers.
4. Click the **Schedule** tab.

   a. Enter as much information about the scheduled dates as you have.
   Some of the fields are available for normal or emergency changes only because standard changes are preapproved.

   Note:
   For normal or emergency changes, enter the planned start and end dates and actual start and end dates manually. Populate the actual start and end date fields during the Implement state as the assignee begins and completes the work.

   b. If the form is configured to show the **CAB required** check box, select it to indicate that CAB approval is required before implementation.
   The **CAB date** field in the change request is automatically updated with the date in the **Meeting start time** field of the CAB meeting form.

   c. If there is an unplanned CI activity, select the **Unauthorized** check box to determine if the change is an unauthorized change.

   For more information, see Unauthorized change request.

   Note:
   This check box is available only for emergency change requests.

   d. If the form is configured to show the **CAB delegate** field, select the user who attends the CAB meeting to describe the change.

   e. In the **CAB recommendation** field, enter notes or recommendations related for the CAB meeting.

5. Click the **Conflicts** tab.
6. To detect change conflicts, click **Check conflicts**.
7. Right-click the form header and click **Save.**
8. Review entries in the related lists and modify the entries as appropriate.

Default Change Request related lists

Field	Description
Affected CIs	List of CIs (from the CMDB) affected by the change. You can associate multiple affected CIs with a change.
Impacted services/ CIs	List of CIs, such as business services or from other CI classes, that are impacted by the affected CI in the change. You can associate multiple impacted CIs with a change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service Offerings	List of service offerings affected by the change. You can associate multiple service offerings with a change. This related list is available only when a service offering is selected. If there are service offerings associated to the Impacted Services, then refresh the Impacted services/CIs related list to view the offerings. **Note:** If you have customized the default view of your form or related list prior to the Paris release, you cannot see the field or the related list by default. Modify the form to add them manually.
Approvers	This list is automatically generated from the workflow. You can also view the **Group** of approvers assigned to the task.
Change Tasks	The list of tasks can be created from a workflow. The default workflow generates tasks in the **Implementation** state. You can also create a new change task. The **Planned start date** and **Planned end date** in task type **Implementation** must fall within the planned start and end dates specified in the change request.
Problems	If the change was generated from a problem, this list is generated automatically.
Incidents Fixed by Change	List of incidents that require the change for resolution.
Incidents Caused by Change	List of incidents caused by the implementation of the change.
CAB Agenda Items	List of agenda items and details of respective items. For example, the meeting start and end time, allocated time for the meeting, state of the meeting, and the decision made for that agenda item. **Note:** The CAB Agenda Items related list is not shown on the form when the list is empty. This feature is available only for Jakarta instances.

9. When the change request is ready to move to the next state, click **Request Approval**.
   The state is moved forward based on the type of change request:
   - Assess state: Group level approval for a normal change request. Approval records are automatically generated based on the **Assignment group**. You can conduct peer and technical reviews of the proposed change.
   - Authorize state: An emergency change request.
   - Scheduled state: Pre-approved standard changes.

   Note:

   To mail the change record, click the more options icon ( ) in the content frame and select **Email**. Both the user who requested the change and the user who is assigned to the change are automatically populated in the list of recipients.

   To view the calendar, click **View Calendar** in the title bar of the Change Request form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Process a change request

Related topics
- State model and transitions

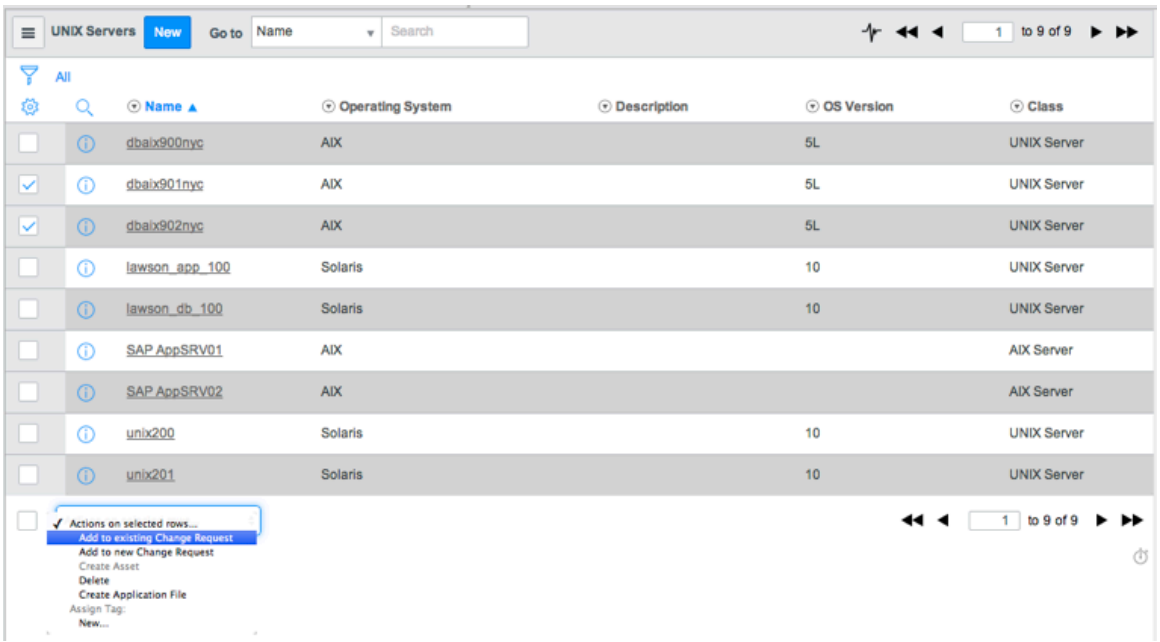
Create a change request from a configuration item (CI)

Create a change request from a list of configuration items (CIs), or add selected CIs from a list to a change record.

Before you begin
Role required: itil, admin, or sn_change_write

Procedure
1. Select a list of CIs.
   For example, navigate to **All** > **Configuration** > **Servers** > **Unix**.
2. Select one or more CIs from the list.
3. Select one of the following options from the Actions list.

Option	Description
Add to existing Change Request	Select this option to associate the CIs with an existing change request.
Add to new Change Request	Select this option to associate the CIs with a new change request.



Note:
CIs with a **Business Service** CI class are added to the **Impacted Services/CIs** related list on the change request. The remaining CIs are added to the **Affected CIs** related list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Depending on your selection, either an existing change requested is updated with the selected CIs or a new change request record is created with the selected CIs.

4. Continue to create or modify the change record as required.

Create a standard change request from the catalog

You can create a standard change request from the published standard change catalog templates.

Before you begin

Role required: itil, admin, or sn_change_write

Procedure

1. Navigate to **All** > **Change** > **Standard Change** > **Standard Change Catalog**.
2. Select one of the following options depending on the type of standard change you want to create.

Option	Description
Network Standard Changes	Create a standard change request for the net work.
Server Standard Changes	Create a standard change request for servers and attached storage.

3. Select a template from the **Items** section.

   Example
   For example, **Add network switch to datacenter cabinet** in the **Network Standard Changes** > **Items** section.
   When you select the catalog item, a standard change is created. The Change Request form is displayed with values from the standard change template.

4. Complete the form with additional information you have.

   Example
   For example, add the **Configuration item** and the **Assignment group**.

5. Open the form context menu and select **Save**.
6. Complete any information in the related lists that apply to the standard change request.
7. Select **Update**.

Copy a change request

You can copy details of an active or canceled change request to a new change request.

Before you begin

Role required: itil, admin, or sn_change_write

About this task

The administrator configures which of the following items are copied to the new change request.

- The content that is copied.
- The attributes or fields and values that are copied. All non-copied attributes are reset to default values.
- The configured related tables that are copied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You cannot copy change details from a standard change.

New change tasks can be created when a change is copied. If your change record has associated workflows that create change tasks, then these change tasks may not be copied because the workflow creates them. Only manually created tasks are copied, if the workflow when creating the task sets the **created_from** field on the **change_task** table to **workflow**. The **created_from** field has a default value of **manual**.

Procedure

1. Navigate to **Change** > **Open**.
2. Select the change request to be copied.
3. Right-click on the header and then click **Copy Change** to copy change details.
   A preview of the new change record appears with values from the original source change record.
4. Edit values on the newly created change record, as appropriate.
5. Click **Submit** to create a new change request record.

What to do next

After an existing change request is copied and a new one created. A user with ITIL role then reviews, approves, implements, and closes the change request as necessary.
In addition, you can associate CIs to the newly created change request.

Related topics

Configure ability to copy a change request

Create a change task

You can create change tasks for a change request. A change task is a piece of work related to the change request. For example, there can be tasks to plan the change, implement the change, and test, and review the work.

Before you begin

Role required: itil, admin, or sn_change_write

About this task

Change tasks can be created manually or from a workflow. The Change Request form has a **Change Tasks** related list, which includes all manual and workflow change tasks. From this related list, you can edit existing tasks or create tasks. Workflow change tasks are generated automatically in **Review** task type.

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Select the change request to add a change task.
3. In the **Change Tasks** related list, click **New**.
4. Fill in the fields, as appropriate.

Change Task form

Name	Definition
Configuration item	The configuration item (CI) or service that the change task applies to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Definition
Planned start date	The date you plan to begin working on the task.
Planned end date	The date the change task is planned to be completed. If the task type is **Implementation**, the **Planned start date** and **Planned end date** values must fall within the planned start and end dates specified in the change request.
Type	The type of change task, **Planning**, **Implementation**, **Testing**, or **Review**. The default workflow generates tasks in type **Review**.
State	The state of the change task: ○ **Pending**: Open and unassigned ○ **Open**: Open and unassigned ○ **In progress**: Open and actively being worked on ○ **Closed**: Inactive and closed. Requires close code and close notes to be provided. ○ **Canceled**
On hold	The **On hold** check box indicates whether the change task is on hold. Provide an **On hold reason** if a change task is placed on hold.
Assignment group	The group that the change task is assigned to.
Assigned to	The user that the change task is assigned to. If an assignment rule applies, the change task is automatically assigned to the appropriate user or group.
Short description	A summary of the task.
Description	A detailed description of the task.

5. To enter work notes for the change task, click the **Notes** tab.
6. To enter notes on why the task was closed, click the **Closure Information** tab.
7. Click **Submit**.
   The change task is added to the change request. The assigned user receives a notification that a task was assigned to them.

Unauthorized change request

Understand how an unauthorized change activity on a configuration item (CI) is captured and managed, so that you can review and take timely action on this change.

As part of the ServiceNow® Service Mapping integration with ServiceNow® ITSM , the Change Management application receives an event notification when an unauthorized change activity is detected. As a result, an emergency unauthorized change request is created for the relevant CI. You can review and approve or reject the unauthorized change from the Change Management application.

Note:
Unauthorized change requests are created only for the CIs that are part of the application services. Also, there is a flapper algorithm that uses a learning pattern to minimize false positives.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

At times, the discovery process (horizontal or top-down discovery) identifies a change on a CI property that may not be an actual change by definition. This identification is due to a measurement error or just a different representation of the same value, such as case sensitivity. The learning pattern identifies the false positives (flapper changes) and prevents triggering the recomputation and time-line updates as an emergency change request is a critical action. You want to avoid false positives and report only real changes.

The learning pattern identifies the false positives as follows:

1. When a CI property associated with a service changes, the new value (CI and field pair) is logged in the flapper's data table.
2. The system runs a nightly job and executes various algorithms on the data that is collected to identify patterns that point to false positives.
3. The system runs all the relevant strategy predicates for the changed CI fields with a confidence level greater than 90%. This step determines whether all the new values are false positives or not. If all the new values are false positives, then the change is ignored, and the model is not updated.

   Note:
   If the CI is associated with an active change request, then this step is skipped.

An unauthorized change request is created when an unplanned CI change activity occurs, and the system triggers the following checks:

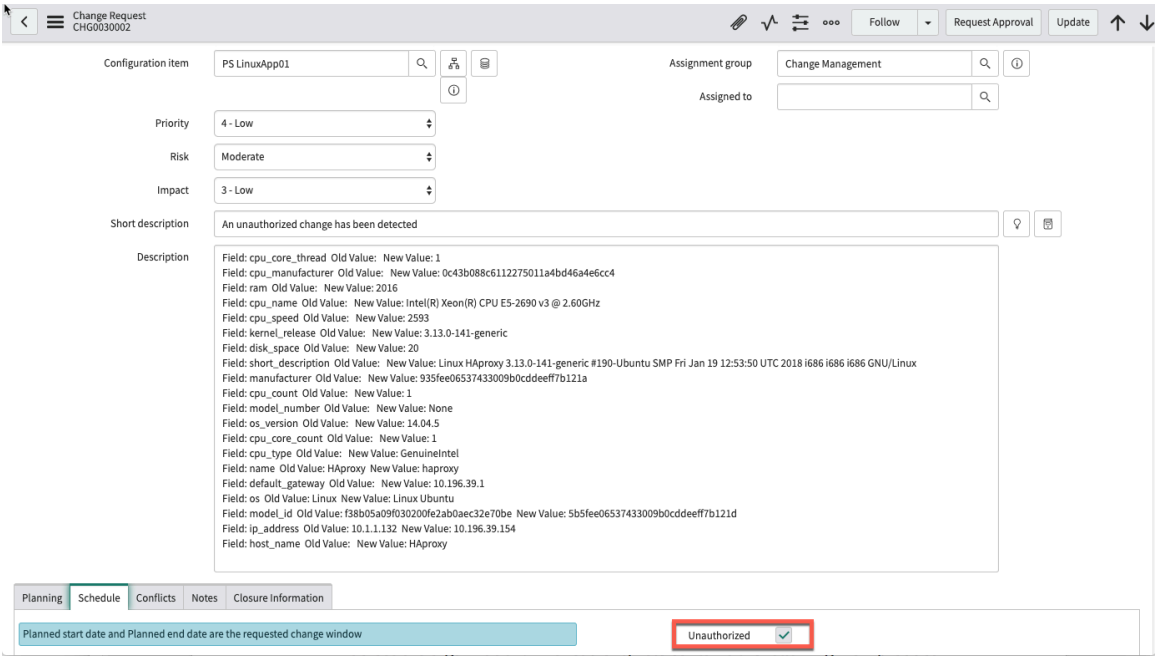
- The system checks to see if the CI is part of the allowed CI classes. If it is allowed, then the system checks to see if this specific CI has been flagged previously. If it was flagged and the previously created unauthorized change was within the notification ignore period, then no further action is taken. If not, then further checks are made to see whether this CI is associated to a change request that matches the condition stated in the properties. If not, then the change to the CI that was detected is flagged as unauthorized and a *`ci.change.unplanned`* event is raised.
- On receipt of the *`ci.change.unplanned`* event, the script checks to see if the **Enable event processing** field is **true**. If it is **true**, then an unauthorized change request is created. By default, this property is **false**.

The *`ci.change.unplanned`* event that is generated automatically triggers the creation of an Emergency type change request.

With the help of the following details that are pre-populated on the form, you can identify and review the unauthorized change:

- The **Unauthorized** option is selected. This option indicates that the change is an unauthorized change.
- The **Assignment group** field is populated with **Change Management**.
- The **Configuration item** field is populated with the item that the unauthorized change was made for.
- The **Description** field is populated with the information on the changed fields of the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



An email notification is sent to the Assignment group, CI Item managed by, Owned by, and Assigned to members for review and approval. However, if there are many CI changes and there are no open change requests created to include the CIs, the system creates unauthorized change requests on these CIs. When this event occurs, the members receive numerous unauthorized change notification emails. In such a case, you can choose to disable these notifications. For more information, see Disable unauthorized change notification.

Note:
Email notifications are sent only when there is an unplanned change on the CI that is part of an application service (discovered or manual service).

After this change request is approved, the state changes to **Review** and the regular process is followed to close the request.

Assign post-implementation review

When a change is implemented without approval, post-implementation review is necessary to evaluate the risk and impact of the unauthorized change.

After the unauthorized change is approved, a change task is created with **State** field as **Review**. This change task is assigned to the Change Management group with the **Short description** field as **Post Implementation Review**. The assigned members who receive the notification can review and close the change task.

Modify the unauthorized change setting

As a change manager, you can clear the **Unauthorized** check box to convert the unauthorized change request to an emergency change request. When you clear the check box, enter the reason for this modification in the **Work notes** field.

If you are an ITIL user, clear the **Unauthorized** check box by creating an outage from the task record with the **Type** field specified as `Outage`. For more information, see Create an outage from a task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When there is an unauthorized change without an outage record associated, then the state flow moves from **Authorize** to **Review** and skips the schedule or implement state. The state changes because the implementation has already happened for this change.

Disable the creation of an unauthorized change request

You can choose to disable the generation of unauthorized change requests that you receive on any unauthorized change event. When a configuration item (CI) that is part of an application service is updated, the system identifies this update and verifies whether the updated CI is part of an open change request.

Before you begin
Role required: admin or change_manager

About this task
If the updated CI is not part of an open change request, then the system triggers a change request, and sends a notification. The Change Management application uses this event to create an unauthorized change. If there are many CI changes with no open change request created to include the CIs, then the system creates unauthorized change requests on these CIs. When this event occurs, numerous unauthorized change requests are triggered, and notifications are sent to the members of the group. To avoid this situation, you can disable the *`Enable event processing`* property before you perform the updates. For more information on additional unauthorized change properties, see Unauthorized change properties.

Note:
Enable the property when you finish your updates. If this property is disabled, unauthorized change requests are not created.

Procedure
1. Navigate to **All** > **Change** > **Administration** > **Unauthorized Change Properties**.
2. Clear the **Enable event processing** property check box.
3. Click **Update**.

Result
The creation of an unauthorized change request is disabled, and no notifications are sent.

Unauthorized change properties

Use the Unauthorized Change Properties page to enable or disable the unauthorized change capability, and to configure the criteria for additional unauthorized change properties.

From this properties page, you can control the capabilities, such as:

- Enabling or disabling the creation of unauthorized change requests when receiving the *`ci.change.unplanned`* event.
- Configuring the type of change requests, which are valid, and fall into the unauthorized change category.
- Configuring a quiet time, whereby, if there is a repeated change to a CI that has been flagged previously, another unauthorized change is not created within that time period.
- Configuring the interval frequency for detection.
- Including a CI class for the change request that must be monitored.

Note:
Monitored CIs must be part of an application service.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate to **Change** > **Administration** > **Unauthorized Change Properties** to view and edit the properties.

Unauthorized change properties

Name	Description
Enable event processing	Enable the property to create unauthorized change events when an unplanned CI change (*ci.change.unplanned*) event is triggered. Default value: False
Notification ignores period	Enter the time duration until which you want to disable sending notifications or creating unauthorized changes for the same CI. Default value: 1 day
Change request query	Add the query conditions to define what change requests are valid and belong to the unauthorized change category. For example, you can add a condition to view all active change requests that are in the implement or review state for the given CI. If the conditions given are not met, then the change becomes an unauthorized change.
CI class inclusion	Choose the CI classes that you want to include and monitor for an unauthorized change to be created.

Process a change request

You can approve, implement, review, and close a change request.

Before you begin

Role required: itil, admin, sn_change_write, or change_manager

As part of processing a change request, ensure that you have detected any change conflicts and performed risk assessment

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Select a change request you like to work upon.
3. You can perform the following actions on a change request based on your role.

Option	Description
Approve or reject a change request	Open the approval record and click **Approve** to approve the change request or **Reject** to reject it. The change request changes to the **Scheduled** state if it is approved or to **New** state if it is rejected.
Implement a change request	Click **Implement** to put the change request in to action. The change request state changes to **Implement**. The workflow creates two change tasks: **Implement** and **Post-implementation**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	testing. Review the change tasks and assign them to a user or group, as appropriate.
Review a change request	Click **Review** after reviewing the details on the change request. The change request is moved to the **Review** state. All open change tasks are set to **Canceled**.
Close a change request	Click **Close** after entering the **Close code** and **Close notes** in the **Closure Information** section. The change request is closed.
Cancel a change request	From the context menu, click **Cancel Change**. Provide a reason for canceling the change and click **Save**. The change request is canceled and the reason for canceling the change is added to the **Work Notes** field.

Note:
Manually created change tasks are not automatically closed or cancelled when state is changed from Implement to Review. You must first close the change tasks and to close the change request.

Users with approval_user role, who approve change requests, do not have access to the change request itself. The following information are made available within the approval record to help these users make the right approval decision:

- Number
- Requested by
- Configuration Item
- Type
- Planned Start Date
- Risk
- Planned End Date
- Impact
- Short Description
- Description
- Justification
- Implementation plan

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Risk and impact analysis
- Backout plan

You can also add approval history to the change request activity log. Click the activity filter icon and select **Approval history** from the list. When there is a change in the approval process, such as an approval, rejection, or comments, the activity log is updated.

Related topics

Create a change request

Associated CIs on a change request

You can associate additional CIs or services to change requests through related lists on the Change Request form. You can also associate CIs with a change request from the dependency views map.

The **Affected CIs** and **Impacted Services/CIs** related lists enable you to manage CI changes.

When you first access a change request and work with these related lists, you can identify CIs across CI classes using configuration class. You can change the configuration class manually to filter the list and narrow the selection of CIs. For example, to filter for Linux servers only, select **Linux Servers** as the **Configuration Class**.

You can also create and save filters to provide quick access to common CI searches. The next time you access the change request, the **Configuration Class** field displays the last associated CI class. This automatic filter ensures that relevant CIs are displayed.

After identifying the CIs affected by a change request, you can add them to the **Affected CIs** related list on the change request. After saving affected CIs, you can open the form context menu and select the **Refresh Impacted Services** option. This option populates the **Impacted Services/CIs** related lists based on the primary CI i.e. the CI that is mentioned on the form.

The **Impacted Services/CIs** and **Service Offering** related lists represents a many-to-many relationship between the Task [task] and CMDB [cmdb_ci] tables. The related list displays CIs, such as business services or other CI classes, and the offerings that are impacted. You can add this related list to any task form such as an incident or problem form. You can also enter the details of the impacted services and the service offerings manually, as required.

Note:

- The manually added CIs are not deleted each time the impacted services are refreshed. However, business services related to the CIs are displayed on the **Impacted Services/CIs** related list.
- Refresh Impacted Services was only available for Change Request table. From this release, it is available for tables that extend the Task table. The list of these tables is driven by the *com.snc.task.refresh_impacted_services* property. This UI action populates the Impacted Services/CIs related list based on the primary CI i.e. the CI that is mentioned on the form.
- The Impacted Services list includes application services discovered by Service Mapping.

Add affected CIs to change requests using dependency views

You can use dependency views to identify dependent CIs affected by a change request, and then add them to the **Affected CIs** related list.

Before you begin

Role required: itil, sn_change_write, or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When a change request is associated with a configuration item, the change record becomes accessible from dependency views. Services affected by the change request are easy to assess in dependency views.

If not visible, the administrator can configure the change request form to display the **Affected CIs** related list.

Procedure

1. In the change request, click the dependency views icon next to the **Configuration item** field.

   Note:
   If there are critical change requests attached to a CI for a database, the map includes the business services that rely on that database. The database icon has a blinking glyph on the lower left edge that indicates any issues with the node.

   The configuration item is displayed in the map with all dependent CIs.
2. Click the down arrow next to the CI to display a list of tasks and issues with the CI.
   The list may contain one or more change requests, and follow-on audit tasks. You can open each record from this list.
3. Click the task number to display the complete list of tasks attached to this CI.
   You can view the user assigned to the change and also open the record for more information.
4. To change the map configuration, select a format from the **Layout** field or use the filter panel to filter the map.
   The dependency views map highlights the affected CIs that depend on the database or other CI.
5. To add an affected CI to the change, click the arrow next to the highlighted node and select **Add Affected CIs**.
6. Reload the change request form.
   You can view the CI you added in the **Affected CIs** related list.

Associate multiple CIs with a change request

You can associate multiple impacted or affected CIs with a single change request.

Before you begin

Role required: itil, change_manager, sn_change_write, or admin

About this task

Use the **Configuration Item** > **Configuration** > **CI Class Manager**.

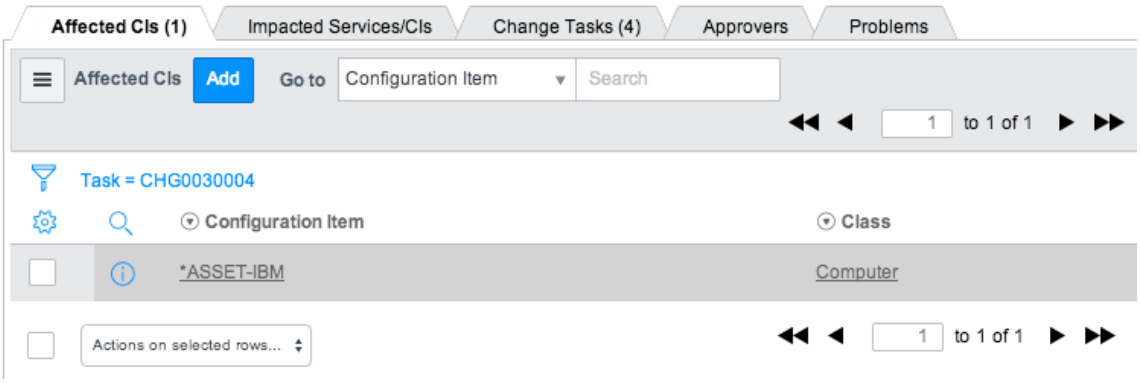
In the Affected CIs related list, a new filter is added for the Principal Class. You can control this functionality by the system property *com.snc.task.principal_class_filter*. The property contains all the task types where the Principal Class filter is applied to.

When you create a change request, you can add multiple CIs to that change request using the **Affected CIs** or **Impacted Services/CIs** related lists in the change record. Affected CIs can be added only when the change request is in the **New** state.

Procedure

1. Navigate to **All** > **Change** > **Open** and select a change request record.
2. In either the **Affected CIs** or **Impacted Services/CIs** related list, click **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the appropriate CIs from the list of CIs displayed in the pop-up window.
   The pop-up window for the **Affected CIs** list is filtered for the configuration class of the last added CI. This automatic filter ensures that relevant CIs are displayed. You can change the class to list other CIs, if appropriate.

   The **Impacted Services/CIs** pop-up window lists all CIs and provides standard filtering options. You can also save any filters you create to provide faster access to common CI searches.

4. Perform one of the following actions.
   - Select the CIs to add and click **Add Selected** to add the selected CIs to the change request.
   - Click **Add All** to add all the CIs in the list to the change request.

Add an affected CI with a calculated application service

From the change request form, you can add an affected CI that is associated with a calculated application service.

Before you begin

Role required: itil, sn_change_write, or admin

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Select a change request to add affected CIs to.
3. On the Change Request form, scroll to the Related Links section.
4. Click the **Affected CIs** tab and then click **Add** to add an affected CI to the change request.

   Note:
   You can export the Affected CIs in an excel. Right click on the change request and open in a new window. Right click on **Configuration Item**, and select **Export Excel**.

5. Open the form context menu and click **Refresh Impacted Services**.
6. Click the **Impacted Services/CIs** tab to see any dynamic services that are associated with the affected CI and that are impacted by the change request.

Mass Update CI

The Mass Update CI plugin enable users to apply the same update to a set of CIs for a specific CI class. The Change Management - Mass Update CI plugin is intended to be used when the Change Management - State Model plugin is activated.

To use these features, activate the Change Management - Mass Update CI plugin.

Note:
This feature is available for normal and emergency changes only.

When you activate the Change Management - Mass Update CI plugin, the **Mass update CI class** check box appears on the Change Request form. When selected, the **Mass update CI class** tab appears and allows changes to be proposed against the configuration items that match that class associated with the affected CI's related list in that change.

When the change moves to the Implement state, the required update for each CI related to the Change Request is created. These updates can then be applied in the Implement or Review state.

Note:
You cannot add or delete a CI when the change request in the **In-progress** state and is not approved.

Use Mass Update CI

You can use the proposed changes in a change request to apply the same update to a set of CIs for a specific CI class.

Before you begin

Role required: itil, sn_change_write, or admin

About this task

Procedure

1. Navigate to **All** > **Change** > **Create New** and select **Normal** or **Emergency** change.
2. Select the **Mass update CI class** check box.
   The **Mass update CI class** tab or form section appears.
3. On the **Mass update CI class** tab, select the CI class to update.

   The dynamic CI group is not available for selection. When using mass update, a specific CI class must be selected and not a group that may have different CI classes.

   The parent CMDB [cmdb_ci] table is selected by default. Search for the class name, for example, enter `linux` or `email`.

   Note:
   If you have selected a dynamic CI group for the **Configuration item** field, the configuration items that are part of the dynamic group and belong to the selected CI class are updated. For example, if the dynamic CI group that you have selected consists of Linux servers, computers, and network switches, and you select Linux servers for the CI class with proposed changes, only the Linux servers in the dynamic group get updated.

4. Enter the proposed changes that you want to make to all the affected CIs.
   Each time that you select a field and value, another line appears. If you enter a proposed change in error, click the **X** beside the line to remove it.
5. Click **Submit**.
6. Open the change request you submitted.
7. In the Affected CIs related list, click **Add**.
   The Add Affected Configuration Items window that opens lists only the CIs in the selected CI class.
8. Select one or more CIs and click **Add Selected**, or click **Add All**.
   If you change the CI class after selecting affected CIs, the list is cleared when you save the record.
9. Continue with the change management process for this change request.
10. When the record reaches the Implement or Review states, click **Apply Proposed Changes**.
    A message appears informing you that the proposed changes were applied to all the affected CIs.

    Note:
    If you are using the Bulk CI Change without Mass Update CI feature, then the proposed changes are applied when the change request is closed.

Activate Change Management - Mass Update CI

Create a change request

Place a change request on hold

You can put a change request on hold to get additional information for the created change request.

Before you begin

The following plugins need to be activated to avail the synchronization of the **On Hold** functionality between change task and change request:

- Change Management — Core [com.snc.change_management]
- Change Management — State Model [com.snc.change_management.state_model]

Roles required: itil, admin, sn_change_write, or change manager

About this task

Change tasks inherit some state conditions from the parent change request they are related to. When a change request is placed on hold, these conditions are applied to it:

- If the change is waiting for approval, the pending approvals are marked **No Longer Required**. When the change request is no longer **On Hold**, the pending approvals are reinstated and are **Awaiting approval**.
- The change can progress only to the **Canceled** state while it is **On Hold**.
- If a change request is canceled while it is **On Hold**, then its **On Hold** flag is set to **false** so the change cannot be canceled and still be **On Hold**.
- If the change request is set to **On Hold**, the value of the **On Hold** field for all the active change tasks for that change request is set to **true** and the **On hold reason** is copied from the change request to the change tasks.
- If you clear the **On Hold** check box in a change request, the **On Hold** field for all the active change tasks for that change request is set to **false** and the **On hold reason** is cleared from the change tasks.
- If the change request is canceled, all the active change tasks related to that change request are also canceled.
- A change request can only be closed when all the active change tasks related to that change request are closed or canceled otherwise a pop-up appears notifying that there are open change tasks that require to be closed.
- If there are existing change tasks that are manually placed on hold, those change tasks do not get overwritten when the change request is placed to the **On Hold** state. Similarly, when the change request is taken off the hold state, the change tasks that were placed on hold manually stays in the **On Hold** state.

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Open the specific change request.
3. Select the **On Hold** check box.
4. In the **On hold reason** field, enter the reason for placing the change request on hold.
5. Click **Update**.

Create a change request

Refresh impacted services and CIs for Change

The Impacted services and CIs related list refreshes its records and also the records listed in the Service Offerings and Business Applications related lists based on the affected CIs. You can identify the impacted services and CIs and take necessary action.

Before you begin

Role required: itil, change_manager, sn_change_write, or admin

About this task

Refreshing impacted Services on a change request form is executed in one of the following ways:

- Conflict detection: When a conflict detection is triggered, refreshing of impacted services may be initiated. The **Automatically include business or application services related to Cis with conflicts in the Impacted Cis/Services related list** property (*`change.conflict.populateimpactedcis`*) controls whether the Impacted Services/CIs related list should be refreshed or not. If this property is enabled, then a call is made to the `ChangeUtils` script include calling a *`refreshImpactedServices`* method for the current change request.
- Automatically when the change request moves from the new state: Impacted services are refreshed when the change request moves from the new state and when the Affected CIs related list is not modifiable.
- Manually when selecting the **Refresh Impacted Services** option from contextual menu.

Procedure

1. Navigate to **All** > **Change** > **Open**.
2. Open the change record for which you want to refresh the related lists those values are based on affected CIs.
3. Click the Additional actions icon and then select **Refresh Impacted Services**.
   The records in the Impacted Services/CIs, Business Applications, and Service Offerings related lists are updated according to this flow:
   - If the *`change.refresh_impacted.include_affected_cis`* property is set to true, all the services from svc_ci_assoc table are retrieved. If the property is set to false, then services are retrieved from `CIUtils` script include.
   - If the *`change.conflict.populateimpactedcis`* property is set to true, then additional services are retrieved from ChangeCollisionHelper and added to the list of services.
   - If the Service Mapping plugin is active, then Application Services are retrieved. These are retrieved, whereby, the association type is **Runs On**, and the association child is one of the CIs in the affected list.

   Once all these services are correlated, a new list is added, and the existing items in the related list are removed, where the **manually_added** flag is set to false. The list of services is then used to populate the Business Applications and Service Offerings if the properties are enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh impacted services properties

Use the refresh impacted services properties to enable or disable the refresh impacted services capability, and to configure the criteria for additional refresh impacted services properties.

By configuring these properties, you can control the capabilities, such as:

- Include the primary configuration item or all the items in the Affected CIs related list.
- Processing of refreshing the impacted services as an event.
- Populate Service Offerings and Business Applications from the Impacted Services related list.

The following properties can be found in sys_properties.list and on the Change properties page.

Refresh impacted services properties

Property	Description
com.snc.change_request.refresh_impacted.include_affected_cis	• When true, all the configuration items listed in the Affected CIs related list are checked. These configuration items are checked against the Application services mapping table (svc_ci_assoc) as this is a faster process, and also returns a more concise relationship picture. All the services from svc_ci_assoc table are retrieved. • If the property is false, only the CI on the change form is used. This uses the method of traversing the cmdb tree structure to find the services. The services are retrieved from `CIUtils` script include. **Note:** If dynamic CI groups are used on the Change form, then this property must be set to true as the associations are located in the svc_ci_assoc table. When a business service is converted to an application service (as an example), all the levels included in the svc_ci_assoc table are considered at the time of conversion.
change.conflict.populateimpactedcis	If this property is set to true, then the `ChangeCollisionHelper` script include checks the configuration items that have been identified in the list of conflicts against the Application services mapping table (svc_ci_assoc) and also table (cmdb_ci_service) to check if there are any business services that are directly impacted.
com.snc.change_request.refresh_impacted.event	• When true, the process of refreshing the impacted services is done through an event. This process is run in the background and

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh impacted services properties (continued)

Property	Description
	you will be notified through a message in Notify that the process has been complete. • When false, this is run in your session. As this is not run in background, there is no notification on completion.
com.snc.change_request.populate_service_offering	• When true, the Service Offerings related list is populated from the Impacted Services/ CIs related list. • When false, the related list is not populated or amended in any way.
com.snc.change_request.populate_business_application	• When true, the Business Applications related list is populated from the Impacted Services/CIs related list. • When false, the related list is not populated or amended.
com.snc.change_request.refresh_impacted_services.message.show	• When true, the `Refresh impacted services is initiated` message appears on the Change request form. • When false, the `Refresh impacted services is initiated` message doesn't appear.

Creating change approval policies

Use the change approval policy to create change approval definitions and the change approval policy workflow to control the approval process for a change request.

Create approval definitions

Use approval definitions to define a set of criteria that are evaluated automatically before the policy is marked as approved.

Before you begin

In the approval definitions, you can define to determine

- If the approval is user or group based.
- If it should automatically approve or reject on behalf of a user.
- If a response to the approval is required.

Role required: change_manager or admin

Note:
Approval definitions can be applied only once if multiple applied decisions have the same approval definitions associated with them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Approval Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

   Note:
   When adding users or groups to which you want to send the approval, specify the **Approval Definition** value as `Approver Source`.

4. Click **Submit**.

Create change approval policies

Use a change approval policy to define approvals that should be generated for your change.

Before you begin
Role required: admin or change manager

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Click **New** to create a new approval policy.
3. Enter the **Name** of the policy.
4. In the **Execution** field, select an option to determine the approach to execute your decision.
   - **First decision that matches**: Uses the first matching decision in the ascending order of the value defined in the **Order** column of the **Decisions** list. The associated approval definition is applied.
   - **Run all decisions that match**: Uses all matching decision and applies the associated approval definition.
5. Click **Submit**.
6. Select the policy you created.
7. Add your decisions to the policy and click **Submit**.

What to do next
To add additional policy inputs and decisions, see Create Policy inputs and Create Decision records..

Create policy inputs

Policy inputs are variable sources that you can use while evaluating a decision to determine the approval action. You can create multiple policy inputs to evaluate the decision created, and also access the change request table and any table change request references.

Before you begin
Role required: admin or change manager

You can create multiple policy input types. By default, the **change_request** policy input of type *`Reference`* is available for all change types. This policy input provides access to the change request table and to any table change request references. For a normal change policy, an extra **manager_approved** policy input of type *`True/false`* is available.

To define additional policy inputs, perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Create a change approval policy or open an existing policy.
   For more information, see Create change approval policy
3. In the **Policy inputs** tab, click **New** to create a record.
   The **Name** and **Application** fields are auto-populated.
4. Click the reference lookup icon for the **Type** field and choose a Type value.
5. Enter a name in the **Label** field.
   The column name for the new record is populated in the **Column Name** field automatically.
6. Depending on the value of the **Type** field, you can configure the other parameters for the policy input.
7. Click **Submit**.

What to do next
After you create a policy input, reference it within a decision.

Create Decision records

Decision records contain the conditions that you can use to determine the change approval action. Create decisions using condition builder when creating change approval policies.

Before you begin
Role required: admin or change manager

You can create decisions to evaluate conditions that reference policy inputs and apply the associated approval definition. To create a decision, perform the following steps:

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > **Change Approval Policies**.
2. Create a change approval policy or open an existing policy.
   For more information, see Create change approval policy.
3. In the **Policy inputs** tab, create a policy input or update an existing record.
   For more information, see Create a decision.
4. In the **Decisions** tab, open the default decision record.
5. Copy and modify the decision record configuration or click **New** to create a new decision record.
6. Provide a label in the **Label** field.
7. In the **Answer** field, select an approval definition.
8. Add any necessary filter conditions using the condition builder.
   These conditions determine the outcome of the policy. For example, to generate approvals at the Assess state that trigger an approval definition when risk is low, set the condition to **[Change request.state] [is] [Assess] AND [Change request.Risk] [is] [Low]**.
9. Click **Submit**.

Change Approval Policy workflow activity

Use the Change Approval Policy workflow activity to control the approval process for a change request by creating user and group approvals according to a change approval policy record. Multiple activities can be used in a workflow, where each activity can reference the same or different Change Approval Policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Using the current change request and additional inputs defined in the **Policy Input** script field in the activity, you can evaluate the Change Approval Policy record, which applies the approval definitions from matching decisions.

Note:
This activity is only available when the workflow runs on a table that extends or is the [change_request] table.

Results

The activity assigns a result value according to the outcome of the applied policy. The possible result values are:

- Approved
- Rejected
- Canceled
- Skipped
- Finished

Input variables

Input variables determine the initial behavior of the activity.

Change Approval Policy activity input variables

Field	Description
Approval Policy	The Change Approval Policy that you want to apply to the change request.
Policy Input	Policy Inputs that are defined on the Change Approval Policy record. Set additional policy inputs here.
Finish condition	Determine if the activity should complete while pending approvals remain. Use this condition if the workflow is configured to handle restarting the Change Approval Policy activity. For example, when the Change Request goes on-hold.

Condition

The following conditions determine which transition runs after this activity.

Change Approval Policy activity conditions

Condition	Description
Approved	Change request is approved when the criteria defined by applied Approval Definitions is met.
Rejected	Any rejection from applied Approval Definitions will result in the Rejected outcome.
Error	The event or condition that generates an error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change Approval Policy activity conditions (continued)

Condition	Description
Skipped	If this condition is not configured on the activity, then the Approved condition is used. This outcome occurs for the following scenarios: • No decisions from the Change Approval Policy match • No approvals can be generated from matched decisions

States

The workflow engine uses the activity state to perform the next logical action on the activity.

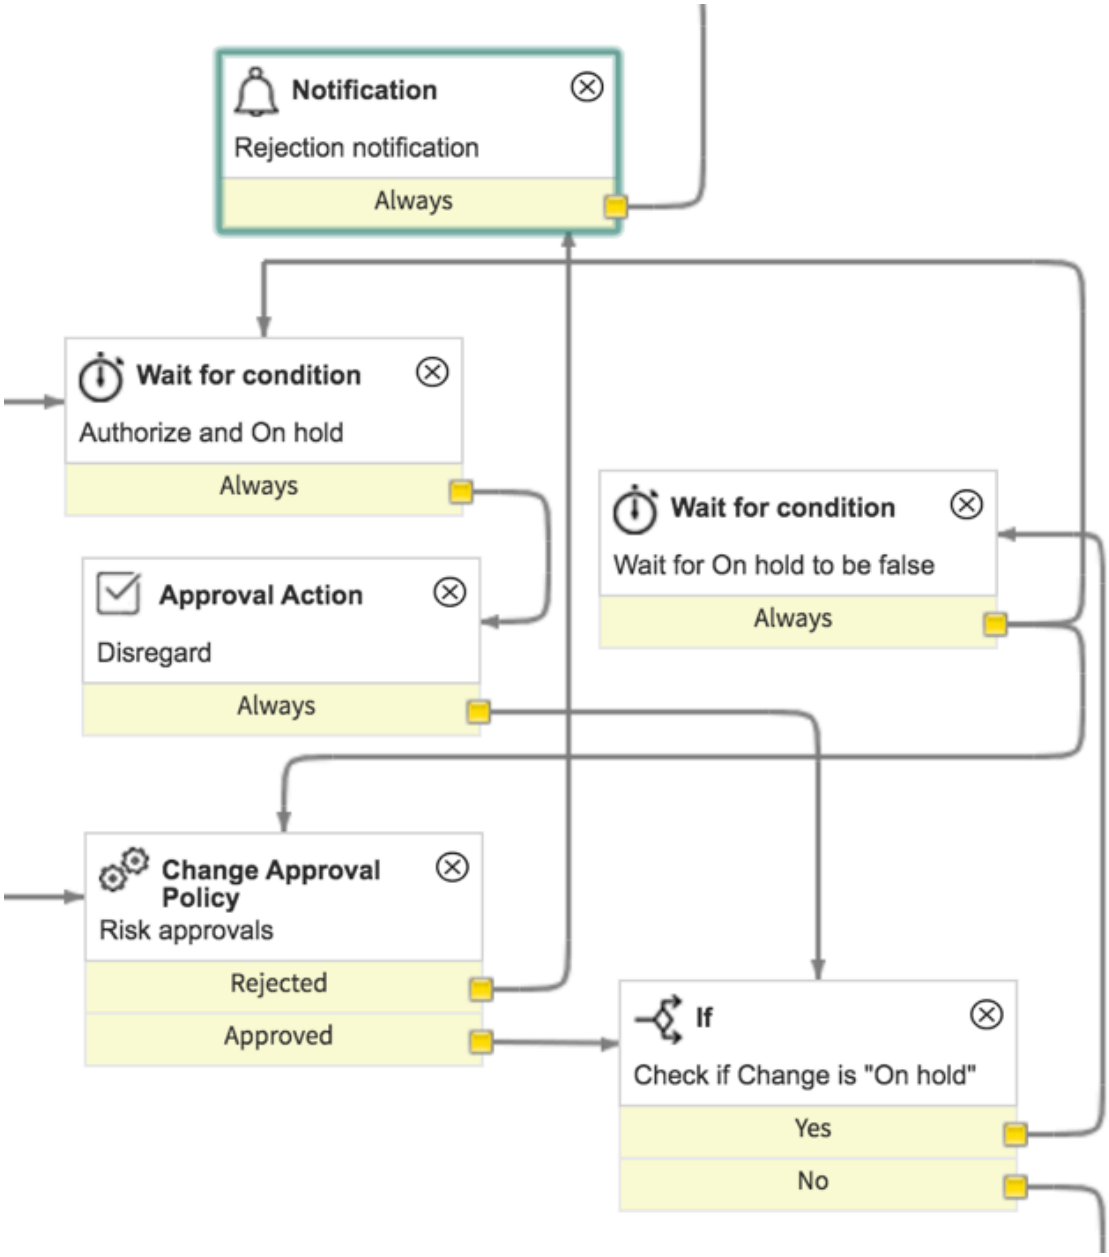
Change Approval Policy activity states

State	Description
Executing	The workflow engine starts the `execute` function of the activity.
Waiting	The workflow engine ignores the activity until a specific event to restart the activity is fired.
Finished	The activity finished running. See the result value for the outcome of the activity.
Cancelled	This activity, or the workflow that contains this activity, was canceled.
Error	A JavaScript error occurred. Review the logs for error details.

Example

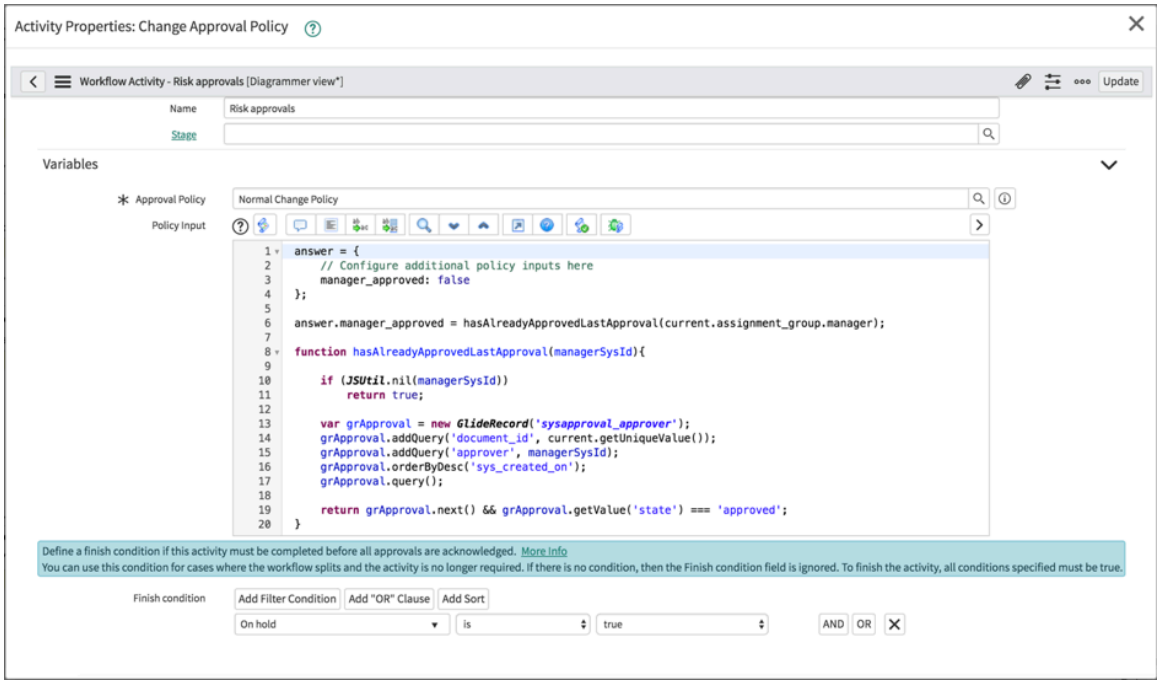
In this example, let us reference the Risk approvals activity in the **Change Request - Normal** workflow. In the workflow, the change approval policy factors if the assigned group's manager has already approved the Change Request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can use this activity to access the risk of the change request of a normal change policy. When this activity runs, the associated decisions executes the approvals that needs to be requested.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use the **Policy Input** field to set up additional inputs. In the given example, the activity defines the manager_approved property and performs the query to check if an approved record exists for the approved group's manager.

Note:
Ensure that the manager_approved policy input is defined in the Change Approval Policy record.

The **Finish condition** field is used to complete the activity by marking pending approvals as **No Longer Required**. In this workflow example, when the Change Request is put on-hold, the Change Approval Policy activity is completed and the workflow disregards the pending approvals before waiting for the Change Request to resume. When the on-hold state is released, the Change Approval Policy activity is restarted.

Use the Change Approval Policy workflow activity

Apply your Change Policy in your Change Request workflow to manage the approvals.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Workflow Editor**.
2. Open the change request workflow that you want to use in the **Change Policy** activity.
3. Drag and drop the **Change Approval Policy** activity from the **Change Policy** section in the **Core** activities tab.

   Note:
   This activity is only available when the workflow runs on a table that extends or is the change_request table.

4. Configure the activity by specifying the Change Approval Policy in the workflow.
5. Configure the Policy input field to setup inputs that are defined on the associated Change Approval Policy record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Configure the **Finish condition** if the workflow needs to handle a scenario where the activity needs to complete ahead of time because of a change in the Change Request.
   For example, when the change request is on-hold.
7. Click **Update**.

Use the Apply Change Approval Policy flow action

Apply your change approval policy in the Change Management Workflow Studio action to control the approval process for a change request. You can create user and group approvals according to a change approval policy record.

Before you begin

Role required: admin

About this task

This flow action uses the **Ask For Approval** flow action to apply approvals that are derived from the Change approval policy. When approvals are being generated, the **Ask For Approval** action avoids generating more than one approval for the same user. For example, if the policy requires approval from two groups and both groups have the same user, then the shared user is notified only once for the approval.

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer** > **Flows**.
2. Select the flow that you want to apply the change approval policy to.
3. Select **Action** > **Installed Spokes** > **ITSM** > **Change** > **Apply Change Approval Policy**.
4. On the form, fill in the fields:

Apply Change Approval Policy form

Field	Description
Action Label	Unique label for the action.
Policy [Change Approval Policy]	Policy that you want to apply to your Change request.
Change Request	Source of the change request required by the policy. Select this field using the data pill picker icon ( ). Alternatively, you can select the change request from the Change Request list.
Due Date	Due date for the approval policy. Select one of the following options: ○ **None**: The approval has no due date. ○ **Approve**: Automatically approve the approval policy on the due date. ○ **Reject**: Automatically reject the approval policy on the due date. ○ **Cancel**: Automatically cancel the approval policy on the due date.

5. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a Change approval policy using decision builder

Create a change approval policy using the Change approval policy decision builder to define the approvals that should be generated for your change.

Before you begin

The Decision Builder [sn_decision_design] plugin must be installed.

A change approval policy can be applied to a change request. An approval policy can contain multiple decisions allowing a single policy to handle every approval required for a change type. When a decision condition matches, the related approval definition is evaluated.

Role required: admin or change_manager

Procedure

1. Navigate to **All** > **Change** > **Change Policy** > .
2. Select **Create new change approval policy**.
3. Enter the name of the policy.
4. In the **Execution** field, select an option to determine the approach to implement your decision.

Option	Description
First decision that matches	Uses the first matching decision in ascending order of the value defined in the **Order** column of the **Decisions** list. The associated approval definition is applied.
Run all decisions that match	Uses all matching decisions and applies the associated approval definition.

5. Select **Create & Continue**.
6. Select **Add an input**.
7. On the form, fill in the fields.

Add an input form

Field	Description
Label	Header of the input.
Type	Type of data used for the input. When the data type is **Reference**, a new column titled Reference appears in the form. The reference is the table associated with the input. The available input types are: ○ Choice ○ Date ○ Date/Time ○ Decimal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Due Date ○ Integer ○ Long ○ Reference ○ String ○ String (Full UTF-8) ○ True/False

8. Add a condition by selecting **Add Condition Column**.
9. On the form, fill in the fields.

Add Condition Column form

Field	Description
Condition column label	Label for the condition.
Description	Brief overview of the condition.
Input	Input linked to the condition column. To evaluate multiple fields, you can add multiple conditions with the Reference input type.
Table	If the data type is **Reference**, this field is automatically set to the name of the reference table.
Data to evaluate	If the input type is **Reference**, specifies whether the condition evaluates a reference record or a field from the reference table.
Condition type	Data type selected for the input.
Default operator	Operator used to evaluate a user-specified value. A default operator is required for all input data types except for True or False.

10. **Optional:** Add more conditions by navigating to the last condition column and the plus icon (+) or by pointing to a condition column and clicking the plus icon (+).
11. For each condition cell, select an operator and enter a value.
For example, if you wanted to evaluate the change approval policy only for hardware issues, you could set the condition **[Assignment group][is][Hardware]**.
12. Select the result column, and then select a desired Change approval definition from the list.
13. In the form header, click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
A change approval policy is created and is evaluated on a change request that matches the defined condition.

Working with the CAB Workbench

Use the CAB workbench to review and authorize change requests and review recently implemented changes.

Create a CAB definition

A Change Advisory Board (CAB) definition is similar to a recurring meeting invitation. When you define a CAB definition, it determines the attributes that are associated with all CAB meetings generated from that definition.

Before you begin
Role required: sn_change_cab.cab_manager

Procedure

1. Navigate to **All** > **Change** > **Change Advisory Board** > **My CAB Definitions**.
2. Click **New**.
3. On the CAB Definition form, fill in the fields.

CAB Definition form

Field	Description
Name	Name for the CAB definition.
CAB Manager	Name of the user who manages the CAB meetings.
Delegates	Delegate CAB members who can substitute as the CAB manager during the meeting.
Board Members	Board members who are expected to attend the CAB meeting, selected from the list of users.
Board Groups	Board groups who are expected to attend the CAB meeting, selected from the list of user groups.
Rolling Meeting Window	Number of days for which you want to create CAB meetings. **Note:** The CAB schedule and related schedules, if any, determine the number of CAB meetings that are created. For example, if you have a CAB schedule of once every week and you enter 28 days in the **Rolling Meeting Window** field, then three CAB meetings are created.
CAB Type	Type of CAB meeting this definition is used for.
Time zone	Time zone for the CAB meeting.
Locations	One or more locations for your CAB meetings. For example, meeting rooms in different offices.
Active	Check box that specifies whether the CAB definition is active. Clear the check box to deactivate the CAB definition.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Conference Details	Information such as meeting links, passwords, and phone numbers.
Agenda Management	
Use filter criteria to drive Change Request date range	If selected, helps to choose a time range for the planned start and end date from **Change Request additional condition** instead of selecting specific dates based on meeting schedule. **Note:** The same field is selected for all CAB meetings in the CAB definition unless individually overridden.
Notification lead time	The advanced notification on the number of agenda items that needs to be discussed.
Auto Add Agenda Decisions	Check box for capturing agenda decisions automatically on the meeting widget. The agenda decision is captured in the following format: `(CAB Automation) - <change request number> - <decision> - <CAB Manager name> - <time><AM/PM> <timezone>`
Automatically Add Change Requests	Check box to define the types of change requests that are automatically added to the CAB meeting agenda. When you select **Automatically Add Change Requests**, the **Refresh CAB Meetings** related link appears. If you click this link, search is performed for change requests that match the value in the **Change Request Addition Conditions** field. If there are any matching change requests, agenda items are created for them and added to the CAB agenda. If you do not select **Automatically Add Change Requests**, then you need to create individual agenda item for the associated change request for the meeting agenda.
Change Request Addition Conditions	Condition builder to specify which change requests are added to the CAB meeting agenda. ○ **Add Filter Condition**: Click to add additional filter conditions, or click **AND** next to the existing filter condition. ○ **Add "OR" Clause**: Click to display the results of multiple filter criteria in a single list. ○ **Add Sort**: Click to define the order of the change requests in this CAB meeting agenda. The agenda order can be defined in CAB Definitions or CAB Meetings, and can be based on one or more fields.
Time per Agenda Item	The time, in minutes and seconds, allotted to discuss each change request on the agenda. The allotted time can be adjusted for agenda items before or during the meeting.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Complete Pre-approved Changes	Check box to mark each pre-approved change request as **Complete** in the CAB meeting agenda. **Note:** Pre-approved changes are automatically marked as complete so that approvers do not have to review them. The pre-approved changes are visible in the CAB Workbench, and can be discussed if necessary.

4. Open the form context menu and select **Save**.
   The **Schedule Entries**, **Related Schedules**, and **CAB Meetings** related lists appear.
5. To set the meeting schedule for your CAB meeting series, complete the following steps:
   You can add one or more schedule entries to a CAB definition to schedule the series of CAB meetings. These schedule entries let you set valid days and times for holding CAB meetings.

   a. In the **Schedule Entries** related list, click **New**.

   b. On the Schedule Entry fields form, fill in these fields.

Schedule Entry fields form

Field	Description
Name	Name for the schedule entry.
Type	Type of schedule entry for the specified date and time duration, for example, appointment or meeting. ▪ **Time off**: Shown as planned time-off. ▪ **Appointment**: Shown as appointment time. ▪ **Meeting**: Shown as meeting time. ▪ **Phone call**: Shown as time for making phone calls. ▪ **Excluded**: The duration is excluded.
Show as	How the schedule entry is displayed on the CAB calendar, for example, busy or tentative.
When	Start and end date and time for the schedule entry.
All day	Check box to make the schedule entry active for the entire duration of the selected dates.
Time zone	Time zone for the schedule entry. The time zone cannot be modified.
Repeats	Frequency with which the schedule entry repeats, for example, daily or weekly. When you select **Monthly**, the **Monthly type** field appears. Enter the number of times in a month when the schedule entry repeats. When you select **Yearly**, the **Yearly type** field appears. Select an option, as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description

	▪ **Day of the year**: Chosen as the current day on which you define the schedule.
	▪ **Floating**: If you select this option, the following fields appear:
	  ▪ **Float week**: The week of the month when the schedule entry repeats.
	  ▪ **Float day**: The day of that week when the schedule entry repeats.
	  ▪ **Month**: The month when the schedule entry repeats.

Repeat every	If the schedule entry is selected to repeat, specifies how often it repeats. For example, if you select weekly repetitions, specify the frequency such as every week or every two weeks. This field appears when you select the **Weekly**, **Monthly**, or **Yearly** options.
Repeat on	If the schedule entry is selected to repeat, then specify when it repeats. For example, if you select weekly repetitions, specify the days of the week when it repeats. This field appears when you select the **Weekly** option.
Repeat until	If the schedule entry is scheduled to repeat, specifies an end date until which the schedule entry is repeated.

c. To add the schedule entry to the CAB definition, click **Submit**.

d. **Optional:** To view the series of CAB meetings in a calendar view in a new browser window or tab, click the **Show Schedule** related link.

6. To set a related schedule for your CAB meeting series, complete the following steps:
   You can add one or more related schedules to a CAB definition. Related schedules enable you to set valid schedules for holding CAB meetings. For example, if you set the public holiday schedule as a related schedule, it ensures that no CAB meeting is scheduled on a public holiday.
   a. In the **Related Schedules** related list, click **Edit**.
   b. Select one or more related schedules and move them to the **Related Schedules List**.
   c. Click **Save**.
   d. **Optional:** On the **CAB Definition** form, click the **Show Schedule** related link to view the defined schedule in the calendar.
7. In the **Related Links** section, click **Refresh CAB Meetings**.
   The CAB meeting series created from CAB definitions inherit the criteria of the CAB definition. You can view the series of CAB meetings generated from the CAB definition in the **CAB Meetings** related list.

What to do next

You can modify CAB meeting details and send meeting requests to attendees. You can also manage agendas by reviewing or adding agenda items to each of the meetings.

View the CAB calendar

The CAB calendar provides an overview of your CAB meeting schedule to help with planning and managing CAB meetings.

Before you begin

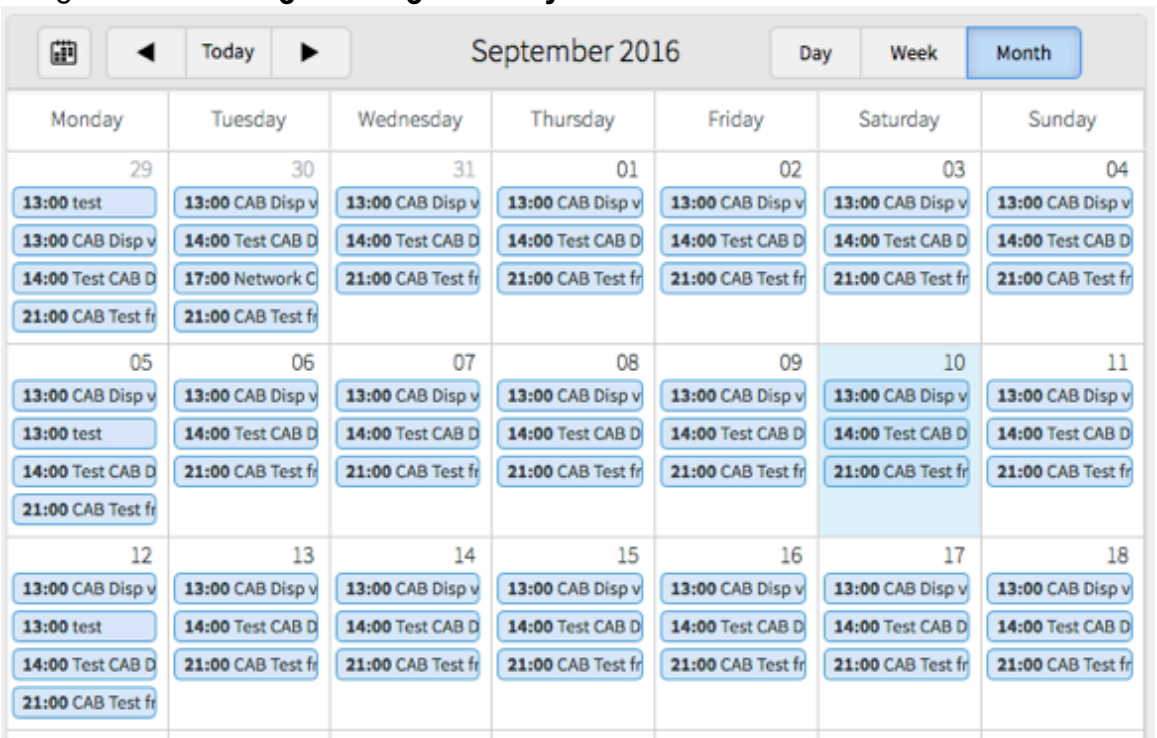
Role required: itil, sn_change_cab.cab_manager, sn_change_read, sn_change_write, or admin

About this task

You can view the CAB calendar to view and attend specific meetings.

Procedure

1. Navigate to **All** > **Change** > **Change Advisory Board** > **CAB Workbench**.



2. You can perform the following actions from the CAB calendar.

Option	Description
View the calendar	Click the options in the top right of the CAB calendar to display the calendar in daily, weekly, or monthly view.
View CAB meeting details at a glance	Click a specific CAB meeting to view details such as the CAB manager, meeting start time, and meeting end time.
Attend a specific CAB meeting	Click the meeting you want to attend and click **Open** to launch the meeting.

Create a single CAB meeting occurrence

Depending on your requirements, you can create an individual Change Advisory Board (CAB) meeting occurrence.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_change_cab.cab_manager

Procedure

1. Navigate to **All** > **Change** > **Change Advisory Board** > **My CAB Meetings**.
2. Click **New**.
3. On the CAB Meeting form, fill in the fields.

CAB Meeting form

Field	Description
Name	Name of the CAB meeting.
CAB manager	Name of the user who manages the CAB meeting. The default is the user that is currently logged in.
Delegates	Delegate CAB members who can substitute as the CAB manager during the meeting.
Board groups	
Board members	
State	○ **Pending**: Indicates that the meeting is yet to begin. It is the default state of the meeting. ○ **In progress**: Indicates that the meeting has begun and is in progress. ○ **Complete**: Indicates that the meeting has occurred and is finished. ○ **Canceled**: Indicates that the meeting has been canceled. **Note:** The system automatically updates the **State** field when the meeting starts and ends from within the CAB workbench. There is no need to manually change this field, unless, for example, the CAB manager wants to cancel a future meeting. If the CAB workbench closes unexpectedly, the CAB manager must manually update the **State** field.
Meeting start time	Start date and time for the meeting. **Note:** When you add an agenda item to a CAB meeting, the **CAB date** field in the change request is automatically updated with this date.
Meeting end time	End date and time for the meeting.
Meeting Notes	Enter notes for the meeting, if any.
Locations	One or more locations for your CAB meetings. For example, meeting rooms in different offices.
Conference Information

Field	Description
Conference details	Information such as meeting links, passwords, and phone numbers.
Agenda Management	
Use filter criteria to drive Change Request date range	If selected, helps to choose a time range for the planned start and end date from **Change Request additional condition** instead of selecting specific dates based on meeting schedule. **Note:** If you select **the Use filter criteria to drive Change Request date range** field in a cab meeting, the **Change Requests starting after** field and the **Change Requests starting on or before** field is disabled for the meeting, and therefore ignored. The change request additional conditions drive the date range.
Change Requests starting after	Change requests that starts after this date and time should be added to the CAB meeting.
Change Requests starting on or before	Change requests that starts on or before this date and time should be added to the CAB meeting.
Complete Pre-approved Changes	Check box to mark each pre-approved change request as **Complete** in the CAB meeting agenda. **Note:** Pre-approved changes are automatically marked as complete so that approvers do not have to review them. The pre-approved changes are visible in the CAB Workbench, and can be discussed if necessary.
Time per Agenda Item	The time, in minutes and seconds, allotted to discuss each change request on the agenda. The allotted time can be adjusted for agenda items before or during the meeting.
Notification lead time	The advanced notification on the number of agenda items that needs to be discussed.
Auto Add Agenda Decisions	Check box to capture agenda decisions automatically on the meeting widget. The agenda decision is captured in the following format: `(CAB Automation) - <change request number> - <decision> - <CAB Manager name> - <time><AM/PM> <timezone>`

4. Open the form context menu and select **Save**.
   The **Agenda Items** and **Attendees** related lists appear.

What to do next

You can now add agenda items and attendees to the cab meeting.

View CAB meeting details

You can view the details of any past, scheduled, or in-progress CAB meeting.

The following information is available:

CAB meeting

Field	Description
Time	○ Total time scheduled for the CAB meeting ○ Time covered until present for a CAB meeting in progress ○ Time spent discussing current agenda item ○ Time assigned to each agenda item
Agenda items	List of agenda items for the CAB meeting. You can view all agenda items or filter the list for current, pending, and completed agenda items.
Calendar	The blackout and maintenance windows are displayed on the change calendar. You can also view when the current agenda item is scheduled. You can view the calendar in a daily and weekly format.
Meeting Notes	Meeting notes, if any, for a past CAB meeting. If you are the CAB manager, you can take notes during the meeting.
Attendees	Details of attendees for the specific CAB meeting including the CAB board and delegates.
Conference Information	Conference details of the CAB meeting.

2. If you are the CAB manager, or one of the CAB delegates who has chosen to host a specific CAB meeting, you can perform the following tasks:

Task	Steps
Edit the change request	Click the edit icon beside the **Change**, **Planning**, and **Schedule** tabs.
Start the meeting	Click **Start meeting**.
End the meeting	Click **End meeting**.
Pause the timer on the current agenda item	Click **Pause** on the **Current Agenda Item** widget.
Move to the next agenda item	Click **Next** after a decision is taken on the current agenda item.
Host the meeting	Click **Attendees** > **Host** to become the host. You can host the meeting when you are a CAB manager or delegate.

Task	Steps
Promote an agenda item	Click **Promote** under a change request name and title to promote it as the next agenda item for discussion.
Take meeting notes	Click **Meeting Notes** to take notes during the meeting. These notes can be shared with CAB attendees.

Modify CAB meeting details

You can modify the agenda items for a specific CAB meeting.

Before you begin

Role required: itil, sn_change_read, sn_change_write, or sn_change_cab.cab_manager

About this task

After you update the CAB board or change request conditions, refresh the CAB meeting to apply the updates. If you add new board members or attendees to the meeting, they are notified via email invitations after the meeting is refreshed.

Procedure

1. Navigate to the CAB meeting whose agenda you want to modify using one of the following steps.

Option	Description
Open from the CAB meeting list	**a.** Navigate to **Change** > **Change Advisory Board** > **All CAB meetings**. **b.** Select and open the CAB meeting to modi fy.
Open from the CAB definition list	**a.** Navigate to **Change** > **Change Advisory Board** > **All CAB definitions**. **b.** Select and open the CAB definition to send out the meeting request. **c.** Select and open the specific CAB meeting to modify.

2. Modify the CAB meeting agenda in the **Agenda Management** tab or form section, as appropriate.

Agenda Management fields

Field	Description
Notification lead time	The advanced notification on the number of agenda items that needs to be discussed.
Automatically Add Change Requests	Check box to define the types of change requests that are automatically added to the CAB meeting agenda. When you select **Automatically Add Change Requests**, the **Refresh CAB Meetings** related

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

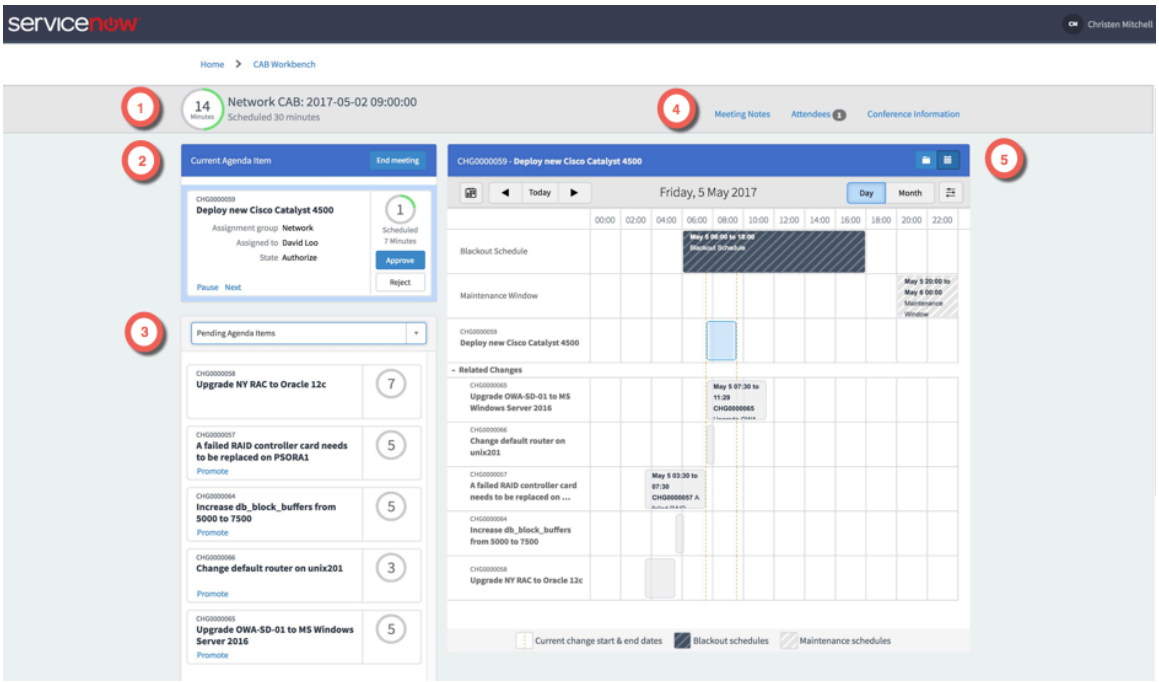
2. Click the **Send meeting request to attendees** related link.
   The CAB meeting invitation is sent to all listed attendees.

CAB meeting attendance using the CAB workbench

As an itil user, you can attend a Change Advisory Board (CAB) meeting, view the agenda items, and the change schedule. If you are an approver, you can approve a change request.

View the details of a CAB meeting and its agenda by navigating to **Change** > **Change Advisory Board** > **CAB Workbench**. From the calendar, you can view the CAB meeting schedule for a day, week, or month. To view details of a meeting, click the meeting and then click **Open** in the pop-up window.

CAB Workbench



The following components describe the different activities that you can perform in the interface:

CAB workbench

Level	Description
1	View the timer that displays the total elapsed time, the meeting name, and the scheduled date and time of the meeting. The timer count starts from zero. The color code in the timer changes based on the overall percentage of time elapsed from the total duration of the meeting: • 0% - 50%: Green • 50% - 70%: Yellow • 75% - 100%: Orange • > 100%: Red The text below the meeting name displays the total time allotted for the meeting.
2	View the current agenda item. The timer displays the amount of time spent discussing the current meeting agenda item. The form area displays the details of the current agenda item that you have selected. When the current agenda item

CAB workbench (continued)

Level	Description
	changes, the details on the form and the calendar change accordingly. If you select an agenda item that is not the current agenda item, the form area displays the details of the selected agenda item. The form area does not display details of the current agenda item even when the current agenda item is changed to the next agenda item. **Note:** If you are one of the approvers for the agenda item, the **Approve** and **Reject** buttons appear below the timer. You can click **Approve** or **Reject** as appropriate, enter your comments in the Confirmation pop-up window, and click **Approve** or **Reject**.
3	Filter the agenda items that you want to view and click **Notify me** to receive a notification before the agenda item starts. Click the **Pending Agenda Items** list, and select the **All Agenda Items**, **My Agenda Items**, or **Approved Agenda Items** option. The list of agenda items appears under the filter condition list, in the order that the items appear in the agenda.
4	• **Meeting Notes**: Displays the document note entered by the host of the meeting. • **Attendees**: Displays the list of attendees and also indicates whether the attendees are currently connected to the meeting. • **Conference Information**: Displays any content that was stored in the **Conference Information** field from the related CAB meeting record.
5	View the details of a current change in the form view or in the calendar view. **Show form**: Click the show form icon ( ) to display change details in the form view. The **Change**, **Planning**, and **Schedule** tabs provide information about the change request meeting, planning, and scheduling. **Show calendar**: Click the show calendar icon ( ) to display change details on the calendar form. You can select the day or the month that you want to view details of a change for. In a day view, you can click the settings icon ( ) and then click the configuration icon ( ) to set relevant filter conditions. If you turn on any of the configuration filter conditions, the related change records are displayed. The change records appear in the time slot of the day that the current change implementation is planned for. In the configuration settings, you can view other potential conflicts. The conflicts can be other change requests that are scheduled for implementation by the same assignee, assignment group, or for the same configuration item. The day and month view of the calendar displays the Blackout Schedule time, Maintenance Window, and the agenda item that is in progress. In the day view, the specific time slot of the planned blackout and maintenance window is highlighted. In the calendar view, the entire day is highlighted.

CAB workbench (continued)

Level	Description
	Note: For standard change proposals, the **Change**, **Proposal**, and **Change Request Values** tabs provide information on change request meeting, proposal, and change request values. The show form ( ) and the show calendar ( ) icons do not appear for standard change proposals.

Add new CAB meeting agenda items

You can add an agenda item to your CAB meeting to customize the agenda and make the meeting more effective.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Change Advisory Board** > **All CAB Meetings**.
2. Click the CAB meeting record that you want to add an agenda item to.
3. On the Agenda Items context menu, click **New**.
4. On the form, fill in the fields.

CAB Agenda Item form

Field	Description
Meeting	Name of the meeting that you selected to add the agenda item.
Task	Lookup list to select the change request or standard change proposal. **Note:** The standard change proposal is available for selection only from Xanadu .
Order	Order that the agenda items will be reviewed during the CAB meeting.
Notification recipients	Recipients to receive the notification about the new agenda item.
Short description	Short description of the task.
Work notes	Detailed description of the task.
State	Current state of the agenda item.
Decision	Status of the agenda item.
Allotted Time	Allotted time for the agenda item in the meeting.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Elapsed Time	Time already spent on the agenda item.

5. Click **Submit**.

CAB meeting management using the CAB workbench

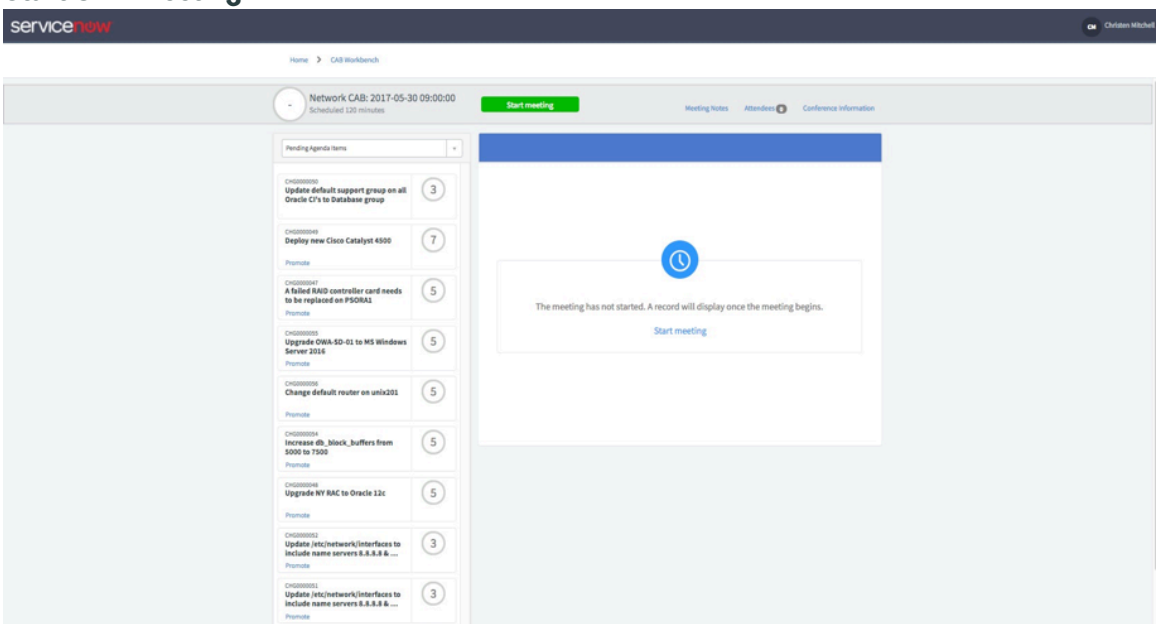
As a Change Advisory Board (CAB) manager, you can view and manage details of a CAB meeting and its agenda items through the CAB workbench.

You can view the details of a CAB meeting and its agenda by navigating to **Change** > **Change Advisory Board** > **CAB Workbench**. The calendar offers a view of your CAB meeting schedules for the day, week, or month. To view your meeting details, click the meeting and then click **Open** in the pop-up calendar. To start a meeting, click **Start meeting**.

Note:
If you click the first agenda item for the first time, a Confirmation window appears. If you want to start the meeting, click **Yes**, otherwise, click **No**.

Watch this six-minute video to learn more about CAB meeting management. This video provides an overview of planning and scheduling within the CAB Workbench module.

Start CAB meeting



The details of the change request meeting appear.

CAB workbench (continued)

Level	Description
	• Click **Demote** to append the current agenda item in the **Pending Agenda Items** list so that you can discuss the agenda item later. **Note:** The timer displays the amount of time spent discussing the current meeting agenda item. • Click **End meeting** to end a meeting.
3	You can filter the agenda items that you want to view. • Click the **Pending Agenda Items** list, and select the **All Agenda Items**, **My Agenda Items**, or **Approved Agenda Items** option. **Note:** The list of agenda items appears under the filter condition list, in the order that the items appear in the agenda. • Click **Promote** if you want an agenda item to appear at the top of the agenda item list.
4	You can take meeting notes whether you are a host or a delegate. You can view the list of attendees and conference information. • **Meeting Notes**: Enables the CAB manager and delegates to document notes for the overall meeting. The notes captured in the widget can be shared from the widget. The widget emails the contents to the list of attendees, which are automatically saved to the corresponding **Meeting Notes** field in the CAB Meeting record. Any notes specific to a change request can be added directly to the change request. To add a note, use the editable view of the form under the edit icon in the upper left of the form widget. **Note:** The agenda decisions made by the CAB and change approvers, such as whether the agenda item is approved or rejected or when CAB manager skips to another agenda item without making a decision, are automatically captured in the meeting notes widget. The agenda decisions are stored in the **Meeting Notes** field in the related CAB Meeting record. • **Attendees**: Displays the list of attendees and indicates if the attendees are currently connected to the meeting via the green Presence icon. The list also displays the attendee's response to the meeting invitation such as Accept, Tentative, Decline, or No response. • **Conference Information**: Displays any content that was stored in the **Conference Information** field on the related CAB Meeting record.
5	You can view the details of a current change in the form view or in the calendar view.

CAB workbench (continued)

Level	Description
	Show form: Click the show form icon to display change details in the form view. The **Change**, **Planning**, and **Schedule** tab provide information about the change request meeting, planning, and scheduling. You can edit the form view, by using the edit icon . To customize the view, click the list contextual menu and then click **View** > **cab_workbench**. On the Change Request form, right-click and navigate to **Configure** > **Form Layout**. On the Configuring Change Request form, you can add fields and sections that you want to display in the form view. **Show calendar**: Click the show calendar icon to display current change details on the calendar form. You can select the day or the month that you want to view meeting details for. In the day view, click the settings icon and then click the configuration icon to set relevant filter conditions. If you turn on any of the configuration filter conditions, the related change records are displayed. The change records appear in the time slot of the day that the current change implementation is planned for. In the configuration settings, you can view other potential conflicts. The conflicts can be other change requests that are scheduled for implementation by the same assignee, assignment group, or for the same configuration item. The day and month view of the calendar displays the Blackout Schedule time, Maintenance Window, and the agenda item that is in progress. In the day view, the specific time slot of the planned blackout and maintenance window is highlighted. In the calendar view, the entire day is highlighted.

Mobile experience for Change Management

Manage your change tasks from anywhere using the Mobile Agent mobile application. With this mobile application, you can stay connected and access the information in real time to complete your tasks.

As an ITSM agent or technician, you can use Mobile Agent when connected online to accomplish the following task:

- Access the change tasks assigned to you or to your group.
- Add comments or work notes or reassign the change tasks.
- Receive push notifications for change tasks assigned or commented on.
- Approve or reject change requests, requests, and requested items.

Watch this three-minute video to learn about the Mobile Agent for managing change tasks. This video demonstrates using the ServiceNow Agent mobile app for managing change tasks.

Download the Mobile Agent mobile application

Access Mobile Agent on your mobile device to manage your change tasks.

Before you begin
Role required: itil or sn_change_write

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Mobile Agent mobile application runs on the Mobile App Builder mobile platform. Activate the ITSM Mobile Experience (com.sn_itsm_mobile) plugin to enable the ITSM mobile application on your device.

Procedure

1. In your mobile device, go to Apple App store if you are on an iOS platform or Google Play Store if you are on an Android platform.
2. Search for `ServiceNow Agent`.
3. Download and install the ServiceNow Agent application.

Get started with Change Management mobile tasks

Access Mobile Agent on your mobile device to manage change tasks.

Before you begin

Download ServiceNow Agent on an iOS platform from the Apple App Store or on an Android platform from Google Play Store. For more information, see Download the Mobile Agent mobile application.

Role required: itil or sn_change_write

Procedure

1. Open Mobile Agent and tap the plus icon (**+**).
2. Add a ServiceNow instance by tapping the plus icon (+) and then entering the instance address.
   You do not need to include `service-now.com` at the end of the instance name.
3. Tap **Change tasks** to get started with managing your change tasks.

View change tasks

You can view the state, risk, and the schedule of the change tasks in the Mobile Agent mobile application.

Before you begin

Role required: itil or sn_change_write

Procedure

1. Tap **My Work** tab.
2. Tap **Change tasks** to open the list of change tasks.
3. Tap the change task for a detailed view.
4. Tap any field with right arrow to view its details.

Add comments to your change tasks

You can add comments to a change task from the Mobile Agent mobile application. For example, to add an insight about the change task or a discussion regarding the change task.

Before you begin

Role required: itil or sn_change_write

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Tap **Change Tasks** to open the list of change tasks.
2. Tap the change task to open the detailed view.
3. Tap **Add comment** to add your worknotes.

Resolve or close a change task

When you implement the change task, you can close the task from the Mobile Agent mobile application.

Before you begin

Role required: itil or sn_change_write

Procedure

1. Tap **My Work** tab.
2. Tap **Change tasks** to open the list of change tasks.
3. From the list of change tasks, swipe left the change task that you want to close.
4. Tap **Close task**.

Legacy: Change Management Platform Analytics Solutions

Platform Analytics Solutions and in-form analytics contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

To enable the solutions for Change Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Change Management. The guided setup takes you through the entire setup and configuration process.

Inactive dashboards

Some dashboards in this content pack are inactive when installed. Complete configuration and run data collection jobs before you activate these dashboards. You can activate dashboards in Dashboard Properties, accessible from the context menu. You have to assign an owner to the dashboard to activate it. For more information about configuring Platform Analytics Solutions, see Configure Platform Analytics Solutions

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The average length of time since the last update made to a change.

Number of new changes

The number of new changes with a registration date on the data collection date.

Change backlog growth

The number of closed changes subtracted from the number of new changes.

Number of closed changes

The number of changes with a close date on the data collection date.

% of urgent changes

Percentage of urgent changes. Is a formula: Number of new changes classified as urgent / Number of new changes * 100

Average close time of changes

The average length of time in hours between when a change request is opened and closed.

Average implementation time of closed changes

The average length of time in hours between when a change request enters the Implementation state and when it is closed

Number of reassigned open changes

The number of changes with a reassignment count of 1 or higher

Number of unsuccessful changes

The number of closed changes with a Close Code of "Unsuccessful"

The following indicators are not displayed on the dashboard but are used in formulas:

- Summed age of open changes
- Summed age of updated since of open changes
- Summed duration of closed changes
- Summed implementation time closed changes
- Summed re-assignment of open changes

Legacy: Change Velocity dashboard

Use this dashboard to track the average duration of change requests in the last 30 days.

> **Important:**
>
> Starting in Xanadu release, the Change dashboard is deprecated. Users can use Change dashboard to view, and track the open changes.

The Change Velocity dashboard is divided into the following tabs for effective usage. The ServiceNow® Performance Analytics capability in the Change Velocity dashboard provides the following benefits:

- The **Current Pipeline** tab provides insights into current change activity. The **Historical Pipeline** tab provides details on trends and patterns associated with the change management process flow. The **Process KPIs** tab represents a modern set of Change KPIs that are used to evaluate the change process.

Change Velocity dashboard view

Manage the workspace configuration for a Change request in Service Operations Workspace

Utilize the new table-based configuration to align with the Service Operations Workspace Dynamic Overview Pages with the change process of your organization.

These configuration options allow users to define how the Dynamic Overview pages render throughout the change life cycle. This includes configuration options for overview pages, contextual sidebar and activity stream behavior for each state.

With this you can configure the following components in the workspace configuration:

- Control the display of the cards in the contextual side panel
- Control the order of the cards to be displayed in the Overview pages
- Control the display of activity stream bar in the Overview pages
- Configure the journal fields

Show the activity stream bar

Show the activity stream bar for a for a change request in Service Operations Workspace.

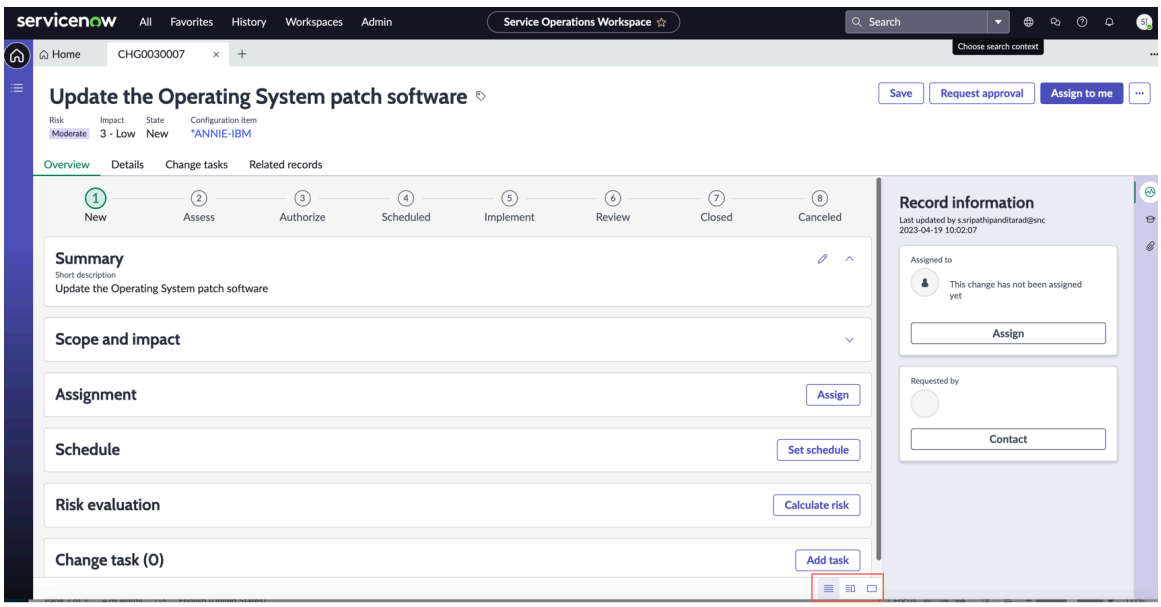
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Workspace Configuration** > **Overview Container**.
2. Select a state.
3. On the Change Overview Container form for the selected state, enable **Display action bar**.
4. Right-click on the form header and select **Save**.

   The action bar is shown on the Service Operations Workspace at the bottom of the screen.



Configure the order of the cards in Overview section

Configure the order of the cards that display in the Overview section for a change request in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Workspace Configuration** > **Overview Card**.
2. Right-click on Chg overview container column, and select **Group By Chg overview container**.
3. Select a state.
4. In the **Change Overview Cards** section, modify the order of the overview cards using **Display order**.
5. Right-click on the form header, and select **Save**.

Configure the journal field of a change request

You can configure if the **Work notes** or **Additional comments** sections to display for a change request.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Change** > **Workspace Configuration** > **Overview Journal Field**.
2. Select a Chg overview card.
3. In the **Change Overview Fields** section, to delete select the journal field, and select **Delete** from **Actions on selected rows.**
4. Right-click on the header and select **Save**.

Reference section for Change Management

Reference sections provide additional information about components installed with Change Management.

Configuring maintenance schedules - Best practices

Maintenance schedules define the periods during which a Configuration Item or change can be implemented.

These schedules are incorporated into the conflict detection process for change requests. If a change request doesn't adhere to the relevant maintenance schedule, a conflict record is generated for the change request.

There are two ways to define Maintenance schedules for Conflict Detection:

- Configure maintenance schedule. This path is enabled through the change.conflict.currentwindow system property.
- Create maintenance schedule using Schedules table [cmn_schedule]. This method can be enabled using the change.conflict.ci_maint_sched system property.

Note:
These system properties can be configured on the Conflict properties.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

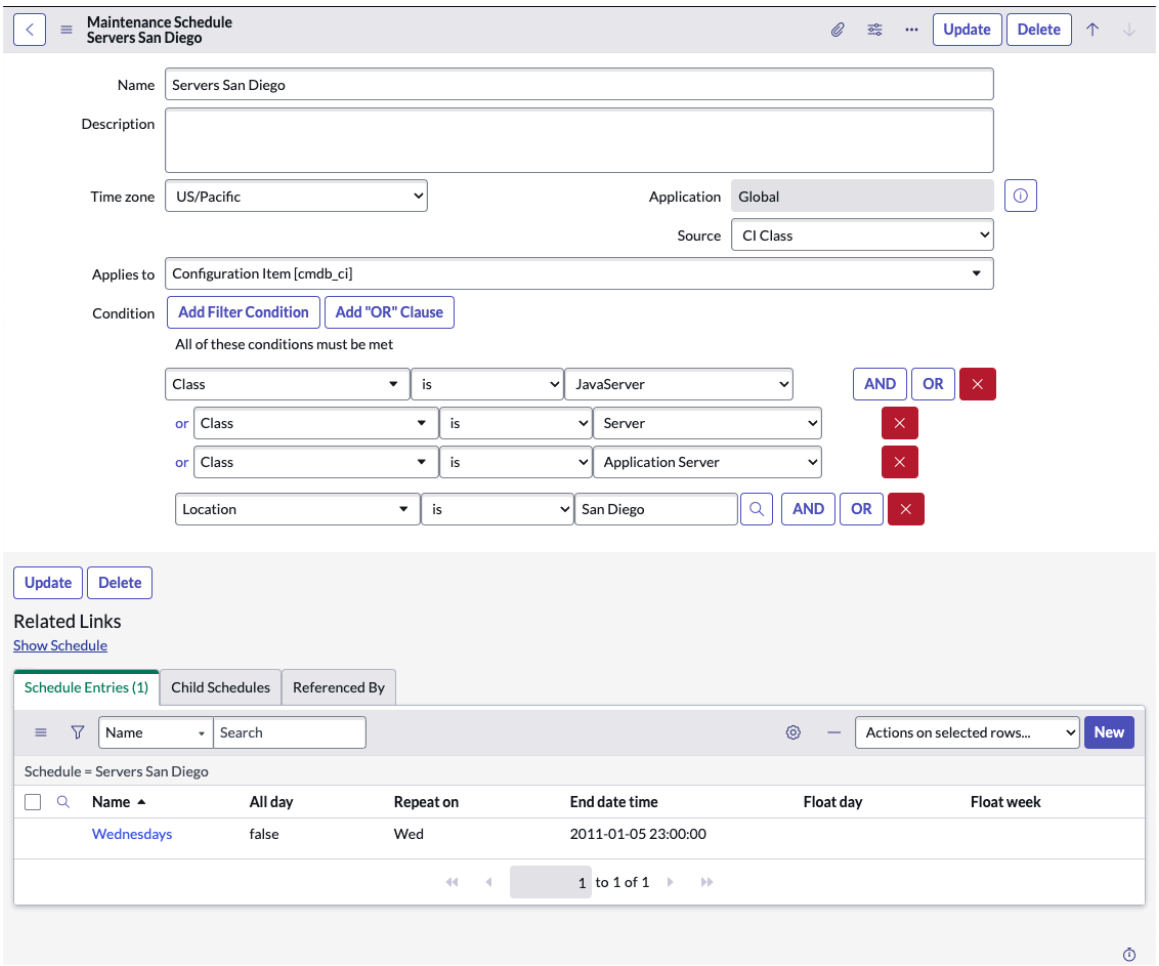
Maintenance schedule using schedule maintenance form

All Maintenance Schedules defined through this method are processed based on the condition field, which must be evaluated to determine its applicability to the change request, the primary CI, or the associated Affected CIs (if they are executed in Advanced mode).

It should be noted that the presence of multiple Maintenance Schedules extends the time required to determine their relevance, and this duration increases with each Affected CI.

If a generic schedule is applicable to numerous CIs or change requests, you must define a maintenance schedule using Configure maintenance schedule.

However, if your schedules are tailored to a limited number of CIs, you must consider creating maintenance schedule using schedules table.



Maintenance schedule using schedules table

This method is designed where individual CIs or small groups of CIs must follow a specific schedule.

In such cases, the maintenance schedule should be set in the Schedule table (cmn_schedule) instead of the maintenance schedule table. This approach prevents the need for conflict detection to process the schedule twice using maintenance form and the schedule table.

Unlike the maintenance schedule record, the schedule record lacks a condition or an **Applies to** field, as it is intended to be directly associated with a CI. After defining the schedule record, the **Type** must be set as `maintenance` to link to a CI. To attach this schedule to a CI, it should be

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change Management properties (continued)

Name	Description
	• Type: true | false • Default value: false
com.snc.change_request.enable_unauthorized	Enables the creation of unauthorized change • Type: true | false • Default value: false
com.snc.change_request.event.state_updated.enabled	Generates the *sn_change.state.updat* • Type: true | false • Default value: false
com.snc.change_request.event.state_updated.states	Enter the change request state field values, e when any of the state value changes, for exar event for all state changes. For more informat **Note:** For this property to take effect, property

Change Management properties for Discovery integration

If your organization is subscribed to Discovery , integration with Discovery is automatically enabled. With this integration, any configuration item (CI) with an IP address that is part of a change request process can be maintained automatically. When Discovery is activated, the following three new properties become available.

Name	Description
com.snc.change_request.auto.discovery	Trigger Discovery for the Affected CIs automatically, manually or not at all. • Type: Choice list • Values: Off, Both, Automatic, Manual • Default value: Off
com.snc.change_request.disco.auto.state	Defines which Change Request states Discovery will be automatically triggered. • Type: String • Default value: Review
com.snc.change_request.disco.manual.state	Defines which Change Request states allow Discovery to be manually triggered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	• Type: String • Default value: Implement, Review

Change Management properties available from sys_properties table

The following properties are available for further configuration. To list them, enter `sys_properties.list` in the navigator text box and filter for *`com.snc.change_request`*.

Name	Description
com.snc.change_request.copy.related_lists	Related lists (comma-separated) that will be copied from the originating change. • Type: string • Default value: task_ci,task_cmdb_ci_service,change_task
com.snc.change_request.rl.change_task.attach.enable_copy	Copy attachments from originating change task. • Type: true | false • Default value: true
com.snc.change_management.policy.approval.log	The debug logging property that provides the detailed logging information of the workflow activity when using Change Approval Policies. Type: choice list

Analyze change request risk and impact rating

After you create a change request, you can assess and analyze the risk and impact rating for the change request. You can review any conflicts that are detected by reviewing the change request.

Analyze the risk of change and review detected conflicts in the following ways.

Risk conditions and calculation

Change Management features provide ways to calculate and assess the risk of change requests, and to identify and resolve conflicts.

Risk assessment and calculation assists you with understanding the urgency and impact of change requests. Conflict detection assists you with scheduling change requests for the least impact to stakeholders. This features minimize the risk and cost of rapid changes in your environment.

Risk Calculator property

The Best Practice - Change Risk Calculator plugin enables dynamic calculations of the risk and impact of a change. The administrator specifies how and when risk and impact rules are applied.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Best Practice- Change Risk Calculator plugin bundles some risk calculations using configuration item (CI) attributes and time measures.

A change management system property determines the risk calculation method. In **Change** > **Administration** > **Risk Properties**, the administrator selects one of the following methods.

Change Risk calculation method

Option	Description
UI Action	Enables users to click the **Calculate Risk** related link to check condition rules on demand. This UI action applies matching conditions according to their order. Each time a rule is applied, an alert is displayed confirming the new values for risk and impact. The **Calculate Risk** related link appears on the Change Request form only if the following statements are true. • There are risk and impact conditions that apply to the current change record. • The user has the admin or the itil role.
Business Rule	Enables conditions to be evaluated and applied dynamically through a business rule on the Change Request table. The conditions are evaluated before a change request record is inserted or updated. Users with the admin or the itil role or both can execute this business rule. **Note:** The *Run Risk Calculation* business rule replaces the *Calculate Risk* business rule when the Change Management - Risk Assessment plugin is activated.
None	Disables the processing of risk and impact rules.

Add or modify risk and impact conditions

You can define risk calculation rules on which the risk and impact of a change are calculated. Best Practice - Change Risk Calculator is activated by default in the base system.

Before you begin

Role required: itil_admin or admin

About this task

Risk Conditions are run against the change request based on their **Order** field from lowest to highest. The first Risk Condition that matches the change request record is applied. All subsequent risk conditions are then ignored whether they match or not. A risk calculation rule is defined with two elements.

- Conditions that can evaluate to *true* or *false*. You can use a condition builder or write a script.
- **Risk** and **Impact** field value settings when the conditions evaluate to **true**.

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Risk Conditions**.
2. Click **New**, or click the risk condition to modify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also edit risk conditions from within the Change Request form by opening the form context menu and clicking **Edit Risk Conditions**.

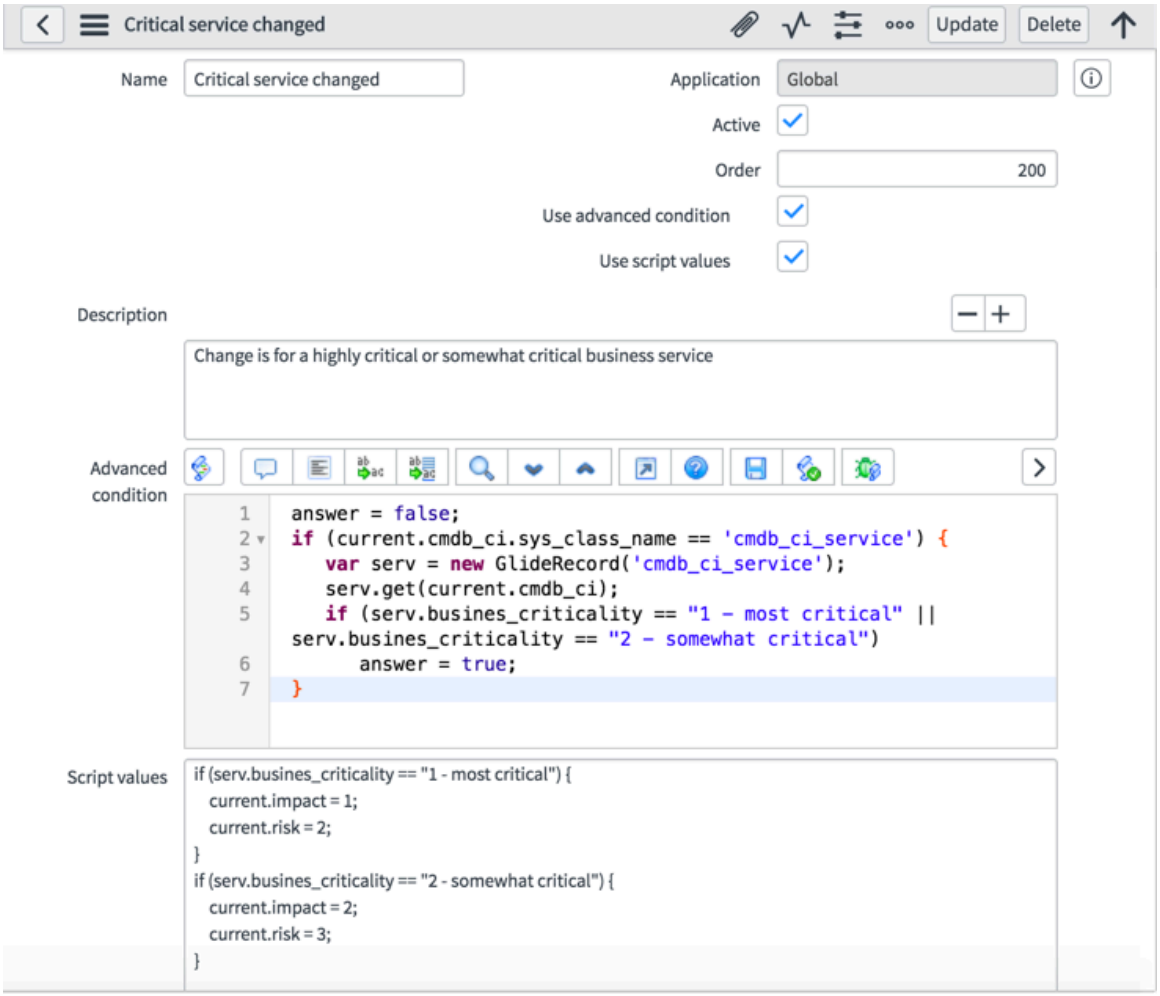
3. Complete or update the form, as appropriate.

Field	Description
Name	Enter a descriptive name for the rule
Risk Impact	Select a value for one of these fields. The selection determines which field to update based on this risk calculation.
Active	Select the check box to use the rule.
Order	Enter the order in which this risk calculation is evaluated. Rules with lower numbers are evaluated first. If there are two or more rules with differing orders, the rule with the lowest order is evaluated and the others are ignored.
Use advanced condition	Select the check box to enter a script instead of using the condition builder.
Use script values	Select the check box to hide the **Risk** and **Impact** fields. The script specifies the risk and impact values.
Description	Enter a description of how this risk calculation is applied.

4. Specify the rule based on your selected rule method.

Example
In the following example, the **Advanced condition** script first determines whether the CI is a business service. If so, the script identifies whether the **Business criticality** value is **1 - most critical** or **2 - somewhat critical**. If it does, it sets the global variable answer to *true*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When the **Advanced condition** script returns *true*, the script in the **Script values** field sets the change request **Impact** and **Risk** values based on the **Business criticality** value.

Risk assessment

There are two methods to calculate the risk of a change. The Best Practice - Change Risk Calculator is activated in the base system by default. Change Management - Risk Assessment is optional.

- Change Risk Calculator uses predefined properties and conditions to calculate a risk value.
- Change Management - Risk Assessment uses information provided by the end user to assess a risk value.

The two methods can be used individually or together, depending on your requirements. If the methods are used together, the highest risk value from both methods is always selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Risk assessment and calculation

Note:
If both Risk Assessment and Risk Calculator are active but you want to use only one method, remove conditions for the method you do not want to use.

If you activate Change Management - Risk Assessment, the administrator can add the **Task Assessment** > **Task** related list to the change request form, if necessary. The related list displays risk assessments associated with the change request.

Related topics

Perform risk assessment

Define risk assessments

Change Management - Risk Assessment provides a flexible way to capture information from the end user to calculate the risk of the associated change request. You can define the risk assessment questions, thresholds, and conditions that calculate risk for any change request.

Before you begin

Role required: itil_admin

Change Management - Risk Assessment must be activated.

About this task

You can use a series of questions to capture the risk of a change. A different assessment of the questionnaire can be defined on the change record. The assessment uses a weighted score approach for each question. The composite weighted score derived from the answer of the end user is used to calculate risk. This score is based on the thresholds associated with the risk assessment.
Change Risk Assessment is an application built on Survey and Assessment V2 architecture. While it's possible to configure multiple metric categories on this architecture, it is better not to do so to avoid errors.

You can configure multiple change Risk Assessment definitions each with one Metric Category, where the Metric Category filter is identical to the filter of the change Risk Assessment condition.

Procedure

1. Navigate to **All** > **Change** > **Administration** > **Risk Assessments**.
2. Click **New**.
3. Complete the form, as appropriate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Input value
Name	Name for the risk assessment. This name is displayed to the end user.
State	The state of the assessment: **Draft** or **Published**.
Description	Description of the risk assessment.
Condition	Conditions which determines if a risk assessment is attached to the change. Typically, the first attachment that matches the conditions gets attached during evaluation. Therefore, ensure that the conditions result in the correct assessments being attached especially when defining multiple questionnaires. **Note:** Ensure that the conditions are simple and mutually exclusive so that the assessment conditions are easy to understand and maintain.

4. Click the form context menu and select **Save**.
   The page refreshes with the **Assessment Categories** and **Assessment Thresholds** related lists. The **Assessment Categories** related list enables you to define the questions that the end user answers to assess the risk of a change request.
5. Complete the following steps to create an assessment question.

   a. In the **Assessment Categories** related list, click **New**.

   b. Complete the form, as appropriate.

   Metric category

Field	Description
Name	Name of the assessment category.
Create Stakeholders	If selected, automatically creates stakeholders for all assessable records linked to this category.
Weight	Value that represents importance of this category relative to other categories. The weight is multiplied to the score of the answer to calculate the weighted score.
Filter	Only assessable records that meet filter conditions are evaluated by metrics in this category.
Description	Description of the assessment category.

   c. Click **Submit**.

   d. Open the assessment category.

   e. In the related list, click **Assessment Metrics**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Complete the form, as appropriate.

Assessment metrics

Field	Description
Name	Name of the assessment metric.
Category	The category of the assessment metric.
Method	The method of gathering data for this metric.
Weight	Value that represents importance of this metric relative to other metrics. The weight is multiplied to the score of the answer to calculate the weighted score.
Order	Order of the question in the assessment.
Active	If selected, the metric is activated to be used for assessments and result calculations.
Mandatory	If selected, makes a field mandatory in an assessment.
General	
Question	Question that is displayed on the assessment.
Description	Tool tip text for the assessment.
Depends on	The condition that determines whether the metric is shown to the user or not.
Allow Additional Information	If selected, a text box appears for the user to enter additional information for the question.
Field Type	
Data type	The data type of the answer that is given by a user for a question. **Note:** Depending on the data type that you select, additional fields may appear.

g. Click **Submit**.

h. In the **Assessment Threshold** related list, click **New**.

i. Complete the form, as appropriate.

Change risk assessment threshold

Field	Description
Risk Assessment	The assessment name for which assessment threshold is applied.
Risk	Risk value applied on the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Risk value can be overridden by risk conditions.
Application	The name of the application that contains the record.
Score greater than	The threshold against which the composite score is compared and evaluated.

j. Click **Submit**.

Note:
You can create or edit the assessment questionnaire through the Assessment Designer module or by clicking **Edit in Assessment Designer** related link.

For example, after you define the risk assessment, this is how the risk assessment score is calculated and set.

- *asmt_metric_result* stores the score set.
- The weight is calculated as `sum (asmt_metric_result.normalized_value)` where `asmt_metric_result.normalized_value = actual_value * weight`.
- The risk calculated as `sum(actual_value * weight) > threshold`. For example, If the result is 7 and moderate threshold is 6 risk is moderate.

Perform risk assessment

You can perform risk assessment of existing change requests after the risk assessment criteria are defined. After assessing the risk, you can view the risk assessment responses in the change request.

Before you begin
Role required: itil, sn_change_write, or admin

About this task
Verify that the **Risk Assessment** related list is configured on the Change Request form. If it is not configured, an administrator can add the **Task Assessment** > **Task** related list.

The **Risk Assessment** related link is available only when the change request meets the risk assessment condition and risk assessment category condition, the change request type is **Normal** or **Emergency**, and the **State** is **New**, **Assess**, or **Authorized**. On clicking the **Risk Assessment** related link, the Change Risk Assessment form appears if you have not assessed the risk for this change request before. When you submit the form, these three things appear at the top of the change request form:

- **Risk assessment evaluated**: The estimation of risk after it is assessed against the Change Risk Assessment form and the criteria set for assessment for the change request.
- **Risk Condition applied**: The result of the risk calculated against pre-defined risk conditions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Risk set to**: The final weight of risk based on risk assessment and risk calculation.

> **Note:**
> If you have filled the Change Risk Assessment form earlier but clicked **Risk Assessment** related list again, a pop-up window appears informing that you have already completed the risk assessment for the change request and confirms whether you want to edit the existing risk assessment. Click **Yes** to fill the Change Risk Assessment form again. Click **No** to use the existing risk assessment to calculate risk.

Procedure

1. Open a change request.
2. Click the **Risk Assessment** related link.
3. Answer the questions and click **Submit**.
   After submitting the risk assessment, click the **Risk Calculation** related link to calculate the risk. The result of risk assessment, risk calculation, and the value that appears in the **Risk** field of the change request form appears.

   Users with survey_admin or survey_reader role can navigate to **Legacy Surveys** > **Survey Responses** and filter by **Instance**. Survey instances are individual assessments distinguished by the date and time when they are taken.

Related topics

Risk assessment

Migrate to legacy change risk assessments

Users can migrate legacy change risk assessments to versions compatible with the new Change Risk Assessment table schema and logic.

Before you begin

Few points to remember:

- Customers with Change Management - Risk Assessment [Legacy] (`com.snc.change.risk_assessment`) plugin already installed on their instances should only follow this task.
- The Change Management - Risk Assessment [Legacy] (`com.snc.change.risk_assessment`) plugin cannot be installed for customers who are on Kingston and later releases.
- Migration guidance and best practice suggests that the migration should be performed on a development instance and not on a production instance.
- The development instance must have the new Change Management - Risk Assessment [com.snc.change_management.risk_assessment] plugin installed.
- All migration work must be captured in an update set, moved to a test instance, and then tested before moving them to a production instance.

Role required: itil_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following legacy risk assessment components are migrated:

- Risk assessment definition, questions, and question choices.
- For multiple assessment conditions, the migration might result in the following one or more than one risk assessment records:
  - If all the multiple assessment conditions are on the same table, then the migration results in only one risk assessment.
  - If the multiple assessment conditions are on different tables, then the migration creates as many risk assessments as they pertain to different tables.

Procedure

1. Create an update set and set it as the current set.
   For more information, see Create and select an update set as the current set.
2. Navigate to **Change** > **Risk Assessment (legacy)**.
3. Open the legacy risk assessment that you want to migrate to a change risk assessment.
4. Click the **Migrate to Risk Assessment** related link.
5. Click **OK**.
6. Repeat steps 4-5 for all the legacy risk assessment to be migrated.

What to do next

After all the legacy risk assessments are migrated, reach out to the support team to run the following scripts:

```
disable_legacy_change_risk_assessment.js
```

Capture the results in the update set created and later mark the update set as closed complete. For more information, see Mark an update set complete.

Note:
The given procedure is a suggested practice. Alternatively, you can capture each migrated Change Risk Assessment in their own update set. You can also capture the results of disabling of the Change Management - Risk Assessment [Legacy] using `disable_legacy_change_risk_assessment.js` in a separate update set.

Migrated risk assessment components

When you migrate a change risk assessment, the system maps records from legacy risk assessment to the new risk assessment tables.

To create a functional risk assessment on the assessment framework, the system converts risk assessment records to the most logical equivalent assessment risk records. This may mean multiple assessment risk records are created from one legacy risk record.

Migrated components

Risk assessment components	Change risk assessment components
Assessment Main [assessment_main]	Change Risk Assessment [change_risk_asmt]
Assessment Question [assessment_question]	Assessment category [asmt_metric_category]
	Assessment Metric [asmt_metric]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migrated components (continued)

Risk assessment components	Change risk assessment components
Assessment Question Choice [assessment_question_choice]	Assessment metric definition [asmt_metric_definition]
Risk Assessment Thresholds [risk_assessment_threshold]	Assessment Thresholds [change_risk_asmt_threshold]
Assessment Conditions [assessment_conditions]	This is included in Change Management - Risk Assessment [com.snc.change.risk_assessment].

Success Probability definitions

Success Probability definition is a configuration that defines the probability and the matching conditions of a change request.

By default, the success probability definition is defined for Change Success Score, Change Model Success, and Calculated.

The order field determines the execution order of the definitions, the order with least value is given higher precedence.

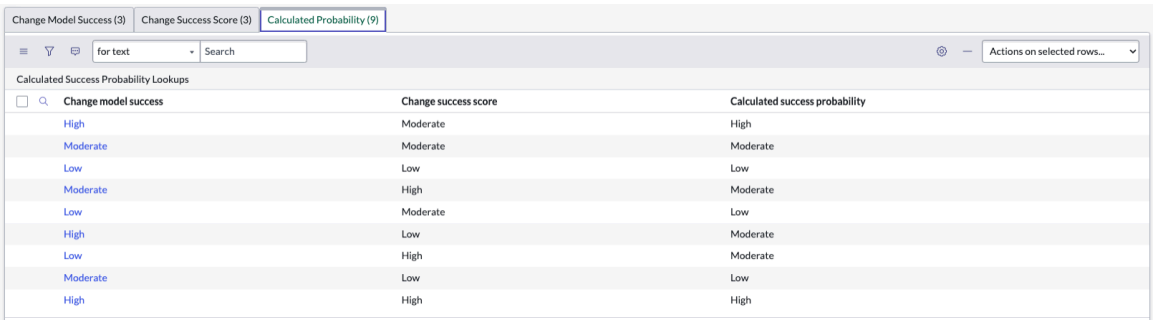
The default values are created for Change Model Success, Change Success Score, and Calculated irrespective of the probability selected on the success probability definition.

Change manager can modify the existing records in the table. The Success Score Validations business rule validates if any record is created with the allowed minimum and maximum values for Change Model Success and Change Success Score.

When Change Model Success or Change Success Score is set as probability on the Success probability definition, the corresponding related list is visible on the Success probability definition record, however, when Calculated is set all the three related lists are visible on the record.

The “Greater than or equal to” field of Change Model Success and Change Success Score related list determines the Success Probability that must be returned by the Success probability definition.

For example, if the Probability is set to Calculated on the record, and if Change Model Success evaluates to High and Change Success Score evaluates to Moderate, the success Probability definition returns High as the Success Probability.



You can edit the value in the Calculated success probability column for each combination of Change model success and Change success score. When you modify the choices for success probability on a change request, you must click **Refresh probability mappings** under **Related**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Links to update the combinations of related records for Change Model Success, Change Success Score, and Calculated probabilities. You can also update the multiple records by executing **Refresh probability mappings** on the list.

Note:

Success probability plugin supports domain separation. The **sn_chg_probability_success**, **sn_chg_probability_model_success**, and **sn_chg_probability_calculated_lookup** tables are process separated when you install the domain separation plugin.

Calculated Risk Score

Risk lookup table is to get the risk value corresponding to the success probability value and impact value.

sn_chg_probability_risk_lookup table is used to fetch the data to calculate the risk value of the change request.

By default, there are nine records with all the possible mappings for Impact and Success Probability along with their corresponding risk values.

Change manager can add new records and delete existing records in the table. The Check impact and probability combination business rule validates the duplicate mapping entries.

Navigate to **All** > **Change** > **Administration** > **Calculated Risk Score**.

All the risk calculating engines calculate their corresponding risk value, the system picks the highest risk and defines the risk for the Change. You can modify the Risk values irrespective of the values defined for Impact and Success probability.

You can view the success probability definition that has set the success probability on the change request by accessing the sn_chg_probability_details table. This table can be accessed by the users who has read access to the change requests.

On the change request form, in the **Related Links**, click **Calculate risk**. The risk engines calculate the risk for the Change. Click the icon against the **Risk** field to view the risk set for the Change.

Click the icon against **Calculated Risk Score** to find which type of success probability definition is responsible to set the risk for the change. There are three types of calculated risk score:

- Calculated (Impact + Success Probability)
- Calculated (Impact + Change Success Score)
- Calculated (Impact + Change Model Success)
- Not set: When the risk is not evaluated

Note:

Risk lookup supports domain separation. The **sn_chg_probability_risk_lookup** table is process separated when you install the domain separation plugin.

Change management integrations

You can integrate Change Management with other ServiceNow applications such as Discovery, Software Asset Management, and Hardware Asset Management.

The following topics provides information about integration of different applications with Change Management, prerequisites, and way to enable functionality of those integrated applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change Management integration with ITOM Visibility

If your organization is subscribed to ITOM Discovery or ITOM Visibility, integration with these ITOM products is automatically enabled. With this integration, any configuration item (CI) with an IP address that is part of a change request process can be maintained automatically. Change request fulfillers can also manually request the discovery process for a CI.

Enabling integration

Depending on subscriptions purchased by your organization, you must install and configure the following plugins:

- For ITOM Discovery - the Discovery plugin (com.snc.discovery)
- For ITOM Visibility - the Discovery plugin (com.snc.discovery) and Service Mapping plugin (com.snc.service-mapping)

Integration with ITOM Discovery

When Discovery is activated, Change Management exposes three new properties within the Change Properties module (**Change Management** > **Administration** > **Change Properties**):

Change Management properties for Discovery

Property	Description
Configures how discovery is triggered for Affected CIs (automatically, manually or off)	Determines whether to trigger discovery for the affected CIs automatically, manually, both, or not at all. Type: Choice list Values: Off, Both, Automatic, Manual Default value: Off **Note:** If the property below is set to Both, and you trigger discovery manually, then the automatic discovery will not be triggered for that change request.
List of Change Request states (comma-separated) where discovery can be triggered manually	Defines the change request state values to allow discovery to be manually initiated. For these defined state values, the Initiate Discovery related link is available. Type: String Default value: Implement, Review **Note:** If there are multiple languages used on the instance, then this property needs to be set to the internal state value for Review.
List of Change Request states (comma-separated) where discovery triggers	Defines the change request state values for which discovery is automatically triggered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change Management properties for Discovery (continued)

Property	Description
automatically. E.g. when the Change Request's state changes to Review	Discovery initiates when transitioning to the state values listed. Type: String Default values: Review **Note:** If there are multiple languages used on the instance, then this property needs to be set to the internal state value for Review.

Note: For the last two properties in the above table, if there are multiple languages used on the instance, then the property needs to be set to the internal value, which is 0, for Review.

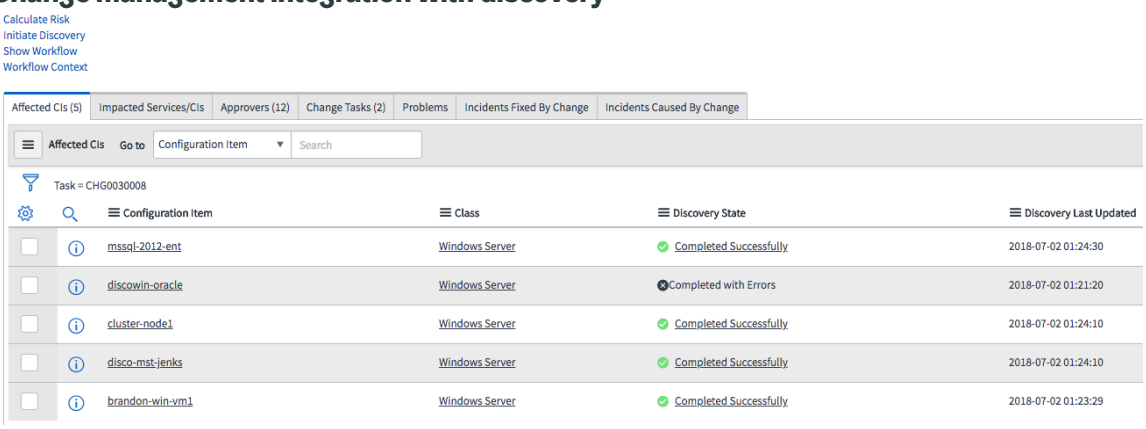
In addition to the new properties, the **Discovery State** and the **Discovery last updated** fields get added to the **Affected CI** related list. **Discovery State** provides one of five status values and a corresponding icon to reflect that status:

- In Progress
- Completed Successfully
- Completed w/Warning
- Completed w/Error
- Cancelled

The Discovery State value is presented as a link to the corresponding Discovery log file. The **Discovery last updated** field contains a date and time stamp indicating the last time Discovery was executed.

If you have opted to manually initiate the Discovery module, or opted for both manual and automatic initiation, then the **Initiate Discovery** related link appears in the Related Links section when the state of the change request matches one of the defined states in the property. When Discovery is triggered, the values in the **Discovery State** and the **Discovery last updated** fields change.

Change management integration with discovery



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration with ITOM Visibility

You can view the changes in the context of application services. Service maps available in Service Mapping show changes to an application service as a whole and to the individual configuration items (CIs) comprising the service.

If the ServiceNow AI Platform is configured to validate changes, all changes are evaluated and rendered as valid or not. If a change is valid, its change record on the application service map is marked as approved. For more information about configuring the platform for change validation, see Managing proposed changes.

The type of change mark depends on the nature of changes that it represents:

Light gray balloon ( )

Unapproved change that does not influence the application service behavior. For example, a change in a network path or adding a node to a cluster.

Dark gray balloon ( )

Unapproved change that changes the application service behavior.

Green balloon ( )

An approved change in deployments where the ServiceNow AI Platform is configured to validate changes.

Double balloon ( )

Multiple separate changes that happened a short time from each other.

Change Management integration with Software Asset Management

The Change Management integration with Software Asset Management (SAM) displays the projected licensing cost implication of a change.

This integration focuses on the projected license cost change when a change is proposed to one or more configuration item (CI) processor resources (CPU or CPU Core) running software licensed by the processor.

This integration requires the Software Asset Management Professional (com.snc.samp) and Change Management - License Change Projections (com.sn_samp_change) plugins.

Note:
You need to request the activation of the Change management – License Change Projections plugin (com.sn_samp_change) through the HI Service Portal.

When a change request is in the **New** state, users can propose a change to the CPU or CPU Cores of a CI using **Propose Change** or **Mass Update CI**. Those proposed changes are captured in an XML field that is then passed to Software Asset Management when the change request transitions into its first approval state. Once Software Asset Management performs the projected licensing cost change, those results are displayed in a new form section called License change projection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The License change projection form section displays the license projection change summary for every CI in scope for the change. The left side of the section displays fields relaying the current spend, projected spend, the spend change, and the number of impacted installations. On the right is a bar graph providing a visual representation of that information.

For a more detailed breakdown of the license change projections, a related list can be added to the Change Request form called **CI Projection Summary**. This related list provides a CI-by-CI breakdown of the license change projection summary information and provides easy access to the Software Asset Management CI Project Summary record and additional data.

Mass Update CI

Change Management integration with Hardware Asset Management

The Change Management integration with Hardware Asset Management helps in determining the asset action that must be performed on the configuration item (CI) that is associated with a hardware asset. Using this capability, change implementers can quickly update asset records directly from change and the Asset Manager can see current state on all assets that were updated by the change request.

This integration requires the Hardware Asset Management Professional (com.sn_hamp) plugin.

Note:
You must request the activation of the Hardware Asset Management Professional (com.sn_hamp) plugin from the ServiceNow® application store.

When the configuration items listed in the Affected CIs related list have an asset associated, then the **Asset action** field is populated.

You can choose an **Asset action** for the CI, from the Affected CI related list. This **Asset action** field provides three possible actions that can be selected which triggers an event.

- **Deploy**: When this action is selected, the *sn_hamp.asset.deploy* event is triggered.
- **Update/Repair**: No event is triggered for this action.
- **Retire**: When this action is selected, the *sn_hamp.asset.retire* event is triggered.

Note:
The **Asset action** column can be added to the Affected CI related list if not already available.

When a change request is in the **Implement** state, the proposed asset action triggers the corresponding event. When the workflow is complete, the asset action updates the asset and the related records and progresses to the **Review** state.

Note:
If the asset action is not selected, then the change request will not progress to the **Review** state.

For more information, see Hardware Asset Management

Domain separation and Change Management

Domain separation is supported in Change Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Change Management overview

Change Management provides a systematic approach to controlling the life cycle of all changes, facilitating beneficial changes with minimum disruption to IT services.

How domain separation works in Change Management

Change management involves the management of change requests. A change request allows you to implement a controlled process for the addition, modification, or removal of approved and supported configuration items (CIs). The request records the detailed information about the change, such as the reason for the change, the priority, the risk, the type of change, and the change category.

- A change request is an extension of a Task. Records are created in the domain of users creating the task they have in session.
- All change properties are global, meaning they are the same for every application that uses the **[sys_properties]**table properties. The table is not domain separated so any changes made impact all domains.

Domain separated tables

Change Request [change_request].

Use case

An ITIL user in the Acme domain logs in and creates a change request. The change request is created in the domain that the user has selected.

How domain separation works in Change Advisory Board (CAB) Workbench

- CAB meetings synchronize with the CAB Definition table if the meeting was generated via a definition, or the meeting was created manually and has the CAB Definition field populated.
- CAB Meetings are created in the domain of the user if the meeting is created manually without an associated CAB definition.
- Meeting records are not supported if in a different domain from the associated definition.
- All other CAB records have their domain master set to the associated CAB Meeting record.

Domain separated tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CAB Definition [cab_definition]
- CAB Meeting [cab_meeting]

Domain tables (linked to domain of its associated cab_meeting)

- CAB Attendee [cab_attendee]
- CAB Agenda Item [cab_agenda_item]
- CAB Runtime State [cab_runtime_state]

Use cases

- A CAB manager creates a new CAB definition and generates 20 meetings while in the ACME domain. The result: Both the definition and meetings are created within the ACME domain.
- A CAB manager creates an ad-hoc CAB meeting from the related list on the CAB definition form. Result: The meeting is created in the domain of the CAB meeting.
- All other use cases behave in the same way as when domain separation is not enabled.

How domain separation works in Change Schedules (New feature)

- Change Schedule definitions encapsulate all the configuration options and related records used to display a given Change Schedule.
- Records are created in the domain of the current user.
- Ancillary records are created in the domain of the Change Schedule definition.

Domain separated tables

- Change Schedule Definition [chg_soc_definition]
- Related Definition [chg_soc_definition_child]
- Style Rule [chg_soc_definition_style_rule]
- Style Rule [chg_soc_style_rule]
- Style Rule [chg_soc_def_child_style_rule]

Use cases

An ITIL user in the ACME domain logs in and navigates to the Change Schedule landing page. The user can view the Change Schedules in both their current or global domain.

Tutorial: add a new change management state

This tutorial provides an example of adding a new state to the existing state model.

Before you begin

Role required: script_include_admin, ui_policy_admin, ui_action_admin, or admin

About this task

Consider the following scenario:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Based on your organization's requirements, you must add a new state, **Complete**, between the existing **Implement** and **Review** states. You must also add the ability to decide if the **Review** state is needed.

Perform the following steps:

Procedure

Open the **Change Request** form.

Create a new choice

Create a new choice for the change request state.

Before you begin
Role required: admin

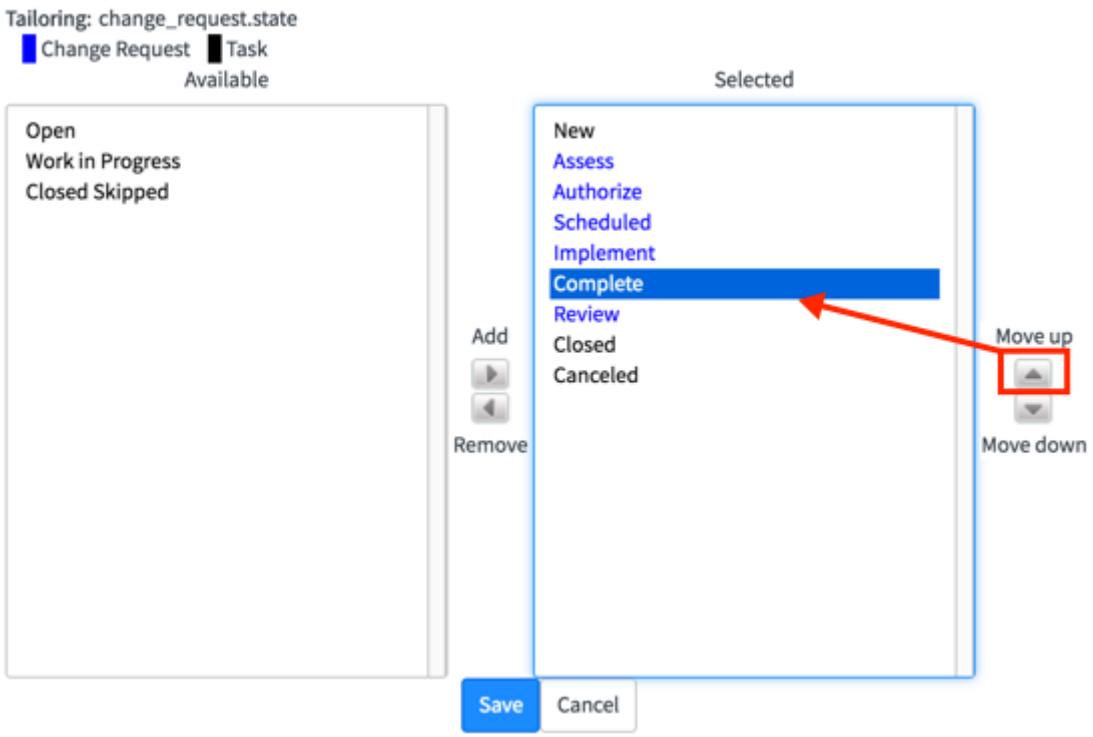
Procedure

1. Open the **Change Request** form.
2. Right-click the **State** field label and select **Configure Choices**.
   The Configuring State Choices slushbucket opens.
3. Enter the following information and click **Add**.

Field	Description
New item text	Enter Complete.
Numeric value	Enter -6.
Apply to table	Set to Change Request

   The new state appears in the **Selected** slushbucket on the form.
4. Use the up and down arrows to move the new state between **Implement** and **Review** states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Save**.
   The new choice is created and the **Change Request** form reopens.

Create a custom field

Create a custom choice field to indicate whether a change request must go through the **Review** state.

Before you begin

Role required: admin

Procedure

1. Open the **Change Request** form.
2. Complete the following steps to create a new field on the Change Request form.

   a. Open the form context menu and select **Configure** > **Form Layout**.

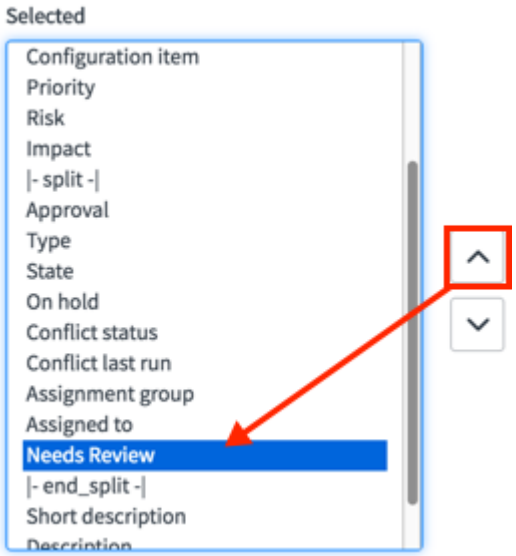
   b. Enter the following values in the **Create new field** section.

Field	Value
Name	Needs Review
Type	Choice

   c. Click **Add** to add the new field to the slushbucket.
   The new field appears at the bottom of the **Selected** slushbucket.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Use the up and down arrows next to the slushbucket to move the new field next to the **Assigned to** field.



b. Click **Save**.
The Change Request form reopens with the **Needs review** field below the **Assigned to** field.

3. Complete the following steps to configure the choices for the **Needs review** field.

a. Right-click the **Needs review** field label and select **Configure choices**.

b. In the **Enter new item** field, add **Yes** and **No** choices and click **Add**.
The choices appear in the **Selected** list.

c. Click **Save**.

The Change Request form reopens. The **Needs review** choice list contains the**Yes** and **No** choices.

4. **Optional:** If the value in the **Needs review** field is **Yes**, **No**, or blank, configure the default by completing the following steps.

a. Right-click the **Needs review** field label and select **Configure Dictionary**.

b. In the **Choice List Specification** section, select **Dropdown with – None –**as the default **Choice**.

c. Click **Update**.
The Change Request form reopens. The **Needs review** field displays **-- None --**.

Add a UI policy

Add a UI policy to display the **Needs review** field for **Normal** change requests when it reaches the **Complete** state.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the **Change Request** form.
2. Open the form context menu and select **Configure** > **UI Policies**.
3. Click **New**.
4. Enter the following values on the **UI Policy** form.

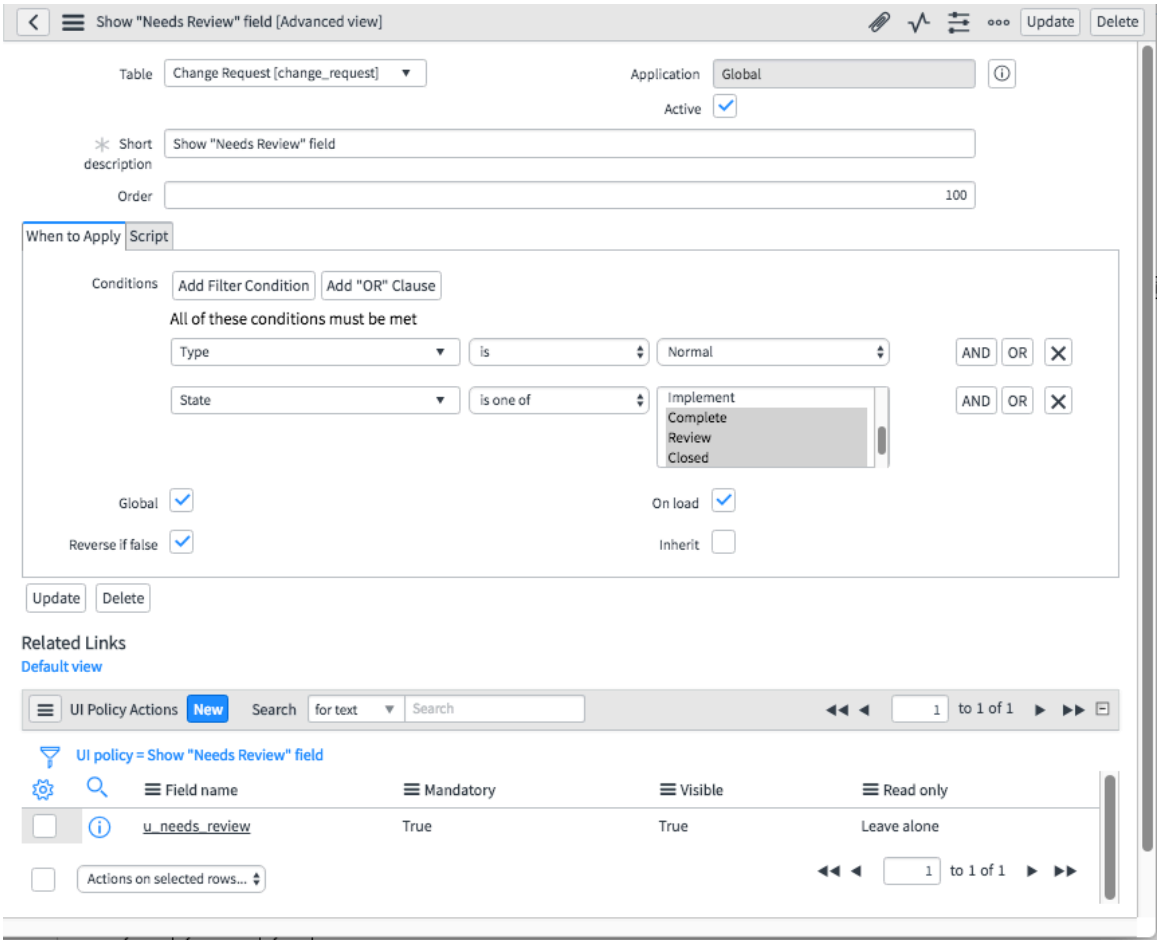
Field	Value
Table	Change Request
Short description	Show “Needs review” field
Conditions	[Type] [is] [Normal] [State] [is one of] [Review, Complete, Closed]

5. Open the form context menu and select **Save** to create the UI Policy record and stay on the form.
   The **UI Policy Actions** related list appears.
6. Click **New** in the **UI Policy Actions** related list.
7. Enter the following values.

Field	Value
Field name	Needs review
Mandatory	True
Visible	True

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Click **Submit** to create the UI Policy action and return to the **UI Policy** form.



Create an ACL

Create an access control rule (ACL) to prevent the **Needs review** field from being modified after it has been set.

Before you begin

Role required: admin with elevated security

About this task

The newly created UI Policy makes the **Needs review** field mandatory when a change request reaches the **Complete** state.

The subsequent configuration of the state model ensures that a value is required in the **Needs review** field before the change request can be saved in the **Complete** state. To prevent the **Needs review** value from being changed after it has been set, create a new access control level record (ACL) to make the field read-only.

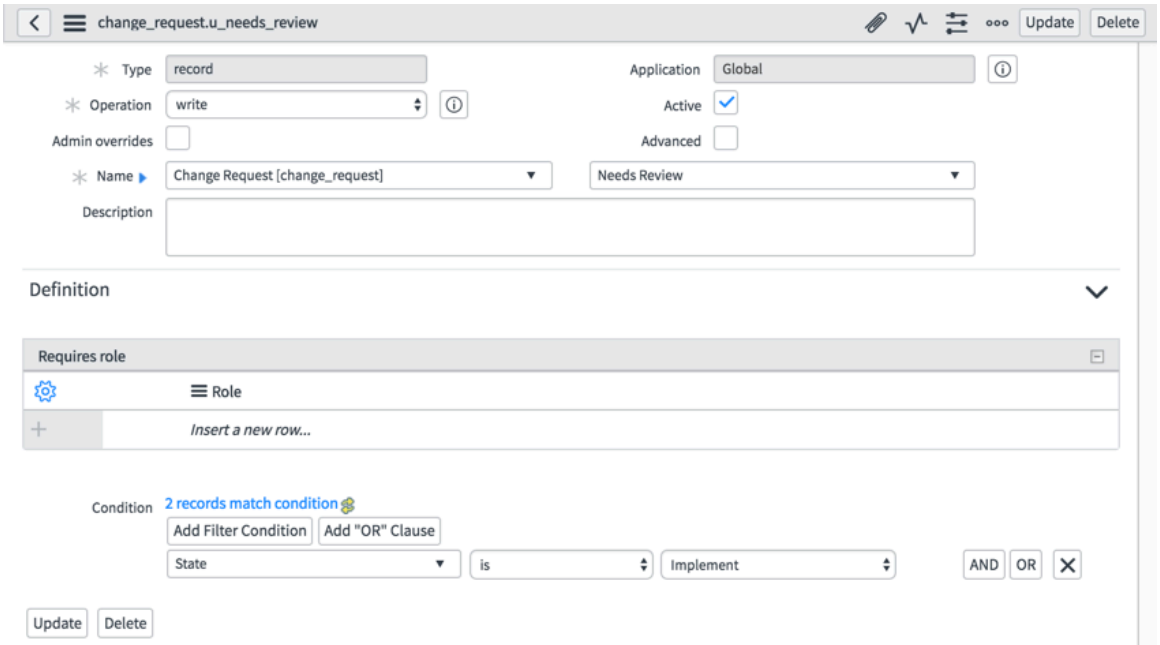
Procedure

1. Open the **Change Request** form.
2. Open the form context menu and select **Configure** > **Security Rules**.
3. Elevate your security role in the user menu that opens when you click your name in the header. Only administrators with elevated security roles can add ACLs.
4. Click **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enter the following values.

Field	Value
Type	Record
Operation	Write
Name (first part)	Change Request
Name (second part)	Needs review
Condition	[State] [is] [Implement]



6. Click **Submit**.

Update the state handler script include

Update the *ChangeRequestStateHandler* script include with the new **Complete** state.

Before you begin

Role required: admin

About this task

The *ChangeRequestStateHandler* script include defines the states available for the Change Request state model.

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Open the *ChangeRequestStateHandler* script include and modify the script as follows.
   a. Add the following line to the top of the script in the **Constants** section:

```
ChangeRequestStateHandler.COMPLETE = "complete";
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Add the following line as the last line of the function in the *Initialize* function:

```
this.STATE_NAMES["-6"] = ChangeRequestStateHandler.COMPLETE;
```

```
1  var ChangeRequestStateHandler = Class.create();
2
3  // All references to statehandler constants should be through this class
   ChangeRequestStateHandler
4  ChangeRequestStateHandler.DRAFT = ChangeRequestStateHandlerSNC.DRAFT;
5  ChangeRequestStateHandler.ASSESS = ChangeRequestStateHandlerSNC.ASSESS;
6  ChangeRequestStateHandler.AUTHORIZE = ChangeRequestStateHandlerSNC.AUTHORIZE;
7  ChangeRequestStateHandler.SCHEDULED = ChangeRequestStateHandlerSNC.SCHEDULED;
8  ChangeRequestStateHandler.IMPLEMENT = ChangeRequestStateHandlerSNC.IMPLEMENT;
9  ChangeRequestStateHandler.REVIEW = ChangeRequestStateHandlerSNC.REVIEW;
10 ChangeRequestStateHandler.CLOSED = ChangeRequestStateHandlerSNC.CLOSED;
11 ChangeRequestStateHandler.CANCELED = ChangeRequestStateHandlerSNC.CANCELED;
12 ChangeRequestStateHandler.COMPLETE = "complete";
13
14 ChangeRequestStateHandler.prototype =
   Object.extendsObject(ChangeRequestStateHandlerSNC, {
15     initialize: function(changeRequestGr) {
16         ChangeRequestStateHandlerSNC.prototype.initialize.call(this,
   changeRequestGr);
17         this.STATE_NAMES["-6"] = ChangeRequestStateHandler.COMPLETE;
18     },
19
20     type: "ChangeRequestStateHandler"
21 });
```

3. Click **Update**.

Update the state model script include

Update the *ChangeRequestStateModel_normal* script include to add new functions for the **Complete** state.

Before you begin

Role required: admin

About this task

You update the *ChangeRequestStateModel_normal* with the following configuration.

- Add new *canMove* and *moving* functions for the **Complete** state. These functions can return a value of **true** since there are no special conditions for or extra actions to perform when moving to the **Complete** state.
- Modify the definition of the existing object for the **Implement** state to ensure that the next state is **Complete**.
- Add an object for the **Complete** state, which defines **Review** and **Closed** as the next two states.

> **Note:**
> The *canMove* functions for the transition to these states from **Complete** checks the **Needs review** custom field to determine the correct next state.

Procedure

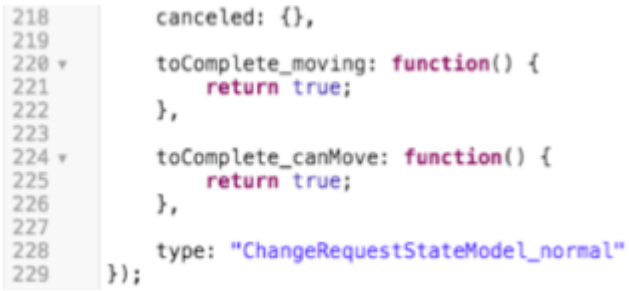
1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Open the *ChangeRequestStateModel_normal* script include and modify the script as follows.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Add the following line at the end of the script include but before the line that starts with **type**:

```
toComplete_moving: function() {
              return true;
         },

         toComplete_canMove: function() {
               return true;
         },
```



```
    canceled: {},

    toComplete_moving: function() {
        return true;
    },

    toComplete_canMove: function() {
        return true;
    },

    type: "ChangeRequestStateModel_normal"
});
```

b. Modify the existing *implement* object to *toComplete*:

```
implement: {
            nextState: [ "complete" ],

            complete: {
                moving: function() {
                    return this.toComplete_moving();
                },

                canMove: function() {
                    return this.toComplete_canMove();
                }
            },

            canceled: {
                moving: function() {
                   return this.toCanceled_moving();
                },

                canMove: function() {
                   return this.toCanceled_canMove();
                }
            }
        },
```

3. Add the following new state object for *complete*.

```
complete: {
            nextState : [ "review", "closed" ],

            review : {
                  moving : function() {
                        return this.toReview_moving();
                  },

                  canMove : function() {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                        if
(this._gr.getValue("u_needs_review") == "Yes")
                            return true;

                        return false;
                    }
                },

                closed : {
                      moving : function() {
                            return this.toClosed_moving();
                      },

                      canMove : function() {
                            if
(this._gr.getValue("u_needs_review") == "No")
                            return true;

                     return false;
                     }
                },

                canceled : {
                      moving : function() {
                            return this.toCanceled_moving();
                      },

                      canMove : function() {
                            return this.toCanceled_canMove();
                      }
                }
          },
```

4. Click **Update**.

Create a UI action

Create a UI action to display a button on a change request for the **Complete** state.

Before you begin

Role required: admin

About this task

The UI action must contain a condition that uses the state model script include to decide when the **Complete** button is displayed on the Change Request form. In this case, the **Complete** button is displayed only when the change has reached the **Implement** state.

Procedure

1. Open the **Change Request** form.
2. Open the form context menu and select **Configure** > **UI Actions**.
3. Locate and open the existing *Implement* UI action.
4. Open the form context menu and click **Insert and Stay** to create a duplicate record.
5. Modify the following fields with new values.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Values
Name	Complete.
Action name	state_model_move_to_complete.
Hint	Progresses change to Complete state.
Onclick	`moveToComplete();`.
Condition	gs.hasRole('itil') && new ChangeRequestStateHandler(current).isNext("**complete**")
Script	Update function, state name, and state value. `function moveToComplete(){ var ga = new GlideAjax("ChangeRequestStateHandlerAjax"); ga.addParam("sysparm_name", "getStateValue"); ga.addParam("sysparm_state_name", "complete"); ga.getXMLAnswer(function(stateValue) { g_form.setValue("state", stateValue); gsftSubmit(null, g_form.getFormElement(), "state_model_move_to_complete"); }); } if (typeof window == 'undefined') setRedirect(); function setRedirect() { current.update(); action.setRedirectURL(current); }` .

6. Click **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a process flow record

Create and add a process flow record for the **Complete** state. The process flow formatter displays at the top of the Change Request form.

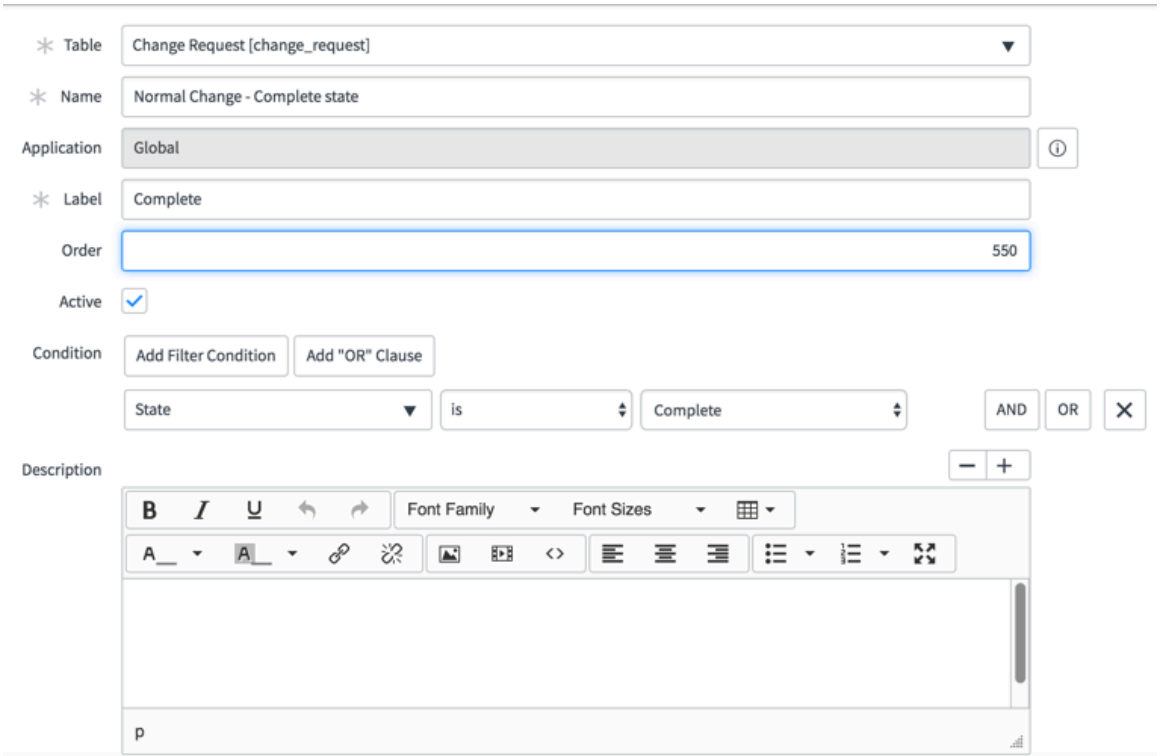
Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System UI** > **Process Flow**.
2. Open the **Normal Change – Implement state** record.
3. Open the form context menu and click **Insert and Stay** to create a duplicate record.
4. Modify the following fields with new values.

Field	Values
Name	Normal Change – Complete State
Label	Complete
Order	550
Condition	[State] [is] [Complete]



5. Click **Update**.

Update the change request workflow

Update the change request workflow to reflect the addition of the **Complete** state.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The Change Request – Normal workflow for the **Normal** type change request must be updated to progress the change request to **Complete** instead of **Review**.

In case of a change request of type **Normal**, in the **Assess** state, any user from the **Assignment group** can approve the change request. When the value of **Risk** is **Moderate** or **High**, a CAB approval is initiated in the **Authorization** state. In case the **Risk** is **Low**, an approval from the CAB team is not required. Instead, the manager of the assignment group can approve the change request.

Note:
If the manager of the assignment group also happens to be the user who had approved the change request in the **Assess** state, the **Authorize** state is skipped and the state of the change request is set to **Scheduled**.

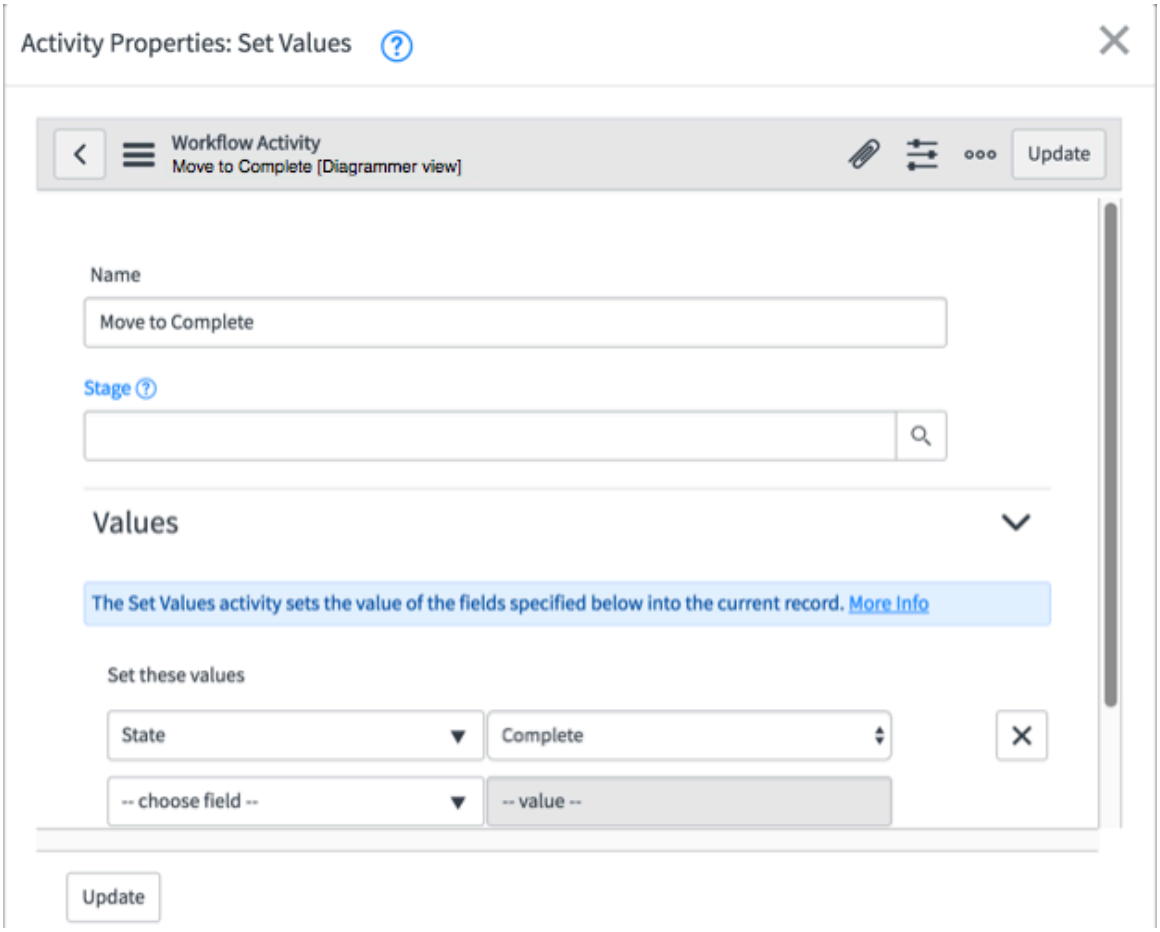
The functionality is available only for the new customers.

Procedure

1. Navigate to **All** > **Workflow** > **Workflow Editor**.
2. Select **Change Request – Normal** from the list of workflows.
3. Select the **Checkout** option from the **Context** menu to create a new version of this workflow.
4. Open the **Set Values** activity that transitions to the **End** activity and modify the following fields.

Field	Value
Name	Move to Complete
Set these values	State = Complete

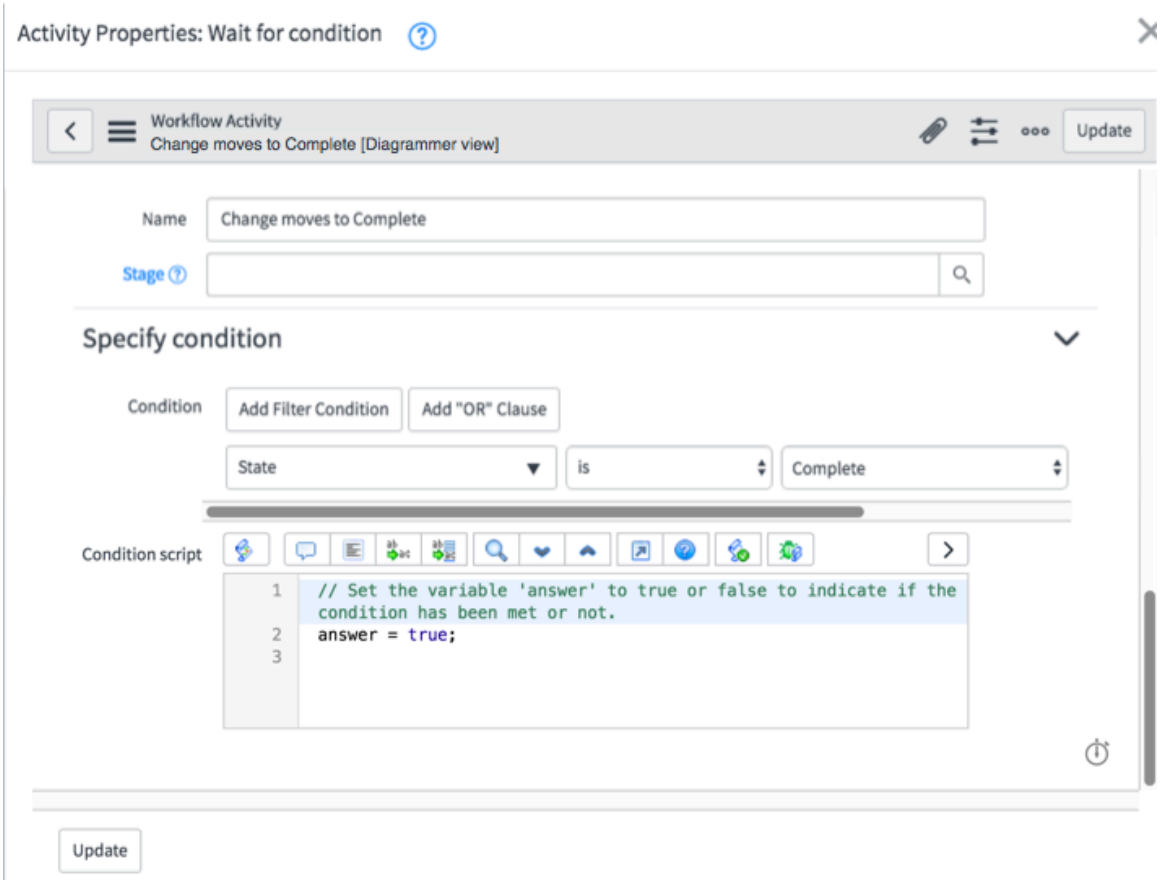
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Click **Update**.
6. Open the **Wait for conditions** activity that transitions to the End activity and modify the following fields.

Field	Value
Name	Change moves to Complete
Set these values	[State] [is] [Complete]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Click **Update**.
8. Open the Workflow Actions menu and click **Publish**.

Change Management workflows

The Change Management processes for a change request are controlled by workflows defined for a specific change request type. You can use the graphical Workflow Editor to modify one of the default workflows, or to create additional change request workflows.

By default, six change request workflows are provided.

Default change workflows

Workflow	Description
Change Request - Emergency	The workflow process that an emergency change request follows.
Change Request - Emergency change tasks	The child workflow process that handles the creation and management of the change tasks for the emergency change request workflow.
Change Request - Normal	The workflow process that a normal change request follow.
Change Request - Normal change tasks	The child workflow process that handles the creation and management of the change tasks for the normal change request workflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default change workflows (continued)

Workflow	Description
Change Request - Standard	The workflow process that a standard change request follow.
Change Request - Standard change tasks	The child workflow process that handles the creation and management of the change tasks for the standard change request workflow.

Change flows

The Change Management Change flows provide a library of reusable actions and end-to-end implementations of the Change models provided in the base system.

You can use ServiceNow® Workflow Studio to create, operate, and troubleshoot flows. Workflow Studio is a single interface that provides:

- Natural language descriptions.
- Runtime information.
- Consolidated configuration.

The provided flows are read-only to ensure that they can be upgraded. To change the behaviour of these flows, make a copy of the read-only flow, and contact Support to deactivate the read-only flow. Deactivating the read-only flow ensures that the copied flow is the only version that is triggered.

If you need to activate the change flows in the base system, you must contact the support to log a case to activate the change flows.

By default, these Change flows are provided:

Default Change flows

Flow	Description
Change - Cloud Infrastructure - Authorize	Process cloud infrastructure changes for approvals.
Change - Emergency - Authorize	Process an emergency change that is in authorize state and is not on hold.
Change - Emergency - Implement	Process an emergency change that is in the implement state.
Change - Emergency - Review	Process an emergency change in the review state.
Change - Implementation tasks	Process to create implementation and post implementation change tasks for change request and wait until completion.
Change - Normal - Assess	Process a normal change that is in the assess state and is not on hold.
Change - Normal - Authorize	Process a normal change that is in the authorize state and is not on hold.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default Change flows (continued)

Flow	Description
Change - Normal - Implement	Process a normal change that is in the implement state.
Change - Standard	Process a standard change.
Change - Standard - Implement	Process a standard change that is in the implement state.
Change - Unauthorized - Authorize	Process an unauthorized change for approvals.

Change Management Workflow Studio actions

Use Workflow Studio actions as building blocks to handle the Change models and types. The flow actions are available under the ITSM spoke in Workflow Studio.

Change Management flow actions

Action	Description
Apply Change Approval Policy	Controls the approval process for a change request by creating user and group approvals according to a change approval policy record. Multiple actions can be used in a flow, where each action references the same or different Change approval policies.
Cancel Change Tasks from Flow	Cancels all related pending and open change tasks that are created from a flow.
Check Change for User Approval	Checks if the specified user has already approved the change request.
Disregard change approvals	Sets all related pending approvals to no longer required.
Evaluate Change Model	Evaluates the Change Model associated with this change request against the current state of the Change Request. Evaluating the change model evaluates all applicable conditions, determines if the state should be changed and changes it if one matches.

Coaching

Use ServiceNow® Coaching to monitor your teams' performance and coach your employees to improve their skill set.

Review and assess the quality of your teams' completed interactions and tasks. Based on these assessments, you can assign course items for your teams. When they complete the training, the skills associated with it get added to their skills set.

© 2026 ServiceNow, Inc. All rights reserved.

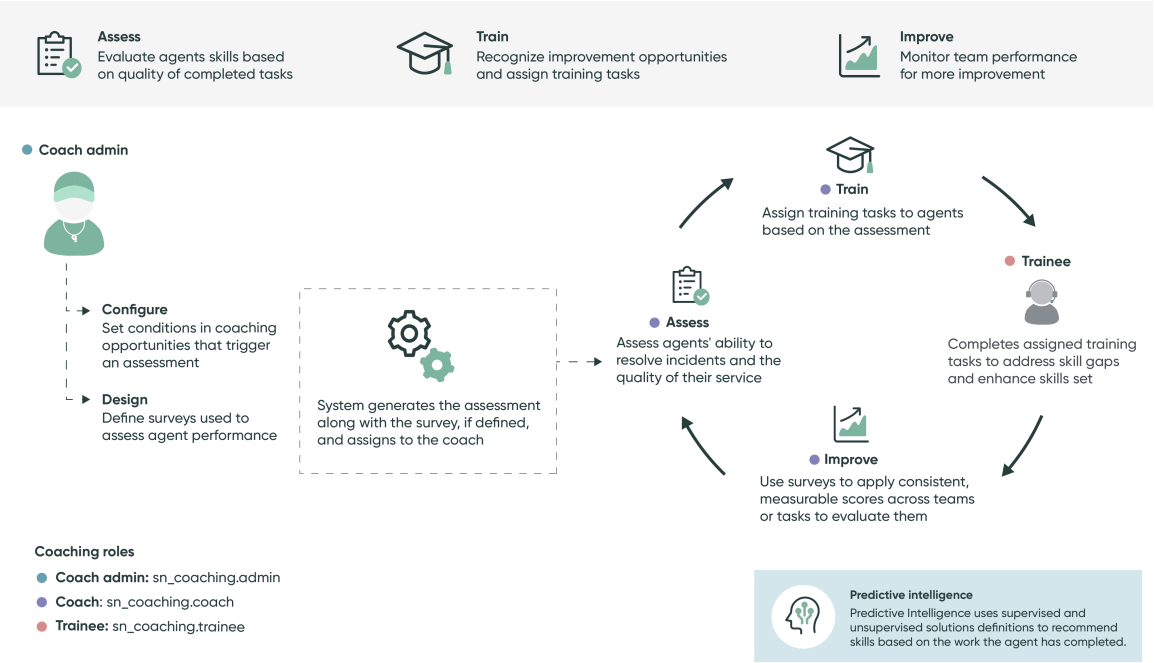
Get started with Coaching

The image shows a high-level workflow on how coaching admins set up Coaching, and how managers and agents use Coaching.

Note:
You can use Predictive Intelligence when you use Coaching with Workforce Optimization for ITSM.



Coaching terminology

Terminology	Description
Coaching assessment	Assessments allow you to evaluate an agent and then assign training and skills based on the evaluation. An assessment can be generated automatically from a coaching opportunity based on conditions set in the opportunity. As assessment can also be generated manually.
Coaching opportunity	A critical moment in a process that generates an assessment based on set conditions. A coaching opportunity can be generated at any time during the life cycle of any task record such as incident, problem, change request, or request items.
Virtual coach	A record that can be associated with a coaching opportunity that automatically completes tasks associated with an assessment.
Coaching survey	A survey associated with a coaching assessment that lets coaches provide feedback on the agents' completed work and lets agents provide feedback on the coaching effectiveness.

Coaching assessments

You can create coaching assessments manually and associate it with a task record or generate them automatically using coaching opportunities. When the trigger conditions set in a coaching opportunity are met, an assessment is automatically generated and automatically assigned to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the trainee's coach to assess the context in which the assessment was triggered. For example, you can set conditions in the coaching opportunity to create a coaching assessment when an employee does not write clear work notes when they escalate an incident. The coach can evaluate the employee using the assessment and add learning tasks to train them to write better work notes.

After you create coaching assessments manually or automatically, you can do any of the following:

- Award skills
- Assign learning tasks
- Associate coaching surveys to the assessment

Note:
You can automate these tasks using a virtual coach that's associated with the coaching opportunity.

Awarding skills: After the coach completes an assessment, they can award skills that's related to the assessment to the trainee.

Assigning learning tasks: Coaching assessments can have learning tasks associated with it to train the agent based on the assessment. When the agent completes the training, the skills associated with the learning tasks are added to the agent's skills set. For example, if the agent resolved an escalation that required router skills and if the agent does not have that skill, then the learning tasks can include training for router skills. After the agent completes the training, the router skills is added to the agent's skill set. Next time when an incident that requires router skills is assigned to the agent, they will be able to successfully resolve the incident.

Setting up coaching surveys: Coaching surveys can be associated with a coaching assessment. When the coach completes the coaching assessment, a survey can be triggered. Coaching surveys let coaches provide feedback on the ability of the agents' to resolve incidents or the quality of their completed tasks. Trainee surveys let agents provide feedback on the coaching effectiveness.

- **Survey for the coach** is taken by the coach where the coach can provide feedback to rate the trainee. For example, did the trainee demonstrate the knowledge and technical competence required?
- **Survey for the trainee** is taken by the agent where the agent can provide feedback to rate the coach. For example, were the learning tasks assigned to the agent useful in building skills?

Coaching opportunity

A coaching opportunity is a critical moment in a process where coaching assessments get triggered based on conditions set in the coaching opportunity record. A coaching opportunity can be generated at any time during the life cycle of any task record such as incident, problem, change request, or request items. For example, you can set conditions to trigger a coaching opportunity when an incident reassigned or escalated. For examples on identifying coaching opportunities, see Identifying coaching opportunities.

You can do the following in a coaching opportunity record:

- Set trigger conditions.
- Associate skills, learning tasks, or surveys with the coaching opportunity. These items get automatically associated with the assessment that is associated with the opportunity.
- Define a virtual coach. When an assessment is automatically created from an opportunity, and if a virtual coach record is associated with it, then the assessment will automatically be moved to closed, complete state. It will also automatically award skills and any learning tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

associated with the assessment to the trainee. The surveys associated with the opportunity will be assigned to the coaches or trainee as well.

Note:

- All virtual coach records will have a coaching opportunity associated with it but not all coaching opportunities will have an associated virtual coach record.
- A virtual coach cannot be associated a manually generated assessment.

For information on virtual coach, see Identify and add course items for a virtual coach.

Example of assessment triggers

Did the coaching opportunity trigger an assessment?	Is a virtual coach associated with the coaching opportunity and are the conditions set met?	Result
Yes	Yes	Because a virtual coach is associated with the coaching opportunity, it completes the following tasks automatically: • Award skills • Assign learning tasks • Associate coaching surveys to the assessment
Yes	No	Because a virtual coach is not associated with the coaching opportunity, you must complete the following tasks manually: • Award skills • Assign learning tasks • Associate coaching surveys to the assessment
No	No	You can create a manual assessment and complete the following tasks manually: • Award skills • Assign learning tasks • Associate coaching surveys to the assessment

You can use Coaching for any task-based process for such as Change Management, Customer Service Management or Incident Management to set up Coaching. You can also use Coaching for a non-task or custom table source by configuring a business rule.

To gain a general understanding of the application and how it is used, see Coaching overview.

Request Coaching

The Coaching (com.sn_coaching) plugin requires a separate subscription and must be activated by ServiceNow personnel.

Before you begin

Role required: admin

About this task

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Coaching plugins

Plugin	Description
Coaching (com.sn_coaching)	Activates the Coaching application. This plugin includes demo data and activates related plugins if they are not already active. The Coaching application is available with the ITSM Professional subscription only. Please contact your account manager for more information.
Coaching with Learning (sn_coach_lrn) **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activates the Coaching with Learning application and enables you to integrate the Learning module with the Coaching application.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears:
   `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Coaching roles

Assign Coaching roles to specify what different users can see and do.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Description	Roles inherited
sn_coaching.trainee [Coaching trainee]	Able to view coaching assessments to which they belong. Able to add work notes in a coaching assessment by clicking **Review Assessments**.	• skill_user • survey_reader • pa_viewer
sn_coaching.coach [Coaching coach]	Able to read and write coaching assessments assigned to the coach group to which they belong. Able to assign a training and virtual coaches to a coaching opportunity. **Note:** The Coaching coach is not able to create a new coaching opportunity.	• sn_coaching.trainee • pa_viewer • sn_lc.catalog_manager
sn_coaching.admin [Coaching admin]	Able to perform all functions.	• sn_coaching.coach • survey_admin • sn_cim_improvement_requester • sn_lc.learning_admin
Learning catalog group manager [sn_lc.catalog_group_manager]	Grants administrative rights to create, read, or update learning libraries based on groups.	• sn_lc.task_creator • sn_lc.content_writer

Coaching overview

After you enable Coaching, you can set up roles and groups, define coaching opportunities, create training material, and start assessing and coaching employees. The Coach and Trainee dashboards provide useful overviews to manage and measure results.

Note: For detailed information on how to get started with Coaching, see Coaching and the Coaching demo.

Initial Coaching setup

Once you have enabled Coaching, set up the application by assigning user roles, configuring coaching opportunities and creating training content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Set up Coaching roles and groups
2. Define trigger conditions for a coaching opportunity
3. Identify learning content and a virtual coach
4. Set up surveys

Workflow of Coaching roles

An employee with the Coaching trainee role is in need of coaching at a critical moment in a process.

An administrator with the Coaching admin role is in charge of setting up coaching opportunities, learning content, virtual coaches, and surveys used in the coaching process.

A manager, or coach, with the Coaching coach role is a subject matter expert of a process and is responsible for providing coaching to an employee, or trainee.

Coaching dashboards

Use Coaching dashboards to manage and measure results in a simplified view.

- Coaching Dashboard
- Trainee Dashboard

Identifying coaching opportunities

Coaching opportunities can be found in many tasks that occur throughout your environment.

- Writing better work notes when service desk escalates incidents to a second level.
- Correctly setting affected configuration items when the service desk works on incidents.
- Using the correct naming convention for admin in update sets.
- Coaching during the onboarding and the warranty period of a new application.
- Correctly reassigning a case to another user with pertinent information in comments.
- Engaging a user on closed records when non-positive feedback is received through surveys.
- Spot-checking a user on quality control.
- Helping to guide project managers in projects.
- Improving knowledge article quality when knowledge articles are attached to resolved incidents.

Common ITSM assessment triggers

You can define activities that occur when trainees work through an ITSM process, such as resolving an incident, as assessment triggers.

Table	Assessment triggers
Incident	Moment of first response
	Categorization and prioritization
	Reassignment
	Proposal of solution to the customer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Assessment triggers
Problem	Definition of the Problem statement
	Writing the Known Error
	Writing the Workaround
	Root Cause analysis
	Root Cause confirmation
	How can this issue be avoided?
Change	Categorization and prioritization
	Implementation description
	Risk analysis
	Impact analysis
	Approval
	Implementation
	Post implementation review

Integration with other applications

Coaching opportunities, coaching assessments, and assigned training in Coaching are integrated with these applications.

- Continual Improvement Management

  One example of a coaching opportunity with CIM would be to use improvement initiatives to set up external training tasks.

  Note:
  The Continual Improvement Management (com.sn_cim) plugin must be active to create an improvement initiative. Continual Improvement Management requires a separate subscription and must be activated by ServiceNow personnel.

- Skills Management

  In a coaching assessment, you can assess trainee skills to identify gaps so the trainee can be coached to acquire new skills or to enhance their existing skill level.

- Knowledge management

  You can assign knowledge articles as assigned training.

Domain separation and Coaching

Domain separation is supported in Coaching. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain Separation Overview

All tables including Coaching Opportunity, Coaching Assessment, Virtual Coach, and Trainings support domain separation so the coach and Coaching admin can view records within the (tenant) domain to which they belong.

How domain separation works in Coaching

Domain separation is supported in Coaching with no setup or configuration required. You can create coaching opportunities and coaching assessments in separate domains, including the global domain.

Coaching assessments extend the platform Task [task] table.

When domain separation is implemented, coach and trainee users can view coaching assessments and trainings only in the domain assigned. The **Domain** and **Domain Path** columns are available for coaching opportunities, coaching assessments, virtual coaching, and trainings provided with the base system.

The **Domain** column contains the name of the domain to which the event or alert belongs, and the **Domain Path** column contains the unique domain identifier.

Note:
If the domain column is not shown, click the **Update Personalized List** icon and add the required column. You can also add the domain path column, if desired.

Domain-separated tables

- Coaching Assessment [sn_coaching_assessment]
- Coaching Opportunity [sn_coaching_opportunity]
- Trainings [sn_coaching_recommendation]
- Assigned Training [sn_coaching_assessment_recommended_learning]
- Assigned Training [sn_coaching_opportunity_recommended_learning]
- Virtual Coach [sn_coaching_opportunity_virtual_coach_m2m]
- Virtual Coaching [sn_coaching_virtual_coach]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

- A Coaching admin that belongs to a parent domain creates a coaching opportunity at a parent domain level or at a child domain level. Coaching opportunities created at a parent level are available to view in all domains.
- A Coaching admin has access to multiple domains but wants to update content in a record within a specific domain. The domain specified in the record drives the functionality of that record and reference fields.
- A Coaching user that belongs to the Acme domain can view the coaching assessment task created in the Acme domain.
- A Coaching user wants to associate an assigned training for an integrated application in the Acme domain. The user must belong to the domain of the integrated application from which a record is associated.
- The trainee user of a parent domain can view a coaching assessment of the parent as well as of all child domains of that parent. A trainee user must belong to the Acme domain, its parent domain, or the global domain to view that coaching assessment.

Domain separation for service providers

Setting up Coaching and surveys

To take full advantage of Coaching, configure the Coaching application and set up surveys.

Setting up Coaching

Configure Coaching to start assessing and coaching trainees.

1. Set up Coaching roles and groups to identify Coaching users, coaches, and admins.
2. Define an assessment trigger on the Coaching Opportunity form.
3. Identify training content that is provided as part of a training or virtual coaching.
4. Configure virtual coaches to add to a coaching opportunity.
5. Set up surveys to provide feedback on the coaching experience so you can make improvements.

Setting up surveys

You can obtain feedback for both the coach and the trainee by creating surveys that are accessed from a Coaching Assessment form that has been resolved or closed.

- Survey taken by trainee to provide feedback on the coach
- Survey taken by coach to provide feedback on the trainee

Access the Survey designer for Coaching by navigating to **Survey** > **Survey Designer**.

Access the Coaching Survey definitions by navigating to **Coaching** > **Coaching Surveys**.

Coaching Properties

Properties

Property	Description
sn_coaching.kb_article_duration	Number of days to read the knowledge article. The admin (sn_wfo.admin) sets the number of days for the trainee to complete reading the article. The number of days is converted to the due date for the trainee to complete the training. It is calculated from the current date taking the trainee's time zone into consideration. • **Type:**Integer • **Default value:**5
sn_coaching.exclude_weekends_on_training_due_date	Excludes weekends when the due date is set for trainees to complete training. • **Type:**true | false • **Default value:**true

Define trigger conditions for a coaching opportunity

Use the Coaching Opportunity form to define a critical moment in a process on which a user can be coached. A coaching opportunity consists of the relationship between a process that can be improved, and coaches and trainees.

Before you begin

Role required: sn_coaching.admin

About this task

When the triggered conditions defined in a coaching opportunity are met, an assessment for that trainee is generated. The coaching assessment is then assigned to a coach for training, or is completed using automated virtual learning content.

Procedure

1. Create a coaching opportunity using the guided setup or by using the application navigator.
2. Click **New**.
3. Fill in the fields on the Coaching Opportunity form.
   a. Select the table that contains the field for coaching in the **Table** field.
   b. Select the **Trainee field** from the source table.
   c. To limit the trainees for which a coaching assessment is generated, select a specific **Trainee group**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select a coach or a group of coaches to assess and provide feedback to trainee assessments generated from this coaching opportunity.
   - To select a coach group, from the **Coach group** field, select the group of coaches.
   - To select the assignment group manager as the coach for the selected task record, enable the **Specify coach user** check box and select the coach user from the selected table.

e. Add the condition for the critical moment in the **Trigger** fields.
   See Common ITSM assessment triggers for examples.

4. Fill in the fields in the **Snapshot Settings** tab.

   a. Select the **Snapshot fields** that contain the values to capture in the coaching assessment when an assessment is triggered.

   b. To use an advanced script, select the **Advanced** check box and add your script.
      See Scripts for more information on scripting.

5. Fill in the fields in the **Frequency** tab.

   a. To limit the number of coaching assessments generated, set the **Random sample (%)** to a percentage of the total number.
      If you reduce the random sample size, you can prevent certain trainees from being excluded by specifying **Users who should be coached on every opportunity**. For example, you may want new employees to be coached every time.

   b. Specify the **Assessment duration** after which the coaching assessment is set to **Closed Complete** state.
      You can disable automatic closure behavior by deactivating the *`Close assessments after expiration`* scheduled job.

   c. To **Prevent duplicate assessments** from being created for a trainee for the same coaching opportunity within a certain time period, select the check box.
      Specify the **Time period** within which duplicate assessments are not created.

6. Fill in the fields in the **Surveys** tab.

   a. To select feedback surveys taken by trainees and coaches when the coaching assessment is in **Resolved** state, select a **Survey taken by Coach** and a **Survey taken by Trainee**.

7. Fill in the fields in the **Related KPIs** tab.

   a. Select the primary KPI improved by the coaching opportunity in the **Improvement KPI** field.

   b. Select the **Strategic objective** affected by the coaching opportunity in the **Strategic objective** field.

      Note:
      You can set strategic objectives by navigating to **Continual Improvement** > **Strategy Objectives**.

      You can add assigned trainings and virtual coach items to the related lists, if applicable, to complete the coaching opportunity.

Identify and add course items for a virtual coach

Define filters and add course items for automated virtual coaching. When a coaching assessment is triggered, the course items are automatically attached to the assessment.

Before you begin

Role required: sn_coaching.admin

About this task

Typical assigned course item content includes micro trainings, best practices, tips, knowledge articles, videos, and community links.

Procedure

1. Navigate to **Coaching** > **Virtual Coach** > **All** and click **New** to create a record.
2. Fill in the fields on the form.

Field	Description
Table	The table from which a coaching opportunity is generating assessments.
Course Items	Course items you want to associate with the virtual coaching record. This could include a message, a link, a video, or source code. **Note:** The course items are automatically attached to the coaching assessment when the conditions in the virtual coaching record are met. You can also access course items by navigating to **Coaching** > **Course items**.
Advanced	Enable to set advanced conditions. See Scripts for more information on scripting.
Condition	Set filter conditions that trigger virtual coaching.
Autofill fields	Set one or more fields and the value for each value that you want to automatically populate.

Example: Coaching admin sets up learning content

Virtual Coaching form

Field	Description
Number	CVC0000106
Short Description	Virtual Coach for the Incident Process
Table	Incident [Incident]
Course Items	Core Java
Active	Selected

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Virtual Coaching form (continued)

Field	Description
Advanced	Cleared
Condition	• Assigned to changes • Configuration item is empty
Autofill fields	• State Resolved • Performance rating N/A

Training form

Field	Value
Number	CR0000106
Title	Increase customer satisfaction by solving issues faster
Active	Selected
Category	Customer Experience
Content	Watch this video to increase customer satisfaction by solving issues faster.

Create a survey and associate with a Coaching opportunity

Create a survey for coaches or trainees to assess the training quality. Add a question bank to the survey. Associate the survey with a coaching opportunity to provide feedback when the coach completes the coaching assessment.

Before you begin

Role required: sn_coaching.admin

Procedure

1. Create a survey to associate with a coaching opportunity.

> **Note:**
> If you already have a survey that you want to associate with a coaching opportunity, go to the Associate a survey with a coaching opportunity step.

   a. Navigate to **All** > **Coaching** > **Administration** > **Survey Designer**.
   b. In the **Name** field, enter the name for the coaching survey.
   c. Select the **Configuration** tab.
   d. In the **Survey Owners** field, select **Coaching Admin**.
   e. In the **Description** field, enter a description for the survey.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. In the **Source table** field, select Coaching Assessment [sn_coaching_assessment].

g. In the **Duration** field, enter the length of time recipients are given to complete the survey.

h. Select **Save**.
For more information on configuring a survey, see Survey Designer Configuration form.

2. Create a question bank for the survey.

a. Navigate to **All** > **Surveys** > **Question Bank**.

b. In the **Assessment Metric Categories** list, click **New.**

c. In the **Name** field, enter a name for the question bank and then right-click the form header and select **Save**.

d. In the Assessment Metrics related list, click **New**.

e. In the Survey Question form, enter the name, question, and data type, and select **Submit**.
For more information on creating or updating a question bank, see Survey questions.

3. Associate the question bank with the survey.

a. Navigate to **All** > **Coaching** > **Administration** > **Coaching Surveys**.

b. In the Assessment Metric Types list, select the survey you've created.

c. In the Metric Categories related list, select **New Category from Bank**.

d. Select the question bank you've created and select **Add selected**.

e. Select **Update**.

4. Associate a survey with a coaching opportunity.

a. Navigate to **All** > **Coaching** > **Coaching Opportunities**.

b. Select the Surveys related list.

c. Do any of the following:

- To add a survey to be taken by the coach, in the **Survey taken by Coach** field, using the search icon select the survey.
- To add a survey to be taken by the trainee, in the **Survey taken by Trainee** field, using the search icon select the survey.

For more information on the coaching opportunities, see Define trigger conditions for a coaching opportunity.

Coaching your trainee

A manager, or coach, is a subject matter expert of a process and is responsible for providing coaching to an employee, or trainee. Use the Coach Dashboard to manage and measure the effectiveness of your coaching.

You can access the Coaching Dashboard from the Coaching navigation menu, or directly from the dashboard list. Click a report to view the detailed data.

Note:

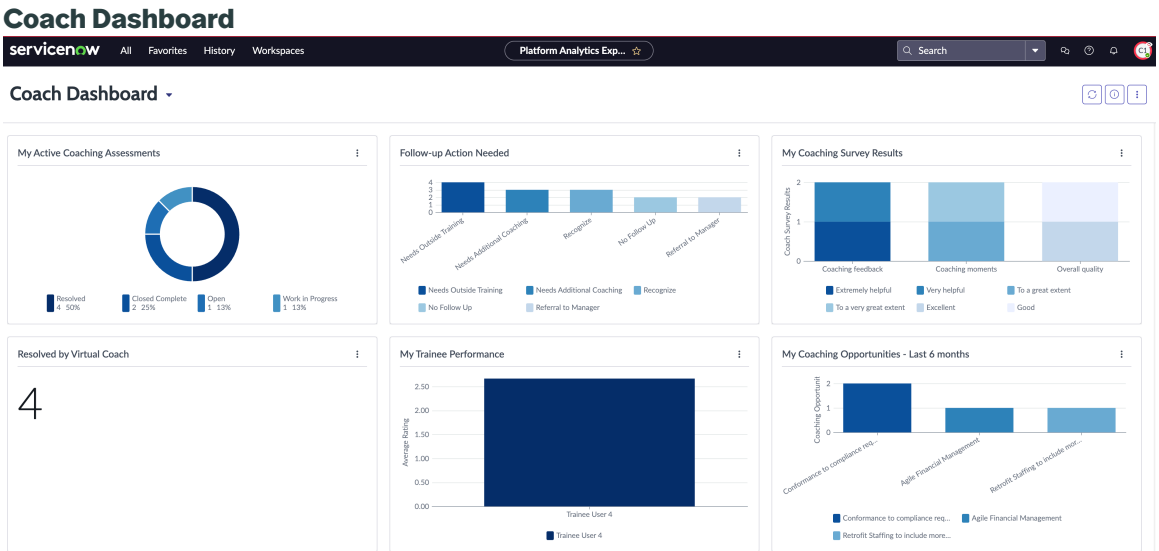
- You must have the Coaching coach role to view the Coach Dashboard.
- The Coach Dashboard page uses the Next Experience user interface. For more information on Next Experience, see Next Experience UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Coaching begins once a trainee assessment has been assigned to you. Coaching assessments are triggered from a coaching opportunity that is set up by the coaching admin. Use coaching assessments to facilitate a dialog with your trainee, assign training content, and set a due date and other details.

The Coach Dashboard lets you manage the details and effect your coaching has on your trainees.

- Check the progress state of your coaching assessments.
- Analyze the number and types of follow-up actions necessary on your resolved coaching assessments.
- View the types of survey feedback from your trainees.
- View the number of your assessments that were resolved by the virtual coach.
- Check the performance rating of your trainees from your coaching.
- View the list of KPIs affected by your coaching.
- Verify the types of coaching opportunities that are being assigned to you (last 6 months).



Report	Description
My Active Coaching Assessments	Coaching assessments assigned to you that are in **New**, **Work in Progress**, and **Resolved** states.
Follow-up Action Needed	Coaching assessments grouped by **Followup Needed** field. • **Recognize** • **Needs Additional Coaching** • **Needs Outside Training** • **Referral to Manager** • **Create Virtual Coach** • **No Follow Up**
My Coaching Survey Results	Feedback results on coaching from trainees.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report	Description
Resolved by Virtual Coach	Coaching assessments resolved by virtual coaching.
My Trainee Performance	Coaching assessments grouped by trainee performance rating.
KPI Addressed with my Coaching	KPIs addressed by your coaching.
My Coaching Opportunities - Last 6 months	Coaching opportunities assigned to you in the past 6 months.

Assess a trainee

Use a coaching assessment to review the work of a trainee and to provide training and feedback.

Before you begin

Role required: sn_coaching.coach

About this task

A trainee can view any field on the coaching assessment form and add comments to the to the **Work notes** field. A trainee can submit feedback for a coach using a survey when a coaching assessment is in resolved, closed complete, or closed incomplete state.

When an assessment is generated, all users in the Coach group receive a notification. Assessments are generated automatically (as the result of a coaching opportunity) or created manually. You can provide feedback for your trainees using a survey at any time during the coaching assessment.

You can create a coaching assessment from incidents, problems, change requests, or any other table that extends the task table. Enable the display of the **Create Coaching Assessment** button and create your assessments using that button.To enable display of the button:

- Configure the UI actions on the record.
- In the `sn_coaching.CoachingExtensionPoint` extension point, make sure the `getCreateAssessmentUITables` method is implemented to return the name of the tables.

Procedure

1. Navigate to **All** > **Coaching** > **Coaching Assessment** and select a coaching assessment in the **Open** state.

   You can take a survey using the **Start Survey** button to provide feedback for the trainee at any point during the assessment. After you complete the survey, the score is calculated using the **Calculate coaching survey score** business rule and is automatically populated in the **Trainee Rating** field. The trainee rating generates an assessment rating that is populated in the **Assessment Rating** field.

   Note:
   Surveys are not available for assessments that are created manually.

2. Fill in the fields on the Coaching Assessment form.
   a. Verify the **Coach group**, which is obtained from the coaching opportunity, is accurate.
   b. Set the coaching assessment **Coach** field to a coach.
   c. In the **Due Date** field, enter the date when the assessment is due.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The coaching assessment is set to **Closed Incomplete** state after the due date. Use system properties to set due dates to complete training. For more information, refer to Coaching Properties. You can disable automatic closure behavior by deactivating the **Close assessments after expiration** scheduled job.

3. Fill in the fields in the **Notes** tab.
   a. Add a **Description** to the coaching assessment.
   b. Add **Work notes** to facilitate a dialog with the trainee.
4. Review the **Snapshot** content in the **Snapshot** tab and add your feedback in the **Notes** field.
5. Fill in the fields in the **Feedback** tab.
   a. Set the **Assessment rating** based on the coaching experience.
   When you submit feedback for a trainee, the score in the **Trainee Rating** field, which is based on a scale of 1-10 is converted to a rating such as good or excellent. This rating displays in the **Assessment rating** field.
   b. Set the **Follow up** action as part of coaching.
6. Review the skills applicable to the trainee in the **Trainee Skillset** related list.
   See Skills Management for more information.
7. Add assigned training content in the **Assigned course items** related list.
8. Review survey feedback for the trainee in the **Survey Results** related list.
9. When coaching is finished:
   a. Add a **Summary** of the coaching experience as an overview of your assessment.
   b. Set the coaching assessment to **Resolved**.

Coaching field descriptions

Assign skills after completing an assessment

Automatically assign skills to trainees for specific skill levels based on the course items they have completed. For example, if a trainee completes the course items for learning Japanese at an expert level, then the skill level 'expert' can be assigned to the trainee.

Before you begin

Role required: sn_coaching.coach and sn_coaching.admin

About this task

You can associate skills with coaching opportunities, coaching assessments, or course items. When a trainee completes a coaching assessment, you can automatically assign the skill the trainee has acquired during that coaching opportunity.
The coaching assessments generated from coaching opportunities award the skills to the trainee after the assessment is complete. If the assessment is configured to include assigned course items, the skills associated with course items are also added to the assessments.

Procedure

1. Associate skills with coaching assessment or opportunities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Click **Submit**.
   You can navigate to the **All Awarded Skills** related list in a **Coaching Assessments** record for a trainee to view all skills to be awarded for that trainee. The **Source** field displays whether the award came from an opportunity, assessment, or training.

Training your agents using Coaching With Learning

Use Coaching with Learning to train your agents with internal and external learning content. Organize similar content in learning libraries. Assign learning tasks and track completion.

Important:
Coaching With Learning is available when you enable the Coaching With Learning application from the ServiceNow® Store. To enable this application, see Request Coaching.

Organize related learning content

Create a learning library to organize related content into categories.

Before you begin
Role required: sn_coaching.coach

Procedure

1. Navigate to **All** > **Learning** > **Content** > **Learning Libraries**.
2. Create a learning library.
   a. Click **New**.
   b. In the **Title** field, enter a unique name for the learning library.
   c. In the **Description** field, enter a description for the learning library.
   d. Right-click the form header and click **Save**.

   Note:
   The learning library is visible to all groups that you directly or additionally manage.

3. Add course items to the learning library.
   a. Click the **Content** related list.
   b. Click **Add**.
   c. In the **Add Learning Courses** pop-up window, select all course items you want to add to the learning library.
   d. Click **Add Selected**. The course items are added to the learning library.

   Note:
   To remove any course item you have added, select the course item and click **Remove**.

4. Add user to the library.
   a. Click the **Applicable Users** related list.
   b. Click **Edit**.
   c. Move the desired users to the **Applicable Users List** field.
   d. Click **Save**.

Add internal learning content

Add internal courses so that agents can learn new content and enhance their skills set.

Before you begin

Role required: sn_coaching.coach

Procedure

1. Navigate to **All** > **Learning** > **Content** > **Learning Content**.
2. Create an internal learning content.
   a. Select **New**.
   b. Fill in the following fields.

Name	Description
Title	Name of the course.
Internal source	Select the type of content for the course. Here are the available types of courses: ▪ URL—Youtube, Vimeo, or any link for a video ▪ Knowledge article ▪ Free form
Days to complete	The number of days required to complete the course. Default value is set to 5.
Course catalog	The catalog associated with the course.
Knowledge article	If the internal source is a knowledge article, select the article.
URL Domain	If the internal source is URL, select the domain for the URL. Here are the available URL domain types: ▪ Youtube ▪ Vimeo ▪ Other
URL	If the internal source is URL, enter the URL for the selected domain.
Estimated duration	Length of time when the course has to be completed. For example, for a video, it is the duration of the video. For a KB article, the duration is estimated based on the length of the article.

3. Select **Save**.
4. Add a skill to the internal learning content.
   a. Select the **Associated skills** related list.
   b. Select **New**.
   c. In the **Skill** field, select a skill you want to associate with the internal content.
   d. In the **Skill level** field, select a skill level for the selected skill.
   e. Select **Save**.

Add a learning task to the internal content

Add a learning task to an internal content and track the task completion.

Before you begin
Role required: sn_coaching.coach

Procedure

1. Navigate to **All** > **Learning** > **Content** > **Learning Content**.
2. Add a learning task to the internal learning content.
   a. Select the **Learning Tasks** related list.
   b. Select **New**.
   c. In the **Assigned to** field, select a trainee to whom you want to assign the learning task.
   d. In the **Course item** field, select the course item to associate with the learning task.
   e. In the **Due date** field, select the calendar icon and select the date and time when you want to trainee to complete the learning task.
   f. Select **Save**.

Add external learning content

Add courses from third-party applications such as Udemy, Pluralsight, Cornerstone, or ServiceNow University to enable your users to gain skills from external learning content.

Before you begin
To add external learning content:

- You must have the Workforce Optimization for ITSM application installed.
- You must integrate Coaching With Learning with third-party learning management systems. For information on how to perform this integration, see Integrating Learning Core with third-party learning management systems.

Role required: sn_coaching.coach

Procedure

1. Navigate to **All** > **Learning** > **Content** > **External Content**.
2. Select a course.
3. Click **Go to course**.
   You can review and learn the external course.

Complete a learning task

Enhance your skills set by completing learning tasks from internal or external learning content.

Before you begin
Role required: sn_coaching.trainee

Procedure

1. Navigate to **All** > **Learning** > **Tasks** > **Learning Tasks**.
2. Select a learning task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Complete the learning task.
4. Click **Mark as Complete**.

Managing your coaching assessments

Employees, or trainees, are assessed on work they have done that has triggered a coaching opportunity. Once assessed, the trainee is assigned training by the coach. Use the Trainee Dashboard to manage your assessments and track results.

You can access the Trainee Dashboard from the Coaching navigation menu, or directly from the dashboard list. Click a report to view the detailed data.

Note:
You must have the Coaching trainee role to view your Trainee Dashboard.

Your training starts when your assessment has been assigned to a coach. Coaching assessments are triggered from a coaching opportunity set up by the coaching admin and are used to facilitate your learning, as well as providing a dialogue with your coach.

The Trainee Dashboard lets you manage your assessments and track results.

- Keep track of your active coaching assessments.
- Analyze how your assessments have been rated in the past.
- View the types of survey feedback from your coaches.
- Manage the full list of your coaching assessment details.

Trainee dashboard

Report	Description
My Active Training Assessments	Coaching assessments for you that are in **New**, **Work in Progress**, and **Resolved** states.
My Coaching History	Coaching feedback history (provided by the coach).
My Survey Results	Survey feedback results of the coach to the trainee.
My Assessment Details	List of active coaching assessments and trainings.

Work with your coach

Use your assessments to work with your coach, including assigned training and due dates. You can view your assessments and track your results using the Trainee Dashboard.

Before you begin

Role required: sn_coaching.trainee

About this task

You can provide feedback for your coach when the assessment is in resolved, closed complete, or closed incomplete state.

Procedure

1. Navigate to **All** > **Coaching** > **Trainee Dashboard**.
2. Select an active **Coaching Assessment** record from the **My Assessment Details** list to view feedback from your coach.
3. View the **Notes** from your coach for coaching instructions.
4. Complete any learning content in the **Assigned Trainings** related list before the **Due date**.
5. Add any **Notes** for your coach that are applicable to your progress or learning status.
6. To provide feedback for the coach, click **Start Survey**.
   The Provide Training Feedback form appears.
7. Complete the feedback and click **Submit**.
   The score for the survey is added to the **Coach rating** field.
8. To assess your survey results and other reports, navigate to **Coaching** > **Trainee Dashboard**.

Coaching on a non-task table

To provide coaching on a table source that does not extend the Task table, you must create a business rule to initiate the coaching process.

The business rule **Evaluate coaching opportunity on tasks** initiates coaching for tables that extend Task. You can copy this business rule and modify it for tables that do not extend the Task table.

Field	Description
Specify coach user	Check box to enable the **Coach** field.
Coach	Field from the selected table that identifies the coach.
Coach group	Group of coaches that assess and provide feedback to trainees.
Active	Check box to activate the coaching opportunity. Clear the check box to disable.
Trigger	Event that triggers a coaching opportunity for the selected table. Conditions for opportunities are generally unique events, such as when an incident is reassigned.

Frequency tab

Field	Description
Random sample (%)	Percentage of the total assessments that get created. Use a random sample percentage to reduce the number of assessments that are created if too many events that meet the criteria for creating a coaching assessment occur.
Users who should be coached on every opportunity	Users that always get coached, regardless of random sample percentage. Because the specified users are exempted from the random sample percentage, a coaching assessment is always created when the assessment is triggered. Selected users might be new hires, for example, or others who require additional coaching. **Note:** Only shown if the **Random sample (%)** is less than 100.
Assessment duration	Amount of time before the assessment is set to **Closed Complete** state.
Prevent duplicate assessment	Check box to prevent an assessment from being created within a specified time period if one exists for that user for the same opportunity.
Within time period	Time period within which duplicate assessments are not created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Coaching Assessment form

Number	Unique (CAS) number for the coaching assessment.
Trainee	Trainee user that triggered the assessment in the coaching opportunity.
Record	Record associated with the assessment triggered in coaching opportunity.
Opportunity	Coaching opportunity number associated with the coaching assessment.
State	State of the assessment. • **Open**: New coaching opportunity. • **Work in Progress**: Trainee is being coached. • **Resolved**: All coaching and learnings have been provided to the trainee. **Note:** Learnings may not have been completed by the trainee. • **Closed Complete**: Assessment has been resolved and closed. • **Closed Incomplete**: Assessment has been closed but was not completed, typically because the coaching assessment **Due date** has expired.
Coach group	Group of coaches to which the assessment is assigned. Default value is populated from the coaching opportunity form.
Coach	Coach user performing the assessment. This field is typically set by the coach before performing the assessment, but can also be set by a member of the coach group or by the coaching admin.
Due date	Date the assessment is due. After this time, the assessment is set to **Closed Incomplete** state.

Notes tab

Field	Description
Description	Description of the assessment.
Work notes	Notes about the assessment (journal field).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notes tab (continued)

Field	Description
	Additional notes can be added as the coach and trainee engage in further dialogue.

Snapshot tab

Field	Description
Snapshot	Field contents of the task, action, or behavior captured at the time the coaching opportunity was triggered.

Feedback tab

Field	Description
Assessment rating	Value of the performance of the trainee for reporting and trend-tracking purposes. • Excellent • Good • Average • Poor • Unacceptable
Follow up Needed	Further action required, if any, to improve the performance of the trainee. • **Recognize**: Trainee needs recognition for good performance. • **Needs Additional Coaching**: Trainee needs additional feedback from the coach. • **Needs Outside Training**: Trainee needs additional training outside the scope of the coaching assessment. • **Referral to Manager**: Indicates a major issue with the trainee performance. • **Create Virtual Coach** • **No Follow Up**
Summary	Summary of the coaching assessment.

Coaching Assessment actions

Button	Description
Complete Assessment	Set the coaching assessment to **Closed Complete** state.
Reopen Assessment	Change the coaching assessment state from **Resolved** or **Closed Complete** back to **Work In Progress** for additional action. Either the coach or the trainee can reopen the coaching assessment.
Submit feedback	Feedback submitted by either a trainee or a coach from the survey form.
Delete	Deletes the coaching assessment from the Assessment Created by Opportunity list.

Virtual Coaching form

Field	Description
Short Description	Description of the virtual coaching (CVC) record.
Table	Table source of coaching opportunity events.
Training	Record that contains related training content.
Active	Check box to activate the virtual coaching. Clear the check box to disable.
Advanced	Check box to use a script to determine when the automation triggers.
Conditions	Event that triggers a virtual coaching for the selected table. Conditions for virtual coachings are generally unique events.
Script	Script that defines the evaluation process applied to the selected table. Select the fields from the table to capture the values for. **Note:** Only shown if **Advanced** check box is selected.
Autofill fields	Fields to autofill under certain conditions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Training form

Field	Description
Number	Unique (CMC) number of the training.
Title	A short description for the training.
Category	Category of learning content, which is used for reporting. • Customer experience • Best Practice Series • Soft-Skill Communication • Behavioral Coaching • Product Support
Content	Content for assigned users to learn.

The **Preview Message** related list shows the learning content in the context of the trainee.

Coaching troubleshooting

Troubleshooting actions can help resolve common issues when setting up or running Coaching.

Issue	Resolution
Error after creating a coaching opportunity: `You must create a business rule for a non-task type source table to trigger a coaching assessment. For more information, refer to http://servicenow.com/docs/?context=CSHelp:Coaching-Non-Task-Table.`	Create a business rule to initiate the coaching process for a non-task type table. *`Copy the Coaching Opportunity creator for Task business rule and modify it for tables that do not extend Task.`*
Do not automatically close a coaching assessment after the due date has passed.	Deactivate the *`Close assessments after expiration`* scheduled job in **System Definition** > **Scheduled Jobs**.
Coaching assessment is not created.	These resolutions are applicable to a coaching assessment not being created: • Add the trainee as a member of the trainee group. • Clear the **Prevent duplicate assessment** check box if the trainee already has a coaching assessment for the same coaching opportunity. • Include the trainee in the **Users who should be coached on every opportunity** list when the **Random sample (%)** is less than 100.

Initial CIM setup

Install the CIM plugin. For more information, see Install CIM.

To use guided setup to configure CIM, navigate to **Continual Improvement** > **Administration** > **Guided Setup** and select **Configure** in the Request CIM section.

Once CIM is activated, assign user roles and groups.

- Improvement Manager
- Improvement Coordinator
- Approver group membership (CIM Approvers, default is empty)

For more information, see Assign a role to a user.

Use the Continual Improvement Workbench to plan and manage improvements. Both tile and list views are supported.

Workflow of CIM roles

The workflow of improvements from an improvement request to final approval Continual Improvement Management involves various responsibilities.

1. An **Improvement Requester**, such as a help desk manager, process owner, or ITIL user, recognizes the need for an improvement with the organization and submits an improvement request.
2. The **Improvement Manager** reviews the improvement, accepts it, and assigns it to an Improvement Coordinator for implementation. The Improvement Manager also runs prioritization meetings with Improvement Coordinators and uses the Continual Improvement workbench to monitor, manage, and plan overall progress of improvements. When all tasks are complete, the Improvement Manager reviews improvements for closure.
3. After the improvement request is assigned, the **Improvement Coordinator** along with the Improvement manager creates phases and tasks to complete the improvement. The Improvement Coordinator also meets with task owners to track progress and timely completion.

For more information about CIM roles, see CIM roles.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integration with other applications

CIM is integrated with other ServiceNow® applications to enable you to create improvements across various processes and services within the company. These integrations provide you a centralized framework to implement, manage, and monitor the progress and impact of improvements. You can create improvement initiatives from integrated applications and conversely, create records for integrated applications from improvement initiatives.

For more information about the applications integrated with CIM, see Improvement integration with other applications.

Domain separation

Domain separation capability is supported in Continual Improvement Management with no setup or configuration required.

You can create improvements separately in a specific domain, or in the global domain.

Install CIM

Install the Continual Improvement Management plugin from ServiceNow Application Manager after purchasing a subscription.

Before you begin

Role required: admin

About this task

The Continual Improvement Management (com.sn_cim) plugin is available with ITSM Professional, CSM Professional, and HR Service Delivery Professional subscriptions only. Contact your ServiceNow account manager to purchase a subscription and activate the plugin on your organization's instances.

If you don't have an account manager, decide to delay activation after purchasing a subscription, or want to evaluate the product on a sub-production instance without charge:

- Request CIM activation on your instance by using the Now Support portal. For more information, see the Requesting a Plugin from the Service Catalog [KB0751715] Knowledge Base article.
- Install CIM from ServiceNow Application Manager.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the Application Manager page, search for **Continual Improvement Management**.
3. In the Family Plugins section, select **Continual Improvement Management (CIM)**.
4. On the Continual Improvement Management (CIM) page, select **Install**.
5. Review the installation details and select **Install now**.
6. **Optional:** Install demo data by selecting the **Load demo data** check box.
7. Select **Install**.
   The Installation progress window displays the installation status of each component and the time taken to complete the installation.

   After installation is complete, a message appears that Continual Improvement Management has been successfully installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The plugin is installed and activated on your instance.

8. **Optional:** View more information about the installed plugin by selecting **View Details**. The following details are provided:
   - Plugin version
   - Activation and update details
   - Key application features
   - List of plugins installed or activated with CIM.

Improvement integration with other applications

You can create an improvement request from within multiple integrated applications. You can also create many application tasks from within an improvement initiative. Set the Continual Improvement Management attributes property to determine which field values get copied to integrated application tasks.

Set Continual Improvement Management properties for integration with other applications.

As part of Continual Improvement Management integration with other applications, improvement requests can be created from within other applications and, conversely, records for other applications can be created from within an improvement initiative (or CIM task).

Multiple tasks from outside integrated applications can be linked to a single improvement initiative (or CIM task), and multiple CIM tasks can be linked to a single integrated application task for maximum flexibility when creating improvements.

An improvement initiative can be created from these applications.

- Benchmarks
- Coaching
- Configuration Management Database (CMDB)
- Customer Service Management
- Demand Management
- Governance, Risk, and Compliance (GRC)
- Incident Management
- Problem Management
- Survey Management

As part of an improvement initiative, these records can be created.

- Demand record
- Project (optional)

As part of a CIM task, these records can be created:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- change record
- Coaching opportunity
- Create a knowledge article
- Create a story

Integration property

You can set field values that get copied to the improvement request when the improvement request is created from within another application.

To access Continual Improvement Management properties, navigate to **Continual Improvement** > **Administration** > **Properties**.

Note:
System admin role is required to set Continual Improvement Management properties.

Property	Description
List of attributes (comma-separated) that will be copied from the originating improvement initiative. sn_cim.initiative_copy_attributes	Specifies the field values that are copied from the originating improvement initiative to the application task record (for example, demand, project, change record) created from the improvement initiative. • Short description (short_description) • Description (description) • Priority (priority) • CIM estimate (cim_estimate) • Benefit (benefit) • Assigned to (assigned_to) • Strategic objective (strategic_objective) • Business process (business_process) • Business service (business_service) • Approver group (approver_group) • Type (type)

Create Improvement Initiative related link

- Benchmarks

  When you create an improvement initiative from Benchmarks, the improvement is associated with the Benchmarks recommendation candidate, and the Benchmarks KPI is added to the improvement initiative.

- Using UI extension points in server-side UI macros
- Using client extension points in client-side UI scripting

Create improvement initiatives from integrated applications

Create improvement initiatives from applications integrated with Continual Improvement Management to enable planning, implementation, monitoring, and impact assessment of improvements in a centralized framework.

Before you begin

Role required: sn_cim.improvement_requester

About this task

Records of applications integrated with CIM display the **Create Improvement Initiative** link in the Related Links section.

Procedure

1. Navigate to the application's records list.
   For example, navigate to **All** > **Benchmarks** > **Recommendation Setup** > **All** to open the Benchmarks records list.
2. Find and open the record from which you want to create an improvement.
3. Select **Create Improvement Initiative** in the Related Links section.
4. Enter the field values in the Improvement Initiative form.
   For more information, see Improvement field descriptions.
5. Select **Submit**.

Result

The improvement initiative is created and UI changes display on the source application record and on the initiative record. For more information, see Updates after improvement initiative creation from integrated applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create application records from improvement initiatives

Create records for integrated applications from improvement initiatives or CIM tasks to transform improvement initiatives into broader, actionable efforts to enable improvements across teams and processes.

Before you begin

Role required: sn_cim.improvement_coordinator or sn_cim.improvement_manager

Procedure

1. Navigate to your improvement initiative or CIM task record.
   - Improvement initiative: **All** > **Continual Improvement** > **My CIM Initiatives**
   - CIM task: **All** > **Continual Improvement** > **CIM Tasks**
2. Find and open the Improvement Initiative or CIM task record from which you want to create an application record.
3. Create an application record by selecting the corresponding application record link in the Related Links section.

Note:
Related links are visible only when a CIM task is in the Open, Work in Progress, or On Hold state.

Record type	Link to select
Demand	Create Demand
Project	Create Project
Coaching opportunity	Create Coaching Opportunity
Knowledge base articles	Create Knowledge
Agile Development story	Create Story
Performance Analytics automated indicator	Create PA Indicator
Change	Create Change

Note:

Default field values set in the *sn_cim.initiative_copy_attributes* property are populated in the application record form. Contact your administrator to edit this property by adding or deleting fields. For more information, see Configure CIM integration property.

4. Select **Submit**.

Result

The application record is created and UI changes display on the source improvement initiative or CIM task record and corresponding application records. For more information, see Updates after application record creation from improvement initiatives.

Configure CIM integration property

Configure the CIM sn_cim.initiative_copy_attributes integration property to define field values to be copied from an improvement initiative to application records that you create from the initiative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Continual Improvement** > **Administration** > **Properties**.
2. In the **List of attributes (comma-separated) that will be copied from the originating improvement initiative** text field, add or delete field values by using commas to separate the values.
   The default field values included in the sn_cim.initiative_copy_attributes property are:
   - Short description (short_description)
   - Description (description)
   - Priority (priority)
   - CIM estimate (cim_estimate)
   - Benefit (benefit)
   - Assigned to (assigned_to)
   - Strategic objective (strategic_objective)
   - Business process (business_process)
   - Business service (business_service)
   - Approver group (approver_group)
   - Type (type)
   - Service offering (service_offering)

Integrate Continual Improvement Management using extension point

Integrate CIM with other applications by using the *CIMIntegrationAPI* extension point. It defines the inbound and outbound extension points for integrating CIM with other applications.

Before you begin
Role required: admin or sn_cim.improvement_manager

About this task
The *CIMIntegrationAPI* defines the inbound and outbound extension points for integrating CIM with other applications. Inbound integrations enable you to create improvement initiatives from integrated applications. Outbound integrations enable you to create application records from improvement initiatives or CIM tasks.

Procedure

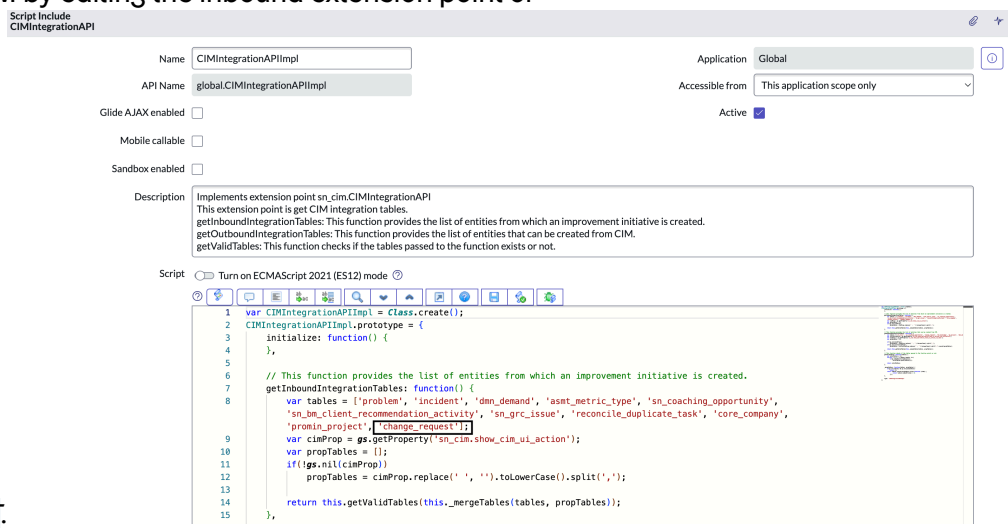
1. Navigate to **All** and enter `sys_extension_point.list` in the search field.
2. In the Extension Points context menu, type `CIMIntegrationAPI` in the search field.
3. Select **sn_cim.CIMIntegrationAPI**.
4. Select **Create Implementation** under Related Links.
   A new instance of the *CIMIntegrationAPI* is created.
5. Enter a name for the new API instance.
6. Save the record.
7. In the **Script** field, edit the inbound or outbound integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For inbound integrations, add application names in the `var tables` parameter of the `getInboundIntegrationTables` function.
- For outbound integrations, add application names in the `var tables` parameter of the `getOutboundIntegrationTables` function.

Enclose the values in single quotation marks and use commas to separate multiple values.

The following example shows integrating improvement initiatives from change requests with CIM by editing the inbound extension point of `CIMIntegrationAPI`.



8. Save and update the record.
   For inbound integrations, the **Create Improvement Initiative** related link is added to records of applications integrated with CIM.
9. For outbound integrations, configure related links on CIM task records to integrated applications.
   For more information, see Create a UI action.

Domain separation and Continual Improvement Management

Domain separation in Continual Improvement Management is configured to apply to all features of the application. Separation of data is configured along with separation of logic and process. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation overview

When an improvement opportunity is discovered within your organization, you can implement the improvement in a structured manner using Continual Improvement Management with domain separation.

Once an improvement initiative is created, the Improvement Manager uses the Improvement Register to review and prioritize the improvement, and assigns improvement tasks. CIM task owners are responsible to fulfill assigned tasks to the desired outcome of that improvement. Both Improvement Register and CIM Task tables support domain separation so the Improvement Requester, task owners, Improvement Coordinator, and Improvement Manager can view only the improvement initiatives and related tasks within the (tenant) domain to which they belong.

How domain separation works in Continual Improvement Management

Domain separation is supported in Continual Improvement Management with no CIM setup or configuration required. Improvements can be created in separate domains, including the global domain.

Continual Improvement Management extends the platform Task [task] table.

When domain separation is implemented, CIM users can view and request improvements initiatives only in the domain assigned. **Domain** and **Domain Path** columns are available for two main CIM tables (Improvement Register and CIM Tasks) provided with the base system. The **Domain** column contains the name of the domain to which the event or alert belongs, and the **Domain Path** column contains the unique domain identifier.

Table	Contents
[sn_cim_register]	Improvement Initiatives
[sn_cim_task]	CIM Tasks

Note:
If the domain column is not shown, click the **Update Personalized List** icon and add the required column. You can also add the domain path column, if desired.

Use cases:

- An Improvement Requester that belongs to the Acme domain creates an improvement initiative and wants to view it.

  A user must belong to the Acme domain, its parent domain, or the global domain to view the improvement initiative.

- An Improvement Manager that belongs to a parent domain tries to view an improvement initiative in a child domain.

  The user of a parent domain can view improvement initiatives of the parent as well as all child domains of that parent.

- An Improvement Requester that belongs to Acme domain wants to create an improvement initiative on behalf of another user in the Acme domain.

  A user must belong to the same domain as the user for which the improvement initiative is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An Improvement Requester wants to associate a record for an integrated application in the Acme domain.

  A user must belong to the domain of the integrated application from which a record is associated.

- An Improvement Manager has access to multiple domains, but wants to update a record with content within a specific domain.

  The domain specified for the current record drives the functionality of that record and reference fields.

Domain separation for service providers

Monitor and plan improvements

Use the Continual Improvement Workbench to monitor and plan improvements in a single view. The workbench shows tile and list views of improvements in progress, as well as listings under review, and in the backlog to help you plan your sprint.

Before you begin

Role required: sn_cim.improvement_manager, sn_cim.improvement_coordinator

About this task

The workbench is flexible graphical view that you can tailor to your needs, which is helpful for the Improvement Manager when running planning meetings and when doing a quick status update to other stakeholders.

The tile-based drag-and-drop user interface makes it easy to monitor, plan, and approve improvements.

Section	Description
Overview tab	Shows two groups of improvements. • Tiles in Implement and On Hold states. • Listings in Review state. This list can be customized in the Workbench Review list layout. Use this section for daily monitoring and assessment of improvements being implemented, as well as those recently implemented that are in review.
Planning tab	Lists two groups of improvements. • Listings in Implement and On Hold states. • Listing for backlog (New, Accepted, Assess, and Approved states). Use this section for ranking and prioritization of improvements in the Implement state, or

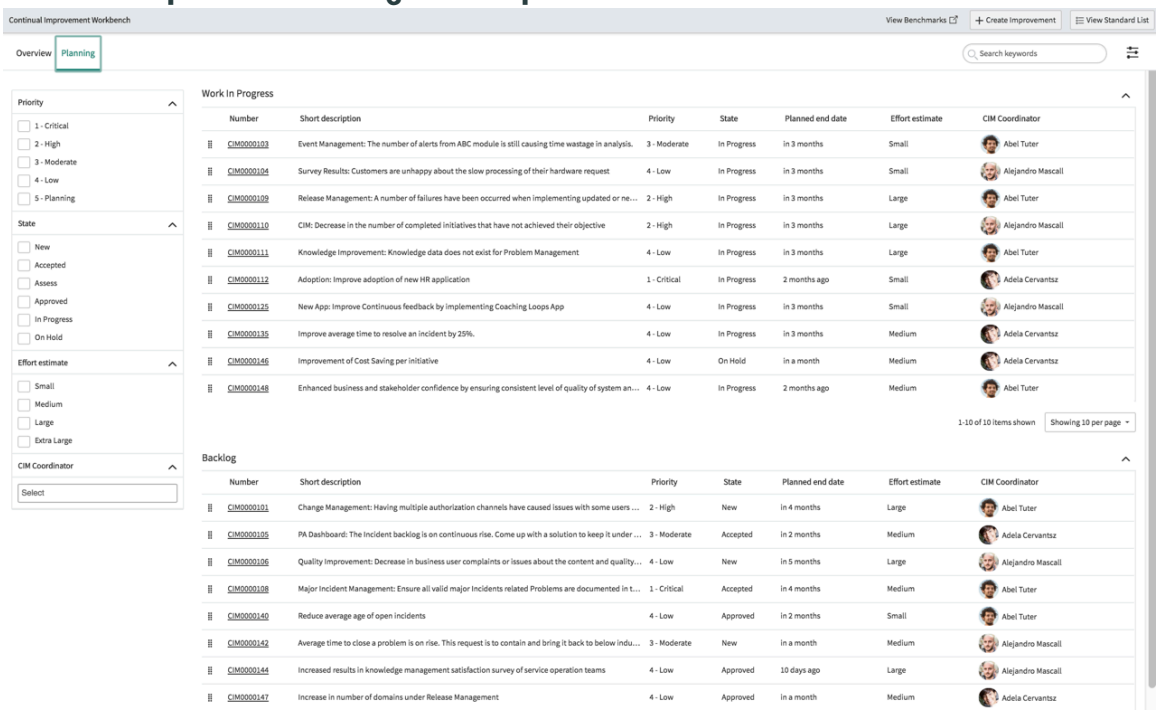
Section	Description
	in the backlog (improvement initiatives in Approved, Assess, Accepted, and New states, listed in that order). **Note:** Configuration changes made to the Planning workbench are reset when the Planning workbench is reloaded.

Continual Improvement Management Improvement Workbench



Features:

- Tile layout (12 improvement tiles shown by default).
- Search by keyword.
- Sort by rank, priority, due date, or effort estimate.
- Status on tile (percentage complete, assignment, priority, and time left)

  Percentage complete is based on the total planned duration of all CIM tasks in each phase of the improvement. For example, if a task in a phase that has a planned duration of 10 days is 100% complete in 10 days, and if another task in the same phase has a planned duration of 5 days and is 0% complete in 10 days, the phase to which these tasks belong will show as 50% complete.

  Note:
  Percent complete values are shown per phase, and per improvement.

- Color-coded status badge on tile.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Status badge	Description
Complete	All tasks have been completed (percent complete is 100%).
Overdue	Due date has passed.
Due soon	Less than 15% of duration left until the due date.
On Hold	Improvement has been placed on hold.

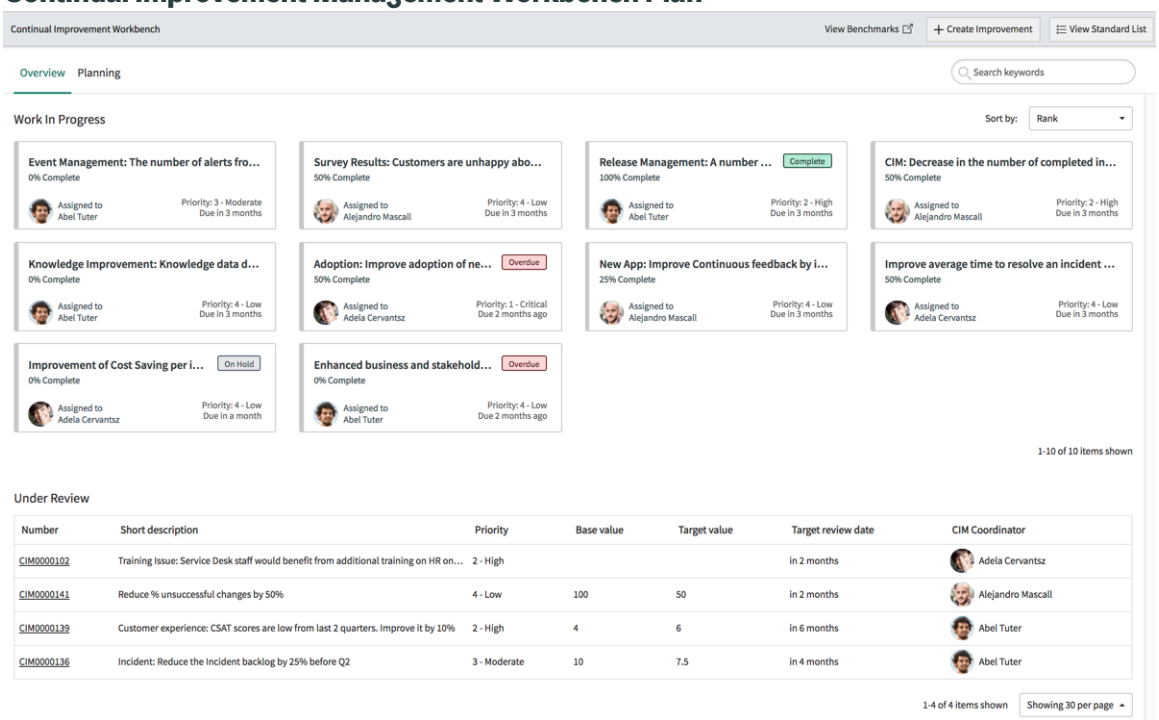
- Customize fields shown in workbench lists using the Workbench Review view.

  Access the Workbench Review view from the List Controls menu ( ) of the Improvement Register (**List Controls** > **View** > **Workbench Review**).

> **Note:**
> Only the fields visible in the Improvement Register [Workbench Review] view are shown in the workbench overview section.

On the planning page, you can prioritize your backlog using an easy-to-use drag-and-drop interface, similar to sprint planning, where you have an active sprint and a list of backlog items. Move backlog items to the Work in Progress list, which is your active sprint.

Continual Improvement Management Workbench Plan



Features:

- Color coding on **Planned end date** field (red, green)
- Search by keyword.
- Move items up or down a list.
- Group multiple items together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Drag and drop within and between lists.

  Note:
  Moving an item, or group of items, from one list to another changes the state of the improvement.

  For example, moving an item from Backlog to Work in Progress changes the state from **Approved** to **Implement**. Conversely, moving an item from Work in Progress back to the Backlog changes the state to **Approved**.

  Only approved items can be moved from the Backlog list to the Implement list.

- Customize fields shown in workbench lists using the Workbench Planning view.

  Access the Workbench Planning view from the List Controls menu ( ) of the Improvement Register (**List Controls** > **View** > **Workbench Planning**).

- Filter by priority, benefits, effort estimate, and CIM Coordinator.

  Note:
  The filters are dynamic and show only the fields visible in the Workbench Planning view.

- Toggle the Filter menu and fields shown using the Configuration menu ( ).

  Note:
  Only the fields visible in the Improvement Register [Workbench Planning] view are shown in the workbench planning section.

Procedure

1. Navigate to **Continual Improvement** > **Workbench**.
2. On the Overview tab, analyze the Work in Progress tiles to get an overall picture of the improvements in progress.
   Color-coded alert banners call out improvements that need attention. You can click on a tile to view the improvement.
3. Use the Planning tab to build the contents of your current sprint, according to capacity.
   a. Drag and drop items from the Backlog list to the Work in Progress list.
   b. Use the filters (Priority, Benefits, Effort Estimate, and CIM Coordinator) to narrow the data contained in the lists so you can focus on certain groups of improvements.
4. Use the Configuration menu to customize the columns shown in the Planning tab lists that is specific to your needs.

Requesting improvements

Identify improvement opportunities within your environment and create an improvement request to begin implementation.

You can request improvements either manually from Continual Improvement Management, or from an application that is integrated with Continual Improvement Management.

Continual Improvement Management integration with other applications lets you:

- Create an improvement initiative from within other applications
- Create a record for another application as part of an improvement initiative or CIM task

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Identifying improvement opportunities

There are many different ways you can identify improvements in your organization. Improvement opportunities need not to be limited to the applications you use, your area of expertise, or your specific group.

You can identify improvement opportunities based on feedback from other groups.

Process manager or process owner

Reach out to the process manager or process owner to identify improvement suggestions for a process that is not working well.

IT, development, and project management groups

Reach out to the IT staff, development team, and project management staff for improvement suggestions, and provide the Improvement Requester role so they can submit an improvement request from within an integrated application with one click.

You can also identify improvement opportunities from within many different applications.

Application	Description
Surveys	Review customer feedback and complaints and send additional assessments soliciting customers for improvement opportunity suggestions.
Performance Analytics	Monitor process KPIs and internal process assessments in Performance Analytics reports to identify improvement opportunities.
Benchmarks	Compare KPI performance with Benchmarks baseline reports, and identify improvement opportunities in Benchmarks recommendations.
Service	Review undesirable trends in reports to identify improvement opportunities.
Problem Management and Change Management	Review Problem Management and Change Management trend reports to identify improvement opportunities.
Risk and GRC Audits	Review Risk registers and GRC Audit test failures to discover improvement opportunities.
IT Service Management	Review ITSM regularly to identify improvement opportunities for what is not working well.

Create an improvement request

Create an improvement request for improvement opportunities you identify in your environment. Once submitted, the improvement request is analyzed and implemented by the Improvement Manager and Improvement Coordinator.

Before you begin

Role required: sn_cim.improvement_requester

About this task

Continual Improvement Management Process Flow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Identify an opportunity for improvement.
   Any type of improvement identified in your company qualifies as the basis for an improvement request. For example, KPI performance, customer satisfaction, resources, processes, training, to name a few.
2. Determine your improvement goal.
   The improvement goal is the expected result to be achieved from the improvement.
3. Submit an improvement request.

   a. Navigate to **Continual Improvement** > **Create New**.
   A CIM phase is automatically created when you create the initiative, if the *sn_cim.create_default_phase* system property is enabled. For more information, see Properties installed with Continual Improvement Management.

   b. Fill in the short description and the business justification, and click **Submit**.
   The improvement request is created and set to **New** for the Improvement Manager to accept or reject based on alignment with strategic objectives.

4. To track the status of your improvement request, navigate to **Continual Improvement** > **My CIM Requests**.

Example: Create improvement request

In the process of reviewing KPI performance in the Performance Analytics application, the incident manager noticed the **Average time to resolve an incident** KPI scorecard was too high (24 hours).

As part of the improvement identification process, the incident manager analyzed the KPI performance by comparing it with values from other companies using the Benchmarks application, determined an improvement was needed, and set a target goal.

Improvement Initiative form

Field	Value
Number	CIM0000135 (set internally)
Business service	IT Services
Business process	Incident Management
Short description	(Required) Improve average time to resolve an incident by 25%
Business justification	Average time to resolve an incident time is bad compared to Industry average. I compared our value with global values from companies in the same industry using the Benchmarks application.
State	New
Priority	4 - Low (default)

Managing improvements

After an improvement is requested, the Improvement Manager reviews it, assigns an Improvement Coordinator, and monitors progress of all improvements to ensure value and success. The Improvement Coordinator works with the Improvement Manager to implement the improvement.

The Improvement Manager oversees, identifies, drives, and monitors the progress of all improvements.

The Improvement Coordinator manages the improvements to which they have been assigned by the Improvement Manager, and works with the CIM task owners to track task completion.

Note:
Although both roles can cancel an improvement, only the Improvement Manager can delete an improvement, which removes it from the Improvement Register list.

Process flow

1. The process flow starts with a **new** improvement request. A need for improvement is identified in the environment and a new improvement request is submitted by a user with the Improvement Requester role.
2. The Improvement Manager then verifies that the new improvement request aligns with at least one company strategic objective, and assigns an Improvement Coordinator before accepting the improvement as valid. The assigned Improvement Coordinator is notified that the improvement request has been **accepted**.

   There is typically more than one Improvement Coordinator in a company since that role is responsible for implementing and tracking the progress of assigned improvement initiatives at the task level, and there can be many tasks per improvement.
3. Once accepted, the Improvement Manager sets the remaining attributes on the Improvement Initiative form, and progresses it to be **assessed** for approval (by Approver group members).
4. During assessment, users in the approver group (shown in the Approvers related list) are notified of the approval request. One or all of the approver group members evaluate the improvement attributes and either **approve** or reject the improvement.
5. Once approved, the Improvement Coordinator and Improvement Manager work together (in regular implementation meetings, for example) to determine what work is needed to ready the improvement for **implementation**.

   During implementation, the Improvement Coordinator creates and assigns phases and can create tasks directly from an initiative or from a phase to complete the improvement. The Improvement Coordinator works with the task owners (in regular task status meetings, for example) to track the progress of task completion. Records for other supported applications can also be created from within the improvement initiative or CIM task, if needed, and are typically shown in a related list in the improvement initiative or CIM task.

   If, for some reason, implementation for the improvement has been halted, the Improvement Manager or Improvement Coordinator can place the improvement **on hold**. All CIM tasks that are not closed or canceled are also placed on hold. You can cancel a CIM initiative at any

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

stage when the initiative is in progress. When you cancel an initiative, the initiative as well as the tasks associated with the initiative move to **Closed Incomplete**.

6. The Improvement Coordinator places the improvement under **review** when all CIM tasks in all CIM phases are verified 100% complete. The Improvement Manager reviews the improvement completeness and sets the improvement to **closed**.

CIM task progress rollup calculation

You can create a task directly from an initiative or from a phase. When a task is moved to the Closed Complete state, the progress of the CIM initiative is calculated based on the percentage of all tasks that are in Closed Complete state for that initiative. The duration of the task which is based on the planned end date is also taken into consideration when the progress of the CIM initiative is calculated. The longer the duration, the slower the progress. As you add new tasks to a phase or associate it directly with the CIM initiative, the percentage completion for the CIM initiative is updated accordingly.

The table below shows an example of how the CIM task progress rollup is calculated.

Example CIM task progress rollup calculation

Parent Record	Task	Task duration	State	Contribution to initiative progress (%)
CIM Phase 1	Task 1	2 days	Closed Complete	20%
CIM Phase 1	Task 2	3 days	Closed Complete	30%
CIM Initiative	Task 3	2 days	Any state other than Closed Complete	50% **Note:** This task is directly associated with the CIM initiative.

Alignment with company strategic objectives

You can ensure alignment with company goals by setting the **Strategies** field on the Improvement Initiative form to one or more company enterprise strategies from the Strategic Objectives lookup list so they are linked.

Note:
Only the Improvement Manager can create a strategy.

Coordinating improvements with enterprise strategies of the company ensures the improvement contributes to the overall goals of the company.

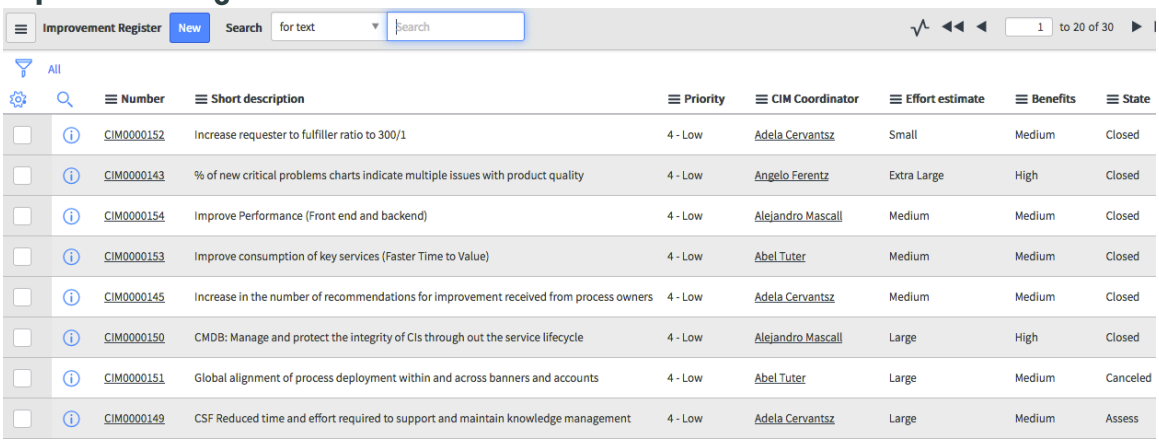
Access enterprise strategies by navigating to **Continual Improvement** > **Enterprise Strategies** (or **Organization** > **Enterprise Strategy**).

Improvement Register list

View, prioritize, and track improvements, related tasks, and phases from one Improvement Register list that includes all open and closed improvements in one list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Improvement Register

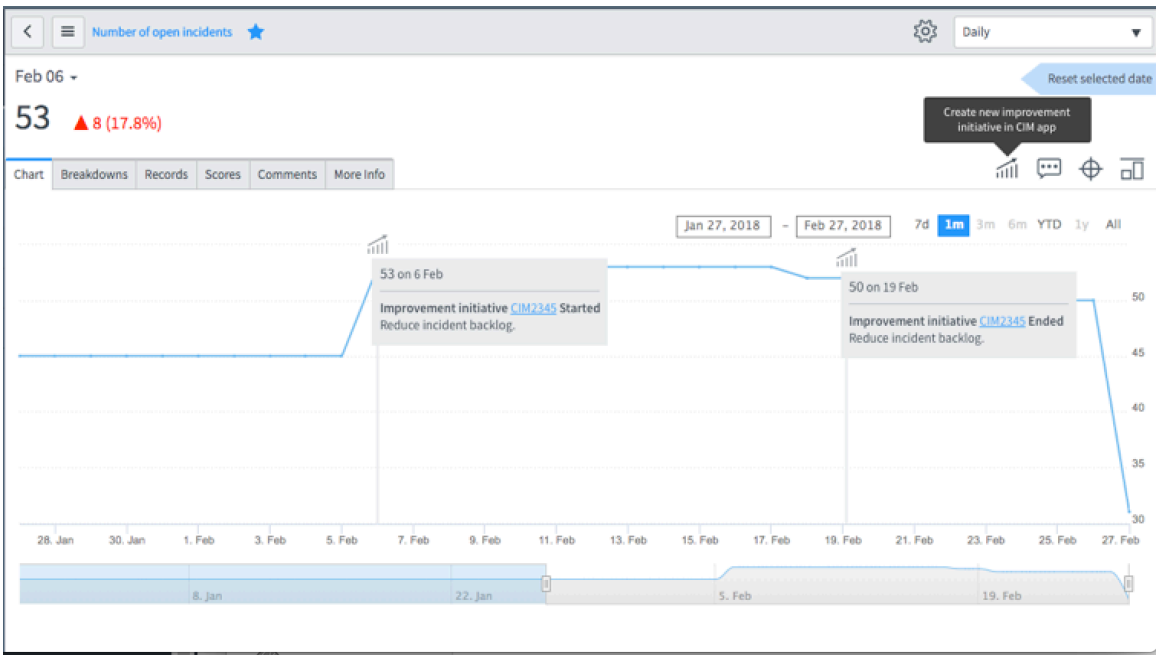


Number	Short description	Priority	CIM Coordinator	Effort estimate	Benefits	State
CIM0000152	Increase requester to fulfiller ratio to 300/1	4 - Low	Adela Cervantsz	Small	Medium	Closed
CIM0000143	% of new critical problems charts indicate multiple issues with product quality	4 - Low	Angelo Ferentz	Extra Large	High	Closed
CIM0000154	Improve Performance (Front end and backend)	4 - Low	Alejandro Mascall	Medium	Medium	Closed
CIM0000153	Improve consumption of key services (Faster Time to Value)	4 - Low	Abel Tuter	Medium	Medium	Closed
CIM0000145	Increase in the number of recommendations for improvement received from process owners	4 - Low	Adela Cervantsz	Medium	Medium	Closed
CIM0000150	CMDB: Manage and protect the integrity of CIs through out the service lifecycle	4 - Low	Alejandro Mascall	Large	High	Closed
CIM0000151	Global alignment of process deployment within and across banners and accounts	4 - Low	Abel Tuter	Large	Medium	Canceled
CIM0000149	CSF Reduced time and effort required to support and maintain knowledge management	4 - Low	Adela Cervantsz	Large	Medium	Assess

Embedded Performance Analytics scorecard

Use the Analytics Hub embedded in the Improvement Initiative form for continuous KPI monitoring, and to track the progress of the KPI improvement during the lifecycle of the improvement. The KPI scorecard is useful so you can monitor the incremental benefits of the KPI, or adjust CIM tasks and assignments to meet your improvement goal, if needed.

Embedded KPI scorecard



The improvement icon ( ) indicates the start and end dates that are tracked on the KPI scorecard chart.

Scorecards are also shown for any KPIs listed in Impacted KPIs related list on the Improvement Initiative form.

Accept an improvement

Accept and assign a new improvement request so it can be assessed for approval. You can reject the improvement request if it does not align with company strategic objectives.

Before you begin

Role required: sn_cim.improvement_manager, sn_cim.improvement_coordinator

About this task

Precondition: Improvement Requester created an improvement request.

Procedure

1. Identify the new improvement request.
   a. Navigate to **Continual Improvement** > **Open**.
   b. In the Improvement Register list, open an improvement in the **New** state.
2. Align the improvement request with company strategic objectives, and assign an Improvement Coordinator.
   a. On the Improvement Initiative form, unlock the **Strategies** field to access your company strategic objectives, then click the lookup list.
   b. Select the enterprise strategy aligned with the improvement request.

      Note:
      Only the Improvement Manager can create a strategy.

   c. Click the **CIM Coordinator** lookup list and select an Improvement Coordinator to manage the improvement.
3. Complete the fields for business service, business process, priority, effort estimate, benefits, and why this improvement is important.
4. In the header bar, click **Accept** to progress the improvement request to the **Assess** state. Improvement Coordinator is notified of assignment.
5. Complete the content in the Goals, Details, and Schedule tabs on the Improvement Initiative form.

Example: Accept improvement request

In the process of reviewing KPI performance in the Performance Analytics application, the incident manager noticed the **Average time to resolve an incident** KPI scorecard was too high (24 hours).

As part of the acceptance process, the Improvement Manager determined that KPI performance improvement aligned with the Automation/Effort Reduction strategic objective, assigned the Improvement Coordinator that drives KPI improvements, and accepted the improvement request.

Prepare an improvement

Once the improvement is approved, you can create CIM phases, tasks, and identify impacted KPIs. The Improvement Coordinator for the improvement works with the Improvement Manager to plan implementation.

Before you begin

Role required: sn_cim.improvement_manager, sn_cim.improvement_coordinator

About this task

Plan your implementation as phases to keep track of your project milestones. Add tasks to the phase and monitor the progress for the milestones. You can also track your goals by creating tasks directly from the initiatives.

Continual Improvement Management Implementation Process

Preconditions:

- Improvement Requester created the improvement request.
- Improvement Manager accepted and assigned the improvement request.
- Approver group member assessed and approved the improvement.

Procedure

1. Determine phases and tasks needed for the improvement.
   Improvement Manager and Improvement Coordinator meet to determine the tasks required to complete the improvement, and whether multiple phases are required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Set up CIM phases to track CIM tasks.
   a. Navigate to **Continual Improvement** > **Open** and open the improvement in the **In Progress** state.
   b. In the CIM Phases related list, click **New** and fill in the description and planned end date.
   c. Right-click the form header and select **Save**.
   d. In the CIM Tasks related list, click **New** to create a CIM task.
   e. In the **Parent** field, select the a CIM Phase record to which you want to associate the CIM task.
   f. Set the CIM task attributes, including assignment, priority, state, planned end date, and short description.
   g. Click **Submit**.
3. Create and assign CIM tasks for an improvement.
   a. In the CIM Tasks related list, click **New** to create a CIM task.
   By default, the CIM task is linked to the CIM initiative. To track the task within a phase, in the **Parent** field, select the a CIM Phase record to which you want to associate the CIM task.
   b. Set the CIM task attributes, including assignment, priority, state, planned end date, and short description.

   Note:
   - When the planned end date for a CIM task is updated, the planned end date that the CIM initiative that the task is associated with also gets updated. When the state for a CIM task is moved to Work In Progress, the Actual Start Date field is automatically updated with the current date.
   - When the task is assigned, the task assignee receives an email notification.

4. To create a separate application task for an integrated application, click the related link for that application task.
5. To monitor a KPI with the improvement, add a record to the Impacted KPIs tab.
6. Meet with CIM task owners to oversee status, monitor work completed, add or update tasks and phases, and track overall progress of the improvement to completion.
   a. Oversee the progress of CIM tasks with task owners on a regular basis until all tasks are presented as complete.
   b. On the Improvement Initiative form, verify that all tasks in the CIM Tasks related list are **Closed Complete**.
   The improvement coordinator and task assignee receive an email notification when the task is moved to **Close Incomplete**, **Closed Skipped**, or **Closed Complete** state.
   c. On the Improvement Initiative form, verify that all phases in the CIM Phases related list are 100% complete.
7. Click **Review** in the header bar to request the improvement be reviewed by the Improvement Manager for closure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example: Implement improvement

In the process of reviewing KPI performance in the Performance Analytics application, the incident manager noticed the **Average time to resolve an incident** KPI scorecard was too high (24 hours).

As part of the implementation process, the Improvement Manager and Improvement Coordinator determined the work required in the next three to six months to complete the improvement, with a target review date 3 months after start.

- Configured default CIM Phase 1 (added two CIM tasks), and created CIM Phase 2 (added two CIM tasks).
- Created a Change Management application task record (CHG0030001) associated with CIM Task 2 using the **Create Change** related link, and set the change record attributes.
- Added four KPIs to the Impacted KPIs tab to monitor with the improvement.

Improvement Coordinator met with CIM task owners regularly to oversee status and monitor work completed, and set the improvement status to review after all implementation was complete.

Assess an improvement for approval

Once accepted and set to assess, Approver group members evaluate the improvement for approval before implementation can begin.

Before you begin

Role required: None (must be a member of the Approver group)

About this task

Continual Improvement Management - Assess Process Flow

Note:
Only one Approver group member needs to approve the improvement before moving to the next state. To require additional approvers, configure the CIM Approval workflow in Flow Designer.

The default expiration period for approval requests is seven business days. Pending approval requests are automatically canceled after seven days but can be resubmitted for approval.

Preconditions:

- Incident manager created an improvement request.
- Improvement Manager accepted and assigned the improvement request.

By default, an improvement requires approval before it can progress to the Implement state. You can disable the approval requirement using the *sn_cim.need_approval* property. When disabled, the **Approver group** field and the **Approvers** related list on the Improvement Initiative form are not shown.

Procedure

1. Navigate to **All** > **Self Service** > **My Approvals**.
2. On the Approval form, scroll down to the **Summary of Item being approved** section and assess the details of the improvement, including alignment with strategic objectives

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(strategies), business service, business process, priority, effort estimate, benefits, and why this improvement is important.

3. Click **Approve** in the header bar to approve the improvement.
   The improvement is ready for implementation by the Improvement Manager and Improvement Coordinator.

   A default CIM phase (CIMT number) is automatically created.

Example: Approve an improvement

In the process of reviewing KPI performance in the Performance Analytics application, the incident manager noticed the **Average time to resolve an incident** KPI scorecard was too high (24 hours).

As part of the approval process, an Approver group member assessed the details of the improvement and approved it to begin implementation.

Review and close an improvement

Once all tasks in each phase of the improvement have been completed, the Improvement Coordinator sets the improvement to review for the Improvement Manager to close.

Before you begin

Role required: sn_cim.improvement_manager, sn_cim.improvement_coordinator

About this task

Continual Improvement Management Review and Close Process

Preconditions:

- Incident manager created an improvement request.
- Improvement Manager accepted and assigned the improvement request.
- Approver group member approved the improvement.
- Improvement Manager and Improvement Coordinator implemented the improvement.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Review the improvement for closure.
   a. Navigate to **Continual Improvement** > **Under Review**.
   b. In the Improvement Register list, open the improvement in the **Monitor/Review** state.
   c. On the Improvement Initiative form, verify that all phases in the CIM Phases related list are 100% complete.
2. Verify the improvement has met the improvement goal.
3. Close the improvement.
   a. In the Closure Notes tab, set the closure code, achieved outcome category, and close notes.
   b. Click **Close** in the header bar to close the improvement.
   The improvement is no longer shown in the Open Improvement Register list.

Example: Close improvement

In the process of reviewing KPI performance in the Performance Analytics application, the Incident Manager noticed the **Average time to resolve an incident** KPI scorecard was too long (24 hours).

As part of the review process for **Improve average time to resolve an incident by 25%** improvement, the Improvement Manager verified the work for the improvement is complete (Improvement Initiative form and CIM Phases related list shows 100% complete).

The Improvement Manager also verified the improvement in two places before closing the improvement.

- Performance Analytics now shows that the **Average time to resolve an incident** KPI has a value of 16 hours, which is more improvement than the target value of 18 hours (18 hours is 25% faster than the previous average of 24 hours).
- Benchmarks application now shows that the company result for the **Average time to resolve an incident** KPI has a value of 16 hours, which is 2 hours better than the global industry average.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Description
	The improvement is set to implement by the Improvement Manager. **States** list: • Implement • Canceled • Assess (for reapproval) If additional tasks were added, or if the target has changed, the improvement may need to go through approval again. List Controls menu ( ) options on the Improvement Initiative form: • Copy Initiative • Submit for Re-Approval
In Progress	CIM task creation is completed by the Improvement Manager or Improvement Coordinator. CIM tasks are completed by the task owners. The Improvement Coordinator determines either that the improvement is complete and sets it to review, or that progress is halted and places it on hold. **States** list: • Monitor/Review • On Hold • Assess (for reapproval) If additional tasks were added, or if the target has changed, the improvement may need to go through approval again. List Controls menu ( ) options on the Improvement Initiative form: • Copy Initiative • Submit for Re-Approval
On Hold	Improvement is no longer in progress but may resume at a later date. The Improvement Manager determines the outcome of the improvement including whether it should go back to implementation, or be closed or canceled. **States** list:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Description
	• Implement • Closed • Canceled **Note:** When an improvement is placed on hold, all active CIM tasks (not closed or canceled) are also placed on hold, but the state can be changed manually. When the improvement is taken off hold, all active CIM tasks (not closed or canceled) are set to Open state (unless they were changed manually). List Controls menu ( ) options on the Improvement Initiative form: Copy Initiative.
Monitor/Review	All CIM tasks for the improvement are complete, improvements have been measured, and no further action is required by the task owners. The improvement is reviewed for closure by the Improvement Manager. **States** list: • Implement • Closed • Assess (for reapproval) If additional tasks were added, or if the target has changed, the improvement may need to go through approval again. List Controls menu ( ) options on the Improvement Initiative form: Copy Initiative.
Closed	Improvement is complete and is added to the Closed Improvement Register list.
Delete	Improvement is removed from the Improvement Register list. Available in each state but only to the Improvement Manager.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIM task states

An improvement contains of one or more CIM tasks to complete the improvement. A CIM task is assigned to an owner to be responsible for the work specified.

The state of a CIM task indicates the level of progress for the task.

State	Description
Pending	State of a CIM task added before the improvement has been approved. If a CIM task is added after the improvement is approved, the CIM task is set to Pending state until the improvement is approved again. Once approved, the CIM task is set to Open state. If rejected, the CIM task remains in the Pending state.
Open	State of a new CIM task for an improvement that has been approved.
Work in Progress	State of a CIM task for which work has begun.
Closed Complete	State of a closed CIM task that has been completed.
Closed Incomplete	State of a closed CIM task that has been closed but not fully completed.
Closed Skipped	State of a closed CIM task for which no work has been done.
On Hold	State of a CIM task for an improvement set to On Hold state. The state of a CIM task on hold can be manually changed to Open or Work In Progress states.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

State	Description
	Note: When an improvement is placed on hold, all active CIM tasks (not closed or canceled) are also placed on hold, but the state can be changed manually. When the improvement is taken off hold, all active CIM tasks (not closed or canceled) are set to Open state (unless they were changed manually).

CIM approver states

Each improvement needs at least one approval to progress to the Implement state. The Approvers related list in the improvement contains a list of user approval records and the state of the approval.

The users in the Approvers related list belong to the **Approver Group** specified on the Improvement Initiative form. Once the improvement has been approved by an Approver Group member, approval from other members is no longer required to progress the improvement. However, other Approver Group members can still set their individual approval state.

To require additional approvers, configure the CIM Approval workflow in Flow Designer.

Improvement process flow

Process flow for Continual Improvement Management

Process flow	Role	Description	Next action
Create Improvement Initiative	Improvement Requester	The need is determined for an improvement and an improvement request is created.	Click **Submit.** Required: Short Description
New	Improvement Manager	Acceptance is determined by verifying that the improvement objective aligns to a company strategic objective, and an Improvement Coordinator is assigned.	Click **Accept.** Required: • Improvement Coordinator • Strategies
Accepted	Improvement Manager	Other attributes are set and the improvement request is ready to be assessed for approval (by Approver group members).	Click **Assess.** (Waiting for approval) Approver group members are notified.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process flow	Role	Description	Next action
			Required: Approver Group
Assess	CIM approver (member of the Approver group) CIM approver states	The improvement attributes are assessed for approval from the Approvers related list.	Click **Approved.**
Approved	Improvement Manager or Improvement Coordinator	Improvement Coordinator and Improvement Manager work together to determine what is needed to ready the improvement for implementation.	Click **Implement**. **Actual start date** (Schedule tab) is automatically populated.
Implement	Improvement Coordinator	Implementation of the improvement begins with the assigned task owners. Any problem, change, or knowledge submission is shown in the corresponding related list.	Click **Review** if implementation is complete. Click **On Hold** if the process has halted. Required: On Hold Reason
On Hold	Improvement Manager or Improvement Coordinator	Implementation for the improvement has halted (**On Hold** state) but the process flow remains in **Implement**.	Click **Implement** to continue the process. Click **Close** if no further work will be done.
Review	Improvement Manager	The improvement attributes are reviewed for completeness and efficacy for closure.	Click **Close**. Required: Closure Notes tab **Actual end date** is automatically populated.

CIM roles

Roles are added with installation of Continual Improvement Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIM roles

Role	Description	Contains roles
Improvement Requester [sn_cim.improvement_requester]	Can perform the following application functions: • Create improvement initiative • View and track improvement initiatives they've submitted • View all CIM requests within the organization • Follow and monitor improvements by adding them to the Watched CIM Initiatives list	None
Improvement Coordinator [sn_cim.improvement_coordinator]	Can perform Improvement Manager functions for improvements that they're assigned to as Improvement Coordinator. • Coordinate improvements within their area of expertise at the process or service level • Access the Continual Improvement Workbench Improvement Coordinators can't perform these functions:	• sn_cim.improvement_requester • app_service_user • certification • cmdb_query_builder • dependency_views • itil Problem/change/incident records can be added. • knowledge • pa_analyst • pa_contributor • pa_power_user Can assess existing Performance Analytics indicators and create new ones. • pa_target_admin • pa_threshold_admin • pa_viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CIM roles (continued)

Role	Description	Contains roles
	• Create enterprise strategies • Delete improvement	• sn_bm_client.benchmark_data_viewer • sn_bm_client.benchmark_recommendation_viewer Can view Benchmarks data and recommendations and create improvement initiatives from Benchmarks recommendations. • template_editor • view_changer • sn_coaching.admin • scrum_story_creator
Improvement Manager [sn_cim.improvement_manager]	Can perform all application functions and is responsible for all improvements. • Accept new improvement requests • Assign improvements to Improvement Coordinators for implementation • Access the Continual Improvement Workbench • Monitor the progress of improvements • Review and close improvements	• sn_cim.improvement_coordinator • sn_process_optimization_viewer

For information about assigning user roles, see Assign a role to a user

Automatic assignment of the Improvement Requester role

The Improvement Requester (sn_cim.improvement_requester) role is automatically assigned to the roles listed in the following table when CIM is activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Application	Role
Strategic Portfolio Management (only if SPM plugins are active)	
Agile Development	scrum_master
Demand Management	it_demand_manager
Portfolio Management	it_portfolio manager
Program Management	it_program_manager
Project Management	it_project_manager
Test Management	tm_test_manager
ITSM	
Benchmarks	• sn_bm_client.benchmark_admin • sn_bm_client.benchmark_recommendation_viewer
Change Management	change_manager
Coaching	sn_coaching.admin
Incident Management	incident_manager
ITSM	itil
Survey Management Assessments	• survey_admin • survey_reader
Performance Analytics and Reporting	
Performance Analytics	• pa_admin • pa_power_user • pa_viewer

Email notifications by role

Email notifications are sent when the state of the improvement request changes or when the target date is breached based on the user role.

Email notification list by role

CIM task closed	No	Yes	No	No	Yes

Improvement field descriptions

Improvement Initiative form and related field descriptions.

Improvement Initiative form

Field	Description
Number	Unique CIM number.
Business service	CMDB Business service improved by the improvement initiative.
Service offering	Service offering associated with this improvement initiative.
Business process	Business process improved by the improvement initiative. When a business process is selected, the improvement area **Type** field on the **Details** tab is automatically set to Process.
CIM Coordinator	User primarily responsible for ensuring the completion of the improvement initiative. The CIM Coordinator must have the Improvement Coordinator role (sn_cim.improvement_coordinator).
Approver group	Group of users that have permission to approve the improvement initiative. CIM Approvers group is added with Continual Improvement Management. Default is empty.
Strategies	Strategic objectives impacted by the improvement initiative. Multiple strategic objectives can be selected. Strategic objectives can be added from the lookup list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The lookup list contains both Continual Improvement Management strategic objectives and business enterprise strategies to align with the improvement initiative. An enterprise strategy can be added from the navigation menu **Continual Improvement** > **Enterprise Strategies**. Also accessible through **Business Planner** and **Organization** navigation menus. **Note:** If the improvement initiative does not align with a company strategic objective, you can click **Reject** in the header bar to reject the improvement initiative.
State	State of the improvement initiative. This field is read only. • New • Accepted • Assess • Approved • In Progress • On Hold • Monitor/Review • Closed • Canceled
On hold reason	Reason for putting the improvement initiative on hold. **Note:** This field is shown only when the state is on hold. When an improvement initiative is placed on hold, all CIM tasks are also placed on hold, but the state can be changed manually. When the improvement initiative is taken off hold, the CIM tasks are returned back to their previous state unless they were changed manually.
Priority	Sequence in which an incident or problem is to be worked on, based on impact and urgency. • 1 - Critical • 2 - High • 3 - Moderate • 4 - Low • 5 - Planning

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Effort estimate	Estimate of effort to complete all required tasks for the improvement initiative. • Small • Medium • Large • Extra Large
Benefits	Expected level of benefits achieved by completing the improvement initiative.
Percent complete	Percentage of work completed. The percentage is based on the completed state of the CIM phases that belong to this improvement initiative. For example, if there are five CIM phases, each contributes to 20% completion.
Short description	Brief explanation of the improvement initiative.
Business justification	Description about the importance of the improvement and additional details that includes metrics or KPIs used to measure the success.

Goals tab

Field	Description
Success measurement method	• Automated: PA Indicator: An improvement KPI. • Reports: Reports to track progress. Users who do not use performance analytics can add reports to track the initiatives. • Survey and Assessment: An Assessment metric type. • Manual: All other types.
Improvement KPI	Primary KPI used to measure the improvement of the improvement initiative. The Show Score Card icon launches the Performance Analytics score card for the improvement KPI. **Note:** This field is shown only when the **Success Measurement Method** field is set to **Automated: PA Indicator**.
Breakdown	The breakdown of the improvement KPI, if one exists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is shown only when an improvement KPI is selected for the **Automated: PA Indicator** success measurement method.
Element	The element of the KPI breakdown. **Note:** This field is shown only when a breakdown is selected.
2nd Breakdown	The second-level breakdown of the improvement KPI, if one exists. **Note:** This field is shown only after the first breakdown is selected.
2nd Element	The element of the second-level KPI breakdown. **Note:** This field is shown only when a second-level breakdown is selected.
Time Series	Time series for the improvement KPI. **Note:** This field is shown only when an improvement KPI is selected.
Survey & Assessment	Assessment metric type associated with the improvement initiative. **Note:** This field is shown only for the Survey & Assessment success measurement method. If the improvement initiative was created from within the Survey Management application, this field is not automatically populated.
Base value	Base value of the success measurement method when the target is set.
Percentage improvement	Percent improvement target. **Note:** This field is shown only when an improvement KPI is selected. If the KPI is a percent type, then this field is calculated automatically (based on **Base value** and **Target value** fields).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target value	Absolute target value. **Note:** For the **Automated: PA Indicator** success measurement method, if the KPI is not a percent type, then this field is calculated automatically (based on base value and percentage improvement). If the target value is already set on the indicator, breakdown, element, and aggregation, this field is automatically set. However, you can override this value by specifying a percent in the **Percent Improvement** field. The target value set in this field is synced with the Performance Analytics indicator target for the KPI (**Performance Analytics** > **Indicator** > **Targets**).
Target review date	Date the goal should be achieved. **Note:** For the **Automated: PA Indicator** success measurement method, even if the target date is already set on the indicator, breakdown, element, and aggregation, this field is not automatically set.
Expected outcomes	Tangible artifacts and updates expected by the improvement initiative (for example, updated process published in new template, work Instructions, and FAQ published in knowledge base).

Details tab

Field	Description
Requested for	User for which the improvement initiative was created.
Type	Area improved by the improvement initiative. One or many areas may be selected. • People • Process • Technology When a value is selected for the **Business Process** field, the **Type** field is automatically set to Process.
Watch list	Users notified when updates are made to the improvement initiative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent initiative	Parent initiative associated with this child initiative. When a parent initiative is selected, all associated child initiatives display in the **Child Initiatives** related list.
Source/Parent	Source or parent application from which the improvement initiative was created. • Coaching Opportunity (COP) Coaching opportunity record to which the improvement initiative is linked. • CMDB Remediate Duplicate Tasks record to which the improvement initiative is linked. • Demand (DMND) Demand record to which the improvement initiative is linked. • GRC issue Issue record to which the improvement initiative is linked. • Incident (INC) Incident record to which the improvement initiative is linked. • Problem (PRB) Problem record to which the improvement initiative is linked. • (Survey) Assessment Metric Type Assessment metric type for the survey definition record to which the improvement initiative is linked. **Note:** This field is shown only when an improvement initiative is created from Coaching, CMDB, Demand Management, GRC, Incident Management, Problem Management, or Survey Management applications.

Schedule tab

Field	Description
Planned start date	Expected start date. By default, this field displays the date and time when the CIM initiative was created.
Planned end date	Expected end date. By default, this field displays the date and time for the day after the planned start date.
Actual start date	The date and time when the progress on a new initiative starts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Actual end date	The date and time when the last task associated with an initiative is completed.

Notes tab

Field	Description
Additional comments (customer visible)	Check box to show additional comments that are visible to the customer. If checked, the **Additional comments (Customer visible)** field content is shown.
Work notes	Work notes relating to the improvement initiative. **Note:** Required when submitting the improvement initiative for reapproval.

Closure Notes tab

Field	Description
Closure code	• Successful: Goals met. • Withdrawn: No longer needed/applicable. • Unsuccessful: Goals not met.
Achieved outcome category	• Cost Reduction • Revenue Generation • Time Savings • Customer Satisfaction • Quality Improvement
Close notes	Notes regarding the improvement initiative closure.

CIM Phases related list

Field	Description
Number	Unique CIMT phase number.
Parent	Improvement initiative to which the CIM phase belongs. There can be multiple CIM phases per improvement initiative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The CIM phase groups the tasks, sets a planned end date, and shows the percent complete for tracking purposes.
Percent complete	Percentage of work completed. Percentage is based on the completed state of the CIM tasks that belong to this CIM phase. For example, if there are five CIM tasks, each contributes to 20% completion.
Planned end date	Estimated phase end date.
Actual end date	End date of the phase.
Short Description	Short description of the phase.
Description	(Required) Full description of the phase.

CIM Tasks related list

Field	Description
Number	Unique CIMT task number.
Parent	If the CIM task is tied to a CIM phase, the improvement phase number to which the CIM task belongs. A CIM task can only be tied to one CIM phase. You can also create a CIM task directly from a CIM initiative. CIM tasks consist of the work required to complete the improvement initiative.
Active	Check box that indicates whether the task is active.
Assigned to	User primarily responsible for completion of the task.
Improvement Initiative	Improvement initiative number to which the CIM task belongs.
Priority	Sequence in which an incident or problem is to be worked on, based on impact and urgency. • 1 - Critical • 2 - High

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• 3 - Moderate • 4 - Low • 5 - Planning
State	State of the task. • Pending • Open • Work In Process • Closed Complete • Closed Incomplete • Closed Skipped • On Hold
On Hold Reason	Reason for putting the CIM task on hold. **Note:** This field is shown only when the state is on hold. When an improvement initiative is placed on hold, all CIM tasks are also placed on hold, but the state can be changed manually. When the improvement initiative is taken off hold, the CIM tasks are returned back to their previous state (unless they were changed manually).
Planned end date	Estimated end date of the task.
Short Description	Short description of the task.
Description	Full description of the task.
Work notes	Work notes for the task.

Impacted KPIs related list

Field	Description
Improvement Initiative	Improvement initiative number to which the impacted KPI belongs.
Impacted KPI	Other related KPIs (independent of the **Improvement KPI**) that are affected by changes made as a result of the improvement initiative.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Breakdown	The breakdown of the impacted KPI. **Note:** This field is shown only when an impacted KPI is selected.
Element	The element of the KPI breakdown. **Note:** This field is shown only when a breakdown is selected.
Breakdown Level 2	The second-level breakdown of the improvement KPI, if one exists. **Note:** This field is shown only after the first breakdown is selected.
Element Level 2	The element of the second-level KPI breakdown. **Note:** This field is shown only when a second-level breakdown is selected.
View Scorecard	Related link to view the scorecard for the KPI. **Note:** The View KPI details button displays the details of the improvement KPI.

Approvers related list

Field	Description
State	State of the approval. • Not Yet Requested • Requested • Approved • Rejected • Canceled • No Longer Required
Approver	User authorized to approve the improvement initiative. Approvers are members of the group set in the **Approver Group** field on the Improvement Initiative form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Comments	Comments for the approval improvement initiative.
Created	Date the improvement initiative was created.

Components installed with Continual Improvement Management

Several types of components are installed with activation of the com.sn_cim plugin, including tables, user roles, and scheduled jobs.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed with Continual Improvement Management

Role title [name]	Description	Roles inherited
Improvement Requester [sn_cim.improvement_requester]	Able to perform these application functions: • Create improvement initiative • View **My CIM requests** • View **Watched CIM requests** • View **All** CIM requests	None
Improvement Coordinator [sn_cim.improvement_coordinator]	Able to perform all functions for improvements to which they are assigned as Improvement Coordinator except:	• sn_cim.improvement_requester • app_service_user • certification • cmdb_query_builder • dependency_views • itil Problem/change/incident records can be added. • knowledge

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Roles inherited
	• Create Enterprise Strategies • Delete improvement Although able to perform Improvement Manager functions, an Improvement Coordinator can only perform those functions for improvements that they are assigned as Improvement Coordinator by the Improvement Manager. Primary responsibility is to coordinate improvements within their area of expertise (at the process or service level). Can access both Continual Improvement Workbench and dashboard.	• pa_analyst • pa_contributor • pa_power_user Existing Performance Analytics indicators can be accessed, and new ones created. • pa_target_admin • pa_threshold_admin • pa_viewer • sn_bm_client.benchmark_data_viewer • sn_bm_client.benchmark_recommendation_viewer Benchmarks data and recommendations can be viewed and an improvement initiative can be created from Benchmarks recommendations. • template_editor • view_changer • sn_coaching.admin • scrum_story_creator
Improvement Manager [sn_cim.improvement_manager]	Able to perform all application functions. The Improvement Manager is primarily responsible for all improvements,	• sn_cim.improvement_coordinator • sn_process_optimization_viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Roles inherited
	including initial acceptance of new improvement requests, assignment, and closure. The Improvement Manager also monitors the overall progress of all improvements.	

Scheduled jobs installed with Continual Improvement Management

Scheduled job	Description
[PA Continual Improvement]	Daily CIM data collection.
[PA Continual Improvement]	Historical CIM data collection.

Tables installed

Table	Description
Improvement Initiative [sn_cim_register]	Contains all improvement initiatives.
CIM Task [sn_cim_task]	Contains the CIM tasks created for an improvement initiative.
Impacted KPIs [sn_cim_related_kpi]	Contains KPIs related to the CIM improvement initiative.
Inbound CIM Integration [sn_cim_inbound_m2m]	Contains M2M tables to integrate Continual Improvement Management with other ServiceNow applications. With an inbound CIM integration, you can create a CIM record from the application that is integrated with Continual Improvement Management.
Outbound CIM Integration [sn_cim_outbound_m2m]	Contains M2M tables that integrates other ServiceNow applications withContinual Improvement Management. With an outbound CIM integration, you can create an outcome based on the integrated application, for example, a story or knowledge article from a CIM record.

Properties installed with Continual Improvement Management

To access Continual Improvement Management properties, navigate to **Continual Improvement** > **Administration** > **Properties**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
System admin role is required to set Continual Improvement Management properties.

Property	Description
sn_cim.need_approval	Enables approval process for Continual Improvement initiatives. By default, an improvement requires approval before it can progress to the Implement state. When the check box is enabled, it indicates that manual approval is required for the improvement to progress from Accepted state to Approved state. • Type: Yes|No • Default value: Yes If this property is not checked, the improvement automatically progresses to Approved state once it is accepted, and the **Approver group** field and the **Approvers** related list on the Improvement Initiative form are not shown.
sn_cim.initiative_copy_attributes	When a copy of the improvement initiative is created, the list of attributes (field values) that will be copied to the new initiative.
sn_cim.create_default_phase	Enable the property to create the default phase when an improvement initiative is created. • Type: Yes|No • Default value: No

Quick tests for Continual Improvement Management

Validate the continued functionality of Continual Improvement Management during application development and after upgrades. Copy and configure these automated tests to identify customizations needing review. All test suites and tests should pass.

Note:
To run CIM automated tests:

- The Continual Improvement Management Automated Tests (com.sn_cim_atf) plugin must be enabled.
- The *sn_cim.create_default_phase* system property must be enabled. For more information, see Properties installed with Continual Improvement Management.

Name	Description
CIM Parent test suite	Parent test suite that contains multiple child test suites. • CIM Inbound Integration • CIM Outbound Integrations • CIM Phase and Task • CIM State Flow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
	Note: There is no dependency between child test suites.
CIM Inbound Integrations	Suite that contains tests to create an improvement initiative from inbound integration applications. • Problem Management • Incident Management • Demand Management • Coaching • Survey Management • Assessments
CIM Outbound Integrations	Suite that contains tests for all CIM outbound integrations. • From an improvement initiative: Create demand and create project. • From an improvement initiative task: Create knowledge article, change request, coaching opportunity, and story.
CIM Phase and Task	Suite that contains tests for CIM phase and CIM task creation, roll-up tasks, roll up phases, and dates.
CIM State Flow	Suite that contains all CIM state-related tests.
CIM: Create a demand from an improvement initiative	Tests that a user with the Improvement Manager role can create a demand from an improvement initiative.
CIM: Create a project from an improvement initiative	Tests that a user with Project manager and Improvement Manager roles can create a project from an improvement initiative.
CIM: Create a change request from an improvement initiative task	Tests that a user with the Improvement Manager role can create a change request from an improvement initiative task.
CIM: Create a coaching opportunity from an improvement initiative task	Tests that a user with Coaching admin and Improvement Manager roles can create a coaching opportunity from an improvement initiative task.
CIM: Create a knowledge article from an improvement initiative task	Tests that a user with Knowledge admin and Improvement Manager roles can create knowledge article from an improvement initiative task.

Name	Description
CIM: Create a story from an improvement initiative task	Tests that a user with Project manager and Improvement Manager roles can create a story from an improvement initiative task.
CIM: Create a task within a phase	Tests that a task can be created within a phase.
CIM: Improvement Coordinator creates a task and phase	Tests that a user with the Improvement Coordinator role can create a task and phase.
CIM: Improvement Coordinator state flow from Approved to Implement	Tests that a user with the Improvement Coordinator role can change an improvement initiative from Approved state to Implement state.
CIM: Improvement Manager creates a strategic objective	Tests that a user with the Improvement Manager role can create a strategic objective.
CIM: Improvement Manager creates a task and phase	Tests that a user with the Improvement Manager role can create a task and phase.
CIM: Improvement Manager deletes an improvement initiative	Tests that a user with the Improvement Manager role can delete an improvement initiative.
CIM: Improvement Requester cannot create a task or phase	Tests that a user with the Improvement Requester role cannot create a task or phase.
CIM: Improvement Requester creates an improvement initiative	Tests that a user with the Improvement Requester role can create an improvement initiative.
CIM: Inbound integration from Assessments	Tests that a user with the Survey administrator role can create an improvement initiative from an assessment.
CIM: Inbound integration from a coaching opportunity	Tests that a user with the Coaching admin role can create an improvement initiative from a coaching opportunity.
CIM: Inbound integration from Demand Management	Tests that a user with the Demand manager role can create an improvement initiative from a demand.
CIM: Inbound integration from Incident Management	Tests that a user with the itil role can create an improvement initiative from an incident.
CIM: Inbound integration from Problem Management	Tests that a user with the itil role can create an improvement initiative from a problem.
CIM: Inbound integration from Survey Management	Tests that a user with the Survey administrator role can create an improvement initiative from a survey.
CIM: Initiative reject approval state flow from Assess to Accepted	Tests when an improvement initiative in Assess state is rejected by an approver, the state reverts back to Accepted.
CIM: Initiative state flow from Implement to On Hold	Tests that an improvement initiative in Implement state can be changed to On Hold state.

Name	Description
CIM: Initiative state flow from New through Closed	Tests that an improvement initiative in New state can be progressed through states Accepted, Assess, Approved, Implement, Review, to Closed state.
CIM: Initiative state flow from On Hold to Implement	Tests that an improvement initiative in On Hold state can be changed to Implement state.
CIM: Initiative state flow from On Hold to Review	Tests that an improvement initiative in On Hold state can be changed to Review state.
CIM: Initiative state flow from Review to Implement	Tests that an improvement initiative in Review state can be changed to Implement state.
CIM: New phase planned end date check	Tests that the planned end date for a new phase is at least one day later than the planned start date of the improvement initiative.
CIM: Phase creation for a new improvement initiative	Tests that a phase is automatically created when an improvement initiative is created.
CIM: Planned end date always later than planned start date	Tests that the planned end date of the improvement initiative is not earlier than the planned start date of the improvement initiative.
CIM: Roll-up phase to improvement initiative value check	Tests that the phase-level roll-up value for the improvement initiative (percent complete) is accurate.
CIM: Roll-up tasks to phase value check	Tests that the task-level roll-up value for the phase (percent complete) is accurate.
CIM: Skip approval process flow	Tests that the approval process is skipped when the Enable approval process for Continual Improvement initiatives property is cleared.
CIM: Submit an initiative in Accepted state to Cancel	Tests that an improvement initiative in Accepted state can be submitted for Cancel action.
CIM: Submit an initiative in Approved state for Re-Approval	Tests that an improvement initiative in Approved state can be submitted for Re-Approval action.
CIM: Submit an initiative in Assess state for Revert to Accepted	Tests that an improvement initiative in Assess state can be submitted for Revert to Accepted action.
CIM: Submit an initiative in Implement state for Re-Approval	Tests that an improvement initiative in Implement state can be submitted for Re-Approval action.

Improvement initiative	Project record
Projects related list is added that contains the project (PRJ) record.	No change.

- Change record

CIM task	Change record
Change (CHG) record is added to the Change Requests related list.	No change.

The following are the corresponding states of the Change record and the CIM task.

CIM task state	Change record state
New	New
In Progress	Implement
Closed	Closed

- Coaching Opportunity

CIM task	Coaching opportunity record
Coaching opportunity (COP) record is added to the Coaching Opportunities related list.	No change.

- Knowledge Base article

CIM task	Knowledge Base article record
Knowledge article record is added to the Knowledge Articles related list.	No change.

- Agile Development Story record

CIM task	Story record
The story (STRY) record is added to the Stories related list.	No change.

Deprecated Continual Improvements dashboard

The Continual Improvements dashboard enables an Improvement Process Coordinator or Manager to determine which process to start next, how many initiatives they have underway at a given time, and what the employee participation is.

This dashboard is included in the Continual Improvements Management plugin.

		Name: Priority 5 Query: priority=5 Weight: 10

View improvement reports (deprecated)

Evaluate improvement results using the Continual Improvements dashboard overview and outcome analysis reports to determine how well the improvements are helping your company.

Before you begin

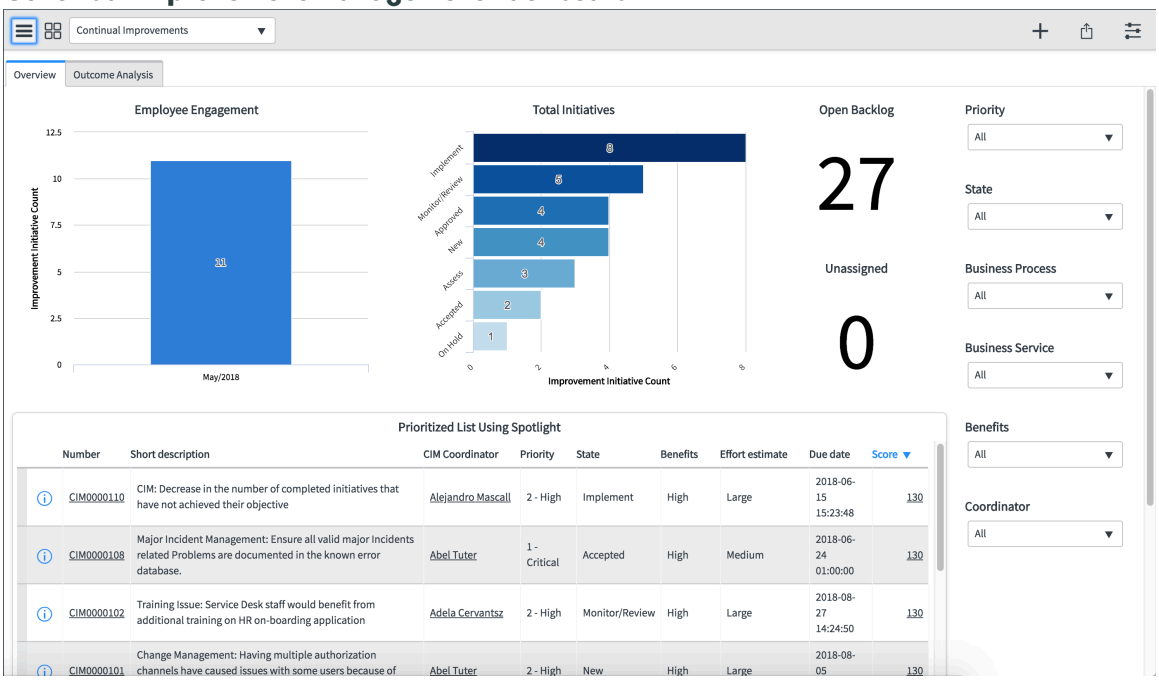
Role required: sn_cim.improvement_manager, sn_cim.improvement_coordinator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Reports and Spotlight list can be filtered by improvement priority, state, business process, business service, benefits, and CIM coordinator.

Continual Improvement Management Dashboard



Overview:

-

Report	Description
Employee Engagement	Open improvement count from the last six months.
Total Initiatives	Improvement count by state.
Open Backlog	Number of open improvements.
Unassigned	Number of improvements without a CIM Coordinator assigned.

- Prioritized List Using Spotlight.

  To use Spotlight to help prioritize the improvement backlog, navigate to **Continual Improvement** > **Administration** > **Spotlight Config**.

  Improvements can be prioritized based on multiple weighted criteria so you can quickly identify the most important tasks. The Improvement Register list shows improvement ranking based on specific criteria (priority, benefits, and effort estimate).

Outcome Analysis:

- Outcomes Achieved - Last 6 Months

  Report of closed improvement count in the last six months grouped by:

  - Category
  - Strategy

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Closure Code
- Type

- KPIs Completed in the Last 6 Months

  List of closed improvements in the last six months.

Procedure

1. Navigate to **Continual Improvement** > **Dashboard**.
2. On the Overview tab, use the filters (Priority, State, Business Process, Business Service, Benefits, and Coordinator) to narrow the data contained in the reports.
   You can click a report to view a list of improvements that make up that report.
3. On the Outcome Analysis tab, select a report from the **Group by** list to view improvement results by different attributes.
   You can click a report to view a list of improvements that make up that report.
4. Compare monthly reports to evaluate the impact improvements have on your company.

Expense Line

Expense lines enable you to track costs and represent when a point-in-time expense incurred. Expense lines can be created manually or generated by the scheduled processing of recurring costs.

The Expense Line plugin is active for all instances. To use the Expense Allocations and Expense Allocation Rules modules, activate the Cost Management plugin.

The ServiceNow AI Platform generates expense lines automatically when you create an asset, and updates expense lines automatically when you revise the **Cost** or **Quantity** field on an asset record.

Users with the financial_mgmt_admin and financial_mgmt_user roles can work with expense lines.

Expense lines integrate closely with asset management, CMDB, cost management, and contract management, but can be used with any application. The **Source ID** field on an expense line record can be linked to any record in any table. This identifier allows expenses to be associated with a wide variety of items, such as a contract, an individual asset, a single configuration item, a software installation, a lease, a service contract, a user, or a group.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Contains roles	Description
		distribution costs, expense lines, and expense allocations.
Financial user [financial_mgmt_user]	none	Can read allocation units and expense allocations. Can create, read, and write rate cards and expense lines. Can create, read, write, and delete fixed assets, depreciation, distribution costs.

Script includes installed with Expense Line

Script includes are added with activation of Expense Line.

Script include	Description
ExpenseLine	Helps create expense line records.
ExpenseManagementUtils	Provides utilities for financial management modules.
ExpenseManagementUtilsAJAX	Provides AJAX utilities for expense lines.

Client scripts installed with Expense Line

Client scripts are added with activation of Expense Line.

Client script	Table	Description
Populate sources if inherited	[fm_expense_line]	Copies the source fields of the parent expense line to the current line on the Expense Line record if an expense line is inherited.
Populate source fields from asset	[fm_expense_line]	If the source asset changes, updates related source fields on the Expense Line record . For example, if the asset source field changes, the configuration item source field is updated, as well.
Populate source fields from ci	[fm_expense_line]	Updates related source fields if the source configuration item changes on the Expense Line record.
Populate source fields from contract	[fm_expense_line]	Updates related source fields if the source contract changes on the Expense Line record.
Populate source fields from task	[fm_expense_line]	Updates related source fields if the source task changes on the Expense Line record.

Business rules installed with Expense Line

Business rules are added with activation of Expense Line.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Create Expense Line	[alm_asset]	Automatically creates an expense line for a new asset based on asset cost unless the asset is a merged software license.
Set source allocation fields	[fm_expense_line]	Sets the related source fields when the source ID changes. For example, when an asset becomes the source ID, the asset source field and configuration item source field are automatically populated.
Update Costs	[alm_consumable]	Updates the cost of a consumable when quantity is reduced.

Domain separation and Expense Line

Domain separation is unsupported in Expense Line processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Related topics

Domain separation for service providers

View an expense

Expense lines can be used in various ways, for example, how to view expenses that are associated with a given contract.

Before you begin

Role required: asset or contract_manager

About this task

Procedure

1. Navigate to **Contract** > **Contract** > **All**.
2. Select a contract.
3. View the **Expense Lines** related list.
   All the expense lines for the contract are listed. The total cost of the contract and its current value are also shown.
4. Select an expense line to view its details.

Expense lines and expense allocations

The Expense lines application tracks costs and record expenses incurred. Expense allocations let you associate expenses with items such as users, groups, or departments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Expense lines are a key component of cost management because they can be generated from any application and are used to allocate expenses to business entities. Expense lines can be created manually or generated automatically when costs are created by scheduled processing.

Users with the financial_mgmt_admin and financial_mgmt_user roles can work with expense lines and expense allocation rules.

To use expense allocation rules, activate the Cost Management application.

Create an allocation rule

Expense allocation rules enable you to associate expenses with an item, such as a user, group, or department.

Before you begin

To use expense allocation rules, activate Cost Management.

Role required: admin, financial_mgmt_admin, or financial_mgmt_user

About this task

Note:
Expense Allocations are generated through the out-of-the-box scheduled job, Process Expense Allocation.

Procedure

1. Navigate to **All** > **Cost** > **Administration** > **Expense Allocation Rules**.
2. Click **New**.
3. Complete the form.

Allocation rule fields

Field	Description
Name	The allocation rule name.
Table	The table to which the allocation rule is associated.
Allocation field	The field on the table to populate with the expense allocation.
Inherited	Check box that indicates whether the expense allocation is inherited.
Active	Check box that indicates whether the expense allocation is available to use.
Percentage	The percentage of the expense line allocated to the table and field combination. Not available if the **Advanced** check box is selected.
Summary type	The expense allocation category: **Grow Business**, **Run Business**, or **Transform Business**. Categorizing expense allocations can be useful for reporting.
Condition	The condition under which the expense allocation is applied. Not available if the **Advanced** check box is selected.
Advanced	Check box that indicates whether to display the **Script** field.
Script	The script field that determines expense allocations. This field is only available if the **Advanced** check box is selected.

4. Click **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.

Related topics

Condition builder

Automatic expense line creation

You can automatically create expense lines to facilitate the accurate reporting of expenses.

If enabled, the following processes generate expense lines automatically.

- Active CI rate cards are processed monthly to generate expense lines for each CI in the rate card. If a CI relationship is changed, existing expense lines are not affected. Changes are reflected in the next scheduled expense line.
- Active distribution costs are processed monthly to generate expense lines based on distribution rule targets.
- Closed tasks on task rate cards are processed to generate expense lines.

Expense lines can also be imported from external systems or generated from scripts. To generate an expense from a server-side script, use the ExpenseLine API.

Related topics

Create or edit a CI relationship

Create expense lines manually

You can create expense lines at a single level or in a hierarchy to better organize expense information.

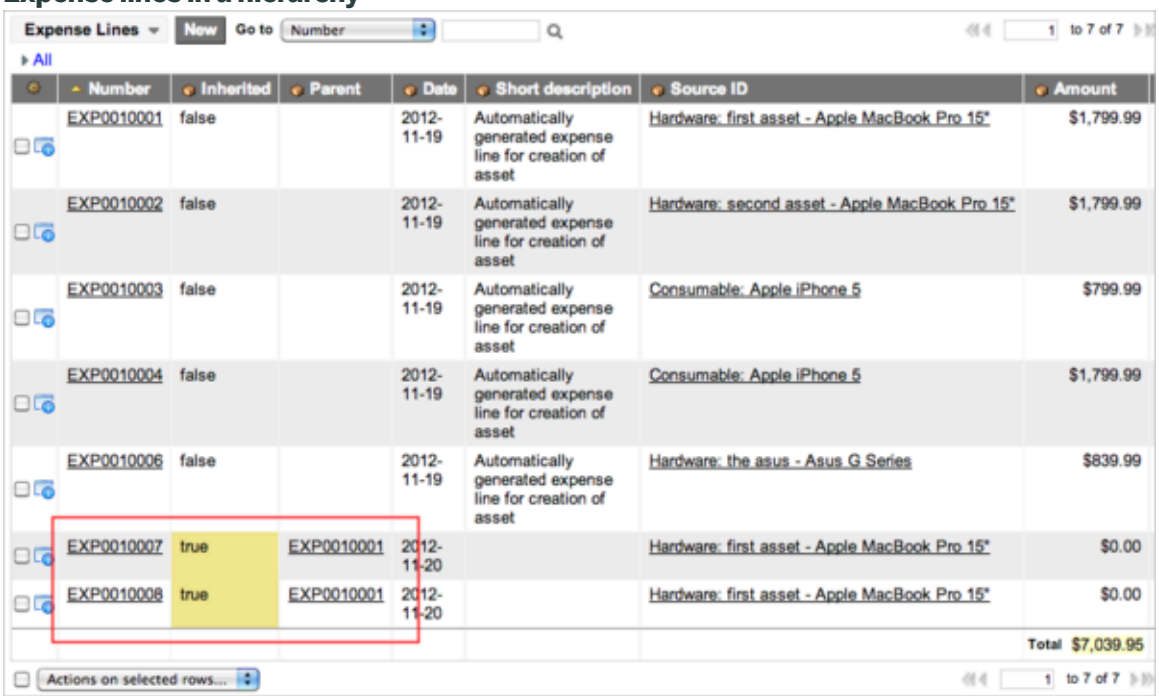
Before you begin

Role required: admin, financial_mgmt_admin, or financial_mgmt_user

About this task

Use a hierarchy if it makes sense for your organization. In the example below, the last two expense lines are a level under expense line number EXP0010001.

Expense lines in a hierarchy



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Costs** > **Expense Lines**.
2. Open an expense line record, or click **New** to create a new expense line.
3. Complete the form.

Expense line table

Field	Description
Number	The unique number identifying the expense line.
Date	The date on which the expense line was created.
Rate Card	The identification number of the rate card to which the expense line is associated.
Rate type	The rate type that is considered during the expense line generation. This field is read-only.
Source ID	The identification number of the item associated with the expense line. If this field is filled in, corresponding information is automatically added to the **Source** fields on this form.
Amount	The monetary value of the item specified in the **Source ID** field. Enter a negative value to indicate a credit.
Process date	The date the expense line is processed.
Inherited	Check box that indicates whether the expense line is on another expense line.
State	The current state of the expense line, either **Pending** or **Processed**.
Summary type	The expense line category: **Grow Business**, **Run Business**, or **Transform Business**. Categorizing expense lines can be useful for reporting.
Short description	A brief description of the expense line.
Asset	The identification number of the asset associated with the expense line, if any.
Fixed asset	Fixed asset that contains the asset in this expense line. A fixed asset is a container that holds one or more individual assets, including hardware or software assets. The system auto-populates this field with the appropriate fixed asset if the named **Asset** is contained within that fixed asset.
Contract	The identification number (not the contract number) of the contract associated with the **Asset**, if any.
User	The name of the user associated with the **Asset**, if any.
Configuration Item	The name of the configuration item associated with the expense line, if any.
Task	The identification number of the task associated with the expense line, if any.
Cost center	The cost center financially responsible for the item identified in **Source ID**, if any.

Related topics

Create fixed assets

Delete an expense line

Deleting an expense line also deletes all expense allocations that were generated from the expense line.

Before you begin
Role required: admin

About this task
Deleting expense lines and allocations should be limited to an emergency case only when they were created incorrectly.

Procedure

1. Navigate to **All** > **Costs** > **Expense Lines**.
2. Select an expense line.
3. From the **Actions on selected rows** drop-down menu, choose **Delete**.
4. In the confirmation dialog box, click **Delete**.

Create a sample allocation rule

You can create a sample expense allocation rule that allocates the cost of an incident to the department of the caller.

Before you begin
To use expense allocation rules, activate the Cost Management application.

Role required: admin, financial_mgmt_admin, or financial_mgmt_user

Procedure

1. **Costs** > **Administration** > **Expense Allocation Rules**
2. Click **New**.
3. In **Name**, enter `Incident Caller Department`.
4. In **Table**, select **Incident**.
5. In **Allocation field**, click the control, expand the **Caller** element, and select a department.
6. In **Percentage**, enter `100` to allocate all the expense to the caller's department.
7. Select the **Active** check box.
8. Click **Submit**.
   After an incident expense line is created, the allocation rule processes the expense line and generates an expense allocation linking the expense and amount to the caller's department. The expense is stored in the **Target** field on the Expense Allocation record.

Cost Management

Use a scripted allocation

Scripted allocations define custom allocation amounts and targets by executing a script.

Before you begin
Role required: admin, financial_mgmt_admin, or financial_mgmt_user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can use scripted allocations to perform any of the following actions.

- Allocate an expense to all cost centers based on the current head count in the cost center.
- Query usage data to determine the allocation amount to assign to a target.
- Track the business users that are consuming business services.

Procedure

1. Navigate to **All** > **Costs** > **Administration** > **Expense Allocation Rules**.
2. Select an expense allocation rule.
3. Select the **Advanced** check box.
4. Use the following concepts to build the script
   - Query for target records and data to use for calculating the allocation amount.
   - Create allocation records using the ExpenseAllocation API.

   The following variables are available during the script processing:
   - *allocation*: expense allocation object used to create allocations.
   - *expense*: GlideRecord for the expense_line that is being processed.
   - *rule*: GlideRecord for this rule.

   To create an allocation record, use the allocation object already instantiated in the script scope:

```
allocation.createAllocation(targetGlideRecord, amount);
```

Domain separation and Expense Line

Domain separation is unsupported in Expense Line processing. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

DevOps Change Velocity

With ServiceNow® DevOps Change Velocity, you can import data from your DevOps tool chain to the ServiceNow platform and deliver changes faster without sacrificing compliance.

You can automatically create change requests from your Continuous Integration (CI) and Continuous Deployment (CD) pipelines and then automatically approve the change requests based on policies. This enables developers to remain in their tools while providing visibility, accelerate the time required to approve change requests, and provide an audit trail.

Exploring DevOps Change Velocity

Learn how ServiceNow® DevOps Change Velocity helps your Development and Change Management teams accelerate change and connect their DevOps tool chain with ServiceNow so that the DevOps tool data can be used to automate change processes.

DevOps Change Velocity overview

DevOps Change Velocity collects data from your DevOps planning, coding, testing, and orchestration tool chain to provide visibility across the entire software delivery life cycle. This enables a single view for both the Development team and the Operations team across the end-to-end activities (plan, develop, build, test, deploy, and operate).

The DevOps Change Velocity application provides the following major benefits:

Change automation

Automate the change workflow and approval decisions to increase change velocity while ensuring governance and control. Create and complete DevOps change requests automatically and automate approval decisions based on input data (auto-approve, auto-reject or manually approve).

Change traceability

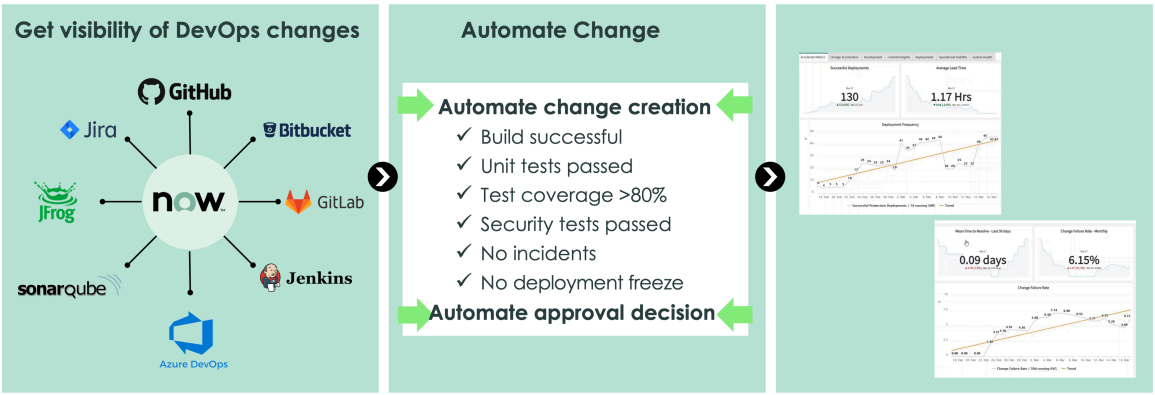
Track the progress of your work items, commits, artifacts, builds, and releases using the change requests to lend additional transparency and provide a single source of truth to all the personas involved.

DevOps Insights

View flow metrics, change acceleration metrics and other KPIs across the end-to-end software delivery value chain and connected tools.

To learn about the tools that the DevOps Change Velocity application supports, see DevOps Change Velocity integrations.

To understand how you can incrementally progress to get value faster using DevOps Change Velocity, see User journey for DevOps Change Velocity.



Benefits of DevOps Change Velocity according to persona

Persona	Challenges	DevOps Change Velocity benefits
Developer	• Long feedback loop for change approval • Manual collection of data • Swivel chair (entering data in multiple interfaces) from changes to work items • Lack of end-to-end visibility of the entire DevOps life-cycle • Significant time spent on admin tasks	• Automated data collection process through integrations • No time lost in manually creating a change request or providing evidence manually • More time for actual development work • Developers can keep working in their own tools
Change manager	• Difficulty in handling an increasing number of changes • Not able to focus on only the changes that truly need human intervention	• Accelerate change process with automated flows • Visibility over pipeline, tests, and change in a single tool • Automated documentation of change content and controls

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

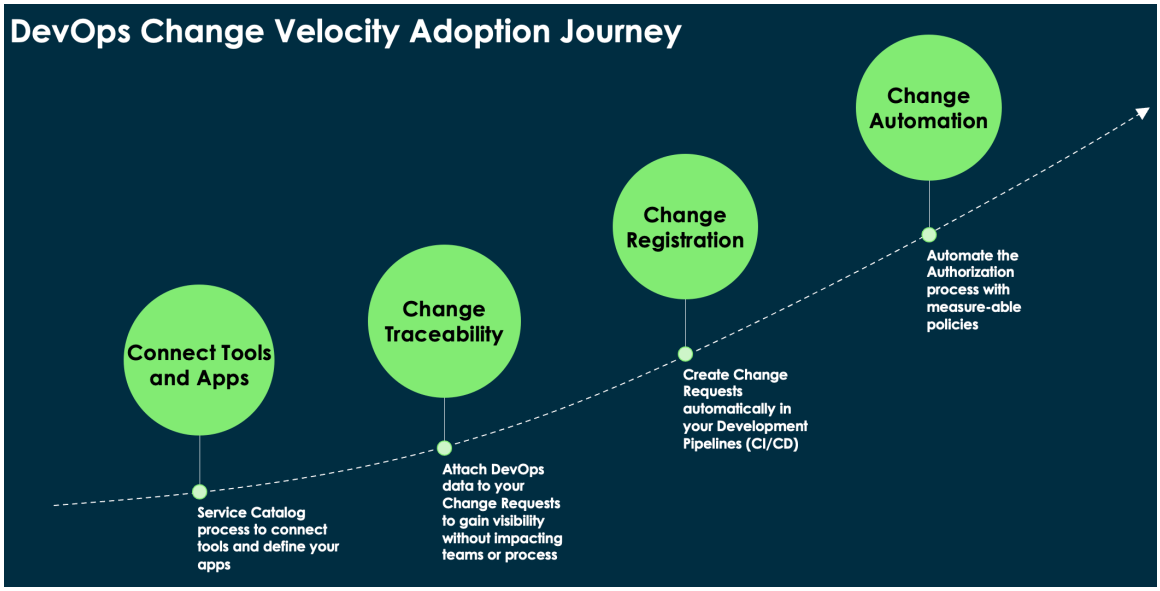
Persona	Challenges	DevOps Change Velocity benefits
	• Manual work to respond to audit request • Significant time spent on gathering data	• Automate appropriate change governance driven by data • One-click audit response
Release manager	• Lack of correlation between changes and release to measure progress • Unable to eliminate manual tasks from delivery processes	• Enhanced visibility into the release plan and progress • Automation of more tasks with integrations • Improved release reliability
Application development leadership	• Lack of visibility across teams and value streams • Lack of team performance comparison data • Inability to identify and resolve performance bottlenecks	• Visibility into the entire value stream • Normalized views of team performance • Identify bottlenecks and take appropriate action
Operations and Support teams	• Limited forecast and speed of remediation • Lack of visibility over change content and impact • Too many tools to correlate change, release, and incidents	• Single tool to manage changes and incidents • Easier correlation between change and incident • Reduced Mean Time to Resolution (MTTR) from improved visibility
IT compliance officer	• Limited visibility to ensure compliance • Lack of transparency of data and process to measure risks	• Ensure compliance with automated change policy • Improved control and visibility with automated gathering of data

Explore more details such as the user adoption journey, supported integrations, and Insights in the following sections.

User journey for DevOps Change Velocity

Review the adoption journey of the DevOps Change Velocity application to enable a phased (crawl, walk, run, fly) approach toward complete automation of change approvals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



While automating change request creation from the Continuous Integration (CI) and Continuous Deployment (CD) pipelines and automatically approving them will be your end goals with DevOps Change Velocity, you can approach your implementation in this phased manner. Each phase here provides incremental value over the previous phase and enables you to get started with minimum changes to your existing processes:

1. Connect Tools and Applications: Get started by integrating your key DevOps tools and choosing the key objects from these tools to track. This can be done without needing to modify your pipelines or any of the development assets. And then create DevOps Apps for the teams that you want to onboard first. Completing this phase is necessary to bring data from your tools over to the ServiceNow AI Platform.

   For more information on integrating tools, see Integrating DevOps Change Velocity with third party tools.

2. Change traceability: After you have established integration with your key DevOps tools, relevant data from these tools will start coming into ServiceNow. Then you can continue to use your existing process to create changes but save time by having all relevant information added to the change request with just a few clicks. This information includes stories, code commits, test results, quality scans, and others. For more information on modeling a change request flow, see Customizing DevOps flows.

   After these two phases are completed, you can progress toward the next two phases, which help you achieve automation of your change process, accelerate deployments, and increase velocity. You can start your implementation with these two phases as they don't need any changes to your existing processes or pipelines.

3. Change registration: This phase builds value further by automating the change request creation from the CI/CD pipelines. With this phase you'll need to modify the team's CI/CD pipeline to enable automatic creation of change requests. This automation saves the time of your developers as they don't have to manually fill the change requests, which reduces the risk of human error. For more information, see Configuring DevOps change request details within the pipeline.
4. Change automation: This is the final phase in value realization where data from the tools will come into ServiceNow in real time, change requests will be automatically created and they'll be automatically approved or rejected based on data driven policies. This phase requires creating policy guidelines and enabling automated change approvals decisions based on input data to reduce risk and increase the rate of change success. For more information, see Accelerating your DevOps change process.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All through these four phases, the Insights dashboards help you analyze operational and business reports and to determine the overall efficiency#and growth of your#development processes.

DevOps Change Velocity integrations

Get an overview of how DevOps Change Velocity integrates with your external DevOps toolchain and the tools supported for this integration.

The DevOps Change Velocity integration with external tools is achieved by exposing REST endpoints to receive webhook notifications or direct REST calls from these tools in real-time. Additionally, DevOps Change Velocity enables importing of data from these tools using polling. DevOps API enables integration with any coding, planning, or orchestration tools. For more information, see DevOps API.

Supported tools

The DevOps Change Velocity application provides connectors by default to connect the following commonly used DevOps tools to import data. If your tool isn't included in this list, you can manually connect and configure an integration. See User-created integrations in DevOps Change Velocity.

Tool type	Tools and the supported version

Planning	• Azure Boards (Azure DevOps latest cloud version)
	• Azure DevOps Server (ver 2022.0.1)
	• Jira Server and Jira Cloud (latest cloud version)
	• ServiceNow Agile Development 2.0
	• GitHub (latest cloud version)
	• GitHub Enterprise (ver 3.7)
	  ○ Basic authentication
	  ○ OAuth
	• Rally (latest cloud version)

Coding	• Azure Repos (Azure DevOps latest cloud version)
	• Azure DevOps Server (ver 2022.0.1)
	• Bitbucket (ver 7.19.2 on-premises)
	• Bitbucket Cloud (latest cloud version)
	• GitHub (latest cloud version)
	• GitHub Enterprise (ver 3.7)
	  ○ Basic authentication
	  ○ OAuth
	• GitLab (ver 13.0.6 for on-premises or latest cloud version)

Orchestration	• Azure Pipelines (Azure DevOps latest cloud version) Jobs supported:

Tool type	Tools and the supported version
Security	• Veracode (latest cloud version) • Checkmarx One (ver 1.0.17) • Checkmarx SAST (ver 1.0.16)

Third-party extensions

Use the ServiceNow extensions to model your pipeline in DevOps and configure branch analysis for tools like SonarQube.

Additional extensions may be required for applications such as Jenkins or Azure DevOps. These extensions are used when ServiceNow DevOps can't integrate using only the native REST API and push notifications.

Jenkins plugin for ServiceNow DevOps

A Jenkins plugin is provided to enable change acceleration so your orchestration tool can communicate and control certain aspects of pipeline executions from within ServiceNow DevOps.

Install the plugin from the Jenkins Marketplace. Navigate to **Manage Jenkins > System configuration > Plugins** in your Jenkins instance. Search for **ServiceNow DevOps Plugin** and select it, and then select **Install**.

ServiceNow DevOps for Azure DevOps

Use the **ServiceNow DevOps** extension on Visual Studio Marketplace if you plan to integrate your Azure DevOps pipeline with ServiceNow DevOps.

For more information, see Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.

ServiceNow DevOps custom actions for GitHub Actions

Use the **ServiceNow DevOps** custom actions on GitHub marketplace if you plan to integrate your GitHub workflows with ServiceNow DevOps.

For more information, see GitHub Actions configurations.

To start integrating DevOps Change Velocity with your toolchain, see Integrating DevOps Change Velocity with third party tools.

- DevOps administrators can check the current health of the system.
- DevOps app owners can view the development and quality metrics by app or team.
- Executives and Change managers can track the velocity of changes.

DevOps Insights dashboard

The DevOps Insights dashboard provides a flexible graphical view of operational and business reports.

DevOps managers, Change managers, and executives can use this dashboard to determine the overall efficiency#and performance of the development teams and processes.

- Monitor activities, KPIs, and metrics using a centralized dashboard.
- Track performance over time using ServiceNow Performance Analytics.
- View break down of the numbers by application, repository, service, business app, work item type, and product over time.

For more information, see DevOps Insights dashboard - Workspace.

DevOps System Health dashboard

The System Health dashboard lets the DevOps administrator view the overall health of integrations, connectivity status, as well as view trends of inbound event processing data.

For more information, see DevOps System Health dashboard.

Getting started with DevOps Change Velocity

Learn about the setup process for DevOps Change Velocity that is required before configuring integrations with your toolchain.

The DevOps playbooks provide a task-oriented view and guides you through the various steps while setting up your applications, tools, and discovering and configuring your pipelines. If you have not enabled the Next Experience UI, you can still perform the following tasks using the Classic UI. For more information about migrating to the Next Experience UI and configuring workspaces, see Next Experience UI.

1. Install DevOps Change Velocity.

2. Assign roles and tasks using workspace.

   Roles that are installed with DevOps Change Velocity are listed in Components installed with DevOps Change Velocity.

3. Set up integration user account.

4. Onboard to DevOps Change Velocity.

   Get started by connecting tools, creating applications, and automating change creation.

- Accelerate your DevOps change process using DevOps Change Velocity. See Accelerating your DevOps change process.

Install DevOps Change Velocity

Install the DevOps Change Velocity application from the ServiceNow Store.

Before you begin

Role required: admin

Ensure that the application and all of its associated store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

If you're installing DevOps Change Velocity in your production instance for the first time, ensure that you opt-in to the following required products. For more information, see Opt in to the ServiceNow Store products.

Devops Change Velocity	https://store.servicenow.com/sn_appstore_store.do#!/store/product/e5ff61c51b345d50ee92cb31604bcba4
Playbook Experience	https://store.servicenow.com/sn_appstore_store.do#!/store/product/e4cecaf0db2be81079279ee4db9619f2

About this task

To install the DevOps application on a subprod instance, navigate to the DevOps Change Velocity app on the ServiceNow Store and select **Request Install** to send your request.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Select the **Not Installed** tab to view a list of applications available for installation.
3. Find the DevOps Change Velocity application using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the application by its name or ID (sn_devops_chgvlcty). If you can't find an application, you may have to request it from the ServiceNow store.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release note information for all released apps, see the ServiceNow Store version history release notes.

4. Select **Install**.
5. In the Application installation dialog box, review the application dependencies.

   If your application requires other applications, install them first if they are not already installed.

   Installing your application also automatically installs the dependent applications or plugins if they aren't installed already.

6. If you want to install demo data, select **Load demo data**.
   Demo data includes sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

   Note:
   If you don't load the demo data for a store application during installation, you can't load it later.

7. Select **Install**.
   Based on your connection, the installation procedure can take almost an hour or more to complete.

Result
Installing DevOps Change Velocity also installs the dependent applications, user roles, tables, scheduled jobs, and other components.

See Components installed with DevOps Change Velocity.

What to do next
Assign roles and tasks using workspace.

Note:
Roles that are installed with DevOps Change Velocity are listed in Components installed with DevOps Change Velocity.

Assign roles and tasks using workspace

Assign roles and tasks to users and groups so that they can perform the required DevOps tasks.

Before you begin
Role required: admin or sn_devops.admin

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace**.
2. Use one of the following ways to onboard users and groups:
   - From the Home page, from the Accounts and users widget, select **Assign roles** or **Assign users**.
   - From the left navigation panel, navigate to **Administration** > **Onboarding** and select the onboarding task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Onboard users and groups by assigning them roles and tasks.

What to do next

Set up integration user account in DevOps Change Velocity

Set up integration user account in DevOps Change Velocity

Set up the integration user account to enable integrating with your third-party tools.

Before you begin

Role required: admin

About this task

Important:
This setup is required only when DevOps Config is installed, and for Rally and Split tool integrations. For all other tool integrations or if you're using only DevOps Change Velocity, you can skip this procedure.

This is a one-time setup. You can set the integration user password either using Workspace or Classic UI.

The DevOps integration user is the ServiceNow system user that your third-party orchestration tools use to send data to DevOps Change Velocity.

The default integration user credential will be applicable for all the tools. However, if you want to set up separate integration user credential per tool connection you can also do the same but ensure that the user account has the sn_devops.integration role assigned.

Procedure

Set the integration user password in one of the following ways.

What to do next

- Onboard to DevOps Change Velocity using Workspace
- Start integrating DevOps Change Velocity with third-party tools.

Onboard to DevOps Change Velocity using Workspace

After installing DevOps Change Velocity, you can integrate with your DevOps toolchain and automate change requests directly from the DevOps Change Workspace.

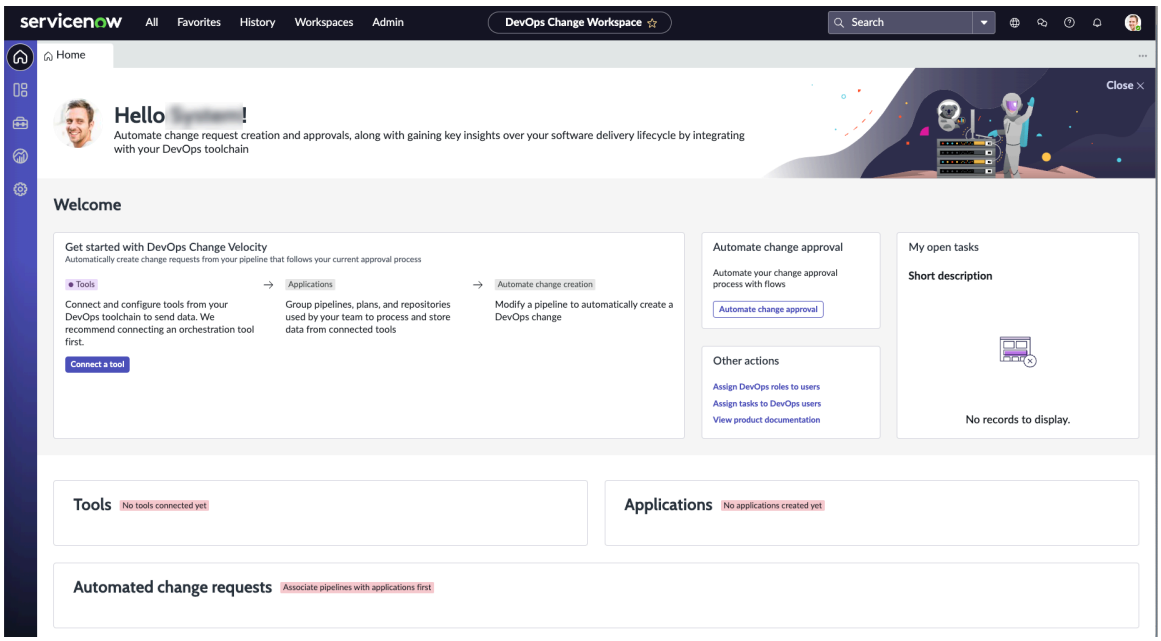
You can onboard as a DevOps admin, a tool owner, or an app owner.

Onboard as DevOps admin

Role required: sn_devops.admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. From the Home page, from the Get started with DevOps Change Velocity guide, select **Connect a tool**.



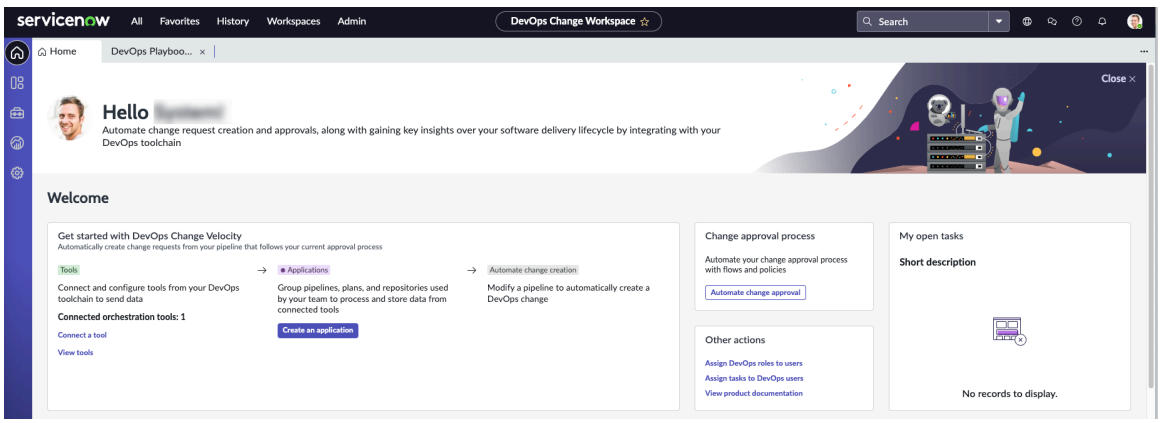
Note:
To automate change requests for pipelines, connect your orchestration tool.

2. Using the connect playbook activity, connect to your DevOps tools.

   For more information about connecting to a tool, see Integrating DevOps Change Velocity with third party tools.

3. Select **Create an application** to create an application and associate objects to it.

   For more information about creating an application, see Create an application - Workspace.



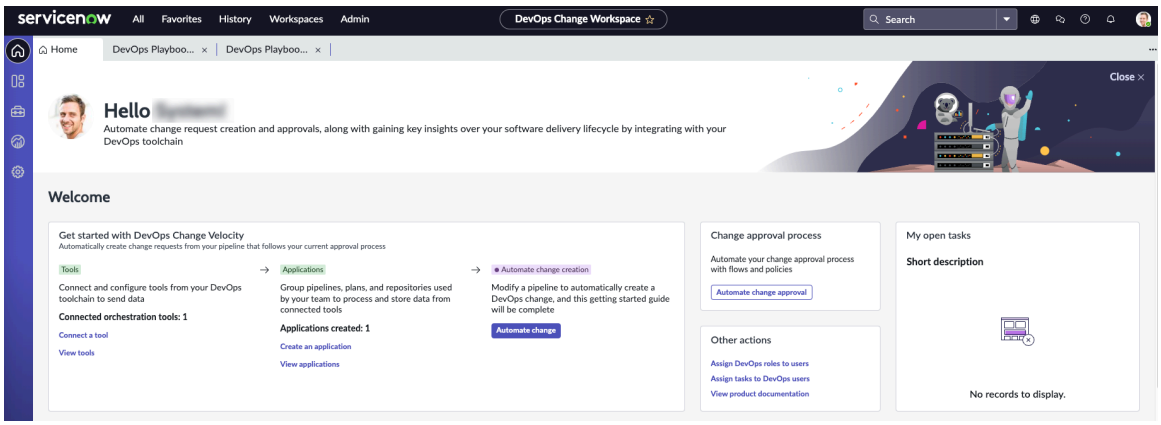
4. To automate change requests for pipelines, connect your orchestration tool and associate the pipelines with your application.

   For more information on associating pipelines, see Associate tool objects to applications - Workspace.

5. Select **Automate change** to create an automated change request.

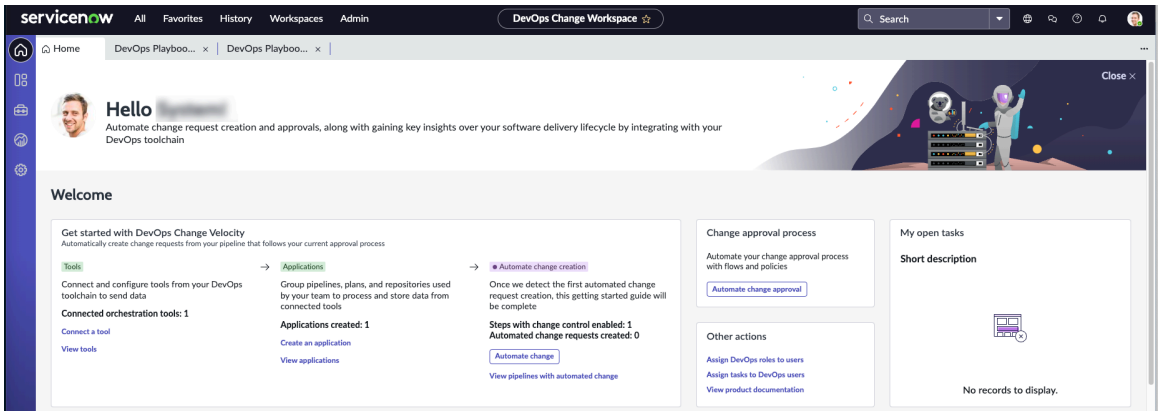
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information about creating automated change requests, see Automate DevOps change request creation.

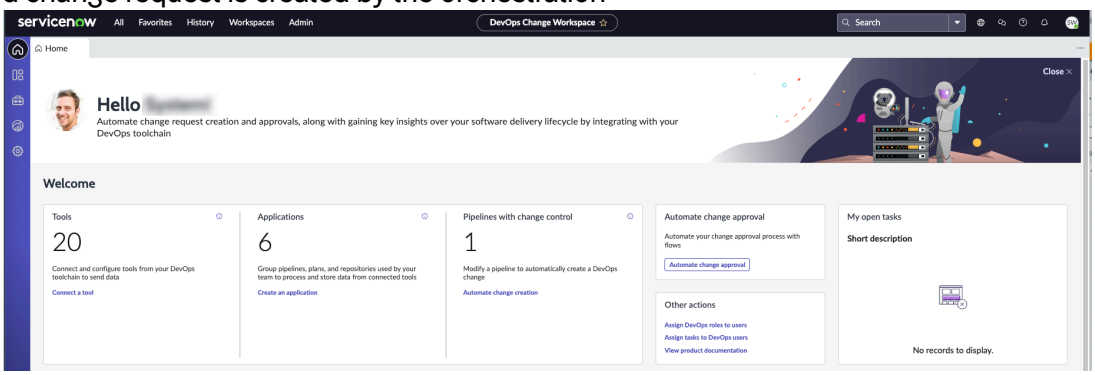


6. Modify your orchestration pipeline to enable change control.

You can run the pipeline to verify that change requests are automatically created.



The getting started guide will be marked as complete when the first automated change request is created by the orchestration pipeline.

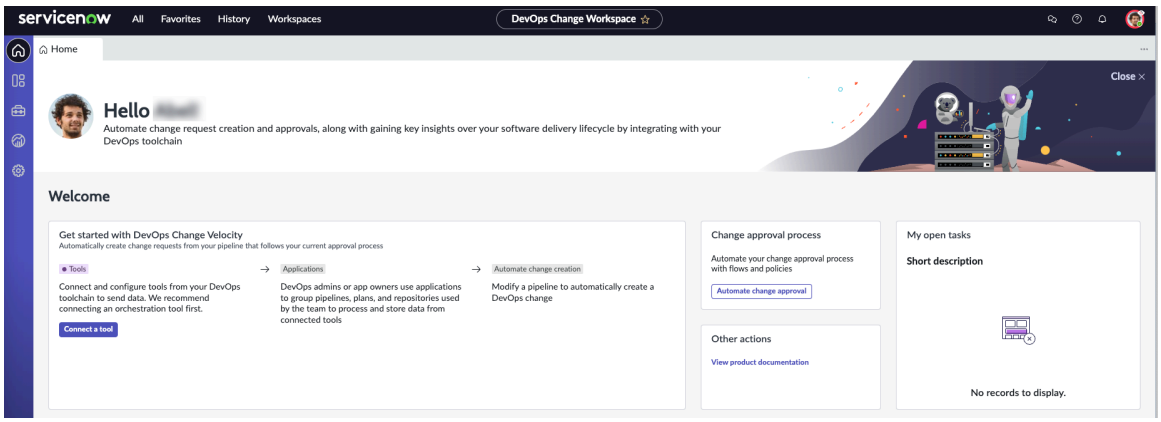


Onboard as a tool owner

Role required: sn_devops.tool_owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. From the Home page, from the Get started with DevOps Change Velocity guide, select **Connect a tool**.



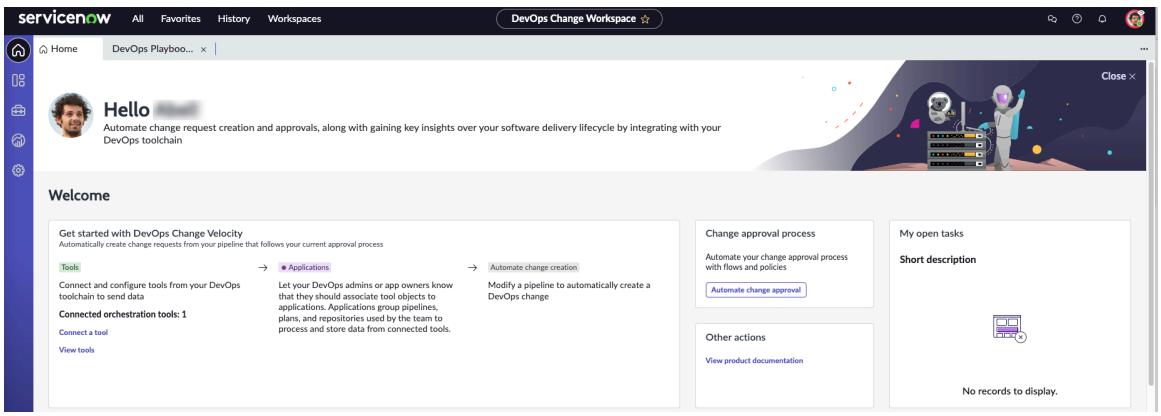
Note:
To automate change requests for pipelines, connect your orchestration tool.

2. Using the connect playbook activity, connect to your DevOps tools.

   For more information about connecting to a tool, see Integrating DevOps Change Velocity with third party tools.

3. If an application hasn't been created, ask your DevOps admin or app owner to create an application and associate objects to it.

   For more information about creating an application, see Create an application - Workspace.



4. To automate change requests for pipelines, connect your orchestration tool and associate the pipelines with your application.

   For more information on associating pipelines, see Associate tool objects to applications - Workspace.

5. Select **Automate change** to create an automated change request.

   For more information about creating automated change requests, see Automate DevOps change request creation.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The getting started guide will be marked as complete when the first automated change request is created by the orchestration pipeline.

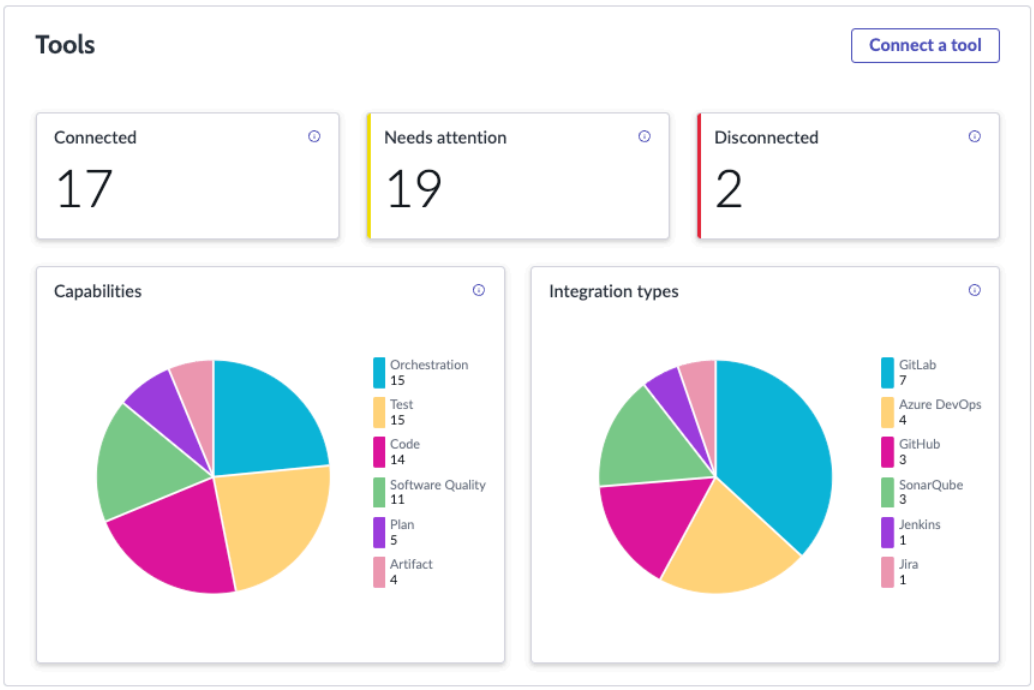
Workspace widgets

Tools widget

The Tools widget gives an overview of your connected tools, with the following details:

- Number of tools that are in the connected state. You can select the card to see the list of connected tools.
- Number of tools that need attention. You can select the card to see the list of unconfigured tools.
- Number of tools that are in disconnected state. You can select the card to see the list of disconnected tools.
- Number of tools grouped by their capabilities. You can select a capability to see the list of tools created for that capability.
- Number of tools grouped by their tool types. You can select an integration type to see the list of tools connections created for that particular tool type.
- DevOps admins and tool owners can connect to a tool from the widget.

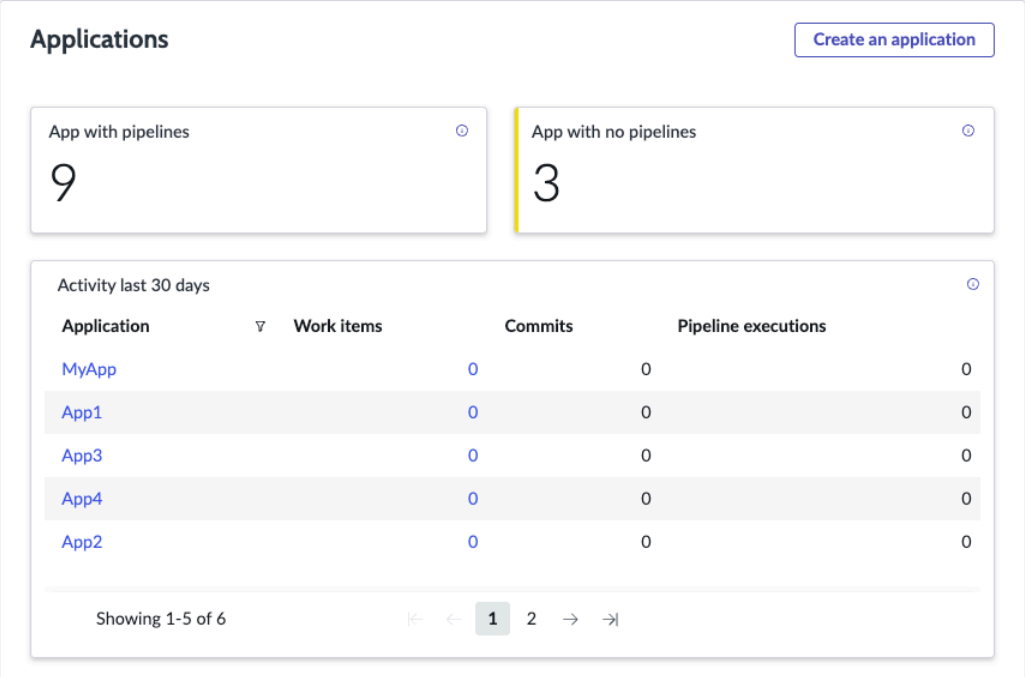


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applications widget

The Applications widget gives an overview of your applications, with the following details:

- Number of applications with at least one associated pipeline. You can select the card to see the list of apps with pipelines.
- Number of without any pipelines. You can select the card to see the list of apps with no pipelines.
- Number of work items, commits, and pipeline executions from all applications in the last 30 days. You can select the card to see the list of disconnected tools.
- Number of tools grouped by their capabilities. You can select a capability to see the list of tools created for that capability.
- Number of tools grouped by their tool types. You can select an integration type to see the list of tools connections created for that particular tool type.
- DevOps admins and app owners have the option to create an application from the widget.



Automated change requests widget

The Applications widget gives an overview of your applications, with the following details:

- Number of change requests created in the last 30 days. You can select the card to see the list of change requests.
- Number of change requests that are pending approval in the last 30 days.
- Number of pipelines with change control enabled, but hasn't automatically created a change request.
- Number of tools grouped by their capabilities. You can select a capability to see the list of tools created for that capability.
- Number of tools grouped by their tool types. You can select an integration type to see the list of tools connections created for that particular tool type.

Integrating DevOps Change Velocity with third party tools

Integrate your orchestration, planning, coding, artifact, software quality, and security tools with DevOps Change Velocity for end to end change traceability and automation.

You must onboard a minimum of one planning, one coding, and one orchestration tool to enable change outcomes.

Use the workspace to onboard tools for a guided experience. Alternatively, you can use the Service Catalog or Classic environment experience.

Azure DevOps integration with DevOps Change Velocity

Connect to your Azure DevOps instance to discover boards, repositories, and pipelines to enable change automation and traceability.

Azure DevOps integration overview

The following Azure DevOps tools are supported:

- Azure Boards (planning)
- Azure Repositories (coding)
- Azure Pipelines (orchestration)
  - Build (CI) pipelines — agent and agentless (server) jobs
  - Release (CD) pipelines

Capture tags from Azure DevOps coding tool commits.

Jenkins also supports testing capabilities with JUnit. Test tool integration lets you view test results in DevOps Change Velocity for Azure DevOps unit, functional, and performance tests.

Azure DevOps extension

You can use the **ServiceNow DevOps** extension for Azure DevOps on Visual Studio Marketplace to integrate your Azure pipeline with DevOps Change Velocity.

The **ServiceNow DevOps** extension includes:

- ServiceNow DevOps service connection
- ServiceNow DevOps Release Gate
- Azure build (CI) pipeline agent and server job custom tasks
- ServiceNow DevOps Build Sonar Registration (for Build pipelines)
- ServiceNow DevOps Release Sonar Registration task (for Release pipelines)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bulk commits in Azure DevOps

Large commits are supported with Azure DevOps.

To support large commits, perform these actions:

- Install the ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream) plugin.
- For optimal performance, disable flow logging by setting the Workflow Studio *com.snc.process_flow.reporting.level* property to **Off**.
- For MID Server settings, view the MID Server support for Data Stream actions section.

The Azure DevOps data stream can currently process up to 8000-9000 commits per code push. The number of run commits listed for a task execution are limited to 200.

Get started

You can connect to Azure DevOps at the organization level or at individual project levels.

Connecting at an organization level is recommended as it is enables discovery of multiple projects at once using one set of credentials. This makes it easier to discover multiple projects at a time and for updating credentials.

Connecting at a project level if you want to restrict access to the project to a certain group of users. Since DevOps group access controls are at the tool level, to restrict access to a project, you must create an Azure DevOps tool connection for that project.

Use one of the following options to onboard Azure DevOps. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Azure DevOps to DevOps Change Velocity — Workspace

Connect to your Azure DevOps instance using the DevOps Change Workspace playbook to collect data for planning, coding, orchestration, artifact, and software quality functions.

Connecting Azure DevOps with DevOps Change Velocity Modeling an Azure pipeline in DevOps

You can connect to Azure DevOps (ADO) at your organization level or at individual project level. If you're connecting at the project level, for each project at your organization, you must repeat the connection process. After connecting to an instance of the tool, you can configure additional settings that enable DevOps to import pipelines, task execution records, and step execution records.

When you configure webhooks in your Azure DevOps instance to send data to DevOps Change Velocity, Azure DevOps uses token authentication for the integration user by default. The DevOps Change Velocity APIs are invoked using token authentication and you don’t have to enter the integration user name and password while configuring. If the devops.system user isn’t available in your ServiceNow instance, you must set the **Switch to this user after token based authentication is successful** property. For more information, see DevOps Change Velocity properties. The step to enter the integration user name and password is required only in the following scenarios:

- If DevOps Config is installed, as DevOps Config APIs are invoked using basic authentication.
- If you use the Azure Invoke REST API service connection. You must enable the *This property decides whether to create a Generic Connection on configure operation for Azure DevOps* property in this case.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
DevOps Change Velocity uses the term instance to refer to a particular occurrence of a tool. Azure DevOps uses the term project instead.

Connect an organization

Connect and configure your Azure DevOps instance directly at your Azure DevOps organization level. All the projects within the organization can be discovered, and you can choose to configure multiple projects within the organization. You can manage the tool at the organization level.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

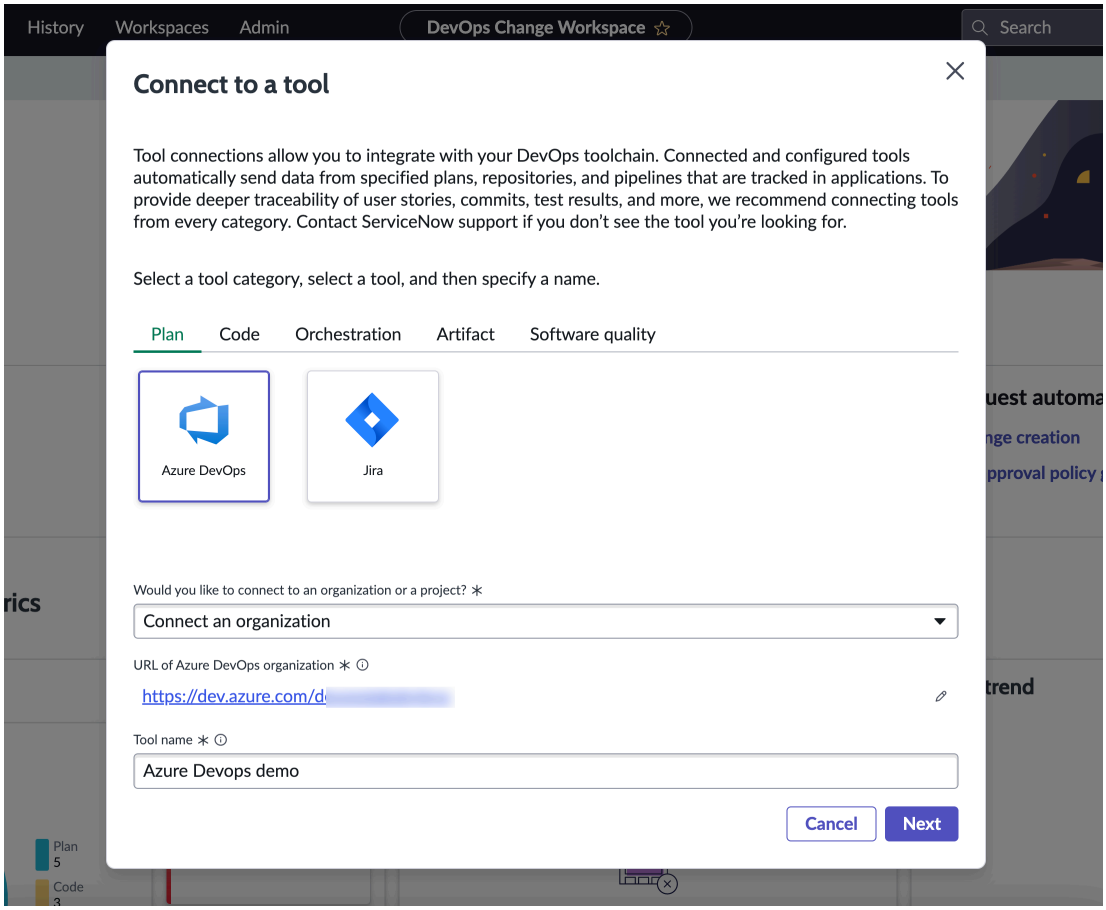
Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Azure DevOps.

   Important:
   If you want to discover and track tool objects like pipelines, plans, or repositories while connecting to the tool, you must connect your tool from the Application module.

2. In the Connect to a tool modal, enter the connection details.
   a. Select **Connect an organization** from the drop-down list.
   b. Enter the Azure DevOps URL for the organization.
   c. In the **Tool name** field, enter a name for the tool.
   d. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The DevOps playbook opens to help you complete the onboarding tasks.

3. In the Enter Azure DevOps instance details section, select one of the following values in the **Credential type** field.

Option	Description
Personal Access Token	Enter the password or access token to ac cess this instance. For information on creating a PAT, see OAuth 2.0	Pre-requisites: ○ Create a tenant in Microsoft Entra ○ Add a user to tenant in Microsoft Entra

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ Create an organization in Azure portal ○ Create an Azure DevOps app ○ Register Azure DevOps as an OAuth provider ○ Configure organization and project level set tings ○ Create credential record and get OAuth to ken **Use an existing OAuth credential record** **a.** Select the **Use an existing OAuth creden tial record** option. **b.** Select a value in the **Credential** field. **Create a new credential record** **a.** Clear the **Use an existing OAuth credential record** option. **b.** Enter the application ID of your Azure appli cation (available in the Overview section of your Azure application registry in Azure) in the **Application (client) ID** field. **c.** Enter the directory ID of your Azure applica tion (available in the Overview section of your Azure application registry in Azure) in the **Directory (tenant) ID** field. **d.** Enter the client secret of your Azure ap plication (available in the Certificates & secrets section of your Azure applica tion registry in Azure) in the **Client secret** field. 
4. If your tool instance is attached to a MID Server, select the **MID Server** option and enter its details.

   For more information about MID server, see MID Server selection.

5. Select **Connect**.

6. Permission checks are run on the credentials that you entered.
   Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information

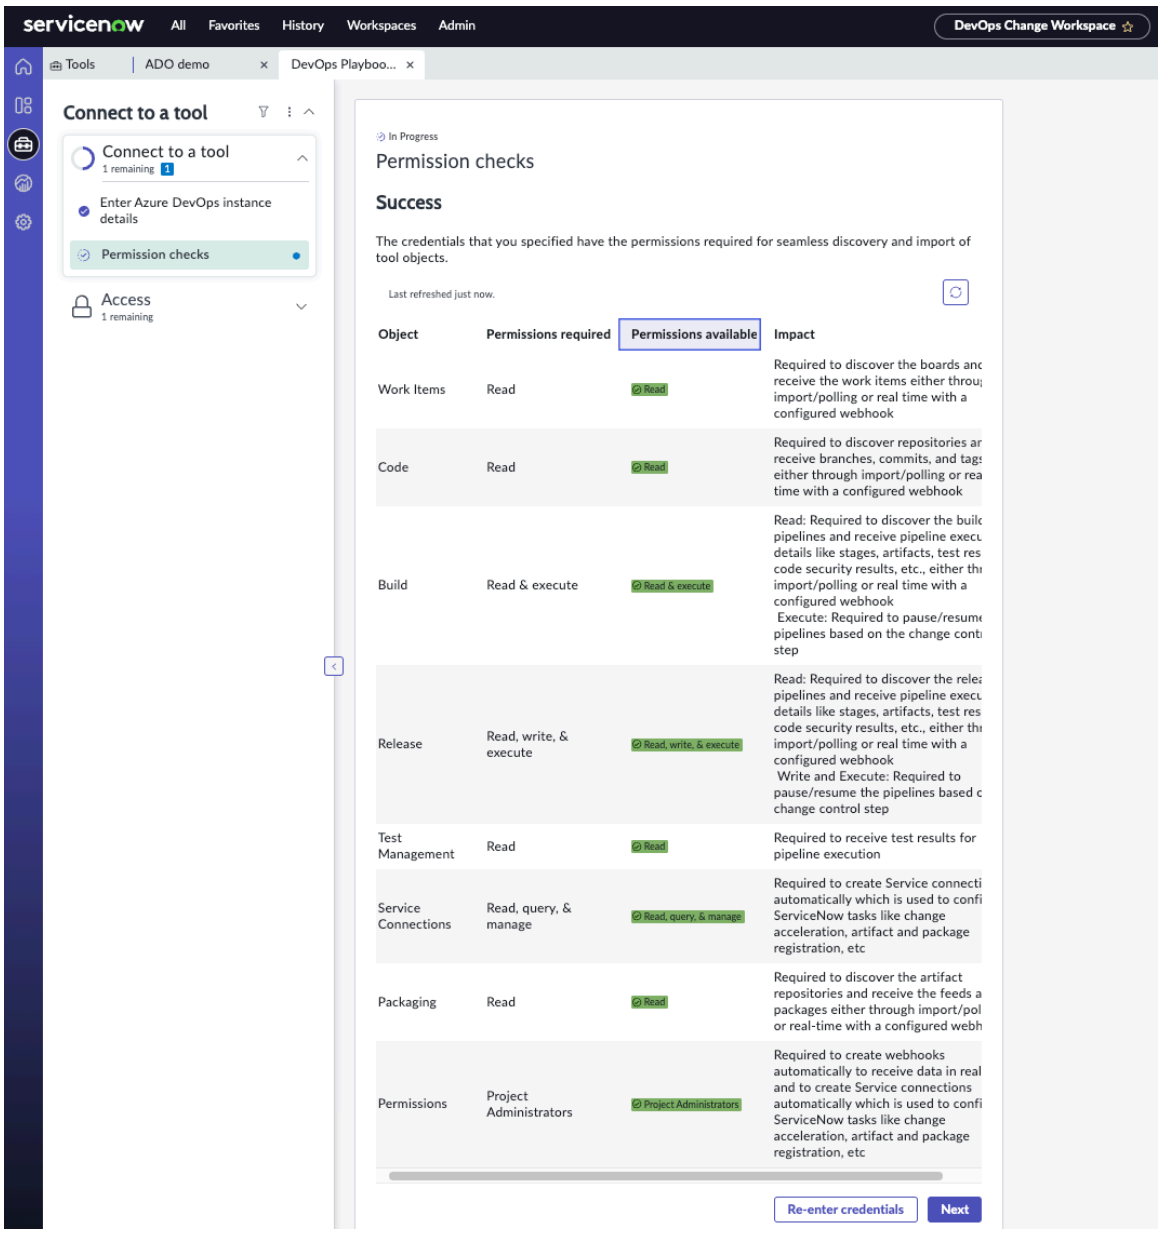
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

on all the required permissions, see Azure DevOps permissions in Permissions required for DevOps tools.

You can choose to continue with the tool connection even if you don't have all the required permissions.

Note:
When onboarding an Organization, the **Project Administrators** privilege requires the owner of the PAT to be a member of the organization's **Project Collection Administrators** group.

You need the Project Administrators privilege only for onboarding the tool. Once the tool is successfully onboarded, you can choose to turn off the Project Administrators privilege from the PAT.



7. Specify the access for the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

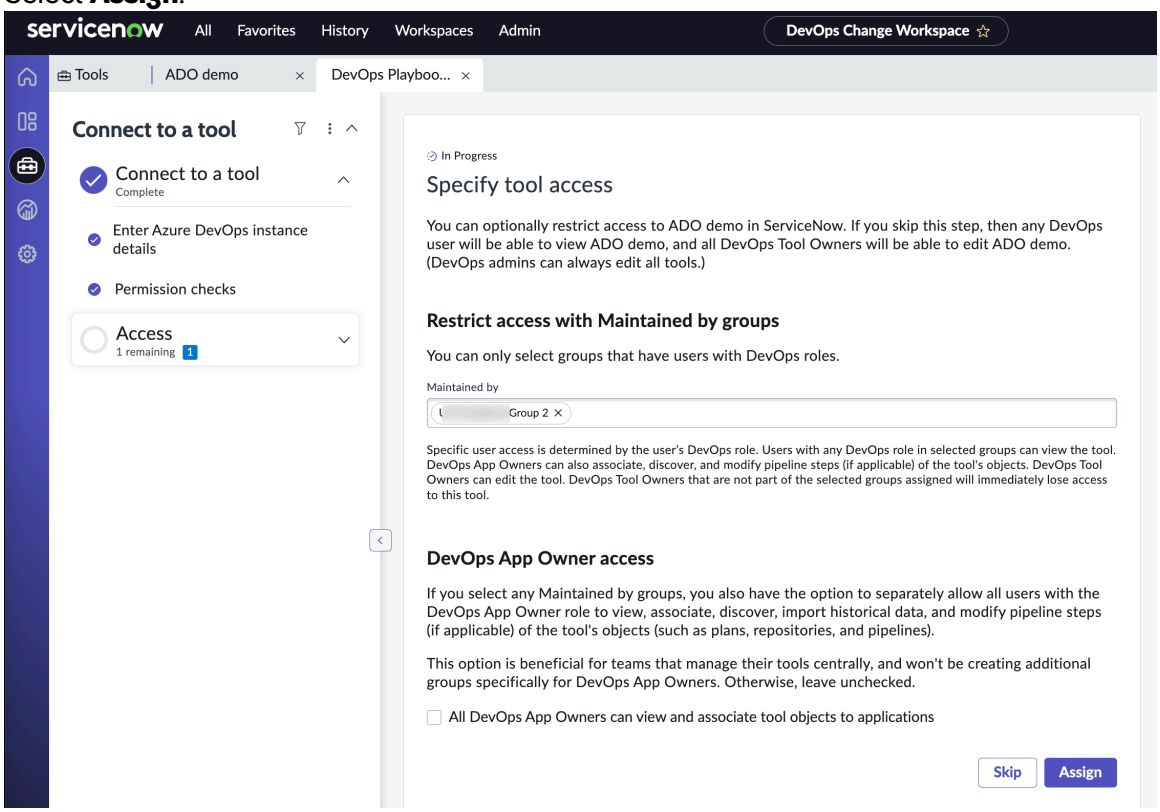
The tasks these users in the groups can perform depends on the role assigned to them.

- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

Note:
If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

b. If you choose to control access to the tool, the **All DevOps App Owners can view and associate tool objects to applications** option becomes available for selection.
This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

c. Select **Assign**.



8. Install the ServiceNow DevOps extension in your Azure DevOps instance.

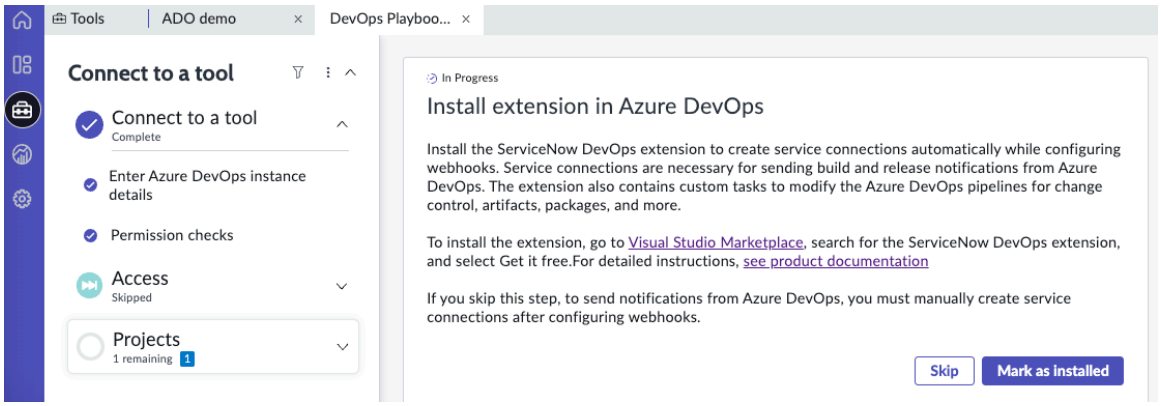
The ServiceNow DevOps extension will automatically create service connections while configuring webhooks. Service connections are required for sending build and release notifications from Azure DevOps. The extension also contains custom tasks to modify the Azure DevOps pipelines for change control, artifacts, and packages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on the extension, see Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.

Note:
If you skip this step, to send notifications from Azure DevOps, you must manually create service connections after configuring webhooks.

After installing the extension, select **Marked as installed**.



9. Configure webhooks automatically in your Azure DevOps instance to send data to DevOps Change Velocity.

   Choose to send data by either nightly polling or configuring webhooks to send real-time data.

   - Webhooks: Enable real-time notifications for your pipeline executions. Real-time notifications are ideal to maintain the most up-to-date information particularly for automating change requests.

     To use webhooks, select **Configure.**

   - Nightly polling: If you don't choose to configure now, you can enable nightly polling later to fetch data for any tracked plans by setting the *`Enable Polling`* property to **Yes**.

   a. Enter the DevOps integration user name and password.

   For information about creating the DevOps integration user and password, see Set up integration user account in DevOps Change Velocity.

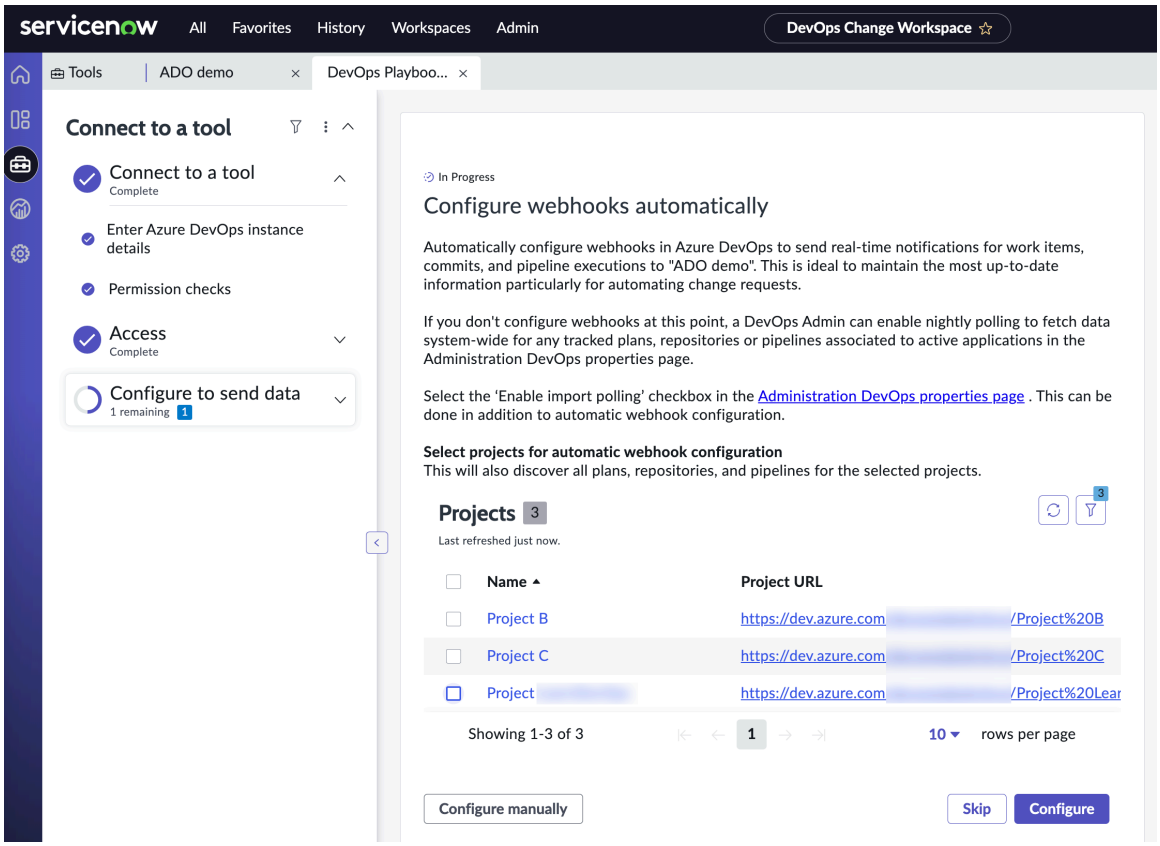
   Note:

   - The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property is enabled. If this step is not required, webhooks are configured using token-based authentication.
   - When DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is enabled, you can regenerate token (auto-configure with new token) from the workspace UI only, which will update the integration user password. When DevOps Config is not installed, token can be regenerated from both the workspace and classic UI for token based authentication. Re-generate your token periodically for better security.

   b. Select the projects for which you want to configure webhooks.

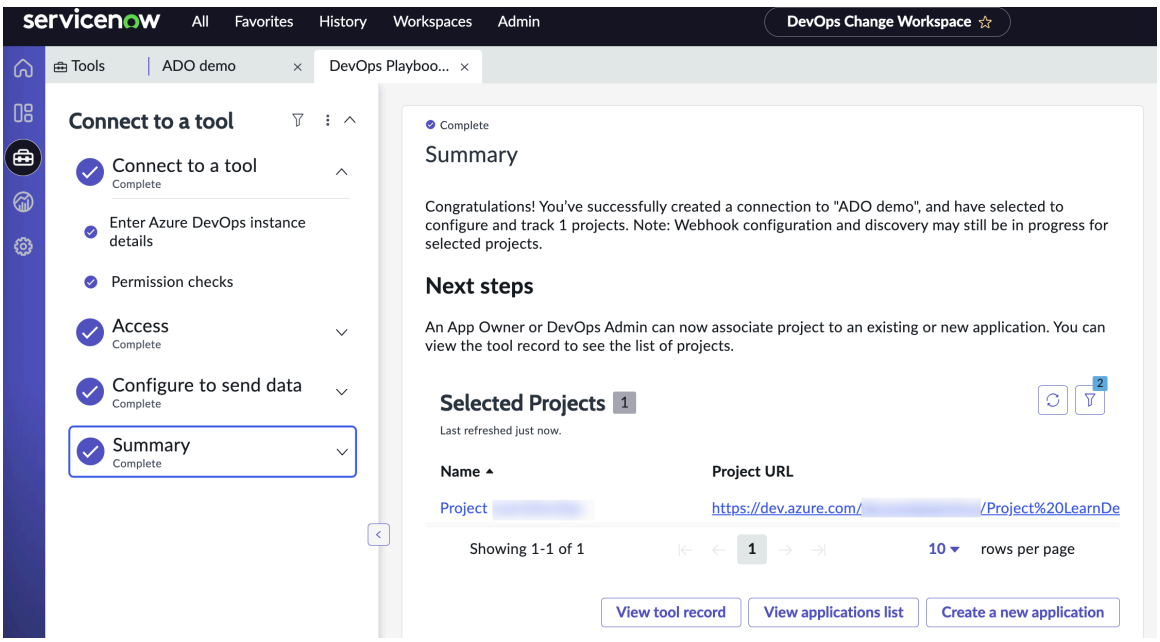
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Configure**.



To configure webhooks manually, select **Configure manually**. See Configure webhooks in Azure DevOps manually for more information.

Webhook configuration and discovery happen in the background, and you're taken to the Summary page.



10. From the Summary page, select **View tool record** to review the details of the connected tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You've successfully onboarded your Azure DevOps tool to DevOps Change Velocity at the organization level.

What to do next
From the **Projects** tab on the tool record page, select a project to navigate to the project record page. From here, you can discover project objects, and configure webhooks for the project.

- Select **Discover** to discover the project objects, including existing plans (boards), repositories, and pipelines.
- If you created the tool directly at the project level, then selecting **Discover projects** from the **Projects** tab of the tool record page will discover all the projects in your organization as well.
- Select **Configure** and enter the integration user credentials to configure webhooks for the project.
- If you're on the tool records page, selecting **Configure projects** and entering the integration user credentials gives the list of unconfigured projects in your organization. Select the projects that you want webhooks configured for and select **Configure**.

> **Note:**
> The step to enter the integration user name and password is required to configure webhooks only when DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is disabled. If this step is not required, webhooks are configured using token-based authentication.

- To import historical data to the project objects like plans, repositories, or pipelines, associate the objects with an application, and import the data. For more information, see Associate tool objects to applications - Workspace.

Connect a project

Connect and configure your Azure DevOps instance directly at the project level. If you have multiple projects within the organization, you must connect each of them separately.

Before you begin
Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure
1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Azure DevOps.

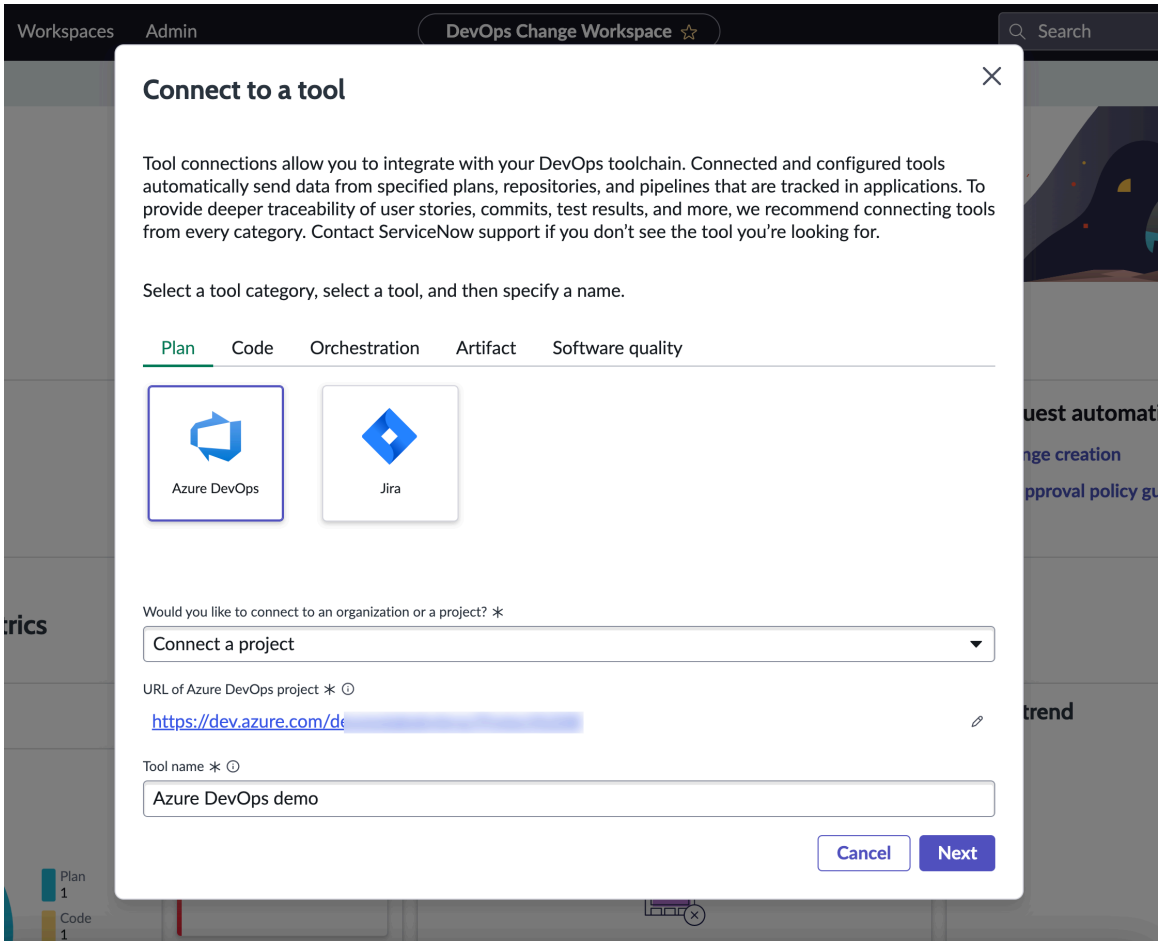
> **Important:**
> If you want to discover and track tool objects like pipelines, plans, or repositories while connecting to the tool, you must connect your tool from the Application module.

2. In the Connect to a tool modal, enter the connection details.
   a. Select **Connect a project** from the drop-down list.
   b. Enter the Azure DevOps URL for the project.
   c. In the **Tool name** field, enter a name for the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Select **Next**.

The DevOps playbook opens to help you complete the onboarding tasks.



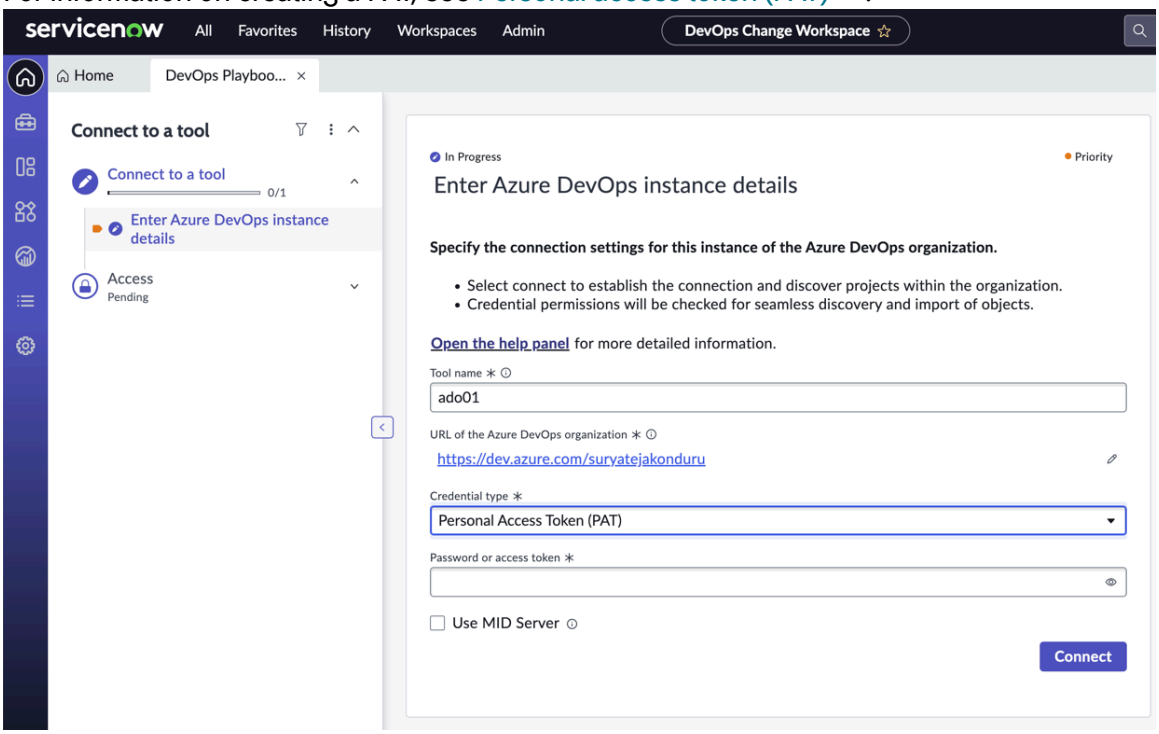
3. Enter the instance details for your tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Enter Azure DevOps instance details section, select one of the following values in the **Credential type** field.

- **Personal Access Token**: Enter the password or access token to access this instance.

  For information on creating a PAT, see Personal access token (PAT).



- **OAuth 2.0**: Pre-requisites:
  - Create a tenant in Microsoft Entra
  - Add a user to tenant in Microsoft Entra
  - Create an organization in Azure portal
  - Create an Azure DevOps app
  - Register Azure DevOps as an OAuth provider
  - Configure organization and project level settings
  - Create credential record and get OAuth token

Use an existing OAuth credential record

i. Select the **Use an existing OAuth credential record** option.

ii. Select a value in the **Credential** field.

Create a new credential record

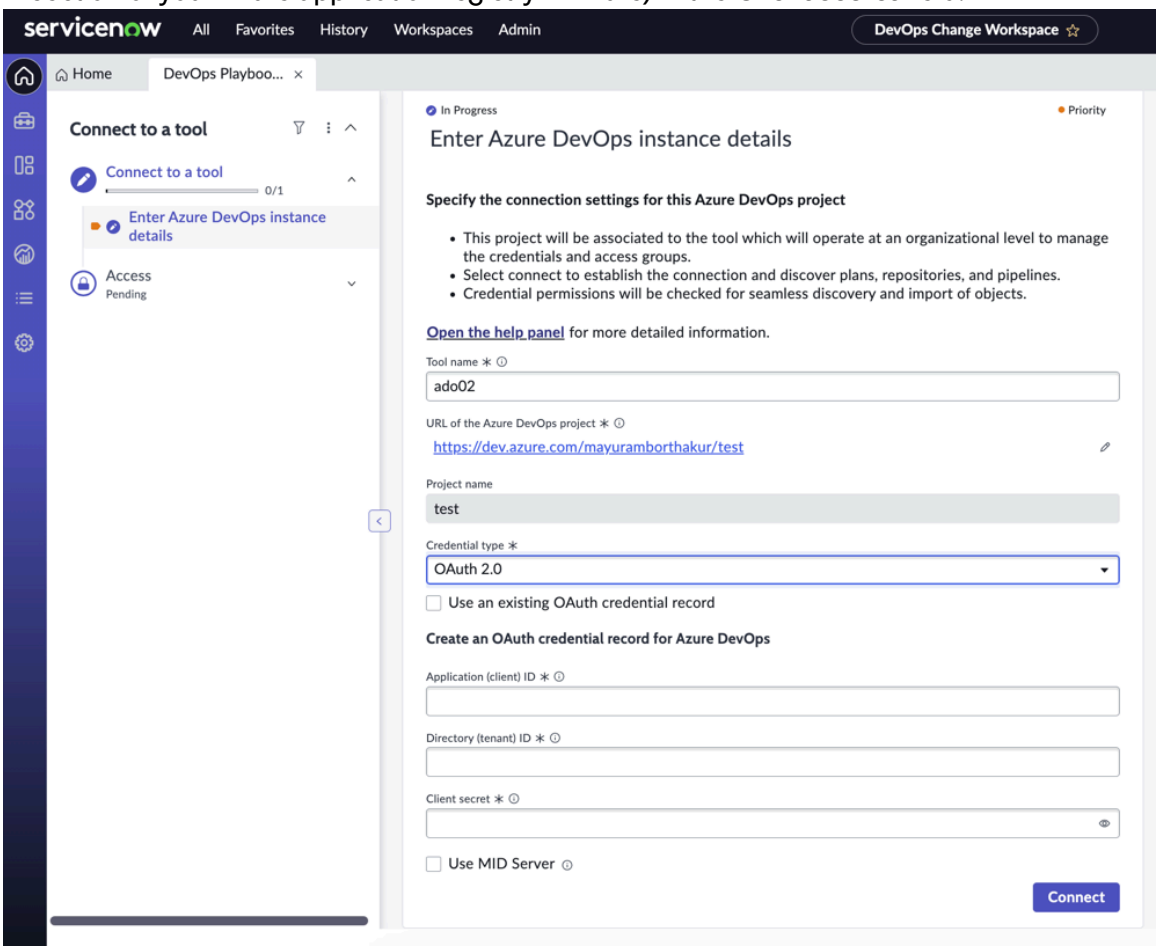
i. Clear the **Use an existing OAuth credential record** option.

ii. Enter the application ID of your Azure application (available in the Overview section of your Azure application registry in Azure) in the **Application (client) ID** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. Enter the directory ID of your Azure application (available in the Overview section of your Azure application registry in Azure) in the **Directory (tenant) ID** field.

iv. Enter the client secret of your Azure application (available in the Certificates & secrets section of your Azure application registry in Azure) in the **Client secret** field.



b. **Optional:** If your tool instance is attached to a MID Server, select the **MID Server** option and enter its details.

   (Optional) For more information about MID server, see MID Server selection.

c. Select **Connect**.

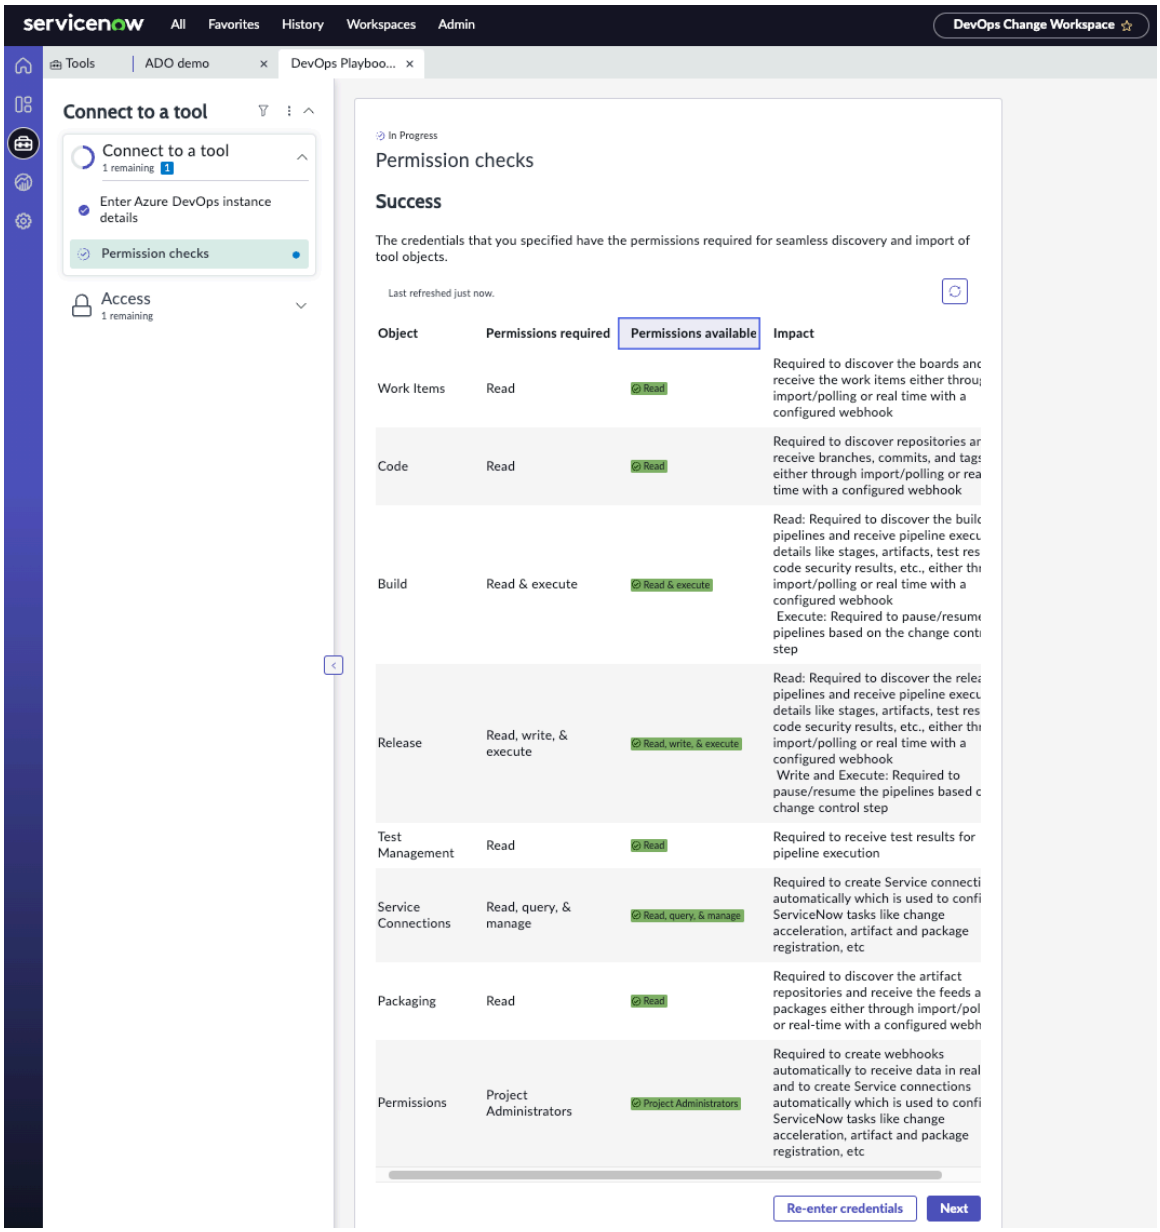
d. Permission checks are run on the credentials that you entered.
   Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information on all the required permissions, see Azure DevOps permissions in Permissions required for DevOps tools.

   You can choose to continue with the tool connection even if you don't have all the required permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When onboarding a Project, the **Project Administrators** privilege requires the owner of the PAT to be a member of the project's **Project Administrators** group.

You need the Project Administrators privilege only for onboarding the tool. Once the tool is successfully onboarded, you can choose to turn off the Project Administrators privilege from the PAT.



e. Select **Next**.

4. Specify the access for the tool.

a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

The tasks these users in the groups can perform depends on the role assigned to them.

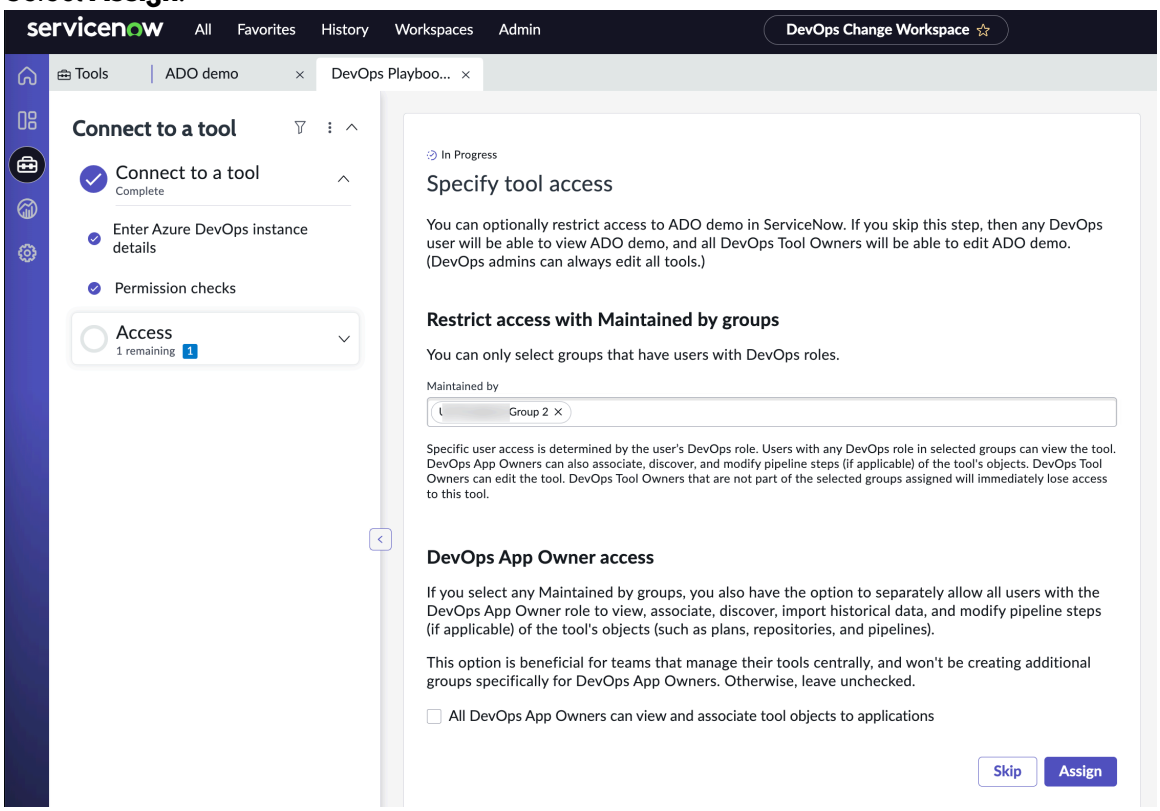
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

Note:
If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

b. If you choose to control access to the tool, the **All DevOps App Owners can view and associate tool objects to applications** option becomes available for selection.
This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

c. Select **Assign**.



5. Install the ServiceNow DevOps extension in your Azure DevOps instance.

The ServiceNow DevOps extension will automatically create service connections while configuring webhooks. Service connections are required for sending build and release notifications from Azure DevOps. The extension also contains custom tasks to modify the Azure DevOps pipelines for change control, artifacts, and packages.

For more information on the extension, see Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.

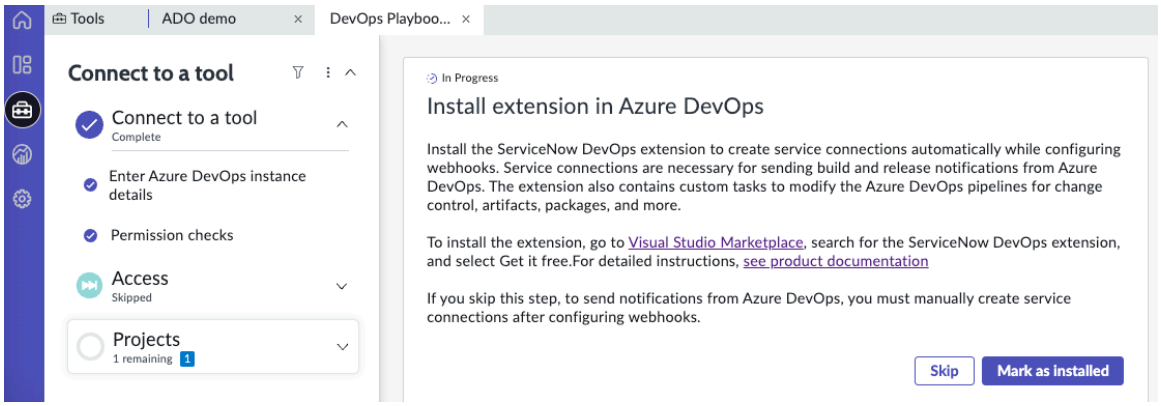
Note:
If you skip this step, to send notifications from Azure DevOps, you must manually create service connections after configuring webhooks.

After installing the extension, select **Marked as installed**.



6. Configure webhooks automatically in your Azure DevOps instance to send data to DevOps Change Velocity.

   Choose to send data by either nightly polling or configuring webhooks to send real-time data.

   - Webhooks: Enable real-time notifications for your pipeline executions. Real-time notifications are ideal to maintain the most up-to-date information particularly for automating change requests.

     To use webhooks, select **Configure.**

   - Nightly polling: If you don't choose to configure now, you can enable nightly polling later to fetch data for any tracked plans by setting the *`Enable Polling`* property to **Yes**.

   a. Enter the DevOps integration user name and password.

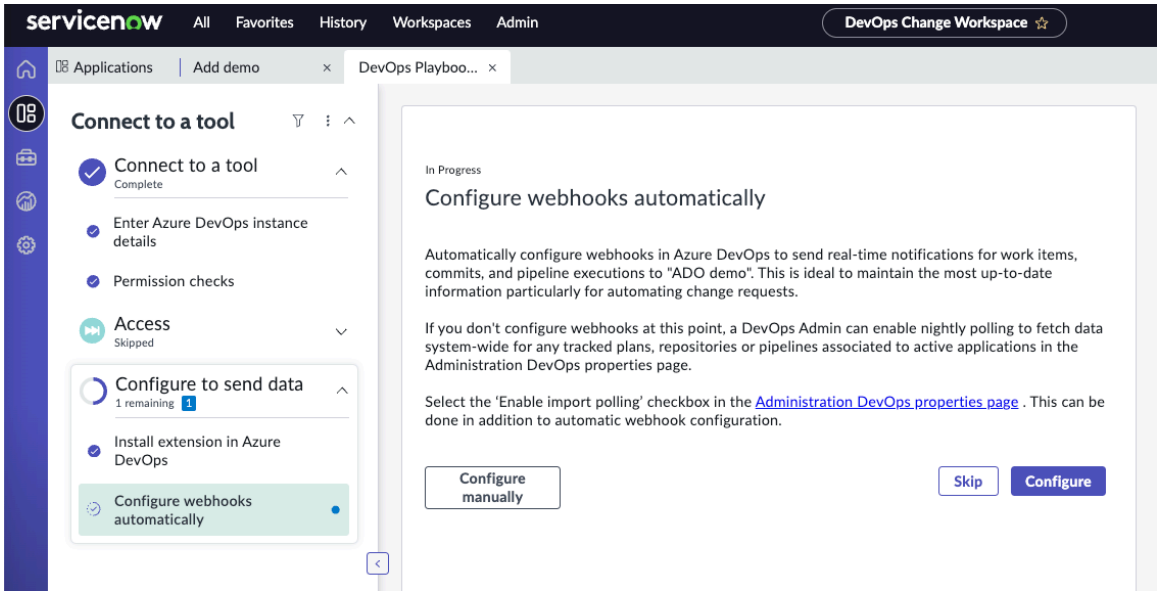
      For information about creating the DevOps integration user and password, see Set up integration user account in DevOps Change Velocity.

      Note:

      - The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property is enabled. If this step is not required, webhooks are configured using token-based authentication.
      - When DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is enabled, you can regenerate token (auto-configure with new token) from the workspace UI only, which will update integration user password. When DevOps Config is not installed, token can be regenerated from both the workspace and classic UI for token based authentication. Re-generate your token periodically for better security.

   b. Select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To configure webhooks manually, select **Configure manually**. See Configure webhooks in Azure DevOps manually for more information.

Important:

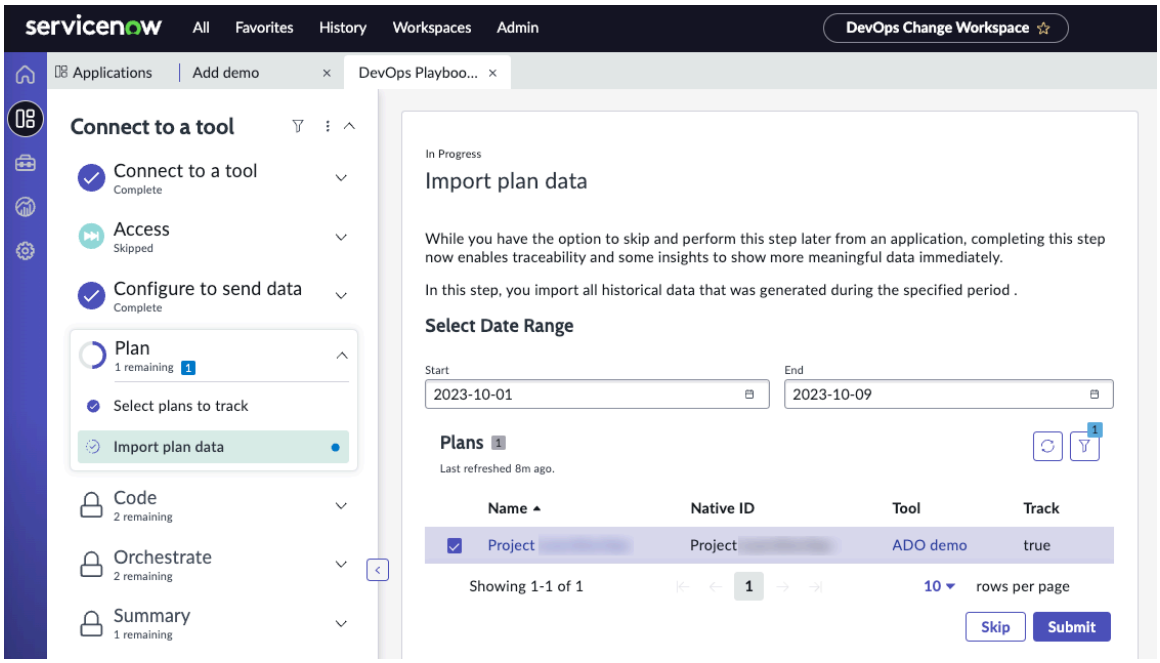
- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then plans, repositories, and pipelines available in your project are discovered. You can track and import historical data from them.

7. Select the plans to track.
   a. Select the plans for which you want to track updates and associate to the application.
   b. Select **Next**.

   c. If you want to import plan data, select the date range and select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can import up to 90 days of data.

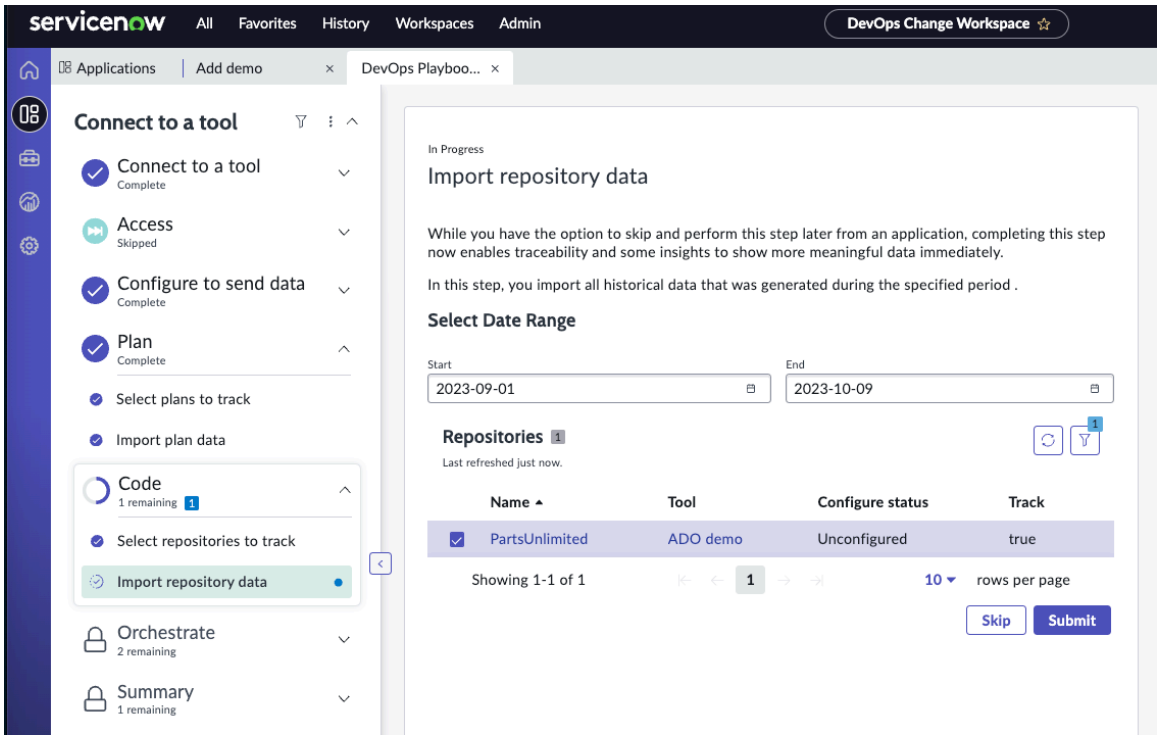


8. Select the repositories to track.
   a. Select the repositories for which you want to track updates and associate to the application.
   b. Select **Next**.

   c. If you want to import repository data, select the date range and select **Submit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

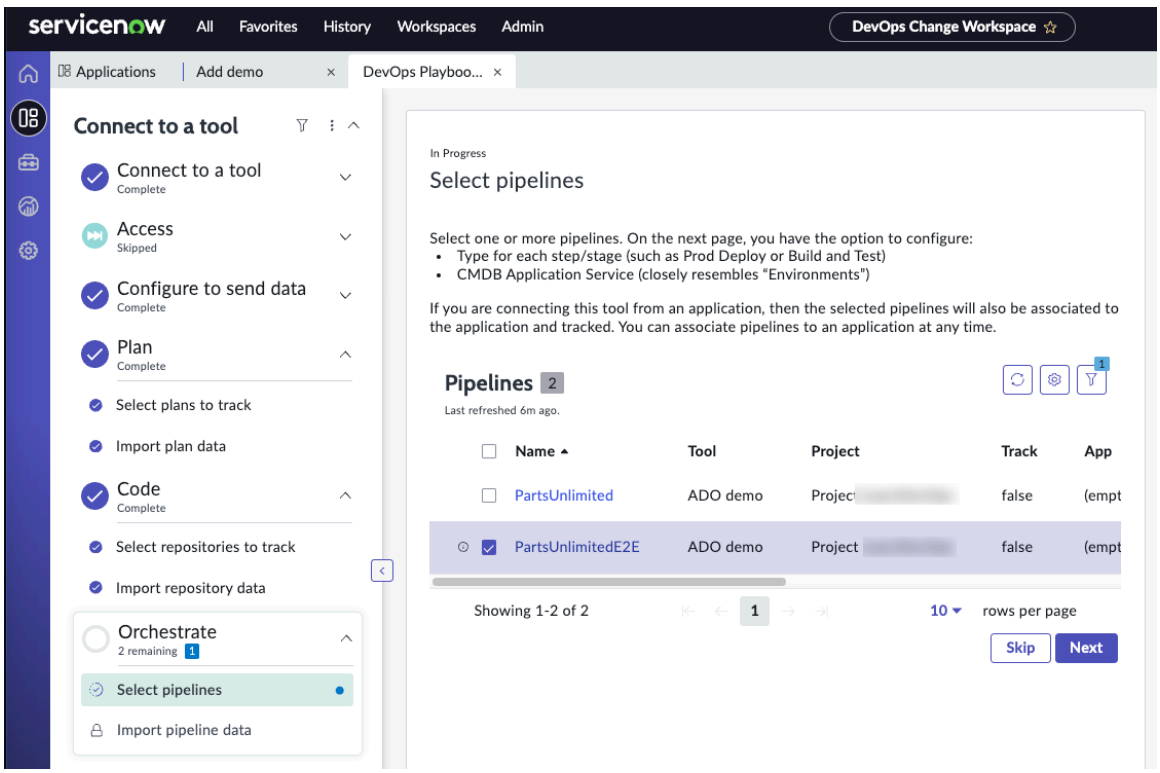
You can import up to 90 days of data.



9. Select the pipelines to track.

a. Select the pipelines for which you want to track updates and associate to the application.

b. Select **Next**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. For each selected pipeline, all steps or stages are imported for the last successful execution. In the Assign services to pipeline steps activity, you can select the following for each pipeline step:

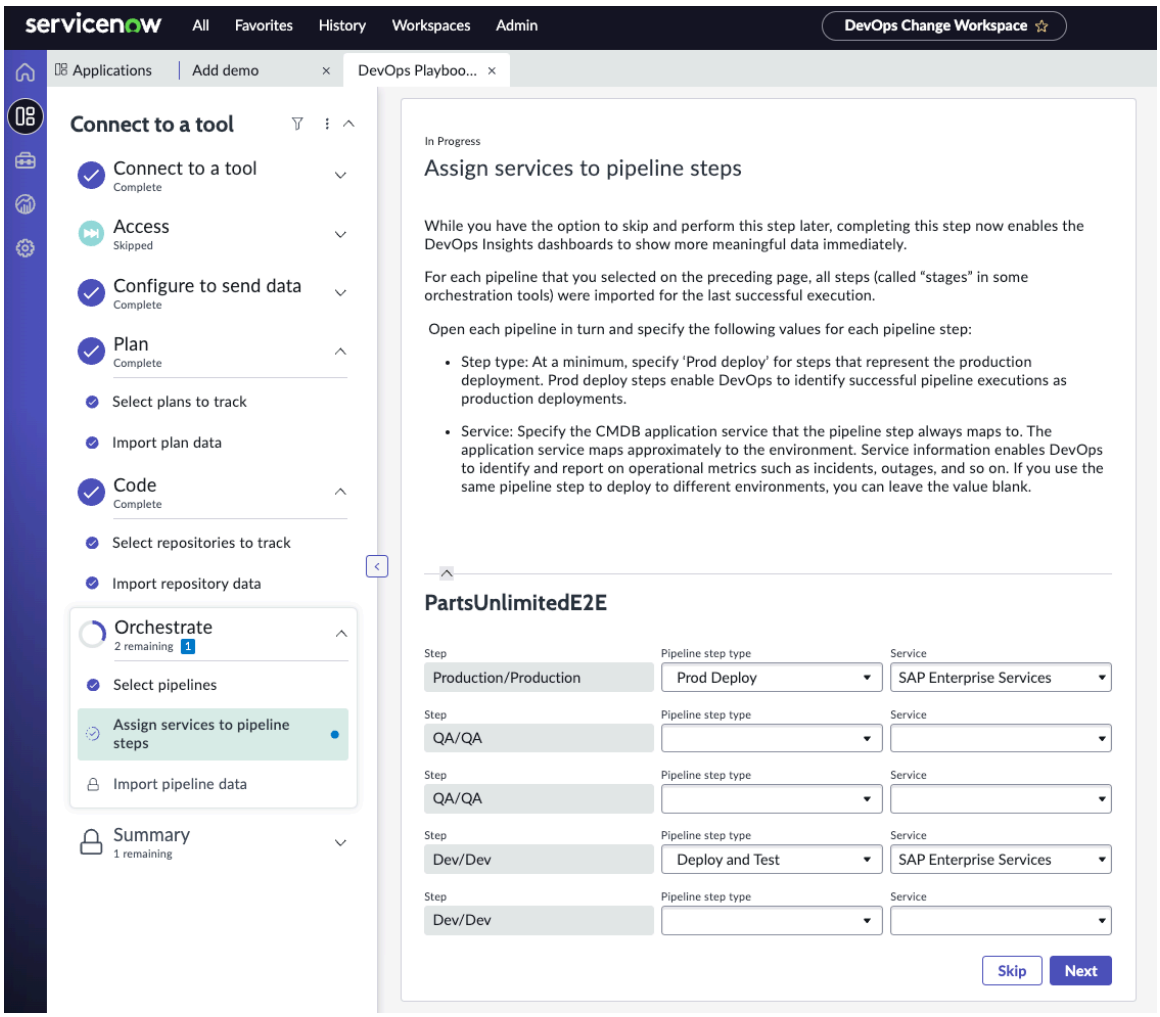
i. Pipeline step type: Select a step type for which you want to assign a service.

> **Tip:**
> Specify at least the *`Prod deploy`* step type for steps that represents the production deployment to enable DevOps to identify successful pipeline executions as production deployments.

ii. Service: Select the CMDB application service that the pipeline step maps to.

Application service maps approximately to the environment. If you use the same pipeline step to deploy to different environments, leave the field empty. Service information enables DevOps to identify and report on operational metrics such as incidents, outages, and so on.

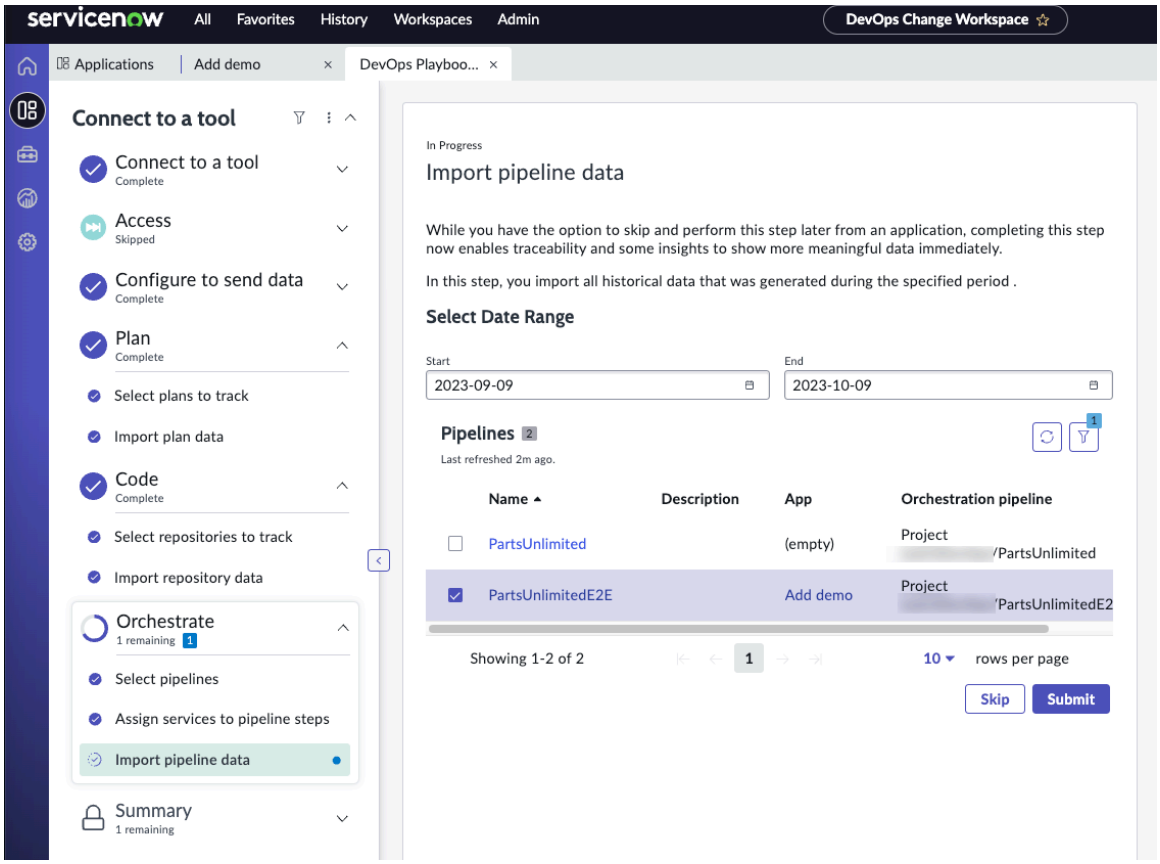
d. Select **Next**.



e. If you want to import pipeline data, select the date range and select **Submit**.

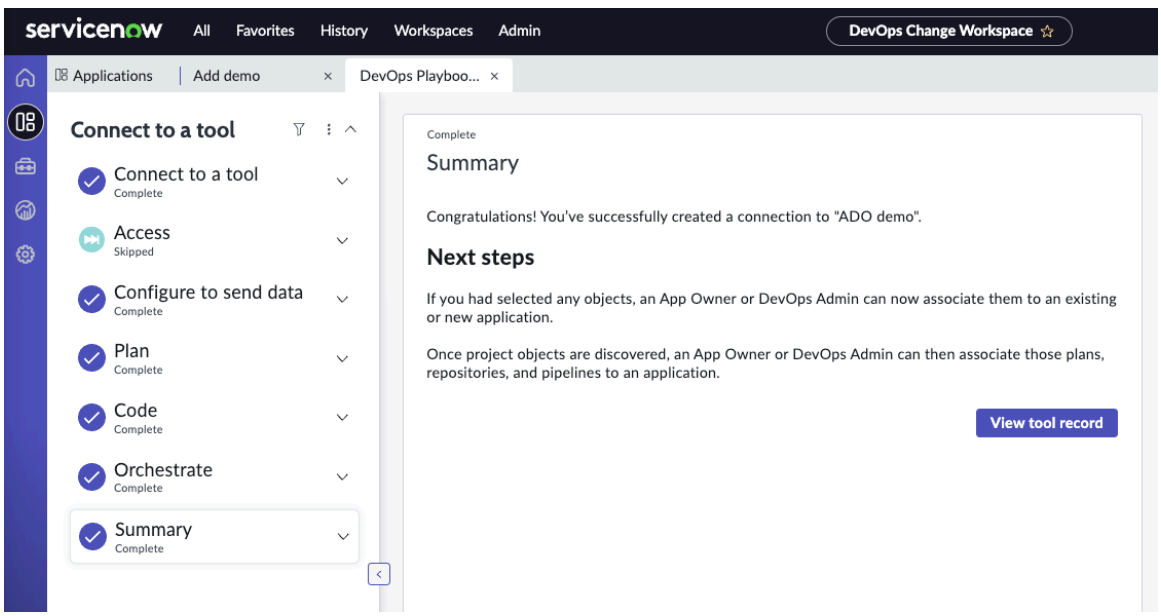
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can import up to 90 days of data.



10. You're taken to the Summary page.

From the Summary page, select **View tool record** to review the details of the connected tool.



Result

You've successfully onboarded your Azure DevOps tool to DevOps Change Velocity at the project level.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

From the **Projects** tab on the tool record page, select a project to navigate to the project record page. From here, you can discover project objects, and configure webhooks for the project.

- Select **Discover projects** to discover the project objects, including existing plans (boards), repositories, and pipelines. This will discover all the projects in your organization as well.
- Select **Configure projects** to configure webhooks for the project.
- If you're on the tool records page, selecting **Configure projects** and entering the integration user credentials gives the list of unconfigured projects in your organization. Select the projects that you want webhooks configured for and select **Configure**.

  Note:
  The step to enter the integration user name and password is required to configure webhooks only when DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is disabled. If this step is not required, webhooks are configured using token-based authentication.

- To import historical data to the project objects like plans, repositories, or pipelines, associate the objects with an application, and import the data. For more information, see Associate tool objects to applications - Workspace.

Configure webhooks from the tool record

Onboard Azure DevOps to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your Azure DevOps instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Azure DevOps integration.
Tool integration	Select Azure DevOps.
Connect to an organization or project	Select from the list. ○ **Connect an organization**: Connect directly at your Azure DevOps organization level. All the projects within the organization

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	will be discovered, and you can choose to configure multiple projects within the organization. ○ **Connect a project**: Connect directly at the project level.
Tool URL	Azure DevOps organization URL (for example, `https://dev.azure.com/<your organization>`) or the Azure DevOps project URL (for example, `https://dev.azure.com/<your organization>/<your project>`).
Credential type	Type of credential, **Basic Auth** or **OAuth 2.0**. **Basic Auth** **a.** Enter your ADO instance username. **b.** Enter the Personal access token (PAT) or password for your Azure DevOps instance. **Note:** When you generate a Personal access token (PAT) for Azure DevOps, you must select the scopes to authorize if you aren't granting complete access. See Azure DevOps PAT scopes for DevOps. **OAuth 2.0** Pre-requisites: ○ Create a tenant in Microsoft Entra ○ Add a user to tenant in Microsoft Entra ○ Create an organization in Azure portal ○ Create an Azure DevOps app ○ Register Azure DevOps as an OAuth provider ○ Configure organization and project level settings ○ Create credential record and get OAuth token In the **Tool credential** field, select an OAuth 2.0 tool credential record. **Note:** Only records that are not in use and configured for ADO can be selected as an existing credential record.

Field	Description
Do you wish to configure webhook for this tool?	Option to enable configuring webhooks automatically for Azure DevOps. Select to enable. **Note:** This option isn't available if you're connecting at the organization level. You can configure webhooks from the tool records page.
Integration username	This field is available only when the option to configure webhook is selected. Enter the username for the DevOps Integration User account. **Note:** ○ The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property is enabled. If this step is not required, webhooks are configured using token-based authentication. ○ When DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is enabled, you can regenerate token (auto-configure with new token) from the workspace UI only, which will update integration user password. When DevOps Config is not installed, token can be regenerated from both the workspace and classic UI for token based authentication. Re-generate your token periodically for better security. .
Integration user password	This field is available only when the option to configure webhook is selected. Enter the password for the DevOps Integration User account.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ○ The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *This property decides whether to create a Generic Connection on configure operation for Azure DevOps* property is enabled. If this step is not required, webhooks are configured using token-based authentication. ○ When DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is enabled, you can regenerate token (auto-configure with new token) from the workspace UI only, which will update integration user password. When DevOps Config is not installed, token can be regenerated from both the workspace and classic UI for token based authentication. Re-generate your token periodically for better security.
Use MID Server	Optional. Select#MID Server for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps and capability is set to REST.

For a list of all the permissions required on the credentials for connecting to Azure DevOps, see Azure DevOps permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved:
   - If connecting to an organization, the tool is created.
   - If connecting to a project, the tool is created, connected, and project objects like plans, repositories, and pipelines are discovered.

When connecting to a project, for the discovered objects, you can import historical data from the tool and also associate an application with it.

6. From the DevOps catalog items, select **DevOps App Onboarding**.
7. Select **Try It**.
8. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Onboarding pipelines	Enter the connected Azure DevOps tool name.
Pipelines	Select the pipelines for which you want to import historical data.
Artifact repositories	Select the artifacts for which you want to import historical data.
Onboarding repositories	Enter the connected Azure DevOps tool name.
Import from and Import to	Select the dates for which you want to import the pipeline and artifact data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Repositories	Select the repositories for which you want to import historical data.
Import from and Import to	Select the dates for which you want to import the Repositories data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Onboarding plans	Enter the connected Azure DevOps tool name.
Plans	Select the plans for which you want to import historical data.
Import from and Import to	Select the dates for which you want to import the Plans data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.

9. Select **Order Now**.
   A request is created. When the request is approved, the plans, repositories, artifacts, and pipeline objects are associated to the app record and webhooks are configured for real-time tracking. Historical data is imported for the selected items. The **Track** field is automatically enabled for imported plans, repositories, and pipelines.

Onboard Azure DevOps to DevOps Change Velocity — Classic

Create an Azure DevOps tool record in DevOps Change Velocity to connect, discover, and import Azure DevOps tool data.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

About this task

Actions:

- **Connect** to Azure DevOps organization or project.
- **Discover** plans, repositories, orchestration tasks, and pipelines.
- **Configure** webhooks in Azure DevOps.
- **Import** work item, plan version, and feature records, branch and commit records, and task execution and step execution records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To customize Azure Boards import of work item states or types, use the *DevOpsAzureDevOpsWorkItemHelper* script include.

Procedure

1. Navigate to **DevOps** > **Tools** > **Create New (legacy)**.
2. On the Create DevOps tool form, fill in the fields.

Field	Description
Tool name	Name of your choice to identify this tool.
Tool Integration	Select **Azure DevOps**.
Connect to an organization or project	Select from the list. ○ **Connect an organization**: Connect directly at your Azure DevOps organization level. All the projects within the organization can be discovered, and you can choose to configure multiple projects within the organization. ○ **Connect a project**: Connect directly at the project level.
Tool URL	Azure DevOps organization URL (for example, `https://dev.azure.com/<your organization>`) or the Azure DevOps project URL (for example, `https://dev.azure.com/<your organization>/<your project>`), depending on your earlier selection.
Credential type	Type of credential, **Basic Auth** or **OAuth 2.0**. **Basic Auth** **a.** Enter your ADO instance username. **b.** Enter the Personal access token (PAT) or password for your Azure DevOps instance. **Note:** When you generate a Personal access token (PAT) for Azure DevOps, you must select the scopes to authorize if you aren't granting complete access. See Azure DevOps PAT scopes for DevOps. **OAuth 2.0** Pre-requisites: ○ Create a tenant in Microsoft Entra ○ Add a user to tenant in Microsoft Entra ○ Create an organization in Azure portal

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Create an Azure DevOps app ○ Register Azure DevOps as an OAuth provider ○ Configure organization and project level settings ○ Create credential record and get OAuth token In the **Tool credential** field, select an OAuth 2.0 tool credential record. **Note:** Only records that are not in use and configured for ADO can be selected as an existing credential record.

For a list of all the permissions required on the credentials for connecting to Azure DevOps, see Azure DevOps permissions in Permissions required for DevOps tools.

3. **Optional:** If your Azure DevOps instance is attached to a MID Server, select the **Use MID Server** option and enter its details.

   (Optional) For more information about MID server, see MID Server selection

4. Select **Submit**.

   The tool is automatically connected using a connection alias and HTTP tool connection (Basic Auth credential) and the tool record details are shown in a form.

   Note:
   If you do not have global admin privileges for your tool (to allow automatic configuration of the webhook URL), you might need to have the tool admin user configure it for you (cut and paste the webhook URL into the tool configuration). Once the webhook is configured in the tool, **Enter Manual Configuration Mode** to connect to the tool manually, then exit.

On successful tool creation, you're taken to the tool record page.

5. **Optional:** If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

6. Discover tool objects, including existing application plans (projects associated with the tool), repositories, orchestration tasks, and pipelines.
   - Connected to organization: Select **Discover projects** to discover the projects from the organization. After discovery, the projects from your organization are available under the **Projects** related list.
   - Connected to a project: The project is discovered during connection creation and is available under the **Projects** related list. Selecting **Discover projects** from the **Projects** tab of the tool record page discovers all the projects in your organization.

   Select a project from the **Projects** related list to navigate to the project record page. Select **Discover** to discover the project objects, including existing plans (boards), repositories, and pipelines.

7. Configure webhook URLs in Azure DevOps.

   a. You can configure directly from the tool records page, or from the project record page for each product.
      - To configure from the tool records page, select **Configure projects**. Select the projects that you want to configure and select **Continue.**.
      - To configure from the project records page, first select the project from the tool records page and select **Configure**.

   b. Enter the DevOps integration user and password and select **Send**.

      On send, webhooks and service connections are automatically created in Azure DevOps. This sends the notifications from Azure DevOps tools to DevOps Change Velocity using the DevOps Integration user. For information on setting up Integration user account, see Set up integration user account in DevOps Change Velocity.

      Note:
      - The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property is enabled. If this step is not required, webhooks are configured using token-based authentication.
      - When DevOps Config is installed or the Generic Connection on configure operation for Azure DevOps property is enabled, you can regenerate token (auto-configure with new token) from the workspace UI only, which will update integration user password. When DevOps Config is not installed, token can be regenerated from both the workspace and classic UI for token based authentication. Re-generate your token periodically for better security.

   Note:
   For plans, the **Track** field is automatically set to **True**.

8. For the discovered plans, you can import historical data from the tool and also associate an application with it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Open a plan record from the Plans related list.

b. Select the **Import** related link.
Records are created for the plan in the Work Items, Plan Versions, and Features related lists.

- Work items related list shows tasks, bugs, and stories.

  Native State and **Native Type** fields of the work item contain the original state and type values from the source tool.

- Plan Versions related list shows releases.
- Features related list shows epics and features.

> **Note:**
> Historical import of Azure DevOps work items isn't supported for Agile Boards CMMI process.

c. In the Apps related list, select **Edit...** to select an App to associate with the plan (project), or select **New** to create one.
A plan must have an associated App record to complete the planning tool setup.

9. For the discovered repositories, import historical data for the tool, and associate the repository with an app.

a. Open the repository record from the Repositories related list.

b. Select **Import**.
Imported branch records and commit records from the repository are added to the corresponding related lists.

c. In the **App** field, select the lookup list and select an App record to associate with the repository, or click **New** to create one.

Imported historical data records are added to the corresponding related lists.

What to do next

For Azure pipelines, Model an Azure pipeline in DevOps to complete the configuration in DevOps Change Velocity.

- Map each pipeline to a specific app.
- Create pipeline steps and map each step to an Azure pipeline job.
- Configure change control.

Setting up Azure DevOps OAuth 2.0 credential

Create Azure DevOps OAuth 2.0 credential and use them to connect your Azure DevOps instance.

If you want to use Basic Authentication credentials instead of OAuth 2.0, skip this section and proceed to onboarding Azure DevOps using one of the following options:

- Onboard Azure DevOps to DevOps Change Velocity — Workspace
- Onboard Azure DevOps to DevOps Change Velocity — Service Catalog
- Onboard Azure DevOps to DevOps Change Velocity — Classic

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a tenant in Microsoft Entra

Create a tenant in Microsoft Entra and set up the required permissions to create an Azure DevOps (ADO) app.

Before you begin

Role required: Tenant Creator in Azure DevOps.

About this task

Your tenant represents your organization and helps you to manage a specific instance of Microsoft Cloud services for your internal and external users.

If you have an existing tenant, which has access to create an ADO app, you do not need to perform this procedure. If you don't have a tenant, you must create a tenant in Microsoft Entra, which will have access to create an ADO app.

Procedure

1. In the Microsoft Entra portal, navigate to **Overview > Manage tenants** .
2. Select **Create**.
3. Select the **Workforce** configuration, and select **Continue**.
4. Enter the following information:
   - Your desired Organization name into the **Organization name** box.
   - Your desired Initial domain name into the **Initial domain name** box.
5. Select **Next: Review + Create**.
6. Review the information that you entered and if the information is correct, select **Create** in the lower left corner.

   For more information, see the Microsoft documentation.

Add a user to tenant in Microsoft Entra

Add a user who contains the admin role, to the tenant created in the previous procedure.

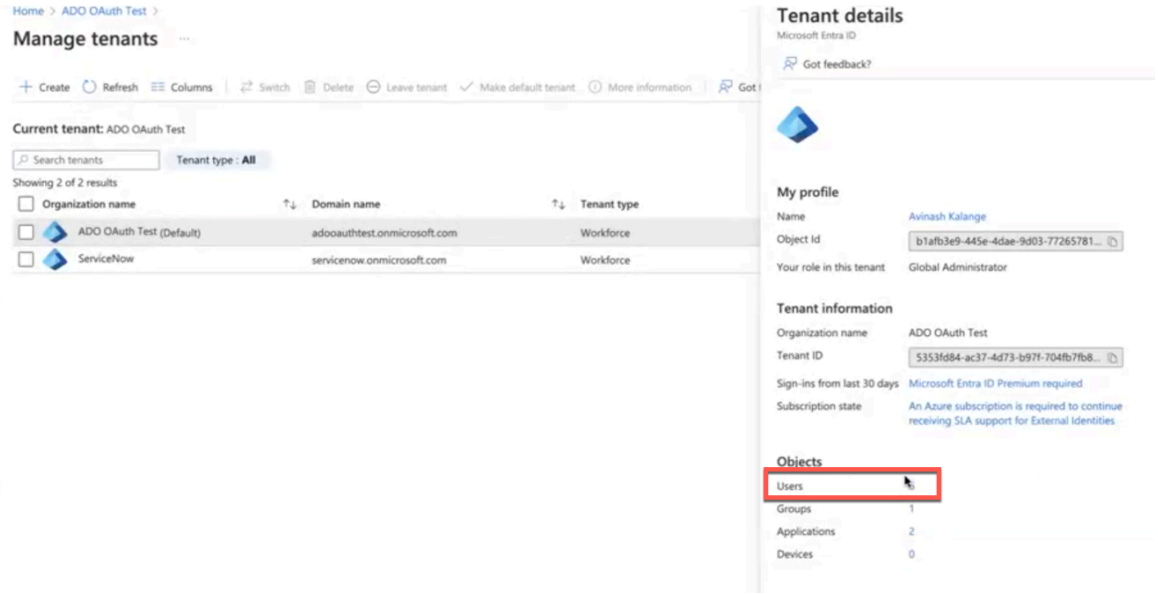
Before you begin

Role required: User Administrator in Azure DevOps

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Microsoft Entra ID tenant page, select the number of users link in the Tenant details section.



2. Select **New user > Create new user**.
3. In the Basics tab, enter the following details.

Basics tab fields

Field	Value
User principal name	Enter a unique user name and select a domain from the menu after the @ symbol.
Mail nickname	If you need to enter an email nickname that is different from the user principal name you entered, clear the **Derive from user principal name** option, then enter the mail nickname.
Display name	Enter the user's name.
Password	Provide a password for the user to use during their initial sign-in. Clear the Auto-generate password option to enter a different password
Account enabled	This option is checked by default. Clear to prevent the new user from being able to sign in. You can change this setting after the user is created. This setting was called **Block sign in** in the legacy create user process.

4. Select **Next: Properties** to complete the next section.

Properties tab fields

Field	Value
Identity	Enter the user's first and last name. Set the User type as either Member or Guest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Job information	Add any job-related information, such as the user's job title, department, or manager.
Contact information	Add any relevant contact information for the user.
Parental controls	For organizations like K-12 school districts, the user's age group may need to be provided. Minors are 12 and under, Not adult are 13-18 years old, and Adults are 18 and over. The combination of age group and consent provided by parent options determine the Legal age group classification. The Legal age group classification may limit the user's access and authority.
Settings	Specify the user's global location.

5. Select **Next: Assignments** to complete the next section.
6. In the Assignments section, select **+ Add** role.
7. From the menu that appears, select the **Global Administrator** role from the list and select the **Select** button.
8. Select the **Review + create** button.

   For more information, see the Microsoft documentation.

Create an organization in Azure portal

Create an organization in the new tenant, which has access to create an app.

Before you begin

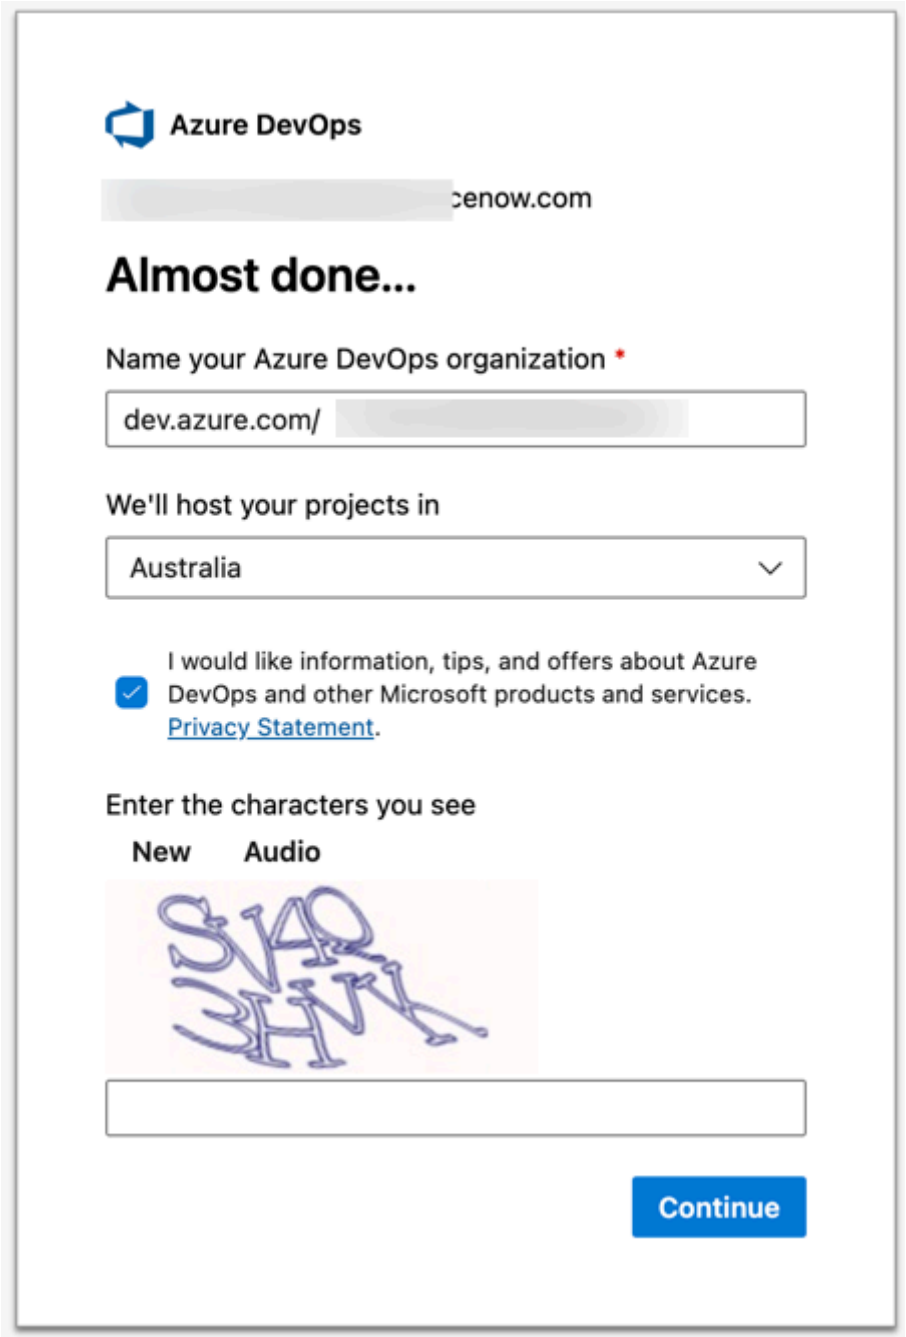
Role required: Global Administrator in Azure DevOps

Procedure

1. Log in to Azure portal with the user created in the previous procedure.
2. Navigate to **Azure DevOps Organizations > My Azure DevOps Organizations**.
3. Select **Create new organization**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter the name of your ADO organization and location, and then select **Continue**.



This newly created org will be connected with the tenant created in the Create a tenant in Microsoft Entra topic.

Create an Azure DevOps app

Create and configure an Azure DevOps (ADO) app and copy the required values to enable OAuth 2.0 authentication with your ServiceNow instance.

Before you begin
Role required: Global Administrator in Azure DevOps

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

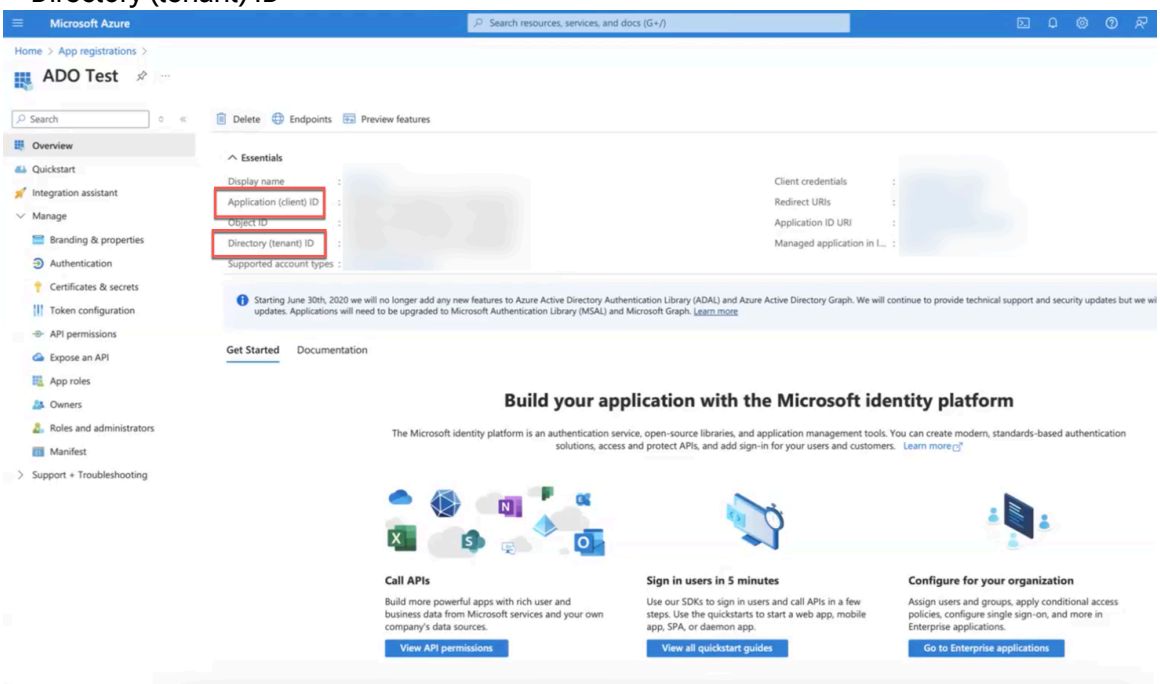
Procedure

1. In the Azure portal, navigate to **App registrations** .
2. Select **+ New registration**.
3. On the App registrations page, enter your application's registration information as described in the table.

App registrations page

Field	Value
Name	Enter a meaningful application name that is displayed to users.
Supported account types	Select Accounts in this Organizational directory only (Single tenant)
Redirect URL	Enter your ServiceNow instance URL.

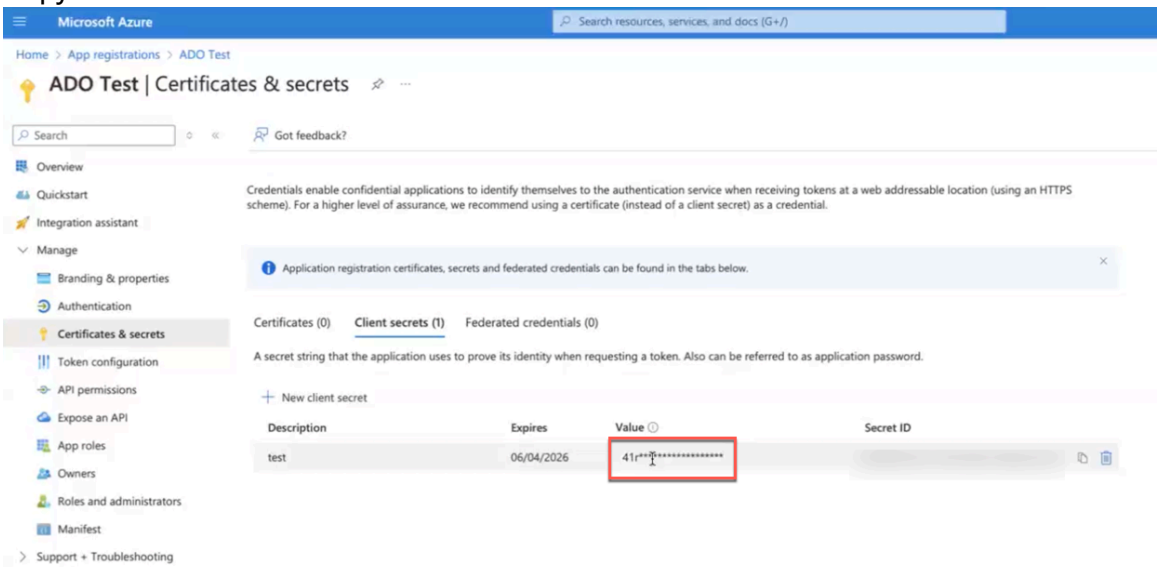
4. Select **Register**.
5. In the newly created application, from the Overview page in the left navigation pane and copy the following details:
   - Application (client) ID
   - Directory (tenant) ID



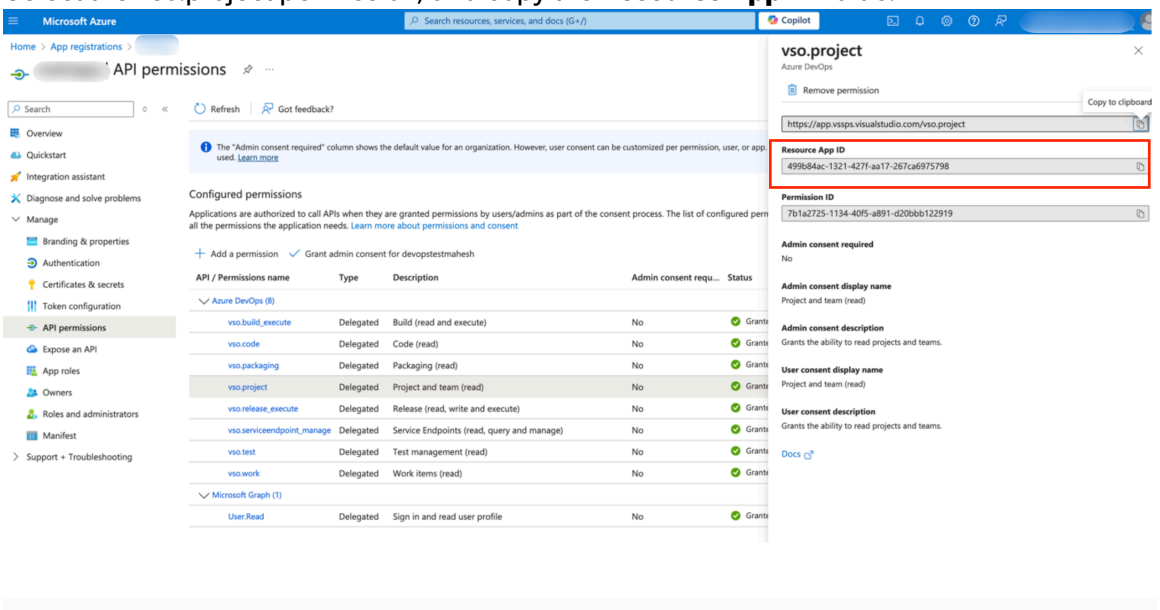
6. Add a client secret by selecting the **Manage > Certificates & secrets** link in the left navigation pane.
   For more information, see the Add a client secret and Register an application topics in Microsoft documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Copy the client secret value.



8. Navigate to **Manage > API permissions**.
9. Select **+ Add a permission**, and select the Microsoft APIs tab on the right.
10. Search and select Azure DevOps and add the **vso.project** permission.
11. Select the vso.project permission, and copy the **Resource App ID** value.



Note:
The resource app ID value copied here will be added in the OAuth Entity Scopes for the Application Registry.

Register Azure DevOps as an OAuth provider

Use the information generated during Azure DevOps (ADO) app account configuration to register Azure DevOps as an OAuth provider and enable the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

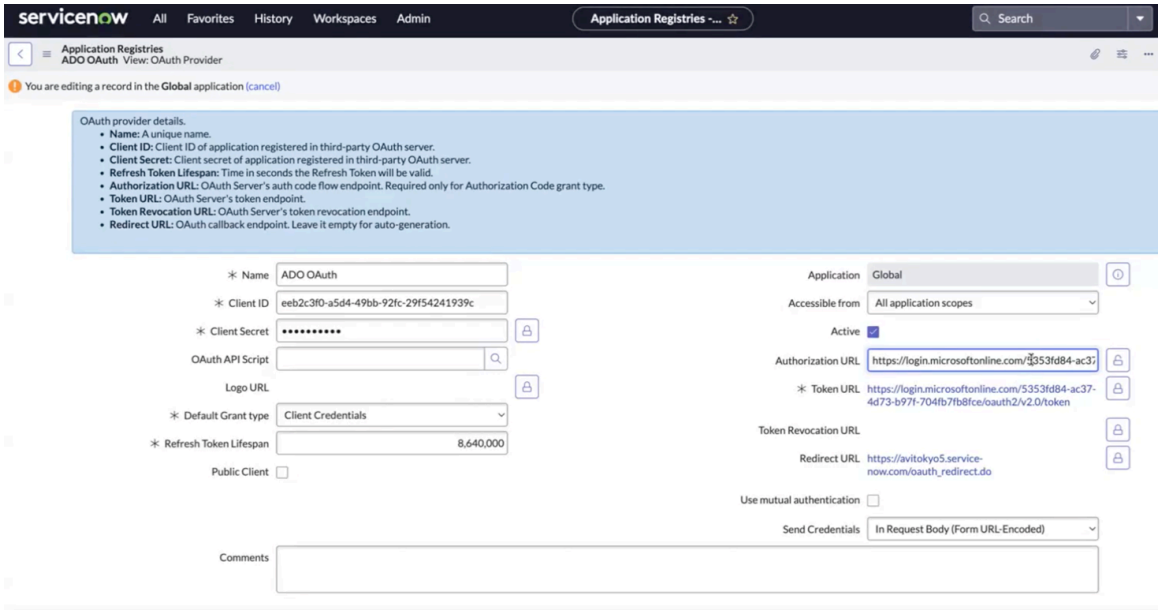
1. In ServiceNow DevOps Change Velocity, navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
   The **What kind of OAuth application?** message is displayed.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.

Application Registry form fields

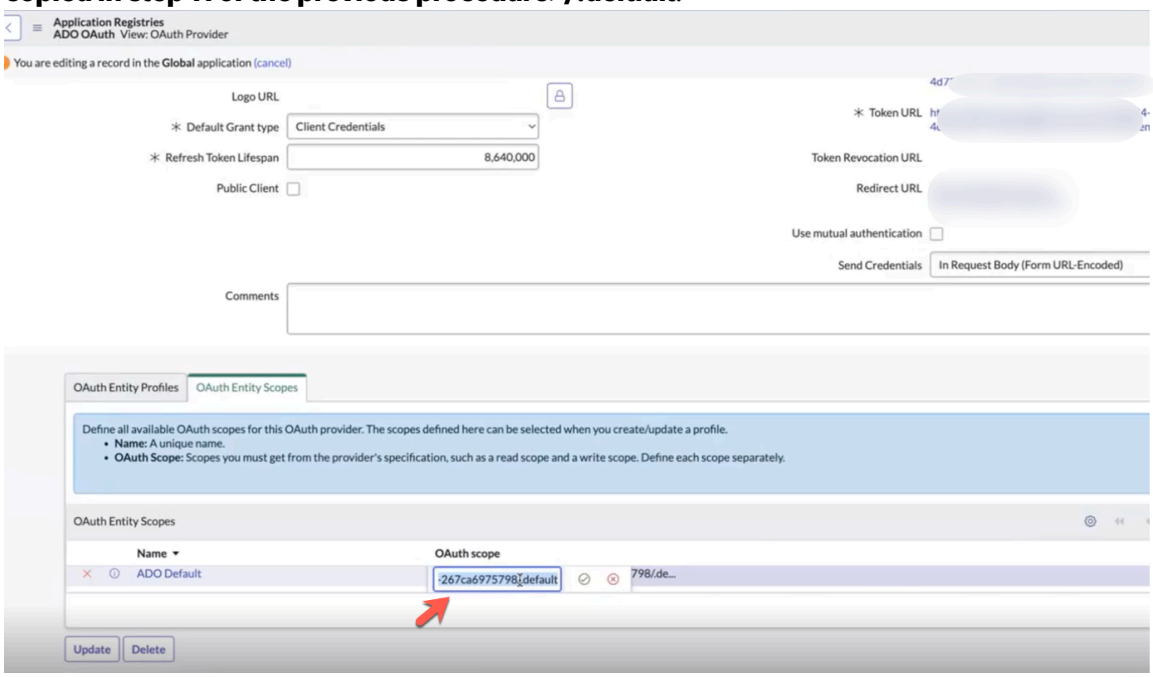
Field	Description
Name	Name to uniquely identify the record. For example, enter `My ADO App Provider`.
Client ID	Client ID of your ADO app (hint: available in the **Overview** section of your ADO app).
Client Secret	Client secret of your ADO app (hint: available in the **Certificates & secrets** section of your ADO app).
Default Grant type	Type of grant associated with application registry. Select **Client Credentials**.
Authorization URL	Enter: https://login.microsoftonline.com/<Directory (tenant) ID>/oauth2/v2.0/authorize Where, Directory (tenant) ID is the alphanumeric value found in the Overview section of your ADO app.
Token URL	Enter: https://login.microsoftonline.com/<Directory (tenant) ID>/oauth2/v2.0/token Where, Directory (tenant) ID is the alphanumeric value found in the Overview section of your ADO app.

5. Leave the rest of the form fields as is.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select and hold (or right-click) the form header, and select **Save**.
   The system validates the OAuth credentials and populates the **Redirect URL** (Hint: It should match the redirect URL previously provided in your ADO app creation).
7. Select the **OAuth Entity Scopes** related tab.
8. Add the OAuth scope value as **<Resource App ID value copied in step 11 of the previous procedure>/.default**.



Configure organization and project level settings

Configure organization and project level settings for your app.

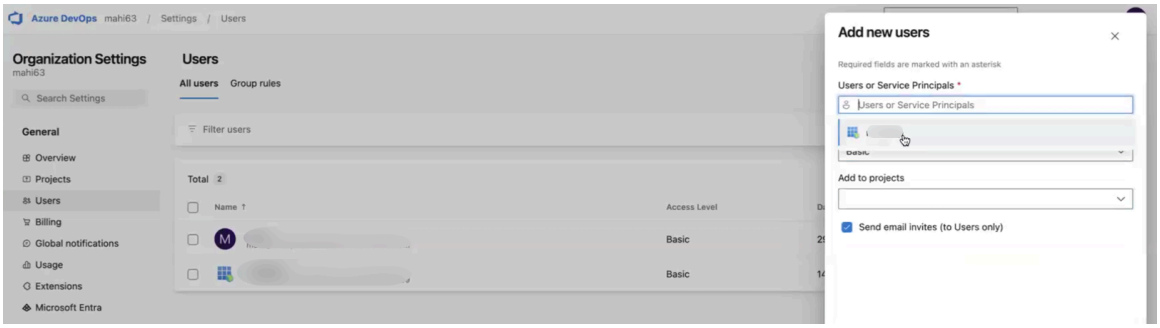
Before you begin

Role required: Member of the **Project Collection Administrators** group or organization's owner.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

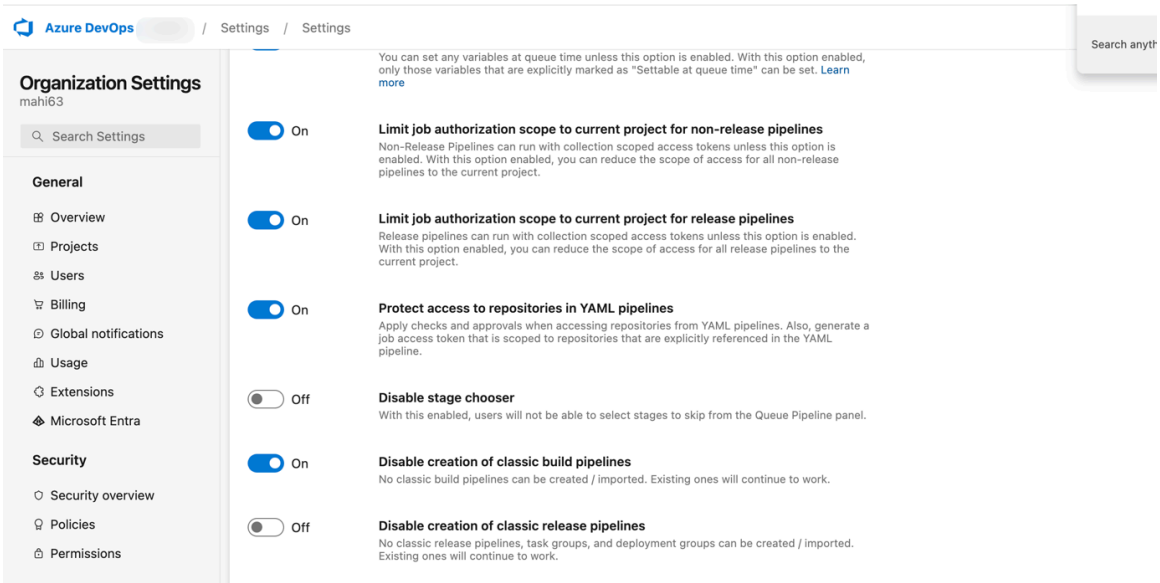
Procedure

1. Navigate to **Organizational Settings** of your organization in the Azure DevOps portal.
2. Select **Users**.
3. In the **Users or Service Principals** field, select the app you created in the previous procedure to the list.



4. Navigate back to the users list, and select the app user.
5. Select the **Actions** menu, and select **Manage Access**.
6. Add the project that you want to enable the app to access, and assign the **Project Administrator** role to that project.

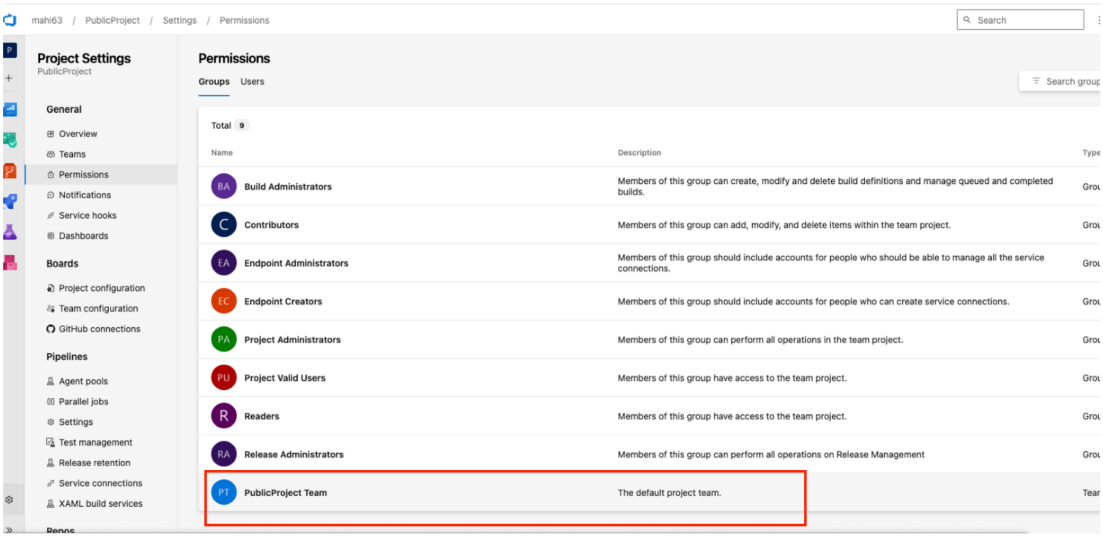
> **Note:**
> If you aren't seeing your release or classic pipelines, ensure that the **Disable creation of classic release pipelines** setting is switched off for your organization.



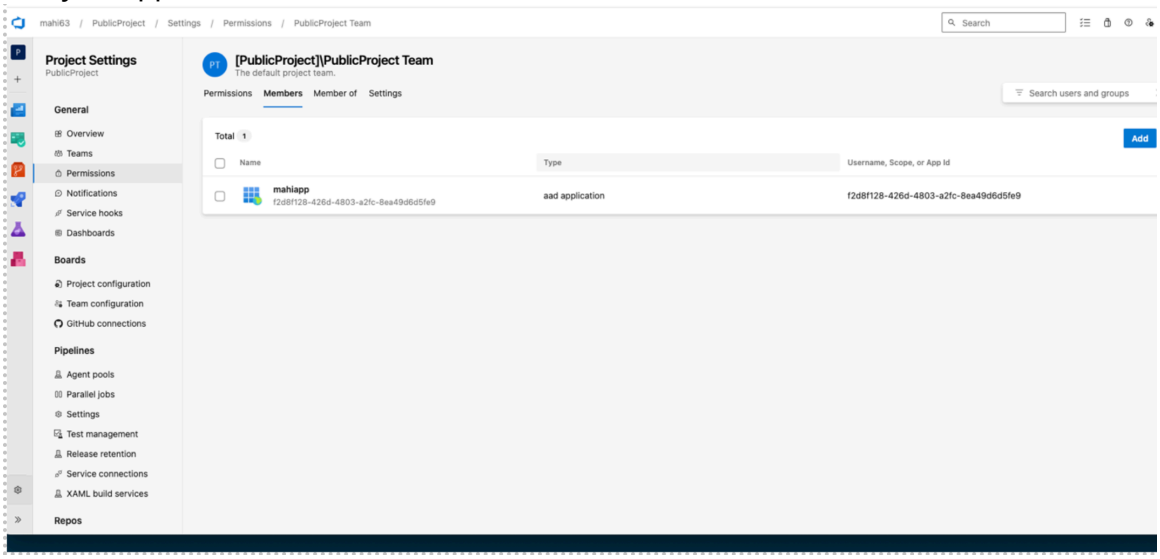
7. Navigate to **Project Settings** of your project.
8. Select **Permissions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

There will be one project team created under permissions by default.



9. Select the default project team, and navigate to the Members tab.
10. Add your app user.



Create credential record and get OAuth token

Create credential record and get OAuth token.

Before you begin

Role required: admin, sn_devops.admin

About this task

For ADO OAuth 2.0, you must create separate credential records for build, release, and feeds in ServiceNow.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
   The **What type of Credentials would you like to create?** message is displayed.
3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OAuth 2.0 Credentials form fields

Field	Value required
Name	Name to uniquely identify the record. For example, enter `My ADO APP Build Credential`.
Active	Option to enable the record.
OAuth Entity Profile	Default OAuth Entity profile created in the Application Registry.

5. Save the record.
6. Select the **Get OAuth Token** related link to generate the OAuth token.
7. Repeat the procedure to create release and feeds credentials.

Model an Azure pipeline in DevOps

Model an Azure pipeline by mapping the pipeline to an app, and mapping DevOps Change Velocity pipeline steps to Azure pipeline jobs.

Before you begin

Role required: sn_devops.admin

Procedure

1. Map your pipeline to an app in DevOps.

   a. Navigate to **DevOps** > **Apps & Pipelines** > **Apps** and open the application record to associate with the pipeline.

   b. In the Pipelines related list, click **Edit...** to select a pipeline to associate with the app, or click **New** to create the pipeline.

   > **Note:**
   > While associating a pipeline with an app, the pipeline steps are also fetched during import.

   For a new pipeline, fill in the **Orchestration pipeline** field using the project name and pipeline name as specified in Azure DevOps Pipelines in path format.

   For example, `My Project/My Classic Build Pipeline`.

   > **Note:**
   > The `project` name must be specified with the pipeline because there could be multiple pipelines with the same name in different projects.

   c. Click **Submit**.

2. Open the pipeline record again and select the **Track** check box so events from the pipeline are received.
   The **Track** check box must be selected to integrate the pipeline with DevOps Change Velocity.
3. Create DevOps steps automatically or manually to map to each Azure pipeline job so an orchestration task can be created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Manual creation of steps is not required when you Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.

- Automatically create and map pipeline steps in DevOps by running your Azure pipeline when you Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.

  Pipeline steps are automatically created, mapped, and associated when DevOps receives step notifications from your Azure pipeline during the run.

- Manually create and map each pipeline step to an Azure pipeline job.

  In the Steps related list, click **New** to create a DevOps step for each Azure pipeline job (**Orchestration stage** field).

  Note:
  The **Orchestration stage** field value of each step is case-sensitive and must match the original name of the corresponding Azure pipeline job.

Name	Name of the pipeline step.
Pipeline	Pipeline in which the step is configured.
Type	Pipeline step type. ▪ Build and Test ▪ Test ▪ Deploy ▪ Deploy and Test ▪ Manual ▪ Prod Deploy
Order	Order in which the steps are run. **Note:** The step order determines the order of the cards in the Pipeline UI. The order of the cards in the Pipeline UI is by task execution.
Orchestration stage	Azure pipeline job name (case-sensitive). **Note:** For step association with Azure pipeline jobs, the **Orchestration stage** field must be configured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business service	Configuration service that applies to the step.

Once orchestration tasks are created, associate each orchestration task in the Orchestration Tasks related list with a DevOps pipeline step.

4. Enable change control automatically or manually.
   - If you are using the ServiceNow DevOps extension for Azure DevOps, run your Azure DevOps pipeline to automatically enable change control.
   - If you are configuring change control manually, select the **Change control** check box in a step to enable change acceleration and the corresponding configuration fields. For Azure release (CD) pipelines, enable change control in the first step of the required stage only. Change control for Azure release (CD) pipelines is supported only in pre-deployment gates.

     Note:
     ServiceNow Change Management must be installed for change acceleration.

Change receipt	Select to enable change receipt for the step so the pipeline doesn't pause when a change request is created. All pipeline data is included in the change, but approval is not required for the pipeline to proceed.
Change approval group	Approval group for the change request. The change approval group becomes the **Assignment group** in the DevOps change request. **Note:** Ensure that the selected group has members and a group manager so the approver field is not empty.
Change type	Change request type to create. ▪ Normal (default) ▪ Standard ▪ Emergency
Change model	Change model for the change request. For more information, see DevOps change models.
Template **Note:** This field is shown only when **Change type** is Normal or Emergency.	List of templates to use to auto populate fields for Normal or Emergency change requests. Select a template or create a new one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard change template **Note:** This field is shown only when **Change type** is Standard.	List of standard change templates to use for Standard change requests. **Note:** This field is required for Standard change type.
Change controlled branches	(Multibranch only) Comma-separated list of branches under change control. Wildcards are supported.

You can set up change control in your Azure DevOps YAML or Classic Azure pipeline using the Azure Invoke REST API or the ServiceNow DevOps extension for Azure DevOps.

What to do next

Configure the Azure pipeline for DevOps

Associate Azure pipeline steps in DevOps

For manually created DevOps steps, associate each orchestration task in the Orchestration Tasks related list with a DevOps pipeline step to track the activity of each stage in your Azure pipeline.

Before you begin

Role required: sn_devops.admin

Procedure

1. Navigate to **All** > **DevOps** > **Tools** > **Orchestration Tools**, and open the Azure DevOps tool record.
2. In the Orchestration Tasks related list, enter the corresponding DevOps pipeline step in the **Step** field of each orchestration task.

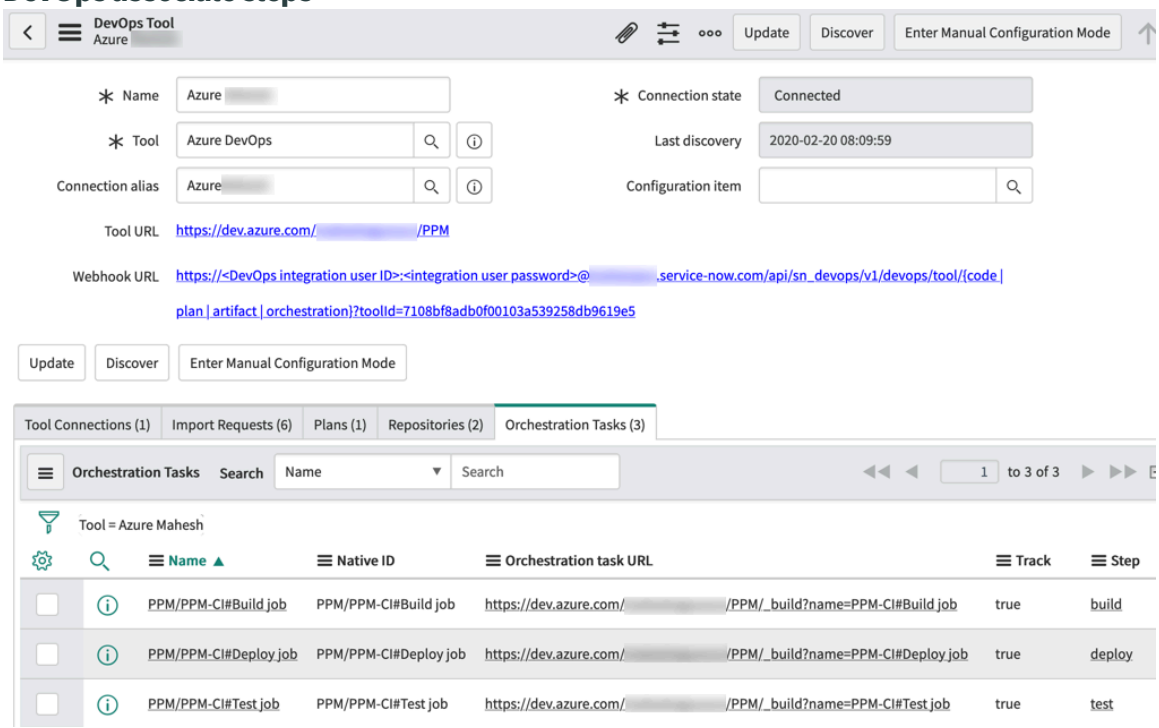
   Note:
   The **Track** field is set to **True** by default when you discover orchestration tasks and pipelines. Tracking is required to receive job notifications from Azure DevOps.

   Azure pipeline job run notifications are sent to the DevOps application. Each task execution notification corresponds to an orchestration task and, because orchestration tasks are mapped to a certain step in your DevOps pipeline, you can track the activity in each stage of your pipeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

DevOps associate steps



Configuring the Azure pipeline for DevOps

Change control, artifacts, and packages can be configured in the Azure pipeline for integration with DevOps.

You can configure change control in Azure pipelines two ways.

- Use the Azure Invoke REST API.
- Use the ServiceNow DevOps extension for Azure DevOps.

The **ServiceNow DevOps** extension for Azure DevOps includes:

- ServiceNow DevOps service connection
- ServiceNow DevOps Release Gate
- Azure build (CI) pipeline agent and server job custom tasks

Configuring change control using the Azure Invoke REST API

You can use the Azure Invoke REST API in your YAML or Classic Azure pipeline to configure change control for DevOps.

You must enable the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property to use Invoke REST API.

For Azure Invoke REST API details, visit the Microsoft documentation site and search for `Invoke HTTP REST API task- Azure Pipelines`.

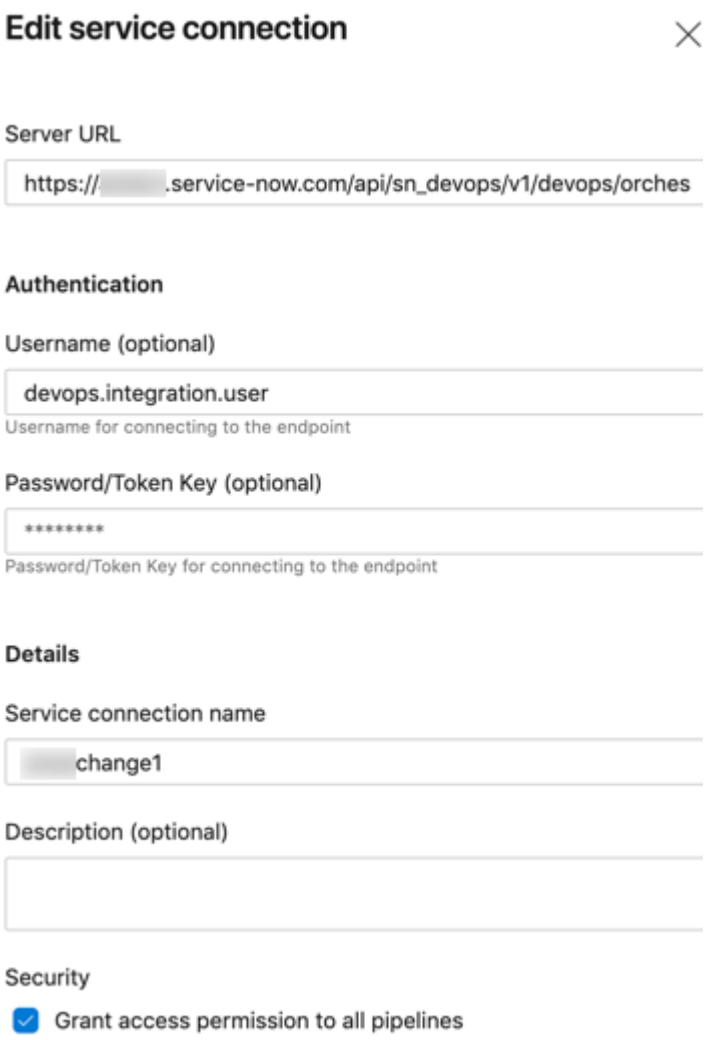
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

If you have duplicate or reused job names in your pipeline execution steps, ensure that the stageName attribute contains azurestageName/jobName in it's value, i.e. `stageName = azureStageName/jobName`. The artifact registration tasks send both stage and job names to associate the artifact version to the correct task execution.

Generic service connection

Using the Azure Invoke REST API requires the creation of a generic service connection in Azure DevOps.



YAML Azure pipeline

In Azure DevOps, a server task must be created with the service connection as the change control endpoint.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invoke REST API payload requirements

Azure pipeline type	Values
Build	• buildNumber • isMultiBranch • branchName
Release	• releaseNumber • projectName

Note:
For release pipelines, set the **Pre-deployment conditions** > **Advanced** > **Completion event** field to Callback.

Build pipeline:

```
- task: InvokeRESTAPI@1
      inputs:
        connectionType: 'connectedServiceName'
        serviceConnection: 'change1'
        method: 'POST'
        body: |
         {
            "buildNumber": "$(build.buildId)",
            "isMultiBranch": "true",
            "branchName": "$(build.sourceBranchName)"
         }
        waitForCompletion: 'true'
```

Release pipeline:

```
- task: InvokeRESTAPI@1
      inputs:
        connectionType: 'connectedServiceName'
        serviceConnection: 'change1'
        method: 'POST'
        body: |
         {
            "releaseNumber": "$(Release.ReleaseId)",
            "projectName": "$(System.TeamProject)"
         }
        waitForCompletion: 'true'
```

Classic Azure pipeline

For a Classic Azure pipeline, an Invoke REST API server task must be added.

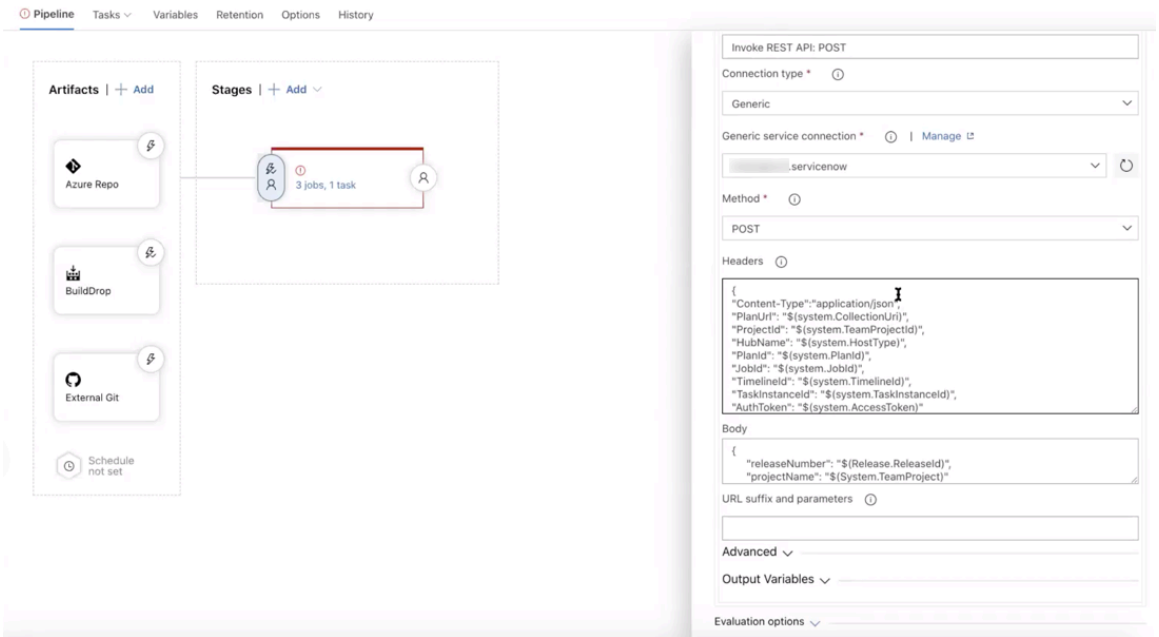
Classic Azure release pipeline example



Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions

Install and configure DevOps extension for Azure DevOps to send build and release notifications from your Azure pipeline to DevOps Change Velocity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_devops.admin

About this task
You can use **ServiceNow DevOps** extension on Visual Studio Marketplace - Extensions for Azure DevOps to integrate your Azure pipeline with the ServiceNow DevOps application. For more information about artifacts and packages in DevOps Change Velocity, see Artifacts and packages.

- **ServiceNow DevOps** service connection

  Required to connect the Azure pipeline to ServiceNow

- **ServiceNow DevOps Release Gate**

  Required to enable change control in Azure release (CD) pipelines (in pre-deployment conditions only).

Azure build (CI) pipeline custom tasks:

- Agentless (server) job
  - **ServiceNow DevOps Server Artifact Registration** custom task

    Required for agentless (server) jobs to register an artifact in the ServiceNow instance

  - **ServiceNow DevOps Server Package Registration** custom task

    Required for agentless (server) jobs to register a package in the ServiceNow instance

  - **ServiceNow DevOps Server Change Acceleration** custom task

    Required for agentless (server) jobs to automatically create a change request in ServiceNow Change Management as part of the Azure pipeline.

    Note:
    The **ServiceNow DevOps Server Change Acceleration** task does not require **ServiceNow DevOps Server Job Notification** tasks.

  - **ServiceNow DevOps Server Get Change** custom task

    Required to retrieve the change request number in a pipeline based on specific change details for a server job.

  - **ServiceNow DevOps Server Update Change** custom task

    Required to update the change request details associated with a pipeline for a server job.

- Agent job
  - **ServiceNow DevOps Agent Artifact Registration** custom task

    Required for agent jobs to register an artifact in the ServiceNow instance

  - **ServiceNow DevOps Agent Package Registration** custom task

    Required for agent jobs to register a package in the ServiceNow instance

  - **ServiceNow DevOps Agent Get Change** custom task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required to retrieve the change request number in a pipeline based on specific change details for an agent job.

- **ServiceNow DevOps Agent Update Change** custom task

  Required to update the change request details associated with a pipeline for an agent job.

> **Note:**
> The **ServiceNow DevOps Agent Artifact Registration** and **ServiceNow DevOps Agent Package Registration** tasks are not supported for Release pipelines.

- Software Quality scans (SonarQube/SonarCloud)
  - **ServiceNow DevOps Build Sonar Registration** custom task (for Build pipelines)
  - **ServiceNow DevOps Release Sonar Registration** custom task (for Release pipelines)

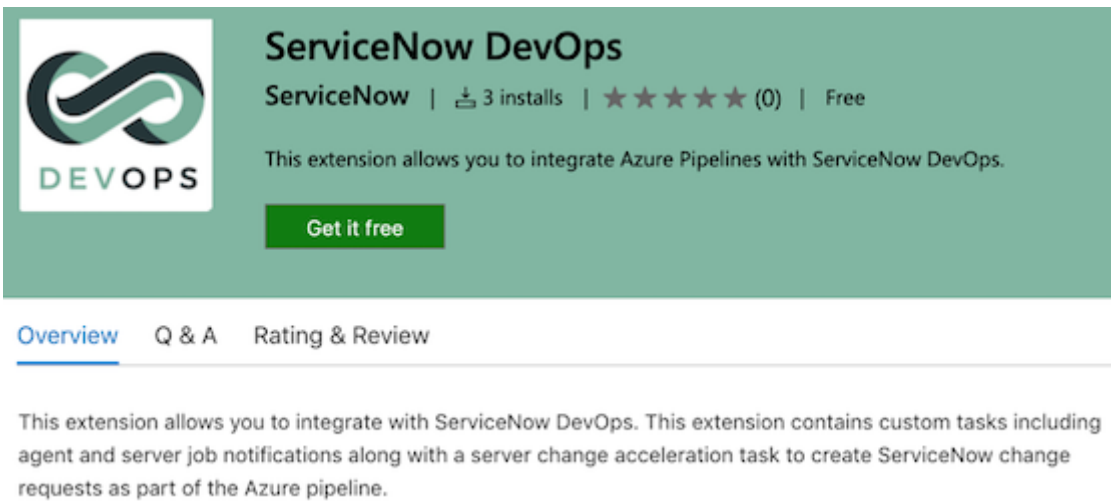
> **Note:**
> The **ServiceNow DevOps Build Sonar Registration** task is not supported for Release pipelines.

- Security scans:
  - **ServiceNow DevOps Build Security Results** custom task (for Build pipelines)
  - **ServiceNow DevOps Release Security Results** custom task (for Release pipelines)

> **Note:**
> The **ServiceNow DevOps Build Security Result** task is not supported for Release pipelines.

Procedure

1. Go to Visual Studio Marketplace, search for the **ServiceNow DevOps** extension, and click **Get it free**.



2. Select your Azure DevOps organization and select **Install**.
3. From your Azure DevOps project, navigate to **Project settings** > **Pipelines** > **Service connections**.
4. Select **New service connection** and from the list select **ServiceNow DevOps**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Next** and enter the following details:

Authentication method	Select whether authentication is done through the token-based or basic method.
ServiceNow instance	`https://<your-instance>.service-now.com/`
Tool ID	The sys_id of the orchestration tool. You can copy this value using the `Copy sys_id` command on the Orchestration Tool form. If you are using the workspace, select **More form options (⋮) > Copy sys_id** on the Azure DevOps tool connection form. If you are using Service Catalog or Classic, select **Additional actions (≡) > Copy sys_id** on the Azure DevOps tool connection form.
Username	Enter `devops.integration.user`. **Note:** The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property is disabled. If this step is not required, webhooks are configured using token-based authentication.
Password	Password for DevOps Integration User. **Note:** The step to enter the integration user name and password is required to configure only when DevOps Config is installed or the *`This property decides whether to create a Generic Connection on configure operation for Azure DevOps`* property is disabled. If this step is not required, webhooks are configured using token-based authentication.
API Token	API token for connection to the endpoint.
Service connection name	Enter `DevOps Connection`
Grant access permission to all pipelines	Select check box.

Set up an Azure build (CI) pipeline in DevOps

Use the ServiceNow DevOps extension for Azure DevOps to configure change control and artifacts and packages in your Azure build (CI) pipeline.

Before you begin

Role required: sn_devops.admin

Procedure

1. Navigate to **Pipelines** in your Azure DevOps instance.
2. Select the pipeline for which you want to enable change control.
3. Select **View**.
   The YAML editor for the pipeline is displayed along with the **Tasks** search pane on the right.
4. Search for the required custom action in the **Tasks** pane and select it.

Custom action	Steps
ServiceNow DevOps Server Change Acceleration	**a.** In the **Display name** field, enter **ServiceNow Change Acceleration**. **b.** In the **ServiceNow endpoint** field, enter `My Connection`. **c.** In the **Upstream job executed** field, enter the value that indicates the previous job in line. For example, the job before Server might be `Test`. **d.** In the **Change request details** field, set closure code and change request fields from within the pipeline. Select the information icon to view sample output. For more information regarding change acceleration, see change acceleration.
ServiceNow DevOps Agent Artifact Registry	**a.** In the **ServiceNow endpoint** field, enter `My Connection`. **b.** In the **Artifacts payload** field, enter the JSON containing list of artifacts. For more information regarding artifacts, see Artifacts and packages.
ServiceNow DevOps Agent Package Registry	**a.** In the **ServiceNow endpoint** field, enter `My Connection`. **b.** In the **Package name** field, enter the name of the package that contains artifacts. **c.** In the **Artifacts payload** field, enter the JSON containing build details and list of artifacts. For more information regarding artifacts, see Artifacts and packages.
ServiceNow DevOps Server Get Change	Get and update change request details in Azure DevOps pipeline
ServiceNow DevOps Server Update Change	Get and update change request details in Azure DevOps pipeline

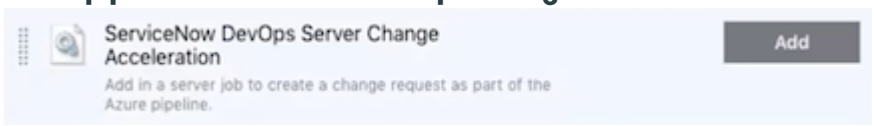
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

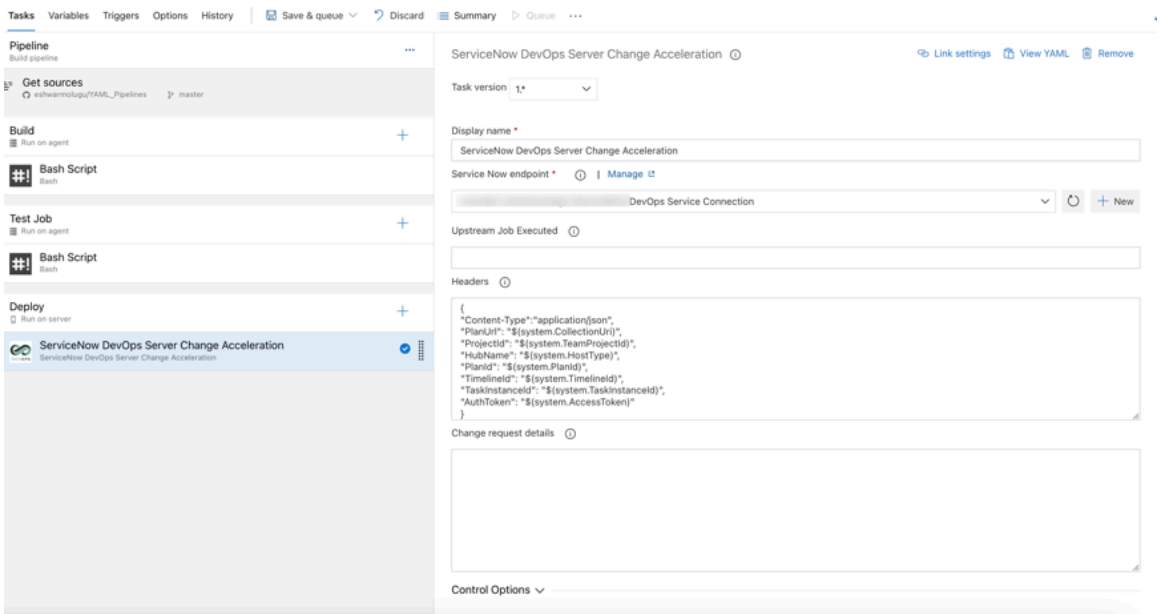
Custom action	Steps
ServiceNow DevOps Agent Get Change	Get and update change request details in Azure DevOps pipeline
ServiceNow DevOps Agent Update Change	Get and update change request details in Azure DevOps pipeline

5. Select **Add**, to add the custom task to the Tasks section of your Azure pipeline.

Example:

Azure pipeline: ServiceNow DevOps Change Acceleration custom task





© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
- stage: Prod
  #dependsOn: []
  jobs:
  - job: 'P1'
    steps:
    - task: Bash@3
      inputs:
        targetType: 'inline'
        script: |
          # Write your commands here
          echo 'Job j2 '

  - job: 'P2'
    dependsOn: ['P1']
    steps:
    - task: Bash@3
      inputs:

        script: |
          # Write your commands here
          echo 'Job j2 '
  - job: "P3"
    dependsOn: ['P2']
    pool: server
    steps:
    - task: ServiceNow-DevOps-Server-Change-Acceleration@1
      inputs:
        connectedServiceName: 'empsunildevops9-eshwarmolugu-ServiceNow DevOps Service Connection'
```

Change request details example

```
- stage: Deploy
  dependsOn: Build
  jobs:
    - job: 'now_change'
      pool: server
      steps:
        Settings
        - task: ServiceNow-DevOps-Server-Change-Acceleration@1
          inputs:
            connectedServiceName: '$(ServiceNowConnection)'
            changeRequestDetails: |
                {
                  "autoCloseChange" : true,
                  "attributes": {
                    "comments" : "This update for work notes is from ADO Job",
                    "work_notes" : "Update this to work_notes",
                    "category" : "Service",
                    "priority" : "2"
                  }
                }
```

Set up an Azure release (CD) pipeline in DevOps

Use the ServiceNow DevOps extension for Azure DevOps to configure change control, and artifacts and packages in your Azure release (CD) pipeline.

Before you begin

Role required: sn_devops.admin

About this task

Note:

Change control in Azure release (CD) pipelines is supported in pre-deployment gates only. Pre-deployment gate change requests are mapped to the step execution of the first job in that stage.

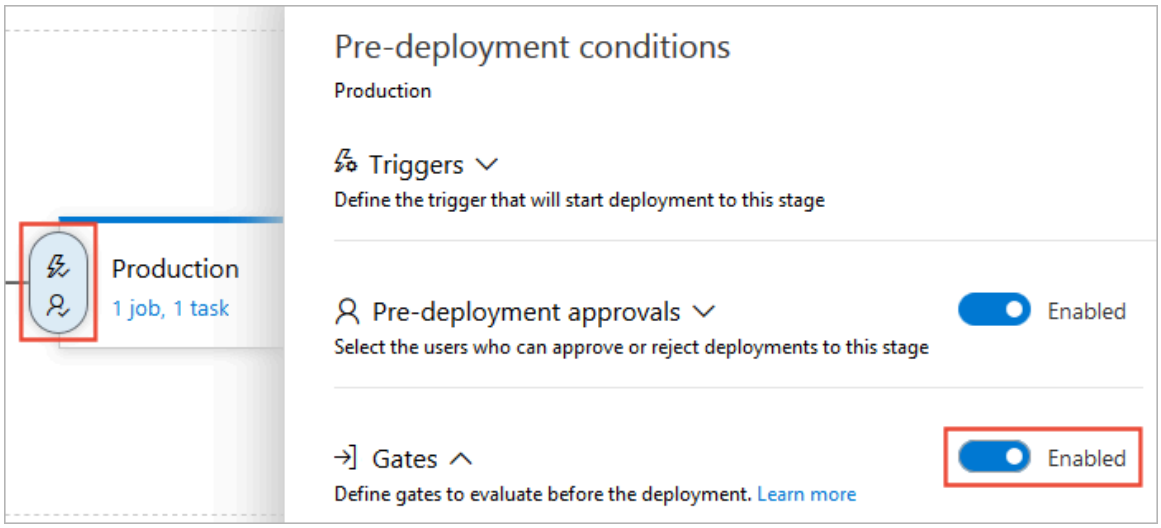
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phases in an Azure release pipeline are mapped to a step. The step name for a multi-config or multi-agent job must include the phase name only, and not the actual job name derived at pipeline execution run time.

Task executions for skipped jobs are marked as failed.

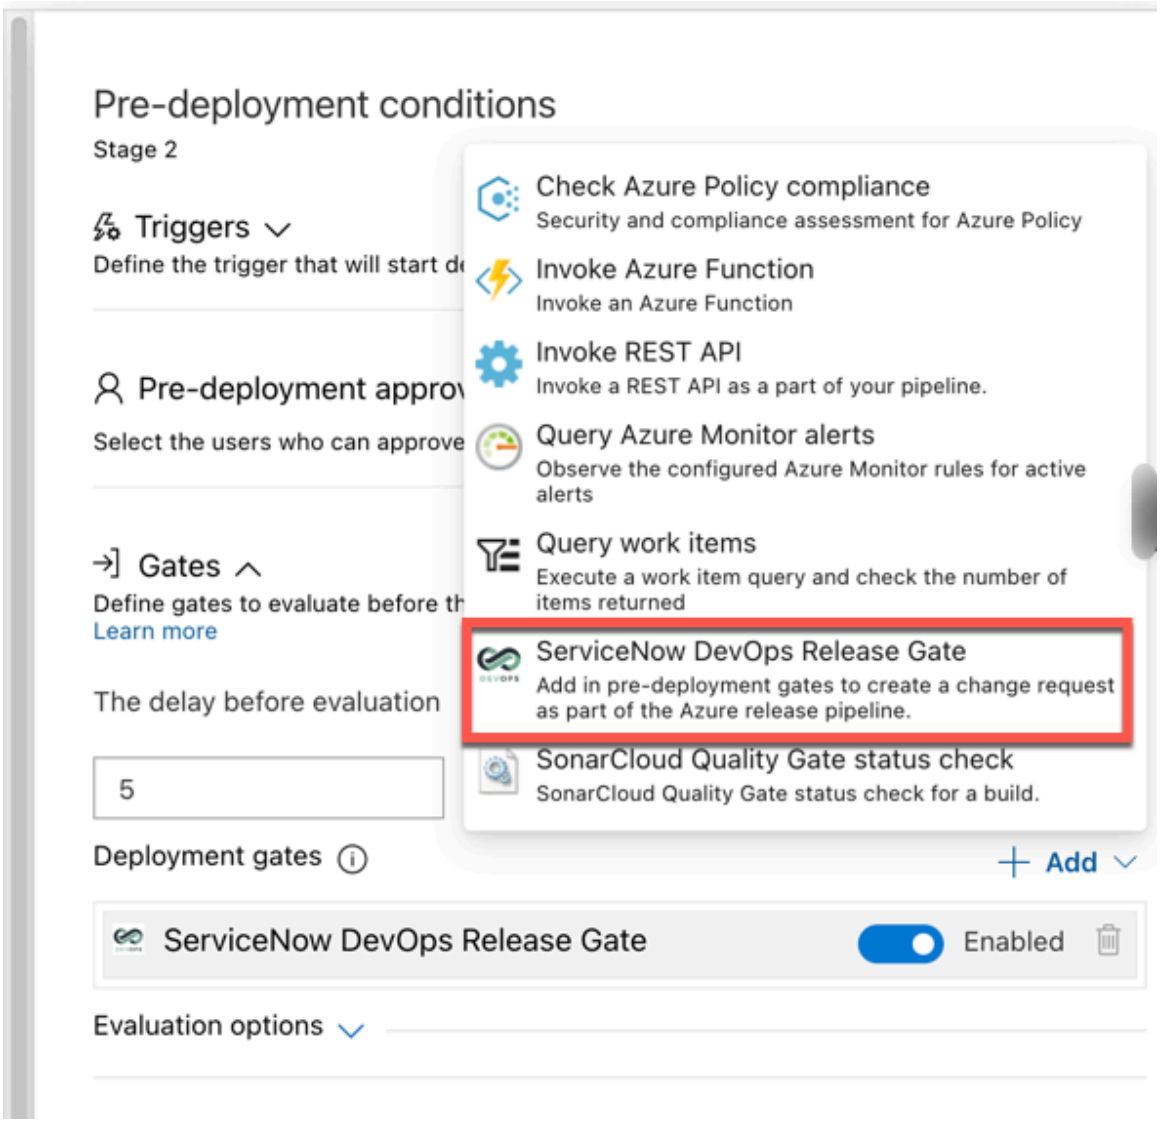
Procedure

1. In Azure DevOps Pipelines, select **Pipelines > Releases**, and then select your release pipeline.
2. Select **Edit** to open the pipeline editor.
3. Select the pre-deployment ( )icon for your stage, and then select the toggle button to enable **Gates**.

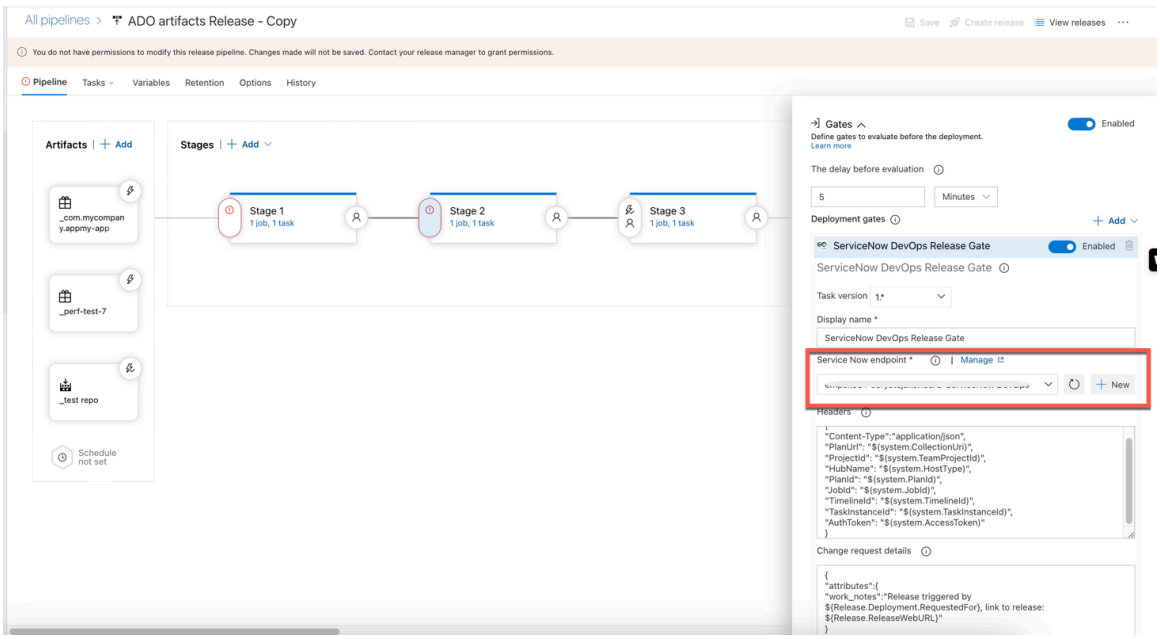


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **+Add**, and select **ServiceNow DevOps Release Gate**.



5. Select **ServiceNow DevOps Release Gate** and select the ServiceNow endpoint.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Exit the release gate configuration, and expand the Evaluation options section to configure the following timing fields.

The time between re-evaluation of gates	Re-evaluation interval in minutes, hours, or days. If the change request is canceled or rejected, the Azure pipeline release gate keeps re-evaluating the change request status at the configured interval until timeout. No user intervention is required for further attempts of re-evaluation after the change request has already been approved, rejected, or canceled.
The timeout after which gates fail	Timeout value in minutes, hours, or days. If the pre-deployment conditions fail, the subsequent jobs of the stage are marked as failed, and the start and end time defaults to the current system time.

Azure release pipeline pre-deployment gate configuration

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Configure artifacts in your Azure release (CD) pipeline.

   To set up artifacts using the build pipeline as the source, these names must match.

   - Repository name, and build pipeline name (for example, DeployableRepo).
   - Name property of the build pipeline artifact, and source alias property of the release pipeline artifact (for example, BuildDrop).

   In addition to the build pipeline, you can select artifacts from any other eight sources. To track commit & work item details, follow these rules.

   - When the source is the build pipeline, the `semantic version` property of the artifacts should be in the format `MAJOR . MINOR . PATCH` (for example 5.1.3).
   - When the source is not the build pipeline, define a `semantic version` by implementing the **DevOpsArtifactSemanticVersionAPI** extension interface.

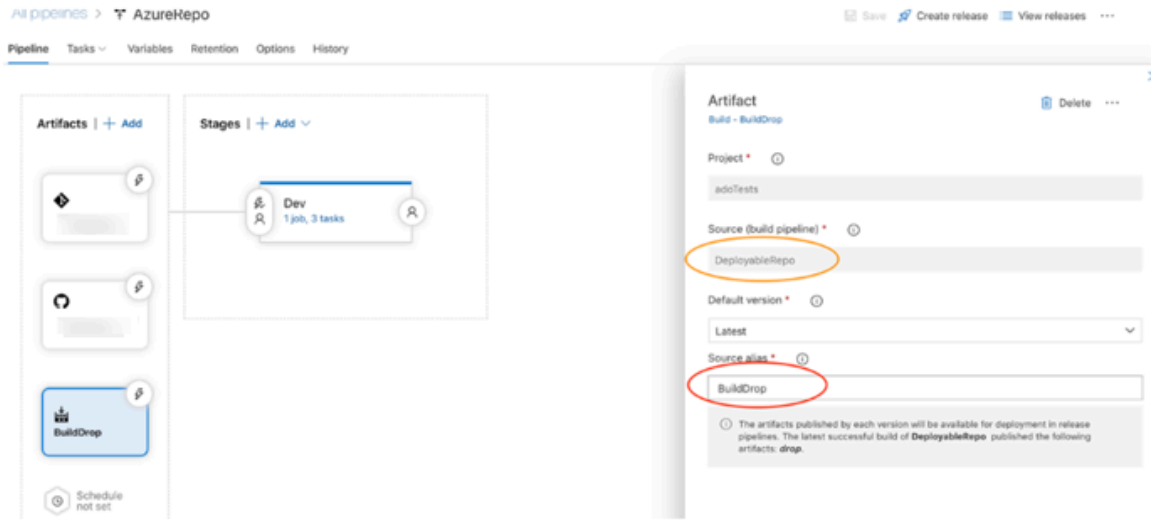
   See Artifacts and packages for more information regarding artifacts.

Example:

Artifact setup - build pipeline source

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Artifact setup - release pipeline



Azure DevOps PAT scopes for DevOps

Scope access levels are required when using a personal access token (PAT) to access Azure DevOps during setup.

Scope access level settings are based on the capability you have configured. Set the corresponding access level for seamless functionality. For information on creating a PAT, see Personal access token (PAT).

Important:
With the access level permissions specified in the following table in Azure DevOps, and the ServiceNow DevOps extension, you can connect to Azure DevOps from ServiceNow. Your Azure DevOps admin does not have to manually configure webhooks and service connections in Azure DevOps.

Important:

- When onboarding a Project, the **Project Administrators** privilege requires the owner of the PAT to be a member of the project's **Project Administrators** group.
- When onboarding an Organization, the **Project Administrators** privilege requires the owner of the PAT to be a member of the organization's **Project Collection Administrators** group.

Scope access level settings per capability and their impact

Capability	Scope	Access level	Impact
Boards	Work item	Read	Required to discover the boards and receive the work items either through import/polling or real time with a configured webhook.
Repos	Code	Read	Required to discover repositories and receive branches, commits, and tags either through import/polling or real time with a configured webhook.
Build pipelines	Build	Read & Execute	• Read: Required to discover the build pipelines and receive pipeline execution details like stages, artifacts, test results, code security results, etc., either

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scope access level settings per capability and their impact (continued)

Capability	Scope	Access level	Impact
			through import/polling or real time with a configured webhook. • Execute: Required to pause/resume the pipelines based on the change control step.
Release pipelines and gates	Release	Read, write and execute	• Read: Required to discover the release pipelines and receive pipeline execution details like stages, artifacts, test results, code security results, etc, either through import/polling or real time with a configured webhook. • Write and Execute: Required to pause/resume the pipelines based on change control step.
Test build and release pipelines	Test management	Read	Required to receive test results for pipeline execution.
Service Connections	Service connection	Read, query, and manage	Required to create Service connection automatically which is used to configure ServiceNow tasks like change acceleration, artifact and package registration, etc.
Packaging	Packaging	Read	Required to discover the artifact repositories and receive the feeds and packages either through import/polling or real-time with a configured webhook.

Note:
You must have the Update build information permission on your pipeline for all pipeline features to work seamlessly. Contact your ADO Project Administrator if you don't have this permission.

Limitation of Azure DevOps

If you create an Azure tool with custom defined access level, and you reconfigure such a tool because of change in your Integration user credentials, then the existing service hooks for release created and release deployment are not updated. Instead, two new service hooks are created with new configuration details. To avoid the duplication of these service hooks, you must create the tool with full access level.

Configure SonarQube scans on Azure DevOps pipelines

Configure SonarQube or SonarCloud scans on MS Azure DevOps pipelines. Check Azure DevOps pipeline executions for SonarQube scans on every stage of the pipeline's execution and fetch lists and details of scans from any stage to DevOps Change Velocity. Drill down on the Scan Details based on categories.

Before you begin
Ensure that you meet the following prerequisites before you configure SonarQube scans on your Azure DevOps pipeline:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- You are using a compatible SonarQube version. See DevOps Change Velocity integrations for supported tool versions.
- Connect, configure the Azure DevOps tool and discover existing repositories, orchestration tasks, and pipelines.
- Create a SonarQube tool record. For more information, see SonarQube integration with DevOps Change Velocity.
- Install the SonarQube extension from the Visual Studio Marketplace and configure branch analysis to use the Azure Devops tasks in your build definitions to analyze your projects. For more information, see SonarQube documentation.
- Install the following custom extension tasks on your Azure DevOps instance.
  - ServiceNow extension to integrate Azure Pipelines with DevOps Change Velocity. For more information, see Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.
  - ServiceNow DevOps Build Sonar Registration (for Build pipelines)
  - ServiceNow DevOps Release Sonar Registration task (for Release pipelines)

Role required:

- admin or sn_devops.admin in DevOps Change Velocity
- admin in Azure DevOps
- admin role in SonarQube with access to all projects that the SonarQube scans are configured on.

About this task

By default, Azure DevOps provides you with the following tasks to run a SonarQube scan on build and release pipelines:

- Prepare analysis on SonarCloud
- Run Code analysis
- Publish Quality Gate Result

Add and configure custom ServiceNow extension tasks in order to them default tasks, to fetch the scan details to ServiceNow DevOps from Azure DevOps build and release pipelines. The scan details that are fetched are:

- pipelineName
- buildNumber
- stageName
- branchName
- sonarProjectKey
- sonarInstanceUrl

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Set up and configure the Azure DevOps and SonarQube Integration to fetch scan analysis from Build pipelines.

   a. In the Azure DevOps console, navigate to **Organization** > **SonarIntegrations** > **Pipelines** > **Jobs**.

   b. Click the **Add Tasks** icon ( ), and search for the ServiceNow extensions in the **Add tasks** search bar.

   c. Add the following tasks.

   - ServiceNow DevOps Build Sonar Registration task.
   - ServiceNow DevOps Release Sonar Registration task.

   d. On the form, fill in the fields.

   ServiceNow DevOps Build/ Release Sonar Registration

Field	Description
Display name	Auto-populates on entering key and URL.
ServiceNow endpoint	The ServiceNow instance endpoint that is automatically created during Tool configuration. Use the same service connection for this task.
Sonar project Key	Enter the same project key value which you used while configuring the **Prepare analysis on SonarCloud** task.
Sonar Instance Url	Enter the same URL which you used to connect to the Sonar tool during tool creation.
Job Name	The name of the Azure DevOps pipeline job. This field appears only for the **ServiceNow DevOps Release Sonar Registration** task.

   Important:
   In the list of tasks for the pipeline job, ensure that the **ServiceNow DevOps Build Sonar Registration** or **ServiceNow DevOps Release Sonar Registration** task is added after the **Run Code Analysis** task.

   You have configured the build pipelines to send sonar scan results to your DevOps application. Scan results are mapped to the Software Quality capability are processed by an associated base system sub flow (*FetchSonarScanId*), once an event is created and processed in the Inbound Events table.

2. Associate Azure pipelines steps in DevOps.
3. Run the pipeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Based on the scan results on various stages of pipeline's execution, the results are shown in the corresponding step of the pipeline in ServiceNow DevOps. Inbound events are created for notifications and subflows are triggered based on the notification type and capability.

What to do next

- View scan details as part of Task Executions. View details of all the Sonar scans that are part of the task execution mapped to a build or release pipeline execution step.

  1. Navigate to **DevOps** > **Orchestrate** > **Task Execution** click a relevant Task Execution record.
  2. Click the Software Quality Summary related list.
  3. Click a relevant Scan ID record.
     The Software Quality Scan Summary and Scan Details are displayed.

- View scan details as part of Change Request. View all the scans that were part of this build/release pipeline in the **Software Quality Results** > **Software Quality Summary** related list.

  1. Navigate to **DevOps** > **Orchestrate** > **Pipeline Change Requests**
  2. Click the Software Quality Summary related list.
  3. Click a relevant Scan ID record.
     The Software Quality Scan Summary and Scan Details are displayed.

Restarting failed build or release pipeline jobs and stages

Rerun or redeploy Azure DevOps build, release changes, or pipelines that are failed or canceled in that stage or pipeline. The reattempts display on the DevOps pipeline UI as continuous runs instead of creating new executions.

Rerun Azure DevOps pipelines or stages

You can rerun a failed or canceled build or release pipelines or change jobs in Azure DevOps. The reruns are processed as part of the same pipeline execution as the first run in ServiceNow DevOps. You can rerun entire pipelines or specific failed or canceled jobs and stages. You can now choose to reuse a change request instead of creating a new change request each time you restart a stage or a pipeline.

An *attemptNumber* parameter is added to the payload which helps us track reruns. Associated test summary, software quality scan results, commits, work items corresponding to every rerun attempt is also updated in ServiceNow DevOps.

If you are using the Configuring change control using the Azure Invoke REST API you must add the attempt number parameter to your payload body in the specified syntax format for build and release pipelines. If you do not specify the attempt number parameter, the default attempt number is set to 1.

Example attempt number parameter in build pipeline payload:

```
"attemptNumber": "$(system.jobAttempt)"
```

Example attempt number parameter in the release pipeline payload:

```
"attemptNumber": "$(Release.AttemptNumber)"
```

Note:
Do not use the existing started and completed notifications for the stage jobs. If your jobs consider the started and completed notifications the rerun functionality does not work.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reusing Change Requests

If a change enabled job is rerun, and a change request exists for the previous run/attempt, you can choose to reuse the previous change request or create a new change request, using the base system 'DevOps Change Request Reusability Decision Subflow'. The default implementation of this subflow, allows you to reuse a change request from the previous attempt if the change request is in implement, or post-implement states. If the Change request is in any other state, by default, a new change request is created when you rerun the job. Per existing behavior, all associated details such as test summaries, and scans, are newly generated while commits and work items are retained unchanged for new change requests.

For example, when a pipeline fails at a specific stage after the change request is approved, and you rerun that stage. The change request is reused, the associated test summary and software quality scans, and the commits and work items associated to the artifact are associated with the same change request which you approved.

To apply a custom logic for reusability, you can copy the existing subflow, make the changes, publish it, and update the new subflow name under **DevOps Properties** > **DevOps Change Request Reusability Decision Subflow**.

In the regular base system flow when a change is created, ' Customizing DevOps flows' is used to update the#*State*#field of step execution record after a decision is taken on the change request. However, when you reuse a change, the first trigger condition of a change request being created is not met. A base system subflow 'DevOps Change Request Reusability Model Subflow' is triggered instead, whenever a change request is reused when a job is a rerun. The default implementation of this subflow is similar to the DevOps Model Change Request flow. You can create a custom subflow and update the subflow name at **DevOps Properties** > **DevOps Change Request Reusability Model Subflow**.

Pipeline UI changes

ServiceNow DevOps synchronizes all the changes that are caused when you restart or rerun a stage or a job, and displays them in the DevOps pipeline UI.

- Click a card to view the latest attempt of that stage.
- Click the **View all attempts** link to see all the step executions and related information associated to the step or stage that is run more than once.
- The View change link displays the change request associated with the latest attempt.

In previous releases, failed jobs were either ignored or a new pipeline execution job was created for reruns and processed accordingly. For more information, see DevOps Pipeline UI.

Execution sequence and waiting logic for rerun jobs

Processing sequence and waiting logic for rerun jobs are different when you reuse or create a change request as part of a rerun job.

Existing Considerations

- A change request should not exist in a stage which contains parallel jobs.
- If more than one stage is running in parallel, change request should not be the first job in both the stages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Parallel stages in release pipelines are processed and displayed in the pipeline UI as they occur in the Azure DevOps pipeline. Parallel stages in build pipelines are still processed in parallel but appear in a serial order in the pipeline UI.

Upgrade Considerations

There is no change in the functionality or execution when you run the first pipeline attempt. All stages are processed sequentially and associated tests, software quality scans and change requests are executed and created as modeled.

Note:

- Run a new pipeline after you upgrade if you have rerun stages and pipelines before upgrading. Rerun attempts and failed events prior to the upgrade are ignored by ServiceNow DevOps for reattempts.
- If you have only run the pipeline once before upgrade, you can rerun the stage or the pipeline. The rerun functionality applies as designed and is saved in ServiceNow DevOps.

Execution Sequence and processing logic

- If the same artifact version registration call is received in reattempt, the registration call is ignored.
- Package registration calls with same package name are not ignored. A new package associated to artifact versions and pipeline execution is created during reattempt. The artifacts that are associated to the latest package, will be shown on the change request.

From the Azure DevOps GUI, if you rerun a stage in a build pipeline the subsequent stages reruns are also triggered in it's specified sequence. If you reattempt processing a pipeline before all the stages of the previous attempt are not complete. The subsequent attempt waits until all the events in the previous attempt are processed.

For release pipelines, the stages are run in the specified sequence only during the first run. For subsequent rerun attempts manually run each stage. In release pipelines even if stages are running in parallel in Azure DevOps, from the second attempt onwards the events are processed in the specified sequence.

- When a new change request is created for a reattempt stage job, and the stage that you are reattempting includes a test and a software quality scan only the latest Test Summary and Software Quality scan results display on the change request related list.
- When a change request is reused for a rerun stage job, the Test Summary and Software Quality scan results for each attempt displays in the change request related list.

Parallel stages in Azure DevOps release pipelines

Parallel stages in a release pipeline are now processed concurrently and displayed in the DevOps pipeline UI in real time. Base system pre-deployment conditions and release gates enable you to create change requests that include details from parallel stages.

Base system parallel stage support for Azure DevOps

Organizations use parallel stages to automate and speed up release processes for tasks that can be performed in parallel. For example, a release pipeline has integrated multiple test and software quality tools and has jobs configured to run in parallel. Not running each job sequentially significantly speeds up the release pipeline execution.

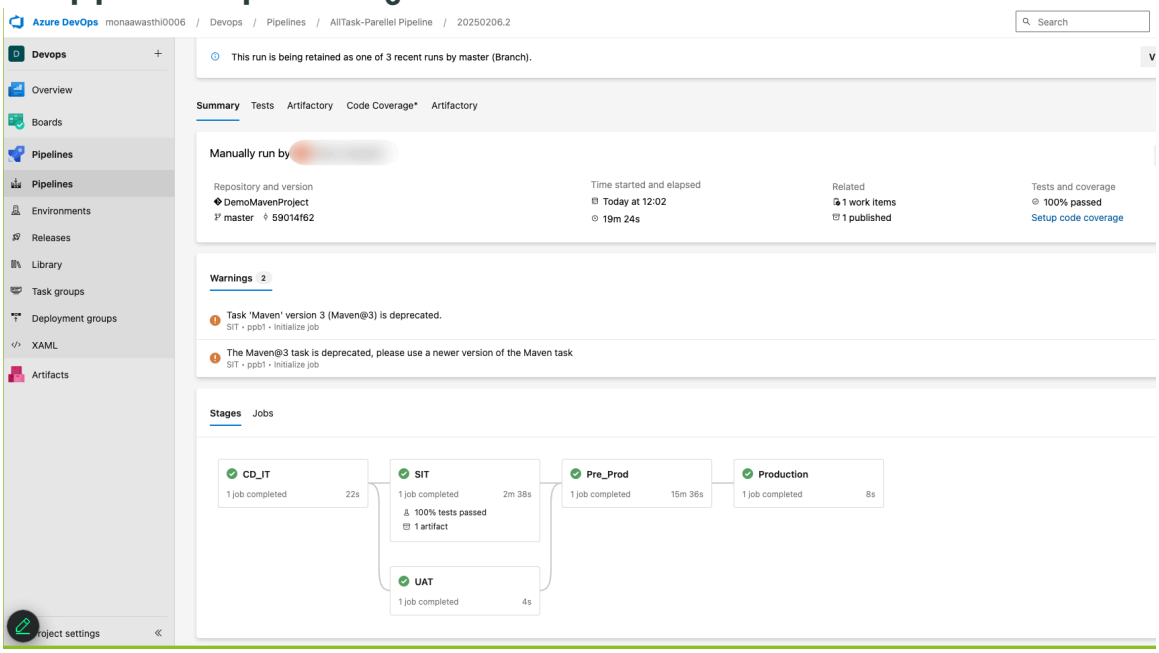
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow DevOps supports processing parallel stages in release pipelines and displays the stages in a parallel view in the DevOps pipeline UI. Effectively, the DevOps pipeline UI replicates the Azure DevOps GUI in real time.

You can also see the details of the processed stages in the pipeline UI.

Important:
Support for parallel stages is restricted to Release pipelines. Build pipelines continue to appear in a sequential or serial manner in the DevOps pipeline UI, even if parallel stages are configured for build pipelines in Azure DevOps.

ADO pipeline with parallel stages



Sample ADO pipeline with parallel stages

```
pipeline {
    agent any

    stages {
        stage('Build') {
            steps {
                echo 'Building...'
                // Your build steps here
            }
        }

        stage('Test') {
            parallel {
                stage('Unit Tests') {
                    steps {
                        echo 'Running unit tests...'
                        // Your unit test steps here
                    }
                }
                stage('Integration Tests') {
                    steps {
                        echo 'Running integration tests...'
                        // Your integration test steps here
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                    }
                }
                stage('Additional Tests') {
                    steps {
                        script {
                            parallel(
                                'Nested Stage 1': {
                                    echo 'Running nested
 parallel stage 1...'
                                    // Your nested parallel
 stage 1 steps here
                                },
                                'Nested Stage 2': {
                                    echo 'Running nested
 parallel stage 2...'
                                    // Your nested parallel
 stage 2 steps here
                                }
                            )
                        }
                    }
                }
            }
        }

        stage('Deploy') {
            steps {
                echo 'Deploying...'
                snDevOpsChange changeRequestDetails:
 '{ "attributes": {"chg_model":
 "e55d0bfec343101035ae3f52c1d3ae49","standard_change_template="
563504cc47410200e90d87e8dee490e2"},"autoCloseChange":
 false}',changeStepTimeOut: 18000, pollingInterval: 60
                // Your deploy steps here
            }
        }
    }
}
```

ServiceNow® DevOps release gate in pre-deployment conditions to create Change requests

A base-system ServiceNow DevOps Release Gate is added along with pre-deployment conditions. Enable base system deployment gates that are configured to call the ServiceNow AI Platform instance, to create a change request before the deploy to production stage. Change requests are now created after all previous (upstream) stages complete processing. The change request captures relevant details from all upstream stages and displays them in the following corresponding related lists.

- Commits
- Work Items
- Test Summaries
- Software Quality Summary
- Artifact Versions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the pipeline execution completes processing the parallel stages preceding the production deployment stage, a change request is automatically created and mapped to the deploy to production stage in the Pipeline Executions view. The production stage completes processing once the change request is approved.

From the **Pipeline Execution** view of the relevant pipeline, click the **Pipeline UI** related link to view the real-time state of the pipeline as it appears in Azure DevOps. The associated artifact details which are sourced from the build pipeline, Test Results, Software Quality Summary Results display on the pipeline UI.

Change creation sequence for parallel jobs

Job information from Azure is received in ServiceNow during the following times:

1. Upon the completion of a stage.
2. When the register-change step executes.

Azure provides job information sequentially based on job queue time, despite jobs potentially running in parallel. Consequently, if the register-change step executes while a parallel job queued earlier remains unfinished, the system assumes the parallel job is an upstream task, causing the change creation process to wait for its completion. However, stage completion notifications are not received until all jobs, including the register-change job, have finished.

This creates a deadlock scenario where the change process in ServiceNow waits for the parallel job to complete, while the parallel job waits for the stage completion notification, which in turn waits for the register-change job to finish.

Due to this deadlock, by the time the change is created, the Azure pipeline job has already failed, leading to the 500 error in the event API. Rerunning the job resolves the issue as the previously queued parallel jobs are marked as completed.

Upgrade Considerations

Ensure that you review the following considerations before upgrading.

Important:
A change request should not exist in a stage which contains parallel jobs.

- The **Upstream execution** column in the Task Executions table is not displayed for fresh installations. Any customizations that you have made using the **Upstream execution** column prior to the upgrade are unaffected.
- If stages are running in parallel, a change request should not be the first job in any stage.
- After upgrading, new release pipeline executions process parallel stages concurrently and display parallel stages and associated details in the pipeline UI. Azure DevOps release pipelines that are already executed and stored in ServiceNow DevOps prior to the upgrade remain unaffected and continue to display parallel stages (that are already executed and persisted) in ServiceNow DevOps serially.
- If the pre-deployment ServiceNow DevOps release gate is enabled in more than one start stage in a release pipeline with multiple start stages, it might result in multiple pipeline executions.

Note:
A package is created for each start stage but any one package is associated per pipeline execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps work item import for Azure Boards

Azure Boards work items are mapped to default ServiceNow DevOps states and types during import. You can use the DevOpsAzureDevOpsWorkItemHelper script include to customize the mappings.

Default Azure Boards work item mapping

Native State and **Native Type** fields of the work item contain the original state and type values from the source tool.

Work item type mapping

ServiceNow DevOps	Azure Boards Basic	Azure Boards Agile	Azure Boards Scrum
Task	Task	Task Test case	Task Impediment Test case
Bug	Issue	Bug Issue	Bug
Story	--	User story	Product backlog item
Epic	Epic	Epic	Epic
Feature	--	Feature	Feature

Note:
Historical import of Azure DevOps work items is not supported for Agile Boards CMMI process.

Work item state mapping

ServiceNow DevOps	Azure Boards Basic	Azure Boards Agile	Azure Boards Scrum
Planned	To Do	New	New Open Approved Committed To do
WIP	Doing	Active Design	In Progress Design
Complete	Done	Ready Closed	Done Ready

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Work item state mapping (continued)

ServiceNow DevOps	Azure Boards Basic	Azure Boards Agile	Azure Boards Scrum
			Closed
Deleted	Deleted	Completed Deleted	Removed

Note:
When an imported Azure Boards work item type or state is not recognized, the value is set to **Other**.

Customize Azure Boards state and type mappings

Access the DevOpsAzureDevOpsWorkItemHelper script include in the **System Definition** > **Script Includes** module.

This script example adds new states and types for custom processes MyScrum and CustomBasic. CustomBasic inherits the state and type defined for Basic process.

```
var DevOpsAzureDevOpsWorkItemHelper = Class.create();

DevOpsAzureDevOpsWorkItemHelper.prototype =
 Object.extendsObject(DevOpsAzureDevOpsWorkItemHelperSNC, {

 setDefaultProcess: function (projectProcess){

 DevOpsAzureDevOpsWorkItemHelperSNC.prototype.setDefaultProcess.
call(this, projectProcess);

  //set custom states and types
  var newStates, newWITypes;
  if (projectProcess == 'NPScrum'){
   // no parent process set. So type and states avaibale will be
 linited to newStates
   // and newWITypes
   newStates = {
    'Delayed': 'planned',
    'Approved': 'wip'
   };
   newWITypes= {
    'Request': 'story',
    'Incident': 'task'
   };

  } else  if (projectProcess == 'CustomBasic'){
   //set parent process to Basic to inherit basic states and
 types
   this.setParentProcess('Basic');
   newStates = {
    'Auto-Approved': 'wip'
   };
   newWITypes= {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    'UserStory': 'story'
   };
  }

  this.setStates(newStates);
        this.setWorkItemTypes(newWITypes);
 },

 type: 'DevOpsAzureDevOpsWorkItemHelper'
});
```

Track specific pipelines in Azure DevOps

Enable and configure specific pipelines in Azure DevOps that you want to track. Select the pipelines you want to monitor and receive job notifications from Azure DevOps.

Before you begin

- Connect DevOps to Azure DevOps tools.
- Ensure that you have modeled, configured, and associated Azure pipelines to DevOps.
- Review how to configure form layouts. For more information, see Configuring the form layout

Role required: admin, personalize_form

About this task

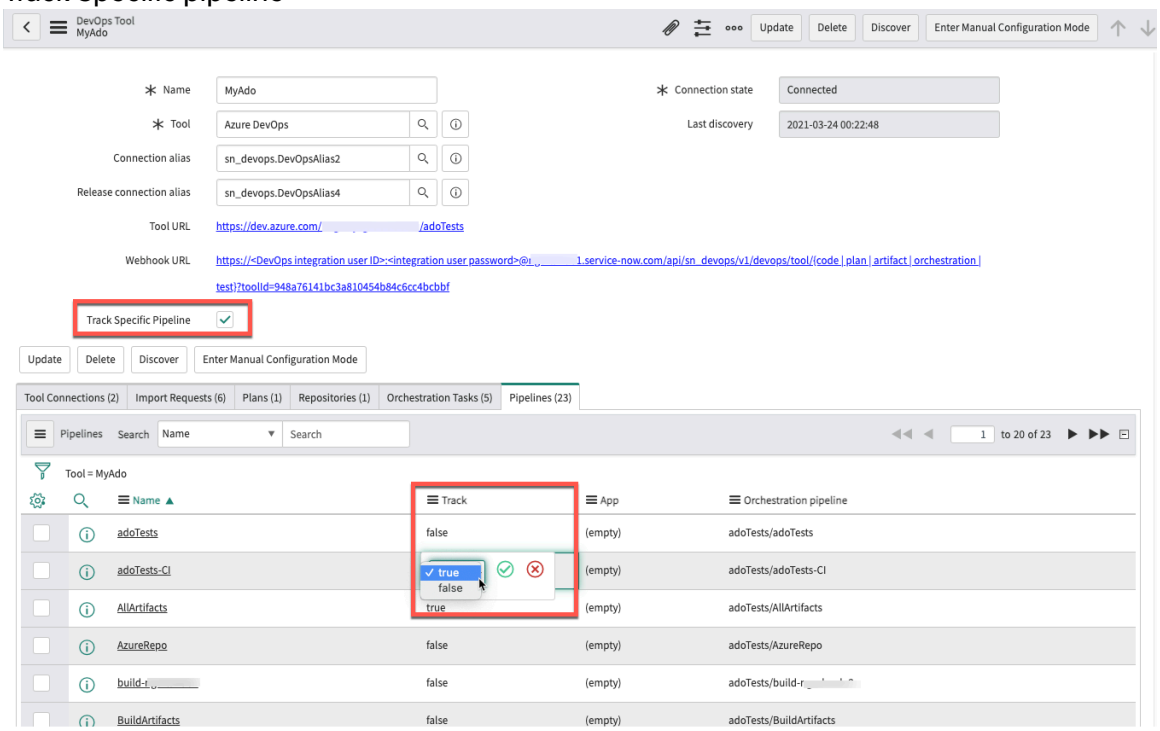
By default, the **Track Specific Pipeline** field is set to **False** when you discover Azure DevOps orchestration tasks and pipelines. The **Track** flag for all Azure DevOps pipelines is also disabled. So, by default, this leads to all pipelines sending job notifications to DevOps and increased processing times, which could cause the pipeline you really want to track to be delayed. So, enable the **Track Specific Pipeline** check box to process only notifications for the pipeline events that you specify to track, and ignore all other pipeline notifications.

Procedure

1. Navigate to **All** > **DevOps** > **Tools** > **Orchestration Tools**, and open the Azure DevOps tool record.
2. Click the **Additional Actions** icon (), and select **Configure** > **Form Layout**.
3. Move the **Track Specific Pipeline** field to the selected list.
4. Click **Save**.
   You are redirected back to the Azure DevOps form in the DevOps tool, and the **Track Specific Pipeline** check box appears.
5. Select the **Track Specific Pipeline** check box.
6. Navigate to the Pipelines related list.
7. Click the **Update Personalized List** icon ().
8. In the Personalize List Columns form, move the **Track** field to the Selected list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Track Specific pipeline



9. Click **OK**.
   You are redirected back to the Pipelines related list, where the **Track** field now appears.
10. Navigate to the pipeline step which you want to track, double-click the **Track** field.
11. Change the **Track** field's value to **true**, and click **Save**.

Result

Only the pipelines that have **Track** field set to **true** in the Pipelines related list are now being tracked and sent to the Inbound Events table [sn_devops_inbound_event_list.do]. All pipelines that have the **Track** field set to **false** are ignored.

Note:

- If the **Track Specific Pipeline** check box is selected only those pipelines that have the **Track** field value set to **true** are tracked and sent to the Inbound Events table. If **Track** field is set to **false** for all pipelines none of the pipelines are tracked.
- If the **Track Specific Pipeline** check box is unselected, all events of the pipeline are tracked and sent to the Inbound Events table.

Managing Azure DevOps artifacts

DevOps Change Velocity makes it easy to manage artifacts published through Azure DevOps build pipelines. You can import and track these artifacts and manage the packages in DevOps Change Velocity.

Types of artifact sources supported by DevOps Change Velocity:

- Build
- Azure Artifacts

Build Artifacts

Build and pipeline artifacts published using the Publish Build Artifacts (PublishBuildArtifacts) and Publish Pipeline Artifacts (PublishPipelineArtifacts) tasks respectively on the Azure DevOps are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

automatically created in your DevOps Change Velocity instance. You can also import historical data for build artifacts.

Build artifacts created using the Publish Build Artifacts task will be part of the artifact repository whose name will be defaulted to the build pipeline name.

Note:
If two artifacts with the same name, belonging to the same repository, and having different versions are used as release triggers for a release pipeline, then the related lists (like work items, commits, test summaries, and so on) will include DevOps data related to both the artifact versions when a change exists in the release pipeline. For example, if artifact-1.0 and artifact-2.0 are release triggers to manage rollback scenarios in deployment, then change (if part of the release pipeline) will include related lists data for both the versions.

You can also continue to leverage the existing Extension-based artifact registration and import. For more information, see Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions and Artifacts and packages.

Important:
Using Extension-based artifact registration isn't required if the PublishBuildArtifacts and PublishPipelineArtifacts tasks mentioned above are used.

Azure Artifacts

You can import and track the artifacts to your DevOps Change Velocity instance. You can import Azure DevOps artifacts that are published to the Azure Artifacts using the Universal Package task only.

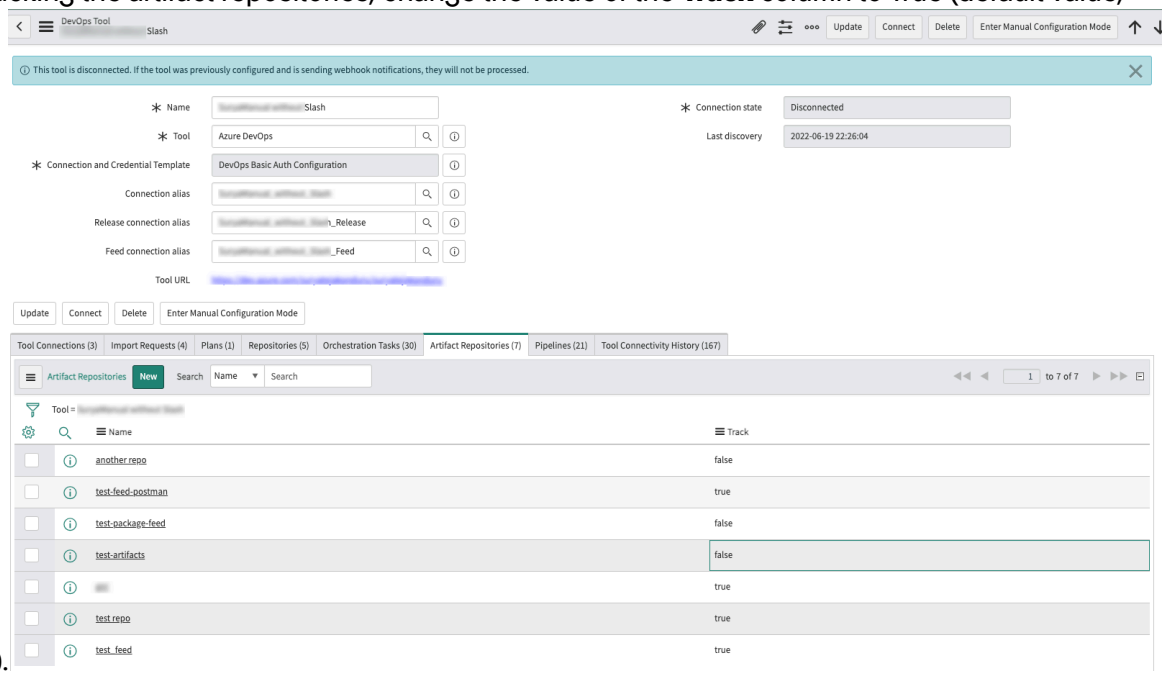
Note:
Only **Universal** packages are currently supported for importing and tracking.

(DevOps 1.35 and later versions) The **Feed connection alias** field is available on the Azure DevOps Tools form. This field is auto-populated with an alias for the feed connection. For more information about connecting a DevOps tool, see Integrating DevOps Change Velocity with third party tools.

After upgrade, to select and add the artifact repositories using App Onboarding, you must select **Discover** to discover existing artifact repositories. The records are added to the Artifact Repositories related list. For more information about the adding artifact repositories, see Associate tool objects to applications - Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For tracking the artifact repositories, change the value of the **Track** column to True (default value, False).



When an Azure Artifact is published via the Universal Package Task, the artifact information is associated with a build pipeline within 24 hours using the *`ADO Artifacts Daily`* scheduled job.

Note:

- As Azure DevOps Artifact creation is not dependent on Build Pipeline completion. If Azure DevOps Artifact is used as Trigger for a Release Pipeline, it would be triggered even if Build pipeline is pending completion due to a change request.
- The scheduled job is executed every 24 hours by default and can also be executed on-demand. However, as the scheduled job is performance intensive, it shouldn't be executed frequently.

The following points must be considered while importing Azure DevOps artifacts:

1. Artifacts can't be published from the Release Pipelines due to Azure DevOps limitations.
2. Artifact Repositories are tracked as follows:
   - Historical Import of Azure DevOps artifacts is accomplished using the App Onboarding. For more information, see Associate tool objects to applications - Workspace.
   - For real-time tracking of the artifacts, the value for the **Track** column must be changed to True (default value, False). Otherwise, the Feed or Artifact Repository won't be tracked.
3. The application supports the project-specific feeds but not the Organization specific feeds. Azure DevOps artifacts when published through Azure DevOps pipeline are only supported.
4. Azure DevOps artifacts not linked to any build or release pipeline (orphan artifacts) aren't supported.
5. Azure DevOps Artifacts are stored in the following format:
   - Azure DevOps artifact linked to only Build Pipeline (or) Build and Release Pipeline:

     `<artifact-name>-<1.build-number.0> (Build Number of Build Pipeline)`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Azure DevOps artifact linked only to Release Pipeline:

  <artifact-name>-<1.build-number.0> (Build Number of Release Pipeline)

Azure DevOps Artifact mapping with DevOps Change Velocity

The following table explains the mapping of Azure DevOps artifacts with ServiceNow DevOps fields:

Azure DevOps Artifact	DevOps Change Velocity
Feeds	Artifact Repositories
Packages	Artifacts
Provenance/build number	Versions

Limitations

- Azure DevOps Artifact Project with 4000 Feeds (or less) is supported.
- Azure DevOps artifact Feed with 800 packages or artifacts (or less) is supported.
- Azure DevOps pipeline with 200 packages or artifacts (or less) publishing is supported.

Get and update change request details in Azure DevOps pipeline

Get and update the change request details associated with an Azure DevOps pipeline.

Before you begin

Ensure that you meet the following prerequisites before you perform this procedure:

- Connect, configure the Azure DevOps tool and discover existing repositories, orchestration tasks, and pipelines.
- Install the following custom extension tasks on your Azure DevOps instance.
  - ServiceNow extension to integrate Azure Pipelines with DevOps Change Velocity. For more information, see Use the ServiceNow DevOps extension for Azure DevOps and Azure DevOps custom actions.

Role required:

- admin or sn_devops.admin in DevOps Change Velocity
- admin in Azure DevOps

About this task

When you update the **state** parameter in a change request, only the following transitions are supported:

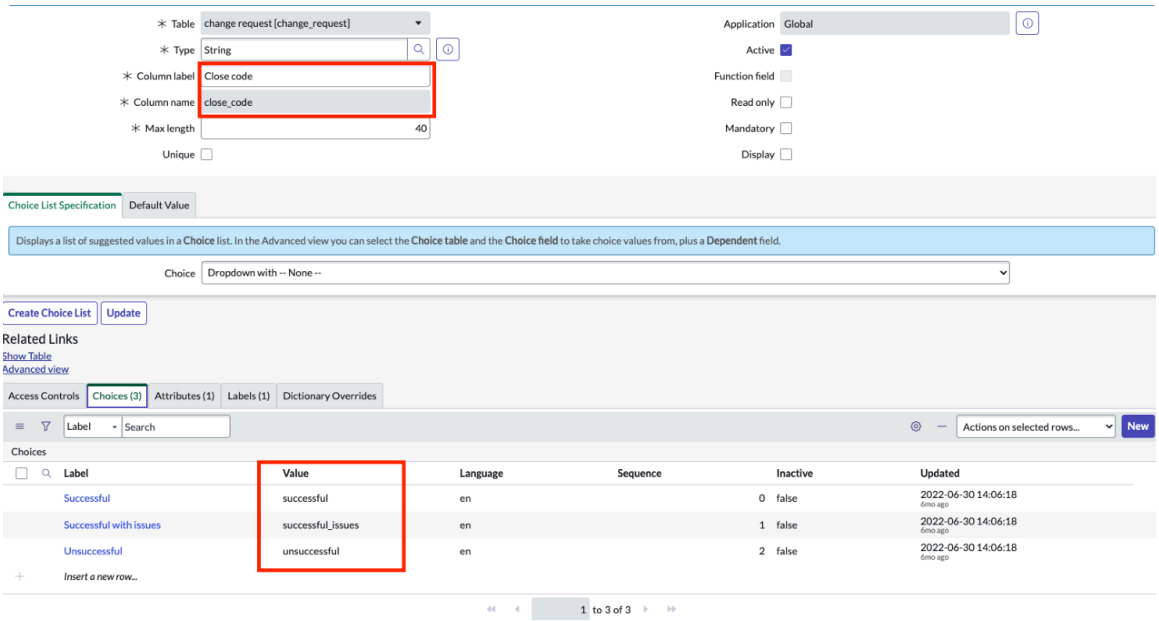
- cancel: Change request state must be **implement** to move the state to **cancel**. **reason** is a mandatory input to update the state to canceled.
- closed: Change request state must be **implement** or **post implement** to move the state to **close**. **close_code** and **close_notes** are mandatory input to update the state to closed.

Specify the change request state as an integer value:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- 4 - Cancel (Value set in the sn_devops.change_request.cancel_state property)
- 3 - Closed (Value set in the sn_devops.change_request.closed_state property)

When you update a choice field, you must specify a valid choice value that is available in the corresponding choice list. For example, the choice list values for the **Close code** field are successful, successful_issues, and unsuccessful.



Procedure

1. In the Azure DevOps console, navigate to **Organization** > **Pipelines** > **Jobs**.
2. Select the **Add Tasks** icon ( ), and search for the ServiceNow extensions in the **Add tasks** search bar.
3. Add the following extension tasks for get and update functions based on whether you are using a server or agent job.

Get function	○ ServiceNow DevOps Server Get Change ○ ServiceNow DevOps Agent Get Change
Update function	○ ServiceNow DevOps Server Update Change ○ ServiceNow DevOps Agent Update Change

4. In the task, update the following input parameters based on the function you are using.

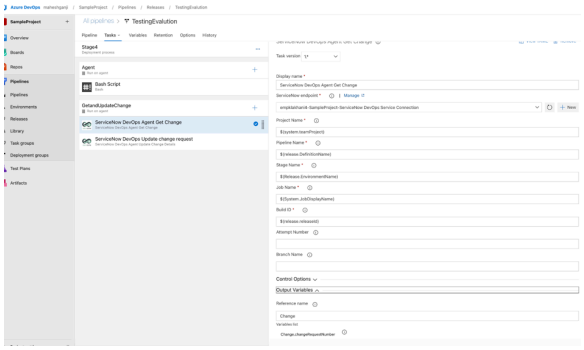
Get function	○ Project Name ○ Pipeline Name ○ Stage Name ○ Job Name ○ Build ID

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Attempt Number
- Branch Name (only for multi-branch pipeline)

Note:
If you do not provide the change request details as input parameters, the change request number associated with the current pipeline and stage will be retrieved.

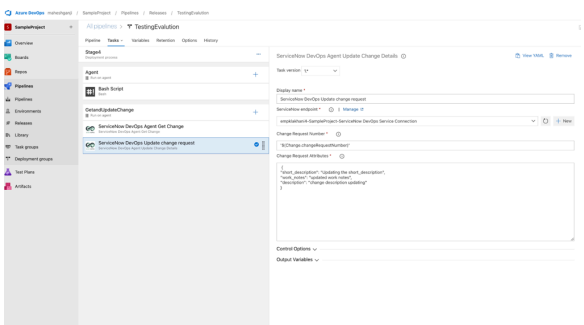
Enter a reference name for the get change request task, which will be used to reference the change request number in the update task. See the following example.



Update function

- Change request number whose details need to be updated.
- Change request attributes to be updated as Key:Value pairs.

```
{ "short_description": "Test description",
 "priority": "1", "start_date": "2021-02-05
 08:00:00",
"end_date": "2022-04-05 08:00:00",
 "justification": "test justification",
 "description": "test description",
"cab_required": <true/false>, "comments":
 "This update for work notes is from ADO
 file", "work_notes": "test work notes",
"assignment_group": "<SYS_ID>",
 "state":"<STATE_CODE>",
 "close_code":"<successful/successful_issues/u
nsuccessful>", "reason":"<As per Choice
 List>" }
```



The changeRequestNumber value must be referenced using the get task reference name in the "<task_name>.<changeRequestNumber>" format. See the following example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Attempt number is optional. If not specified, the latest CHG number from the current pipeline execution is retrieved. Otherwise, you can explicitly specify the attempt number without using any environment variables.

5. Save the changes.

ServiceNow DevOps change request state in Azure DevOps pipeline logs

View the change request state and the corresponding policy conditions in the Azure DevOps pipeline console logs whenever the state of a change request is updated.

You can navigate to the console logs in your Azure DevOps pipeline to view the state of a change request when a change request is created or when the state of the change request is updated. The policy conditions associated with the change request state will also be evaluated and displayed in the logs. For example, if the DevOps Change Request Advanced Automation Policy is activated, the policy conditions will be evaluated and the corresponding decision made (auto-approve/auto-reject/manual-approval) will be displayed in the logs.

The following change request details are displayed:

- number
- details
- status
- sys_id
- type
- risk
- priority
- changeState
- plannedStartDate
- plannedEndDate
- changeRequestURL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
changeState is the state of the change request, and **status** is the status of the step execution.

The logs for policy conditions will be displayed for the base system change flows as follows:

- DevOps Model Change Policy: Only logs will be displayed on change creation and when the change state is updated.
- DevOps Change Request Minimal Automation Policy: Logs along with change decision and policy conditions corresponding to the change decision will be displayed.
- DevOps Change Request Advanced Automation Policy: Logs along with change decision and policy conditions corresponding to the change decision will be displayed.

The change policy input and decision conditions are stored in the Decisions [sys_decision_question] table. Logs will be displayed if the following fields and operators are used as input for policy conditions:

Fields

- code_coverage
- commits_without_work_item
- integration_tests_failed
- load_tests_failed
- regression_tests_failed
- num_of_outages_in_last_7_days
- num_of_current_outages
- num_of_open_incidents
- total_num_of_commits
- tests_passing_percent
- risk
- code_security
- commits

Operators

- <=
- >=

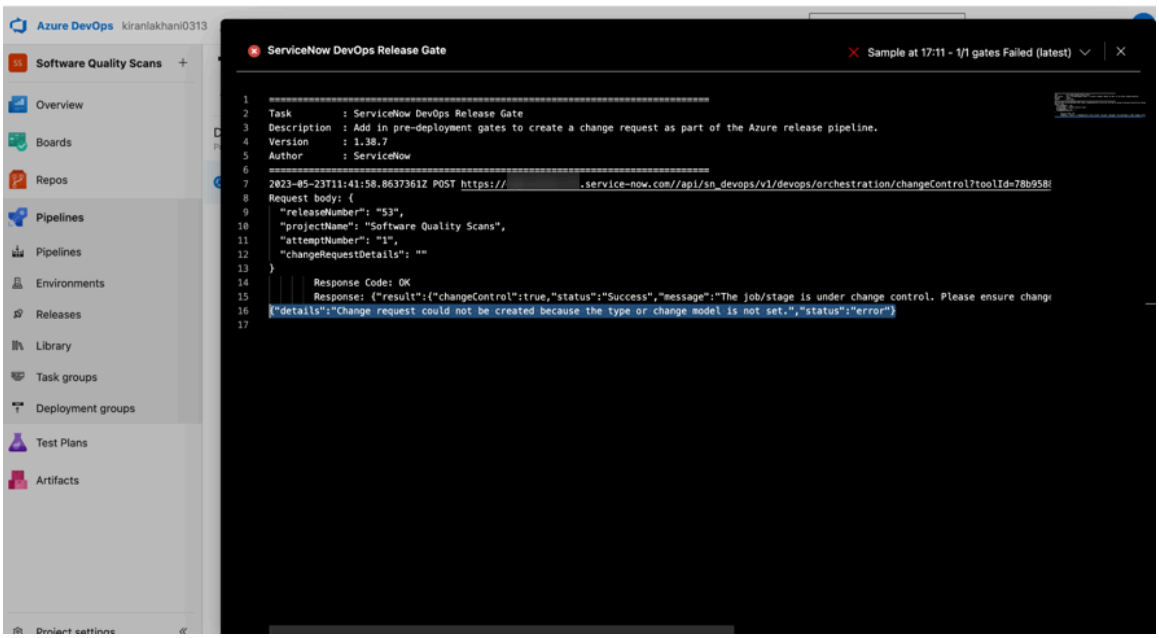
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- !=
- =
- <
- >
- ISNOTEMPTY
- ISEMPTY
- BETWEEN
- ANYTHING
- NSAMEAS
- SAMEAS
- GT_FIELD
- LT_FIELD

Note:
If any field is modified in a change policy other than the base system fields, then those fields must be manually added to the flow for policy conditions to be evaluated.

If a change request does not get created due to any issue, then the reason for the failure and the state is also logged in the console.



Note:
For Azure DevOps, if change receipt is enabled, the very first log may not be displayed onto the console. That is, when the change is created and is in the New state.

Configure and test webhooks

Manually configure webhooks in Azure DevOps and test them.

Configure webhooks in Azure DevOps manually

Configure webhooks in Azure DevOps to send sync notifications to the DevOps Change Velocity application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

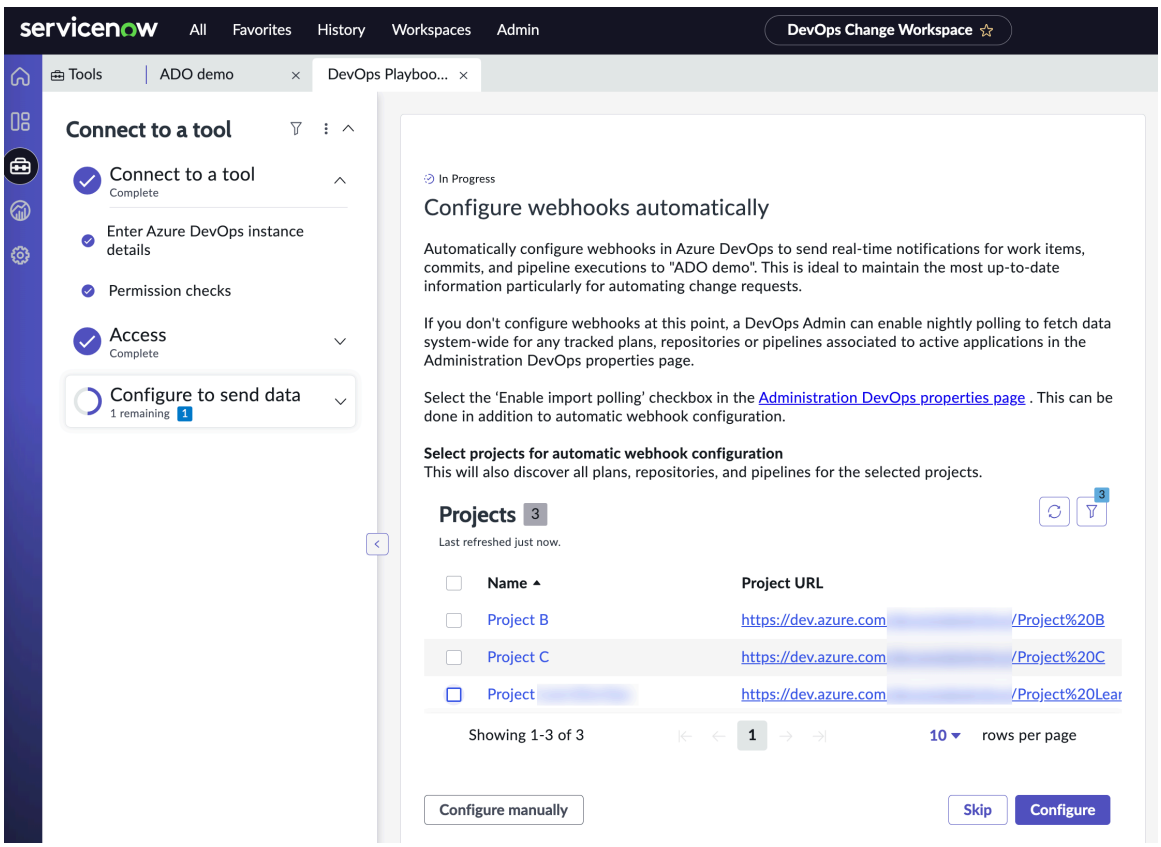
Role required: sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity, Azure DevOps admin

About this task

You can also access manual configuration from the Azure DevOps tool record in DevOps Change Velocity.

Procedure

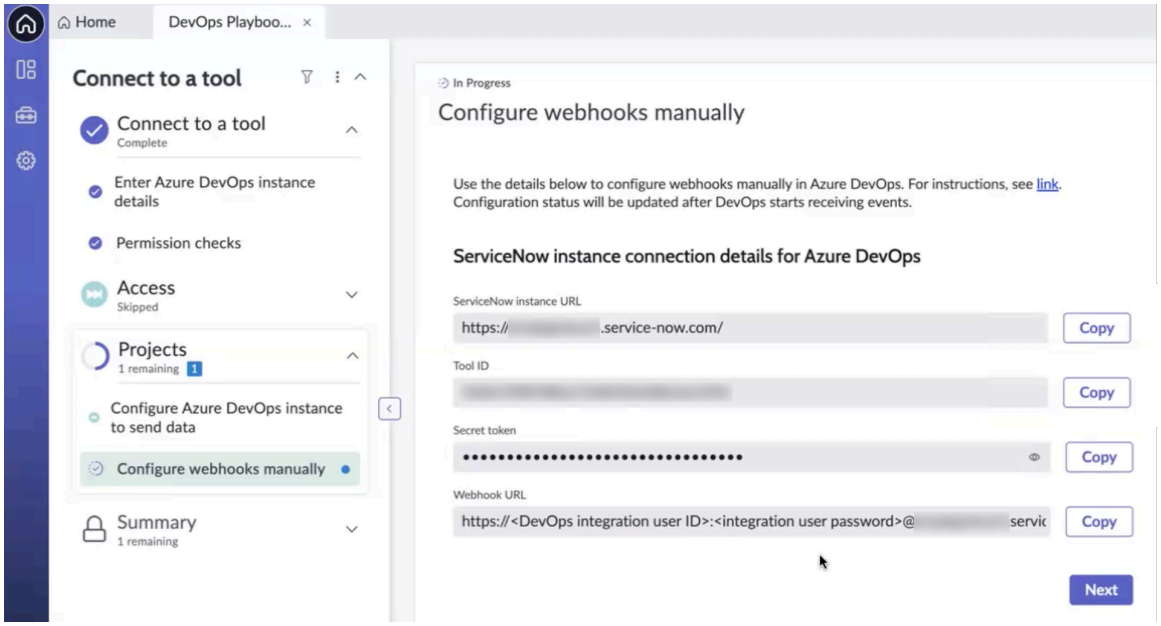
1. In Azure DevOps, open the project for which you are configuring webhooks.
2. Navigate to **Settings** > **Service Hooks** and create a NEW SERVICE HOOKS SUBSCRIPTION, in Azure DevOps.
3. In DevOps Change Velocity, choose **Configure manually** when configuring the tool instance to send data.



4. In DevOps Change Velocity, copy the **Webhook URL** field from the ServiceNow instance connection details for Azure DevOps.

> **Note:**
> Select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Modify the copied Webhook URL to reflect your tool details, and paste the URL in Azure DevOps.

   For example:

   ```
   https://myinstance.service-now.com/api/
   sn_devops/v2/devops/tool/{code | plan | artifact
   | orchestration | test | softwarequality }?
   toolId=23410545938c71d0db5bfe686cba1036&projectId=<project_sys_id>
   ```

   a. Select one of the tool capabilities `{code | plan | artifact | orchestration | test | softwarequality }` to match your tool.
   For example:

   ```
   https://myinstance.service-now.com/api/
   sn_devops/v2/devops/tool/orchestration?
   toolId=23410545938c71d0db5bfe686cba1036&projectId=<project_sys_id>
   ```

   b. Replace `<project_sys_id>` with your Azure DevOps project ID in ServiceNow (native_id column in the sn_devops_project table).

   c. Copy the modified URL to the **URL** field of the NEW SERVICE HOOKS SUBSCRIPTION in Azure DevOps.

6. In DevOps Change Velocity, copy the **Secret token** field from the ServiceNow instance connection details for Azure DevOps.
7. In Azure DevOps, in **Header** field of the NEW SERVICE HOOKS SUBSCRIPTION, paste the copied **Secret token** in the correct format.

   a. Use this format for the Azure DevOps **HTTP headers** field:
   `"token : <tokenValue>"`

   b. Replace `<tokenValue>`, with the copied **Secret token** from the ServiceNow instance connection details for Azure DevOps.

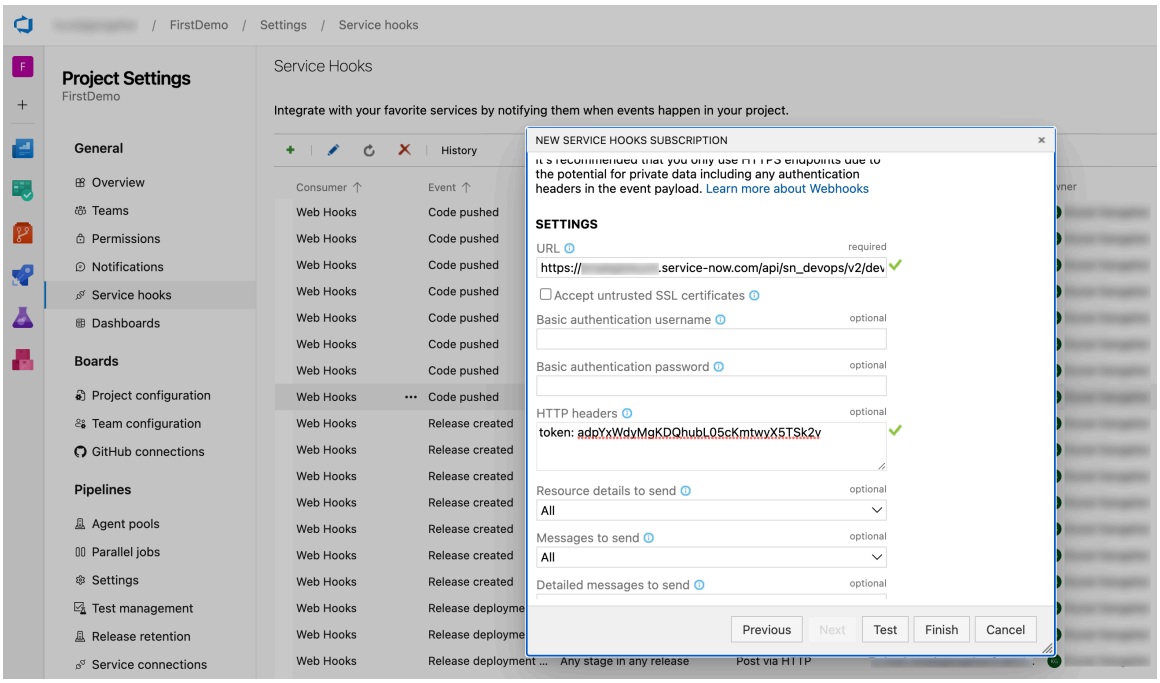
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy field values

From DevOps Change Velocity field	To Azure DevOps field
Webhook URL (modified)	URL
Secret token	HTTP headers In the format: `token : <tokenValue>`



Test webhooks in Azure DevOps

You can manually test if webhooks are configured correctly directly from Azure DevOps for each project.

Before you begin

Role required: Azure DevOps admin privileges

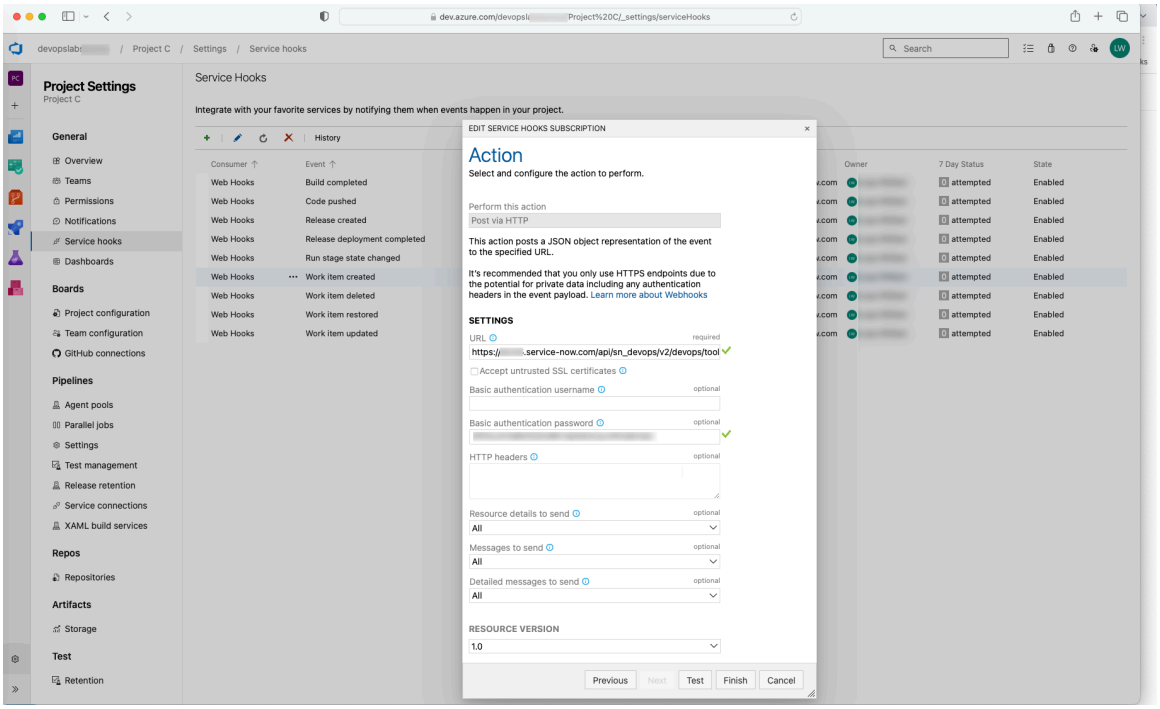
Procedure

1. Navigate to Azure DevOps and select the project for which you want to test webhooks.
2. Navigate to **Project settings** > **Service hooks**.
   For each project, DevOps Change Velocity creates webhooks for these events:
   - Build completed
   - Code pushed
   - Release created
   - Release deployment completed
   - Run stage state changed
   - Work item created

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Work item deleted
- Work item restored
- Work item updated

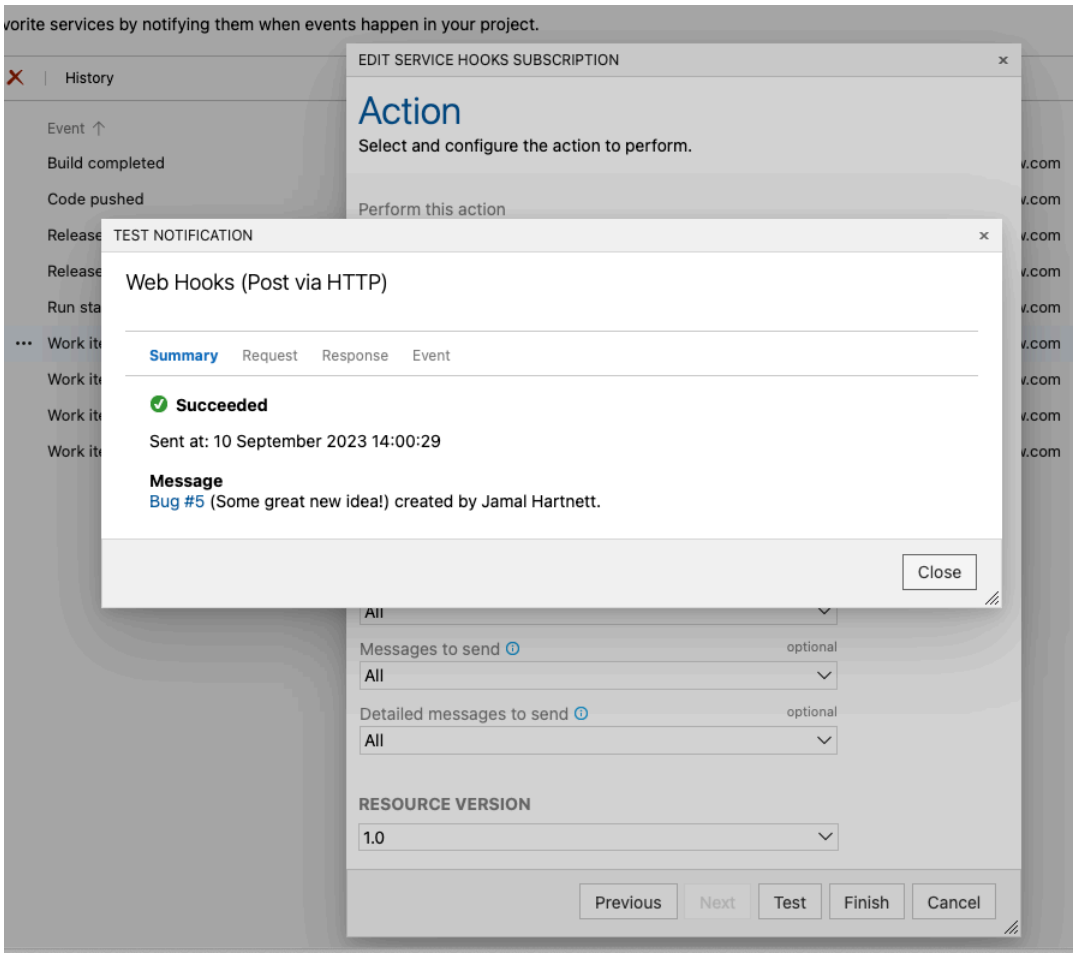
3. Select a webhook and select **Edit**.
4. Select **Next** to see the URL and authentication details.



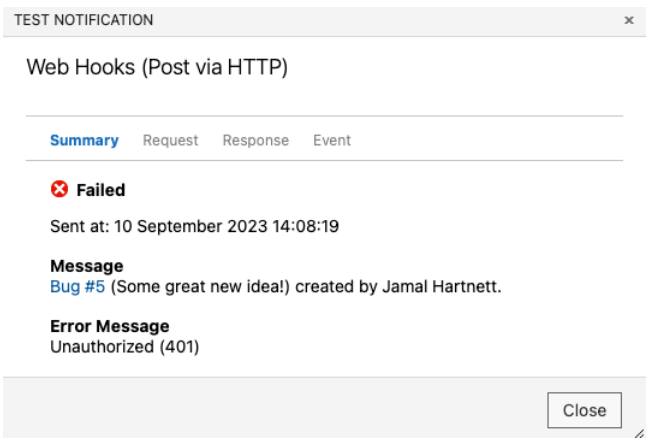
5. To test the webhook, select **Test**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the webhook is configured correctly, you'll receive a **Succeeded** message.



- If the webhook is configured incorrectly, you'll receive a **Failed** message.



To fix a webhook, you can try the following options:

- Reconfigure the webhooks by selecting **Configure** from the project record page in DevOps Change Velocity. This will reconfigure all the existing webhooks for the project.
- Verify if the *`toolId`* and *`projectId`* are correct in the **URL** field. You can find the correct values in the tool record page in DevOps Change Velocity.

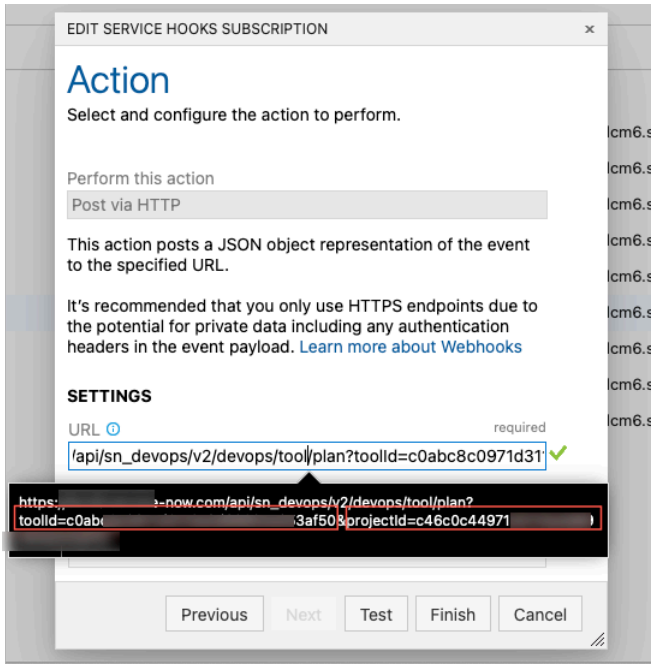
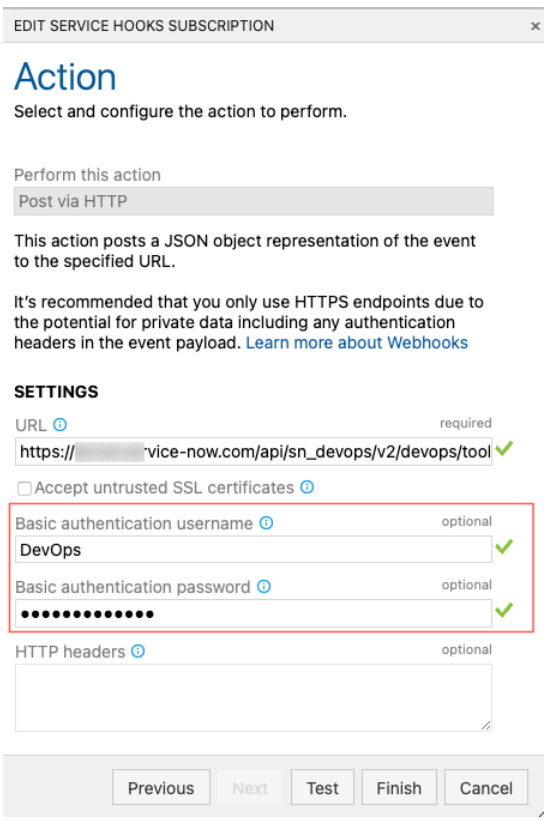
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

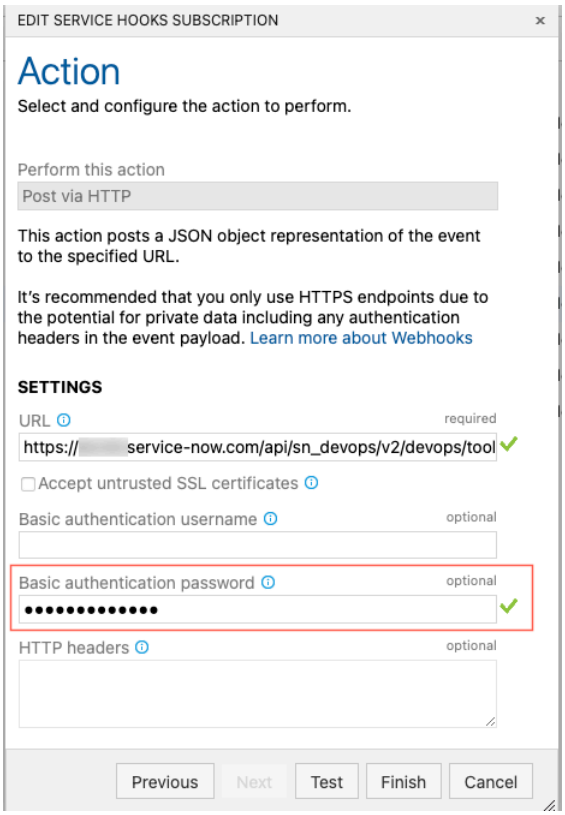


- If you're using the integration user credentials for authentication, check if the credentials are correct in the **Basic authentication** username and password fields.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you're using the secret token for authentication, the token value is masked in the **Basic authentication password** field. You can replace the token in this field.



GitHub integration with DevOps Change Velocity

Connect to your GitHub instance to discover repositories, plans, pipeline definitions and configure real-time notifications or polling to enable change traceability and automation.

GitHub integration overview

DevOps Change Velocity supports Plan (Plans), Code (Repository) and Orchestration (Actions) capabilities for the GitHub tool.

Both GitHub and GitHub Enterprise are supported.

The following operations are performed as part of integrating GitHub:

- Connect: Discover repositories, plans, and pipeline definitions by connecting your GitHub instances to DevOps Change Velocity.
- Configure: Enable sending real-time notifications for commits, work items, and pipelines by automatically creating a Webhook (push, issues, and workflow_job) in GitHub so that this data can be used to create change policies.

Repositories under an organization can also be discovered and configured if you have the following base permissions for the organization (member privileges):

- Discover: Base permission of Read.
- Configure: Base permission of Admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If Base permissions is specified as **No permission** for an organization, repositories under that organization can't be discovered even if they're public. The owner of an organization can either select all repositories or specific repositories for an organization and only the selected repositories are discovered. Even if a repository is public, it can't be discovered unless the owner selects it for an organization.

For repositories under an organization, you must not have the same repository configured in more than one tool on an instance. If the same repository is configured for multiple tools, then data is associated with a random tool as part of notifications events. If you want to configure the same repository in a different tool, you must delete the webhooks created from the first tool, untrack the repository under that tool, and then configure the same repository in the different tool.

Authentication methods

You can connect to GitHub using one of the following authentication methods:

- Basic authentication

  If you connect your GitHub instance with basic auth, you can use the custom actions from the GitHub marketplace. GitHub environments aren't supported for basic auth connection.

- OAuth 2.0 credentials
  - If you connect your GitHub instance with OAuth 2.0 credentials for Authorization code, you can use the custom actions from the GitHub marketplace and create secrets to use in workflows. For more information, see OAuth 2.0 credentials for GitHub Apps - Authorization Code.
  - If you connect your GitHub instance with OAuth 2.0 credentials for GitHub Apps - JWT, you can use the custom actions from the GitHub marketplace, create secrets to use in workflows, and GitHub environments to deploy to an environment. For more information, see OAuth 2.0 credentials for GitHub Apps - JWT. For GitHub repositories under an organization, only one organization can be installed per tool (i.e - One GitHub App can be installed with One GitHub Org and with One GitHub tool). If you want to add more organizations, you can create separate tools and apps.

Note:
The OAuth Authorization Code & JWT grant types are supported for GitHub & GitHub Enterprise with MID server.

Custom actions by ServiceNow are available in GitHub Marketplace for the orchestration capability, to push information from Actions (workflows) and to pause or resume workflows from DevOps Change Velocity. For more information on custom actions, see ServiceNow DevOps custom actions from GitHub marketplace.

To capture the workflow data in DevOps Change Velocity, you must configure Secrets in your GitHub tool. For more information, see GitHub Actions configurations.

There are a few limitations for GitHub Actions support, see GitHub Actions configurations.

Get started

Use one of the following options to onboard GitHub. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard GitHub to DevOps Change Velocity — Workspace

Connect to your GitHub instance using the DevOps Change Workspace playbook to discover, configure, and import repositories, plans, and pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

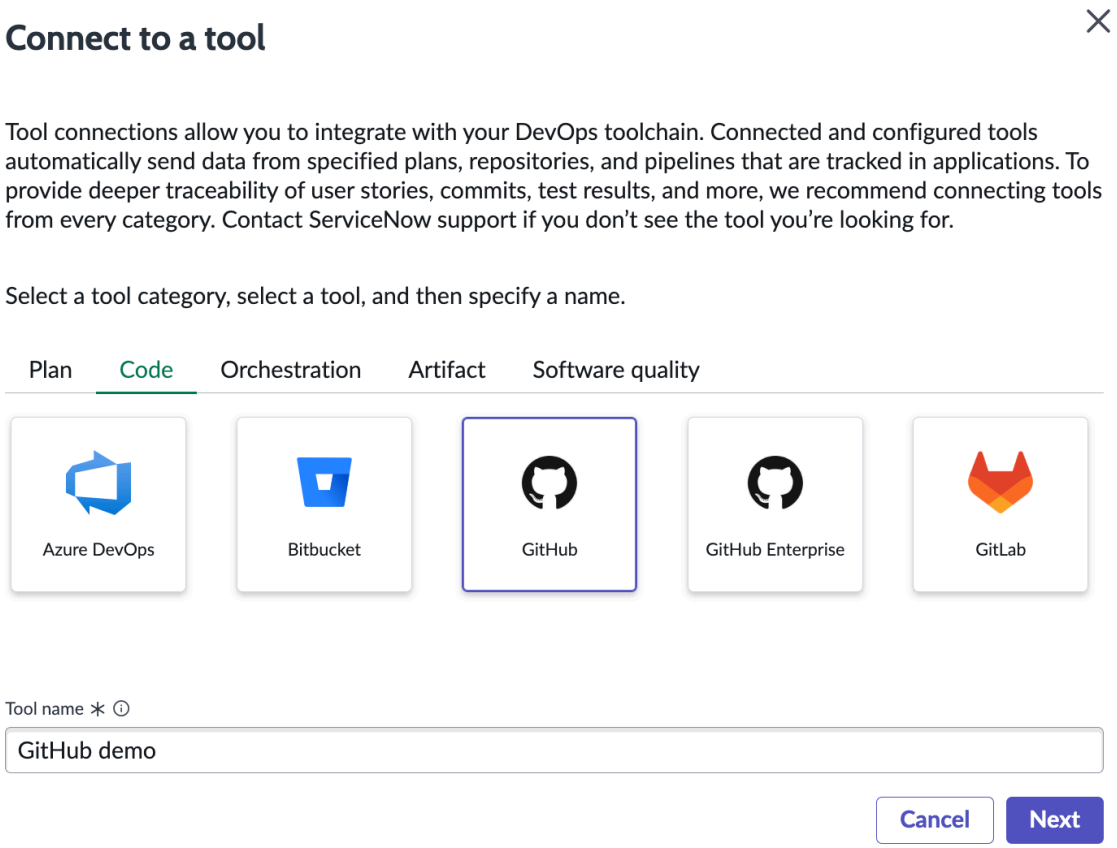
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard GitHub.

   Important:
   If you want to discover and track tool objects like pipelines, plans, or repositories while connecting to the tool, you must connect your tool from the Application module.

2. In the **Tool name** field, enter a name for the tool.



3. Select **Next**.

   The DevOps playbook opens to help you complete the onboarding tasks.

4. Complete the connection and configuration using the playbook.

   a. In the **Credential type** field, select one of the following credential type.

   - Basic Auth
   - OAuth 2.0 with Authorization Code
   - OAuth 2.0 with JSON Web Token (JWT)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Enter the credentials.

Basic Auth	Enter the username and password/access token of your GitHub instance. OAuth 2.0 with Authorization Code	Select an existing OAuth 2.0 with Authorization Code credential record or create an OAuth 2.0 with Authorization Code credential record. For more information, see Create a credential record for GitHub App provider (Authorization Code). OAuth 2.0 with JSON Web Token (JWT)	To connect using OAuth 2.0 with a JWT, you must first perform the following: ▪ Create and configure a GitHub App ▪ Generate the Java KeyStore certificate for GitHub ▪ Attach the GitHub Java KeyStore certificate to your instance After completing the prerequisites, you can continue with the DevOps Change Velocity Connect playbook activity: **i.** Select the **Use an existing JWT credential record** option if you want to use an already existing JWT credential record. If this option is not selected, the fields to create a new JWT credential record are displayed. Proceed to the next step. **ii.** In the **JKS certificate** field, select an existing JKS certificate. This is the name you entered to uniquely identify the JWT provider. JKS certificates are created using shell commands to create a sys_certificate record.

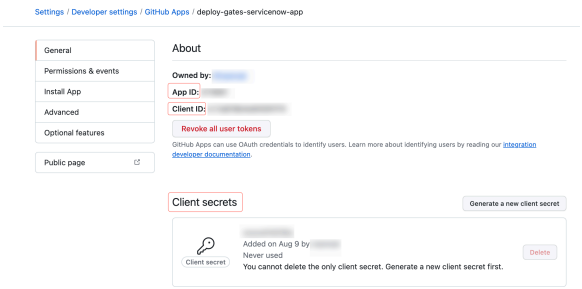
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Create a JWT signing key for the GitHub JKS certificate.

iii. In the **Signing key** field, enter the signing key to be assigned to your JKS certificate. This is the export password entered while generating the JKS certificate.

iv. In the **GitHub App ID** field, select the app ID of your GitHub App (available in the About section of your GitHub App configuration in GitHub). The following image displays an example of the About section of a GitHub App configuration from where you can access the GitHub App ID, Client ID, and Client secret.



v. In the **Client ID** field, select the client ID of your GitHub App (available in the About section of your GitHub App configuration in GitHub).

vi. In the **Client secret** field, select the client secret of your GitHub App (available in the About section of your GitHub App configuration in GitHub).

vii. In the **Token URL** field, select the location of the token endpoint that the instance uses to retrieve and refresh tokens.

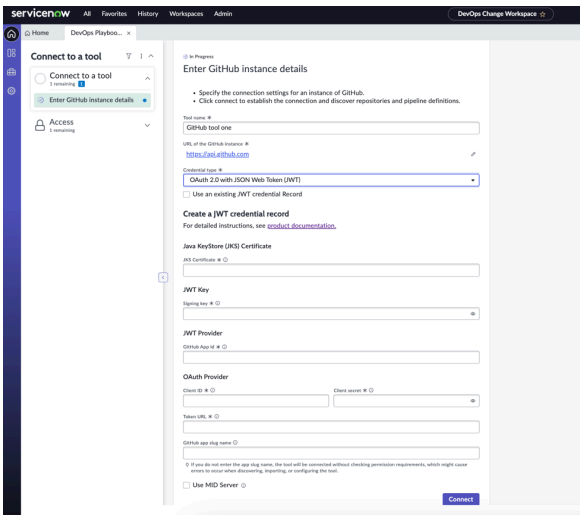
For cloud version, enter: `https://api.github.com/app/installations/<installation_id>/access_tokens`.

For enterprise version, enter: `https://<HOST_URL>/api/v3/app/installations/<installation_id>/access_tokens`.

For the installation id, go to Install App section in your GitHub App configuration in GitHub and select the gear icon to configure your

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

app. The installation id will be in the webpage URL. For example, https://github.com/settings/installations/<installation_id>.



If the OAuth credential is created using GitHub Apps - JWT, the **Configure with GitHub App** option will be available on the tool record page.

For more information on OAuth2.0 credentials, see Setting up GitHub OAuth 2.0 credentials for DevOps Change Velocity.

c. **Optional:** Enter a value in the **GitHub app slug name** field to check the permission requirements of the tool before connecting if you have created your Oauth 2.0 credentials using GitHub Apps.
You can find the app slug name on the settings page of your app.

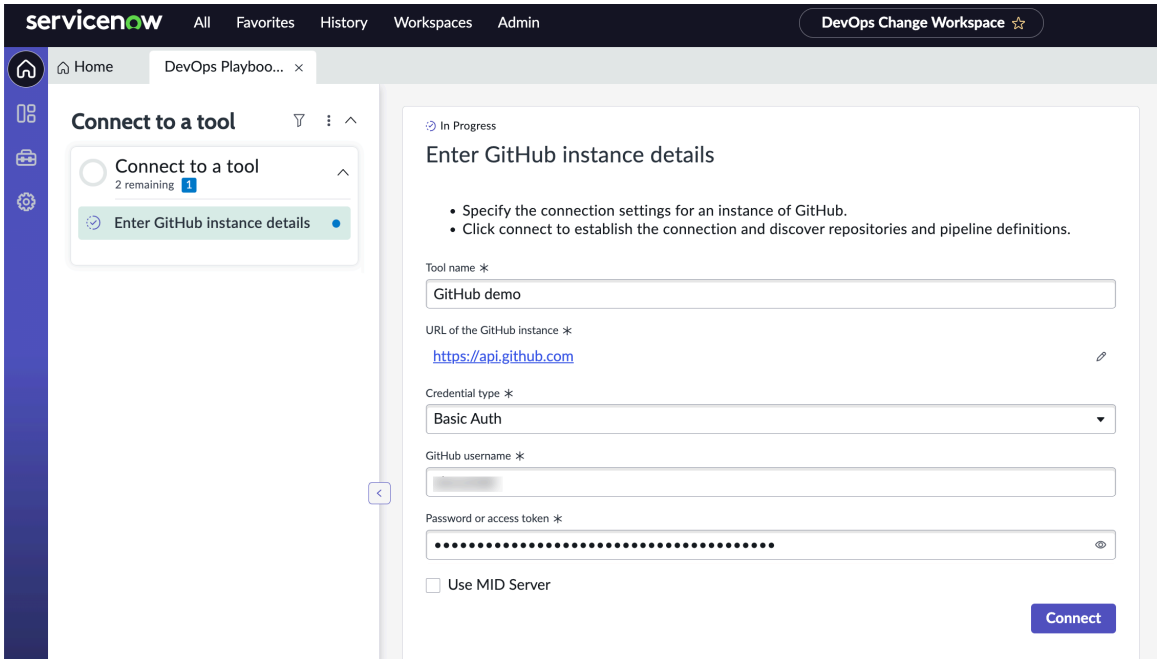
d. **Optional:** If your GitHub instance is attached to a MID Server, select the **MID Server** option and enter its details.

(Optional) For more information about MID server, see MID Server selection.

Note:
The OAuth Authorization Code & JWT grant types are supported for GitHub & GitHub Enterprise with MID server.

e. Select **Connect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



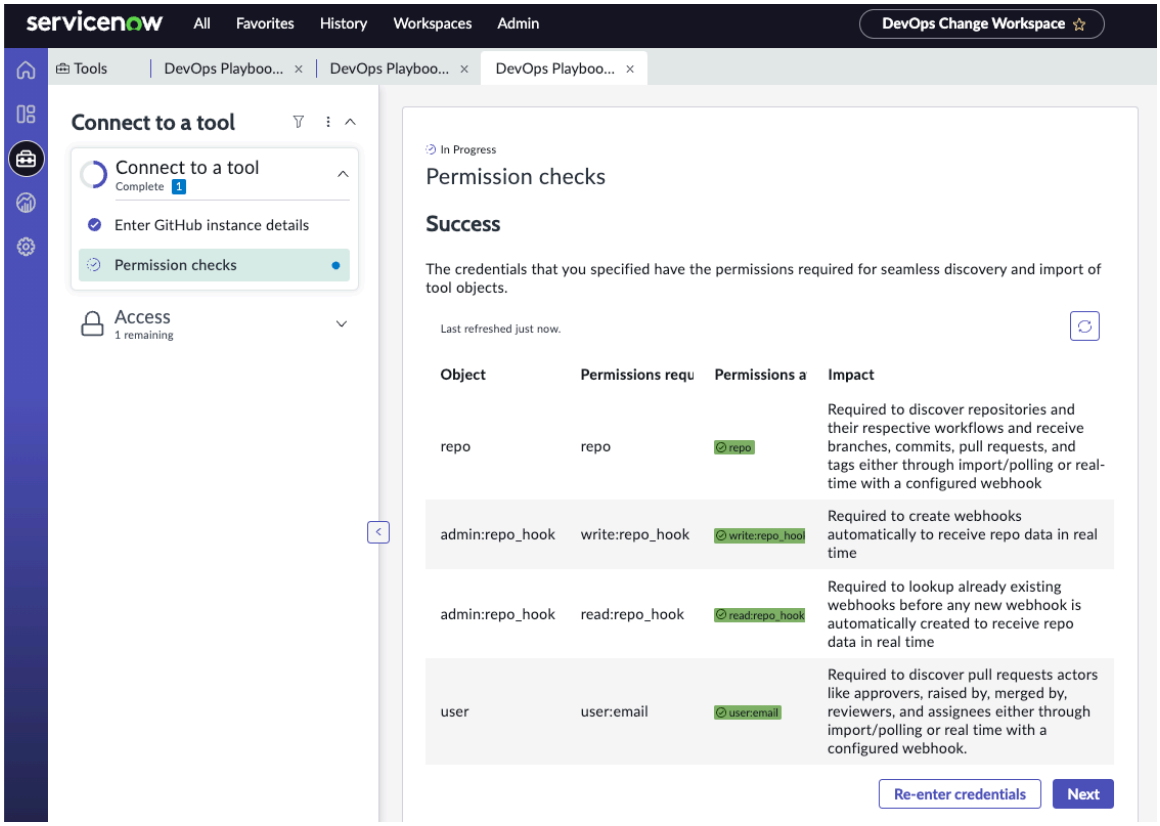
f. Permission checks are run on the credentials that you entered.

Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information on all the required permissions, see GitHub permissions in Permissions required for DevOps tools.

For OAuth 2.0, if you haven't entered the GitHub app slug name, the tool is connected without checking permission requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

g. Select **Next**.



5. Specify the access for the tool.

   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

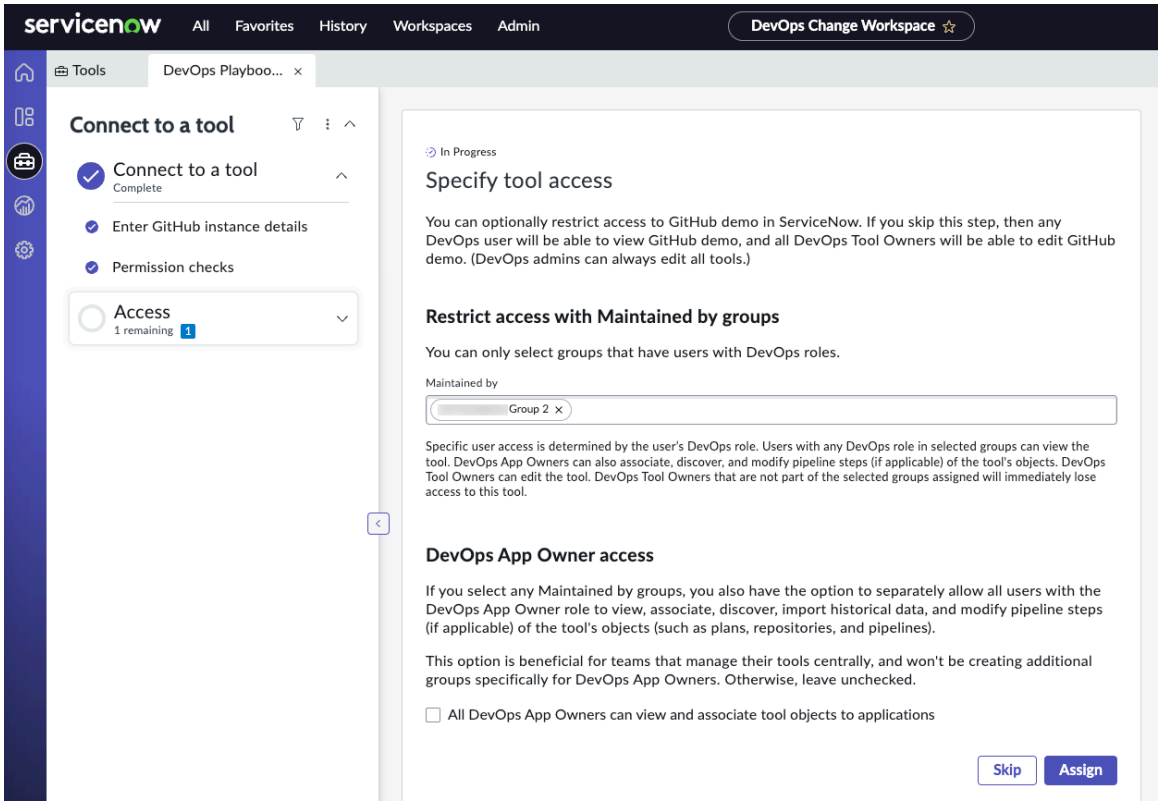
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Configure webhooks automatically in your GitHub instance to send data to DevOps Change Velocity.

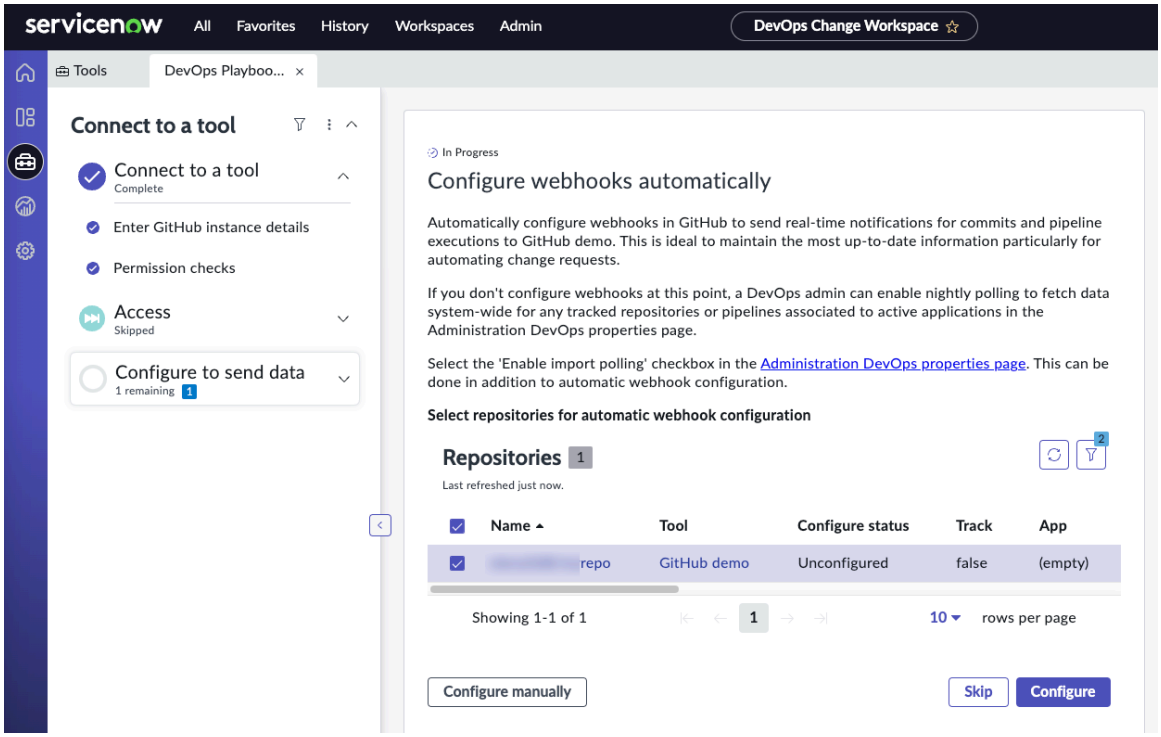
   This action configures the following webhooks:

   - *`push`*: To gather repository commits, branches, and tags
   - *`workflow_job`*: To gather pipeline data
   - *`issues`*: To gather issues (work item) data

   Note:
   Completing the configuration as part of this task is recommended as real-time notifications are ideal to maintain current information, particularly for automating change requests. Otherwise, you can set up the webhook by configuring it manually later by enabling nightly polling to fetch data system for any tracked repositories or pipelines by setting the *`Enable Polling`* property to **Yes**.

   Select the repositories for which you want to configure webhooks and select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To configure manually, select **Configure manually**. See Configure webhooks in GitHub manually for more information.

Important:

- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then repositories and pipelines available are discovered. You can track and import historical data from them.

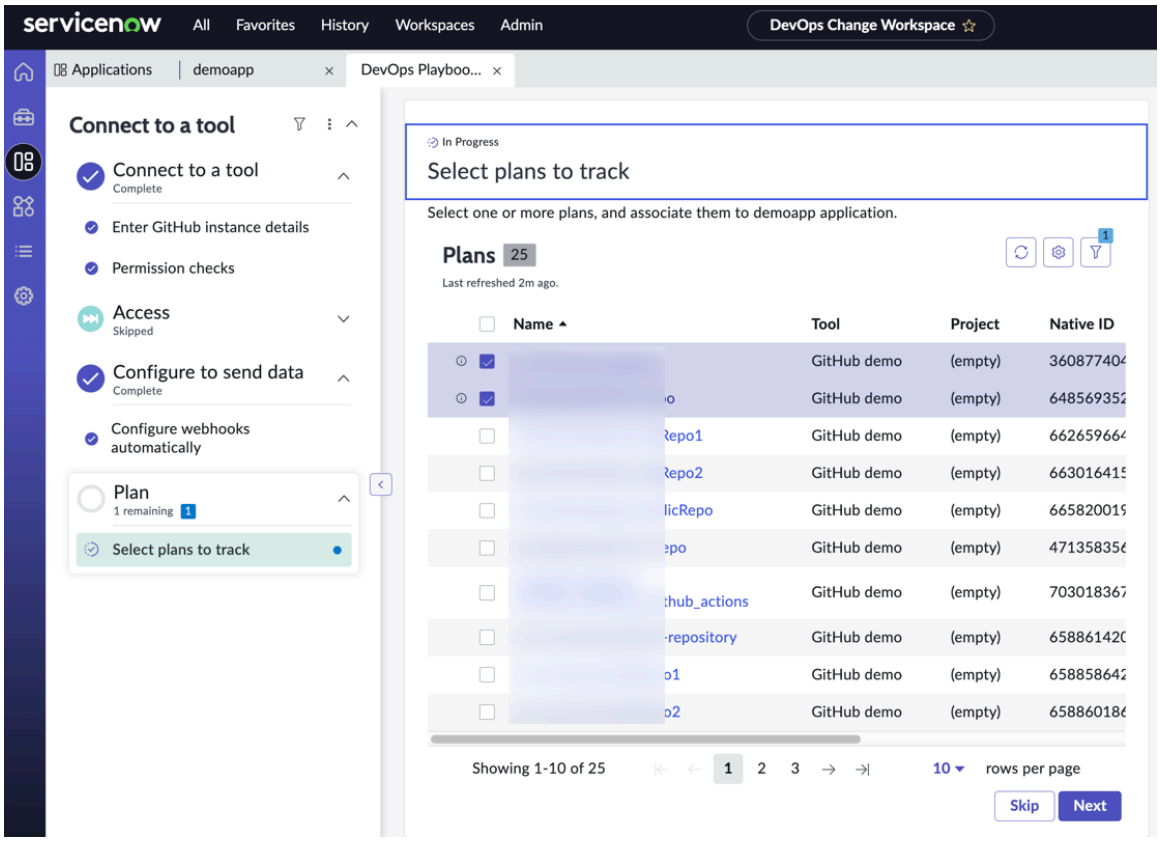
7. Select the plans to track.

   a. Select the plans for which you want to track updates and associate to the application.

      After the tool onboarding is complete, the work items only for these selected plans are automatically imported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Next**.

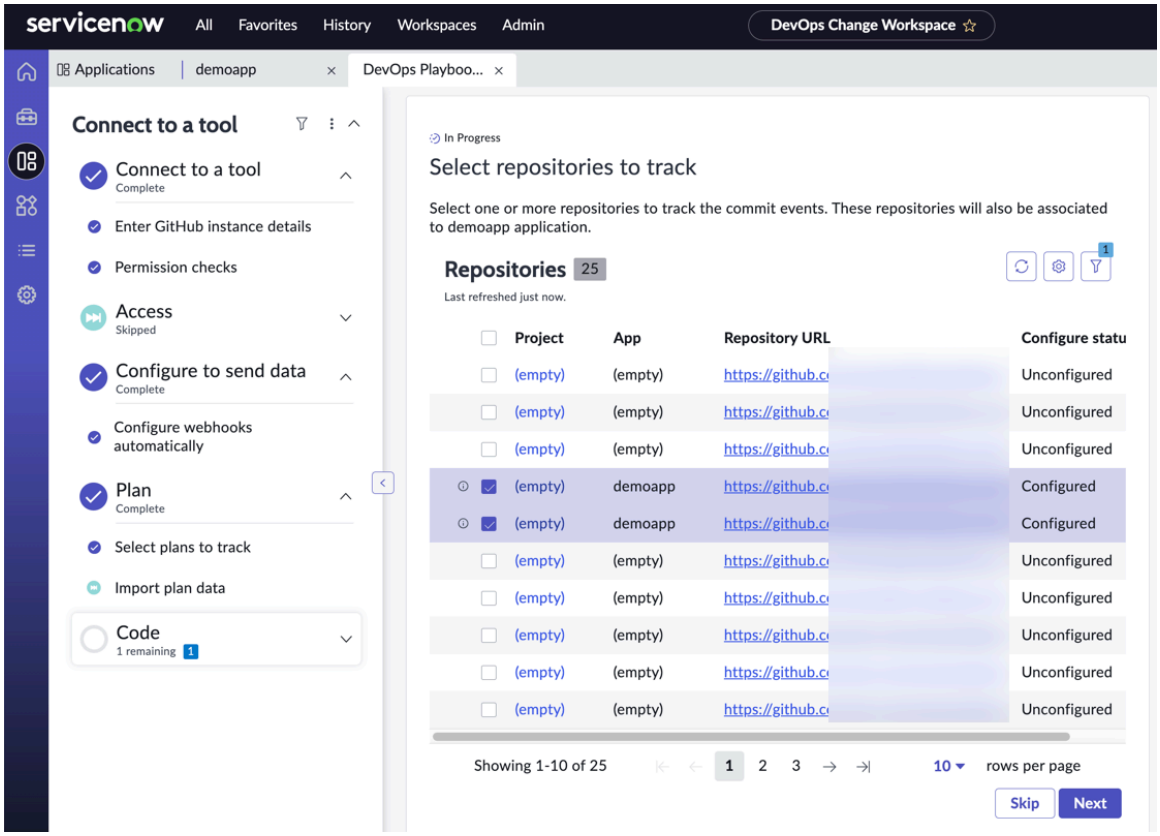


8. Select the repositories to track.

a. Select the repositories for which you want to track updates and associate to the application.

b. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. If you want to import repository data, select the date range and select **Submit**.

You can import up to 90 days of data. Workflows associated with the repositories will also be imported.

9. Select the pipelines to track.

a. Select the pipelines for which you want to track updates and associate to the application.

b. Select **Next**.

c. For each selected pipeline, all steps or stages are imported for the last successful execution. In the Assign services to pipeline steps activity, you can select the following for each pipeline step:

i. Pipeline step type: Select a step type for which you want to assign a service.

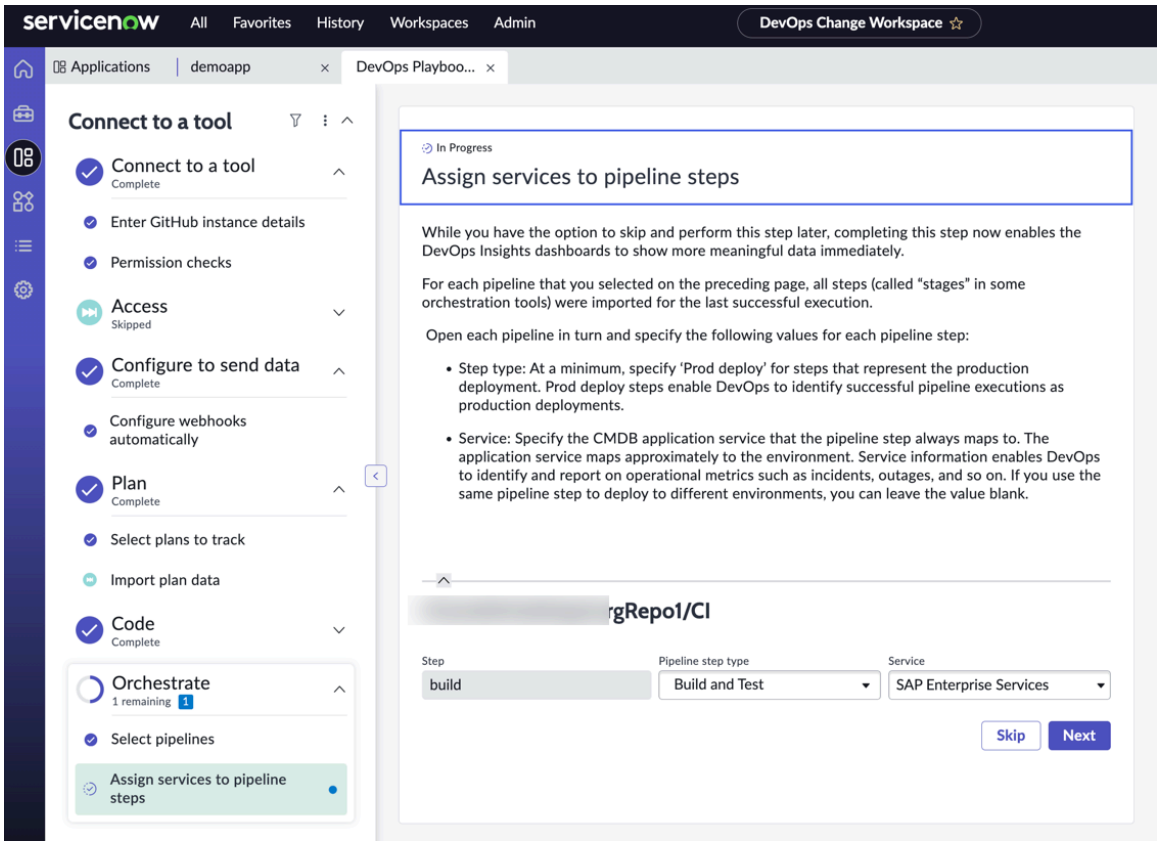
> **Tip:**
> Specify at least the *`Prod deploy`* step type for steps that represents the production deployment to enable DevOps to identify successful pipeline executions as production deployments.

ii. Service: Select the CMDB application service that the pipeline step maps to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

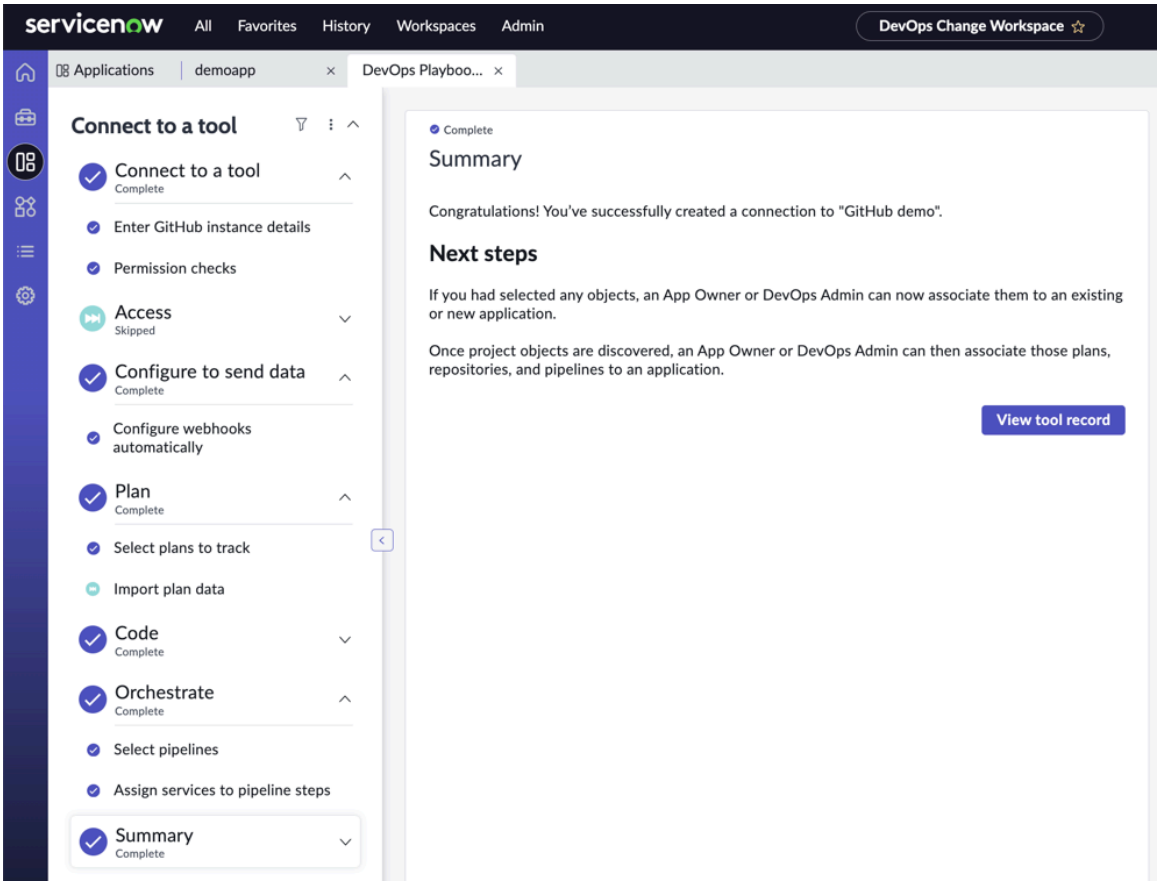
Application service maps approximately to the environment. If you use the same pipeline step to deploy to different environments, leave the field empty. Service information enables DevOps to identify and report on operational metrics such as incidents, outages, and so on.

d. Select **Next**.



10. From the **Summary** page, select **View tool record** to review the details of the connected GitHub tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For GitHub Actions pipelines, you must perform some additional steps like creating secrets, defining the workflow configuration in GitHub, and so on. For more information, see GitHub Actions configurations.

Result

You've successfully onboarded your GitHub tool to DevOps Change Velocity.

What to do next

You can manually discover plans after your GitHub tool is onboarded as well. As there is no plan entity in GitHub, the repositories will be considered to discover corresponding plan records in ServiceNow.

1. From the tool record page, select **Discover** to discover plans.
2. Select **Configure**. Plans are tracked and a webhook called *issues* is created to send real-time notifications for work items.

The following information is updated for a work item in ServiceNow when the corresponding issue is updated in GitHub.

- Change in issue title
- Assignees update
- Transfer issue

Note:
When an issue is transferred, the same will be marked as transferred in the repository from which it is being transferred and opened in the repository to which it is being transferred.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Delete issue

> **Note:**
> When an issue is deleted in GitHub, the corresponding work item is not deleted in ServiceNow but the state of the work item will be marked as deleted.

If you are an upgrading customer, plans will be discovered for your repositories through the scheduled job to discover periodically or through manual discovery. After your plans are discovered, you can enable the *sn_devops.track.github.issues* property to re-configure all the previously configured repositories at once so that all plans are tracked and the issues webhook is created for work items.

> **Note:**
> Historical import of plans is not supported.

Configure webhooks from the tool record

Onboard GitHub to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your GitHub instance using the ServiceNow Service Catalog.

Before you begin
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   > **Note:**
   > You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your GitHub integration.
Tool integration	Select GitHub or GitHub Enterprise.
Tool URL	Enter https://api.github.com.
Credential type	Select Basic Auth or OAuth, depending on the credentials you're using. ○ For Basic Auth, enter the username and password or access token. ○ For OAuth, enter the credentials.
Use MidServer	Optional. Select#MID Server#for a tool that is attached to a#MID Server. Application is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	automatically set to#DevOps and capability is set to REST.

For a list of all the permissions required on the credentials for connecting to GitHub, see GitHub permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is created, connected, and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Select the pipelines for which you want to import historical data.
Onboarding repositories	Enter the connected GitHub tool name.
Repositories	Select the repositories for which you want to configure webhooks and import historical data. **Note:** If you do not select a pipeline in the **Onboarding pipelines** field, all pipelines within the repository selected here will be associated.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Do you wish to configure webhook for the tool?	Select the check box if you want to configure webhooks for the selected repositories.
Onboarding plans	Leave empty.

8. Select **Order Now**.
   A request is created. When the request is approved, the repository and pipeline objects are associated to the app record and webhooks are configured for real-time tracking. Historical data is imported for the selected repositories and the associated workflows. The **Track** field is automatically enabled for imported repositories and pipelines.

Onboard GitHub to DevOps Change Velocity – Classic

Connect your GitHub instance to discover, configure, and import repositories, plans, and pipelines.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Complete the steps specified in the Getting started section before connecting to a tool.

About this task

- **Connect** to GitHub and get the webhook URL when you submit a DevOps tool record.
- **Discover** repositories and plans.
- **Configure** the webhook in the GitHub repository.
- **Import** branch and commit records.

Procedure

1. Enter the GitHub instance details to connect to DevOps Change Velocity by navigating to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. Enter a value in the **Tool Name** field and fill in the tool details.

Create DevOps Tool form

Field	Description
Tool integration	Tool to integrate. In this case, select **GitHub**.
Tool URL	URL of the existing GitHub instance to integrate. For e.g, https://api.github.com
GitHub credential type	○ Basic Auth ▪ GitHub username ▪ Personal access token (classic) Only a personal access token (classic) is supported with basic authentication. When you generate a personal access token (classic) for GitHub, you must specify the scopes to authorize if you are not granting complete access. The minimum scopes that you must select for authorization are repo, admin:repo_hook, and user:email. ○ OAuth GitHub Tool Credential. See Setting up GitHub OAuth 2.0 credentials for DevOps Change Velocity.

For a list of all the permissions required on the credentials for connecting to GitHub, see GitHub permissions in Permissions required for DevOps tools.

3. **Optional:** Select **MID Server** for an on-premises tool that is attached to a MID Server.

   (Optional) Application is automatically set to DevOps and capability is set to REST.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The OAuth Authorization Code & JWT grant types are supported for GitHub & GitHub Enterprise with MID server.

4. Select **Submit**.

On successful tool creation, you are taken to the tool record page.

5. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

   The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

6. Select **Discover** to discover existing repositories, plans, or pipelines for the tool.
   Repository records are added to the Repositories related list.
7. Automatically configure the webhook URL in a GitHub repository to send notifications to the DevOps tool by selecting **Configure**.
   Alternatively, you can choose to enable nightly polling to fetch data system for any tracked repositories or pipelines by setting the **Enable Polling** property to **Yes**.

   Note:
   If you do not have admin privileges for your GitHub tool (to allow automatic configuration of the webhook URL), you might need to have the tool admin user configure it for you (create and configure the webhook URL manually in your tool instance). Once the webhook is configured in the tool, Enter Manual Configuration Mode to connect to the tool manually, then exit.

8. Click **Import** to import historical data from the repository.
   Imported branch records and commit records from the repository are added to the corresponding related lists.
9. In the **App** field, click the lookup list and select an App record to associate with the repository, or click **New** to create one.

Setting up GitHub OAuth 2.0 credentials for DevOps Change Velocity

Create OAuth 2.0 credentials for GitHub Apps or OAuth apps and use them to connect your GitHub instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to use Basic Authentication credentials instead of OAuth 2.0, skip this section and proceed to onboard GitHub using one of the following options:

- Onboard GitHub to DevOps Change Velocity — Workspace.
- Onboard GitHub to DevOps Change Velocity — Classic.

Note:
The OAuth Authorization Code & JWT grant types are supported for GitHub & GitHub Enterprise with MID server.

Note:
DevOps connection and credential aliases (DevOpsAlias1 through DevOpsAlias10) are used to connect automatically when you set up your GitHub instance using OAuth 2.0. To connect to more than 10 tools, or if you receive an error saying all DevOpsAlias connection and credential aliases are being used, an admin can create additional aliases in the sn_devops application scope. For more information, see Create a Connection & Credential alias. If necessary, you can reuse a DevOpsAlias alias that is no longer in use by inactivating the HTTP connection.

OAuth 2.0 credentials for GitHub Apps - JWT

Perform the following steps to integrate your GitHub Apps using the JWT bearer token.

Before you begin

Role required:

- oauth_admin in DevOps Change Velocity.
- Admin account in GitHub.

Note:
The OAuth 2.0 JWT grant type is supported for GitHub & GitHub Enterprise with MID server.

Configure the GitHub App in your GitHub account (JWT)

Create a custom GitHub App from your GitHub account to enable OAuth 2.0 authentication with your ServiceNow instance.

Before you begin

GitHub requirement: GitHub App configured to integrate with ServiceNow

Role required: No instance role required

About this task

Complete these steps from your GitHub account. See Building GitHub Apps on the GitHub Developer site for instructions on creating and configuring custom applications.

Procedure

1. From your GitHub account, create your GitHub App by navigating to **Developer Settings** > **GitHub Apps**.
2. In the **Homepage URL** field, enter `https://<instance-name>.service-now.com`.
3. In the **User authorization callback URL** field, enter `https://<instance-name>.service-now.com/oauth_redirect.do`.
4. In the **Identifying and authorizing users** section, deselect the **Expire user authorization tokens** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **Webhook** section, select the **Active** field.
6. In the **Webhook URL** field, enter `https://<instance-name>.service-now.com/api/sn_devops/v2/devops/tool/apps?toolId=<Tool ID>`, where Tool Id is your GitHub tool id (sys_id) from DevOps Change Velocity.

   Note:

   If you are newly creating the tool and don't have the Tool ID, you can enter the webhook URL without the Tool ID and configure it later. To configure later:

   a. Navigate to the connected tool's tool record page.

   b. Select **Configure GitHub App**, then select **Auto configure with existing token**.

   
   This configures the Webhook URL of the GitHub App automatically.

   You can get the Tool ID in one of the following ways:

   - While connecting with the tool in DevOps Change Velocity, the Tool Id is available in the page URL. For example, `https://<instance-name>.service-now.com/.../sn_devops_tool/<Tool ID>/...`.
   - You can copy the webhook URL from the GitHub tool record page in DevOps Change Velocity, from **Configure** > **Configure manually** > **Webhook URL**.

7. Leave the remaining fields empty (default).
8. In the **Repository permissions** section, configure the following settings.

Action	Read-only
Checks	Read-only
Contents	Read-only
Deployments	Read and write
Environments	Read-only
Metadata	Read-only
Pull requests	Read-only
Secrets	Read-only
Webhooks	Read and write **Note:** Read and write permissions are required to configure webhooks from ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you are already using a GitHub App and you update any of the permissions, you must review and accept those permissions for your GitHub App. You can navigate to your app, and select **Configure > Review request > Accept new permissions**.

9. Leave the remaining permissions as `No access` (default).
10. In the **Subscribe to events** section, select the **Deployment protection rule** option.
11. Save the changes.
12. After creating the GitHub App, generate a new private key and save it to your machine.
13. Install the newly created GitHub App on the accounts of your choice.

    a. From the GitHub Apps settings page, select your app.

    b. In the left sidebar, select **Install App**.

    c. Select **Install** next to the organization or personal account containing the correct repository.

    d. Install the app on all repositories or select repositories.
    For more information, see Installing GitHub Apps.

Generate the Java KeyStore certificate for GitHub

Generate a Java KeyStore (JKS) certificate for the JWT authentication.

Before you begin
Role required: admin

Procedure

1. Create a CA signed certificate using the GitHub App private key:

```
openssl req -new -x509 -key <file-name>.pem -out
 <certificate-name>.pem -days 1095
```

2. Enter the required details.
3. Create the PKCS 12 file using the GitHub App private key and CA signed certificate:

```
openssl pkcs12 -export -in <certificate-name>.pem -inkey
 <file-name>.pem -certfile <certificate-name>.pem -out
 <PKCS-12-file-name>.p12
```

4. Provide the export password.
5. Create the JKS file:

```
keytool -importkeystore -srckeystore
 <PKCS-12-file-name>.p12 -srcstoretype pkcs12 -destkeystore
 <JKS-certificate-filename>.jks -deststoretype JKS
```

6. Provide the destination and source keystore passwords.

Attach the GitHub Java KeyStore certificate to your instance

Enable the JWT Bearer Grant token authentication by attaching the valid GitHub Java KeyStore (JKS) certificate to your ServiceNow instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Ensure the availability of a valid Java KeyStore certificate.

Role required: admin

Procedure
1. Navigate to **All** > **System Definition** > **Certificates**.
2. Select **New**.
3. On the form, fill in the fields.

X.509 Certificate form fields

Field	Description
Name	Name to uniquely identify the record. For example, `My GitHub App Certificate`.
Notify on expiration	Option to specify the users to be notified when the certificate expires.
Warn in days to expire	Number of days to send a notification before the certificate expires.
Active	Option to enable the certificate.
Type	Option to select the type of the certificate. Select **Java Key Store**.
Expires in days	Number of days until the certificate expires.
Key store password	Password associated with the certificate (hint: the destination KeyStore password previously created).
Short description	Summary about the certificate.

4. Select the attachments icon ( ) and attach a JKS certificate.
5. Select **Validate Stores/Certificates**.

Create a JWT signing key for the GitHub JKS certificate

Create a JSON Web Token (JWT) signing key to assign to your GitHub Java KeyStore certificate.

Before you begin
Role required: admin, sn_devops.admin

Procedure
1. Navigate to **All** > **System OAuth** > **JWT Keys**.
2. Select **New**.
3. On the form, fill in the fields.

JWT Keys form fields

Field	Description
Name	Name to uniquely identify the JWT signing key. For example, `My GitHub App JWT Key`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Signing Keystore	Valid JKS certificate attached in the previous task. For example, `My GitHub App Certificate`.
Key Id	Unique Id to identify which key is used when multiple keys are used to sign tokens.
Signing Algorithm	Algorithm to sign with the JWT key (hint: RSA 256).
Signing Key Password	Password associated with the signing key (hint: the source keystore password previously created).
Active	Option to enable the key.

4. Select **Submit**.

Create a JWT provider for your GitHub signing key

Add a JSON Web Token (JWT) provider to your ServiceNow instance for GitHub.

Before you begin

Role required: admin, sn_devops.admin

Procedure

1. Navigate to **All** > **System OAuth** > **JWT Providers**.
2. Select **New**.
3. On the form, fill in the fields.

JWT Provider form fields

Field	Description
Name	Name to uniquely identify the JWT provider. For example, `My GitHub App JWT Provider`.
Expiry Interval (sec)	Number in seconds to set the lifespan of JWT provider tokens (Hint: You can leave it as default).
Signing Configuration	Valid JWT signing key previously created. For example, `My GitHub App JWT Key`.

4. Right-click the form header, and select **Save**.
5. Enter your GitHub App **App ID** (available in the **About** section of your GitHub App configuration in GitHub) as the value of the **iss** claim, in the Standard Claims related list.
6. Leave **aud** and **sub** values blank (default).

Register GitHub as an OAuth Provider (JWT)

Use the information generated during GitHub App account configuration to register GitHub as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin, sn_devops.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

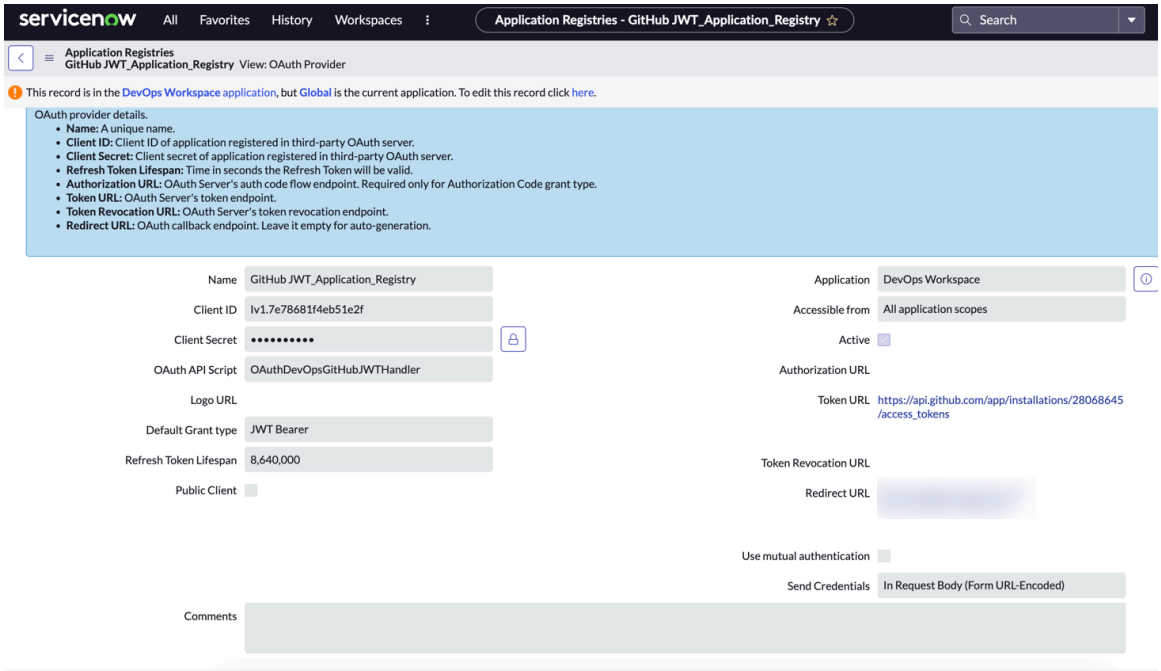
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.
   The **What kind of OAuth application?** message is displayed.
3. Select **Connect to a third party OAuth Provider**.
4. On the form, fill in the fields.

Application Registry form fields

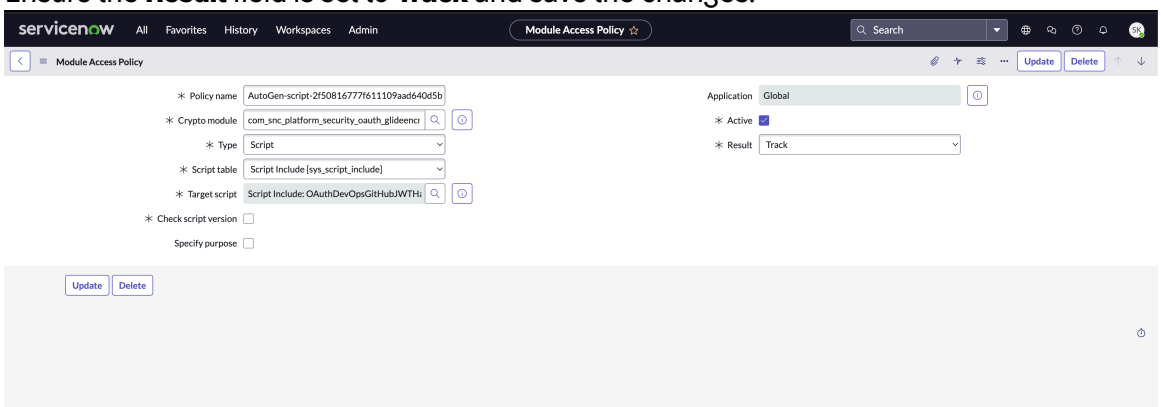
Field	Description
Name	Name to uniquely identify the record. For example, enter `My GitHub App Provider`.
Client ID	Client ID of your GitHub App (hint: available in the **About** section of your GitHub App configuration in GitHub).
Client Secret	Client secret of your GitHub App (hint: available in the **About** section of your GitHub App configuration in GitHub).
OAuth API script	Option that enables you to reference an amended OAuthUtil script include. Select **OAuthDevOpsGitHubJWTHandler**.
Default Grant type	Type of grant associated with application registry. Select **JWT Bearer**.
Token URL	The location of the token endpoint that the instance uses to retrieve and refresh tokens. For cloud version, enter: `https://api.github.com/app/installations/<installation_id>/access_tokens`. For enterprise version, enter: `https://<HOST_URL>/api/v3/app/installations/<installation_id>/access_tokens`. For the installation id, go to Install App section in your GitHub App configuration in GitHub and select the gear icon to configure your app. The installation id will be in the webpage URL. For example, https://github.com/settings/installations/<installation_id>.

5. Leave the rest of the form fields as default.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Right-click the form header, and select **Save**.
7. Open the default profile created in the **OAuth Entity Profiles** related list.
8. Populate the **JWT Provider** field with the JWT provider previously created and save the form.
9. Navigate to **Key Management > Module Access Policies > All**.
10. Select the policy that has **com_snc_platform_security_oauth_glideencrypter** as the **Crypto module** field value and **Script Include: OAuthDevOpsGitHubJWTHandler** as the **Target script** field value.
11. Ensure the **Result** field is set to **Track** and save the changes.



Create a credential record for GitHub App provider (JWT)

Create a credential record to the GitHub App provider previously created to authorize actions.

Before you begin

Role required: admin, sn_devops.admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
   The **What type of Credentials would you like to create?** message is displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **OAuth 2.0 Credentials**.
4. On the form, fill in the fields.

OAuth 2.0 Credentials form fields

Field	Value required
Name	Name to uniquely identify the record. For example, enter `My GitHub App Credential`.
Active	Option to enable the record.
OAuth Entity Profile	Default OAuth Entity profile created in the Application Registry.

5. Save the record.
6. Select the **Get OAuth Token** related link to generate the OAuth token.

OAuth 2.0 credentials for GitHub Apps - Authorization Code

Perform the following steps to integrate your GitHub Apps using Authorization code.

Before you begin

Role required:

- oauth_admin in DevOps Change Velocity.
- Admin account in GitHub.

Note:
Only user-level repositories are supported. You must have access to all the GitHub repositories that you want to configure in DevOps Change Velocity using Authorization code.

The OAuth Authorization Code grant type is supported for GitHub & GitHub Enterprise with MID server.

Configure the GitHub App in your GitHub account (Authorization Code)

Create a custom GitHub App from your GitHub account to enable OAuth 2.0 authentication with your ServiceNow instance.

Before you begin

GitHub requirement: GitHub App configured to integrate with ServiceNow

Role required: No instance role required

About this task

Complete these steps from your GitHub account. See Building GitHub Apps on the GitHub Developer site for instructions on creating and configuring custom applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From your GitHub account, create your GitHub App by navigating to **Developer Settings** > **GitHub Apps**.
2. In the **Homepage URL** field, enter `https://<instance-name>.service-now.com`.
3. In the **User authorization callback URL** field, enter `https://<instance-name>.service-now.com/oauth_redirect.do`.
4. In the **Identifying and authorizing users** section, deselect the **Expire user authorization tokens** field.
5. In the **Webhook** section, deselect the **Active** field.
6. Leave the remaining fields empty (default).
7. In the **Repository permissions** section, configure these settings.

Action	Read-only
Checks	Read-only
Contents	Read-only
Deployments	Read and write
Environments	Read-only
Metadata	Read-only
Pull requests	Read-only
Secrets	Read-only
Webhooks	Read and write **Note:** Read and write permissions are required to configure webhooks from ServiceNow.

8. Leave the remaining permissions as `No access` (default).
9. Install the newly created GitHub App on the accounts of your choice.

Register GitHub as an OAuth Provider (Authorization Code)

Use the information generated during GitHub App account configuration to register GitHub as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin, sn_devops.admin

Procedure

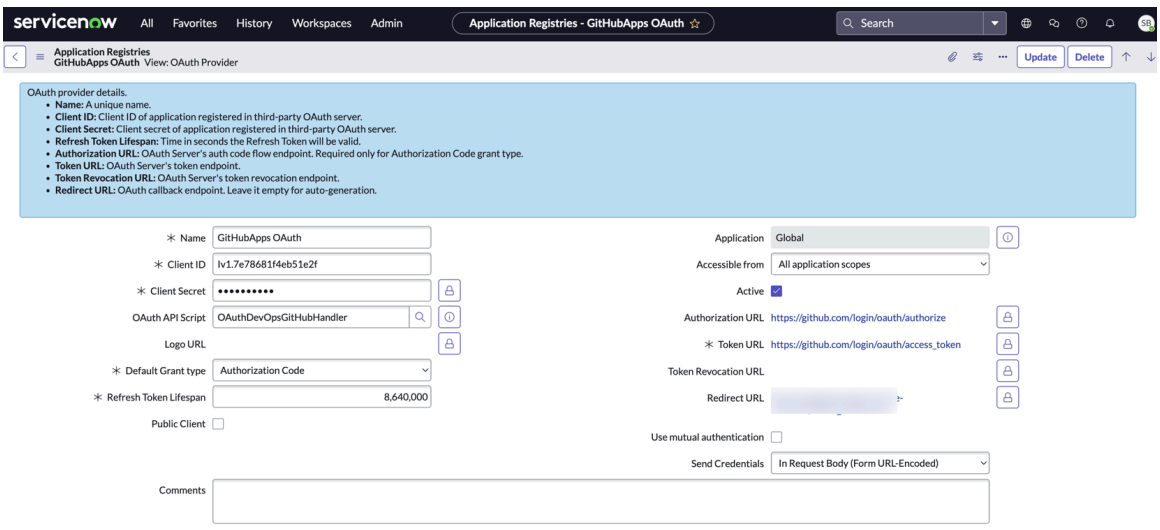
1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays an empty Application Registries form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Complete the form.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `My GitHub App Provider`.
Client ID	Enter the client ID of your GitHub App (hint: available in the **About** section of your GitHub App configuration in GitHub).
Client Secret	Enter the client secret of your GitHub App (hint: available in the **About** section of your GitHub App configuration in GitHub).
OAuth API script	Select **OAuthDevOpsGitHubHandler**.
Default Grant type	Select **Authorization Code**.
Authorization URL	Enter `https://github.com/login/oauth/authorize`. For an on-premises deployment, use the proper GitHub host URL.
Token URL	Enter `https://github.com/login/oauth/access_token`. For an on-premises deployment, use the proper GitHub host URL.

5. Leave the rest of the form fields as default.



6. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL** (Hint: It should match the **User authorization callback URL** previously provided in your GitHub App configuration).
   - The system populates **OAuth Entity Profile** with **Grant Type** as **Authorization Code**. For example, **OAuth Entity Profile** is created with default **Name**, **My GitHub App Provider default_profile**

Create a credential record for GitHub App provider (Authorization Code)

Create a credential record to the GitHub App provider previously created to authorize actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin, credential_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays an empty OAuth 2.0 Credentials form.
4. Fill in these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `My GitHub App Credential`.
Active	Enable
OAuth Entity Profile	Select the default OAuth Entity profile you created previously.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**. **Note:** You must connect to your GitHub tool instance using MID Server to use this credential.
Order	Select the order to apply this credential. For example, enter `100`.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.

GitHub Actions configurations

ServiceNow DevOps custom actions from GitHub marketplace

GitHub Actions configurations

Configuration information on GitHub Actions, such as, secrets, workflows, and limitations.

Secrets in GitHub Actions

Create secrets (credentials) in GitHub repository or GitHub organization. Secrets are environment variables (encrypted) that you create in an organization or repository. These secrets are available to use in GitHub Actions workflows. For more information, see Encrypted secrets.

Secret	Description
SN_INSTANCE_URL	ServiceNow instance URL. For example, https://<instance_name>.service-now.com.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

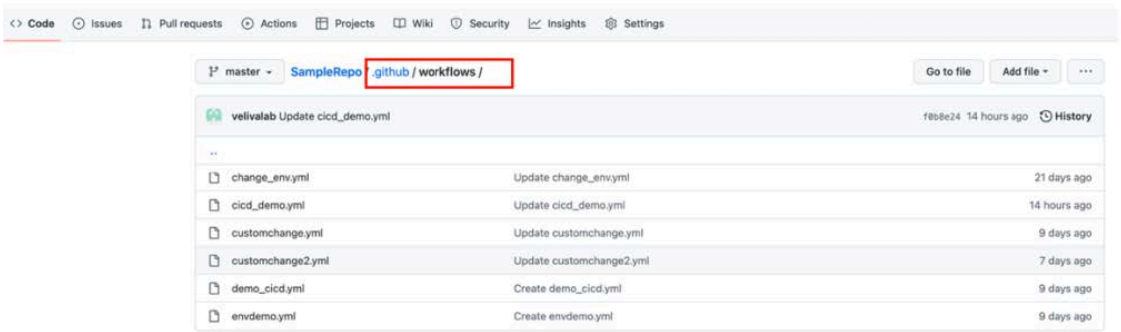
Secret	Description
SN_ORCHESTRATION_TOOL_ID	Sys_id for the GitHub tool created in ServiceNow instance.
SN_DEVOPS_INTEGRATION_TOKEN	Secret token for the GitHub tool created in DevOps (`devops-integration-token` parameter). To access your secret token navigate to your GitHub tool record in ServiceNow (**All > Tools > Orchestration Tools**), and select **Copy token** in the Classic UI.

Workflows in the GitHub repository

Create a YAML file to define workflow configuration in your GitHub repository.

The following points must be considered while defining the workflow:

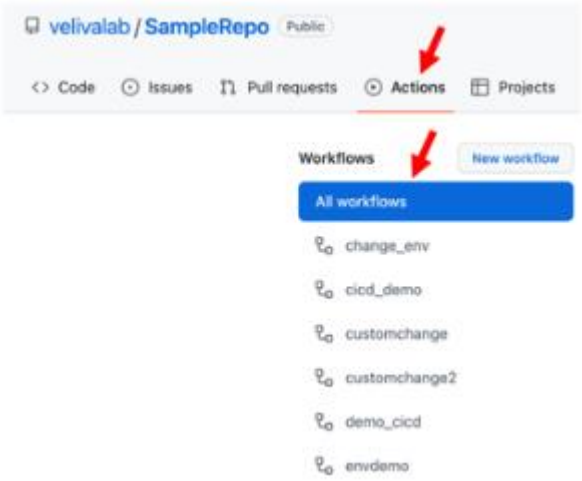
- All workflows of your repository must have either a .yml or .yaml file extension. All workflows must be under `.github/workflows` directory and follow the syntax defined in the Workflow syntax for GitHub Actions.



- The name of the workflow must match with the workflow file name.

- The names of the workflows under **All workflows** on the **Actions** tab must match with the workflows saved under the `.github/workflows` directory of your repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- A display name must be given for every job and must be unique for every job in the workflow. The job name must match with the stage name in the custom action.

```
change:
  name: Change Request Attributes
  runs-on: ubuntu-latest
  needs: registerPackage
  steps:
    - name: ServiceNow DevOps Change Attributes
      uses: ServiceNow/servicenow-devops-change@v2.0.0
      with:
        devops-integration-token: ${{ secrets.SN_DEVOPS_TOKEN }}
        instance-url: ${{ secrets.SN_INSTANCE_URL_ADEVOPS2 }}
        tool-id: ${{ secrets.SN_ORCHESTRATION_TOOL_ID_ADEVOPS2 }}
        context-github: ${{ toJSON(github) }}
        job-name: 'Change Request Attributes'
        change-request: '{"setCloseCode":"true","attributes":{"short_description":"Automated Software Deploymen
        interval: '100'
        timeout: '3600'
        deployment-gate: '{"environment":"deploy-gates-demo","jobName":"Deploy"}'
```

- Use the `workflow_dispatch` event to trigger a workflow manually.

GitHub Actions workflow run details in DevOps

After you configure the webhooks, the notifications from GitHub Actions are sent to ServiceNow DevOps whenever a workflow is executed or triggered.

The following details are sent to the ServiceNow instance when a workflow is manually executed or triggered automatically on a GitHub repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The workflow_job webhook notifies the ServiceNow instance with status of the job (queued, in_progress, completed) when the workflow is manually run or automatically triggered on a GitHub Repository.
- Inbound Events are created in the ServiceNow instance for status of the job (queued, in_progress, and completed) and in_progress events are ignored.
- Queued and completed inbound events are processed and ServiceNow DevOps Pipeline Steps and Orchestration Tasks are created for jobs configured in the workflow.
- Pipeline Execution is created for every workflow run with Task Executions and Step Executions records created for each job executed in the workflow run.
- You can use the Pipeline UI to visualize interactions and results across a pipeline execution.

GitHub re-runs

Change requests created for GitHub jobs are re-used if the change requests are in the implement and post-implement stages. For example, for a pipeline execution:

- If a job fails before the change request is in the implement stage, the change request created will not be re-used when the failed jobs are re-run.
- If the failed jobs or all jobs are re-run, a new change request will be created.
- Now if a job fails when the change request is in the implement or post-implement stages, the change request will be re-used when the failed jobs or all jobs are re-run.

> **Note:**
> If the change request is already implemented in a previous step before the job failed, then the during re-runs, the pipeline execution will not be stopped. The change request is considered as already approved and implemented.

Composite workflows

For composite workflows where one workflow calls another workflow and the change step is in the child workflow, the *job-name* parameter for the change step must be of the format `job-name: '<parent-job-name> / <child-job-name>'`. Here the space before and after the forward slash (/) is mandatory.

Example of a job-name parameter in the child workflow

```
steps:
  - name: Custom Change
    uses: ServiceNow/servicenow-devops-change@v4.0.0
    with:
      devops-integration-token: ${{ inputs.devops-integration-token }}
      instance-url: ${{ inputs.instance-url }}
      tool-id: ${{ inputs.tool-id }}
      context-github: ${{ toJSON(github) }}
      job-name: 'call-devops-change / Deploy'
      change-request: '{"setCloseCode":"true","attributes":{"short_description":
      interval: '100'
      timeout: '3600'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GitHub Actions limitations for DevOps Change Velocity integration

- GitHub Actions and GitHub Environments are supported in GitHub Enterprise Server starting from version 3.3.
  - For detailed information about GitHub environments, see Using environments for deployment.
  - GitHub environments are available to private repositories only in GitHub Enterprise Cloud.
- For GitHub Organizations, use a specific account (with access to the required organizations) with personal access token for integrating with ServiceNow DevOps or you can also use GitHub Apps through Authorization Code 2.0 or JWT.

  For tool creation using GitHub Apps - JWT, you must create separate tool for separate organization.
- Only the latest GitHub Actions scan results can be pulled from an instance for a workflow run.
- ServiceNow DevOps Change Automation using custom action or environment is not supported for parallel jobs. For parallel jobs, the webhook notification payload does not contain information on the jobs executed in parallel with a sequence number. Due to this limitation, the sequence of jobs depends on the execution order returned by the response of the (/repos/{owner}/{repo}/actions/runs/{run_id}/jobs) API.
- Callback URL to pause and resume workflow run from the ServiceNow instance is supported only with GitHub Actions Deployment Gates feature. However, change creation is possible through both deployment gates and GitHub Custom Action.
- User who creates GitHub tool in the ServiceNow instance must be a reviewer to approve the workflow for GitHub Environments.

Related topics

Configure webhooks in GitHub manually

ServiceNow DevOps custom actions from GitHub marketplace

Use the custom actions from the GitHub marketplace to collect SonarQube scan data, security data, pause or resume workflow, or resume workflow until a change request is approved or rejected in your instance, or get and update change request details and so on.

Alternatively, you can use Docker container images to implement custom actions for GitHub Actions pipelines. For more information, see Implement custom actions for pipelines using generic Docker container image.

ServiceNow DevOps SonarQube custom action

Save the SonarQube scan results of a project initiated by the workflow run in your ServiceNow instance. You must create the SonarQube tool in your instance and use the ServiceNow DevOps SonarQube custom action at the steps level of a job in the workflow.

View the SonarQube analysis results using one of the following methods:

- Navigate to **DevOps** > **Software Quality Results** > **Software Quality Summary**.
- Navigate to **DevOps** > **Orchestrate** > **Task Execution** and selecting a relevant **Task Execution** record.

Perform the following tasks to use the custom action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create SonarQube tool in your instance.

  Generate token from **User** > **My Account** > **Security** page in your SonarQube tool and create tool in the ServiceNow instance using the generated token. For more information, see Onboard SonarQube to DevOps Change Velocity — Workspace and Onboard SonarQube to DevOps Change Velocity — Classic.

- Create the following Secrets to save SonarQube scan results in the ServiceNow instance.
  - SONAR_HOST_URL: SonarQube instance URL. For example, `https://sonarcloud.io`
  - SONAR_PROJECT_KEY: The key to identify a project in the SonarQube instance. For example, `org.examples:demo`
- Configure the ServiceNow DevOps SonarQube custom action in the workflow.

  The custom action `servicenow-devops-sonar` must be configured at steps level of job in the workflow with **uses** keyword. The inputs of this custom action must not be tampered to save SonarQube analysis results in the ServiceNow instance. For more information, see ServiceNow DevOps Sonar.

ServiceNow DevOps Test Report custom action

Save unit test results of the project initiated by the workflow run in your ServiceNow instance. The ServiceNow DevOps Test Report custom action must be used at the steps level of job in the workflow.

View the unit test results saved in your ServiceNow instance by navigating to **DevOps** > **Test Results** > **Test Summaries**.

You can also view by navigating to **DevOps** > **Orchestrate** > **Task Execution** and clicking a relevant **Task Execution** record.

Perform the following tasks to use the custom action.

- Create Secrets in the GitHub Repository.
- Configure the DevOps Test Report custom action in the workflow.

  The custom action `servicenow-devops-test-report` must be configured at steps level of job in the workflow with **uses** keyword. The inputs of this custom action must not be tampered to save the unit test results in your ServiceNow instance. For more information, see ServiceNow DevOps Test Report.

ServiceNow DevOps Register Artifact custom action

Save artifacts created or deployed by the workflow run in your ServiceNow instance. Use the ServiceNow DevOps Register Artifact custom action at steps level of job in the workflow.

View the artifacts details saved in your instance by navigating to **DevOps** > **Artifact** > **Artifacts**.

Perform the following tasks to use the custom action:

- Create Secrets in the GitHub Repository.
- Configure ServiceNow DevOps Register Artifact custom action in the workflow.

  The custom action `servicenow-devops-register-artifact` must be configured at steps level of job in the workflow with **uses** keyword. The inputs of this custom action must not be tampered to save artifact details in your instance. For more information, see ServiceNow DevOps register artifacts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow DevOps Register Package custom action

Save packages created or deployed by the workflow run in the ServiceNow instance. Use the ServiceNow DevOps Register Package custom action at steps level of job in the workflow.

View the package details saved in the ServiceNow instance by navigating to **DevOps** > **Artifact** > **Packages**.

Perform the following tasks to use the custom action.

- Create Secrets in the GitHub Repository.
- Configure ServiceNow DevOps Register Artifact custom action in the workflow.

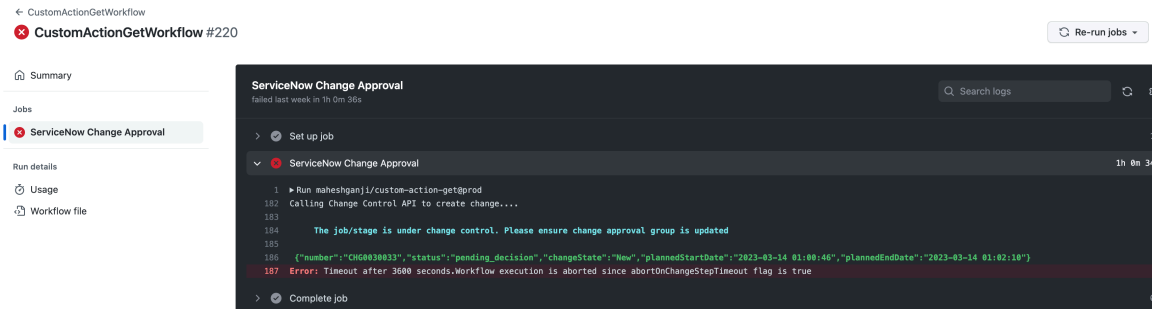
  The custom action `servicenow-devops-register-package` must be configured at steps level of job in the workflow with **uses** keyword. The inputs of this custom action must not be tampered to save artifact details in your instance. For more information, see ServiceNow DevOps register package.

ServiceNow DevOps Change Automation custom action

Create a change request in the ServiceNow instance to pause and resume the workflow run from the ServiceNow instance.

Use the ServiceNow DevOps Change Automation custom action at steps level of job in the workflow. If the change is not created within the time period specified in the threshold (changeCreationTimeOut), and the **abortOnChangeCreationFailure** parameter is enabled, the pipeline will be aborted.

This custom action creates a change request in ServiceNow, enables the **Change Control** option, and polls the ServiceNow instance at the defined time interval for change status until either the change is approved or rejected or the timeout threshold (timeout) is reached. GitHub aborts the workflow run if the timeout threshold is reached and the **abortOnChangeStepTimeout** parameter is enabled.



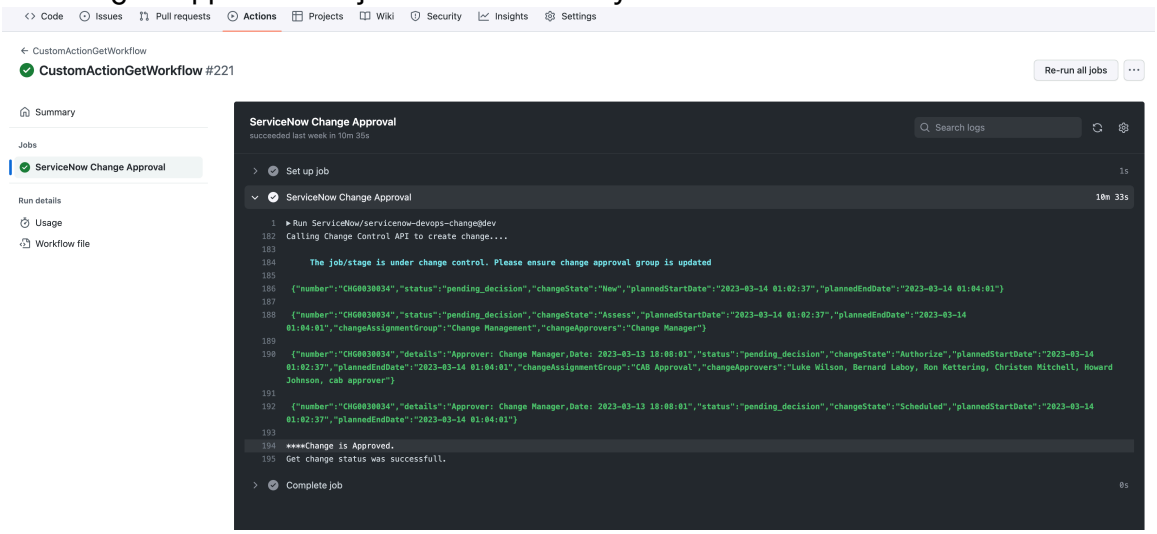
This custom action immediately resumes the workflow run when change receipt is enabled for pipeline in ServiceNow without waiting for the change to be approved or rejected in the ServiceNow instance.

View the change created for the workflow run in the ServiceNow instance by navigating to **DevOps** > **Orchestrate** > **Pipeline Change Requests**.

The change number with status **pending_decision** is displayed in the GitHub Actions console while polling the ServiceNow instance for change status. The details like change comments, approved by, approved on, and status are logged in GitHub Actions console after

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the change is approved or rejected or canceled by the user in the ServiceNow instance.

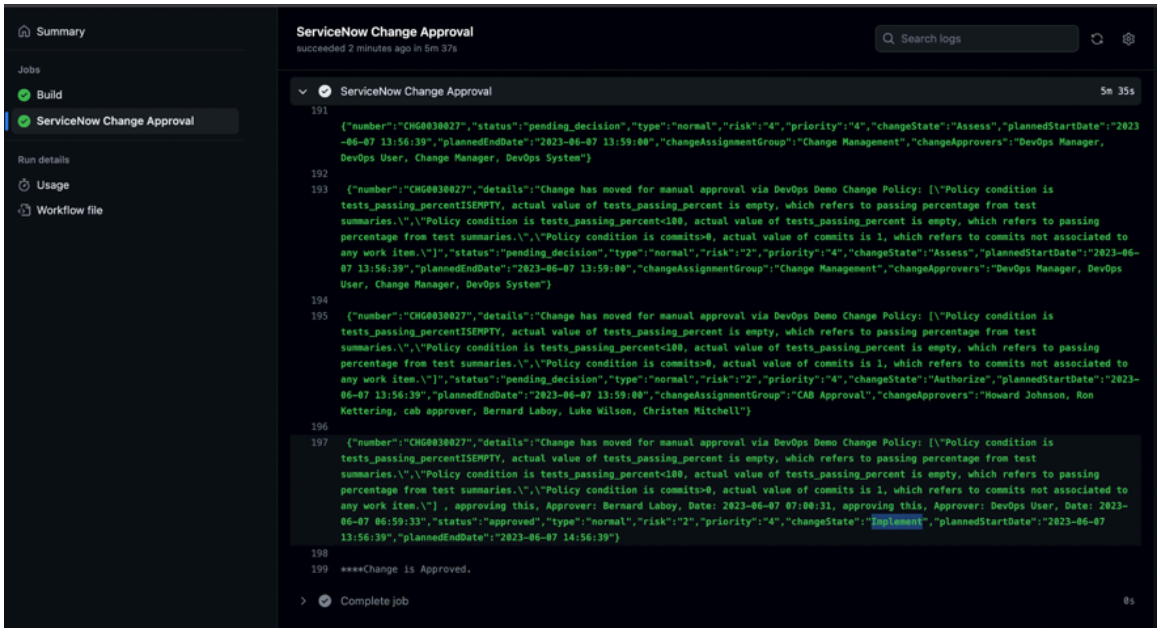


You can navigate to the console logs in your pipeline to view the state of a change request when a change request is created, change details will be displayed as per the polling time interval. The policy conditions associated with the change request state will also be evaluated and displayed in the logs. For example, if the DevOps Change Request Advanced Automation policy is activated, the policy conditions will be evaluated and the corresponding decision made (auto-approve/auto-reject/manual-approval) will be displayed in the logs.

The following change request details are displayed:

- number
- details
- status
- sys_id
- type
- risk
- priority
- changeState
- plannedStartDate
- plannedEndDate
- changeRequestURL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
changeState is the state of the change request, and **status** is the status of the step execution.

The logs for policy conditions will be displayed for the base system change flows as follows:

- DevOps Model Change Policy: Only logs will be displayed on change creation and when the change state is updated.
- DevOps Change Request Minimal Automation Policy: Logs along with change decision and policy conditions corresponding to the change decision will be displayed.
- DevOps Change Request Advanced Automation Policy: Logs along with change decision and policy conditions corresponding to the change decision will be displayed.

The change policy input and decision conditions are stored in the Decisions [sys_decision_question] table. Logs will be displayed if the following fields and operators are used as input for policy conditions:

Fields

- code_coverage
- commits_without_work_item
- integration_tests_failed
- load_tests_failed
- regression_tests_failed
- num_of_outages_in_last_7_days
- num_of_current_outages
- num_of_open_incidents
- total_num_of_commits
- tests_passing_percent
- risk
- code_security
- commits

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operators

- <=
- >=
- !=
- =
- <
- >
- ISNOTEMPTY
- ISEMPTY
- BETWEEN
- ANYTHING
- NSAMEAS
- SAMEAS
- GT_FIELD
- LT_FIELD

Note:
If any field is modified in a change policy other than the base system fields, then those fields must be manually added to the flow for policy conditions to be evaluated.

Perform the following tasks to use the custom action.

- Create Secrets in the GitHub Repository.
- Configure ServiceNow DevOps Change Automation custom action in the workflow.

  The custom action `servicenow-devops-change` must be configured at steps level of job in the workflow with **uses** keyword. The inputs of this custom action must not be tampered to create change in your instance and poll for change status every number of seconds. For more information, see ServiceNow DevOps change automation.

ServiceNow DevOps Get Change Github Action

Retrieve the change request number in a GitHub Actions pipeline based on specific change details.

The ServiceNow DevOps Get Change Github Action custom action must be added at the step level in a pipeline job to retrieve the change request number from a ServiceNow instance by specifying change details.

ServiceNow DevOps Update Change Github Action

Update change request details associated with a GitHub Actions pipeline.

The ServiceNow DevOps Update Change Github Action custom action must be added at the step level in a pipeline job to update the change request in a ServiceNow instance. The change request number whose details need to be updated and the change request details to be updated must be specified as input.

ServiceNow DevOps Security Results Action

Retrieve security scan results in ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The ServiceNow DevOps Security Results Action custom action must be added at the step level in a pipeline job to retrieve security scan results in ServiceNow.

GitHub Deployment Gates for ServiceNow DevOps Change

Use the GitHub Deployment Gate capability to decide on whether a new deployment should proceed or halt.

Before you begin

GitHub deployment gates are supported only if you have connected your GitHub instance with Oauth 2.0 credentials for GitHub Apps using the JWT bearer token. For more information, see OAuth 2.0 credentials for GitHub Apps - JWT.

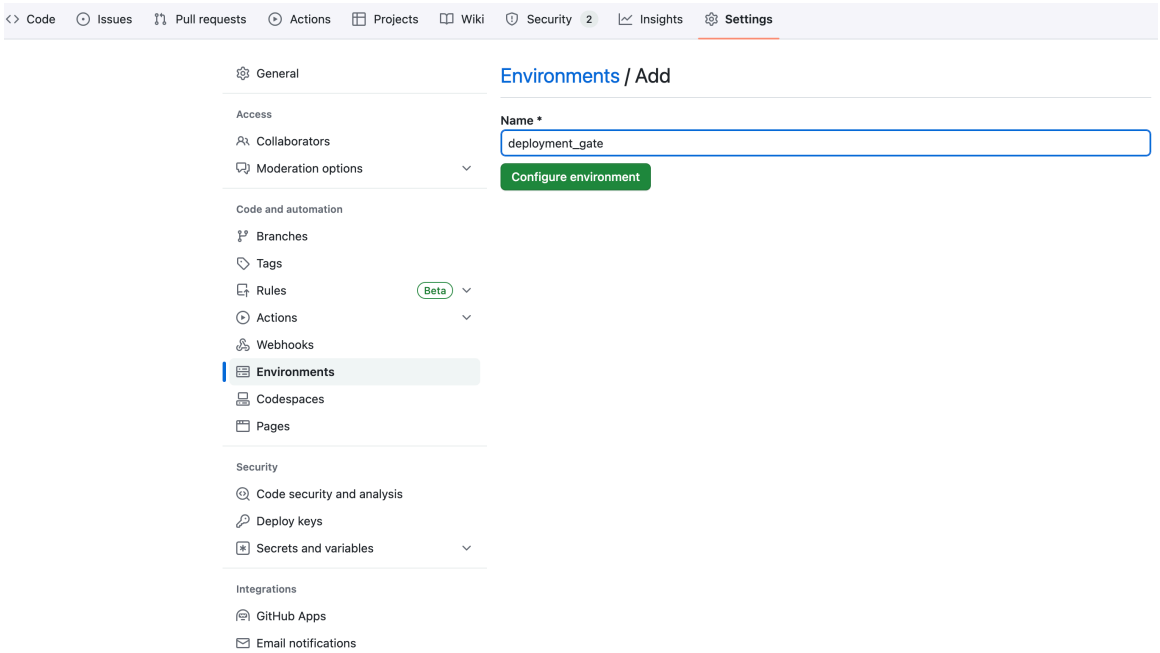
By default, the Deployment protection rules section is available for environments in all the repositories selected in the installed GitHub App.

Role required: Permission to create environments in GitHub

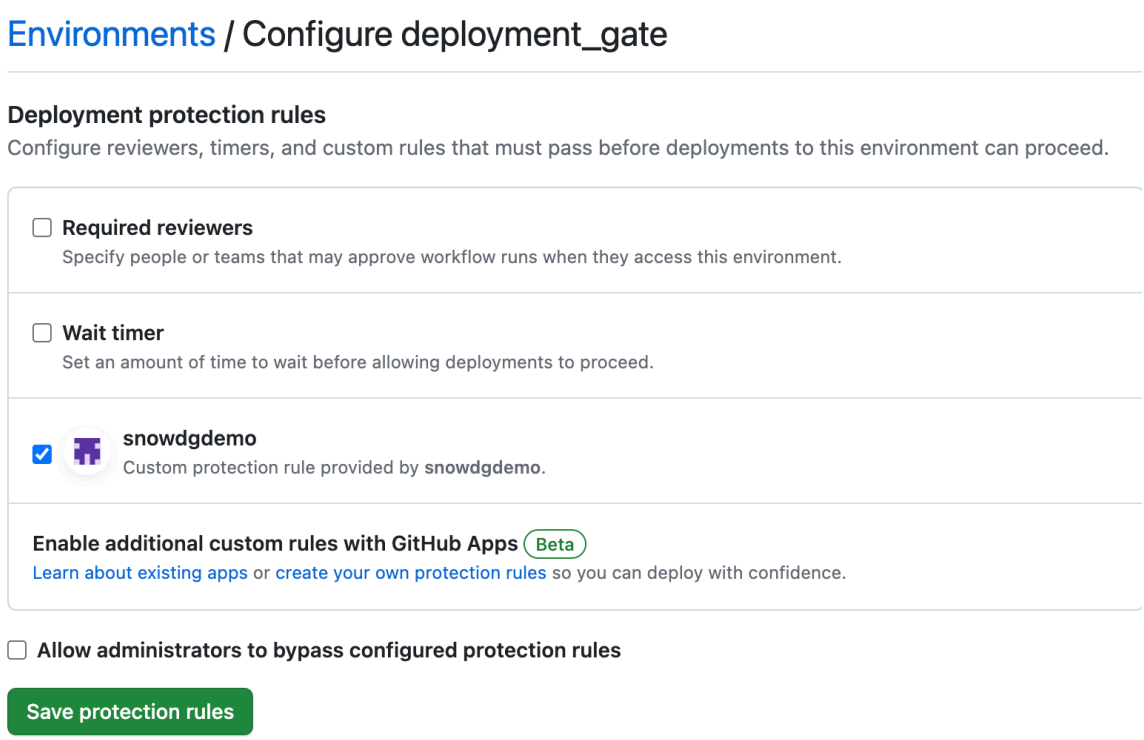
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Settings > Environments** from a repository and click **New environment** to create an environment.



2. In the Deployment protection rules section, select the installed GitHub App name, and select **Save protection rules**.



3. Add the ServiceNow DevOps Change Automation custom action at the step level (for example, changeRequest job in workflow/yaml file) in a pipeline job to create the change for deployment gates.
   The *deployment-gate* parameter must be added in the following JSON format.

```
'{"environment":"deployment_gate","jobName":"Deploy"}'
```

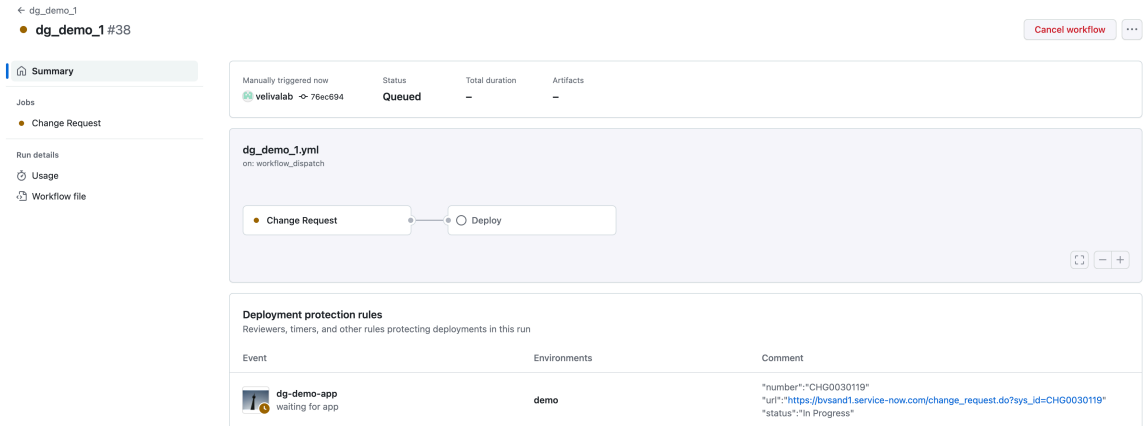
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Here *environment* key value is the environment created with deployment protection rules, and *jobName* key value is the deployment job created in the workflow/yaml file with dependency on the change request job configured with the ServiceNow DevOps Change Automation custom action.

```
  change:
    name: Change Request Attributes
    runs-on: ubuntu-latest
    needs: registerPackage
    steps:
      - name: ServiceNow DevOps Change Attributes
        uses: ServiceNow/servicenow-devops-change@v2.0.0
        with:
          devops-integration-token: ${{ secrets.SN_DEVOPS_TOKEN }}
          instance-url: ${{ secrets.SN_INSTANCE_URL_ADEVOPS2 }}
          tool-id: ${{ secrets.SN_ORCHESTRATION_TOOL_ID_ADEVOPS2 }}
          context-github: ${{ toJSON(github) }}
          job-name: 'Change Request Attributes'
          change-request: '{"setCloseCode":"true","attributes":{"short_description":"Automated Software
Deployment","description":"Automated Software
Deployment.","assignment_group":"a715cd759f2002002920bde8132e7018","implementation_plan":"Software update is tested and
results can be found in Test Summaries Tab; When the change is approved the implementation happens automated by the CICD
pipeline within the change planned start and end time window.","backout_plan":"When software fails in production, the
previous software release will be re-deployed.","test_plan":"Testing if the software was successfully deployed"}}'
          interval: '100'
          timeout: '3600'
          deployment-gate: '{"environment":"deploy-gates-demo","jobName":"Deploy"}'

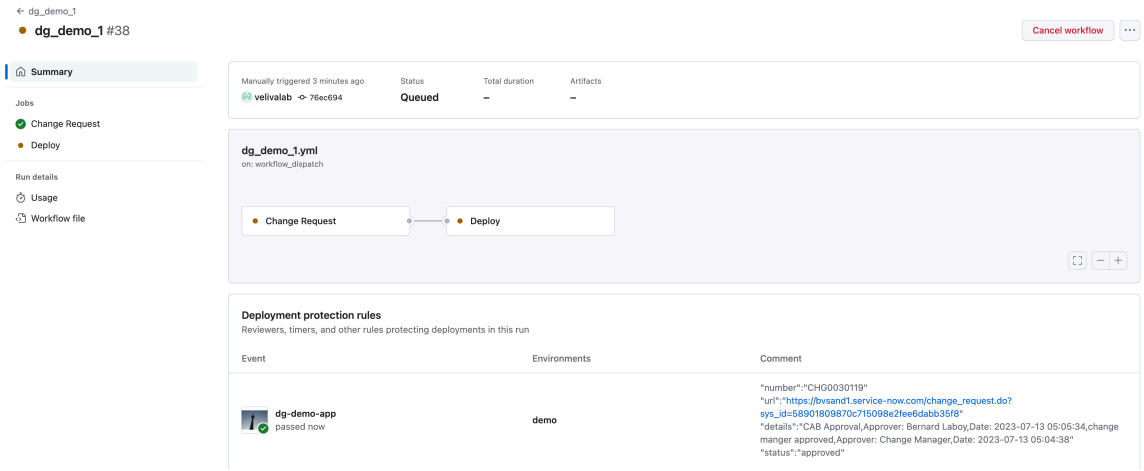
  deploy:
    name: 'Deploy'
    needs: change
    runs-on: ubuntu-latest
    environment: deploy-gates-demo
    steps:
      - name: Run deployment scripts
        run: echo Completed Deployment.
```

When the deployment gate specific workflow/yaml file is run in GitHub Actions, the details like change number, change url, and status will be displayed once the change request is created in ServiceNow.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The details like change comments, approved by, approved on, and status are logged in the GitHub tool after the workflow run is resumed from ServiceNow, i.e. when change request is approved and the change request state is updated to Implement in ServiceNow.



Configure webhooks in GitHub manually

Configure webhooks in GitHub to send sync notifications to the DevOps Change Velocity application.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity, GitHub admin

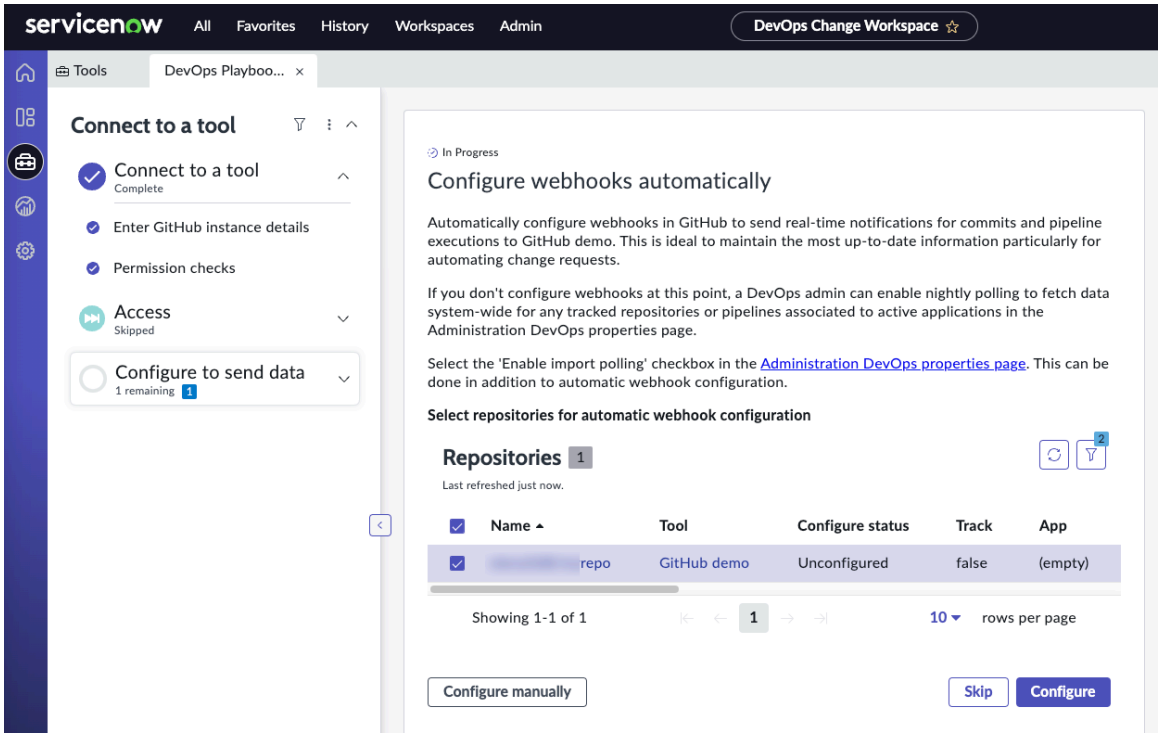
About this task

You can also access manual configuration from the GitHub tool record in DevOps Change Velocity.

Procedure

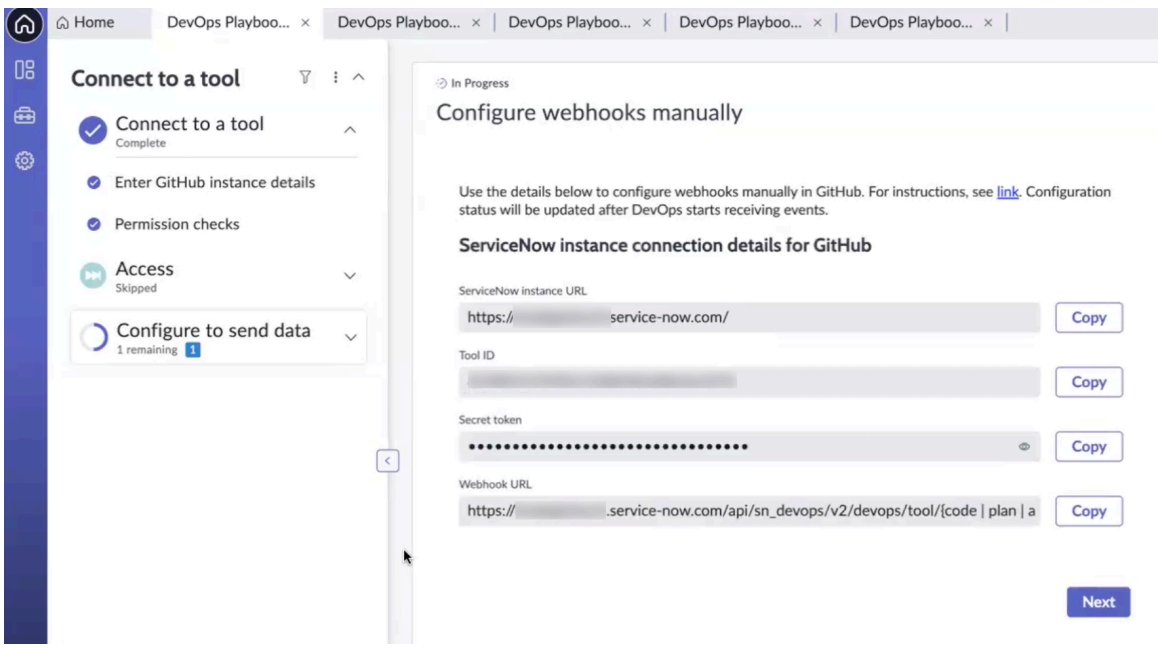
1. In GitHub, navigate to **Settings** > **Webhooks** and add a webhook.
2. In DevOps Change Velocity, choose **Configure manually** when configuring the tool instance to send data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In DevOps Change Velocity, copy the **Webhook URL** field from the ServiceNow instance connection details for GitHub.

> **Note:**
> Select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times.



4. Modify the copied Webhook URL to reflect your tool details, and paste the URL in GitHub.

   For example:

```
https://myinstance.service-now.com/api/sn_devops/v2/devops/
tool/{code | plan | artifact | orchestration | test |
softwarequality }?toolId=23410545938c71d0db5bfe686cba1036
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select one of the tool capabilities `{code | plan | artifact | orchestration | test | softwarequality }` to match your tool.
For example:

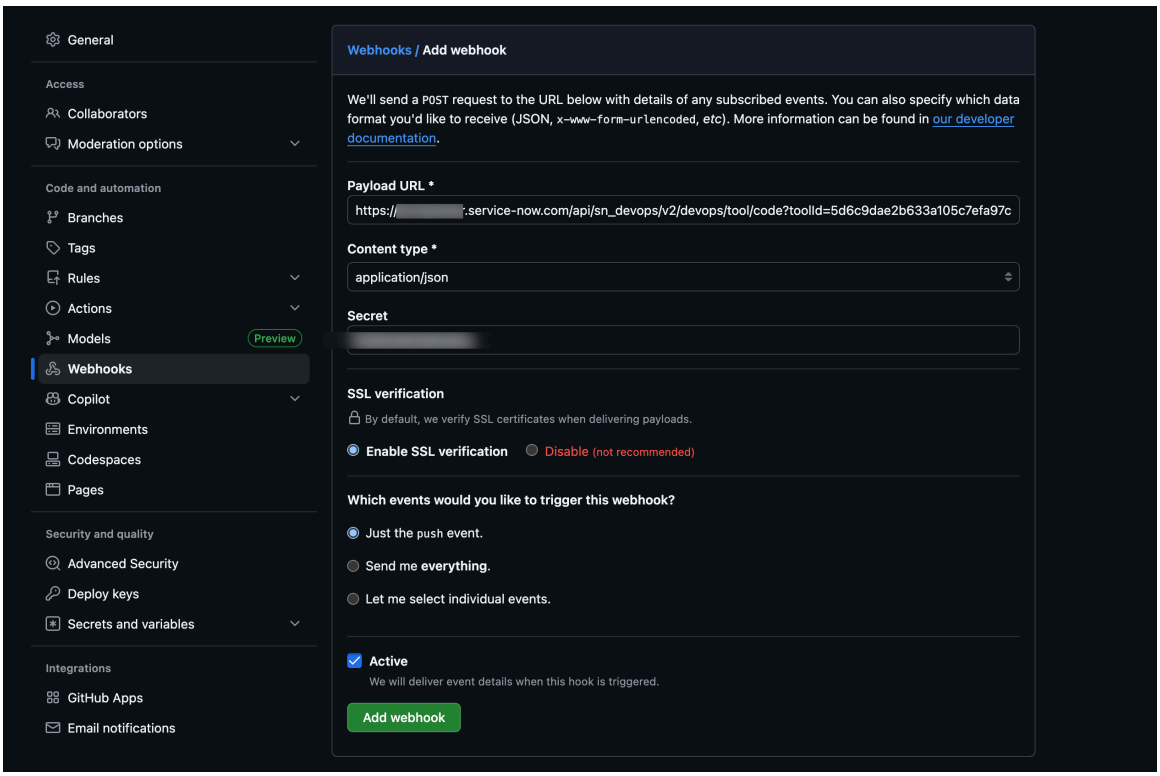
```
https://myinstance.service-now.com/api/sn_devops/v2/devops/tool/orchestration?toolId=23410545938c71d0db5bfe686cba1036
```

b. Copy the modified Webhook URL to the **Payload URL** field of the new webhook in GitHub.

5. In DevOps Change Velocity, copy the **Secret token** field from the ServiceNow instance connection details for GitHub, and paste in the **Secret** field of the new webhook in GitHub.

Copy field values

From DevOps Change Velocity field	To GitHub field
Webhook URL (modified)	Payload URL
Secret token	Secret



GitLab integration with DevOps Change Velocity

Connect to your GitLab instance to discover plans, repositories, and pipeline definitions and configure real-time notifications or polling to enable change traceability and automation.

GitLab integration overview

Versions supported:

- On premises - base version 13.x and above
- GitLab Cloud

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps Change Velocity supports Plan (Issues), Code (Repository) and Orchestration (Pipelines) capabilities for the GitLab tool. In case of pipelines, only basic pipelines are supported but not the multi-project ones.

- **Connect**: Discover plans, repositories, and pipeline definitions by connecting your GitLab instances to DevOps Change Velocity.
- **Configure**: Enable sending real-time notifications for commits, pipelines, and work items by automatically creating a webhook in GitLab so that this data can be used to create change policies.

Note:
If you are upgrading to version 5.0.0 from a previous release, you must re-configure your tool to receive GitLab Issues (planning) related events.

Trigger events required for code capability:

- Push events
- Tag push events
- Comments
- Merge request events

Trigger events required for orchestration capability:

- Job events
- Pipeline events

Trigger events required for planning capability:

- Issues events
- Confidential issues events

Key points

- A pipeline must be run and completed at least once before enabling change control.
- If a manual job in GitLab is canceled, or times out before completion, the corresponding change remains in **Open** state until the change request approval process is completed manually.
- Pipeline discovery is limited to the first 100 results using the project search filter. To discover additional pipelines, modify the search filter (which appears when you select **Discover**) to expand the results for the discovery request.
- Milestone discovered from a GitLab plan is displayed as release version in ServiceNow DevOps Change Velocity.
- Repositories or pipelines created or updated after the project has already been discovered and configured are tracked manually.
- JUnit test type integration is supported for GitLab. GitLab unit test reports support test reports only in the JUnit report format. You can convert different test types to JUnit and persist it. For detailed information, see Unit test reports and Unit test report examples.
- Test tool integration lets you view test results in DevOps for GitLab unit, functional, and performance tests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started

Use one of the following options to onboard GitLab. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard GitLab to DevOps Change Velocity — Workspace

Connect to your GitLab instance using the DevOps Change Workspace playbook to discover plans, repositories, and pipelines.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

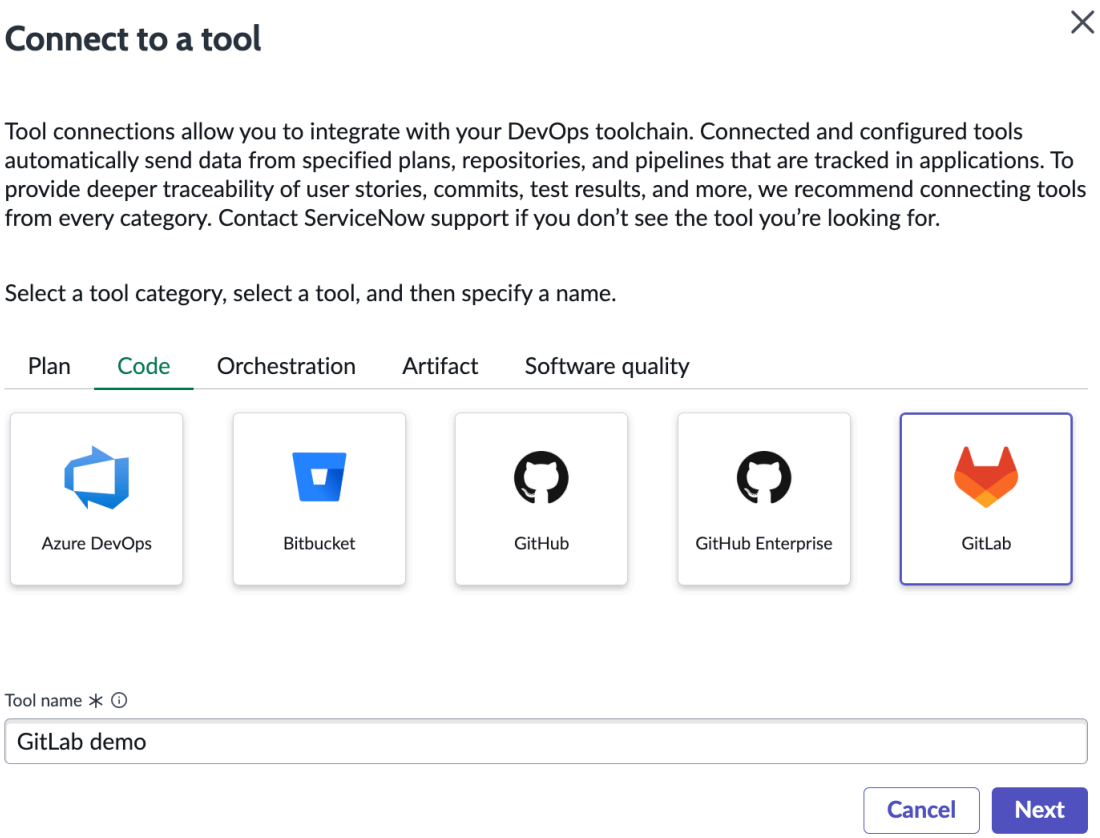
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard GitLab.

   Important:
   If you want to discover and track tool objects like plans, pipelines, or repositories while connecting to the tool, you must connect your tool from the Application module.

2. In the **Tool name** field, enter a name for the tool.



3. Select **Next**.

   The DevOps playbook opens to help you complete the onboarding tasks.

4. Enter your GitLab instance details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter your GitLab instance URL.

b. In the **Credential type** field, select one.

- Basic Auth
- OAuth 2.0

c. Enter the credentials.

- Basic Auth: Enter the username and password/access token of your GitLab instance.

  Note:
  Only personal access token is supported. When you generate the token, select the scope API and grant read/write access including all the groups and projects, container registry, and package registry.

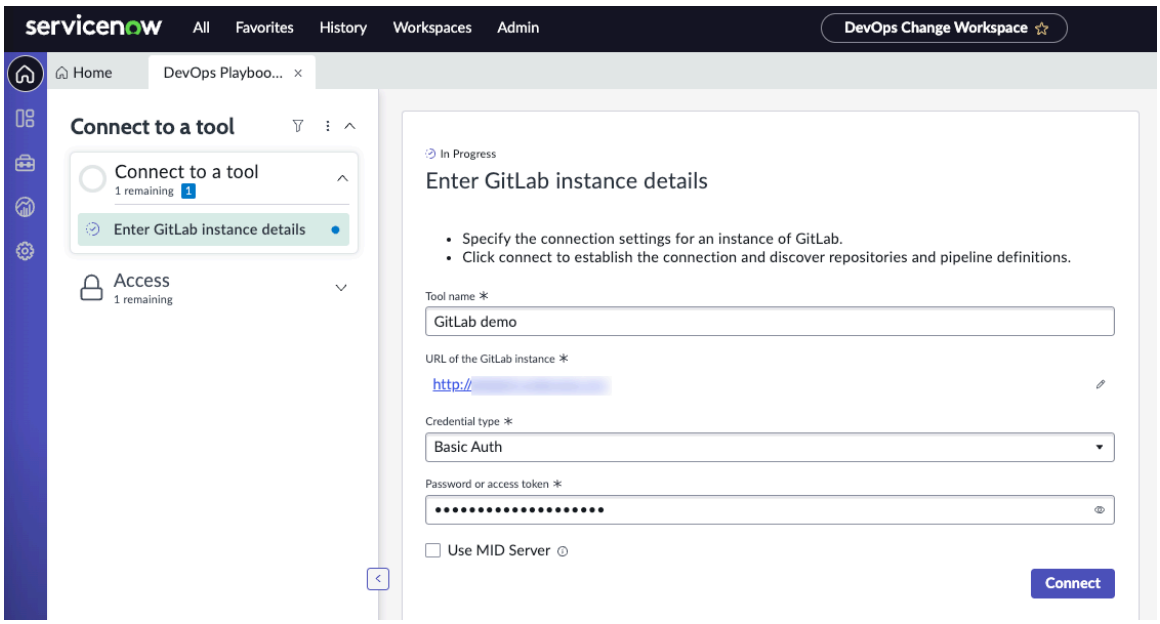
- OAuth 2.0: Enter your OAuth credential.

  For more information on OAuth2.0 credentials, see Setting up GitLab OAuth 2.0 credentials for DevOps.

d. Optional: If your GitLab instance is attached to a MID Server, select the **MID Server** option and enter its details.

(Optional) For more information about MID server, see MID Server selection

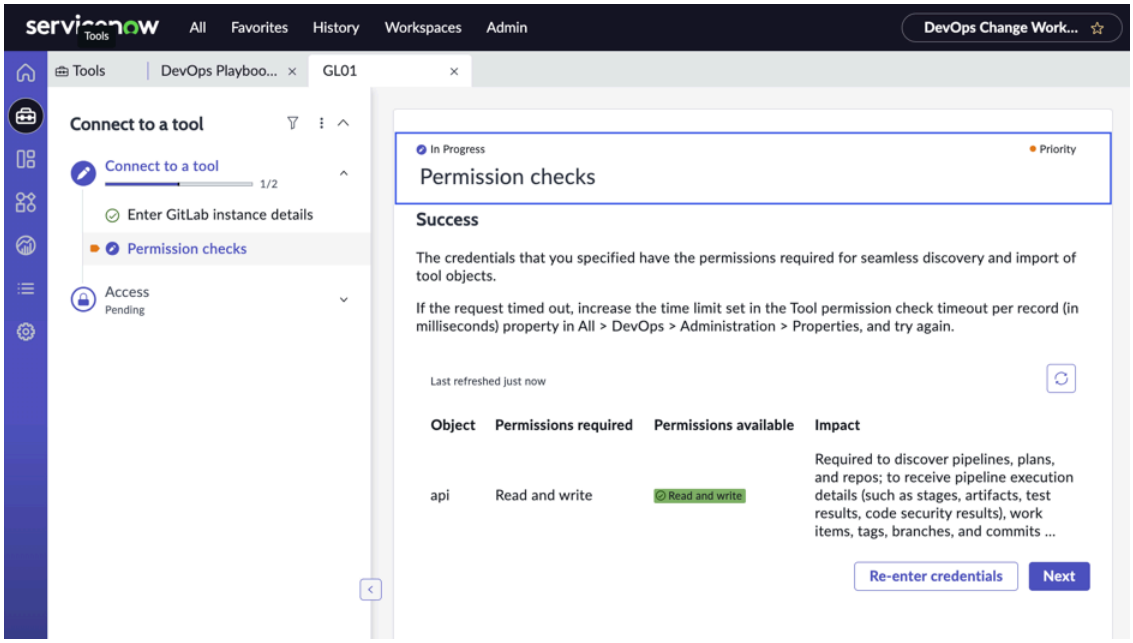
e. Select **Connect**.



5. Permission checks are run on the credentials that you entered.
Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information on all the required permissions, see GitLab permissions in Permissions required for DevOps tools.

You can choose to continue with the tool connection even if you don't have all the required permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Next**.
7. Specify the access for the tool.
   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

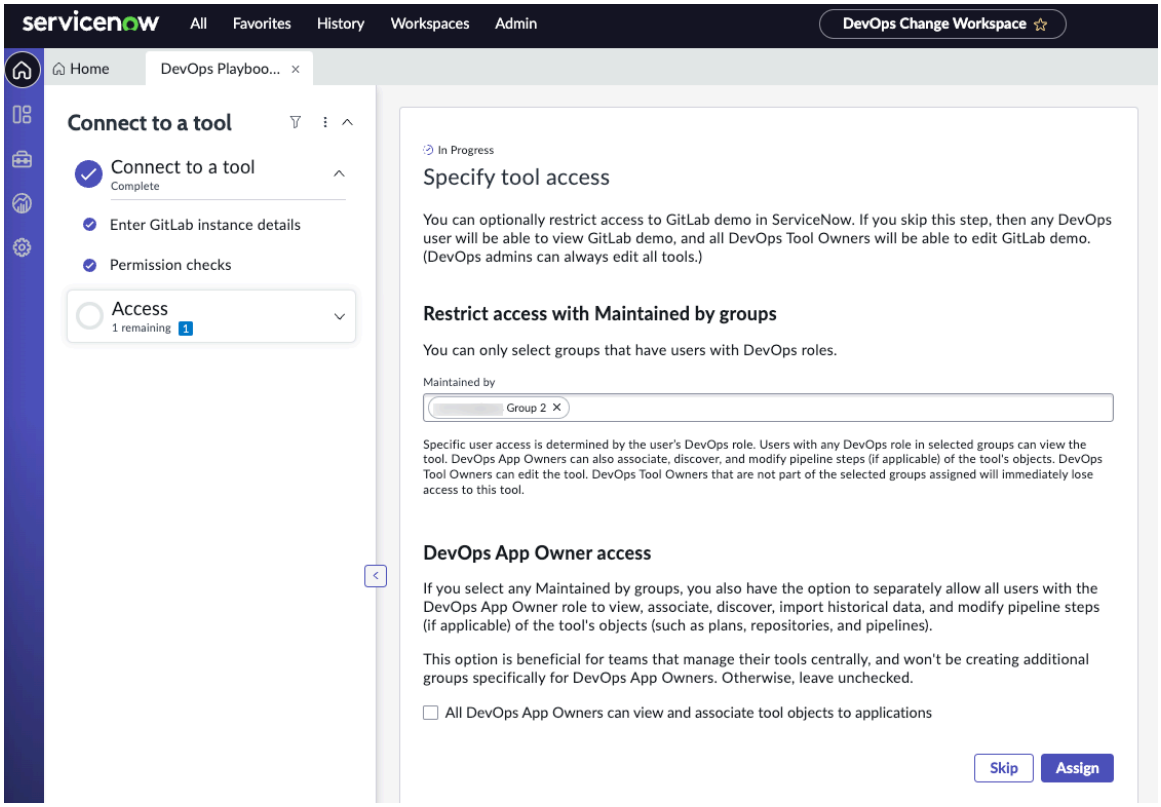
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

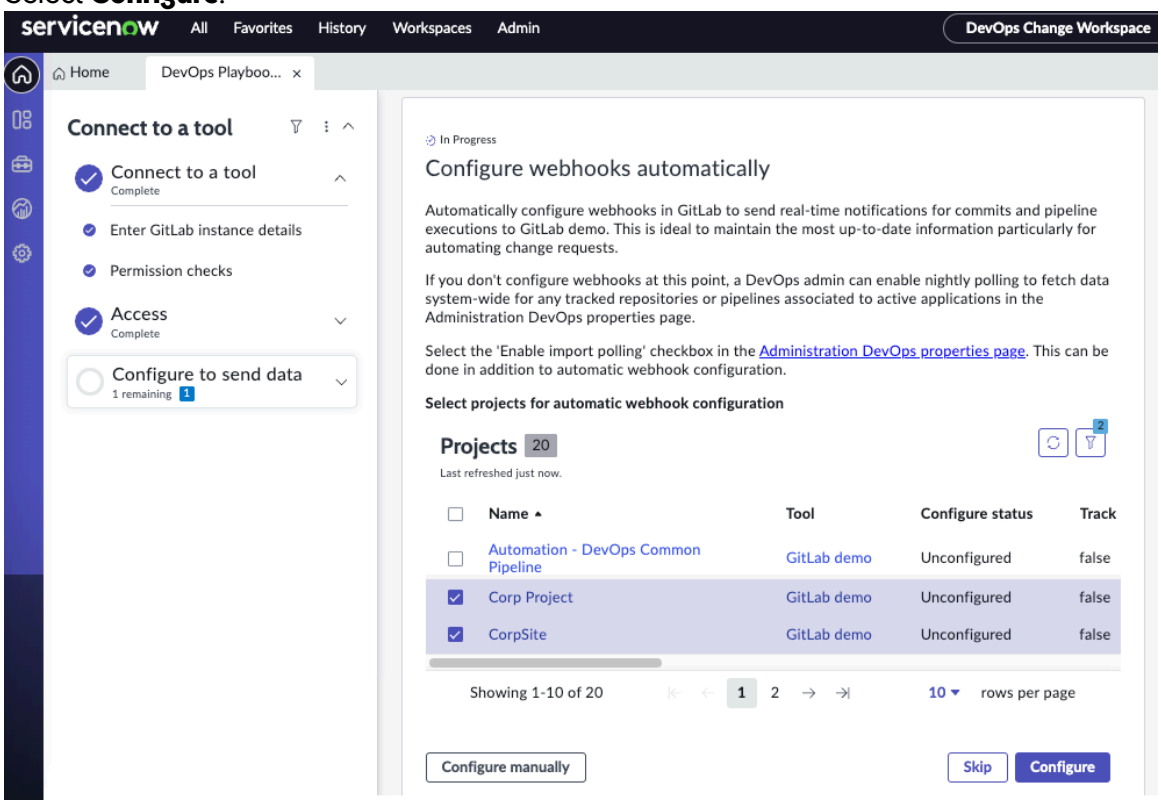
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Select the projects for which you want to configure webhooks automatically.

   You can also choose to enable nightly polling to retrieve data for any tracked pipelines by selecting the **Enable Polling** property option in the **Administration** module. See DevOps Change Velocity properties.

9. Select **Configure**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To configure manually, select **Configure manually**. See Configure webhooks in GitLab manually for more information.

Important:

- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then plans, repositories, and pipelines available in your project are discovered. You can track and import historical data from them.

10. Select the pipelines that you want to associate to the application, and select **Associate pipelines**.

    For each selected pipeline, all steps are imported for the last successful execution.

11. **Optional:** In the Assign services to pipeline steps activity, specify **Step type** and **Service** for each pipeline step.

    (Optional) Completing this step as part of tool onboarding enables the DevOps Insights dashboards to show more meaningful data immediately.

12. Select the plans you want to associate to the application, and select **Associate plans**.
13. Select the repositories you want to associate to the application, and select **Associate repositories**.
14. In the Import historical data step, select the date range in the **Start date** and **End date** fields and select **Import data**.

    Note:
    You can import up to 90 days of data.

15. Select **Next**.
16. From the **Summary** page, review the details of the successfully connected GitLab tool.

    Select **View tool record** to review the details of the connected instance.

Result

You've successfully onboarded your GitLab tool to DevOps Change Velocity.

Note:
If your tool credential changes, you must also update the credentials in DevOps Change. For more information, see Update third-party tool credentials in DevOps Change Velocity.

Related topics

Configure webhooks from the tool record

Onboard GitLab to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your GitLab instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your GitLab integration.
Tool integration	Select GitLab.
Tool URL	URL of your GitLab instance.
Credential type	Select Basic Auth or OAuth, depending on the credentials you're using. ○ For Basic Auth, enter the username and password or access token. ○ For OAuth, enter the credentials.
Tool password/ Access token/API Key	GitLab password or access token.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps and capability is set to REST.

   For a list of all the permissions required on the credentials for connecting to GitLab, see GitLab permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is created, connected, and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Leave empty.
Onboarding repositories	Enter the connected GitLab tool name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Repositories	Select the repositories for which you want to configure webhooks and import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Do you wish to configure webhook for the tool?	Select the check box if you want to configure webhooks for the selected repositories.
Onboarding plans	Enter the connected GitLab tool name.
Plans	Select the plans for which you want to import historical data.
Import from and Import to	Select the dates for which you want to import the Plans data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.

8. Select **Order Now**.
   A request is created. When the request is approved, the plan and repository objects are associated to the app record and webhooks are configured for real-time tracking. Historical data is imported for the selected plans and repositories. The **Track** field is automatically enabled for imported repositories.

Onboard GitLab to DevOps Change Velocity — Classic

Create an GitLab tool record in DevOps Change Velocity to connect, discover, and import GitLab tool data.

Before you begin

Complete the steps specified in the Getting started section before connecting to a tool.

Role required: sn_devops.admin or sn_devops.tool_owner

About this task

- **Connect** by using your GitLab instance details.
- **Discover** plans, repositories, and pipelines.
- **Configure** webhooks in GitLab.
- **Import** branch and commit records, work items, task execution and step execution records.

Procedure

1. Enter the GitLab instance details to connect to DevOps Change Velocity.

   a. Navigate to **DevOps** > **Tools** > **Create New (legacy)** and create a record.

   b. Enter a **Tool Name** and fill in the tool details.

Tool URL	GitLab tool URL. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	`https://gitlab.com`
Tool Username	GitLab username
Tool Password / Access Token	GitLab access token **Note:** Only personal access token is supported. When you generate the token, select the scope api and grant read/write access including all groups and projects, the container registry, and the package registry.

For a list of all the permissions required on the credentials for connecting to GitLab, see GitLab permissions in Permissions required for DevOps tools.

c. **Optional:** Select **MID Server** for an on-premises tool that is attached to a MID Server. The **Application** value is automatically set to DevOps and the **Capability** value is set to REST.

d. Click **Submit**.
The tool is connected successfully.

On successful tool creation, you're taken to the tool record page.

2. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

   The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

3. Click **Discover** to discover existing plans, repositories, and pipelines, and fill in the fields in the project Search Filter window.

   Note:
   GitLab plans, repos, and pipelines discovered are determined by these filter conditions. To discover additional repos, modify the project filter to expand the results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Owned by me (recommended)	Searches for the repositories in the project that the current user owns.
Currently member of	Searches for the repositories in the project that the current user is a member of.
Search	Searches for the repositories in projects with the specified text string.

Note:
GitLab plans, repositories, and pipelines discovered are also determined by the credentials (level of access) configured in the connection.

Records are added to the corresponding related lists.

4. Automatically configure the webhook URL in a GitLab repository to send notifications to the DevOps tool by selecting **Configure**.
   Alternatively, you can choose to enable nightly polling to fetch data system for any tracked plans, repositories, or pipelines by setting the **Enable Polling** property to **Yes**.
5. For discovered plans, repositories, and pipelines, import historical data for the tool and associate with an app.

   a. Open the repository or plan or pipeline record from the corresponding related list and click **Import**.
   Imported branch records, commits, pipeline executions, work items and so on are added to the corresponding related lists.

   b. In the **App** field, click the lookup list and select an App record to associate with the repository, plans, or pipeline.

   Imported historical data records are added to the corresponding related lists.

Setting up GitLab OAuth 2.0 credentials for DevOps

Integrate your GitLab account with your ServiceNow instance by creating a custom OAuth application in GitLab and authenticating requests from ServiceNow DevOps.

Configure your GitLab account, register GitLab in the application registry, and create a credential record for the GitLab App provider.

Role required: oauth_admin.

Configure the GitLab App in your GitLab account (Authorization Code)

Create a custom GitLab App from your GitLab account to enable OAuth 2.0 authentication with your ServiceNow instance.

Before you begin
Role required: admin

About this task
Configure GitLab as an OAuth 2.0 authentication identity provider. For more information, see GitLab documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From your GitLab account, create your App by navigating to **Edit Profile** > **Applications**.
2. In the **Add new application** form, specify a **Name**, and in **Redirect URI** field, enter `https://<instance-name>.service-now.com/oauth_redirect.do`.
3. In the **Scopes** section, ensure that you select the **api** check box.
4. Leave the remaining fields empty (default).
5. Click **Save application**.
   The application is created. You can open the application to access the Application ID, Secret key, and Callback URL.
6. Install the newly created GitLab App on the accounts of your choice.

Register GitLab as an OAuth Provider (Authorization Code)

Use the information generated during GitLab App account configuration to register GitLab as an OAuth provider and allow the instance to request OAuth 2.0 tokens.

Before you begin

Role required: admin

Procedure

1. Navigate to **System OAuth** > **Application Registry**.
2. Click **New**.
   The system displays the message **What kind of OAuth application?**
3. Select **Connect to a third party OAuth Provider**.
   The system displays an empty Application Registries form.
4. Complete the form.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `My GitLab App Provider`.
Client ID	Enter the Application ID of your GitLab App.
Client Secret	Enter the secret key of your GitLab App.
OAuth API script	Select **OAuthDevOpsGitLabHandler**.
Default Grant type	Select **Authorization Code**.
Authorization URL	Enter `https://gitlab.com/oauth/authorize`. For an on-premise deployment, use the proper GitLab host URL.
Token URL	Enter `https://gitlab.com/oauth/token`. For an on-premise deployment, use the proper GitLab host URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Leave the rest of the form fields as default.
6. Right-click the form header, and click **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL** (Hint: It should match the **Redirect URI** value previously provided in your GitLab App configuration).
   - The system populates **OAuth Entity Profile** with **Grant Type** as **Authorization Code**. For example, **OAuth Entity Profile** is created with default **Name**, **My GitLab App Provider default_profile**.
7. Validate that the **OAuth Entity Scopes** related list contains the **api** scope.

Create a credential record for GitLab App provider (Authorization Code)

Create a credential record for the GitLab App provider previously created to authorize actions.

Before you begin

Role required: admin

Note:
The user who creates the credential record, and generates the OAuth token in ServiceNow must have at least the Maintainer role in GitLab for project webhooks, and Owner role for group webhooks to ensure that webhooks can be auto-configured. For more information, see GitLab documentation.

Procedure

1. Navigate to **Connections & Credentials** > **Credentials**.
2. Click **New**.
   The system displays the message **What type of Credentials would you like to create?**.
3. Select **OAuth 2.0 Credentials**.
   The pop-up window displays an empty OAuth 2.0 Credentials form.
4. Fill in these values.

Field	Value required
Name	Enter any name to uniquely identify the record. For example, enter `My GitLab App Credential`.
Active	Enable
OAuth Entity Profile	Select the default OAuth Entity profile you created previously.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**.
Order	Select the order to apply this credential. For example, enter `100`.

5. Save the record.
6. Click the **Get OAuth Token** related link to generate the OAuth token.
   A successful token generation indicates that you can now authenticate connection between ServiceNow DevOps and GitLab via OAuth.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GitLab pull request configurations

GitLab pull (merge) request pipeline executions, which goes through change acceleration before moving to production, can be tracked in DevOps Change Velocity. This integration also collects GitLab merge requests meta data to persist in DevOps Change Velocity. The data is linked with the change created in the merge request pipeline execution and can be used for applying change policies, review, and approval.

- Create, update, close, re-open, and merge of pull requests are supported.
- Pull request pipeline execution for change acceleration in GitLab pipelines is supported. Pull request details will be available for use in the change approval policy.
- Status of GitLab pipeline is updated with the pull request status automatically after the change creation. The pipeline is paused and resumed automatically.
- Email ids are defaulted to the format `<user_name>@noreply.gitlab.com`.
- Comments are supported as part of merge request support. Create and update to pull requests are supported, while delete and edit are not supported.
- Maximum of 100 commits will be shown in DevOps Change Velocity. If you need to access more than 100, you must refer your GitLab instance. Only the latest comment is populated.

Settings to enable pull (merge) requests for change approval

The DevOps property **Enable to track GitLab pull (merge) requests. If not enabled, then pull (merge) requests and related events will be ignored** enables the tracking of pull (merge) requests from GitLab in DevOps Change Velocity.

Note:
The property is enabled by default. If you don't want the merge (pull) requests to be tracked, you must disable it.

When enabled, the pull (merge) request changes will be reflected in DevOps Change Velocity. When disabled, DevOps Change Velocity ignores the pull request events.

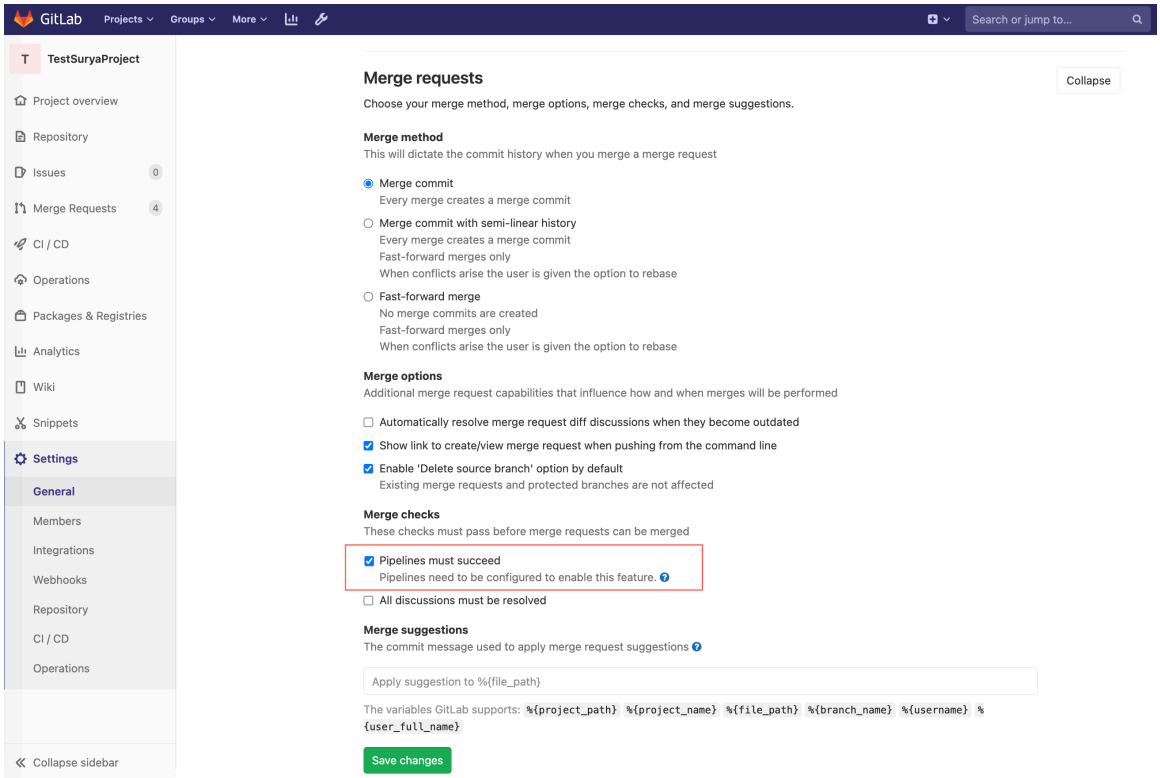
For pull request and orchestration pipeline linking and to enable change approval tracking, the following are required:

- Use GitLab Docker for change tracking. For detailed information, see Implement custom actions for pipelines using generic Docker container image.
- From your GitLab project,

1. Navigate to
   - For GitLab cloud: **Settings** > **Merge requests**.
   - For On premises (13.x): **Settings** > **General** > **Merge requests**.
2. Select the **Pipelines must succeed** check box.

   With this selection, only if the change is approved, you can proceed with the merge request. That is, when the check box is selected, pull requests will be blocked until the change is approved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Save changes**.

- Navigate to your project and open the `.yml` file.

To the `.yml` file, add the following rule at the pipeline level or at specific job levels.

```
rules:
 - if: $CI_PIPELINE_SOURCE == 'merge_request event'
 - if: $CI_PIPELINE_SOURCE != 'merge_request_event'
```

Example for pipeline level:

```
workflow:
  rules:
  - if: $CI_PIPELINE_SOURCE == 'merge_request_event'
  - if: $CI_PIPELINE_SOURCE != 'merge_request_event'
```

Example for job level:

```
changeapproval:
   stage: changeapproval
   script:
     - sndevopscli create change -p
 '{"changeStepDetails":{"timeout":3600,"interval":100},"attribu
tes":{"short_description":"Automated Software
 Deployment","description":"Automated Software
 Deployment.","assignment_group":"a715cd759f2002002920bde8132e7
018","implementation_plan":"Software update is
 tested and results can be found in Test Summaries
 Tab.","backout_plan":"When software fails in
 production, the previous software release will be
 re-deployed.","test_plan":"Testing if the software was
 successfully deployed or not"}}'
   rules:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  - if: $CI_PIPELINE_SOURCE == 'merge_request_event'
  - if: $CI_PIPELINE_SOURCE != 'merge_request_event'
```

Model a GitLab basic CI pipeline in DevOps

Model a GitLab basic CI pipeline by mapping the pipeline to an app, and mapping DevOps pipeline steps to GitLab pipeline jobs.

Before you begin

Role required: sn_devops.admin

Procedure

1. Map your pipeline to an app.

   a. Navigate to **DevOps** > **Apps & Pipelines** > **Apps** and open the application record to associate with the pipeline.

   b. In the Pipelines related list, click **Edit...** to select a pipeline to associate with the app, or click **New** to create the pipeline.

   > **Note:**
   > While associating a pipeline with an app, the pipeline steps are also fetched during import.

   For a new pipeline, fill in the **Orchestration pipeline** field using the group name, subgroup name (if applicable), and project name as specified in GitLab.

   For example, `My Group/My SubGroup/My Project`.

   If a project is not under a group, simply specify `My Project`.

   c. Click **Submit**.

2. Open the pipeline record again and create DevOps steps to map to each GitLab pipeline job so an orchestration task can be created.
   Steps can be created in one of the following ways.

   - Automatically create and map pipeline steps in DevOps by running your GitLab pipeline.

     Pipeline steps are automatically created, mapped, and associated when DevOps receives step notifications from your GitLab pipeline during the run.

   - Manually create and map each pipeline step to a GitLab pipeline job.

     In the Steps related list, click **New** to create a DevOps step for each GitLab pipeline job (**Orchestration stage** field).

     > **Note:**
     > The **Orchestration stage** field value of each step is case-sensitive and must match the original name of the corresponding GitLab pipeline job.

Name	Name of the pipeline step.
Pipeline	Pipeline in which the step is configured.
Type	Pipeline step type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	▪ Build and Test ▪ Test ▪ Deploy ▪ Deploy and Test ▪ Manual ▪ Prod Deploy
Order	Order in which the steps are run. **Note:** The step order determines the order of the cards in the Pipeline UI. The order of the cards in the Pipeline UI is by task execution.
Orchestration stage	GitLab pipeline job name (case-sensitive). **Note:** For step association with GitLab CI pipeline jobs, the **Orchestration stage** field must be configured.
Business service	Configuration service that applies to the step.

Once orchestration tasks are created, associate each orchestration task in the Orchestration Tasks related list with a DevOps pipeline step.

3. **Optional:** Select the **Change control** check box in a step to enable change acceleration and the corresponding configuration fields.

Note:
The Change Management feature must be installed for change acceleration.

Change receipt	(Optional) Select to enable change receipt for the step so the pipeline doesn't pause when a change request is created. All pipeline data is included in the change, but approval is not required for the pipeline to proceed.
Change approval group	(Optional) Approval group for the change request. The change approval group becomes the **Assignment group** in the DevOps change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

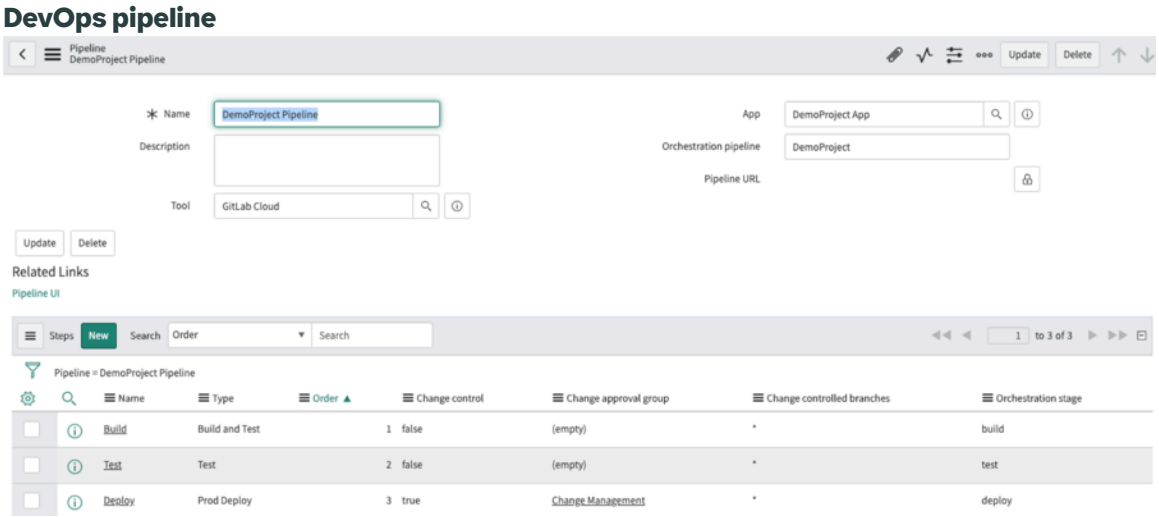
	Note: Ensure that the selected group has members and a group manager so approver field is not empty.
Change type	Change request type to create. ○ Normal (default) ○ Standard ○ Emergency
Change model	Change model for the change request. For more information, see DevOps change models.
(Optional) Template **Note:** This field is shown only when **Change type** is Normal or Emergency.	(Optional) List of templates to use to auto populate fields for Normal or Emergency change requests. Select a template or create a new one.
(Optional) Standard change template **Note:** This field is shown only when **Change type** is Standard.	List of standard change templates to use for Standard change requests. **Note:** This field is required for Standard change type.
Change controlled branches	(Optional) (Multibranch only) Comma-separated list of branches under change control. Wildcards are supported.

You can set up change control in GitLab for manual GitLab jobs.

Note:
A pipeline must be run and completed at least once before enabling change control.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:



What to do next

Change acceleration in GitLab

Bulk commits in GitLab

Bulk commits are supported with GitLab.

To support large commits, perform these actions:

- Install the ServiceNow IntegrationHub Action Template - Data Stream (com.glide.hub.action_type.datastream) plugin.
- For optimal performance, disable flow logging by setting the Flow Designer com.snc.process_flow.reporting.level property to **Off**.
- For MID Server settings, view the MID Server support for Data Stream actions section.

GitLab code push webhook sends a maximum of 20 commits in a notification. If the number of commits in the push are less than 20, a single inbound event is created and processed in the ServiceNow instance.

If the number of pushed commits are equal or greater than 20, multiple inbound events are created from the original event with each new event containing a batch of 19 commits. The original inbound event is marked as ignored.

Currently, GitLab Data stream action can process up to 10,000 commits in a single push.

Configure webhooks in GitLab manually

Configure webhooks in GitLab manually to send job, push, and issues notifications to the DevOps application.

Before you begin

Role required:

- sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity
- Maintainer (or higher) for the GitLab projects.

About this task

Create webhooks for the following two triggers in GitLab for every project you want to track.

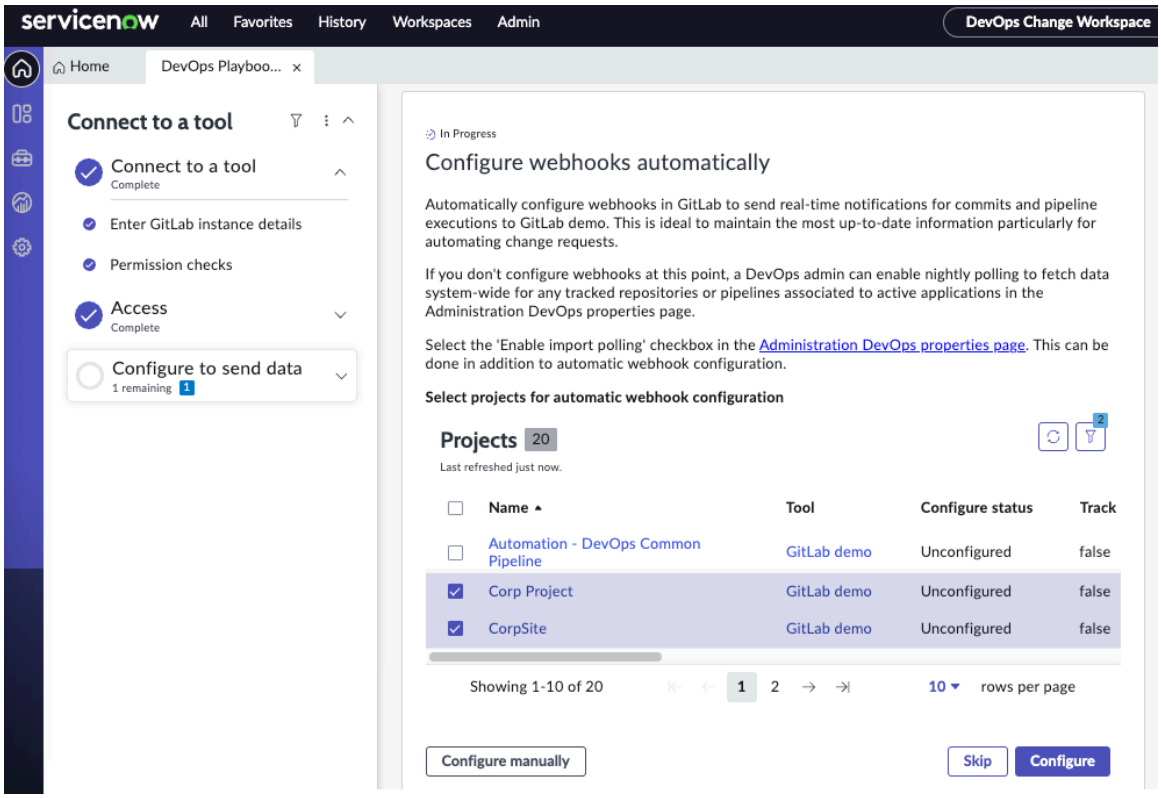
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Push events (code capability)
- Job events (orchestration capability)
- Issues events (planning capability)

You can also access manual configuration from the GitLab tool record in DevOps Change Velocity.

Procedure

1. In GitLab, navigate to **Project** > **Settings** > **Webhooks** and add a webhook.
2. In DevOps Change Velocity, choose **Configure manually** when configuring the tool instance to send data.

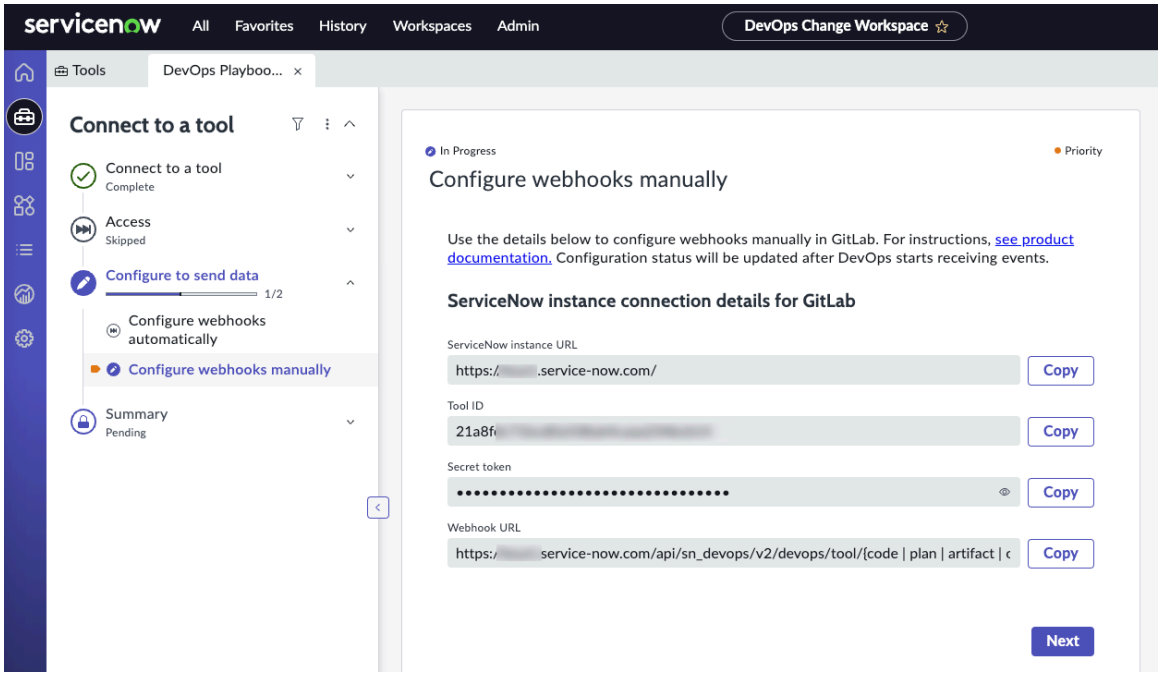


> **Note:**
> You can also access manual configuration from the GitLab tool record in DevOps Change Velocity. From the tool record, select **Configure** > **Configure manually**.

3. Copy the **Webhook URL** field from DevOps Change Velocity connection details for GitLab.

> **Note:**
> Select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Modify the copied Webhook URL to reflect your tool details, and paste the URL in GitLab.

   For example:

   ```
   https://<your instance>.service-now.com/api/sn_devops/
   v2/devops/tool/{code | plan | artifact | orchestration | test |
   softwarequality }?toolId=<your ToolId>
   ```

   a. Select one of the tool capabilities `{code | plan | artifact | orchestration | test | softwarequality }` to match your tool.
   For example:

   ```
   https://<your instance>.service-now.com/api/sn_devops/
   v2/devops/tool/code?toolId=<your ToolId>
   ```

   b. Copy the modified Webhook URL to the **URL** field of the new webhook in your GitLab instance.

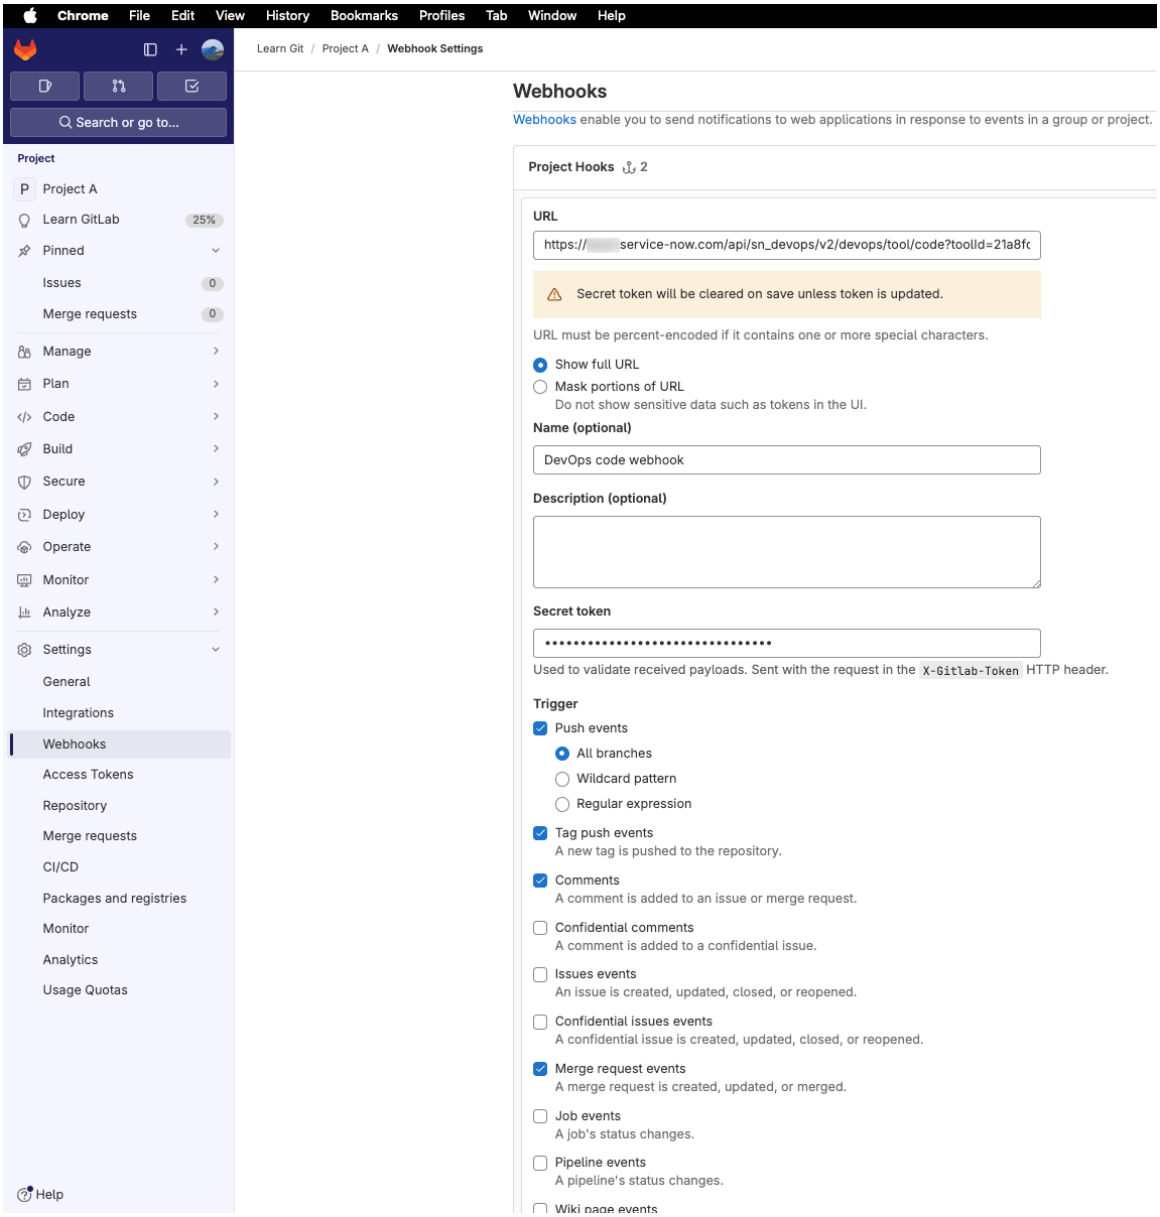
5. Copy the **Secret token** field from the ServiceNow instance connection details for GitLab, and paste in the **Secret Token** field of the new webhook in your GitLab instance.

Copy field values

From DevOps Change Velocity	To GitLab
Webhook URL (modified)	URL
Secret token	Secret Token

6. Select the check boxes for **Push events**, **Tag push events**, **Comments**, and **Merge request events** for coding capability events.

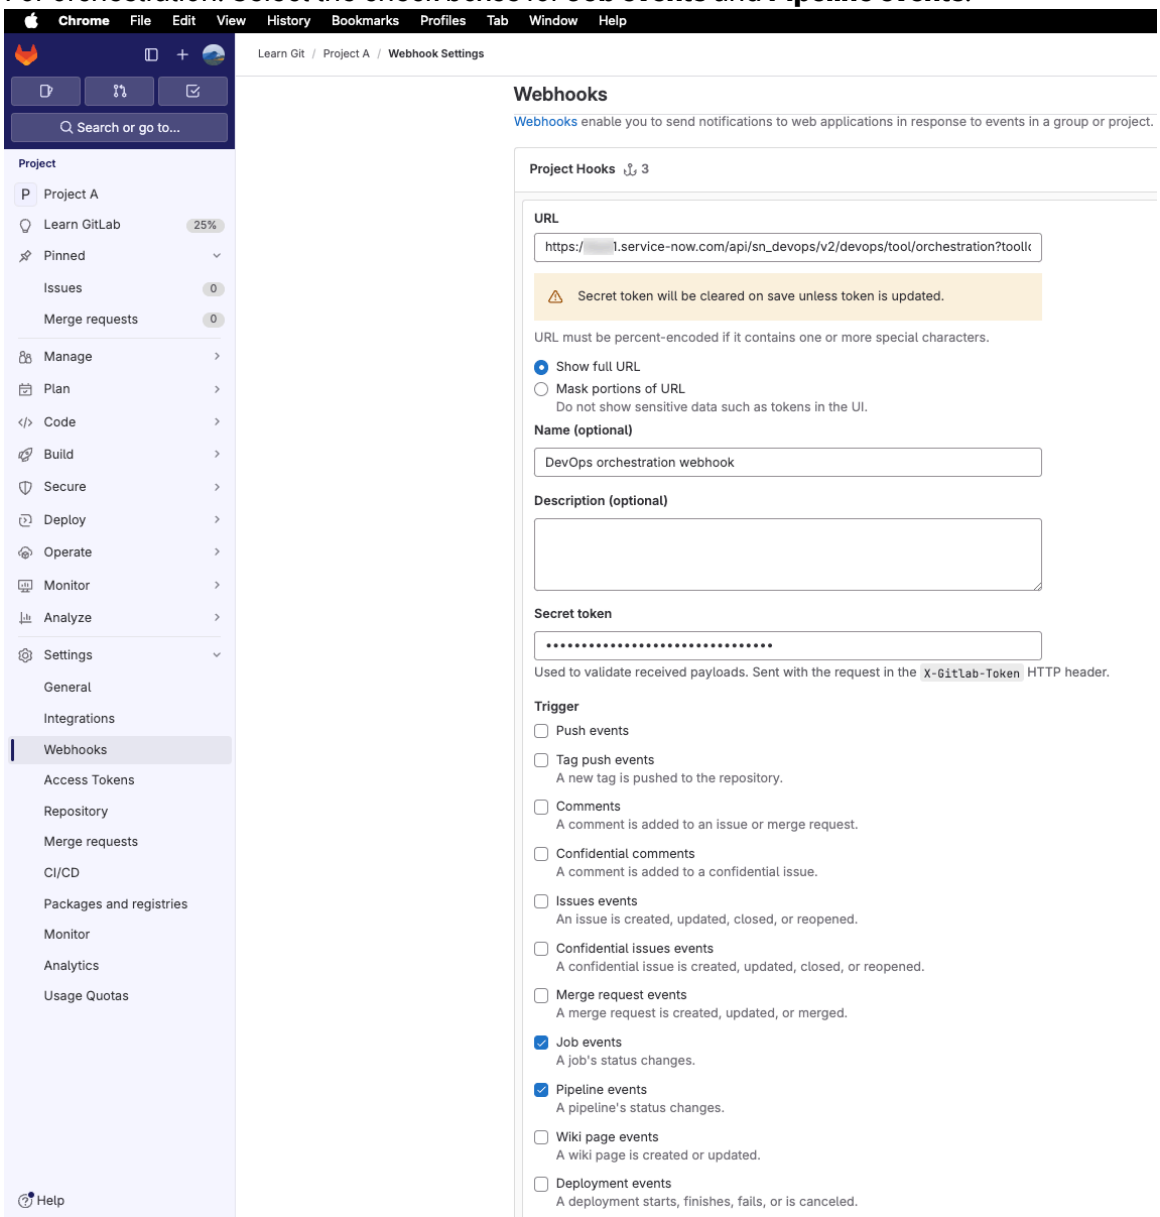
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select **Add webhook**.
8. Repeat the procedure to create webhooks for planning and orchestration capability events in GitLab.

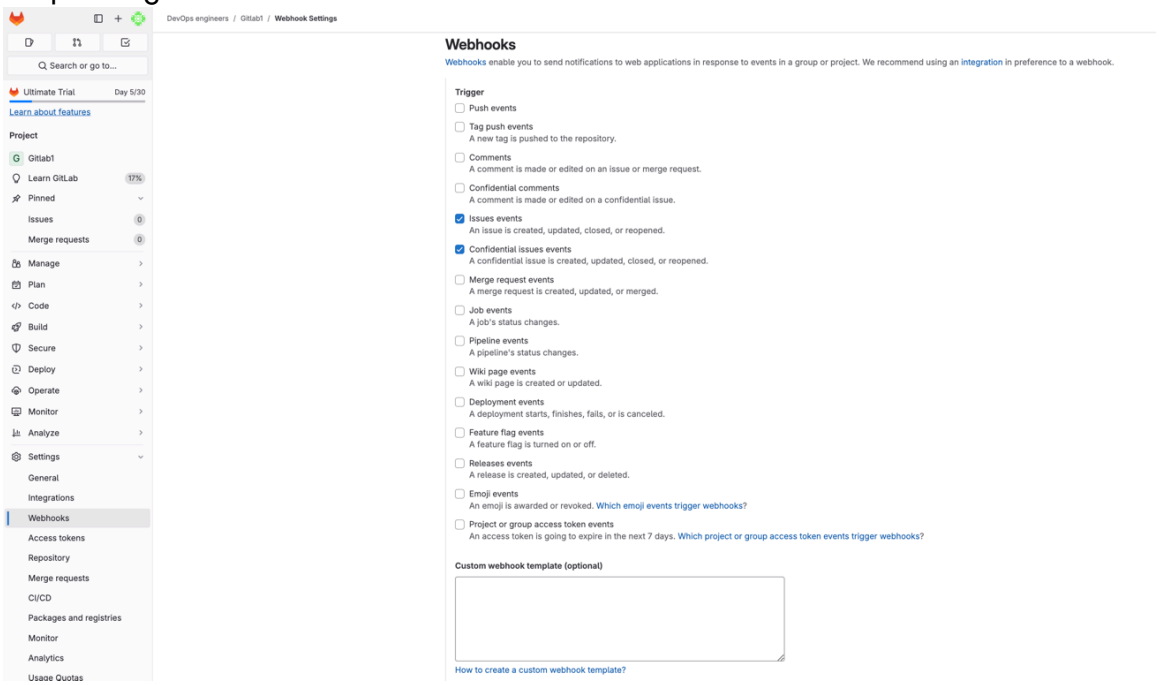
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For orchestration: Select the check boxes for **Job events** and **Pipeline events**.



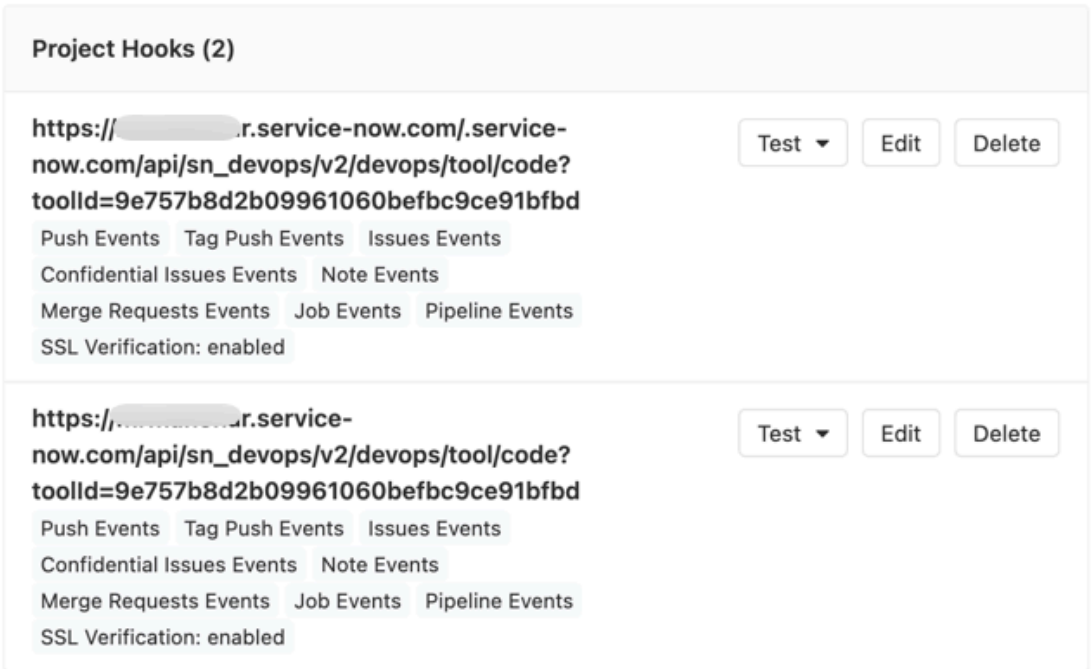
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For planning: Select the check boxes for **Issues events** and **Confidential issues events**.



9. Select **Add webhook**.

GitLab webhooks for DevOps Change Velocity integration:



Change acceleration in GitLab

Change acceleration is supported in DevOps Change Velocity for GitLab jobs.

Change acceleration can be enabled using the following ways:

- Using ServiceNow custom actions for GitLab
- Using manual jobs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Publishing test results from GitLab pipelines

JUnit test type integration is supported for GitLab. GitLab unit test reports support test reports only in the JUnit report format. You can convert different test types to JUnit and persist it. For detailed information, see Unit test reports and Unit test report examples.

Test tool integration lets you view test results in DevOps for GitLab unit, functional, and performance tests.

GitLab pipelines with parallel jobs

GitLab Docker Image supports change creation in GitLab pipelines containing parallel jobs.

Note:
If your GitLab pipeline has parallel jobs, it is better to use the GitLab Docker Image, rather than *when:manual*. For detailed information about GitLab Docker Image, see Implement custom actions for pipelines using generic Docker container image.

Sample yaml pipeline demonstrating parallel jobs:

```
image: servicenowdocker/sndevops:3.1.0  # Update docker version
 per your current version.
stages:
  - pre-build
  - build
  - test
  - pre-prod
  - prod

Scan PreProd:
  stage: pre-build
  script:
    - echo $CI_JOB_NAME

Check policies in PreProd:
  stage: build
  needs:
    - job: "Scan PreProd"
  script:
    - exit 1  # Simulating a failed test job
  allow_failure: true  # Allow this job to fail without stopping
 the pipeline

Check policies in Prod:
  stage: build
  needs:
    - job: "Scan PreProd"
  script:
    - echo $CI_JOB_NAME

Deploy App in Test:
  stage: test
  needs:
    - job: "Scan PreProd"
  script:
    - echo $CI_JOB_NAME
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Deploy App in PreProd:
  stage: pre-prod
  needs:
    - job: "Deploy App in Test"
    - job: "Check policies in PreProd"
  allow_failure: false
  script:
    - echo $CI_JOB_NAME
    - sndevopscli create change -p
 "{\"changeStepDetails\":
{\"timeout\":3600,\"interval\":100},\"autoCloseChange\":true}"

Deploy App in Prod:
  stage: prod
  needs:
    - job: "Deploy App in PreProd"
    - job: "Check policies in Prod"
  allow_failure: false
  script:
    - echo $CI_JOB_NAME
    - sndevopscli create change -p
 "{\"changeStepDetails\":
{\"timeout\":3600,\"interval\":100},\"autoCloseChange\":true}"
```

Change acceleration for manual jobs

Enable change tracking for the pipeline in the tool record page in DevOps Change Velocity.

The GitLab job under change control must have these instructions for the pipeline execution to be resumed or canceled via the change request:

- *when:* `manual`
- *allow_failure:* `false`

For example:

```
deploy:
  stage: deploy
  tags:
    - local-runner1
  when: manual
  allow_failure: false
  script:
    - echo 'Deploy'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For *when:manual* based changes, for a change request to get created at a certain stage, all the previous stages must complete successfully. If any of the previous stages is not invoked or not successful, even though there is no dependency of the current stage on its immediate previous stage, a change request will not get created in ServiceNow.

GitLab pipeline parallel stages is supported with GitLab Docker Image. For more details, see GitLab pipelines with parallel jobs and Implement custom actions for pipelines using generic Docker container image.

Refer to the CI/CD pipeline configuration reference for more information on how to configure a GitLab job.

Additional considerations:

- If *allow_failure* is set to `true`, the pipeline continues even when the change is rejected.
- A user with the appropriate role access in GitLab can unblock and continue a pipeline regardless of the change request state.

GitLab change acceleration behavior

Manual execution	Change acceleration in step	Change request approved	Result
Yes	Yes	N/A	If the manual job is under change control, the change is automatically created.
		Yes	The manual job is automatically executed.
		No	The manual job is automatically rejected/failed.
	No	N/A	The manual job waits for manual intervention from the pipeline owner via the GitLab UI (default behavior).
No	Yes	N/A	The change request is not created.

Note:
Parallel jobs are displayed sequentially, based on the order in which the jobs are queued for execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Jenkins integration with DevOps Change Velocity

Connect to your Jenkins instance to discover pipeline definitions and configure real-time notifications or polling to enable change traceability and automation.

Jenkins integration overview

DevOps Change Velocity supports Orchestration capability for the Jenkins tool and various kinds of pipeline types like Single Pipeline, Multibranch Pipeline, Folder, and Freestyle project types. For Folder, three levels are supported by default. Integrating Jenkins with DevOps Change Velocity enables you to retrieve the data from your Jenkins pipeline for end-to-end traceability and policy creation for change automation.

Get started

Onboard Jenkins to DevOps Change velocity

Connect your Jenkins instance to DevOps Change Velocity to retrieve data like artifacts, test results, scan results, and so on from your Jenkins pipelines. We recommend that you onboard using Workspace Onboard Jenkins to DevOps Change Velocity — Workspace for an intuitive experience.

You can connect to using one or both of the following authentication methods:

- Basic authentication, using the DevOps Integration User credentials.

  For more information about the integration user credentials, see Set up integration user account in DevOps Change Velocity.

- Secret token generated during tool connection.

Set up Jenkins plugin to send real-time data

Automatically configure Jenkins to send real time notifications for your pipeline executions to DevOps Change Velocity. Real time notifications are ideal to maintain the most up-to-date information, particularly for automating change requests. For more information on setting up the plugin, see Configure Jenkins plugin.

Note:

- If you're using DevOps Config, it's recommended to connect to Jenkins using basic authentication.
- You must ensure that the basic authentication credentials and secret token used are valid.

Note:
Jenkins also supports testing capabilities with J Unit. Test tool integration lets you view test results in DevOps for Jenkins unit, functional, and performance tests.

Use one of the following options to onboard Jenkins. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Jenkins to DevOps Change Velocity — Workspace

Connect to your Jenkins instance using the DevOps Change Workspace playbook to discover pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Install and enable the **ServiceNow DevOps** plugin for Jenkins. If you've already installed it, update to the latest version. For instructions, see Configure Jenkins plugin.

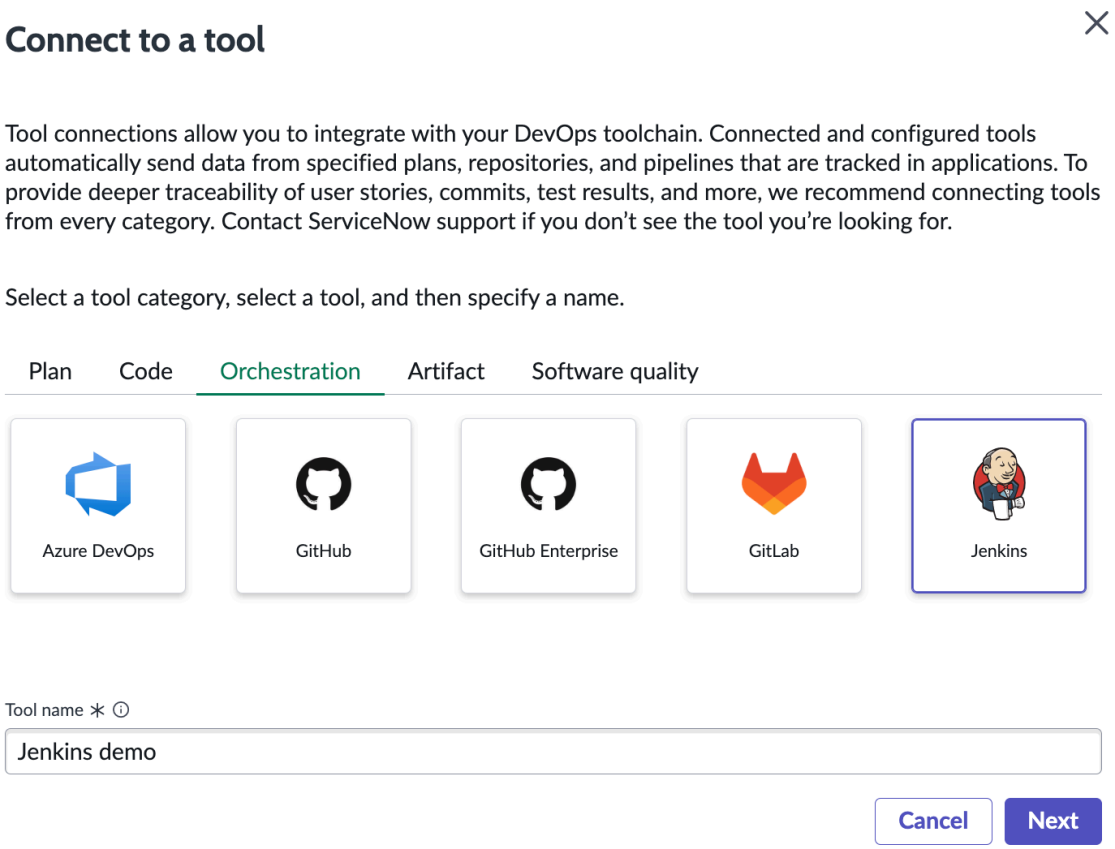
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the playbook to onboard Jenkins.
   You can connect a tool from an application if you also know which specific pipelines should be associated and tracked under that application to streamline the setup. This will allow you to easily associate and import data from Jenkins as well.

   Important:
   If you want to discover and track tool objects like pipelines while connecting to the tool, you must connect your tool from the Application module.

2. In the **Tool name** field, enter a name for the tool.



3. On the **Jenkins instance details** playbook activity:

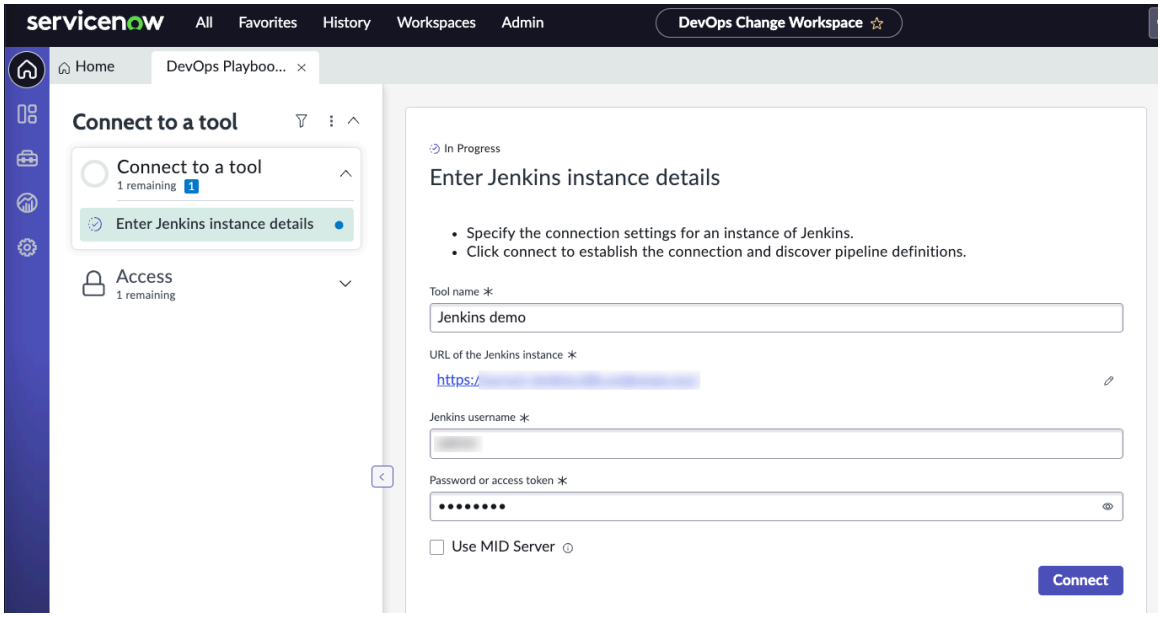
   a. Enter the URL of your Jenkins instance.

   b. Enter the login credentials (password or access token or API token) of the Jenkins instance.
   To generate API token, see Connect to Jenkins using API token authentication.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. If your Jenkins instance is attached to a MID Server, select the MID Server option and enter its details.
A MID server is required if your tool instance is hosted on-prem. For more information about MID server, see MID Server selection

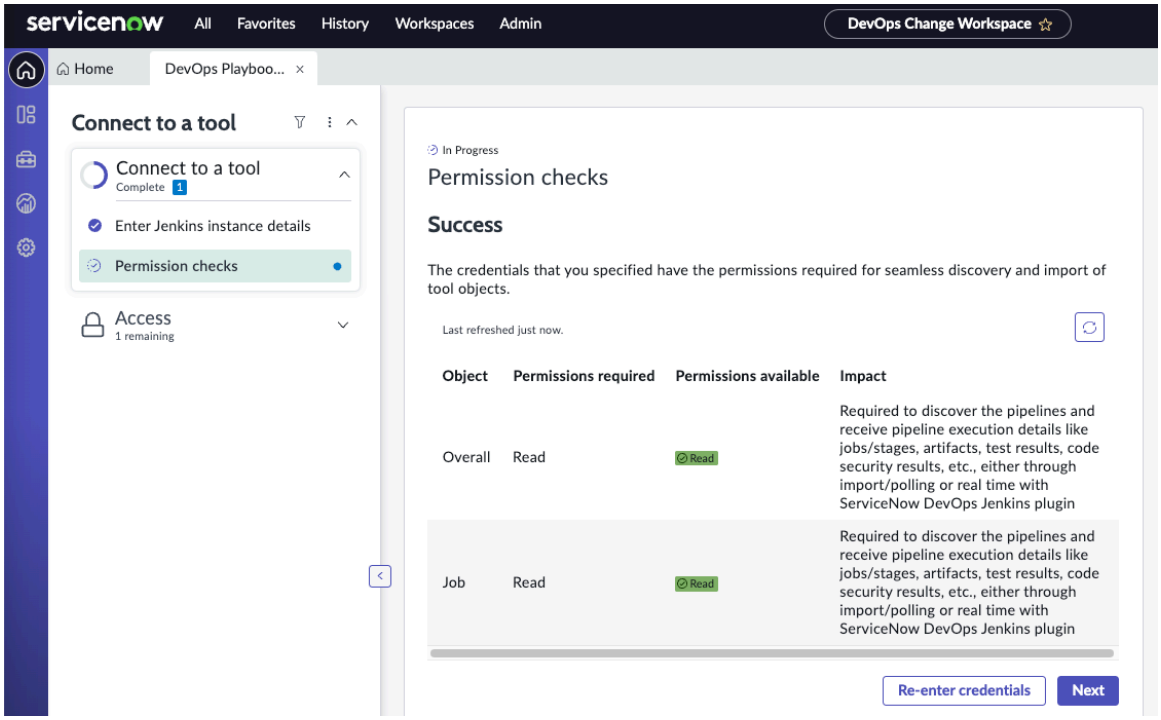
4. Select **Connect**.



5. Permission checks are run on the credentials that you entered.
Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information on all the required permissions, see Jenkins permissions in Permissions required for DevOps tools.

You can choose to continue with the tool connection even if you don't have all the required permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Next**.
7. Specify the access for the tool.
   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

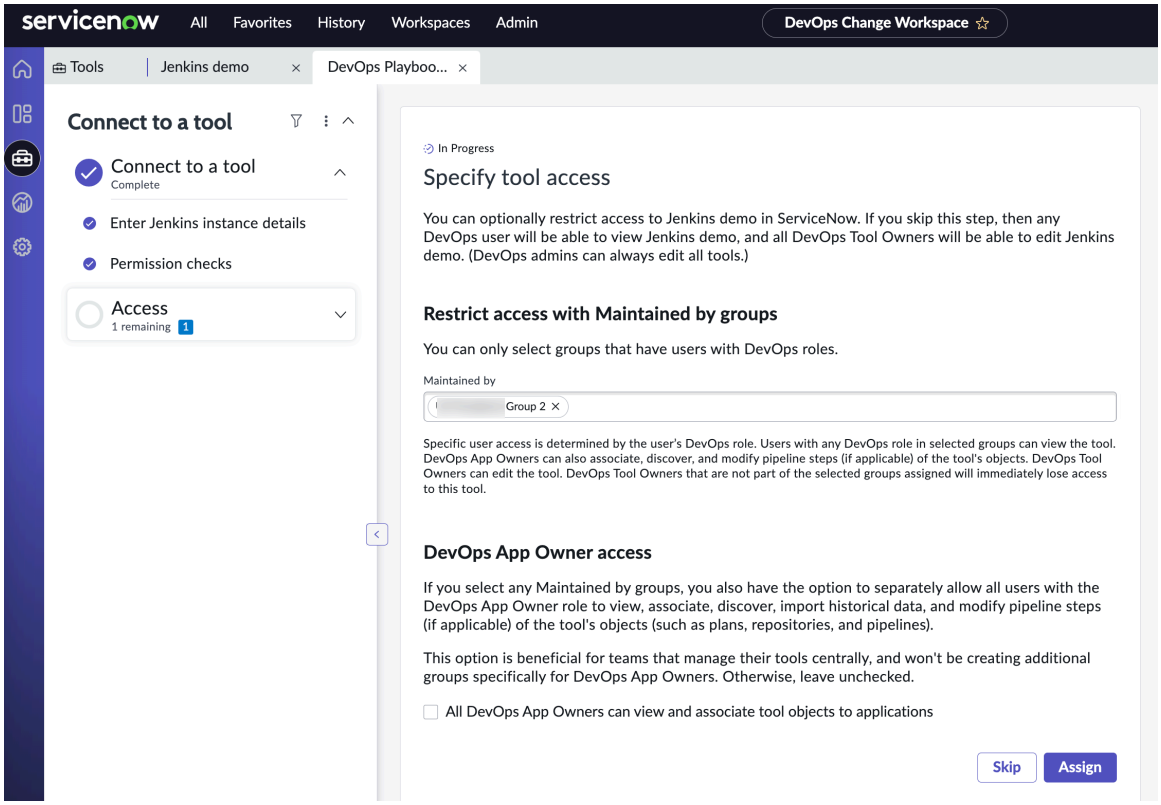
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

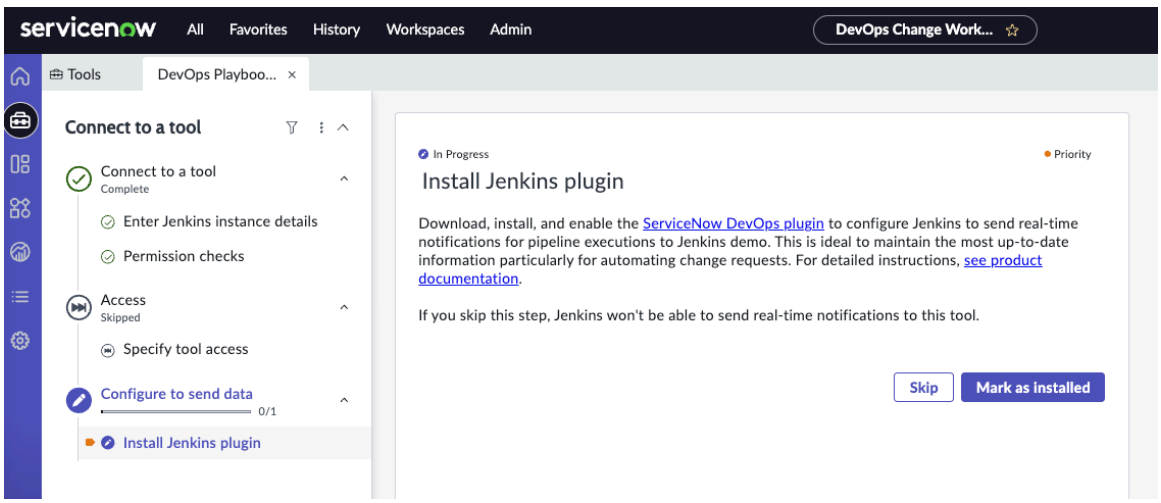
   c. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Install the ServiceNow DevOps plugin for Jenkins.

   For more information on the extension, see Configure Jenkins plugin.

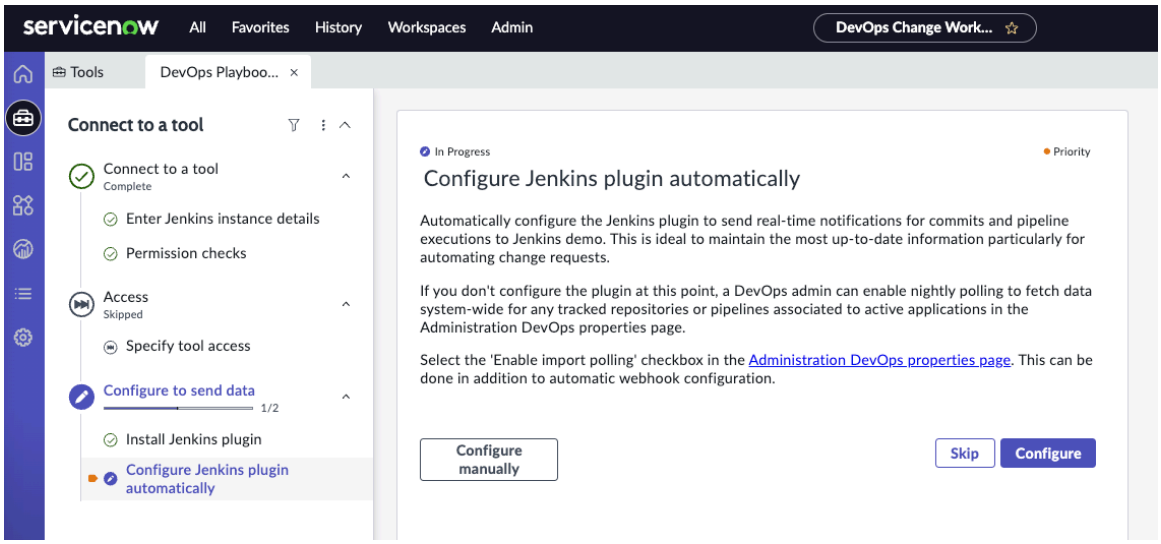


9. Select **Configure** to automatically set up **ServiceNow DevOps Configuration** in your Jenkins instance.

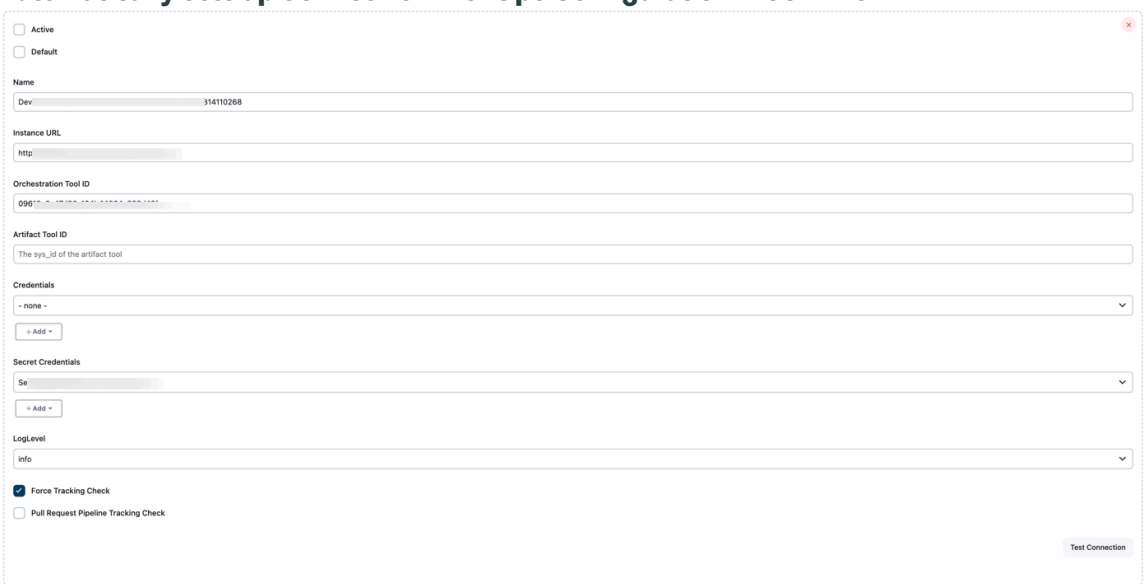
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- You must first install and enable the **ServiceNow DevOps** plugin for Jenkins. If you've already installed it, update to the latest version. For instructions, see Configure Jenkins plugin.
- To configure webhooks automatically, Jenkins admin access is required.
- If you choose to automatically configure this tool, then the existing set up for **ServiceNow DevOps Configuration** in Jenkins will be over-written.
- You can add a total of ten ServiceNow configurations.



Automatically sets up ServiceNow DevOps Configuration in Jenkins



To configure webhooks manually in Jenkins, see Configure webhooks manually for Jenkins.

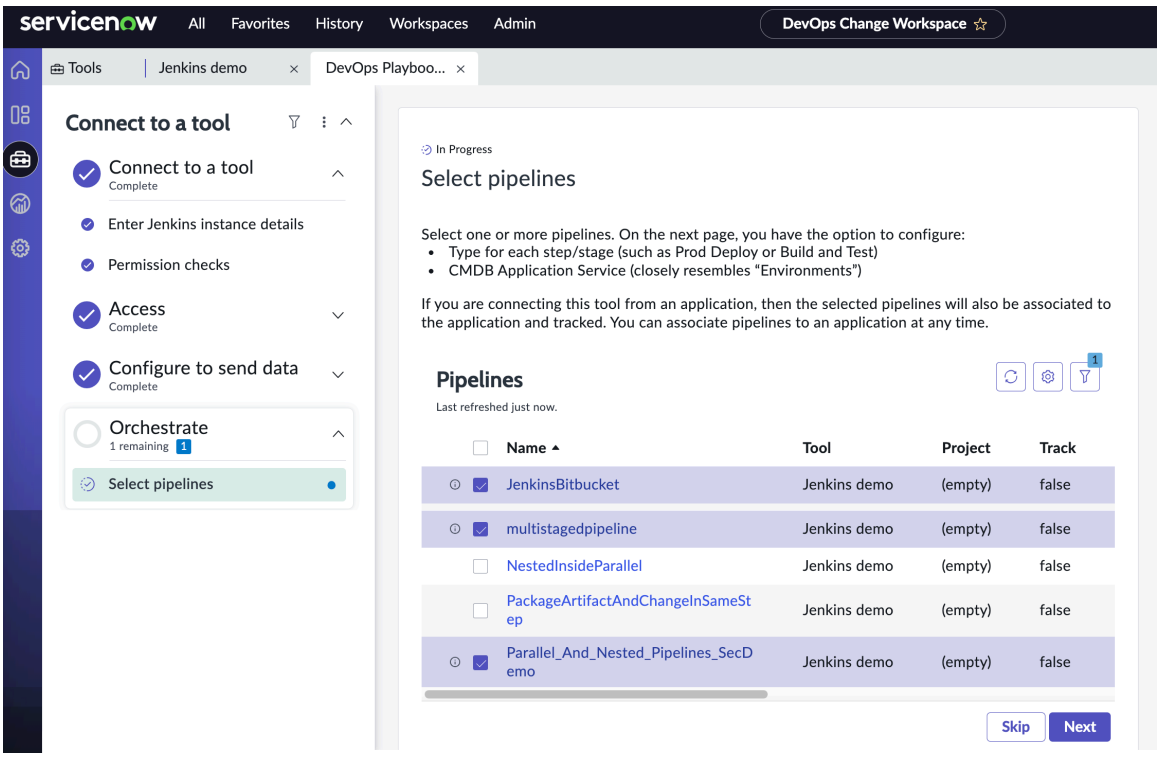
You can also choose to enable nightly polling to retrieve data for any tracked pipelines by selecting the **Enable Polling** property option in the **Administration** module. See DevOps Change Velocity properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then pipelines available in your instance are discovered. You can track and import historical data from them.

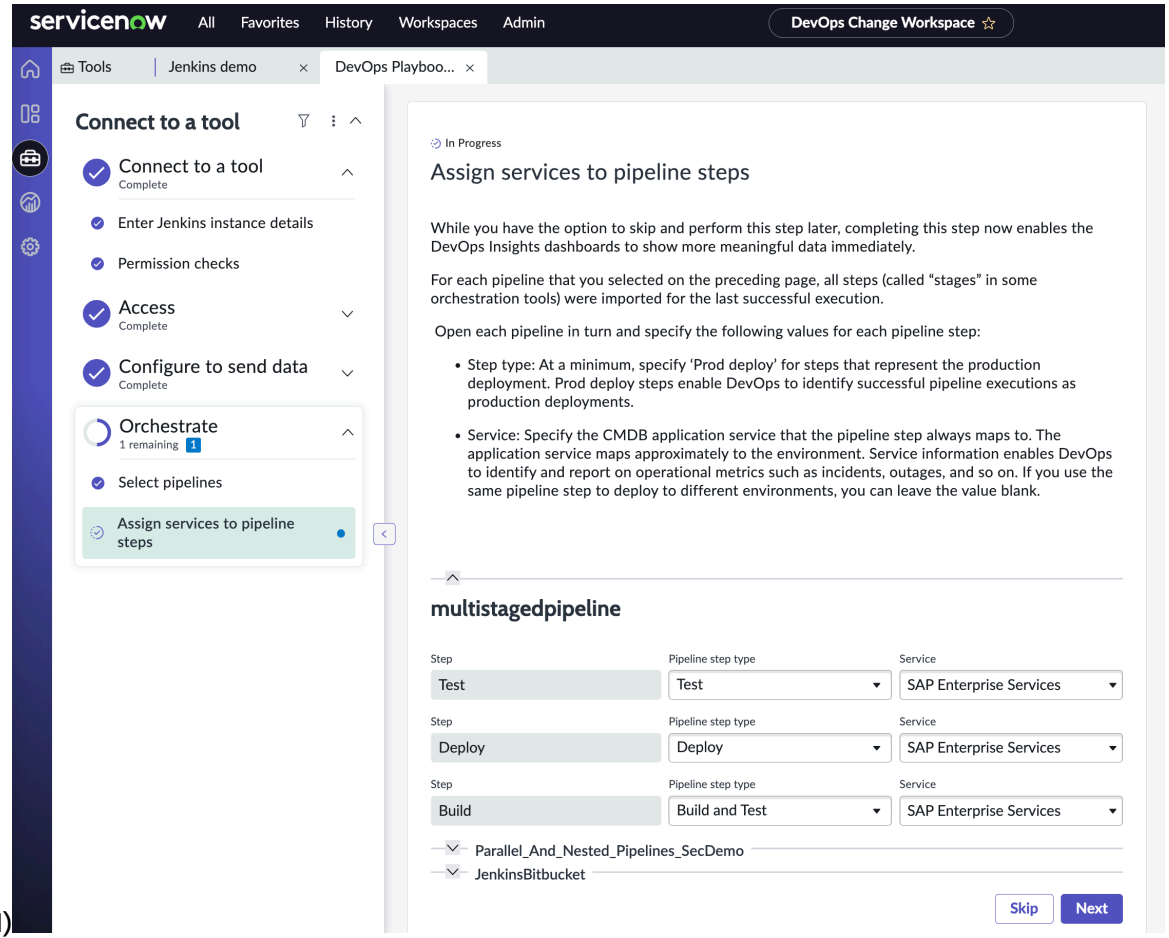
10. Select the pipelines that you want to track from **Select pipelines** playbook activity. For each selected pipeline, all steps are imported for the last successful execution.



11. **Optional:** In the Assign services to pipeline steps activity, specify **Step type** and **Service** for each pipeline step.

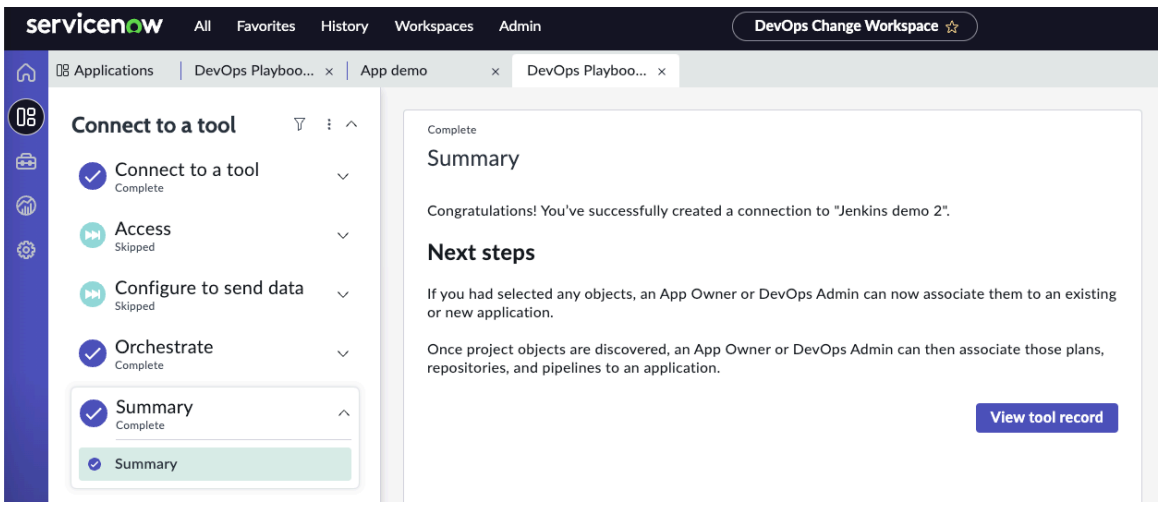
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional)



Completing this step as part of tool onboarding enables the DevOps Insights dashboards to show more meaningful data immediately.

12. If you want to import pipeline data, select the date range and select **Submit**.
13. From the **Summary** page, select **View tool record**to review the details of the connected Jenkins tool.



Note:
If your tool credential has changed, you must update the credentials in your ServiceNow instance. For more information, see Update third-party tool credentials in DevOps Change Velocity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You've successfully onboarded your Jenkins tool to DevOps Change Velocity.

Configure webhooks from the tool record

Onboard Jenkins to DevOps Change Velocity — Service Catalog

Connect your Jenkins instance using the ServiceNow Service Catalog to retrieve data like artifacts, test results, scan results, and so on.

Before you begin
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure
1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Jenkins integration.
Tool integration	Select Jenkins.
Tool URL	URL for your Jenkins instance.
Tool username	Username for your Jenkins instance.
Tool password/ Access token	Access credentials for your Jenkins instance.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps and capability is set to REST.

   For a list of all the permissions required on the credentials for connecting to Jenkins, see Jenkins permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is connected and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Enter the connected Jenkins tool name.
Pipelines	Select the pipelines for which you want to configure webhooks and import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Onboarding repositories	Leave empty.
Onboarding plans	Leave empty.

8. Select **Order Now**.
   A request is created. When the request is approved, the pipeline objects are associated to the app record, which enables real-time tracking. Historical data is also imported for the selected pipelines. The **Track** field is automatically enabled for imported pipelines.

Onboard Jenkins to DevOps Change Velocity — Classic

Connect your Jenkins instance to discover and track your pipelines, and import your orchestration tasks for end to end traceability and change automation.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Install and enable the **ServiceNow DevOps** plugin for Jenkins. If you've already installed it, update to the latest version. For instructions, see Configure Jenkins plugin.

About this task

Actions:

- **Connect** to Jenkins and get the webhook URL when you submit a DevOps tool record.
- **Discover** orchestration tasks and pipelines.
- **Import** task execution and step execution records.

Note:
You can authenticate your connection with Jenkins using Jenkins API tokens. For more information, see Connect to Jenkins using API token authentication.

Procedure

1. Create a tool record in DevOps to automatically connect to Jenkins and get the webhook URL.

   a. Navigate to **DevOps** > **Tools** > **Create New (legacy)** and create a record.

   b. Enter a **Tool Name** and fill in the tool details.

Tool Integration	Jenkins
Tool URL	Jenkins tool URL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	For example: `https://jenkins.com`
Tool Username	Jenkins user name
Tool Password / Access Token	Jenkins password, access token or the API token you generate. **Note:** To generate API token, see Connect to Jenkins using API token authentication.

For a list of all the permissions required on the credentials for connecting to Jenkins, see Jenkins permissions in Permissions required for DevOps tools.

c. Select MID Server for an on-premises tool that is attached to a MID Server.
The Application value is automatically set to DevOps and the Capability value is set to REST.

d. Click **Submit**.
The tool is connected successfully.

On successful tool creation, you're taken to the tool record page.

2. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

The tasks the users in the groups can perform depends on the roles assigned to them.

- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

Note:
Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

3. Click **Discover** to discover the existing orchestration tasks (Jenkins stages) and pipelines.

Note:
Orchestration tasks and pipelines are discovered for folders nested to the level specified in the *sn_devops.discover.folder.depth* property. For more information, see Properties installed with DevOps.

Records are added to the corresponding related lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Open a discovered record from the Orchestration Tasks related list and click the **Import** related link to import historical data from the orchestration task.
   Imported task execution records and step execution records are added to the corresponding related lists.

Model a Jenkins pipeline in DevOps

Model a Jenkins pipeline by mapping the pipeline to an app, and mapping DevOps pipeline steps to Jenkins stages.

Before you begin

The Jenkins plugin for ServiceNow DevOps is provided to enable change acceleration so your orchestration tool can communicate with ServiceNow DevOps and control certain aspects of pipeline executions.

Install the plugin from the Jenkins Marketplace. Navigate to **Manage Jenkins > System configuration > Plugins** in your Jenkins instance. Search for **ServiceNow DevOps Plugin** and select it, and then select **Install**.

Ensure that your Jenkins tool is connected and configured. For more information, see Onboard Jenkins to DevOps Change Velocity — Workspace.

Role required: sn_devops.admin

About this task

Both scripted pipelines (Jenkinsfile) and freestyle jobs are supported.

For Jenkinsfile pipelines, pipeline steps are created, mapped, and associated to orchestration tasks automatically, instead of manually.

Procedure

1. Map your pipeline to an app in DevOps.

   a. Navigate to **DevOps** > **Apps & Pipelines** > **Apps** and open the application record to associate with the pipeline.

   b. In the Pipelines related list, click **Edit...** to select a pipeline to associate with the app, or click **New** to create the pipeline.
   For a new pipeline, fill in the **Orchestration pipeline** field using the full project name as specified in Jenkins.

   > **Note:**
   > While associating a pipeline with an app, the pipeline steps are also fetched during import.

   c. Click **Submit**.

2. Open the pipeline record again and select the **Track** check box so events from the pipeline are received.

   > **Note:**
   > The **Track** check box must be selected to integrate the pipeline with DevOps.

3. Create DevOps steps automatically or manually to map to each Jenkins pipeline stage so an orchestration task is created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For declarative or scripted pipelines, run your Jenkins pipeline to automatically create and map pipeline steps in DevOps.

  Pipeline steps are automatically created, mapped, and associated when DevOps receives step notifications from your Jenkins pipeline during the run.

- For freestyle jobs, manually create and map each pipeline step to a Jenkins pipeline job.

  In the Steps related list, click **New** to create a DevOps step for each Jenkins pipeline stage (**Orchestration stage** field)

  Note:
  The **Orchestration stage** field value of each step is case-sensitive and must match the original name of the corresponding Jenkins pipeline stage.

Name	Name of the pipeline step.
Pipeline	Pipeline in which the step is configured.
Type	Pipeline step type. ▪ Build and Test ▪ Test ▪ Deploy ▪ Deploy and Test ▪ Manual ▪ Prod Deploy
Order	Order in which the steps are run. **Note:** The step order determines the order of the cards in the Pipeline UI. The order of the cards in the Pipeline UI is by task execution.
Orchestration stage	Jenkins pipeline stage name (case-sensitive). **Note:** For step association with Jenkins pipeline stages, the **Orchestration stage** field must be configured.
Business service	Configuration service that applies to the step.

  Once orchestration tasks are created, associate each orchestration task in the Orchestration Tasks related list with a DevOps pipeline step.

4. **Optional:** Enable change control automatically or manually based on the type of pipeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For declarative or scripted pipelines, if you have used the snDevOpsChange script in your pipeline, run your Jenkins pipeline to automatically enable change control. You can also enable change control manually by following the steps provided for freestyle jobs.
- For freestyle jobs, select the **Change control** check box in a step to enable change acceleration and the corresponding configuration fields.

Note:
ServiceNow Change Management must be installed for change acceleration.

Change receipt	(Optional) Select to enable change receipt for the step so the pipeline doesn't pause when a change request is created. All pipeline data is included in the change, but approval is not required for the pipeline to proceed.
Change approval group	(Optional) Approval group for the change request. The change approval group becomes the **Assignment group** in the DevOps change request. **Note:** Ensure that the selected group has members and a group manager so the approver field is not empty.
Change type	Change request type to create. ▪ Normal (default) ▪ Standard ▪ Emergency
Change model	Change model for the change request. For more information, see DevOps change models.
(Optional) Template **Note:** This field is shown only when **Change type** is Normal or Emergency.	(Optional) List of templates to use to auto populate fields for Normal or Emergency change requests. Select a template or create a new one.
(Optional) Standard change template	List of standard change templates to use for Standard change requests.

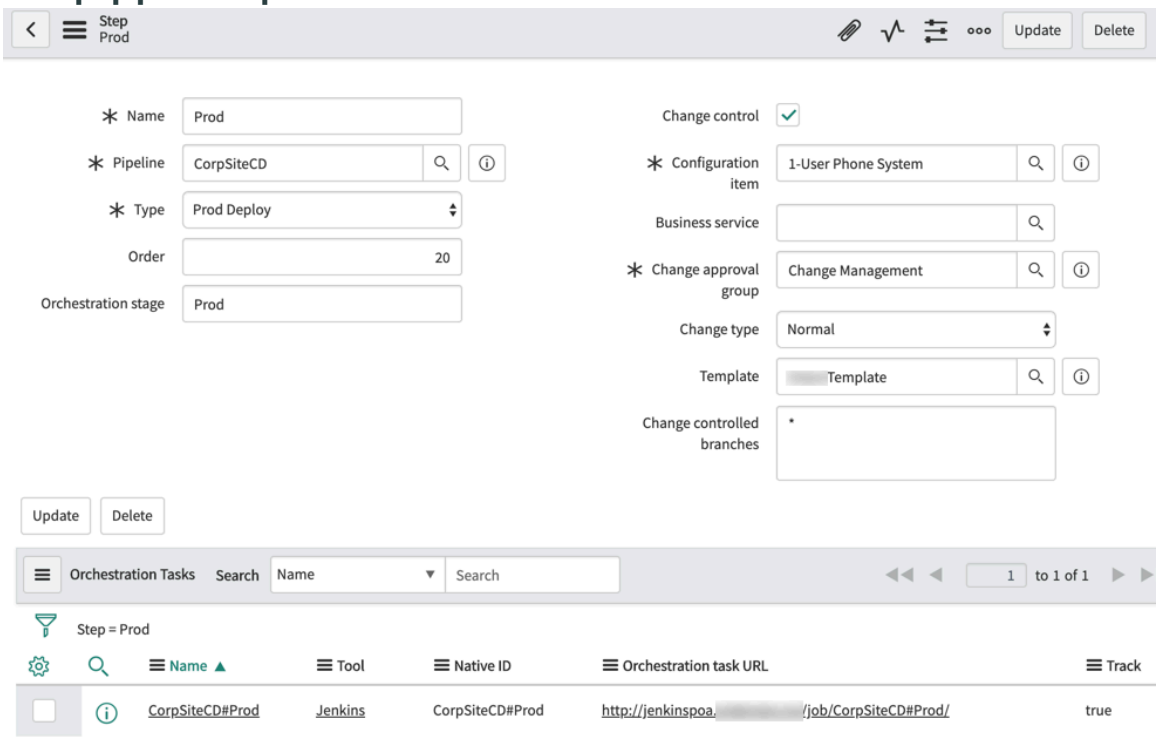
DevOps pipeline step



Additional information - Jenkins

Additional information on Jenkins.

Configure Jenkins plugin

Configure Jenkins to send real time notifications for your pipeline executions to DevOps Change Velocity.

Before you begin

Role required: Jenkins admin

Procedure

1. Install the **ServiceNow DevOps** plugin from the Jenkins Marketplace by navigating to **Manage Jenkins > System configuration > Plugins** in your Jenkins instance.
2. Search for **ServiceNow DevOps Plugin** and select it, and then select **Install**.

Related topics

Configure webhooks manually for Jenkins

Configure webhooks manually for Jenkins

Configure webhooks in Jenkins to send sync notifications to the DevOps Change Velocity application.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity, Jenkins admin

About this task

You can add a total of ten ServiceNow DevOps configurations. For example, you can configure Jenkins connections for your Development, Testing, Production instances, and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you are an upgrading customer, you must download and install the latest Jenkins plugin to enable multiple ServiceNow configurations. After installation, your existing configuration will be retained and made the default configuration.

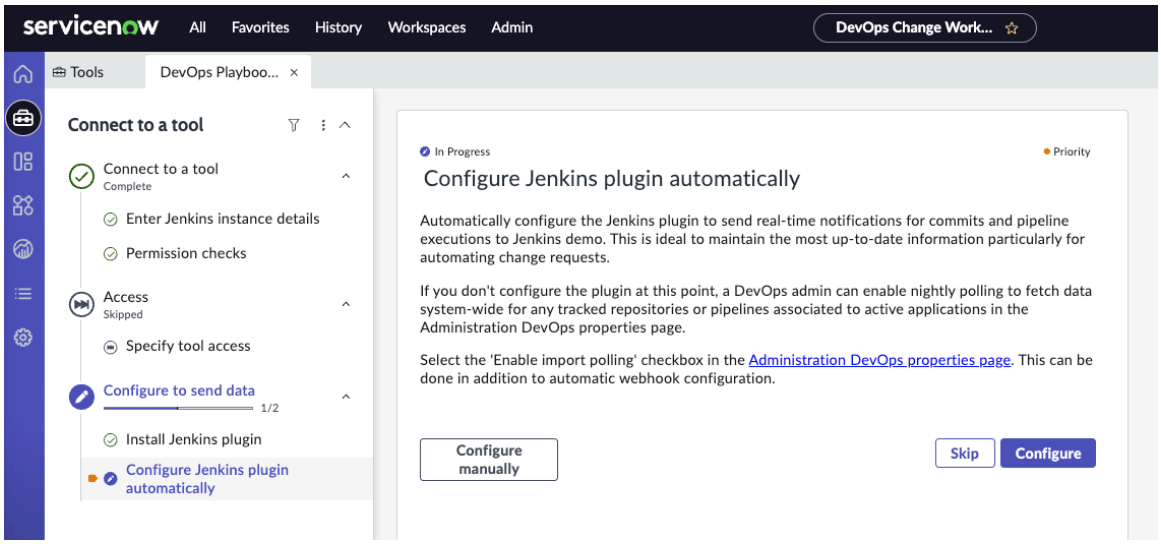
In the ServiceNow DevOps Configuration section in Jenkins, the values in the **Name** field and the combination of the **Instance URL** and **Orchestration Tool ID** fields must be unique.

If you choose to automatically configure a tool from ServiceNow, then the existing set up for ServiceNow DevOps Configuration will be over-written in Jenkins.

If DevOps Config is installed, you will only be able to configure Jenkins manually.

Procedure

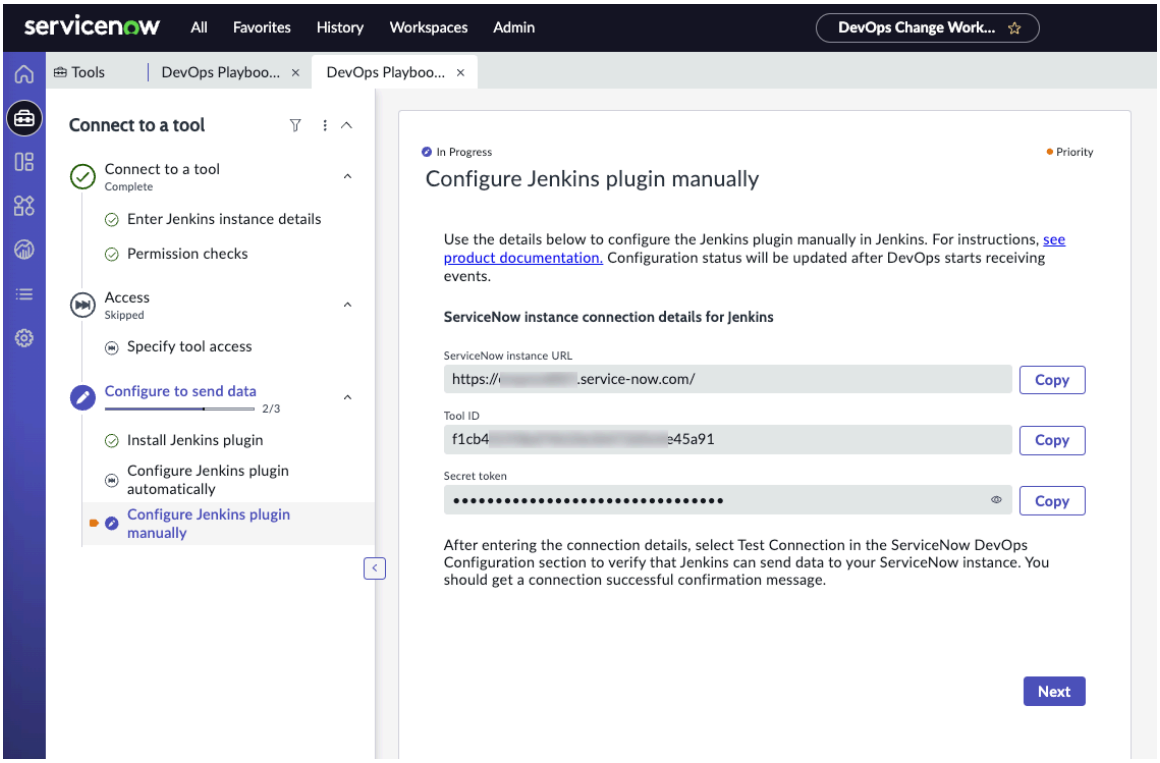
1. In DevOps Change Velocity, choose **Configure manually** when configuring the tool instance to send data.



2. Select **Copy** in the appropriate field to copy the value to your clipboard.

   The field label changes to **Copied**, but you can copy multiple times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



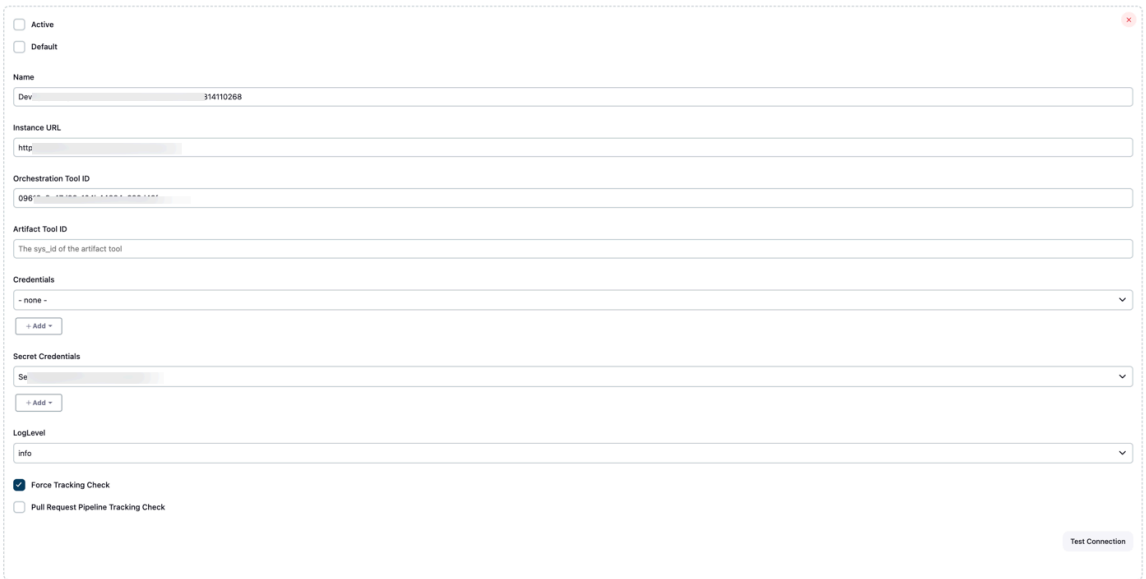
3. In Jenkins, navigate to **Manage Jenkins** > **System configuration** > **Manage Plugins** > **Configure System**.
4. In the ServiceNow DevOps Configuration section, select **Add**.

> **Note:**
> You can add multiple connections by selecting **Add** for each new configuration.

5. Configure the plugin by filling in the fields.

   When enabled, Jenkins starts sending events to DevOps as inbound events.

> **Note:**
> Values are case-sensitive.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Select this option to make the connection active. By default this option is selected when you select **Add** for a new connection. **Note:** All the connections that have Active enabled, will send webhook notifications for your pipeline execution,however for the change step only the connection specified will be considered.
Default	Select this option to make the connection the default one when the connection name is not passed in an existing step on a pipeline. **Note:** Not selecting this option when only one connection is available will result in error.
Name	Unique name of the connection. **Note:** The name value is auto-generated when you auto configure a connection from ServiceNow.
Instance URL	Enter your ServiceNow instance URL you copied in step 2. For example, `https://<your-instance>.service-now.com`.
Orchestration Tool ID	The sys_id of the orchestration tool you copied in step 2. Alternatively, you can copy this value from the webhook URL (*`toolid`* value), or obtain it directly using the `Copy sys_id` command on the Orchestration Tool record. **Note:** The combination of the Instance URL and Orchestration Tool ID values must be unique for each connection.
Artifact Tool ID	The sys_id of the artifact tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credentials	Select the basic authentication credentials that you want to use for connecting to Jenkins. **a.** To add credentials, select **Add**. **b.** In the **Username** field, enter your DevOps Integration User details. By default, it is devops.integration.user. **c.** In the **Password** field, enter your DevOps Integration User password.
Secret Credentials	Select the secret token that you copied in step 2. Alternatively, you can perform the following steps to obtain the secret token from the tool record. **a.** Copy the secret token for your Jenkins tool in DevOps Change. ▪ Workspace: Navigate to the tool record, select **Configure** and copy the secret token. ▪ Classic UI: Navigate to the tool record and select **Copy token**. **b.** To add tokens, select **Add**. **c.** From the **Kind** list, select **Secret text**. **d.** In the **Secret** field, enter the secret token generated while creating the Jenkins tool connection in DevOps. **e.** In the **ID** field, enter a name for the token.
Log Level	The level of log messages you want to store in Jenkins logs/ ServiceNow log recorder. Select from one of the following options: ○ inherit ○ off ○ severe ○ warning ○ info ○ config ○ fine ○ finer ○ finest ○ all

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For more information on Log levels and log recorders, see Jenkins log levels and Log Recorders
Force Tracking Check	Select the check box to make a REST (POST) API call to Jenkins for each pipeline execution to determine whether the pipeline is tracked or not. Clear the check box to store details in the *snPipelineInfo.json* file and stop making API calls for every pipeline execution. **Note:** When a pipeline is tracked, all active Jenkins configurations will receive job notifications.
Pull Request Pipeline Tracking Check	Select the check box to enable tracking for pull request pipelines. **Note:** When a pipeline is tracked, all active Jenkins configurations will receive job notifications.

6. Select **Test Connection**.
   Verify that the connection successful message displays.
   - If you've added basic authentication credentials, on successful connection, you will see the message: `Connection using 'Credentials' is successful.`
   - If you've added the secret token, on successful connection, you will see the message: `Connection using 'Secret Credentials' is successful.`
7. Select **Apply** to apply the changes and select **Save**.

Connect to Jenkins using API token authentication

Connect to Jenkins using API token authentication instead of user name and password.

Before you begin

Role required:

- Jenkins: admin or any user with overall Read and Job Read roles

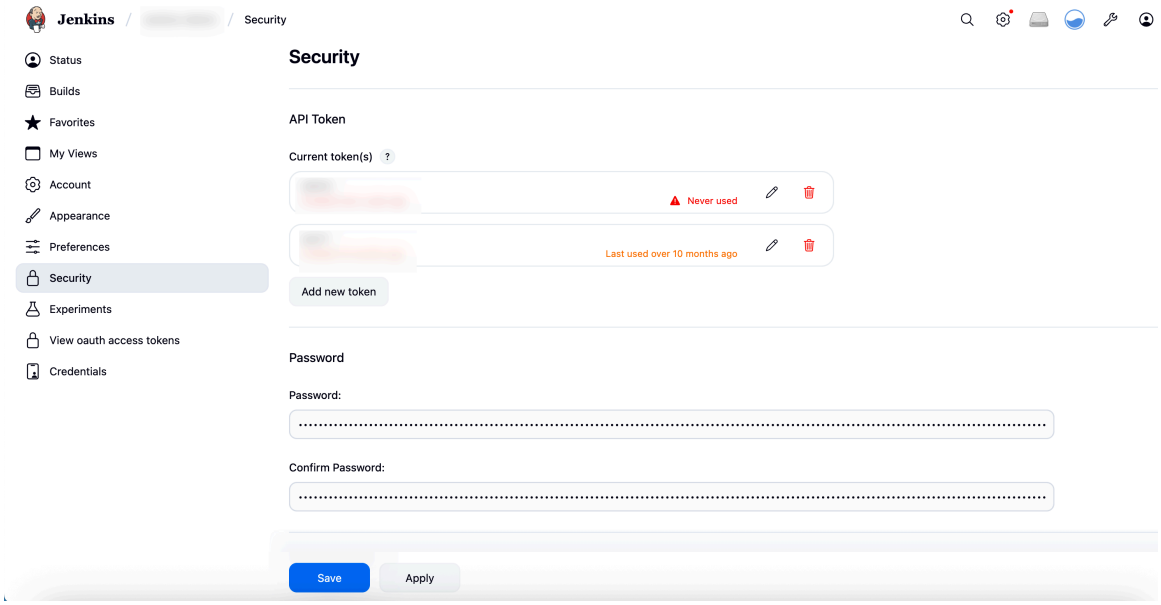
About this task

You can have multiple active API tokens at the same time and track the usage of your tokens. You can also revoke API tokens as needed. You can also use the Jenkins API token for authentication when you're using the Jenkins CLI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Jenkins banner frame, select your user name to open the user menu.
2. Select **Security**.



3. In the Security page, select **Add new Token**.
4. Select **Generate**.
5. Copy the API token that is generated

Note:

- Regenerate the tokens every 6 months (depending on your context). Jenkins displays an indicator concerning the age of the token
- Use a different token for each application so that if an application is compromised you can revoke its token individually.
- If your token expires, regenerate the token and update it in the ServiceNow AI Platform instance
- ServiceNow DevOps DevOps does not support using Legacy API Tokens because Jenkins does not recommend the use of Legacy API Token. For more information, see the Jenkins blog post.

Reduce calls from Jenkins to ServiceNow DevOps to fetch pipeline information

Enable the Force Tracking Check field in the Jenkins configuration form to create a pipeline tracking file in Jenkins. ServiceNow DevOps makes a REST call to Jenkins to update the tracking file when the Track field in a pipeline is modified.

Force Tracking Check

The ServiceNow DevOps configuration section in Jenkins includes a **Force Tracking Check** check box to reduce the number of calls made from Jenkins to DevOps to fetch pipeline information such as pipelines being tracked. Base-system flows:

- DevOps Jenkins File Update- Track flow
- DevOps Jenkins File Update- Test Info flow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How it works

In previous versions, a REST call fetched the pipeline information for every Jenkins build triggered. If you had multiple pipelines in your Jenkins environment and were tracking only a few of them, this meant that a call was made to fetch the tracking information for each pipeline even if you were tracking a few of them.

The first time you trigger a Jenkins build or pipeline execution, Jenkins makes a pipeline information API call and creates *snPipelineInfo.json* file in /{JENKINS_HOME}/jobs/{jobName} directory. For each subsequent pipeline execution Jenkins checks the information available in the *snPipelineInfo.json* file before making a pipeline info API call.

If you disable the **Force Track Check** check box:

- The DevOps Jenkins File Update- Track flow triggers when you update the **Track** field on the pipeline form. The **Track** field info is updated in the *snPipelineInfo.json* file.
- DevOps Jenkins File Update- Test Info flow triggers when you update Test type mapping for Jenkins tool integration and verify that Test info is updated in *snPipelineInfo.json* file.

If you enable the **Force Track Check** check box, Jenkins makes pipeline info API calls to DevOps even if track/test information exists in the *snPipelineInfo.json* file.

Using a declarative or scripted pipeline in DevOps

When you use a Jenkinsfile, steps are created, mapped, and associated to orchestration tasks automatically instead of manually.

Jenkinsfile is a text file that contains the definition of a Jenkins pipeline and is checked into source control.

Each root-level stage configured in the Jenkinsfile is discovered as a separate orchestration task in DevOps that is mapped to an individual step.

Note:
The **Track** field for the pipeline must be set to **True** in DevOps to receive job notifications from Jenkins. All active Jenkins configurations will receive job notifications when this field is set to **True**.

DevOps Jenkinsfile commands

- *snDevOpsChange(ignoreErrors:{true/false},changeRequestDetails:{setCloseCode:{true/false},attributes:})*

  Where *ignoreErrors* specifies the setting to prevent job failure if there is an error (true/false)

  Where *changeRequestDetails* specifies closure code and change request fields from within the pipeline

  Enables change control for each root-level stage that is mapped to a DevOps step.

- *snDevOpsArtifact*

  Registers artifacts when configuring Artifacts and packages.

- *snDevOpsPackage*

  Creates a package for artifacts when configuring Artifacts and packages.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *snDevOpsGetChangeNumber*

  Retrieves the change request number in a Jenkins pipeline based on specific change details.

- *snDevOpsUpdateChangeInfo*

  Updates the change request details associated with a Jenkins pipeline.

- *snDevOpsSecurityResult*

  Configures security scans on any stage of the pipeline and the scan details are retrieved from the corresponding stage to DevOps Change Velocity.

You can specify the Jenkins server configuration in any of these steps by passing the *configurationName* attribute in your pipeline. If the configuration name is not specified in any step, the default configuration will be used in that step. Passing an incorrect configuration name will result in the step to fail unless the **Ignore ServiceNow DevOps errors** option is selected while configuring the Jenkins plugin.

Note:
Stage mapping is only supported for stages at the root level, not nested or parallel stages.

Jenkins snippet generator for DevOps

You can use the Jenkins Snippet Generator utility to generate a template code for the orchestration tasks for scripted pipelines. You can use the snippet generator utility to create template for the following orchestration tasks.

- SnDevOpsArtifact
- SnDevOpsChange
- SnDevOpsPackage
- snDevOpsGetChangeNumber
- snDevOpsUpdateChangeInfo
- snDevOpsSecurityResult

To generate a step snippet, navigate to the Pipeline Syntax from a configured pipeline, select the step from the **Sample Step** list, and update the values for different variables in the step. Select the **ignore error** option to prevent job failure if there is an error. Select **Generate Pipeline Script** to create a snippet. You can copy and paste the snippet into a pipeline.

Example of a pipeline script for the SnDevOpsChange task:

```
snDevOpsChange changeCreationTimeOut: 3600,
 changeRequestDetails: '{ "attributes": { "short_description":
 "Test description", "priority": "1", "start_date": "2021-02-05
 08:00:00", "end_date": "2022-04-05 08:00:00", "justification":
 "test justification", "description": "test description",
 "cab_required": true, "comments": "This update for work
 notes is from jenkins file", "work_notes": "test work notes",
 "assignment_group": "a715cd759f2002002920bde8132e7018" },
 "setCloseCode": false, "autoCloseChange": true }',
 changeStepTimeOut: 18000, configurationName: 'Jenkins1',
 pollingInterval: 60
```

Parallel and sub-stage support

When a stage (or set of parallel stages) is nested within a pipeline stage, these rules apply:

- Any action from the nested stage is processed as part of the parent root-level stage
- Only one change request is created (at the parent root level) even if multiple stages nested under the parent root-level stage trigger a change
- Orchestration tasks created are always associated with the parent root-level stage (not the nested stage)

Example: Sub stage

In this sub-stage example, if a change request gets created from the sub stage (deploy PROD), the details of the parent root-level stage (deploy) are used in the change request, and orchestration tasks are also associated with the parent root-level stage (deploy).

```
stage("deploy") {
         stages{
             stage('deploy UAT') {
                when{
                   branch 'dev'
                }
            stage('deploy PROD') {
               when {
                  branch 'master'
               }
                steps{

                  snDevOpsChange()
                }
            }
        }
```

Example: Parallel stage

In this parallel stage example, if a change request is created from a sub stage (UAT test-1 and/or UAT static code test), only the first change request is created (using the details of the parent root-level stage, UAT test) regardless of whether both sub stages (UAT test-1 and UAT static code test) get triggered.

There is no indication of which parallel stage generated the change, and orchestration tasks are associated with the parent root-level stage (UAT test).

```
stage('UAT test') {
      parallel {
          stage('UAT test-1') {
              steps {
                  snDevOpsChange()
                  // 'UAT test-1' tasks
              }
                post {
                  success {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                    // post success tasks. E.g.: junit
'**/target/surefire-reports/*.xml'
                }
            }
        }
        stage('UAT static code test') {
            steps {
                snDevOpsChange()
                // 'UAT static code test' tasks
            }
        }
    }
}
```

Configure SonarQube scans on Jenkins pipelines

Configure SonarQube scans on Jenkins pipelines.

Before you begin

Ensure that you meet the following pre-requisites before configuring your Jenkins pipelines for SonarQube scans

- SonarCloud or SonarQube version 8.6.1 community edition
- SonarQube Scanner for Jenkins 2.4 or higher is installed on your Jenkins instance/ environment.
- ServiceNow DevOps plugin version 1.27 or later for Jenkins.
- Ensure that SonarQube scans are configured and exist on your Jenkins pipelines using the SonarQube Scanner plugin for Jenkins. For more information, see
  - SonarQube Scanner for Jenkins
  - SonarScanner for Jenkins
- A SonarQube tool is created and is connected to the SonarQube server. For more information, see SonarQube integration with DevOps Change Velocity.

Role required: sn_devops.admin

About this task

When you run a pipeline which has SonarQube scan executions, the details are fetched into ServiceNow DevOps from the Jenkins pipeline. Using the Jenkins plugin, we check if the scan execution is configured in the Jenkins pipeline and check for SonarQube scans on every orchestration stage, using the `withSonarQubeEnv` tag. If a SonarQube analysis has happened on any stage of the pipeline's execution, as part of our end notification we add a model with the `scanID` and `url` details for every scan that occurs in a particular stage. These scan analytics or details are correlated and displayed in the Software Quality Summary related list from Change requests and Task executions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In Jenkins, navigate to **Manage Jenkins** > **Configure System**, select the **Enable injection of SonarQube server configuration as build environment variables** check box in the **SonarQube Servers** section, and fill in the fields.

SonarQube Installations

Field	Description
Name	A unique name for the configuration/project.
Server URL	URL or IP address of the SonarQube server.
Server authentication	Select the relevant authentication token type for the configuration.

Note:
Use these same SonarQube server details or values while creating the SonarQube tools in ServiceNow DevOps as well as in the Jenkins pipeline.

2. Click **Test Connection**.
   Verify that the connection successful message is shown.
3. Click **Apply** and **Save**.
4. Run the pipeline.

Result

Based on the scan results on various stages of pipeline's execution, the results are shown in the corresponding step of the pipeline. Inbound events are created for notifications and subflows are triggered based on the notification type and capability.

What to do next

Note:

Navigate to the pipeline UI to view the scan details under the **Quality** > **Software Quality Results**.

- View scan details as part of Task Executions. View details of all the Sonar scans that are part of the task execution mapped to a build or release pipeline execution step.

  1. Navigate to **DevOps** > **Orchestrate** > **Task Execution** click a relevant Task Execution record.
  2. Click the Software Quality Summary related list.
  3. Click a relevant Scan ID record.
     The Software Quality Scan Summary and Scan Details are displayed.

- View scan details as part of Change Request. View all the scans that were part of this build/release pipeline in the **Software Quality Results** > **Software Quality Summary** related list.

  1. Navigate to **DevOps** > **Orchestrate** > **Pipeline Change Requests**
  2. Click the Software Quality Summary related list.
  3. Click a relevant Scan ID record.
     The Software Quality Scan Summary and Scan Details are displayed.

© 2026 ServiceNow, Inc. All rights reserved.

Configure JFrog in Jenkins

Configure JFrog plugin for Jenkins to publish, deploy, or download artifacts.

Before you begin

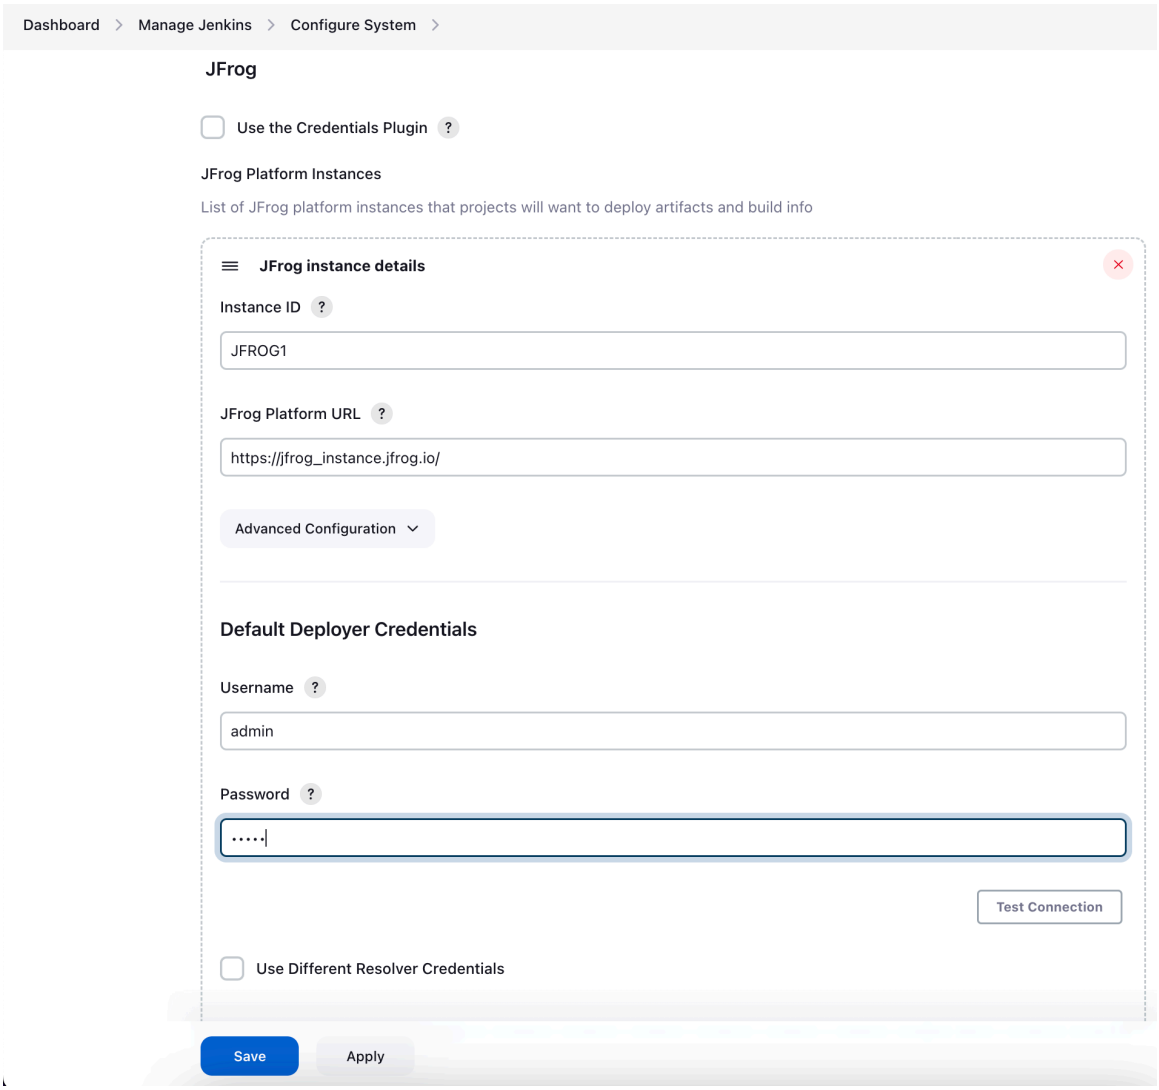
Role required: admin role in Jenkins

Procedure

1. Install the Artifactory plugin, to integrate Jenkins with JFrog , to publish, deploy, or download artifacts.
2. After the installation, configure the JFrog server details from **Manage Jenkins** > **Configure System**.

Note:

To be able to integrate JFrog with Jenkins, the build info must be published for JFrog along with the artifacts.



3. Use the following scripts to download or upload artifacts to Jenkins.

   Scripted pipeline to upload:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
     def server = Artifactory.server 'JFROG1'
               def uploadSpec = """{
                  "files": [{
                    "pattern":
"${env.WORKSPACE}/target/artifact-1.3.jar",
                     "target": "default-docker-virtual/"
                  }]
               }"""

            def buildInfo = server.upload(uploadSpec)
            server.publishBuildInfo buildInfo
```

Scripted pipeline to download:

```
         def server = Artifactory.server 'JFROG1'
               def downSpec= """{
                  "files": [{
                    "pattern":
"default-docker-local/artifact-1.3.jar",
                    "target":"/var/jfrog_artifacts/"
                  }]
               }"""

            def buildInfo = server.download(downSpec)
            server.publishBuildInfo buildInfo
```

Notify change request rejection or cancellation reason to Jenkins pipeline

Send change request rejection or cancellation reason along with approver name and the change request number to Jenkins pipeline logs.

Before you begin

- Ensure that you have upgraded to ServiceNow DevOps version 1.28 or later.
- Have an active Jenkins integration.

Role required: sn_devops.admin

About this task

You can send change request rejection or cancellation reasons or comments to the Jenkins pipeline logs.

- Ensure that you enter appropriate reasons or comments when rejecting or canceling a Change Request manually.
- If you have loaded demo data during upgrade, and are using the DevOps Demo Change Automation flow or a custom flow based on it, a notification with default message values is sent to the Jenkins pipeline logs.

Note:

- The Change request number is also automatically sent to the Jenkins pipeline logs (for both scripted and freestyle pipelines) as soon as the change is created.
- The *Approver name* and time stamp of the cancellation/rejection is also automatically sent to the Jenkins pipeline logs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To manually reject or cancel change requests, follow these steps:
   a. Navigate to **DevOps** > **Orchestrate** > **Pipeline Change Requests** > **Change Request record**.
   b. Open the required Change Request record.
   - From the context menu, click **Cancel Change**. In the **Cancel Change Request > Reason** field, enter an appropriate reason for cancelling the change, and click **Save**.
   - In the Approvers related list, provide your inputs in the **Comment** field, right-click the record, and click **Reject**.

   The change request is canceled/rejected and the reason for canceling the change is added to the **Comments** field and sent to the Jenkins pipeline log.
2. To send custom messages (from auto-rejected change requests) to Jenkins, follow these steps:
   a. Navigate to **Flow Designer** > **DevOps Demo Change Automation flow** > **DevOps Demo Change Policy**.
   b. Navigate to the *DevOps Auto Reject* decision >*DevOps Apply Change Approval Definition* subflow > *Devops Create Auto Approval Record* action.
   c. Modify the action's input script for the `approval.comments` attribute value.
   By default, the auto-rejected change requests stores and sends the `approval.comments = 'Auto ' + state + ' via Change Policy';` variables as messages to the Jenkins pipeline as notifications.
3. In Jenkins, navigate to the pipeline (that is corresponding to the rejected change request), and then select **Console Output**.
   The Change Request's rejection or cancellation comments that are stored as part of the step execution reflect in the Jenkins Console Output.

Notify ServiceNow DevOps change request number to Jenkins pipelines

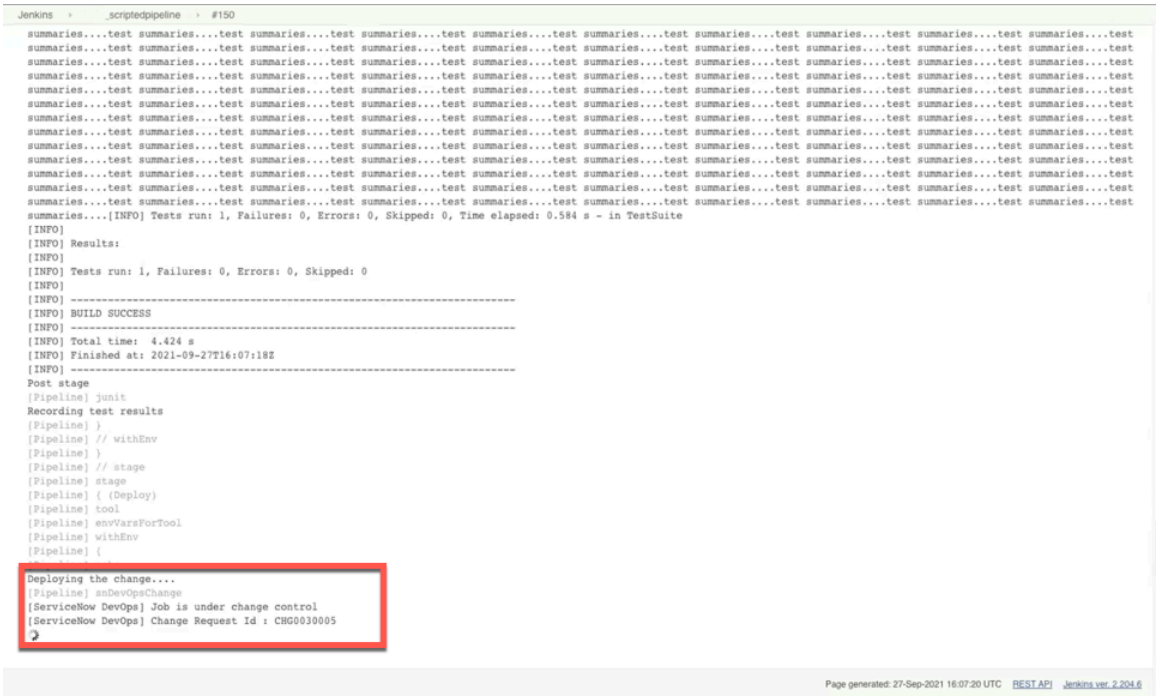
Send change request numbers to the Jenkins pipeline steps or logs when a change request is created in ServiceNow DevOps.

Sending ServiceNow DevOps change request to Jenkins pipeline

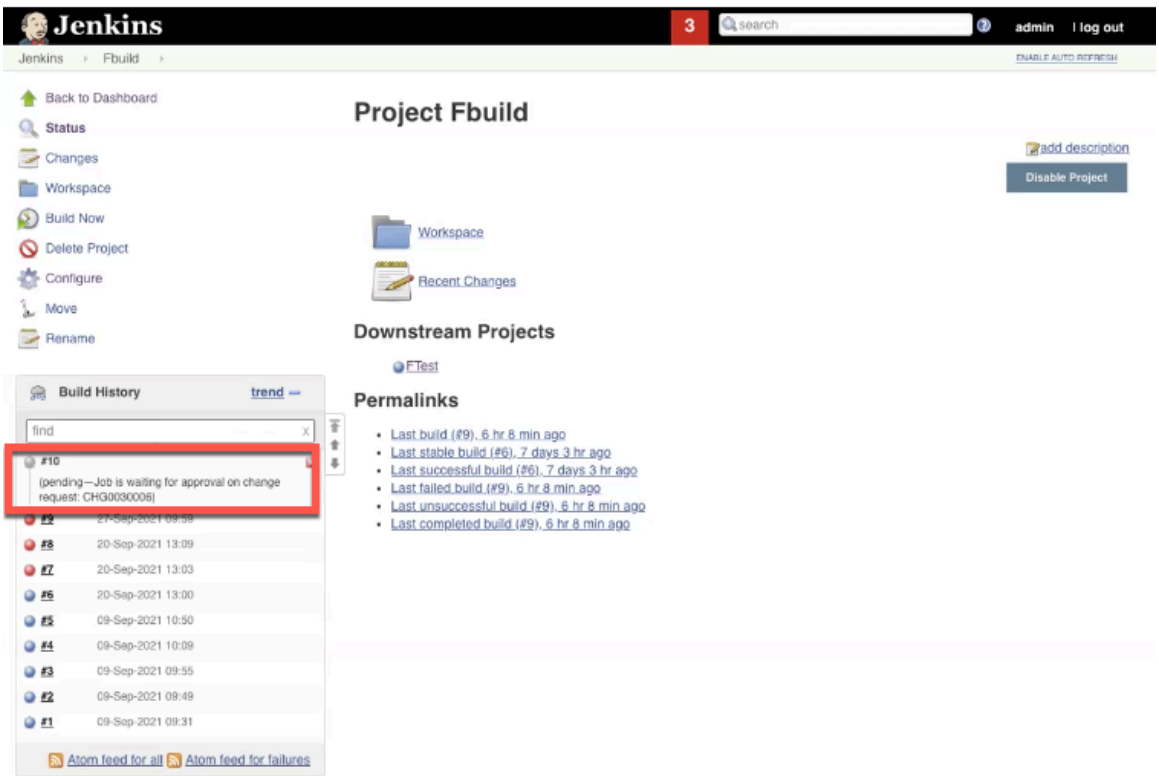
Change requests that are created as part of Jenkins pipeline executions for both scripted and free-style pipelines are notified to the Jenkins pipeline console.

When you trigger a scripted Jenkins pipeline and a change request is created as part of the pipeline execution stage in ServiceNow DevOps, the change request number is notified to Jenkins. The change request number displays in the Jenkins pipeline job logs for scripted pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Upon triggering a free-style Jenkins pipeline, the change request that is created as part of the ServiceNow DevOps pipeline execution stage waits for the approval action to be performed on the change. The change request number and details display against the relevant build in the Jenkins console's **Build History** section.



Note:
After an approval or rejection action is performed on the change request in ServiceNow DevOps, the change request displays in the Jenkins pipeline build logs, similar to scripted pipelines.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get change request number in Jenkins pipeline

Retrieve the change request number in a Jenkins pipeline based on specific change details by running the snDevOpsGetChangeNumber script.

Before you begin

Role required: Jenkins admin

Procedure

1. In your Jenkins dashboard, open the pipeline for which you want to retrieve the change request number.
2. Navigate to **Configure > Pipeline**.
3. In the Pipeline script section, update the `snDevOpsGetChangeNumber` script with the following input parameters:
   - Pipeline Name

     Note:
     For a multi-branch pipeline, the pipeline name must be suffixed with the branch name.

   - Build Number
   - Stage Name

     Note:
     For a nested-stage, the stage name must be prefixed with the parent stage name.

   - Branch Name (only for multi-branch pipeline)

   Note:
   If you do not provide the change request details as input parameters, the change request number associated with the current pipeline and stage will be retrieved.

   Example of a multi-branch pipeline:

   ```
   snDevOpsGetChangeNumber (changeDetails: """{ "pipeline_name":
    "github_multi_branch_pipeline/scratch/release",
    "build_number": "${env.BUILD_NUMBER}", "stage_name":
    "Prod/Deploy", "branch_name": "scratch/release" }""");
   ```

   Example of a Jenkins pipeline:

   ```
   snDevOpsGetChangeNumber (changeDetails: """{ "pipeline_name":
    "github_pipeline", "build_number": "${env.BUILD_NUMBER}",
    "stage_name": "Prod/Deploy" }""");
   ```

4. Save the script.
5. Navigate to **DevOps > Orchestrate > Pipeline Change Requests**.
6. Select the change record associated with the pipeline.
7. Approve the change request by selecting#**Approved**# in the**State** #field.
8. In Jenkins, open the pipeline for which you are retrieving the change request number.
9. Select **Build Now**.
   The change request number associated with the pipeline will be displayed as an output in the pipeline.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Update change request details in Jenkins pipeline

Update the change request details associated with a Jenkins pipeline by running the snDevOpsUpdateChangeInfo script in the pipeline.

Before you begin

Role required: Jenkins admin

About this task

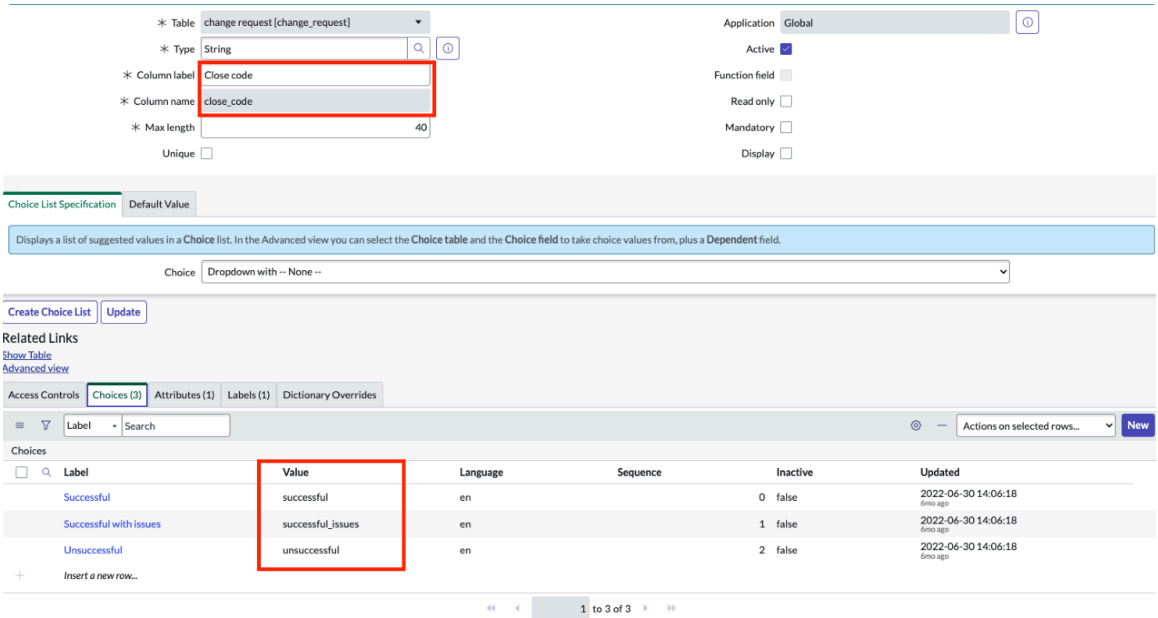
When you update the **state** parameter in a change request, only the following transitions are supported:

- cancel: Change request state must be **implement** to move the state to **cancel**. **reason** is a mandatory input to update the state to canceled.
- closed: Change request state must be **implement** or **post implement** to move the state to **close**. **close_code** and **close_notes** are mandatory input to update the state to closed.

Specify the change request state as an integer value:

- 4 - Cancel (Value set in the sn_devops.change_request.cancel_state property)
- 3 - Closed (Value set in the sn_devops.change_request.closed_state property)

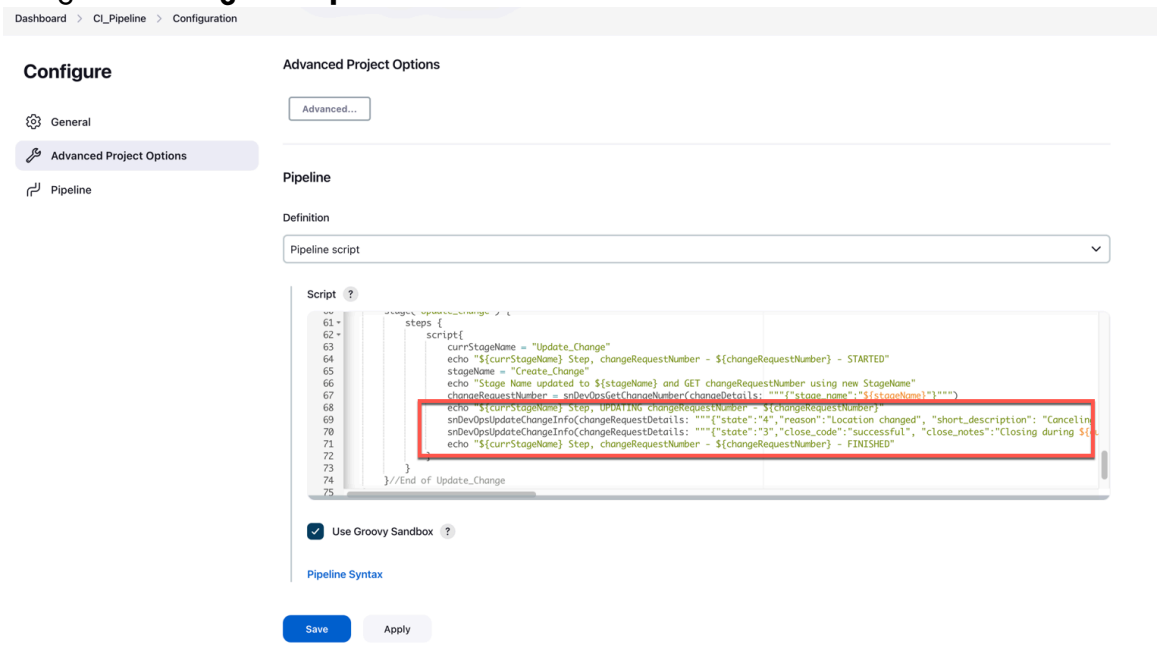
When you update a choice field, you must specify a valid choice value that is available in the corresponding choice list. For example, the choice list values for the **Close code** field are successful, successful_issues, and unsuccessful.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In your Jenkins dashboard, open the pipeline for which you want to update the change request details.
2. Navigate to **Configure > Pipeline**.



3. In the Pipeline script section, update the `snDevOpsUpdateChangeInfo` script with the following input parameters:
   - Change request number whose details need to be updated.
   - Change request details to be updated as Key:Value pairs.

```
{ "short_description": "Test description", "priority": "1",
 "start_date": "2021-02-05 08:00:00",
"end_date": "2022-04-05 08:00:00", "justification": "test
 justification", "description": "test description",
"cab_required": <true/false>, "comments": "This update for work
 notes is from jenkins file", "work_notes": "test work notes",
"assignment_group": "<SYS_ID>", "state":"<STATE_CODE>",
 "close_code":"<successful/successful_issues/unsuccessful>",
 "reason":"<As per Choice List>"
```

4. Save the script.
5. Navigate to **DevOps > Orchestrate > Pipeline Change Requests**.
6. Select the change record associated with the pipeline.
7. Approve the change request by selecting#**Approved**# in the**State** #field.
8. In Jenkins, open the pipeline for which you are updating the change request details.
9. Select **Build Now**.
   The change request details specified in step 3 will be updated for the pipeline.

ServiceNow DevOps change request state in Jenkins pipeline logs

You can use the Jenkins Snippet Generator utility to configure how and when the change state and the corresponding policy conditions must be displayed in the Jenkins pipeline job logs. This enables developers to view the status of the change in the console logs of the pipeline itself.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To generate a step snippet, navigate to the Pipeline Syntax from a configured pipeline, select the **SnDevOpsChange** step from the **Sample Step** list, and update the values for the change state variables in the step. Select the **ignore error** option to prevent job failure if there is an error. Select **Generate Pipeline Script** to create a snippet. You can copy and paste the snippet into the pipeline to start receiving the change state notifications. Update the following variables in the **SnDevOpsChange** step to receive change state notifications:

- **Polling Interval**: Specifies the frequency (in seconds) at which Jenkins polls ServiceNow for the change status and updates the console logs with the status. The change status is updated in the console logs only when the **Change state transitions**, **Assignment Group updates**, **Approval updates**, **Planned Start/End date**, or **Change Details** (if any) fields are updated.

  Note:
  If no value is entered in the field, polling interval check won't be run to update the change status in the console logs.

- **Change Creation Timeout**: Specifies the change creation timeout value in seconds. On timeout, Jenkins checks the change creation status in ServiceNow. If the change did not get created, the pipeline is resumed or aborted based on the **Abort on change creation failure** flag. By default, the pipeline is aborted when timeout is specified and the **Abort on change creation failure** flag is selected.

  Note:
  If no value is entered in the field, change creation timeout check won't be run to update the pipeline.

- **Abort on change creation failure**: Abort or resume the pipeline if change is not created till the change creation timeout.
  - Selected: Abort
  - Cleared: Resume
- **Change Step Timeout**: Specifies the change step timeout value in seconds. On timeout, Jenkins checks the change step status in ServiceNow. If the change step is still in progress, the pipeline is resumed or aborted based on the **Abort on change step timeout** flag. By default, the pipeline aborted when timeout is specified, and the **Abort on change step timeout** flag is selected.

  Note:
  If no value is entered in the field, change step timeout check won't be run to update the pipeline.

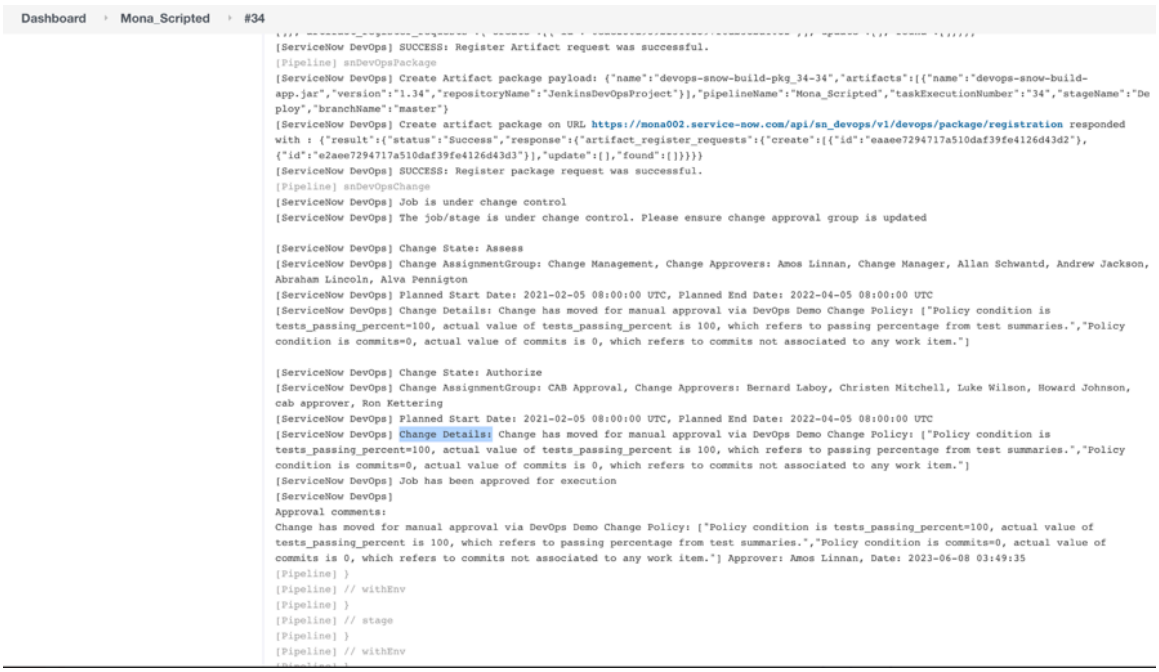
- **Abort on change step timeout**: Abort or resume the pipeline if the change step is still in progress on change step timeout.
  - Selected: Abort
  - Cleared: Resume

You can navigate to the console logs in your pipeline to view the state of a change request when a change request is created or when the state of the change request is updated. The policy conditions associated with the change request state will also be evaluated and displayed in the logs. For example, if the DevOps Change Request Advanced Automation policy is activated, the policy conditions will be evaluated and the corresponding decision made (auto-approve/auto-reject/manual-approval) will be displayed in the logs.

The following change request details are displayed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- number
- details
- status
- sys_id
- type
- risk
- priority
- changeState
- plannedStartDate
- plannedEndDate
- changeRequestURL



The logs for policy conditions will be displayed for the base system change flows as follows:

- DevOps Model Change Policy: Only logs will be displayed on change creation and when the change state is updated.
- DevOps Change Request Minimal Automation Policy: Logs along with change decision and policy conditions corresponding to the change decision will be displayed.
- DevOps Change Request Advanced Automation Policy: Logs along with change decision and policy conditions corresponding to the change decision will be displayed.

The change policy input and decision conditions are stored in the Decisions [sys_decision_question] table. Logs will be displayed if the following fields and operators are used as input for policy conditions:

Fields

- code_coverage
- commits_without_work_item
- integration_tests_failed

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- load_tests_failed
- regression_tests_failed
- num_of_outages_in_last_7_days
- num_of_current_outages
- num_of_open_incidents
- total_num_of_commits
- tests_passing_percent
- risk
- code_security
- commits

Operators

- <=
- >=
- !=
- =
- <
- >
- ISNOTEMPTY
- ISEMPTY
- BETWEEN
- ANYTHING
- NSAMEAS
- SAMEAS
- GT_FIELD
- LT_FIELD

Note:
If any field is modified in a change policy other than the base system fields, then those fields must be manually added to the flow for policy conditions to be evaluated.

If a change request does not get created due to any issue, then the reason for the failure and the state is also logged in the console.

Nested and parallel stages in Jenkins pipelines

Use nested and parallel stages in scripted Jenkins pipelines to speed up your pipeline execution. Change requests are created for nested and parallel stages and not just for the parent stage.

Support for nested and parallel stages in Jenkins pipelines

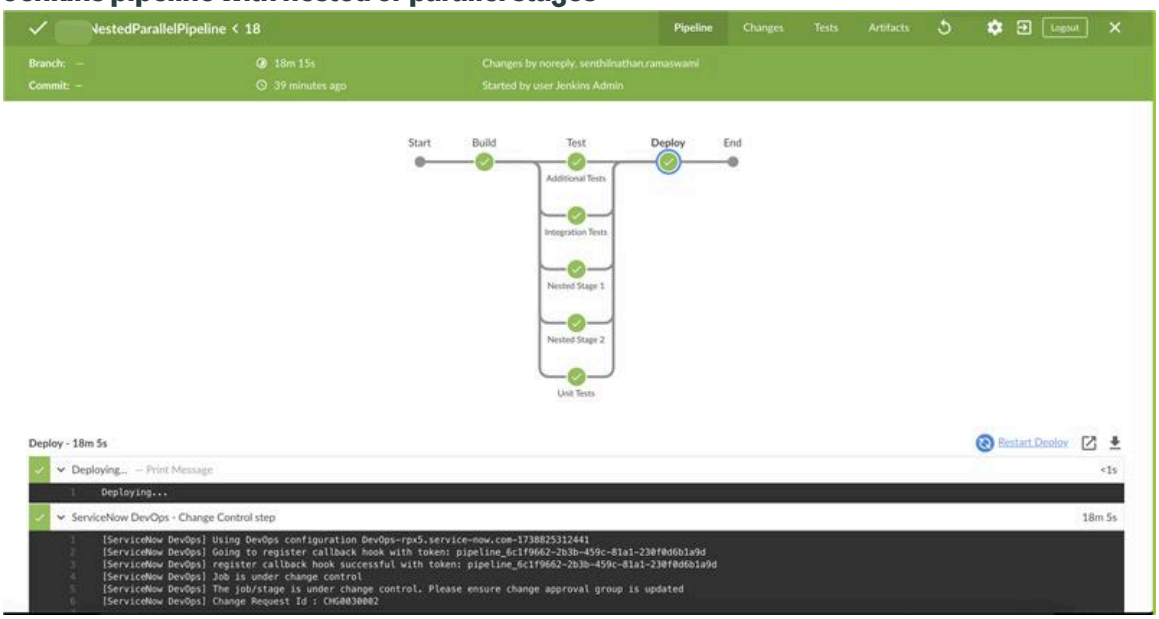
You can use nested and parallel stages in scripted Jenkins pipelines to automate and speed up tasks that can be run in parallel. For example, you have a scripted Jenkins pipeline with nested and parallel stages for various test cases such as different quality checks for different operating systems and browsers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow DevOps supports processing parallel and nested stages in Jenkins pipelines and displays the pipeline, in the DevOps pipeline UI. In effect, the ServiceNow DevOps pipeline UI renders or replicates the Jenkins pipeline UI in real time. From the **Pipeline Execution** view of the relevant pipeline, click the **Pipeline UI** related link to view the real-time state of the pipeline as it appears in Jenkins. The associated artifact details that are sourced from the build pipeline, Test Results, Software Quality Summary Results, and Change request details display on the pipeline UI.

Important:
Support for parallel and nested stages is restricted to scripted pipelines in Jenkins. Freestyle pipelines continue to appear in a sequential or serial manner in the DevOps pipeline UI, even if parallel and nested stages are part of freestyle pipelines in Jenkins.

Jenkins pipeline with nested or parallel stages



Sample pipeline with nested or parallel stages

```
pipeline {
    agent any

    stages {
        stage('Build') {
            steps {
                echo 'Building...'
                // Your build steps here
            }
        }

        stage('Test') {
            parallel {
                stage('Unit Tests') {
                    steps {
                        echo 'Running unit tests...'
                        // Your unit test steps here
                    }
                }
                stage('Integration Tests') {
                    steps {
                        echo 'Running integration tests...'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                        // Your integration test steps here
                    }
                }
                stage('Additional Tests') {
                    steps {
                        script {
                            parallel(
                                'Nested Stage 1': {
                                    echo 'Running nested
 parallel stage 1...'
                                    // Your nested parallel
 stage 1 steps here
                                },
                                'Nested Stage 2': {
                                    echo 'Running nested
 parallel stage 2...'
                                    // Your nested parallel
 stage 2 steps here
                                }
                            )
                        }
                    }
                }
            }
        }

        stage('Deploy') {
            steps {
                echo 'Deploying...'
                snDevOpsChange changeRequestDetails:
 '{ "attributes": {"chg_model":
 "e55d0bfec343101035ae3f52c1d3ae49","standard_change_template="
563504cc47410200e90d87e8dee490e2"},"autoCloseChange":
 false}',changeStepTimeOut: 18000, pollingInterval: 60
                // Your deploy steps here
            }
        }
    }
}
```

Change requests in nested and parallel stages

Change requests are created for all nested and parallel stages, once all upstream events (prior to the change request) are received. In previous releases, nested or parallel stages in Jenkins pipelines were not identified nor processed in ServiceNow DevOps. Only parent stages were identified and processed in a linear or sequential manner. If change requests existed as part of any nested and parallel stages, those change requests were ignored and a single change request was processed as part of the parent stage. When you run a new pipeline after upgrading, new steps and steps executions are created for nested stages.

Nested and parallel stages were not processed previously, and approval groups were mapped only to the parent stage. Because nested and parallel stages are identified during processing, you must verify that relevant approval groups are mapped to the appropriate nested or parallel stage. If subsequent steps of the pipeline are dependent on the change request's being approved, the pipeline execution is paused, and resumed when the change request is approved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Upgrade Considerations

If you are already using Jenkins with nested and parallel pipelines as your orchestration tool, consider the following while upgrading.

- Upgrade during off-peak hours.
- Ensure that you do not have any pipeline executions that are currently in progress by ServiceNow DevOps. If pipeline executions are being processed, step executions might not be created as expected for the in-progress pipeline runs. Rerun the pipeline to create appropriate step executions.

Jenkins log levels and Log Recorders

Set log levels in the Jenkins plugin for ServiceNow DevOps based on the extent of log detail you need for debugging.

Base system Log Recorder in Jenkins logs

You can set the level of detail that your log messages capture. In previous versions of the plugin, you could only enable or disable the **Debug** mode, which meant that you could either enable or disable all Jenkins logs without the ability to select the level of information or detail you want to save in your logs. Often, this leads to excessive information in your logs, used up more disk space, and collected information that might not always be relevant or useful.

The flexibility to set log levels allows you to select the right log level information that is appropriate for your organizational needs. You can select custom log levels based on the log levels or categories that Jenkins currently supports.

The log level is turned off by default for first-time DevOps installations. Consider the following items after successfully upgrading:

- if the **Debug** check box was previously selected, the log level is enabled and set to *Info* by default.
- If the **Debug** check box was cleared previously, by default, log levels are tuned off.

Note:

The Jenkins log does not record log messages at a level lower than *Info*. The base system ServiceNow DevOps log recorders are used to record this message.

You can select a custom level from the Jenkins plugin- ServiceNow DevOps Configuration form > Log level list. A base system ServiceNow DevOps log recorder is created in the Jenkins Log Recorders list. For more information, see Jenkins documentation on viewing logs.

Note:
Do not modify the log recorder from the Jenkins > Log Recorders > Configure log recorders. Editing the log recorder from Jenkins creates a duplicate entry for any changes to the log levels that you make. Please use the list of log levels in the ServiceNow DevOps Configuration form, to modify the log levels.

Argo CD integration with DevOps Change Velocity

Connect to your Argo CD instance to automate the deployment of applications from GitHub repositories.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Argo CD integration overview

This integration enables the ServiceNow platform to manage the change request closure process based on the sync status received from Argo CD for continuous deployment of applications.

You must activate the DevOps Integration with Argo CD plugin (sn_devops_argocd) before connecting your Argo CD instance in ServiceNow. For more information on activating a plugin, see Activate a plugin.

Workflow

Here is the workflow of how the continuous deployment process works through Argo CD in ServiceNow DevOps.

- Create an Argo CD tool connection in ServiceNow DevOps Change Velocity using the Classic or Workspace UI.
- Create a webhook in Argo CD manually.
- Update your Config file in the GitHub repository for deployment. While updating the Config file, specify the change request number in the commit tag (sn_devops_change-<change request number>).

  Note:
  The change request number specified in the commit tag must already be created by the CI pipeline and in the implement state.

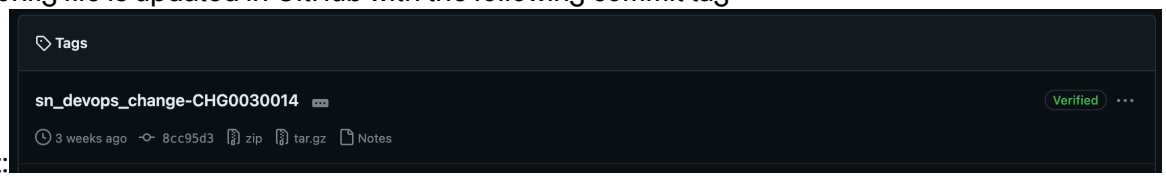
- Sync the required app associated with your Config file and repository in Argo CD.
- Once sync is successful, notifications are sent to ServiceNow DevOps and inbound events are created.
- Change request number is retrieved from the inbound events and updated with the Argo CD synchronization status.
- Change request is closed and based on the sync status, the close code, worknotes, and close notes fields are updated in the change request.

Example

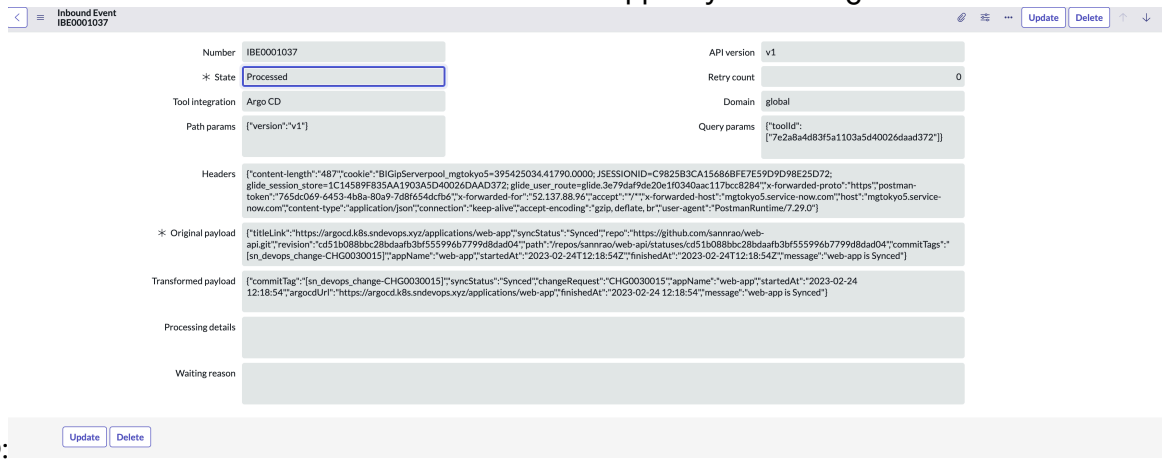
The following examples specify how changes made in Argo CD are notified to ServiceNow DevOps through the webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

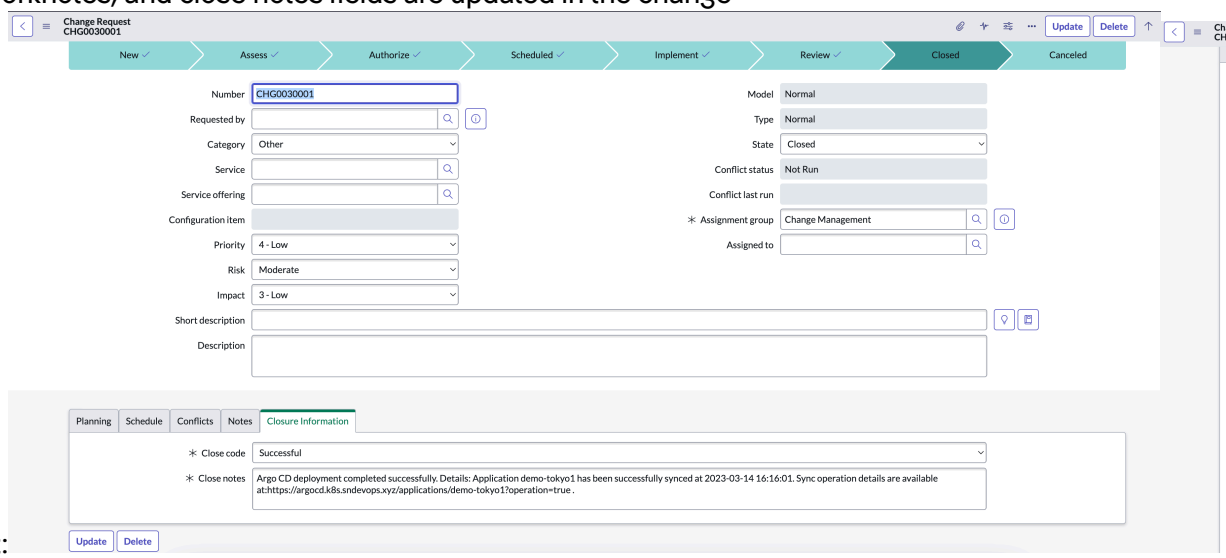
- The Config file is updated in GitHub with the following commit tag format:



- Inbound events are created in ServiceNow when an app is synced in Argo CD:



- If sync is successful, the change request is closed and the close code, worknotes, and close notes fields are updated in the change request:



Onboard Argo CD to DevOps Change Velocity – Workspace

Connect to your Argo CD instance using the DevOps Change Workspace playbook to automate the deployment of applications from GitHub repositories.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

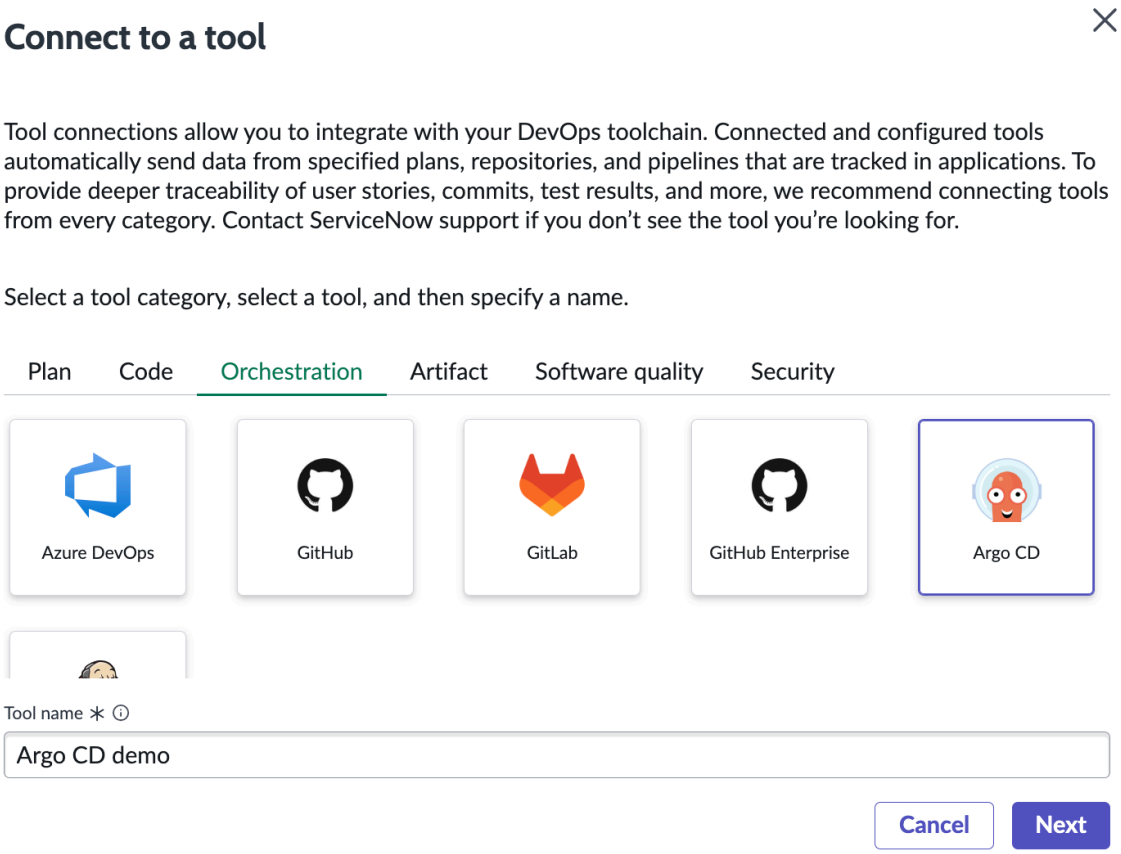
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Argo CD.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Specify a name for the tool in the **Tool name** field, and select **Next**.



3. On the Argo CD instance details playbook activity:

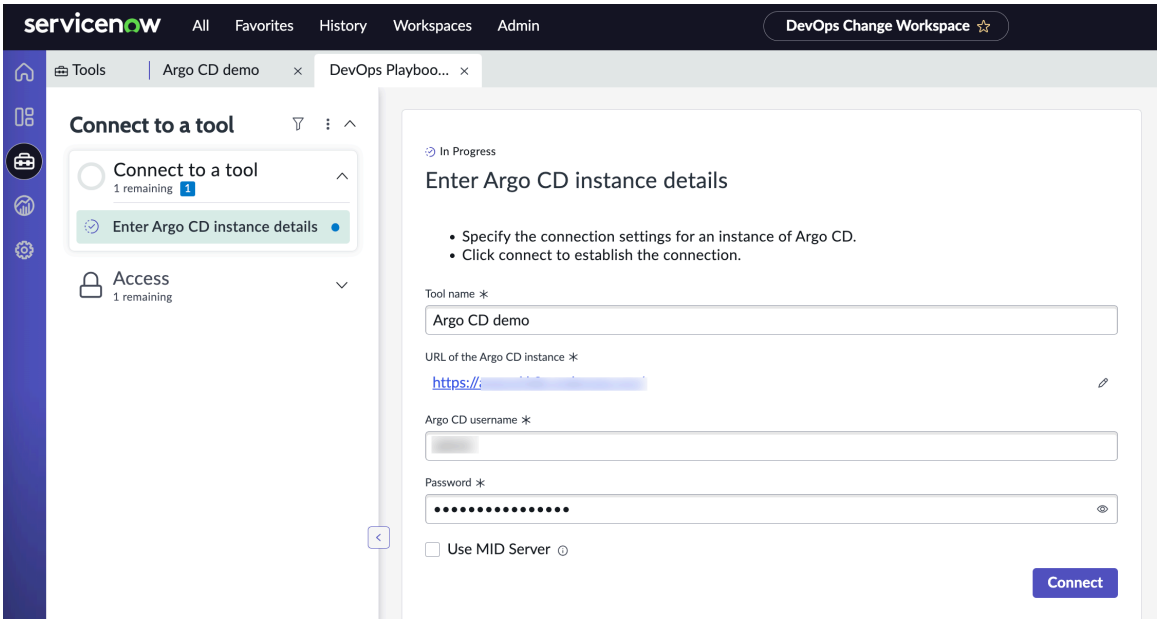
   a. Enter the URL of your Argo CD instance.

   b. Enter the login credentials of the Argo CD instance.

   > **Note:**
   > To generate a token for the user in Argo CD, go to **Accounts**. Ensure that the user has the capability: apiKey. For more information, see Argo CD documentation.

   c. **Optional:** Select the MID Server option and enter its details if your Argo CD instance is attached to a MID Server.
   A MID server is required if your tool instance is hosted on-prem. For more information about MID server, see MID Server selection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Connect**.
5. Specify the access for the tool.
   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

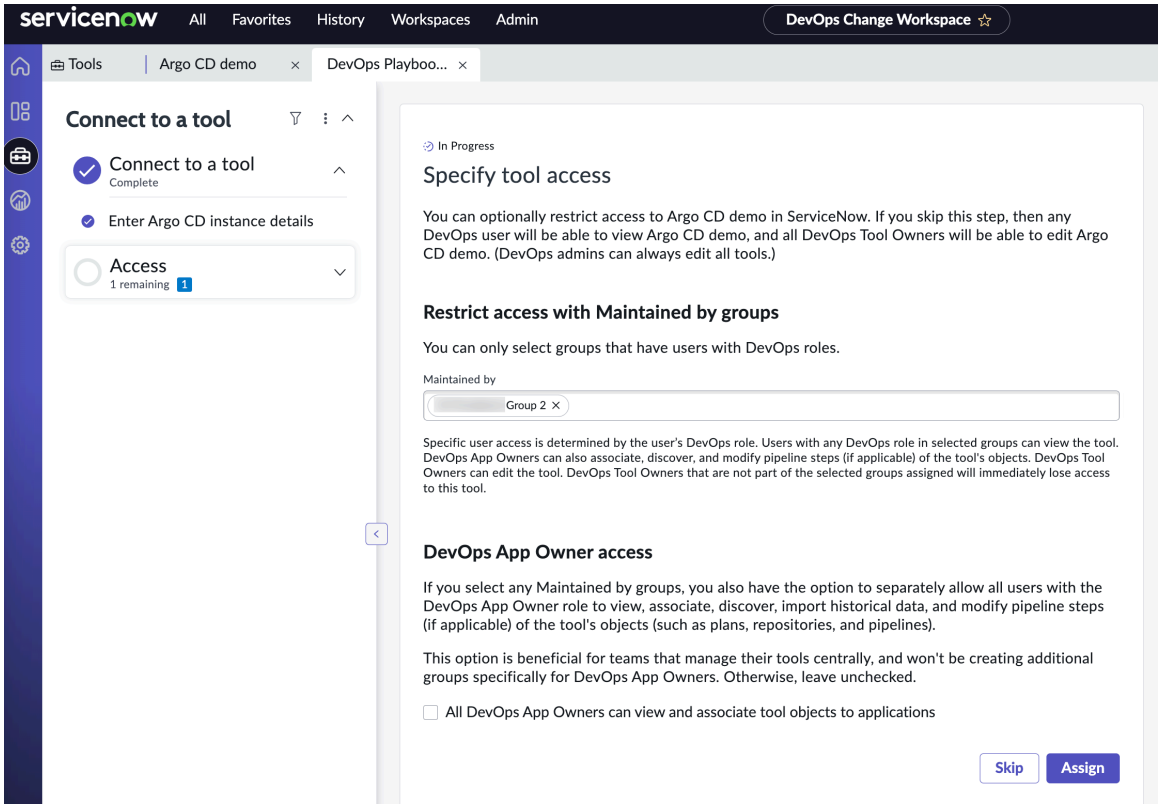
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

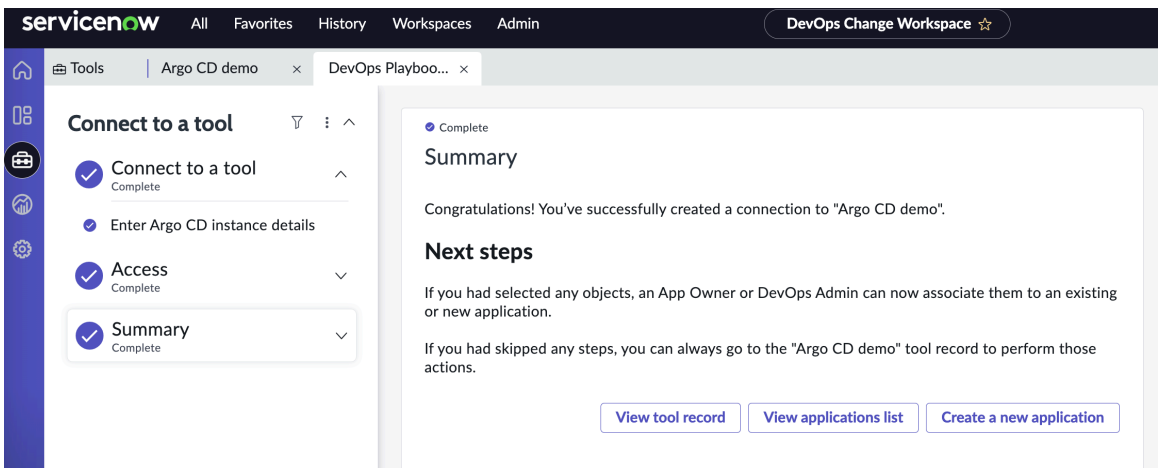
      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. From the **Summary** page, select **View tool record** to review the details of the connected instance.



Result

You've successfully onboarded your Argo CD tool to DevOps Change Velocity.

Onboard Argo CD to DevOps Change Velocity — Service Catalog

Connect your Sonar instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Argo CD integration.
Tool integration	Select Argo CD.
Tool URL	Argo CD instance URL.
Tool username/API ID	Username of your Argo CD instance.
Tool password/ Access token/API key	Argo CD user token or password.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps and capability is set to REST.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is connected and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Enter the connected Argo CD tool name.
Pipelines	Select the pipelines for which you want to configure webhooks and import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Onboarding repositories	Leave empty.
Onboarding plans	Leave empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Select **Order Now**.
   A request is created. When the request is approved, the pipeline objects are associated to the app record, which enables real-time tracking. Historical data is also imported for the selected pipelines. The **Track** field is automatically enabled for imported pipelines.

Onboard Argo CD to DevOps Change Velocity — Classic

Connect your Argo CD instance using the Classic UI in DevOps Change Velocity.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **DevOps > Tools > Create New (legacy)** and create a record.
2. Enter a **Tool Name** and fill in the tool details.

Create DevOps Tool form

Field	Description
Tool integration	Tool to integrate. In this case, select **Argo CD**.
Tool URL	URL of the existing Argo CD instance to integrate. For example: https://argocd.k8s.sndevops.xyz/
Tool username	Username of your Argo CD instance.
Tool password	Password of your Argo CD instance.

3. **Optional:** Select **MID Server** for an on-premises tool that is attached to a MID Server. Application is automatically set to DevOps and capability is set to REST.
4. Select **Submit**.
   The tool is automatically Connected Successfully using a connection alias, and HTTP tool connection (basic authentication credential).

Configure webhooks in Argo CD manually

Configure webhooks in Argo CD to send sync notifications to the DevOps Change Velocity application.

Before you begin

Role required: Argo CD admin

About this task

The subscription to Argo CD application events can be defined using the `notifications.argoproj.io/subscribe.<trigger>.<service>:<recipient>` annotation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

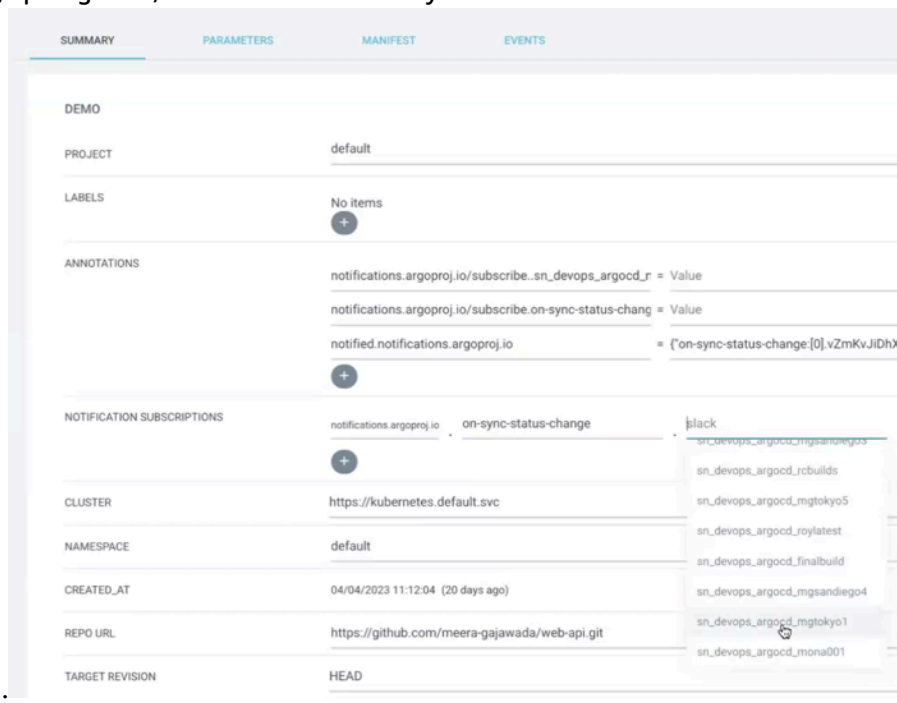
1. In Argo CD, update the `ConfigMap: argocd-notifications-cm.yaml` to set up the notifications that are send to DevOps Change Velocity.

```
apiVersion: v1
kind: configMap
metadata:
  name: argocd-notifications-cm
  namespace: default
data:
  context: |
    argocdUrl: "https://<argocdURL>"
  service.webhook.sn_devops_argocd: |
    url:
 https://<instance>.service-now.com/api/sn_devops/v2/devops/to
ol/orchestration?toolId=<toolId>
    basicAuth: #optional username password
      username: ""
      password: ""
  template.app-sync-succeeded: |
    webhook:
      sn_devops_argocd:
        method: POST
        body: |
          {
          "titleLink" :
 "http://<argocdURL>/applications/{{.app.metadata.name}}",
          "syncStatus" : "{{.app.status.sync.status}}",
          "repo" : "{{.app.spec.source.repoURL}}",
          "revision": "{{.app.status.sync.revision}}",
          "path":
 "/repos/{{call .repo.FullNameByRepoURL .app.spec.source.repoUR
L}}/statuses/{{.app.status.operationState.operation.sync.revisi
on}}",
          "commitAuthor" :
 "{{(call .repo.GetCommitMetadata .app.status.sync.revision).Au
thor}}",
          "commitMessage" :
 "{{(call .repo.GetCommitMetadata .app.status.sync.revision).Me
ssage}}",
          "commitTags" :
 "{{(call .repo.GetCommitMetadata .app.status.sync.revision).Ta
gs}}",
          "startedAt" :
 "{{.app.status.operationState.startedAt}}",
          "finishedAt" :
 "{{.app.status.operationState.finishedAt}}",
          "message": "{{.app.metadata.name}} app is synced"
          }
  trigger.on-sync-status-unknown: |
    - description: Application status is 'Unknown'
      send:
      - app-sync-status-unknown
      when: app.status.sync.status == 'Unknown'
  trigger.on-sync-succeeded: |
    - description: Application syncing has succeeded
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    send:
    - app-sync-succeeded
    when: app.status.operationState.phase in ['Succeeded']
subscriptions: |
  - recipients:
    - sn_devops_argocd
    triggers:
    - on-sync-succeeded
    - on-sync-status-unknown
```

2. Open the Argo CD app for which you are configuring webhooks.
3. Navigate to **APP DETAILS > SUMMARY**.
4. Add the **notifications.argoproj.io/subscribe.<trigger>.<service>: <recipient>** annotation with the trigger condition to sync the change status for your instance.
   For example, `notifications.argoproj.io/subscribe.on-sync-succeeded.sn_devops_argocd`.



Jira integration with DevOps Change Velocity

Connect to your Jira server or cloud instance to discover plans and enable real-time notifications for projects, issues, and releases.

Jira integration overview

When you connect and configure a Jira instance, all existing work items are imported through plans, and a webhook is established to ensure updates are tracked real-time. You can then associate these planning objects to application for end-to-end traceability.

Get started

Use one of the following options to onboard Jira. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Jira to DevOps Change Velocity — Workspace

Connect to your Jira Server or Jira Cloud instance from the DevOps Change Workspace to discover available plans and register webhooks to track projects, stories, features, and epics.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Jira.

> **Important:**
> If you want to discover and track tool objects like plans while connecting to the tool, you must connect your tool from the Application module.

2. Connect to your Jira Server or Jira Cloud instance.

Jira Server	**a.** From the **Platform** list, select **Jira Server**. **b.** In the **Tool name** field, enter a name for the tool. This name is used to identify your Jira instance from the list of tools connected to DevOps Change Velocity. Jira Cloud	**a.** From the **Platform** list, select **Jira Cloud**. **b.** In the **Tool name** field, enter a name for the tool. This name is used to identify your Jira instance from the list of tools connected to DevOps Change Velocity.

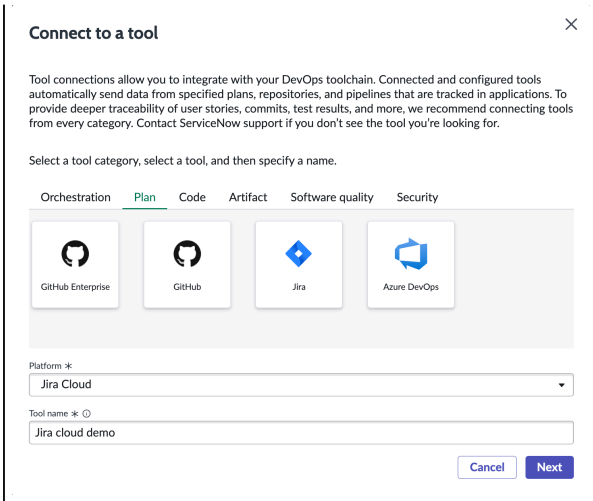
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select **Next**.

   The DevOps playbook page opens to help you complete the onboarding tasks.

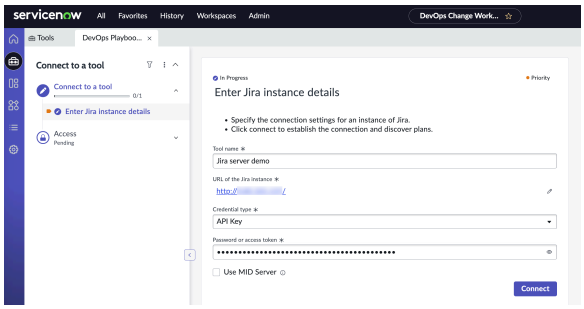
4. Complete the connection to your Jira tool using the playbook.

   a. Enter the connection details.

Jira Server	i. Enter your Jira server instance URL. ii. From the **Credential type** list, select the authentication type you want to use to connect with your Jira server. ▪ **Basic Auth** 1. Enter your Jira server username. **Note:** The Jira user that you use here must have the Jira Administrators permissions. 2. Enter the password or access token to access this instance.  ▪ **API Key**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Enter the API token to access the instance.



iii. If your Jira instance is attached to a MID Server, select the **MID Server** option and enter its details.

For more information about MID server, see MID Server selection

---

Jira Cloud

i. Enter your Jira Cloud instance URL.

> **Note:**
> If you select the credential type as **OAuth 2.0 with 3LO** in the next step, you must enter your Jira instance URL in the following format:
>
> ```
> https://api.atlassian.com/ex/jira/<Cloud-ID>
> ```
>
> For information on obtaining the value of Cloud ID, see Obtain the value of Cloud ID.

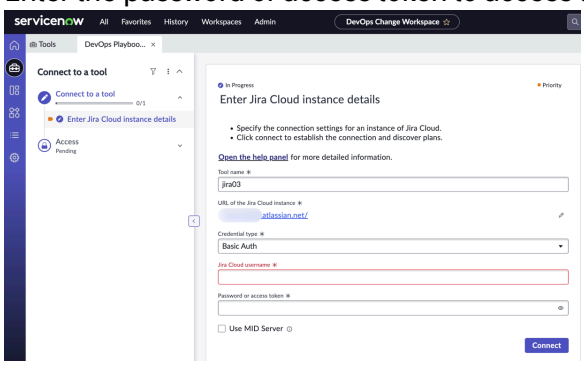
ii. Select the credential type as **Basic Auth** or **OAuth 2.0 with 3LO**.

Basic Auth

1. Enter your Jira Cloud username.

> **Note:**
> The Jira user that you use here must have the Jira Administrators permissions.

2. Enter the password or access token to access this instance.



OAuth 2.0 with 3LO

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

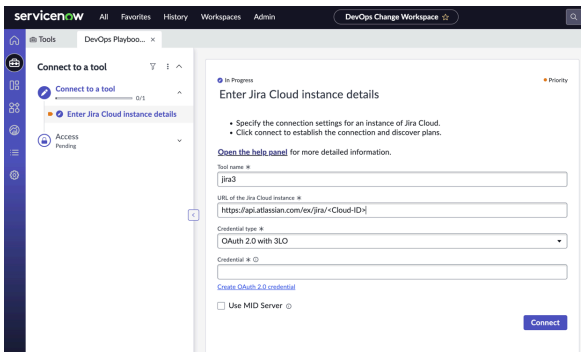
Pre-requisites:

-
-
- Create a credential record for Jira Cloud

Select an existing OAuth 2.0 credential record in the **Credential** field, or select **Create OAuth 2.0 credential record** to create a new record. For instructions on creating a new credential record, see Create a credential record for Jira Cloud.

Note:

- The option to create a new OAuth 2.0 will only be available if you have the connection & OAuth admin role.
- Only records that are not in use and configured for Jira Cloud can be selected as an existing credential record.



iii. If your Jira instance is attached to a MID Server, select the **MID Server** option and enter its details.

For more information about MID server, see MID Server selection

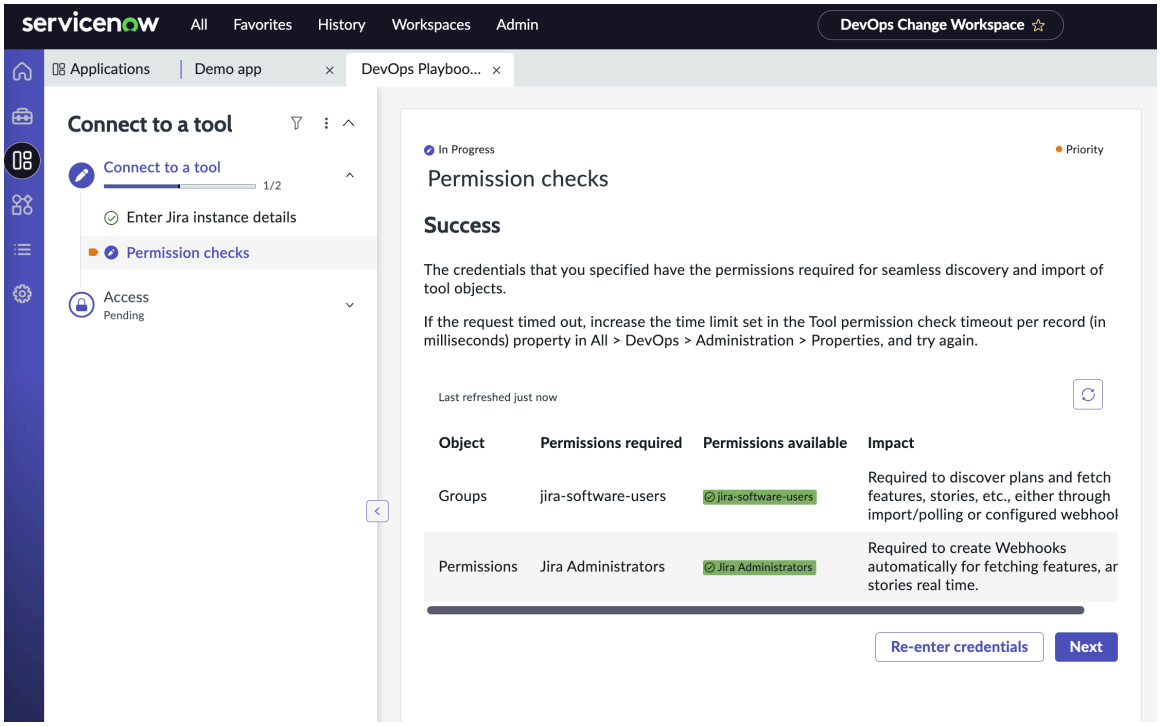
b. Select **Connect**.

If the connection is successful, the tool is created in the DevOps Change Velocity and connected to your Jira instance.

c. Permission checks are run on the credentials that you entered.
Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information on all the required permissions, see Jira permissions in Permissions required for DevOps tools.

You can choose to continue with the tool connection even if you don't have all the required permissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



d. Select **Next**.

5. Specify the access for the tool.

a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

The tasks these users in the groups can perform depends on the role assigned to them.

- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

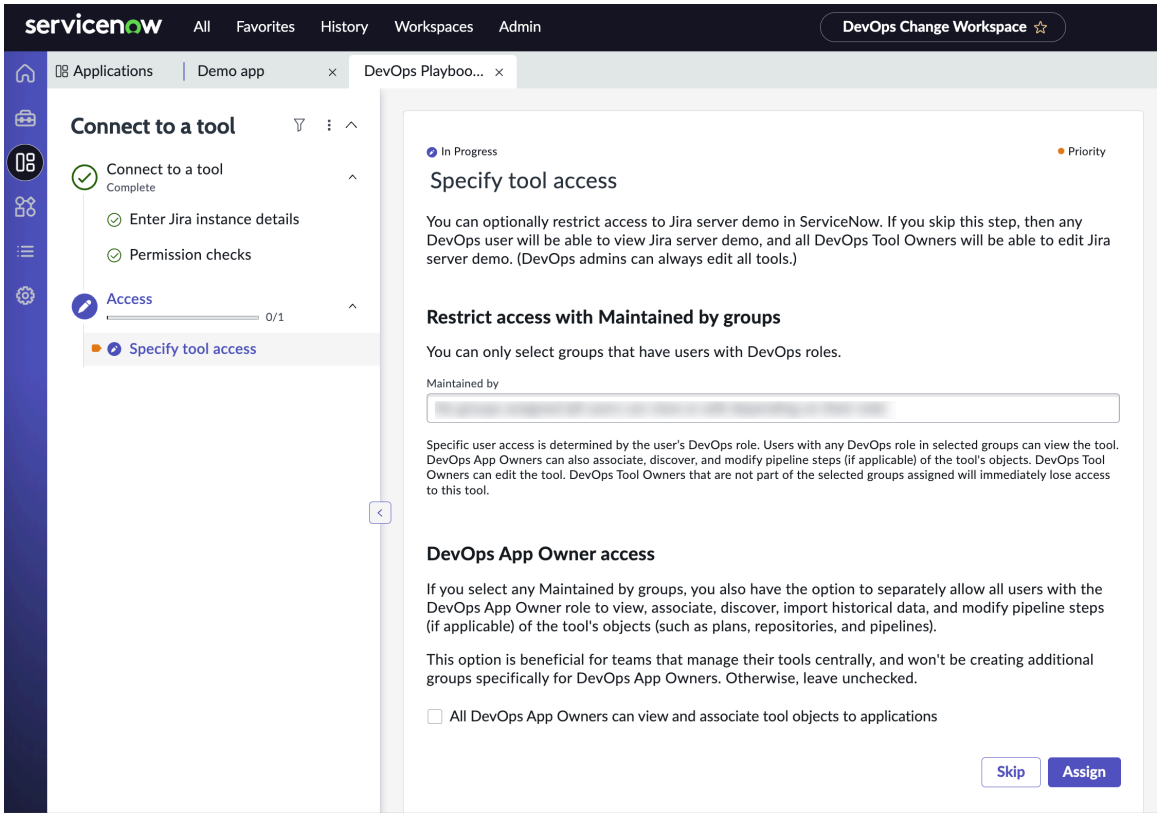
Note:
If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Assign**.



6. To send data in real time between DevOps and your Jira instance, select **Configure**.

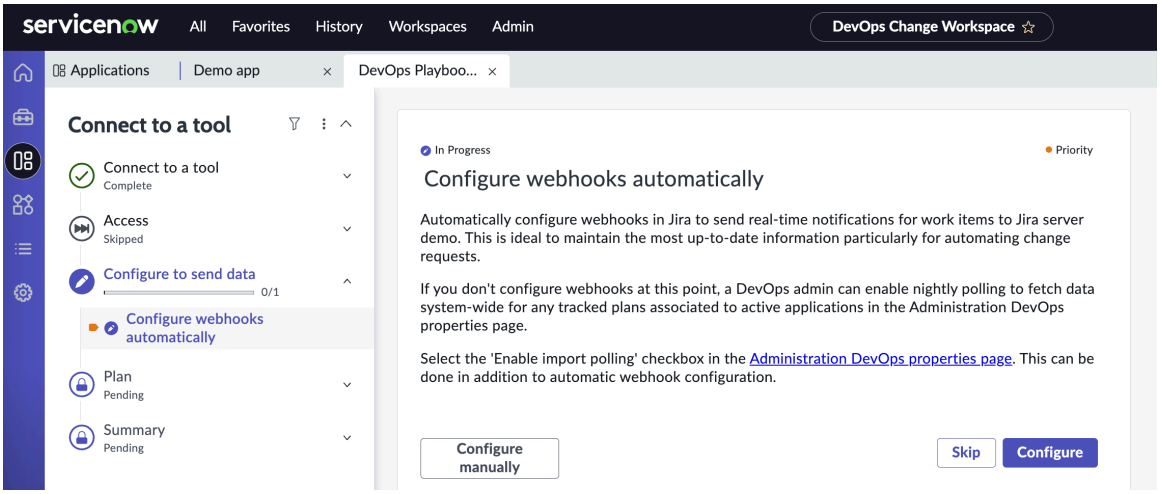
This action does the following:

- Registers a webhook between your Jira and ServiceNow instances, and enables real-time data transfer between the two.
- If you have connected your Jira tool using OAuth 2.0 based authentication, the webhooks are created for the OAuth 2.0 integration app in Jira when you configure automatically, whereas if you have connected using basic authentication, the webhooks are created for all your projects in Jira. If you choose to configure the webhooks manually for a Jira tool created using OAuth 2.0 based authentication, a duplicate webhook may get created.

All the discovered Jira projects are listed as Plans.

If you don’t choose to configure now, you can enable nightly polling later to fetch data for any tracked plans by setting the *`Enable Polling`* system property to **Yes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To configure manually, select **Configure manually**. See Configure webhooks in Jira manually for more information.

Important:

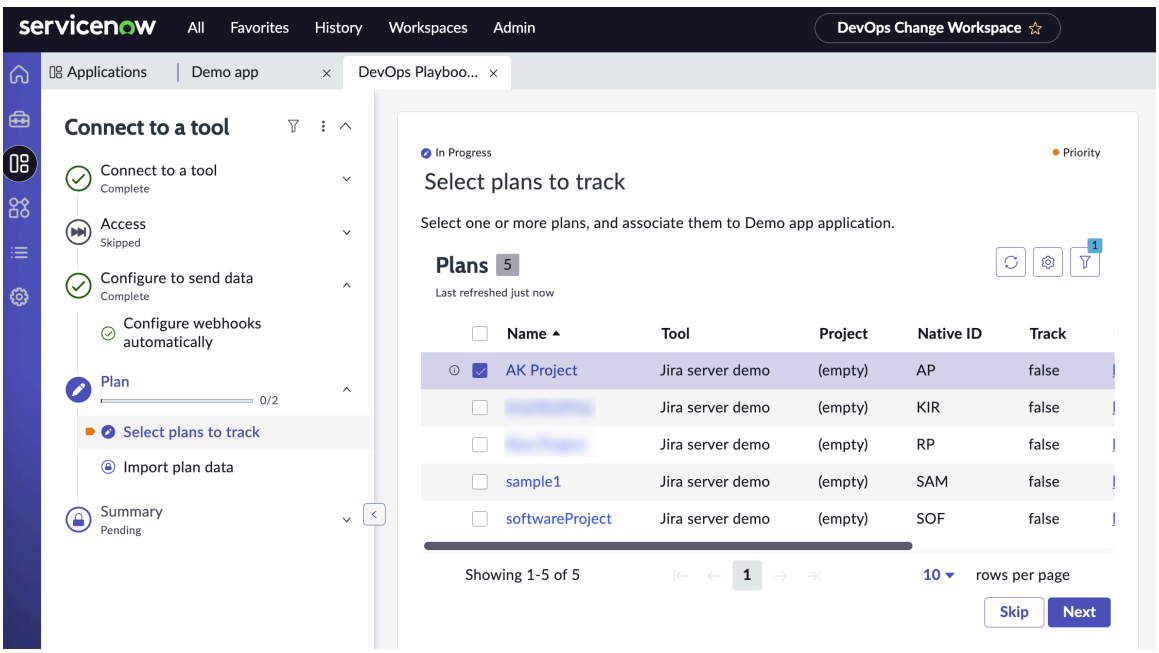
- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then plans available in your Jira instance are discovered. You can track and import historical data from them.

7. Select the plans to track.

a. Select the plans for which you want to track updates and associate to the application.

After the tool onboarding is complete, the work items only for these selected plans are automatically imported.

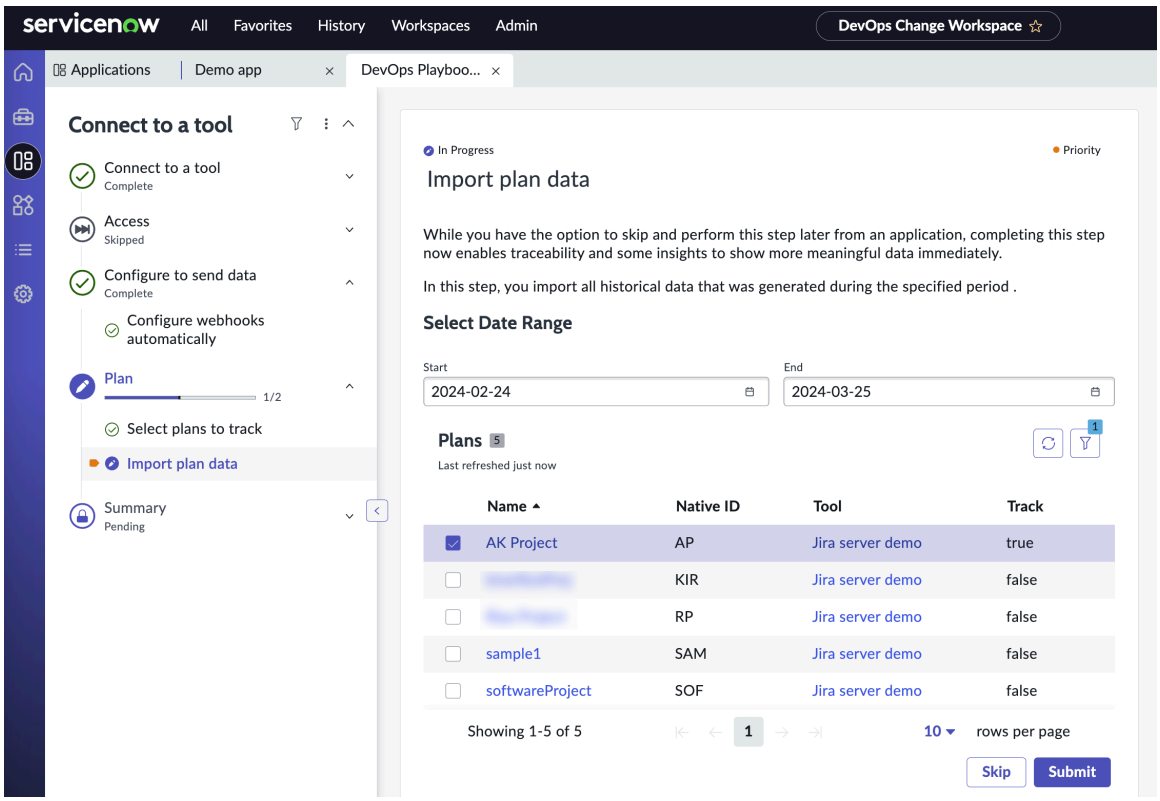
b. Select **Next**.



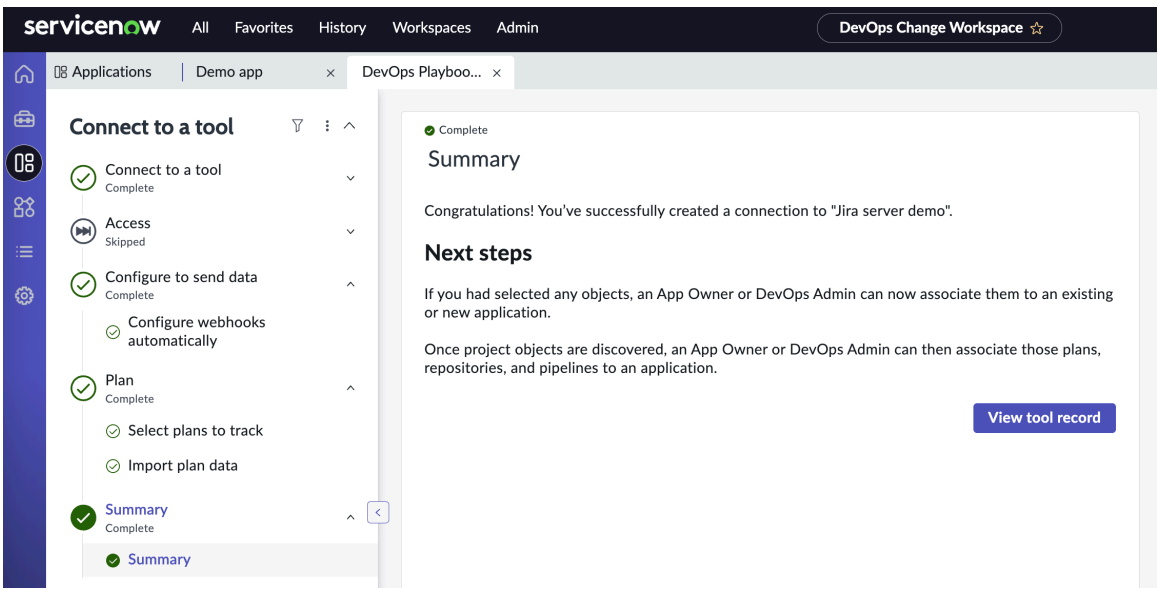
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. If you want to import plan data, select the date range and select **Submit**.

You can import up to 90 days of data.



8. From the **Summary** page, select **View tool record** to review the details of the connected instance and the plans discovered from it.



Result

You've successfully onboarded your Jira tool to DevOps Change Velocity.

What to do next

From the tool record page, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- See the details and status of the tool.
- **Discover** plans and **Configure** webhooks.

Note:

  - By default, projects are discovered in a set of 50 for Jira Cloud. 50 is the maximum pagination limit supported by Jira. If you want to reduce this value, then you should edit the respective constant in DevOpsCommonConstants script.
  - Project and version data that are discovered aren't updated or tracked in real time.

- Assign groups to control access to the tool using the **Maintained by** field.
- Check credential permissions and update credentials for the tool. For more details, see Check permissions and update credentials for tools — Workspace.
- From the **Plans** tab, select a plan to view its details such as imported work items, features, and others.
- To import historical data from the plans, associate the plans with an application, and import the data. For more information, see Associate tool objects to applications - Workspace.

Note:
It is recommended not to update the project key for projects in Jira. If the project key is updated, the updated object names will not reflect in DevOps Change Velocity. Only when the object is updated in Jira, the new name will reflect in DevOps Change Velocity.

Configure webhooks from the tool record

Onboard Jira to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your Jira Server or Jira Cloud instance using the ServiceNow Service Catalog.

Before you begin
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

Note:
You can also access the service catalog from the Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Jira Server	**a.** In the **Tool name** field, enter a name for the tool. **b.** In the **Tool integration** field, search for and select Jira. **c.** Enter your Jira server instance URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	d. From the **Credential type** list, select the authentication type you want to use to connect with your Jira server. ▪ **Basic Auth** **i.** Enter your Jira server username. **Note:** The Jira user that you use here must have the Jira Administrators permissions. **ii.** Enter the password or access token to access this instance. ▪ **API Key** Enter the API token to access the instance. **e.** If you want to configure webhooks for all the projects discovered in your Jira instance, then select the option **Do you wish to configure webhook for the tool?** **f.** Select#**Use MidServer** for an on-premises tool that is attached to a#MID Server. Application is automatically set to#DevOps and capability is set to REST.
Jira Cloud	**a.** In the **Tool name** field, enter a name for the tool. **b.** In the **Tool integration** field, search for and select Jira Cloud. **c.** in the **Tool URL** field, enter your Jira Cloud instance URL. **d.** In the **Credential type** field, select **Basic Auth** or **OAuth 2.0**. **Basic Auth** **i.** Enter your Jira Cloud username. **Note:** The Jira user that you use here must have the Jira Administrators permissions. **ii.** Enter the password or access token to access this instance. **OAuth 2.0** Pre-requisites: ▪ ▪ Obtain the value of Cloud ID ▪ ▪ Create credential record for Jira Cloud In the **Tool credential** field, select an existing OAuth 2.0 tool credential record. **Note:** Only records that are not in use and configured for Jira Cloud can be selected as an existing credential record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	e. If you want to configure webhooks for all the projects discovered in your Jira instance, then select the option **Do you wish to configure webhook for the tool?** **Note:** If you have connected your Jira tool using OAuth 2.0 based authentication, the webhooks are created for the OAuth 2.0 integration app in Jira when you configure automatically, whereas if you have connected using basic authentication, the webhooks are created for all your projects in Jira. **f.** Select#**Use MidServer** for an on-premises tool that is attached to a#MID Server. Application is automatically set to#DevOps and capability is set to REST.

For a list of all the permissions required on the credentials for connecting to Jira, see Jira permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is created, connected, configured, and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding** and select **Try it**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Leave empty.
Onboarding repositories	Leave empty.
Onboarding plans	Enter the connected Jira tool name.
Plans	Select the plans for which you want to import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.

8. Select **Order Now**.
   A request is created. When the request is approved, the plan objects are associated to the app record, which enables real-time tracking. Historical data is also imported for the selected plans. The **Track** field is automatically enabled for imported plans.

Onboard Jira to DevOps Change Velocity — Classic

Connect your Jira Server or Jira Cloud instance to discover, configure, and import projects and work items such as stories, epics, and features.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Complete the tasks in Getting started with DevOps Change Velocity.

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Connect to your Jira Server or Jira Cloud instance.

   a. Navigate to **DevOps** > **Tools** > **Create New (legacy)**.

   b. Enter the details for connecting to your Jira instance.

Jira Server	i. In the **Tool name** field, enter a name for the tool. ii. In the **Tool integration** field, search for and select Jira. iii. Enter your Jira server instance URL. iv. From the **Credential type** list, select the authentication type you want to use to connect with your Jira server. ▪ **Basic Auth** 1. Enter your Jira server username. **Note:** The Jira user that you use here must have the Jira Administrators permissions. 2. Enter the password or access token to access this instance. ▪ **API Key** Enter the API token to access the instance.
Jira Cloud	i. In the **Tool name** field, enter a name for the tool. ii. In the **Tool integration** field, search for and select Jira Cloud. iii. in the **Tool URL** field, enter your Jira Cloud instance URL. iv. In the **Credential type** field, select **Basic Auth** or **OAuth 2.0**. **Basic Auth** 1. Enter your Jira Cloud username. **Note:** The Jira user that you use here must have the Jira Administrators permissions. 2. Enter the password or access token to access this instance. **OAuth 2.0** Pre-requisites:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	▪ ▪ Obtain the value of Cloud ID ▪ ▪ Create credential record for Jira Cloud In the **Tool credential** field, select an existing OAuth 2.0 tool credential record. **Note:** Only records that are not in use and configured for Jira Cloud can be selected as an existing credential record.

For a list of all the permissions required on the credentials for connecting to Jira, see Jira permissions in Permissions required for DevOps tools.

c. **Optional:** If your Jira instance is attached to a MID Server, select the **MID Server** option and enter its details.

(Optional) For more information about MID server, see MID Server selection

d. Select **Submit**.

The tool is automatically connected using a connection alias and HTTP tool connection (Basic Auth credential).

On successful tool creation, you're taken to the tool record page.

2. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

The tasks the users in the groups can perform depends on the roles assigned to them.

Role	Description
DevOps Tool Owner role	Can view and edit the tool.
DevOps App Owner role	Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
DevOps Administrator role	Can edit all tools.
Other DevOps roles	Can view the tool.

Note:
Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

3. Select **Discover#**o discover all existing projects from Jira.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
By default, projects are discovered in a set of 50 for Jira Cloud. 50 is the maximum pagination limit supported by Jira. If you want to reduce this value, then you should edit the respective constant in DevOpsCommonConstants script.

4. Select **Configure** to configure webhooks.

   This action does the following:

   - Registers a webhook between your Jira and ServiceNow instances, and enables real-time data transfer between the two.
   - If you have connected your Jira tool using OAuth 2.0 based authentication, the webhooks are created for the OAuth 2.0 integration app in Jira when you configure automatically, whereas if you have connected using basic authentication, the webhooks are created for all your projects in Jira.

   All the discovered Jira projects are listed as Plans.

   If you don't choose to configure now, you can enable nightly polling later to fetch data for any tracked plans by setting the *Enable Polling* system property to **Yes**.

   Note:
   If you don't have admin privileges for Jira to allow automatic configuration of the webhook URL, request your Jira admin to configure it for you. This action would require creating and configuring the webhook URL manually in your tool instance. After the webhook is configured in the tool, select **Enter Manual Configuration Mode** to connect to Jira manually, then exit the manual configuration mode.

5. Select the**Import**elated link to import historical data from Jira projects.

   Imported work items are added to the corresponding related lists.

   Note:
   If the project key for a project is updated in Jira, the updated object names will not reflect in DevOps Change Velocity. Only when the object is updated in Jira, the new name will reflect in DevOps Change Velocity.

Configure webhooks in Jira manually

Configure webhooks in your Jira Server or Jira Cloud instance to send sync notifications to the DevOps Change Velocity application.

Before you begin

Role required:

- sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity.
- Jira admin role in your Jira Server or Jira Cloud instance.

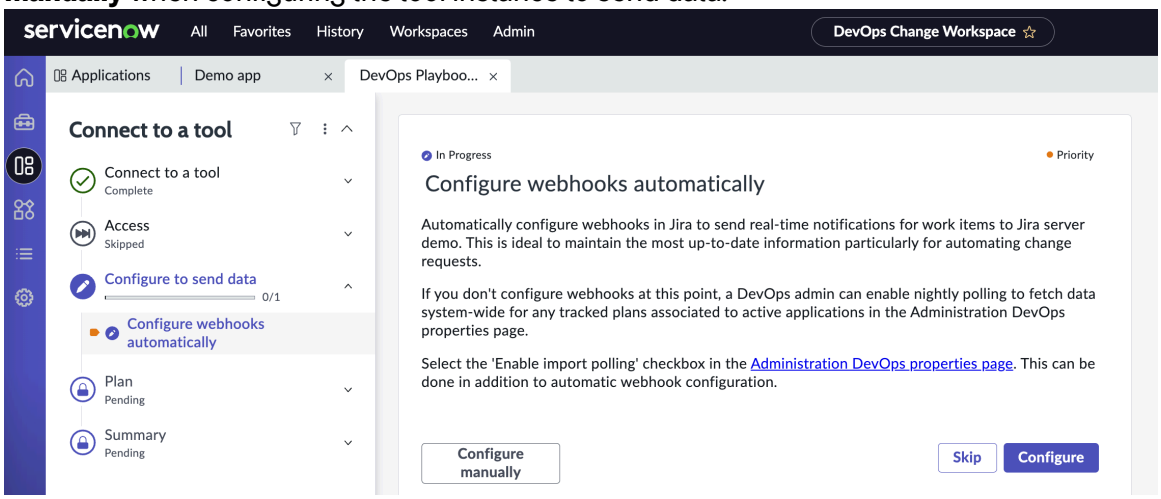
About this task

If you have connected your Jira tool using OAuth 2.0 based authentication, the webhooks are created for the OAuth 2.0 integration app in Jira when you configure automatically, whereas if you have connected using basic authentication, the webhooks are created for all your projects in Jira. If you choose to configure the webhooks manually for a Jira tool created using OAuth 2.0 based authentication, a duplicate webhook may get created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

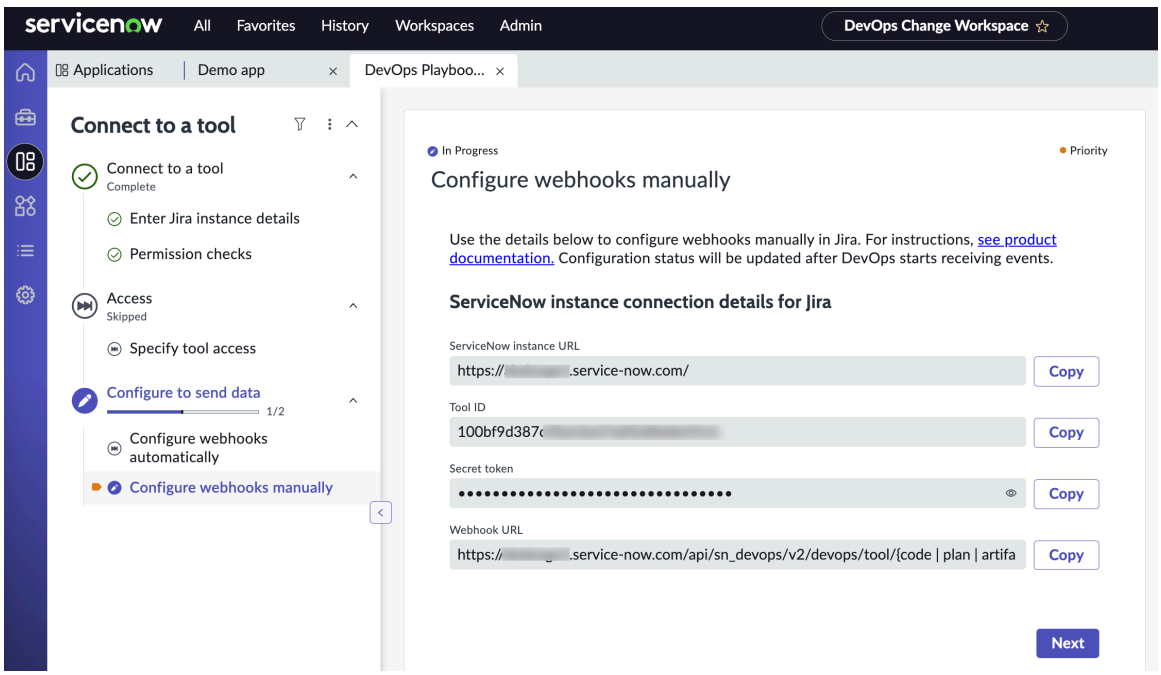
1. In DevOps Change Velocity, in the Configure to send data playbook activity, select **Configure manually** when configuring the tool instance to send data.



> **Note:**
> You can also access manual configuration from the Jira tool record in DevOps Change Velocity. From the tool record, select **Configure** > **Configure manually**.

2. Copy the **Webhook URL** field from the ServiceNow instance connection details for Jira.

> **Note:**
> Select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times.



3. Navigate to:
   - For Jira Server navigate to **Administration** > **System** > **WebHooks**.
   - For Jira Cloud instance, navigate to **Settings** > **System** > **WebHooks**.
4. Select **Create a WebHook**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enter the details for the webhook.

Field	Description
Name	Enter a name for the webhook.
Status	Select **Enabled**.
URL	Paste the Webhook URL copied from DevOps Change Velocity. ○ Modify the copied webhook URL to reflect the code capability. For example, `https://<your_instance>.service-now.com/api/sn_devops/v2/devops/tool/code?toolId=<your_toolID>?ni.nolog.token=<Secure Token>` ○ Append the token to the end of the webhook URL.
Events	Select the events to be tracked. For example: 
6. Select **Create**.
   If you want to test the webhook, see the section on Jira in Test webhooks manually.

Rally integration with DevOps Change Velocity

Connect to your Broadcom Rally instance to discover plans and configure real-time notifications to enable change traceability and automation.

Rally integration overview

With this integration, you can configure and expose data like projects, user stories, and defects from Rally. You can then associate these planning objects to an application for end-to-end traceability.

Install Rally plugin

You must install the Rally application from ServiceNow Store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The default object types configured for Rally are `"ObjectTypes"["HierarchicalRequirement","Defect","Feature"]`.
- The file script include **Rally state mapping helper** is editable. You can override this file with your specific customization as required.
- Scheduledstate in Rally is used when mapping object state to internal ServiceNow work item state.
- For tool mappings, see Tool mappings.

Get started

Use one of the following options to onboard Rally. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Rally to DevOps Change Velocity — Workspace

Connect to your Rally instance using the DevOps Change Workspace playbook to configure webhooks and discover plans.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

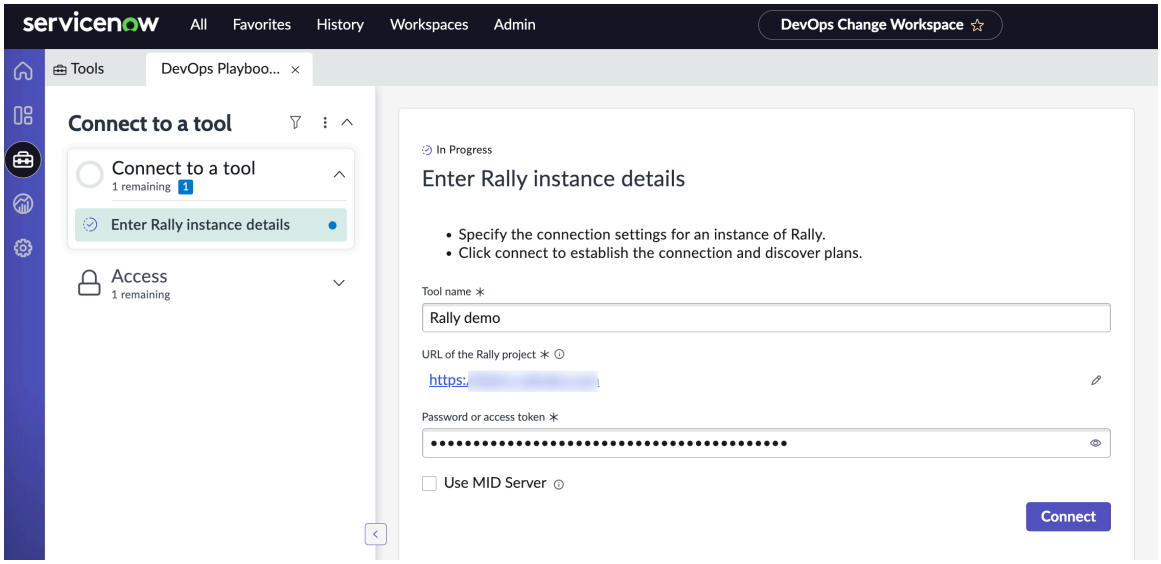
1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Rally.

   Important:
   If you want to discover and track tool objects like plans while connecting to the tool, you must connect your tool from the Application module.

2. Enter a tool name to identify your tool and select **Next**.
3. On the Enter Rally instance details playbook activity, enter the following details:
   a. In the **URL of the Rally project** field, enter your Rally project URL.
   b. In the **Password or access token** field, enter the API token for your Rally instance.
   c. (Optional) If your Rally instance is attached to a MID Server, select the **Use MID Server** option and enter its details.

      A MID server is required if your tool instance is hosted on-prem. For more information about MID server, see MID Server selection.
4. Select **Connect**.
   On successful connection, the tool is created in ServiceNow and connected to your Rally instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Specify the access for the tool.

   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

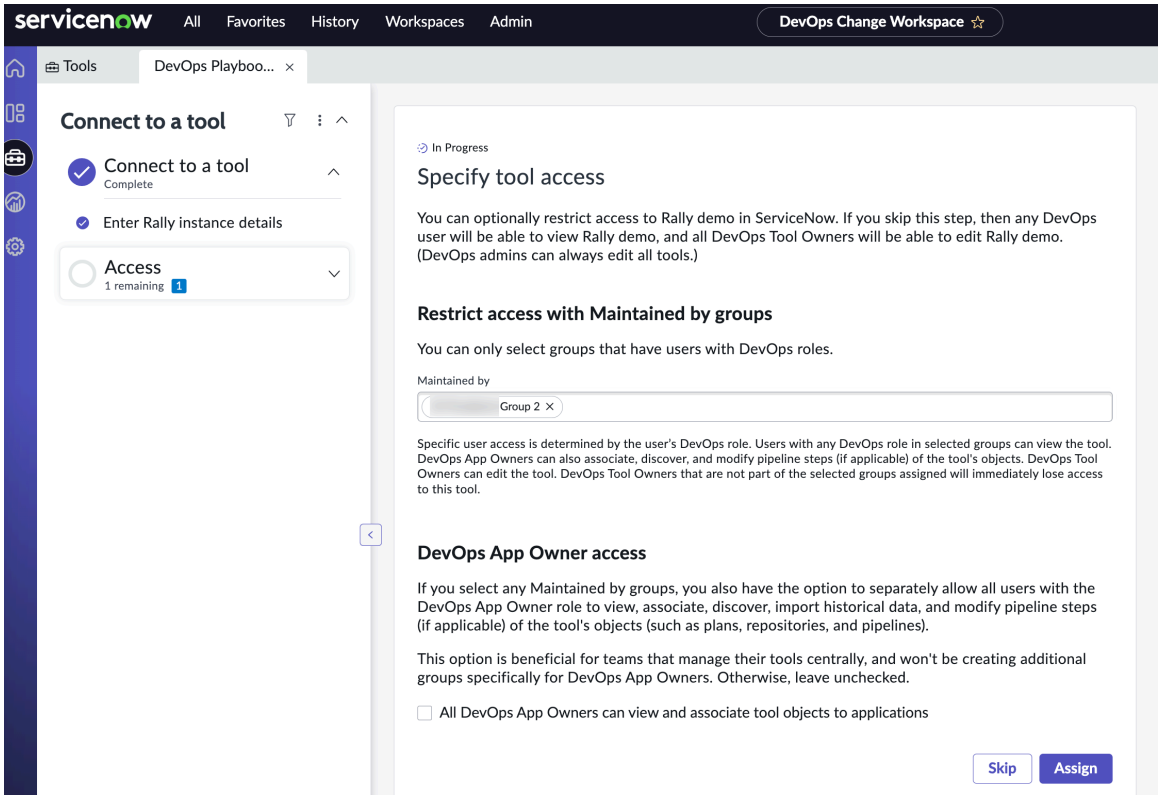
      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.
   This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



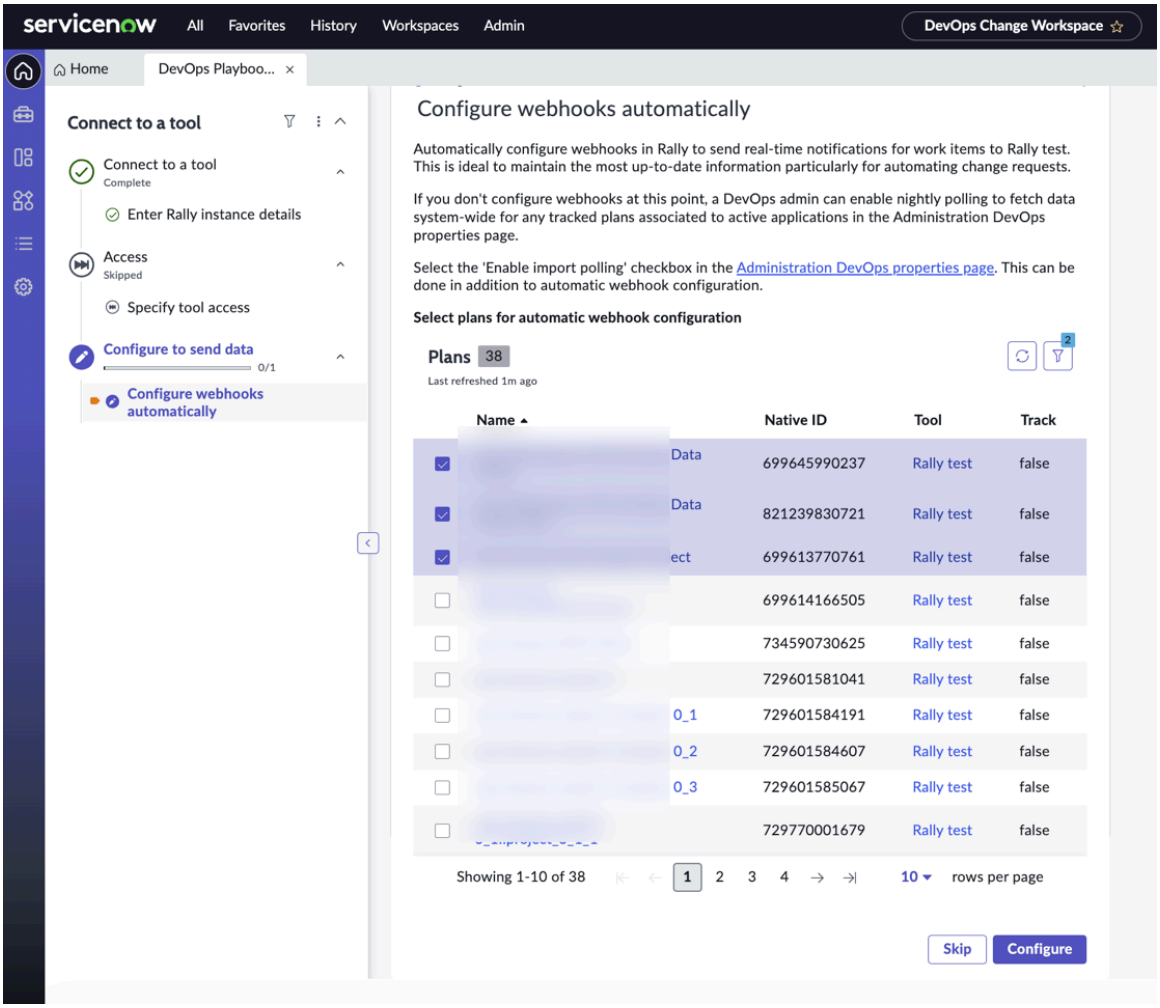
6. Configure webhooks automatically in Rally to send real-time notifications.

> **Note:**
> If you prefer not to configure webhooks, you can enable nightly polling to fetch data for all tracked plans by selecting the **Enable import polling** check box in DevOps properties.

   a. Select the plans that you want to track.

   b. Select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



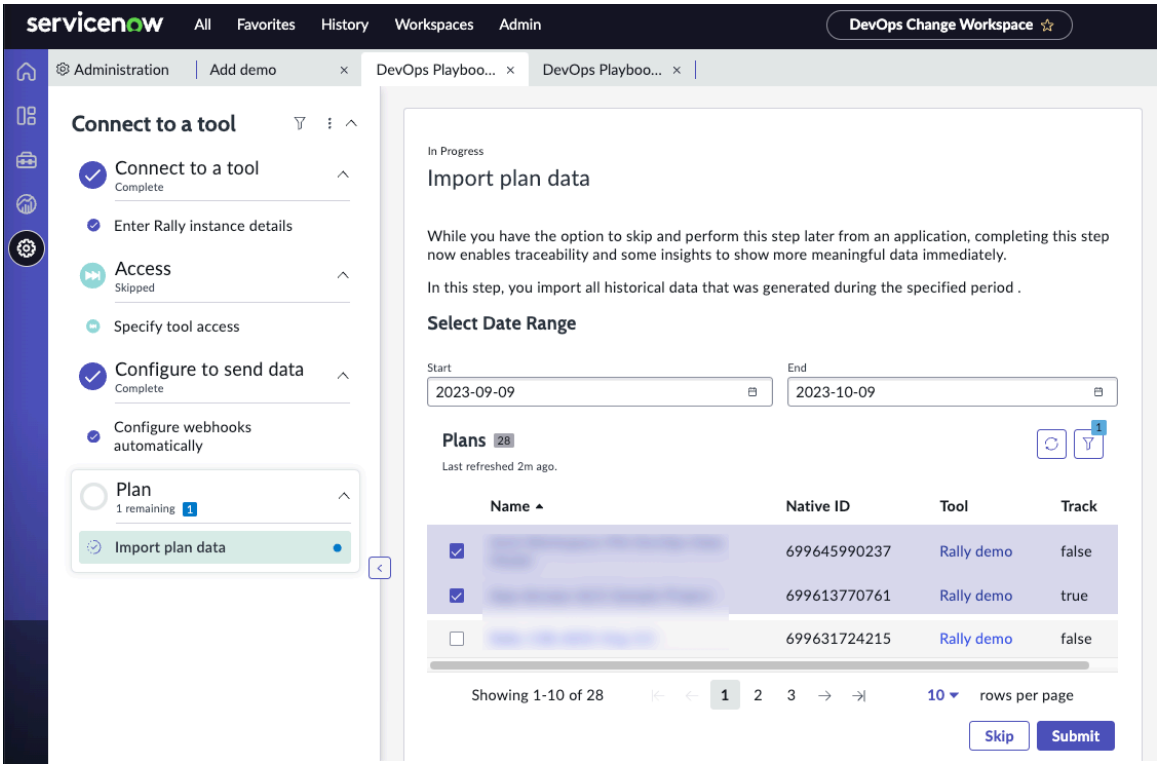
Important:

- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then plans available in your instance are discovered. You can track and import historical data from them.

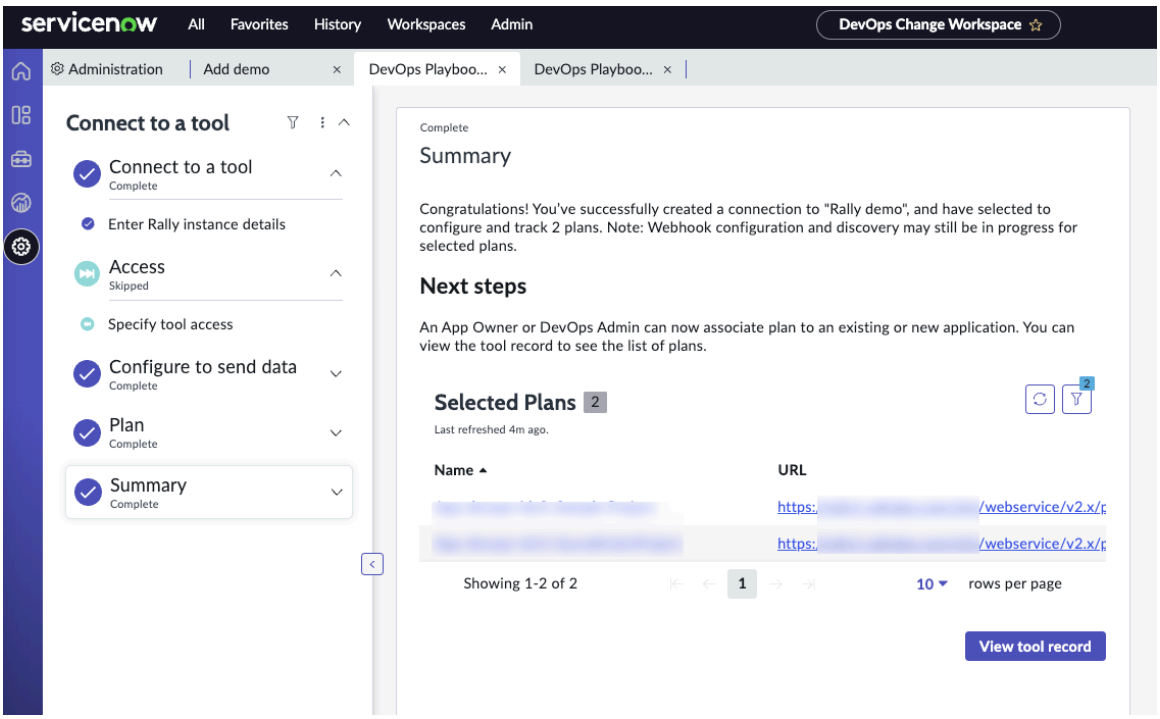
7. If you want to import plan data, select the date range and select **Submit**.

   You can import up to 90 days of data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. From the **Summary** tab, select **View tool record** to review the details of the connected instance and the plans discovered from it.



Result

You've successfully onboarded your Rally tool to DevOps Change Velocity.

What to do next

From the tool record page, you can do the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- See the details and status of the tool.
- Discover plans and configure webhooks.
- Assign groups to control access to the tool using the **Maintained by** field.
- From the **Plans** tab, select a plan to view its details such as imported work items, features, and others.
- To import historical data from the plans, associate the plans with an application, and import the data. For more information, see Associate tool objects to applications - Workspace.

Related topics

Configure webhooks from the tool record

Onboard Rally to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your Rally instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Rally integration.
Tool integration	Select Rally.
Tool URL	URL of your Rally instance to integrate.
Tool password/ Access token	Enter the API key for Rally.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps#and capability is set to REST.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is created, connected, discovered, and configured.
6. From the DevOps catalog items, select **DevOps App Onboarding** and select **Try it**.
7. In the DevOps App Onboarding form, enter the details:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Leave empty.
Onboarding repositories	Leave empty.
Onboarding plans	Enter the connected Rally tool name.
Plans	Select the plans for which you want to import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.

8. Select **Order Now**.
   A request is created. When the request is approved, the plan objects are associated to the app record, which enables real-time tracking. Historical data is also imported for the selected plans. The **Track** field is automatically enabled for imported plans.

Onboard Rally to DevOps Change Velocity — Classic

With this integration, you can configure and expose data like projects, user stories, and defects from the Rally. You can then associate these planning objects to application for end-to-end traceability.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. In the Create DevOps tool form, enter the tool details:

Tool name	Name for the tool you're integrating.
Tool integration	Tool to integrate. Select Rally.
Tool URL	URL of your Rally instance to integrate.
Tool password / Access token	Enter the API key for Rally.
Use MID Server	MID Server is optional. Select MID Server for an on-premises tool that is attached to a MID Server. The Application value is automatically set to DevOps and the Capability value is set to REST. For more information, see MID Server selection.

3. Click **Submit** to connect to your Rally instance.

On successful tool creation, you're taken to the tool record page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

   The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

5. Click **Discover** to import existing projects associated with Rally.
   Plan records are added to the **Plans** related links.
6. To configure webhooks for Rally projects:
   a. Click **Configure**.
   b. Select the projects for which you want to configure webhooks and click **Continue**.
7. **Optional:** To import historical data, select a plan and click **Import**.
   Select the dates to import historical data from the Rally project. You can see the imported data under **Work Items**. Select a work item to see details including commits made.

   Note:
   Scheduledstate in Rally is used when mapping object state to internal ServiceNow work item state.

   Formatted id is used for the work item NativeID, for associating work items and commits.

Configure webhooks for Rally manually

Configure webhooks for Rally to send sync notifications to the DevOps Change Velocity application.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity.

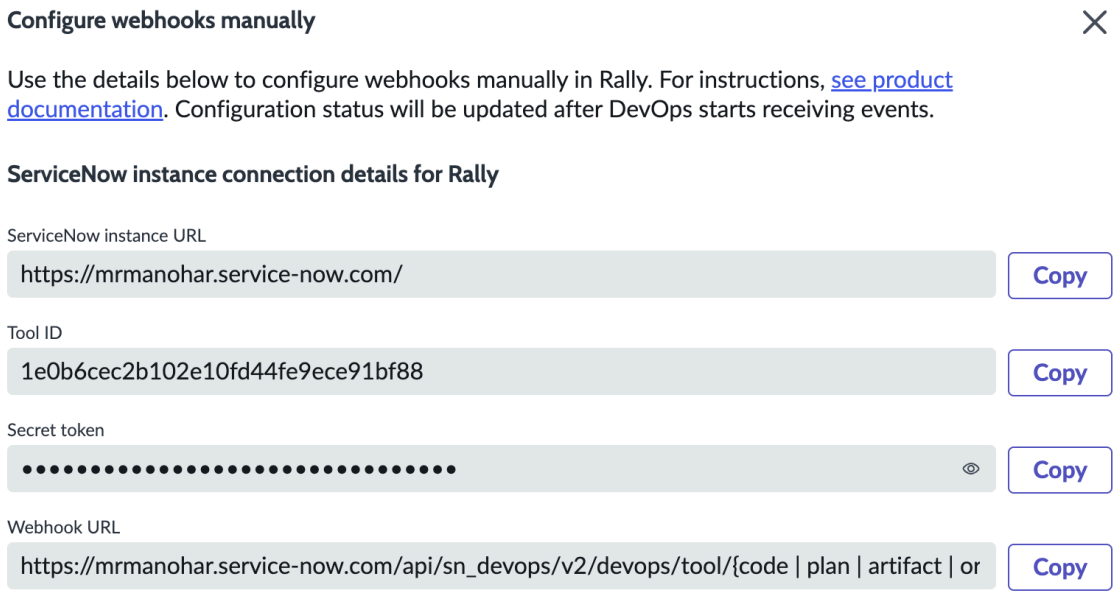
About this task

To send inbound events to a ServiceNow instance for Rally, you must use the following API endpoint structure: `<instance_url>/api/sn_devops/v2/devops/tool/plan?toolId=<toolId>&&ni.nolog.token=<token>`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In DevOps Change Velocity, in the Configure to send data playbook activity, select **Configure manually** when configuring the tool instance to send data.



Note:
You can also access manual configuration from the Jira tool record in DevOps Change Velocity. From the tool record, select **Configure** > **Configure manually**.

2. Select **Copy** in the appropriate field to copy the value to your clipboard.
The field label changes to **Copied**, but you can copy multiple times.
3. Use the following API endpoint structure to send inbound events to your ServiceNow instance. `<instance_url>/api/sn_devops/v2/devops/tool/plan?toolId=<toolId>&&ni.nolog.token=<token>`.
For more information, see Creation of webhooks to send inbound events to DevOps Change Velocity using token.

Agile Development 2.0 integration with DevOps Change Velocity

Connect to your ServiceNow Agile Development 2.0 instance to track your products and the stories, epics, and release versions associated with it.

For more details about Agile Development 2.0, see Agile Development 2.0.

Get started

Use one of the following options to onboard Agile Development 2.0. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Agile Development 2.0 to DevOps Change Velocity — Workspace

Connect to your Agile Development 2.0 instance using the DevOps Change Workspace playbook to enable tracking of stories and epics.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the Agile Development 2.0 plugin. For more information, see Activate Agile Development 2.0.

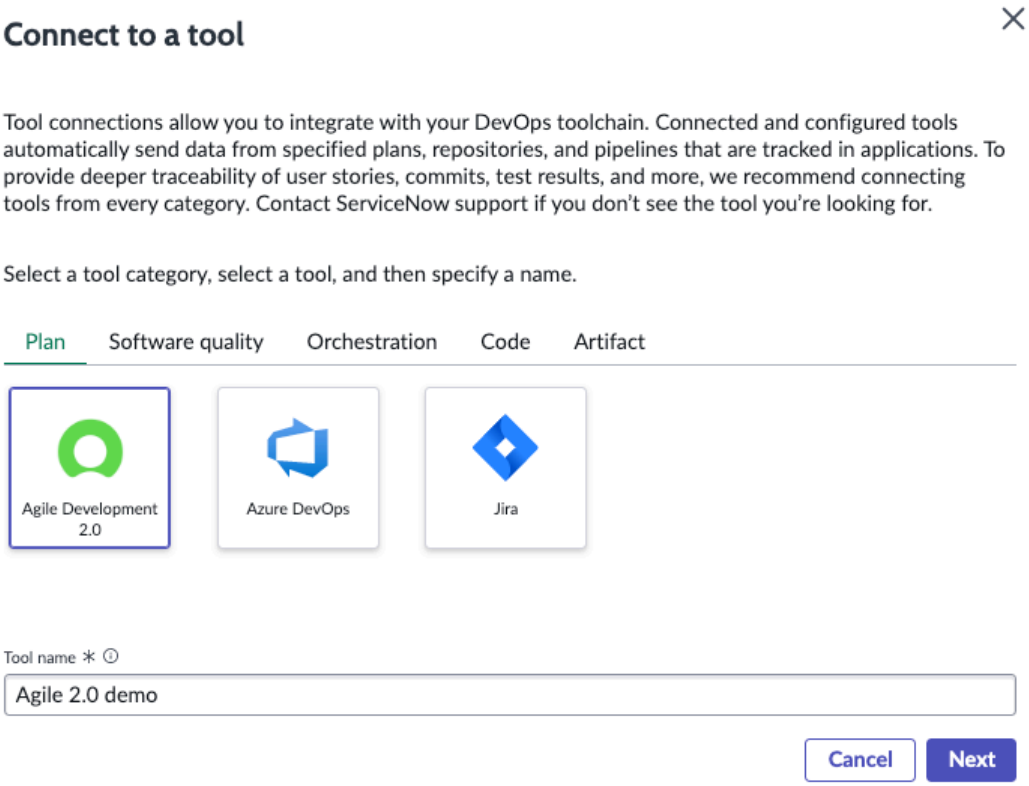
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Agile Development 2.0.

   Important:
   If you want to discover and track tool objects like plans while connecting to the tool, you must connect your tool from the Application module.

2. In the **Tool name** field, enter a name for the tool.

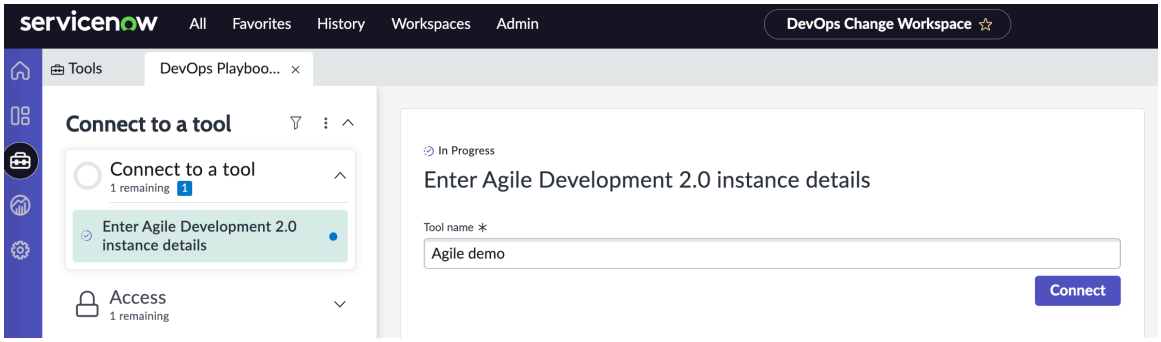


3. Select **Next**.

   The DevOps playbook opens to help you complete the onboarding tasks.

4. Select **Connect**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Specify the access for the tool.

   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

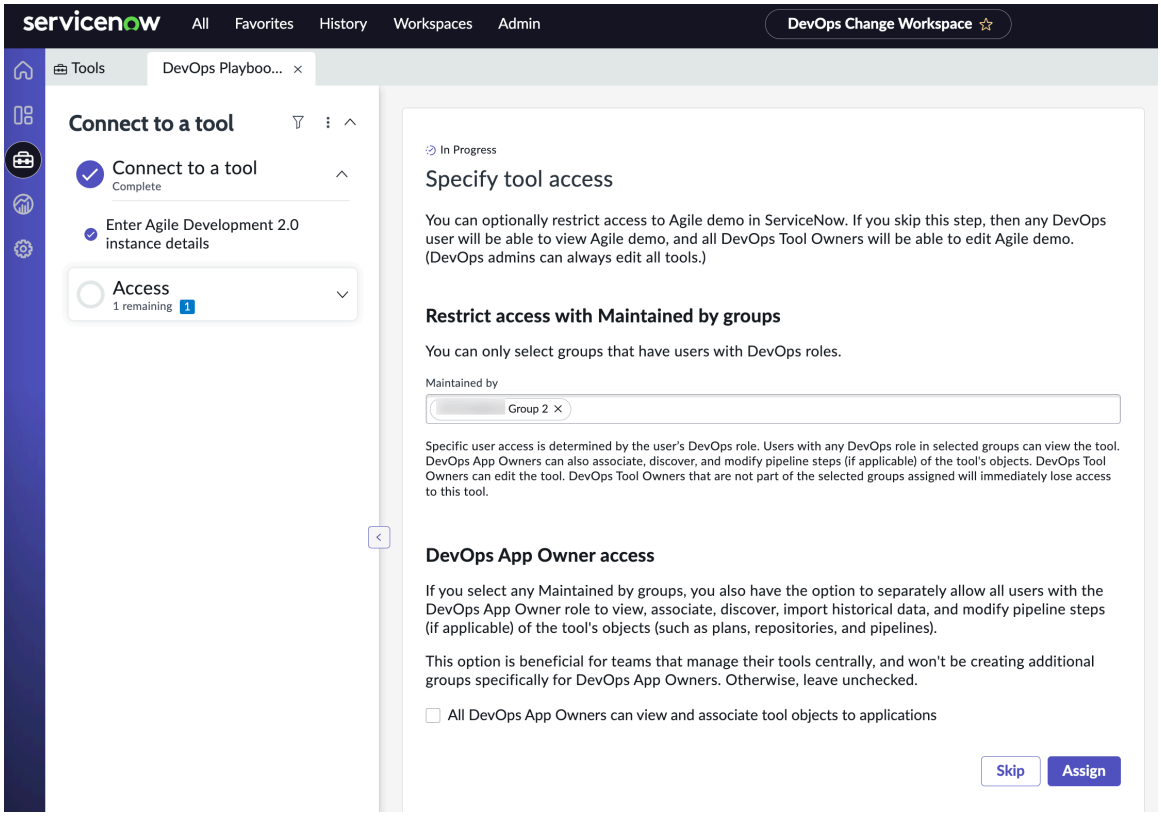
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



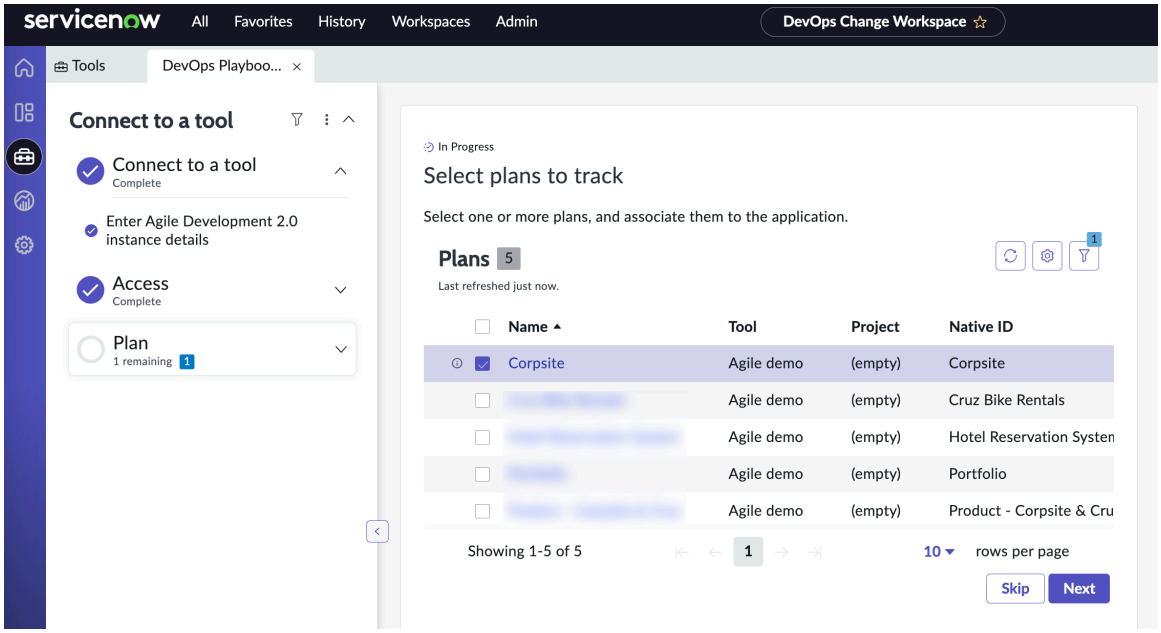
Important:

- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then plans available in your project are discovered. You can track and import historical data from them.

6. Select the plans for which you want to track updates and associate to the application, and select **Next**.

   If you don’t choose to select plans now, you can enable nightly polling later to fetch the data for any tracked plans by setting the *`Enable Polling`* system property to **Yes**.

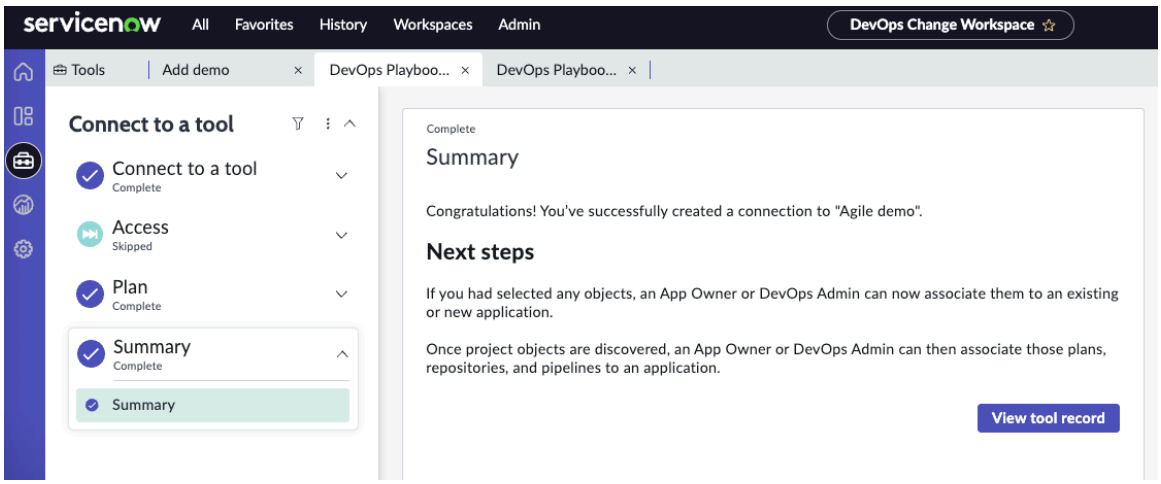
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. If you want to import plan data, select the date range and select **Submit**.

   You can import up to 90 days of data.

8. From the **Summary** page, select **View tool record** to review the details of the connected instance and the plans discovered from it.



Result

You've successfully onboarded your Agile Development 2.0 tool to DevOps Change Velocity.

Onboard Agile Development 2.0 to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your Agile Development 2.0 instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Jira cloud version is not supported.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from the Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Agile Development 2.0 integration.
Tool integration	Select Agile Development 2.0.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is created, connected, configured, and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding** and select **Try it**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Leave empty.
Onboarding repositories	Leave empty.
Onboarding plans	Enter the connected Agile Development 2.0 tool name.
Plans	Select the plans for which you want to import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.

8. Select **Order Now**.
   A request is created. When the request is approved, the plan objects are associated to the app record, which enables real-time tracking. Historical data is also imported for the selected plans. The **Track** field is automatically enabled for imported plans.

Onboard Agile Development 2.0 to DevOps Change Velocity — Classic

Connect to Agile Development 2.0 and discover plans from it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Create a tool record in DevOps to automatically connect to Agile Development 2.0 and get the webhook URL.

   a. Navigate to **DevOps** > **Tools** > **Create New (legacy)**.

   b. On the form, fill in the fields.

Tool name	Name of your choice to identify the tool.
Tool Integration	Select **Agile Development 2.0**

   c. Click **Submit**.

   On successful tool creation, you're taken to the tool record page.

2. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

   The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

3. Click **Discover** to discover Products from Agile Development 2.0.

   Discovered records are added to the Plans related list.

4. Import data for the discovered plans by clicking the **Import** related link from a plan's record. Epics, stories, and release versions associated to this plan are listed in the respective related lists.

   - Work items related list shows stories and defects.

     Native State and **Native Type** fields of the work item contain the original state and type values from the source tool.

- Features related list shows epics.

Bitbucket integration with DevOps Change Velocity

Connect to your Bitbucket instance to track Bitbucket repositories, commits, branches, and pull requests.

Bitbucket integration overview

DevOps Change Velocity supports the Code (Repository) capability for the Bitbucket tool.

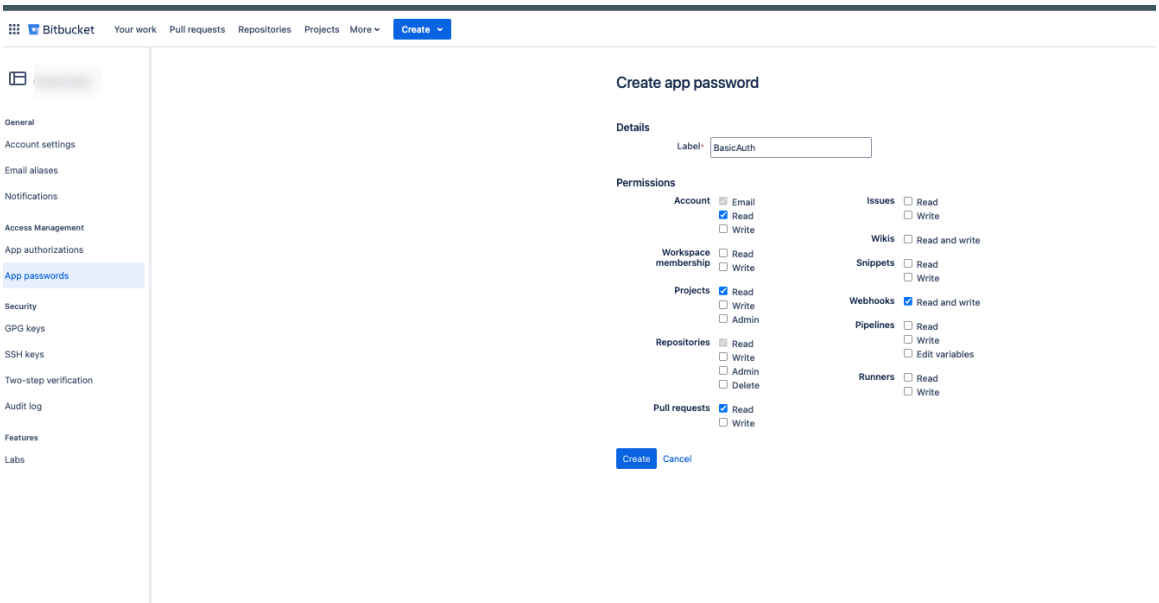
Authentication methods

You can connect to Bitbucket Cloud using one of the following authentication methods:

Basic Auth

When you select the credential type as Basic Auth the repositories for all the workspaces in the organization are discovered. You can get the user name and password for Basic Auth from the settings of your Bitbucket account. To copy the user name, navigate to **Settings > General > Account settings**, and copy the user name from the Bitbucket profile settings section. To copy the password, navigate to **Settings > Personal Bitbucket settings > App passwords**, and select **Create app password**. Enter the necessary details and select the required permissions, and then select **Create**, and copy the password. The following permissions must be selected while creating the credentials:

- Account: Read
- Projects: Read
- Webhooks: Read and write
- Pull requests: Read

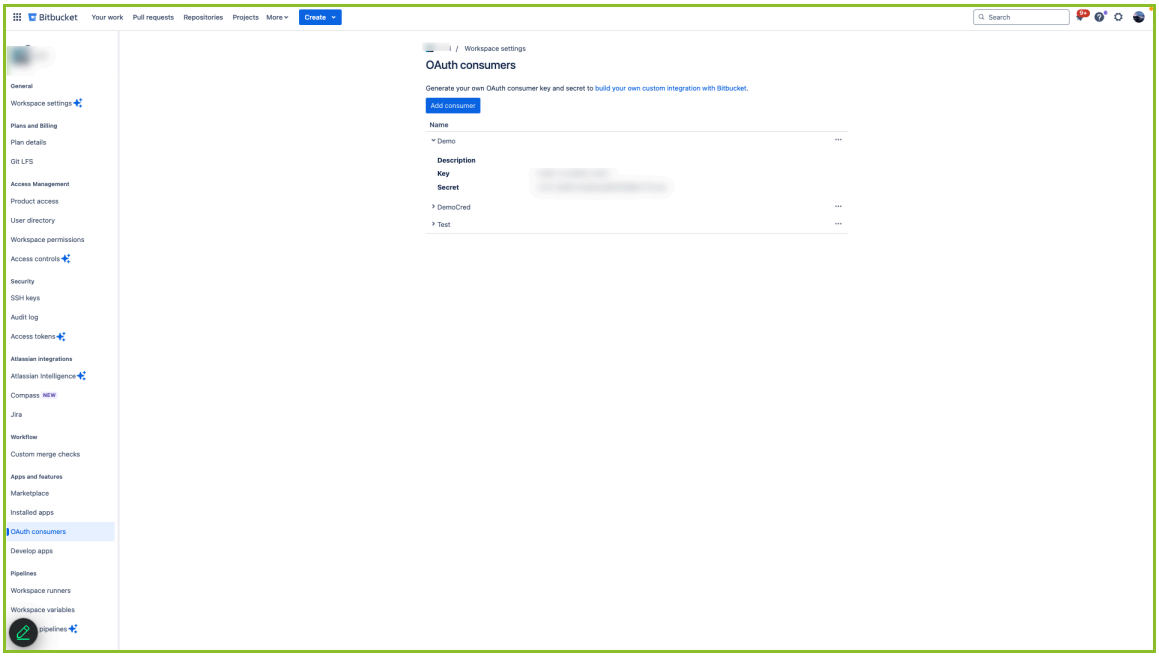


OAuth 2.0 - Authorization Code

You must create the OAuth consumer in the Bitbucket tool with the required permissions before creating the OAuth record for

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authorization Code. You can navigate to **Workspace settings > OAuth consumers > Add consumer** in Bitbucket to add the OAuth consumer.

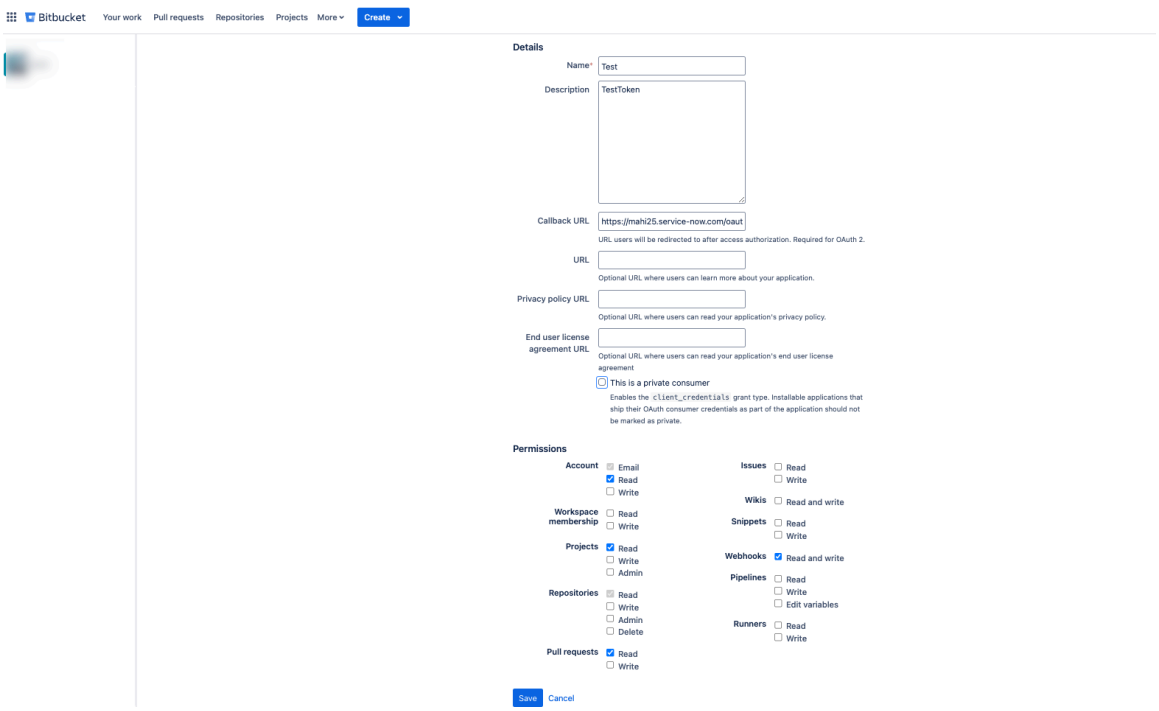


Select the following permissions for the OAuth consumer.

- Account: Read
- Projects: Read
- Webhooks: Read and write
- Pull requests: Read

Ensure that the **This is a private consumer** option isn't selected. You must enter your ServiceNow instance URL in the **Callback URL** field in the following format.

```
https://<instanceurl>/oauth_redirect.do
```



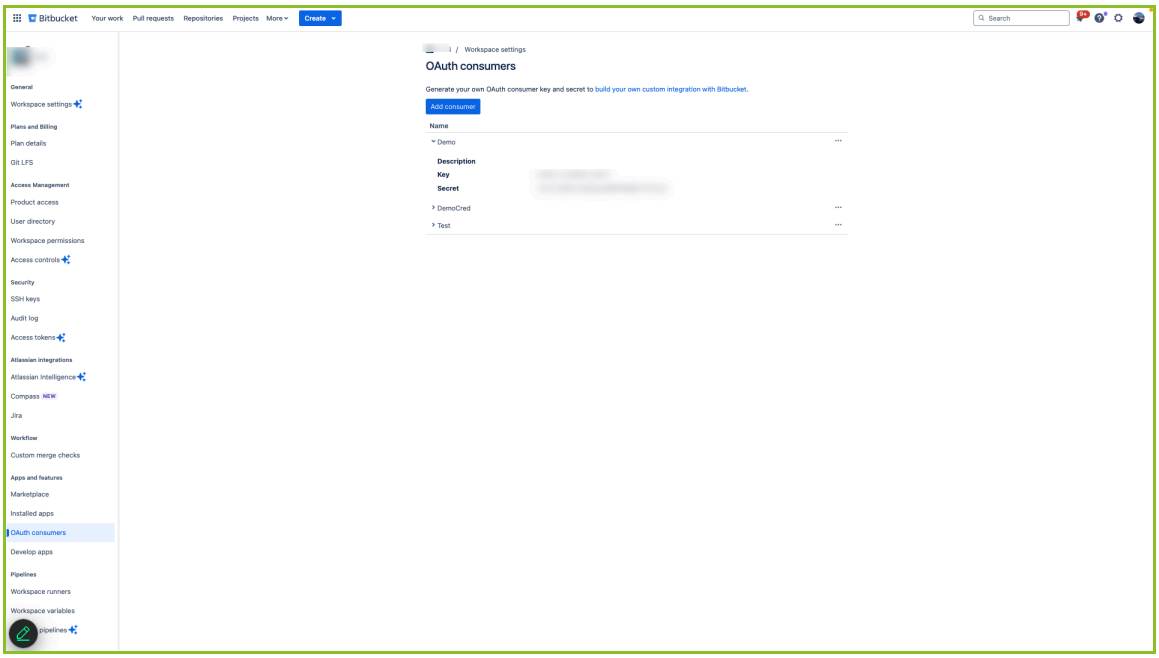
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can create an OAuth 2.0 - Authorization Code credential by performing the steps specified in the Set up OAuth 2.0 Authorization Code for Bitbucket Cloud procedure.

Note:
When you select the credential type as Oauth 2.0 - Authorization Code for Bitbucket Cloud, the repositories for all the workspaces are discovered. This is a limitation from Bitbucket side

OAuth 2.0 - Client Credentials

You must create the OAuth consumer in the Bitbucket tool with the required permissions before creating the OAuth record for Client Credentials. You can navigate to **Workspace settings > OAuth consumers > Add consumer** in Bitbucket to add the OAuth consumer.



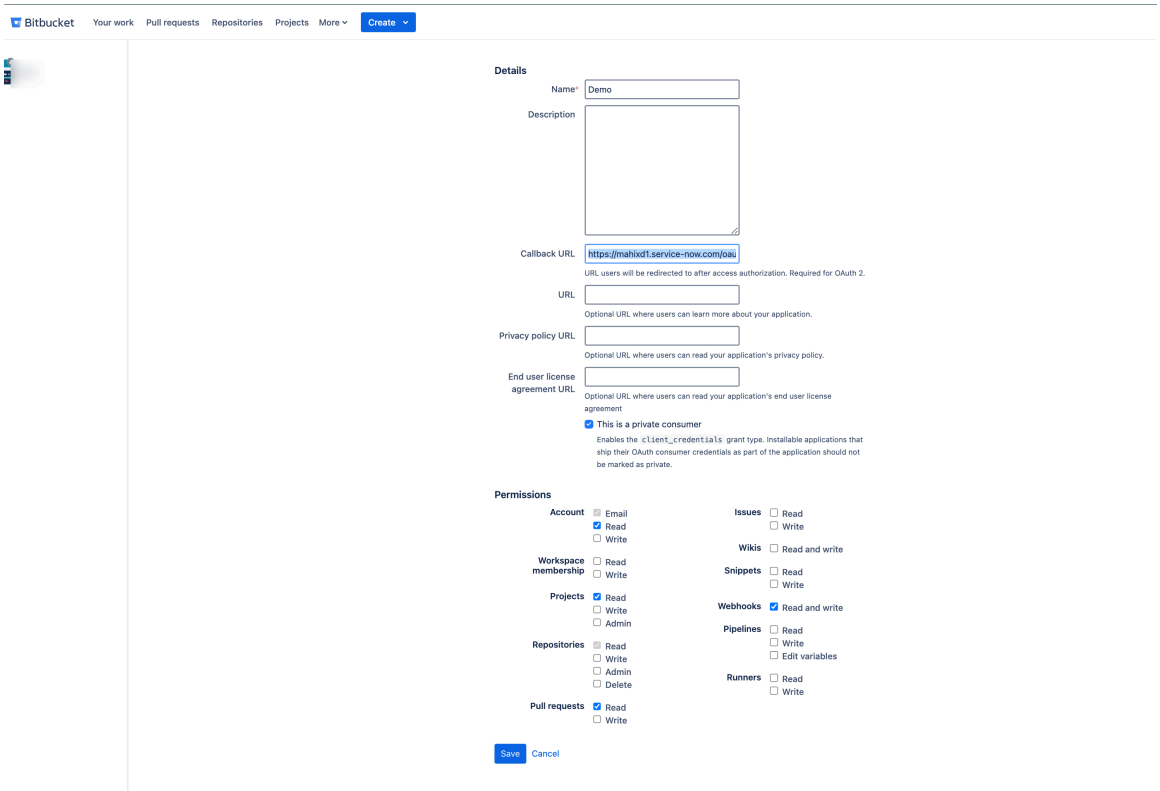
Select the following permissions for the OAuth consumer.

- Account: Read
- Projects: Read
- Webhooks: Read and write
- Pull requests: Read

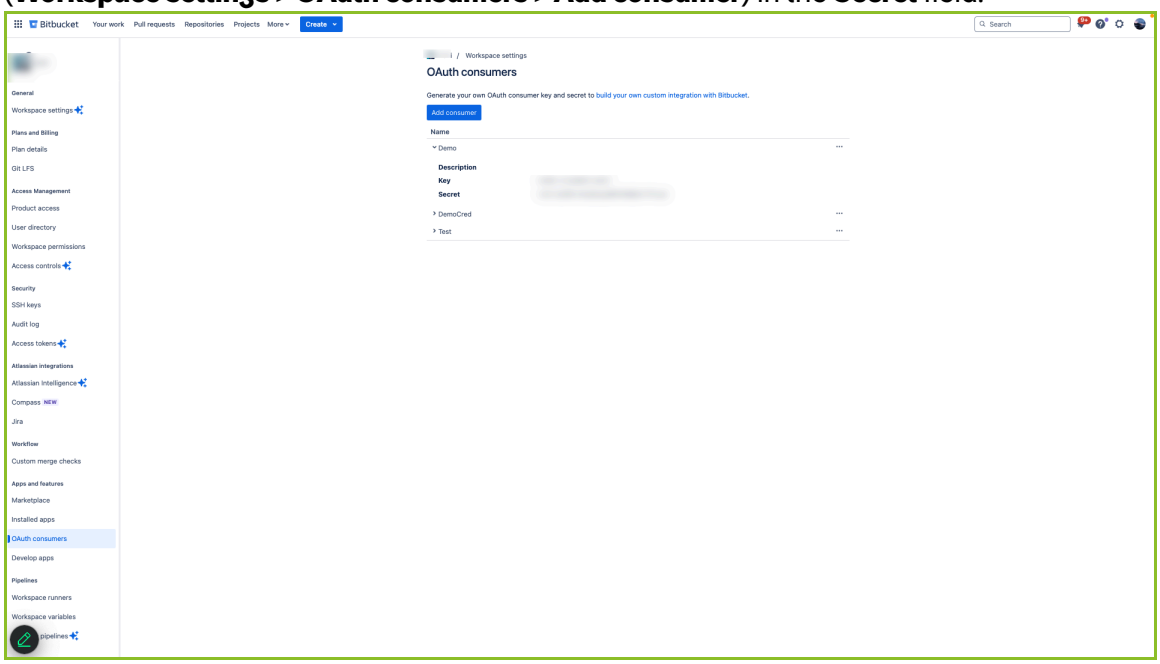
Ensure that the **This is a private consumer** option is selected as well. You must enter your ServiceNow instance URL in the **Callback URL** field in the following format.

```
https://<instanceurl>/oauth_redirect.do
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can create an OAuth 2.0 - Client Credential record in the workspace UI while onboarding the tool. You need the **Client Id** and **Client secret** values of your Bitbucket workspace. Client ID of your Bitbucket tool is available in the OAuth consumers section of your workspace settings (**Workspace settings > OAuth consumers > Add consumer**) in the **Key** field. Client secret of your Bitbucket tool is available in the OAuth consumers section of your workspace settings (**Workspace settings > OAuth consumers > Add consumer**) in the **Secret** field.

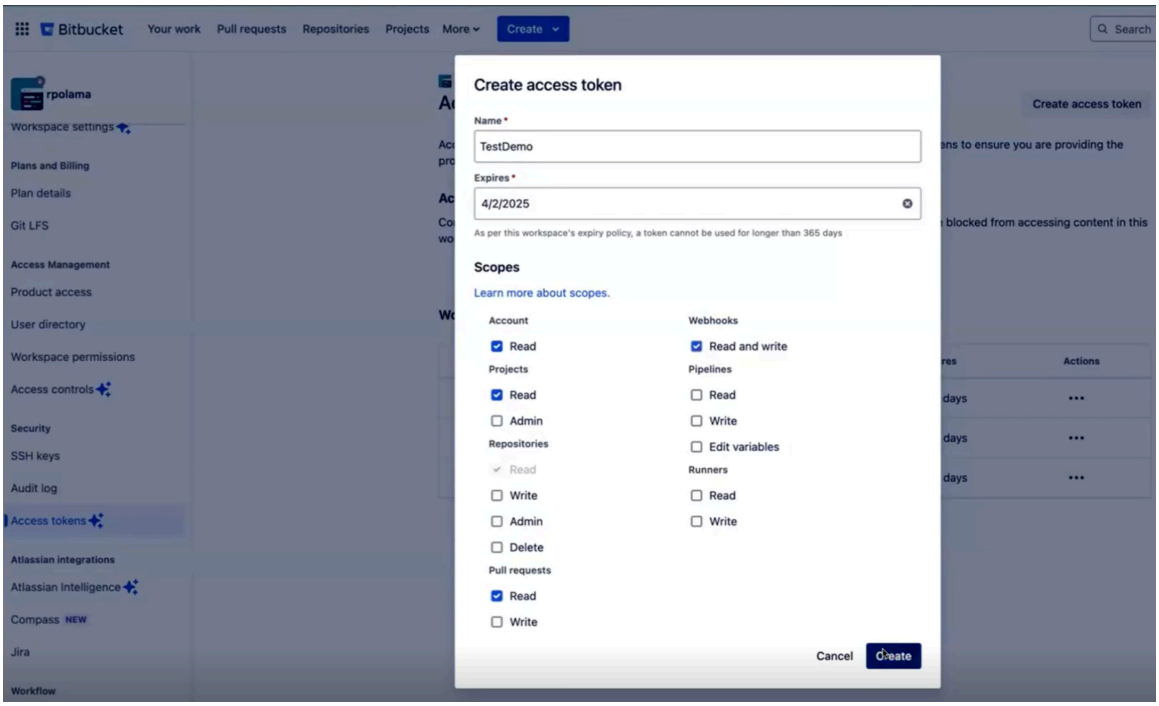


Access Token

You can create the access token by performing the steps specified in the Atlassian documentation. Ensure that the following permissions are provided while creating the access token:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Account: Read
- Projects: Read
- Webhooks: Read and write
- Pull requests: Read



You also need the workspace ID of your Bitbucket workspace. Copy it from the **Workspace ID** field in the Workspace settings of your Bitbucket Cloud account.

Get started

Use one of the following options to onboard Bitbucket. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Bitbucket to DevOps Change Velocity — Workspace

Create, connect, discover, and configure your Bitbucket instance using the DevOps Change Velocity workspace.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

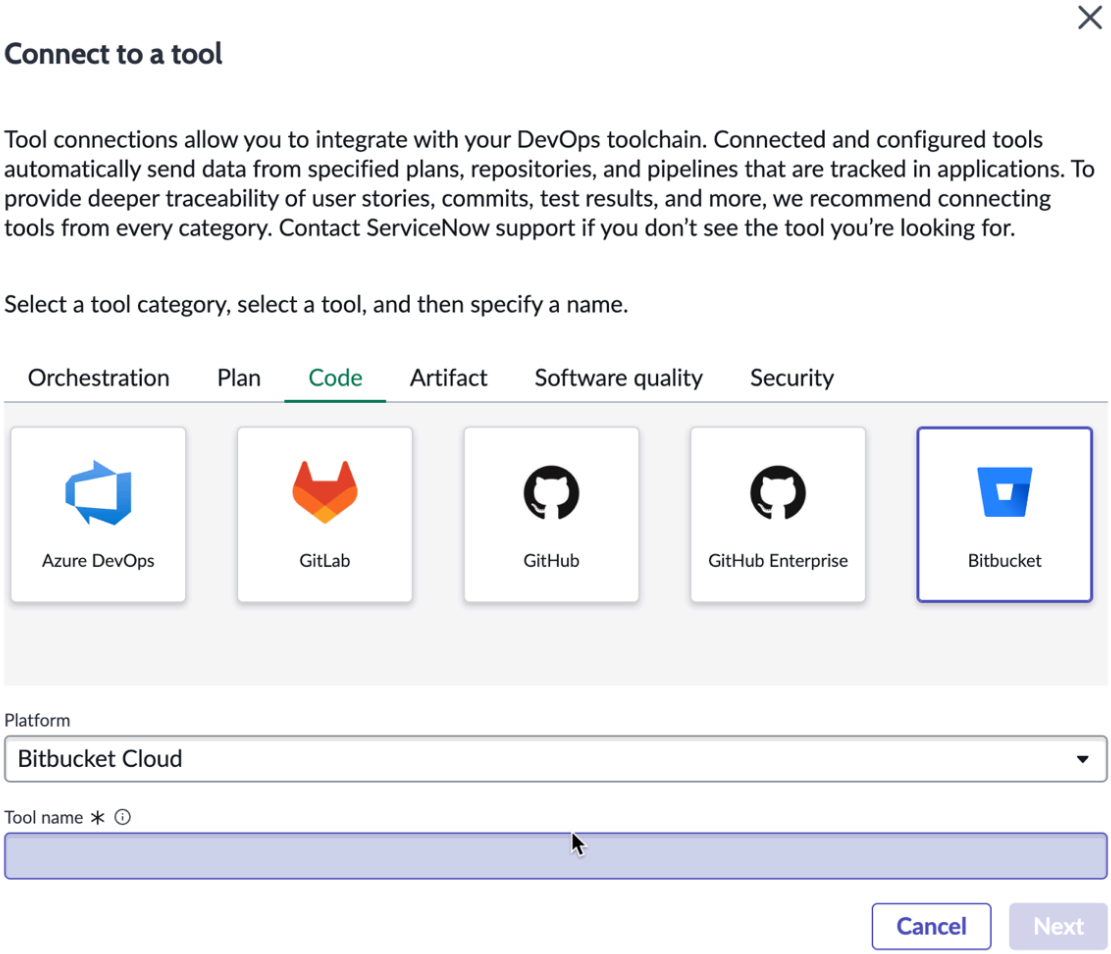
Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Bitbucket.

> **Important:**
> If you want to discover and track tool objects like repositories while connecting to the tool, you must connect your tool from the Application module.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Select **Bitbucket Cloud** or **BitBucket Server** from the Platform drop-down, enter a name for the tool in the **Tool name** field, and select **Next**.



3. On the Bitbucket instance details playbook activity, enter the following details.

4. Select **Connect**.
5. Permission checks are run on the credentials that you entered.

   Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. For detailed information on all the required permissions, see Bitbucket permissions in Permissions required for DevOps tools.

   You can choose to continue with the tool connection even if you don't have all the required permissions.

6. Select **Next**.
7. Specify the access for the tool.
   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

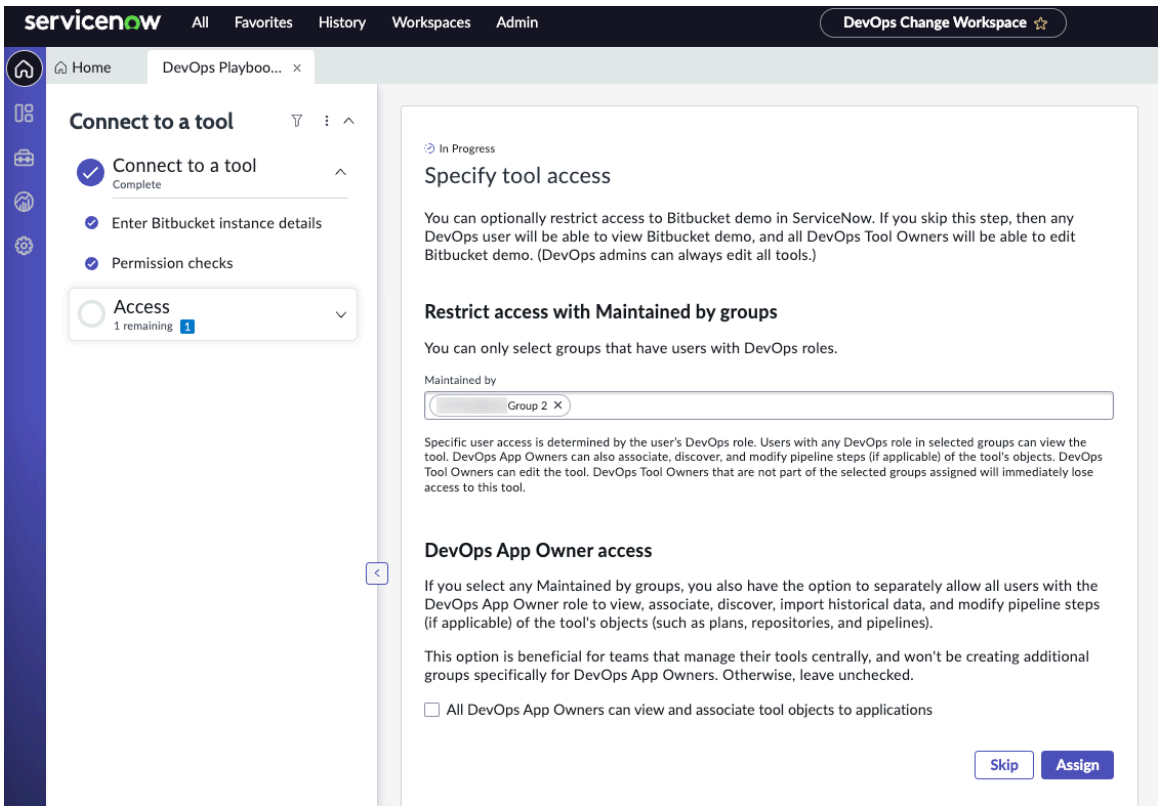
- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

Note:
If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

c. Select **Assign**.



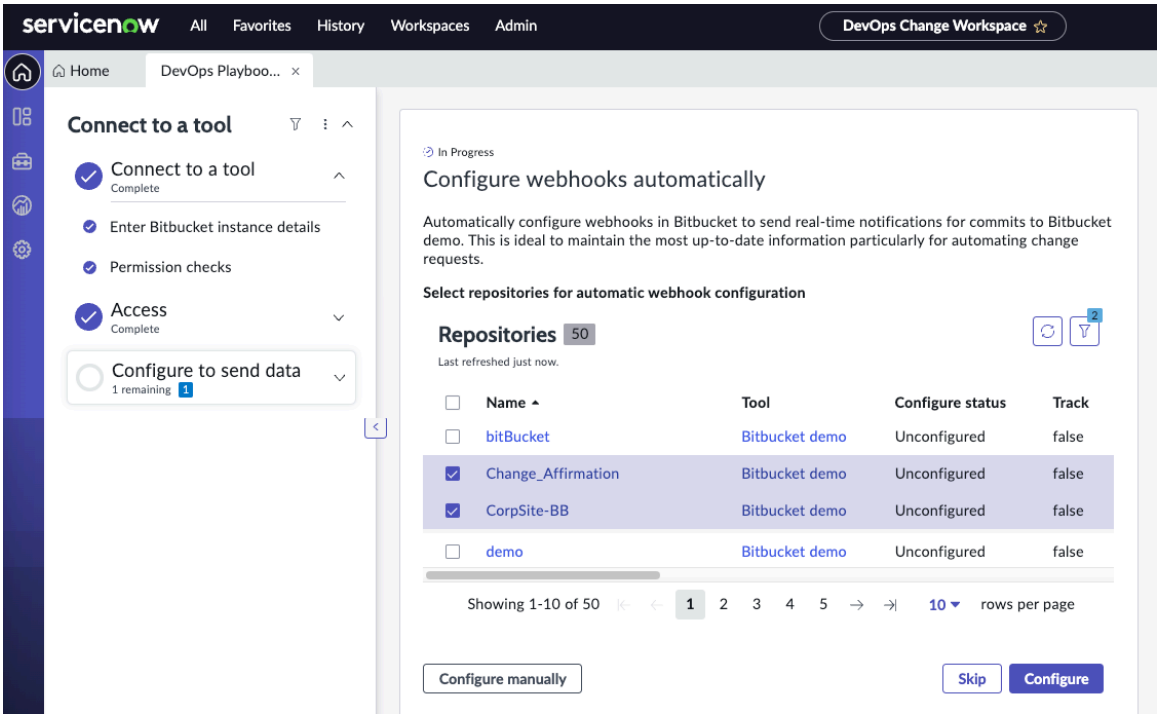
8. Select the repositories for which you want to configure webhooks automatically.

Real-time notifications are ideal to maintain the most up-to-date information particularly for automating change requests.

You can also set up webhook by configuring it manually. Alternatively, you can choose to enable nightly polling to fetch data system for any tracked repositories by setting the **Enable Polling** property to **Yes**.

9. Select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



To configure manually, select **Configure manually**. See Configure webhooks in Bitbucket manually for more information.

Important:

- If you're connecting from the Home page or Tools module, the connection is complete and you're taken to the Summary page.
- If you're connecting from the Applications module, then repositories available in your instance are discovered. You can track and import historical data from them.

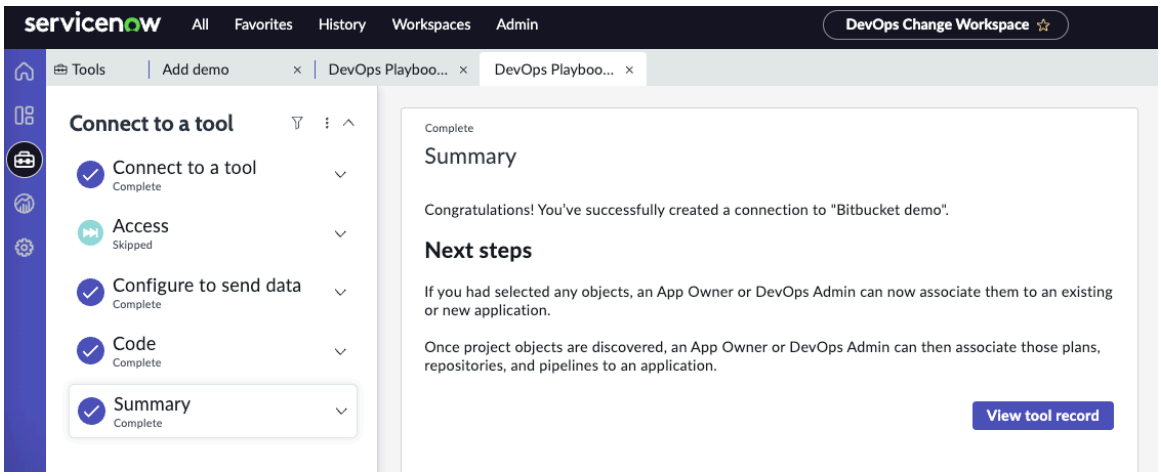
10. Select the repositories you want to associate to the application, and select **Associate repositories**.
11. In the Import historical data step, select the date range in the **Start date** and **End date** fields and select **Import data**.

    Note:
    You can import up to 90 days of data.

    Imported commits, branches, and pull request records from the repository are added to the corresponding related lists.
12. Select **Next**.
13. From the **Summary** page, review the details of the successfully connected Bitbucket tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Select **View tool record** to review the details of the connected instance and the repositories discovered from it.



Result

You've successfully onboarded your Bitbucket tool to DevOps Change Velocity.

Note:
If your tool credential changes, you must also update the credentials in DevOps Change. For more information, see Update third-party tool credentials in DevOps Change Velocity.

Related topics

Configure webhooks from the tool record

Onboard Bitbucket to DevOps Change Velocity — Service Catalog

Create, connect, discover, and configure your Bitbucket instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Bitbucket integration.
Tool integration	Select Bitbucket.
Tool URL	URL of your Bitbucket instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential type	Select the credential type as one of the following: ○ Basic Auth ○ Access Token ○ OAuth 2.0 - Authorization Code ○ Oauth 2.0 - Client Credentials For more information, see Bitbucket integration with DevOps Change Velocity.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps and capability is set to REST.

For a list of all the permissions required on the credentials for connecting to Bitbucket, see Bitbucket permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is created, connected, and discovered.
6. From the DevOps catalog items, select **DevOps App Onboarding**.
7. In the DevOps App Onboarding form, enter the details:

Are you creating a new app or adding to an existing one?	Select from the options whether to create a new app or use an existing app.
App	Enter the name for the app that you're creating or using.
Onboarding pipelines	Leave empty.
Onboarding repositories	Enter the connected Bitbucket tool name.
Repositories	Select the repositories for which you want to configure webhooks and import historical data.
Import from and Import to	Select the dates for which you want to import the data. By default, the last 30 days are selected. You can choose to import data for a maximum of 90 days.
Do you wish to configure webhook for the tool?	Select the check box if you want to configure webhooks for the selected repositories.
Onboarding plans	Leave empty.

8. Select **Order Now**.
   A request is created. When the request is approved, the repository objects are associated to the app record and webhooks are configured for real-time tracking. Historical data is imported for the selected repositories. The **Track** field is automatically enabled for imported repositories.

Onboard Bitbucket to DevOps Change Velocity — Classic

Create, connect, discover, and configure your Bitbucket instance using the Classic UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Complete the steps specified in the Getting started section before connecting to a tool.

About this task

- **Connect** by using your Bitbucket instance details.
- **Discover** repositories.
- **Configure** to create the webhook in the Bitbucket repository automatically.
- **Import** commits, branches, and pull request records.

Procedure

1. Enter the Bitbucket instance details to connect to DevOps Change Velocity by navigating to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. Enter a value in the **Tool Name** field and fill in the tool details.

Create DevOps Tool form

Field	Description
Tool integration	Tool to integrate. In this case, select **Bitbucket**.
Tool URL	URL of the existing Bitbucket instance to integrate.
Tool username, Tool password / Access token	Login credentials of the existing Bitbucket instance.

For a list of all the permissions required on the credentials for connecting to Bitbucket, see Bitbucket permissions in Permissions required for DevOps tools.

3. Select **MID Server** for an on-premises tool that is attached to a MID Server.
Application is automatically set to DevOps and capability is set to REST.
4. Select **Submit**.
The tool is connected successfully.

On successful tool creation, you are taken to the tool record page.

5. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

6. Select **Discover** to discover existing repositories for the coding tool.
   Repository records are added to the **Repositories** related list.
7. Automatically configure the webhook URL in a Bitbucket repository to send notifications to the DevOps tool by selecting **Configure**.
   Alternatively, you can choose to enable nightly polling to fetch data system for any tracked repositories by setting the *Enable Polling* property to **Yes**.
8. Select **Import** to import historical data from the repository.

Note:
If your tool credential has changed, you must update the credentials in your ServiceNow instance. For more information, see Update third-party tool credentials in DevOps Change Velocity.

Imported commits, branches, and pull request records from the repository are added to the corresponding related lists.

9. In the **App** field, click the lookup list and select an App record to associate with the repository, or click **New** to create one.

Set up OAuth 2.0 Authorization Code for Bitbucket Cloud

Set up OAuth 2.0 Authorization Code credentials for Bitbucket in DevOps Change Velocity to use a more secure authentication method.

Before you begin

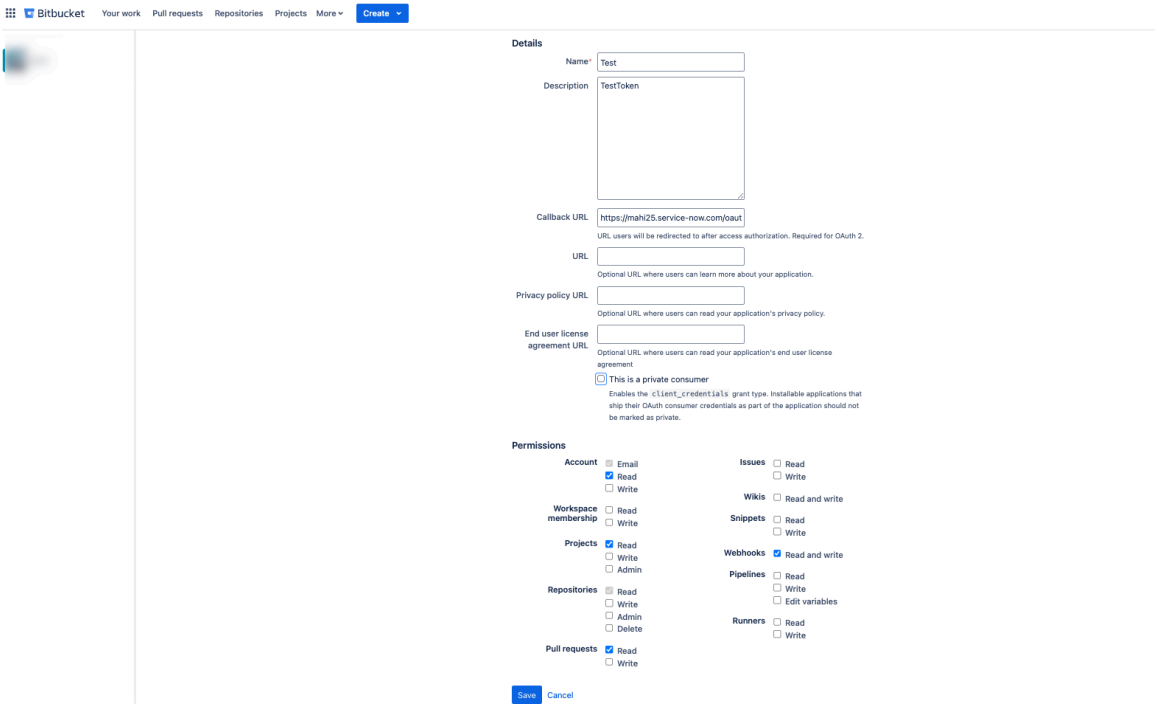
The OAuth consumer must be created in the Bitbucket tool with the required permissions before creating the OAuth credential record. You can navigate to **Workspace settings > OAuth consumers > Add consumer** in Bitbucket to add the OAuth consumer. The following permissions must be selected when you create the credentials for OAuth 2.0.

- Account: Read
- Projects: Read
- Webhooks: Read and write
- Pull requests: Read

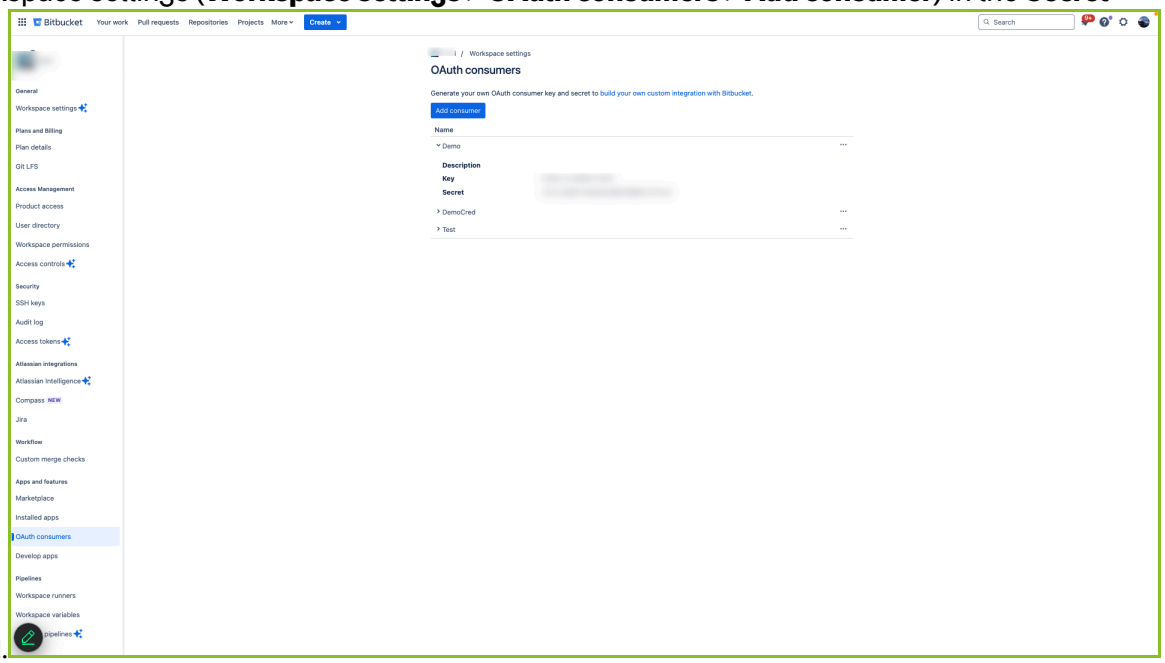
The **This is a private consumer** option must be deselected. You must enter your ServiceNow instance URL in the **Callback URL** field in the following format.

```
https://<instanceurl>/oauth_redirect.do
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You need the **Client Id** and **Client secret** values of your Bitbucket workspace. Client ID of your Bitbucket tool is available in the OAuth consumers section of your workspace settings (**Workspace settings > OAuth consumers > Add consumer**) in the **Key** field. Client secret of your Bitbucket tool is available in the OAuth consumers section of your workspace settings (**Workspace settings > OAuth consumers > Add consumer**) in the **Secret** field.



Role required: admin

About this task

When you select the credential type as OAuth 2.0 - Authorization Code for Bitbucket Cloud, the repositories for all the workspaces are discovered. This is a limitation from Bitbucket side.

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry**.
2. Select **New**.

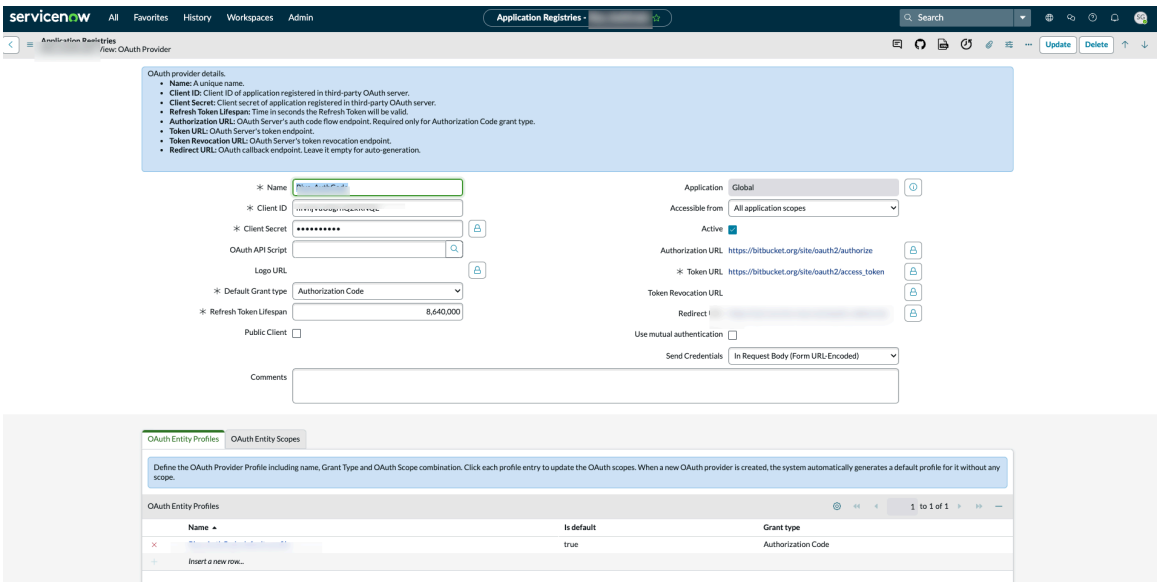
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system displays the message **What kind of OAuth application?**

3. Select **Connect to a third party OAuth Provider**.
   The system displays an empty Application Registries form.
4. Fill the following fields in the form.

Field	Value required
Name	Enter any name to uniquely identify the record.
Client ID	Client ID of your Bitbucket tool, which is available in the OAuth consumers section of your workspace settings in the **Key** field of Bitbucket cloud.
Client Secret	Client secret of your Bitbucket tool, which is available in the OAuth consumers section of your workspace settings in the **Secret** field of Bitbucket cloud.
Default Grant type	Select **Authorization Code**.
Authorization URL	Enter `https://bitbucket.org/site/oauth2/authorize`
Token URL	Enter `https://bitbucket.org/site/oauth2/access_token`

5. Leave the rest of the form fields as default.



6. Select and hold (or right-click) the form header, and select **Save**.
   - The system validates the OAuth credentials and populates the **Redirect URL** (Hint: It should match the **User authorization callback URL** previously provided in your Bitbucket Cloud configuration).
   - The system populates **OAuth Entity Profile** with **Grant Type** as **Authorization Code**. For example, **OAuth Entity Profile** is created with default **Name**, **My Bitbucket App Provider default_profile**
7. Navigate to **All** > **Connections & Credentials** > **Credentials**.
8. Select **New**.
   The system displays the message **What type of Credentials would you like to create?**.
9. Select **OAuth 2.0 Credentials**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The pop-up window displays an empty OAuth 2.0 Credentials form.

10. Fill in these values.

Field	Value required
Name	Enter any name to uniquely identify the record.
Active	Enable
OAuth Entity Profile	Select the default OAuth Entity profile that you created in step 6.
Applies to	Select the MID Servers that can use this credential. For example, select **All MID Servers**. **Note:** You must connect to your Bitbucket tool instance using MID Server to use this credential.
Order	Select the order to apply this credential. For example, enter `100`.

11. Save the record.
12. Select the **Get OAuth Token** related link to generate the OAuth token.

Configure webhooks in Bitbucket manually

Configure webhooks in Bitbucket to send sync notifications to the DevOps Change Velocity application.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity, Bitbucket admin

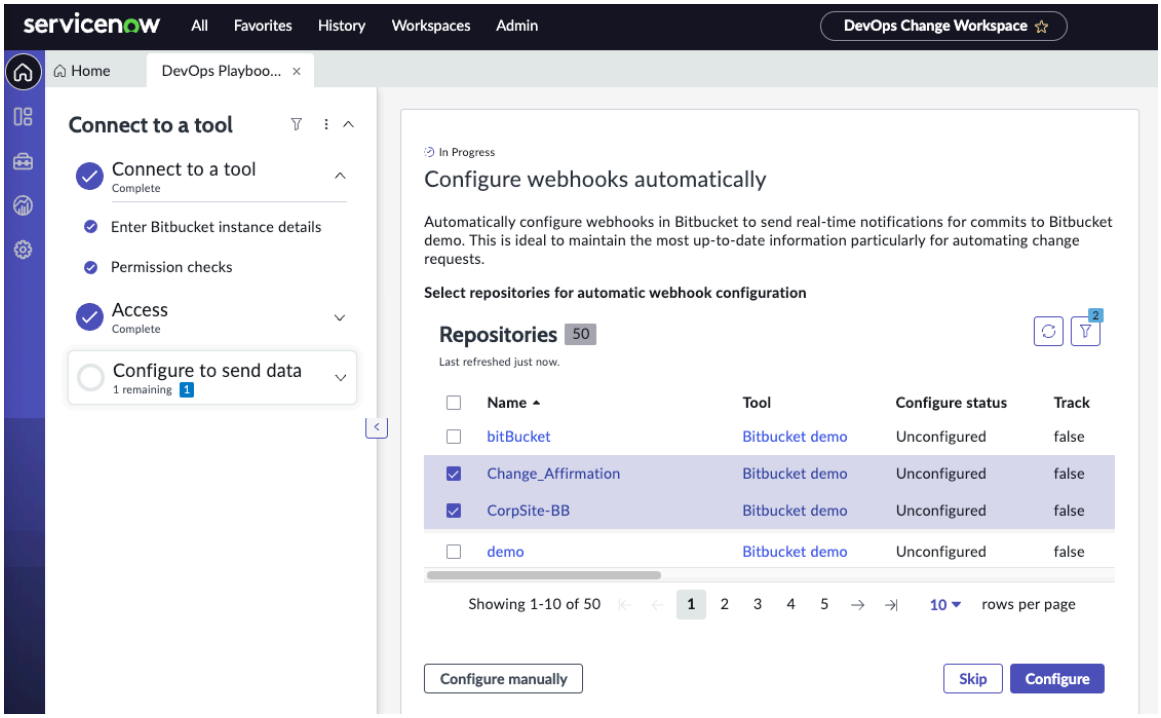
About this task

You can also access manual configuration from the Bitbucket tool record in DevOps Change Velocity.

Procedure

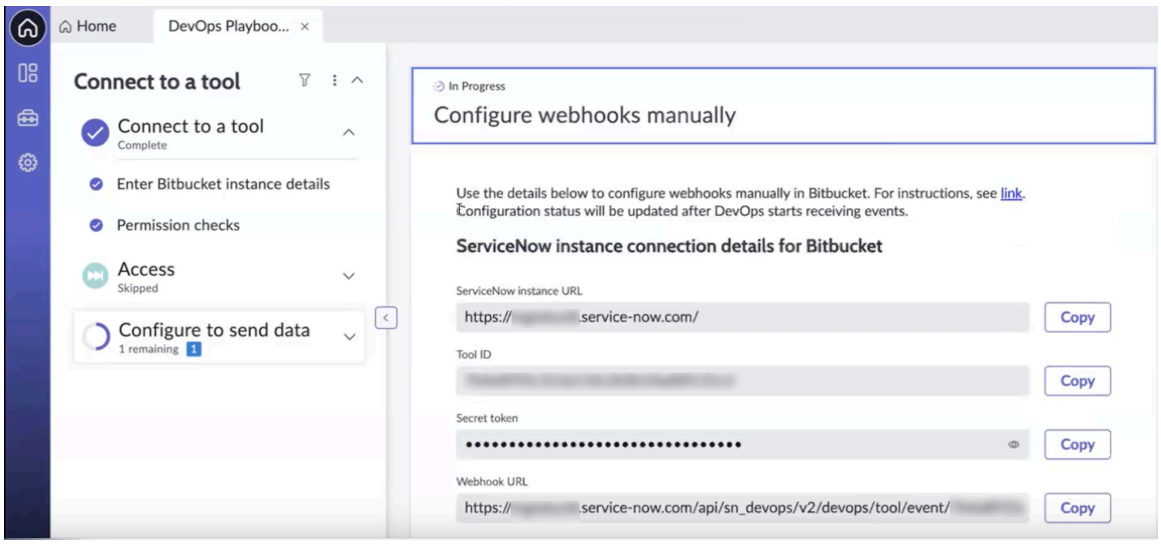
1. In Bitbucket, navigate to **Settings** > **Webhooks** for the specified repo, and add a webhook.
2. In DevOps Change Velocity, choose **Configure manually** when configuring the tool instance to send data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



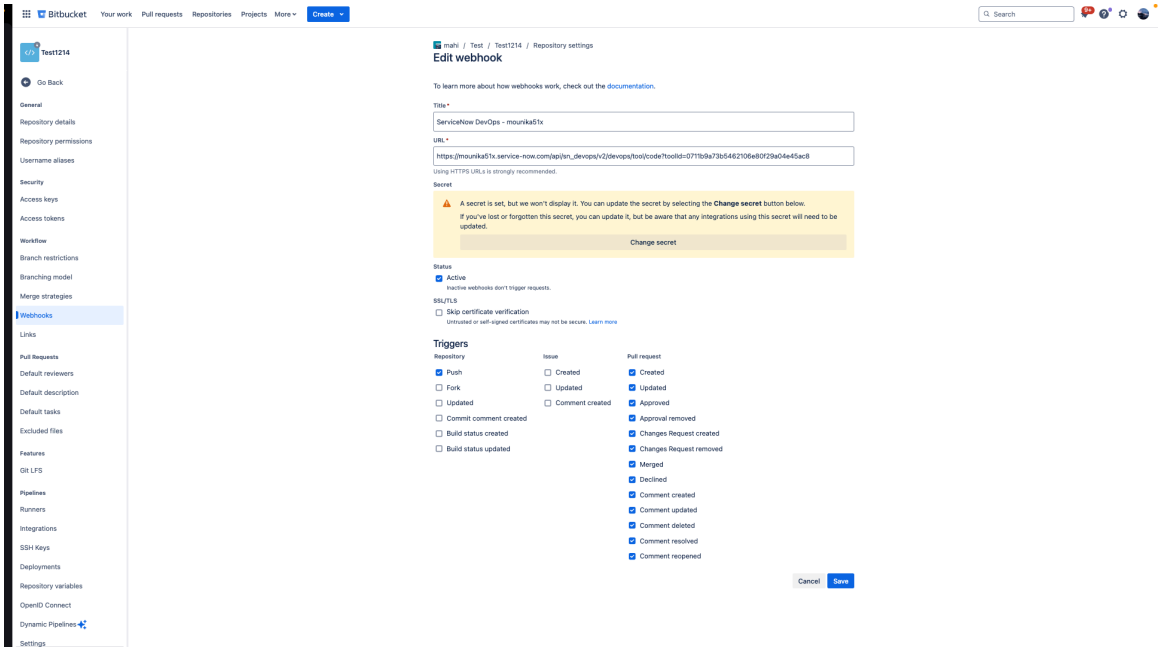
3. In DevOps Change Velocity, copy the **Webhook URL** field from the ServiceNow instance connection details for Bitbucket.

> **Note:**
> Select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times.



4. In Bitbucket, navigate to **Repository settings > Webhooks > Edit webhook**, and paste the copied Webhook URL in the **URL** field.
5. Select the following triggers.
   - Repository: Push
   - Pull request: Created, Updated, Approved, Approval removed, Changes Request created, Changes Request removed,Merged, Declined, Comment created, Comment updated, Comment deleted, Comment resolved, Comment reopened.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select **Save**.

JFrog integration with DevOps Change Velocity

Connect to your JFrog instance to track artifacts published to JFrog from pipeline executions in Jenkins, GitHub Actions, Azure DevOps, and GitLab.

For Jenkins, you must activate the Jenkins Artifactory plugin in your Jenkins server to generate the artifacts as part of your pipeline run and publish them in the JFrog artifact repositories.

Note:
Historical import of JFrog artifacts is not supported. You can import JFrog artifacts that are built by Jenkins using the Service Catalog import historical data process. For more information, see Importing historical data for DevOps tools. Discover and configure is also not supported for JFrog.

Get started

Use one of the following options to onboard JFrog. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard JFrog to DevOps Change Velocity — Workspace

Connect to your JFrog instance using the DevOps Change Workspace playbook to track artifact repositories published to JFrog.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

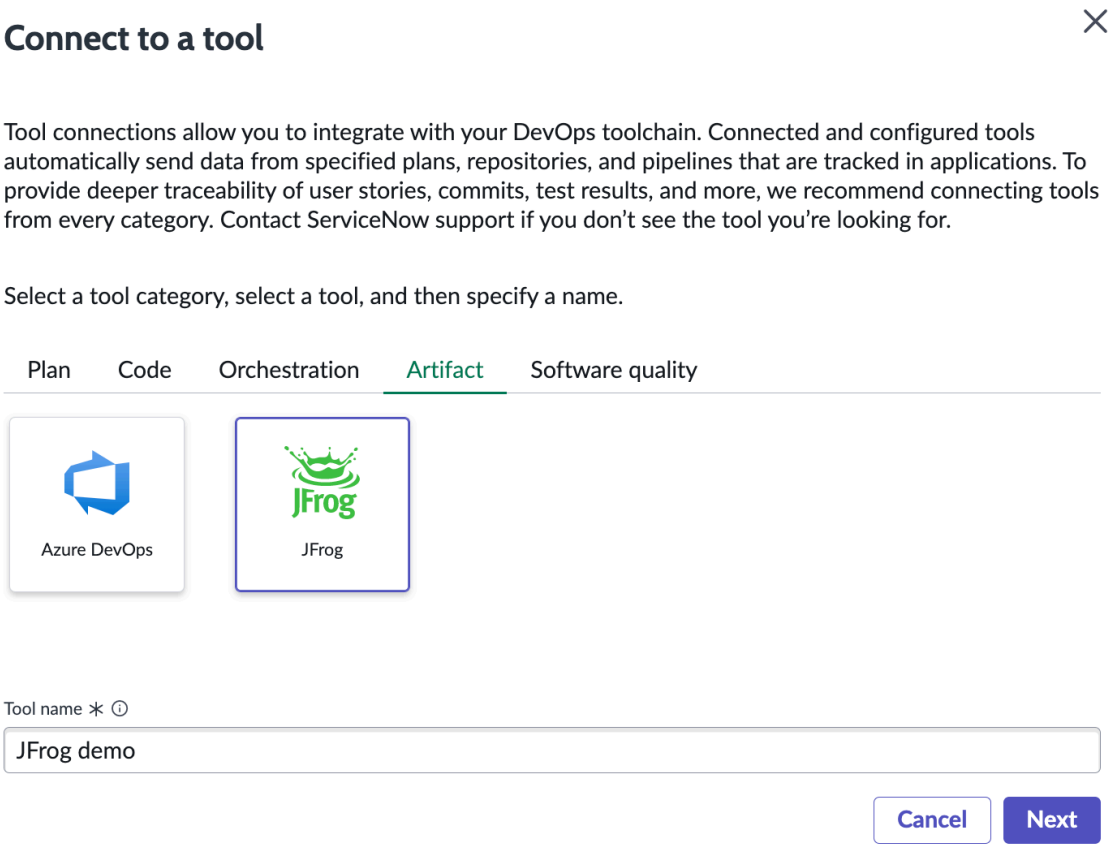
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard JFrog.

2. Specify a name for the tool in the **Tool name** field, and select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On the JFrog instance details playbook activity:

a. Enter the URL of your JFrog instance.

b. Enter the login credentials of the global admin for the JFrog instance.

c. Optional: Select the MID Server option and enter its details if your JFrog instance is attached to a MID Server.
A MID server is required if your tool instance is hosted on-prem. For more information about MID server, see MID Server selection.

© 2026 ServiceNow, Inc. All rights reserved.
