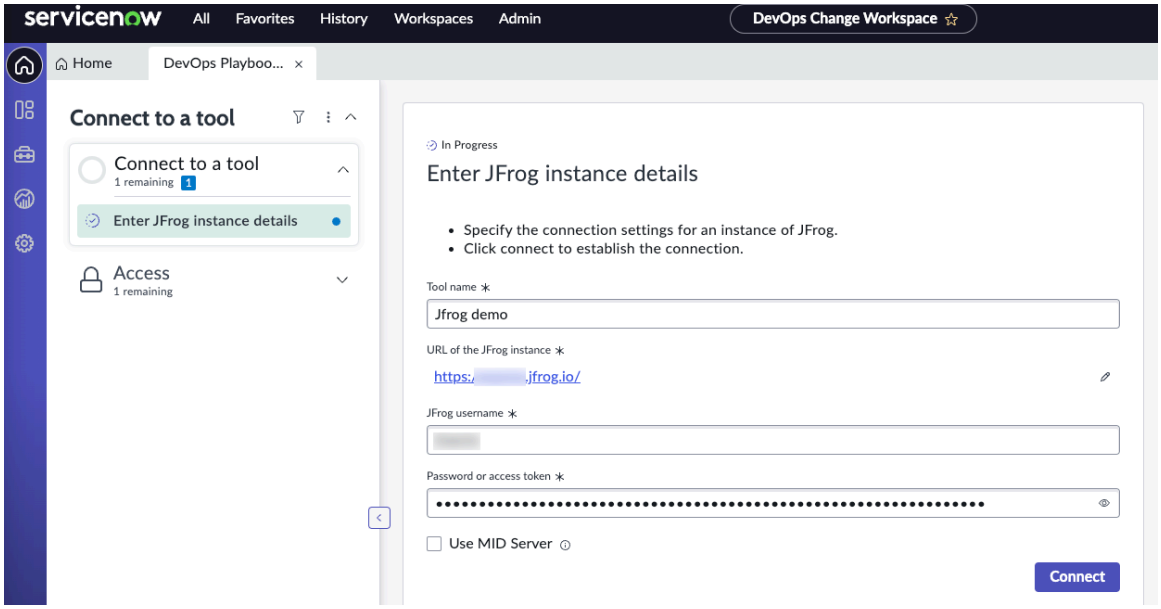
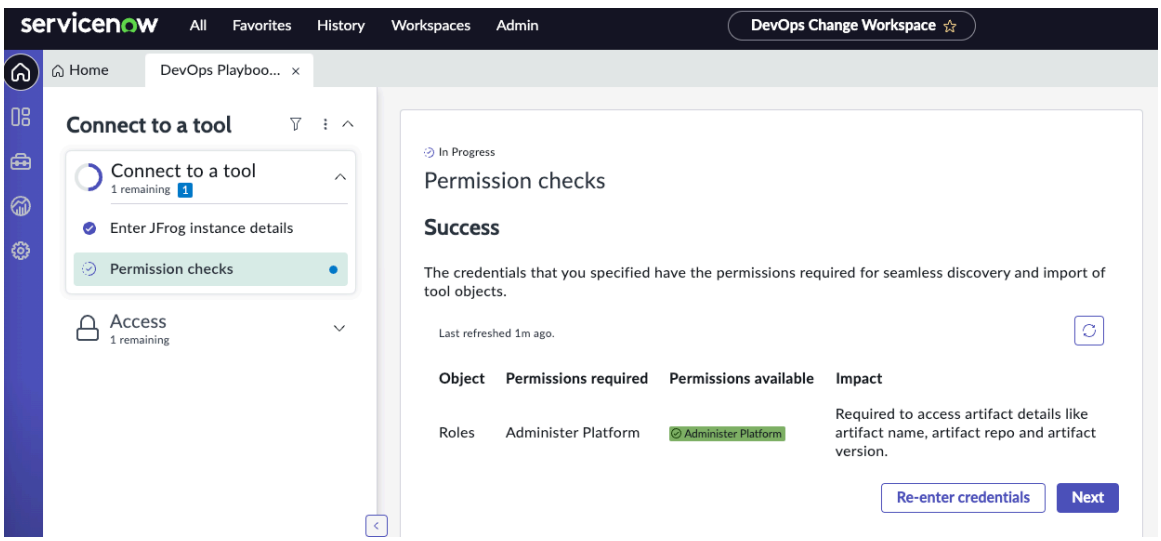
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Connect**.
5. Permission checks are run on the credentials that you entered.
   Permissions required and permissions that are available are displayed. If you want to enter credentials with better permissions, select **Re-enter credentials**. The credentials that you specified must have the Administer Platform role in JFrog for seamless discovery and import of tool objects. This is a limitation from JFrog. For detailed information on all the required permissions, see Jira permissions in Permissions required for DevOps tools.

   You can choose to continue with the tool connection even if you don't have all the required permissions.

   Note:
   If your tool credential has changed, you must update the credentials in your ServiceNow instance. For more information, see Update third-party tool credentials in DevOps Change Velocity.



6. Select **Next**.
7. Specify the access for the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

The tasks these users in the groups can perform depends on the role assigned to them.

- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

> **Note:**
> If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

c. Select **Assign**.

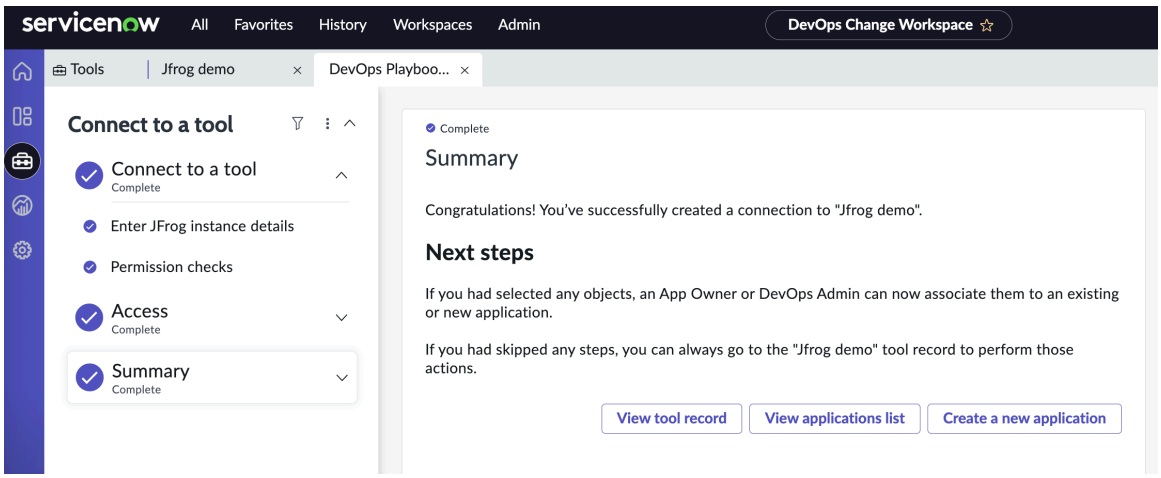
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. From the **Summary** page, select **View tool record** to review the details of the connected instance.



Result

You've successfully onboarded your JFrog tool to DevOps Change Velocity.

Onboard JFrog to DevOps Change Velocity — Service Catalog

Connect your JFrog instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your JFrog integration.
Tool integration	Select JFrog.
Tool URL	URL of your JFrog instance.
Tool username, password or access token	Login credentials of the global admin for the existing JFrog instance.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to DevOps #and capability is set to REST.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a list of all the permissions required on the credentials for connecting to JFrog, see JFrog permissions in Permissions required for DevOps tools.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is connected.

Onboard JFrog to DevOps Change Velocity — Classic

Connect to an instance of the JFrog artifact tool to enable you to track artifacts published to JFrog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Complete the steps specified in the Getting started section before connecting to a tool.

Procedure

1. Enter the JFrog instance details to connect to DevOps Change Velocity by navigating to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. Enter a value in the **Tool Name** field and fill in the tool details.

Create DevOps Tool form

Field	Description
Tool integration	Tool to integrate. In this case, select **JFrog**.
Tool URL	URL of the existing JFrog instance to integrate.
Tool username, Tool password / Access token	Login credentials of the global admin for the existing JFrog instance.

For a list of all the permissions required on the credentials for connecting to JFrog, see JFrog permissions in Permissions required for DevOps tools.

3. Select **MID Server** for an on-premises tool that is attached to a MID Server.
   Application is automatically set to DevOps and capability is set to REST.
4. Click **Submit**.

> **Note:**
> If your tool credential has changed, you must update the credentials in your ServiceNow instance. For more information, see Update third-party tool credentials in DevOps Change Velocity.

If the connection is successful, the tool is created in ServiceNow and connected to your JFrog instance.

On successful tool creation, you're taken to the tool record page.

5. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

Note:
Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

Associate steps from GitHub, GitLab, and Azure DevOps with JFrog

JFrog Artifactory support for GitHub Actions, Azure DevOps, and GitLab in DevOps Change Velocity enables you to import the artifact data published to JFrog Artifactory for the corresponding pipeline executions. This can then be linked with all the DevOps data collected in DevOps Change Velocity, like Work Items, Commits, Quality Summary, Test Runs, and so on, which helps to trace and identify the root causes.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Azure DevOps release pipelines are not supported.

Associate steps from GitHub, GitLab, and Azure DevOps to your JFrog tool. Before you can associate steps, you must:

- Connect and configure your GitHub, GitLab, or Azure DevOps tools in DevOps Change Velocity.
- Run the pipelines in the respective GitHub, GitLab, or Azure DevOps instances.
- Discover pipelines and steps in the respective tools in DevOps Change Velocity.
- Connect the JFrog tool in DevOps Change Velocity. The tool must be in the connected state.

Important:
- Build info must be published to JFrog along with the artifacts.
- Build info must contain the URL and modules or dependencies information.

Associate steps from pipelines

1. Open the tool record page of your GitHub, GitLab, or Azure DevOps tool and select the **Pipelines** tab.
2. Select the pipelines that you want to associate with your JFrog tool.
3. Select **Associate artifact tool**.

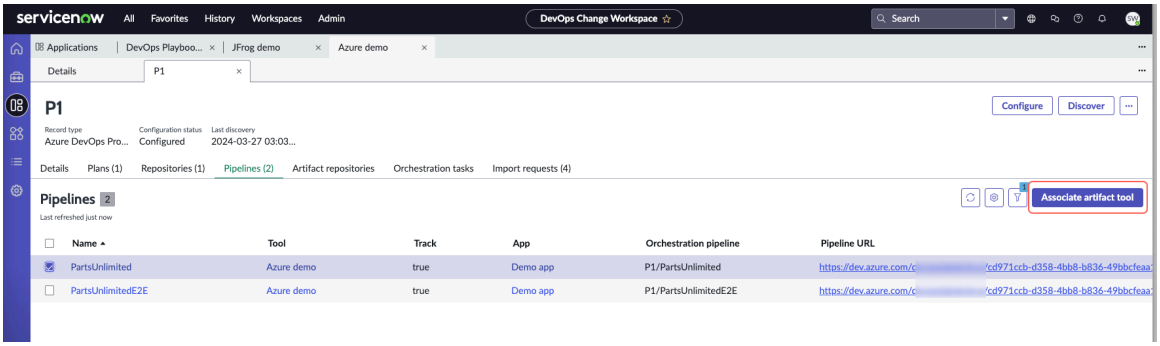
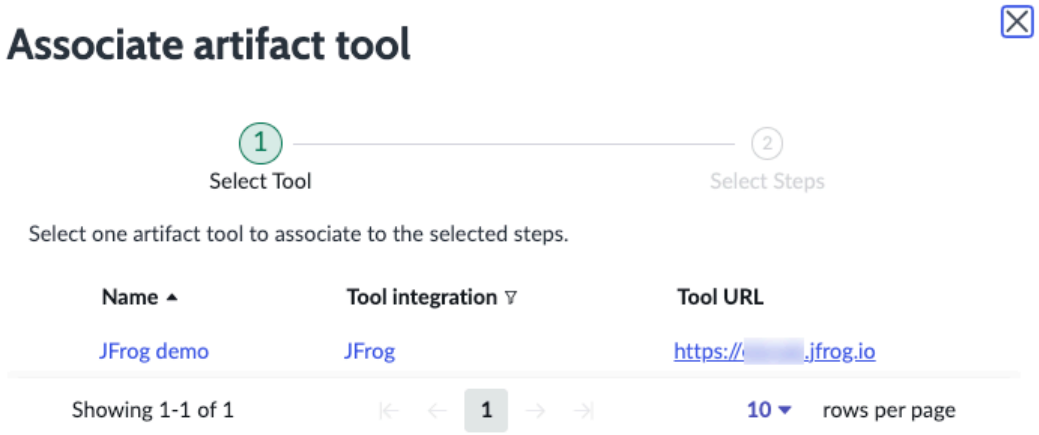
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the JFrog tool to which you want the association.

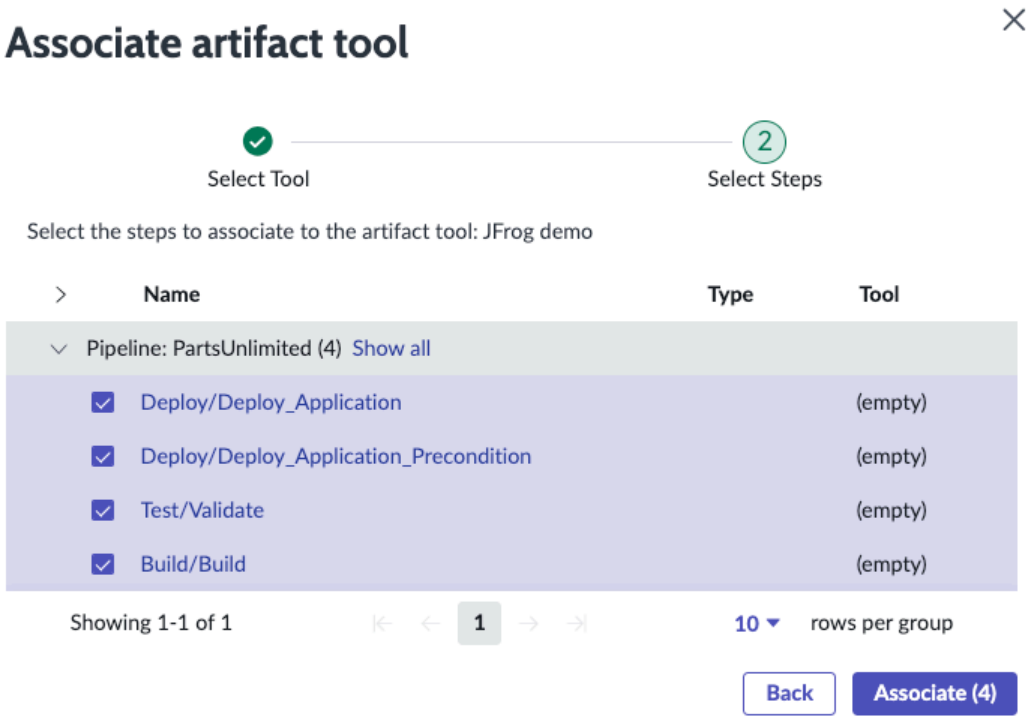
Note:
Only the connected JFrog tools are available for selection.



5. Select the pipeline steps that you want to associate with the selected JFrog tool and select **Associate**.

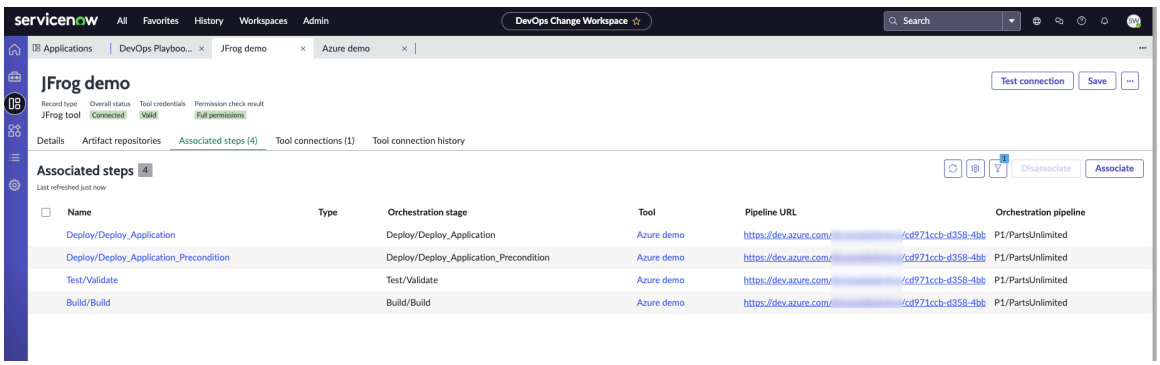
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A step can only be associated with one tool.



The steps are associated with the JFrog tool. You can view the associated steps in your JFrog tool record, under the **Associated steps** tab.

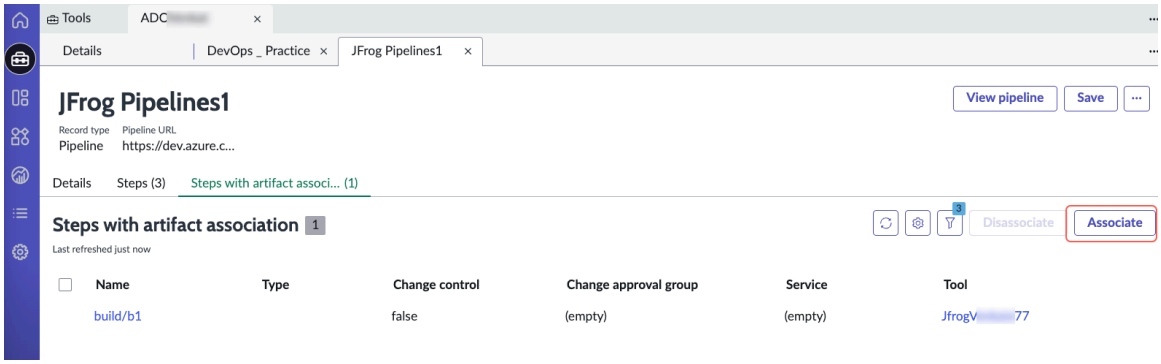
To disassociate a step, select it from the **Associated steps** tab in your JFrog tool record and select **Disassociate**.



Associate steps from the Steps table

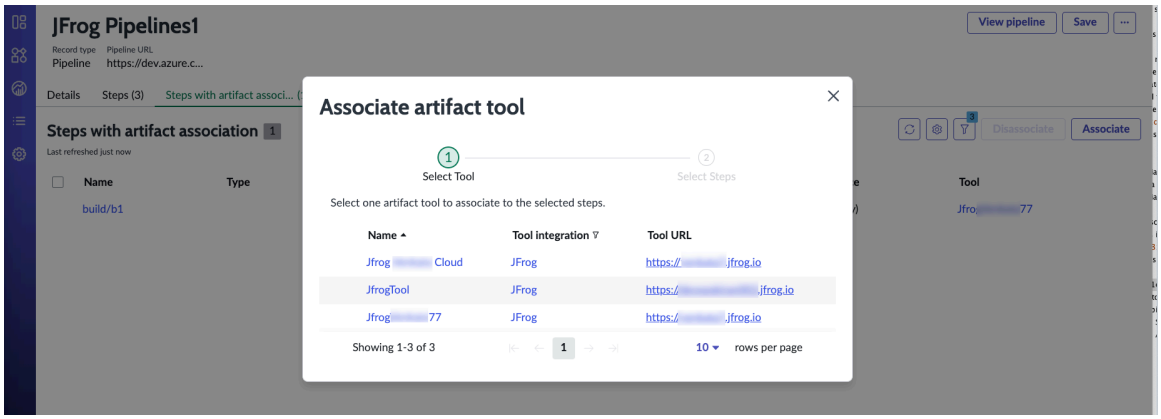
1. Open the tool record page of your GitHub, GitLab, or Azure DevOps tool and select the pipeline whose steps you want to associate with your JFrog tool.
2. From the pipeline record, select the **Steps with artifact association** tab and select **Associate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



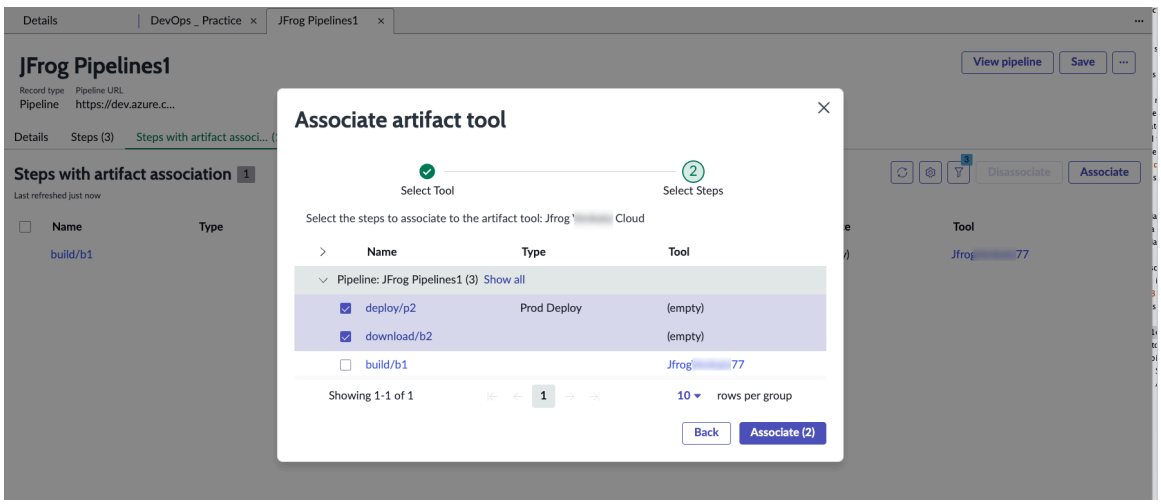
3. From the list of connected JFrog tools, select the tool that you want the steps to be associated with.

Note:
Only the connected JFrog tools are available for selection.



4. From the list of steps in the pipeline, select the ones you want to associate with the selected JFrog tool and select **Associate**.

Note:
If you select a step, which is already associated with another JFrog tool, it is disassociated from that tool and then associated with the current JFrog tool.



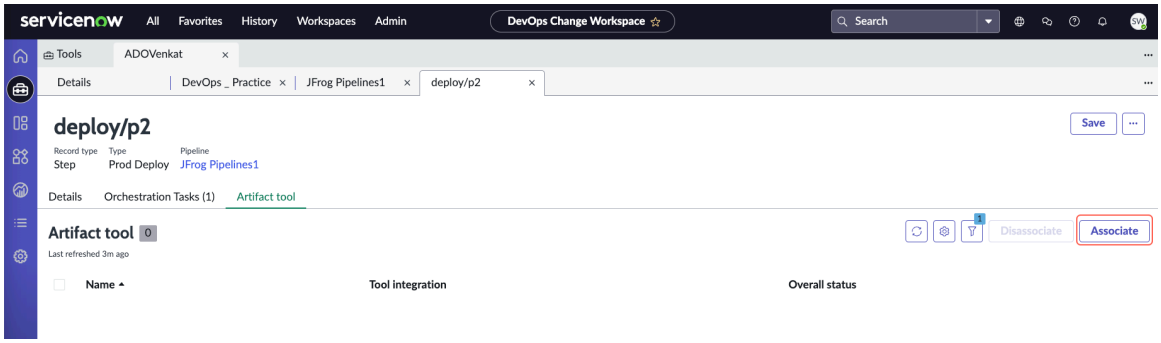
The selected steps are associated with the JFrog tool. To disassociate a step, select it and then select **Disassociate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate step from the step record

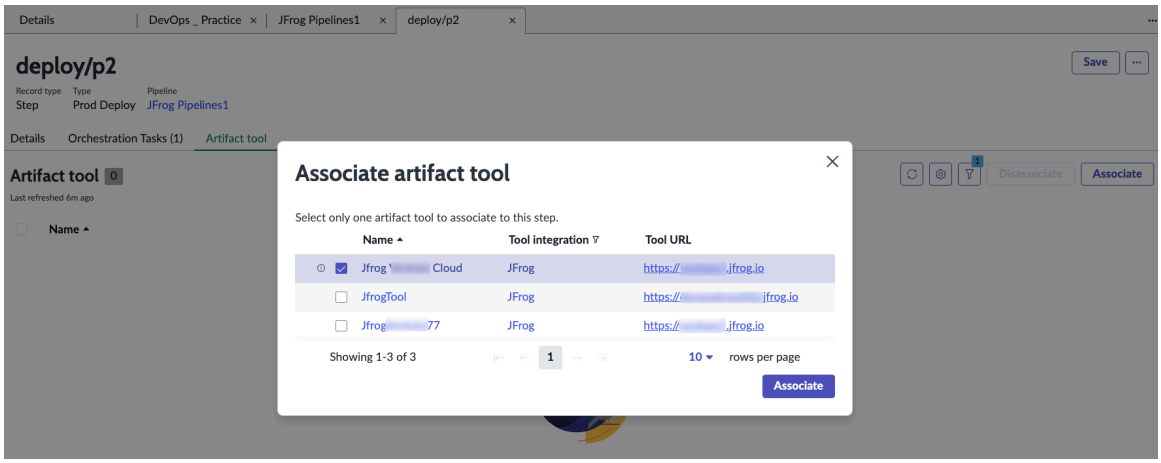
For individual steps, you can associate with a connected JFrog tool directly from the step record.

1. Open the step record page of the step that you want to associate with your JFrog tool.
2. Select the **Artifact tool** tab and select **Associate**.



3. From the list of connected JFrog tools, select the tool that you want the step to be associated with and select **Associate**.

> **Note:**
> Only the connected JFrog tools are available for selection.



The step is associated with the selected JFrog tool. To disassociate the step, select it and then select **Disassociate**.

Associate steps from the JFrog tool

You can associate steps directly from the JFrog tool.

1. Navigate to the connected JFrog tool.
2. Select the **Associated steps** tab and select **Associate**.

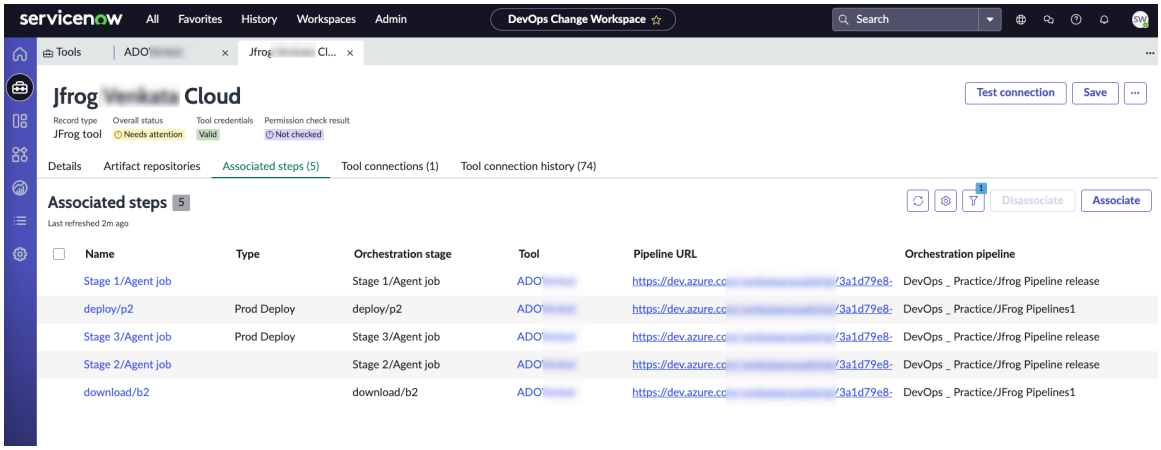
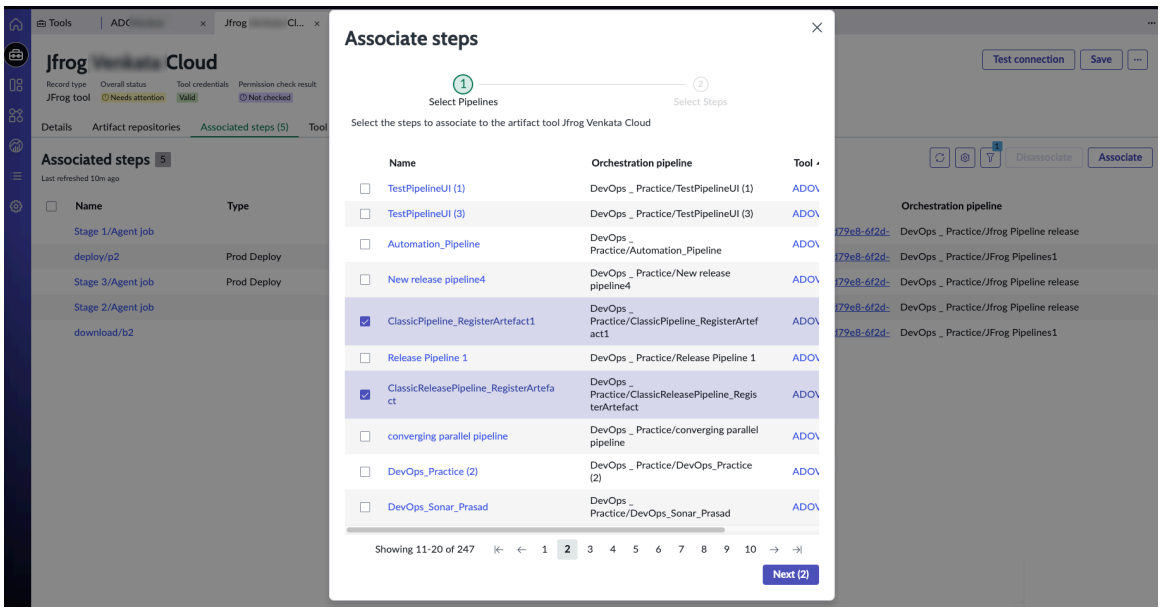
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



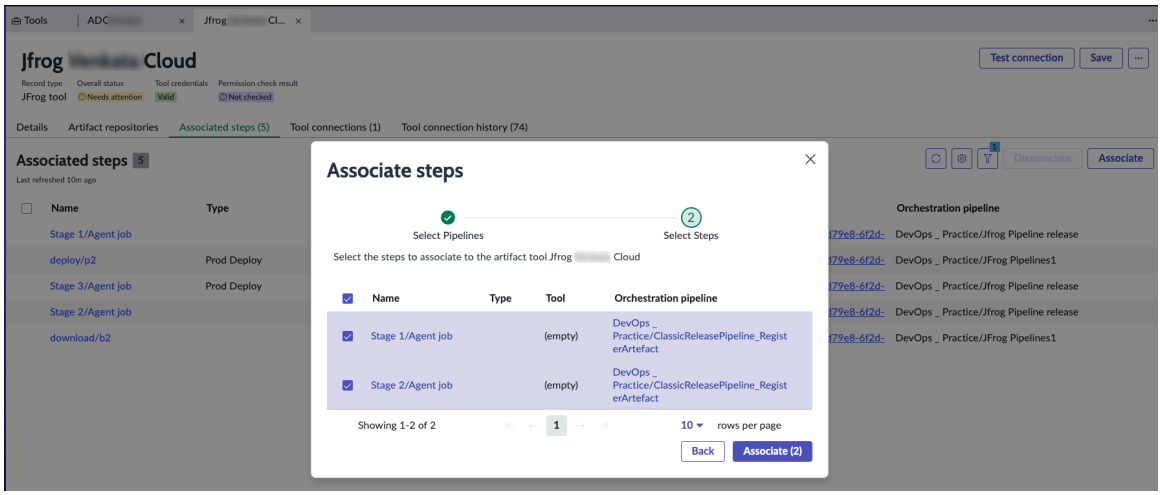
3. Select the pipelines whose steps you want to associate with the JFrog tool and select **Next**.



4. Select the steps from the pipelines that you want to associate with the JFrog tool and select **Associate**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you select a step, which is already associated with another JFrog tool, it is disassociated from that tool and then associated with the current JFrog tool.



The selected steps are associated with the JFrog tool. To disassociate a step, select it and then select **Disassociate**.

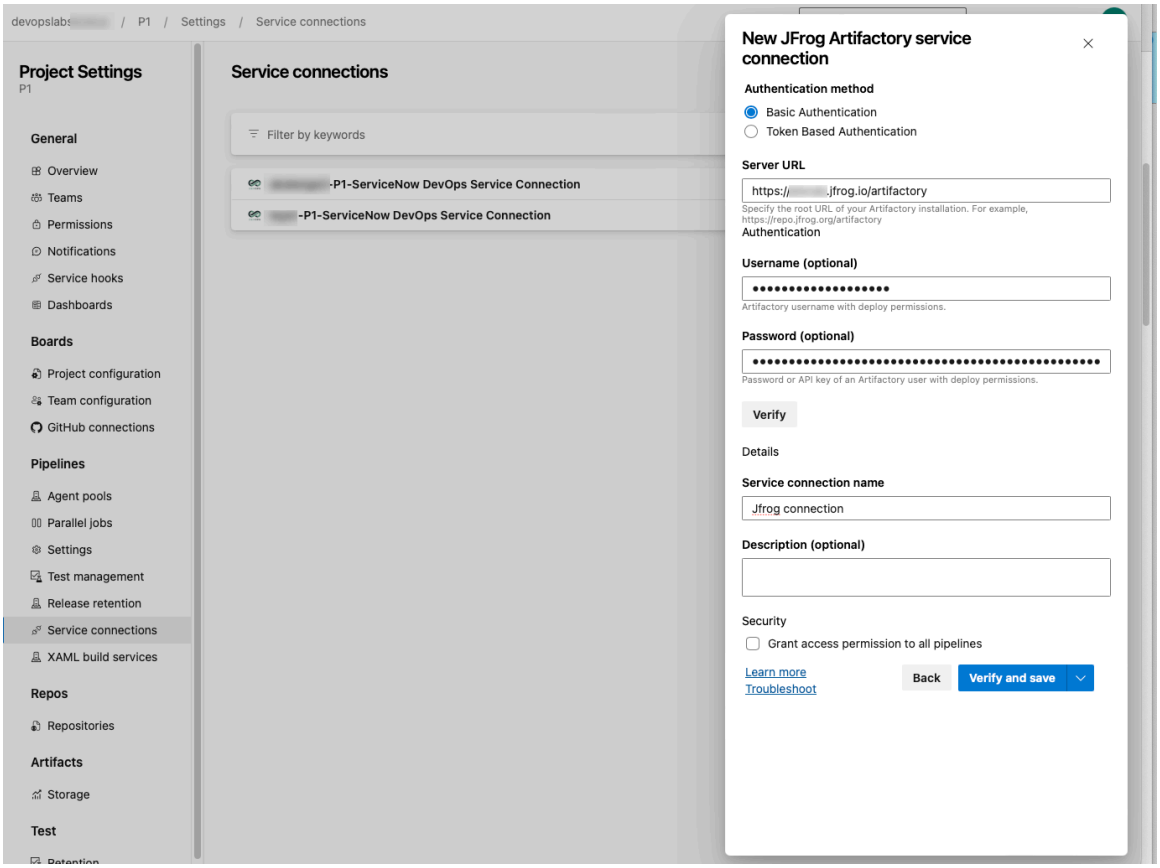
Configure Azure DevOps for JFrog

Configure your Azure DevOps instance to enable upload and download of JFrog artifacts.

The following settings are required in your Azure DevOps instance:

1. Install the plugin JFrog Artifactory.
2. Select your project and navigate to **Project settings** > **Pipelines** > **Service connections**.
3. Select **New service connection**, search and select the installed **JFrog Artifactory** plugin, and select **Next**.
4. Enter your JFrog instance details and create a service connection for JFrog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
The **Username** and **Password** fields must contain the credentials to your JFrog instance entered in the **Server URL** field.

Upload artifacts from Azure DevOps to JFrog

To upload artifacts:

1. Navigate to your project pipeline.
2. In your stage for uploading, add the task **Artifactory Generic Upload** for uploading artifacts.
3. For the **Artifactory Generic Upload** task:
   a. Select the service connection you created for JFrog.
   b. In the **Spec** field, entire your file spec.
   c. Select the **Collect build info** check box.
   d. The **Build number** field should contain the *`BuildId`* parameter.
   e. Select **Add**.

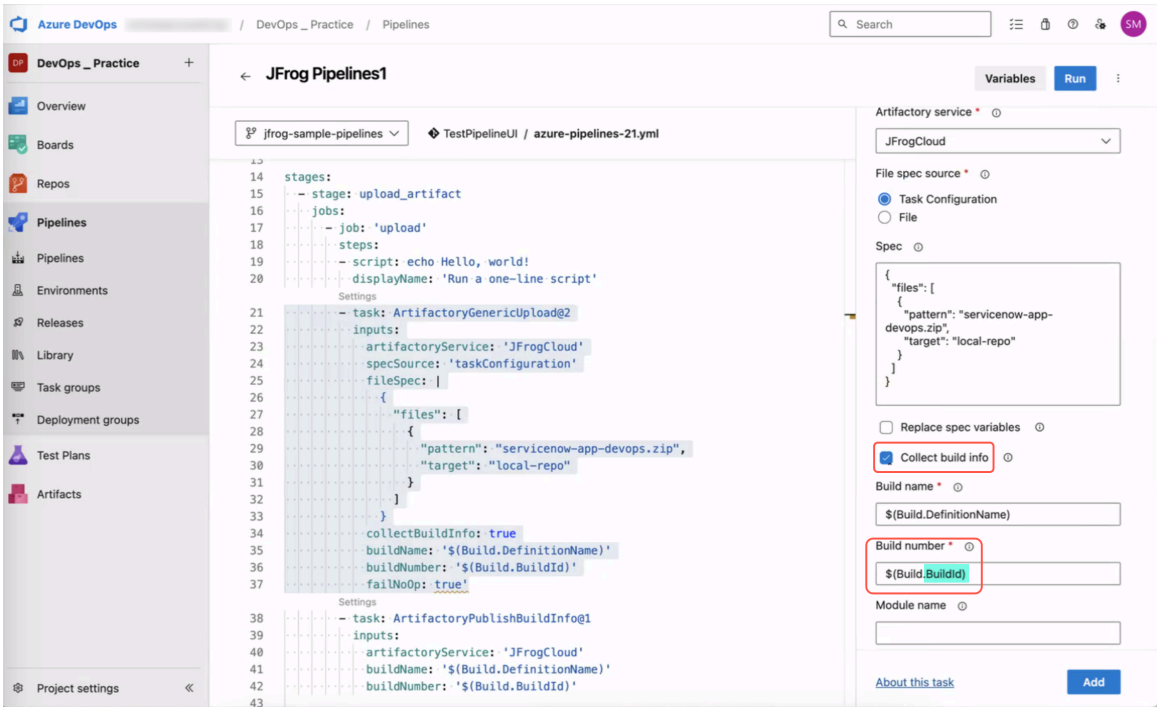
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Add the task **Artifactory Publish Build Info** for publishing build info.
5. For the **Artifactory Publish Build Info** task:
   a. Select the service connection you created for JFrog.
   b. The **Build number** field should contain the *BuildId* parameter.
   c. Select **Add**.

Sample pipeline to upload and download artifacts for GitLab

Pipeline samples for GitLab containing steps to upload and download artifacts for GitHub.

To upload and download artifacts from GitLab to JFrog, the parameters *JFROG_URL*, *JFROG_USER*, and *JFROG_PASSWORD* must be set as CI/CD variables in your GitLab instance.

1. Navigate to your project, then go to **Settings** > **CI/CD** > **Variables**.
2. Select **Add variable**.
3. Enter the parameter in the **Key** field and enter the value for the parameter in the **Value** field.
4. Select **Add variable** to save.

Create a CI/CD variable for the following 3 parameters:

- *JFROG_URL*
- *JFROG_USER*
- *JFROG_PASSWORD*

SonarQube integration with DevOps Change Velocity

Connect to your SonarQube instance that is integrated with your CI/CD pipelines to retrieve code quality and code security results.

SonarQube integration overview

Sonar scans that are configured on GitHub Actions, Jenkins, and Azure DevOps pipelines are supported in DevOps Change Velocity. Both SonarCloud and SonarQube (on-premises) are supported.

You can view the code quality and code security summary results either in the related list of a Change Request or the Task Execution of the pipeline in your ServiceNow instance. You can also use code quality and code security results in defining change policies and conditions for change automation.

DevOps Change Velocity captures both overall and new code metrics.

Get started

You can onboard your Sonar instance using an admin or a non-admin Sonar user.

Pre-requisite configuration for admin user

In SonarQube: Project-level access to your SonarQube instance to configure scans for all your projects.

Pre-requisite configuration for non-admin users

- In SonarQube:
  - The non-admin user must have access to a branch created using Branch Analysis. For more information, see Branch Analysis.
  - The non-admin user must have Browse and Execute Analysis permissions for the projects (both private and public) for which you want to run and view scan results.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can set up branch analysis to enable SonarCloud to analyze branches in your projects apart from the main branch. You can't set up or perform branch analysis on SonarQube community edition licenses. Upgrade to SonarQube Developer or Enterprise editions to set up branch analysis on SonarQube on-premises implementations.

- In DevOps Change Velocity
  1. Navigate to **All** > **DevOps** > **Administration** > **Properties**.
  2. Enable the **DevOps Non-Admin Software Quality Summary Flag** property by selecting the **Yes** option.

Sonar custom action and extension are available in the GitHub and Azure DevOps marketplace respectively. For Jenkins, the Sonar scan results are retrieved using ServiceNow Jenkins plugin.

For more information on the scan results captured in ServiceNow, see Software Quality Results.

Use one of the following options to onboard SonarQube. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard SonarQube to DevOps Change Velocity — Workspace

Connect to your Sonar instance using the DevOps Change Workspace playbook.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard SonarQube.

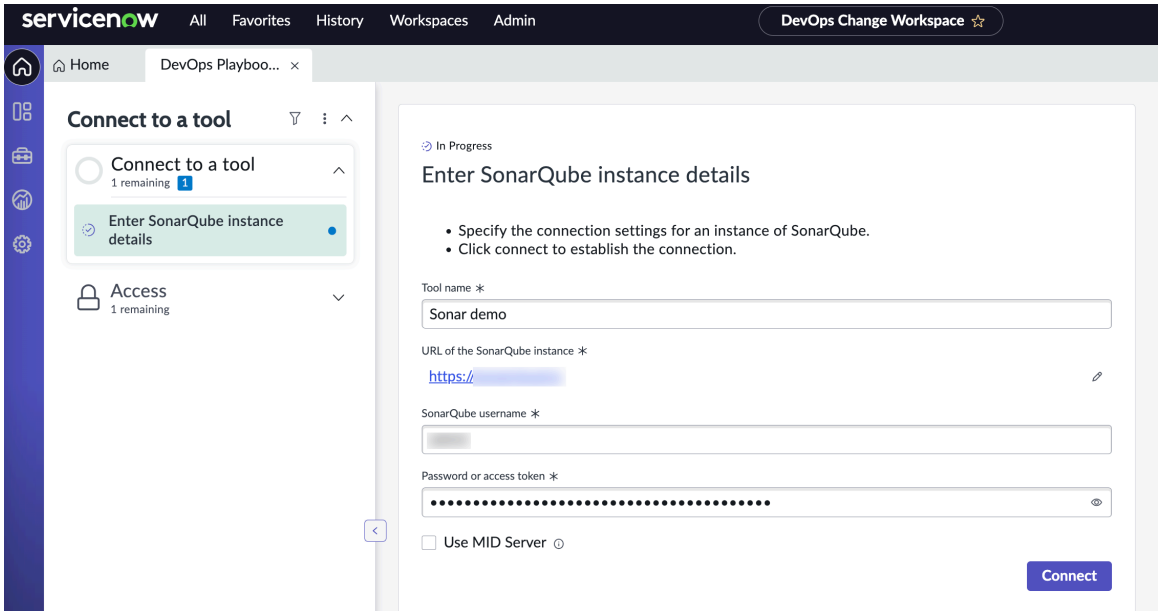
2. Enter a name to identify your tool and click **Next**.
3. On the Enter Sonar instance details playbook activity section, enter the following details:
   a. In the **URL of the SonarQube instance** field, enter the SonarQube or SonarCloud instance URL.

      For example, https://sonarcloud.io.

   b. In the **SonarQube username** field, enter the user name for your Sonar account.
   c. In the **Password or access token** field, enter the token generated in Sonar.
   d. If your Sonar instance is attached to a MID Server, select the **Use MID Server** option and enter its details.

      A MID server is required if your tool instance is hosted on-prem. For more information about MID server, see MID Server selection.
4. Click **Connect** and review the details of the successfully connected Sonar instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Specify the access for the tool.

   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

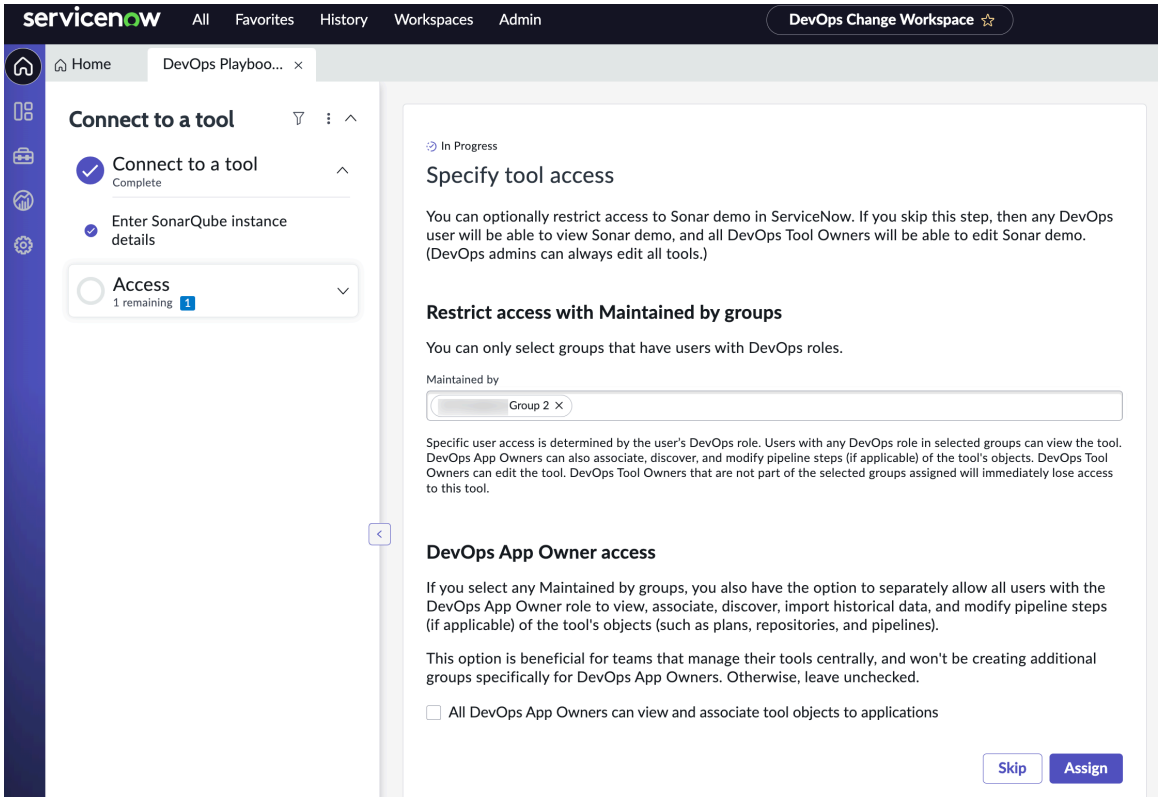
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

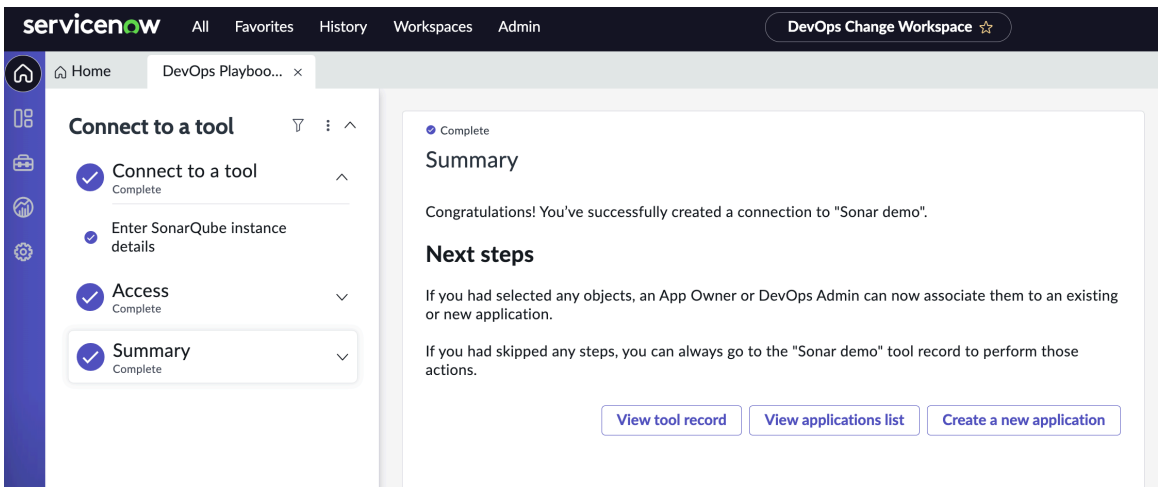
      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. From the **Summary** page, select **View tool record** to review the details of the connected instance.



Result

You've successfully onboarded your SonarQube tool to DevOps Change Velocity.

Onboard SonarQube to DevOps Change Velocity — Service Catalog

Connect your Sonar instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

   Note:
   You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps App Onboarding** and **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Sonar integration.
Tool integration	Select SonarQube.
Tool URL	SonarQube/SonarCloud instance URL. For example,https://sonarcloud.io.
Tool password/ Access token	SonarQube user token.
Use MidServer	Optional. Select#MID Server#for an on-premises tool that is attached to a#MID Server. Application is automatically set to #DevOps and capability is set to REST.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is connected.

Onboard SonarQube to DevOps Change Velocity — Classic

Connect to your Sonar instance to retrieve scan results.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. In the Create DevOps tool form, enter the tool details:

Tool name	Name for the tool you're integrating.
Tool integration	Tool to integrate. Select SonarQube.
Tool URL	SonarQube/SonarCloud instance URL. For example,https://sonarcloud.io **Note:** Don’t enter the slash (/) character at the end of your Sonar tool URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool password / Access token	SonarQube user token **Note:** Only user tokens generated from **User** > **My Account** > **Security** in your Sonar instance are supported. Before generating the token for a SonarQube user, ensure that you grant Browse permission for all your Sonar projects. `api: Grants complete read/write access to the API, including all groups and projects, the container registry, and the package registry.`
Use MID Server	MID Server is optional. Select MID Server for an on-premises tool that is attached to a MID Server. The Application value is automatically set to DevOps and the Capability value is set to REST. For more information, see MID Server selection.

3. Click **Submit** to connect to your Sonar instance.

On successful tool creation, you're taken to the tool record page.

4. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

   The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

What to do next

- Configure SonarQube scans on Azure DevOps pipelines
- Configure SonarQube scans on Jenkins pipelines

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Split.io integration with DevOps Change Velocity

Connect to your Split.io instance to manage feature flags requests directly from you ServiceNow instance.

Split integration overview

Feature flags are used to turn code off and on in your production environment.

This integration extends the ServiceNow platform to manage the CHG approval process for feature flags and segments of Split. This capability enables managing updates to feature flags from DevOps Change Velocity.

- Split.io feature flag tool integration support enables discovery of workspaces, environments, segments, and feature flags.
- Users can set CHG request fields to enable Split.io for CHG control.
- Upon approval/rejection of a CHG request, the callback URL in Split.io for the split or segment is invoked to resume implementation of the update to the split and segment.

Enable integration with ServiceNow DevOps in Split tool

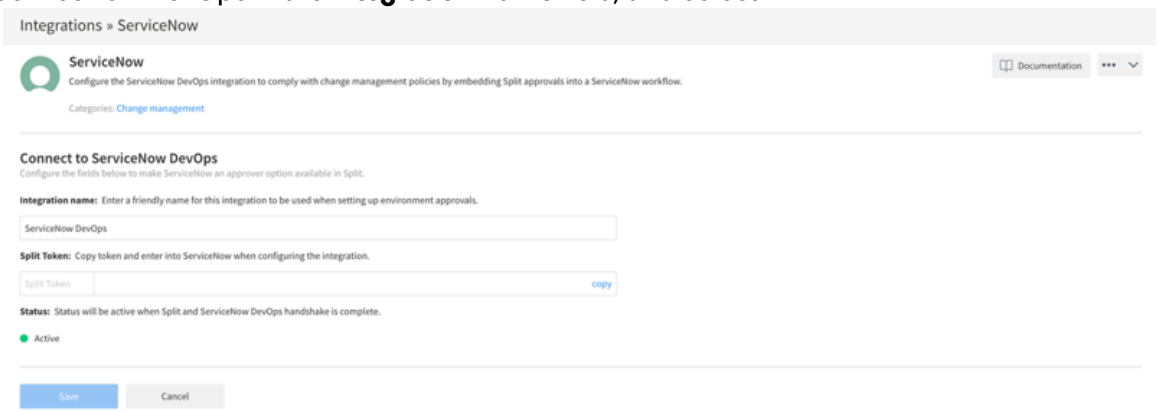
Enable integration with ServiceNow DevOps in Split tool and restrict approvers to only the enabled integration for your environment.

Before you begin

Role required: admin in Split organization

Procedure

1. In Split tool marketplace, navigate to **Admin Settings > Integrations**.
2. Add ServiceNow DevOps in the **Integration Name** field, and select

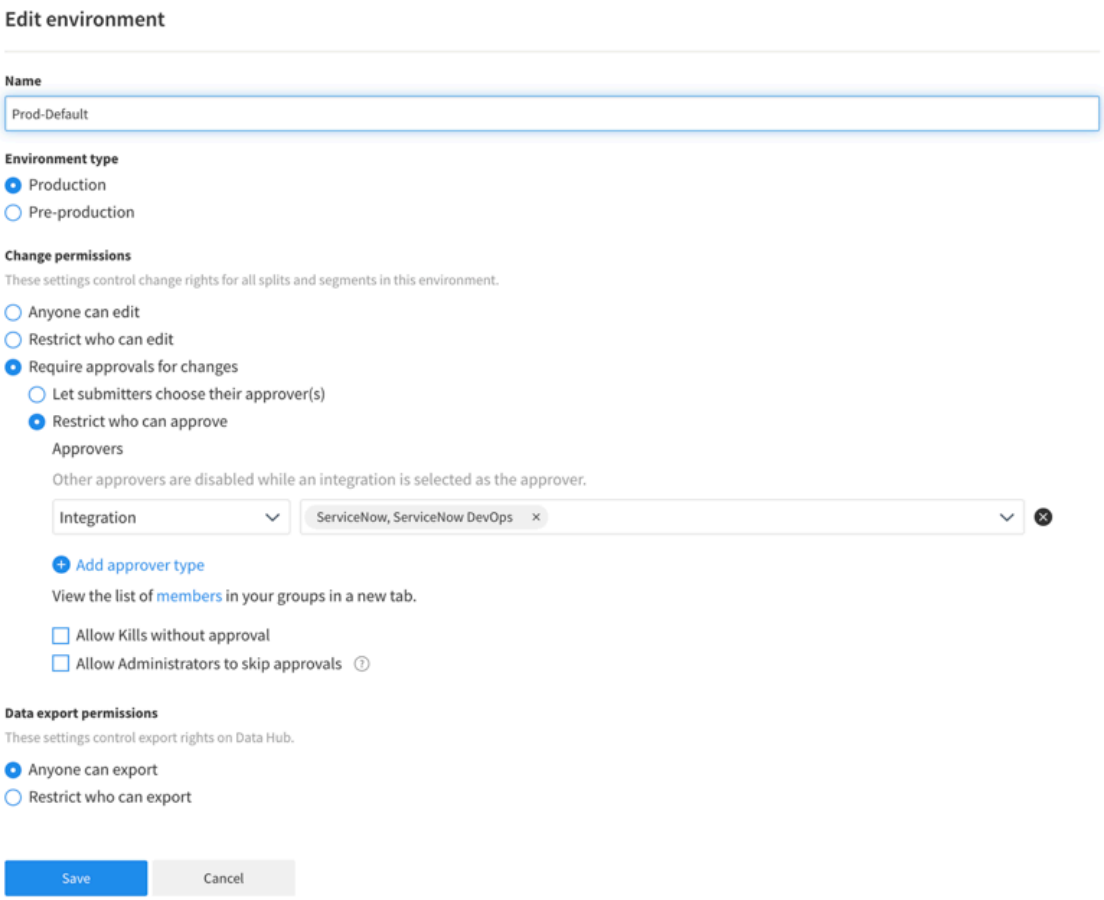


Save.
A token is generated, which must be used while onboarding the Split.io tool.

3. Navigate to **Admin Settings > Workspaces > Choose the required workspace > Edit the Environment**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. In the **Change permissions** field, select **Require approvals for changes > Restrict who can approve**.
5. Select **Integrations** from the drop-down and select the integration configured in step 2 as, and select



Save.

Onboard Split to DevOps Change Velocity — Classic

Create a Split tool record to connect and discover workspaces, environments, segments, and feature flags from the connected Split tool.

Before you begin

Role required: sn_devops.admin

Procedure

1. Create a tool record in DevOps to automatically connect to Split and get the webhook URL.

   a. Navigate to **DevOps** > **Tools** > **Create New (legacy)** and create a record.

   b. Enter a **Tool Name** and fill in the tool details.

Tool Integration	Split
Tool URL	Split tool URL. For example:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	`https://api.split.io`
Tool Username	Split username
Tool Password / Access Token	Split password or access token. For information on creating a Split token, see Enable integration with ServiceNow DevOps in Split tool.

MID Server is optional. Select MID Server for an on-premises tool that is attached to a MID Server. Application is automatically set to DevOps and capability is set to REST.

c. Select **Submit**.
The tool is automatically **Connected Successfully** using a connection alias, and HTTP tool connection (basic authentication credential).

> **Note:**
> If you do not have global admin privileges for your tool (to allow automatic configuration of the webhook URL), you may need to have the tool admin user configure it for you (cut and paste the webhook URL into the tool configuration). Once the webhook is configured in the tool, **Enter Manual Configuration Mode** to connect to the tool manually, then exit.

On successful tool creation, you're taken to the tool record page.

2. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

The tasks the users in the groups can perform depends on the roles assigned to them.

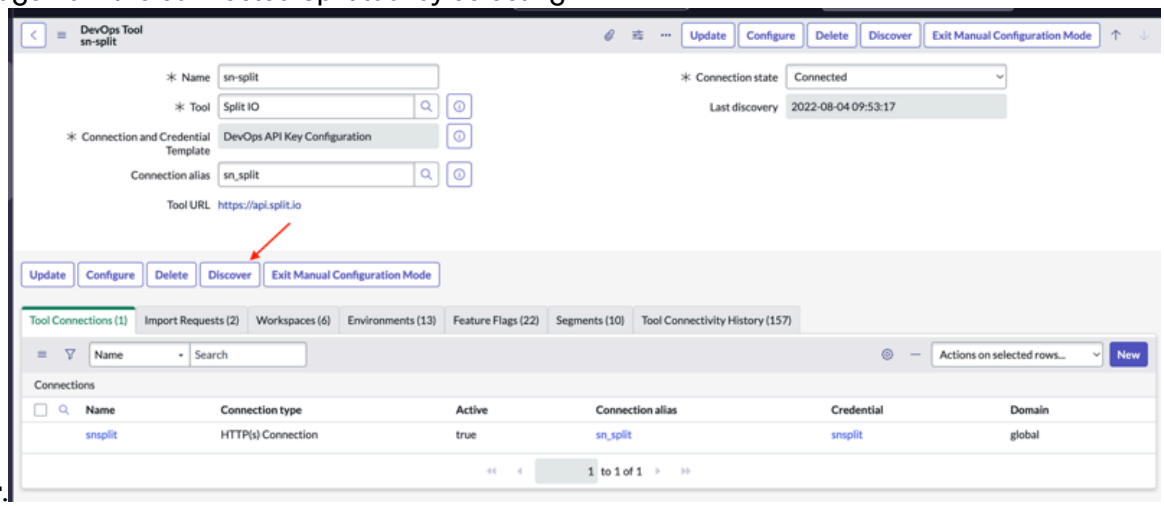
- DevOps Tool Owner role: Can view and edit the tool.
- DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
- DevOps Administrator role: Can edit all tools.
- Other DevOps roles: Can view the tool.

> **Note:**
> Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

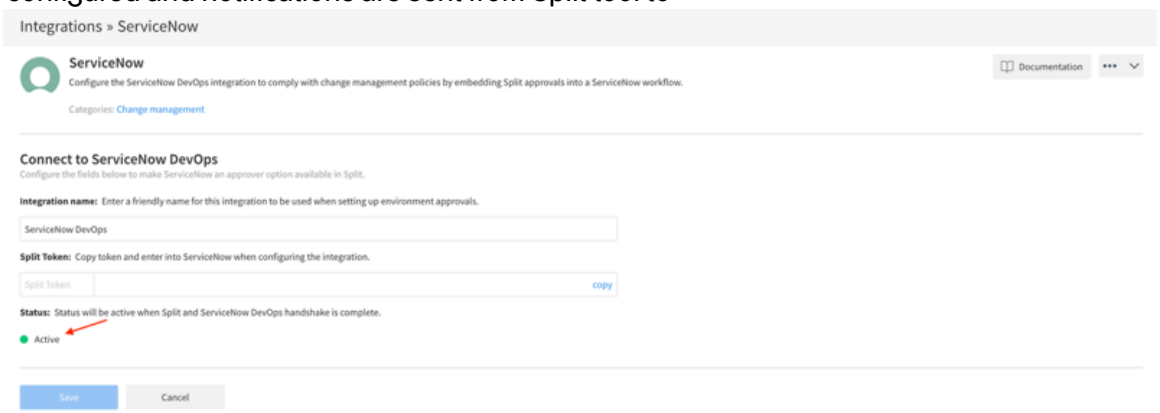
The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Discover workspaces, environments, segments, and feature flags from the connected Split tool by selecting **Discover**.



4. Automatically configure the webhook URL in Split tool by selecting **Configure**. ServiceNow Integration will be activated on Split. Webhooks are auto-configured and notifications are sent from Split tool to DevOps.

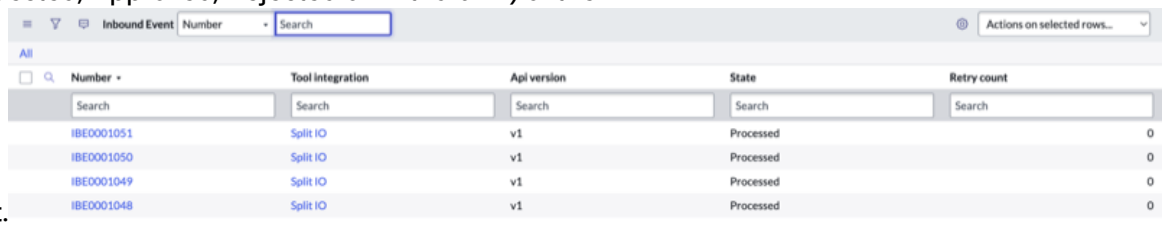


Example:

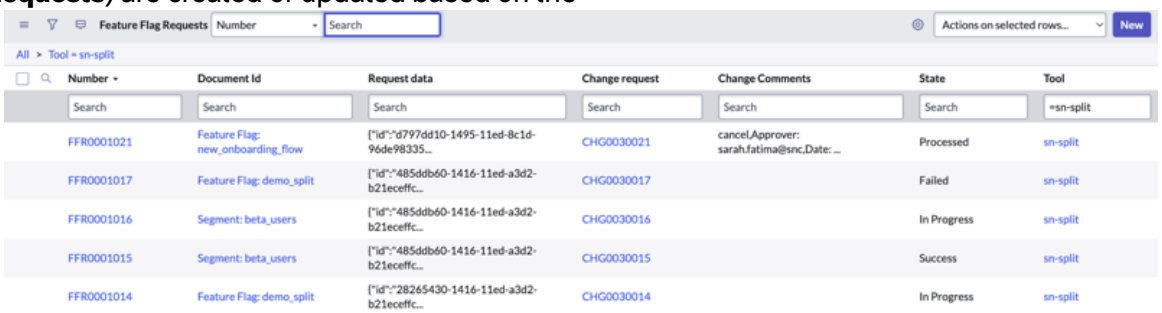
The following example specifies how changes made in the Split tool are notified to ServiceNow DevOps through the webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

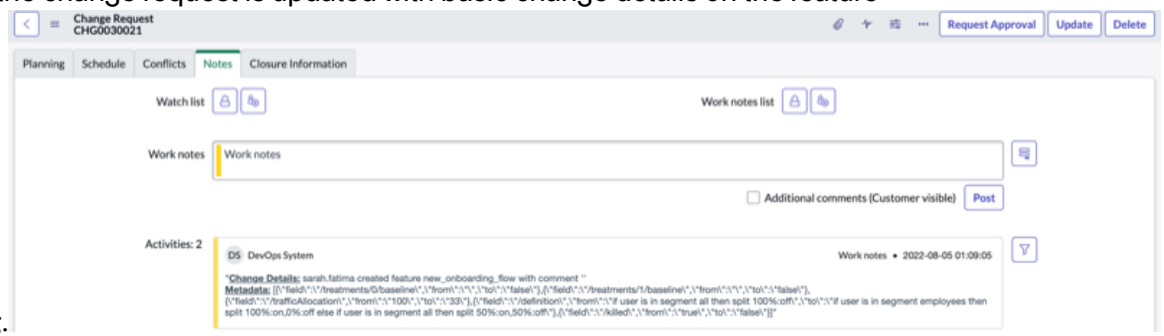
- Inbound events are created in ServiceNow for status (Requested, Approved, Rejected or Withdrawn) of the event.



- Feature Flag requests (**DevOps > Feature Flag > Feature Flag Requests**) are created or updated based on the status.



- A change request is created for every Feature Flag request, and work notes on the change request is updated with basic change details on the feature flag.



Veracode integration with DevOps Change Velocity

Connect to your Veracode instance that is integrated with your CI/CD pipelines to retrieve security scan results. This helps you determine how vulnerable your code is.

Veracode integration overview

Veracode scans that are configured on GitHub Actions, Jenkins, Azure DevOps, GitLab, and Harness pipelines are supported in DevOps Change Velocity.

Ensure that your Veracode credentials have the following API roles.

- Upload and Scan
- Results

For more information, see Veracode documentation.

You can configure Veracode scans on any stage of the pipeline and the scan details are retrieved from the corresponding stage to DevOps Change Velocity. If you're using Azure DevOps or GitHub Actions orchestration tools, then you must add the custom action code in your pipeline always. If you're using Jenkins, and your pipeline already has a Veracode security scan step, you don't have to add the custom action code in your pipeline. Ensure that your Veracode security scan step has waitForScan: true. This is required for the system to retrieve the scan information.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to configure Veracode for the GitLab tool, you can either use the generic Docker container image to add the Veracode security step or perform the steps specified in the Integrate security tools with GitLab topic.

For Harness pipelines, you can configure Veracode scans only through the generic Docker Container Image. For more information, see Implement custom actions for pipelines using generic Docker container image.

You can view the security scan results either in the related list of a Change Request, or the Task Execution of the pipeline, or in the Pipeline UI in your ServiceNow instance. You can also use security results in defining change policies and conditions for change automation.

Get started

You must install the DevOps Vulnerability Integrations (sn_devops_vul_ints) and Vulnerability Response Integration with Veracode (sn_vul_veracode) plugins before connecting your Veracode instance to ServiceNow. For more information on activating a plugin, see Install a ServiceNow Store application.

Note:

- The sn_vul.app_sec_manager role is added to the DevOps Tool Owner [sn_devops.tool_owner] role when the DevOps Vulnerability Integrations plugin (sn_devops_vul_ints) is installed.
- The sn_vul_veracode.configure_integration role is added to the DevOps Tool Owner [sn_devops.tool_owner] role when the Vulnerability Response Integration with Veracode plugin (sn_vul_veracode) is installed.

For more information on the scan results captured in ServiceNow, see Security scan results.

Use one of the following options to onboard Veracode. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Veracode to DevOps Change Velocity - Workspace

Connect to your Veracode instance using the DevOps Change Workspace playbook.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

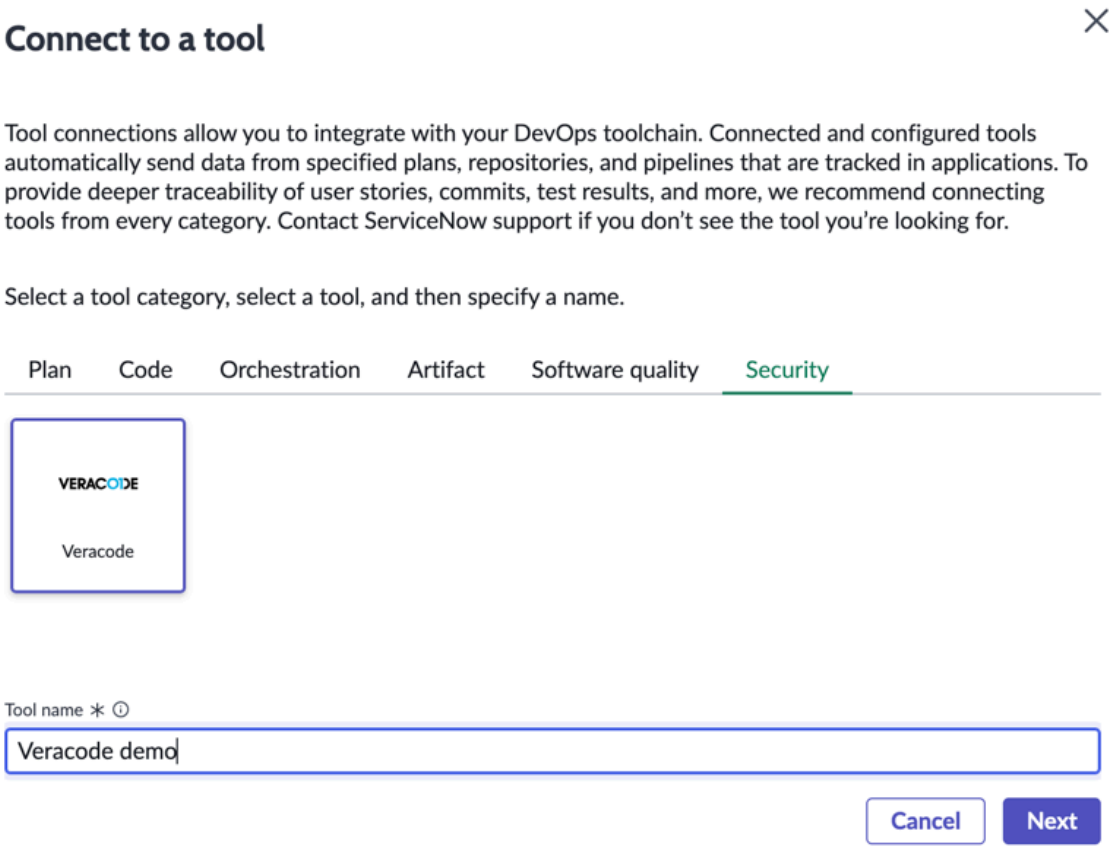
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Veracode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Enter a name to identify your tool and select



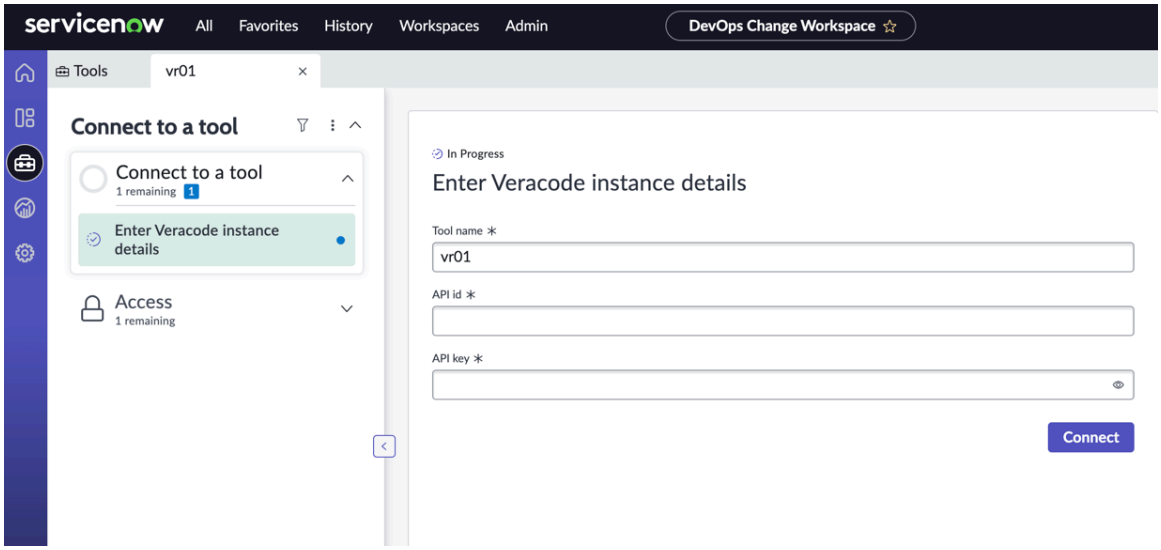
Next.

3. On the Enter Veracode instance details playbook activity section, enter the following credentials:
   a. In the **API id** field, enter the API ID of your Veracode instance.
   b. In the **API key** field, enter the API key of your Veracode instance.

> **Note:**
> Ensure that your Veracode credentials have the following API roles.
> - Upload and Scan
> - Results
>
> For more information, see https://docs.veracode.com/r/c_API_roles_details.

4. Select **Connect** and review the details of the successfully connected Veracode instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Specify the access for the tool.
   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

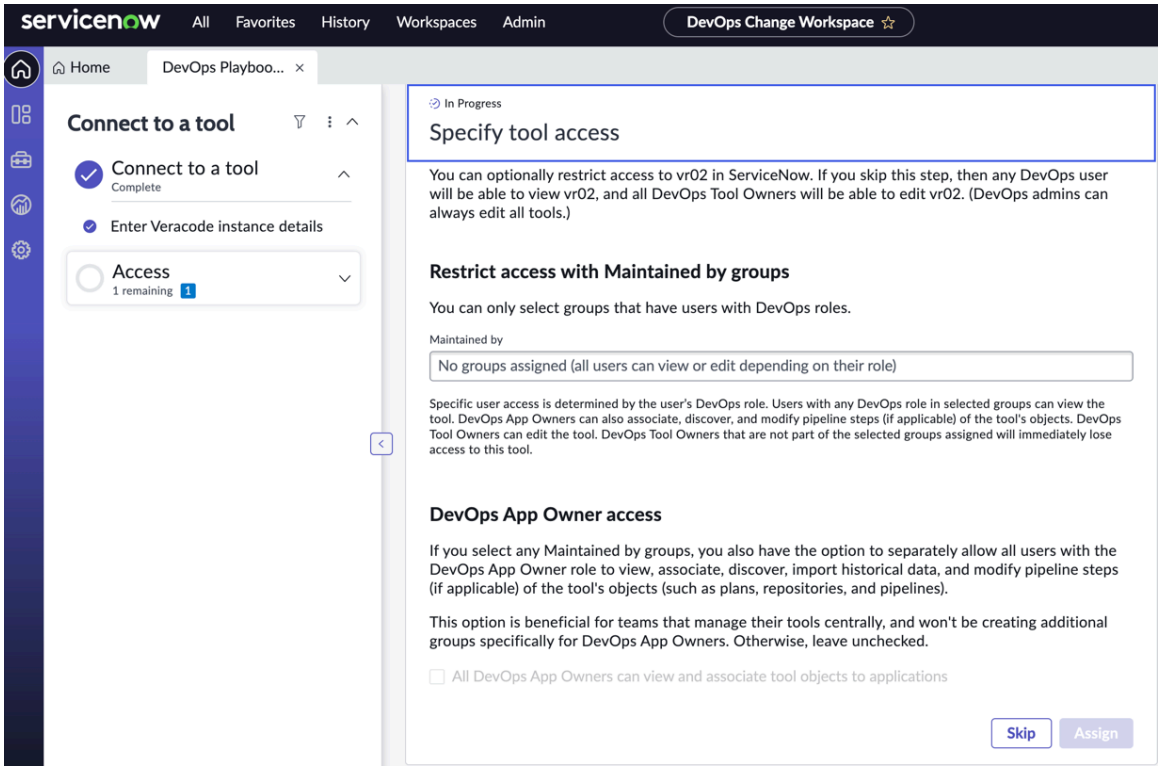
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

   b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

      This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

   c. Select **Assign**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

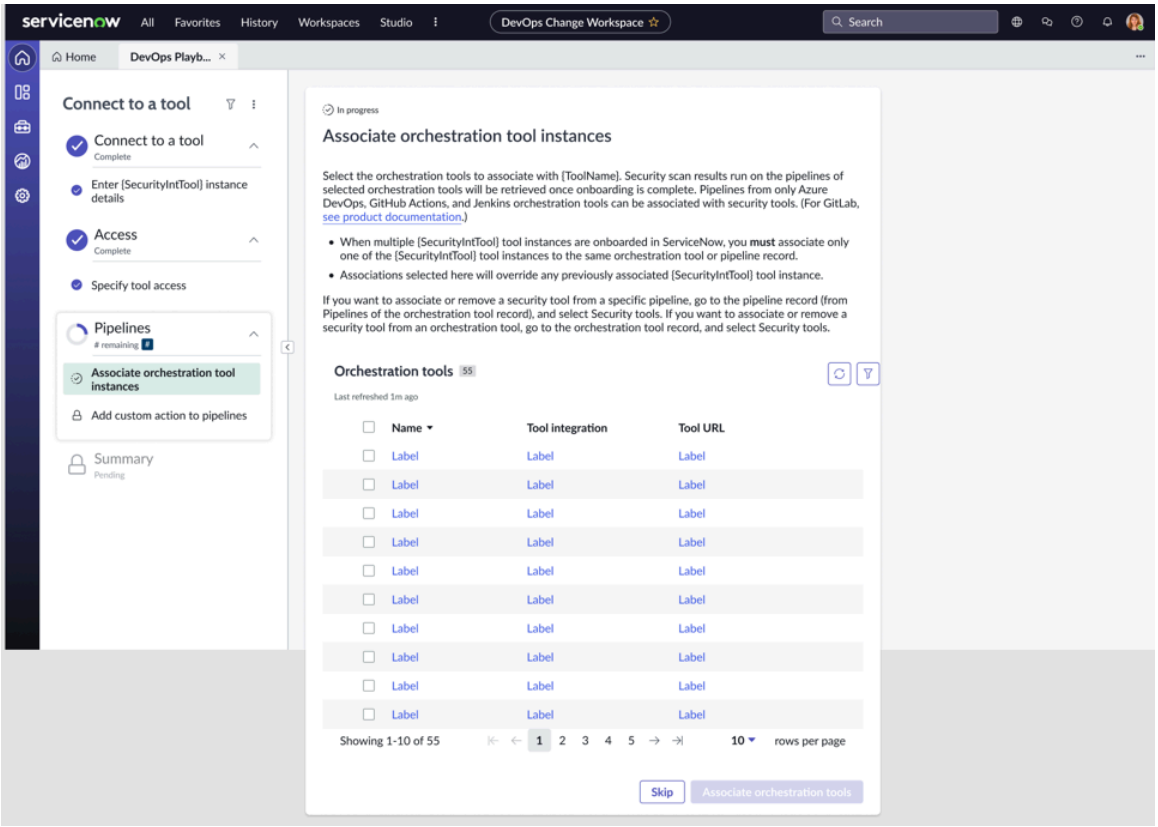


6. If this isn't the first instance of the security tool you're onboarding, select the orchestration tool to associate with your security tool instance from the Associate orchestration tool instances playbook activity.

   This activity isn't displayed if this is the first security tool instance you're onboarding.

   Note:
   This playbook activity is required only if you're onboarding more than one security tool instances. When multiple security tool instances are onboarded in ServiceNow, you must associate only one of the security tool instances to the same orchestration tool or pipeline record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. From the Add custom action to pipelines playbook activity section, copy the required custom action code and add it as a step in your pipeline.
   - If only one security instance is onboarded in ServiceNow, the pipelines will be automatically associated with Veracode when the pipeline is run.
   - If this is the first security tool instance you're onboarding, the custom action codes for the orchestration tool that you've onboarded in ServiceNow will be available to copy.
     - If you are using Azure DevOps or GitHub Actions orchestration tools, then you must add the custom action code in your pipeline always.
     - If you're using Jenkins, and your pipeline already has a Veracode security scan step, you don't have to add the custom action code in your pipeline. Ensure that your Veracode security scan step has **waitForScan: true**. This is required for the system to retrieve the scan information.
   - If this is the not the first security tool instance you're onboarding, the respective custom action codes for orchestration tools that you've selected in step 6 will be available to copy. If you're using Jenkins, and your pipeline already has a Veracode security scan step, you don't have to add the custom action code in your pipeline. Ensure that your Veracode security scan step has **waitForScan: true**. This is mandatory for the system to retrieve the scan information.
   - If you want to configure Veracode for the GitLab tool, you can either use the generic Docker container image to add the Veracode security step or perform the steps specified in the Integrate security tools with GitLab topic.
   - For Harness pipelines, you can configure Veracode scans only through the generic Docker Container Image. For more information, see Implement custom actions for pipelines using generic Docker container image.
   - Alternatively, you can associate pipeline with security tool instance by adding security tool ID to the custom action code. This will override any previously associated security tool instance.

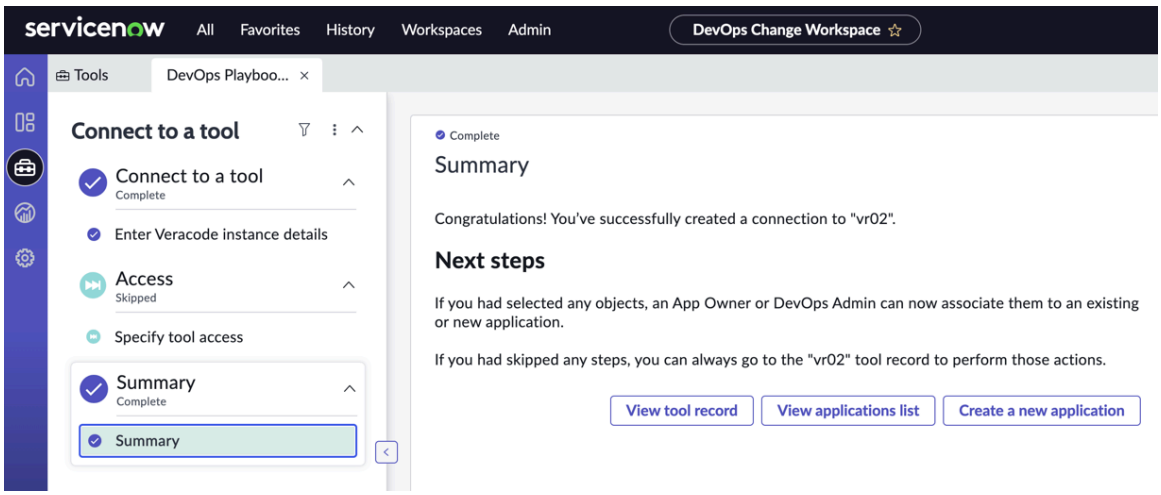
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For information on configuring the Veracode scans on your pipeline, see Configure Veracode scans on your pipeline

8. Mark the activity as complete.
9. From the **Summary** page, select **View tool record** to review the details of the connected instance.



What to do next

Configure Veracode scans on your pipeline

Onboard Veracode to DevOps Change Velocity - Service Catalog

Connect your Veracode instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

> **Note:**
> You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details:

Field	Description
Tool name	Name for your Veracode integration.
Tool integration	Select Veracode.
Tool username/ API ID	API ID of your Veracode instance.
Tool password/ Access token / API Key	API key of your Veracode instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You must have the Results and Upload and scan API roles for your Veracode credentials. For more information, see https://docs.veracode.com/r/c_API_roles_details

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is connected.

What to do next
Configure Veracode scans on your pipeline

Onboard Veracode to DevOps Change Velocity - Classic

Connect to your Veracode instance to retrieve scan results.

Before you begin
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure
1. Navigate to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. In the Create DevOps tool form, enter the tool details:

Field	Description
Tool name	Name for your Veracode integration.
Tool integration	Select Veracode.
Tool username/ API ID	API ID of your Veracode instance.
Tool password/ Access token / API Key	API key of your Veracode instance.

Note:
You must have the Results and Upload and scan API roles for your Veracode credentials. For more information, see https://docs.veracode.com/r/c_API_roles_details

3. Click **Submit** to connect to your Veracode instance.

On successful tool creation, you're taken to the tool record page.

4. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

Note:
Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

What to do next

Configure Veracode scans on your pipeline

Configure Veracode scans on your pipeline

Configure Veracode scans on your Azure DevOps, Jenkins, GitHub, GitLab, or Harness pipelines.

You can configure Veracode scans on any stage of the pipeline and the scan details are retrieved from the corresponding stage to DevOps Change Velocity. If you are using Azure DevOps or GitHub Actions orchestration tools then you need to add the custom action code in your pipeline always. If you are using Jenkins, and your pipeline already has a Veracode security scan step, you do not have to add the custom action code in your pipeline. Ensure that your Veracode security scan step has waitForScan: true. This is required for the system to retrieve the scan information.

If you want to configure Veracode for the GitLab tool, you can either use the generic Docker container image to add the Veracode security step or perform the steps specified in the Integrate security tools with GitLab topic.

For Harness pipelines, you can configure Veracode scans only through the generic Docker Container Image. For more information, see Implement custom actions for pipelines using generic Docker container image.

1. Navigate to the step in your pipeline and add the custom action.

Azure DevOps	**a.** Navigate to your pipeline .yml file.
	b. In the **Tasks** section on the right side, search for the **ServiceNow DevOps Security Results** extension task.
	c. Enter the ServiceNow endpoint.
	d. Enter the Security results attributes as the following.
	`{ "scanner": "Veracode", "applicationName": "", "buildVersion": "", "securityToolId": "" }`
	// scanner: Scanning tool and is required e.g. Veracode.
	// applicationName: Name of your Veracode application and is required. This attribute is applicable only for Veracode.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	// buildVersion: Veracode Scan name / build version and is optional. This attribute is applicable only for Veracode.
	
	// securityToolId: Security tool onboarded in ServiceNow (sys_id of the onboarded security tool) and is optional.
	
	e. Select **Add** to add the custom action code to your pipeline.

Jenkins	**a.** Navigate to the Pipeline Syntax from a configured pipeline.
	
	b. Select the **snDevOpsSecurityResult** step from the **Sample Step** list, and update the values for the security scan attributes in the step.
	
	c. Select **Generate Pipeline Script** to create a snippet. You can copy and paste the snippet into the pipeline.
	
	`snDevOpsSecurityResult { securityResultAttributes:{"scanner":"Veracode", "applicationName": "", "buildVersion": "", "securityToolId": ""}}`
	
	// scanner: Scanning tool and is required e.g. Veracode.
	
	// applicationName: Name of your Veracode application and is required. This attribute is applicable only for Veracode.
	
	// buildVersion: Veracode Scan name / build version and is optional. This attribute is applicable only for Veracode.
	
	// securityToolId: Security tool onboarded in ServiceNow (sys_id of the onboarded security tool) and is optional.

GitHub Actions	**a.** Navigate to your workflow .yml file. **b.** In the **Marketplace** section on the right side, search for the **ServiceNow DevOps Security Results** custom action. **c.** Add the following snippet into your .yml file. `SecurityScanResults: needs: build runs-on: ubuntu-latest name: Servicenow Security Scan Results`

© 2026 ServiceNow, Inc. All rights reserved.

2. Run the pipeline to retrieve the security scan results.

Associate orchestration tool from Veracode tool record and vice-versa

You can associate orchestration tool from the Veracode tool record and associate the Veracode tool record from the orchestration or pipeline record.

Before you begin

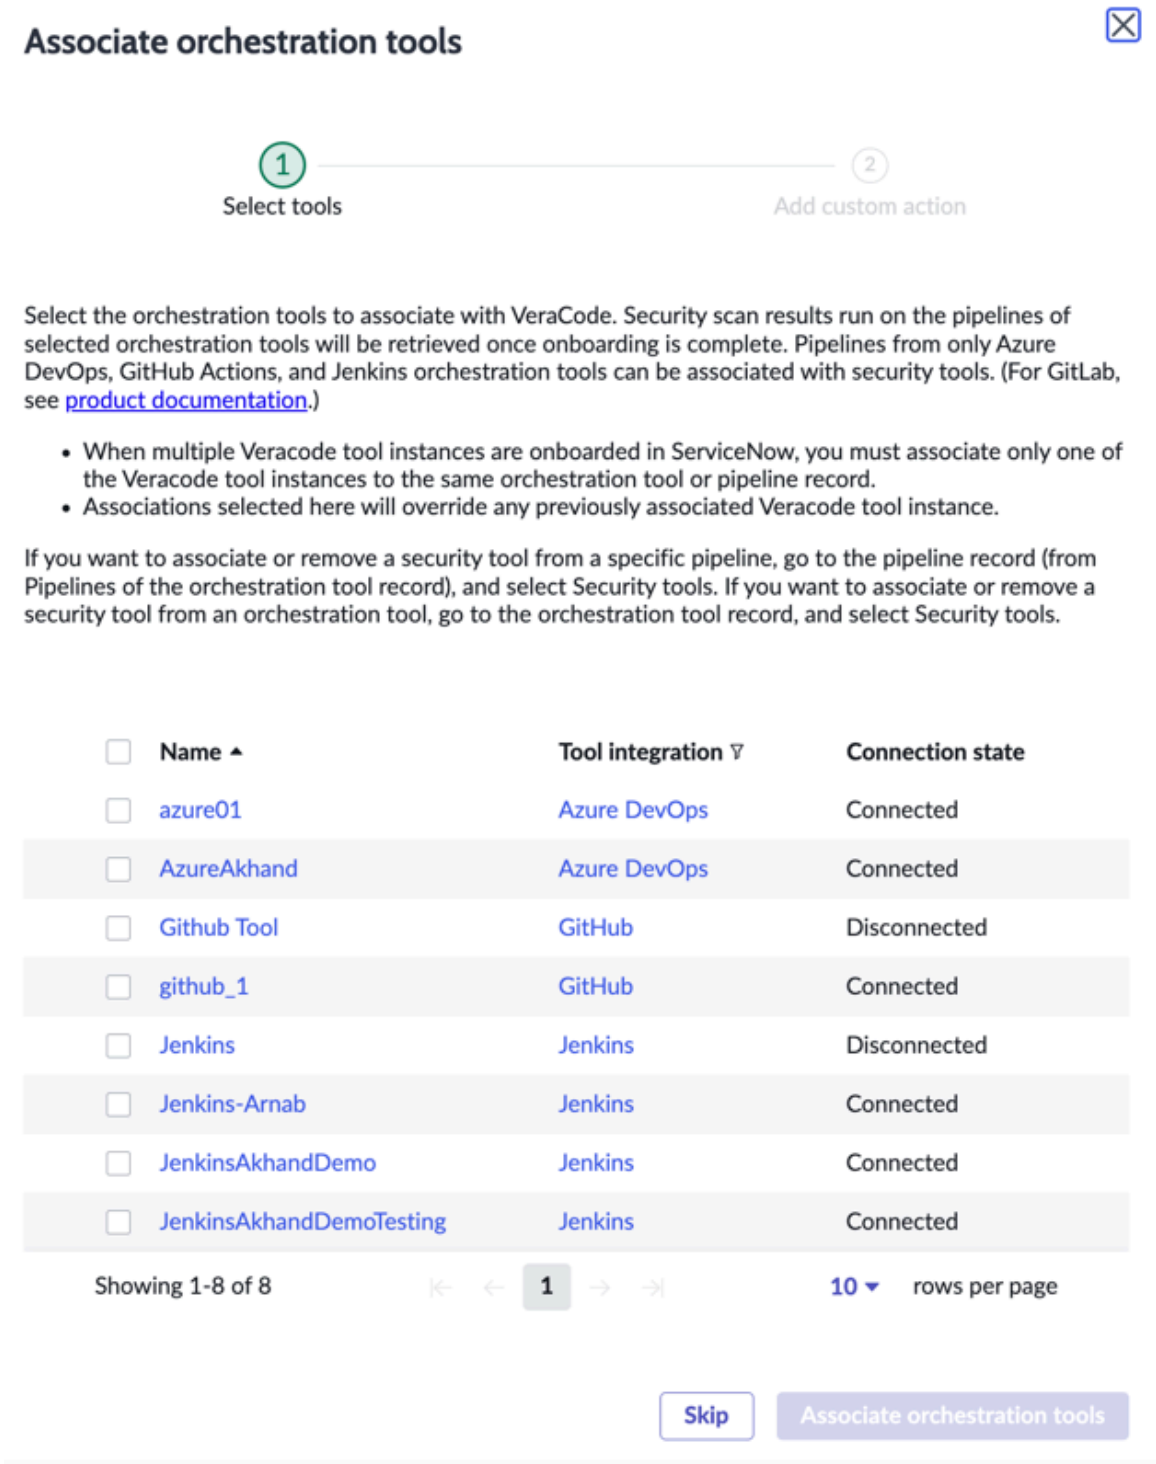
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces >DevOps Change Workspace > Tools > Security tools**.
2. From the Security tools list, select the tool with which you want to associate an orchestration tool.
3. In the Security tool record, navigate to the Orchestration tools tab.
4. Select **Associate orchestration tools**.

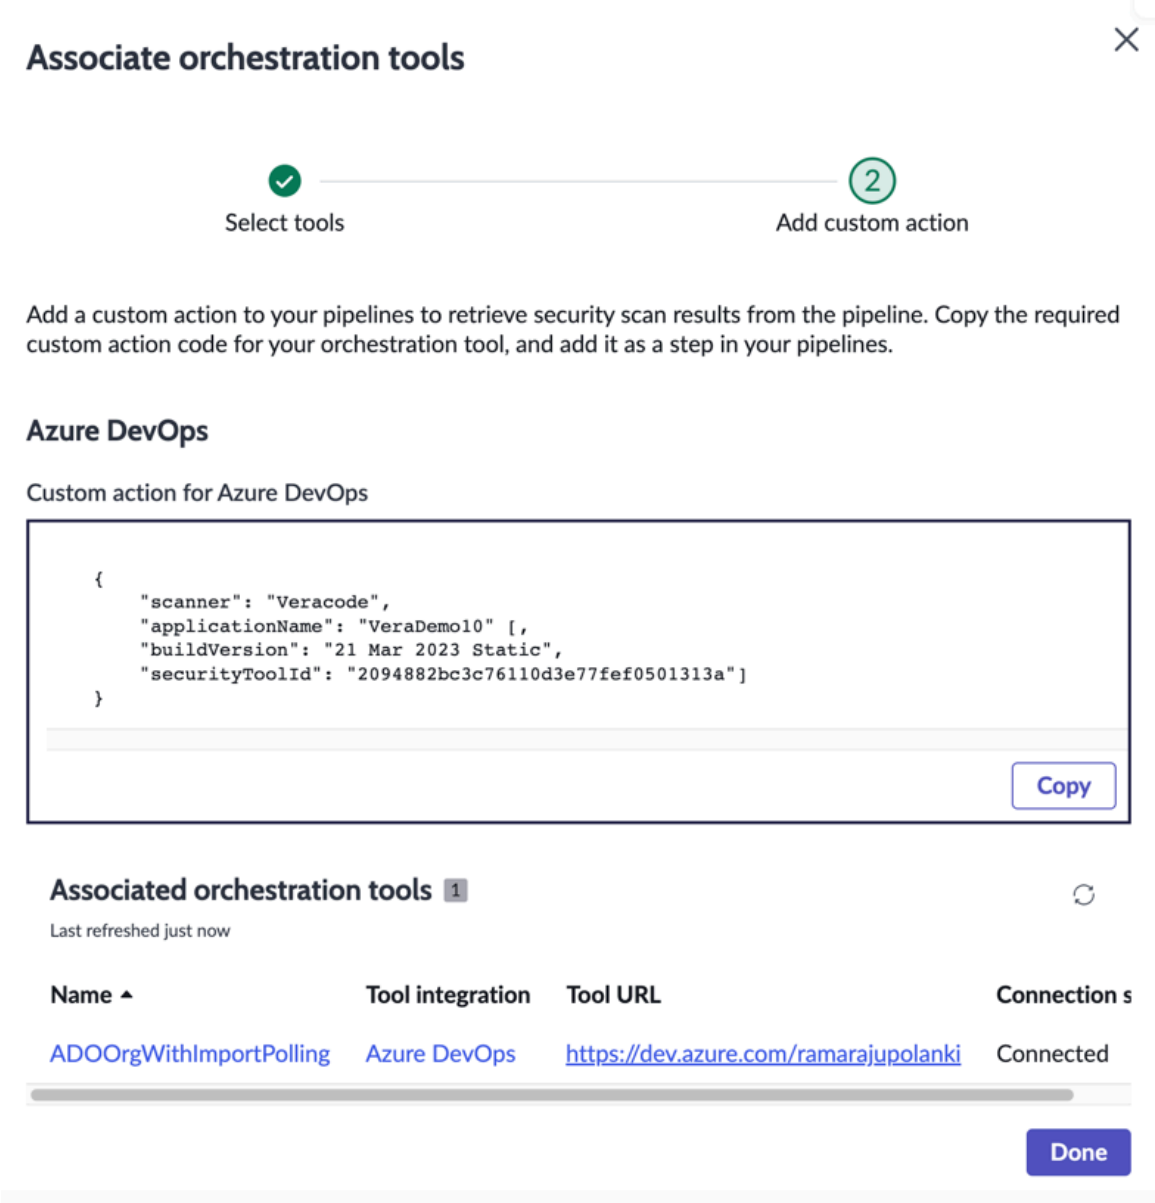
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the Select tool dialog box, select the orchestration tools you want to associate with your security tool, and select **Associate orchestration tools**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Add custom action dialog box, copy the required custom action code for your orchestration tool, and add it as a step in your pipelines.



7. Select **Done**.

> **Note:**
> In a similar way, you can associate a security tool instance with an orchestration tool or pipeline record. You can navigate to the orchestration tool or pipeline record, and from the Security tools tab, you can select **Associate security tool**. In the dialog boxes that are displayed, you can select the security tool instances to associate and then copy the custom action to add it in the corresponding pipeline step.

Additional info - Veracode

Additional information on Veracode such as association of orchestration tool from security tool, security scan results, and change policies based on security summary tables.

Security scan results

Security scan results display scan details from security scans configured on your GitHub Actions, Jenkins, Azure DevOps, GitLab, or Harness pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure security scans in your GitHub Actions, Jenkins, Azure DevOps, GitLab, and Harness pipelines to retrieve the scan results in DevOps Change Velocity. Security inbound events will be created in ServiceNow from the corresponding pipeline run that are then processed to store the scan results. You can view the scan results for each scan that was part of your build or release pipeline executions.

Note:
If you want to configure Veracode for the GitLab tool, you can either use the generic Docker container image to add the Veracode security step or perform the steps specified in the Integrate security tools with GitLab topic.

The retrieved scan summaries are stored in the following tables:

Application Vulnerability Scan Summary (sn_vul_app_vul_scan_summary)

Column name	Description
Source	Source application vulnerability scanner for this application record.
Detected Flaw Count	Total number of new detected flaws in the scan.
Last scan date	Date of the most recent scan.
Last scan rating	Rating assigned by the scanner based on the detected items of the most recent scans.
Last static scan date	Date of the most recent static scan.
Last static scan rating	Rating assigned by the scanner based on the detected items of the most recent static scan.
Last dynamic scan date	Date of the most recent dynamic scan.
Last dynamic scan rating	Rating assigned by the scanner based on the detected items of the most recent dynamic scan.
Last interactive scan date	Date of the most recent interactive scan.
Last interactive scan rating	Rating assigned by the scanner based on the detected items of the most recent interactive scan.

Application Vulnerability Scan Summary Details (sn_vul_app_vul_scan_summary_details)

Column name	Description
Category name	Name of the vulnerability category.
Severity	Severity of the flaws in the scan report.
Count	Number of flaws in the category for a severity.

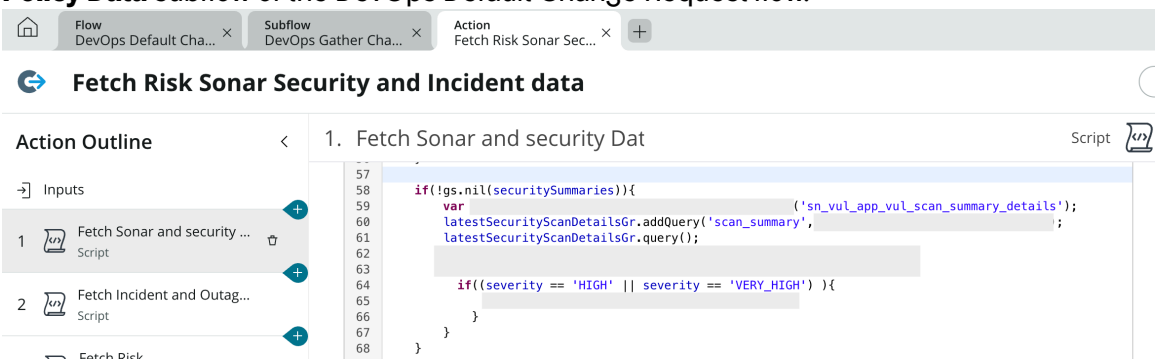
Change policies based on security summary tables

You can use the security conditions that are available in the base system or customize them based on your requirement.

The vulnerability severity conditions are present in the **Fetch Risk Sonar Security and Incident data** action in the **DevOps Gather Change**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy Data subflow of the DevOps Default Change Request flow.



If the severity condition is classified as **HIGH** or **VERY HIGH** from Veracode or Checkmarx, then the change request is automatically rejected.

If you are an upgrading customer and you want to customize the conditions with any additional security data or change the existing conditions, you must update the script in the **Fetch Risk Sonar Security and Incident data** action in the change flow. Ensure that you are referring to the *Application Vulnerability Scan Summary Details (sn_vul_app_vul_scan_summary_details)* table in the script when you customize. For more information, see Security scan results.

Checkmarx integration with DevOps Change Velocity

Connect to your Checkmarx instance that is integrated with your CI/CD pipelines to retrieve security scan results. This helps you determine how vulnerable your code is.

Checkmarx integration overview

Checkmarx scans that are configured on GitHub Actions, Jenkins, Azure DevOps, GitLab, and Harness pipelines are supported in DevOps Change Velocity.

Two Checkmarx tools can be integrated with DevOps Change Velocity, which are Checkmarx One and Checkmarx SAST. For more information, see Checkmarx One and Checkmarx SAST documentation.

Ensure that your Checkmarx SAST user has a role that has permissions to read **Project** and **Scan Results** to get summary details. For more information, see Checkmarx documentation. Ensure that your Checkmarx One user has the **create-scan** and **manage-project** roles to access Scan summary details. For more information, see Checkmarx documentation.

Note:
If you are integrating with Checkmarx One, you can retrieve only Static Application Security Testing (SAST) scans but not Software Composition Analysis (SCA) scans.

You can configure Checkmarx scans on any stage of the pipeline and the scan details are retrieved from the corresponding stage to DevOps Change Velocity. If you're using Azure DevOps or GitHub Actions orchestration tools, then you must add the custom action code in your pipeline always. If you're using Jenkins, and your pipeline already has a Checkmarx One security scan (checkmarxASTScanner) step, you don't have to add the custom action code in your pipeline. For Checkmarx SAST, the custom action code must be added in your pipeline even if it has the security scan step (checkmarxASTScanner).

If you want to configure Checkmarx for the GitLab tool, you can either use the generic Docker container image to add the Checkmarx security step or perform the steps specified in the Integrate security tools with GitLab topic.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For Harness pipelines, you can configure Checkmarx scans only through the generic Docker Container Image. For more information, see Implement custom actions for pipelines using generic Docker container image.

You can view the security scan results either in the related list of a Change Request, or the Task Execution of the pipeline, or in the Pipeline UI in your ServiceNow instance. You can also use security results in defining change policies and conditions for change automation.

Get started

You must install the DevOps Vulnerability Integrations (sn_devops_vul_ints) and Checkmarx One Vulnerability Integration (x_chec3_chexone) or Checkmarx CxSAST Vulnerability Integration (x_chec3_cxsast) plugins before connecting your Checkmarx instance to ServiceNow. For more information on activating a plugin, see Install a ServiceNow Store application.

Note:
The sn_vul.app_sec_manager role is added to the DevOps Tool Owner [sn_devops.tool_owner] role when the DevOps Vulnerability Integrations plugin (sn_devops_vul_ints) is installed.

For more information on the scan results captured in ServiceNow, see Security scan results.

Use one of the following options to onboard Checkmarx. For a guided experience, use the workspace to onboard a tool. Alternatively, you can use the Service Catalog or Classic experience.

Onboard Checkmarx to DevOps Change Velocity - Workspace

Connect to your Checkmarx instance using the DevOps Change Workspace playbook.

Before you begin
Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

Role required: sn_devops.admin or sn_devops.tool_owner

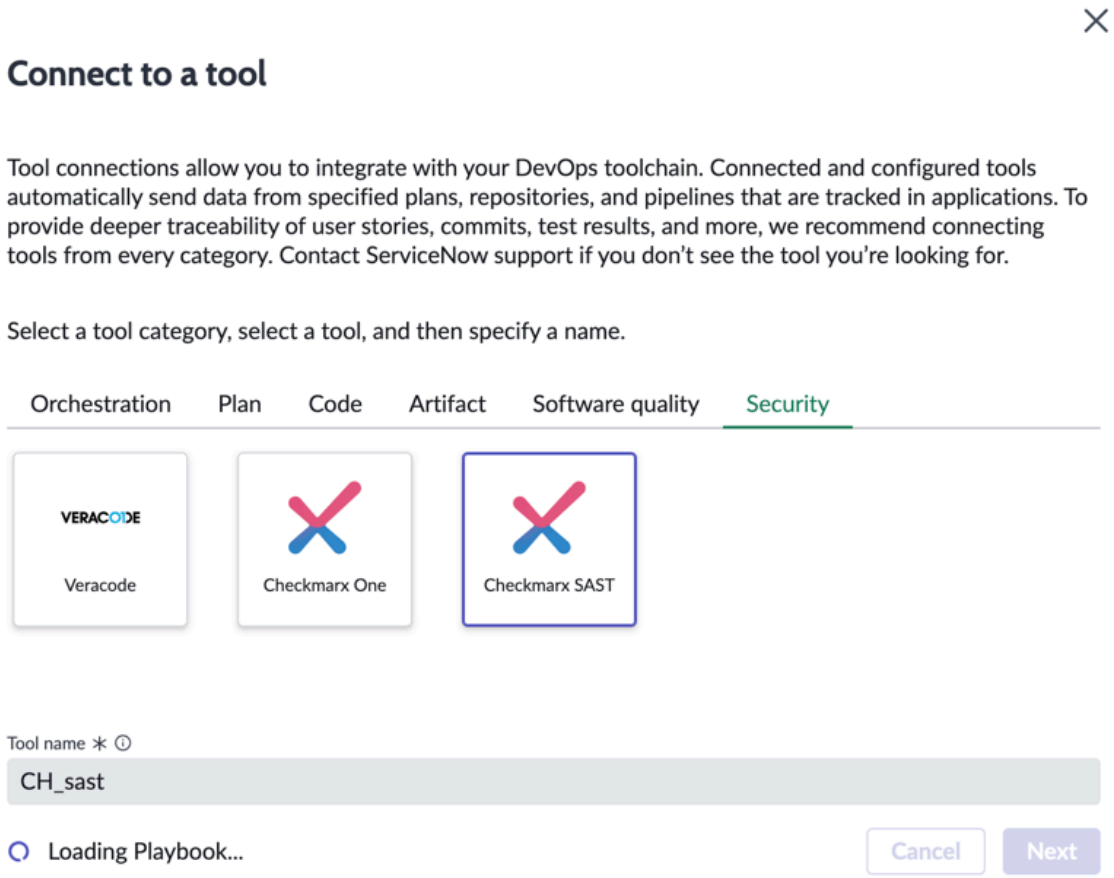
About this task
Checkmarx has two types of tools - Checkmarx SAST and Checkmarx One.

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Checkmarx.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Enter a name to identify your tool and select **Next**.



3. On the instance details playbook activity section, enter the following credentials based on whether you are connecting to Checkmarx One or Checkmarx SAST.

   Ensure that your Checkmarx SAST user has a role that has permissions to read **Project** and **Scan Results** to get summary details. For more information, see Checkmarx documentation. Ensure that your Checkmarx One user has the **create-scan** and **manage-project** roles to access Scan summary details. For more information, see Checkmarx documentation.

4. Select **Connect** and review the details of the successfully connected Checkmarx instance.
5. Specify the access for the tool.
   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

      The tasks these users in the groups can perform depends on the role assigned to them.

      - DevOps Tool Owner role: Can view and edit the tool.
      - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
      - DevOps Administrator role: Can edit all tools.
      - Other DevOps roles: Can view the tool.

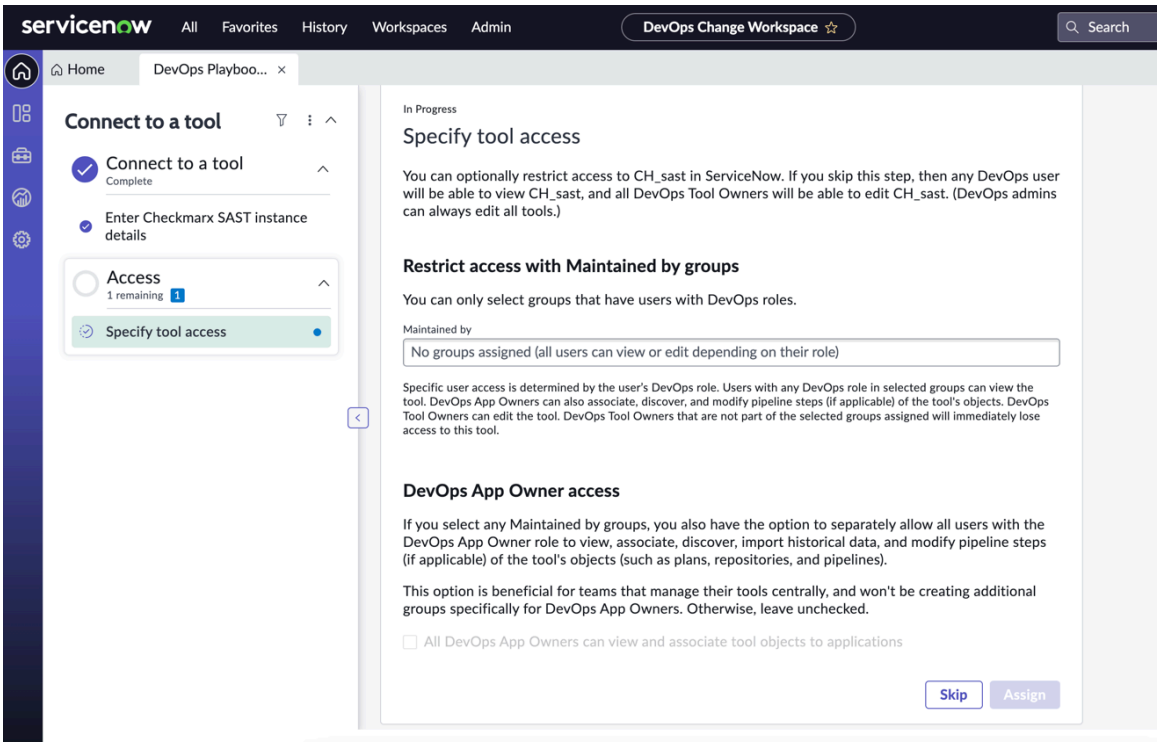
      Note:
      If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

c. Select **Assign**.

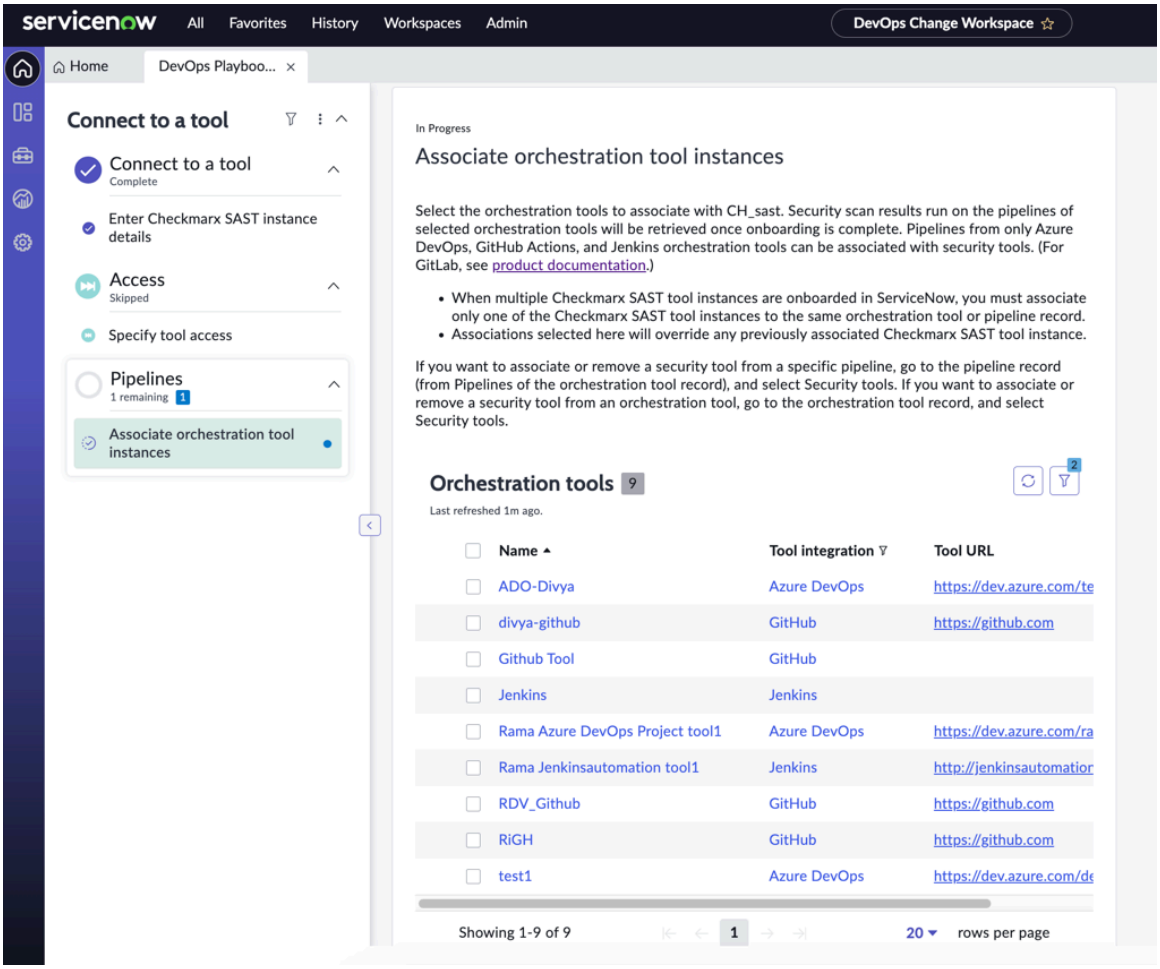


6. If this isn't the first instance of the security tool you're onboarding, select the orchestration tool to associate with your security tool instance from the Associate orchestration tool instances playbook activity.

This activity isn't displayed if this is the first security tool instance you're onboarding.

> **Note:**
> This playbook activity is required only if you're onboarding more than one security tool instances. When multiple security tool instances are onboarded in ServiceNow, you must associate only one of the security tool instances to the same orchestration tool or pipeline record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. From the Add custom action to pipelines playbook activity section, copy the required custom action code and add it as a step in your pipeline.
   - If only one security instance is onboarded in ServiceNow, the pipelines will be automatically associated with Checkmarx when the pipeline is run.
   - If this is the first security tool instance you're onboarding, the custom action codes for the orchestration tool that you've onboarded in ServiceNow will be available to copy.
     - If you are using Azure DevOps or GitHub Actions orchestration tools, then you must add the custom action code in your pipeline always.
     - You can configure Checkmarx scans on any stage of the pipeline and the scan details are retrieved from the corresponding stage to DevOps Change Velocity. If you're using Azure DevOps or GitHub Actions orchestration tools, then you must add the custom action code in your pipeline always. If you're using Jenkins, and your pipeline already has a Checkmarx One security scan (checkmarxASTScanner) step, you don't have to add the custom action code in your pipeline. For Checkmarx SAST, the custom action code must be added in your pipeline even if it has the security scan step (checkmarxASTScanner).
   - If this is the not the first security tool instance you're onboarding, the respective custom action codes for orchestration tools that you've selected in step 6 will be available to copy. If you're using Jenkins, and your pipeline already has a Checkmarx One security scan (checkmarxASTScanner) step, you don't have to add the custom action code in your pipeline.
   - If you want to configure Checkmarx for the GitLab tool, you can either use the generic Docker container image to add the Checkmarx security step or perform the steps specified in the Integrate security tools with GitLab topic.

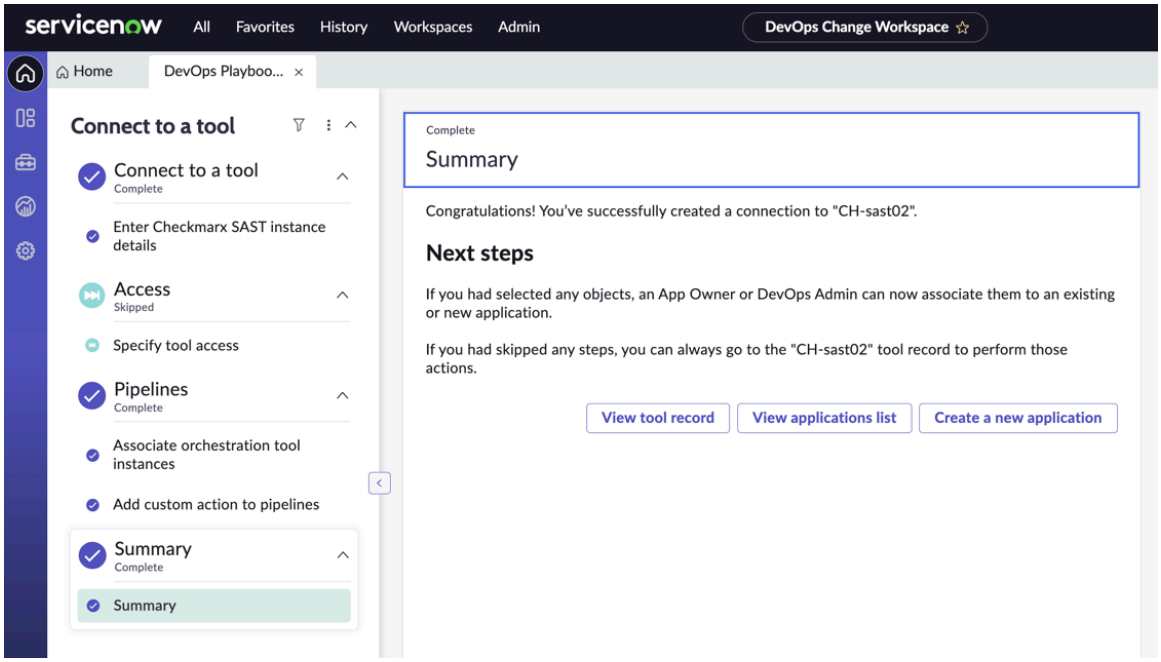
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For Harness pipelines, you can configure Checkmarx scans only through the generic Docker Container Image. For more information, see Implement custom actions for pipelines using generic Docker container image
- Alternatively, you can associate pipeline with security tool instance by adding security tool ID to the custom action code. This will override any previously associated security tool instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Mark the activity as complete.
9. From the **Summary** page, select **View tool record** to review the details of the connected instance.



What to do next

Configure Checkmarx scans on your pipeline

Onboard Checkmarx to DevOps Change Velocity - Service Catalog

Connect your Checkmarx instance using the ServiceNow Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.

> **Note:**
> You can also access the service catalog from Employee Center or Service portal.

2. From the DevOps catalog items, select and activate **DevOps Tool Onboarding**.
3. After activating, select **DevOps Tool Onboarding** and select **Try it**.
4. In the DevOps Tool Onboarding form, enter the tool details based on whether you are onboarding Checkmarx SAST or Checkmarx One.

Checkmarx SAST

Field	Description
Tool name	Name for your Checkmarx integration.
Tool integration	Checkmarx SAST.
Server URL	Base URL of your Checkmarx One intance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Tool username/ API ID	API ID of your Checkmarx instance.
Tool password/ Access token / API Key	API key of your Checkmarx instance.
MID server	MID server associated with the Checkmarx One instance.

Checkmarx One

Field	Description
Tool name	Name for your Checkmarx integration.
Tool integration	Checkmarx One.
CheckmarxOne Access Control Base URL	Access Control Base URL of your Checkmarx One instance.
CheckmarxOne API Base URL.	API Base URL of your Checkmarx One instance.
Tenant	Name of your Checkmarx One tenant account.
Client Id	Name you used to store your Checkmarx Client ID in your repository.
Client Secret	Name you used to store your Checkmarx Secret in your repository.

Ensure that your Checkmarx SAST user has a role that has permissions to read **Project** and **Scan Results** to get summary details. For more information, see Checkmarx documentation. Ensure that your Checkmarx One user has the **create-scan** and **manage-project** roles to access Scan summary details. For more information, see Checkmarx documentation.

5. Select **Order Now**.
   A request is created. When the request is approved, the tool is connected.

What to do next
Configure Checkmarx scans on your pipeline

Onboard Checkmarx to DevOps Change Velocity - Classic

Connect to your Checkmarx instance to retrieve scan results.

Before you begin
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **All** > **DevOps** > **Tools** > **Create New (legacy)**.
2. In the Create DevOps tool form, enter the tool details based on whether you are onboarding Checkmarx SAST or Checkmarx One.

Checkmarx SAST

Field	Description
Tool name	Name for your Checkmarx integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Tool integration	Checkmarx SAST.
Server URL	Base URL of your Checkmarx One intance.
Tool username/ API ID	API ID of your Checkmarx instance.
Tool password/ Access token / API Key	API key of your Checkmarx instance.
MID server	MID server associated with the Checkmarx One instance.

Checkmarx One

Field	Description
Tool name	Name for your Checkmarx integration.
Tool integration	Checkmarx One.
CheckmarxOne Access Control Base URL	Access Control Base URL of your Checkmarx One instance.
CheckmarxOne API Base URL.	API Base URL of your Checkmarx One instance.
Tenant	Name of your Checkmarx One tenant account.
Client Id	Name you used to store your Checkmarx Client ID in your repository.
Client Secret	Name you used to store your Checkmarx Secret in your repository.

Ensure that your Checkmarx SAST user has a role that has permissions to read **Project** and **Scan Results** to get summary details. For more information, see Checkmarx documentation. Ensure that your Checkmarx One user has the **create-scan** and **manage-project** roles to access Scan summary details. For more information, see Checkmarx documentation.

3. Click **Submit** to connect to your Checkmarx instance.

On successful tool creation, you're taken to the tool record page.

4. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field on the **Access** tab.

   The tasks the users in the groups can perform depends on the roles assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   Note:
   Only groups containing users with DevOps roles are available for selection in the **Maintained by** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **All App Owners can view and associate tool objects to applications** option becomes available for selection if you choose to restrict access to the tool. This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

What to do next

Configure Checkmarx scans on your pipeline

Configure Checkmarx scans on your pipeline

Configure Checkmarx scans on your Azure DevOps, Jenkins, GitHub, GitLab, or Harness pipelines.

You can configure Checkmarx scans on any stage of the pipeline and the scan details are retrieved from the corresponding stage to DevOps Change Velocity. If you're using Azure DevOps or GitHub Actions orchestration tools, then you must add the custom action code in your pipeline always. If you're using Jenkins, and your pipeline already has a Checkmarx One security scan (checkmarxASTScanner) step, you don't have to add the custom action code in your pipeline. For Checkmarx SAST, the custom action code must be added in your pipeline even if it has the security scan step (checkmarxASTScanner).

If you want to configure Checkmarx for the GitLab tool, you can either use the generic Docker container image to add the Checkmarx security step or perform the steps specified in the Integrate security tools with GitLab topic.

For Harness pipelines, you can configure Checkmarx scans only through the generic Docker Container Image. For more information, see Implement custom actions for pipelines using generic Docker container image.

1. Navigate to the step in your pipeline and add the custom action.

Azure DevOps	**a.** Navigate to your pipeline .yml file. **b.** In the **Tasks** section on the right side, search for the **ServiceNow DevOps Security Results** extension task. **c.** Enter the ServiceNow endpoint. **d.** Enter the Security results attributes as the following. ▪ Checkmarx SAST `- task: ServiceNow-DevOps-Build-Security-Results@1 inputs: connectedServiceName: "" # ServiceNow DevOps Change Velocity Service Connection securityResultAttributes: |`

2. Run the pipeline to retrieve the security scan results.

Associate orchestration tool from Checkmarx tool record and vice-versa

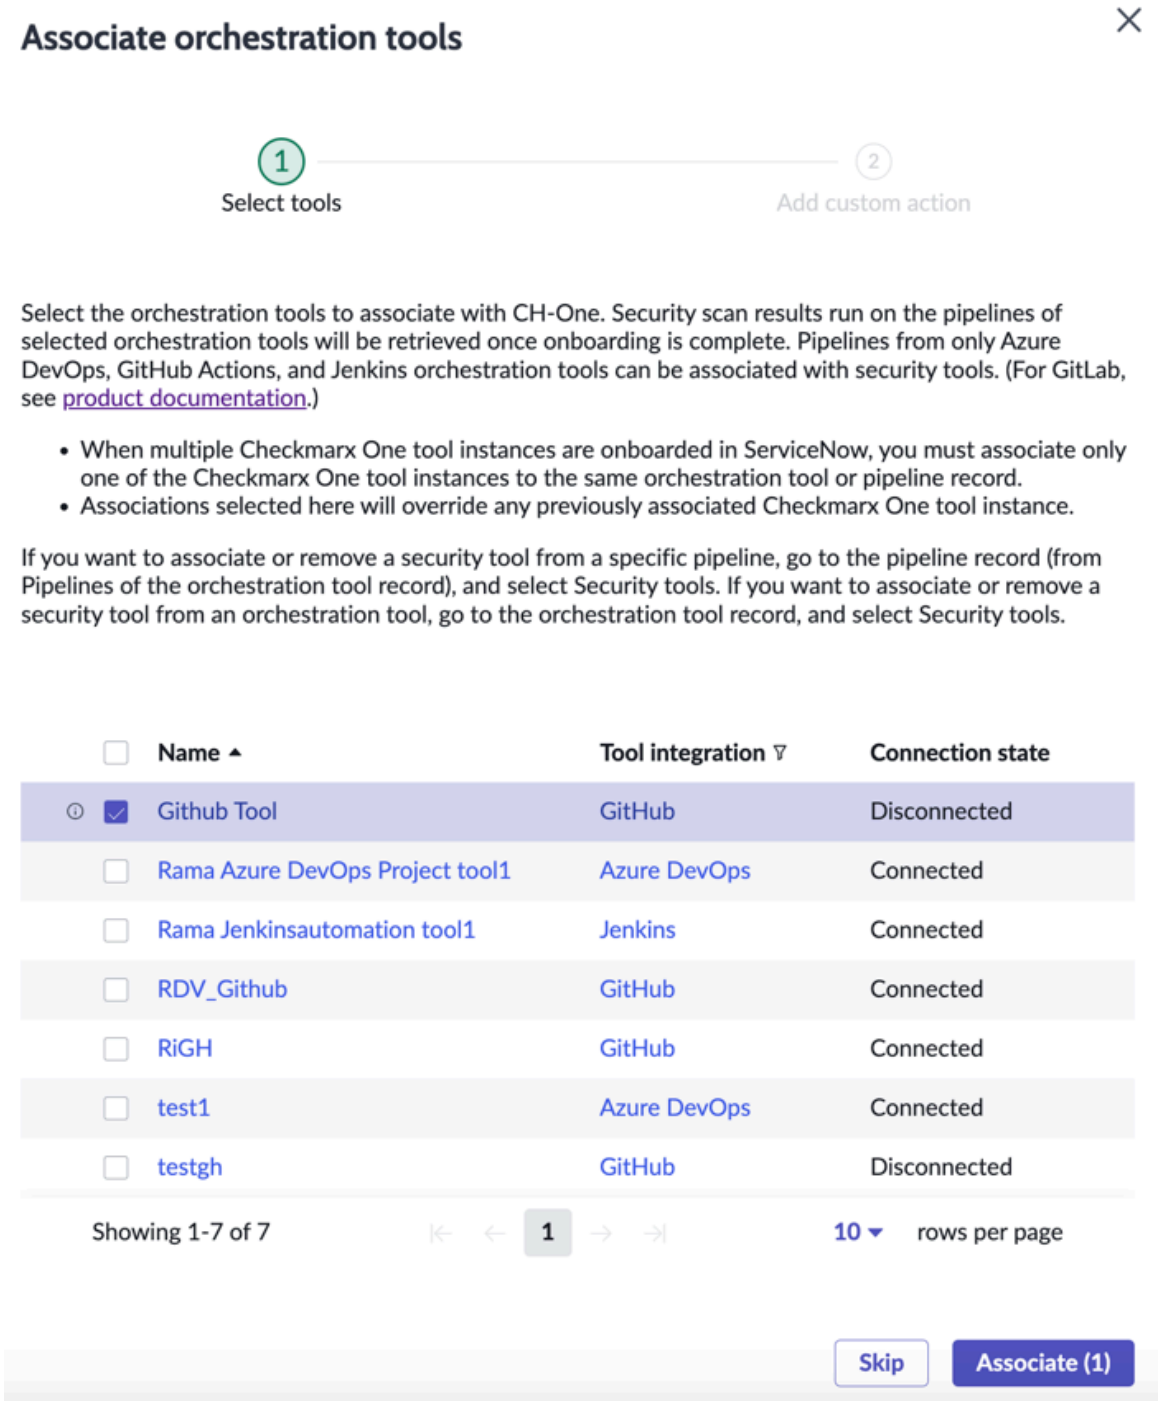
You can associate orchestration tool from the Checkmarx tool record and associate the Checkmarx tool record from the orchestration or pipeline record.

Before you begin
Role required: sn_devops.admin or sn_devops.tool_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces >DevOps Change Workspace > Tools > Security tools**.
2. From the Security tools list, select the tool with which you want to associate an orchestration tool.
3. In the Security tool record, navigate to the Orchestration tools tab.
4. Select **Associate**.
5. In the Select tool dialog box, select the orchestration tools you want to associate with your security tool, and select **Associate**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Add custom action dialog box, copy the required custom action code for your orchestration tool, and add it as a step in your pipelines.

7. Select **Done**.

> **Note:**
> In a similar way, you can associate a security tool instance with an orchestration tool or pipeline record. You can navigate to the orchestration tool or pipeline record, and from the Security tools tab, you can select **Associate**. In the dialog boxes that are displayed, you can select the security tool instances to associate and then copy the custom action to add it in the corresponding pipeline step.

Harness integration with DevOps Change Velocity

Connect to your Harness instance to discover pipeline definitions and configure real-time notifications or polling to enable change traceability and automation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started

Use the workspace to onboard the Harness tool. Configure webhooks manually in Harness to send pipeline notifications to DevOps Change Velocity.

Onboard Harness to DevOps Change Velocity - Workspace

Connect to your Harness instance using the DevOps Change Workspace playbook to discover pipelines.

Before you begin

Complete the tasks specified in the Getting started with DevOps Change Velocity topic.

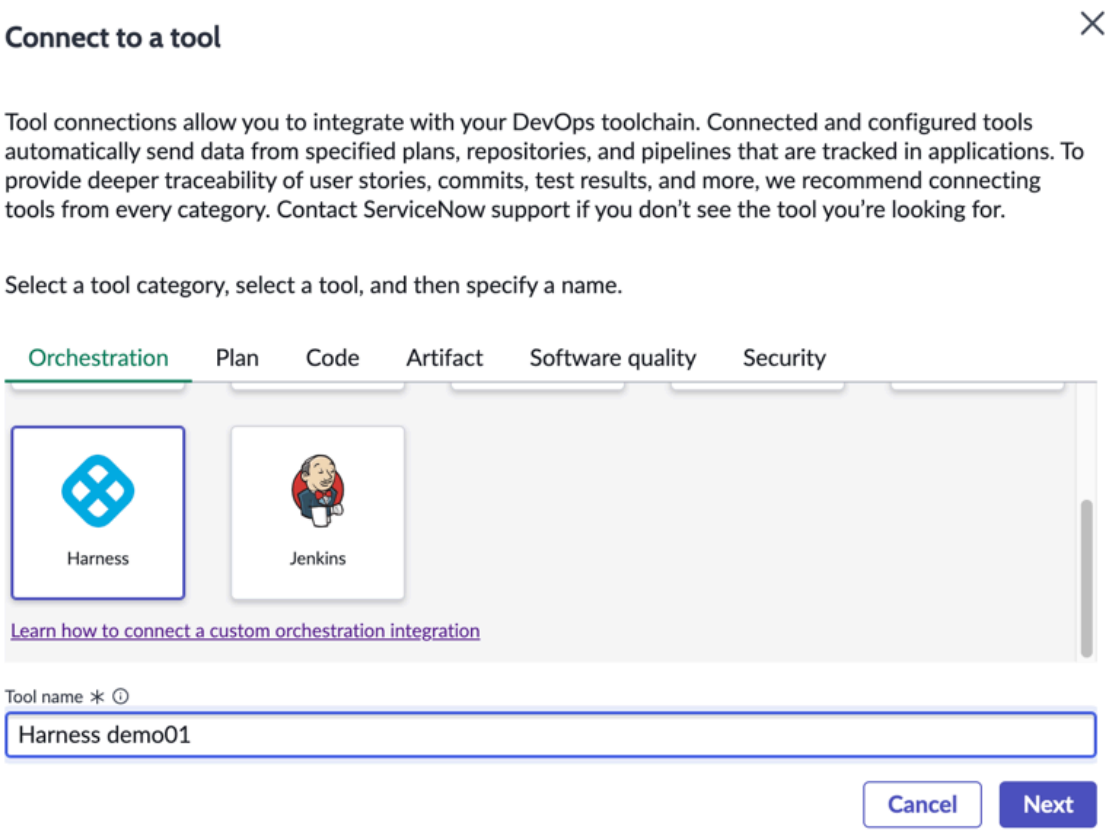
Role required: sn_devops.admin or sn_devops.tool_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** and use one of the following options to open the Playbook to onboard Harness.

> **Important:**
> If you want to discover and track tool objects like pipelines while connecting to the tool, you must connect your tool from the Application module. The steps for associating tool objects in this procedure are only applicable when you connect your tool from the Application module.

2. In the **Tool name** field, enter a name for the tool.



3. Select **Next**.

The DevOps playbook opens to help you complete the onboarding tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Enter your Harness instance details.

   a. Enter your password or access token for Harness.

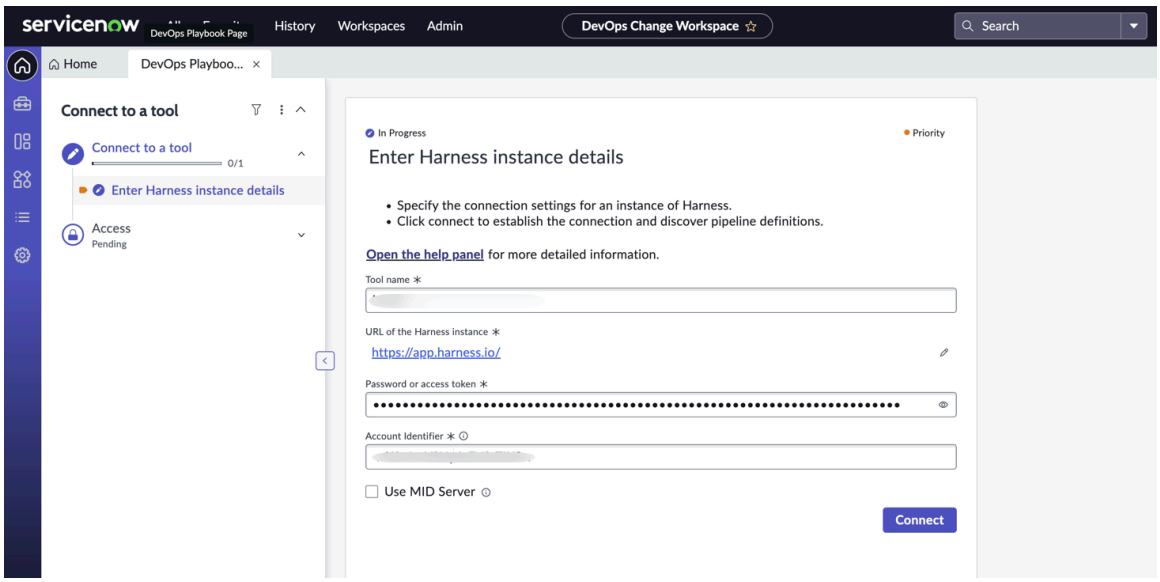
   b. Enter a value in the **Account Identifier** field.

   > **Note:**
   > Account Identifier is the unique identifier for your account in the Harness platform. Copy it from Account Settings of your Harness account.

   c. If your Harness instance is attached to a MID Server, select the **MID Server** option and enter its details.

   For more information about MID server, see MID Server selection

   d. Select **Connect**.



5. Specify the access for the tool.

   a. If you want to control access to the tool, add the groups that must be given access to the tool in the **Maintained by** field.

   The tasks these users in the groups can perform depends on the role assigned to them.

   - DevOps Tool Owner role: Can view and edit the tool.
   - DevOps App Owner role: Can view the tool and can associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects (such as plans, repositories, and pipelines).
   - DevOps Administrator role: Can edit all tools.
   - Other DevOps roles: Can view the tool.

   > **Note:**
   > If you don't select a group and skip this step, all users with the DevOps Tool Owner role will be able to edit the tool.

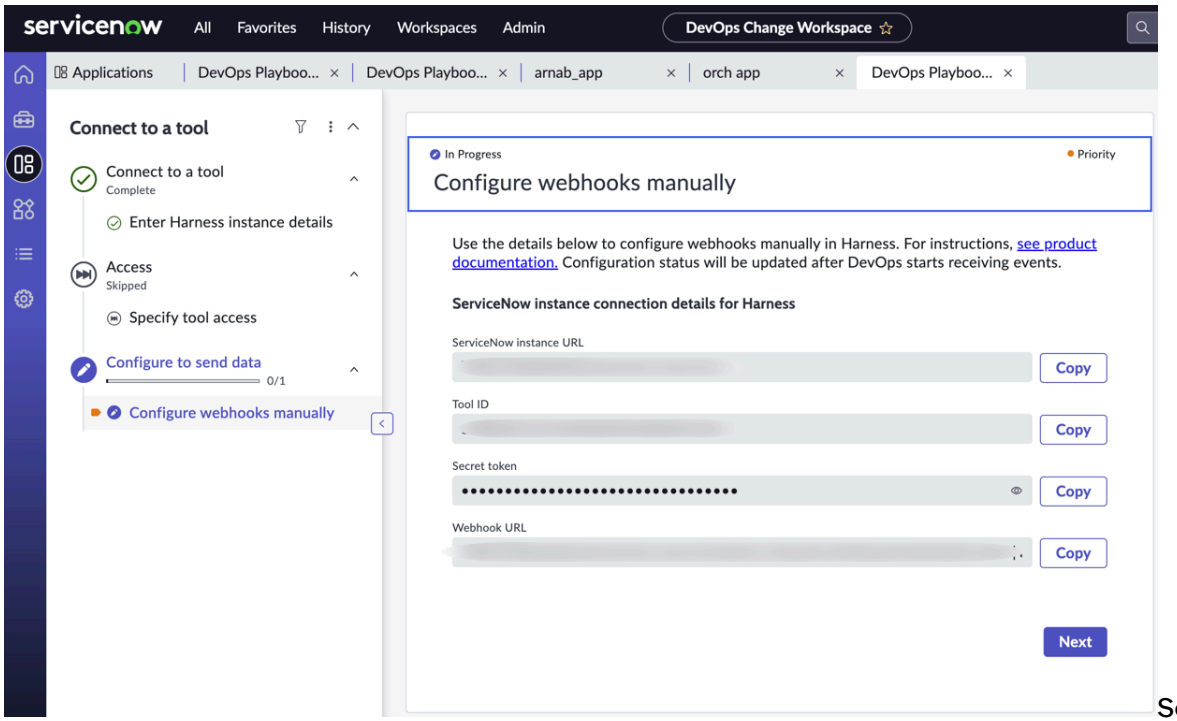
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. If you choose to control access to the tool, the **All App Owners can view and associate tool objects to applications** option becomes available for selection.

   This option enables all users having the DevOps App Owner role to access the tool. If selected, they'll be able to view, associate, discover, import historical data, and modify pipeline steps (if applicable) of the tool's objects.

c. Select **Assign**.

6. In the Configure webhooks manually screen, copy the ServiceNow instance connection details for Harness.



See Configure webhooks in Harness manually for more information.

7. Select the pipelines that you want to track and associate to the application, and select **Associate pipelines**.

   For each selected pipeline, all steps are imported for the last successful execution.

8. **Optional:** In the Assign services to pipeline steps activity, specify **Step type** and **Service** for each pipeline step.

   (Optional) Completing this step as part of tool onboarding enables the DevOps Insights dashboards to show more meaningful data immediately.

9. In the Import historical data step, select the date range in the **Start date** and **End date** fields and select **Import data**.

   Note:
   You can import up to 90 days of data.

10. Select **Next**.

11. From the **Summary** page, review the details of the successfully connected Harness tool.

    Select **View tool record** to review the details of the connected instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You've successfully onboarded your Harness tool to DevOps Change Velocity.

Note:
If your tool credential changes, you must also update the credentials in DevOps Change. For more information, see Update third-party tool credentials in DevOps Change Velocity.

Configure webhooks in Harness manually

Configure webhooks manually in Harness to send pipeline notifications to DevOps Change Velocity.

Before you begin
Role required:

- sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity
- Harness admin

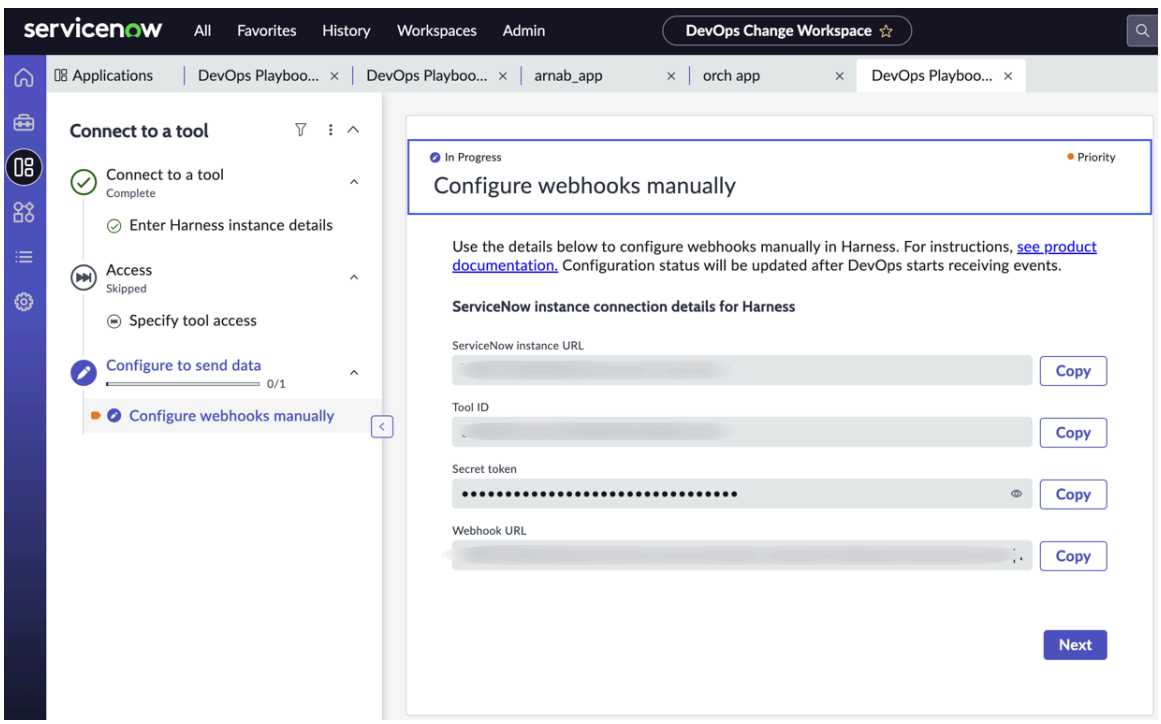
Procedure

1. In DevOps Change Velocity, choose **Configure manually** when configuring the tool instance to send data.

   Note:
   You can also access manual configuration from the Harness tool record in DevOps Change Velocity. From the tool record, select **Configure manually**.

2. Copy the **Webhook URL** and the other field values from DevOps Change Velocity connection details for Harness.

   Note:
   Select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times.



3. Modify the copied Webhook URL to reflect your tool details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
https://<your instance>.service-now.com/api/sn_devops/
v2/devops/tool/{code | plan | artifact | orchestration | test |
softwarequality }?toolId=<your ToolId>
```

a. In <your instance>, enter the copied ServiceNow instance URL.

b. Select one of the tool capabilities `{code | plan | artifact | orchestration | test | softwarequality }` to match your tool.
For example:

```
https://demoinstance.service-now.com/api/sn_devops/v2/devops/
tool/orchestration?toolId=<your ToolId>
```

c. In <your ToolId>, enter the copied tool ID.
For example:

```
https://demoinstance.service-now.com/api/sn_devops/v2/devops/
tool/orchestration?toolId=ac0cif1a1b7696107940a864gjhgbcb58
```

d. Add the "&ni.nolog.token=<copied secret token>" parameter in the URL to pass the secret token.
For example:

```
https://demoinstance.service-now.com/api/
sn_devops/v2/devops/tool/orchestration?
toolId=ac0cdf1a1b7696107940a864gjhgbcb58&ni.nolog.token=brl1jhab63nn56
```

e. Add "&projectId=<project_sys_id>" in the URL to add the account identifier.

> **Note:**
> Project Id or Account Id is the unique identifier for your account in the Harness platform. Copy it from Account Settings of your Harness account.

For example:

```
https://demoinstance.service-now.com/api/
sn_devops/v2/devops/tool/orchestration?
toolId=ac0cdf1a1b7696107940a864gjhgbcb58&ni.nolog.token=brl1jhab63nn56&pro
```

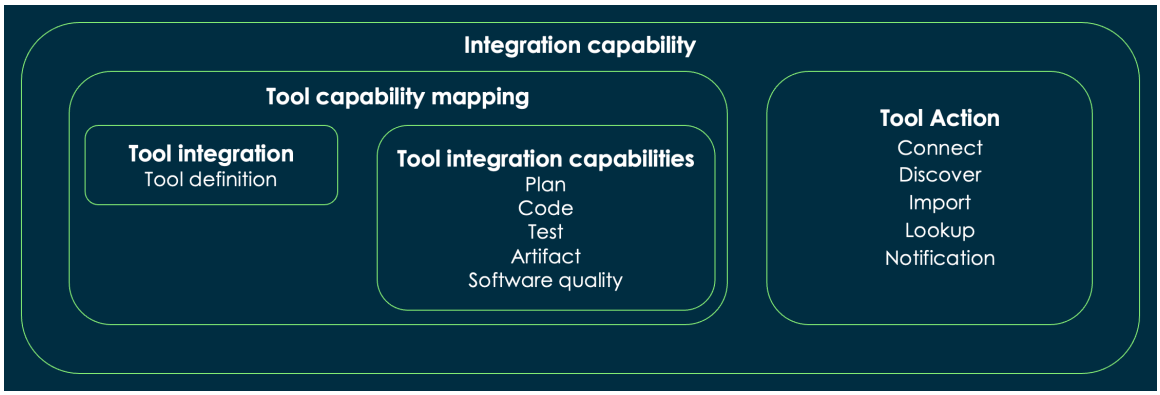
User-created integrations in DevOps Change Velocity

User-created integrations are for integrating additional planning, coding, and test tools that are not available by default in the DevOps Change Velocity application.

The DevOps Change Velocity application includes tool definitions for integrating some common planning, coding, and DevOps test tool integration, but you can also set up user-created integrations for additional tools in your DevOps environment.

Integration objects

DevOps tool integration consists of these objects.



Tool capability actions

- **Connect** action:

  When connecting, the subflow for the specific tool is called and the connection state is updated. The connection status message is shown on the form.

  See Connect capability subflow for more details.

- **Discover** action:

  When discovering, an import request record is created and the subflow for the specific tool is called (as defined in the Integration Capability record). **Detail** and **Status** fields in the Import Request record are updated with the number of items discovered, updated, and failed.

  The transformed payload consists of an array of objects as a JSON string. Elements vary depending on the tool type.

  See Discover capability subflow for more details.

- **Import** action:

  Import action does not support historical import functionality.

- **Lookup** action:

  The Lookup main flow is provided to support artifact tool type in a subflow created by your integration developer.

- **Notification** (webhook) action:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The source tool is configured manually (by your integration developer) to send raw data to the ServiceNow instance. The raw payload is then transformed into a standard JSON object using a subflow.

See the Notification capability subflow and the DevOps - POST /devops/tool/{capability} endpoint of the DevOps API for more details.

Note:
If a subflow is not specified, default handling of notifications occurs (*`original payload`* is automatically copied to *`transformed payload`*).

This behavior is useful when the transactional data of the tool is supported by ServiceNow DevOps as is.

See the expected standard payloads in the Notification capability subflow for more details.

DevOps integration configuration overview

Tool integration configuration can be completed by your integration developer and your DevOps admin.

Integration developer

- Create a tool integration record in DevOps to define the tool you are integrating (source tool).
- Create a Workflow Studio subflow to collect and transform data from the tool you are integrating (source tool).
- Create a tool capability mapping record in DevOps to map the tool integration record to the tool type capability.

  Note:
  Notifications (webhook) capability is supported. Connect and discover capabilities are also supported.

- Create an integration capability record in DevOps to specify the action for the tool type capability.

DevOps admin

- Create a (planning, coding, or test) tool record in DevOps to connect to the tool you are integrating (source tool).

  Note:
  The tool integration record must be specified in the **Tool** field of the tool record.

- Configure the source tool with the webhook and credentials.

Inbound events

An inbound event serves as a staging area for the notifications flow that supports reprocessing of failed payloads. Meaning, a record in an error state from a failed integration or transformation can be retried.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If an Inbound Event record is in the **Error** state, the flow was not able to insert the record successfully into the core DevOps tables.

Common errors can be resolved with these actions.

Inbound event error states

Error	Action
Missing required fields	The transformed payload does not match the standard payload. Refer to the standard and JSON payloads provided.
Repository not marked for tracking	The commit cannot be inserted. The DevOps admin needs to track the repository.
[Subflow] has not been published within application scope [app_scope]	The subflow is created but not published yet.
Timeout exception	The subflow takes more time than the value set in the property: *com.glide.hub.flow_api.default_execution_ti* See FlowAPI - executeSubflowQuick(String name, Map inputs, Number timeout) for more details. **Note:** The execution of the subflow exceeds the value set in the **Timeout** field in the Integration Capability record.
Did not find a matching subflow for notification capability and [tool_integration_sys_id] tool integration	The flow was not able to find the matching subflow. Verify the integration setup procedure.
Payload does not match the expected capability.	The **Original payload** (payload being sent) is a different **Capability** type than the tool type capability configured in your tool capability mapping. The payload type must match the tool type capability configured in your tool integration.

Note:
An inbound event record is not created when any of the following conditions occur:

- Source tool has not passed the tool ID as a query parameter.
- Source tool has passed on a tool ID, but there is no matching tool ID in the instance.

Test Type	Tool Integration	Test Type Mapping
		GitHub and GitHub Enterprise • GitHub - JUnit • GitHub Nunit • GitHub Xunit • GitHub Unit test • GitHub - Integration • GitHub - Regression • GitHub - Smoke • GitHub - System • GitHub - User Acceptance • GitHub - Load

DevOps test tool integration

Test tool integration lets you view test results in DevOps for Jenkins, Azure DevOps, GitHub, GitHub Enterprise, and GitLab unit, functional, and performance tests.

For GitLab and Jenkins, only JUnit test type integration is supported.

Note:
For other test types, use the DevOps - POST /devops/tool/{capability} endpoint of the DevOps API.

- Selenium tests run and published using TestNG are reported by the Jenkins plugin for ServiceNow DevOps.
- Test type categorization is supported.
- Additional tests results reported by tools, such as Apache JMeter, can be processed in DevOps using custom Workflow Studio subflows (no pipeline changes required).

Category	Test type
Unit	JUnit (default) NUnit XUnit Unit test **Note:** • For GitLab and Jenkins, only the JUnit test type integration is supported. • For ADO, GitHub, and GitHub Enterprise, the JUnit, NUnit, XUnit, and Unit test type integrations are supported.

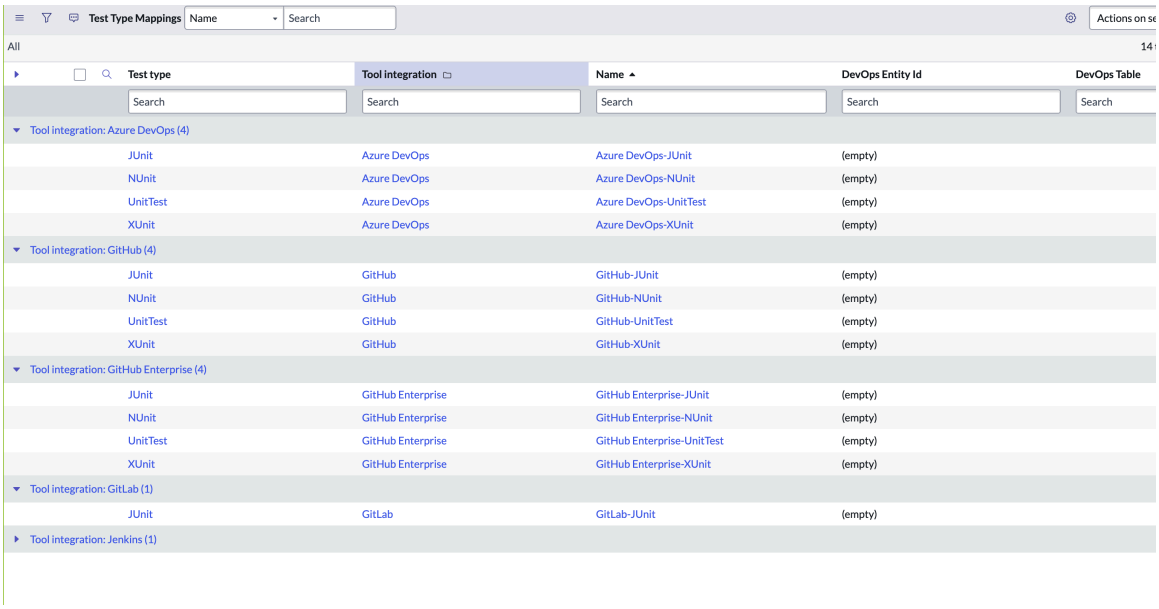
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Category	Test type
	You can change the default test type by modifying the *[sn_devops.default_test_type]* DevOps property.
Functional	• Integration • Regression • Smoke • System • User Acceptance
Performance	Load

Test type mapping

The test type mapping connects the test type and entity being tested with the DevOps tool (**DevOps** > **Integrations** > **Test Type Mappings** module.)



An accurate test type mapping ensures that the test type always appears as intended in the test summary results.

Field	Description
Test type	• JUnit • Nunit • Xunit • Unit test

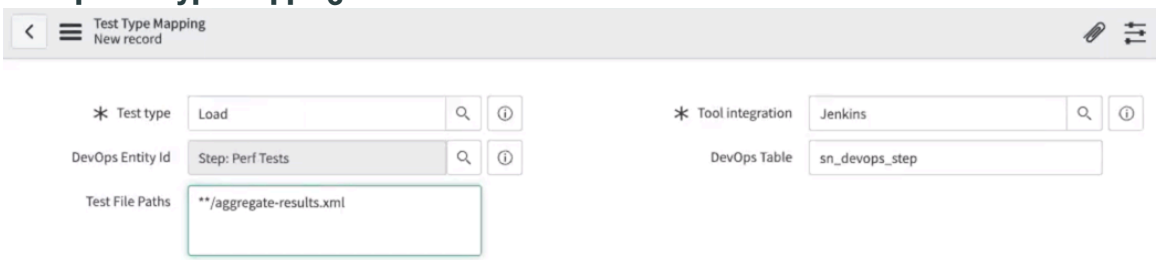
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field		Description
		Note: ○ For GitLab and Jenkins, only the JUnit test type integration is supported. ○ For ADO, GitHub, and GitHub Enterprise, the JUnit, NUnit, XUnit, and Unit test type integrations are supported. • Integration • Regression • Smoke • System • User Acceptance • Load
DevOps Entity Id	Table name	DevOps table name that contains the entity linked to the test results (in the test report payload). • Step [sn_devops_step] • Pipeline [sn_devops_pipeline] **Note:** Only DevOps Step and Pipeline tables are supported.
	Document	Name of the entity specified in the selected table. For example, the name of the step, pipeline, artifact, or package.
Test File Paths (Jenkins tests only)		Path to the generated test result file on the Jenkins server. This is useful so test reports with attributes that don't conform to JUnit or TestNG

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	implementation, such as JMeter for example, can still be leveraged by DevOps. Separate multiple files by a comma. **Note:** You must use a Workflow Studio subflow to transform a raw test payload.
Tool integration	Tool that's running the test.
DevOps Table	DevOps table that corresponds to the table name in the **DevOps Entity Id** setting.

DevOps test type mapping



Example yaml file of ADO unit test

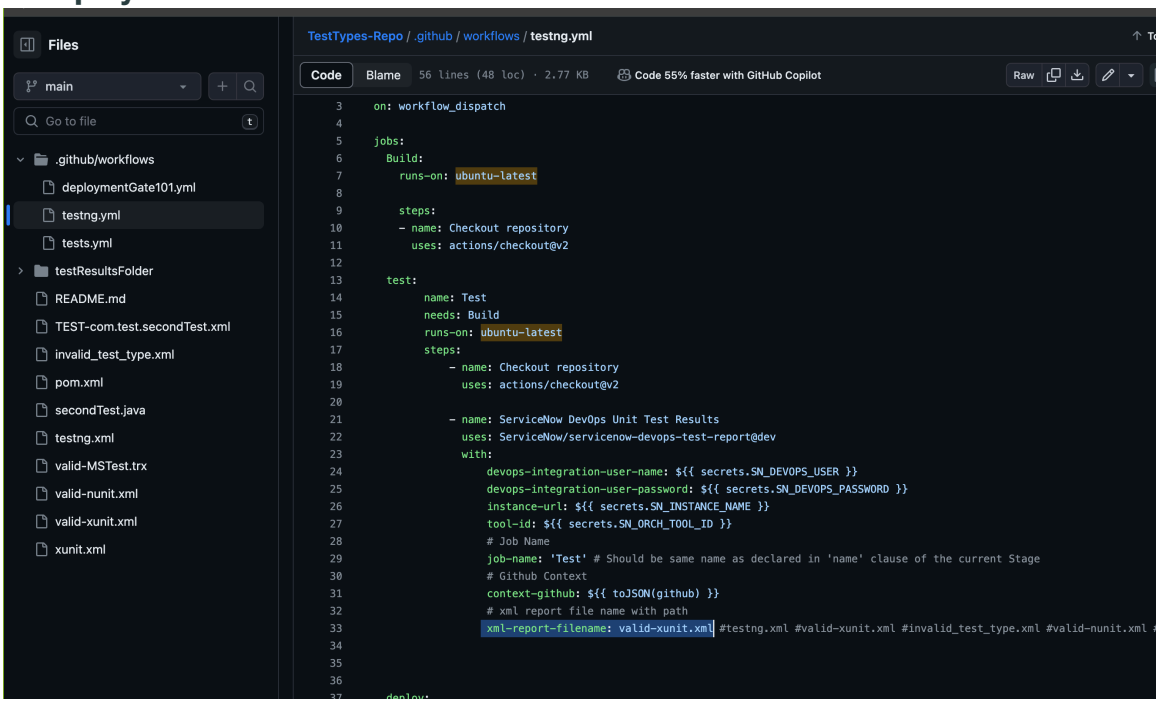
Example yaml file of GitHub unit test



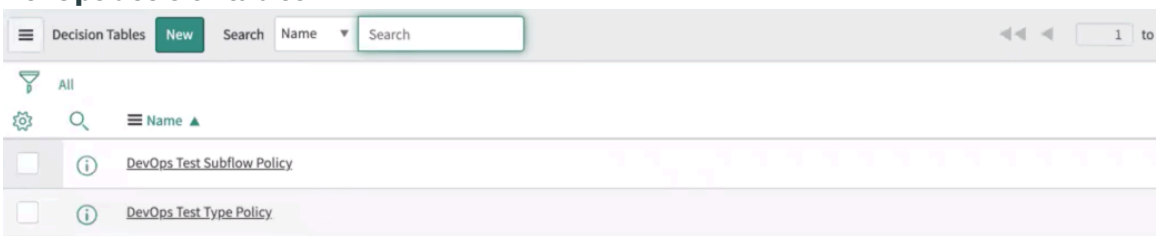
Transforming a raw test payload

You can transform a raw test report (a report containing attributes that do not conform to JUnit or TestNG implementation), such as JMeter for example, by configuring the **DevOps Test Subflow Policy** decision table to call a custom subflow (**Decision Tables** > **Decision Tables** module).

Note:
You must create the custom Workflow Studio subflow that transforms the raw test payload.

If there is more than one test type in a performance stage, you can use the **DevOps Test Type Policy** decision table to configure the test type for each test so the test result payloads are transformed correctly.

DevOps decision tables



DevOps decision tables

Decision table	Purpose	Configuration
DevOps Test Subflow Policy	To automatically call a custom subflow that transforms the raw payload received by the tool. Decision inputs:	Create a decision that specifies the custom subflow to call when the raw payload is received.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps decision tables (continued)

Decision table	Purpose	Configuration
	• Test Result Payload • Test Type	Set the conditions to contain fields that would be included in the raw payload. For example, to call Jenkins BZ Performance Test custom subflow: Conditions: • `Test Type is Load` (Load is the test type configured for performance tests) • `Test Result Payload contains throughput` • `Test Result Payload contains concurrency` Answer: FLow: Jenkins BZ Performance Test
DevOps Test Type Policy	To automatically set test types when more than one type of test is configured in a performance test stage. This is necessary so the results for the second test type get transformed correctly. For example, when both a Load performance test and a JUnit performance test are mapped in the same DevOps step, the JUnit test results won't get formatted correctly unless a decision is created. Decision inputs: • Step • Test Result Payload • Tool Integration • Pipeline	Create a decision for each type of test in the performance test stage to set the test type. Load test: • Conditions: ◦ `Step is Perf Tests` ◦ `Test Result Payload contains throughput` ◦ `Test Result Payload contains concurrency` • Answer: `TestType : Load` JUnit test:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps decision tables (continued)

Decision table	Purpose	Configuration
		• Conditions: ○ `Step is Perf Tests` ○ `Test Result Payload does not contain throughput` ○ `Test Result Payload does not contain concurrency` • Answer: `TestType : JUnit`

DevOps multiple performance test types

```
stage('Checkout') {
    snDevOpsStep()
    snDevOpsChange()
    node {
        echo 'Checking out..'
        checkout scm
    }
}
stage('Tests'){
  snDevOpsStep()
  node {
    sh 'mvn clean test'
    step([$class: 'Publisher', reportFilenamePattern: '**/testng-results.xml'])
  }
}
stage('Perf Tests'){
  snDevOpsStep()
  node {
    bzt "load_test1.yml"
    junit '**/xunit.xml'
  }
}

```

DevOps multiple test type mappings

Test Type Mappings | New | Search | Name | Search | 1 to 4 of 4

All

Test type	Tool integration	Name ▲	DevOps Entity Id	DevOps Table	Test File Paths
JUnit	Azure DevOps	Azure DevOps-JUnit	(empty)		
Integration	Jenkins	Jenkins-Integration	Step: Tests	sn_devops_step	
JUnit	Jenkins	Jenkins-JUnit	(empty)		
Load	Jenkins	Jenkins-Load	Step: Perf Tests	sn_devops_step	**/aggregate-results.xml

Configure a test tool in DevOps

Configure a test tool in DevOps to view unit, functional, and performance test results.

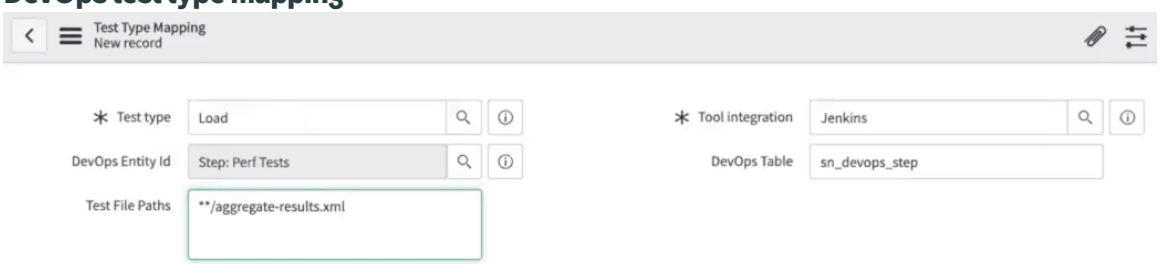
Before you begin

Role required: sn_devops.admin

Procedure

1. Navigate to **All** > **DevOps** > **Integrations** > **Test Type Mappings** and create a record to map the test type to the integration tool.
2. In the Test Type Mapping record, use the search icon ( ) to select **Test type** and **Tool integration** field values.

DevOps test type mapping



3. Click the search icon ( ) in the **DevOps Entity Id** field, and fill in the test details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	DevOps table name that contains the entity linked to the test results.
Document	Name of the entity specified in the selected table.

DevOps test mapping entity ID

See the Test type mapping section for more details.

4. **Optional:** To capture the raw test payload of non-JUnit or -TestNG tests, enter an .xml filename and path (comma separate multiple files).

   (Optional) You can transform a raw payload using decision tables and a custom Workflow Studio subflow.

   Note:
   You must create the custom subflow that transforms the raw payload.

   See the Transforming a raw test payload section for more details on configuring decision tables.

5. Run the test and view test results by navigating to **DevOps** > **Test Results** (Test Summaries and Performance Test Summaries).

DevOps Test Summaries example

Example:

Scripted pipeline example with test configuration

```
stage('Checkout') {
    snDevOpsStep()
    snDevOpsChange()
    node {
        echo 'Checking out..'
        checkout scm
    }
}
stage('Tests'){
  snDevOpsStep()
  node {
    sh 'mvn clean test'
    step([$class: 'Publisher', reportFilenamePattern: '**/testng-results.xml'])
  }
}
stage('Perf Tests'){
  snDevOpsStep()
  node {
    bzt "load_test1.yml"
    //junit '**/xunit.xml'
  }
}

```

Add test results to change requests using test API

Add test results to DevOps change requests using the test capability of the DevOps - POST /devops/tool/{capability} API. The API is available for all test types for various tools connected to DevOps Change Velocity.

For more information about the API, see DevOps - POST /devops/tool/{capability}. To use the API in Azure DevOps, GitHub, and Jenkins, you must use the format mentioned in the respective sections below.

Prerequisites

Role required: sn_devops.admin

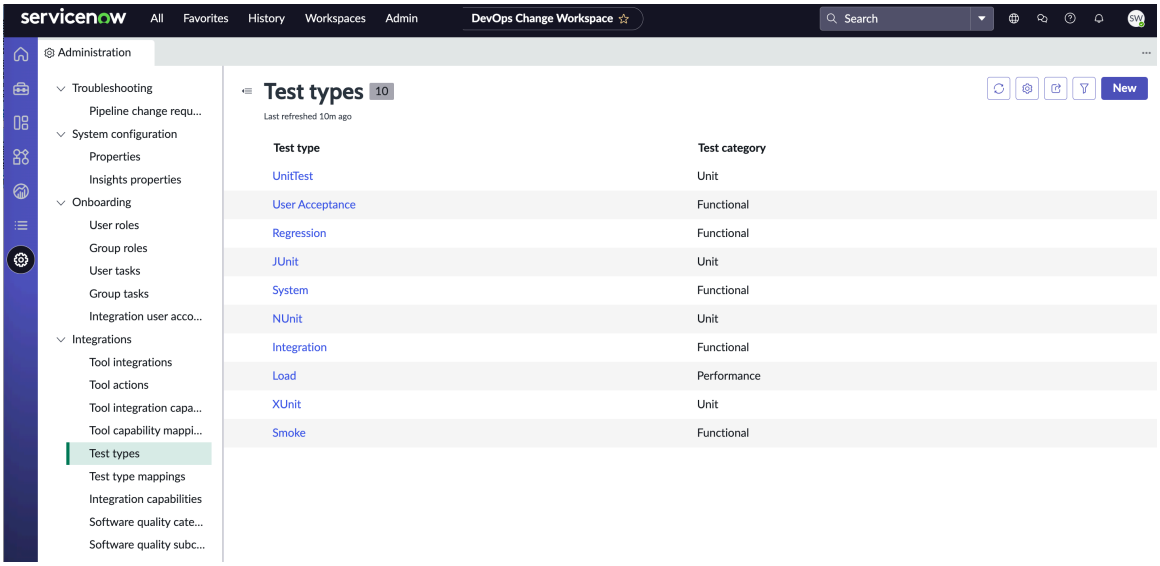
You must make sure that the test type you want to use in the API is available as a test type in DevOps Change Velocity and that it is mapped with the respective orchestration tool.

1. Navigate to **DevOps Change Workspace** > **Administration** > **Integrations** > **Test types**.

   You can also use the classic UI navigation **DevOps** > **Integrations** > **Test Types**.

2. Verify if the test type is available in the Test types table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. For custom test types, select **New** and add the test type to the list.

   a. In the **Test type** field, enter a name for your test type.

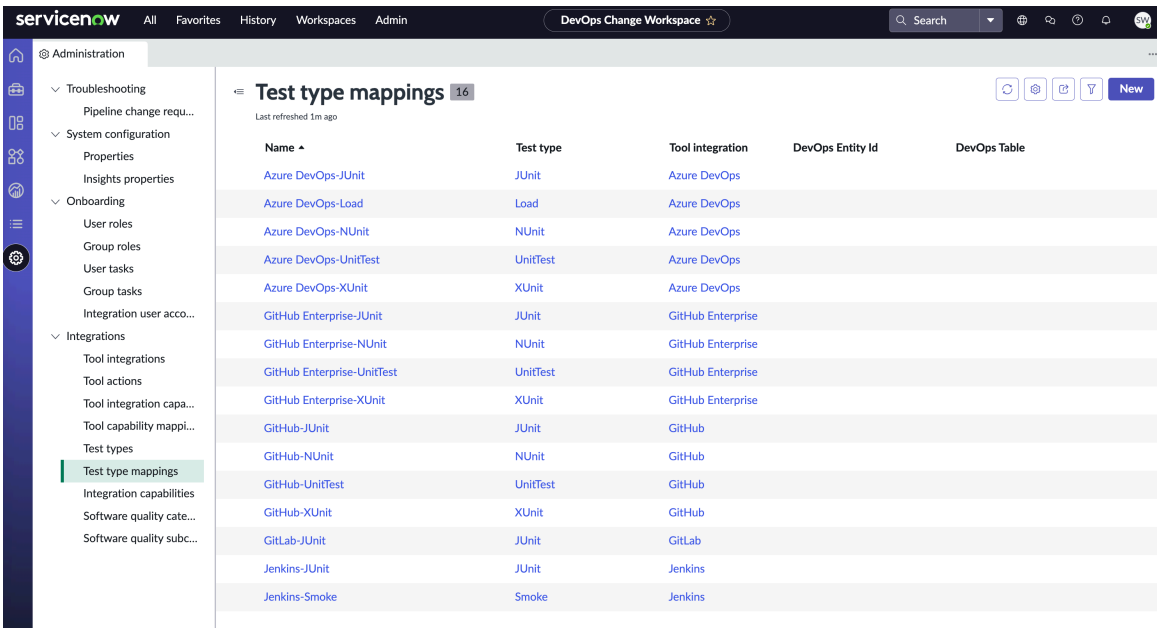
   b. From the **Test category** list, select the category of your test type.

   c. Select **Save**.

4. Navigate to **DevOps Change Workspace** > **Administration** > **Integrations** > **Test type mappings**.

   You can also use the classic UI navigation **DevOps** > **Integrations** > **Test Type Mappings**.

5. Verify if the test type is mapped to your orchestration tool.



6. If the mapping is not available, then select **New** and create the mapping.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the **Test type** list, select the test type that you want to map.

b. From the **Tool integration** list, select your orchestration tool.

c. Select **Save**.

Azure DevOps

For Azure DevOps pipelines, use the format given here to add test results to change requests for various test types.

Format for URL suffix and parameters:

```
/api/sn_devops/v1/devops/tool/test?toolId=<devops_ToolID>&testType=<test_type>
```

- The parameter *toolId* must be a valid Tool Id from a connected and configured tool in DevOps Change Velocity.
- The parameter *testType* should have a test type mapping in DevOps Change Velocity.

Within the *Body*, you must pass the parameters based on the test type.

Note:
For the generic connection, use the following:

- username: devops.integration.user
- password: <devops.integration.user password>

Pipeline configuration for performance tests

Sample parameters for the body:

```
{
  "name": "Perf. tests DEMO5",
  "duration": 0,
  "maximumVirtualUsers": 10,
  "throughput": "5/min",
  "maximumTime": 10000,
  "minimumTime": 5000,
  "averageTime": 7000,
  "ninetyPercent": 8000,
  "standardDeviation": 2,
"startTime": "2023-12-14T23:31:31z",
  "finishTime": "2023-12-14T23:40:32z",
  "buildNumber": $(Build.BuildNumber),
  "stageName": "Test API Job",
  "pipelineName": "TEST-CI-PIPELINE"
}
```

Jenkins

For Jenkins pipelines, use the format given here to add test results to change requests for various test types.

Pipeline configuration for performance tests

Sample pipeline:

```
pipeline {
    agent any
    stages {
        stage('POST API Call') {
            steps {
                script {
                    def apiUrl =
 'https://<your_instance>.service-now.com/api/sn_devops/v1/devo
ps/tool/test?toolId=<devops_ToolID>&testType=<performance_test_t
ype>'
                    def requestBody = [
                        name: "Performance Load tests jenkins",
                        duration: 0.0,
                        maximumVirtualUsers: 10,
                        throughput: "6/min",
                        maximumTime: 1000,
                        minimumTime: 300,
                        averageTime: 700,
                        ninetyPercent: 600,
                        standardDeviation: 2.0,
                        startTime: "2023-12-14T23:31:31z",
                        finishTime: "2023-12-14T23:40:32z",
                        buildNumber: env.BUILD_NUMBER,
                        stageName: "POST API Call",
                        pipelineName:
 "KLPerformanceTestPipeline"
                    ]
                    def auth = "<password>" //
 devops.integration.user:<password> in base64 encoded.
```

        }
    }
}
```

Limitations of the test API

- Waiting logic will not be taken care of.
- Re-run scenarios cannot be handled.

Add attachments to change requests using attachment API

Add test report xmls as attachments to DevOps change requests using the attachment API.

For more information about the API, see Attachment - POST /now/attachment/file.

The attachment API URL is:

`https://<your_instance>.service-now.com/api/now/attachment/file?table_name=change_request&table_sys_id=$(getServerChange.sys_id)&file_name=<attached_filename.xml>`, where

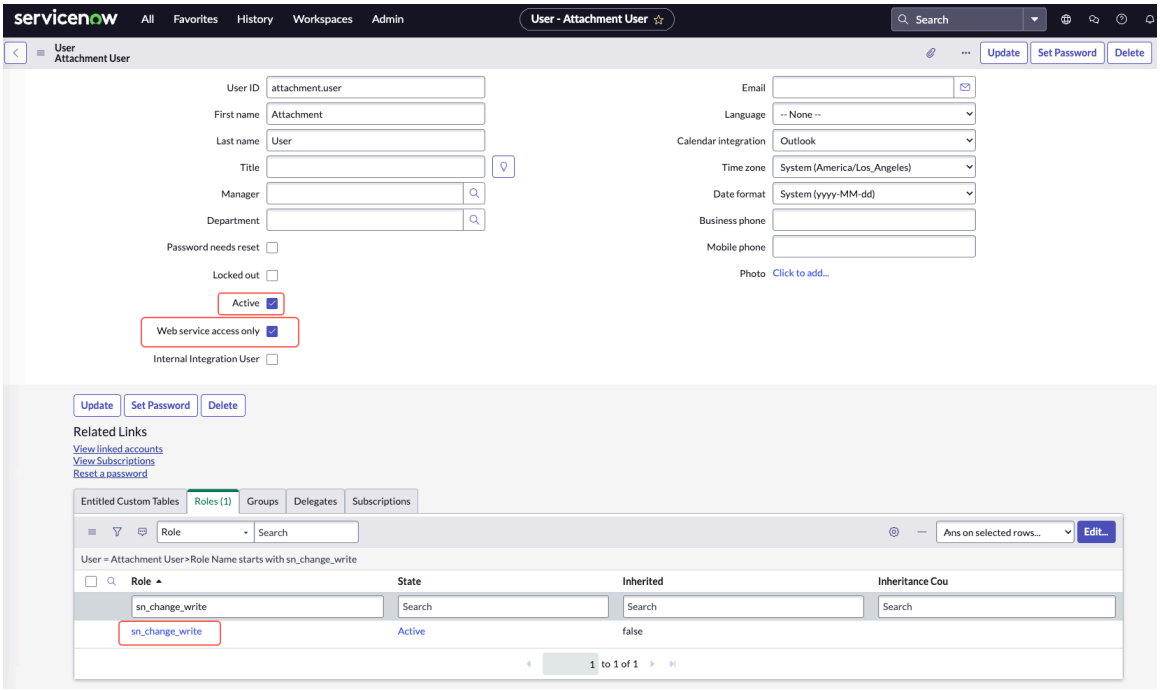
- table_name = 'change_request'
- table_sys_id = <chg record sys_id>
- file_name = Any name for the attachment

Azure DevOps

Prerequisites

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create an active user with the option **Web service access only** selected. For information on how to create a user, see Create a user.
- Assign the role **sn_change_write** to the user. For information on how to assign the role, see Assign a role to a user.



- The system property **sn_devops.enable_ado_generic_connection** must be enabled.
- While configuring your Azure DevOps project, to upload to chg. table, the generic connection used should have a user having the role **sn_change_write**.

For Azure DevOps pipelines, use the format given here to add attachments to change requests.

Sample pipeline:

```
stage: PostDeploy
    jobs:
      - job: 'pd1'
        pool: server
        steps:
            - task: ServiceNow-DevOps-Server-Get-Change@1
              inputs:
                connectedServiceName: 'v01-Software Quality
 Scans-ServiceNow DevOps Service Connection'
                projectName: '$(system.teamProject)'
                pipelineName: '$(build.definitionName)'
                stageName: 'Deploy'
                jobName: 'd1'
                buildNumber: '$(build.buildId)'
                branchName: '$(Build.SourceBranchName)'
              name: getServerChange
            - task: InvokeRESTAPI@1
              inputs:
                connectionType: 'connectedServiceName'
                serviceConnection: 'v01 - new'
```

le?table_name=change_request&table_sys_id=${changeId}&file_name=
test10111.xml'", returnStdout: true).trim()
                    }
                }
            }
        }
}
```

Limitations of the attachment API

- The attachment xml file's text size should be acceptable to the orchestration tool.
- For Azure DevOps, *sn_change_write* role is needed for authentication of attachment API, to upload the file to the change record.

DevOps user-created security tool integration

You can integrate additional security tools that are not supported in the base system in DevOps Change Velocity.

Configure user-created security tool

Connect your custom security tool that is integrated with your CI/CD pipelines to DevOps Change Velocity to retrieve security scan results.

Before you begin

You must create the application vulnerability integration by following the step-by-step instructions in the Configure DevOps with Application Vulnerability Response for better visibility into CI/CD pipeline [KB1441741] enablement guide. This is a required pre-requisite setup to onboard your custom security tool from DevOps Change Velocity.

Role required:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

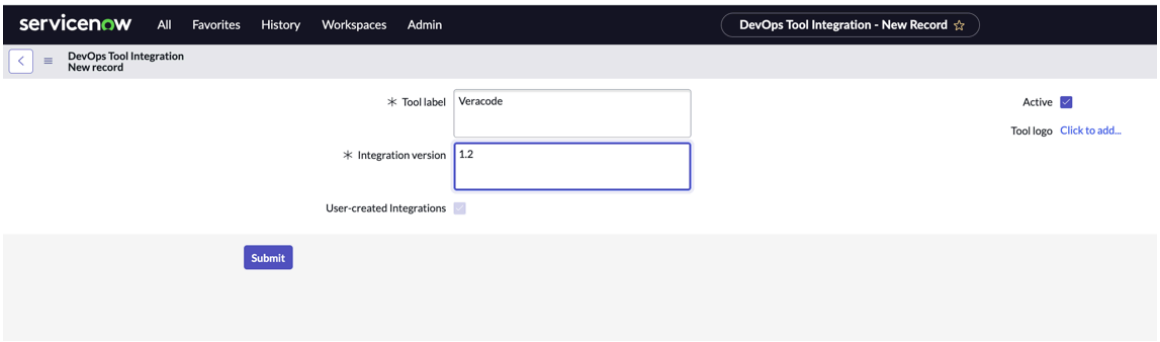
- Developer role for the scoped app
- DevOps admin role

Note:
When creating an integration as a scoped app, the system admin must assign these roles to the integration developer, so the integration developer is able to create tool integration and integration capability records for the specific scope.

Procedure

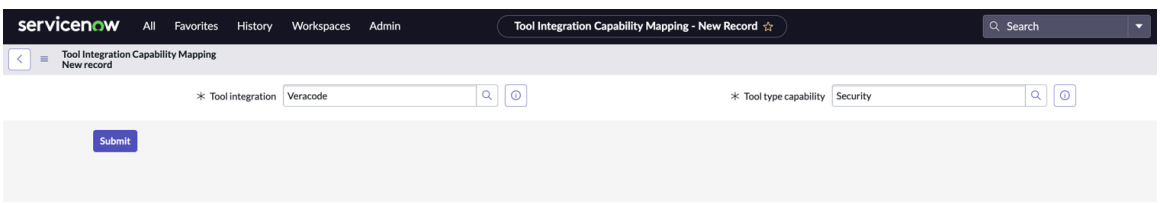
1. Navigate to **DevOps > Integrations > Tool Integrations** and create a record to define the tool you are integrating.
2. Select **Create manually**, and enter the following values in the form fields.

Field	Value
Tool label	Name of the tool integration.
Integration version	Version of the tool integration.



3. Select **Submit**.
4. Open the newly created tool integration and navigate to the Tool Integration Capability Mappings related list.
5. Select **New**, and enter the following values in the form fields.

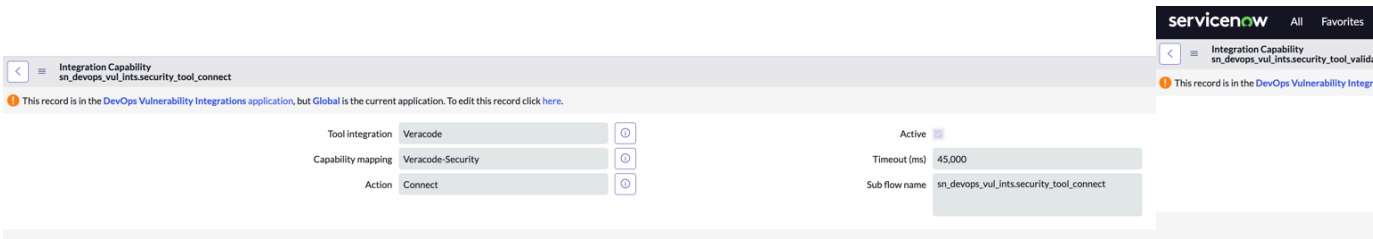
Field	Value
Tool integration	Sample tool
Tool type capability	Security



6. Select **Submit**.
7. Navigate to the Integration Capabilities related list, and select **New**.
8. Create the **Connect** and **Validate** records by entering the following values in the form fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Tool integration	Sample Code Tool
Capability mapping	Capability mapping record created in step 6.
Action	Connect **Note:** Do not edit tool action records.
Active	Selected
Timeout (ms)	Timeout for the corresponding subflow. If execution of the subflow exceeds this value, a timeout exception occurs. Value is in milliseconds (ms). Default is 45,000 (45 seconds).
Subflow name	○ For Connect: sn_devops_vul_ints.security_tool_connect ○ For Validate: sn_devops_vul_ints.security_tool_validate
Domain	global



9. Open the newly created tool integration record and add the **SecOps source integration** and **Integration handler** name fields to the form by navigating to **Configure > Form layout**. In the tool integration form, enter the following values for these fields.
   - SecOps source integration: Select the source integration that is created in the Third Party Integrations (sn_sec_int_integration) table as described in the **Configuration page > Steps to create a configuration** section in the Configure DevOps with Application Vulnerability Response for better visibility into CI/CD pipeline [KB1441741] enablement guide.
   - Integration handler name: sn_devops_vul_ints.DevOpsSecurityToolIntegrationHandler
10. Ensure that "Tool Integration name" DevOps Integration (example: Veracode DevOps Integration) is created in the Application Vulnerability Integration (sn_vul_app_integration) table and mapped to the source integration that is created in the Third Party Integrations (sn_sec_int_integration) table as described in the **Configuration page > Steps to create a configuration** section in the Configure DevOps with Application Vulnerability Response for better visibility into CI/CD pipeline [KB1441741] enablement guide.

What to do next

By default, when you onboard your tool from workspace, you have to enter the mandatory fields as defined in the Configuration Page section in the Configure DevOps with Application Vulnerability Response for better visibility into CI/CD pipeline [KB1441741] enablement guide. Not all the mandatory fields are credential fields. In the base system, all the mandatory fields are displayed while updating credentials. If you want to update the credentials for this tool when the

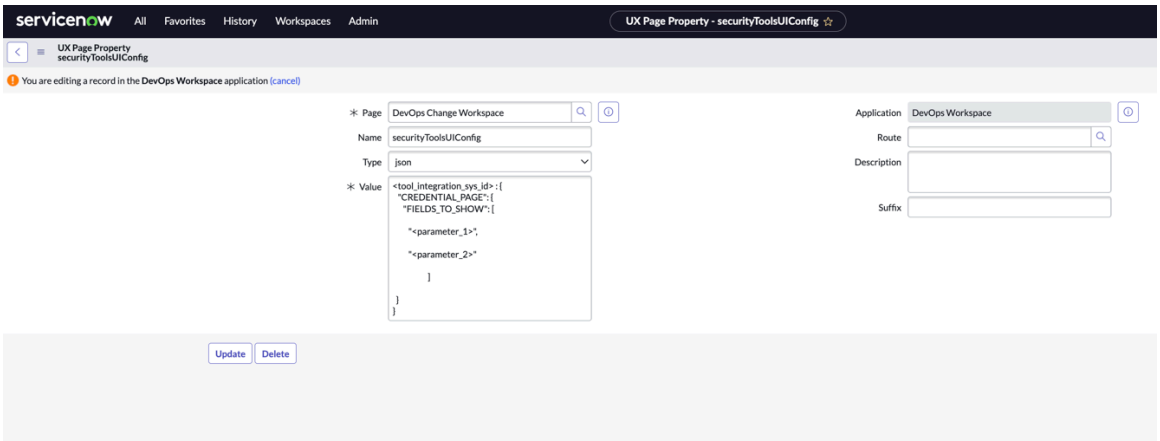
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

credentials have expired, you may not want to enter all the mandatory fields. To configure the mandatory fields that you want to show in the Update credentials page, perform the following steps.

1. Navigate to **Now Experience Framework > Experiences**.
2. Select **DevOps Change Workspace**.
3. On the UX Page Properties related list, select **securityToolsUIConfig**.
4. Add the following entry to the JSON.

```
<tool_integration_sys_id> : {
   "CREDENTIAL_PAGE": {
      "FIELDS_TO_SHOW": [
          "<parameter_1>",
          "<parameter_2>"
                    ]
  }
}
```



Integrate security tools with GitLab

Configure security tool for GitLab which is not supported in the base system.

Before you begin

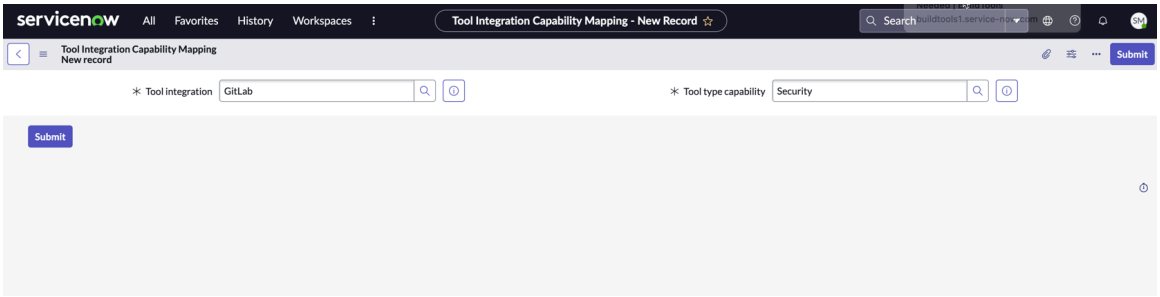
Role required: sn_devops.admin

Procedure

1. Navigate to **DevOps > Integrations > Tool Integrations** and open the GitLab orchestration tool integration record.
2. Navigate to the Tool Integration Capability Mappings related list.
3. Select **New**, and enter the following values in the form fields.

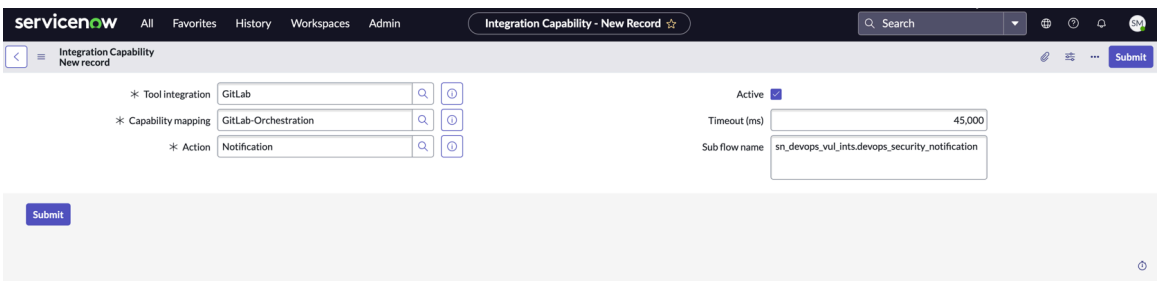
Field	Value
Tool integration	GitLab
Tool type capability	Security

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Submit**.
5. Navigate to the Integration Capabilities related list, and select **New**.
6. Enter the following values in the form fields.

Field	Value
Tool integration	GitLab
Capability mapping	Capability mapping record created in step 4.
Action	Notification **Note:** Do not edit tool action records.
Active	Selected
Timeout (ms)	Timeout for the corresponding subflow. If execution of the subflow exceeds this value, a timeout exception occurs. Value is in milliseconds (ms). Default is 45,000 (45 seconds).
Subflow name	sn_devops_vul_ints.devops_security_notification
Domain	global



Note:
Deactivate the *BR Seeded tool integrations not editable* business rule to integrate security tools with GitLab.

7. Modify the *sn_devops_ints.DevOpsGitLabIntegrationHandler* script include by navigating to **System definitions > Script include**, and searching for the *DevOpsGitLabIntegrationHandler* script.
   a. Modify the handleEvent method to process the security scan results from the GitLab pipeline. Ensure that your security stage name in your GitLab pipeline is same as the name you update in the VERACODE_STAGE_NAME, CMARX_ONE_STAGE_NAME, or

CMARX_SAST_STAGE_NAME variable in the handleEvent method. Replace the handleEvent method code with the following code snippet.

```
handleEvent: function(eventGr) {
   try {
       var renameHandler = new
sn_devops.DevOpsPipelineRenameHandler(this.refTable,
this.appContext, this.relatedRecord);
       renameHandler.handlePipelineRename(eventGr);
       var payload =
JSON.parse(eventGr.getValue("original_payload"));
       this._logger.debug("typeof payload >>" + typeof
payload);
       if (!gs.nil(payload) && typeof payload === 'object')
{
           var status =
this.getTaskExecutionStatus(payload);
           this._logger.debug("Task Execution status -> " +
status);
           if (gs.nil(status))
               this.updateInboundEvent(eventGr, {
                   processing_details: gs.getMessage('Task
execution status [{0}] is not handled',
payload.build_status),
                   state:
sn_devops.DevOpsCommonConstants.INBOUND_EVENT_STATE_IGNORED
               });
           else {
               // create fake start event for cancelled job
               if (status == 'cancelled') {
                   this.createFakeEvent(eventGr, payload,
'running');
               }
               var normalizedObject = {};
               normalizedObject.taskExecution =
this.getTaskExecutionObject(eventGr, payload, status);
               normalizedObject.orchestrationTask =

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
getPipelineWithSecurityEventPayload: function(payload) {
        var gr = new
 GlideRecordSecure('sn_devops_task_execution');
        gr.addEncodedQuery("execution_url=" +
 payload.pipelineInfo.taskExecutionUrl);
        gr.query();
        var task = null;
        if (gr.next()) {
            task = gr;
        }
        if (gs.nil(task) || gs.nil(task.orchestration_task)
 || gs.nil(task.orchestration_task.step)) {
            throw "Pipeline Info not found";
        }
        var step =
 task.orchestration_task.step.getRefRecord();
        var pipelineDAO = new sn_devops.DevOpsPipelineDAO();
        var query = 'sys_id=' + step.pipeline;
        var pipeline =
 pipelineDAO.getLimitedRecordsByEncodedQuery(query);
        return pipeline;
    },
```

DevOps user-created orchestration tool integration

Integrate DevOps Change Velocity with any orchestration tool that is not supported in the base system.

If the orchestration tool your organization uses isn't provided in the base system, you can create an orchestration tool integration on your own. There are two ways in which you can create the integration.

- Using transform scripts manually. See the Now Support Knowledge Base [KB1794252] article for more information.
- Using the DevOps Change Workspace by performing the steps specified in Create a tool integration from the DevOps Change Workspace.

Create a DevOps tool integration

To create a DevOps tool integration, your integration developer configures DevOps tool integration settings, and a Workflow Studio subflow to collect and transform data from the source tool. Then your DevOps admin configures your DevOps tool connections.

Before you begin

Note:
When creating an integration as a scoped app, the system admin must assign these roles to the integration developer so the integration developer is able to create tool integration and integration capability records for the specific scope.

- Developer role for the scoped app
- DevOps admin role

Role required: sn_devops.admin

About this task

Creating a DevOps tool integration procedure involves configuration by both your integration developer and your DevOps admin.

- Your integration developer creates a tool integration record in DevOps, a Workflow Studio subflow, a tool capability mapping, and an integration capability record in DevOps to map the capabilities and actions together.

  Note:
  Notification, connect, and discover capabilities are supported.

- Your DevOps admin sets up DevOps connections (planning or coding tool), and configures the source tool with the webhook and credentials.

This procedure provides detailed steps to create your DevOps tool integration.

Procedure

1. Integration developer:
   Configure the source tool integration capabilities and actions, and a subflow.

   a. Navigate to **DevOps** > **Integrations** > **Tool Integrations** and create a record to define the tool you are integrating (source tool).

   Note:
   Do not edit the tool integration records provided with the DevOps application.

   DevOps tool integration

Tool label	Sample Code Tool
Table	Code Tool [sn_devops_tool]
Use packageable integrations	Selected
Integration version	1.0
Active	Selected

   b. Navigate to **Flow Designer** > **Designer** and create a subflow to collect and transform data from the tool you are integrating (source tool).

   Note:
   The **Run As** field must be set to System User, and the **Inputs** label must be set to current variable.

   Notification subflow properties

Name	Code Tool Notification
Application	Sample Integration App
Accessible From	All application scopes
Description	Code tool for integration app
Run As	System User

   The subflow must contain Get More Data via API calls, and/or transform the original payload. Copy the transformed payload into the inbound events record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Do not edit the DevOps main flow.

c. Navigate to **DevOps** > **Integrations** > **Tool Capability Mappings** and create a record to map the tool integration record to the tool type capability.

DevOps tool capability mapping

Tool integration	Sample tool
Tool type capability	Code

d. Navigate to **DevOps** > **Integrations** > **Integration Capabilities** and create a record to specify the action for the tool capability mapping.

Note:
Do not edit the integration capability records provided with the DevOps application.

DevOps integration capability

Tool integration	Sample Code Tool
Capability mapping	Sample Code Tool-Code **Note:** Do not edit tool type capability records.
Action	Notification **Note:** Do not edit tool action records.
Active	Selected
Timeout (ms)	Timeout for the corresponding subflow. If execution of the subflow exceeds this value, a timeout exception occurs. Value is in milliseconds (ms). Default is 45,000 (45 seconds).
Subflow name	x_snc_sample_integ.code_tool_notification The name is prefixed by the scope name and a dot (.) before the actual subflow name. For example, given: ▪ `connect_code_tool` subflow ▪ `my_app_scope` scope The value for this field is `my_app_scope.connect_code_tool`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Note: If the **Subflow name** field is left blank for a Notification capability, default handling of notifications occurs. See Notification tool capability action.
Domain	global

2. DevOps admin:

   Configure the connection from DevOps to the source tool.

   a. The tool record must contain:
      - Reference to the tool integration record created by the integration developer (in the **Tool** field)
      - Tool label
      - Connection alias (connection and credential)

   b. Copy the notification (webhook) created on the DevOps planning tool to the source tool service hook of the notification endpoint and set the credentials to devops.integration.user.

   You can view the state of integration events in the Inbound Event list (**DevOps** > **Administration** > **Inbound Events**).

   The inbound event record state is set to **Processed** once the object has been inserted into the DevOps Core table. Event states include New, In Progress, Processed, Unmatched, and Error.

3. If the tool integration record and the subflow are created in a different scope, the DevOps admin must create two new Cross scope privileges records to allow the app to access the inbound events table.
   Navigate to **System Applications** > **Application Cross-Scope Access** and create read and write cross scope privileges records to allow your app to access the inbound events table.

Field	Read	Write
Source Scope	Auto populated based on the current application	
Target Scope	DevOps	
Target Name	sn_devops_inbound_event	
Target Type	Table	
Operation	Read	Write
Status	Allowed

Cross scope access records (read and write)

Creating DevOps subflows

For user-created integrations, create a DevOps Workflow Studio subflow to collect and transform data from the tool you are integrating.

ServiceNow Flow Designer is a ServiceNow AI Platform feature your integration developer can use to automate processes using a sequence of actions. Trigger conditions start the flow, and variables pass information between actions.

See Flow Designer Subflows for information on how to create a subflow.

Notification capability subflow

Item	Expected value
Inputs	Label: current Type: Reference.Inbound Event
Outputs	N/A

Transform the original payload, and save the final payload in the **transformed_payload** field.

Expected standard JSON Notification capability payload - Planning tool

Note:
The version attribute in the JSON payload is optional. Even if you do not provide the version attribute, the payload is processed successfully.

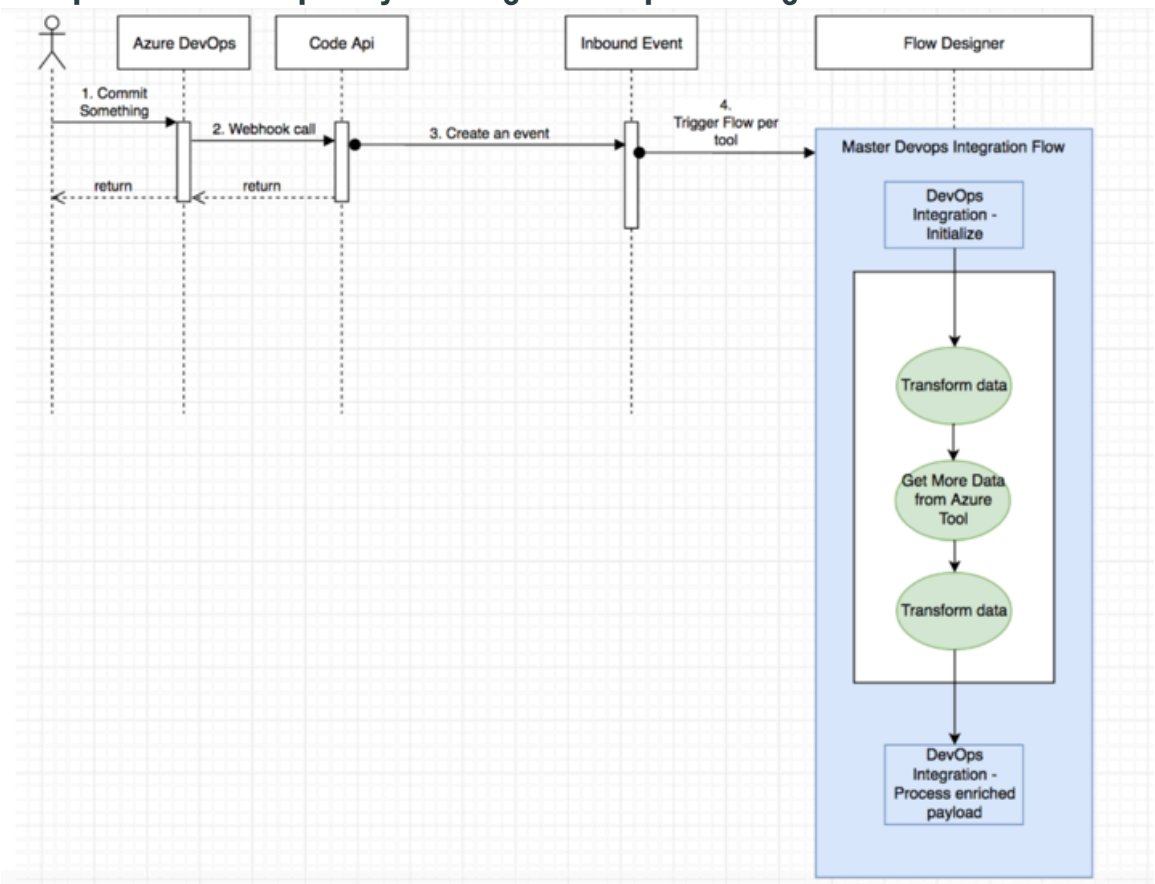
DevOps Notification capability flow diagram example - Coding tool



Connect capability subflow

The Connect capability is supported.

Item	Expected value
Inputs	Label: current Type: Reference.DevOps Tool Tool record for which the **Connect** button action is clicked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Item	Expected value
Outputs See subflow outputs.	• Label: connected Flag indicating the success or failure of the connection made to the target tool (true/false). • Label: errormessage String message displayed on the form for connection failure. The variable is an empty string if the connection is successful.

Connect errors shown on the DevOps tool form:

Connection failed

Subflow was executed successfully but the connection could not be made.

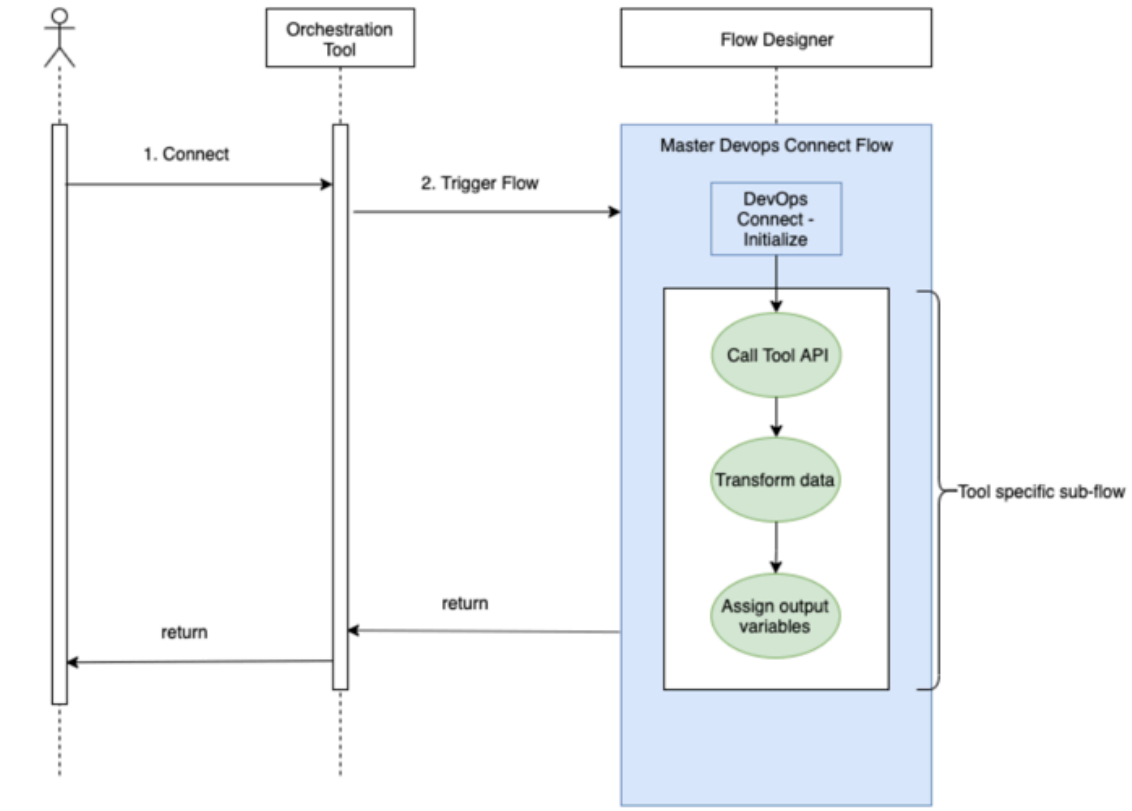
Error: Failed to get failure details from the tool specific connect flow

Subflow execution failed for an unknown reason.

Error updating the tool connect status

The connection_state attribute could not be updated for an unknown reason.

DevOps Connect capability flow diagram example - Orchestration tool



Discover capability subflow

The Discover capability is supported.

The Discover main flow is triggered during import request record creation. An import request has these states and messages.

State	Message
Requested	--
Processing	--
Completed	Updated <number> object(s) Found <number> objects with invalid toolId Found <number> objects failed validation
Error	• Unable to parse payload string from Subflow • discoverpayload is expected to be an array of objects • ImportRequest record does not have reference to tool table
Paused	--
Canceled	--
Unmatched	--

Input label	Type
details	(String)

Add custom fields for a planning tool integration

Add custom fields into your planning tool integration to improve configurability and access business-specific information, which facilitates more informed decision-making.

Before you begin

Role required: sn_devops.admin

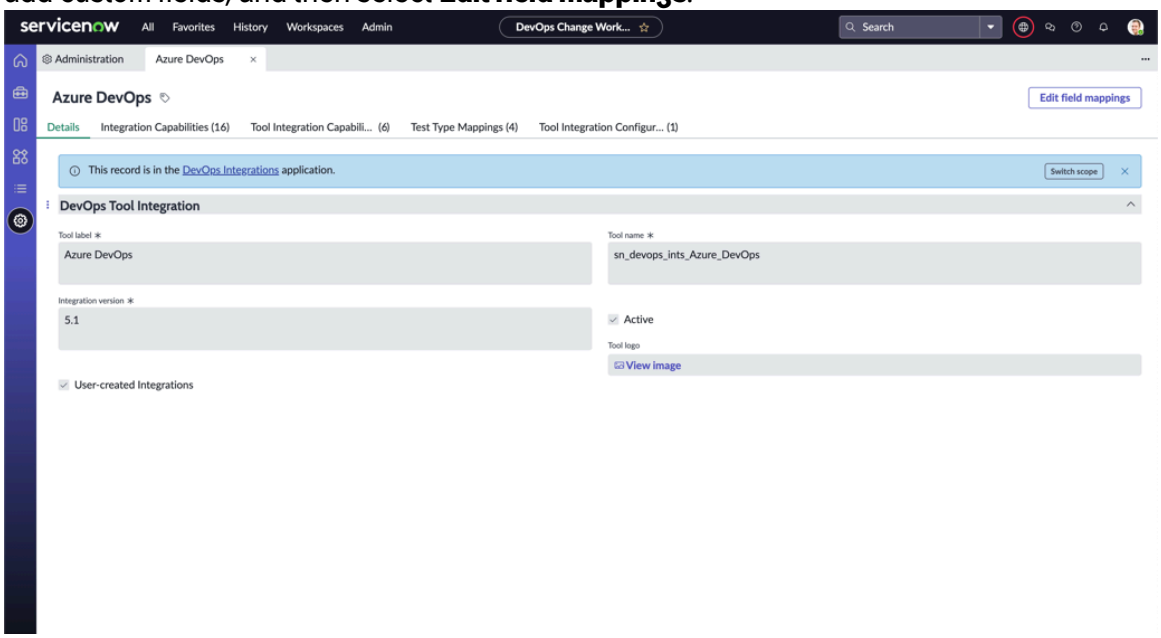
About this task

You can add custom fields to a planning tool integration by using record transformers. Create record transformers for each tool action, and add record transformer rules to map fields in your tool to fields in the DevOps data model. For example, consider a scenario where the Azure DevOps work item Id is defined as "adoid" during the import process. If you want to align it with the ServiceNow work item Id, you can achieve this by creating a record transformer for the import action. Within this transformer, you must establish rules to map the "adoid" field to the corresponding ServiceNow work item Id field. After the field mapping is created, every time an inbound event is received from Azure DevOps to bring in work items, the data will be processed through the configured transformer into the transformed payload.

Note:
This feature is available only for the base system plan type tool integrations except for ServiceNow Agile Development 2.0.

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** > **Administration**.
2. Select **Integrations > Tool integrations** from the Lists tab.
3. Select the planning tool integration for which you want to add custom fields, and then select **Edit field mappings**.



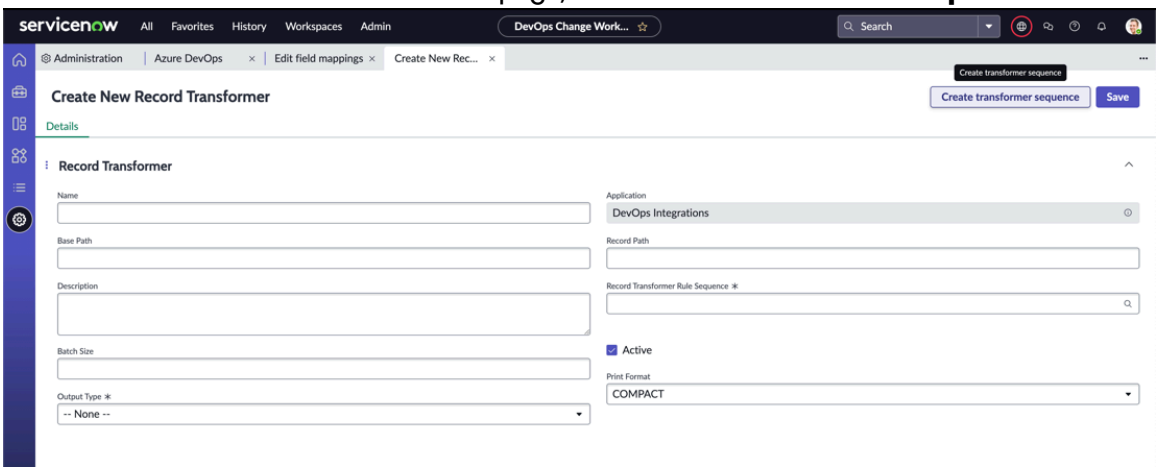
Note:
Verify that the application scope is selected as DevOps Integrations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

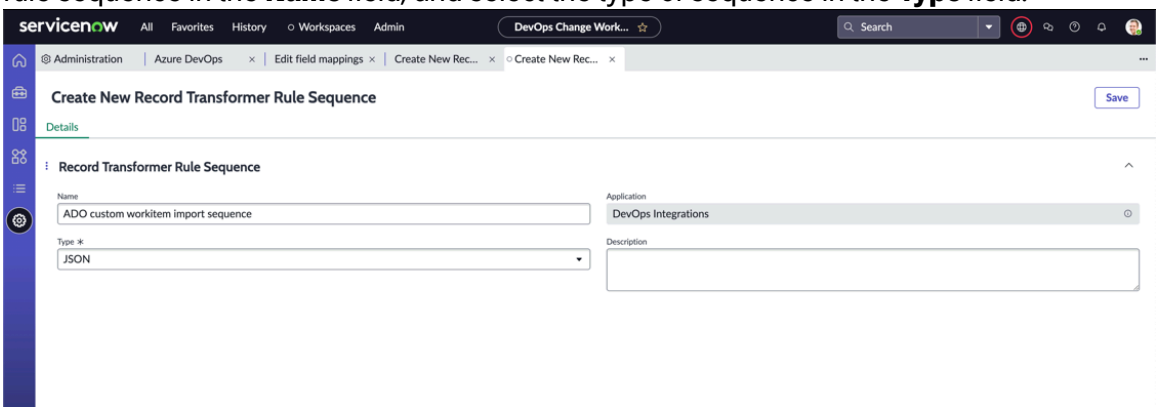
4. In the Edit field mappings page, select the **Create a record transformer** button in the Planning capability transformation section.

> **Note:**
> You must create a record transformer for each tool action. In this procedure, a record transformer is created for the Import action.

a. On the Create New Record Transformer page, select **Create transformer sequence**.



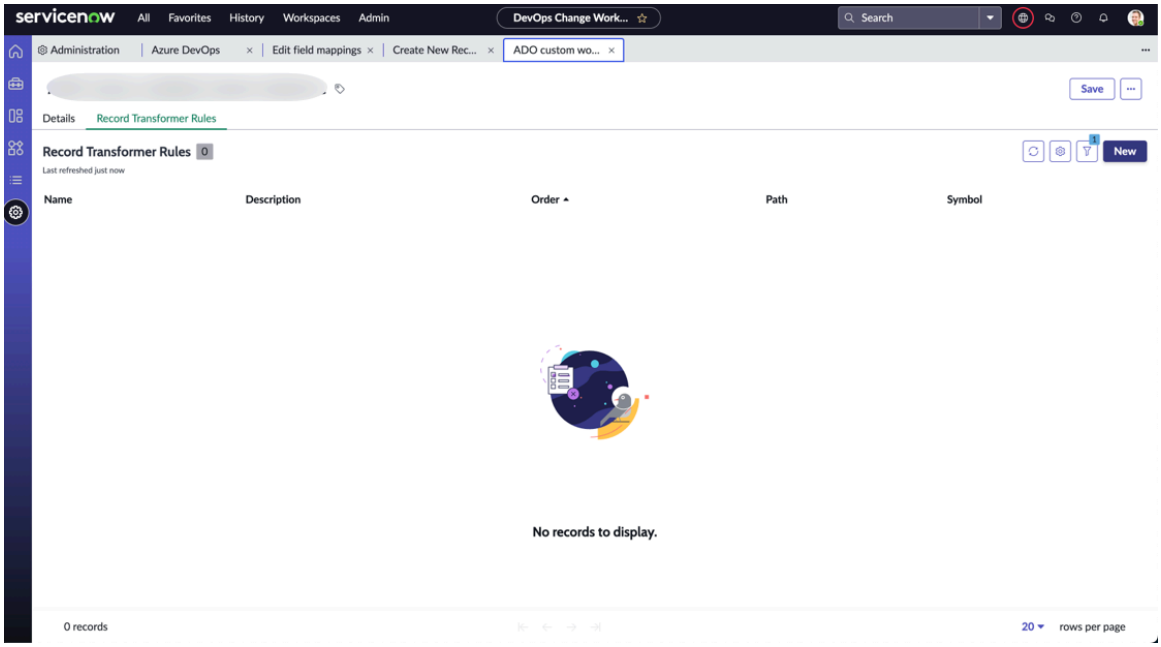
b. In the Create New Record Transformer Rule Sequence page, enter the name of the rule sequence in the **Name** field, and select the type of sequence in the **Type** field.



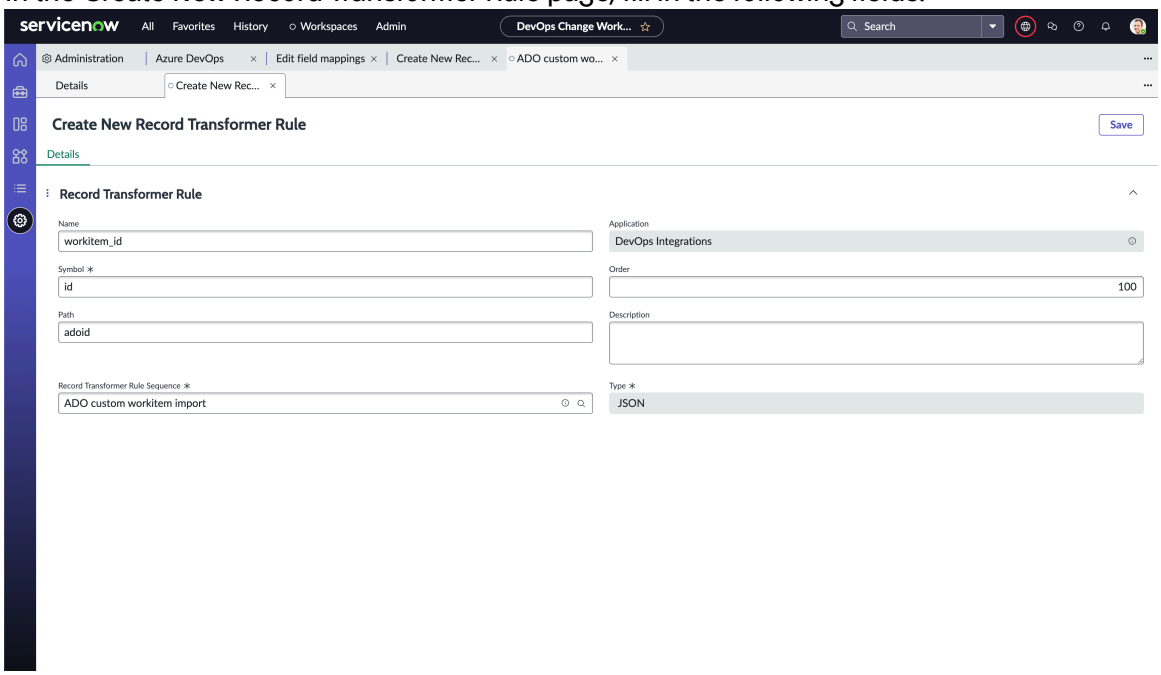
c. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Navigate to the transformer record page, and select the **Record Transformer Rules** tab, and then select **New**.



6. In the Create New Record Transformer Rule page, fill in the following fields.



Create New Record Transformer Rule

Field	Description
Name	Name of the rule in the sequence.
Symbol	Name of the field in the transformed payload to where the custom field value is extracted to.
Path	Payload path from where the custom field value is retrieved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order in which the rule must be run in the sequence.
Description	Text explaining the rule.

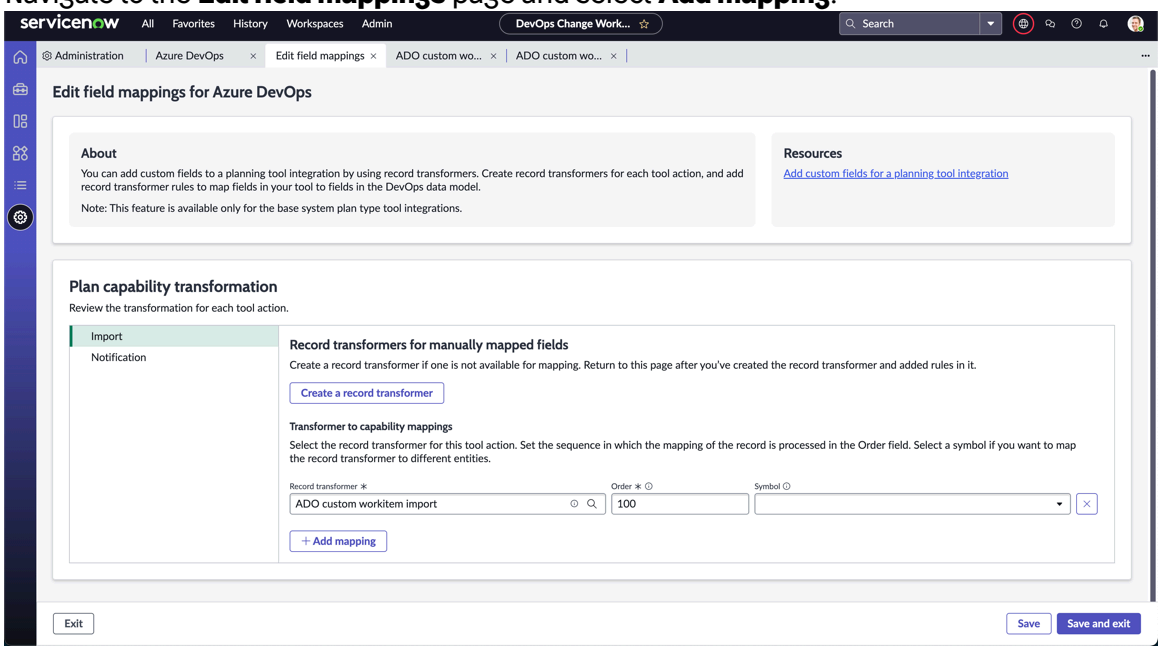
Note:
Multiple rules can also be added to a custom column from the JSON payload and more fields can be mapped. All the transformations added are considered in the transformed payload.

7. Select **Save**.
8. Navigate to the Details section of the transformer record, and fill in the following fields.

Record Transformer

Field	Description
Name	Name of the record transformer.
Base Path	Path to read from for the incoming payload.
Description	Text explaining the record transformer.
Record Path	Path to write to for the transformed payload.
Record Transformer Rule Sequence	Rule sequence that you want to associate with this record transformer.
Active	Option to make the record transformer active.

9. Select **Save**.
10. Navigate to the **Edit field mappings** page and select **Add mapping**.



a. Select the record transformer for the tool action.
b. Set the sequence in which the mapping of the record is processed in the **Order** field.
c. Select a symbol if you want to map the record transformer to different entities.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Symbol field here is different from the Symbol field in the Create New Record Transformer Rule form in step 6.

d. Select **Save**.

Note:
You can add multiple field mappings for an action as per your requirement.

Create a tool integration from the DevOps Change Workspace

Create a tool integration from the DevOps Change Workspace for integrating additional orchestration, planning, and coding tools that are not available by default in the DevOps Change Velocity application.

Before you begin

Complete the tasks specified in Getting started with DevOps Change Velocity.

Role required: sn_devops.admin or sn_devops.tool_owner

Set the application scope to the custom application.

About this task

Watch this video to understand how to create a tool integration from the DevOps Change Workspace.

https://player.vimeo.com/video/1085044419?h=ee7cb2545b&badge=0&autopause=0&player_id=0&app_id=58479

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace**.
2. In the DevOps workspace, navigate to **Administration** > **Integrations** > **Tool integrations**.
3. Select **New**.
   Alternatively, you can open an existing tool integration record, and then select **Edit** (for a custom tool integration that is not supported in the base system).

   Note:
   For planning tools that are not supported in the base system, you can select **Edit** in the tool integration record to navigate to the Transformation step, where you can add any additional field. For planning tools that are supported in the base system, you can select **Edit field mappings** to add any additional field. For information on adding additional fields for supported planning tools, see Add custom fields for a planning tool integration.

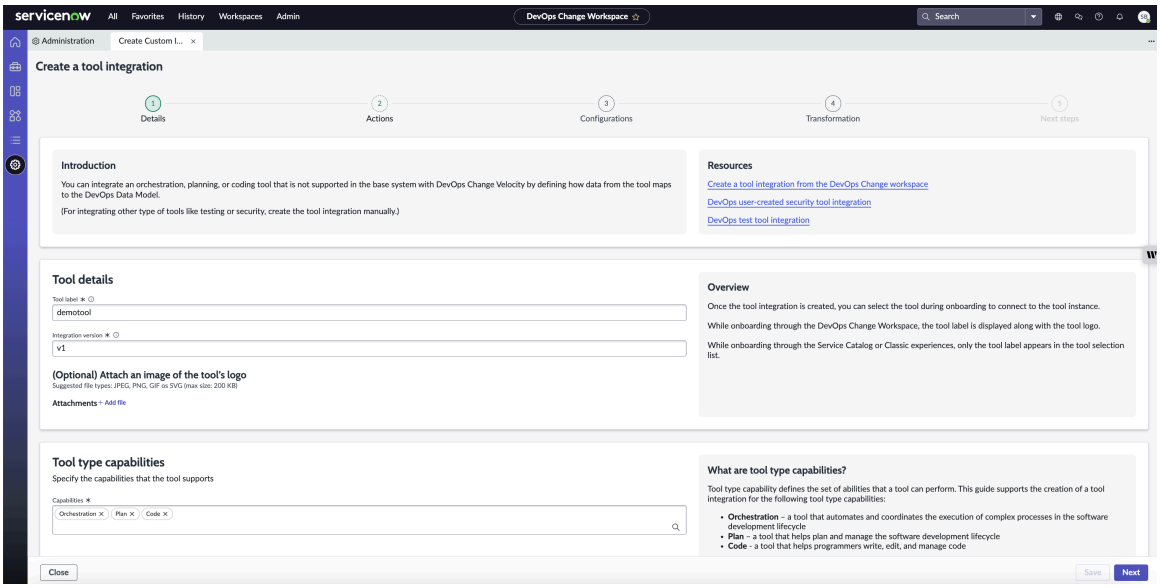
   The Details step is displayed.
4. In the Tool details step, fill in the following:

Details step fields

Field	Description
Tool label	Name of the tool integration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

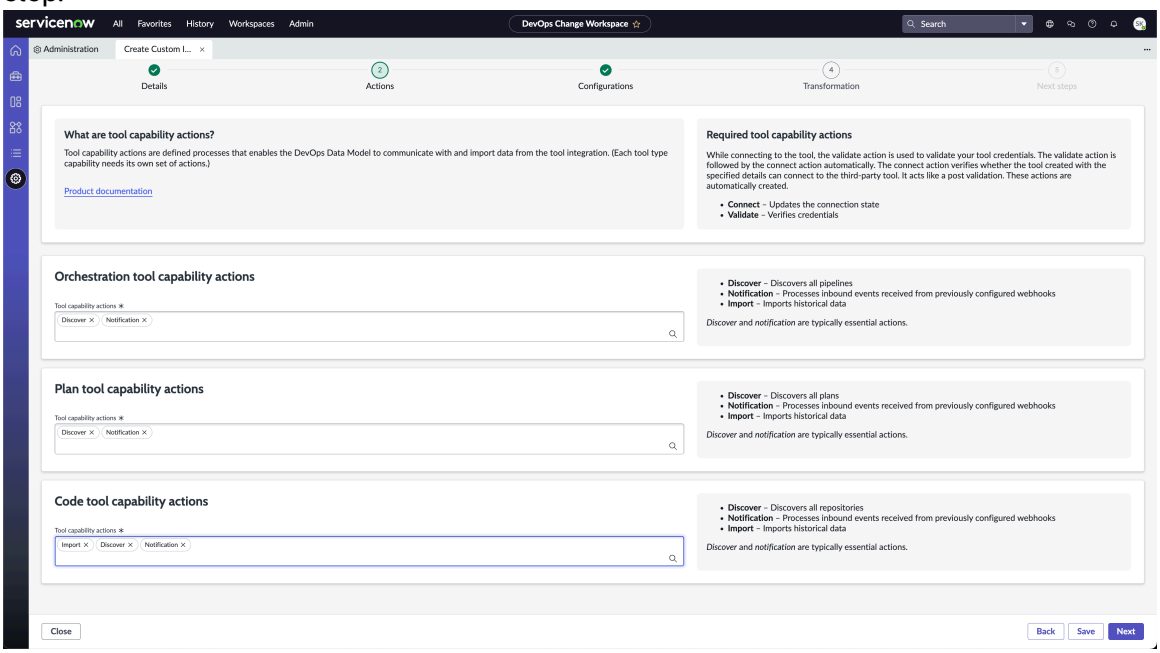
Field	Description
Integration version	API version of the tool integration.



5. **Optional:** Add an image of the tool's logo by selecting **+Add file**.
6. In the Tool type capabilities section, select the capability that your tool supports in the **Capabilities** field.

> **Note:**
> A tool can be mapped to multiple tool type capabilities. Tool integration is supported for orchestration, plan, and code capabilities.

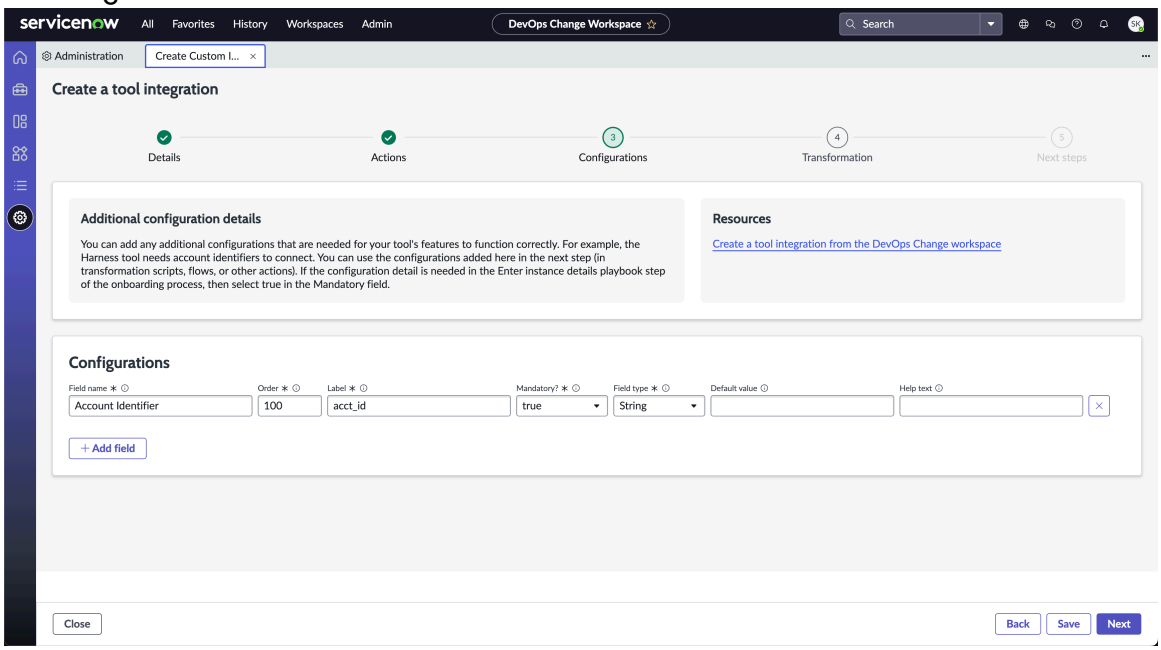
7. Select **Next**.
   A tool integration record is created.
8. In the Actions step, select the required actions for the tool capabilities selected in the previous step.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Tool capability actions are defined processes that enables the DevOps Data Model to communicate with and import data from the tool integration. Each tool type capability needs its own set of actions.

9. Select **Next**.
   Integration capability records for the selected actions are created with default values.
10. In the Configurations step, add any additional configurations that are needed for your tool by selecting **Add field**.



The fields configured here will be displayed as parameters for the playbook whenever you are onboarding a tool.

11. Fill in the following fields.

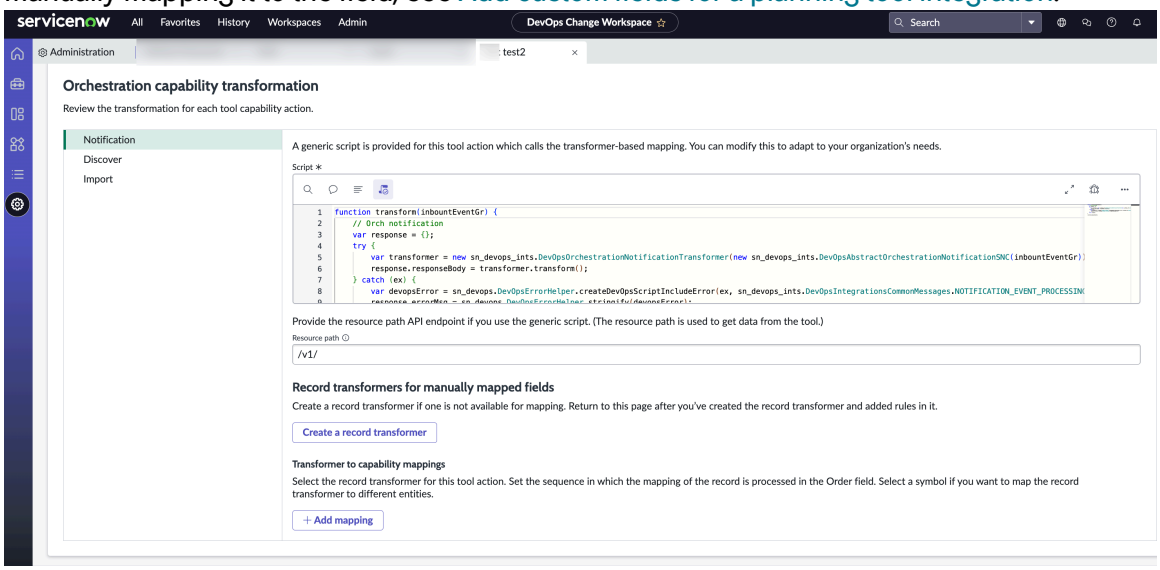
Configurations

Field	Description
Field name	Name of the configuration.
Order	Sequence in which this configuration is processed.
Label	Label of the configuration.
Mandatory	If marked true, this will appear as a connection detail when connecting an instance of this tool integration.
Field type	Type of the field, which can be string or password
Default value	Default value of this configuration.
Help text	If this configuration is mandatory, then the help text appears for this field in connection details when connecting an instance of this tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

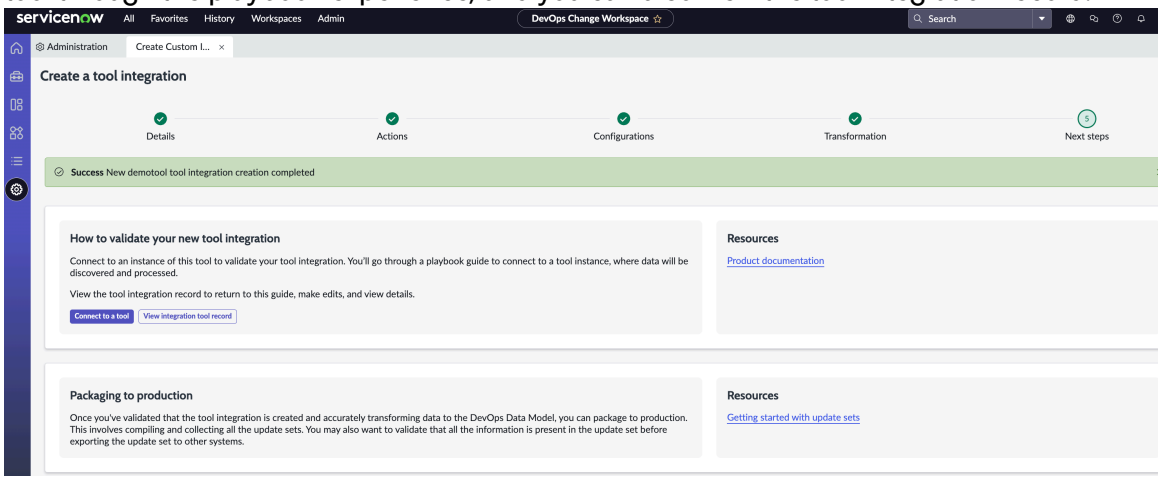
12. Select **Next**.
    A tool integration configuration record is created for the additional field.
13. In the Transformation step, review the transformation for each tool capability action, and add any custom field to the tool integration.
    A generic transform script is provided for each tool action. You can extend the generic script which calls the transformer-based mapping or create record transformers and manually map it to the fields. To extend, you can create a new script by extending the DevOpsGenericIntegrationHandlerSNC class to override the required method, and use this newly created script in the transform script.
    - Enter the resource path API endpoint in the **Resource path** field if you use the generic script.

    - If not already available, create a record transformer for the Notification, Discover, and Import actions for each of the capabilities by selecting the **Create a record transformer**, and add record transformer rules to map fields in your tool to fields in the DevOps Data Model. For information on creating a record transformer and manually mapping it to the field, see Add custom fields for a planning tool integration.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

14. In Next steps, you can validate your tool integration by connecting to an instance of the tool through the playbook experience, and you can also view the tool integration record.



Note:
On selecting the **Connect to a tool** button, you will see the newly created tool integration in the list of tools available to connect.

What to do next

Creation of webhooks to send inbound events to DevOps Change Velocity using token

Creation of webhooks to send inbound events to DevOps Change Velocity using token

You must create webhooks to send inbound events to DevOps Change Velocity using token based authentication.

To send inbound events to a ServiceNow instance, you must use the following API endpoint structure:

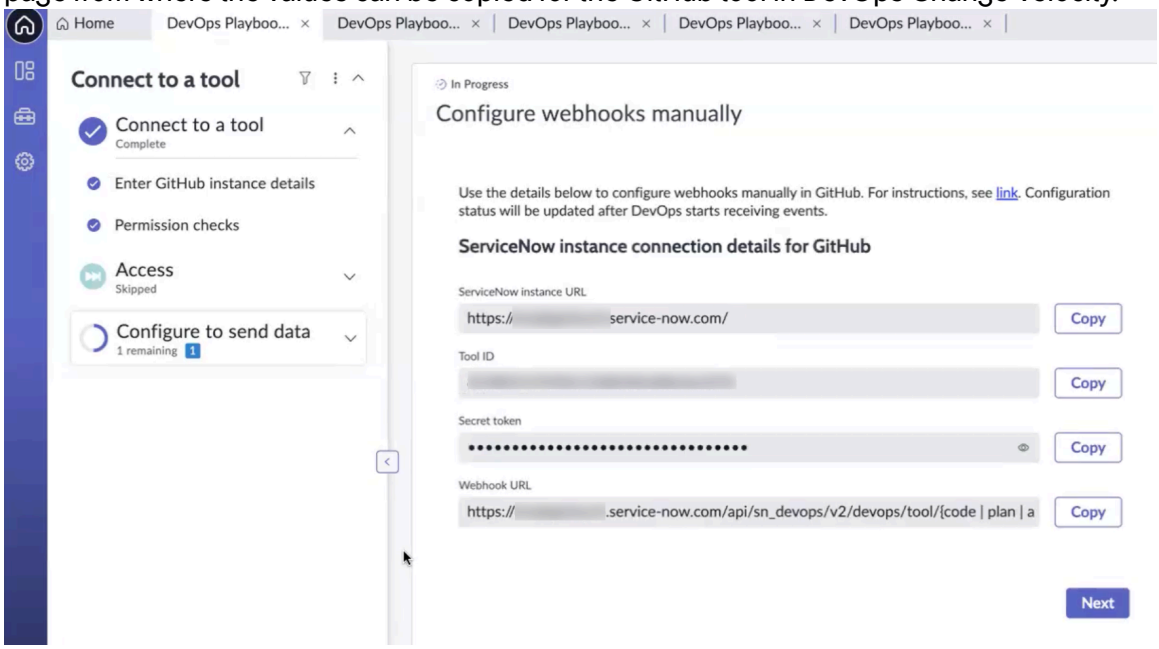
```
<instance_url>/api/sn_devops/v2/devops/tool/{capability}?toolId=
<toolId>
```

where capability can be plan, code, or orchestration.

You can copy the details like the tool Id, instance URL, and so on by selecting **Configure manually** from the tool record or in the configure step while onboarding the tool. You can then select **Copy** in the appropriate field to copy the value to your clipboard. The field label changes to **Copied**, but you can copy multiple times. The following image displays the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

page from where the values can be copied for the GitHub tool in DevOps Change Velocity.



For token authentication, you must pass the token as part of the authorization header or query parameters as the endpoints are secured. You can use one of the following methods:

- Pass the token as a header by using the following format: `Header Name: Authorization Header Value: sn_devops.DevOpsToken <ToolId>:<Token>`, where <ToolId> is the ID of the tool, and <Token> is the authentication token copied from the Tool Record page.
- Pass the token as a query parameter in the URL: `<instance_url>/api/sn_devops/v2/devops/tool/{capability}?toolId=<toolId>&ni.nolog.token=<Token>`, where <ToolId> is the ID of the tool, and <Token> is the authentication token copied from the Tool Record page.

For Basic authentication, you can use the following V1 endpoint: `https://user:password@<instance_url>/api/sn_devops/v1/devops/tool/{capability}?toolId=<toolId>`, replace user and password with your ServiceNow credentials.

If you have a custom tool or a different authentication method, you can implement your own authentication logic. For example, you can implement an authenticateToken function in your handler class. The function should verify the token and ensure proper authentication. You must have the admin role in ServiceNow to implement your own authentication logic.

Update third-party tool credentials in DevOps Change Velocity

If your tool credential has changed, you must update the credentials in your ServiceNow instance to avoid getting disconnected.

Before you begin

Role required: sn_devops.admin

Procedure

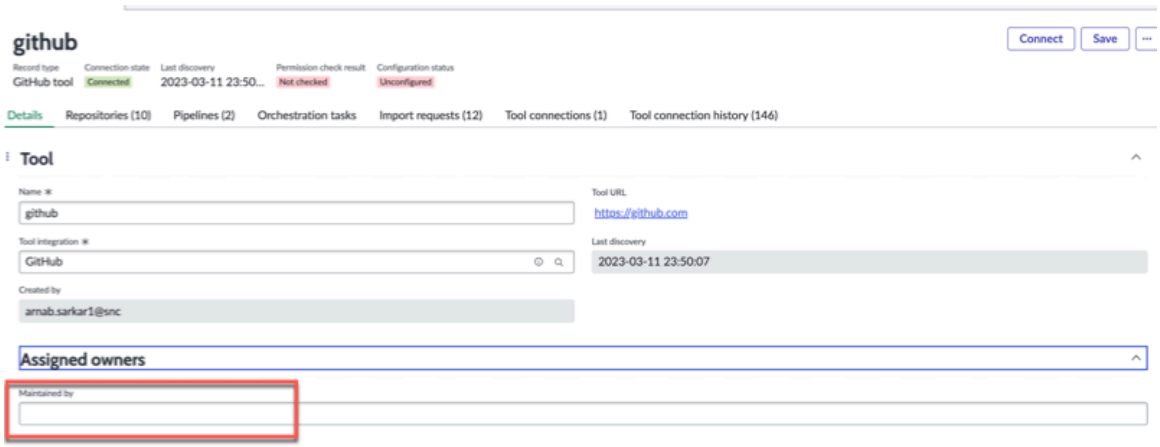
Update your tool credentials using one of the following methods.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Notifications on tool credential expiration

Notifications are sent to tool users on expiration of tool credentials to alert them. Notifications are also sent proactively before the expiration of tool credentials for GitHub tools created with basic authentication. This enables tool users with the sn_devops.tool_owner or sn_devops.admin roles to update the tool credentials and prevent any loss of data.

A universal task is created and assigned to users with the sn_devops.tool_owner role who are part of any user group specified in the **Maintained by** field, and any user with the sn_devops.admin role. They will be notified of the universal task through notification (in the bell icon), email, and an open task in the workspace home page.



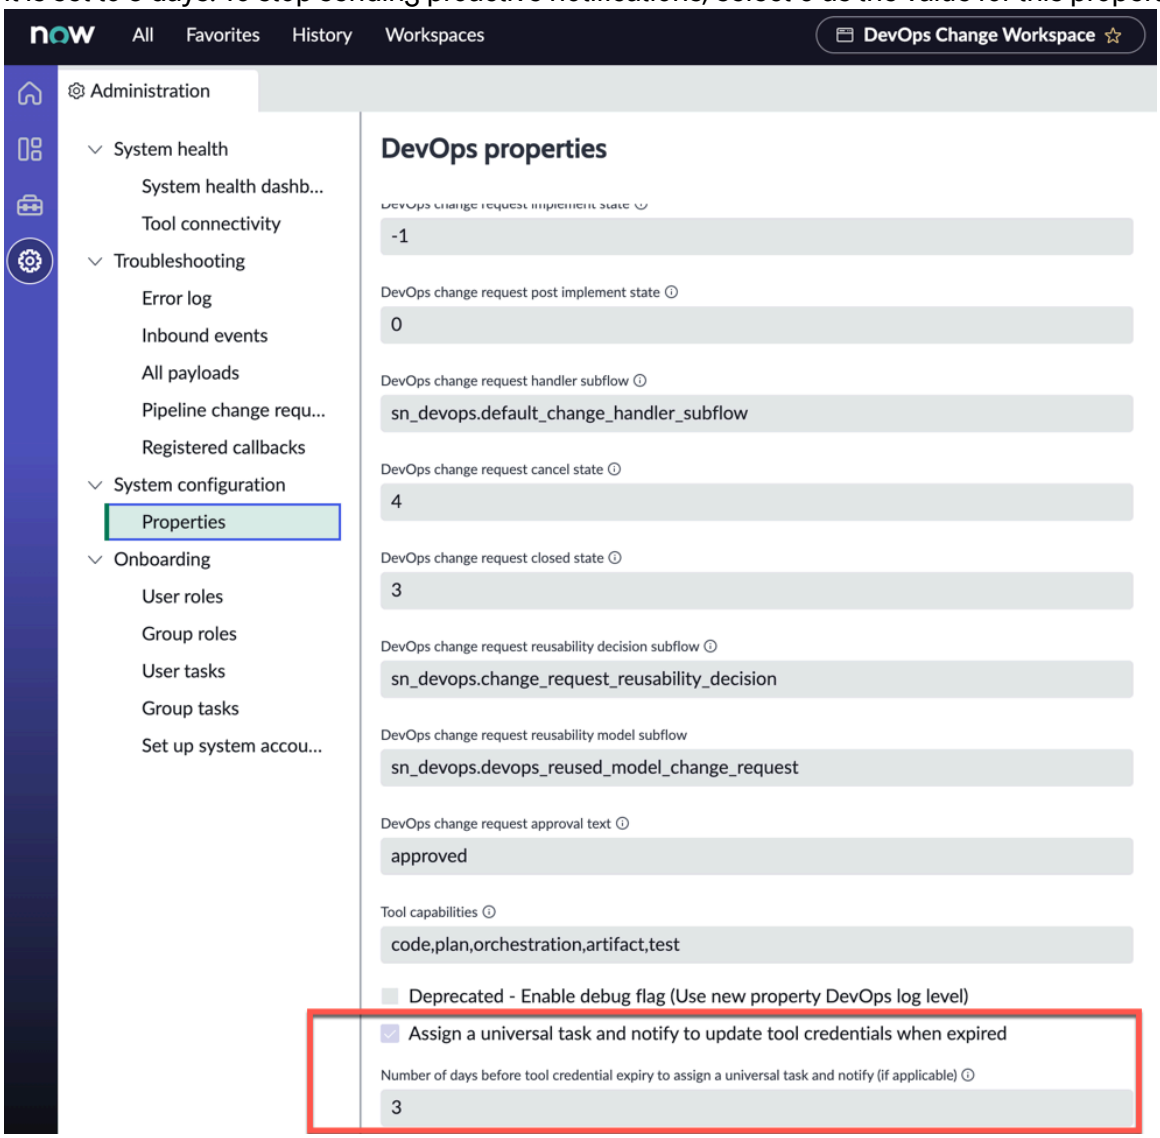
Notifications are also displayed in the tool record in the form of a banner message to any user with access to the tool when the tool credentials expire. But the credentials can be updated only by users with the sn_devops.tool_owner or sn_devops.admin role.

The credentials expiration check happens in the system every one hour. If your tool credentials have expired, it might take a maximum of one hour for the system to send notifications.

For GitHub tools created with basic auth, notifications are also sent proactively before the expiration of tool credentials. Apart from the universal task and banner notification, a field message is also displayed in the case of proactive expiration notifications. You can set the number of days before which expiration notifications must be sent in the **Number of days before tool credential expiry to assign a universal task and notify (if applicable)** property. By default,

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

it is set to 3 days. To stop sending proactive notifications, select 0 as the value for this property.

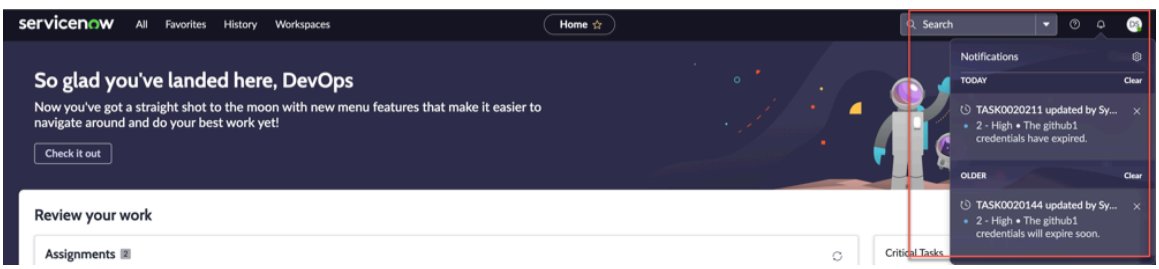


If you want to stop sending notifications for expired credentials after expiry, disable the *`Assign a universal task and notify to update tool credentials when expired`* property. For more information, see DevOps Change Velocity properties.

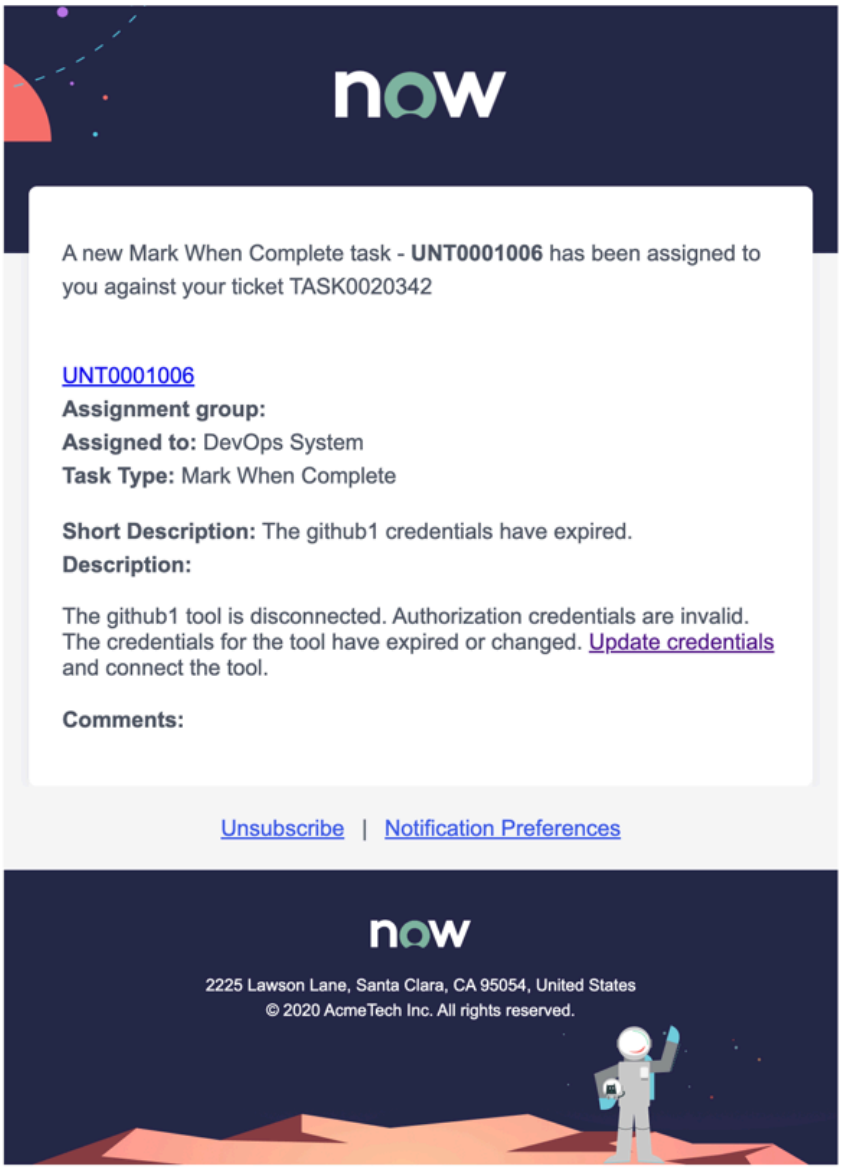
The following types of notifications are sent:

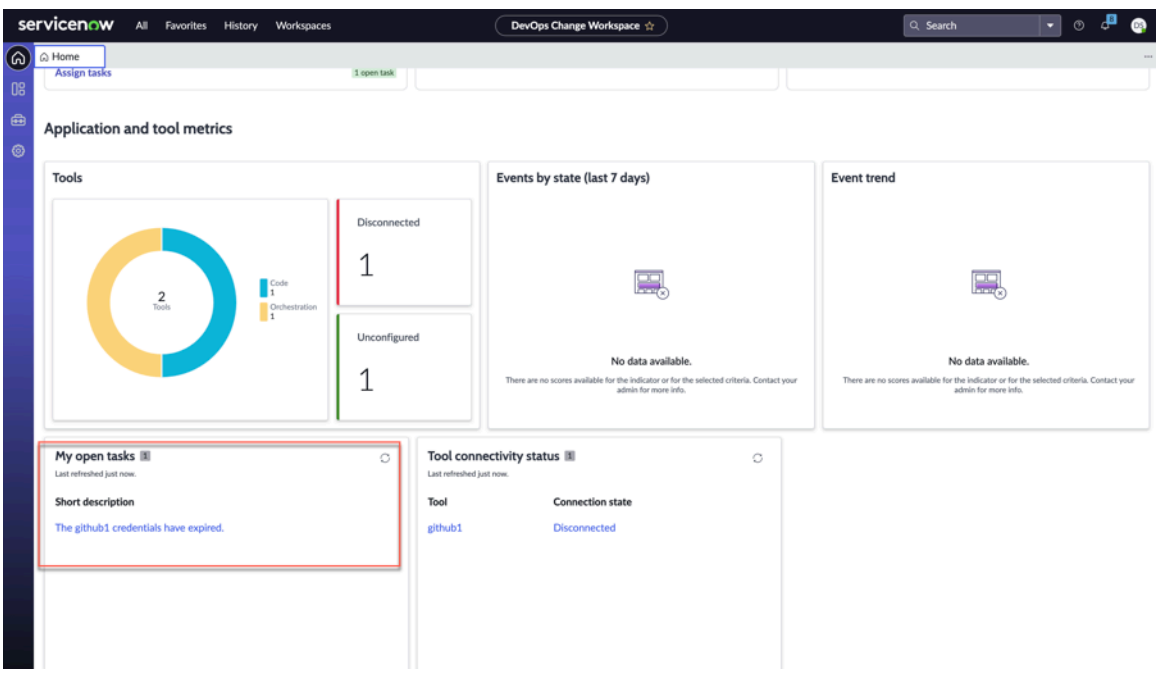
Universal task

A universal task is created and notifications are sent to users with the sn_devops.tool_owner role who are part of any user group specified in the **Maintained by** field, and any user with the sn_devops.admin role.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

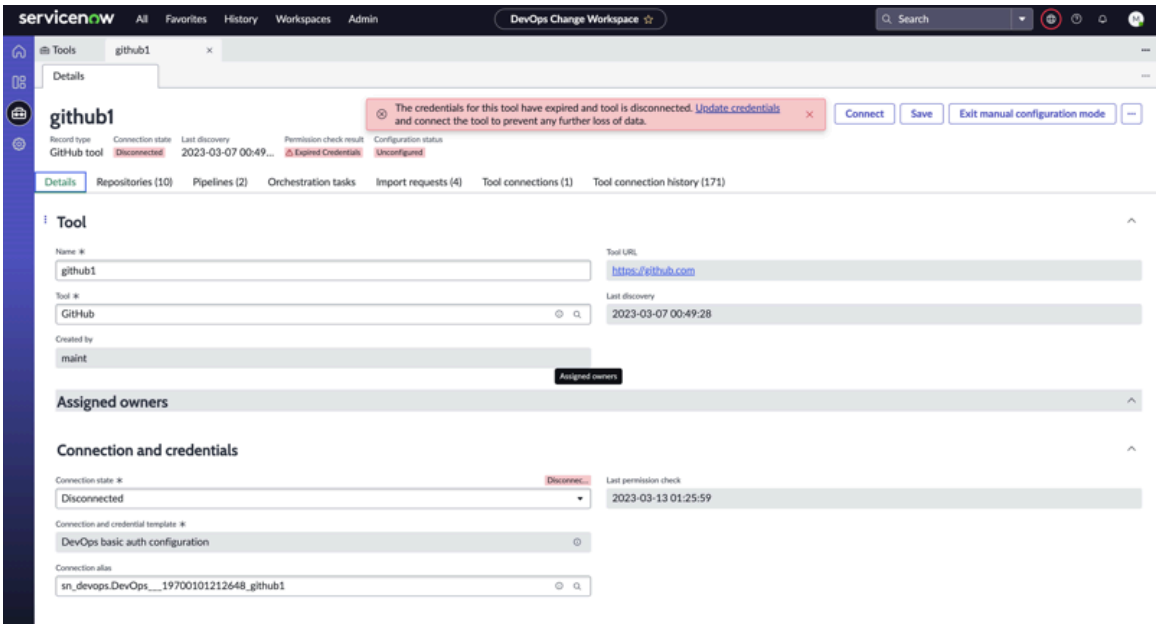




© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

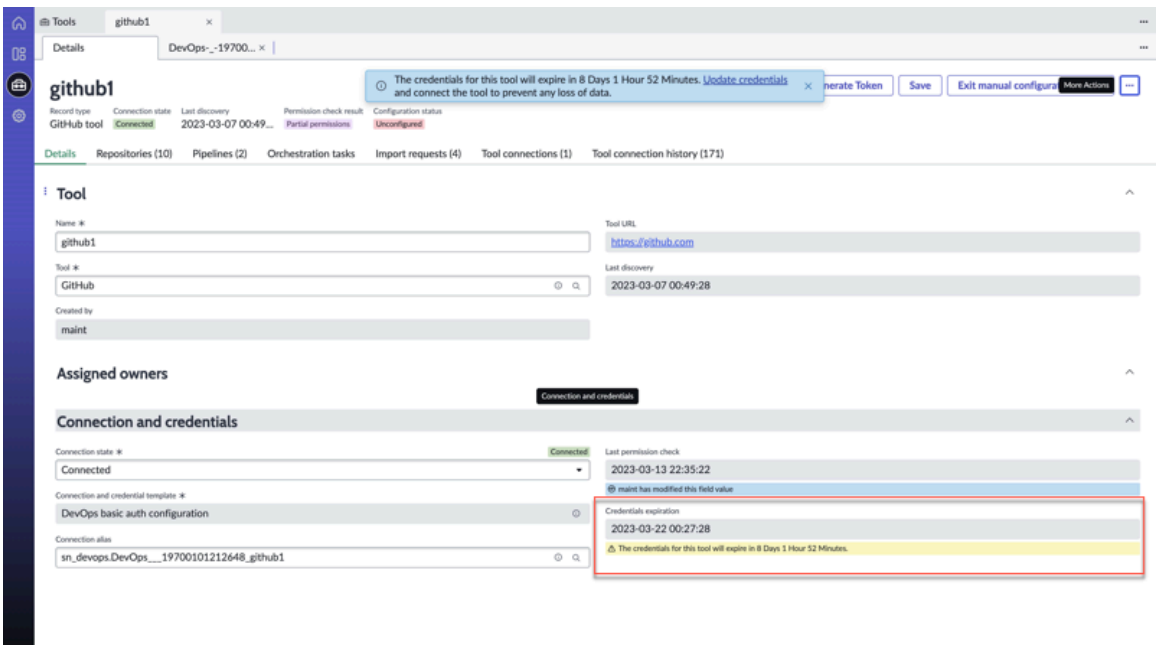
Banner message

A banner message is displayed on the tool record to all users with access to the tool record.



Field message

A field message is displayed on the **Credentials expiration** field in the tool record for a GitHub tool created with basic auth.



When the credentials of your tool expire, the tool gets disconnected. You can select the **Update credentials** link in the notifications, and update your tool credentials. After the credentials are updated, connect to the tool again to start receiving data. For information on updating tool credentials, see Update third-party tool credentials in DevOps Change Velocity.

Applications in DevOps Change Velocity

In DevOps Change Velocity, an application collects all the up-to-date data that connected tools send about plans, repositories, and pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An application is needed to group plans, repositories, and pipelines together which enable tracking automatically and provide associations for DevOps data such as commits linked to work items. You can link the application with other ServiceNow products, including DevOps Config.

You must create an application to enable traceability for user stories, commits, test results, and more. Associating plans, repositories, and pipelines to an application also enables pipeline modeling, change governance, and metric reporting. In the DevOps Change, this procedure generates a single DevOps application record (sn_devops_app) that is used by both DevOps and DevOps Config (if installed).

When DevOps Config is installed, the DevOps application record is also linked to a CDM application record (sn_cdm_application). The CSDM application model (name, owner, manufacturer) functions as the link between ServiceNow DevOps products.

Create an application - Workspace

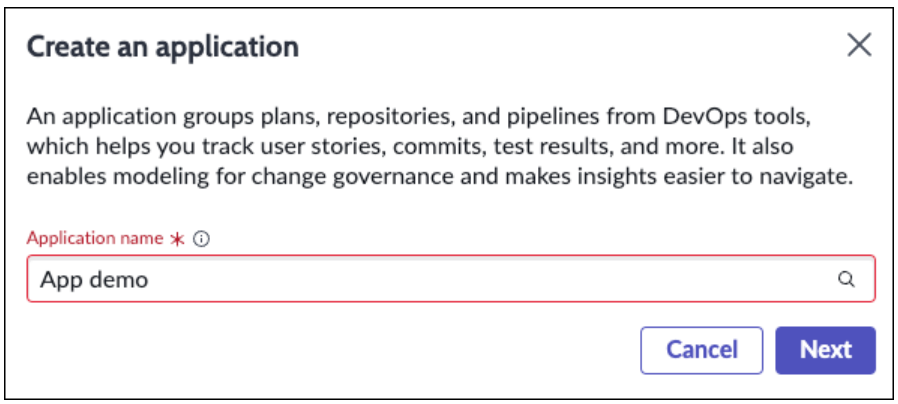
Create applications using the DevOps Change Workspace and associate pipelines, plans, and repositories to it.

Before you begin

Role required: sn_devops.admin or sn_devops.app_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace**.
2. You can create an application using any of the following options:
   - Select **Create an application** from the Home page.
   - Select the **Applications** ( ) module and select **New**.
3. In the Create an application modal, in the **Application name** field, enter the name for your application.



You can either create a new application, which will create a new application model with the same name, or select an existing application model, which will create an application with the same name as the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Type	Result
New application	○ The system generates a new DevOps application, a new application model, and a new SDLC component (SDLC-C) in the CMDB. ○ The SDLC-C is assigned the same name as the new application. ○ If the DevOps Config application is installed, then DevOps associates the application to the CDM application.
Existing application model	The system generates a new DevOps application from that application model. ○ The application is given the same name as the application model. ○ If an SDLC component exists for the application model, then DevOps associates the SDLC-C to the new application. ○ If an SDLC component doesn't exist for the application model, then DevOps generates a new SDLC-C with the same name as the application model. ○ If DevOps Config is installed, then DevOps creates a CDM application and associates the SDLC-C to the application.

The Create an Application playbook activity opens.

4. In the Enter application details playbook activity:

   a. Select the **Business app** in CMDB that you want linked to your application.

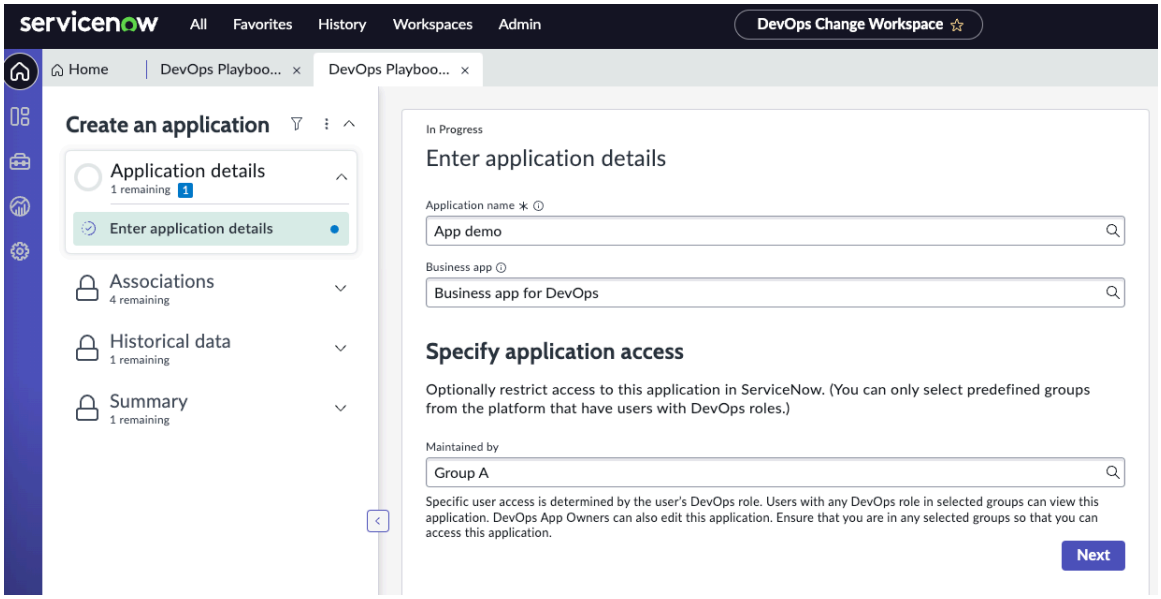
   b. (Optional) Add user groups to the **Maintained by** field to control access to the application.

      You can select any group that has at least one user with DevOps roles. When user groups are added:

      - Users with DevOps App Owner role or DevOps Administrator role can edit the application.
      - Users having other DevOps roles can view the application.
      - Users having DevOps roles, but aren't part of the groups added can't view the application.

   c. Select **Next**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



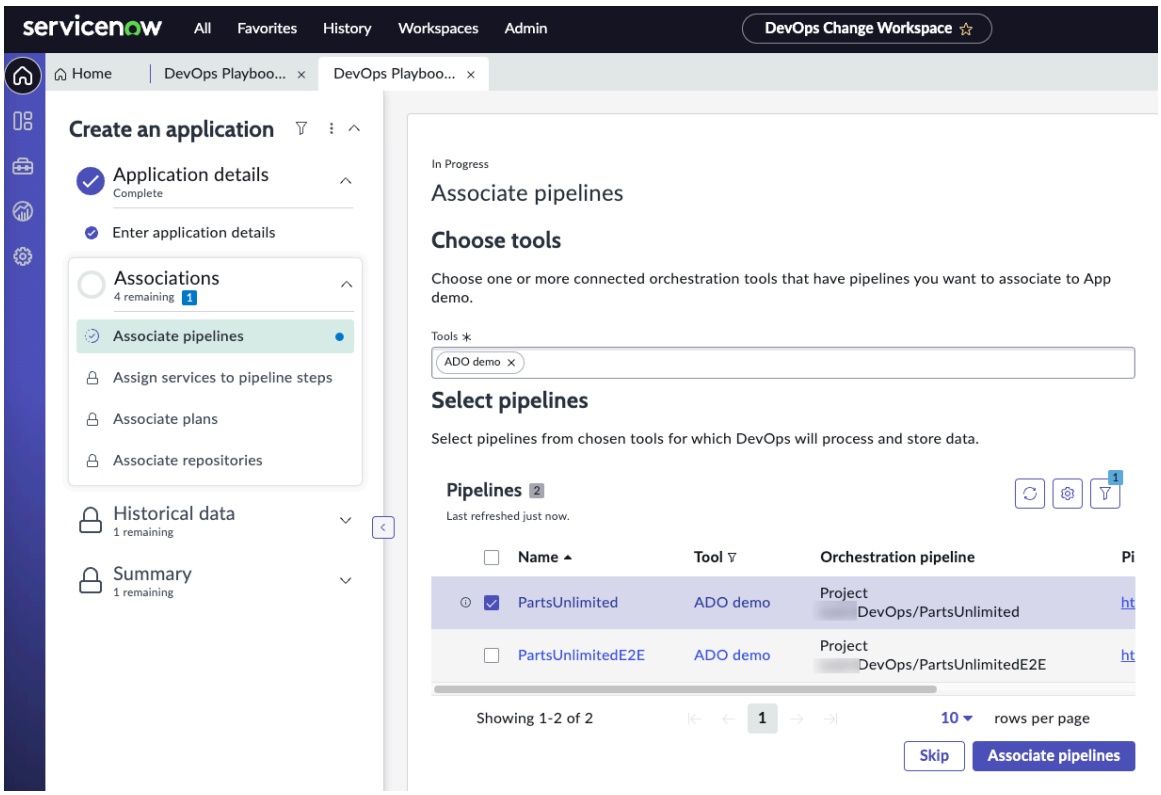
5. In the Associate pipelines playbook activity:

   a. Add the orchestration tools whose pipelines you want to associate with the app to the **Tools** field.

   > **Note:**
   > You can skip this step if you haven't connected to an orchestration tool, or if you don't want to associate pipelines.

   b. Select the pipelines that you want to associate with the app.

   c. Select **Associate pipelines**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Assign services to pipeline steps playbook activity:

   a. For each selected pipeline, all steps or stages are imported for the last successful execution. You can select the following for each pipeline step:

      i. **Pipeline step type**: Select a step type for which you want to assign a service.

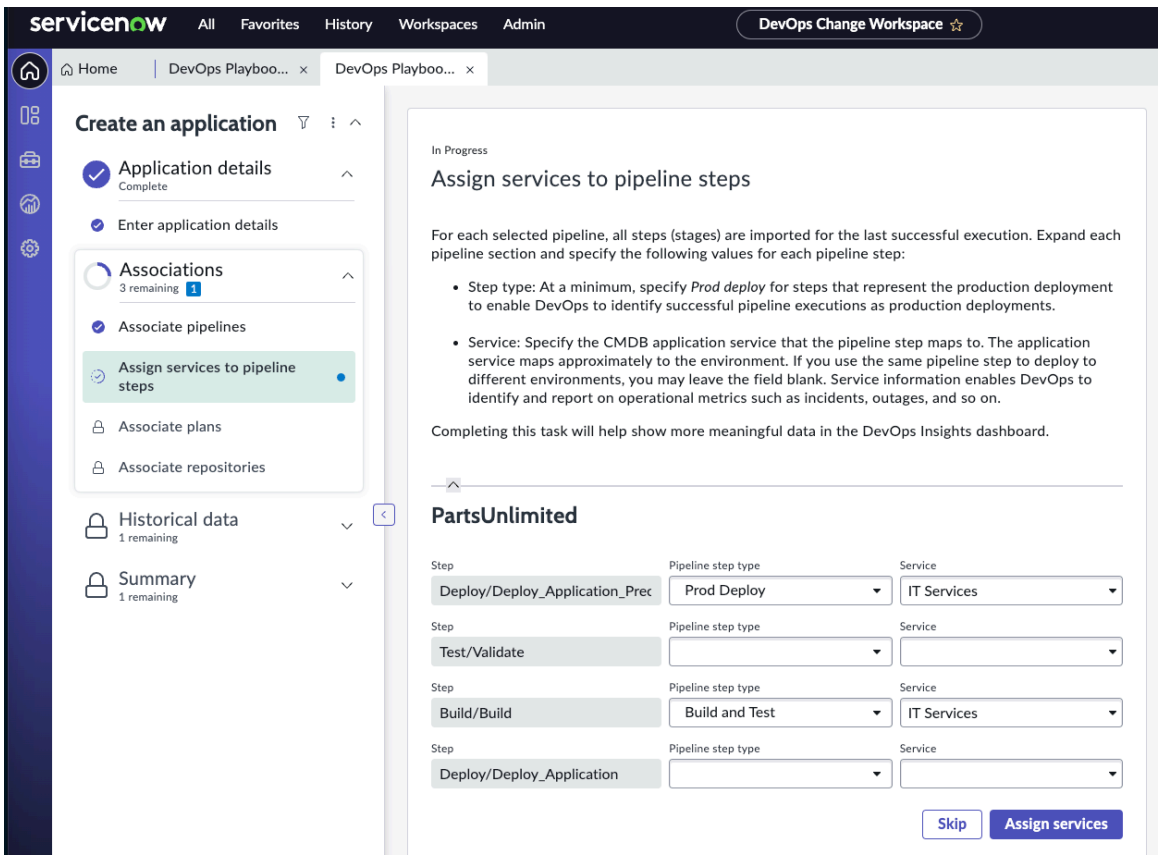
      Tip:
      Specify at least the *`Prod deploy`* step type for steps that represents the production deployment to enable DevOps to identify successful pipeline executions as production deployments.

      ii. **Service**: Select the CMDB application service that the pipeline step maps to.

      Application service maps approximately to the environment. If you use the same pipeline step to deploy to different environments, leave the field empty. Service information enables DevOps to identify and report on operational metrics such as incidents, outages, and so on.

   b. Select **Assign services**.

   Note:
   You can skip this step if your pipeline doesn't have any steps or if you haven't associated pipelines.



7. In the Associate plans playbook activity:

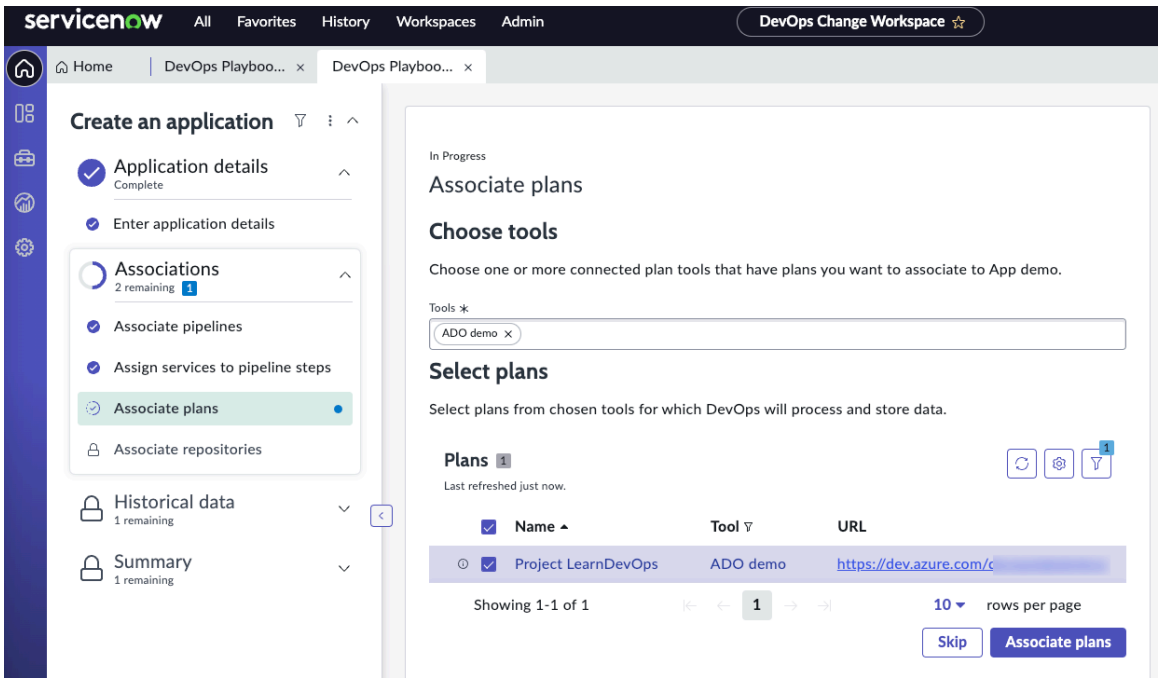
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Add the planning tools whose plans you want to associate with the app to the **Tools** field.

> **Note:**
> You can skip this step if you haven't connected to a planning tool, or if you don't want to associate plans.

b. Select the plans that you want to associate with the app.

c. Select **Associate plans**.



8. In the Associate repositories playbook activity:

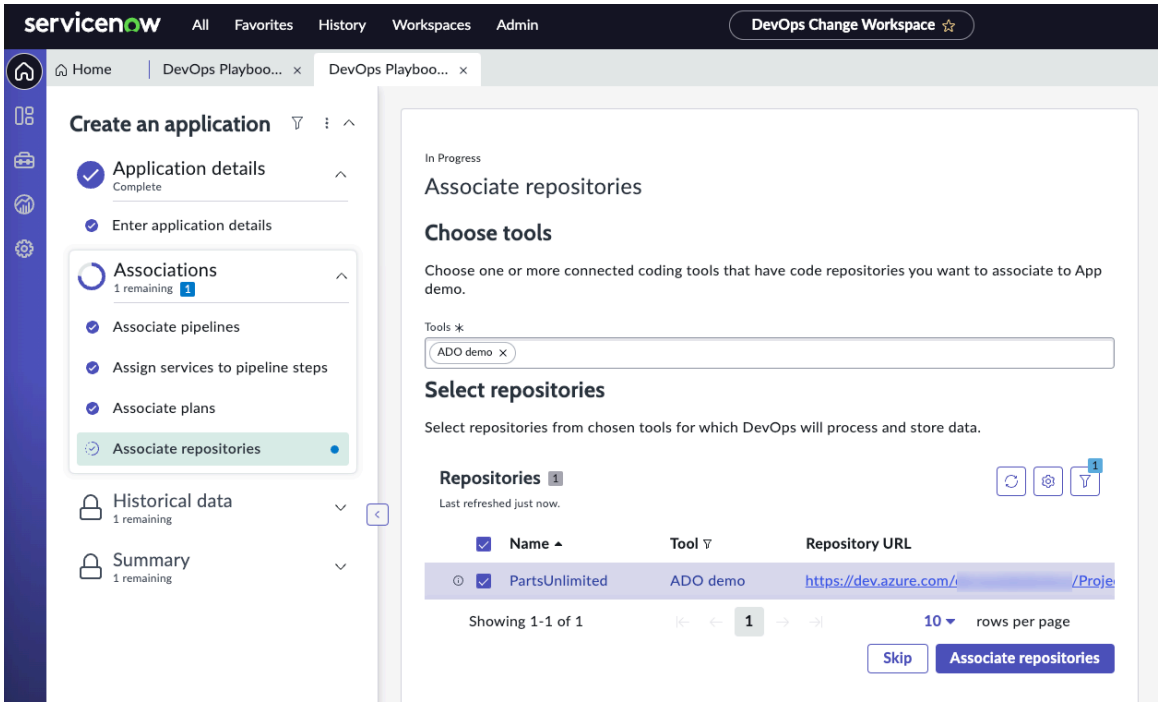
a. Add the coding tools whose repositories you want to associate with the app to the **Tools** field.

> **Note:**
> You can skip this step if you haven't connected to a coding tool, or if you don't want to associate repositories.

b. Select the repositories that you want to associate with the app.

c. Select **Associate repositories**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

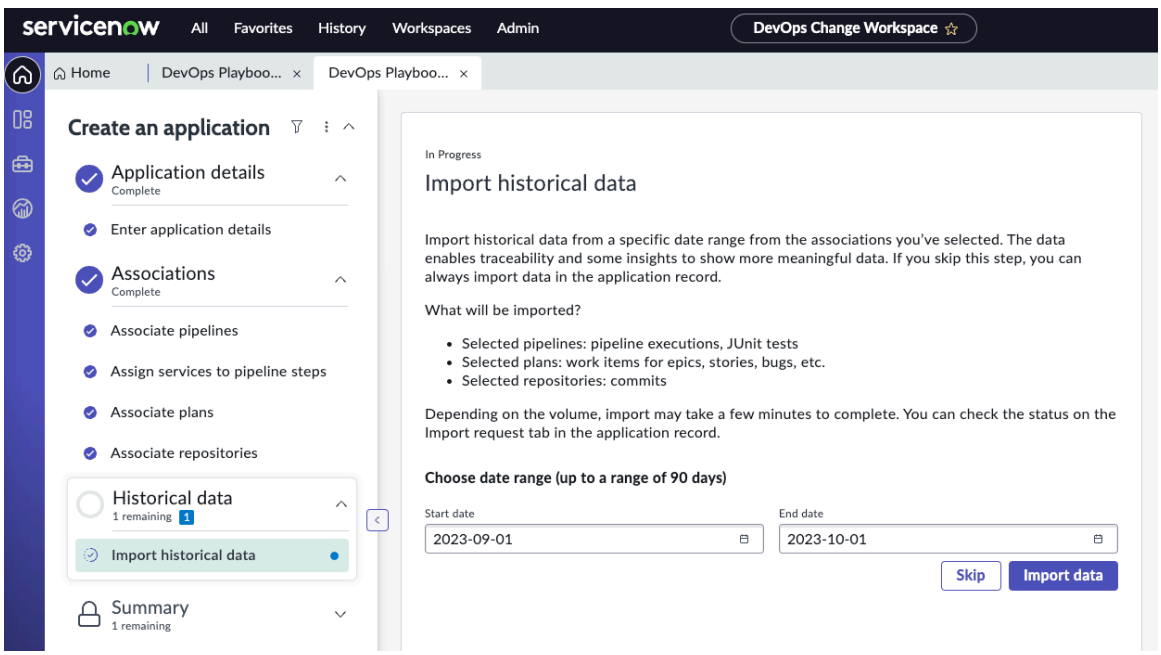


9. In the Import historical data playbook activity:

a. Select the start and end dates for import. You can import up to 90 days of data.

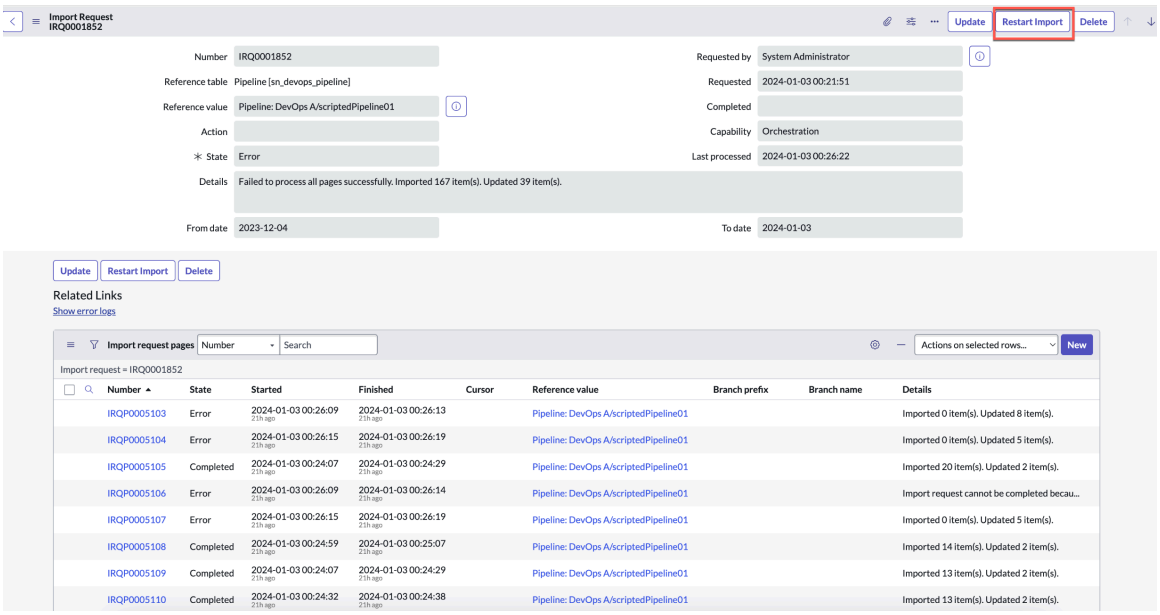
> **Note:**
> You can skip this step if you don't want to import any data from the select pipelines, plans, and repositories.

b. Select **Import data**.

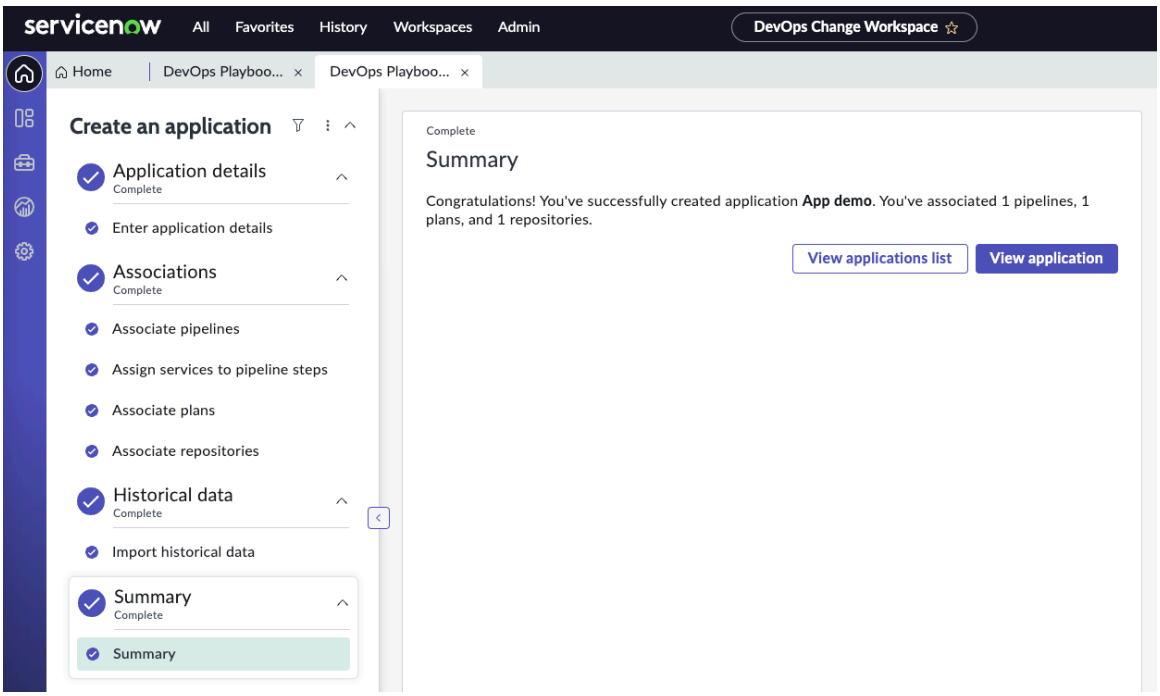


> **Note:**
> If your import request could not be completed due to an error, you can select **Restart Import** in the corresponding **Import Request** record to retry the import.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. From the **Summary** page, select **View application** to review the details of the created application.



If you skipped associating objects to the application or if you want to associate other objects, see Associate tool objects to applications - Workspace.

Associate tool objects to applications - Workspace

After creating an application, you can associate plans, repositories, and pipelines with it. Applications group plans, repositories, and pipelines from DevOps tools, which provides traceability to user stories, commits, test results, and so on.

Before you begin

Role required: sn_devops.admin or sn_devops.app_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace** > **Applications**.
2. Select the application.
3. From the application record page, select the tab for the object type that you want to associate.
4. Select **Save**.

Create an application - Classic

Create applications using the Classic UI or the Service Catalog.

Before you begin

Role required: sn_devops.admin or sn_devops.app_owner

Procedure

1. You can create applications using the Classic UI, or the Service Catalog.
   - Classic UI: Navigate to **All** > **DevOps** > **Apps & Pipelines** > **Create App (legacy)**.
   - Service Catalog: Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintatin Items** > **Create DevOps Application** > **Try It**.
2. On the Create DevOps Application form, choose whether to create a new application and new application model or to base the application on an existing application model.
3. Select **Submit**.

What to do next

You can view the list of all the applications from the Apps page in the Classic UI. Navigate to **All** > **DevOps** > **Apps & Pipelines** > **Apps** and select your application.

For each application, you can:

- Update details such as#**Business app**, **State (Active)**, and#**Log Level**. Applications marked as **Active** are polled daily for updates to associated plans, repositories, and pipelines.
- Control access to the application by adding user groups to the **Maintained by** field. You can select any group that has at least one user with DevOps roles.

  When user groups are added:
  - Users with DevOps App Owner role or DevOps Administrator role can edit and associate objects with the application.
  - Users having other DevOps roles can view the application.
  - Users having DevOps roles, but aren’t part of the groups added can't view the application.

  Note:
  DevOps admins can always see and edit everything in DevOps.

- View and associate plans, repositories, pipelines, and artifact repositories. Associate the appropriate tool objects to the application to ensure that all the DevOps data is grouped and tracked. For more information, see Associate tool objects to applications – Classic.
- Delete the application record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Associate tool objects to applications – Classic

After creating an application, you can associate plans, repositories, pipelines, and artifacts with it.

Before you begin

Role required: sn_devops.admin or sn_devops.app_owner

Procedure

1. Navigate to **All** > **DevOps** > **Apps & Pipelines** > **Apps**.
2. Select the application.
3. From the application record page, select the related list for the object type that you want to associate.

Accelerating your DevOps change process

Enable the change acceleration feature of DevOps Change Velocity for automatic change request creation in your pipeline, and use change approval flows and policies to automate approval under certain conditions.

Note:
ServiceNow Change Management must be installed for change acceleration.

Enable and set up change control when you model your pipeline in DevOps:

- Model an Azure pipeline in DevOps
- Model a GitLab basic CI pipeline in DevOps
- Model a Jenkins pipeline in DevOps

You can view details for active change requests by navigating to **DevOps** > **Orchestrate** > **Pipeline Change Requests**.

Change control process

When change control is enabled for a job in your DevOps development pipeline, a change request is automatically created and set to Assess state to request approval for the execution of the current stage or job if an assignment group is added for the change request. Change requests can be approved automatically by configuring conditions in a change approval policy.

Pipeline steps can be configured to enable change receipts, which do not pause the pipeline. Change requests created with change receipts enabled include all pipeline data, but do not require approval to proceed in the pipeline and the change request will be in post implement states. For change requests created without enabling change receipt, the pipeline will be paused until the change request is approved, and upon approval, the pipeline will be resumed.

If you want to stop the automatic transition of the change request states even when change receipt is turned on, you must disable the sn_devops.enable_change_receipt_state_transition property. For more information, see DevOps Change Velocity properties.

Once approved, either automatically or manually, change requests move to Implement state and the job is run. Once the job is run, the change request is moved to the closed state with Close code as successful on a successful job run or Unsuccessful on error in the job run. For information on customizing your change request states, see Custom change request process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If a change request is not approved and moved to the canceled or closed state, the associated Jenkins, GitHub, or ADO job is marked as failed and a console message is shown:

For Jenkins: `[ServiceNow DevOps] Job was not approved for execution`

For GitHub: `Error: **** Change has been created but the change is either rejected or cancelled`

For ADO: `"changeState":"Closed"`

Automatic approval of change requests using flows and policies

You can automate the change approval process for all your DevOps change requests. DevOps Change Velocity uses flows and DevOps data (such as work items, commits, code coverage, code security, risk, and test results) to update the state of a change request and automatically approve it based on change approval policies. Three flows are available in the base system that you can clone, customize, and activate (in Flow Designer). By default, the DevOps Change Request Manual Approval Flow is activated. DevOps flows are applicable to only automatically created change requests or change requests that have change receipt turned off.

Flows

A flow is an automated process consisting of a trigger (which specifies when to run the flow) and a sequence of reusable actions (where the actions perform a sequence of operations on your data). Flows are built in Flow Designer, a ServiceNow AI Platform feature that enables process automation. For more information, see Flow Designer.

You can use one of the DevOps flows available in the base system as a template; clone the flow and customize it to your business requirements. Ensure that only one DevOps flow is in the active state at any time to avoid conflicts and errors. A DevOps flow is applicable to change requests that have the DevOps category or if the devops_change property is set to true. (An automatically created DevOps change request sets the category to DevOps by default).

By default, the flows are configured to update the state of the step execution based on the change request state, and any additional default behavior. Based on the step execution state, a callback is made to the pipeline:

- If the DevOps change request is approved, the flow will update the step execution state to approved, and the change request state is updated to implement. After that the pipeline will be resumed.
- If the DevOps change request is rejected, the flow will update the step execution state to rejected, and the change request state is updated to new. After that the pipeline will be terminated.
- If the DevOps change request is canceled, the flow will update the step execution state to canceled by user, and the change request is updated to canceled. After that the pipeline will be canceled.

If a business rule or data policy causes an error while updating a change in the DevOps Change Request Manual Approval Flow, DevOps Change Request Minimal Automation Approval Flow, or DevOps Change Request Advanced Automation Approval Flow, the corresponding error will be displayed in the worknotes of the change request and logged in the console logs of the pipeline tool.

© 2026 ServiceNow, Inc. All rights reserved.

DevOps flow	Default behavior
DevOps Change Request Manual Approval Flow	This flow is activated by default. With this flow, DevOps change requests must go through a manual approval process, where the flow waits for the change request to reach an eligible state (rejected, implemented, or specific implementation state). When reached, this flow will update the state of the step execution based on the state of the change request. If the change request is type-based, the flow will wait for the change to get rejected, implemented, or canceled. If the change request is model-based, the flow will wait for the change to get rejected, get canceled, or reach one of the implementation states defined in the model or the implement state specified in the DevOps property. This flow won't trigger for DevOps change requests whose model is a base system DevOps change model (DevOps or DevOps simplified) to avoid conflicts and errors.  You can clone this flow and customize it to make changes. Ensure that the other DevOps flows are deactivated.
DevOps Change Request Minimal Automation Approval Flow	This flow gathers DevOps data and runs the DevOps Change Request Minimal Automation Policy, which determines if the change should

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps flow	Default behavior
	be auto-rejected, auto-approved, or sent for manual approval. This flow is triggered for DevOps change requests whose type or model is set to normal. Activate this flow if you want to automate change request approvals, but start minimally.  You can clone this flow and customize it to make changes. Ensure that the other DevOps flows are deactivated. You can also add the DevOps - Update Minimal Automation Policy Decision Reason action to this flow to update the policy decisions to the step execution change comment and the change request worknotes to know the reasons for the decision. You can add this action inside every decision block and specify the required input. DevOps Change Request Advanced Automation Approval Flow	This flow gathers DevOps data and runs the DevOps Change Request Advanced Automation Policy, which determines if the change should be auto-rejected, auto-approved, or sent for manual approval. This flow is triggered for DevOps change requests whose type or model is set to normal.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps flow	Default behavior
	If the DevOps change request is approved, the flow will update the change request to the scheduled state, and the planned start date will be used to set the change request start date. On the change request start date, the flow will update the change request state to implement. After that the pipeline will be resumed. Activate this flow if you want to automate change request approvals with a robust change policy.  You can clone this flow and customize it to make changes. Ensure that the other DevOps flows are deactivated.
DevOps Demo Change Automation flow	When demo data is installed, the DevOps Demo Change Automation flow is available where normal type of change request or normal model change request can be auto-approved based on the decision policies. As a part of demo data, the decision policies available are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps flow	Default behavior
	• DevOps Low Risk Auto Approval policy, where the failed test count is zero##. • DevOps High risk manual approval policy, where the failed test count is greater than zero#.  You can clone this flow and customize it to make changes. Ensure that the other DevOps flows are deactivated.

To read guidelines on how to use flows, subflows, and actions more effectively, see General guidelines for Workflow Studio flows, subflows, and actions.

Change approval policies

A change approval policy is a course of action that can be applied to a change request. It consists of the following:

- Policy input: Variable sources evaluated within a condition.
- Decisions: Determines whether the change approval definition must be applied based on conditions.
- Approval definitions: Defines the type of approval that can be applied.

The DevOps Change Request Minimal Automation Policy and DevOps Change Request Advanced Automation Policy are available by default. The three normal change policies available are:

- DevOps Model Change Policy
- DevOps Change Request Minimal Automation Policy
- DevOps Change Request Advanced Automation Policy

For more information on change approval policies, see Change approval policies.

The DevOps automated approval flows use change approval policies and DevOps data (such as work items, commits, pull requests, test summaries, security summaries, and quality summaries) to automatically update the change record state and step execution state to approved, rejected, or canceled. You can view and edit these policies based on your business requirements, or create your own in the decision table. See the following decision tables.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The DevOps Change Request Minimal Automation Policy has the following conditions and criteria by default:

Condition	Criteria	Description
Commit linked to work items	Not Empty	Each code commit must have an agile story to adhere to your agile development practices. Each commit comment must have the Story ID linked to it.
Unit Test Coverage %	>70%	Unit Test coverage must be greater than 70% for change auto approval. This applies to integration test tools that are used with any orchestration tool, such as Jenkins, Gitlab, Azure DevOps, or Github Actions.
Code security	>0 blocker or critical 0	>0 blocker or critical 0Code security scans must have 0 vulnerabilities, with blocker, critical, and major vulnerabilities.

The DevOps Change Request Advanced Automation Policy has the following conditions and criteria by default:

Condition	Criteria	Description
Commit linked to work items	Not Empty	Each code commit must have an agile story to adhere to your agile development practices. Each commit comment must have the Story ID linked to it.
Regression tests failed	0	All regression tests must pass for change auto approval. This applies to integration test tools that are used with any orchestration tool, such as Jenkins, Gitlab, Azure DevOps, or Github Actions.
Integration tests failed	0	All integration tests must pass for change auto approval. This applies to integration test tools that are used with any orchestration tool, such as Jenkins, Gitlab, Azure DevOps, or Github Actions.
Commits -> Total Changes	>50	Commits greater than 50 require manual change approval
Load Tests Failed	0	All load tests must pass for change auto approval. This applies to integration test tools that are used with any orchestration tool, such as Jenkins, Gitlab, Azure DevOps, or Github Actions.
Unit Test Coverage %	>70%	Unit Test coverage must be greater than 70% for change auto approval. This applies to integration test tools that are used with any orchestration tool, such as Jenkins, Gitlab, Azure DevOps, or Github Actions.
Code Coverage %	>70%	>70%Code quality scans coverage must be greater than 70% for change auto approval. This applies to SonarQube tool integration with orchestration tool such as Jenkins, or Azure DevOps or Github Actions.
Code security	>0 blocker or critical 0	>0 blocker or critical 0Code security scans must have 0 vulnerabilities, with blocker, critical, and major vulnerabilities.
Number of outages in 7 days	>70%	Zero outages in 7 days.
Number of current outages	0	No new current outages.
Number of open incidents	0	No new or open current incidents.

The three outcomes for the DevOps Change Request Minimal Automation and DevOps Change Request Advanced Automation policies (depending on the conditions that you specify) are:

- Auto approval: If the conditions specified in the policy are met, the change request is automatically approved.
- Auto reject: If one or more of the conditions specified in the policy are not met, the change request is automatically rejected.
- Manual approval: If one or more conditions need manual approval by a user or group, that is specified in the policy. Notifications are sent by the policy to the relevant users or groups to expedite the manual approval and progress the change request.

You can apply your change approval policy in the Change Management Workflow Studio action to control the approval process for a change request. For more information, Use the Apply Change Approval Policy flow action.

Change approval work notes

When a change request is updated based on a flow and change approval policy, the work notes associated with the change request are updated to one of the following hard-coded messages:

- Change Approval Policy not found. Change Request has been rejected (%s).
- %s is inactive. Change Request has been rejected (%s).
- No Decisions matched. %s has been skipped (%s).
- No approvals were generated from matched Decisions. %s has been skipped (%s).
- Change Request has been rejected by %s (%s).
- Change Request has been approved by %s (%s).

The work notes are updated based on a logic which uses the combination of one of the hard-coded messages + the policy name + action label used in the flow associated with the change

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

request. In this combination, you can change only the value of policy name and the action label but not the hard-coded message. For example,

```
if (APPROVED.equals(state))
38 message = String.format(APPROVED_MSG, policyName,
 actionLabel);
```

Default Change Handler subflow

Use the Default Change Handler subflow to populate these change request fields with default values.

- Requested by
- Justification
- Implementation Plan
- Backout plan
- Test Plan
- Short Description
- Description
- Start Date
- End Date
- Risk Impact Analysis

The Default Change Handler subflow overrides the field values that were populated using a template while creating the change request record.

If desired, you can write a custom subflow in place of this flow by modifying the *[sn_devops.change_request_handler_subflow]* DevOps property.

Custom change request templates

When you enable change control in the ServiceNow DevOps step , you can select a custom template to populate fields automatically while creating the change request. The change request **Category** field is automatically set to DevOps.

Note:
Do not configure the **Category** and **changeType** fields from the custom template.

The type of change request corresponds to the change request table in global scope.

Automatic change request related lists

For a change request automatically created by DevOps, the **Category** field is automatically set to DevOps, and these related lists are added:

Commits

Commits associated with the change request.

Work Items

Work items associated with the change request.

Artifact Versions

List of artifact versions associated to the package linked to pipeline execution for packages created before the change request is approved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If no package is linked to the pipeline execution, then the list is empty.

Test Summaries (replaces Test Results related list)

List of test summaries for a pipeline execution associated with an artifact, package, or task execution before the change request.

See Test Results for more details.

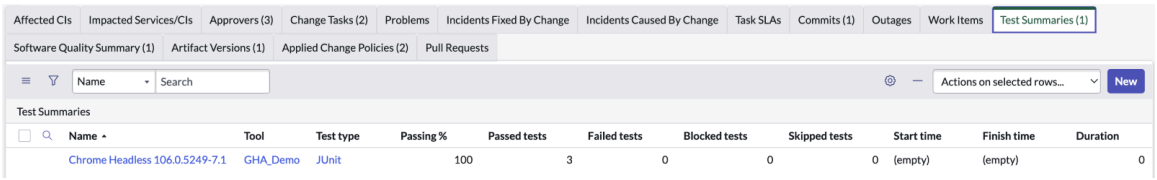
Software Quality Summary

List of software quality summaries for a pipeline execution associated with an artifact, package, or task execution before the change request.

Security Summaries

List of security summaries for a pipeline execution associated with an artifact, package, or task execution before the change request.

Note:
Security scan results on the change record associated to a pipeline execution with a linked package are also displayed in the Security Summaries tab.



Note:
Implementation details from the orchestration tool are automatically added to the **Work notes** field on the change request form. Detail added to the work notes is limited to 5 KB of the task execution log for the step.

Custom change request process

These DevOps change properties are available to customize your change request flow.

- DevOps change request implement state
- DevOps change request post implement state
- DevOps change request cancel state
- DevOps change request approval text

To customize your change request flow, you must first create a **System Definition** > **Choice List**. For example, `DevOps_Implement (value - 10)`.

Then, add the choice list to **System Definition** > **Script Include** > **ChangeRequestStateHandlerSNC**.

Once you have created the choice list and added it to the script include, you can update DevOps change properties with the new choice list values. For example, *`DevOps change request implement state`*`-10`.

DevOps Risk Condition

You can use the DevOps risk and impact calculation based on committer risk score.

This condition is inactive by default.

Test Results related list

Lists the tests that were run in a pipeline after a package was created. If no package was created, then the list includes the tests that were run after an artifact version was created.

Scenarios:

A package is created in the pipeline, but no artifact versions are registered.

- If the change request is created in the package creation stage:

  No test results are displayed because a package is not yet linked to the pipeline execution.

- If the change request is created in a stage after the package creation stage:

  Build test summaries include those associated with stages after the package creation stage, up to the change-controlled stage.

Artifact versions are registered, but no package is created.

- If the change request is created in the artifact version stage:

  No test results will be displayed, because no tests are associated until the task execution is completed.

- If the change request is created in a stage after the artifact version stage:

  Build test summaries include those in the artifact version stage, as well as the stages afterward, up to the change-controlled stage.

Both artifact versions and package are created in the pipeline.

- If the change request is part of the stage after artifact version and package creation stages:

  Build test summaries include those associated with the package creation stage, as well as the stages afterward, up to the change-controlled stage.

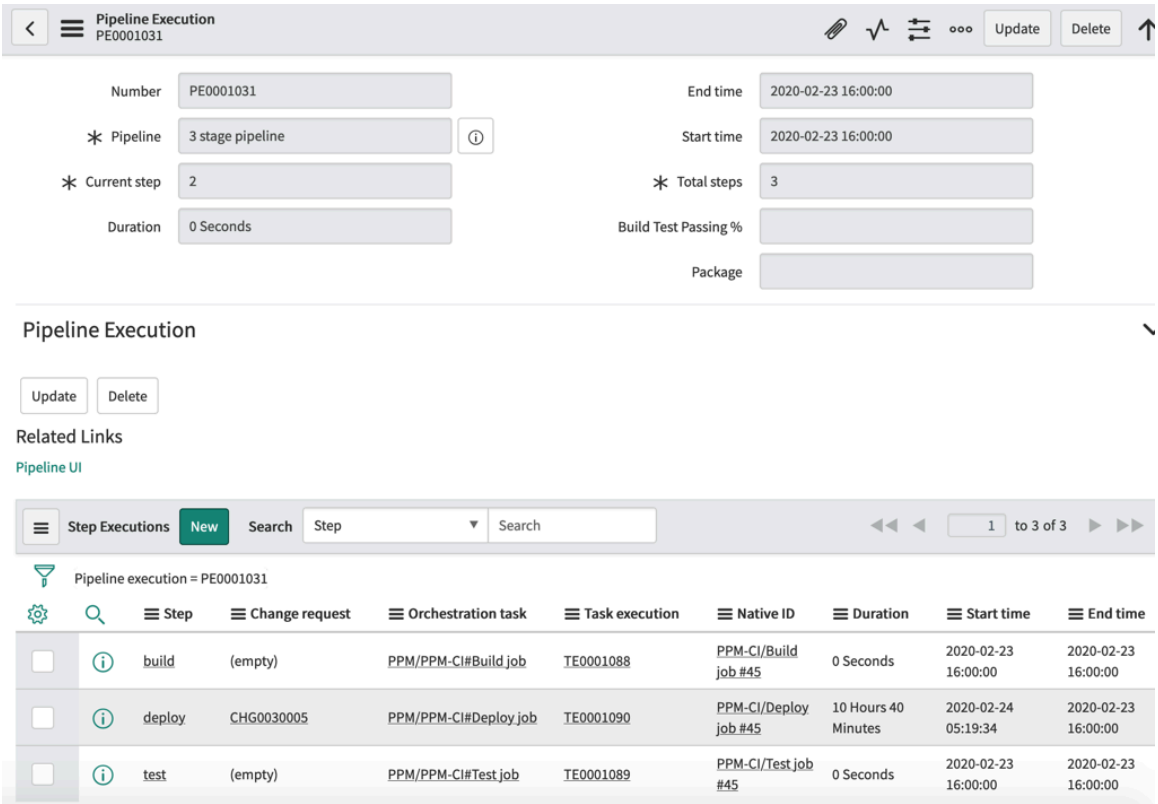
- If the change request is part of the package creation stage, and artifact versions are created as part of an earlier stage;
  - or the change request is created in a stage (not package creation) after the artifact version stage, but before package creation stage;
  - or the change request is part of the package creation stage and artifact versions are created as part of an earlier stage:

  Build test summaries include those associated with the artifact version stage, as well as stages afterward, up to the change-controlled stage.

Pipeline executions view

You can view pipeline activity by navigating to **DevOps** > **Orchestrate** > **Pipeline Executions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Customizing DevOps flows

Customize or recreate the DevOps Change Request Manual Approval, DevOps Change Request Minimal Automation Approval, and DevOps Change Request Advanced Automation Approval flows based on your requirements using a flow or a script.

You can clone the DevOps flows and then customize them according to your requirements. To clone a flow, navigate to the flow you want to clone from the Base system DevOps flows sections or from the Flow Designer landing page (**All > Process Automation > Flow Designer**). On the top-right corner of the Flow page, select **More Actions > Copy flow**. In the Create a copy of this flow dialog box, enter the new name for the flow, and select DevOps Data Model as the application. Select the **Copy** button to create the new flow. The new flow will open in Flow Designer. Make any changes to customize it to your business requirements. You can run the flow to make sure it has no errors by selecting the **Test** button on the top-right corner of the screen before activating the flow. Activate the flow when it's ready by selecting the **Activate** button.

Customize the DevOps Change Request Manual Approval flow

In the DevOps Change Request Manual Approval flow, the state of step execution is changed based on the change approval. However, you can customize or recreate this flow based on your requirements.

After the change request state is moved to approved, canceled, or rejected (either manually or by using a change policy), call the **Update state of step execution based on change approval** Workflow Studio action to update the **State** field of the step execution record.

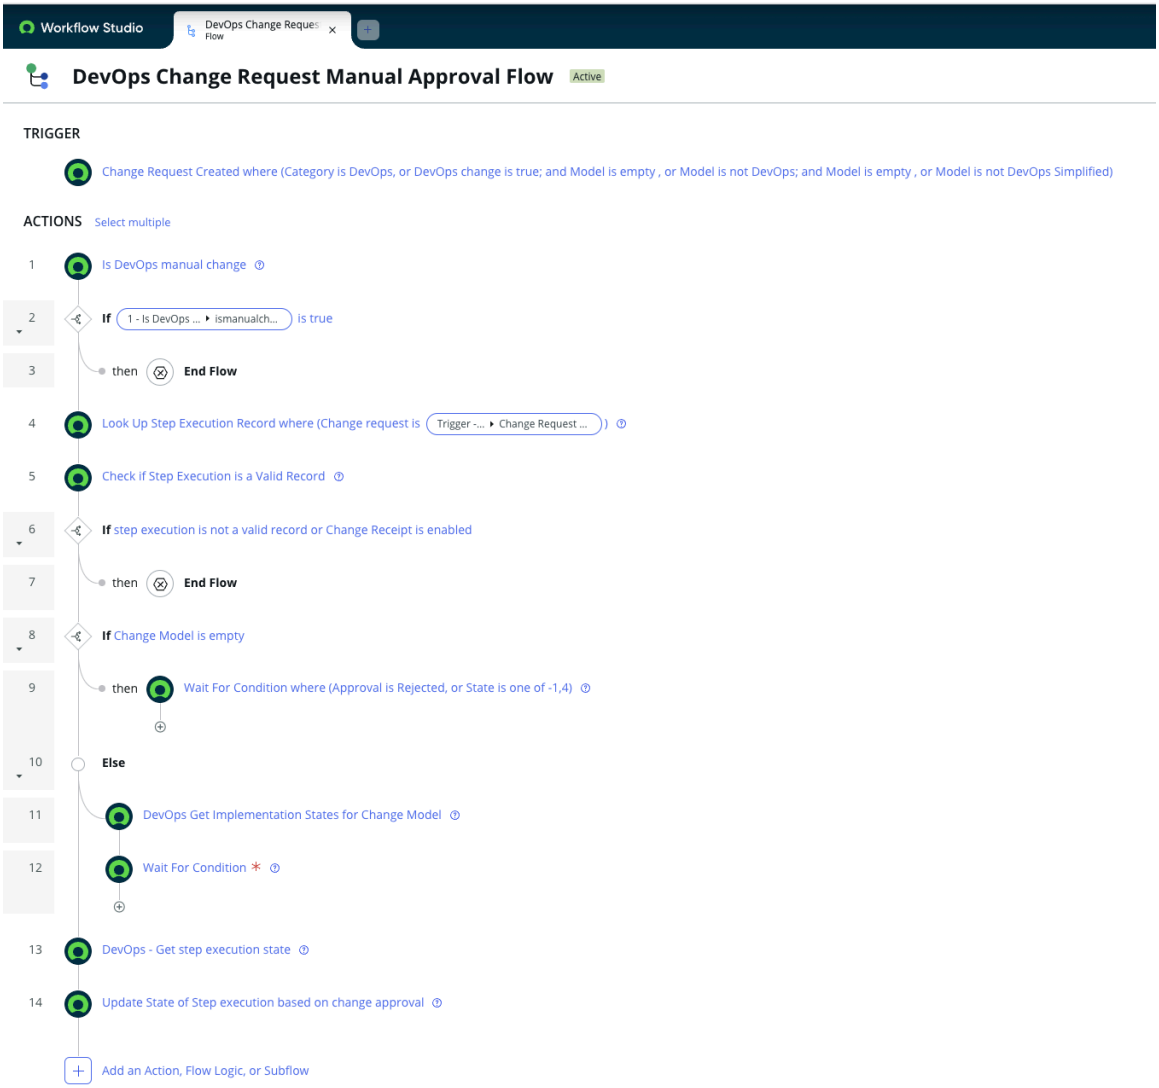
You can use either a flow or a script to call the action.

Calling the Workflow Studio action using a flow

Calling the **Update state of step execution based on change approval** Workflow Studio action is required to update the state of the step execution record according to the approval field in the change request record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action serves as a trigger for the **Change Control Callback** flow, which is used to notify the change decision to the orchestration tool.



Calling the Workflow Studio action using a script

Method to call the Workflow Studio action from a script:

```
sn_fd.FlowAPI.executeAction('sn_devops.update_state_of_
step_execution_based_on_change_approval', inputs);
```

Customize the DevOps Change Request Minimal Automation Approval flow

In the DevOps Change Request Minimal Automation Approval flow, the change is approved and the state of the change moves from the new to the implementation state. After the change request state is moved to approved, call the **DevOps - Update Step Execution and Change Request States** Flow Designer action to update the **State** field of the step execution record.

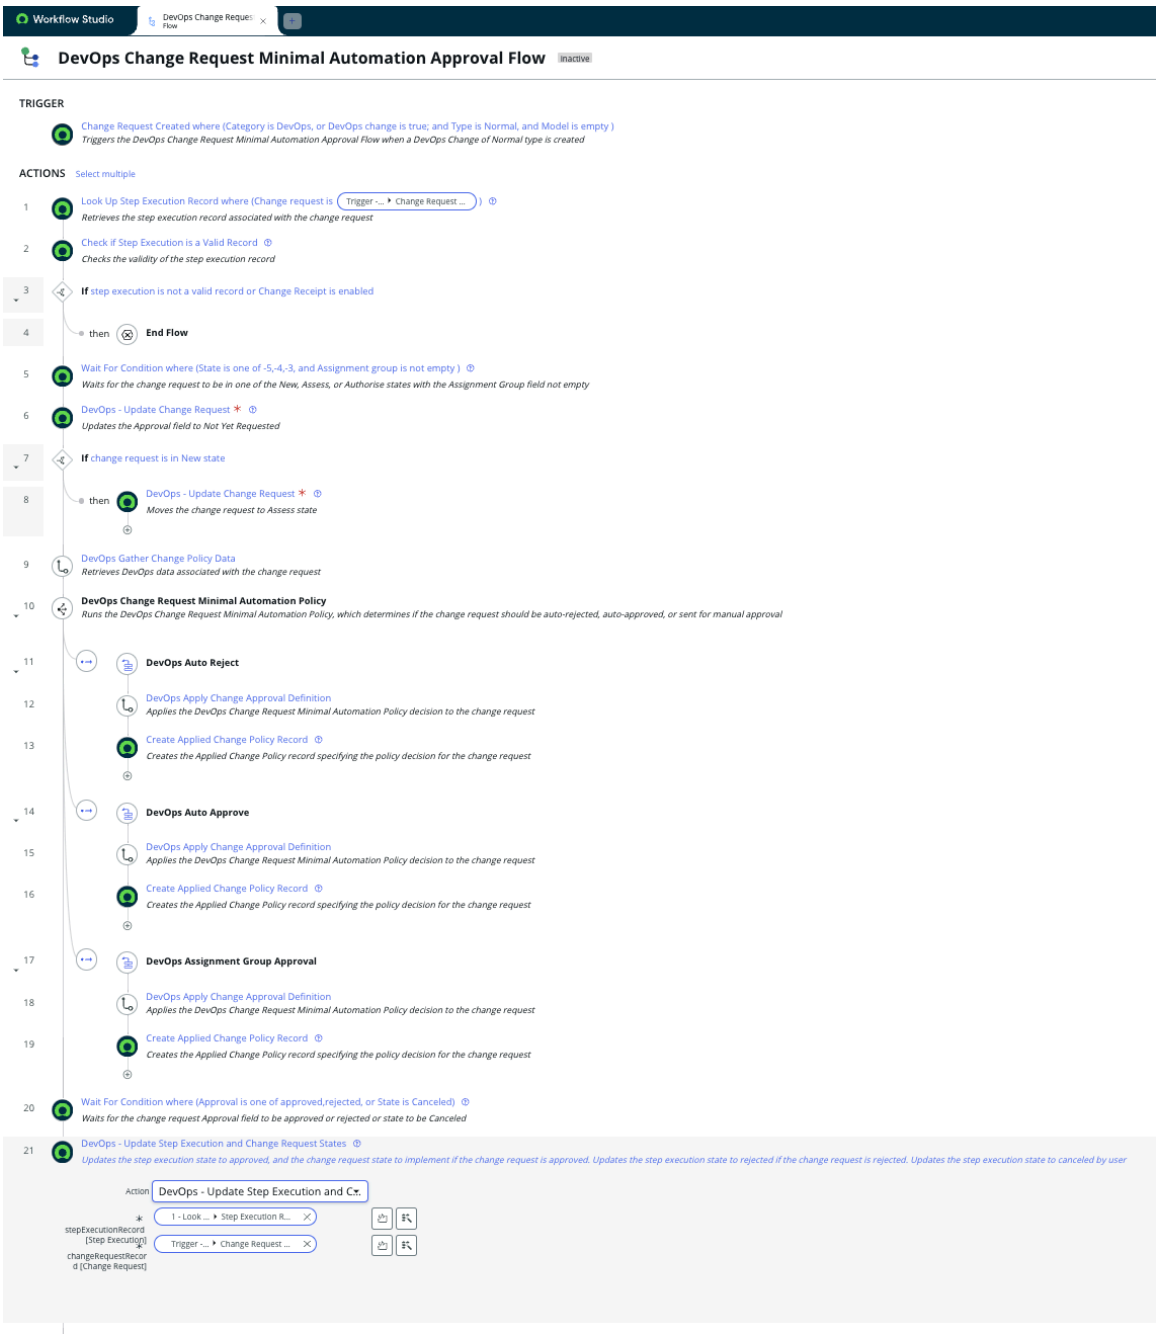
You can use either a flow or a script to call the action.

Calling the Workflow Studio action using a flow

Calling the **DevOps - Update Step Execution and Change Request States** Workflow Studio action is required to update the state of the step execution record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This action serves as a trigger for the **Change Control Callback** flow, which is used to notify the change decision to the orchestration tool.



Calling the Workflow Studio action using a script

Method to call the Workflow Studio action from a script:

```
sn_fd.FlowAPI.executeAction('sn_devops.devOps-_update_step_execution_and_change_request', inputs);
```

Customize the DevOps Change Request Advanced Automation Approval flow

In the DevOps Change Request Advanced Automation Approval flow, the change is approved and the state of the change moves from the new to the implementation state. After the change request state is moved to approved, call the **Update step execution record** action to update the **State** field of the step execution record.

Related topics

Accelerating your DevOps change process

Automate DevOps change request creation

Modify your pipeline to automatically create a DevOps change request.

About this task

The step 5 in this topic requires you to specify the attributes for the change request. Change attributes can be specified in multiple areas. They can be specified in the pipeline step of DevOps Change Velocity, in the Default Change Handler subflow, in an approval flow, in a template, or passed in the pipeline. If a change model is used, they can also be specified in model presets. For more information, see DevOps change request attributes.

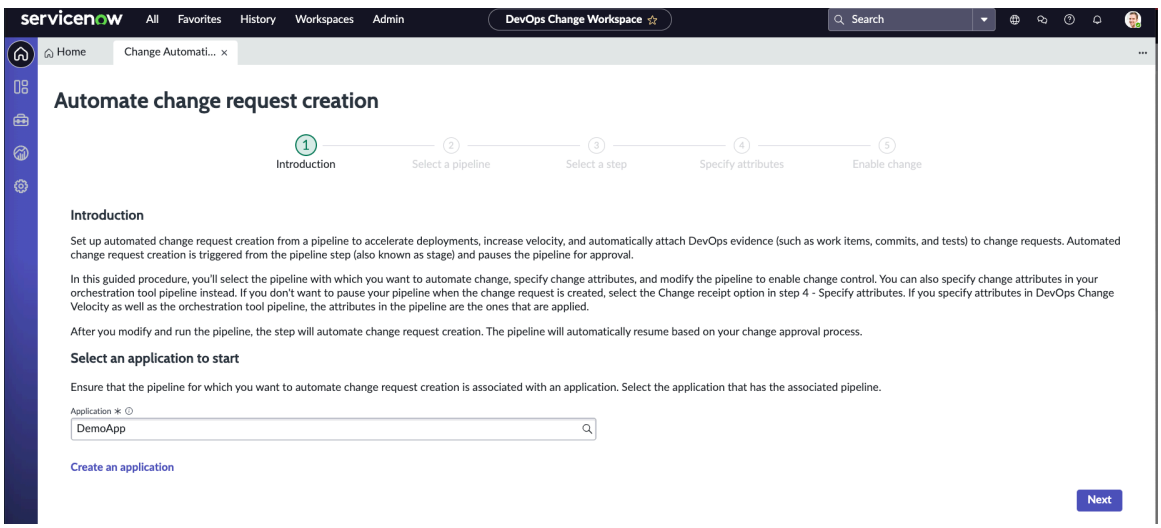
If you have used business rules, then you must set the *sn_devops.change_request.apply_attributes_on_creation* property to true, so that the change attributes passed in the pipeline are set when the change request is created instead of the attributes being passed after the change request is created. For more information, see DevOps Change Velocity properties.

Before you begin

Role required: sn_devops.admin, sn_devops.tool_owner, or sn_devops.app_owner

Procedure

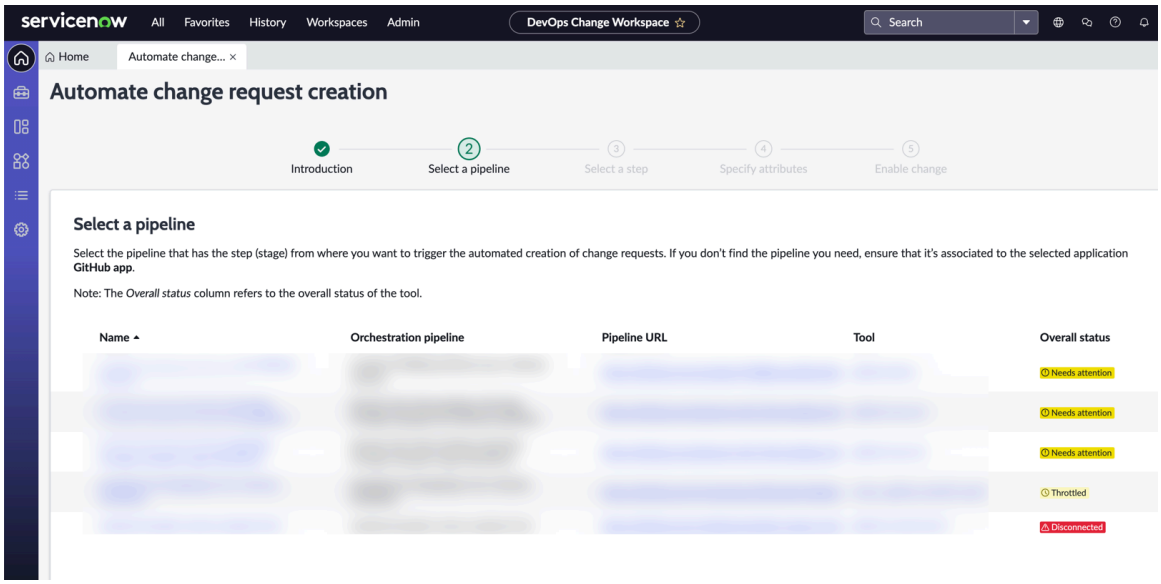
1. From the DevOps Change Workspace, select **Automate change creation**.
2. In the **Application** field, select the application that you want to associate with the pipeline for which you want to automate change request creation, and select **Next**.



3. Select the pipeline that has the step (stage) from where you want to trigger the automated creation of change requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

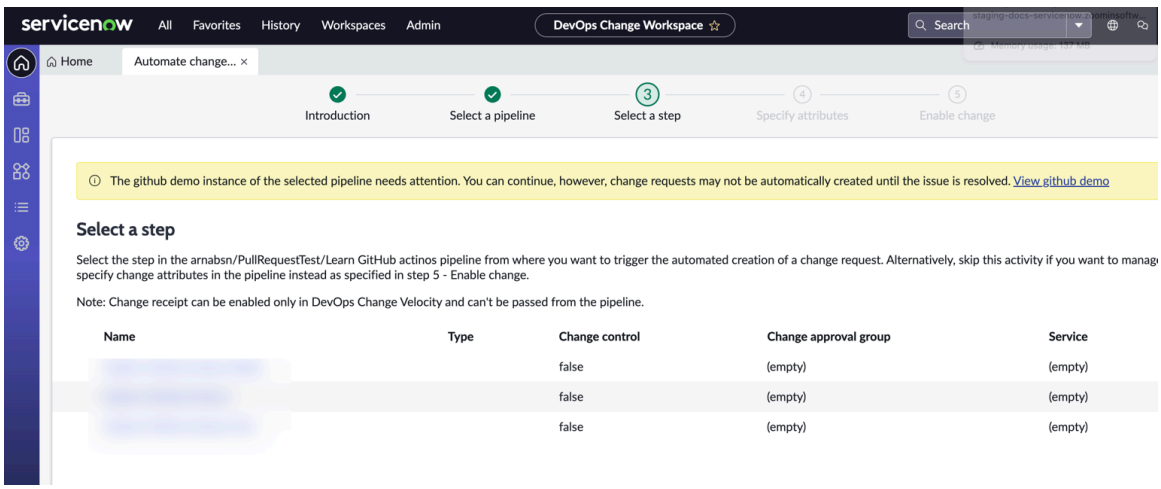
Note:
If you don't see the pipeline, make sure that it's associated to the application selected in the previous step.



You can see the connection state of the tool associated with the pipeline in the **Overall status** column. An alert will also be displayed based on the connection state of the tool before proceeding to the next step.

4. Select the step in the pipeline from where you want to trigger the automated creation of a change request.

Note:
You can skip this activity if you want to manage and specify change attributes in the pipeline instead as specified in the **Enable change** step.



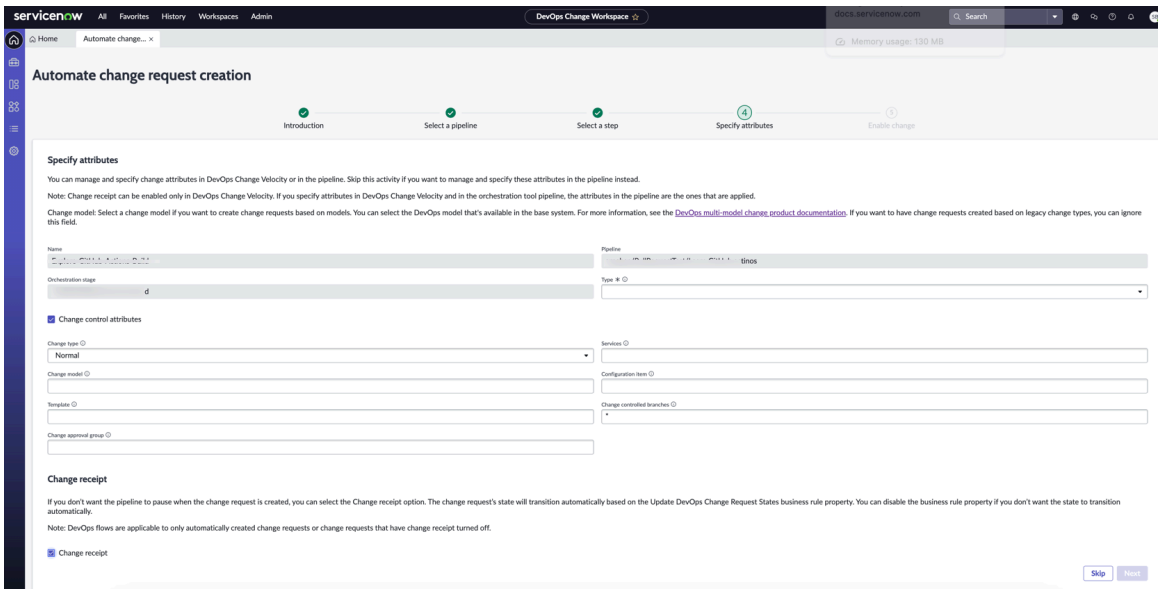
5. Specify the change attributes in the change fields and enable change receipt by selecting the Change receipt option.

Note:
You can skip the activity of specifying change attributes if you want to manage and specify these attributes in the pipeline instead. However, change receipt can be enabled only from ServiceNow DevOps Change Velocity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

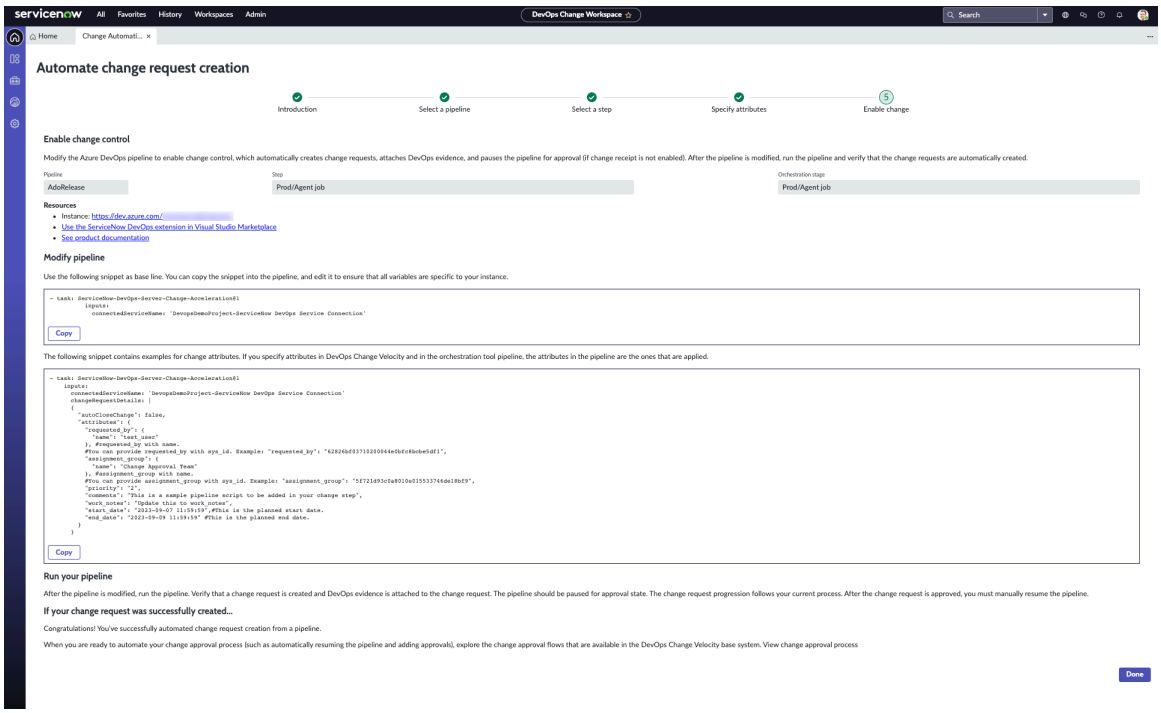
For more information on configuring change settings, see Create a Change.

You must enable change receipt if you don't want the pipeline to pause when the change request is created. You can disable the sn_devops.enable_change_receipt_state_transition property if you don't want the state to transition automatically.



6. Modify your pipeline and use the corresponding code snippet to enable change control and specify change attributes.
   Depending on your orchestration tool, the steps to enable change control are displayed. Follow the instructions given on the page and modify your pipeline accordingly.

   The following image displays the steps for Azure DevOps.



7. Select **Done**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a DevOps Change request and associate existing DevOps data — Workspace

Create a DevOps change request and associate existing DevOps data through the Workspace UI.

Before you begin

Role required: sn_devops.admin

About this task

For more information on using Change features, see Create a Change.

Important:
You can update the associated data after you create a request, but you cannot edit a change request if it is in one of the following states:

- Implement
- Post-Implement
- Cancelled

Procedure

1. Navigate to **Workspaces** > **DevOps Change** > **Applications** ( ).
2. Select an application from **Applications** list.
3. In the Recommended actions panel, select **Create manual change**.
4. In the **Category** list, select *DevOps* and then select **Save**.
5. Select **Add DevOps data** to add supporting data to the change request.
6. Complete the Add DevOps data pages.

   a. Specify the following values on the **Select data type and associations** page:

Select data type and associations

Field	Description
Data type	The type of data to associate with the change request. ▪ Artifact version ▪ Release version ▪ Build number
Data associations	The specific data to associate with the change request. You can select multiple artifact versions and build numbers. If you select *Build number* as the **Data type**, then you must also specify the application name and corresponding pipelines and build numbers.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Next** to open the Verify data associations page.

c. Navigate the tabs to verify that the associated data is mapped accurately.
Update settings as needed.

- Work Items
- Commits
- Pull Requests
- Test Summaries
- Artifact Versions
- Software Quality Summaries
- Security Scan Summaries

d. Select **Submit**.

The Change request form is updated.

7. Configure other settings as needed.
For example, specify the schedule.

> **Note:**
> For more information on configuring settings, see Create a Change.

8. Select **Save**.

What to do next

To modify the data that is associated to the change request, select **Edit DevOps data**. Verify the associated data that you added or removed in the **Additions**/**Removal** tabs in the **Add DevOps Data** modal.

Create a DevOps change request and associate existing DevOps data — Classic

Create a DevOps change request and associate existing DevOps data through the Classic UI.

Before you begin

Role required: sn_devops.admin or sn_devops.app_owner

About this task

Create a DevOps change request and associate existing DevOps data. You can modify the associated details after you have created a DevOps change and associated data with it.

> **Important:**
> If the Change request is in one of the following states, the **Edit DevOps Data** button is inactive:
>
> - Implement
> - Post-Implement
> - Cancelled

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Change** > **Create New** > **Create Normal Change**.

   Note:
   For more information on using the Change module, see Create a Change.

2. From the **Category** list, select *DevOps* or *Other*.
3. **Optional:** Select the **DevOps Change** option, if you have selected *Other* in the **Category** field.
4. Click the **Add DevOps Data** button on the form header.

   Note:
   The **Add DevOps Data** button appears only if you have selected *DevOps* as the category, or *Other* as the category and selected the **DevOps Change** option.

   The **Add DevOps Data** modal displays.

5. In the **Select data type and associations** section, select the data type and the related data associations.

   a. Select any of the following options from the **Data Type** list.

   - Artifact Version
   - Release Version
   - Build Number

   Note:
   You can select multiple Artifact versions and Build Numbers.

   b. Select the data you want to associate with the change from the **Artifact Version**, **Release Version** or **Build Number** field.

   Important:
   If you select *Build Number* as the **Data Type**, you must also specify the application name, and corresponding pipelines and build numbers. You can search for build numbers by the branch name as well.

6. Click **Next**.
7. Verify that the associated data for the following fields is mapped accurately.
   - Work Items
   - Commits
   - Pull Requests
   - Test Summaries
   - Artifact Versions
   - Software Quality Summaries
   - Security Scan Summaries
8. Click **Submit**.
   The Change Request form displays.
9. Select the **Assignment group** to which this change request is assigned.
10. Configure the change window for the change request from the Schedule tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For more information on configuring the schedule, see Create a Change.

11. Click **Submit**.

What to do next
To modify the associated DevOps data to the change request, click the **Edit DevOps Data** button. Verify the associated data that you added or removed in the **Additions**/**Removal** tabs in the **Add DevOps Data** modal.

DevOps change request without mandating category as DevOps

Enable categorizing DevOps change request from DevOps properties. Change requests that are created as part of pipeline execution steps can be created with a category other than DevOps.

Before you begin
Role required: sn_devops.admin

About this task
Change requests created in the DevOps application aren't created with **Category** as DevOps.

Use related templates for specific categories, such as *Hardware, Software, Database* and so on, to create DevOps change requests. You can categorize DevOps change requests from the DevOps properties.

New change requests that are created in the DevOps application after you enable the property can continue to use custom change policies and approval workflows, in addition to the base system's DevOps Demo Change Automation flow, and the DevOps Model Change Request flow. If you don't enable this property, change requests continue to be created and processed with the category attribute set to DevOps.

Procedure
1. From the DevOps Change Workspace, navigate to **Administration** > **System configuration** > **Properties**.
   You can also navigate from **All** > **DevOps** > **Administration** > **Properties**.
2. Enable the **Categorize DevOps changes requests on "DevOps change" field** property.
   Select the check box to enable categorizing any change request created from the DevOps application, as a DevOps change request.

   By default, the property check box is cleared. To make changes, set the application scope to DevOps Data Model.

   Important:
   DevOps Insights capabilities are disabled when this property is selected.

Result
Any new change request that is created from the DevOps application is considered as a DevOps change irrespective of the category attribute and processed accordingly. DevOps change request creation and processing no longer depend only on the category attribute being set to DevOps.

Change request creation with DevOps data retrieval errors

Create change requests even with errors in DevOps data retrieval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change request creation overview

Note:
Change request creation with DevOps data retrieval errors is supported only for Azure DevOps, GitHub Actions, GitLab, Jenkins, and Harness pipelines.

You can create a change request with or without errors in DevOps data retrieval. This functionality can be controlled by the **Enable change request creation even with errors in DevOps data retrieval** property. When the **Enable change request creation even with errors in DevOps data retrieval** property is enabled, and an error occurs in retrieving DevOps data like work items, commits, test summaries, or security summaries, the corresponding change request is still created. The data that can be retrieved will still be associated with the change request. For the data that can't be retrieved, the reason for the error will be notified to the user in the third-party console, and the same information will also be added in the **Change Comments** field in the Step Execution record and the change **Worknotes**.

If the **Enable change request creation even with errors in DevOps data retrieval** property isn't enabled, a change request is created only when there's no error in any step of a pipeline run. When an error occurs, the pipeline is aborted and the reason for the error is added in the inbound event's **Processing details** field, and the same is notified to the user in the third-party console.

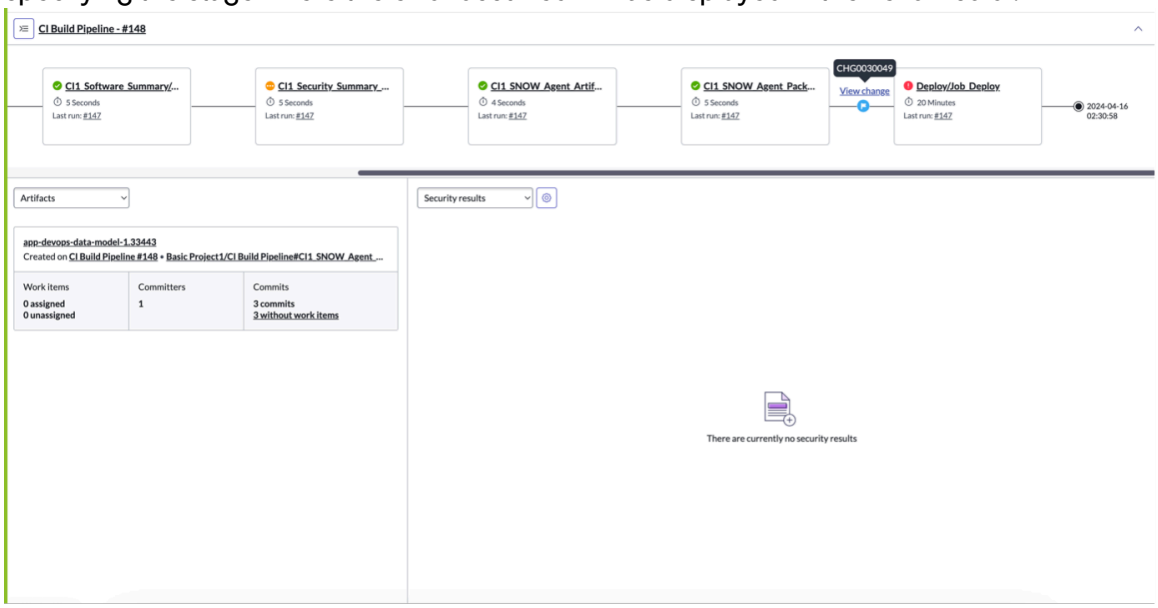
For more information, see DevOps Change Velocity properties.

Approval for change requests with DevOps data retrieval errors

For change requests created with DevOps data retrieval errors, the *`is_change_with_partial_data`* policy input is set to **True** for all the change approval policies. Only a manual change approval decision is applied to such changes so that you can approve or reject the change after manually verifying the DevOps data in it. In the DevOps Gather Change Policy Data subflow, the *`Is change with partial data`* action determines whether a change is created with DevOps data retrieval errors or not.

Pipeline UI for change requests with DevOps data retrieval errors

When a change request gets created with DevOps data retrieval errors, the card specifying the stage where the error occurred will be displayed in the Yellow color.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If your build pipeline (CI) is set up to trigger a release (CD) pipeline and a change is created in the release pipeline, the data is collected from the build pipeline and associated with the change request. There may be a situation where ServiceNow DevOps Change Velocity will receive and process the release pipeline events before build pipeline events. In this case, the change will be created with DevOps data from the build pipeline even though there's an error in retrieving some of the data. You can observe this behavior even though the **Enable change request creation even with errors in the DevOps data retrieval** property is enabled. Also, the *is_change_with_partial_data* policy input will be false in this case, and the approval process will be applied in the way it's defined in the approval flows unlike always manual in case of change requests with DevOps data retrieval errors.

Callback timeout

If an inbound event goes into the waiting state during a pipeline run, the system tries to process the change until the timeout value in the *sn_devops.change_request_callback_timeout* property is exceeded, after that the pipeline is aborted. The reason for the error is displayed in your third-party tool's console logs. When a pipeline is canceled because of callback timeout, the same information is added in the callback record of the corresponding step execution. You can contact your DevOps admin to increase the timeout value in the *sn_devops.change_request_callback_timeout* property. The default value of this property is 120 minutes, and the minimum value is 60 minutes. For more information, see DevOps Change Velocity properties.

Note:
If you are using GitHub change automation custom action, GitLab Docker change automation custom action, or Harness Docker change automation custom action in your corresponding pipeline to create change requests, you need to provide the **interval** in the custom action, which enables GitHub, GitLab, or Harness to poll ServiceNow DevOps for the change status. When the change reaches an appropriate state in ServiceNow within the specified interval, the appropriate status depending on the outcome of the change will be sent to GitHub, GitLab, or Harness pipeline, which will resume or abort the pipeline. See ServiceNow DevOps custom actions from GitHub marketplace and Implement custom actions for pipelines using generic Docker container image for more details. So, when your pipeline with the change custom action is run, and if any of the step notification from GitHub, GitLab, or Harness did not reach ServiceNow DevOps, then the association of callback, step execution, and task execution will not happen in ServiceNow DevOps. As the association is not available, the change will not be created and ServiceNow DevOps will wait until the association is in place. At the same time, GitHub, GitLab, or Harness will poll ServiceNow for the change status until the time specified in the interval is reached. If the interval is passed and also the timeout specified in the *sn_devops.change_request_callback_timeout* property is reached, ServiceNow DevOps will not terminate your pipeline as it should but will leave it for the default timeout set in the GitHub, GitLab, or Harness step that will eventually terminate the pipeline. The important information in this scenario is that ServiceNow DevOps will not be able to notify the user that the step events did not reach ServiceNow DevOps in the GitHub, GitLab, or Harness console logs.

Upgrade

After you upgrade, the property will be set to false by default. Your current change process will function as is, but the only difference you'll see is that, when an error occurs in retrieving DevOps data the pipeline is aborted (instead of waiting indefinitely) and the reason for the error is added in the inbound event **Processing details** field, and the same is notified to the user in the third-party console. If you want to create change requests with errors in retrieving DevOps data and also not fail your pipeline, you can enable the **Enable change request creation even with errors in DevOps data retrieval** property. This provides value to your change approvers and AppDev

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

teams by getting the changes created automatically with DevOps evidence that is gathered and appropriately notified in the change request work notes and third-party console logs with errors or data that may be missing.

Limitation

If the **Enable change request creation even with errors in DevOps data retrieval** property is enabled, and the ADO artifact package step in your pipeline results in error, the change will be created without ADO artifacts associated with it, but the corresponding error will not be notified in Worknotes, or Step Execution change comments, or in the ADO console log.

Artifacts and packages

Artifacts and packages enable DevOps Change Velocity to track development and testing activities across a wide range of deployment and release models. This feature ensures that pipeline activity stored in the DevOps data model can be retrieved and applied when artifacts are created and released at different times or in different pipelines.

Artifacts

When an artifact version is registered, related activities like commits, tests, and code scans are tracked so that regardless of when the artifact version is deployed, those details can be retrieved. It can be in the current pipeline execution, a later execution of the same pipeline, a pipeline that is triggered by the current one, or a separate pipeline that is triggered independently.

When you associate commits with an artifact version (CI pipeline), and define an artifact package (CD pipeline), all artifact versions generated since the last time the app was deployed to production are included in the list of commits for the change. Consolidation of these items is helpful, especially when there are multiple CI builds before the deployment.

DevOps change request attributes:

- **Category** DevOps or the **Categorize DevOps change requests on "DevOps Change" field** check box is selected in DevOps properties. For more information, see DevOps change request without mandating category as DevOps.
- Commits and Work Items related lists

Packages

A package tracks when one or more artifact versions are being used in a deployment pipeline. This provides two important benefits:

1. Retrieval of activities for all artifact versions declared in the package. For example, for use in an automated change approval policy.
2. Recording when a specified artifact version was successfully released, ensuring that information tied to them is no longer considered. For example, for later change requests.

Artifact setup

1. Create an artifact tool record in DevOps.

   Note:
   An artifact tool isn't necessary unless a webhook or user-created integration subflow configuration is required to look up artifact versions.

2. Register artifacts in the CI pipeline.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create a package in the CD pipeline.

Note:
The package creation step must be before the Prod Deploy step.

Artifact registration

Configure artifact registration in a scripted pipeline or freestyle job using the DevOps API / `artifact/registration` endpoint. Multiple artifact versions are supported.

For Jenkins pipeline:

- Scripted and declarative pipeline (*`snDevOpsArtifact`* Jenkinsfile command)

  For example:

```
snDevOpsArtifact(artifactsPayload: """{"artifacts":
 [{"name": "sa-web.jar", "version": "1.9","semanticVersion":
 "1.9.0","repositoryName": "services-1031"}], "branchName":
 "master"}""")
```

- Freestyle job (**Register Artifact** build step)

  For example:

```
{"artifacts":[{"name":"sentiment-analysis-web2","version":"1.9"
,"semanticVersion":"1.9.0","repositoryName":"maven-releases"}]}
```

Artifact package creation

Important:
You must add the package creation step before the change step in your pipeline, and package creation must be added in a stage which is previous to the change step, so that packages are linked to the pipeline execution for a change request.

Configure artifact package creation in a scripted pipeline or freestyle job using the DevOps API `/package/registration` endpoint.

Note:
Package name must be specified.

For Jenkins pipeline:

- Freestyle job (**Create Package** build step)

  For example:

```
{"artifacts":[{"name":"sentiment-analysis-web2","version":"1.9"
,"repositoryName":"maven-releases"}]}
```

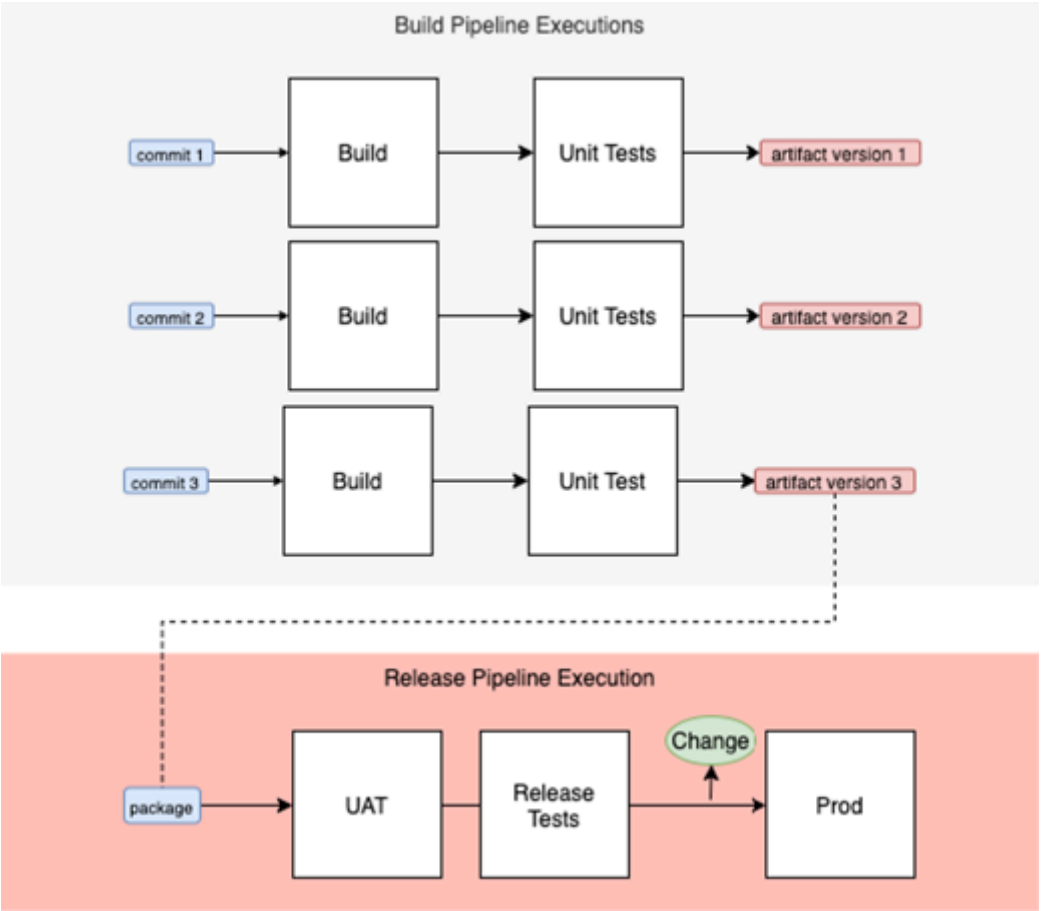
- Declarative and scripted pipeline (*`snDevOpsPackage`* Jenkinsfile command)

  Package with more than one artifact (from different repos) in the payload, for example:

```
snDevOpsPackage(name: "sentimentpackage", artifactsPayload:
 """{"artifacts":[{"name": "sa-web.jar", "version": "1.9",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"repositoryName": "services-1031"}, "{"name": "sa-db.jar",
"version": "1.3.2", "repositoryName": "services-1032"}],
"branchName": "master"}""")
```



Note:
When an artifact version isn't available during the build, build details (pipelineName or projectName, taskExecutionNumber, stageName, branchName) are used to look up the artifact version in the task execution.

Jenkins plugin step `includeBuildInfo` can be used to include build details in the API call.

Artifact workflow and objects

The orchestration tool job publishes the new artifact (consisting of versions) to the artifact repository. Each artifact version is associated with a task execution (consisting of the related code commits). A package is created for the release (consisting of specific artifact versions flagged for deployment) and, after the deployment stage completes, the package is marked as deployed to production.

These objects are part of the artifact structure.

- **Artifact tool**

  Used to support artifact repository managers such as JFrog Artifactory.

  Note:
  An artifact tool isn't necessary unless a webhook or user-created integration subflow configuration is required to look up artifact versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Artifact repository**

  Target for artifacts generated in a build, and also a source of artifacts required by a build. Can be created manually, or through the RegisterArtifact API as new artifacts are published under new repositories in a tool.

- **Artifact**

  Artifact name for which different builds (artifact versions) are generated. Can be created manually, or through the RegisterArtifact API. Artifacts (versions) are associated with a task execution and published to an artifact repository.

- **Artifact version**

  Specific version of the artifact. Deployable component of an application generated by a CI build. When provided, semantic version is used.

  Can be created through discovery, or through the RegisterArtifact API. Artifacts (versions) are associated with a task execution and published to a tracked artifact repository.

- **Semantic version**

  Optional attribute of an artifact version that, when provided, is used to determine commits for a change. Semantic version format is (MAJOR.MINOR.PATCH).

- **Package**

  Collection of artifact versions used as input to a CD pipeline, or for associating test results.

  Package creation is triggered by the CreatePackage API call from the orchestration tool and contains the name, version, and repository name of all the artifact versions included in the package. A check box indicates whether the package has been deployed to production.

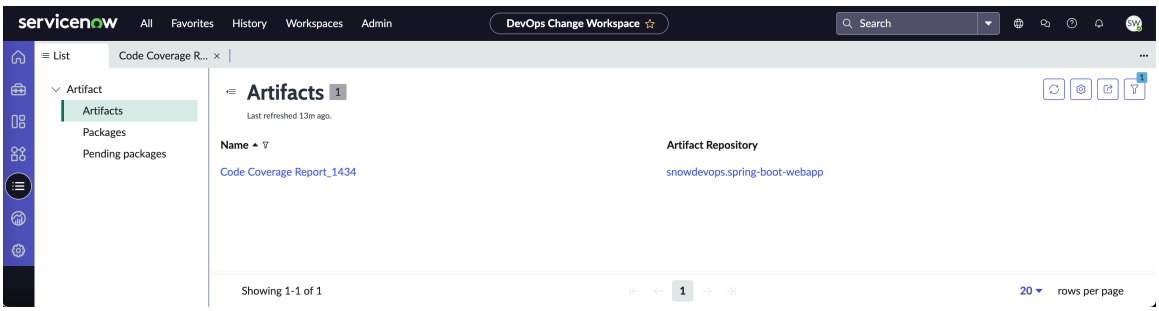
You can see all the existing artifacts and packages directly using the **List** module in the application navigator.

Navigate to **DevOps Change Workspace** > **Lists** > **Artifact** for all artifact-related information.



Artifacts and packages monitoring

When artifacts and packages are registered from a source tool into ServiceNow, they are often staged in the *sn_devops_artifact_staging* table, while the remaining necessary data for creation and linkage of these objects is either received from inbound events, or fetched by DevOps flows.

Most of the times, these staging records are processed within a few seconds. But there may be cases where the necessary data is never received, so these records may be left idle. The **Description** field on the table below contains a summary of the details missing in such cases to help in easier monitoring.

Note:
It is recommended to have unique artifact names for release builds, that is, different artifact names for builds running on different branch builds.

Staging type	Staging code	When can this occur	Final state?	Description
register_artifact	ERROR_CALLING_SUBFLOW	During artifact registration call, when the artifact version isn't provided in the artifacts payload, and look-up subflow is supported but the artifact version couldn't be found.	Yes (Ignored)	Your artifact registration request was ignored for the following reason: Artifact version not found by the look-up subflow.
register_artifact	ERROR_CALLING_SUBFLOW	During artifact registration call, when the artifact version isn't provided in the artifacts payload, and look-up subflow is supported but could not find the artifact version due to an error in the subflow.	Yes (Ignored)	Your artifact registration request was ignored for the following reason: Artifact version not found by the look-up subflow due to an error (refer to DevOps logs for additional details).
register_artifact	ERROR_CALLING_SUBFLOW	During artifact registration call, when the artifact version isn't provided in the artifacts payload, and look-up subflow is supported but wasn't executed because the parent artifact record could not be found in the system.	Yes (Ignored)	Your artifact registration request was ignored for the following reason: Artifact not found.

Commits included in DevOps change request

The DevOps artifact package and its associated artifact versions are used to determine which commits are included in a DevOps change.

Commits are included in a change based on the change type.

Change type	Commits included
Manual	Commits from the artifact versions of the package in the change. In addition, the commits from task executions of all the pipeline executions in the change reference record when the data_type column is plan or pipeline execution are included.
Automated	• Without package: All commits from the artifact versions are included. The artifact versions are the ones that are linked to the pipeline execution and the task executions for that pipeline execution. • With package: If any of the upstream task executions of the change has the prod deploy step, then commits from the last successful prod deploy pipeline execution are included. Commits that appear in multiple pipeline executions will be listed only once. If the prod deploy step is not present in the upstream task executions, the commits from all the artifact versions of the package are included.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change type	Commits included
	• Run commits: If there are no commits from either of the with or without package flow as specified previously, then the run commits from the upstream task executions of the change request are associated.

All commits for artifact versions in the package that were generated after the last deployment date (up to the version currently being deployed) are included in the change request. Previous major versions are not included.

Note:
Patch and hot fix versions are excluded.

When provided, semantic version is used to determine commits for a change. Format is (MAJOR.MINOR.PATCH). For example, semantic version 2.0.1 is read as follows:

- Major version 2
- Minor version 0
- Patch/hotfix version 1

Failed task executions between the previous and current artifact versions that did not build an artifact but have associated commits are also associated to the created artifact version.

Types of commits

- Normal commits: Commits on the tracked repository are associated to the change request.
- Revert commits: Commits that have the revert field value as true. A revert commit results in a reverted commit and revert commit in the source tree. Both the commits are not associated to the change request.
- Merge commits: Commits that have the merge field value as true.
  - Merge commit: The source tree tracks the commit to a branch over time and allows for a special merge commit to be made. This merge commit combines the parent commits located directly after the most recent common commit on both the current branch and the branch to be merged. Merge commit adds a new commit on the main branch.
  - Squash and merge: Squashing during a merge generates the working tree and index state to match a merge without creating a merge commit. Squash and merge keeps the changes but removes the individual commits from history. It has a single commit with the merge value as true.

Example: Commits and packages

This example consists of:

- Three build pipelines (A, B, and C)
- A release pipeline (ABC) under change control, with four packages:
  1. Build pipeline A (major version 1)
  2. Build pipelines A and B (major version 1)
  3. Build pipelines B and C (major version 1)
  4. Build pipelines A, B, and C (major version 1)

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Package 1 (A 1.1.0)

Commit	Build pipeline	Semantic version	Included in package
1	A	1.0.0	X
2	A	1.0.1	--
3	A	1.1.0	X

Note:
Commit 2 (build A, semantic version 1.0.1) is not included in the package because the semantic version syntax indicates a patch or hot fix.

Package 2 (A 1.2.0, B 1.1.0)

Commit	Build pipeline	Semantic version	Included in package
4	A	1.1.1	--
5	A	1.2.0	X
6	A	1.2.0	X
7	B	1.0.0	X
8	B	1.0.0	X
9	B	1.1.0	X
10	B	1.1.0	X

Note:
Commit 4 (build A, semantic version 1.1.1) is not included because the semantic version syntax indicates a patch or hot fix.

Package 3 (B 1.2.0, C 1.0.0)

Commit	Build pipeline	Semantic version	Included in package
11	A	1.3.0	--
12	B	1.2.0	X
13	B	1.2.0	X
14	C	1.0.0	X
15	C	1.0.0	X
16	C	1.0.0	X

Note:
Commit 11 (build A, semantic version 1.3.0) is not included because the package does not specify build A.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Package 4 (A 1.4.0, B 1.3.0, C 1.2.0)

Commit	Build pipeline	Semantic version	Included in package
17	A	1.4.0	X
18	A	1.4.0	X
19	B	1.3.0	X
20	B	1.3.0	X
21	C	1.1.0	X
22	C	1.1.0	X
23	C	1.2.0	X
24	C	1.2.0	X

Note:
Commit 11 is also included in this package because it is part of the changes in major version 1 of build A since the last package (including major version 1 of build A), package #2, was deployed to production.

Example: Commit calculation logic

Use case with the logic for calculating commits that get associated to artifact versions. The branch information is included whenever the commits are defined.

For example, consider two pipelines, one on the main branch, one on the test branch. Run scenario:

- Create a commit C0 on main, run CI build, but don’t create Artifact Version.
- Create a commit C1 on test, run CI build, but don’t create Artifact Version.
- Create a commit C2 on main, run CI build and the build fails.
- Create 2 commits C3,C4 on main, run a CI build and create an Artifact Version (v1.0).

Expected result: Artifact Version (v1.0) is associated to C0, C2, C3, C4. Commit C1 is excluded as it's on a different branch.

Continuing with the use case:

- Create 1 commit C5 on main, run CI build, but don’t create Artifact Version.
- Create 1 commit C6 on main, run CI build and create an Artifact Version (v2.0).

Expected result: The new artifact version (v2.0) created is associated to C5, C6.

Summary:

- All commits from pipeline executions (success & failed) in the same branch, between last Artifact Version for a given Artifact and current Artifact Version, are associated.
- If no previous Artifact Version for the given Artifact is found, then all commits from pipeline executions in the same branch are associated.

Continuing with the use case:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a release with Artifact Version from the previous step, have a CD pipeline with Step type = Prod Deploy.

Expected result:

- Release is associated with the same Artifact Version (v2.0).
- Change Request created shows Artifact Version (v2.0) and Commits C0, C2, C3, C4, C5, C6.

Summary:

- Commits from both Artifact Versions (v1.0, v2.0) built on main branch (no previous package was deployed to Prod) are shown in the change request, but not the commit from execution on test branch.
- The number of commits shown in the change request will be the same as the number in the tool.

Continuing with the use case:

- Create 2 commits C7, C8 on test branch, run CI build and create an Artifact Version.

  Expected result: Artifact Version (v3.0) is associated to C1, C7, C8.

- Create 2 commits C9, C10 on main branch, run CI build and create an Artifact Version.

  Expected result: Artifact Version (v4.0) is associated to C9, C10.

- Create a release with Artifact Version from previous step (v4.0), have a CD pipeline with Step type = Prod Deploy.

  Expected result:

  - Release is associated with Artifact Version (v4.0).
  - Change Request created shows Artifact Version (v4.0) and commits C9, C10.

Summary:

- The change request shows commits just from the latest Artifact Version built on main branch, as commits from previous Artifact Versions built on main had been deployed to Prod on the previous package.
- No commits from Artifact Version built on test are shown.
- The number of commits shown in the change request will be the same as the number in the tool.

DevOps Pipeline UI

Use the Pipeline UI to visualize interactions and results across a pipeline execution. This graphical view shows pipeline step progression and other details for each pipeline.

From DevOps, get a quick view of how everything is connected to see exactly what is happening with the pipeline and when. From the ServiceNow Change Management application, you can access the Pipeline UI and quickly see the commits, the committers, and other details for the change request in one place.

The Pipeline UI displays parallel stages as modeled in Azure DevOps release pipelines. The pipeline UI displays the real-time state of the pipeline as it appears in Azure DevOps. The associated artifact details sourced from the build pipeline, Test Results, Software Quality Summary Results also display on the pipeline UI. For more information, see Parallel stages in Azure DevOps release pipelines.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Pipeline UI shows all attempts of any stage or job that has been rerun or restarted. For more information, see Restarting failed build or release pipeline jobs and stages.

The Pipeline UI shows the pipeline steps that ran instead of the steps configured in DevOps.

You can access the Pipeline UI using the related link from within certain DevOps forms, and also from a DevOps change request form:

- DevOps Pipeline form
- DevOps Pipeline Execution form
- Change Request form created by DevOps

Note:
You must reload the view to update the status buttons in the pipeline execution History.

Step run states (task execution status)	
Green	Successful. All step executions associated to the pipeline execution passed.
Grey	Not yet run.
Yellow	Waiting (pending, building, validating). At least one step execution is waiting.
Red	Failed. At least one step execution failed. Task execution end date is populated even when the change is rejected. **Note:** To enable the canceling of the change request associated with the step when the step fails, you must set the *sn_devops.cancel_change_on_pipeline_canc* property to Yes. For more information, see Properties installed with DevOps.

Note:
The order the cards appear in the Pipeline UI is determined by the **Order** field in each pipeline step when you modeled your pipeline in DevOps. Skipped stages are not shown.

The order the cards appear in the Pipeline UI by task execution.

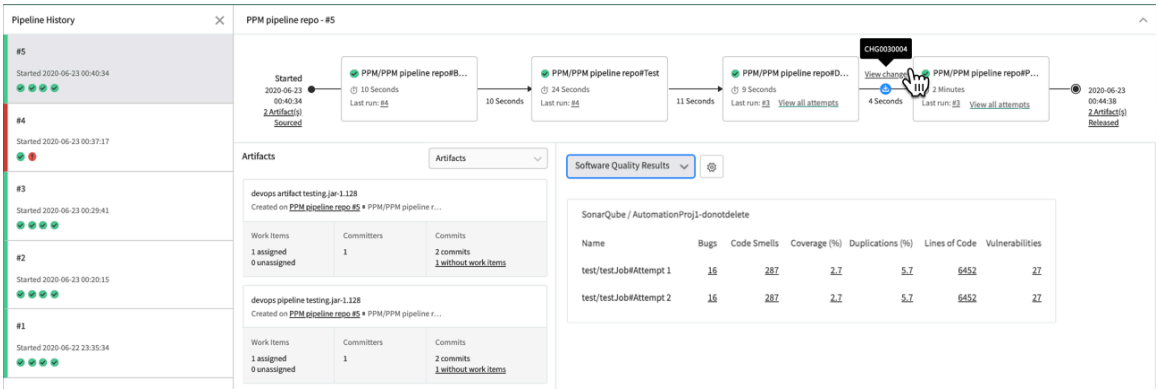
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



UI feature	Description
Pipeline steps	Timing. • Start • Last run • Duration for each step When the downstream task execution starts immediately after the upstream task execution, the duration is 0 seconds. • Wait times in between task executions. Wait time is calculated as: Start time of the task execution minus the end time of the upstream task execution.
View change request	Change request record. Click directly into the change request of the step that was created by DevOps to view details of the change and take action. **Note:** • The change request record for the associated with the latest task execution displays. • Commits reverted in the same pipeline execution are not shown in the commit list.
Pipeline history	Pipeline Execution. Click a history tile to view the previous step details for a pipeline execution. **Note:** Pipeline history is displayed for only the most recent 20 pipeline executions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI feature	Description
View all attempts	All attempts that the job has run in a step. Click the link in the relevant step to view all attempt details.

Artifacts	• Artifact versions
	  ○ Work items
	  ○ Commits
	  ○ Packages
	• Commits
	• Work items
	
	Note:
	Commits reverted in the same pipeline execution are not shown in the commit list.

Test Results	View the build test results to see what tests passed or failed. The quality card contains test summaries: • Test type and test category in the format: `test type/test category` • Native ID of the step • Test pass percentage (unit and functional tests only) • Throughput (performance tests only) • Step name
Software Quality Results	View all the software quality (SonarQube scan) results grouped by project name that were fetched as part of the selected pipeline. You can view the scan results for all categories in a pipeline execution step. You can customize the results that are displayed in the Pipeline UI by configuring the columns in the **Software quality categories shown by default in the Pipeline UI view** (**DevOps** > **Administration** > **Properties** > **DevOps Properties Category** >) property in a comma separated format.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UI feature	Description
	• Click the gear icon to modify the column view in the pipeline UI. • Click the step execution record to view the corresponding Software Quality Scan Summary record. • Click the Vulnerabilities count record to view the Software Quality Scan Detail record and the corresponding sub category details.
Security Results	View all the security results that were retrieved as part of the selected pipeline. You can view the scan results for all categories in a pipeline execution step. You can customize the results that are displayed in the Pipeline UI. • Click the gear icon to modify the view in the pipeline UI. • Click the step execution record to view the corresponding Security scan summary record. • Click the Detected flaws count record to view the Security scan details.

Note:
When you reattempt running a stage or a pipeline job in Azure DevOps, which contains a test or a software quality scan, the results get appended with the attempt number.

Click directly into DevOps change requests, step executions, artifacts, artifact versions, work items, test summaries, and reattempts in flyout windows.

Configuring DevOps change request details within the pipeline

Configure how the closure information, change state, and change request fields are updated from within a pipeline in the change step of the pipeline.

Note:
Configuring change request details from within a GitLab pipeline isn't supported.

The system variable, by default, points to the Default subflow to auto close a change in the base system. The **DevOps auto close change on pipeline completion subflow** (*sn_devops.auto_close_change*) determines how the closure information, change state, and change request fields are updated when a pipeline is completed. If you want to specify a custom subflow that must be activated when a pipeline is completed, you can clone this subflow and customize it according to your requirements.

Closure information and change request attributes are contained with the *changeRequestDetails* object.

Auto close change

Set the *autoCloseChange* parameter to `true/false` in the changeRequestDetails object when creating a change from a pipeline to update the **Close code** and **Close notes** fields and close the change request when a pipeline is completed. The **Actual start date** and **Actual end date** field values are also updated when the pipeline is completed. The date values are based on the pipeline's start time or the pipeline's first stage's start time, and the pipeline's end time or the pipeline's last stage's end time. The close notes will be suffixed with text specifying that the closure information has been updated based on the Auto close change feature.

If set to true, the **Close code** and **Close notes** fields will be updated and the system will try to close the change request when the pipeline is completed.

If set to false, the **Close code** and **Close notes** fields will be updated when a pipeline is completed but the change request won't be closed.

You can also set the **Auto close change** field value for a pipeline in the ServiceNow application. If you select **Update Change Only**, the **Close code** and **Close notes** fields will be updated when a pipeline is completed, and if you select **Update and Close Change**, the change request will also be closed along with updating the closure information.

Based on whether the auto close change is specified in the pipeline or column, the final state considered will be as follows:

autoCloseChange flag in change request attributes	Auto Close Change column value (sn_devops_pipeline)	Final state
True	Update Change Only	Updates change and moves state to close
False	Update and Close Change	Only updates the change
-	Update Change Only	Only updates the change
-	Update and Close Change	Updates change and moves state to close

Note:
The value specified for the autoCloseChange attribute in the pipeline takes precedence over the value specified in the Auto Close Change column in ServiceNow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The auto close change feature is only applicable for basic pipelines with a single change created on it. If there are multiple changes, the latest change will be considered for auto close.
- The auto close change feature isn't supported for Jenkins freestyle pipelines and change requests where the change receipt feature is enabled.
- For an Azure release pipeline, the pipeline completion state is derived by consolidating the state of each stage in the pipeline. If even one stage fails, the pipeline will be considered unsuccessful. If even one stage is partially successful, the pipeline will be considered successful with issues.

Upgrade information

If you're upgrading, you must re-configure your orchestration tool before setting the autoCloseChange parameter for GitHub and Azure build pipelines.

Set Close Code

Set the *setCloseCode:* parameter to `true/false` based on the desired behavior. Default is true.

If set to true, the **Close code** and **Close notes** fields are updated as specified in the change step attributes and the change request is moved to post-implement when a stage is completed. You can override this behavior by enabling the **Auto close code** feature. The setCloseCode feature will get disabled when autoCloseChange is enabled and set to true or false. For more information, see Auto Close Change. Use the autoCloseChange feature for more accurate change request details.

If set to false, when the job or pipeline has completed, the change request isn't updated and remains in the Implement state.

- Closure Information in the change request isn't set (**Close code** and **Close notes** fields are left empty).
- A link to the step execution is added to the **Work notes**.

Change request fields

Set change request field values within the pipeline for the change request template specified.

- Use the *attributes:* parameter to set field values.
- Use the DevOps - POST /devops/orchestration/changeControl endpoint of the DevOps API.

Note:

- If a specified field has a dependent field that is required, you must set that attribute as well.
- If the attribute for the dependent required field isn't set, change request and related step execution are canceled, and work notes are updated.

Field values within the *attributes:* parameter are key-value pairs. Meaning, the key is the field name within the template and the value is the information to populate in the field.

You can use the *changeControl* API to specify fields such as *type*, *cmdb_ci*, *template*, *assignment_group* *business_service*, *standard_change_template*, *chg_model* and create a change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When attributes are passed for change, the order of priority is as follows:

1. Change request fields or changeControl API.
2. Values in the Step record.
3. Values provided in the Change Request template.

Note:
When configuring change requests from within the pipeline, change type and template fields are always taken from one source. You can't use a combination of attributes from the API request and the change request form.

All fields in the Change Request [change_request] table are supported except where specified.

Change request fields supported

Unsupported fields	• risk • impact • number • sys_id • risk_impact_analysis
Supported fields	All remaining fields in the Change Request [change_request] table.

Note:
The attribute name must match the change request field name, and the value specified must be valid.

DevOps change models

DevOps Change Velocity enables you to use fit-for-purpose change models that allow better flexibility in defining change models or processes to reflect modern development practices.

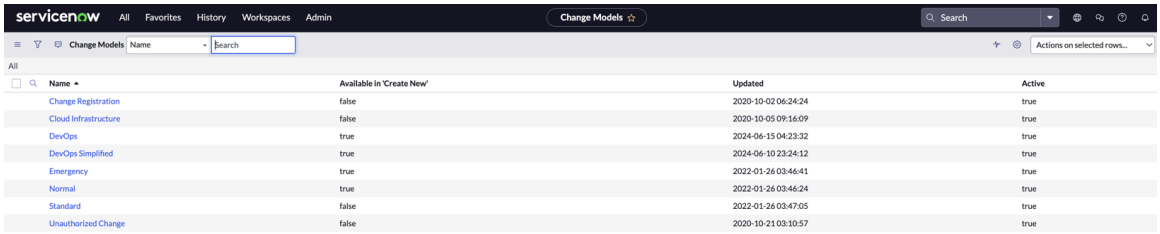
DevOps Change model overview

Important:
For DevOps change requests, use the Change Management - Change Models feature, which provides greater flexibility to enable the change process flow in a way that is optimized for specific use cases. For more information, see Change models. The legacy Change Management - State Model is also supported. For more information, see State model and transitions.

Important:
The DevOps and DevOps Simplified change models are not supported for Argo CD and Split tool change requests.

Use fit-for-purpose change models with a suite of succinct flows and flow actions built in Flow Designer for specific use cases. Instead of using the legacy ITIL-based change processes that are predefined in change workflows (Normal, Standard, and Emergency), you can selectively transition to a wide range of models that are optimized for specific use cases. Change models can be created with states and rules that determine the transitions between the states. For information on change models, see Change models.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Name	Available in 'Create New'	Updated	Active
Change Registration	false	2020-10-02 06:24:24	true
Cloud Infrastructure	false	2020-10-05 09:16:09	true
DevOps	true	2024-06-15 04:23:32	true
DevOps Simplified	true	2024-06-10 23:24:12	true
Emergency	true	2022-01-26 03:46:41	true
Normal	true	2022-01-26 03:46:24	true
Standard	false	2022-01-26 03:47:05	true
Unauthorized Change	false	2020-10-21 03:10:57	true

You can use any of the base system change models including the DevOps or DevOps Simplified change models. To create a change request based on models, you can either configure the **Model** field in the Step form in ServiceNow, or pass the model sys_id or name in the change step from your orchestration pipeline.

Base system DevOps change models

Two change models, called DevOps and DevOps Simplified are included in the base system and are active by default for you to create a model based change request.

Type compatibility flag

The type compatibility *com.snc.change_management.change_model.type_compatibility* property is used to determine what kind of change requests (type- or model-based) will be created. Navigate to **System Properties > All Properties** to set the value for this property. The default value of this property is False. This property enables change type compatibility for change models. When set to true, the change request can be created either as a type-based workflow or change models. When set to false, change request will be created only using change model.

The change request will be created based on the configuration combination as defined in the following tables when the property is set to true or false.

When the type compatibility property is set to True

Change attribute configured in the pipeline step in ServiceNow	Change attribute passed in the pipeline	Change attribute considered in change request creation
Change model: <any selected change model>	Neither model nor change type is passed.	Model-based change request will be created
Change model: <any selected change model>	Type is passed. For example, Normal `{ "attributes": { "type": "normal" } }`	Type-based change request will be created
Change model: <any selected change model> for example, Model 1.	Different model is passed. For example, Model 2.	Change will be created based on Model 2

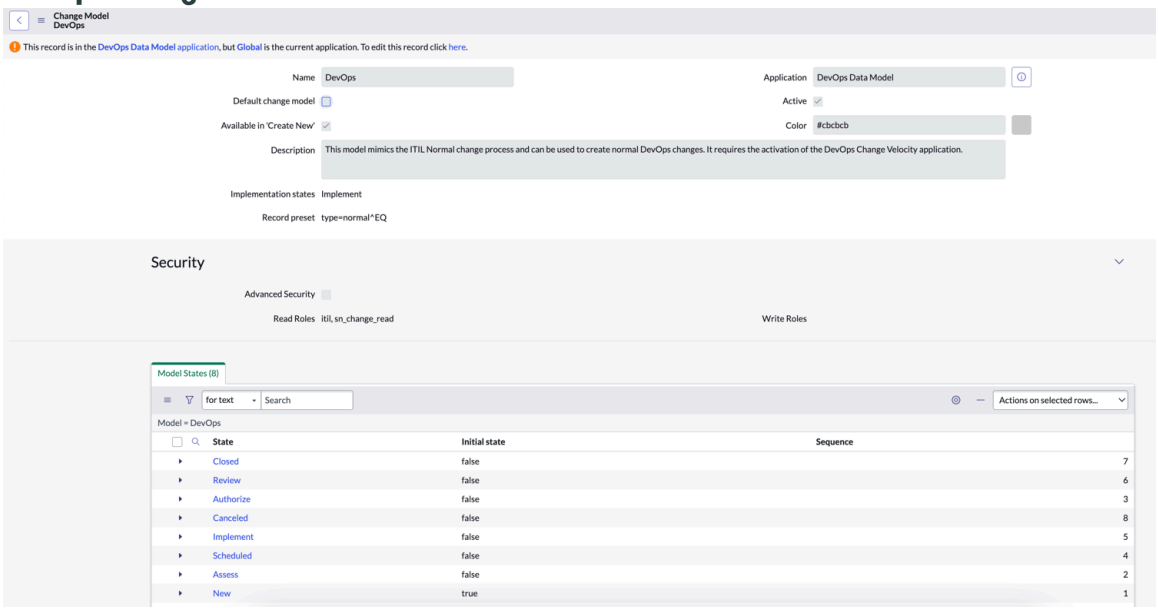
Configuration of DevOps models

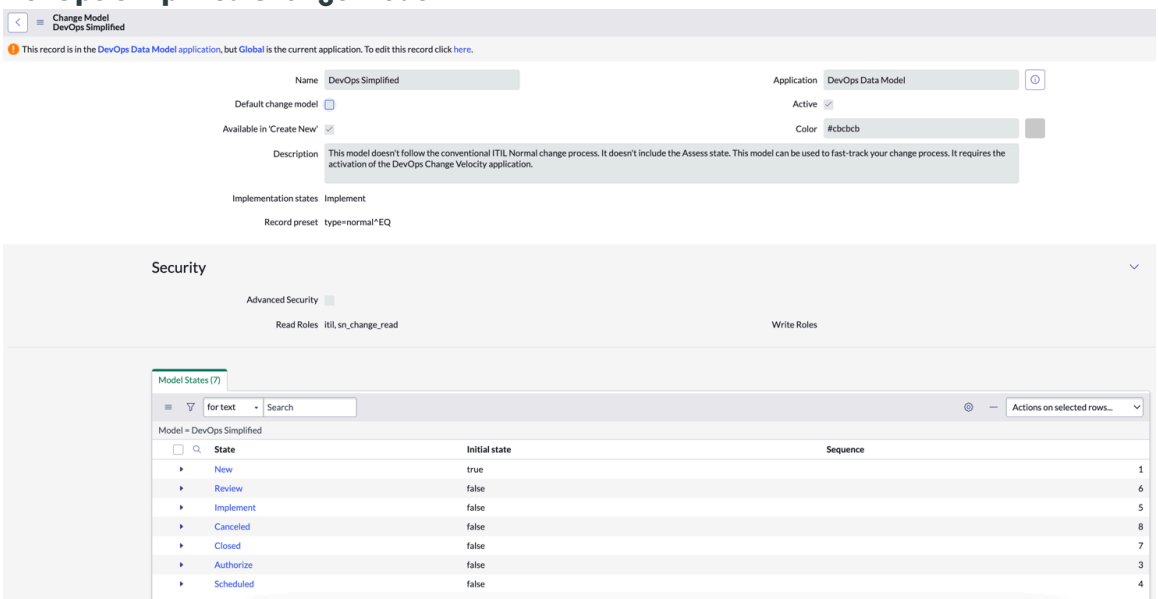
The base system change models have the **Implementation states** field value as Implement, and the **Record preset** field is selected as **Type=Normal** by default. The model states available for the DevOps change model are New, Assess, Authorize, Scheduled, Implement, Review, Closed, and Canceled. And the model states available for the DevOps Simplified change model are New, Authorize, Scheduled, Implement, Review, Closed, and Canceled. Depending on your requirements, you can modify the change models and configure the states and transitions for your specific use case.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps Change Model



DevOps Simplified Change Model



If you want to create your own model instead of using the base system DevOps models, see the instructions in the Create a Change model section.

You can use record presets to configure change details for your change model. Whenever a change is created, these values will be automatically set on the change. You can set a record preset for any change field that exists in the change request.

The following logic is considered for pre-filing the change details when creating a change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you have configured change details in the record preset, then you can't override this value by passing change details from the pipeline.
- If change details aren't configured in the record preset, then the values passed from the pipeline is considered for pre-filing the details in the change request.
- If change details are neither configured in the record preset nor passed from the pipeline, then the values configured in the Step form in ServiceNow are considered.

Change details configured in record preset in ServiceNow	Change details configured in Step form in ServiceNow	Change details passed in the pipeline	Change details pre-filled when change is created
Assignment group: DevOps Report	Assignment group: Not specified	Assignment group: Not specified	Assignment group will be pre-filled from the record preset in the change request
Assignment group: Not configured	Assignment group: Not specified	Assignment group: DevOps Report	Assignment group will be pre-filled from the pipeline in the change request
Assignment group: Not configured	Assignment group: DevOps Report	Assignment group: Not specified	Assignment group will be pre-filled from the Step form in the change request

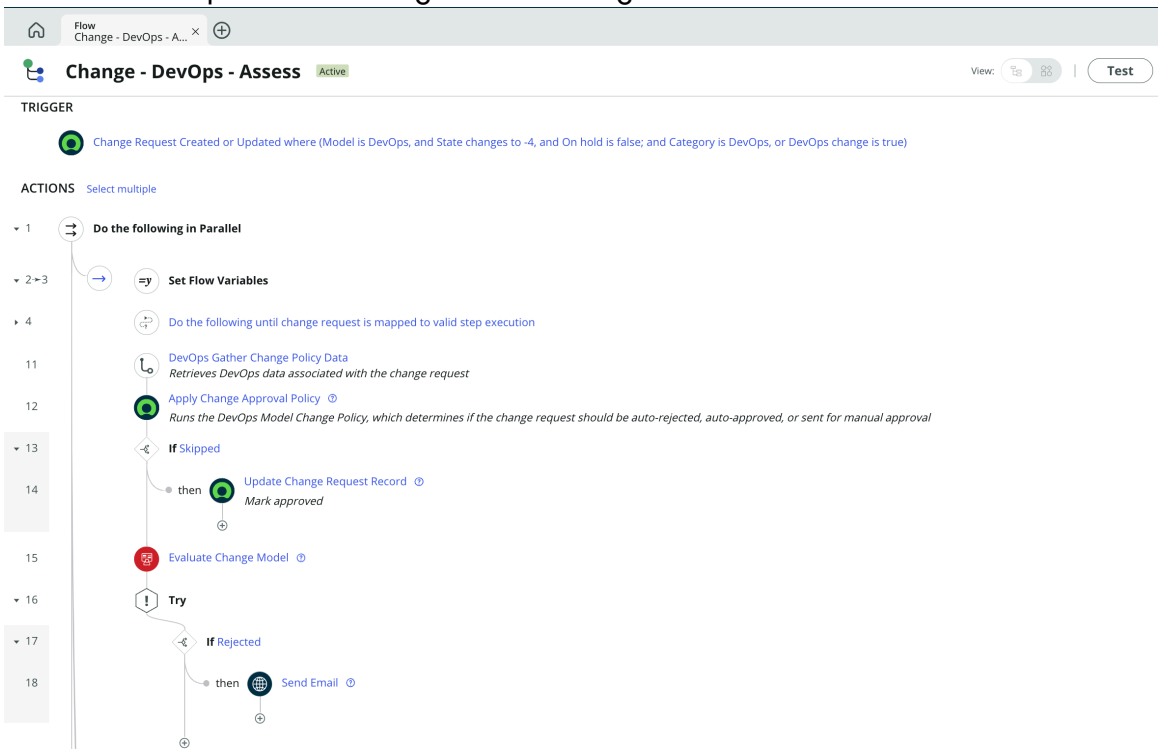
DevOps Change model

The DevOps change model contains flows in the base system for state transition and change approvals. Each state in the DevOps model has its own flows and each flow will get triggered when the required conditions are met. Change approval (auto or manual) is based on the DevOps Model Change Policy. By default, the base system DevOps Model Change Policy only has the manual approval decision activated. When you are ready for more approval automation, you can modify the policy. The following flows explain the state transition and change approval behavior.

- Change - DevOps - New: When the change request is created in the New state, this flow gets triggered. If it has an Assignment Group, then this flow updates the change state to Assess.
- Change - DevOps - Assess: When the change request is in the Assess state, this flow gets triggered. There are two key actions in this flow - DevOps Gather Change Policy Data and Apply Change Approval Policy, which are used to retrieve the DevOps data associated with the change request and check whether the change request must be auto approved, auto rejected, or sent for manual approval. The change approval (auto or manual) happens as part of this flow in the Apply Change Approval Policy action based on the DevOps Model Change Policy. If the change is approved (auto or manual), it moves to the Authorize state. If the change is rejected, an email notification is sent to

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the user who requested the change and the change is moved back to the New state.



- Change - DevOps - Authorize: When the change request is in the Authorize state, this flow gets triggered. In the base system, you will notice that there are two key actions - DevOps Gather Change Policy Data and Apply Change Approval Policy, which are used to retrieve the DevOps data associated with the change request and check whether the change request must be auto approved, auto rejected, or sent for manual approval. The conditions in the DevOps Model Change Policy in the Apply Change Approval Policy action won't be met. So the change approval (auto or manual) in this flow will be skipped. This flow will only move the change request state to Scheduled that triggers the Change - DevOps - Schedule flow.

  Note:
  If your change process requires another approval, you can refer to this flow and customize the DevOps Model Change Policy according to your requirements.

- Change - DevOps - Schedule: When the change request is in the Scheduled state, this flow gets triggered. When the planned start date is reached, the change is moved to the Implement state.
- Change - DevOps - Implement: When the change request is in the Implement state, this flow gets triggered.

The DevOps Model Change Policy contains the following policy inputs:

- is_change_with_partial_data
- regression_tests_failed
- code_security
- code_coverage
- total_num_of_commits
- tests_passing_percent
- load_tests_failed
- num_of_open_incidents

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- num_of_outages_in_last_7_days
- num_of_current_outages
- integration_tests_failed
- commits_without_work_item
- change_request
- risk

The three outcomes for the DevOps Model Change Policy (depending on the conditions that you specify) are:

- Auto approval: If the conditions specified in the policy are met, the change request is automatically approved.
- Auto reject: If one or more of the conditions specified in the policy are not met, the change request is automatically rejected.
- Manual approval: If one or more conditions need manual approval by a user or group, that is specified in the policy. Notifications are sent by the policy to the relevant users or groups to expedite the manual approval and progress the change request.

Note:
By default, the base system DevOps Model Change Policy only has the manual approval decision activated.

Important:
When you use the base system DevOps model as is, the change approval is automated by default. If you do not want automated change approval, you can modify the DevOps Model Change Policy in a way it suits your current change process.

DevOps Simplified model

The DevOps Simplified change model contains flows in the base system for state transition and change approvals. Each state in the DevOps Simplified model has its own flows and each flow will get triggered when the required conditions are met. Change approval (auto or manual) is based on the DevOps Simplified Model Change Policy. The following flows explains the state transition and change approval behavior.

- Change - DevOps Simplified - New: When the change request is created in the New state, this flow gets triggered. If it has an Assignment Group, then this flow updates the change state to Assess.
- Change - DevOps Simplified - Authorize: When the change request is in the Authorize state, this flow gets triggered. There are two key actions in this flow - DevOps Gather Change Policy Data and Apply Change Approval Policy, which are used to retrieve the DevOps data associated with the change request and check whether the change request must be auto approved, auto rejected, or sent for manual approval. The change approval (auto or manual) happens as part of this flow in the Apply Change Approval Policy action based on the DevOps Simplified Model Change Policy. If the change is approved (auto or manual), it moves to the Schedule state. If the change is rejected, an email notification is sent to the user who requested the change and the change is moved back to the New state.

Note:
If your change process requires another approval, you can refer to this flow and customize the DevOps Simplified Model Change Policy according to your requirements.

The three outcomes for the DevOps Simplified Model Change Policy (depending on the conditions that you specify) are:

- Auto approval: If the conditions specified in the policy are met, the change request is automatically approved.
- Auto reject: If one or more of the conditions specified in the policy are not met, the change request is automatically rejected.
- Manual approval: If one or more conditions need manual approval by a user or group, that is specified in the policy. Notifications are sent by the policy to the relevant users or groups to expedite the manual approval and progress the change request.

Note:
By default, the base system DevOps Simplified Model Change Policy only has the manual approval decision activated.

Callback to resume the pipeline

In DevOps Change Velocity, the following considerations are made to send a callback request.

- The implementation states is used to send a callback to the third-party orchestration tool. If only one implementation state is present in the change model, then an absolute comparison is made. When the change created by a change model reaches the implementation state that is set, a call back is sent to the third-party orchestration tool.

Note:
In change models, the Implementation states field can have one or more states. You can define the implementation states for each change model. For more information, see State model and transitions.

- If multiple implementation states are present in the change model, a call back is sent to the third-party orchestration tool in the state where implementation state is reached first.
- If there's no implementation state set on the change model, then the model states are checked for the **Implement** state. If the Implement state is present, then that is considered for call back to the third-party orchestration tool. If there's no implement state in the model states as well, then the value present in the **sn_devops.change_request.implement_state** property is considered. The value of the system property is -1 by default, which is the implement state.

Note:
The Change – DevOps – Update execution state flow is used to send a callback to the third-party orchestration tool. This approval flow waits until the change request is in the Implement state. Once the change request reaches Implement state, this flow updates the Step Execution record to the appropriate (approved, rejected, canceled) state. The moment the Step Execution record is updated, the Change Control Callback flow is triggered to send the callback to the third-party tool.

After upgrade

- The **Change model** field will be displayed in the Step form. This won't impact your existing type-based change creation process as the type compatibility property (*com.snc.change_management.change_model.type_compatibility*) is true.
- If you want to have a model-based change request, set the type compatibility property to false. The **Change model** field in the Step form will be required. For information on configuration combination based on the property, see the table When the type compatibility property is set to False.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you're an existing customer and zbooted your instance, or a new customer, you can create model-based change requests by default. However, you can create type-based change requests by setting the type compatibility property to true.

The following table explains how the change model feature works for new and upgrading customers.

Change model behavior based on upgrade

New or upgrade instance	Type compatibility flag	Model or Type	State transition flows	Auto change approval flows	Callback to 3rd party
zboot (new or existing zbooted)	false	DevOps model	• Change request - DevOps - New • Change request - DevOps - Assess • Change request - DevOps - Authorize • Change request - DevOps - Schedule • Change request - DevOps - Implement	In the base system, change approval (auto or manual) happens through the Change request - DevOps - Assess flow. If you want another level of approval, you can refer to the Change request - DevOps - Authorize flow and customize the DevOps Model Change Policy accordingly.	See the Note in the Callback section.
Upgrade	false	DevOps model	• Change request - DevOps - New • Change request - DevOps - Assess • Change request - DevOps - Authorize • Change request -	In the base system, change approval (auto or manual) happens through the Change request - DevOps - Assess flow. If you want another level of approval, you can refer to the Change request -	See the Note in the Callback section.

Change model behavior based on upgrade (continued)

New or upgrade instance	Type compatibility flag	Model or Type	State transition flows	Auto change approval flows	Callback to 3rd party
			• Change request - DevOps - Implement	Change Policy accordingly.	
Upgrade	true	Type	Current behavior is continued	DevOps Change Request Manual Approval, or DevOps Change Request Minimal Automation Approval, or DevOps Change Request Advanced Automation Approval flows (whichever flow is active)	Change Control Callback flows

Update change model in pipeline

Update the change model in your existing pipeline steps using the DevOps Pipeline Migration to Change Models catalog item.

Before you begin

Role required:

- sn_change_read role to read the change model from the chg_model table.
- sn_devops.viewer role to read the pipelines from the sn_devops_pipeline table.

About this task

If you're an upgrading user, and you want to migrate your existing pipelines steps to change models, you must perform this procedure.

The DevOps Pipeline Migration to Change Models catalog item enables you to update the change model in each step record in your pipeline at once. For example if you have set the type compatibility`com.snc.change_management.change_model.type_compatibility` #property to false and change model input is required in multiple pipeline steps, you can use this catalog item to update the change model for all pipeline steps in one go.

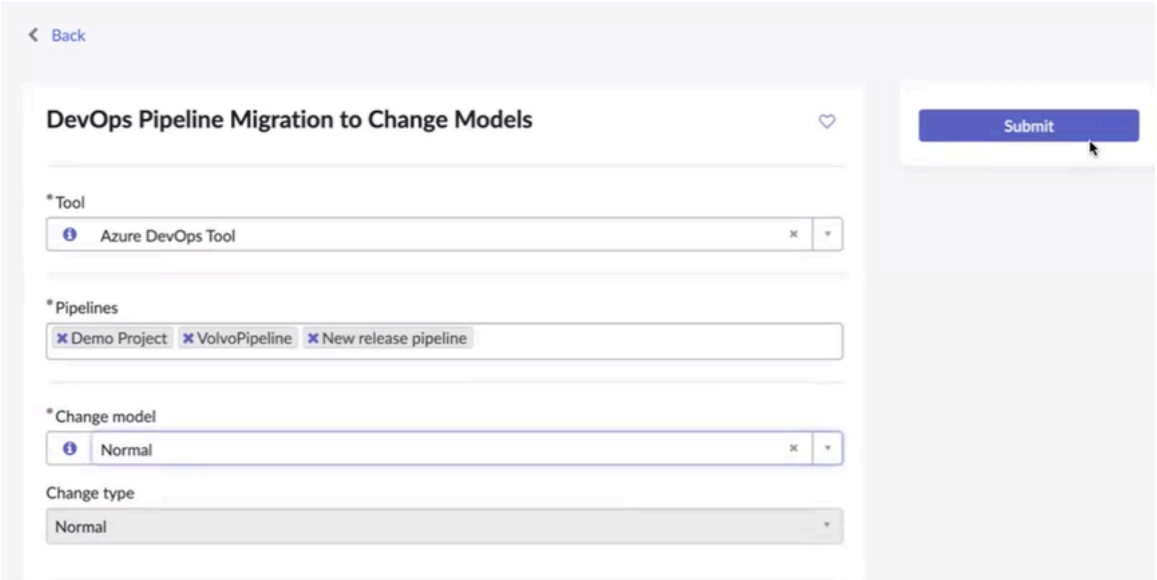
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All > Service Catalog > Catalog Definitions > Maintain Items > DevOps Pipeline Migration to Change Models**, and set the **Active** state to **True** to activate the **DevOps Pipeline Migration to Change Models** maintain item.
   By default the catalog item is turned off.
2. In the Available For related list of the catalog item, add the users to whom the catalog must be available.
3. In the Approve By related list of the catalog item, add the users who can approve the catalog item.
   Alternatively, navigate to **All > Flow Designer > Flows**, and activate the **Request for pipeline migration** catalog flow. You can update the rule set in the **Ask For Approval** action of the flow to add a user or a group of users who can approve the catalog item.
4. To add the catalog item in the Service Catalog categories in Service Portal, set the category of these items to **DevOps** and add the **Service Catalog** catalog.
   If the DevOps category isn't available, you must create a new category called **DevOps** from the catalog item record itself and assign the **DevOps Onboarding** catalog to it.
5. To add catalog item in Employee Service Center, add a new topic in the Assigned Topics related list with taxonomy as **Employee** in the **IT > IT for IT** section.
   The Assigned Topics related list isn't available in the Default view of the **Catalog Item** form.
   To add it, select **Additional icons > Configure > Related Lists** and move the **Connected Content → Catalog item** field to the selected section.
6. Navigate to **All > Service Catalog > Catalog Definitions > Maintain Items** and search for **DevOps**.

   Note:
   You can also access the service catalog from the Employee Center or Service portal.

7. From the DevOps catalog items, select **DevOps Pipeline Migration to Change Models**.



8. In the form, fill in the following fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps Pipeline Migration to Change Models form

Field	Description
Tool	Orchestration tool that contains the required pipelines.
Pipeline	Pipelines for which you want to update the change model.
Change model	Change model to which the existing models are being updated.

9. Select **Submit**.

A request is created. Based on whether the request is approved or rejected, notifications are send to the requester.

Note:
If any of the pipelines you selected in step 8 has any data policy, which doesn't allow the pipeline steps to be updated, the same is updated as an error in the worknotes of the corresponding request.

Option	Description
Approved and successful	○ A comment is added in the request record specifying that migration to change model was successful.  ○ A bell notification is sent to the requester specifying that the mi gration has been successful. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ An email notification is sent to the requester specifying that the migration request has been successful. Rejected and unsuccessful	○ A comment is added in the request record specifying that migration wasn't successful.  ○ A bell notification is sent to the requester specifying that the migration request has been rejected. 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ An email notification is sent to the requester specifying that the mi gration request has been rejected. 
Retrieve change request data using DevOpsChangeRelationshipHelper script

Retrieve data associated with a change request based on the specified relation type using the DevOpsChangeRelationshipHelper script include.

Before you begin

Role required: sn_devops.viewer

About this task

Use Script Includes to store JavaScript functions and classes for use by server scripts. You can call the Script Include from a Business Rule, UI Action, workflow script, Scripted REST API, and so on.

This method retrieves data related to a change request based on the specified relation type.

The supported relation types are:

- DevOpsCommonConstants.COMMIT_TABLE
- DevOpsCommonConstants.DEVOPS_WORK_ITEM
- DevOpsCommonConstants.DEVOPS_TEST_SUMMARY_TABLE
- DevOpsCommonConstants.DEVOPS_SECURITY_SCAN_SUMMARY_TABLE
- DevOpsCommonConstants.DEVOPS_ARTIFACT_VERSION_TABLE
- DevOpsCommonConstants.DEVOPS_SOFTWARE_QUALITY_SUMMARY_TABLE
- DevOpsCommonConstants.DEVOPS_PULL_REQUEST_TABLE

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Search for the DevOpsChangeRelationshipHelper script.
   You can call this Script Include from a Business Rule, UI Action, workflow script, Scripted REST API, and so on.

Example:

Assume you have an instance of the object containing the changeRelationHelperObj method.

```
var changeRelationHelperObj = new
 sn_devops.DevOpsChangeRelationshipHelper();
```

Assume you have a GlideRecord object representing a change request.

```
var changeRequest = new GlideRecord('change_request');
changeRequest.addQuery('number', 'CHG123456');
changeRequest.query();
changeRequest.next();
```

The retrieved data may include additional details depending on the relation type. If data is found, an array containing the related sys IDs information is returned. If data is not found, a debug message is displayed and an empty array is returned. If there is an issue during data retrieval, an error message is displayed with details.

Example 1: Retrieving commit data for a change request.

```
try {
    var commitsData =
 changeRelationHelperObj.getChangeRelationData(changeRequest,
 sn_devops.DevOpsCommonConstants.COMMIT_TABLE);
    if (commitsData && commitsData.length > 0) {
        gs.log('Commits Data:', commitsData);
    } else {
        gs.log('No commits found for Change Request:',
 changeRequest.getDisplayValue());
    }
} catch (error) {
    gs.error('Error fetching commits data:',
 error.getMessage());
}
```

Example 2: Retrieving work items for a change request.

```
try {
    var workItemsData =
 changeRelationHelperObj.getChangeRelationData(changeRequest,
 sn_devops.DevOpsCommonConstants.DEVOPS_WORK_ITEM);
    if (workItemsData && workItemsData.length > 0) {
        gs.log('Work Items Data:', workItemsData);
    } else {
        gs.log('No work items found for Change Request:',
 changeRequest.getDisplayValue());
    }
} catch (error) {
    gs.error('Error fetching work items data:',
 error.getMessage());
}
```

© 2026 ServiceNow, Inc. All rights reserved.

Manage Pull Requests (PR) or Merge Requests in DevOps Change Velocity

Manage Jenkins, GitHub Actions, and Azure DevOps (ADO) pipeline's pull requests for GitHub, Bitbucket, and ADO coding sources from ServiceNow DevOps. You can enable the change approval process on your pull request to control pull request merge approvals from ServiceNow DevOps and monitor pull request details associated with the change request.

Before you begin

Ensure that the following prerequisites are met before approving pull requests:

- Your admin has created a pull request branch in GitHub or Bitbucket using a Multi-branch project pipeline. For more information, see GitHub branch source and Bitbucket branch source.
- Your admin has enabled pull request creation in the ADO repository.
  For more information, see https://marketplace.visualstudio.com/items?itemName=ShaykiAbramczyk.CreatePullRequest.
- Your admin has configured Jenkins integration with DevOps. For more information, see Jenkins integration with DevOps.
- Your admin has configured GitHub integration with DevOps. For more information, see GitHub integration with DevOps.
- Your admin has configured Bitbucket integration with DevOps. For more information, see Bitbucket integration with DevOps.
- Your admin has configured ADO integration with DevOps. For more information, see Azure DevOps integration with DevOps Change Velocity.
- Your admin has enabled the Change Acceleration feature of DevOps for automatic change request creation in your pipeline. For more information, see Accelerating DevOps change.

Role required: sn_devops.admin

About this task

For Jenkins pipelines, pull requests can be managed for GitHub and Bitbucket coding sources.

For GitHub Actions pipelines, pull requests can be managed for GitHub coding source.

For ADO pipelines, pull requests can be managed for ADO coding source.

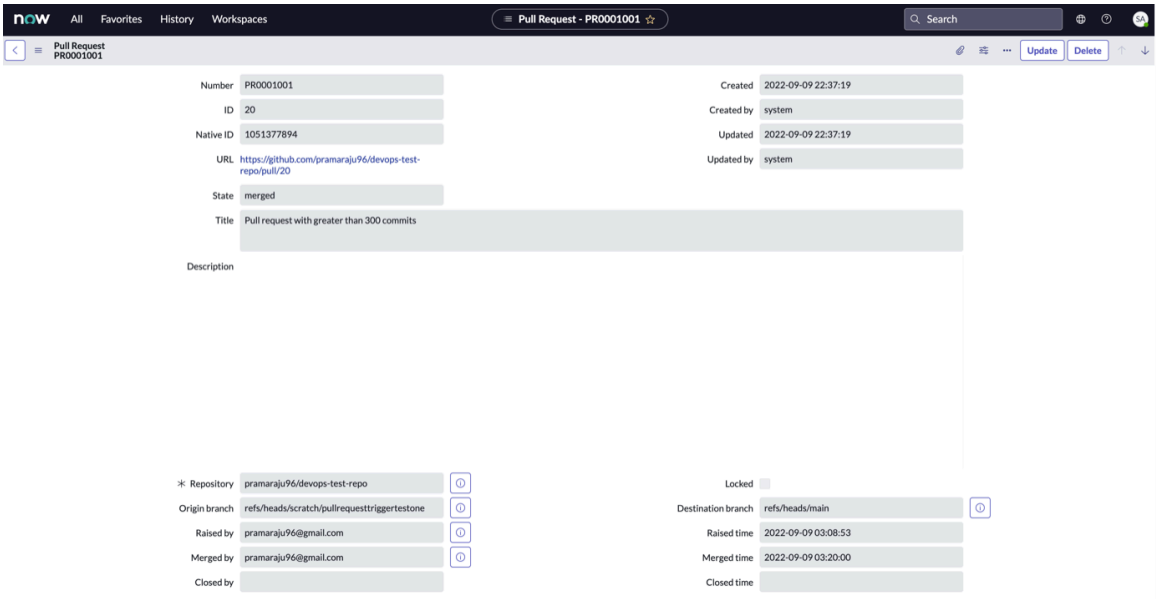
Procedure

1. Create a pull request in GitHub or Bitbucket or ADO.
   For more information, see Creating a pull request or Create a pull request to merge your change.
2. Perform the following steps based on your orchestration tool.

3. Run the pull request pipeline in Jenkins, GitHub Actions, or ADO.
   A build is initiated and a change request notification is sent to the approver associated with the pipeline.
4. Navigate to **DevOps > Orchestrate > Pipeline Change Requests**.
5. Select the change record associated with the pull request.
6. Approve the change request associated with the pull request by selecting **Approved** in the **State** field.
   Merge is enabled in GitHub or Bitbucket or ADO for the pull request. Merge the pull request in the corresponding tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the Pull Requests related list associated with the change record.
8. View the pull request details by clicking the pull request number corresponding to the **Number** field.



All the pull request details (including the details after the request is merged) associated with the change record are displayed. Details such as Pull request ID, Commits, Origin branch, Destination branch, Raised by, Approver, Comments, PR raised time, PR approved time, PR merged/closed time are displayed. Commits from pull requests are shown in the **Commits** related list.

Limitation

Details of pull requests that are created in a BitBucket coding source and associated with a Jenkins pipeline are not displayed for a change request.

DevOps change request attributes

Add or update DevOps change request attributes using the changeInfo REST API, the Default Change Handler subflow, by passing attributes through the pipeline, Update function, or automated flows.

Specifying attributes

Use one of the following methods to specify change request attributes:

- DevOps - PUT /devops/orchestration/changeInfo/{changeInfo} to update fields within a specified change request.

  Note:

  - The changeInfo API won't function when the pipeline is in the paused state.
  - An API call can't be executed while the pipeline is waiting.
  - The API approach must be considered after thorough testing.

- Default Change Handler subflow to populate change request fields with default values. For more information, see Default Change Handler subflow.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Passing the change attributes through the orchestration pipeline. For more information, see Configuring DevOps change request details within the pipeline.
- Passing the change attributes through the Update function in the orchestration pipeline function. For more information, see the following:
  - Get and update change request details in Azure DevOps pipeline
  - Update change request details in Jenkins pipeline
  - ServiceNow DevOps custom actions from GitHub marketplace
  - Implement custom actions for pipelines using generic Docker container image
- Automated flows: DevOps approval flows to make changes in a change request. For more information, see Flows.

Precedence of consideration

When the change attributes are specified through multiple methods, the precedence in which the attribute values are considered will vary. In ServiceNow, attributes can be specified in the pipeline step of DevOps Change Velocity, in the Default Change Handler subflow, or in an approval flow. In the orchestration tool pipeline, attributes can be passed in the pipeline step, or using the REST APIs. If a change model is used, they can also be specified in model presets.

See the following tables and examples to understand the precedence in which the values will be considered.

Precedence of change attributes for type-based changes

Change request	Precedence
Standard	**1.** Change attributes passed through pipeline **2.** Step record fields in ServiceNow **3.** Template passed in change attributes through pipeline **4.** Template in Step fields in ServiceNow
Non-standard	**1.** Change attributes passed through pipeline **2.** Default Change Handler subflow & approval flows **Important:** Setting attribute values in both the Default Change Handler subflow and approval flows can cause conflicts because they might run simultaneously. Set the attribute values in only one source to avoid issues. **3.** Step record fields in ServiceNow **4.** Template passed in change attributes through pipeline **5.** Template in Step fields in ServiceNow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Precedence of change attributes for model-based changes

Change request	Precedence
Standard	**1.** Model Presets **2.** Change attributes passed through pipeline **3.** Step record fields in ServiceNow **4.** Template passed in change attributes through pipeline **5.** Template in Step fields in ServiceNow
Non-standard	**1.** Model Presets **2.** Change attributes passed through pipeline **3.** Default Change Handler subflow & approval flows **Important:** Setting attribute values in both the Default Change Handler subflow and approval flows can cause conflicts because they might run simultaneously. Set the attribute values in only one source to avoid issues. **4.** Step record fields in ServiceNow **5.** Template passed in change attributes through pipeline **6.** Template in Step fields in ServiceNow

Note:
If you have used business rules in your change operations, then you must set the *sn_devops.change_request.apply_attributes_on_creation* property to true, so that the change attributes passed in the pipeline are set when the change request is created instead of the attributes being passed after the change request is created. For more information, see DevOps Change Velocity properties.

Example: Scenario 1

Consider a scenario where the attributes are specified in the Default change handler subflow in ServiceNow and in the Update function in the orchestration pipeline. Assume that the assignment_group attribute is specified as “change mgmt” in the Default change handler subflow, and as “CAB” in the Update function in the pipeline. In this scenario, when the change is created, the value from the Default change handler subflow will be considered, and “change mgmt” will be the value considered for assignment_group. Once the change is approved, and the pipeline is resumed, the value specified in the Update function will be considered, i.e. “CAB”.

Example: Scenario 2

Consider a scenario where the attributes are specified in the Default change handler subflow in ServiceNow and in the change step in the orchestration pipeline. Assume that the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

assignment_group attribute is specified as “change mgmt” in the Default change handler subflow, and as “chg mgmt1” in the change step of the pipeline. In this scenario, when the change is created, the value from change step (chg mgmt1) will be considered, and then once the Default change handler subflow is triggered, the value considered will be “change mgmt”.

Example: Scenario 3

Consider a scenario where the attributes are specified through the template passed in change attributes and in the template of the step record. Assume that the assignment_group attribute is specified as “change mgmt” in the template passed in change attributes, and as “chg mgmt1” in the template of the pipeline step record. In this scenario, when the change is created, the value from the template passed in change attribute (chg mgmt) will be considered.

Example: Scenario 4

Consider a scenario where the attributes are specified in the change attributes and the model preset for a model-based change. Assume that the assignment_group attribute is specified as “change mgmt” in change attributes and as “chg mgmt1” in the model preset. In this scenario, when the change is created, the value from model preset (chg mgmt1) will be considered.

Import based evidence collection

Reduce instance overhead by skipping step-level pipeline processing for accelerated change management and evidence collection for GitHub Actions and Azure DevOps (ADO) orchestration tools.

All relevant evidence in the pipeline is attached to the change request using import request instead of webhook notifications.

Enable import based evidence collection

You can enable this feature by switching on the **Import based evidence collection for orchestration capability** toggle in the Properties page. For more information, see DevOps Change Velocity properties.

Switching the toggle modifies how the pipeline events are processed. When switched on, the setting reduces instance overhead by skipping step-level processing in the pipeline. The skipped step-level events are ignored with the processing details, "IGNORED: This event is ignored because the 'Import based evidence collection for orchestration capability' property is enabled". Conversely, switching off reverts to the standard mode, where all inbound events undergo processing.

Note:
Ensure that no pipeline is running before making changes to this setting. Switching the toggle during an active pipeline execution may cause the pipeline to hang and eventually time out, resulting in incomplete or incorrect data collection. If a change request has already been created, you must cancel it manually, as required evidence may not be attached. Select **Save** to continue, and initiate a new pipeline execution after switching the toggle.

How is the evidence collected

When the change step in a pipeline is triggered, a callback record is created with the **state: created** and **change evidence status: pending**. An import request, with the corresponding import request pages are created to gather pipeline execution details and the required evidence. The change request is then created with all the evidence attached to it. In addition, the import based evidence collection feature is triggered again at the pipeline completion event to ensure all the associated evidence is accurately retrieved and associated with the change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Post-creation of the change request, the auto-approval mechanisms, and subsequent behaviors remains the same as the existing behavior.

For ADO

- For build pipeline, when the property is enabled, the evidence collection happens based on the pipeline completion event only (step level events aren't processed to reduce the instance overhead).
- For release pipeline, even if the property is enabled, the evidence collection happens based on processing step-level events.

For GitHub Actions

- When the property is enabled, the evidence collection happens based on the workflow completion event only (step level events aren't processed to reduce the instance overhead).
- If you're using GitHub Actions Deployment Gates in any of your steps, then you must configure the GitHub app, and the evidence collection happens based on the workflow completion event. For more information on deployment gates, see GitHub Deployment Gates for ServiceNow DevOps Change.

Key points

- Import based evidence collection supports all existing pipeline styles (reruns, parallel, sequential) and configurations for GitHub Actions and ADO.
- All types of evidence collection supported for GitHub Actions and ADO in the base system are also supported when this property is enabled.
- For GitHub Actions, environment-based change isn't supported.
- Historical import and polling features works the same way regardless of the **Import based evidence collection for orchestration capability** property being enabled or turned off.
- Restarting import in the import request record is also supported.
- Troubleshooting and error handling frameworks remain unaffected.
- If you're upgrading, the **Import based evidence collection for orchestration capability** property is turned off by default.

Managing DevOps Change Velocity

Utilize the features of DevOps Change Velocity to efficiently manage your DevOps tools and processes.

Onboard a new tool using DevOps generic playbook

DevOps Change has a pre-build playbook setup for users to configure a new tool. Custom tool integrations can be created using the guided playbook experience in the DevOps Change Workspace.

Playbooks provide end users with a visual, task-oriented guide with the steps to complete a process, ensuring a consistent experience for tool onboarding. For detailed information about playbooks, see About Playbook Experience.

Perform the following steps to onboard your custom tool using the DevOps generic playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Identify tool capabilities

To configure a tool using the generic playbook, first you must identify the capabilities supported by the tool. A tool can have one or more capabilities like code, plan, and orchestration.

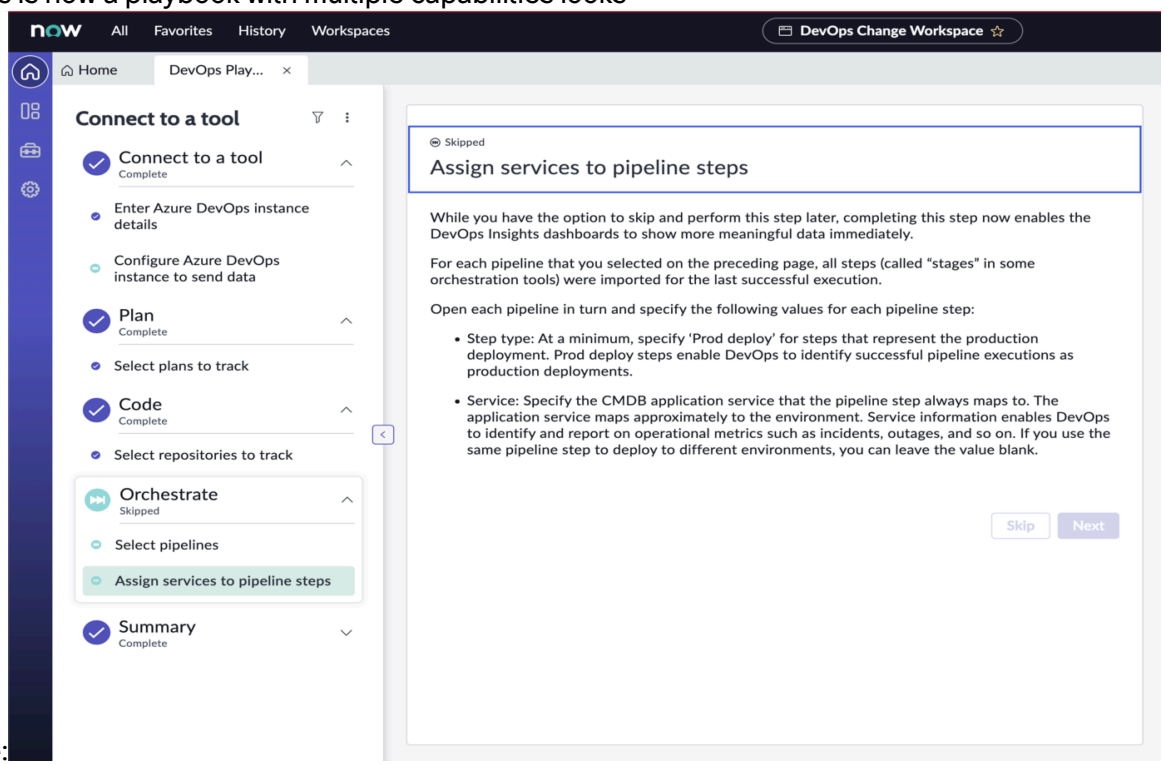
The Generic playbook consists of the following stages and each stage has its related activities:

1. Connect to a tool
   a. Connect to a tool
   b. Specify tool access
   c. Configure the tool
2. Capability

   Capability can be of type plan, code, or orchestrate. If the tool has multiple capabilities, multiple stages exist with the capability name.

   a. Select to track
   b. Import data
   c. Associate (This activity is for the Orchestration tools to associate pipeline steps)
3. Summary

This is how a playbook with multiple capabilities looks like:



2. Configure Activity Definitions

Each Activity in a playbook is associated to an activity definition. DevOps has the following activity definitions:

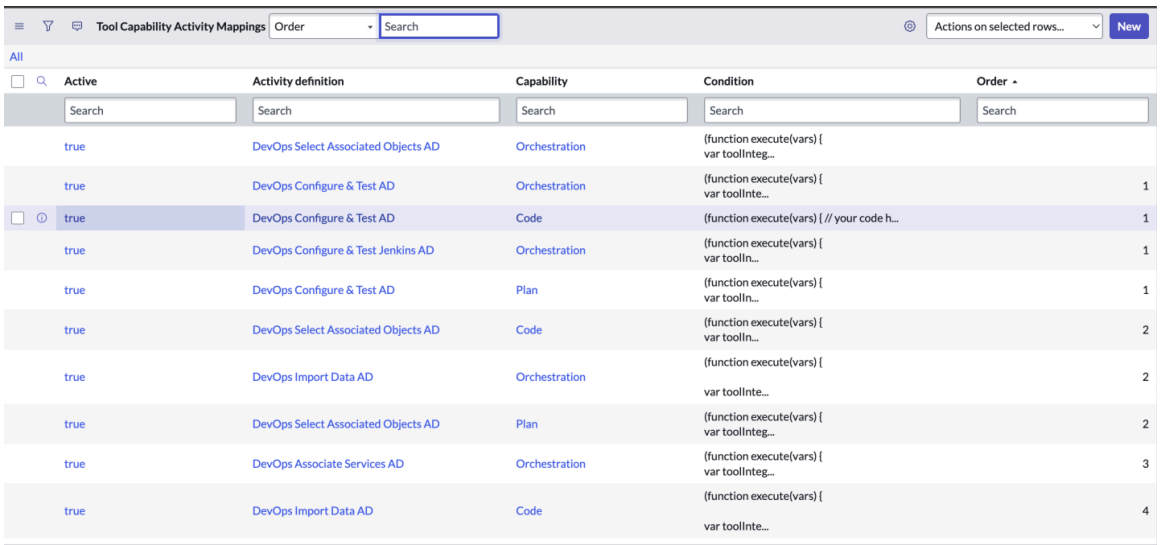
- DevOps CreateTool AD
- DevOps Configure & Test AD
- DevOps Select Associated Objects AD

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- DevOps Import Data AD
- DevOps Associate Services AD
- DevOps Summary AD

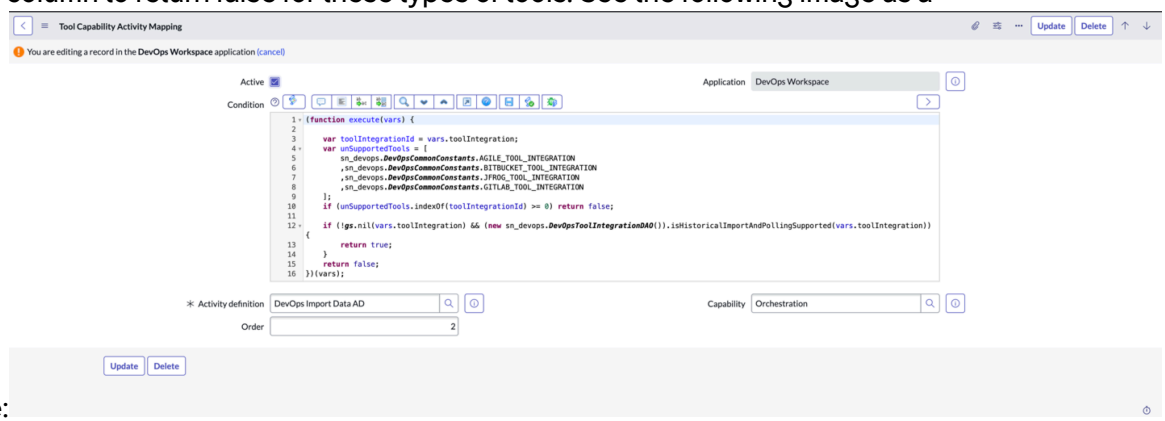
For more information, see Exploring playbooks and About Playbook Experience.

The DevOps table *sn_devops_capability_activity_mapping* has been created to maintain associations between Activity definitions and capabilities. This table configuration is used to dynamically render the stages and activities for a tool. You can update the conditions as needed to either enable or disable a particular activity for a tool.



Active	Activity definition	Capability	Condition	Order
true	DevOps Select Associated Objects AD	Orchestration	(function execute(vars) { var toolInteg...	
true	DevOps Configure & Test AD	Orchestration	(function execute(vars) { var toolInte...	1
true	DevOps Configure & Test AD	Code	(function execute(vars) { // your code h...	1
true	DevOps Configure & Test Jenkins AD	Orchestration	(function execute(vars) { var toolIn...	1
true	DevOps Configure & Test AD	Plan	(function execute(vars) { var toolIn...	1
true	DevOps Select Associated Objects AD	Code	(function execute(vars) { var toolIn...	2
true	DevOps Import Data AD	Orchestration	(function execute(vars) { var toolInte...	2
true	DevOps Select Associated Objects AD	Plan	(function execute(vars) { var toolInteg...	2
true	DevOps Associate Services AD	Orchestration	(function execute(vars) { var toolInteg...	3
true	DevOps Import Data AD	Code	(function execute(vars) { var toolInte...	4

For example, tools like GitLab and JFrog don’t support data import. So you don't require the Data Import activity for such tools. In that case, you must add the logic in the condition column to return false for these types of tools. See the following image as a reference:



3. Configure Activity UI for the Activity Definition

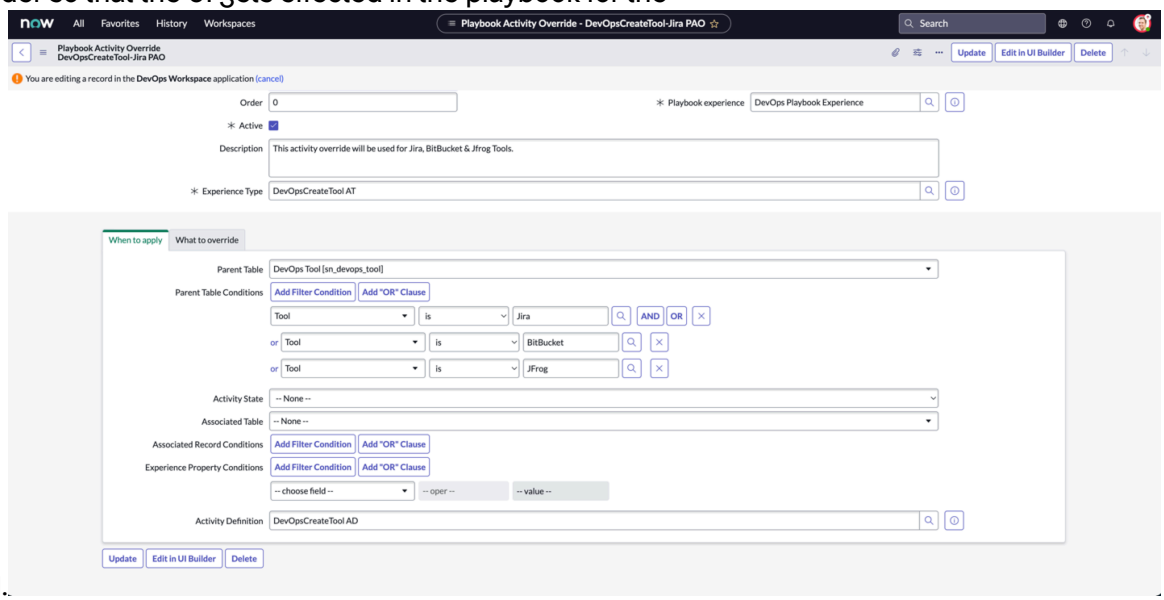
Playbook Activity UIs define the experience type and UI template rendered to users while managing Playbooks. You can configure multiple Activity UIs for an Activity Definition and render any one dynamically based on the condition evaluation.

DevOps has the following AUIs for Create Tool activity. Except this, all other activity definitions have only one Activity UI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure any one the Activity UI based on the requirement.

Identify the required activity UI and add your tool in the condition builder so that the UI gets effected in the playbook for the tool.



Result

After completing these steps, your tool can be onboarded using the DevOps generic playbook.

Integrating DevOps Change Velocity with third party tools

Additional information for onboarding DevOps tools and apps using the Service catalog

Use the onboarding catalog items as a self-service approach to onboard your DevOps tools and apps.

Onboarding tools and apps

> **Note:**
> This content pertains to the Classic Environment, which refers to working in lists of records and on record forms directly, not in the Configurable Workspace interface. You can work in the Classic Environment with Next Experience active, or with it inactive, which is referred to as Core UI, (formerly known as UI16).

Use the ServiceNow Service Catalog to request the onboarding of tools and apps. Fill out the onboarding form details for a tool or an app and submit the request. You can also import the DevOps data for the app that you are creating for swifter and easier onboarding.

Prior to the request creation, an automated workflow approves or rejects the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the workflow is approved, a success message displays.
- When rejected, an inbound event is created capturing error logs. By ensuring the log is error free, you can create a request again.

You can onboard DevOps tools and apps using self-service catalog items.

- Navigate to **All > Service Catalog > Catalog Definitions > Maintain Items > DevOps App Onboarding**, and set the **Active** state to **True** to activate the **DevOps App Onboarding** maintain item. By default the catalog items (App Onboarding) is turned off.
- Navigate to **All > Service Catalog > Catalog Definitions > Maintain Items > DevOps Tool Onboarding**, and set the **Active** state to **True** to activate the **DevOps Tool Onboarding** maintain item. By default the catalog items (Tool Onboarding) is turned off.
- To add the DevOps catalog items in the Service Catalog categories in Service Portal, set the category of these items to **DevOps** and add the **Service Catalog** catalog. If the **DevOps** category is not available, you must create a new category called **DevOps** from the catalog item record itself and assign the **DevOps Onboarding** catalog to it.
- To add the DevOps catalog items in Employee Service Center, add a new topic in the **Assigned Topics** related list with taxonomy as **Employee** in the **IT > IT for IT** section. The Assigned Topics related list is not available in the Default view of the Catalog Item form. To add it, select **Additional icons > Configure > Related Lists** and move the **Connected Content → Catalog item** field to the selected section.
- Navigate to **All > Flow Designer > Flows**, and activate the **Request for onboarding approval** flow, so that the tool or app onboarding requests are approved by default. If you want to request manual approval for onboarding catalog items (i.e. from a user other than the DevOps system user), you can update the rule set in the **Ask For Approval** action of the flow. You can configure manual request approval for such items by configuring the fulfillment process for the catalog item. For more information, see Service Catalog request fulfillment.
- Customize roles for approvals of the request for onboarding approval flow from Flow Designer.

Onboarding at scale

You can also use the onboarding APIs to onboard DevOps tools & apps in bulk instead of onboarding one tool or app per request. In the request parameters for tools or apps, you can specify multiple values to onboard them in one go. For example:

```
{
    "tools":[
    {
        "name": "jira_revamp",
        "type": "Jira",
        "url": "http://jira1.sndevops.xyz",
        "username": "admin",
        "password": "DevOps1!",
        "useMidServer": false
    },
    {
        "name" : "azure_revamp",
        "type" : "Azure DevOps",
        "url"  :
 "https://dev.azure.com/ADOLightweight/Testing%20ADO%20On%20empm
olugu",
        "username" : "devops.integration.user",
        "password" :
 "a5xvoea2osy3ld43p2biojcu6eog5y5q3xicqbbgxwuphjbbcu6a",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "useMidServer" : false
    },
    {
        "name" : "jenkins_revamp",
        "type" : "Jenkins",
        "url"  : "http://jenkins5.sndevops.xyz/",
        "username" : "admin",
        "password" : "DevOps1!",
        "useMidServer" : false
    },
    {
        "name" : "github_revamp",
        "type" : "GitHub",
        "url"  : "https://api.github.com",
        "username": "admin",
        "password": "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",
        "useMidServer" : false
    },
    {
        "name" : "bitbucket_revamp",
        "type" : "Bitbucket",
        "url"  : "",
        "username" : "admin",
        "password" : "DevOps1!",
        "useMidServer" : false
    },
    {
        "name": "gitlab_revamp",
        "type": "GitLab",
        "url": "http://gitlab2.sndevops.xyz",
        "username": "admin",
        "password": "mYdAJQCLi6Qft4Nk3XvS",
        "useMidServer": false
    }],
    "credentials" : {
        "name" : "devops.integration.user",
        "password" : "devops"
    }
}
```

- Onboard DevOps apps at scale by using the DevOps app onboarding API. The POST/devops/onboarding/app request creates an onboarding app event that is asynchronously processed by the DevOps service. For more information, see POST/devops/onboarding/app.
- Onboard DevOps tools at scale by using the DevOps tool onboarding API. The POST/devops/onboarding/tool request creates an onboarding tool event that is asynchronously processed by the DevOps service. For more information, see POST/devops/onboarding/tool.

Importing historical data for DevOps tools

Use the service catalog to onboard a new app and import historical DevOps data for that app. Enable polling to import data that is mapped to associated plans, repositories and pipelines on a scheduled frequency.

Import historical DevOps data for existing tools

You can create an app onboarding request and import historical data for a DevOps tool that you have already on-boarded, using the app onboarding catalog form. Currently, you can

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

import historical data for the last 90 days from current date, and enable polling on a scheduled frequency for the following tools:

- Jira (Plan)
- GitHub and GitHub Enterprise (Coding)
- Jenkins (Orchestration)

Note:

- Ensure that you have created, connected, and discovered the tool you are importing data for.
- Import requests for Plan tool (Jira) are processed first, followed by repository and pipeline import requests.

Import workflow and retries

On successfully submitting the catalog request from the Self-service catalog, the request is sent for approval following the designated approver flow that you have configured. When the request is approved, an inbound event is created for the app onboarding request. The **Processing details** field of the inbound event record displays the import request ID and status. A single import request creates multiple child import request pages that display in the related list. The import request pages are created based on the following logic for the supported tools:

- Jira: a page is created for a range of 15 days.
- GitHub : a page is created for every 100 commits.
- Jenkins: pages are created per build.

. After import requests are complete processing, the associated Work items, Commits, Branches, Tags, Pipeline executions, Test summaries that you mapped are created and persisted in the system.

On successful import you can view all imported commits in the **DevOps** > **Develop**:

- Branches
- Commits
- Committers
- Tags
- Repositories
- Work Items

for details to confirm successful import for the specified date range.

While processing an import request, if any page errors out, an inbuilt retry mechanism tries processing the page for a set number of times. After all automatic retries, if the page is still in error state, the subsequent or remaining pages in the import request are processed. The overall state of the import request remains in error.

For example, if the Plan import request failed (after all retries), we will proceed to process Repository and Pipeline imports. You can configure the retries for the import request from **DevOps** > **Administration** > **Properties** > **Maximum retries per page, while importing**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Specify the count of retries to auto-attempt, in case the import request page fails in the **Maximum retries per page, while importing** field. If after all the automatic retries, page does not succeed, the import request will process the remaining pages. The overall status of the import request reflects as errored.
- You can manually retry attempting a failed import by clicking the **Retry import** button, on the failed import request page,

Polling schedule and configuration

Enable polling to import DevOps data on a scheduled frequency to apps that have imported historical data, and are mapped to associated plans, repositories, and pipelines.

After you have onboarded an app and imported the associated DevOps data, you can enable the base system schedule for import requests to be created for the plans, repositories, and pipelines that are tracked and associated to an app. When the import requests complete processing, the associated data is persisted and display against the app. While the base system *`DevOpsImportPolling`* schedule job is active by default, you must enable polling from the DevOps properties to run the scheduled job.

To enable polling, navigate to **DevOps** > **Administration** > **Properties** > **Enable Import Polling** and select the check box.

Turning this property flag on, enables the base system *`DevOpsImportPolling`* schedule job. The scheduled job for polling considers either the last successful import or 30 days, whichever is later as the ‘start date’, and the current day's date as the 'end date' for the data import, for all apps that are active and have tracked pipelines. The job looks up the time of the last successful import and creates the subsequent import request accordingly. This logic ensures that the scheduled polling job imports the delta of relevant DevOps data for that app, from the last successful import till date, to a maximum of thirty days.

Note:
Do not configure a polling frequency that is less than a day or 24 hours.

The default frequency of the job is set to run daily at midnight using the system time zone. To change the frequency of scheduled job you need the ServiceNow ServiceNow AI Platform Administrator (admin) role.

Navigate to **System Definition** > **Scheduled Jobs** > **DevOpsImportPolling** and modify the **Run** frequency, **Time zone**, and **Time** field values, as needed. For more information, see Schedule Jobs

Note:

- The scheduled job only applies to active apps. Ensure that the app you are configuring polling for is in active state and the **Track** field is enabled for the relevant pipelines.
- Consider the following when you're modifying the schedule frequency:
  - For JIRA the default time zone is based on the time zone of the JIRA server's location.
  - For Jenkins the default time zone is UTC. For more information see Jenkins documentation on System Time time zones.

The schedule jobs that polls to import DevOps data honours the default values for the following DevOps properties related to imports and import requests:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Maximum retries per page while importing
- Maximum number of pages to process at a time for an import request
- To save payloads as attachments on the Import Request Page record, set the "Value" field to "true". Anything else is considered false.

Import existing Azure DevOps pipelines, repositories, and plans

After you have integrated Azure DevOps with DevOps, you can import up to 90 days of existing Azure DevOps pipeline, repository, and plan data. You can then use DevOps dashboards to view and manage Azure DevOps data.

Before you begin

Role required: admin

About this task

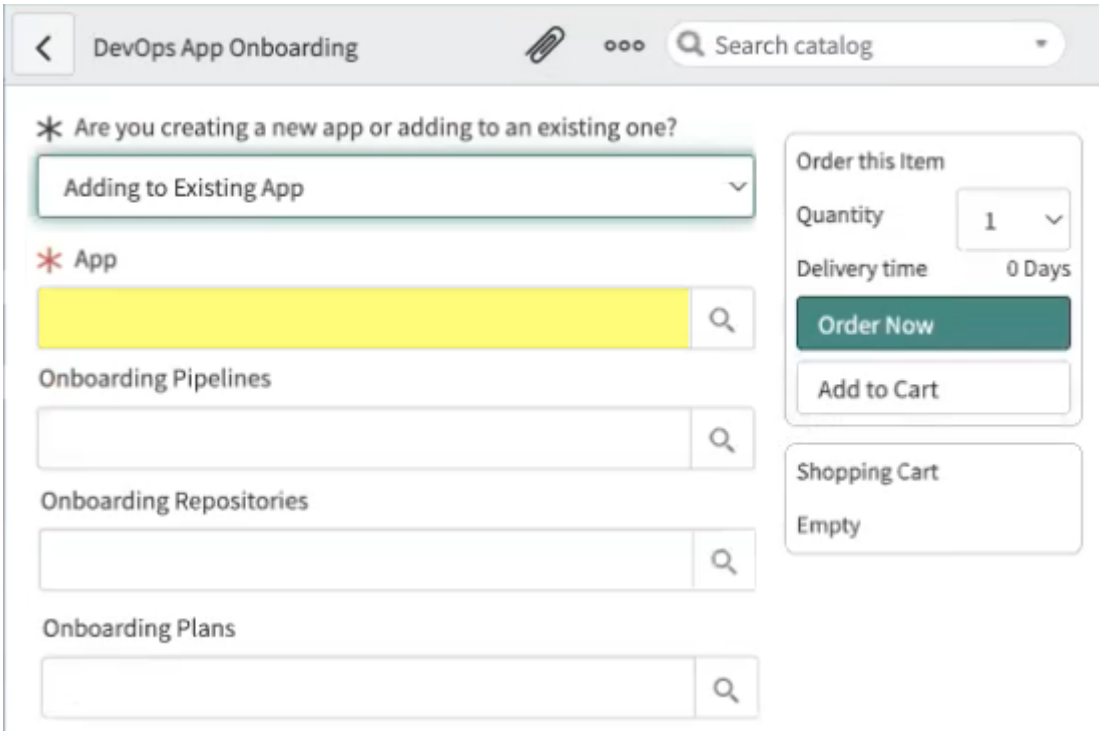
- You will request the data from the service catalog as a predefined catalog item.
- Imported test summaries, artifacts, and packages are linked to pipeline executions and not to step executions.
- SonarQube scan results are not imported.
- Azure DevOps imposes the following restrictions:
  - Maximum 20,000 work items can be imported every 15 days.
  - Maximum 200 run commits can be mapped to any pipeline execution.
  - Test results for pipeline executions longer than 7 days are not returned.

Note:
The import process can take some time, hours for very large data sets.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **My Catalogs** and then select **DevOps Onboarding**.
2. In the **Catalog Items** related list, select **DevOps App Onboarding**.
3. On the Catalog Item form, select **Try It** to request the data.
   The resulting DevOps App Onboarding form enables you to specify the catalog item to order. In this case, the "app" to order is your Azure DevOps instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



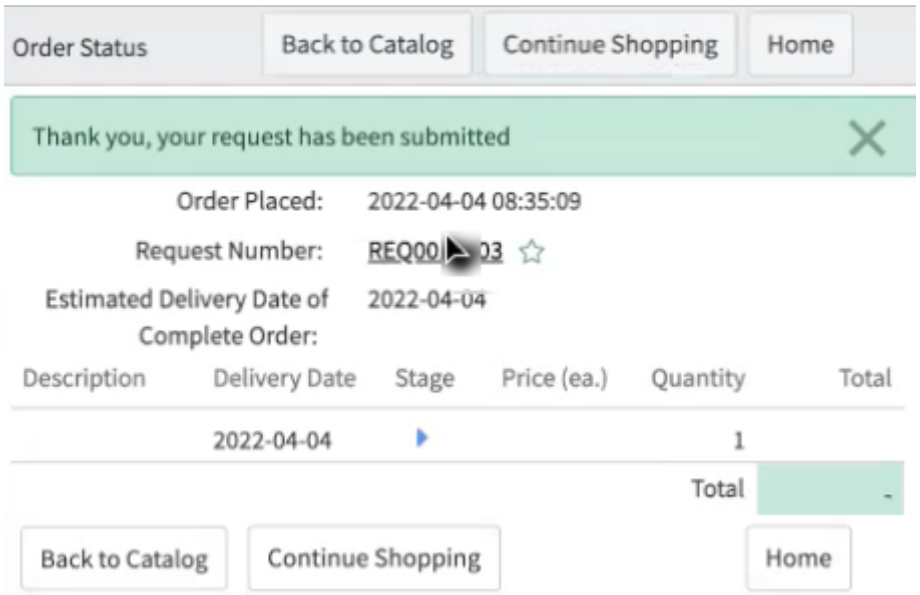
4. Select the Select in list icon ( ) on the **App** field and then select your instance of Azure DevOps.
   Now that you have specified the instance, you will specify date range and sources of data to import.
5. Repeat the following procedure for each pipeline, repository, and plan that you want to import:

   a. Select the Select in list icon ( ) on the appropriate **Onboarding** field to select the item to import.
      You can select multiple items.

   b. Specify the range of dates for the data in the **Import From** and **Import To** fields.

6. Select **Order Now**.
   Your request appears on the Order Status page.
7. Select the request number so you or another user with the admin role can approve the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Approve the request: On the Request form, set **Approval** and **Request state**to **Approved**. The import process begins immediately on approval.

Import existing GitLab pipelines and repositories

After you have integrated GitLab with DevOps, you can import up to 90 days of existing GitLab pipeline and repository data. You can then use DevOps dashboards to view and manage GitLab data.

Before you begin

Role required: admin

About this task

- You will request the data from the service catalog as a predefined catalog item.
- Imported test summaries are linked to pipeline executions and not to step executions.
- Only artifacts published using the artifacts keyword are imported.
- Test results are not displayed for artifacts that have expired. You can set the expiration date of an artifact by configuring the **expire_in** property in the pipeline. For more information on artifact expiration policies, see Artifact and job meta data expiration.
- SonarQube scan results are not imported.
- Only 6400 commits per branch can be imported in a single import.
- GitLab imposes the following restriction: While associating run commits to a pipeline execution, GitLab doesn't provide the starting part of the commit details in some scenarios. It provides only the part before the SHA as '0000000000000000'. In such scenarios, the latest commit will be associated as the run commit. For example, when a new branch is created or when a pipeline is run manually.

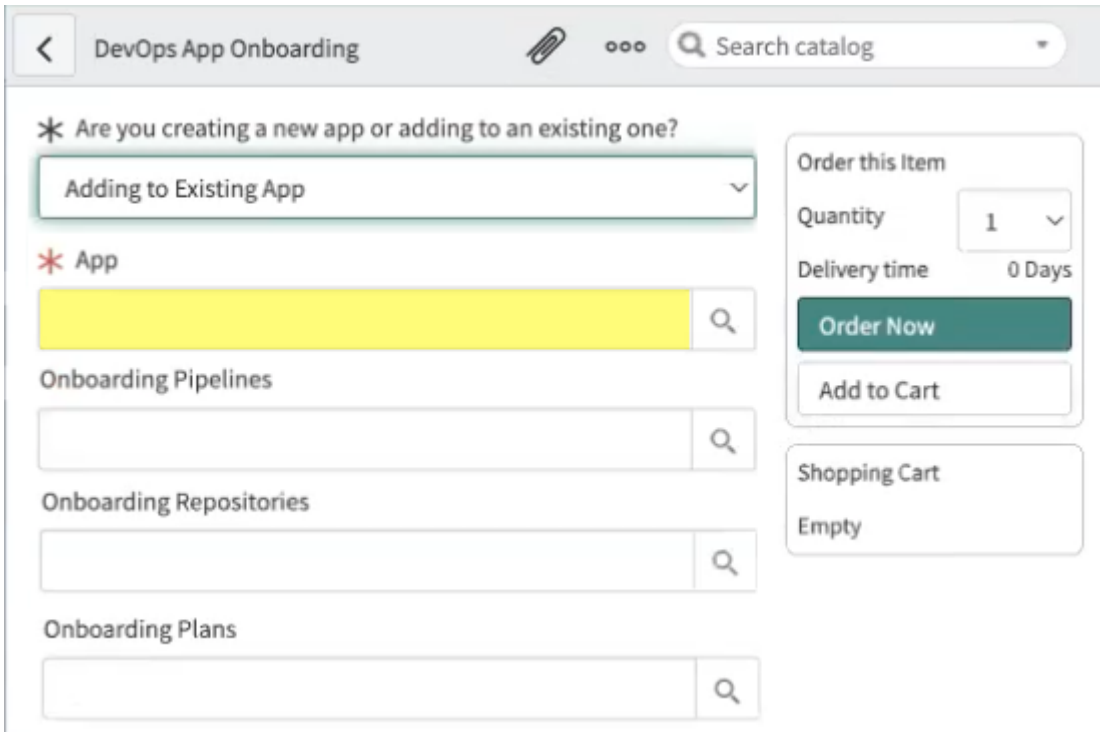
Note:
The import process can take some time, hours for very large data sets.

Procedure

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **My Catalogs** and then select **DevOps Onboarding**.
2. In the **Catalog Items** related list, select **DevOps App Onboarding**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Catalog Item form, select **Try It** to request the data.
   The resulting DevOps App Onboarding form enables you to specify the catalog item to order. In this case, the "app" to order is your GitLab instance.



4. Select the Select in list icon ( ) on the **App** field and then select your instance of GitLab.
   Now that you have specified the instance, you will specify date range and sources of data to import.
5. Repeat the following procedure for each repository that you want to import:

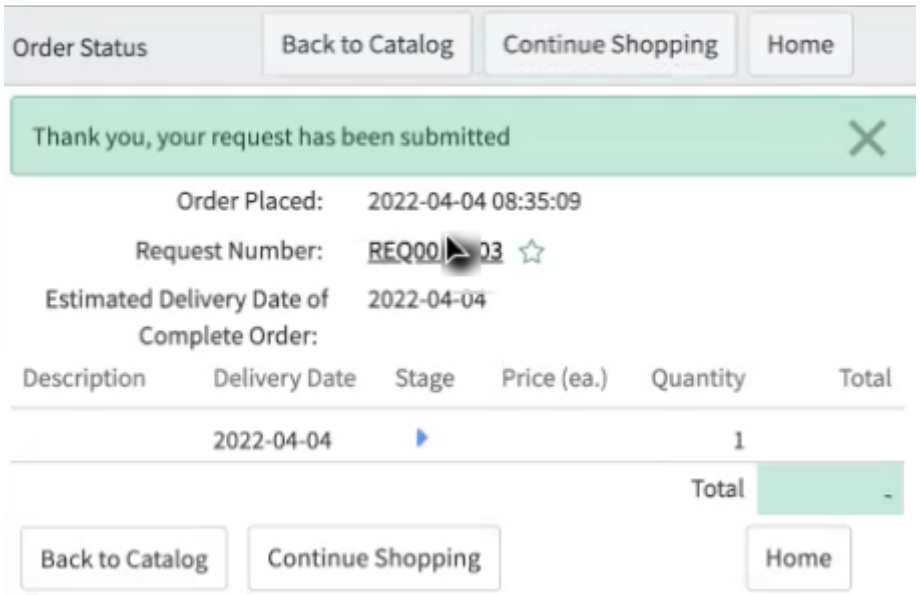
   a. Select the Select in list icon ( ) on the **Onboarding Repositories** field and then select the item to import.
      You can select multiple items.

   b. Specify the range of dates for the data in the **Import From** and **Import To** fields.

   Note:
   The pipelines mapped to the repositories are automatically selected when you select the repository in the **Onboarding Repositories** field. You do not have to select the pipelines separately.

6. Select **Order Now**.
   Your request appears on the Order Status page.
7. Select the request number so you or another user with the admin role can approve the request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Approve the request: On the Request form, set **Approval** and **Request state** to **Approved**. The import process begins immediately upon approval.

Cloning guidelines for DevOps Change Velocity

Clone the DevOps Change Velocity application from one instance to another.

Note:
Valid for Utah and later.

For detailed information for cloning a ServiceNow instance, refer to the following topics.

- System clone
  - Request a clone
  - Clone Target Registration and Authentication
  - Exclude a table from cloning
  - Data preservation on cloning target instances
- New Backup-based Clone Engine [KB0540342]

Base system table exclusion and preservers on global tables used in DevOps

Table name	Exclude table entry present?	Data preservers entry present?
For DevOps tool		
sys_alias	No	No
http_connection	Yes	Yes
discovery_credentials	Yes	Yes
oauth_entity_profile	Yes	Yes
oauth_entity	Yes	Yes
jwt_provider	Yes	Yes
jwt_keystore_aliases	Yes	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table name	Exclude table entry present?	Data preservers entry present?
sys_certificate	Yes	Yes
token_verification	Yes	Yes
sys_user_group	No	No
For DevOps apps		
cmdb_ci_business_app	No	No
cmdb_ci_sdlc_component	No	No
cmdb_application_product_model	No	No

Tools cloned from source instance

- The tools that are cloned from source instance will have a Connection alias (sys_alias) associated with them.
- The Connection record and the Credential record aren't cloned over from the source instance since those tables are excluded.
- Tool URL will be empty because the tool URL is dynamically calculated using connection record.
- Connect test fails because there's no active connection.
- All the underlying entities like projects, plans, pipelines, repositories, work items, commits, pipeline execution, and so on must be present under the tool.
- The tool's token isn't cloned.
- New webhook inbound events won't automatically start to come to the cloned target instance for these tools. The tools must be reconfigured to receive new inbound events.

Manual steps on cloned tools

1. Create Connection and Credential
   - Use the **Create New Connection & Credential** action present under the related links on the tool record or manually create the connection (http_connection) and credential (discovery_credentials) record and associate with the tool's connection alias.
   - Manually run the **Connect** action on the tool and make sure that the tool connection state is **Connected**.
2. Regenerate token and configure
   - For the tools that support token-based webhook configuration, use the **Regenerate token** action from the Related Links on the tool record page.
   - Regenerating the token creates a new token in the token_verification table and creates webhooks for the tool and repos that have Configure status as **Configured**.
   - For the tools that don't support token-based webhooks, click **Configure** and enter the user name and password for the DevOps integration user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Apps cloned from source instance

- Apps that are cloned from the source instance will have all the app associations intact.
- Business app and SDLC component links are maintained.
- Manual steps aren't required after cloning.

Preserving data on target instance

Aim to preserve the existing tools, tool connections, and apps on the target instance.

Level 1 data preservers

Required data preservers

Title	Table name	Purpose	Suggested filter
DevOps tool	sn_devops_tool	To preserve top-level DevOps tool list.	`connection_state=connected^` to preserve all connected tools or filter on specific tool IDs.
Connection & Credential Aliases	sys_alias	Specified in DevOps tool to hold connection details.	`idLIKEdevops^ORidLIKEspoke^` to preserve all aliases related to DevOps.
DevOps app	sn_devops_app	To preserve top-level DevOps App list.	

Manual steps on preserved tools after cloning

1. Maintained by

   If the tool on the target instance had any **Maintained by** user groups specified before cloning, update the user groups, and set them on the tool record manually after cloning.

2. Discover
   - Projects, pipelines, plans, and repositories aren't present for preserved tools after the clone.
   - For Azure DevOps tools, first perform **Discover projects**.
   - Perform **Discover** action on the tool or the project to bring the pipelines, plans, and repositories details.
3. Track

   Track the required pipelines, plans, and repositories.

4. Configure
   - Optional for tools where the webhook url holds a reference to tool sys_id only. For example, GitHub, GitLab, Jira, Bitbucket.
   - You must reconfigure Azure DevOps projects because the project sys_id has changed after rediscover.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Token remains the same for the tool.
- Verify that there are no duplicate webhooks created in the third-party DevOps tool after reconfiguring.

5. Historical import

   Use the import action or workspace to import historical data for plans, repositories, and pipelines.

Manual steps on preserved apps after cloning

1. Maintained by

   If the app on the target instance had any **Maintained by** user groups specified before cloning, update the user groups, and set them on the app record manually after cloning.

2. Associate with app

   Manually reassociate plans, repositories, and pipelines with the app.

3. Relink to SDLC component and application model

   Manually associate the DevOps app to the SDLC component, and SDLC component to the application model.

Level 2 data preservers

Aim to preserve the data and relations under DevOps tools and DevOps apps. These preservers should be used along with the level1 preservers and manual steps.

Required data preservers

Title	Table name	Purpose	Suggested filter
Plugin: DevOps Data Model			
Artifact Repository	sn_devops_artifact_repository	Top-level list of artifact repositories. Required to keep artifact repos that are associated with a preserved tool.	`tool=toolid^EQ`, where `toolid` is the tool being preserved.
Artifact	sn_devops_artifact	Top-level list of artifacts. Required to keep artifacts that are associated with a preserved tool.	`artifact_repository.tool=to` where "`toolid`" is the tool being preserved.
Pipeline	sn_devops_pipeline	Top-level list of pipelines. Required to keep pipelines that are associated with a preserved tool.	`tool=toolid^EQ`, where `toolid` is the tool being preserved.
Release Version	sn_devops_plan_version	Top-level list of release versions. Required to keep release versions that are associated with a	`plan.tool=toolid^EQ`, where `toolid` is the tool being preserved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required data preservers (continued)

Title	Table name	Purpose	Suggested filter
		preserved planning tool.	
Plan	sn_devops_plan	Top-level list of plans. Required to keep plans that are associated with a preserved planning tool.	`tool=toolid^EQ`, where `toolid` is the tool being preserved.
Project	sn_devops_project	Top-level list of projects. Required to keep projects that are associated with a preserved tool. Currently supported by Azure DevOps.	`tool=toolid^EQ`, where `toolid` is the tool being preserved.
Repository	sn_devops_repository	Top-level list of repositories. Required to keep repositories that are associated with a preserved coding tool.	`tool=toolid^EQ`, where `toolid` is the tool being preserved.
App to Artifact Repository	sn_devops_m2m_app_artifact_repo	App/Artifact Repo associations. Required to keep the relationship between preserved apps and artifact repositories.	`app=appid^EQ`, where `appid` is the app being preserved.
App to Artifact	sn_devops_m2m_app_artifact	App/Artifact associations. Required to keep the relationship between preserved apps and artifacts.	`app=appid^EQ`, where `appid` is the app being preserved.
App to Plan	sn_devops_m2m_app_plan	App/Plan associations. Required to keep the relationship between preserved apps and plans.	`app=appid^EQ`, where `appid` is the app being preserved.
Plugin: DevOps Vulnerability Integrations			
DevOps Security Orchestration Relation	sn_devops_security_orchestration_relation	Required to keep the relation between DevOps entitiy (for example, pipeline) and a security tool.	reference_table=sn_devops_pipeline

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom integration data preservers

Aim to preserve the meta-data related to any custom tool integrations on the target instance. These data preservers can be used with both level1 and level2 preservers.

Required data preservers

Title	Table name	Purpose	Suggested filter
Plugin: DevOps Data Model			
Custom tool Integration Capability	sn_devops_integration_capability	Required to keep the supported actions to integration capability mapping records of custom tool integration.	`tool_integration=customTool`, where `customToolIntegrationId` is the *sys_id* of the custom tool integration.
Custom tool Integration Capability Mapping	sn_devops_tool_capability_mapping	Required to keep the integration capability mapping records of custom tool integration.	`tool_integration=customTool`, where `customToolIntegrationId` is the *sys_id* of the custom tool integration.
Custom DevOps Tool Integration	sn_devops_tool_integration	Required to keep the tool integration record of custom tool integration.	`sys_id=customToolIntegratio` where `customToolIntegrationId` is the *sys_id* of the custom tool integration.
Custom Tool permissions	sn_devops_tool_permission	Required to keep the permission check records of custom tool integration.	`tool_integration=customTool`, where `customToolIntegrationId` is the *sys_id* of the custom tool integration.
Plugin: DevOps Workspace			
Custom tool Onboarding task type	sn_devops_ws_onboarding_task_type	Required to keep the onboarding task types of custom tool integration.	`tool_integration=customTool` where `customToolIntegrationId` is the sys_id of the custom tool integration.

Level 3 data preservers

Aim to have all the m2m mapping intact in the target instance.

Note:
The following are DevOps specific tables. If you require other data to be in place, then you can add those tables in the preservers list. For example, Change Requests.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check permissions and update credentials for tools — Workspace

You can perform permission checks and update credentials like passwords and access tokens for your tools from the tool details page.

Permission checks

You can perform permission checks on connected tools at any time, to verify if the existing credentials have the necessary permissions. This check helps to determine if there are possible impacts or if you must get a token or credential with higher-level permissions for the tool.

Note:

SonarQube and Rally doesn't have the option to check for permissions.

1. From the DevOps Change Workspace, navigate to Tools and select the tool to open the details page.

   The **Permission check result** field shows whether the tool credentials have all the necessary permissions, have partial permissions, or if permissions haven't been checked. The **Last Permission check** field tells you when the permission checks were previously run.

2. Click **More Actions**.

   - For Bitbucket, select **Check password permissions**.
   - For GitHub and GitHub Enterprise with OAuth credentials using the GitHub app, select **Check credential permissions** and then enter the **GitHub app slug name**. Click **Check permissions**.
   - For others, select **Check credential permissions**.

   You can see the status of the checks depending on your credential permissions. You need sufficient permissions on your credentials for seamless discovery and import.

3. If permissions aren't sufficient, it's recommended to update the credentials with those having higher-level permissions, or update the permissions for the objects on the external tool.

Update credentials

You can update the tool credentials with credentials having sufficient permissions for seamless discovery and import of data from your tool.

1. From the DevOps Change Workspace, navigate to Tools and select the tool to open the details page.
2. Click **More Actions**. Depending on your tool, the options to update your credentials are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool	Steps
Bitbucket	**a.** Click **Update password**. **b.** Enter the user name and the new password. **c.** Click **Check permissions**. **d.** The permission check results are shown in the Permission check dialog box. If you are satisfied with the permissions for your tool, then update the credentials.
Azure DevOps	**a.** Click **Update credentials**. **b.** Select the **Credential type**. ▪ If the credential type is **Basic Auth**, enter the new password or access token. ▪ If the credential type is **OAuth**, enter the new credential. **c.** Click **Check permissions**. **d.** The permission check results are shown in the Permission check dialog box. If you're satisfied with the permissions for your tool, then update the credentials. **Note:** Since the DevOps tool maps to an Azure DevOps organization, the **Project Administrators** privilege requires the owner of the PAT to be a member of the organization's **Project Collection Administrators** group.
Jira, Jenkins, JFrog	**a.** Click **Update credentials**. **b.** Select the **Credential type**. ▪ If the credential type is **Basic Auth**, enter the new password or access token. ▪ If the credential type is **OAuth**, enter the new credential. **Note:** OAuth 2.0 credentials are not available for Jenkins and JFrog. **c.** Click **Check permissions**. **d.** The permission check results are shown in the Permission check dialog box. If you're satisfied with the permissions for your tool, then update the credentials.
GitLab	**a.** Click **Update credentials**. **b.** Select the **Credential type**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool	Steps
	▪ If the credential type is **Basic Auth**, enter the new password or access token. ▪ If the credential type is **OAuth**, enter the new credential. **c.** Click **Check permissions**. **d.** The permission check results are shown in the Permission check dialog box. If you're satisfied with the permissions for your tool, then update the credentials.
GitHub, GitHub Enterprise	**a.** Click **Update credentials**. **b.** Select the **Credential type**. ▪ If the credential type is **Basic Auth**, enter the user name and new password or access token. ▪ If the credential type is **OAuth** using the GitHub app, enter the new credential. If you don't want to check for permissions, then click **Update** directly, and the credentials are updated. To check the permissions, you must enter the **GitHub app slug name**. ▪ If the credential type is OAuth using the OAuth app (not the GitHub app) at GitHub end, enter the new credential. **c.** Click **Check permissions**. **d.** The permission check results are shown in the Permission check dialog box. If you're satisfied with the permissions for your tool, then update the credentials.
Argo CD, SonarQube, Rally	These tools don't check for permissions. To update credentials: **a.** Click **Update credentials**. **b.** Enter the user name and new password or access token. **c.** Click **Update** to update the credentials.

Permission checks are run on the new credentials. Once permissions check is completed, you can proceed with updating the credentials. If you want to abort the update, click **Cancel**.

Permissions required for DevOps tools

Permissions required in your third-party tool to connect to DevOps Change Velocity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure DevOps permissions

Important:
With the access level permissions specified in the following table in Azure DevOps, and the ServiceNow DevOps extension, you can connect to Azure DevOps from ServiceNow. Your Azure DevOps admin does not have to manually configure webhooks and service connections in Azure DevOps.

Important:

- When onboarding a Project, the **Project Administrators** privilege requires the owner of the PAT to be a member of the project's **Project Administrators** group.
- When onboarding an Organization, the **Project Administrators** privilege requires the owner of the PAT to be a member of the organization's **Project Collection Administrators** group.

Object	Permissions required	Impact
Work Items	Read	Required to discover the boards and receive the work items either through import, polling, or real time with a configured webhook.
Code	Read	Required to discover repositories and receive branches, commits, and tags either through import, polling, or real time with a configured webhook.
Build	Read and execute	Read: Required to discover the build pipelines and receive pipeline execution details like stages, artifacts, test results, code security results, and so on, either through import, polling, or real time with a configured webhook. Execute: Required to pause or resume the pipelines based on the change control step.
Release	Read, write, and execute	Read: Required to discover the release pipelines and receive pipeline execution details like stages, artifacts, test results, code security results, and so on, either through import, polling, or real time with a configured webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object	Permissions required	Impact
		Write and Execute: Required to pause or resume the pipelines based on change control step.
Test Management	Read	Required to receive test results for pipeline execution.
Service Connections	Read, query, and manage	Required to create Service connection automatically which is used to configure ServiceNow tasks like change acceleration, artifact, and package registration, and so on.
Packaging	Read	Required to discover the artifact repositories and receive the feeds and packages either through import, polling, or real-time with a configured webhook.
Permissions	Project Administrators	Required to create webhooks automatically to receive data in real-time and to create Service connections automatically which is used to configure ServiceNow tasks like change acceleration, artifact and package registration, and so on.

Limitation of Azure DevOps

If you create an Azure tool with custom defined access level, and you reconfigure such a tool because of change in your Integration user credentials, then the existing service hooks for release created and release deployment are not updated. Instead, two new service hooks are created with new configuration details. To avoid the duplication of these service hooks, you must create the tool with full access level.

Bitbucket

Object	Permissions required	Impact
Account	Read	Required to discover repos and fetch branches, commit, pull requests, and tags either through import, polling, or configured webhook.
Projects	Read	Required to discover repos and fetch branches, commit, pull requests, and tags either through import, polling, or configured webhook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Object	Permissions required	Impact
Webhooks	Read and write	Required to discover repos and fetch branches, commit, pull requests, and tags either through import, polling, or configured webhook.
Pull requests	Read	Required to discover repos and fetch branches, commit, pull requests, and tags either through import, polling, or configured webhook.

GitHub permissions

The following table lists the GitHub permissions for basic authentication.

Object	Permissions required	Impact
repo	repo	Required to discover repositories and their respective workflows and receive branches, commits, pull requests, and tags either through import, polling, or real-time with a configured webhook.
admin:repo_hook	write:repo_hook	Required to create webhooks automatically to receive repo data in real time.
admin:repo_hook	read:repo_hook	Required to lookup already existing webhooks before any new webhook is automatically created to receive repo data in real time.
user	user:email	Required to discover pull requests actors like approvers, raised by, merged by, reviewers, and assignees either through import, polling, or real time with a configured webhook.

The following table lists the GitHub permissions required for OAuth 2.0 authentication.

Object	Permissions required	Impact
Actions	Read-only	Required to receive workflows associated to the respective repos real time with a configured webhook.
Contents	Read-only	Required to discover repositories and its respective

		features and stories in real time.

Configure webhooks from the tool record

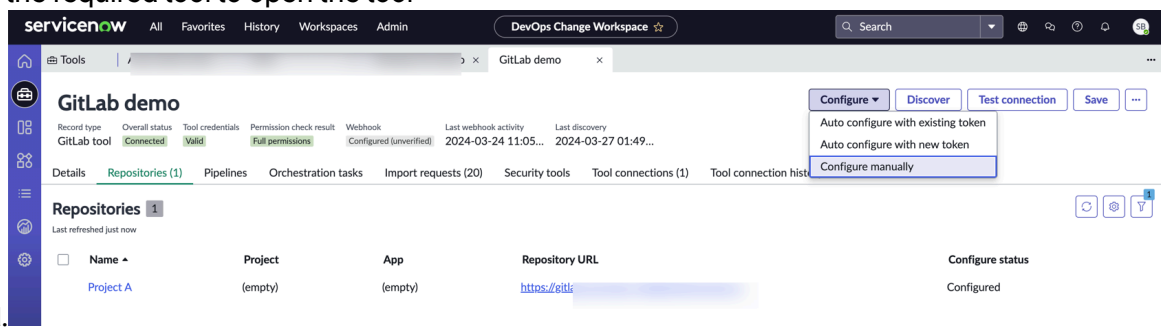
Configure webhooks from the tool record to send data to DevOps Change Velocity after your tool is connected.

Before you begin

Role required: sn_devops.admin or sn_devops.tool_owner in DevOps Change Velocity, and respective tool's admin access to access and configure webhooks.

Procedure

1. Navigate to **All** > **Workspaces > DevOps Change Workspace > Tools**.
2. Select the required tool to open the tool record.



3. Select the **Configure** drop-down menu, and select one of the following actions.

> **Note:**
> You can also select the a Project, Plan, or Repository record and configure the corresponding webhooks for them specifically.

Webhooks are configured in your third-party tool's instance to send data to DevOps Change Velocity.

Test webhooks manually

For tools including GitLab, Rally, Split.io, Jira, Bitbucket, and Argo CD, you have to test webhooks manually if there is any issue with the connection.

GitLab

Role required:

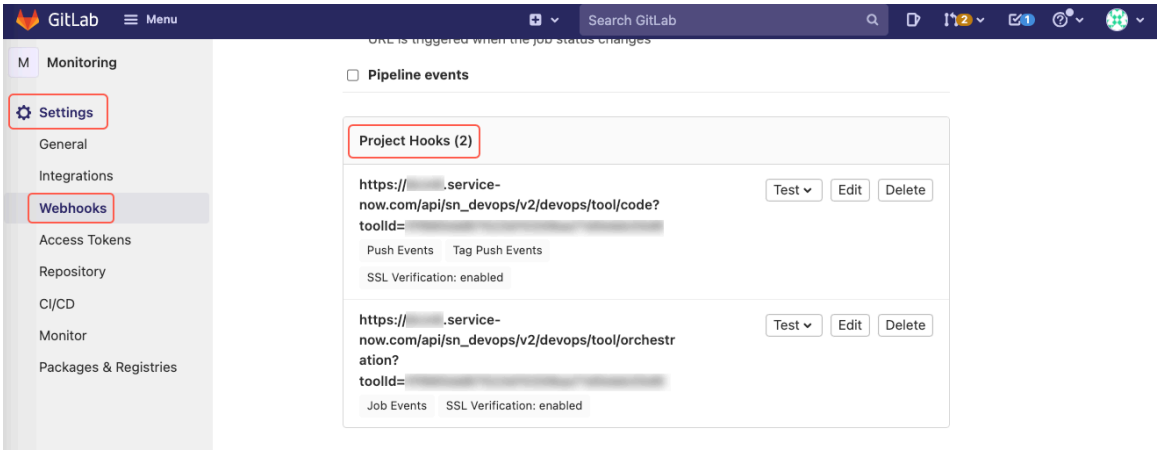
- GitLab: GitLab admin privileges
- DevOps Change: sn_devops.admin or sn_devops.tool_owner

To test webhooks manually in GitLab, you must:

1. Navigate to GitLab and select the project for which you want to test webhooks.
2. Navigate to **Settings** > **Webhooks**.

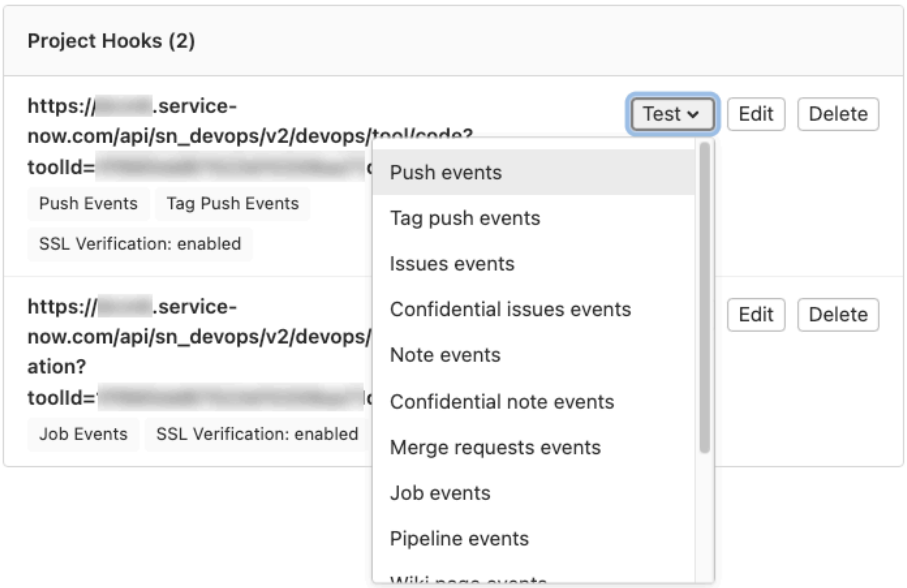
   When your project is configured in DevOps Change Velocity, webhooks are created for that project in GitLab. These webhooks are available under **Project Hooks**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



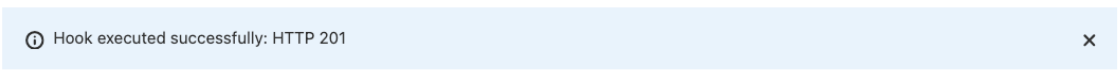
For each project, two webhooks are created. One is for code events and the other for orchestration events.

3. To test a webhook, select **Test** and select **Push events** from the list.



Note:
You can test for other events as well, for example Tag push events.

- If the webhook is configured correctly, you'll receive a success message. For example:



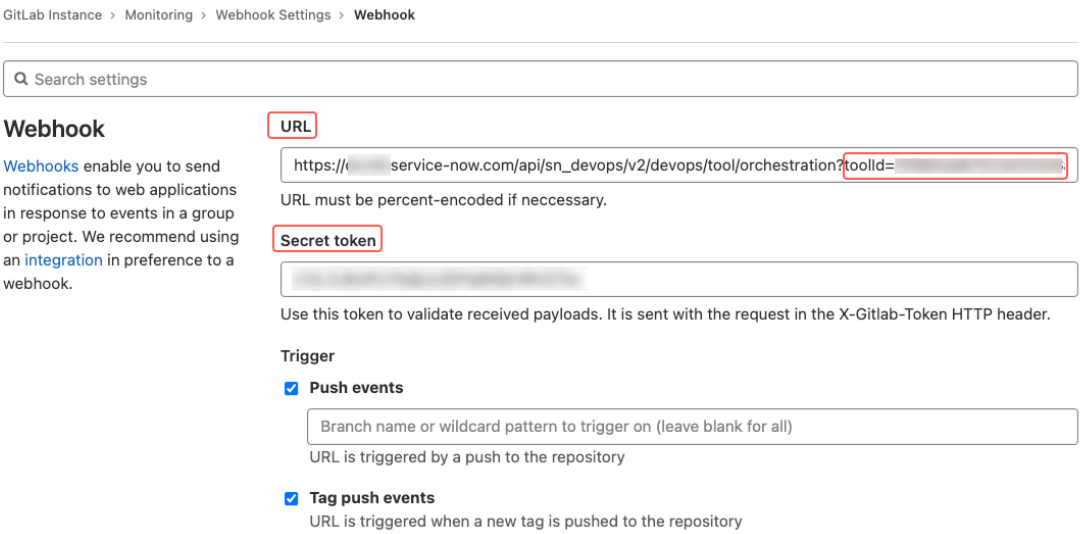
- If the webhook is configured incorrectly, you'll receive an error message. For example:

To fix a webhook, you can try the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reconfigure the webhooks by selecting **Configure** from the project record page in DevOps Change Velocity. This reconfigures all the existing webhooks for the project.
- Select **Edit** for the webhook and verify if the *toolId* is correct in the **URL** field. Verify if the **Secret token** is correct.

  You can find the correct values in the tool record page in DevOps Change Velocity.



For detailed information about webhooks in GitLab, see Webhooks.

Rally

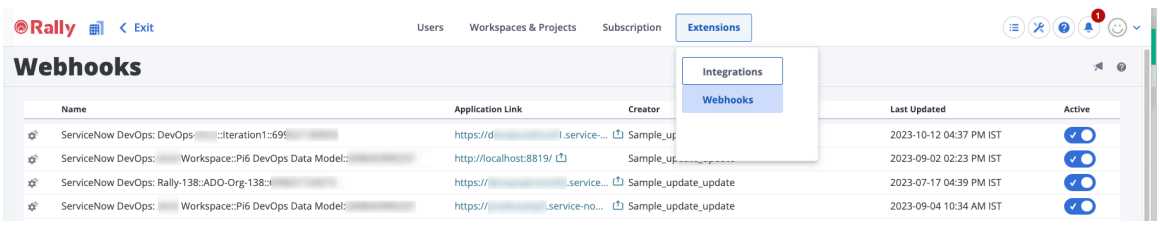
Role required:

- Rally: Rally admin privileges
- DevOps Change: sn_devops.admin or sn_devops.tool_owner

Rally doesn't provide an option to directly test for webhook connectivity. If you're not seeing Rally events in DevOps Change Velocity, you can try the following options:

- From your Rally instance, navigate to **My Settings** > **System Administration** > **Extensions** > **Webhooks**.

  Check if there's a corresponding webhook created for your DevOps Change instance, and that it's **Active**.



- Reconfigure the webhook by selecting **Configure** from the project record page in DevOps Change Velocity. This reconfigures the existing webhook for the project.

For detailed information about webhooks in Rally, see Manage Webhooks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Split.io

Role required:

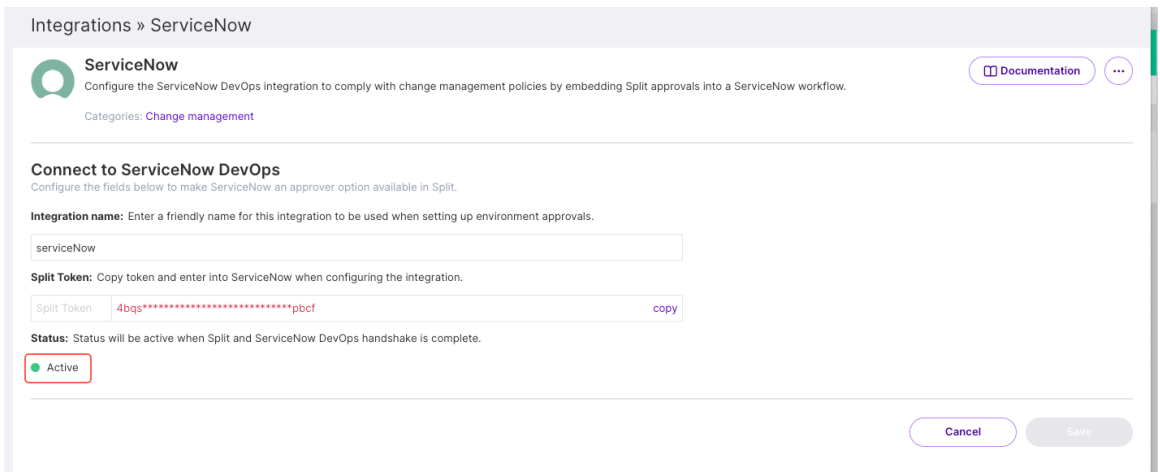
- Split.io: Split.io admin privileges
- DevOps Change: sn_devops.admin or sn_devops.tool_owner

Split.io doesn't provide an option to directly test for webhook connectivity. If you're not seeing Split.io events in DevOps Change Velocity, you can try the following options:

- From your Split.io instance, navigate to **Admin Settings** > **Integration settings** > **Integrations**. Select the **Configured** tab, and select **Edit** for the ServiceNow DevOps application.

  Check if the ServiceNow DevOps application is configured correctly in Split.io. For details on configuring, see Enable integration with ServiceNow DevOps in Split tool.

- Check if the status of the ServiceNow DevOps application is **Active**.



- Reconfigure the webhook by selecting **Configure** from the tool record page in DevOps Change Velocity. This reconfigures the existing webhook for the Split.io tool.

You can also refer to ServiceNow integration with Split.io.

Jira

Role required:

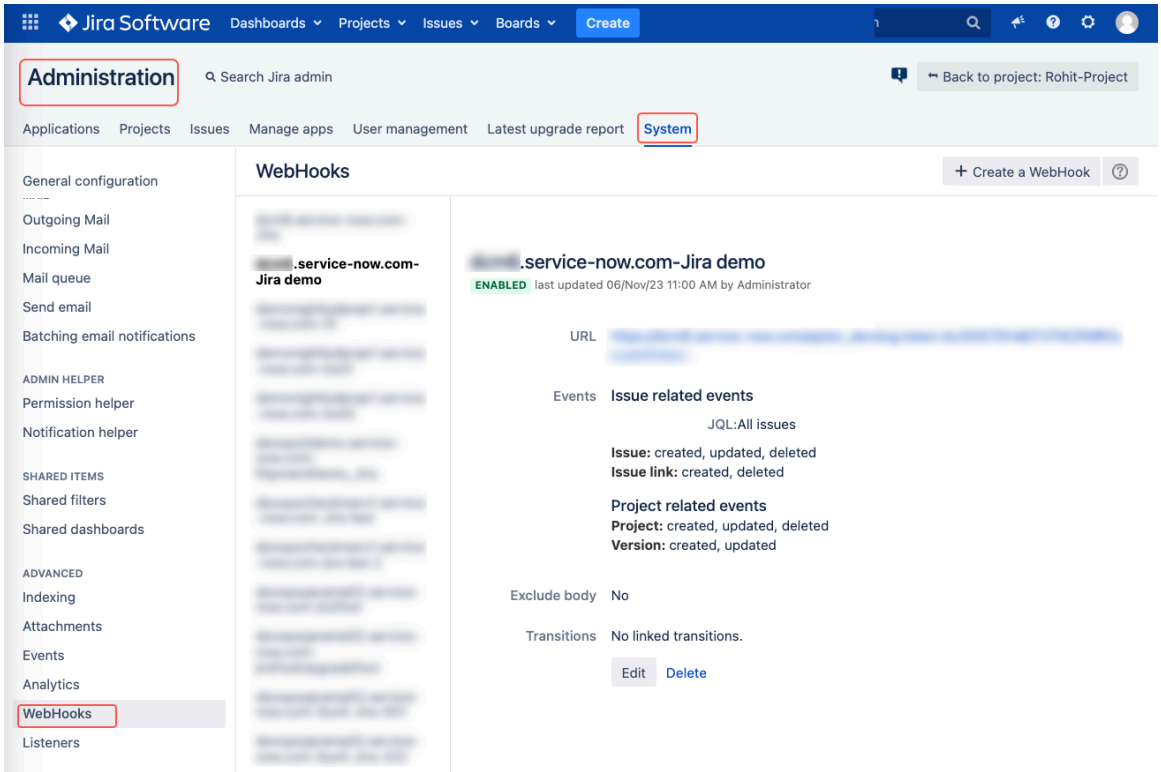
- Jira: Jira admin privileges
- DevOps Change: sn_devops.admin or sn_devops.tool_owner

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Jira doesn't provide an option to directly test for webhook connectivity. If you're not seeing Jira events in DevOps Change Velocity, you can try the following options:

- Navigate to:
  - For Jira Server navigate to **Administration** > **System** > **WebHooks**.
  - For Jira Cloud instance, navigate to **Settings** > **System** > **WebHooks**.

  Check if there's a corresponding webhook created for your DevOps Change instance.



- Select **Edit** for the webhook.
  - Check if the status is **Enabled**.
  - Check if the *Tool ID* in the **URL** field is correct. The *Tool ID* is the value after *?toolId=*.
  - Check if the secret token in the **URL** field is correct. Token value is at the end of the URL, after *token=*.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can find the correct values of the *Tool ID* and *Secret token* in the tool record page in DevOps Change Velocity.

For detailed information about webhooks in Jira, see Webhooks.

- Reconfigure the webhook by selecting **Configure** from the tool record page in DevOps Change Velocity. This reconfigures the existing webhook for the Jira tool.

Note:

If you have connected your Jira tool using OAuth 2.0 based authentication, the webhooks are created for the OAuth 2.0 integration app in Jira when you configure automatically, whereas if you have connected using basic authentication, the webhooks are created for all your projects in Jira. If you choose to configure the webhooks manually for a Jira tool created using OAuth 2.0 based authentication, a duplicate webhook may get created.

Bitbucket

Role required:

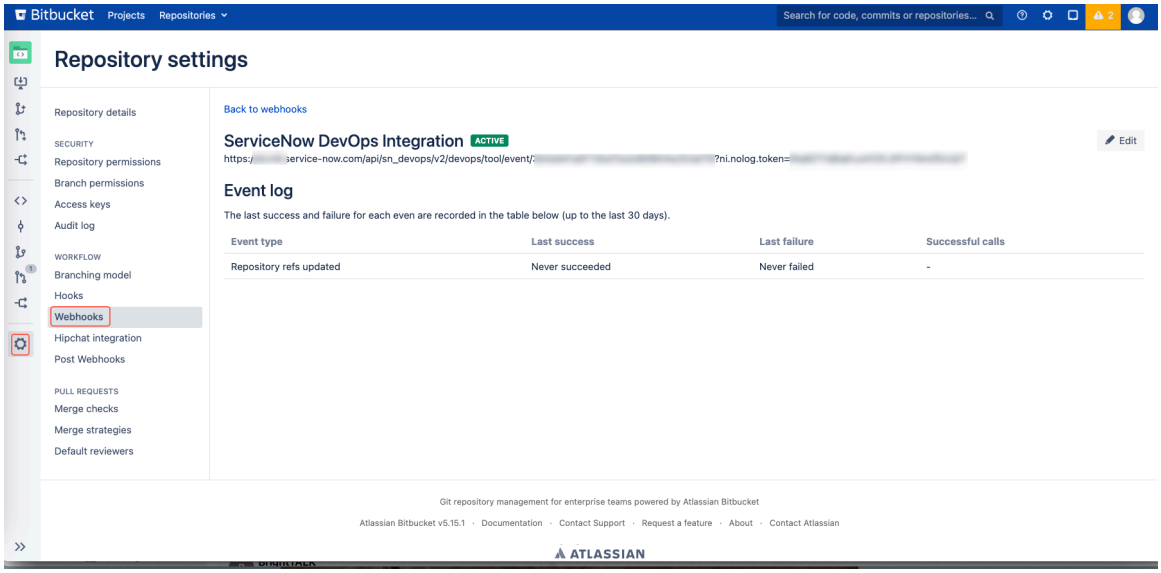
- Bitbucket: Bitbucket admin privileges
- DevOps Change: sn_devops.admin or sn_devops.tool_owner

Bitbucket doesn't provide an option to directly test for webhook connectivity. If you're not seeing Bitbucket events in DevOps Change Velocity, you can try the following options:

- Navigate to Bitbucket and select the repository for which you want to test webhooks. Navigate to **Repository settings** > **Workflow** > **Webhooks**.

  Check if there's a corresponding webhook created for your DevOps Change instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Select **Edit** for the webhook.
  - Check if the status is **Active**.
  - Check if the *Tool ID* in the **URL** field is correct. The *Tool ID* is the value after */event/*.
  - Check if the secret token in the **URL** field is correct. Token value is at the end of the URL, after *token=*.

  You can find the correct values of the *Tool ID* and *Secret token* in the tool record page in DevOps Change Velocity.

  For detailed information about webhooks in Bitbucket, see Manage webhooks.

- Reconfigure the webhook by selecting **Configure** from the tool record page in DevOps Change Velocity. This reconfigures the existing webhook for the Bitbucket tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Argo CD

Role required:

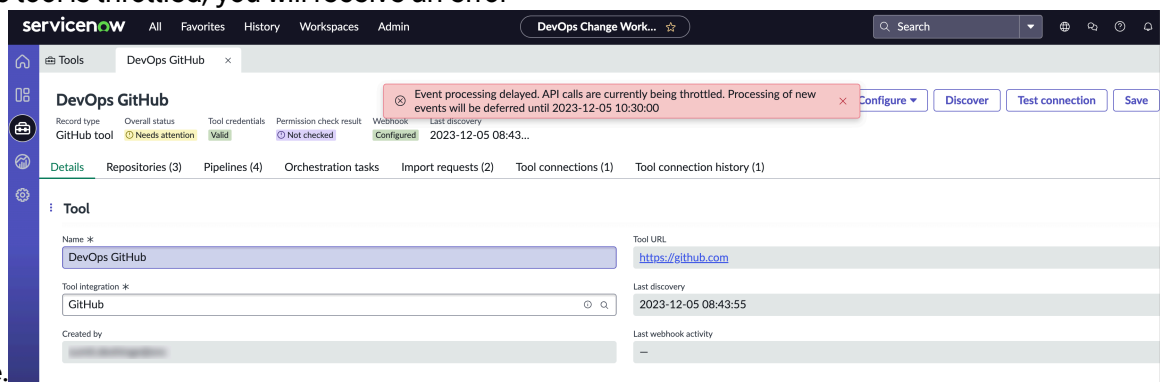
- Argo CD: Argo CD admin privileges
- DevOps Change: sn_devops.admin or sn_devops.tool_owner

Argo CD doesn't provide an option to directly test for webhook connectivity. To configure webhooks, see Configure webhooks in Argo CD manually.

Tool throttling

In DevOps Change Velocity, when a tool is throttled, processing of new events is delayed until the throttling expires and the tool status changes to **Throttled**. This is available for Azure DevOps, GitHub, and GitLab.

When the tool is throttled, you will receive an error message.



Throttled status

Throttled status means that the tool is not allowing API requests to get data because it has reached or exceeded a certain usage limit. API response has a rate limit or too many request errors. In that case, DevOps tool status is changed to **Throttled**.

Why does this happen

Some tools limit the number of API requests that can be made within a specific amount of time. This limit helps prevent abuse and denial-of-service attacks, and ensures that the API remains available for all users.

When this happens, the DevOps tool status is changed to **Throttled** and further inbound events aren’t processed until the rate limit imposed by the tool is removed. Till that time, the inbound events will be in the **Deferred** state. After the throttle expires, processing of events resumes.

How to reset the throttle

Generally, the tool API provides the information about how long the rate limit will be imposed. This indicates the throttle reset time. This information is used to resume API requests for that tool, if there are any pending inbound events or discover or historical import requests.

If a tool doesn't provide the throttle reset time, the default value, which is 15 minutes is applied. The default value can be changed using the property *`Default throttle reset time in minutes from current time`* (sn_devops.throttle.reset.time.default), from the DevOps properties page.

Where to check for the throttled status and reset status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tool Connection Status (sn_devops_tool_connection_status) table contains tool throttling related information. It has columns like tool, throttle reset time, throttle active, which indicates which tool is under throttle, when this throttle will be reset, and whether the throttle is active or

not.

REST_RATE_LIMIT_ERROR will be logged in DevOps error logs. Also, the tool under throttle will have **Throttled** status.

Retry errored inbound events

Run base system or modified scheduled jobs to retry processing errored inbound events. Specify the exceptions or errors to retry events that are in an *`Error`* state.

Before you begin

Role required: sn_devops.admin

About this task

A scheduled job retries processing inbound events that are in *`Error`* state. You can choose to use the scheduled job with its base-system properties or customize the properties to suit your needs.

- Run a scheduled job on inbound events that are in error state.
- Update the list of exceptions and errors so that you can retry processing errored inbound events with those exceptions.
- Specify the count for maximum attempts the retry jobs runs on an inbound event.
- Specify the time elapsed since the last retry job. The retry job runs again on the errored inbound events after the duration you specify.

Based on your error or exception, perform any of the following steps to retry processing the inbound events.

Procedure

1. Modify the *`Retry Errored Inbound Events`* scheduled job frequency.

   a. Navigate to **System Definition** > **Scheduled Jobs**.

   b. Search and open the *`Retry Errored Inbound Events`* job.

   The job checks for errored inbound events.

   > **Note:**
   > By default, the scheduled job runs repeat every two minutes. You can modify the frequency (in minutes), as required.

   c. Select the frequency to run the job, from the **Run** field, and configure the corresponding fields.

   d. Click **Update**.

   You have modified the frequency of the scheduled job.

2. Modify properties related to retry processing inbound events.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **DevOps** > **Administration** > **Properties**.

b. Modify the **Maximum retries for errored inbound events** property.

> **Note:**
> The default value for this property is 3. You can modify the count as needed.

Processing inbound events are retried based on the count you specify.

c. Modify the **Time elapsed (in minutes)** property.

> **Note:**
> The default value for this property is 1440 minutes (24 hours). You can modify the count if required.

Based on the value in this property field, the system retries processing inbound events. For example, if the last attempt to process the inbound events was on 12 noon on 1 January, by default, the scheduled job retries processing errored events after 1440 minutes or 1 day from the timestamp of the last attempt to process the inbound event.

d. To update the exceptions list based on which errored events are retried for processing, modify the **Errors or exceptions (comma separated) for which errored inbound events are set to Retry** property.

> **Note:**
> The default value of this property is *`TimeOutExceptions, FlowObjectAPIException`*. You can update the exceptions you want to retry processing in a comma-separated format.

The exceptions you enter for the property are checked for the **Processing Details** field in the inbound event's record and retries processing.

Result

The scheduled job to retry processing inbound events runs based on either the properties you have configured or the base system properties that are specified by default.

Customized lists

Create customized lists for your List, Change, Tools, and Administration modules. You can create your own version of an existing list, or a new one.

Before you begin

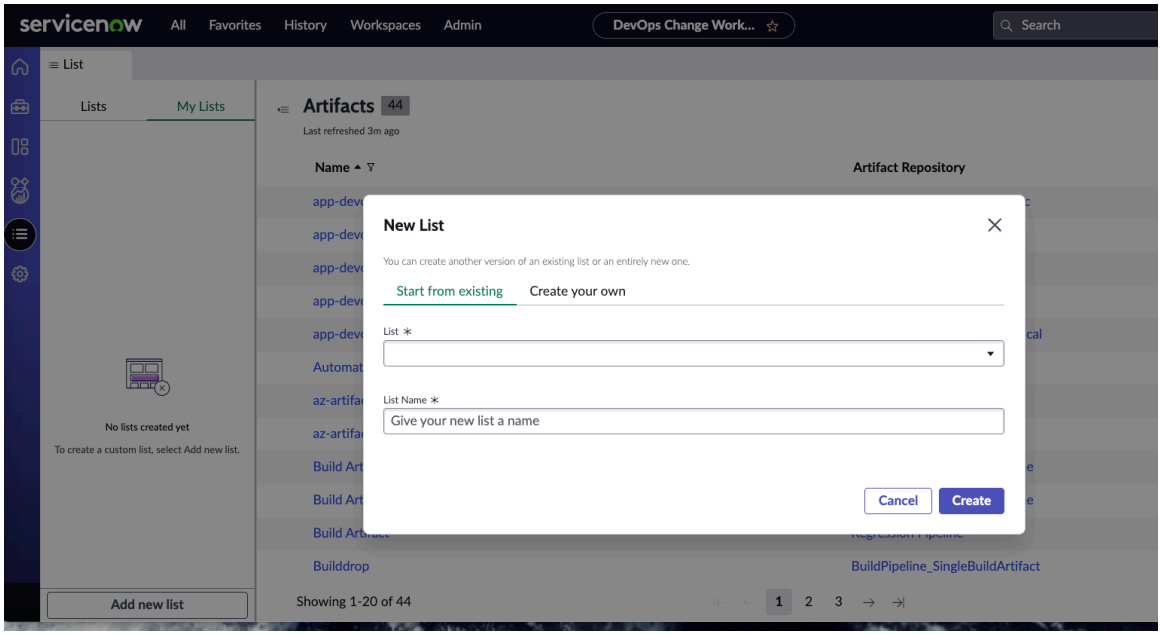
Role required: sn_devops.admin, sn_devops.tool_owner, or sn_devops.app_owner

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace**.
2. Select the module where you want the list added (List, Change, Tools, or Administration).
3. Select **My Lists** tab and select **Add new list**.

You can create a different version of an existing list or a new one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. You can create a different version of an existing list or a new one.
   - To create a list from an existing list:
     a. Select the **Start from existing** tab.
     b. From the **List** drop-down, select an existing list.
     c. In the **List Name** field, give a name for your list.
     d. Select the columns from the list that you want in your list.
     e. If required, add filters for the list.
     f. If you want the list sorted by a column, select the column and order in the **Sort by** section.
     g. Select **Create**.

   - To create your own list:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the **Create your own** tab.

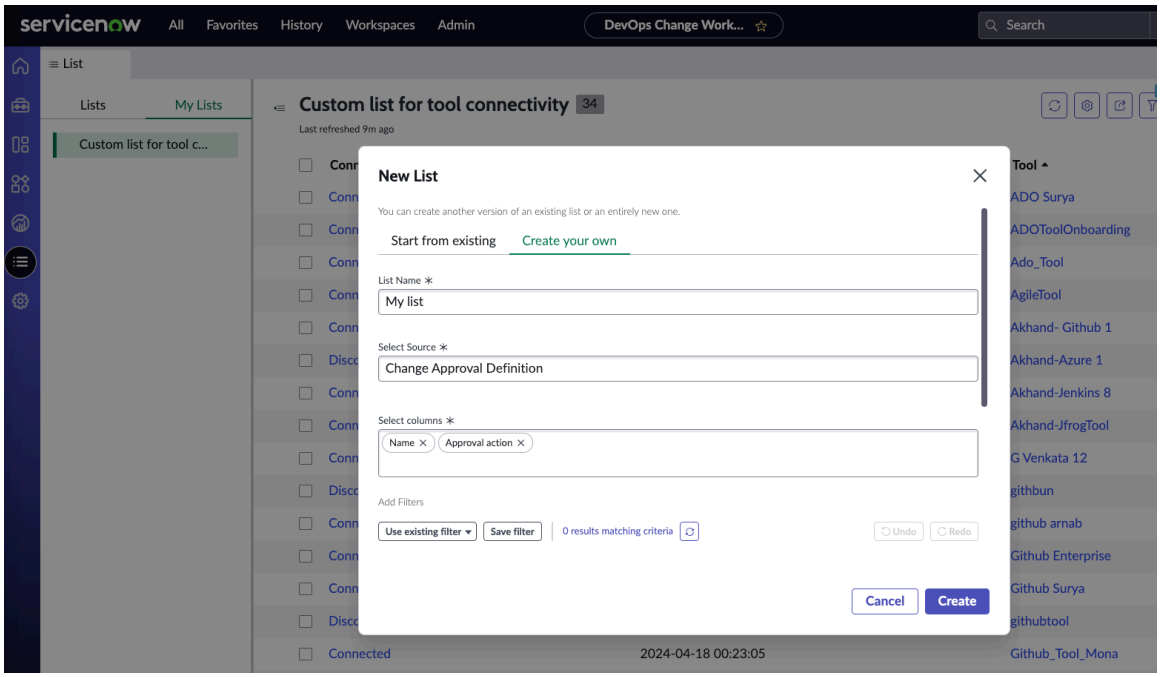
b. From the **Select Source** list, gselect the table using which you want to create your list.

c. Select the columns that you want in your list.

d. If required, add filters for the list.

e. If you want the list sorted by a column, select the column and order in the **Sort by** section.

f. Select **Create**.



Deleting a record in DevOps Change Velocity

Cascade record deletion is implemented to delete all dependent lower level DevOps records whenever a parent or higher level DevOps entity is deleted. Confirmation popups ensure that you understand that data will be lost when you delete a record (for example, the record of a tool connection).

For example, when a Plan record is deleted, all dependent Work Item, Plan Version, and many-to-many relation (like App to Plan, and Work Item to Plan Version) records are deleted.

DevOps cascade deletion is implemented for these tables.

- Pipeline, Pipeline Execution, Step, Orchestration Task, Task Execution
- Repository, Commit, Branch, Tag
- Plan, Work item, Plan Version
- DevOps Tool, Artifact Repository, Artifact, Test Summary / Performance test summary

Delete action on a DevOps form

A user with the sn_devops.admin role can delete a DevOps record, but only if it meets the defined ACL criteria.

Note:
To see the **Delete** button on a form, you must have the sn_devops.admin role, and the current record must meet the criteria defined in the scripted ACL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity	Scripted ACL criteria
Pipeline	A Pipeline record can be deleted only if no other pipeline executions from other pipelines are dependent on the artifact versions generated by the pipeline executions of this pipeline.
Pipeline Execution	A Pipeline Execution record can be deleted only if no other pipeline executions are dependent on the artifact versions generated by this pipeline execution.
Task Execution	A Task Execution record can be deleted if ALL of these conditions are met. • There are no step executions referencing it. • There are no downstream task executions referencing it. • There are no pipeline executions dependent on the artifact versions built by this task execution.
Step	A Step record can be deleted only if there are no orchestration tasks or step executions referencing this step.
Orchestration Task	If the orchestration task has a step associated, it can be deleted only if there are no task executions referencing this orchestration task. If the orchestration task does not have a step associated (example Jenkins freestyle job), it can be deleted only if no other pipeline executions are dependent on the artifact versions generated by the task executions of this orchestration task.
Repository	A Repository record can be deleted only if none of the commits of this repository are associated to the artifact versions (Artifact Version to Commit table) or task executions (Run Commit table). Therefore, before cleaning up the repository, delete the dependent pipeline entities.
Branch	A Branch record can be deleted only if there are no commits associated to it in the Branch To Commit table.
Tag	A Tag record cannot be deleted by a sn_devops.admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity	Scripted ACL criteria
Commit	A Commit record can be deleted if ALL of these conditions are met. • The commit is not associated to the artifact version (Artifact Version to Commit table). • The commit is not associated to task executions (Run Commit table). • The commit is not being referenced by other commits as a revert commit.
Plan	A Plan record can be deleted only if none of the work items of this plan are associated or referenced by any commits.
Work Item	A Work Item record can be deleted if ALL of these conditions are met. • The work item is not being referenced by another work item as parent. • There are no commits referencing or associated to this work item.
Plan Version	A Plan Version record can be deleted only if there are no work items associated to it in the Work Item To Plan Version table.
Test Summary / Performance Test Summary	A Test Summary record can be deleted only if it doesn't have an associated related record (Artifact version/Package/Task Execution) in the Test Summary Relations table.
Artifact	An Artifact Record can be deleted only if all the artifact versions belonging to it are deletable.
Artifact Repository	An Artifact Repository record can be deleted only if all the artifacts belonging to it are deletable.
Artifact Version	An Artifact Version record can be deleted only if it's built by task execution field is empty.
Artifact Staged Request	An Artifact Staged Request record can be deleted when it is either an orphaned record, or the state is Processed / Error.
Package	A Package record can be deleted if ALL of these conditions are met. • There are no pipeline executions referenced to it. • The built by task execution value on the Package record is null.
DevOps Tool	A DevOps Tool record cannot be deleted by a sn_devops.admin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Entity	Scripted ACL criteria
Build Test Summary Build Test Result Commit Details Event Inbound Event	These entities cannot be deleted by a sn_devops.admin.

DevOps record delete cascade

Deleting a record in a parent table cascade deletes all the child records in the hierarchy.

DevOps record delete cascade exceptions

These records are always deleted in the foreground.

Parent record being deleted	Cascade deleted child records
Artifact Version	These records are deleted along with Artifact Version. • Artifact Staged Request • Artifact Version To Commit • Artifact Version to Package
Build Test Summary	These records are deleted along with Build Test Summary.
Package	These records are deleted along with Package. • Artifact Staged Request • Artifact Version to Package

Foreground deletion threshold property

Deletion of DevOps records occurs in the foreground (synchronously) by default. Meaning, other UI actions cannot be performed during synchronous deletion. Because the deletion of a parent record can result in the deletion of multiple child records, you can set a threshold value so the remaining records are deleted in the background.

Note:
Artifact Version, Build Test Summary, and Package records are always deleted in the foreground.

To set the DevOps Cascade delete threshold property, navigate to **DevOps** > **Administration** > **Properties**. Define the total number of records that can be cascade deleted in the foreground, after which the remaining records are deleted in the background. Default is 1000.

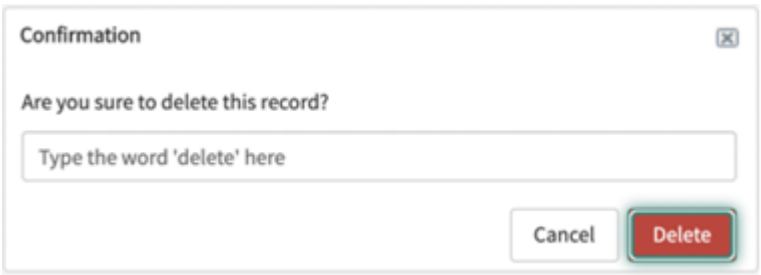
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

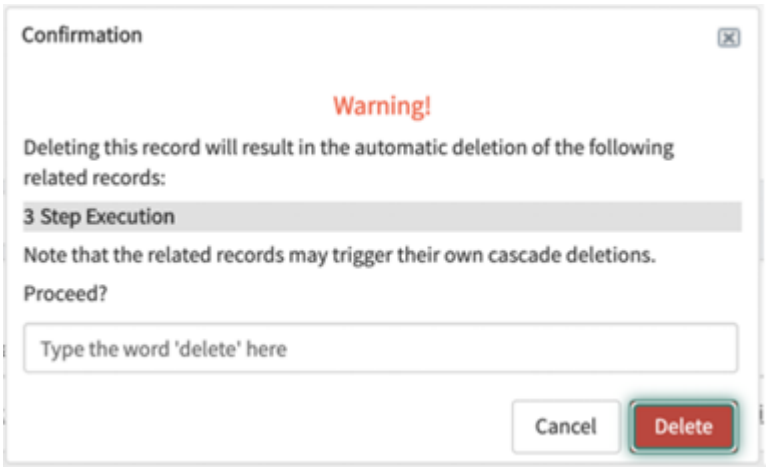
Note:
The records of tables in a hierarchy are deleted in a bottom-up manner. For example, it might be possible that even after triggering the delete action on a Repository record, it will still be available for read, write, and update in the system until deletion is complete.

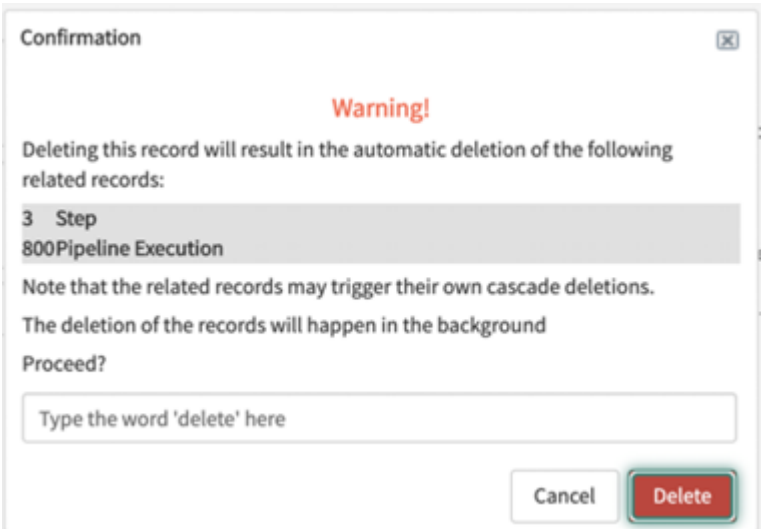
DevOps record deletions do not trigger any business rules or workflows.

DevOps record deletion UI

Cascade delete of a DevOps record triggers multiple confirmation approvals.







Map spoke alias as parent alias for new DevOps tool

Create Jira, GitHub or Jenkins tool with parent alias set to respective spoke alias instead of DevOps Basic authentication. Use a script include to reset parent alias to spoke alias for existing or onboarded tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
This feature is currently supported for Jira spoke v3.1, Jenkins spoke v2.1.1, and GitHub spoke v2.2.2, and later only.

- Ensure that you have an Integration Hub subscription.
- Ensure that you have set up the connection and credential alias using spoke for Jira, Jenkins and GitHub . For more information, see:
  - Jira spoke
  - Jenkins spoke
  - GitHub spoke
- Upgrade to DevOps Data Model and DevOps Integrations version 1.33 or later.

Role required: admin, sn_devops.admin

About this task

Whenever you create a Jira, Jenkins, and GitHub tool, the parent alias will be set to their respective spoke alias, if you have set up the spokes for the supported tools. In previous versions, when we created a tool, the parent alias was set to DevOps Basic Auth (sn_devops.DevOps_BasicAuth) for all the tools we onboarded.

If you have already created / onboarded tools with a connection and credential alias; the functionality does not change on upgrade and the parent alias remains DevOps Basic Auth (sn_devops.DevOps_BasicAuth) unless Jira, Jenkins, and GitHub tools are associated to spoke alias as parent alias. You can use a base system script include to ensure that the parent alias is reset to the spoke alias, for all existing and supported tools that were created earlier.

Note:
Integration Hub uses aliases to manage connection and credential information. Using an alias eliminates the need to configure multiple credentials and connection information profiles when using multiple environments. If the connection or credential information changes, you don't need to update any actions that use the connection. For more information, see Connections and Credentials.

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes** > **DevOpsReparentingConnectionAliasFixScript**.
2. Copy the script from the **Script** field.
3. Navigate to **System Definition** > **Scripts - Background**.
4. Paste the script in the **Run script (JavaScript executed on server)** field.

   Note:
   Ensure that the script is run in Global scope.

   Once the script run is successfully completed, all supported tools created prior to the version 1.33 upgrade, are reset to their corresponding parent alias.

What to do next

Verify that the parent alias is set to sn_jira_spoke.Jira for Jira, sn_github_spoke.GitHub for GitHub, and sn_jenkins_v2_spoke.Jenkins_v2 for Jenkins in the **Connection & Credentials Aliases** form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Delete orphan connection and credential aliases

Delete the connection and credential aliases that do not label any connection or credential record by running a background script. This helps you in freeing up space in your system.

Before you begin

Role required: System Admin (admin)

Procedure

1. Navigate to **All** > **System Definitions** > **Scripts - Background**.
2. Select the scope as **global**.
3. Enter the following script in the **Run script (JavaScript executed on server)** pane.

```
deleteOrphanAliases();
function deleteOrphanAliases() {
    var orphanAliases = new GlideRecord('sys_alias');
    orphanAliases.addEncodedQuery("nameSTARTSWITHDevOps-_-");
    orphanAliases.query();
    while(orphanAliases.next()) {
        if
 (!checkIfAliasHasConnection(orphanAliases.getUniqueValue()))
            orphanAliases.deleteRecord();
    }
};
function checkIfAliasHasConnection(sysAliasId) {
    var httpToolConnGR = new GlideRecord("http_connection");
    httpToolConnGR.addEncodedQuery("connection_alias=" +
 sysAliasId);
    httpToolConnGR.query();
    if (httpToolConnGR.next())
        return true;
    return false;
};
```

4. Select **Run script**.

Implement custom actions for pipelines using generic Docker container image

Use the ServiceNow custom actions to collect data related to change request creation, Sonar scan, artifact registration, and package registration in your pipeline with the help of the generic Docker Container Image.

Docker Image is a software package that can be used to run an application. This image informs how a container should instantiate, and which software components must be run. Docker Container is a virtual environment that combines application code and all the dependencies required to run the application. For more information on Docker, see Docker documentation.

Environmental variables for GitLab

To configure Docker Images, the following environmental variables must be available in your GitLab instance for your project.

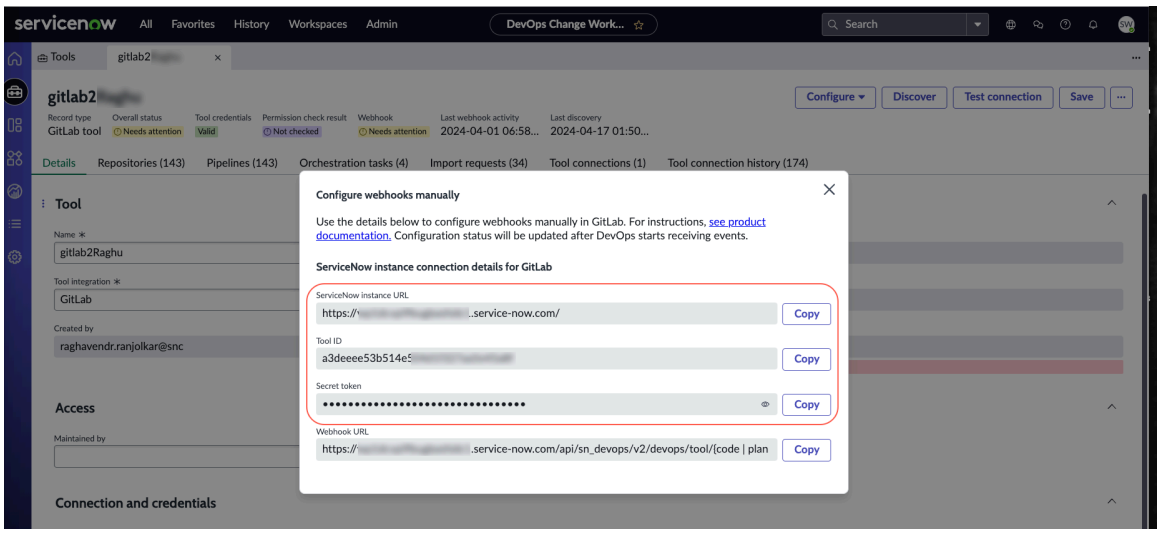
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SNOW_TOKEN: ServiceNow token number. It's a masked variable and wont be displayed in the jobs.
- SNOW_TOOLID: ServiceNow tool ID.
- SNOW_URL: ServiceNow instance URL.

When you configure a GitLab project, the environmental variables are created for the project and the latest configured variable values are considered. If you're an upgrading customer, you must reconfigure your existing GitLab projects or manually add the environmental variables in your GitLab instance. For information on adding variables, see GitLab documentation.

When adding the SNOW_TOKEN variable, you can acquire the token by selecting the **Copy token** button on the tool record, located in the Tool [sn_devops_tool] table.

The environmental variables must be updated with the values available in the Configure webhooks manually pop-up in the tool record page. For details on how to view the connection details, see Configure webhooks from the tool record and Configure webhooks in GitLab manually.



Environmental variables for GitHub Actions

To configure Docker Images, certain environmental variables must be available in your GitHub Actions instance.

The following environmental variables must be configured in your GitHub Actions instance.

Note:
The variables must be updated with the values available in the Configure webhooks manually pop-up in the tool record page.

- SNOW_TOKEN: ServiceNow token number. It's a masked variable and wont be displayed in the jobs.
- SNOW_TOOLID: ServiceNow tool ID.
- SNOW_URL: ServiceNow instance URL.

Note:
For information on adding variables in GitHub Actions, see GitHub documentation.

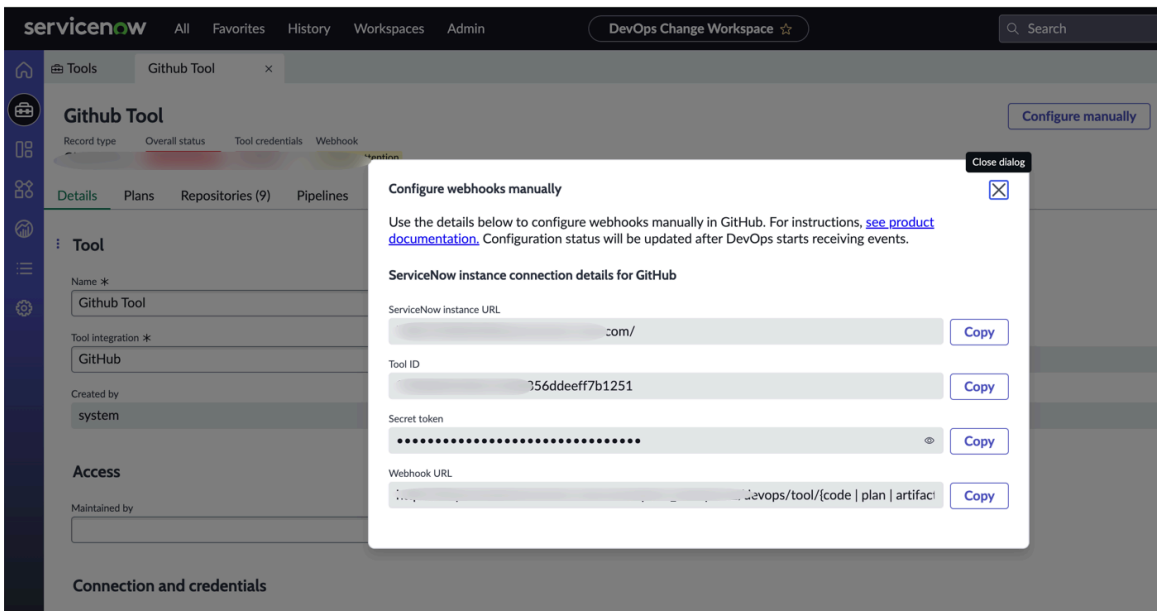
The following environment variables must be passed in your GitHub Actions pipeline:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The values for these variables are dynamically retrieved from GitHub, and you do not have to configure them separately.

- PIPELINE_ID: Workflow run ID of a repository. Usage - PIPELINE_ID: ${{github.run_id }}
- API_V4_URL: URL of the GitHub server. Usage - API_V4_URL: ${{ github.server_url }}
- JOB_ID: Workflow run ID of a repository. Usage - PIPELINE_ID: ${{ github.run_id }}
- PROJECT_PATH: Name of the workflow. Usage - PROJECT_PATH: ${{ github.repository }}/ ${{github.workflow}}
- REPOSITORY_NAME: Name of the repository. Usage - REPOSITORY_NAME: ${{ github.repository }}
- RUN_ATTEMPT: Number of workflow attempts. Usage - RUN_ATTEMPT: ${{ github.run_attempt }}
- PROJECT_TITLE: Name of the workflow. Usage - PROJECT_TITLE: ${{ github.repository }}/ ${{github.workflow}}
- COMMIT_BRANCH: Name of the branch on which the workflow is running. Usage - COMMIT_BRANCH: ${{ github.ref_name }}
- WORKFLOW_NAME: Name of the workflow. Usage - WORKFLOW_NAME: ${{ github.workflow }}

When you configure a repository, the environmental variables are created for the repository and the latest configured variable values are considered. If you're an upgrading customer, you must reconfigure your existing repositories or manually add the environmental variables in your instance.



Environmental variables for Harness

To configure Docker Images, certain environmental variables must be available in your Harness instance.

The following environmental variables must be configured in your Harness instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

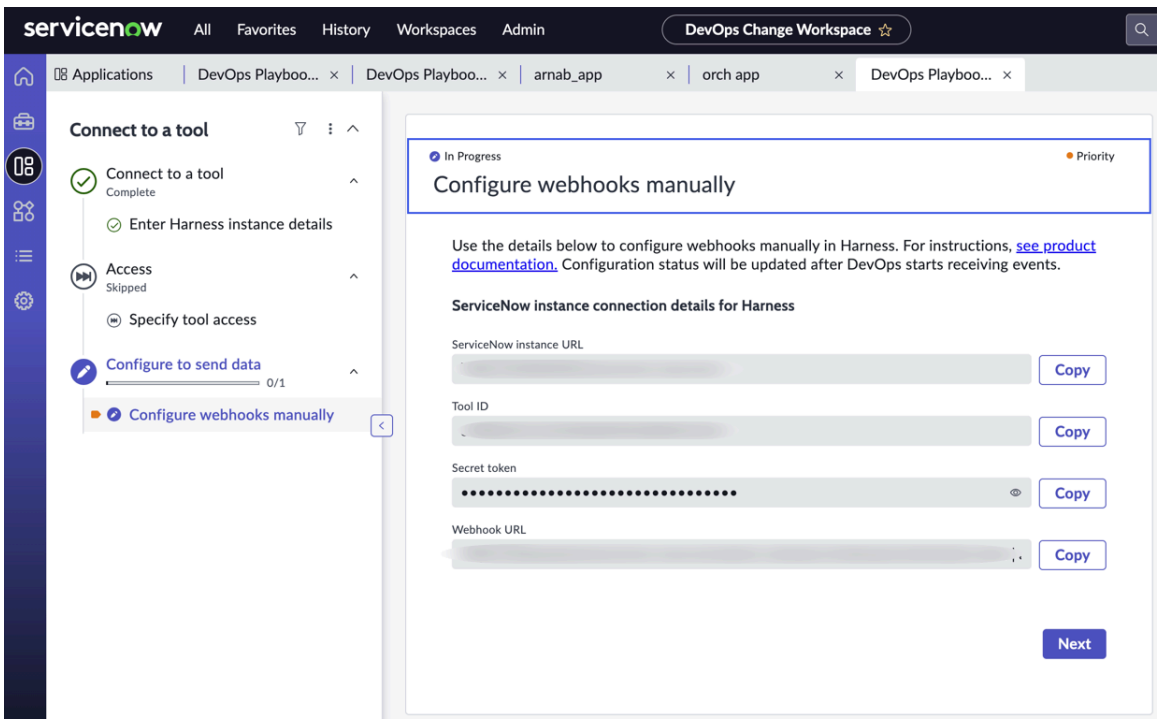
Note:
The variables must be updated with the values available in the Configure webhooks manually pop-up in the tool record page.

- SNOW_TOKEN: ServiceNow token number. It's a masked variable and wont be displayed in the jobs.
- SNOW_TOOLID: ServiceNow tool ID.
- SNOW_URL: ServiceNow instance URL.

The following environment variables must be passed in your Harness pipeline:

- HARNESS_STAGE_NAME: "<+stage.identifier>"
- HARNESS_PIPELINE_NAME: "<+org.identifier>/<+project.identifier>/<+pipeline.name>"

When you configure a repository, the environmental variables are created for the repository and the latest configured variable values are considered. If you're an upgrading customer, you must reconfigure your existing repositories or manually add the environmental variables in your instance.



ServiceNow Docker Image

You must pass the ServiceNow Docker Image (servicenowdocker/sndevops:5.1.0) in your pipeline before adding custom actions in your pipeline. You can clone the app-devops-gitlab public repository located at https://github.com/ServiceNow/app-devops-gitlab, and create the Docker Image by running the following commands:

```
docker build -t servicenowdocker/sndevops:5.1.0
```

```
docker push servicenowdocker/sndevops:5.1.0
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add the Docker Image at the starting of the .yml file. You don't have to add it for each job separately.

Note:
If you want to use multiple images, then add them at the job levels.

You can also customize the **app-devops-gitlab** public repository and create your own Docker Image to pass in the pipeline.

ServiceNow DevOps Change Step

Add the ServiceNow DevOps Change custom step at the job level to create a change in your ServiceNow instance. For example:

```
stages:
  - DevOpsChangeApproval

ServiceNow DevOps Change:
  stage: DevOpsChangeApproval
  image: servicenowdocker/sndevops:5.1.0
  script:
    - sndevopscli create change -p
 "{\"changeStepDetails\":
{\"timeout\":3600,\"interval\":100},\"attributes\":
{\"short_description\":\"Software
 Deployment\",\"description\":\"Software
 Deployment.\",\"assignment_group\":\"xxxxxxxxx\",
\"implementation_plan\":\"Software update is tested and results
 can be found in Test Summaries Tab.\",\"backout_plan\":\"When
 software fails in production, the previous software release
 will be re-deployed.\",\"test_plan\":\"Testing if the software
 was successfully deployed or not\"}}"
```

Note:
If you're using both the Docker change step and the when: manual instruction change step, ensure that you add them at different job levels.

You must enter the input values for this custom action as a JSON-formatted string.

- **changeStepDetails**: [optional] It holds the timeout and interval details.
- **interval**: [optional] The time in seconds to wait between trying the API. The default value is 100 seconds.
- **timeout**: [optional] The maximum time in seconds to wait until the action should fails. The default value is 3600 seconds.

  Note:
  When the timeout value is available here as well in your tool, the timeout value which is earlier is considered.

- **attributes**: [optional] The change request attribute details are to be used while creating a change in a ServiceNow instance. The change request is a JSON object surrounded by curly braces {} containing key-value pairs separated by a comma(,). A key-value pair consists of a key and a value separated by a colon(:). The keys supported in key-value pair

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

are short_description, description, assignment_group, implementation_plan, backout_plan, test_plan, and so on.

- **-ctx**: [optional] Additional context parameters in JSON format. Environmental variable details from GitHub that will be used to build the request for the DevOps Change API. For example,

```
sndevopscli create change -ctx "{\"projectId\": \"123456\",
 \"attemptNumber\": \"${{ github.run_attempt }}\"}" -p
 "{\"changeStepDetails\":
 {\"timeout\":3600,\"interval\":100},\"autoCloseChange\":true,\
"attributes\":{\"short_description\":\"G Venkata Automated
 Software Deployment\",\"description\":\"Automated Software
 Deployment.\",\"assignment_group\":
\"a715cd759f2002002920bde8132e7018\",\"implementation_plan\":
\"Software update is tested and results can be found in
 Test Summaries Tab.\",\"backout_plan\":\"When software
 fails in production, the previous software release will be
 re-deployed.\",\"test_plan\":\"Testing if the software was
 successfully deployed or not\"}}"
```

- **-w**: [optional] Specify whether the pipeline should wait for change creation and approval. By default, the pipeline will be waiting until the change creation and it's approval.

Note:
The name of the change step must contain the **ServiceNow DevOps Change** keyword, which is the job name.

ServiceNow DevOps SonarScan Results

Add the ServiceNow DevOps SonarScan Results custom step at the job level to create a Sonar summary in your ServiceNow instance. For example:

```
stages:
  - DevOpsSonarStage

ServiceNow DevOps SonarScan Results:
  stage: DevOpsSonarStage
  image: servicenowdocker/sndevops:5.1.0
  script:
    - sndevopscli create sonar -url 'https://sonarcloud.io'
 -projectKey 'devsystem2019_TestImportTest'
```

- **url**: [Required] This specifies the Sonar URL.
- **projectKey**: [Required] This specifies the Sonar project key.

Note:
The name of the Sonar step must be same as the job name, which is **ServiceNow DevOps SonarScan Results**.

Limitation

While creating software quality summary results, the MERGE_REQUEST_SOURCE_BRANCH_NAME environment variable will be used for merge pipelines, and DEFAULT_BRANCH will be used for tag pipelines because

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the COMMIT_BRANCH variable isn't available for merge or tag pipelines. For more information, see GitLab documentation.

Register Artifact

Add the artifact custom step at the job level to register an artifact in your ServiceNow instance. For example:

```
stages:
  - artifact

artifact:
  stage: artifact
  image: servicenowdocker/sndevops:5.1.0
  script:
    - sndevopscli create artifact -a
 "[{\"name\":\"Artifact-${JOB_NAME}\",\"repositoryName\":
\"Repo\",\"version\":\"1.${JOB_ID}.0\"}]"
```

You must enter the input values for this custom action as a JSON-formatted string.

-a: [Required] This specifies artifact details.

Register Package

Add the package custom step at the job level to register a package in your ServiceNow instance. For example:

```
stages:
  - package

package:
  stage: package
  image: servicenowdocker/sndevops:5.1.0
  script:
    - sndevopscli create package -n "Package2" -a
 "[{\"name\":\"Artifact-${JOB_NAME}\",\"repositoryName\":
\"Repo\" ,\"version\":\"1.${JOB_ID}.0\"}]"
```

You must enter the input values for this custom action as a JSON-formatted string.

-n: [Required] This specifies the package name.

Get change

Add at job level to get changeRequestNumber from ServiceNow instance with the given changeDetails to identify the change request.

For example:

```
stages:
  - DevOpsGetChange

ServiceNow DevOps Get Change:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  stage: DevOpsGetChange
  image: servicenowdocker/sndevops:5.1.0
  script:
    - sndevopscli get change -p
 "{\"buildNumber\":${CHG_JOB_ID},\"stageName\":\"ServiceNow
 DevOps Change
 Step\",\"pipelineName\":\"GitlabDockerGetAndUpdateChange\"}"

-p: It stands for changeDetails. The change details to be used
 for identifying change request in ServiceNow instance. The
 change details is a JSON object surrounded by curly braces {}
 containing key-value pair separated by a comma ,. A key-value
 pair consists of a key and a value separated by a colon :. The
 keys supported in key-value pair are buildNumber, pipelineName,
 stageName

buildNumber: [mandatory]
This specifies ID of the Job where we have created change
 request.

stageName: [mandatory]
This specifies the Job name where we have created change
 request..

pipelineName: [mandatory]
This specifies the pipeline name.

Outputs:
  sndevopschg.json file created with content: {
    "status": "SUCCESS",
    "changeRequestNumber": "CHGXXXXX"
  }

  changeRequestNumber: Change Request Number found for the given
 change details
  status: To know the status of the Change Request GET.
```

Update change

Add at job level to update change in ServiceNow instance for the changeRequestNumber provided as input along with changeRequestDetails.

For example:

```

stages:
  - DevOpsUpdateChangeStage

ServiceNow DevOps Update Change:
  stage: DevOpsUpdateChangeStage
  image: servicenowdocker/sndevops:5.1.0
  script:
    - sndevopscli update change -n 'CHGXXXXXX' -p
 "{\"short_description\":\"G Venkata12345 Automated
 Software Deployment\",\"description\":\"Automated Software
 Deployment.\",\"assignment_group\":\"XXXXX\",
\"implementation_plan\":\"Software update is tested and results
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 can be found in Test Summaries Tab.\",\"backout_plan\":\"When
 software fails in production, the previous software release
 will be re-deployed.\",\"test_plan\":\"Testing if the software
 was successfully deployed or not\"}"

-n [Not mandatory if we have sndevopschg.json in our pipeline
 yml]: It stands for changeRequestNumber. The change request
 number to identify a unique change request.
   Precedence of choosing changeRequestNumber:
     - changeRequestNumber mentioned in the pipeline yml
     - changeRequestNumber stored in sndevopschg.json.

-p : It stands for changeDetails. The change details to be used
 for Updating the change request information identified by the
 specified change request number with the key-value pairs. The
 change details is a JSON object surrounded by curly braces {}
 containing key-value pair separated by a comma ,. A key-value
 pair consists of a key and a value separated by a colon :. The
 keys supported in key-value pair are short_description, state,
 description, work_notes ..so on

OR
  - sndevopscli update change -p
 "{\"short_description\":\"Updated Automated Software
 Deployment\",\"description\":\"Automated Software
 Deployment.\",\"assignment_group\":\"XXXXXXXXXX\",
\"implementation_plan\":\"Software update is tested and results
 can be found in Test Summaries Tab.\",\"backout_plan\":\"When
 software fails in production, the previous software release
 will be re-deployed.\",\"test_plan\":\"Testing if the software
 was successfully deployed or not\"}"

NOTE: State should be specified at last in case if you are
 update the state of change request.
- sndevopscli update change -p "{\"short_description\":\"Updated
 Automated Software Deployment\",\"description\":\"Automated
 Software
 Deployment.\",\"assignment_group\":\"XXXXXXXXXX\",
\"implementation_plan\":\"Software update is tested and results
 can be found in Test Summaries Tab.\",\"backout_plan\":\"When
 software fails in production, the previous software release
 will be re-deployed.\",\"test_plan\":\"Testing if the software
 was successfully deployed or not\",\"state\":\"3\"}'
```

Auto close change

Incorporate auto close change in ServiceNow instance. For detailed information about auto close, see Configuring DevOps change request details within the pipeline.

For example:

```
stages:
  - changeapproval

ServiceNow DevOps Change Step:
  stage: changeapproval
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  image: servicenowdocker/sndevops:5.1.0
  script:
     - sndevopscli create change -p
 "{\"changeStepDetails\":
{\"timeout\":3600,\"interval\":100},\"autoCloseChange\":true,\"a
ttributes\":{\"short_description\":\"G Venkata Automated
 Software Deployment\",\"description\":\"Automated Software
 Deployment.\",\"assignment_group\":\"xxxxxxxx\",
\"implementation_plan\":\"Software update is tested and results
 can be found in Test Summaries Tab.\",\"backout_plan\":\"When
 software fails in production, the previous software release
 will be re-deployed.\",\"test_plan\":\"Testing if the software
 was successfully deployed or not\"}}"

autoCloseChange: [optional] : Boolean value
```

Security scan results

Add the ServiceNow DevOps Security Scan Results custom step at the job level to retrieve security scan results. For example:

```
stages:
  - DevOpsSecurityScanStageServiceNow

ServiceNow DevOps Security Scan Results:
  stage: DevOpsSecurityScanStageimage
  image: servicenowdocker/sndevops:5.1.0
  script:
      - sndevopscli create securityScan -p
 "{\"pipelineInfo\":{\"buildNumber\":
\"${PIPELINE_ID}\",\"pipelineExecutionUrl\":
\"${PIPELINE_URL}\" },\"securityResultAttributes\":
{ \"scanner\":\"Veracode\",\"applicationName\":
\"PetStoreAPI-Github\",\"buildVersion\":\"\",\"securityToolId\":
\"\"}}"
  -p: [mandatory]It the payload of security result attributes.
 The payload will have attributes as follows:
    buildNumber: PIPELINE_ID (mandatory)pipelineExecutionUrl:
 PIPELINE_URL (mandatory)scanner: Scanning tool and is required
 e.g. Checkmarx One.projectName/projectId: Name/Id of your
 Checkmarx One project and is required. This attribute is
 applicable only for Checkmarx One.applicationName: Name of
 your Veracode application and is required. This attribute
 is applicable only for Veracode.buildVersion": Veracode
 Scan name / build version and is optional. This attribute is
 applicable only for Veracode.scanId: Checkmarx One scan id and
 is optional. This attribute is applicable only for Checkmarx
 One.securityToolId: Security tool onboarded in ServiceNow
 (sys_id of the onboarded security tool) and is optional.
```

Sample pipelines

Example: Sample GitLab pipeline

```

image: servicenowdocker/sndevops:5.1.0
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
stages:
  - pre-build
  - build
  - sonar
  - securityscan
  - changeapproval
  - getchange
  - updatechange
  - deploy

Pre-Build:
  stage: pre-build
  script:
    - echo $JOB_NAME

Artifact and Package:
  stage: build
  script:
    - sndevopscli create artifact -a
 "[{\"name\":\"Artifact-${JOB_NAME}\",\"repositoryName\":
\"TestRepo\",\"version\":\"1.${RUNNER_ID}.0\"}]"
    - sndevopscli create package -n "Test_Package" -a
 "[{\"name\":\"Artifact-${JOB_NAME}\",\"repositoryName\":
\"TestRepo\",\"version\":\"1.${RUNNER_ID}.0\"}]"

ServiceNow DevOps SonarScan Results:
  stage: sonar
  script:
    - sndevopscli create sonar -url 'https://sonarcloud.io'
 -projectKey 'xxxxxxx'

ServiceNow DevOps Security Scan Results:
  stage: securityscan
  script:
    - sndevopscli create securityScan -p
 "{\"pipelineInfo\":{\"buildNumber\":\"${JOB_ID}\",
 \"stageName\":\"ServiceNow DevOps Security Scan
 Results\",\"taskExecutionUrl\":\"${JOB_URL}\" },
\"securityResultAttributes\":{ \"scanner\":\"Veracode\",
\"applicationName\":\"PetStoreAPI-Github\",\"buildVersion\":
\"\",\"securityToolId\":\"\"}}"

ServiceNow DevOps Change Step:
  stage: changeapproval
  variables:
    CHG_JOB_ID: $JOB_ID
  script:
     - echo "CHG_JOB_ID=$CHG_JOB_ID" >> generated_job_id.env
     - sndevopscli create change -p
 "{\"changeStepDetails\":
{\"timeout\":3600,\"interval\":100},\"autoCloseChange\":true,\"a
ttributes\":{\"short_description\":\"G Venkata Automated

Example: Sample Harness pipeline

```
# This is an example pipeline, and your pipeline and container
 configurations may vary from the setup shown here.
# Refer to the pipeline stages for Security, Software, and
 Change configurations.
# Using this YAML file directly will not work as it contains
 several Harness-specific configurations; check the Command
 section present for container steps.

Note:
If you want to add the Sonar Scan Results and Security Scan Results on the same stage, you can use different step names for both the custom actions by updating their default value in the **sonar_step_names** and **security_step_names** fields in the sn_devops_tool_integration_configuration table.

Run health scans for DevOps Change Velocity

Run health check scans on your DevOps Change Velocity instance and get recommendations on fixing any errors that might exist.

Before you begin

Role required: sn_devops.admin

Activate the DevOps Change Health Scan Content Pack application to use this feature. For information on activating a plugin, see Activate a plugin.

About this task

If you are in version (3.0 to 5.0) of DevOps Change Velocity, but you have activated the DevOps Change Health Scan Content Pack application, you can access this feature only from the Classic UI in the ServiceNow AI Platform. For more information on health scans in ServiceNow AI Platform, see Scan checks.

Scan suites are collections of security center checks that execute together. The DevOps Change Velocity Health parent suite contains the DevOps Change Velocity Health - Scheduled and DevOps Change Velocity Health - On-demand suites within it.

You can choose to run the DevOps Change Velocity Health parent scan, which executes all the checks available in the DevOps suite of scans or run each child suite individually which executes the checks applicable to that child suite. Using the DevOps Change Velocity Health - Scheduled child suite, you can create a schedule to regularly trigger DevOps Health instance suite scans even when you don't have an active session. And using the DevOps Change Velocity Health - On-demand suite, you can run the available DevOps Health scan checks on a specific target to obtain focused scan results.

You can also choose to navigate to the Checks list, and run a specific health check scan directly by selecting the check and then selecting **Test Check**. The following checks are available in the DevOps suite.

DevOps suite scan checks

Suite name	Check name	Check description	Resolution details
DevOps Change Velocity Health - Scheduled	DevOps - subflows frequently exceeding execution timeouts	DevOps capability handler subflows have a default time out limit of 45 seconds in the base system. Under normal operating conditions, these timeouts aren't exceeded. When multiple subflows are timing out frequently, it indicates a potential issue.	Increase the timeout value for the subflow that is timing out, in the Integration Capability table. You must have the DevOps Admin role to perform this action.
DevOps Change Velocity Health - Scheduled	DevOps - empty roles in the base system	If any of your base system roles have an empty role reference, it could impact a wide range of DevOps functionality, including the Discover action and event processing.	See the [KB1642669 article for resolution details.
DevOps Change Velocity Health - Scheduled	DevOps - duplicate pipelines	The DevOps data model doesn't enforce uniqueness on key	Delete the duplicate pipeline that does not have any associated

DevOps suite scan checks (continued)

Suite name	Check name	Check description	Resolution details
		records like pipelines, which can lead to intermittent or unpredictable issues. This check identifies duplicate pipeline records in primary DevOps tables, which could cause processing problems if not addressed.	pipeline executions or is not linked to an app.
DevOps Change Velocity Health - Scheduled	DevOps System user access	The devops.system user is used for most server side transaction processing, and in the course of that processing if it cannot access certain key tables the process will fail. Because it's not practical to verify if the user has appropriate access every time it makes a query, the failures tend to manifest indirectly, making them hard and time consuming to diagnose. This check will ensure the devops.system has appropriate access to a specific list of tables required for core product functionality.	Make sure DevOps System user exists. Ensure there are no field level ACLs on sys_connection and credential table
DevOps Change Velocity Health - Scheduled	DevOps - related plugins compatibility	If the plugin versions for applications associated with DevOps Change Velocity are not compatible with the DevOps Change Velocity version in an instance, it might result in various features not functioning correctly. This check identifies if any plugin starting with the name "sn_devops"(excluding	Upgrade the related plugins to the version compatible with DevOps Change Velocity.

DevOps suite scan checks (continued)

Suite name	Check name	Check description	Resolution details
		the sn_devops_pipeline plugin) does not have same version as that of sn_devops_chgvlcty.	
DevOps Change Velocity Health - Scheduled	DevOps - chronically failing or waiting pipelines	If a pipeline is chronically failing or in the waiting state indefinitely, it might cause the DevOps processes to not proceed further. This check identifies pipelines that have failed for the previous ten executions, so that you can take remedial action.	Verify the most recent executions for the pipelines flagged, and investigate inbound events and DevOps error logs tables to help determine the root cause for the failures.
DevOps Change Velocity Health - On-demand	DevOps - incorrectly configured module access policies	If there are missing or incorrectly configured module access policies in your instance, it could impact a wide range of DevOps functionality, including tool connectivity, event processing, pipeline processing, and change creation. Auto-generated module access policies are set to reject by default. This check identifies the module access policies that are configured with the reject result state.	Set the result value of the module access policy for the DevOps application to "Track' to allow the DevOps application to access the credentials. See the [KB1112530] KB article for more details.
DevOps Change Velocity Health - On-demand	DevOps - change control steps with untracked pipelines	If a pipeline has change control enabled but it is not marked for tracking, a change request might not get created when it is run, and the pipeline may get stuck.	Enable tracking for pipelines under change control by selecting the Track option in the tool record page or add the pipeline to an app.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps suite scan checks (continued)

Suite name	Check name	Check description	Resolution details
DevOps Change Velocity Health - On-demand	DevOps - Jenkins plugin compatibility	If the Jenkins plugin version installed in your instance is not compatible with the DevOps Change Velocity version, it might result in Jenkins features not functioning correctly.	Upgrade your Jenkins plugin to the version compatible with DevOps Change Velocity.
DevOps Change Velocity Health - On-demand	DevOps – changes in update set records	If there are modifications in any of the DevOps applications, it could potentially result in updates being skipped or overlooked when upgrading to a newer version. This check scans the update.xml file for DevOps Change Velocity scoped changes.	Before working with update sets, create a standard process for moving customizations. For more information, see the Get started with update sets topic in product documentation.
DevOps Change Velocity Health - On-demand	DevOps - files skipped during upgrade	If any file was skipped during the upgrade process, it could lead to potential issues or an unstable application state. Proactively addressing missing files ensures the upgrade's integrity and prevents unexpected errors or failures.	Manually merge the new updates for the skipped files. See the KB article [KB0952456] for more information.

Procedure

1. Navigate to **Workspaces** > **DevOps Change Workspace**.
2. In the Lists module, select **Health scans** > **Suites**.
3. Select any of the scan suites based on your requirement.
4. Select **Execute suite scan**.

Result

Once the scan is executed, you can view the results and findings of the scan in the Results and Findings lists respectively. A scan result reports the status and type of the scan. You can also see all the checks that ran as part of the scan and all other information related to the scan such as errors and scan logs. A finding is a reference to a record that has violated a rule from a check on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the instance. You can find the source record and the number of times the record triggered the rules of a given check.

Manual configuration mode in DevOps

As an alternative to making a connection using the standard setup process, you can use manual configuration mode to set up a webhook manually.

For example, if you do not have admin privileges for a tool (to allow automatic configuration the webhook URL), you can send an email to the admin of the tool requesting the ServiceNow instance be added to the webhook. Once the instance is added, you can **Enter Manual Configuration Mode** and change the **Connection state** field to Connected (to connect manually).

This way you only need read-only permission to the tool. Once the connection is made, click **Exit Manual Configuration Mode**.

Note:
The **Connection state** field can only be edited in manual configuration mode.

All planning, coding, and orchestration tool connections support manual configuration mode.

Note:
Connection state automatically changes to disconnected if there is a change in configuration, such as URL, credentials, alias, type, or MID Server settings.

Inbound event table data archiving and cleanup

Use table cleaners on the inbound events table to purge event data records beyond a specified period. Configure a retention policy with table rotation on the auto-flush form to manage table size growth and archiving data beyond the specified duration.

Data management

The data management feature allows you to enable archiving and purging of inbound event data. Database rotation and table cleanup configurations are enabled to ensure that eight weeks of event data is retained. Instance performance is preserved using ServiceNow AI Platform features such as Database rotation, table rotation, and table cleanup. A scheduled job is auto-enabled two weeks after you upgrade.

Table rotation on processed inbound events table

The DevOps processed inbound events [sn_devops_processed_inbound_event_list.do] table contains copies of event data from the DevOps inbound events [sn_devops_inbound_list.do] table, that is in state '*processed*' and '*ignored*'.

The processed inbound events table has the table rotation feature enabled. In all, there are eight preconfigured shards, each containing a week's event data from the DevOps inbound event table. By default, once you have 56 days (7 days) (Duration) *8 shards (Rotations) of data in the processed inbound table, table rotation is activated. For more information on applying table rotation, see Apply table rotation

Tip:
To modify table rotation configuration, navigate to **System Definitions** > **Table Rotation** and open the record for DevOps processed inbound events table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs and Table cleaners

Important:
A scheduled job is auto-enabled two weeks after you upgrade . The scheduled job will run every seven days and is deactivated after the last update.

Scheduled jobs activate tables cleaners on the inbound events if either of the following scenarios are met:

- A week after you upgrade, and the processed inbound table has records older than seven weeks.
- Two weeks after you upgrade.

The table cleanup feature for the inbound events table [sn_devops_inbound_table] has two cleaners that are part of the base system upgrade.

1. Table cleaners are activated and run on the inbound events [sn_devops_inbound_table_list.do] for events in the following states.
   - *Processed*
   - *Ignored*

   based on the value specified in the **Age in seconds** field against the value in `sys_created_on` field.
2. Table cleaners are activated and run on the inbound events table [sn_devops_inbound_table_list] for events in the following states.
   - *New*
   - *Retry*
   - *In-progress*
   - *Deferred*

   based on the value specified in the **Age in seconds** field against the value in `sys_created_on` field.

Note:
By default, table cleaners are run on the inbound events table for these states from the time the schedules jobs are activated. The default value in the **Age in Seconds** field is 4,838,400 seconds (56*24*60*60).

Auto-updates to table cleaner frequency

Events in states *processed* and *ignored* are backed up and copied to the processed inbound events [sn_devops_processed_inbound_event_list] table. By default, the process cleaners are auto-updated to an interval of 30 minutes or 1800 seconds, on the inbound events table, if the following conditions are met:

- Two weeks have passed since the scheduled job is active.
- The processed inbound event table has event data older than 7 weeks.

Data archiving rules for DevOps tables

Base system table archiving rules ensure that DevOps data stored in the Configuration Management Database (CMDB) are systematically archived and purged.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Archiving rules for DevOps data in CMDB tables

Data archiving involves managing table size growth and archiving old data. It moves data that is no longer needed every day from primary tables to a set of archive tables. For more information, see Data archiving. Base-system archive rules are configured to auto-archive DevOps tables that are older than a specified period. An archive table is created for any table that has an archive rule associated with it. You can also choose to restore data from archive tables.

Note:
While you can restore any record from the archive tables. Once archived data is restored, the same data is no longer auto-archived. For more information, see Managing archived data.

- Navigate to **System Archiving** > **Archive Rules** and select the individual archive rule whose data you restored.
- Enable the **Auto rearchive** check box, to resume auto-archiving for that archive rule.

Modify base system value for archive rules

You can configure the auto archive duration for all the archive rules that are applicable to DevOps tables from the **Auto archive (in months)** DevOps system property. By default, this property's value is set to 9 (months). Navigate to **DevOps** > **Administration** > **Properties** > **Auto archive (in months)**, to modify the value. For more information on configuring data archiving, see Create an archive rule

The following list indicates the tables that are auto-archived.

Auto-archived DevOps tables

Table	Table Name	Archived table name
Artifact Staged Request	sn_devops_artifact_staging	ar_sn_devops_artifact_staging
Artifact Version	sn_devops_artifact_version	ar_sn_devops_artifact_version
Branch	sn_devops_branch	ar_sn_devops_branch
Build Test Result	sn_devops_build_test_result	ar_sn_devops_build_test_result
Build Test Summary	sn_devops_build_test_summary	ar_sn_devops_build_test_summary
Callback	sn_devops_callback	ar_sn_devops_callback
Commit	sn_devops_commit	ar_sn_devops_commit
Commit Details	sn_devops_commit_details	ar_sn_devops_commit_details
Deployed Artifact to TaskExecution	sn_devops_m2m_artifact_execution	ar_sn_devops_m2m_artifact_execution
Artifact Version to Commit	sn_devops_m2m_artifact_version_commit	ar_sn_devops_m2m_artifact_version_commit
Branch To Commit	sn_devops_m2m_branch_commit	ar_sn_devops_m2m_branch_commit
Run Commit	sn_devops_m2m_commit_execution	ar_sn_devops_m2m_commit_execution
Commit To Work Item	sn_devops_m2m_commit_work_item	ar_sn_devops_m2m_commit_work_item
Pipeline Execution	sn_devops_pipeline_execution	ar_sn_devops_pipeline_execution
Software Quality Scan Summary	sn_devops_software_quality_scan_summary	ar_sn_devops_software_quality_scan_summary

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Auto-archived DevOps tables (continued)

Table	Table Name	Archived table name
Software Quality Scan Summary Relations	sn_devops_software_quality_scan_summary_relations	ar_sn_devops_software_quality_scan_summary
Step Execution	sn_devops_step_execution	ar_sn_devops_step_execution
Tag	sn_devops_tag	ar_sn_devops_tag
Task Execution	sn_devops_task_execution	ar_sn_devops_task_execution
Task Summary	sn_devops_test_summary	ar_sn_devops_test_summary
Test Summary Relations	sn_devops_test_summary_relations	ar_sn_devops_test_summary_relations
Work Item	sn_devops_work_item	ar_sn_devops_work_item

The data archiving rules feature considers and honors parent rules before individual archive rules are run. If you have an associated parent archive rule, the child rules are run only when the parent rules are run. Similarly, when you modify individual rules, you must first disable or disassociate the parent archive rule, make the configuration changes, and re-enable the parent archive rule. Changes to the **Auto archive (in months)** DevOps property overrides any configuration changes made to the duration of child archive rules. For example, you could update the archive rule condition for any of the **Active** DevOps archive rules to a custom value, say three months instead of the default 9 months. However, if you modify the **Auto archive (in months)** DevOps property, all modifications made to the conditions of individual archive rules are overwritten by the value in the **Auto archive (in months)** system property.

Note:
The override function is binding for all scenarios except:

- When an archive rule does not belong to the DevOps scope.
- When an archive rule belongs to the DevOps scope but is inactive.

Base system destroy rules for DevOps data

Base-system destroy rules are also enabled and activated on all the archived DevOps tables. By default, data is deleted from an archived table after 36 months or 1095 days have passed from the time the data is stored in the archive table. For more information, see Create a destroy rule.

DevOps Retry Policy

Enable the DevOps Custom HTTP Retry Policy for most tool communication from ServiceNow flows to automatically retry failed requests when a step encounters an intermittent issue, such as a network failure or request rate limit.

You can navigate to the action in **Flow Designer > Designer > Actions** and in the REST step, select **Enable Retry Policy**. For the DevOps Custom HTTP Retry Policy to take effect, override the default policy for the alias and select the DevOps retry policy.

To customize the retry configuration, access the DevOps Custom HTTP Retry Policy settings in **IntegrationHub > Retry Policy**.

Commits and task executions in DevOps

Run commits in DevOps are associated to a task execution.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a commit to show up as a run commit, the commit record must exist in ServiceNow prior to the job/pipeline run.

In the event that jobs are rerun on the same commit, these conditions apply.

- Azure DevOps doesn't show any run commits.
- GitLab displays only the last commit as a run commit.
- Jenkins displays only the last commit as a run commit on which it was run. The difference of all commits isn't shown.

Multiple commits in a single payload (commit arrays) have these limitations.

Tool	Max commits per payload
Azure DevOps	• If the DevOps property **Enable whether Azure DevOps Run Commits must be determined from the last successful pipeline build** is enabled, DevOps Change will pick up the last commits, up to a maximum of 2000, created after the last successful pipeline build from Azure DevOps as part of Run Commits. • If disabled, only the last 200 commits will be considered for Run Commits.
GitHub	• If the DevOps property **Enable whether GitHub Run Commits must be determined from the last successful workflow run** is enabled, DevOps Change will pick up the first 2000 commits after the last successful workflow run in GitHub as part of Run Commits. • If disabled, only the last commit will be picked up for Run Commits.
GitLab	20

Associating multiple work items to a commit in DevOps

Multiple work items for a commit are supported in DevOps for Azure DevOps, Bitbucket, GitHub, and GitLab.

Work item syntax in the commit message can be customized to reflect the processes in your organization using the DevopsCommitMessageParserSNC script include in the **System Definition > Script Includes** module.

In order to link the commits with work items, the work item native ID is extracted from the commit message. In the base system, DevOps supports following commit message formats:

```
/**
     * Supported patterns
     * Colon pattern
         * Sample supported formats:
             *   1. STRY1,STRY2: Additional bug fixes
             *   2. STRY1 , STRY2 : Additional bug fixes
             *   3. STRY1, STRY2 : Additional bug fixes
     * Hash pattern
         * Sample supported formats:
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            *   1. Fixes for #STRY1, #STRY2, #STRY3
            *   2. Fixes @$#3 and #1 work item
            *   3. Fixes for #STRY1 #STRY2 #STRY3
            *   4. Fixes for AB#123
    * Jira pattern
        * Sample supported formats:
            *   1. JRA-123 fixed
            *   2. JRA-123 JRA-234 JRA-345 resolved
    */
```

If you want to add support for additional message formats to meet the processes in your organization, you can add a custom logic in the `DevopsCommitMessageParser` script include by navigating to the **System Definition > Script Includes** module. `DevopsCommitMessageParser` script include extends from `DevopsCommitMessageParserSNC`. The `DevopsCommitMessageParserSNC` has three regular expressions defined for identifying work item native IDs for supported message formats in the base system. See the following example to include a new custom message format that has work item native IDs in square brackets.

```
var DevopsCommitMessageParser = Class.create();
DevopsCommitMessageParser.prototype =
 Object.extendsObject(DevopsCommitMessageParserSNC, {
    initialize: function() {

 DevopsCommitMessageParserSNC.prototype.initialize.call(this);
        this._customPattern = /\[(.*?)\]/g; // The regex pattern
 to match the words written inside square brackets.
        // Example commits message to match this custom pattern
 is : "[STRY1], [STRY2] Additional bug fixes"
    },
    getWorkitemsFromCommitMessage: function(message, branchName)
 {
        var workitems = [];
        // We first call the getWorkitemsFromCommitMessage
 method from the parent class to get the matching workitems ids
 for OOB formats
        var defaultWI =
 DevopsCommitMessageParserSNC.prototype.getWorkitemsFromCommitMe
ssage.call(this, message, branchName);
        if (!gs.nil(defaultWI) && defaultWI.length > 0) {
            workitems = workitems.concat(defaultWI);
        }
        // Now call your custom method that returns an array of
 workitem native IDs matching custom pattern
        var customWI = this.getWIFromCustomPattern(message);
        if (!gs.nil(customWI) && customWI.length > 0) {
            workitems = workitems.concat(customWI);
        }
        // getUniqueWorkItems method from parent class removes
 duplicates from the workitems array
        workitems = this.getUniqueWorkItems(workitems);
        // return the final list
        return workitems;
    },
    getWIFromCustomPattern: function(message) {
        var wi = [];
        var l;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        var match;
        var matches = message.match(this._customPattern);
        if (gs.nil(matches))
            return wi;
        for (var i = 0; i < matches.length; i++) {
            l = matches[i].length;
            match = matches[i].substring(1, l - 1); // trim the
 brackets
            wi.push(match);
        }
        return wi;
    },
    type: 'DevopsCommitMessageParser'
});
```

Filter ignorable DevOps events

Filter out ignorable DevOps events before they trigger a Flow execution to improve performance.

Azure DevOps and GitHub tool integrations have a filtering mechanism that determines if any incoming event can be ignored before it causes a Flow to be triggered. Both the integrations have their own filters, which may be deactivated or overridden to alter the filtering criteria. These filters check whether the tool is connected, referenced object is tracked and is present in the system.

You can activate or deactivate these filters.

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points** and search for DevOps.
2. Select **sn_devops.DevOpsEventFilterAPI**.
3. From the **Extension Instances** section under **Related links**, select the extension instance of the tool for which you want to activate or disable the filter.
4. Select the **Active** check box to enable the filter.

   By default, the check box is selected. If you want to disable the filter, clear the check box.

Disable recommendation prompts

Disable the prompts recommending the use of DevOps Change Workspace from appearing while creating tools and applications using Classic UI, Service Catalog, Service Portal, and Employee Service Center.

1. Navigate to **All** > **Service Catalog** > **Catalog Definitions** > **Maintain Items** and search for DevOps.
2. For each of the following 4 DevOps catalog items, you must edit the catalog client scripts to comment out the call to `showWorkspaceAdvertisement`.
   - Create DevOps Application
   - Create DevOps tool
   - DevOps App Onboarding
   - DevOps Tool Onboarding
3. Select each DevOps catalog item listed earlier and navigate to the **Catalog Client Scripts** tab under **Related Links**.
4. Select each script available under **Catalog Client Scripts**.
5. Search for the method `showWorkspaceAdvertisement`.
6. If present, comment it out.

   For example, `//showWorkspaceAdvertisement();`.

7. Save the changes.

DevOps Insights reports

To help you plan and implement updates to your DevOps processes, DevOps Insights displays a variety of configurable reports that are grouped by type of metric. From the DevOps Change Workspace, select the DevOps Insights icon ( ) to view the reports.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps Insights

Analyze operational and business reports and to determine the overall efficiency#and growth of your#development processes.

- Monitor activities, KPIs, and metrics in a central dashboard.
- Track performance over time.
- View summary data broken out by bug, epic, feature, "other", story, or task.

Mining and analyzing the metrics

Each report provides both a summary of an important business metric and access to more detailed information about the metric.

- By default, many reports display data for the last 30 days. Select the **Date** icon ( ) to configure a custom date range.
- Point to a specific data point in a chart to view detailed data.
- Select a specific data point to view the key performance indicator (KPI) details for the report in a separate tab. You can then use the powerful data-management tools in the Performance Analytics application to drill deeply into the data.
- To apply any filter other than the date filter, select the filter icon and then move filter categories from the **Available** list to the **Applied** list.
- Filters appear at the top of the tab. For each report, the Applied filter icon ( ) displays the number of filters that are currently applied to a report. Select the icon to view and configure the filters that are applied to a widget.

Schedule of data collection

You must enable the daily data collection job to populate the dashboards with new DevOps data coming in from the connected third-party tools.

1. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.
2. Configure the *[DevOps] Daily Data Collection* job to run as system admin.

> **Note:**
> *[DevOps] Daily Data Collection* job is active by default and configured to run as admin user.

Run the *Load Change Request Repo Detail* scheduler script and *[DevOps] Historical Data Collection* job for historical data:

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Execute the *Load Change Request Repo Detail* scheduler script.

   This job populates the Change Request Repo Detail table [sn_devops_insights_change_request_repo_detail] if you import demo data after installing the DevOps Insights application.

   If you're installing demo data along with the DevOps Insights application, then there's no need to run this job. You can directly run the *[DevOps] Historical Data Collection* performance analytics job to see scores.
3. Navigate to **All** > **Performance Analytics** > **Data Collector** > **Jobs**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Execute the *[DevOps] Historical Data Collection* job to run as system admin.

   The execution time depends on the volume of data. This is a one-time task to collect historical DevOps data, and not meant to be on a schedule.

   Tip:

   Based on the time taken to complete this job, plan on running it during a period of low usage.

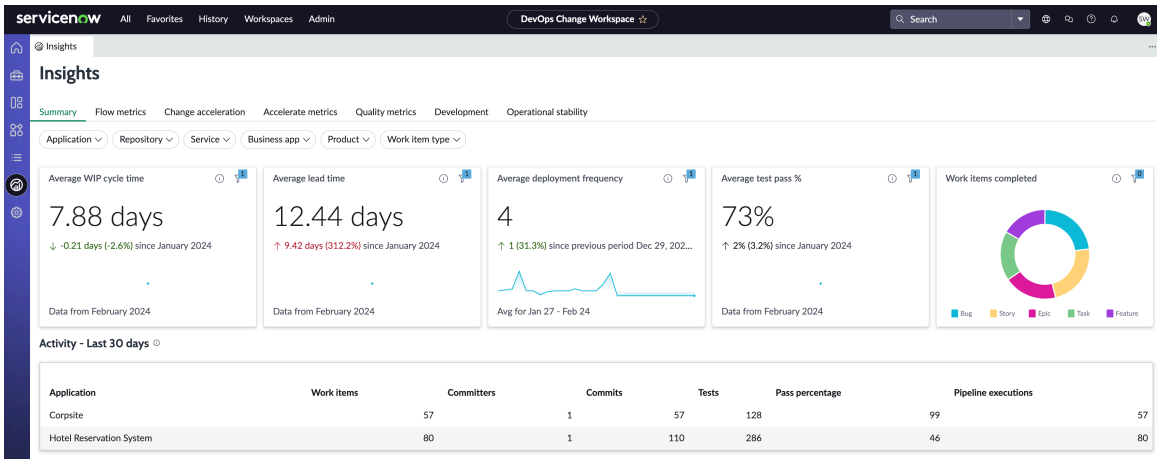
DevOps Insights dashboard - Workspace

The DevOps Insights dashboard provides a flexible graphical view of operational and business reports. Use the dashboard to evaluate the results of your overall DevOps process.

Summary dashboard

The DevOps Insights Summary dashboard enables an overview of key metrics across various categories from accelerate to quality metrics along with a quick glance of the most active applications.

Summary reports



Report	Description	Source
Average WIP cycle time	Average time in days that a work item is in the WIP state before completion.	Calculation: Time to complete WIP items divided by the number of completed work items
Average lead time	Daily average lead time for prod deploy pipeline executions.	Calculation: Sum of successful prod deploy lead times divided by the number of successful production pipeline executions.
Average deployment frequency	Average number of successful production deployments.	Step execution

Flow metrics reports

Report	Description	Source
Average flow time	Average time, in days, that a work item spent from the created state to step execution end time of a successful prod pipeline deployment.	Database view joined by work item, metric instance, commit work item, commit, commit execution, step execution, step, pipeline, app, and application product detail.
Average WIP cycle time	Average time in days that a work item is in a specific state.	Database view joined by Work Item, Metric Instance, Commit, Step Execution, Commit execution, and Commit work item lists.
Average WIP count	Average number of work items that are WIP during the last 30 days.	Average count of Work Items with State set to Work In Progress.
Work items completed	Number of work items in the complete state that are associated to commits through a successful production pipeline deploy in the last 30 days.	Average count of Work Items associated to Step Execution type set to Prod deploy. This requires commit to work item association as only work items deployed through a pipeline are in production.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Flow metrics reports (continued)

Report	Description	Source
	Note: Filters don't apply for this chart.	
Average work item cycle time	Average time in days that a work item is in a specific state.	Database view joined by Work Item, Metric Instance, Commit, Step Execution, Commit execution, and Commit work item lists.
Throughput and distribution	Number of work items, by type, that are associated to commits through a successful production pipeline deploy.	Database view joined by Work Item, Metric Instance, Commit, Step Execution, Commit execution, and Commit work item lists.
Average planned to deploy flow time	Average duration from the time that a work item associated to a commit was created to the time that the item was successfully deployed to production through pipelines.	Database view joined by Work Item, Metric Instance, Commit, Step Execution, Commit execution, and Commit work item lists.
Work in progress	Number of work items that are currently in the work in progress state.	Database view joined by Work Item, Metric Instance, Commit, Step Execution, Commit execution, and Commit work item lists.

Change acceleration dashboard

The DevOps Insights Change acceleration tab displays change acceleration metrics that focus on your path to automation, comparing automated changes to manual changes, change policy decisions, and ROI. You can use this information to verify that automated change requests are being resolved more quickly than manually approved change requests.

Change acceleration reports

Change requests that are part of step executions qualify as DevOps change requests.

Change acceleration reports

Report	Description	Source
DevOps change volume	Number of DevOps change requests created.	Database view joined by Step Execution, Change request, and change request repository.
Time to close changes	Average time in hours to close DevOps changes by application. For each month, this is the average for (Time that change	Database view joined by Step Execution, Change request, and change request repository.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change acceleration reports (continued)

Report	Description	Source
	request was closed) minus (Time that change request was opened).	
Automated vs manual changes	Comparison between the numbers of DevOps change requests using change approval policies and DevOps change requests requiring manual approval. • A change request is considered automated when a change policy performs the approve/reject action. • A manual change is any change request that is assigned to a user or group for the approve/reject action and isn't acted on by a change policy.	Database view joined by Step Execution, Change request, and change request repository.
Changes awaiting approval	Number of DevOps changes that are pending approval by date range. By default, change requests in the New or Assess state are considered awaiting approval. To specify the states that are considered awaiting approval, update the *Change Request Awaiting States* property setting. For details, see DevOps Insights properties.	Database view joined by Step Execution, Change request, System properties, and change request repository detail lists.
Change policy decision: auto-accept	The number of change policy decisions by decision type that automatically accept change requests. Point to a value on the chart to view the list of policy decisions that were used for auto-approval and the number of times that a decision was used for auto-approval.	Database view joined by Step Execution, Change request, System properties, and change request repository detail lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change acceleration reports (continued)

Report	Description	Source
Change policy decision: auto-reject	The number of change policy decisions by decision type that automatically reject change requests. Point to a value on the chart to view the list of policy decisions that were used for auto-rejection and the number of times that a decision was used for auto-rejection.	Database view joined by Step Execution, Change request, Policy applied, Auto approval rejection action, Change approval definition, and change request repository detail lists.
Change acceleration savings	Net amount saved per month by automating DevOps changes. When a change is automated, a developer doesn't have to manually fill out the change request and associate each work item, code commits, test results and other evidence and artifacts to the change. After this activity is automated, hours that would have been spent on filling out the change, searching, tracking down and attaching items from other tools to a change, will now be saved. More work items require a relatively increasing number of hours to associate them manually. Therefore, higher numbers of work items should result in more hours saved after the change is automated. Change acceleration savings are calculated by multiplying the hours saved by the average hourly developer cost. To change the default value of the average hourly developer cost, update the *`Average Hourly developer Cost`* property setting. For details, see DevOps Insights properties.	Calculation: Average hourly developer cost multiplied by developer hours saved.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

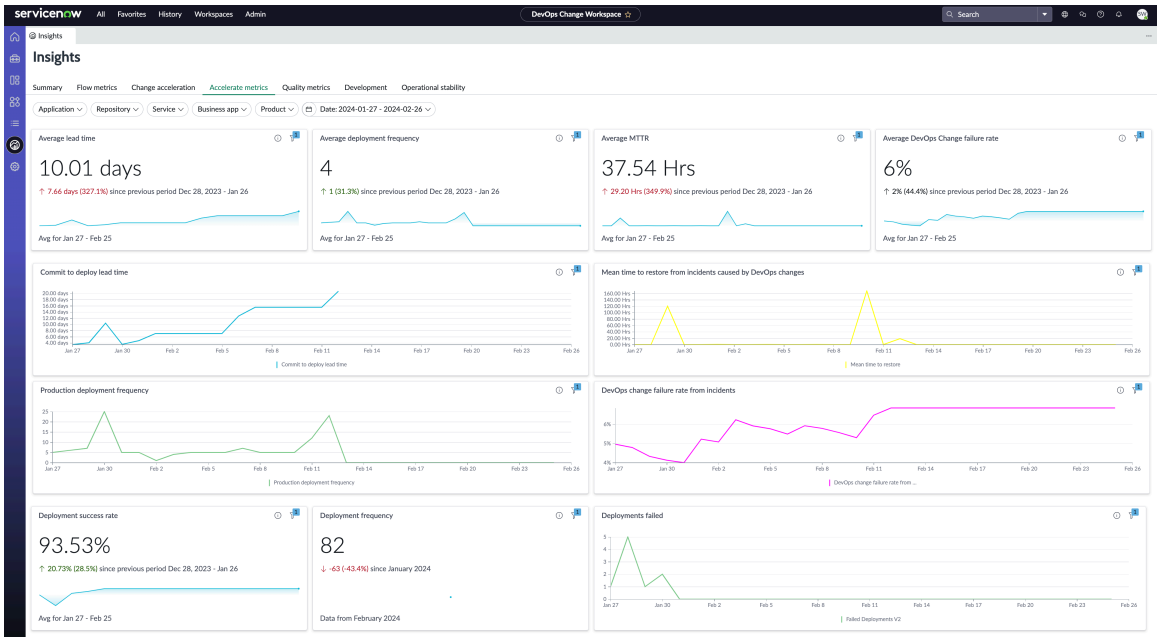
Change acceleration reports (continued)

Report	Description	Source
Developer hours saved	Number of developer hours saved per month by automating DevOps changes. To change the default value of 1 (one) hour per developer, update the *`X hours per Developer time`* property setting. For details, see DevOps Insights properties.	Calculation: Number of work items in a change request multiplied by 1 hour per developer.

Accelerate metrics dashboard

The DevOps Insights Accelerate metrics are four key DevOps metrics that measure software delivery performance. Deployment frequency and lead time measure DevOps speed, while change failure rate and mean time to recovery are used to measure stability.

Accelerate metrics reports



Accelerate metrics reports

Report	Description	Source
Average lead time	Average of: ([Time the code is successfully pushed to production] minus [Earliest commit time]) Applies to pipeline steps of type **Prod Deploy** that are in the completed state.	Pipeline execution

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accelerate metrics reports (continued)

Report	Description	Source
	Note: This widget uses average aggregation and doesn't support multi-element selection.	
Average deployment frequency	Average number of successful production deployments. Applies to pipeline steps of type **Prod Deploy** that are in the completed state.	Step execution
Average MTTR	Average resolve time for an incident caused by a DevOps change. **Note:** This widget uses average aggregation and doesn't support multi-element selection.	Database view joined by Incident, Change Request, Step Execution, Step, Pipeline, and App lists.
Average DevOps change failure rate	Daily average ratio of DevOps change requests that are associated to an incident divided by all DevOps change requests. **Note:** This widget uses formula and doesn't support multi-element selection.	Change request
Commit to deploy lead time	Duration from the earliest commit time to production deployment for a successful pipeline execution. The value includes only steps of type **Prod deploy** that are in the completed state. You might investigate high lead times by identifying the slowest pipeline steps. For example, a manual change approval process could increase lead time.	Calculation: Sum of successful prod deploy Lead times divided by the number of successful production pipeline executions. Needs 'Commits to Task Execution' association. Both Repository and Pipeline must be tracked and associated to the same App. Needs Step type to be Prod Deploy. Needs Task Execution result to be Successful.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accelerate metrics reports (continued)

Report	Description	Source
Mean time to restore from incidents caused by DevOps changes	Daily average time to resolve an incident that was caused by a DevOps change.	Database view joined by step execution, change request, change request repository detail, and incident lists. Calculated only for DevOps incidents by considering incident opened and closed time.
Production deployment frequency	Number of successful production deployments. The value includes only pipeline steps of type **Prod deploy** that are in the completed state. To change the default value of 30 days, update the **Date range** setting.	Database view joined by Change Request, Step Execution, change request repository detail. Needs Step Execution state to be Completed. Needs Step type to be Prod Deploy.
DevOps change failure rate from incidents	Percentage of DevOps changes that caused incidents divided by all DevOps changes deployed to production. If a change request caused multiple incidents, then only the change that caused or triggered the incident is considered. The number of incidents that the change caused isn't considered.	Needs DevOps Change Request (Change associated to a Step Execution). Needs Step Execution state to be Completed. Needs Step type to be Prod Deploy. Needs Incident caused by to be DevOps Change Request.
Deployment Success Rate	Deployments success rate over the last 30 days. Deployment Success Rate = (Number of Successful Deployments in the last 30 days / Total Number of Deployments in the last 30 days) * 100 Applies to steps of type **Prod Deploy** in completed state.	Step Execution

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Accelerate metrics reports (continued)

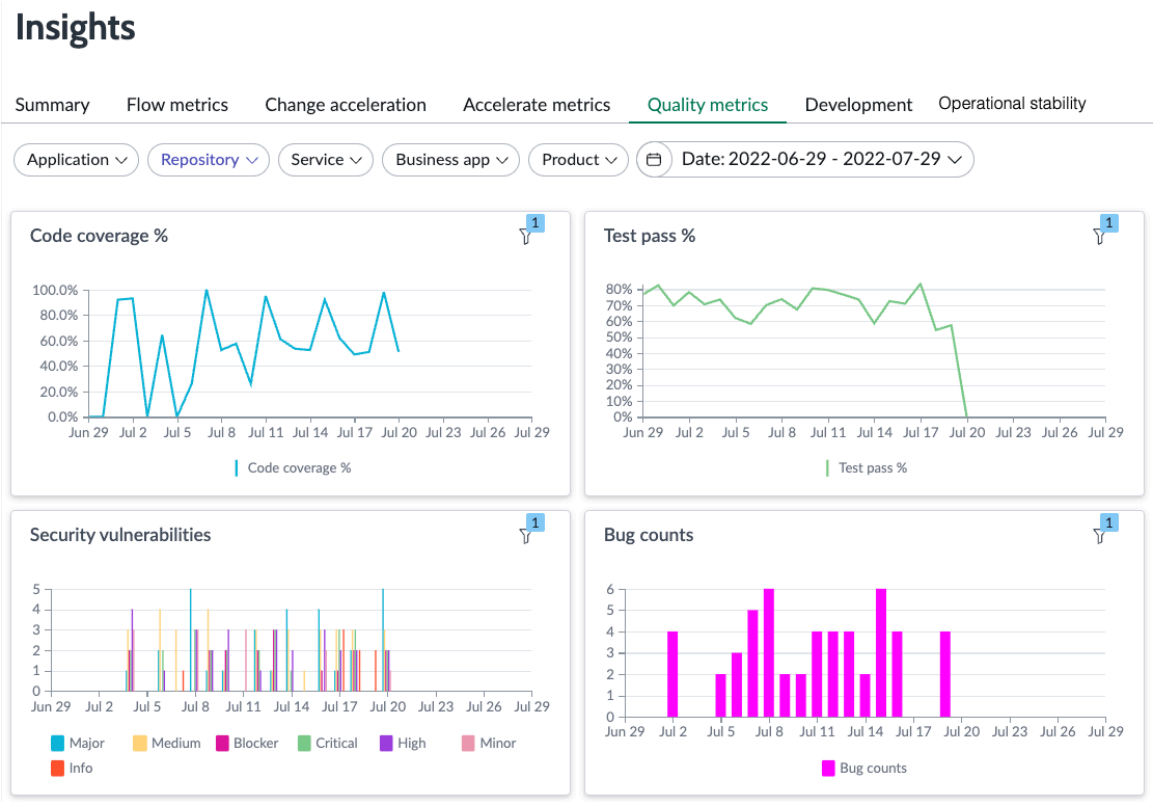
Report	Description	Source
	Note: This widget uses formula and does not support multi-element selection.	
Deployment Frequency	Number of successful production deployments in the last 30 days. Applies to steps of type **Prod Deploy** that are in completed state.	Step Execution
Deployments failed	Number of failed production deployments in the last 30 days. Applies to steps of type **Prod Deploy** that are in failed or user-canceled state.	Step Execution

Quality metrics dashboard

The DevOps Insights Quality metrics dashboard enables a quick glance at data from tools such as SonarQube for code coverage, test pass percentage from your orchestration tools, vulnerabilities from security tools, and even overall bug counts.

Quality metrics reports

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Quality metrics reports

Report	Description	Source
Code coverage %	Percentage of code that is covered by testing.	Needs Software Quality Scan Detail with Category = Coverage (%) Needs Software Quality Scan Summary Relations related to Task Execution
Test pass %	Test pass percentage.	Needs Test Summary related to Task Execution
Security vulnerabilities	Count of security vulnerabilities over time.	Needs Software Quality Scan Detail with Category = Vulnerabilities Needs Software Quality Scan Summary Relations related to Task Execution.
Bug counts	Number of work items of type bug.	Needs *Commits to Work Items* association. Both Repository and Plan must be tracked and associated to the same app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Quality metrics reports (continued)

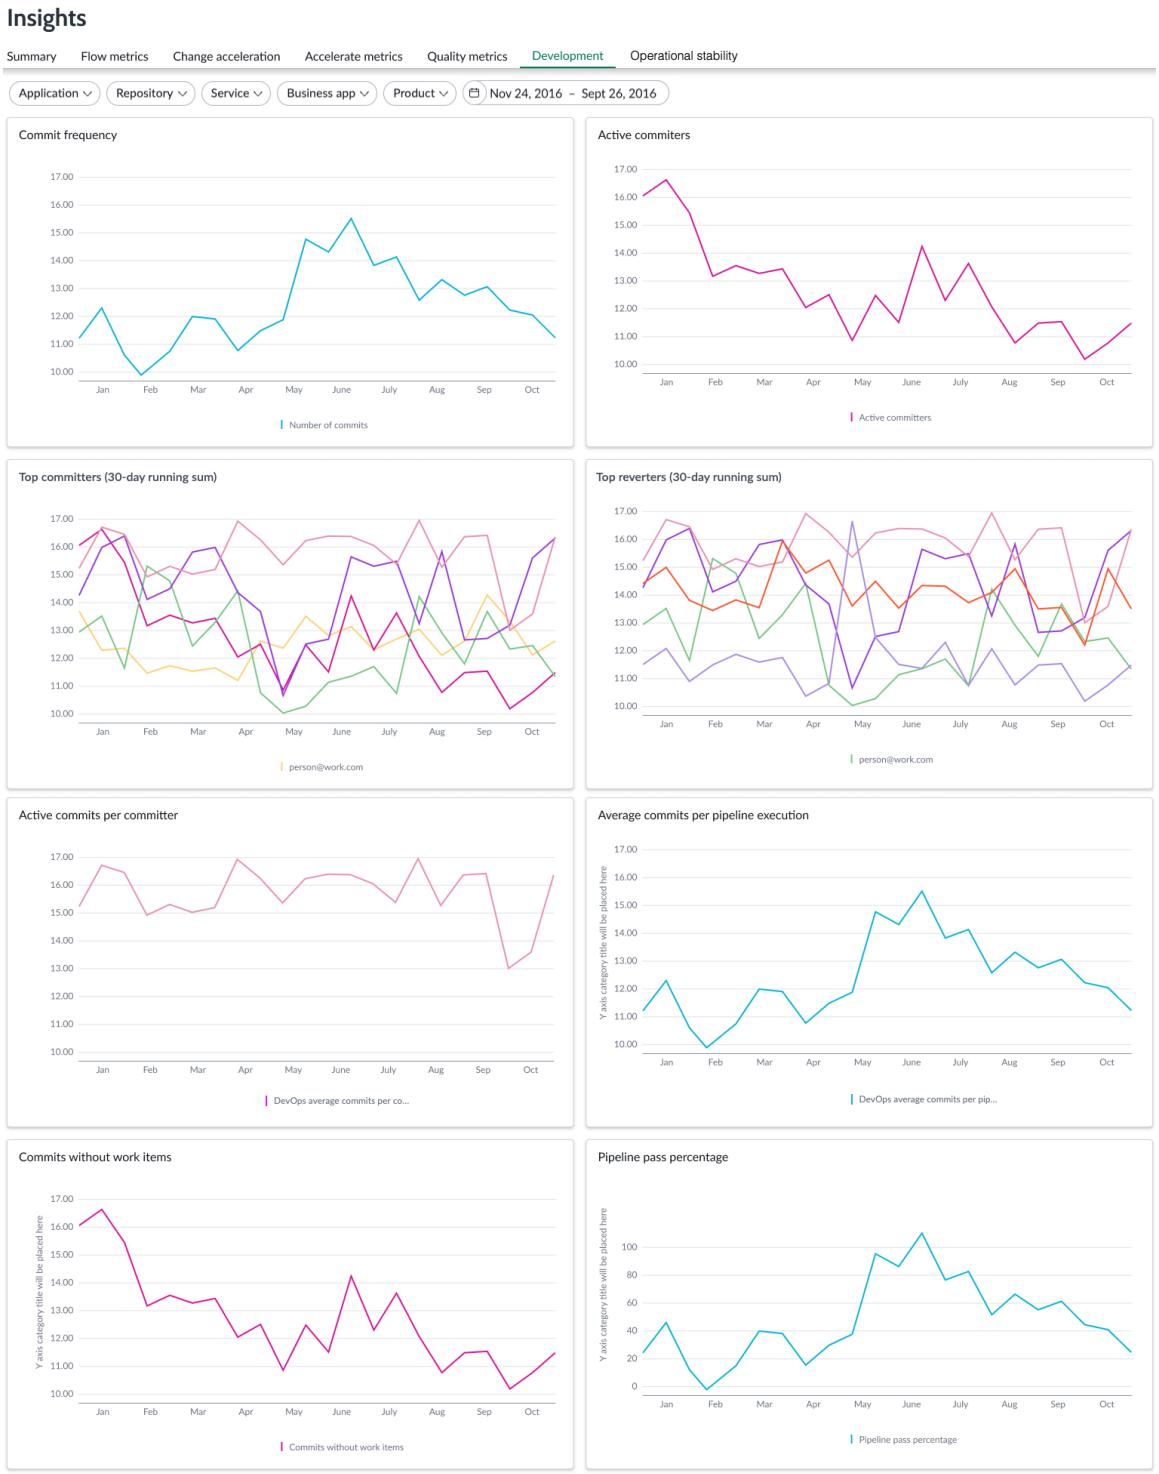
Report	Description	Source
		Needs *Commits to Task Execution* association. Both Repository and Pipeline must be tracked and associated to the same App Needs Work Item to be of type Bug.

DevOps Insights Development dashboard

Development metrics focus on commit data that provides insights into how active and agile your teams are. With this information, you can reach full traceability of work by ensuring that commits are being tagged with the appropriate work items.

Development reports

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Development reports

Report	Description
Commit frequency	Number of commits associated to pipeline executions. Smaller, more frequent commits are preferred over larger less frequent commits.
Active committers	Number of committers that submitted commits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Development reports (continued)

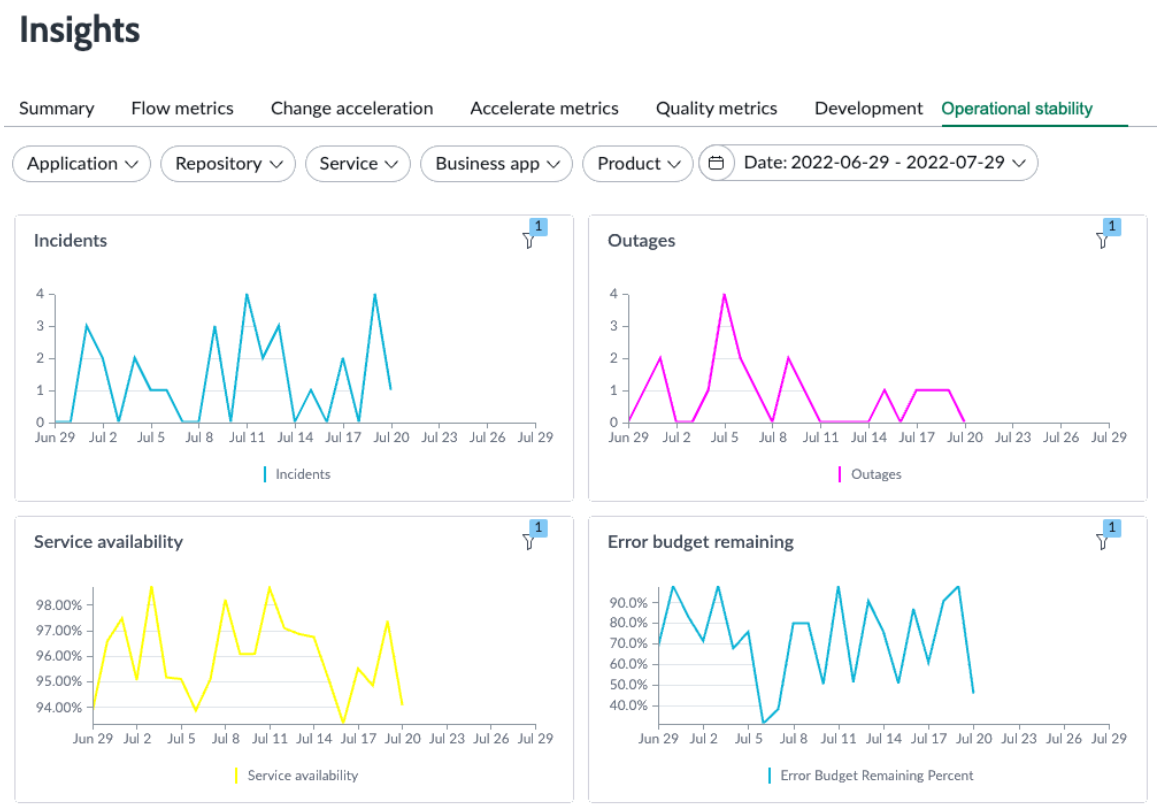
Report	Description
	Because this report uses metric aggregation, it doesn't support multi-element selection.
Top committers (30-day running sum)	Committers with the highest number of commits.
Top reverters (30-day running sum)	Committers with the highest number of reverts.
Average commits per committer	Average calculated as: `(total number of commits)/(active committers)`. A higher value is more favorable. Because this report uses metric aggregation, it doesn't support multi-element selection.
Average commits per pipeline execution	Average commits per pipeline, calculated as (Total number of commits)/(Number of pipeline executions). A low number is preferable, which indicates a concentrated effort, versus switching from task to task without completion. Because this report uses metric aggregation, it doesn't support multi-element selection.
Commits without work items	Commits made that aren't associated to a work item, grouped by committer. This report is useful for investigating and resolving why a commit isn't tied to a work item, because all commits should be tied to a work item.
Pipeline pass percentage	Ratio of successful pipeline executions divided by total number of pipeline executions.

DevOps Insights Operational stability dashboard

Operational metrics reflect on the stability of your applications to enable you to ensure that your teams are moving fast without compromising release quality.

Operational stability reports

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Operations stability reports

Report	Description	Source
Incidents	Number of incidents for pipeline steps of type Prod deploy that are linked to a service in the CMDB.	Needs Step type to be Prod Deploy. Needs Incident associated to a Service that matches the one in the prod deploy Step.
Outages	Number of outages for pipeline steps of type Prod deploy that are linked to a service in the CMDB.	Needs Step type to be Prod Deploy. Needs Outage (cmdb_ci_outage) associated to a Service that matches the one in the prod deploy Step.
Service availability	Average service availability for pipeline steps of type Prod deploy that are linked to a service in the CMDB.	Needs Step type to be Prod Deploy. Needs parent Service Offering associated to a Service that matches the one in the prod deploy Step.
Error budget remaining	Percentage of error budget left to spend in a month, for	Needs Step type to be Prod Deploy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operations stability reports (continued)

Report	Description	Source
	pipeline steps of type Prod deploy that are linked to a service in the CMDB. This data is from the Site Reliability operations application. An error budget is the amount of Service Level Objective (SLO) that you can spend over a specified time. It can be used to manage release velocity. It's typically based on availability, latency, and so on.	Needs parent Service Offering associated to a Service that matches the one in the prod deploy Step. Needs SRO application.

Group DevOps applications into a product

Products that use an application model in the CSDM support hierarchies of applications. You can customize hierarchies to simplify tracking of "rolled-up" data on DevOps Insights reports. This is used for the Product filter in insights.

Before you begin

Role required: application owner, sn_devops.admin

About this task

For example, you can include multiple DevOps microservice applications into a product, include multiple such products into a portfolio, and then include ("roll up") the portfolio in an organization. Another example structure might be **application > team > product > portfolio or business unit**.

- A DevOps application can belong to one or multiple products.
- A product or multiple products can belong to one or multiple other products.
- Multiple applications and products can belong to a product.

For every product, the system creates a corresponding entry in the application model and SDL component tables.

Important:
To add an application to a product, the application must hold execution data. For a newly added application, therefore, you must wait until the data import job has run.

Procedure

1. Create applications as described in Create an application - Workspace.
2. Open the application models table: `<instanceName>/cmdb_application_product_model_list.do` and then follow this procedure to configure each application that will be included in a product.
   a. In the Application models list, select the application model to open the record.
   b. On the Application model form, in the **Model categories** field, select the appropriate category.
   c. Save the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Follow this procedure to create a product that will act as a parent.
   a. In the Application models list, select **New**.
   b. On the Application model form, in the **Name** field, enter the name of the product.
   c. In the **Model categories** field, select **Bundle**.
   d. **Optional:** Enter a short description.
   e. Save the record.
4. Open the Model category of component table (`<instanceName>/cmdb_m2m_model_component_list.do`) to specify the category of each application (the application is the component in this case).
5. For each application, select **New**, specify the following settings, and then submit the record.

Model component form

Field	Description
Model category of component	The **Model categories** value that you specified for the application on the Application model form.
Component	The application.
Bundle	The product that will act as a parent of the application.

The application is now a member of the specified product.

Result

The DevOps Insights tabs provides filters for the reports.

- The scheduled "Data collection" job processes your changes. When the job finishes, you can view reports for the added products. If you are running the job manually, execute the "Update Repo Details and Work Item State Detail" job before executing the Data collection job.
- The **Application** filter lists all applications.
- The **Product** filter lists all applications plus all products.
- To view the members of a product, view the list in the Model category of component table (`<instanceName>/cmdb_m2m_model_component_list.do`). Applications are listed in the **Component** column and products are listed in the **Bundle** column.

DevOps Insights properties

DevOps Insights properties configure how DevOps Insights workspace data is displayed in reports.

Role required: sn_devops.admin

You can view the Insights properties from the DevOps Change Workspace by navigating to **Workspaces** > **DevOps Change Workspace** > **System configuration** > **Insights properties**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with DevOps Insights

Property	Description	Default
X hours per Developer time	The time taken per developer to work on a single work item in hours. This value is used to calculate the Developer hours saved report. For example, for every work item associated to a change request, a developer saved X hours in having to associate the work items, commits, test results, and other related DevOps data for their work.	1
Change Request Awaiting States	The states that are reported as awaiting a change request in the Changes awaiting approval report. Use the following values for the other states: • New: -5 • Assess: -4 • Authorize: -3 • Schedule: -2 • Implement -1 • Review: 0 • Closed: 3 • Canceled: 4	-5, -4
Average Hourly Developer Cost	The average hourly cost of a developer working on DevOps changes in the selected currency. This value is used to calculate the Change acceleration savings report, where we multiply the Developer hours saved by this developer cost to estimate an ROI.	100

DevOps Change Velocity reference

Reference information to provide additional details about DevOps Change Velocity such as tables, users, roles, properties, errors, limitations, and others.

Components installed with DevOps Change Velocity

Several types of components are installed with DevOps Change Velocity, including tables, users, roles, and scheduled jobs.

Demo data is available for this application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Users installed

User	Description
devops.integration.user	DevOps Integration User **Note:** You must configure the password before the DevOps Integration User can configure a tool.
devops.system	DevOps System user

Roles installed

Role title [name]	Description	Contains roles
DevOps Administrator [sn_devops.admin]	Sets up and configures the DevOps application. Only the DevOps Administrator has access to the Administration module. **Note:** To ensure that the devops.system user has correct access, add the sn_devops.admin role to the field-level ACL (sys_connection.*) if a field-level ACL exists on the sys_connection table or include the connection_admin role in the sn_devops.admin role.	• sn_devops.app_owner • sn_devops.integration • sn_devops.tool_owner • action_designer If the DevOps Change Health Scan Content Pack application is installed, the following roles are also added to DevOps Administrator to access the health scan feature. • sn_cicd.sys_ci_automation • scan_user
DevOps Integration [sn_devops.integration]	Has inbound access to the tools in your environment to allow	• flow_operator • cmdb_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
	integration with the DevOps application.	
DevOps App Owner [sn_devops.app_owner]	Oversees the operation of the DevOps application and monitors performance in your DevOps environment. The app owner can: • Create, update, and delete applications only. • Associate or dissociate objects to applications (pipelines, repos, plans, artifact repository) • Perform change automation and modify pipeline steps. • Access to see all the tools but not modify them. • Can click discover from tool records to find new plans, repos, or pipelines from already connected tools. • Has the viewer role.	• sn_devops.viewer • cmdb_read
DevOps Tool Owner [sn_devops.tool_owner]	The tool owners can: • Create new tools. • Perform the following actions on the tool: ○ Discover (classic UI and workspace) ○ Enter Manual Configuration Mode (classic UI and workspace) ○ Configure (classic UI and workspace) ○ Configure Guidance (Jenkins only, workspace)	sn_devops.viewer **Note:** • The sn_vul.app_sec_manager role is added to the DevOps Tool Owner [sn_devops.tool_owner] role when the DevOps Vulnerability Integrations plugin (sn_devops_vul_ints) is installed. • The sn_vul_veracode.configure_integration role is added to the DevOps Tool Owner [sn_devops.tool_owner] role when the Vulnerability Response Integration with Veracode plugin (sn_vul_veracode) is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
	○ Update Credentials (workspace) ○ Check Permissions (workspace) ○ Delete tool (classic UI and workspace) • View System health and Troubleshooting sections of the Administration module and view Insights dashboards. • On the tool record page, the Related Links tabs will show Tool connections and Tool connectivity history. • If users have both Tool Owner and App Owner roles, they can also create apps and change request automations. Tool owners can update credentials only for tools in which they are a member of the access groups, or for tools without access restrictions.	
DevOps Viewer [sn_devops.viewer]	Has access to the DevOps application to use in their environment.	• sn_devops_ws.workspace_user • cmdb_read • sn_devops.report_viewer **Note:** The sn_devops.report_viewer role enables users to view reports that are created for DevOps tables. Users cannot view DevOps reports without this role.

Warning: When you uninstall DevOps Config, there could be empty rows in the **Contains Roles** related list (table: sys_user_role_contains) for the roles installed with DevOps Change Velocity. You must delete these empty rows before discovering tool objects.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled jobs installed

Scheduled job	Description
[DevOps] Historical Data Collection	Collects data from DevOps tools on demand. **Note:** You must run this scheduled job to see historical DevOps data after installation of the DevOps Insights application.
[DevOps] Daily Data Collection	Collects data from DevOps tools daily.
DevOps auto discover tool associations	Automatically discovers new pipelines, plans, and repositories for all the tools that are in connected state and for all the capabilities. This job is scheduled to run once daily. You can deactivate or change the frequency of the schedule: 1. Navigate to **System Definition** > **Scheduled Jobs** and select **DevOps auto discover tool associations**. 2. To deactivate the job, deselect the **Active** check box. 3. To change the frequency, update the **Repeat Interval**.
Tool connectivity history	For all the tools, the scheduled job does the following: • Checks the connectivity of the tool and updates the **Connection state** field in the tool record page. • Checks the inbound events received in the given interval and updates the **Last webhook activity** field in the tool record page with the latest date and time. This job is scheduled to run every hour. You can update the frequency if required. 1. Navigate to **System Definition** > **Scheduled Jobs**. 2. Search for and select **Tool connectivity history**. 3. Update the **Repeat Interval** fields based on your requirement. **Note:** This job is scheduled at the product level and cannot be scheduled for an individual tool.

Property	Description	Default	Name
Maximum retries for errored inbound events	Maximum number of retries for errored inbound events.	3	[sn_devops.max_retry_count_inbound_
Tool capabilities	The tool capabilities supported, entered as comma-separated values.	code,plan,orchestration,artifact,test	[sn_devops.tool_capabilities]
DevOps change request approval text	The DevOps change request approval text to be used for change management customizations.	Approved	[sn_devops.change_request.approved_
DevOps change request - Apply attributes on change creation	If enabled, change attributes are applied when a change is created. If there are any data policies applied on the change attributes, they are enforced when the change is created. If this property is not enabled, change attributes are applied after the change is created, which may cause change creation failure if any data policies are present on the change attributes.	False (disabled)	[sn_devops.change_request.apply_attri
Duration of DevOps system health report (in days)	Defaults to the last 7 days, to show system health metrics like inbound events.	7	[sn_devops.health_duration_report]
Enable automatic association of repos to apps on pipeline execution	If enabled, automatically associates repositories to apps and enables track when a pipeline identifies commits of a repository that is not yet associated. Also associates pipelines that are not yet associated to the corresponding app when the repository	Yes (enabled)	[sn_devops.enable_automatic_associat

Property	Description	Default	Name
	is already assigned to the app.		
Maximum number of pages to process at a time for an import request	The maximum number of pages that must be processed at a time for an import request.	10	[sn_devops.import.max.pages.processi
DevOps change request reusability decision subflow	The subflow that can be called to check if a previously created change can be reused, instead of creating a new one.	sn_devops.change_request_reusability_subflow	[sn_devops.change_request_reusabilit
GitHub URL	For GitHub, this field is used to get the API URL (for REST calls).	https://github.com	[sn_devops.github.url]
DevOps change request cancel state	DevOps change request cancel state to be used for change management customizations.	4 (Canceled)	[sn_devops.change_request.cancel_sta
Maximum orchestration tool executions while importing	Maximum orchestration tool executions while importing Jenkins freestyle jobs.	1000	[sn_devops.import.orchestration_tool.e
To save payloads as attachments on the Import Request Page record, set the "Value" field to "true". Anything else is considered as false.	If true, the fetched JSON payload is saved as an attachment in the Import Request page. To save payloads as attachments on the Import Request Page record, set the **Value** field to true. Anything else is considered false.	False (disabled)	[sn_devops.import.save.payloads.as.at
DevOps non-admin software quality summary flag	Enable to view and monitor SonarQube scans configured on your GitHub Actions, Jenkins, or Azure DevOps pipelines as a non-admin SonarQube user.	False (disabled)	[sn_devops.non_admin_software_quali
Default test type	Default test type from orchestration pipelines.	JUnit	[sn_devops.default_test_type]

Property	Description	Default	Name
Coding tool branches per page	Number of coding tool branches per page.	19	[sn_devops.import.coding_tool.branche
Planning tool issues per page	Number of planning tool issues displayed per page.	100	[sn_devops.import.planning_tool.issues
sn_devops role to be automatically added to active DevOps users	The sn_devops role entered in the value field is automatically added to users who are active DevOps users (for example, making a commit). If a role that is not in the sn_devops scope is provided, it is not added. Leave empty if no role should be automatically provided.	sn_devops.viewer	[sn_devops.discovered.user.auto.assign
Software quality categories shown by default in the Pipeline UI view	The software quality categories shown by default in the Pipeline UI view, entered as comma-separated values.	coverage,lines_of_code,[illegible]	[illegible]
Errors or exceptions (comma separated) for which errorred inbound events are set to Retry	Errors or exceptions for which the errored inbound events are set to Retry. Entered as comma-separated values.	TimeOutException,FlowObjectAPIException	[illegible]_events_retry_erro
DevOps log level	The DevOps log level. Select the appropriate level from the following: • Error • Warning • Information • Debug • Trace	Warning	sn_devops.devops_log_level
Categorize DevOps change requests on **DevOps Change** field	. Select this option to categorize change requests with	False (disabled)	[sn_devops.custom_change_categoriza

Property	Description	Default	Name
	category field set to DevOps as a DevOps change. Clear to disable.		
Orchestration tool executions per page	Number of orchestration tool executions per page.	50	[sn_devops.import.orchestration_tool.e
Enable import polling	Option to enable polling of import requests. Clear to disable polling.	False (disabled)	[sn_devops.enable_import_polling]
GitHub API version path	The GitHub API version path.	/api/v3	[sn_devops.github.api_version_path]
Tool permission check timeout per record (in milliseconds)	During the tool connection process, the system performs permission validations in the foreground, and restricts the tool connection page. For every permission validation, a REST API call is made to external tools to evaluate the availability of the permission. The REST API response time may vary based on your network settings. To avoid delays, you can specify how long the system should wait to get a response from an external tool before marking the permission as an error through this property.	10000	[sn_devops.permission_check_timeout
DevOps change request reusability model subflow	The DevOps change request reusability model subflow.	sn_devops.devops_reusable_change_request	[sn_devops.devops_change_request_model_cha
Time elapsed (in minutes)	The time elapsed in minutes. The retry job checks for errored inbound events from the time/value specified.	1440 (7 days)	[sn_devops.inbound_events_error_retry

Property	Description	Default	Name
Cancel the change request when the associated stage in the pipeline fails or is canceled	When this property is enabled and the orchestration task mapped to a certain step in your DevOps pipeline fails or is canceled, the change request associated with that step is also canceled. A change request can be canceled only if it has not already been rejected or is not in the implement or review state at the time of cancellation.	False (disabled)	[sn_devops.cancel_change_on_pipelin
Cascade delete threshold (recommended foreground limit 1000)	Cascade delete threshold.	1000	[sn_devops.cascade_delete_threshold]
Maximum retries per page while importing	Maximum retries allowed per page while importing data from tools.	3	[sn_devops.import.max.retries.per_pag
DevOps change request post implement state	DevOps change request post implement state to be used for change management customizations.	0 (Review)	[sn_devops.change_request.post_impl
DevOps change request implement state	DevOps change request implement state to be used for change management customizations.	-1 (Implement)	[sn_devops.change_request.implemen
Default committer score	The default committer score.	50	[sn_devops.committer.score.default]
Enable to track GitLab pull (merge) requests. If not enabled, then pull (merge) requests and related events will be ignored.	When this property is enabled, GitLab pull (merge) requests are tracked in DevOps Change Velocity. If disabled, then all merge request events are ignored.	Yes (enabled)	sn_devops.track.gitlab.pullrequests
Default throttle reset time in minutes from current time	If a tool doesn't support a throttle reset time, the throttle reset time will be	15 minutes	[sn_devops.throttle.reset.time.default]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Property	Description	Default	Name
	considered as the current time plus the value given for this property.		
Enable to track Azure DevOps Code Pull-Requests. If this is enabled then azure pull request web-hooks will be auto-configured when tool or project is configured.	When this property is enabled, the Azure DevOps pull request web-hooks are auto-configured whenever a tool or project is configured.	Yes (enabled)	sn_devops.track.azure.pullrequests
Multiply factor for committer score	The multiplication factor to be used for committer score.	1	[sn_devops.committer.score.multiply.fa
Auto archive (in months)	The duration after which the table data is to be auto-archived.	9	[sn_devops.table_auto_archive_duratio
Deprecated - Enable debug flag (Use new property DevOps log level)	DevOps Debug Logger. **Note:** This property is deprecated, use the *sn_devops.devops_log_level* (DevOps log level) property instead.	Yes (enabled)	[sn_devops.enable_debug]
Maximum processing time per page while importing (in seconds)	Maximum processing time in seconds, that should be allowed per page while importing data from tools.	300	[sn_devops.import.max.processing.time
Supported webhook capabilities	Webhook capabilities supported by DevOps Change Velocity.	code,plan,orchestration,artifact,test	[sn_devops.supported_webhook_capa
DevOps change request closed state	DevOps change request closed state to be used for change management customizations.	3	[sn_devops.change_request.closed_sta
Bulk flow timeout (in milliseconds)	Bulk flow timeout in milliseconds.	60000	[sn_devops.bulk_flow_timeout]
GitHub/Bitbucket coding tool commits per page	Number of coding tool commits per page for GitHub and Bitbucket.	100	[sn_devops.import.coding_tool.commits

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Default	Name
Folder depth	Retrieves only those orchestration tasks and pipelines which are in folders whose nesting level is less than or equal to the number specified here. Folder Depth is the level of nesting done on folders in Jenkins, which contains the orchestration task and pipelines that you want to discover. For example, if you want to discover orchestration tasks and pipelines for a folder structure that is nested 2 times in your Jenkins environment, you must enter 2 as the value for this property.	3	[sn_devops.discover.jenkins.folder.dep
DevOps change request handler subflow	If you are using a custom subflow instead of the Default Change Handler subflow in Flow Designer (which is used to populate the change request fields with default values), then you must update this property value to the new subflow. You can copy the Default Change Handler subflow in Flow Designer and update it according to your organization's needs. For information on the Default Change Handler subflow, see Customizing DevOps flows. For information on copying a subflow, see Copy a subflow.	sn_devops.default_change_handler_subflow	[sn_devops.change_request_handler_s

Property	Description	Default	Name
Coding tool repositories per page	The number of repositories that must be displayed per page when you import repositories after connecting to a tool. The total number of repositories imported is not dependent on this property, but the number of repositories that must be displayed per page from the total number of repositories imported can be specified using this property. For example, if your tool contains 1000 repositories and you specify 100 as the property value, 1000 repositories will be imported of which 100 will be displayed per page in the Import Requests page. When you discover repositories, the number of repositories that must be retrieved per API call in the backend is also dependent on this property value. For a large number of repositories, set a relatively smaller value in this property so that lesser number of repositories are retrieved per call and the system does not time out.	100	[sn_devops.import.coding_tool.repos.p
GitHub API URL	GitHub API URL.	https://api.github.com	[sn_devops.github.api_url]
ITBM Agile planning tool issues import max limit	Strategic Portfolio Management (SPM) Agile planning tool issues import max limit.	1000	[sn_devops.import.planning_tool.itbm.i

Property	Description	Default	Name
Assign a universal task and notify to update tool credentials when expired	Admins and tool owners will be notified (through universal task, email, banner, and field message) on expiry of tool credentials after the credentials have expired. As an admin or tool owner, you can update your tool credentials and connect the tool to prevent any further loss of data. For information on updating tool credentials, see Update third-party tool credentials in DevOps Change Velocity.	Yes (enabled)	[sn_devops.credential_expiration.notify
Number of days before tool credential expiry to assign a universal task and notify (if applicable)	Set the number of days before tool credentials expiry to send notifications (through universal task, email, banner, and field message) to admins for GitHub tools created with basic authentication. To stop sending proactive notifications, select 0 as the value for this property. For information on updating tool credentials, see Update third-party tool credentials in DevOps Change Velocity.	3	[sn_devops.credential_expiration.notify
Number of days to display warning alerts when events were not being received	Set the number of days to display warning alerts in the **Last event received** field in the tool record when events were not being received. This only applies for tools which sends data	2	[sn_devops.last_event_received.warnir

Property	Description	Default	Name
	Note: Skipped commits are not considered. If disabled, only the last commit will be picked up for Run Commits.		
This property decides whether to create a Generic Connection on configure operation for Azure DevOps	The step to enter the integration user name and password is required to configure webhooks when this property is enabled.	No	[sn_devops.enable_ado_generic_conne
Maximum limit for the number of pipelines that can be discovered for an Azure DevOps project	Set the maximum number of pipelines that can be discovered in an import request for an ADO project. If your project has more than 15000 pipelines, then you can try setting this property value to that number and see if the pipelines get discovered. If not, you can reduce the value to a lower number and try to discover.	15000	[sn_devops.discover.max.pipelines.ado
Update DevOps Change Request States Automatically when Change Receipt is Enabled	Updates the DevOps change request states automatically when change receipt is enabled. If you want to stop the automatic transition of the change request states even when change receipt is turned on, you must disable this property.	Selected (enabled)	[sn_devops.enable_change_receipt_sta
Switch to this user after token based authentication is successful	If the devops.system user is not available in your ServiceNow instance, use this property to set any other user that has the sn_devops.integration role, which is needed	devops.system	[sn_devops.token_auth.user]

Property	Description	Default	Name
	to complete the token authentication.		
Maximum limit for the number of times the discover action that exceeds the rate limit will be retried.	Determines the maximum number of times the discover action will be automatically retried after it reaches the rate limit. For example, if the rate interval in Azure DevOps is 5 mins, and you enter a value of 4 here, then after every 5min, the discover action will be retried for 4 times.	10	[sn_devops.max_retry_count_discover]
Enable change request creation even with errors in DevOps data retrieval	If enabled, when an error occurs in retrieving DevOps data like work items, commits, test summaries, security summaries, etc, the corresponding change request is still created. The data that can be retrieved will still be associated with the change request. For the data that cannot be retrieved, the reason for the error will be notified to the user in the third-party console, and the same information will also be added in the **Change Comments** field in the Step Execution record and the change **Worknotes**.	No (disabled)	[sn_devops.enable_change_creation_w
Enable state transition from New to Assess when DevOps Change Request Manual Approval Flow is active	If enabled, updates the change request state from New to Assess directly when the DevOps Change Request Manual Approval Flow is active. If you want to stop the automatic	Yes (enabled)	[sn_devops.enable_change_request_st

Property	Description	Default	Name
	transition of the change request state to Assess when the DevOps Change Request Manual Approval Flow is active, you must disable this property.		
Change request callback timeout (in minutes)	Set the timeout value in minutes until which the system will try to process a change when an inbound event goes into the waiting state during a pipeline run. After that the pipeline will be aborted. The reason for the error is displayed in your third-party tool's console logs. When a pipeline is cancelled because of callback timeout, the same information is added in the callback record of the corresponding step execution.	120 minutes	[sn_devops.change_request_callback_
Default Bitbucket branch used for import request	Specify the default Bitbucket branch name that must be used to create an import request.	master	[sn_devops.bitbucket_default_branch]
Close code value for a change request completed successfully when the autoCloseChange parameter is enabled.	Enter the close code value for a change request completed successfully when the autoCloseChange parameter is enabled.	successful	sn_devops.change_request.auto_close
Close code value for a change request completed with issues when the autoCloseChange parameter is enabled.	Enter the close code value for a change request completed with issues when the autoCloseChange parameter is enabled.	successful_issues	sn_devops.change_request.auto_close
Close code value for a change request completed unsuccessfully when the autoCloseChange parameter is enabled.	Enter the close code value for a change request completed unsuccessfully when the autoCloseChange parameter is enabled.	unsuccessful	sn_devops.change_request.auto_close

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Default	Name
Import based evidence collection for orchestration capability	This property modifies how pipeline events are processed. When switched on, the setting reduces instance overhead by skipping step-level processing in the pipeline. The skipped step-level events will be ignored with the processing details, "IGNORED: This event is ignored because the 'Import based evidence collection for orchestration capability' property is enabled". Conversely, switching off reverts to the standard mode, where all inbound events undergo processing.	False (disabled)	sn_devops.import_based_evidence_co

DevOps System Health dashboard

The System Health dashboard lets the DevOps administrator view the overall health of integrations, connectivity status, as well as view trends of inbound event processing data.

Role required: sn_devops.admin

Note:
The DevOps System Health dashboard is available only in DevOps data model 1.33 and later versions.

Use the System Health dashboard to track the health, event status, and connectivity status of your DevOps environment. Interactive charts enable you to view and analyze the system health and inbound event processing details.

Note:

- Scores aren't real-time. For example, if the chart displays that two events are in the waiting state, the events could have already moved to the completed state.
- Because the scores are fetched from formula indicators, you can't drill down to the records in the KPI page.

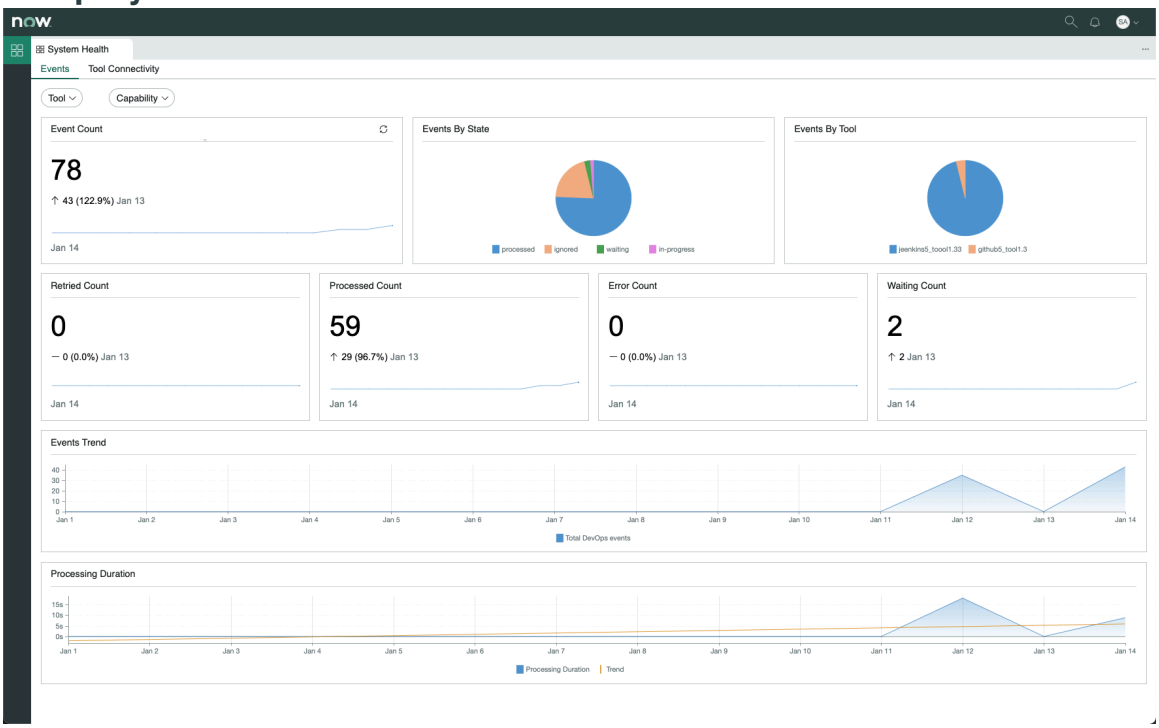
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps System Health Dashboard



Events

From the DevOps Change Workspace, navigate to **Administration** > **System health** > **System health dashboard**.

Report	Type	Description
Event count	Count trend	Daily trending total count of DevOps events. The report displays the percentage and count, which is the last 7 running sum. Total count includes events from [sn_devops_inbound_event], [sn_devops_event], and the [sn_devops_processed_event] tables.
Events by state	Pie chart	Total count DevOps events distributed by current state.
Events by tool	Pie chart	Total count of DevOps events, distributed by tool.
Retry count	Count trend	Daily trend of the count of total retried DevOps. The report displays the percentage and count variance in the last 24 hours.
Processed count	Count trend	Daily trend of the total count of processed DevOps events.

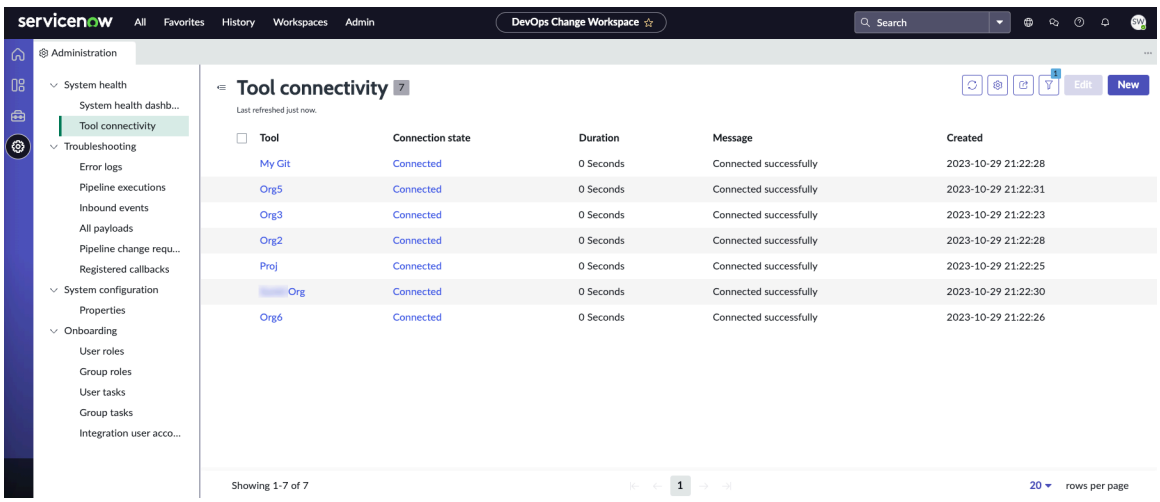
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Report	Type	Description
		The report displays the percentage and count variance in the last 24 hours.
Error count	Count trend	Daily trend of the total count of DevOps events in error state. The report displays the percentage and count variance in the last 24 hours.
Waiting count	Count trend	Daily trend of the total count of DevOps events in waiting state. The report displays the percentage and count variance in the last 24 hours.
Event trend	Line trend	Total trending count of DevOps events. The report displays the percentage and count variance in the last 24 hours.
Processing duration	Line trend	Processing duration of events (in seconds) measured daily.

Tool connectivity

The Tool connectivity status report displays the connectivity status with details of all the integrated tools. The tool connectivity table displays the connection status for each connected tool. A background job tries to connect to the tools every hour and maintains the connection history. You can view the historical details under a new related list on the tools page.

To see the report, from the DevOps Change Workspace, navigate to **Administration** > **System health** > **Tool connectivity**.



System health email notifications

A base system DevOps Report group is added by default. An email notification summarizing the weekly System Health report is sent to the users in this DevOps Report user group that is specified in the **Who will receive** related list of the **System Notifications > Email Notifications** form, as configured in the base system DevOps Health Report notification. For more information, see Email notifications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Add users with DevOps Admin (sn_devops.admin) role to the DevOps Report user group.
- You need to remove a user from the group to unsubscribe the user from receiving notifications.

The base-system email notification contains and displays a comparative digest of key system health performance indicators as compared to their performance in the previous weekly report. The comparative data is sourced from relevant tables and calculated based on required indicators using the date range specified in weekly report. The comparative data and indicators always display with respect to the same tables and indicators vis-a-vis, the data collected against the relevant reports and indicator data for the previous week.

To configure the frequency in which the base system email notification is sent out. Navigate to **System Scheduler** > **Scheduled Jobs** > **Trigger DevOps Health Check Email Notification** and select the **Configure Job Notification** related link, and make the schedule changes.

If you want to modify the users who receive the email notification, modify the user group specified in the **Groups** field of the **Who will receive** section. Navigate to **System Notification** > **Email** > **Notification** > **DevOps Health Script**. For more information, see Add a user to a group.

Use the **Preview Notification** option to check your notification.

For example, you can see which users will or will not receive the notification, along with what instance details and period for which the notification is sent.

DevOps log levels

DevOps log levels allow you to filter logs by level as well by a particular tool or application. Log levels in the DevOps application let you decide the extent of log detail you need for debugging.

The flexibility to set log levels allows you to select the right log level information that is appropriate for your organizational needs. You can select custom log levels based on the log levels or categories that you need and as an application or tool currently supports. In previous versions of DevOps, the default log level was set to debug, and the [sn_devops.enable_debug] property that you could either enable or disable. You can select any of the following log levels for the DevOps application using the DevOps sn_devops.devops_log_level property:

- Error
- Warning
- Information
- Debug
- Trace

Note:

- The base system log level is set to Warning. You must modify the base system value from DevOps properties.
- By default, if you have different log levels for connected apps and for the DevOps application, the log level with more information is printed. For example, if you set up the log level for an app at Error, and for the DevOps application at Trace, the log levels are printed with the most information (Trace).

Multiple flows for in the DevOps application now use the new logging framework to collect log data during the flow execution. The following flows currently support the new log levels:

- Artifact & Package registration flows
- Self Service Onboarding
- Self-Service Catalog — App Onboarding
- Change Traceability flow
- Notification flow for plan, code, and orchestration capabilities

Common errors in DevOps Change Velocity

Identify the root cause of errors that occur in DevOps Change Velocity, and see the corresponding steps that might resolve them.

Tool connection

This table lists the steps required to resolve the errors that might occur when you select the **Submit** or **Connect** button after entering the tool details in the tool connection process:

Message	Action
Tool cannot be created because the tool name has not been entered. Enter the tool name, and try again.	Re-enter the tool name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Action
Tool cannot be created because the tool integration has not been selected. Select the correct tool integration value, and try again.	Select the correct tool integration value.
Tool cannot be created because the tool URL is invalid or incorrect. Re-enter the tool URL, and try again.	Re-enter the tool URL.
Tool cannot be created because the platform version cannot be determined. Create the glide.buildtag.last sys property, and try again.	1. Navigate to **DevOps > Administration > Properties**. 2. Verify if the *`glide.buildtag.last sys`* property exists. 3. If not, create the *`glide.buildtag.last sys`* property.
Tool cannot be created because the associated CreateDevOps tool connection is invalid. Create a valid connection alias, and try again.	1. Navigate to **All > Connections & Credentials > Connection & Credential Aliases** and open the **CreateDevOpsTool** record. 2. In the Connections related list, create a record and enter a name for the connection. 3. On the Connection form, select the **Credential** field lookup list, and then select **New** to create an admin credential. 4. Select **Basic Auth Credentials** and enter a name. 5. Enter admin username and password (required to access the tools in your DevOps environment). A user with connection_admin role can configure an HTTP connection. 6. On the Connection form, enter **https://<instance name>.service-now.com/** for the Connection URL.
Tool cannot be created because the CreateDevOpsTool alias credentials are incorrect. Update the credential record, and try again.	1. Select the **credential record** link in the message. If you are connecting to the tool from the workspace UI, right-click on the credentials record link, and select **Open in a new tab**. 2. In the credentials record page, enter the correct credentials in the **Username** and **Password** fields. 3. Save the changes, and retry connecting to the tool.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Action
Tool cannot be created because the connection URL of the CreateDevOpsTool alias is incorrect. Use the following URL: https://<instancename>.service-now.com,and try again.	1. Navigate to **All > Connections & Credentials > Connection & Credential Aliases** and open the **CreateDevOpsTool** record. 2. On the Connection form, enter **https://<instance name>.service-now.com/** for the Connection URL.
To create a connection alias, you need the connection_admin role. Contact your system administrator.	This error occurs if the connection alias field is empty for a tool record. To create the tool connection, you need a connection alias. Only a user having the *connection_admin* role can create a connection alias. You must reach out to a user having this role, like an administrator, and get the connection alias created.
Tool cannot be created because the <toolname> tool name already exists. Enter a different name, and try again.	Use a different name for the tool.
Tool cannot be created because the <toolname> does not have a valid MID server configuration. Configure a valid MID server, and try again.	1. If you are using the workspace, check if the mid server is running and reachable. 2. If you are using the catalog and record producer, check if the mid server is running and reachable with application as DevOps and Capability as REST.
Tool cannot be created because there are no connection and credentials aliases available for DevOps Data Model scope. Create a new connection and credential alias, and try again.	This error occurs for OAuth authentication. 1. Navigate to **All > Connections & Credentials > Connection & Credential Aliases**. 2. Create a new alias with the application as **DevOps Data Model**.
Tool cannot be created due to a technical issue while creating the credential record.	1. Navigate to **All > Process Automation > Flow Designer > Executions**. 2. Check for the latest execution of the sn_devops.devops_create_credentials subflow to know the details of the error.
Tool cannot be created because credential and domain combination for an active record already exists.	This error occurs for OAuth authentication. 1. Use a different credential. 2. Check if the existing credential is used by any active connection.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Action
Tool cannot be created due to a technical issue while creating the connection record.	1. Navigate to **All > Process Automation > Flow Designer > Executions**. 2. Check for the latest execution of *sn_devops.create_connection_for_tool* action to know the details of the error.
Tool cannot be created because of the following reasons: • The validate subflow is not configured, and • An integration capability record with the same subflow name does not exist for the associated tool integration. Configure the subflow, and create the integration capability record with the Validate action and a subflow name for the tool integration, and try again.	This error occurs only for custom tool integrations. 1. Navigate to **All > Process Automation > Flow Designer**. 2. In the Flow Designer page, select the **Subflows** tab. 3. Open the **DevOps Demo Validate Subflow** record from the list. 4. From the Actions section, open the **DevOps Demo Validate Action** record by selecting the Open action in Action Designer ( ) icon. 5. Select **More Actions menu > Copy Action**.  6. Enter a new name for the action and select the application as **DevOps Integrations**, and select **Copy**. 7. In the copied action, select **Inputs > REST step**. 8. In the Request Details section, enter resource path of your custom tool in the **Resource Path** field.  9. Enter the API version of your custom tool in the **Query Parameters** field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Action
	10. Save the changes. 11. Publish the action by selecting **Publish**. 12. Navigate back to the **DevOps Demo Validate Subflow** record. 13. Select **More Actions menu > Copy Subflow**. 14. Enter a new name for the subflow and select the application as **DevOps Integrations**, and select **Copy**. 15. In the copied subflow, delete the **DevOps Demo Validate Action** action and add the action you created in step 11.  a. In the **Action** field, select the action you created in step 11. b. In the **aliasGR** field, select the Connection & Credential Alias record from the **Data > Lookup records** section. c. In the **apiversion** field, select the api version from the **Data > Subflow Inputs** section. d. Save the changes. 16. Publish the subflow by selecting **Publish**. 17. Navigate to **DevOps > Integrations > Integration Capabilities** and create a record with the **Validate** action. For more information, see Create a DevOps tool integration.  18. Associate the subflow you created in step 16 with the integration capability record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Action
Tool cannot be created due to a connectivity issue. Check the <validate_subflow_name> subflow for more details, and try again.	1. Navigate to **All > Process Automation > Flow Designer > Executions**. 2. Check for the latest execution of <validate_subflow_name> subflow to know the details of the error.
Tool authorization credentials are invalid. Enter valid credentials, and try again.	Re-enter the correct username/password for the tool.
Tool cannot be created because there is no response received from the server. Enter a valid tool URL or Check if server is up and running, and try again.	1. Re-enter the tool URL. 2. Check the mid server.
The connection URL is incorrect, check the URL and try again.	Re-enter the tool URL.
Tool cannot be connected because the GitHub app slug name is incorrect. Enter the correct GitHub app slug name and try again.	You can find the GitHub app slug name on the settings page of your GitHub app. The GitHub app slug name is the URL-friendly name of your GitHub app. For example, if you have created a GitHub app with the name **Test App**, the corresponding URL-friendly GitHub app slug name will be **test-app**. In your GitHub url - "https://github.com/settings/apps/test-app", "test-app" is the GitHub app slug name. For more information, see GitHub documentation.
Password value is too long and could be truncated after encryption. Please either reduce password length or increase field size.	From 18th January 2023, Jira has extended the length of API tokens for Atlassian accounts. You must increase the maximum password value to more than 255 in the discovery_credentials table to accommodate the extended character length. For more information, see the KB1269878 kb article and Atlassian documentation.
Unexpected behaviour from remote host: Circular redirect to 'https://bitbucket.org/account/signin/?next=%2F...%2Frest%2Fapi%2F1.0%2Fusers'.	This error might occur if you try to connect to a BitBucket Cloud instance. BitBucket Cloud is not supported. You must use a BitBucket Server instance to connect to ServiceNow DevOps. Connect to your BitBucket instance via an MID server. A MID server is required if your tool instance is hosted on-prem. For more information about MID server, see MID Server selection
Mismatch in tool URL: Tool URL entered in ServiceNow: https://<URL of the Jenkins instance you entered> Tool URL entered in Jenkins: https://<Jenkins location URL entered in Jenkins> In Jenkins, under Manage Jenkins > System, check that your configured Jenkins URL is the same as the Tool URL entered here.	This error occurs when the Jenkins URL entered in DevOps is different from the Jenkins URL entered in your Jenkins instance. From your Jenkins instance, navigate to **Manage Jenkins** > **System** > **Jenkins**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Message	Action
See the troubleshooting tool on-boarding errors.	**Location**. The **Jenkins URL** entered here must match the **URL of the Jenkins instance** entered in DevOps.

Tool permissions

This section lists the steps required to resolve tool permission errors when you create a DevOps tool using workspace playbooks. Tool permission check guidelines are displayed in a pop-up when you connect to a tool from the workspace.

Action

If any permission is missing, perform the following steps:

- Update the permissions for the provided credentials in the external DevOps tool. Select **Refresh** in the pop-up to perform the checks again.
- Close the pop-up, use different credentials, and select **Connect** again. The permission check pop-up appears with results of the newly entered credentials.
- Review the impact column, and if the impact does not affect your use-case, select **Continue** anyway.

If all permission checks are successful:

- Select **Continue** to progress to the next step in the playbook.
- If errors show up in the result, try again by selecting **Refresh**.
- If the error persists, update the Tool permission check timeout per record (in milliseconds) property and try again.

Tool permission check timeout property

During the tool connection process, the system performs permission validations in the foreground, and restricts the tool connection page. For every permission validation, a REST API call is made to external tools to evaluate the availability of the permission. The REST API response time may vary based on your network settings. To avoid delays, you can specify how long the system should wait to get a response from an external tool before marking the permission as an error. You can specify this time using the **Tool permission check timeout per record (in milliseconds)** property *(sn_devops.permission_check_timeout)*. If you find that some of the permission checks are resulting in an error, try increasing the timeout value, and select **Refresh** in the Permissions pop-up.

Tool notification

This table lists the steps required to resolve errors that might occur in scenarios such as retrieving commit details, pipeline execution details, pull request details, test summaries:

Reason	Action
Authorization credentials are either invalid or do not have the minimum required permissions.	• Verify if your third-party tool credentials have the required scopes. If you are using the workspace UI, you can navigate to the tool record, and select **More actions (** **)**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reason	Action
	> Check credential permissions to know about the required permissions. • Verify if you have entered the correct username/password for your third-party tool. If you are using the workspace UI, and you want to update your tool credentials, then navigate to the tool record, and select **More actions (···) > Check credential permissions**. For more information on updating credentials, see Update third-party tool credentials in DevOps Change Velocity.
There is no response from the server. Check the server connection status, and try again.	• Verify that the DevOps tool server is reachable and responsive. • If MID server is configured, verify if the server is up and running.
Unable to process the request.	Verify if the maximum number of instances associated with a webhook has exceeded. If you encountered this error for GitHub, verify if you have associated more than 20 instances to a webhook.
Authorization credentials do not have the minimum required permissions.	Verify if your third-party tool credentials have the required scopes. If you are using the workspace UI, you can navigate to the tool record, and select **More actions (···) > Check credential permissions** to know about the required permissions.
MID server configuration is invalid. Configure a valid MID server, and try again.	Check if the mid server is running and reachable.
The connection URL is invalid. Enter a valid URL, and try again.	1. Navigate to **All > Connections & Credentials > Connection & Credential Aliases** and open the required connection & credential record. 2. From the Connections related list, open the related **Connection** form. 3. On the **Connection** form, verify if the connection URL of the third-party tool is correct.
The rate limit has been exceeded. Retry after {0}.	Rate limit is the number of API calls an app or user can make within a given time period. Rate limiting is a technique to limit network traffic to help prevent users from exhausting system resources. If the max rate limit allowed

Reason	Action
	in your third-party tool has exceeded, you might encounter this error.
Your credentials does not have the required scopes.	Verify if your third-party tool credentials have the required scopes. If you are using the workspace UI, you can navigate to the tool record, and select **More actions (** ··· **) > Check credential permissions** to know about the required permissions.

Change request

This table lists the steps required to resolve errors that might occur during change request creation:

Error	Action
Change request cannot be created because the type compatibility flag is disabled. Enable the type compatibility flag in system properties or configure the change model in the step record in ServiceNow or enter the appropriate change model sys id in the pipeline.	• Navigate to **All > System Properties**, and enable the *com.snc.change_management.change_model.typ* property, or • Add the change model in the Step form or change attributes of the pipeline.
Change request cannot be created because either the change type or change model is not configured for the pipeline.	Add the change model or type in the Step form or change attributes of the pipeline.

General errors

This table lists steps required to resolve few general errors that might occur while working with the DevOps Change Velocity application.

Issue	Action
Import request not progressing	If an import request remains in the Requested state for too long while performing an import for a tool (such as Jenkins, Jira, or GitHub), delete the import request and try again. **Note:** Delete the existing request to retry importing the same range.
Tool connection fails	Remove the trailing slash ('/') in the **Connection URL** field on the HTTP Connection form.
No change request is created for a Jenkins job under change control	Verify that:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue	Action
	• The tool integration in your instance is set up properly. • The task has been synced in your instance. • Tasks and app steps have been configured in your instance. Change request creation is not supported if the task is under change control: • Is not part of a pipeline (is a standalone task, for example). • Is the first in the pipeline. • Is within the pipeline, but the user manually triggers, or does SCM checkout directly on the task under change control (thus not triggering the pipeline from the beginning).
Jenkins does not block the job under change control (does not wait for change request approval)	Verify that the Jenkins location is configured: Navigate to **Jenkins** > **Manage Jenkins** > **Configure System** and provide the hostname for the **Jenkins URL** field in the Jenkins Location section. **Note:** To avoid caching issues, click **Save** even if the **Jenkins URL** field already contains a value when you first open the form.
Events occurring in the payload log with state Not Connected	If any of the following changes for a connection made manually (using manual configuration mode), the connection is automatically disconnected. • Alias associated with the tool • Type of tool • New active HTTP connection for the same domain added to the alias • Existing HTTP connection for the same domain activated • Connection URL of the HTTP connection • Credentials of the HTTP connection • Use MID Server setting in the HTTP connection Enter manual configuration mode and reconnect.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Issue	Action
Retry Inbound events that fail or error out due to REST API TimeoutException/ FlowObjectAPIException	Update the *Retry Errored Inbound Events* scheduled job to retry processing inbound events that are in *Error* state. • Update the errors or exceptions list to specify exceptions that you want to retry event processing for. • Modify the default *Maximum Retry* count. For more information, see Retry errored inbound events
Pipeline execution in ServiceNow DevOps does not move forward and waits indefinitely as the SonarQube scans do not take place due to the absence of SonarQube tool. The software quality inbound event displays the following error message in the processing details field. "Check if the respective SonarQube tool is created successfully. If not, create the SonarQube tool and retry the inbound event."	For all SonarQube steps in code quality scans, the user must create SonarQube tool in the ServiceNow DevOps instance. For more information, see SonarQube integration with DevOps Change Velocity
Pipeline UI displays broken links between stages.	Navigate to **Task Executions** and ensure that the Upstream executions column has the appropriate upstream link references.

Software Quality Results

Software Quality Results display scan details from SonarQube scans configured on your GitHub Actions, Jenkins, Azure DevOps, or Harness pipelines.

Software Quality Results

You can configure SonarQube scan results from your GitHub Actions, Jenkins, Azure DevOps, and Harness pipelines to be fetched into ServiceNow DevOps. SonarQube notifications create inbound events which are then processed by base system subflows associated with all inbound events with Software Quality capability.

After you have configured SonarQube scans on your pipelines and configured the corresponding plugins, run the pipelines to fetch software quality scan results into ServiceNow DevOps. You can view the scan results by Scan ID for each SonarQube scan that was part of your build or release pipeline execution steps.

Note:
For Harness pipelines, you can configure SonarQube scans only through the generic Docker Container Image. For more information, Implement custom actions for pipelines using generic Docker container image. For GitHub Actions, Jenkins, and Azure DevOps, you can either use the corresponding plugins from the marketplace or the Docker container image.

Software Quality Summaries

Software Quality Summaries shows you a summary of the scans that are run on the pipelines with SonarQube scans on the DevOps app on your ServiceNow AI Platform instance.

Software Quality Summaries

1. Navigate to **Software Quality Results** > **Software Quality Summaries**.
2. Click a **Scan ID** record to view scan details.

   The following Software Quality Scan Summary Details appear for the Scan ID.

Software Quality Scan Summary results

Field	Value
Number	The Scan record number in the CMDB.
Initiated By	The user who initiated the scan
Scan ID	The unique Scan ID
Project Name	The SonarQube project name or key.
Last Scanned	Date Time stamp of the last scan
Scan URL	The SonarQube project URL you configured in the extension task.
Scanner name	The code quality scanner tool name.
Domain	The domain name in which the scans are configured in the instance.
Tool	The name of the SonarQube tool you created.

Note:
The scanID, lastScannedBy, and initiatedBy details are not retrieved when you onboard Sonar using a non-admin user.

The Software Quality Scan Details related list (for each Scan ID) displays for the following categories with a corresponding value signifying the count value against the scan result category.

Software Quality categories for Overall Code metrics:

- Coverage
- Bugs
- Reliability
- Rating
- Code
- Smells
- Duplications
- Security Rating
- Lines of Code
- Vulnerabilities

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

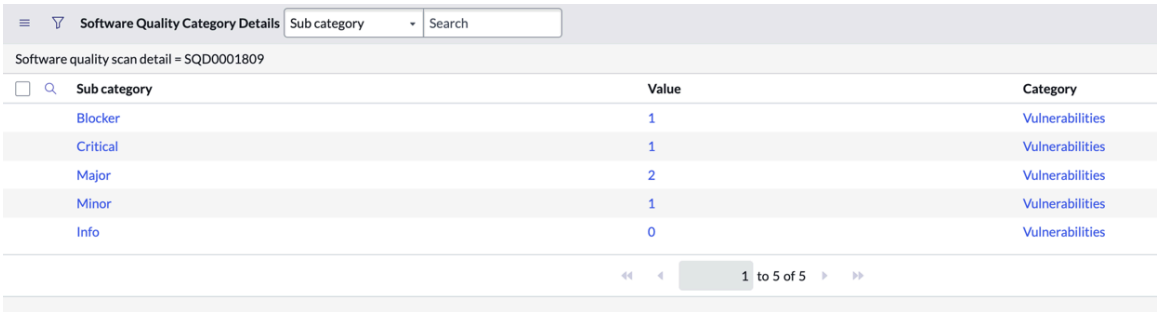
1. Navigate to **DevOps** > **Integrations** > **Software Quality Sub Categories**.

   The Software Quality Sub Categories form displays with the following base-system subcategories:

   - Blocker
   - Critical
   - Major
   - Minor
   - Info



2. Click the **New** button to create custom sub categories.
3. On the form, fill in the fields.

Software Quality Sub Category

Field	Description
Label	A unique label for the sub category.
Domain	The domain in which the DevOps app is running.
Name	A unique name for the sub category.
Category	Select a category from the seeded base-system categories from the lookup list.

4. Click **Submit**.

   You have successfully created a custom sub category.

To view the Software Quality Scan Detail and the Software Quality Category Details related list > Sub category, follow these steps:

- View scan details as part of Task Executions. View details of all the Sonar scans that are part of the task execution mapped to a build or release pipeline execution step.

  1. Navigate to **DevOps** > **Orchestrate** > **Task Execution** click a relevant Task Execution record.
  2. Click the Software Quality Summary related list.
  3. Click a relevant Scan ID record.
     The Software Quality Scan Summary and Scan Details are displayed.

- View scan details as part of Change Request. View all the scans that were part of this build/release pipeline in the **Software Quality Results** > **Software Quality Summary** related list.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Navigate to **DevOps** > **Orchestrate** > **Pipeline Change Requests**
2. Click the Software Quality Summary related list.
3. Click a relevant Scan ID record.
   The Software Quality Scan Summary and Scan Details are displayed.

Domain separation and DevOps Change Velocity

Domain separation is unsupported for DevOps Change Velocity. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

Domain separation in DevOps Change Velocity overview

Use the ServiceNow® DevOps application with your DevOps toolchain to provide data insights, accelerate change, and increase visibility in your DevOps environment using a single system. In DevOps, domain separation targets tenant domain requester use cases in an application. The application has been designed to support requester activities within tenant domains. Logic is in place to route data to tenant domains, based on applicable use cases. The owner of the instance must be able to set up the application to function normally across multiple tenants. The application handles data routing to domains.

All tables in DevOps support data separation only; delegated domain separation is not supported.

To ensure that domain-sensitive information is not available at a global domain, ensure that you create policies at a domain level and not at a global level. While managing Service Providers, create policies at the Service Provider level. If you create policies at a global level instead, when you run the audit, the tag policy "run" findings are created in the Global domain, instead of respective domains.

Domain separation for service providers

DevOps Insights Standard dashboard - Classic

Use the DevOps Insights application with ServiceNow Performance Analytics to gain insight into your DevOps environment.

Important:
The Insights Standard dashboard is deprecated for new users. Instead, you can use the Insights dashboard from the DevOps Workspace. For more information, see DevOps Insights dashboard - Workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To collect daily or historical Insights data, unless these jobs were previously customized, you must select **Active** and set the **Run As** credentials to **System Administrator**:

- **[DevOps] Daily Data Collection (Daily)** (active by default)

  Note:
  This is a scheduled job (to be run regularly) to collect daily DevOps data. For optimal performance, set this job to run during periods of low usage.

- **[DevOps] Historical Data Collection (On Demand)** (inactive by default)

  For new DevOps Insights installations, if you have already been using the DevOps app and you Installed DevOps Insights at a later date, run the Historical Data Collection job to collect historical Insights data.

  Note:
  This is a one-time job to collect historical DevOps data, and not meant to be on a schedule. It might take awhile, so plan on running this job during a period of low usage.

Reports in the dashboard tabs get updated when the dashboard is refreshed.

Change Failure Rate - Monthly	Change Request	Average change failure rate in a month. **Note:** This widget uses formula and does not support multi-element selection.
Deployment Frequency	Step Execution	Number of successful production deployments in the last 30 days. Applies to steps of type **Prod Deploy** that are in completed state.
Change Failure Rate	Change Request	Average change failure rate in the last 30 days.
Mean Time to Resolve Trend	Database view joined by Incident, Change Request, Step Execution, Step, Pipeline, and App lists.	Daily average resolve time for an incident caused by a DevOps change.
Lead Time	Pipeline Execution	([Time the code is successfully pushed to production] - [Earliest commit time]) Applies to steps of type **Prod Deploy** that are in completed state. **Note:** This widget uses average aggregation and does not support multi-element selection.

Operational Stability

The Operational Stability tab shows:

- Service availability

  Average service availability and daily service availability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

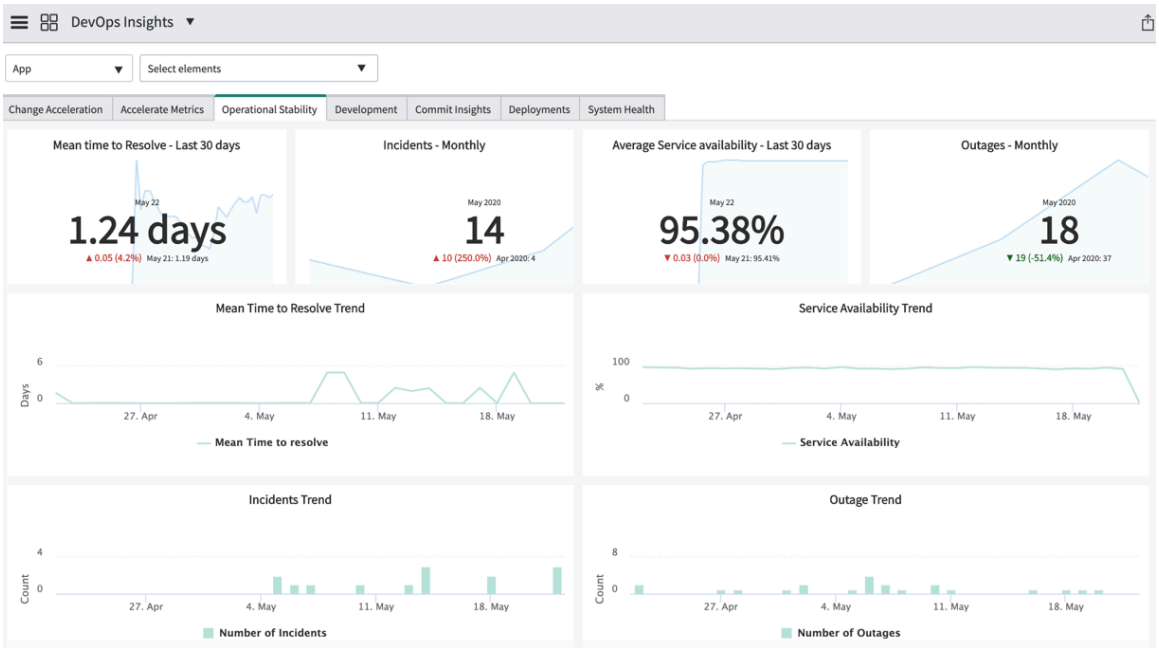
- Mean time to resolve (MTTR)

  Mean time to resolve and daily mean time to resolve.

Note:
You must install the Service Portfolio Management Foundation (com.snc.service_portfolio) plugin to see service availability widgets.

Demo data is also provided for the service availability widgets.

Note:
You must install the Service Portfolio Management Foundation (com.snc.service_portfolio) plugin before installing the DevOps Insights application to see demo data.



Operational Stability

Report	Source list	Description
Mean Time to Resolve - Last 30 days	Database view joined by Incident, Change Request, Step Execution, Step, Pipeline, and App lists.	Average resolve time for an incident caused by a DevOps change in the last 30 days. **Note:** This widget uses average aggregation and does not support multi-element selection.
Incidents - Monthly	Incident	Number of incidents in a month (based on pipeline steps of type **Prod Deploy**) linked to business service in CMDB.

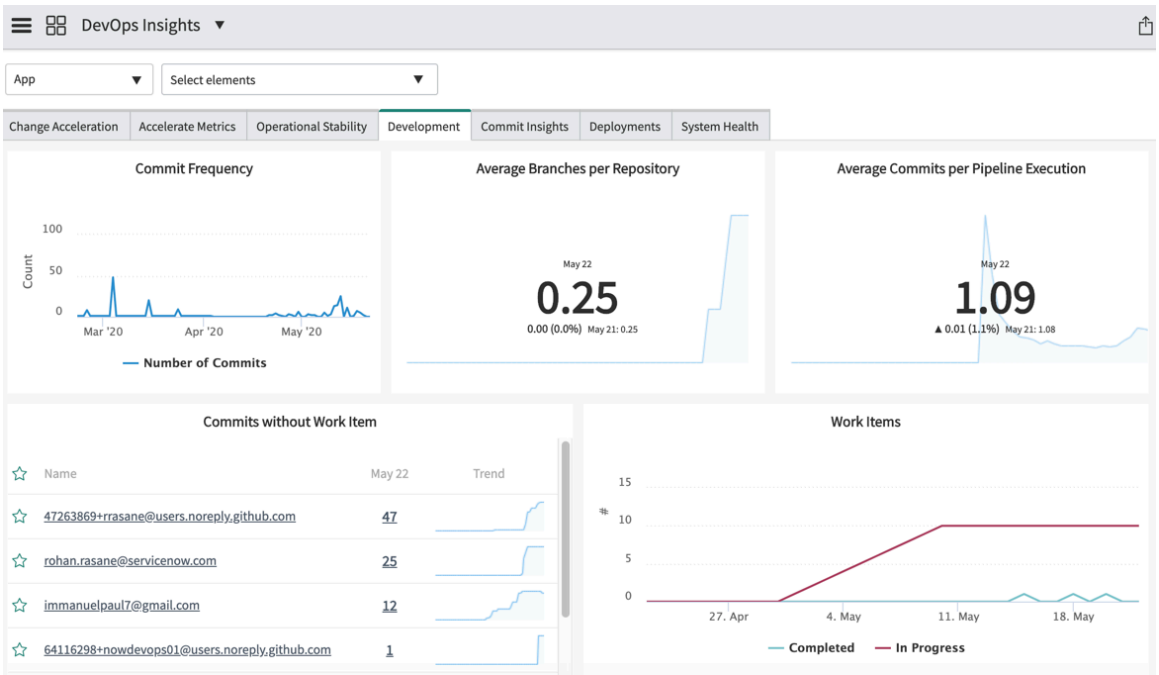
		type **Prod Deploy**) linked to business service in CMDB. This report provides an indication of environment stability.

Development



Development

Report	Source list	Description
Commit Frequency	Commit	Number of commits measured daily. Smaller more frequent commits are preferred over larger less frequent ones.
Average Branches per Repository	Branches, Repository	Average branches per repository on a given day. **Note:** This widget uses formula and does not support multi-element selection.

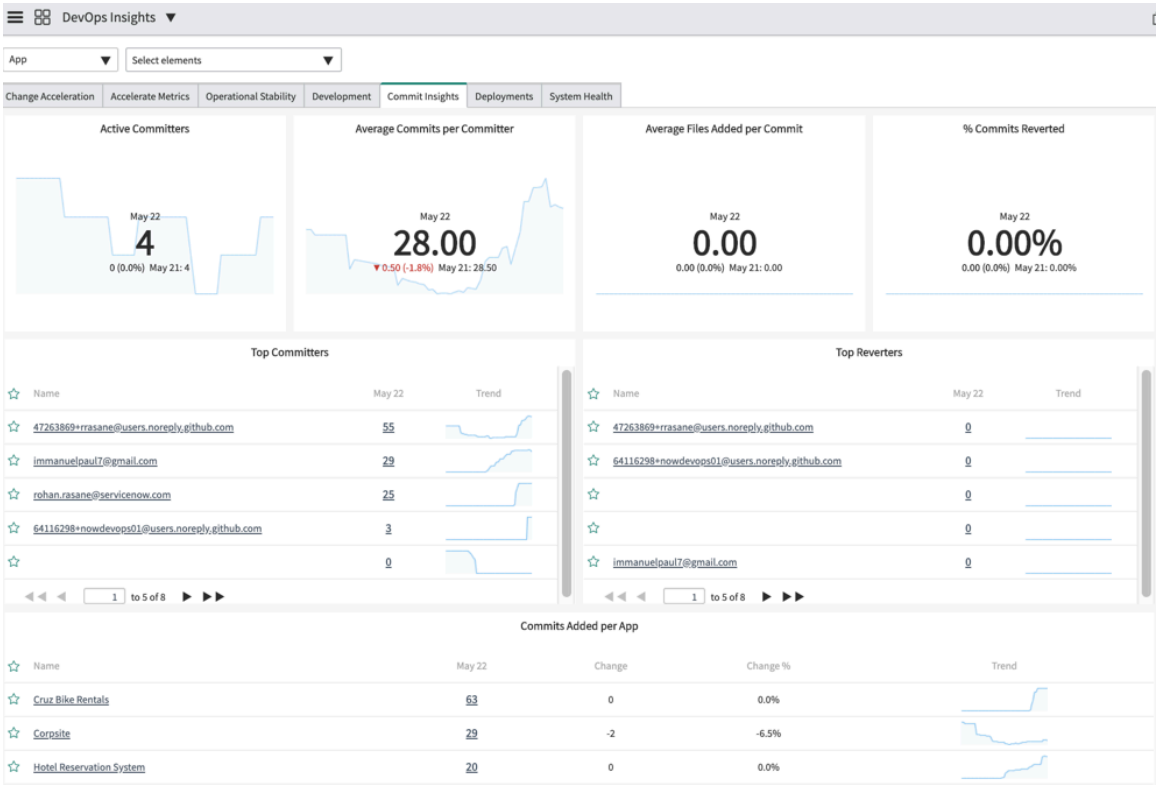
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Development (continued)

Report	Source list	Description
Average Commits per Pipeline Execution	Commit, Pipeline Execution	Average commits per pipeline on in the last 30 days: [[Total number of commits]] / [[Number of pipeline executions]] **Note:** This widget uses average aggregation and does not support multi-element selection. A low number is preferable, which indicates a concentrated effort, versus switching from task to task without completion.
Commits without Work Item	Commit	Commits made that are not tied to a work item, grouped by committer, in the last 30 days. This report is useful for investigating and resolving why a commit is not tied to a work item, because all commits should be tied to a work item.
Work Items	Work Item	Number of work items that are complete or working in progress in the last 30 days. **Note:** Filter is not applicable to this widget.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Commit Insights



Commit Insights

Report	Source list	Description
Active Committers	Commit	Committers that submitted commits in the last 30 days. Shows how many active committers there are. **Note:** This widget uses count distinct aggregation and does not support multi-element selection.
Average Commits per Committer	Commit	Total number of commits in the last 30 days / Active committers. Shows how often committers are committing. A higher value is more favorable. **Note:** This widget uses formula and does not support multi-element selection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Commit Insights (continued)

Report	Source list	Description
Average Files Added per Commit	Commit, Commit Details	Total number of files added in the last 30 days / Total number of commits in the last 30 days. Shows how few files are committed at a time. A lower value is more favorable. **Note:** This widget uses formula and does not support multi-element selection.
% Commits Reverted	Commit	Commits reverted in the last 30 days / Total number of commits in the last 30 days. Shows how many commits have been reverted. A lower value is more favorable. **Note:** This widget uses formula and does not support multi-element selection.
Top Committers	Commit	Committers with the highest number of commits in the last 30 days. Provides visibility into the users that commit the most.
Top Reverters	Commit	Committers with the highest number of reverts in the last 30 days. Provides visibility into the users that revert commits the most.
Commits Added per App	Commit, Commit Details	Number of commits added per app in the last 30 days. Provides visibility into the development activity for each app.

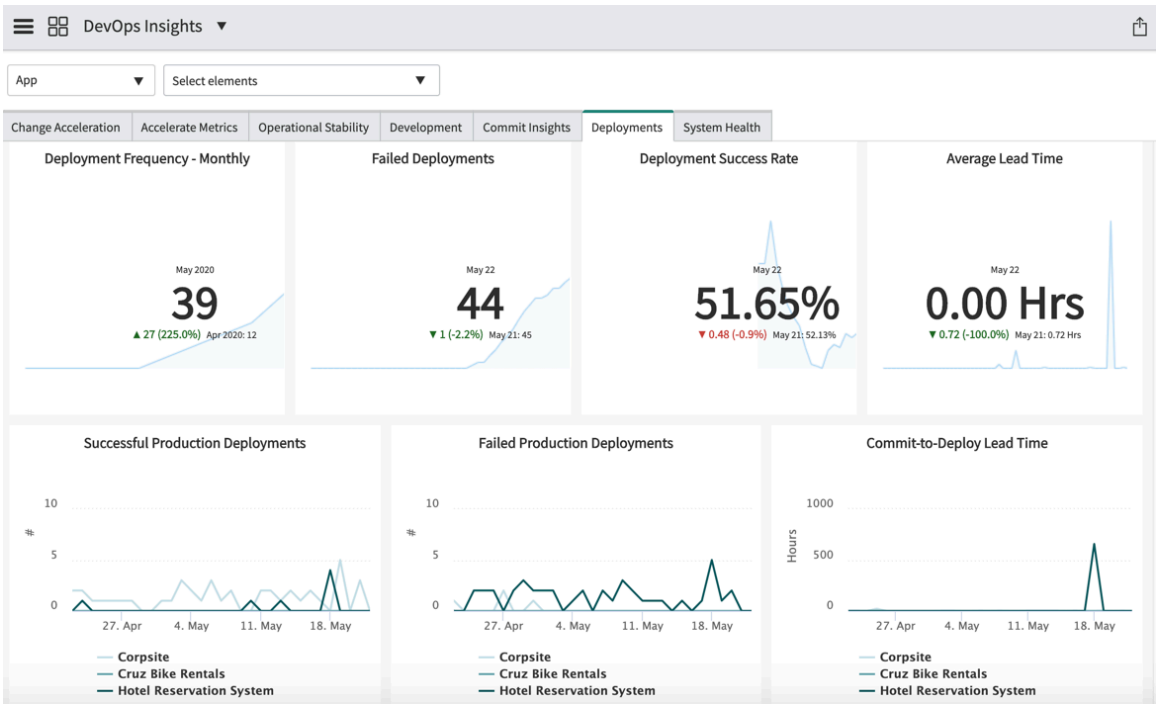
Commit Insights (continued)

Report	Source list	Description
		Note: Filter is not applicable to this widget.

Deployments



Deployment frequency lets you know how often you are delivering value based on production deployments. Typically, more frequent deployments are desired.

Note:
Metrics are based off production deployments (**Type** field is set to Prod Deploy in the app step).

Deployments

Report	Source list	Description
Deployment Frequency - Monthly	Step Execution	Number of successful production deployments in a month. Applies to steps of type **Prod Deploy** that are in completed state.
Failed Deployments	Step Execution	Number of failed production deployments in the last 30 days.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deployments (continued)

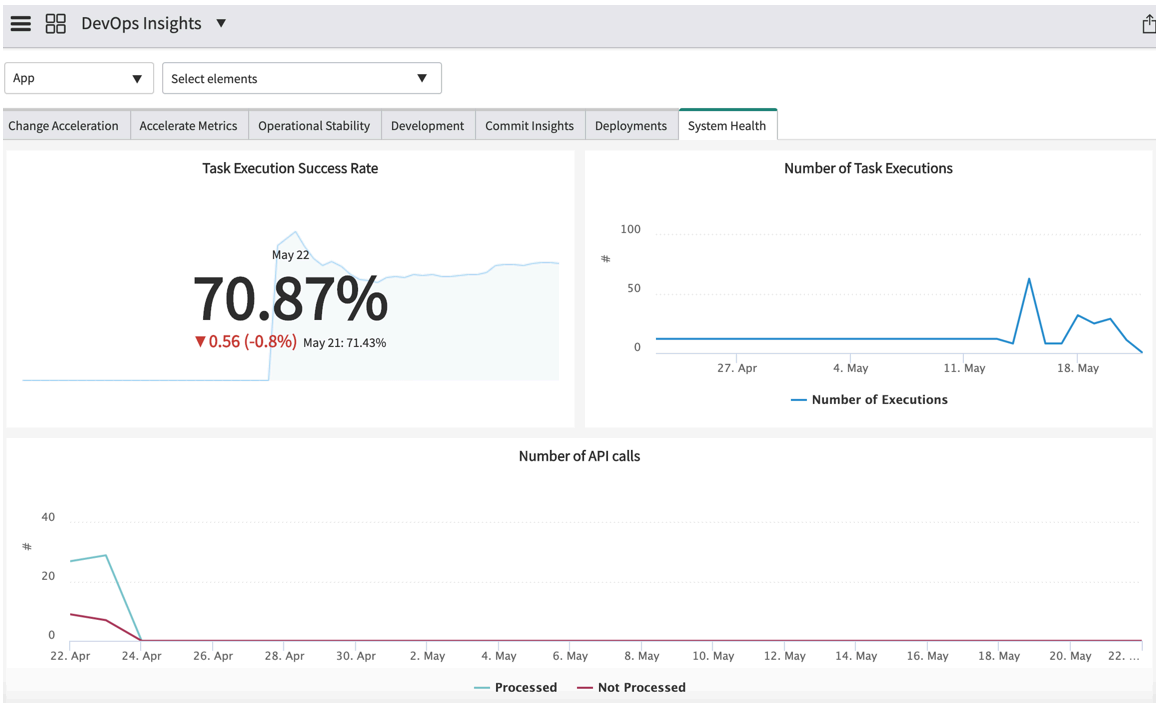
Report	Source list	Description
		Applies to steps of type **Prod Deploy** that are in failed or user-canceled state.
Deployment Success Rate	Step Execution	Deployments success rate over the last 30 days. Deployment Success Rate = (Number of Successful Deployments in the last 30 days / Total Number of Deployments in the last 30 days) * 100 Applies to steps of type **Prod Deploy** in completed state. **Note:** This widget uses formula and does not support multi-element selection.
Average Lead Time	Pipeline Execution	Average of: ([Time the code is successfully pushed to production] - [Earliest commit time]) Applies to steps of type **Prod Deploy** that are in completed state. **Note:** This widget uses average aggregation and does not support multi-element selection.
Successful Production Deployments	Step Execution	Frequency of successful production deployments over time broken down by app. More frequent production deployments are preferred.
Failed Production Deployments	Step Execution	Frequency of failed production deployments over time broken down by app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Deployments (continued)

Report	Source list	Description
Commit-to-Deploy Lead Time	Pipeline Execution	Duration from the earliest commit time to production deployment (for a successful pipeline execution). Minimizing the time it takes from committing code to successfully running it in production is preferable. When the lead time is high, you can investigate the pipeline to identify the slowest steps. For example, a manual change approval process could increase lead time.

System Health



System Health

Report	Source list	Description
Task Execution Success Rate	Task Executions	Success rate for tasks run by the execution tools over time: [[Task Execution Success]] / [[Task Execution]] * 100

Exploring DevOps Config

Use DevOps Config to store and manage all of your config data as a single source of truth. You can also use DevOps Config to validate your config data before deployment, and resolve conflicts in deployed config data.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

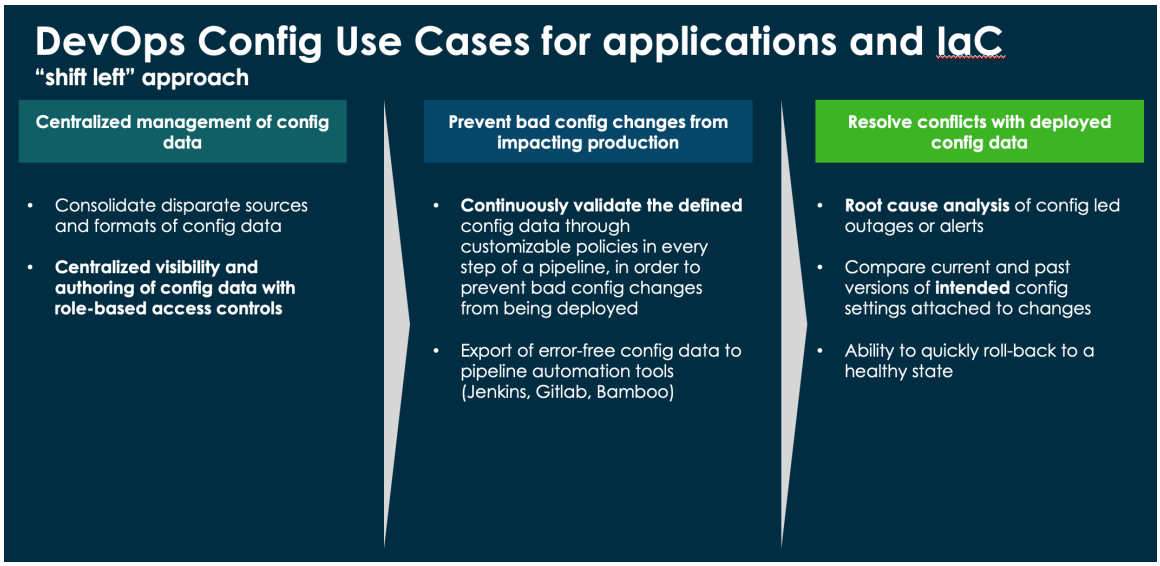
Watch this short video to see how config data snapshots in DevOps Config can help you identify issues caused by unintended config data changes.

DevOps Config investigation with config data

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use root cause analysis of configuration-related outages or alerts to quickly identify and resolve unintended config data changes, also known as configuration "drift." Compare current and past versions of intended config data changes attached to change requests, and roll back to the desired state when needed.

For more information, see Investigate an alert that involves a change to config data.



Manage your configuration data

DevOps Config becomes the single source of truth for your configuration data, rather than the source tool. A consolidated model manages and secures config data across multiple sources with role-based access control.

Although DevOps Config prevents non-compliant changes by validating your configuration data before deployment, security of the configuration data can't be enforced if the data is kept at the source and not stored in DevOps Config.

- Workflow

  DevOps Config manages all your data in one location, validates it as it's written, and exports, when needed.

- DevOps Engineer persona

  Use DevOps Config and DevOps Config API to manage and validate configuration data. Thus, enabling DevOps teams to release at a faster speed, ensuring that no risky or non-compliant changes are introduced in production.

  Use automated gates in a CI/CD pipeline or deployment script so that a deployment is stopped if any change to the application or infrastructure configuration is deemed risky or non-compliant.

  Manage DevOps Config as more policies are added and more exporters are defined.

Validate your configuration data

DevOps Config acts as a test tool by automatically validating your configuration data before deployment to prevent non-compliant changes, while ensuring adherence to policy frameworks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Validation before deployment occurs by executing policies on the configuration data. The DevOps Config Policy content pack includes generic policies that check for standard issues, but can be customized based on use case.

- Workflow

  When configuration data is changed or added, DevOps Config runs policies on the configuration data that's stored across multiple sources, validates it, and returns the outcome.

  In the pipeline, the decision on whether to deploy is made, and the configuration data is retrieved from the source (Git, for example) to deploy.

- App Engineer (or IT infrastructure owner) persona

  Use DevOps Config to validate configuration data. Thus, making sure no risks are introduced and that all changes are compliant with company policies before any changes are applied in a production environment.

  Since the tool integrates with the existing toolset, there's no change to the way work is done and there are no new tools to learn. Changes made to configuration data are validated in the background, and when the outcome is reported, action can be taken.

DevOps Config and DevOps Change Velocity

DevOps Change Velocity collects data from all of your DevOps tools, providing visibility across the entire lifecycle of deployment, while DevOps Config manages and validates your DevOps configuration data.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

DevOps Change Velocity is a horizontal solution orchestrating on top of all of your separate DevOps tools. DevOps Change Velocity features change acceleration and can pause your pipeline. DevOps Config serves a different purpose.

DevOps Config is a point solution that functions as one of your DevOps tools, managing and testing your configuration data prior to production.

DevOps Config works better together with DevOps Change Velocity

Use DevOps Config with DevOps Change Velocity to manage and validate configuration data collected by DevOps Change Velocity.

DevOps Change Velocity is an umbrella product that sits on top of your entire release pipeline (planning, coding, testing, orchestration tools) as your application supply chain (value stream map).

DevOps Config manages, validates, and provides results on how your application and infrastructure are configured, which are the elements instrumented in DevOps Change Velocity.

DevOps Change Velocity and DevOps Config are synced by app object.

With the DevOps Change Velocity change control feature, a change request is created for DevOps Config configuration changes.

In DevOps Change Velocity, navigate to **DevOps** > **Orchestrate** > **Pipeline Change Requests** to view and approve DevOps change requests created by DevOps Config changes. CDM snapshots are listed in the **Config data** related list of the DevOps change request.

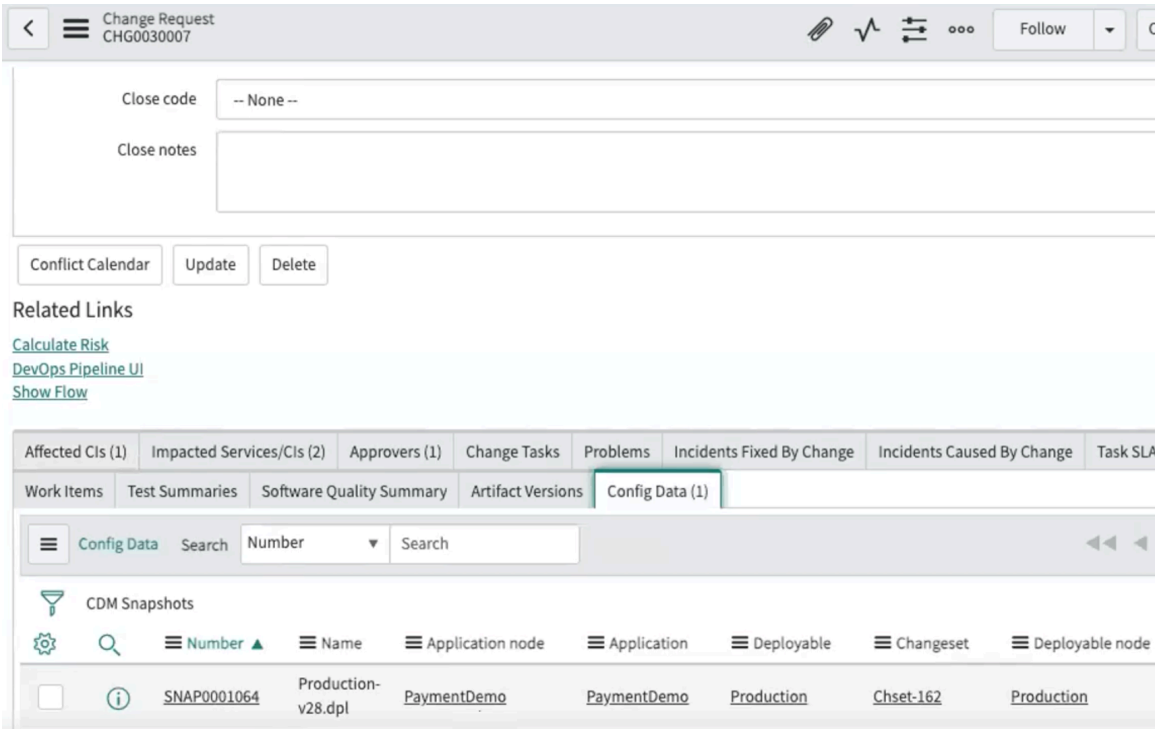
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



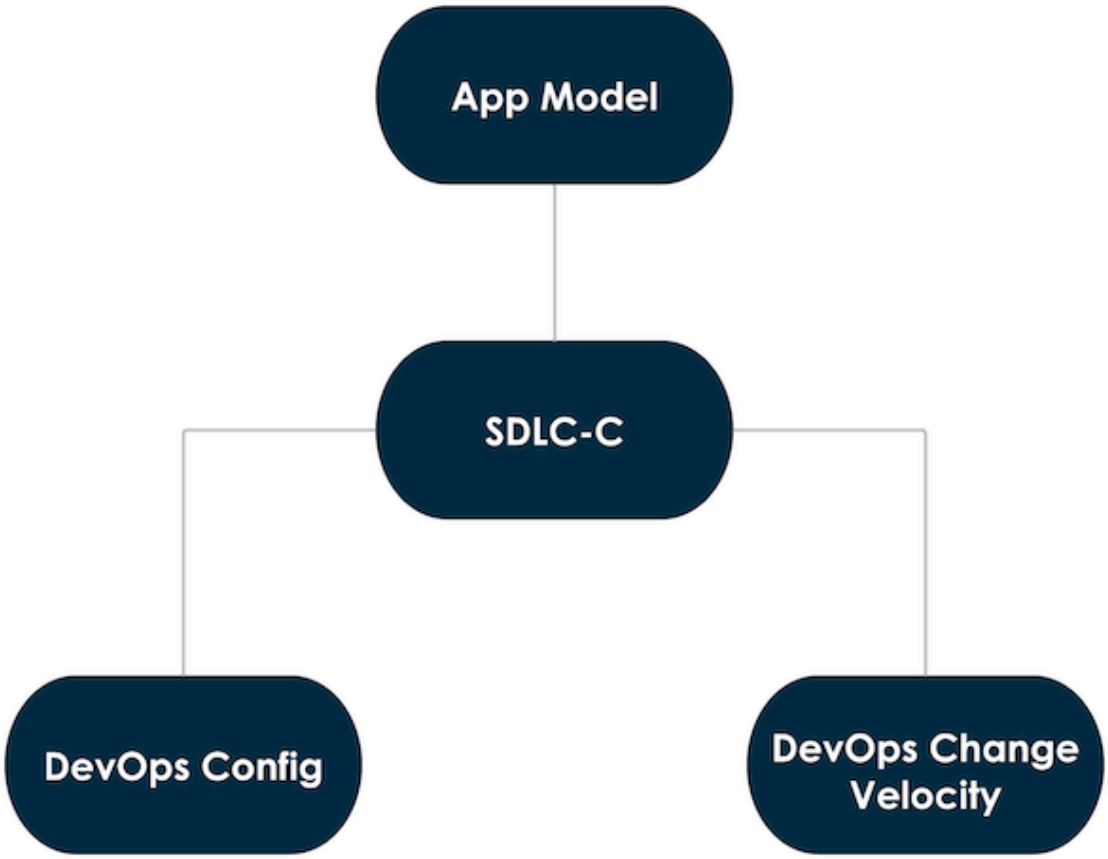
Using an app in DevOps Config

When you create an app in DevOps Config, not only is it the container for the config data of the application, but the application model you choose links DevOps Config with other ServiceNow products, including DevOps Change Velocity.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Each application model has an SDLC Component of the CMDB that is the link between ServiceNow DevOps pipeline products.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



When you create an app in DevOps Config, it's synced with DevOps Change Velocity. Updates and deletions to the app made in either application are also synced.

Note:
An SDLC-C cannot be deleted if there is a DevOps Config or DevOps Change Velocity app associated with it.

Related entities and attributes

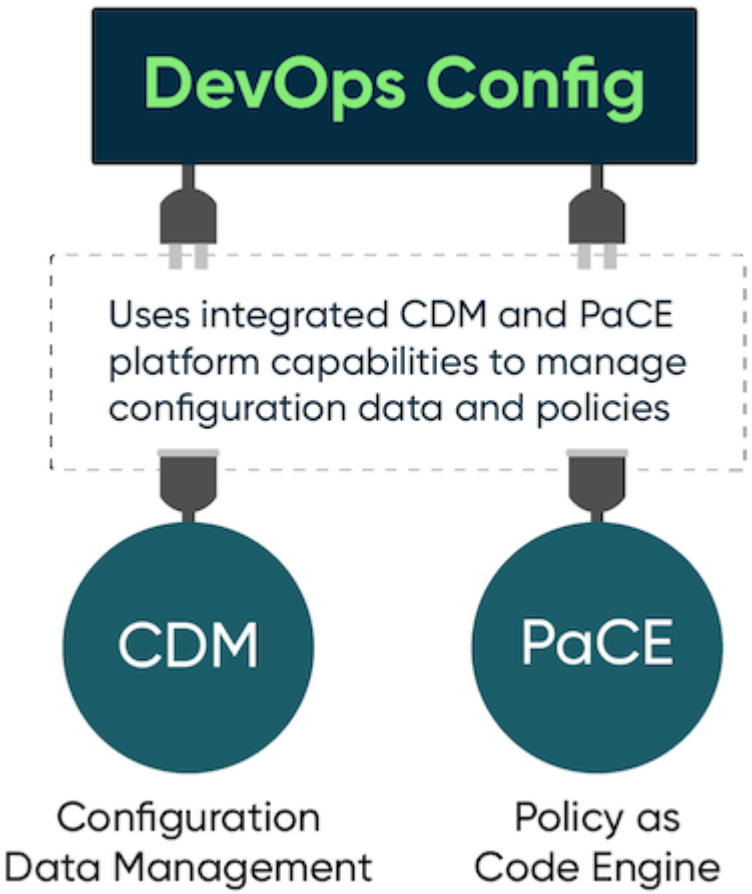
DevOps Config powered by CDM and PaCE

DevOps Config uses Configuration Data Management and Policy as Code Engine platform capabilities to manage configuration data and policies.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

DevOps Config platform capabilities



Configuration Data Management (CDM)

CDM is one of two main capabilities in the DevOps Config product. The CDM plugin manages application and/or infrastructure configuration data within the ServiceNow AI Platform.

CDM consists of the backend tables and logic that handles all aspects of an application configuration data model. The workspace pages that users interact with to manage their data model are also managed by this plugin.

The CDM Context Menu Component plugin is a sub-component of the CDM plugin. It provides the context (for example, three dot) menu for the node list pane in the Config Data tab for an application.

Policy as Code Engine (PaCE)

PaCE is the second main capability in the DevOps Config product. It provides a robust policy engine that uses a policy script (written in javascript) to evaluate a snapshot of configuration data and verifies compliance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

PaCE provides of a comprehensive versioning system so users can audit their policy changes over time. It also contains a test playground to evaluate potential policy script changes before going live with user configuration data.

DevOps Config core application

DevOps Config

DevOps Config is the main application for the DevOps Config product.

The DevOps Config application consists of the workspace that connects users into their data model to manage their config data per application, manage policies to validate their config data, and review the health of their application configuration data.

The Insights dashboard widgets lets users gain insights on their configuration data acumen, and build better habits in managing their configuration data.

DevOps Config content packs

DevOps Config Exporter Content Pack (Optional)

The DevOps Exporter Content Pack is an optional plugin that contains curated exporters that the DevOps Config team created and that users can leverage out-of-the-box to export the config data from their snapshots as they see fit.

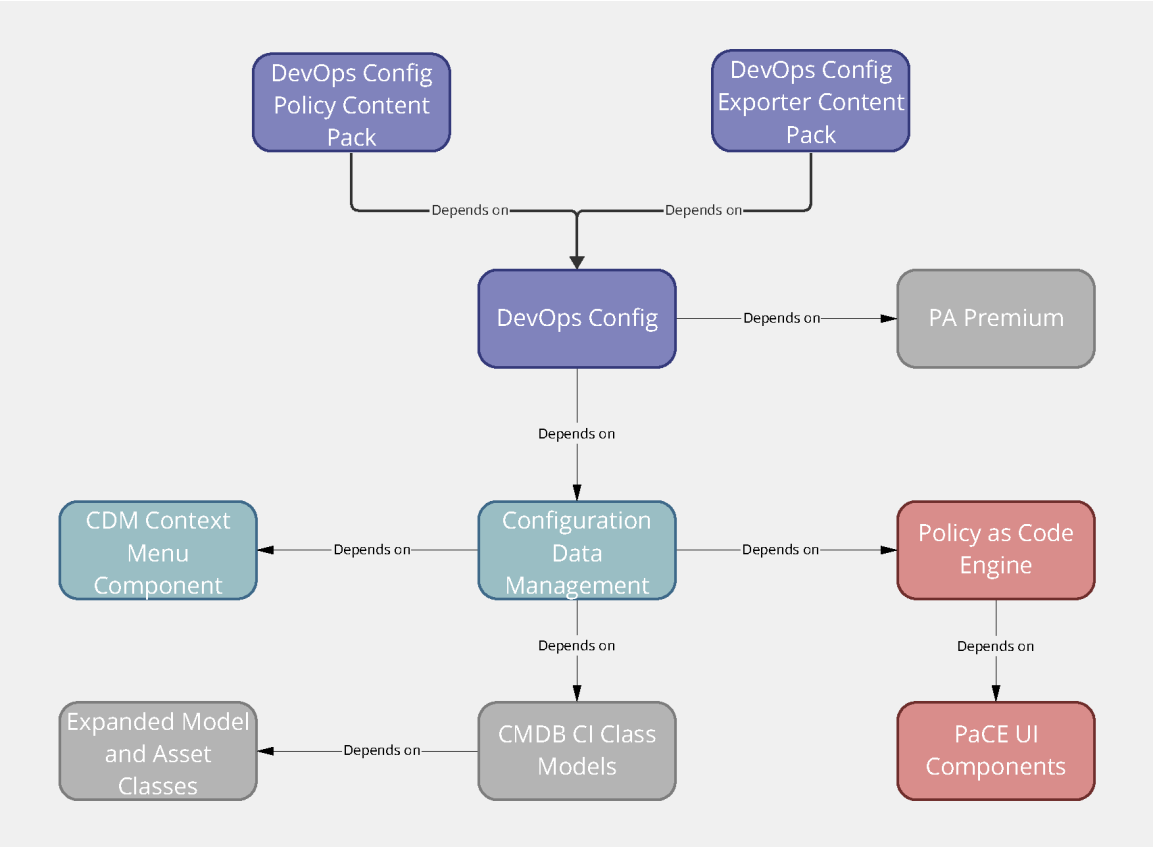
DevOps Config Policy Content Pack (Optional)

The DevOps Config Policy Content Pack is an optional plugin that contains curated policies that the DevOps Config team created and that users can leverage out-of-the-box so they can get to validating their config data right away.

Note:
if users install either of these optional plugins first, they will get DevOps Config and all Dependencies plugins automatically installed as well.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps Config dependencies



These plugins are installed with core DevOps Config applications. They are critical to DevOps Config and do not function properly without them.

CMDB CI Class Models

CDM leverages the CMDB CI Class Models plugin to connect aspects of user application configuration data model to the ServiceNow AI Platform CMDB.

Applications are linked to an Application Model, which is part of the Build phase of the Common Service Data Model (CSDM). Similarly, deployables are linked to an Application Service, which is part of the Operations phase of the CSDM.

The link between DevOps Config and the CSDM is critical for solving problems that may arise across a user software factory.

For example, an operator is able to trace the cause for an alert for a particular CI, to a configuration change, to an application service (of which that CI is a part). This can reduce mean time to resolution, or MTTR, from hours to minutes.

PA Premium

Performance Analytics (PA) Premium plugin is leveraged by the DevOps Config Insights plugin to allow for more than 180 days of reporting data for all DevOps Config Insights widgets.

Expanded Model and Asset Classes

The Expanded Model and Asset Classes Store application adds enterprise model and asset classes that extend out-of-the-box product model and asset classes within the Configuration Management Database (CMDB) class hierarchy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

These extensions include class descriptions, identification rules, identifier entries, and dependent relationships.

DevOps Config terms

These are some of the common DevOps Config terms.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

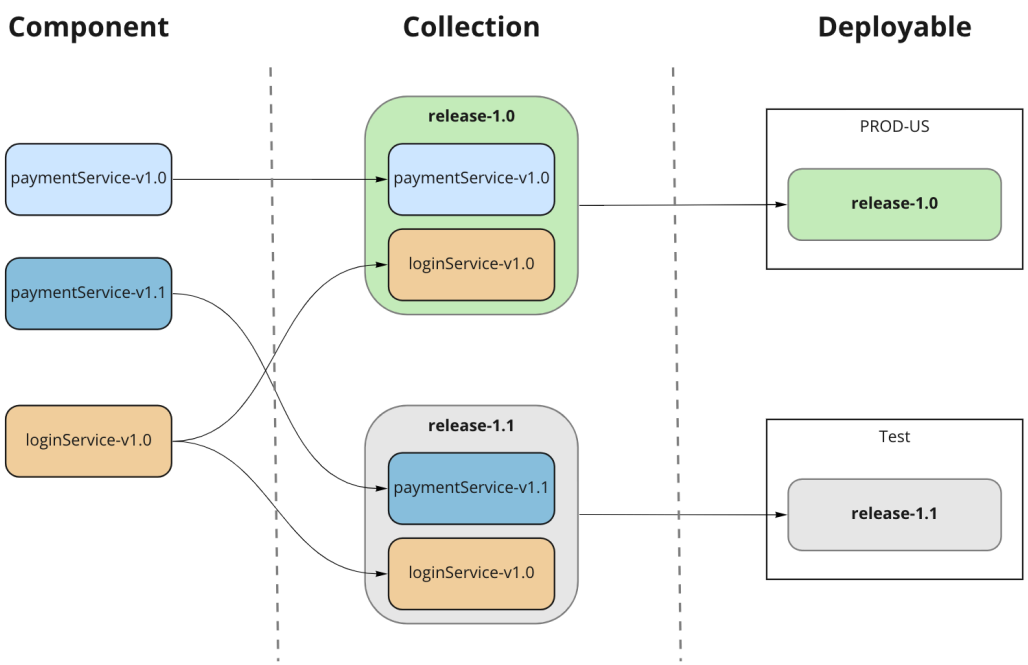
Application

The logical composition of an application or application stack, containing the relevant configuration data needed to provision or deploy into a fleet. This can range from a traditional, monolithic structure to a modern structure that can contain multiple micro-services.

Collection

A set of components that make up a release composition. Collections are included into deployables, and can be used to test different versions of components.

This example shows release-1.0 of an application that is currently deployed to the Production environment.



The microservice team that owns the payment service makes a hotfix and decides to add that into a release-1.1 collection that they are now testing in their Test environment.

Component

The smallest aggregation unit of configuration data. A microservice that is part of a larger application stack is an example of a component.

Configuration Data Item (CDI)

A single unit of configuration data (for example, connection string, heap size, etc.) that is stored as a key-value pair.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data Model

A hierarchy of related configuration data used to deploy an application or infrastructure.

Deployable

A subset of the data model, which encapsulates the set of configuration data that is used to deploy/provision an application or infrastructure for a specific target environment. It generally shares the same nomenclature (for example, Production, Staging, Test, Development, etc.).

Snapshot

The complete data model of a deployable at the time a configuration change is committed. This includes any included components, collections, and vars, as well as deployable-specific vars and overrides.

Vars

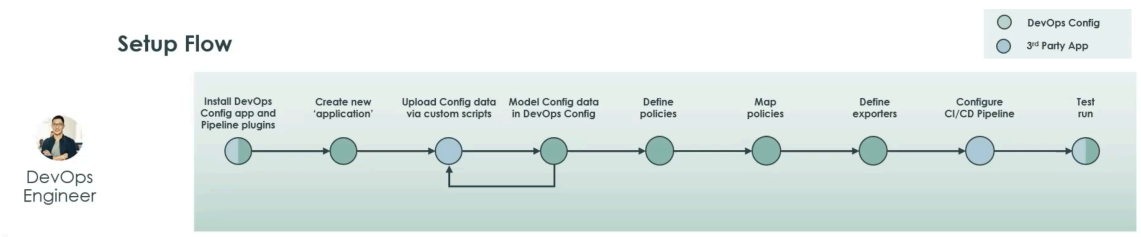
Variable configuration data that can be used to roll up configuration values that are used multiple times throughout different sections in the data model.

Vars created at the component level can be reused anywhere further down, like in a collection and/or deployable. However, vars defined in a particular deployable are intended to be used only in that context (for example, environment-specific creds, memory settings, etc.).

Configuring DevOps Config

The DevOps engineer role installs and sets up DevOps Config, which is used to validate config data (committed by developers, or app engineers) before deployment.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.



Data validation configuration tasks	(Optional) Advanced configuration tasks to extend the use of the data model
1. Install DevOps Config. Install DevOps Config application, content packs, and pipeline plugins. • DevOps Config application. • (Optional) DevOps Config Policy content pack. • (Optional) DevOps Config Exporter content pack.	N/A

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data validation configuration tasks	(Optional) Advanced configuration tasks to extend the use of the data model

• (Optional) Pipeline integration with DevOps Config.
  ○ Argo CD plugin for ServiceNow DevOps
  ○ ServiceNow DevOps extension for Azure DevOps.
  ○ Jenkins plugin for ServiceNow DevOps.	

2. Create an application in DevOps Config. Create an application to set up the entity, and link between ServiceNow products.	N/A
3. Create a deployable in DevOps Config. Create a deployable to define the environments to deploy the configuration data for your application (typically Dev, Test, and Production).	Extend the use of the data model by using components and collections for a deployable in DevOps Config.
4. Upload your configuration data. Upload your configuration data from each tool source to DevOps Config by creating and running an import script.	Upload configuration data depending on use case.
5. Define policies in DevOps Config. Define policies to run for validation of config data using default DevOps Config policies.	Administrate the full life cycle of PaCE policies and create your own.
6. Map policies to a deployable. Map policies to a deployable to run for validation of config data.	Extend the use of the data model by mapping policies to components and collections in DevOps Config.
7. Define exporters in DevOps Config. Define exporters to export config data to your pipeline using default DevOps Config exporters.	• Export config data for use by your deployment tools downstream in your CI/CD pipeline. • Extend the use of the data model by creating a custom exporter.
8. Configure your pipeline in DevOps Config. Configure your pipeline to interact with your data model.	N/A

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data validation configuration tasks	(Optional) Advanced configuration tasks to extend the use of the data model
Use DevOps Config Azure DevOps pipeline tasks and Jenkins pipeline actions to integrate your pipeline with DevOps Config.	
9. Run validation in DevOps Config. Run validation and review the results.	N/A

Install DevOps Config

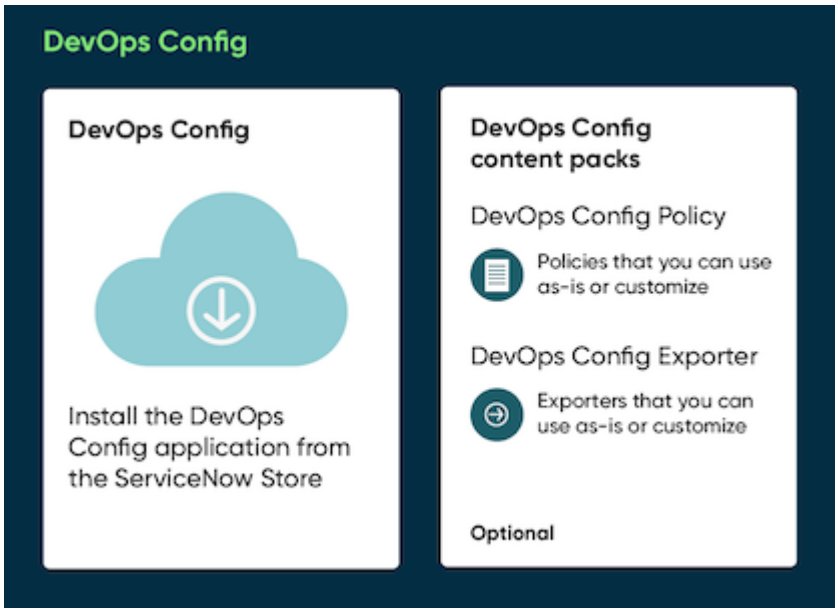
Install the DevOps Config application from ServiceNow Store applications. Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Role required: admin

About this task



Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Click the **Not Installed** tab to view a list of applications available for installation.
3. Locate the DevOps Config application and click **Install**.
   Configuration Data Management and Policy as Code Engine platform capabilities are also installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install DevOps Config Policy content pack

Install DevOps Config Policy content pack for a default set of DevOps Config policies that you can use as-is, or customize for your needs.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Note:
You must install the DevOps Config application before installing the DevOps Config Policy content pack.

Role required: admin

About this task

The DevOps Config Policy content pack contains a set of default DevOps Config policies to validate your configuration data.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Click the **Not Installed** tab to view a list of applications available for installation.
3. Locate the DevOps Config Policy content pack and click **Install**.

Install DevOps Config Exporter content pack

Install DevOps Config Exporter content pack for a default set of DevOps Config exporters that you can use as-is, or customize for your needs.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Note:
You must install the DevOps Config application before installing the DevOps Config Exporter content pack.

Role required: admin

About this task

The DevOps Config Exporter content pack contains a set of Default DevOps Config exporters to export your configuration data.

Procedure

1. Navigate to **System Applications** > **All Available Applications** > **All**.
2. Click the **Not Installed** tab to view a list of applications available for installation.
3. Locate the DevOps Config Exporter content pack and click **Install**.

Create an application in DevOps Config

Create an app in DevOps Config to manage its configuration data, and link DevOps Config with other ServiceNow products, including DevOps Change Velocity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

An admin can create, edit, delete, and view DevOps Config apps.

Role required: sn_devops_config.admin

About this task

Watch this short video to see how to create an application in DevOps Config.

Create an application in DevOps Config

An app in DevOps Config is the container for the config data of an application. An app also ties it with the DevOps Change Velocity application, where configuration data can be viewed in the DevOps Pipeline UI.

In DevOps Change Velocity, an app links work items, code commits and CI/CD pipeline executions together in the DevOps data model, which is displayed in change request, as well as the DevOps Insights dashboard.

Apps in the DevOps Config application and in the DevOps Change Velocity application are synced. Meaning, when an app is created in DevOps Config, it is also created in DevOps Change Velocity, if installed, and vice versa.

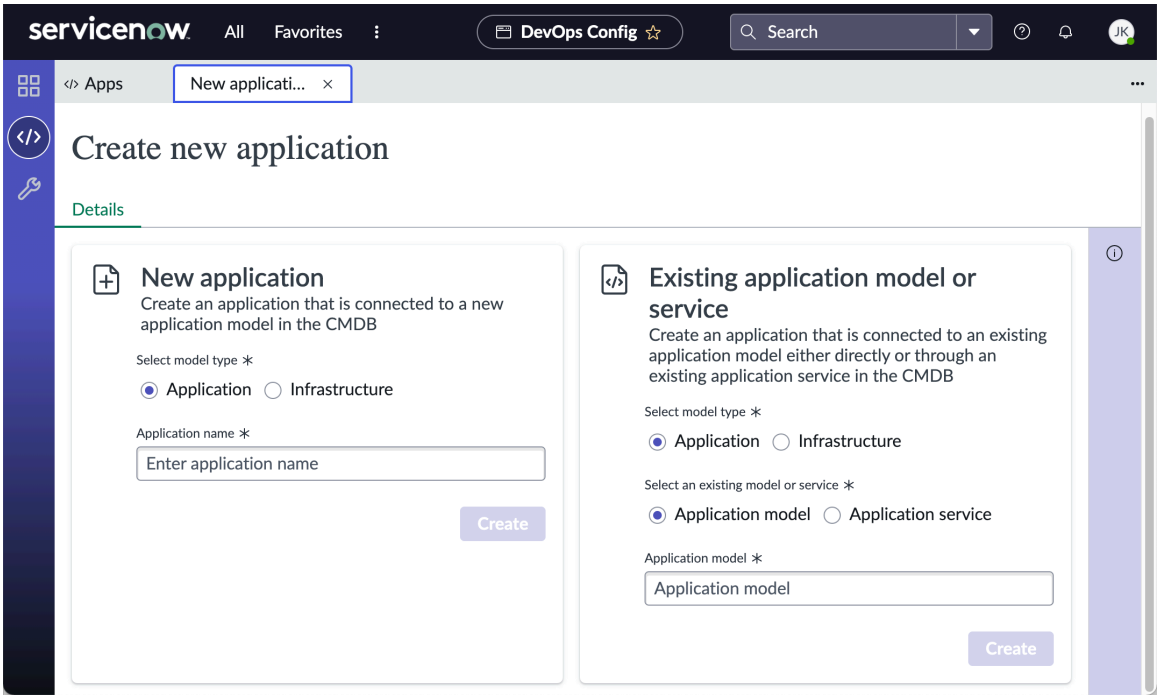
You can edit or delete apps in DevOps Config. When you delete an app:

- In DevOps Config, the state of the application is set to **Inactive** and is no longer accessible in DevOps Config.
- In DevOps Change Velocity, it's also deleted in DevOps Config (if installed).

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Click the apps icon (</>) in the left navigation to open the Apps tab.
3. On the Applications form, click **New** to create an application and a new model, or to create an application and specify an existing model (or service).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For a **New application** without an existing application model, both application and model are created.

For a new application to be tied to an **Existing application model or service**, only the application is created.

The CSDM application model (name, owner, manufacturer) functions as the link between ServiceNow DevOps products. There is an SDLC Component of the CMDB for each CSDM application model.

4. In the **Overview** tab, fill in the Application details and select **Save**.

Maintained by	User groups that maintain the application. With the cdm_admin role, you can add or remove any user groups. If groups you're a member of are removed, you will lose access to the application. **Note:** A user with cdm_all_app_access and one of the other roles (cdm_admin, cdm_editor, or cdm_viewer) can see and manage the application even if they are not in those groups. For more information, see Roles in CDM.
Application description	Description of the application.
Application model owner	Username who owns the application model.
Manufacturer	Manufacturer of the application.

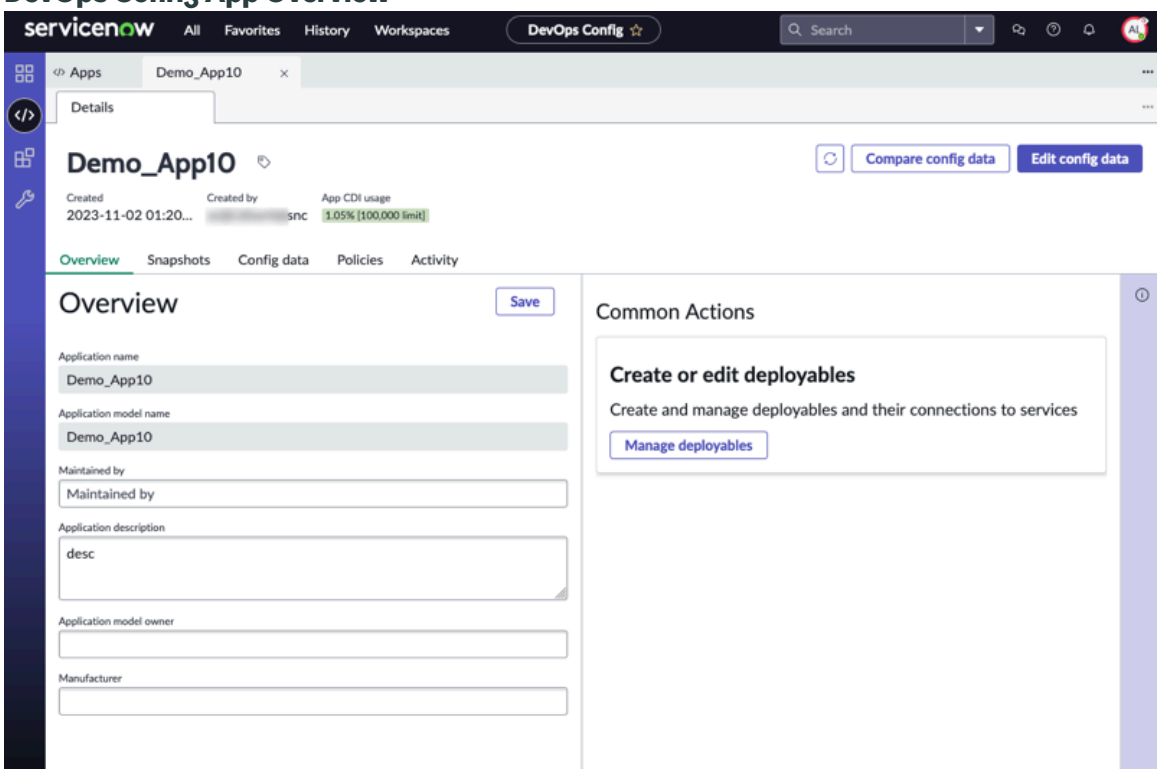
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The application does not yet contain config data, so the next step is to import your existing config data into the application.

After you have imported config data and snapshots are generated, the list of snapshots are displayed in the **Overview** tab.

Example:

DevOps Config App Overview



Create a CDM application that generates a new service in the CMDB

Generate a new service (an application service, application model, or dynamic CI group [infrastructure application type]) in the CMDB) and create a CDM application as the container for the config data for the service.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Admin [sn_cdm.cdm_admin]

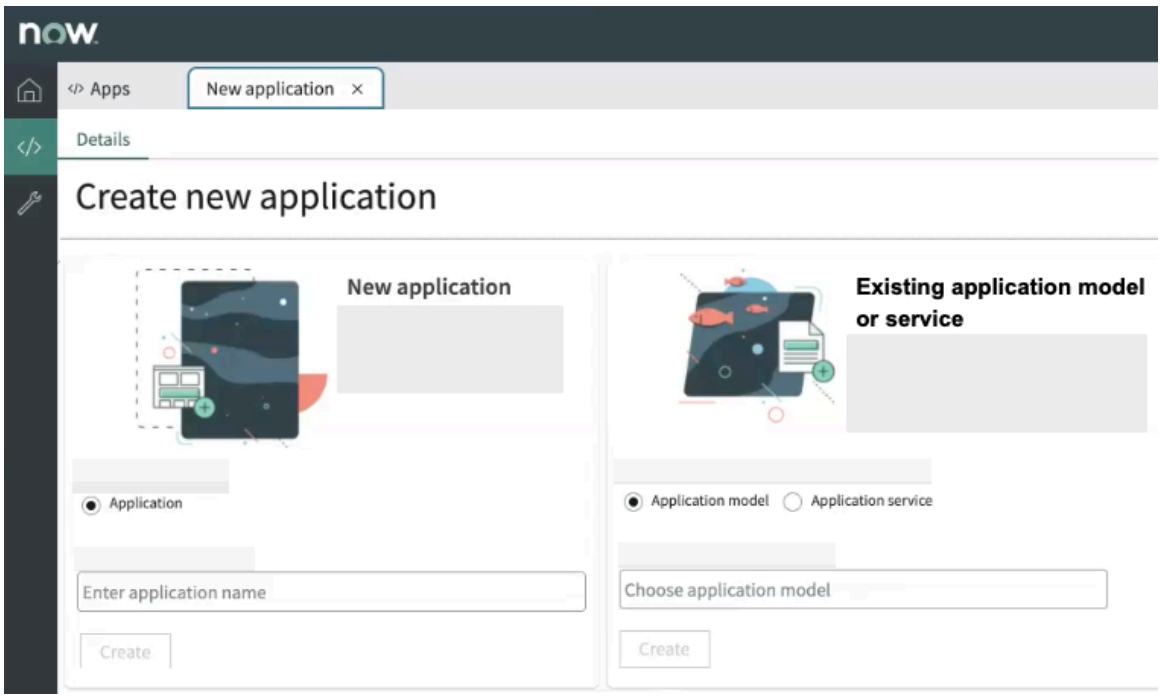
About this task

For the application, you specify the number of deployables to generate and the SDLC environment that the deployables represent. When you upload existing config data into the application, the system maps the data as `[name:value]` pairs (config data items — CDIs) in the appropriate node in the data structure of the CDM application. For an overview of the process of preparing a new application to receive config data, see Preparing an application for config data upload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select the **Applications** icon ( ) to open the Create new application page and then select **New application**.



2. On the **Overview** tab for the new CDM application, fill in additional application details that further identify the service in the CDM.

   The CSDM application model (name, owner, manufacturer) functions as the link between DevOps features. There is an SDLC component of the CDM for each CSDM application model.

Application settings on the Details tab

Application name	Unique and meaningful name for the application.
Application model name	Name of the application model.
Maintained by	Groups with access to the application. Only members of these groups can access the application data.
Application description	Description that helps other users understand the purpose, scope, and intent of the application.
Application model owner	Name of the owner of the application model.
Manufacturer	Manufacturer of the application.

3. Select **Manage deployables** to open the **Edit deployables** tab where you can configure the deployables.
4. Select **Create deployables** and then fill in the settings on the Create Deployables dialog box to specify the quantity and environment type of deployables to create and the CMDB services to connect them to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create Deployables settings

Field	Description
Environment	The kind of environment that is configured by the config data in the deployables. ○ Development ○ Test ○ Production
Connection preference	Option to connect the newly created deployables to the new services. Auto-connect is the only option when creating an application to an existing CMDB entry. **Note:** Because the DevOps pipeline applies config data in a deployable only to the services that the deployable is connected to, every deployable must be connected to a service.
Quantity	The number of deployables to create. Limit: 100.

When you select **Create**, the system generates an application model in the CMDB and the CDM application with the specified number and types of deployables. The system auto-generates names of the form <AppName_EnvironmentType_number>.

5. On the **Edit deployables** tab, select the card for each deployable in turn and update its settings.

   You connect each deployable to a service in the CMDB. The deployable holds the config data for its associated service.

   The system auto-saves your updates to settings.

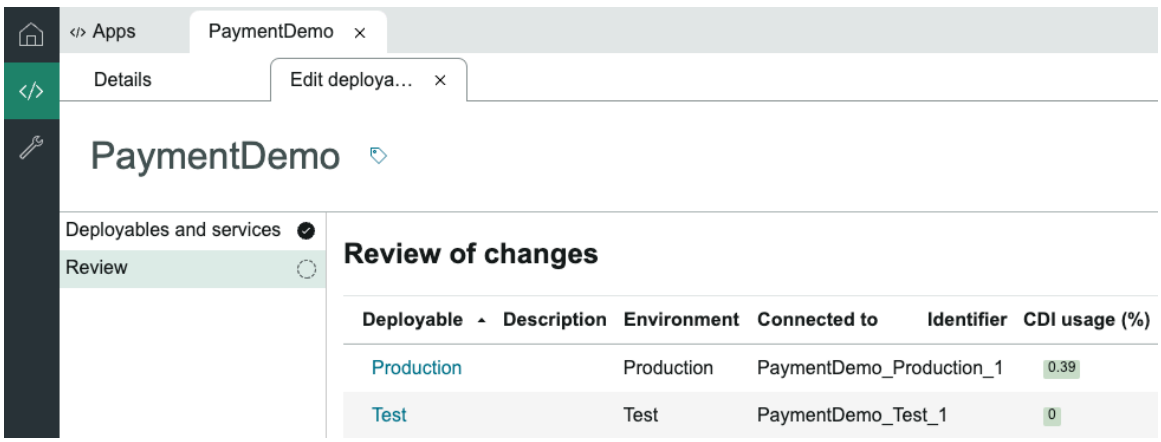
Deployable details settings

Field	Description
Deployable name	Default name for the deployable. To ensure that the auto-generated names are unique, the system adds a timestamp. Rename as needed.
Deployable description	Description that helps other users understand the purpose, scope, and intent of the deployable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Identifier	Unique identifier that distinguishes this deployable from other deployables that share the same name and possibly many config data settings. For example, the production deployable that has the identifier **Pacific** might have different config settings for the `language` setting than the deployable that has the identifier **EU**.
Connected to	Service in the CMDB that the deployable is associated with. Select a service in the **Available services** list. Perform one of the following actions: ○ Link the deployable to a CI in the CMDB: Select the cmdb_ci and then select **Next**. ○ Create a CI to link to: Select **New**, define the CI, and then select **Next**. **Note:** To continue, you must connect each deployable to a service.

6. Click **Next** to view the list of deployables on the **Edit deployables** tab.



What to do next

The application is not yet structured to accept config data, so the next step is to add the data structure. See Add the nodes that will contain config data to a new CDM application.

Create a CDM application that is based on an existing service in the CMDB

Create an application as the container for all config data for a service (an application service, application model, or dynamic CI group [infrastructure] in the CMDB).

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

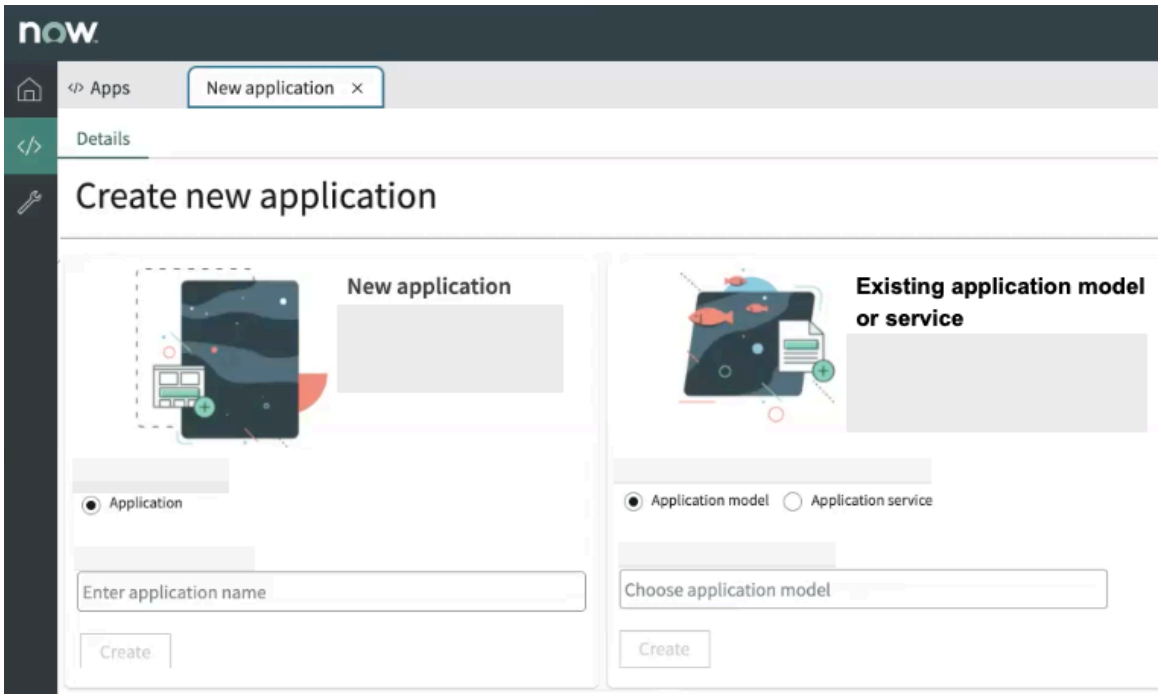
Role required: CDM Admin [sn_cdm.cdm_admin]

About this task

For the application, you specify the number of deployables to generate and the SDLC environment that the deployables represent. When you upload existing config data into the application, the system maps the data as `[name:value]` pairs (config data items — CDIs) in the appropriate node in the data structure of the CDM application. For an overview of the process of preparing a new application to receive config data, see Preparing an application for config data upload.

Procedure

1. Select the Applications icon ( ) to open the Create new application page and then select **Application based on existing services** to specify the CMDB service that the new application will hold config data for.



2. Fill in the settings on the Create Deployables dialog box to specify the quantity and environment type of the deployables and the CMDB services to connect them to.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Create Deployables settings

Field	Description
Environment	The kind of code environment that is configured by the config data in the deployable. ○ Production ○ Development ○ Test
Connection preference	Option to connect the newly created deployables to services. ○ Auto-connect each new deployable to a service in the application model or dynamic CI group. ○ Manually specify the service to connect each new deployable to. You make the connections on the next page. **Note:** Because the DevOps pipeline applies config data in a deployable only to the services that the deployable is connected to, every deployable must be connected to a service.
Quantity	The number of deployables to create. If the number exceeds the number of services that are associated with the existing item in the CMDB, then the system generates new blank services.

When you select **Create**, the system generates the application with the specified number and types of deployables and opens the **Edit deployables** tab for the application.

3. Select **Manage deployables** to open the **Edit deployables** tab where you can configure the deployables.
4. On the **Edit deployables** tab, update the settings for each deployable and then select **Next**. You connect each deployable to a service in the CMDB. The deployable holds the config data for its associated service.

   The system auto-saves your updates to settings.

Deployable details settings

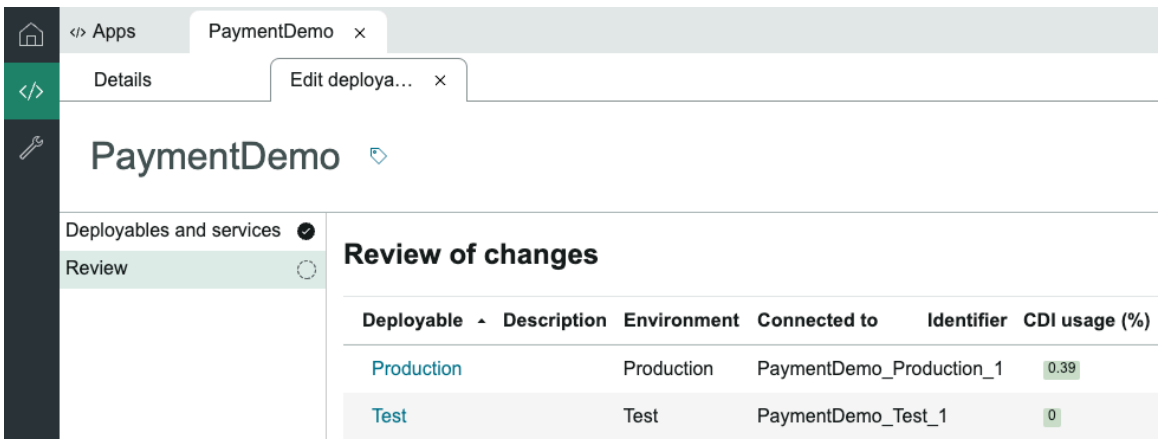
Field	Description
Deployable name	Default name for the deployable that the system generates. Rename as needed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Deployable description	Description that helps other users understand the purpose, scope, and intent of the deployable.
Identifier	Unique identifier that distinguishes this deployable from other deployables that share the same name and possibly many config data settings. For example, the production deployable that has the identifier **Uraguay** might have different config settings for the `currency` setting than the deployable that has the identifier **Greenland**.
Connected to	Service in the CMDB that is configured by the data in snapshots of the deployable. Select a service in the **Available services** list. **Note:** To continue, you must connect each deployable to a service. Perform one of the following actions: ○ Connect the deployable to a CI in the CMDB: Select the cmdb_ci and then select **Next**. ○ Create a CI to connect to: Select **New**, define the CI, and then select **Next**.

The Review page opens.

5. Click **Next** to view the list of deployables on the **Edit deployables** tab.



What to do next

The application is not yet structured to accept config data, so the next step is to add the data structure. See Add the nodes that will contain config data to a new CDM application.

Create and update a deployable

Create a deployable while working in a changeset. You can add multiple components and collections to a deployable.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

Important:
Save your changes whenever you are confident of the changes and before you leave the **Config data** tab.

Note:
Uploaded data items are sorted alphabetically within the structural folders to enable you to locate particular items quickly.

The system places the following limits on the count of config data items (CDIs):

- An application can contain a maximum total of 100,000 CDIs.
- Any single deployable can contain a maximum of 10,000 CDIs.

See CDM system properties for information on configuring the *sn_cdm.max_allowed_cdi_per_application* and *sn_cdm.max_allowed_cdi_per_deployable* property settings.

Procedure

1. On the **Settings** tab for an application, select **Deployables** in the tree view and then select **New**.
2. Fill in the fields on the Enter details page of the wizard and then select **Next**.

Enter details page

Field	Description
Name	Unique and meaningful name for the deployable.

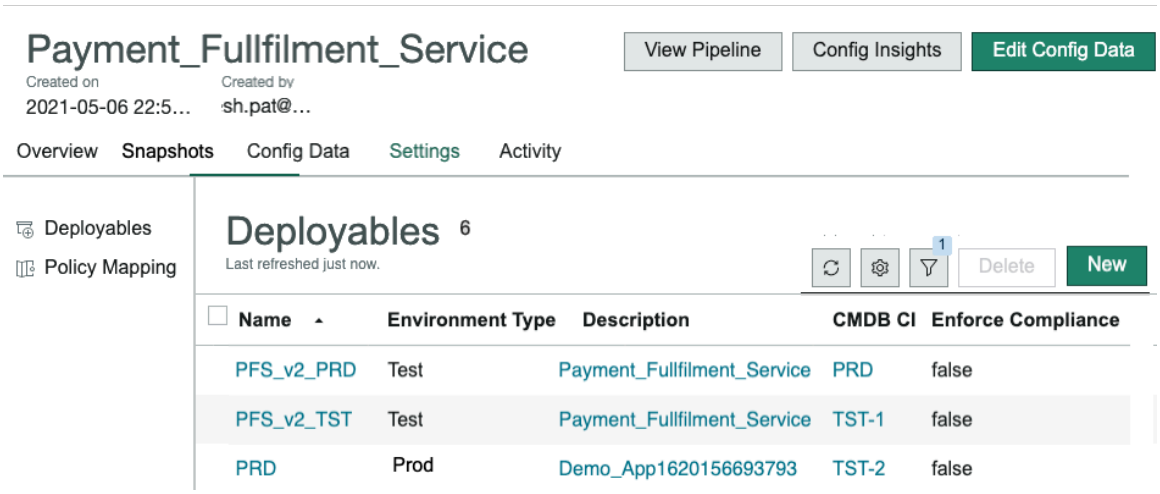
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Description	Description that helps other users understand the purpose, scope, and intent of the deployable.
Environment	The kind of application or infrastructure environment that the deployable implements. ○ Development ○ Production ○ Test
Restrict export	Option to ensure that only snapshots that pass validation can be exported.

The wizard moves to the Link to CMDB page of the wizard.

3. On the Link to CMDB page and perform either of the following actions:
   - Link the deployable to a CI in the CMDB: Select the cmdb_ci and then select **Next**.
   - Create a CI to link to: Select **New**, define the CI, and then select **Next**.

   The wizard moves to the Review page.
4. On the Review page, verify the settings for the new deployable.
   Select **Back** to change settings. Select **Create** to create the deployable.
   The system generates the deployable and displays it in the list on the **Settings** tab for the application.



5. **Optional:** Follow this procedure to add a collection to one or multiple deployables:

   a. For the collection node in the tree, select the menu icon (⋮) and select **Include in deployables**.

   b. Select all deployables in which to include the collection and then select **Include**.

   > **Note:**
   > Only deployables that do not already include the collection appear in the list.

   The collection is included in each selected deployable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) When you add a collection to a deployable, the Editor panel lists included collection names but not contents. The Preview panel displays the full state of the data.

6. **Optional:** Add CDI settings to the deployable that will override or overlay settings in components or collections.
   For more information, see Define or update a component, Define or update a collection in an application, or Create or update a variable CDI.
7. Select **Save** to save the changes in the changeset and ready the changes in the changeset to be committed.
   The Editor panel, List view, and Preview panel refreshes to reflect the resolved state of the changeset. The system updates the changeset but does not update the application. Changes appear on the **Activity** tab. You must commit a changeset to update the config data for the application. After saving, you can move on to other activities and return later to edit the changeset.
8. **Optional:** Select **Commit**.
   The Commit changeset dialog box opens and lists each deployable that is affected by the changes.

   Note:
   After you commit a changeset, the changeset cannot be modified.

   The system generates a snapshot of each deployable that is affected by the changes. The dialog box offers the following **Additional actions**:

   - If no deployables are affected by the changes, select **No additional actions**. The system will update the application to persist the changes.
   - - Select **Validate snapshots** to perform the following operations on all generated snapshots:
       - The system executes all policies that are statically or dynamically mapped to the associated deployable.
       - If the snapshot passes all policies, then the Validation status value is set to **Passed** and no entries are listed on the **Validation Results** tab. If validation was invoked with the **Publish Valid** publish option, then valid snapshots are auto-published.
       - If any policy encounters issues, then the Validation status value is set to **Failed**. The **Validation Results** tab displays all failures or warnings returned by policies.
       - If any policy failed to run to completion, then the Validation status value is set to **Execution error** and the **Validation Results** tab indicates that validation failed due to error.
     - Select **Validate and publish snapshots** to perform validation as described in the **Validate snapshots** action. Only snapshots that pass validation are published. Only published snapshots can be exported.

     Select **Commit**.
     - The system updates the application to persist the changes to config data.
     - The changeset state changes to **Committed**.
     - The changeset cannot be modified.
     - If snapshots were created, the confirmation message includes a link to the snapshots.
     - If an error occurs during the commit process, the changeset state is set to Commit failed.

What to do next

Map policies to the deployable

Delete a deployable

Delete a deployable to delete its config data and all associated snapshots.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Admin [sn_cdm.cdm_admin]

About this task

Note:
When you delete a deployable, existing snapshots cannot be exported or validated and cannot be referred to in exporters or policies.

Procedure

1. For an open application, select the **Settings** tab.
2. Select **Deployables** to view the list of deployables for the application.
3. Select one or more deployables and select **Delete**.
   - The deployables no longer appear in any list.
   - All config data in the deployables is deleted.
   - All existing snapshots are deleted.
   - You can create a new deployable with the same name as a deleted deployable.

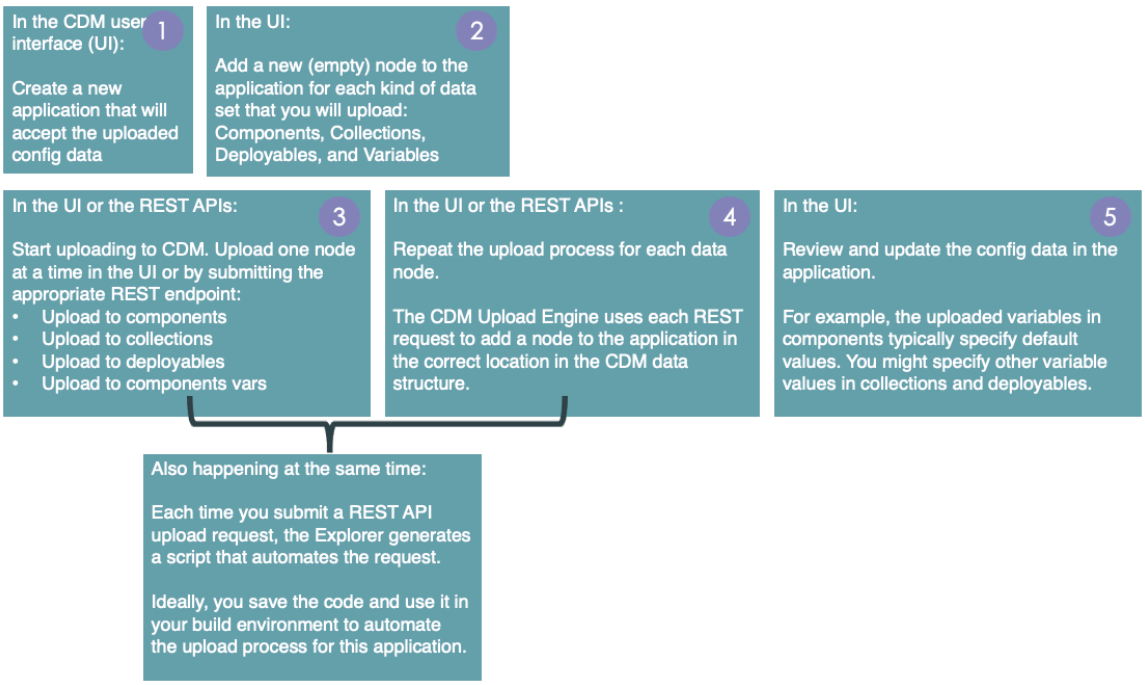
Uploading your config data

You first create a new CDM application structure and then upload the existing config data into the structure.

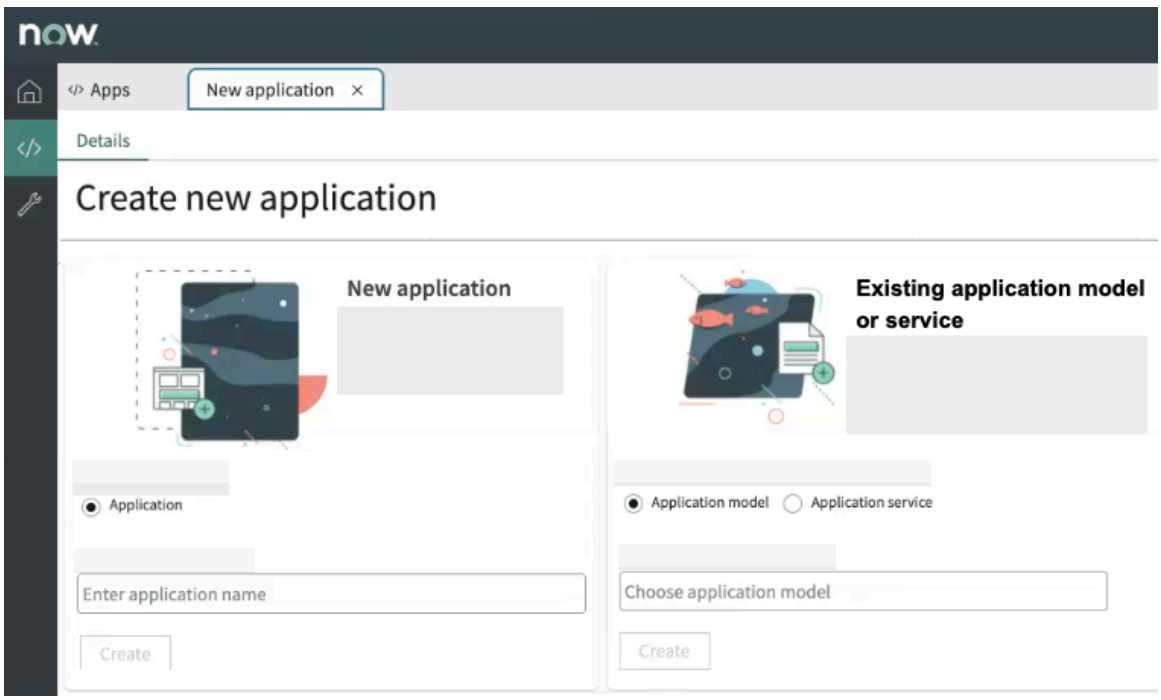
Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How it works: Performing the initial upload of your existing config data into CDM data tables

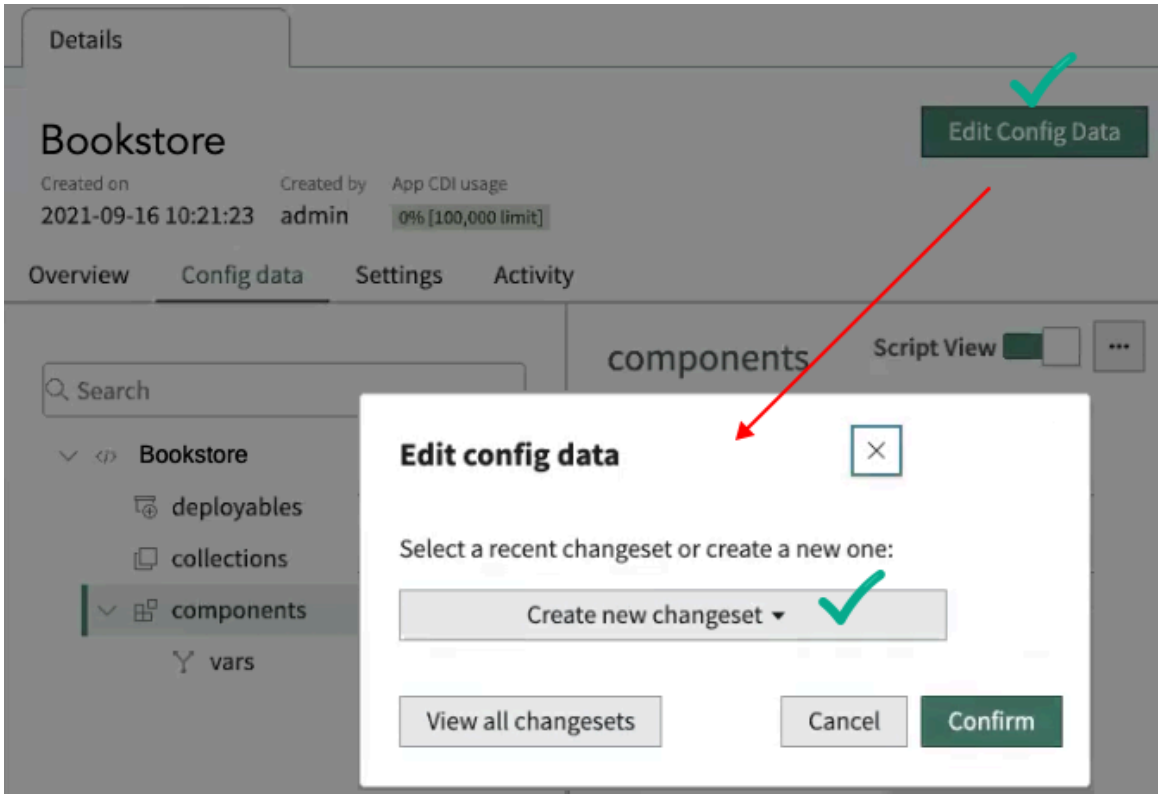


1. Open the CDM user interface and create a new application. For example, let's create the Bookstore application to support an online bookstore. An application in CDM is the full collection of config data for an application service, application model, or dynamic CI group [infrastructure] in the CMDB.



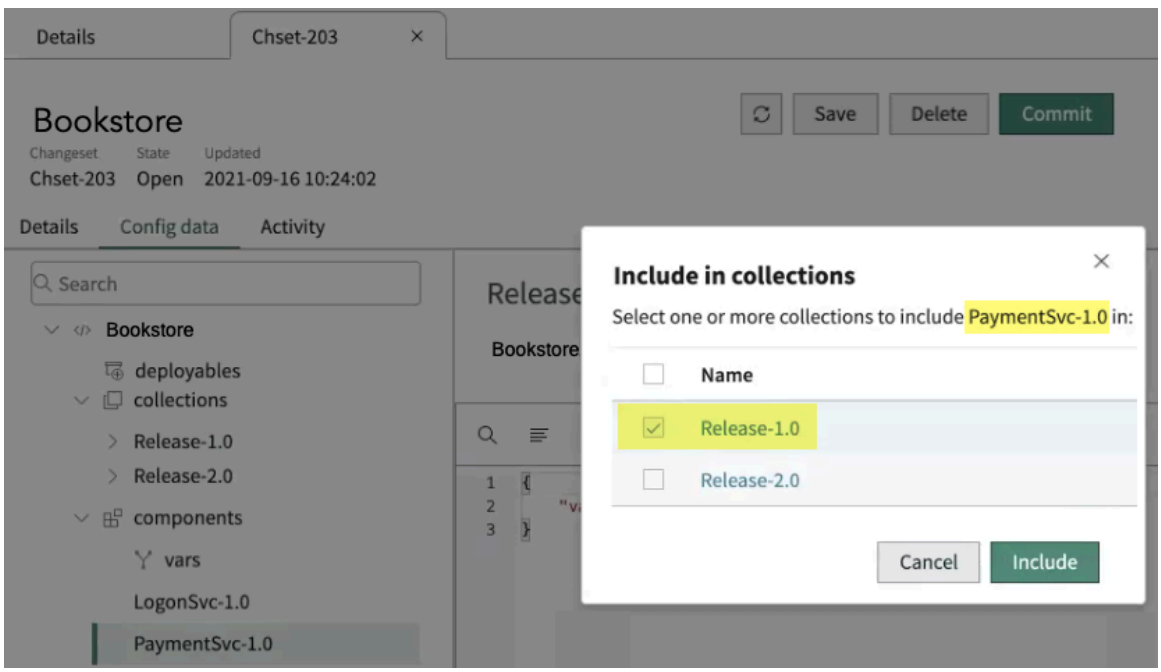
2. Now open the Bookstore application and generate a new changeset so you can begin to put the data structure in place. (A more detailed overview of this process appears in Preparing an application for config data upload.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



In the changeset, define the data structure that includes a node for each set of config data that you will upload. This process is called modeling the data. You add components, collections, deployables, and CDIs as needed. For information on each of these items, see CDM data model. For additional information on adding nodes to an application, see Preparing an application for config data upload.

In this example, two components and two collections have been added. Now, the **PaymentSvc-1.0** component is included in the **Release-1.0** collection. As with all collections, this means that any data in the **PaymentSvc-1.0** component is now included in the **Release-1.0** collection.



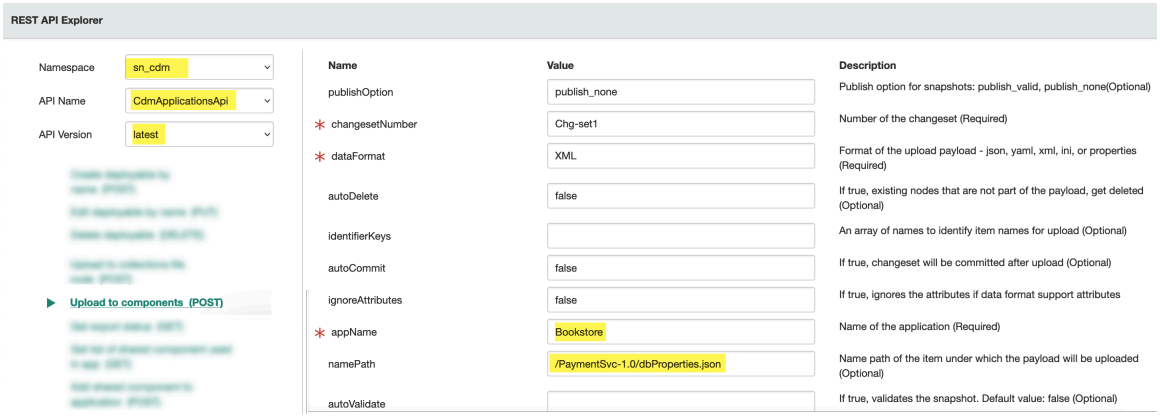
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you are satisfied with the structure (you can update at any time), you open the REST Explorer to begin the process of uploading the source config data into the CDM data tables. Do not commit the changeset — it remains open so you can upload data.

3. Using the REST APIs or the config data editor, set parameter values that specify the name of the application to upload to, the path within the CDM application data structure to place the data, the format of the source data (JSON in the example), and so on.

   Note:
   When you upload your existing config from an XML file and the **ignoreAttributes** is set to **false**, the CDM XML Parser retains the attributes in JSON using identifiers. For more information, see Parsing of XML files in CDM.

   This example shows the REST API Explorer platform utility for clarity. This is an example of how you might construct an *`Upload to components`* REST POST request that creates a `dbProperties.json` node in the **PaymentSvc-1.0** component and then adds the source data to the new node. (You specify the source data to upload in another field.) The APIs are described in CdmApplicationsApi, CdmChangesetsApi, and CdmSnapshotApi.



4. When you select **Send**, the API reads the original config data, uploads it and aligns it into the CDM data structure.

   Note:
   Uploaded data items are sorted alphabetically within the structural folders to enable you to locate particular items quickly.

   The system places the following limits on the count of config data items (CDIs):

   - An application can contain a maximum total of 100,000 CDIs.
   - Any single deployable can contain a maximum of 10,000 CDIs.

   See CDM system properties for information on configuring the *`sn_cdm.max_allowed_cdi_per_application`* and *`sn_cdm.max_allowed_cdi_per_deployable`* property settings.

   Important:
   Each time you submit a POST request, the API performs the POST and also generates an upload script. You can specify one of several script languages. The purpose is for you to use the code in your pipeline system to automate the upload process for this application in future uploads.

5. Back to CDM: Review and update the config data as described in Preparing an application for config data upload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. When you are satisfied that the application is a full and correct representation of the config data, you can commit the changeset. The commit action generates a snapshot of each deployable and causes the API to store the data in CDM tables.

   Now that the application is fully in place, you can manage the data as needed: Update config settings, apply policies to validate the data, export valid snapshots of config data, and so on.

   While you export any snapshot, the system can generate API code that you can use to automate the export process. See Generate API invocation code for an exporter for details.

Parsing of CSV files in CDM

Preparing an application for config data upload

An application in CDM is the full collection of config data for an application service, application model, or dynamic CI group [infrastructure] in the CMDB. After you upload your source config data, the application can support all potential deployables that make up each version of the development, test, and production environments of the service.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Overview: Preparing an application to accept uploaded config data

You follow this general process to prepare an application to accept the upload of config data:

1. On the **Apps** tab, you, a user with the CDM Admin [sn_cdm.cdm_admin] role, create an application record.

   The system generates an application that includes several standard folders in a hierarchical structure. You will map your existing config data into this data structure to enable the benefits that are described in CDM data model.

   The application supports creation of multiple deployables. For example, you might create a deployable for each typical environment: Development, Test, and Production. You might also create multiple versions of each deployable for each environment type.

2. Working in the CDM code editor, you now create a changeset — a draft copy of the application that you can edit.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. While working in the changeset, you create the following types of nodes in the appropriate folders. This process models the config data, that is, it prepares the application to map your source config data into the CDM data structure.

   Note:

   Starting with Configuration Data Management version 4.2, you can define a node using any UTF-8 character, including the forward slash (/).

4. Now that the structure is in place, you use the REST APIs or the CDM code editing panel to upload your existing configuration data into the changeset. The process is described in Uploading your config data. For more information, see CdmApplicationsAPI, CdmChangesetsAPI, and CdmSnapshoAPI.

   Note:
   If you're uploading an XML or CSV file to import your existing config data into CDM, the CDM parser parses the data in a specific way. For more information, see Parsing of XML files in CDM and Parsing of CSV files in CDM.

   You can upload the following types of datasets: component variables, components, collections, and deployables.

   Components

   Components are the building blocks that typically represent the config data for a logical element of an application or a part of an infrastructure service. For example, a monolithic app, a micro-service, a physical server, or a Docker template.

   A component can contain variables that can take on different values in collections and deployables. More detailed instructions appear in Define or update a component.

   Collections

   A collection is the set of components that together define a release — You can think of a collection as a release composition.

   A collection can contain variable or override settings that are specific to the particular version. For example, the VM config data used in release-1 is different from the data used in release-2. release-1 might use the value 2Gb for the *memory* setting (`"memory": "2Gb"`) and release-2 might specify a different value (`"memory": "4Gb"`). In addition, a collection might include config settings that do not appear in its components. You might think of such values as "overlays".

   Deployables

   A deployable is a config dataset (for a development, test, or production environment) that can be deployed into your CI/CD pipeline as a service. Each deployable in an application configures a service in the CMDB. For example, you might create three deployables, one for each environment type: Development, Test, and Production.

   A deployable is made up of the collection or set of collections that define the release for a particular environment. The combination of collections+environment link to an application service in the CMDB or an infrastructure service.

   A deployable can contain variable or override settings that are specific to the environment. For example, the `database` variable has one value in the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

development environment and a different value in the production environment. An override value in the production deployable might specify a required container parameter that is not needed in the development environment.

5. After the data is uploaded, you return to CDM. You update variable and override values so that the relatively small set of components and collections can provide config data for all three deployable environments. For example, the `Development` deployable can use the same components and collections as the `Test` deployable. `Development` uses the default *`database`* variable value. `Test`, in contrast, uses a different value that is appropriate for the test environment.
6. Now, save and commit the changeset. The system performs the following actions:
   - Determine whether there are conflicts with other earlier commits. If the system reports a conflict, you must resolve it and recommit or create a changeset and redo your changes. For more information on conflict resolution, see Conflicts between changeset commits.
   - Push all changes into the data model of the application (the config data is persisted).
   - Generate a snapshot of each deployable that is affected by the changes in the changeset. The system validates config data by executing specified policies against a snapshot. At the moment that the snapshot is created, the snapshot can be published and used to export the config data. Snapshots are permanent records that cannot be edited.

The source config data is now held in CDM tables. You can now manage the data as needed: map policies to each deployable so that the snapshots can be validated, validate the data in a snapshot (apply the policies), export config data, and so on.

Note:
You can map policies to an empty deployable, but that is not a typical procedure.

Validating and correcting configuration data

Add the nodes that will contain config data to a new CDM application

Add the data structure to a new application that will accept the uploaded config data into appropriate nodes.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Admin [sn_cdm.cdm_admin]

About this task

When the system creates a new application, the application has only the highest level of structure: **components**, **collections**, and **deployables** folders. In this procedure, you add

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the component, collection, and deployable nodes that will accept the uploaded config data. When you upload existing config data into the application, the system maps the data as `[name:value]` pairs (config data items — CDIs) in the appropriate node in the data structure of the CDM application. For more information, see CDM data model.

Note:

Starting with Configuration Data Management version 4.2, you can define a node using any UTF-8 character, including the forward slash (/).

Procedure

1. Create the components that will be included in the collections.
   For more information, see Define or update a component and Define or update a collection in an application.
2. Add a collection to one or multiple deployables:

   a. For the collection node in the tree, select the menu icon (⋮) and select **Include in deployables**.

   b. Select all deployables in which to include the collection and then select **Include**.

   Note:
   Only deployables that do not already include the collection or any of its descendants appear in the list. If the collection has the same name as an existing node, then the collection is transformed into an override or overlay.

   The collection is included in each selected deployable.

   When you add a collection to a deployable, the **Editor** panel displays the included collection names but not their contents (overrides or overlays do appear). This strategy reduces clutter and clarifies the structure. To view the fully-resolved content of the data, view the **Preview** panel.
3. Create the components that will be included in the collections.
4. **Optional:** Add CDIs to the deployable that will override or overlay settings in components or collections.

   Note:
   Uploaded data items are sorted alphabetically within the structural folders to enable you to locate particular items quickly.

   The system places the following limits on the count of config data items (CDIs):

   - An application can contain a maximum total of 100,000 CDIs.
   - Any single deployable can contain a maximum of 10,000 CDIs.

   See CDM system properties for information on configuring the *sn_cdm.max_allowed_cdi_per_application* and *sn_cdm.max_allowed_cdi_per_deployable* property settings.

   For more information, see Define or update a component, Define or update a collection in an application, or Create or update a variable CDI.
5. Select **Save** to save the changes in the changeset and ready the changes in the changeset to be committed.
   The Editor panel, List view, and Preview panel refreshes to reflect the resolved state of the changeset. The system updates the changeset but does not update the application. Changes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

appear on the **Activity** tab. You must commit a changeset to update the config data for the application. After saving, you can move on to other activities and return later to edit the changeset.

6. **Optional:** Select **Commit**.
   The Commit changeset dialog box opens and lists each deployable that is affected by the changes.

   Note:
   After you commit a changeset, the changeset cannot be modified.

   The system generates a snapshot of each deployable that is affected by the changes. The dialog box offers the following **Additional actions**:

   - If no deployables are affected by the changes, select **No additional actions**. The system will update the application to persist the changes.
   - Select **Validate snapshots** to perform the following operations on all generated snapshots:
     - The system executes all policies that are statically or dynamically mapped to the associated deployable.
     - If the snapshot passes all policies, then the Validation status value is set to **Passed** and no entries are listed on the **Validation Results** tab. If validation was invoked with the **Publish Valid** publish option, then valid snapshots are auto-published.
     - If any policy encounters issues, then the Validation status value is set to **Failed**. The **Validation Results** tab displays all failures or warnings returned by policies.
     - If any policy failed to run to completion, then the Validation status value is set to **Execution error** and the **Validation Results** tab indicates that validation failed due to error.
   - Select **Validate and publish snapshots** to perform validation as described in the **Validate snapshots** action. Only snapshots that pass validation are published. Only published snapshots can be exported.

   Select **Commit**.
   - The system updates the application to persist the changes to config data.
   - The changeset state changes to **Committed**.
   - The changeset cannot be modified.
   - If snapshots were created, the confirmation message includes a link to the snapshots.
   - If an error occurs during the commit process, the changeset state is set to Commit failed.

What to do next

The application does not yet contain config data, so the next step is to import your existing configuration data into the appropriate nodes in the application. See Uploading your config data.

Create or update a variable CDI

How encrypted data is handled

Parsing of XML files in CDM

The CDM XML parser enables the parsing of attribute key-value pairs in XML files, so when you upload config data from an XML file into CDM, you can easily identify the attributes of each element in the CDM editor or list view.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

This parsing of attribute key-value pairs from an XML file to a JSON format in CDM helps you in the following ways:

- Uploading existing config data from an XML file, including the attributes of XML elements as appropriate key-value pairs in JSON.
- Differentiating attributes from the config data items easily in the CDM editor.
- Validating imported CSV data with attributes in CDM for deployment.
- Converting attribute key-value pairs in JSON format as XML element attributes in XML file.

Parsing of XML to JSON during import

When you import an XML file to upload your config data into CDM, the parser converts attributes and enclosing text in XML elements to the JSON format as follows:

- Adds the *@* prefix to all key names corresponding to attributes of XML elements.
- Adds a *#text* key for the enclosing text value of XML elements that have both attributes and enclosing text.

These options help in identifying attributes and enclosing text in the Editor panel and List view while reviewing the config data.

The following example shows how the conversion looks between XML and JSON formats:

XML format

```
<app>
        <components>
                <paymentService  type="B2C">
                                <provider  region="EMEA">ABCPay</provider>
                                <service>XYZPay</service>
                </paymentService>
        </components>
<app>
```

JSON format

```
{
    "app"  :  {
              "components"  :  {
                        "paymentService"  :  {  //key-value pair for XML
elements with attributes
                                "@type"  :  "B2C",  // @ prefix for attribute
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                                    "provider"  :  {
                                            "@region"  :  "EMEA",  // @
prefix to key name for attribute
                                            "#text"  :  "ABCPay"    // #text
key name for enclosing text
                                        },
                                "service"  :  "XYZPay"  //key-value pair for XML
elements without attributes
                                }
                        }
                }
}
```

Parsing of JSON to XML during export

To keep the XML attributes and enclosing text in their original format when exporting the config data to an XML file format, you must update the config data as follows:

- Add the *@* prefix to all key names to make them parse as attributes of XML elements.
- Add keys named *#text* to CDIs that should be parsed as the enclosing text value of XML elements, when both attributes and enclosing text are present.

Related topics

Uploading your config data

Add the nodes that will contain config data to a new CDM application

Parsing of CSV files in CDM

Parsing of CSV files in CDM

The CDM CSV parser enables parsing of data in CSV files, so when you upload config data from a Comma-Separated Values (CSV) file into CDM, you can easily identify the data format attributes and config data in the CDM editor or list view.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The CDM CSV parser follows the CSV standard RFC 4180. This parsing of data from a CSV file to a JSON format in CDM helps you in the following ways:

- Uploading existing config data from a CSV file with custom header and delimiter attributes to parse them as appropriate key-value pairs in JSON.
- Differentiating data format attributes (metadata) from the config data items (data) in the CDM editor.
- Validating imported CSV data in CDM for deployment.
- Converting config data from JSON format to CSV format with attributes in the original format.

Parsing of CSV to JSON during import

When you import a CSV file into CDM, the parser converts the data in CSV format to the JSON format as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Adds each record from the CSV file as a CDI in separate indexed nodes under the *data* node in JSON format.
- Adds the data format attributes used during CSV upload under the *metadata* node.

The query parameter *dataFormatAttributes* includes attributes for determining the delimiter, headers, first row as header, and secured headers.

Attributes for the CDM CSV parser

Attribute name	Description
delimiter	Character to separate out each header field as a key and the record field as a value of a CDI. You can specify a valid character as the delimiter. Default: `"delimiter": ","`.
containsHeader	Option to determine whether the first row in the CSV file is considered as the header row. This attribute is optional. ○ true: The CSV file contains the first row as the header. ○ false: The CSV file doesn't have the first row as the header. In this case, you must provide the headers in the *headers* attribute. Default: `"containsHeader": "true"`.
headers	List of header fields for record fields in the CSV file. These headers are converted to the key names of the CDIs in the JSON format. **Note:** This attribute is applicable only if the *containsHeader* attribute is set to **false**. If your CSV file doesn't have the first row with headers, you can provide an array of headers. The number of headers must match the number of record fields. Example: `"headers": ["FirstName","LastName","Location","Salary` Default: An empty array: `"headers": []`.
securedHeaders	List of header fields for which the value for all records is displayed in the encrypted format in the JSON format. This attribute is optional. You can provide an array of headers that must be secured. The name of the secured headers must match the name of the headers

© 2026 ServiceNow, Inc. All rights reserved.

Attribute name	Description
	in the **headers** attribute or CSV file. Example: `"securedHeaders": ["Salary"]`. Default: An empty array: `"securedHeaders": []`.

Example: Conversion of CSV to JSON format

This example shows the given data format attributes and the conversion of CSV content to the JSON format based on these attributes.

Data format attributes

> **Note:**
> This parameter is optional. If you don't provide values, the default values of the attributes are used.

```
{ "delimiter": ",", "containsHeader": "true", "headers":
[], "securedHeaders": ["salary"] }
```

CSV format

```
//Sample CSV file content: no header in the first row;
 each line represents a record
  FirstName,LastName,Location,Salary
  David,Ben,NYC,1000
  Jakes D,Ron,IRE,1220
  "George, R",Martin,US,12120
  "Antony, ""Ron",Mak,US,1210
```

JSON format

```
//data node for the records from CSV - each record row converted to individual
 nodes with fields separated by delimiter character converted to individual items
 of the node{
  "data": {
   "0": {
    "FirstName": "David",
    "LastName": "Ben",
    "Location": "NYC",
    "Salary": "*****"
   },
   "1": {
    "FirstName": "Jakes D",
    "LastName": "Ron",
    "Location": "IRE",
    "Salary": "*****"
   },
   "2": {
    "FirstName": "George, R",     //the name has a delimiter char so the full
name is enclosed within " "
    "LastName": "Martin",
    "Location": "US",
    "Salary": "******"
   },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "3" :  {
    "FirstName" :  "Antony, \"Ron" ,  //the last name has "" so a \ is added to
include " in the last name
    "LastName" :  "Mak" ,
    "Location" :  "US" ,
    "Salary" :  "*****"
   }
  } ,
//metadata added for the data format attributes
  "metadata" :  {
   "containsHeader" :  "true" ,
   "delimiter" :  "," ,
   "headers" :  "FirstName#LastName#Location#salary" ,
   "securedHeaders" :  "Salary"
  }
}
```

Parsing of JSON to CSV during export

To keep the CSV config data in its original format when exporting the config data to a CSV file format, ensure that you have the *data* and *metadata* nodes in your data.

- Config data items within the *data* node are converted to individual record rows in the CSV file.
- Data format attributes within the *metadata* node are used to define the delimiter, header, and secret header information in the CSV file.

Define policies in DevOps Config

Define policies in DevOps Config to validate your configuration data.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Role required: sn_devops_config.admin

About this task

You can use or customize default DevOps Config policies to validate that your config data content is compliant, or write and test custom DevOps Config policies.

Procedure

1. In the **Admin** view, select the **Policies** tab.
2. Select a default policy or select **New** to create a policy.
3. Enter the policy name, category, and a description for the policy and select **Save**.

Note:
You must publish a policy version to make it current, and activate it before it can be invoked.

Default DevOps Config policies

How to write and test custom PaCE policies

Mapping policies in DevOps Config

Mapping a policy to a deployable enables you to validate updates on it. These policies in DevOps Config are powered by Policy as Code Engine (PaCE).

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

After you create a policy, you can map it to a deployable to invoke the policy when any changes are made to the deployable. You can map policies using the following mappings:

Static mapping

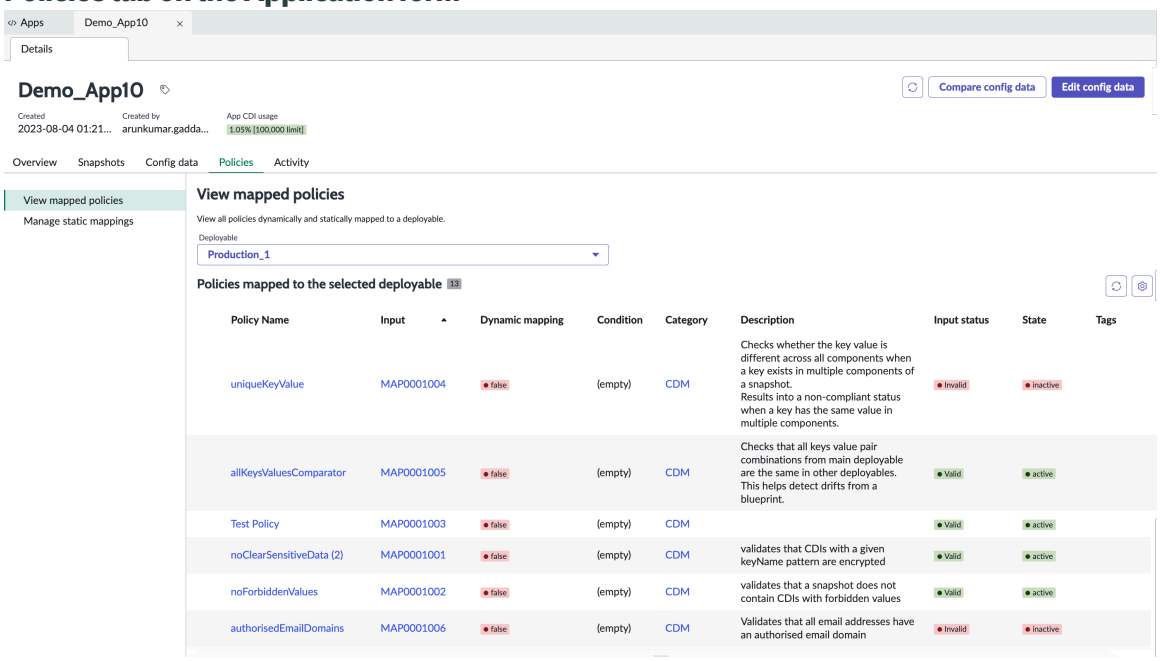
In static mapping, a policy is directly mapped to deployables. This mapping type helps you to apply policies to different environments or configurations. However, if you have to map a policy to multiple deployables, you would have to do it multiple times for each deployable. Validation is triggered on directly mapped policies for a deployable.

Dynamic mapping

In dynamic mapping, a policy is mapped to deployables dynamically based on pre-defined conditions. This mapping type helps you to apply policies to a larger set of deployables across multiple applications that all meet the same conditions. Validation is triggered on dynamically mapped policies at run time for a deployable.

You can view all policies mapped to deployables of an application by selecting the **View mapped policies** option on the **Policies** tab on the Application form. Select a deployable from the list to view policies mapped to it using both static mapping or dynamic mapping.

Policies tab on the Application form



Map policies to a deployable

Map policies to a deployable to define the validation processes that the config data must pass. You can map policies to a deployable using static mapping or dynamic mapping.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_policy_editor or cdm_editor or cdm_admin

About this task

Policies validate any changes to the mapped deployable. Whenever changes that affect a deployable are committed, the system generates a new snapshot of the deployable and then executes all mapped policies against the snapshot. You can also manually execute a policy at any time (for example, to test a policy operation).

Procedure

1. On the **Policies** tab for an application, select **Manage static mappings**.
   The Manage static mappings page lists all deployables that have mapped policies. Policies are grouped by the deployable to which they're mapped.
2. Select **Add**.
   The Map Policies dialog box displays with a list of available policies.
3. Select a deployable against which the policies should be executed.
4. Select the policies in the **Policies** list.
   You can map any number of policies.
5. Select **Map Policies**.
   On the **Manage static mappings** page, the deployable is updated with the list of mapped policies.

Mapped Policies list - Columns

Column header	Description
Policy name	Name of the policy. Policies appear grouped under the deployable to which they're mapped.
Input	Policy settings that are configurable.
Dynamic mapping	Identifier to denote whether the policy is mapped dynamically or statically. ○ **true**: The policy is mapped dynamically based on the defined conditions. ○ **false**: The policy is mapped statically.
Condition	Business conditions based on which the policy is mapped dynamically to specific deployables. For example, to dynamically map policies to only deployables that have the environment type as production, you can define the condition as: **[Environment][is][Production]**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column header	Description
	For more information on defining a condition, see Map PaCE policies using Dynamic Mapping.
Description	Description of the policy, specifying what it validates.
Category	Identifier that enables policy grouping. For example, `Production Policies`.
Input status	Validation state of the mapping inputs in the policy. **Note:** ○ This information reflects the validity of the input settings (that is, the readiness of the policy to perform validation). ○ All mapping inputs are valid on insertion. Inputs become invalid if the policy version is archived or deleted. ○ This value does not indicate whether the snapshot passed validation (that is, whether the snapshot is compliant).
State	Mapping state of the policy with the deployable. Only mapped policies that are **active** execute during snapshot validation.
Tags	Tags that are associated with the policy.

Define exporters in DevOps Config

Define exporters in DevOps Config to export config data from all or part of the data model as input for further deployment or provisioning activities.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Role required: sn_devops_config.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the **Admin** view, select the **Exporters** tab.
2. Select a default exporter or select **New** to create a custom exporter.
   See Create a custom exporter for details.
3. Enter the exporter name and description and then click **Confirm**.

Related topics

Default DevOps Config exporters

Configure your pipeline in DevOps Config

Configure your Argo CD, Azure DevOps, or Jenkins pipeline with DevOps Config to interact with your data model.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

These orchestration tool integrations are included with the DevOps Config base system.

- Argo CD
- Azure DevOps
- Jenkins

Required plugins

Argo CD

Visit the Ancillary Software section on the ServiceNow Store website to download the Argo CD plugin for ServiceNow DevOps to integrate your Argo CD pipeline with the ServiceNow DevOps Config application.

Azure DevOps

Use the ServiceNow DevOps extension for Azure DevOps on Visual Studio Marketplace to integrate your Azure pipeline with the ServiceNow DevOps Config application.

Jenkins

Visit the Ancillary Software section on the ServiceNow Store website to download the Jenkins plugin for ServiceNow DevOps to integrate your Jenkins pipeline with the ServiceNow DevOps Config application.

Run validation in DevOps Config

After you have installed and configured DevOps Config, validate the configuration and review the results.

Before you begin

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Role required: sn_devops_config.admin

About this task

Having the policy validation action at the deployable level and the publish action at the snapshot level protects against non-compliant changes in your production environment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also validate further by mapping more policies to a deployable and validating against your latest snapshot.

Procedure

1. Open your application and in the **Snapshots** tab, and select the snapshot created from the changeset created.
2. Select **Validate** and confirm.
   All policies that are mapped statically and dynamically are run to validate the snapshot.
3. Review compliance results.
   Any future snapshots generated are automatically validated against the configured statically mapped policies. Dynamic mappings are determined at runtime based on the latest conditions matching the deployable.

Fix the data that caused a validation failure

When a policy that executes against a deployable snapshot fails or generates an error or warning, the policy identifies the offending CDI and the reason for the failure. While working in a changeset, you can use the Validation failures panel to navigate directly to the offending CDI so you can correct the issue.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: sn_devops_config.admin

About this task

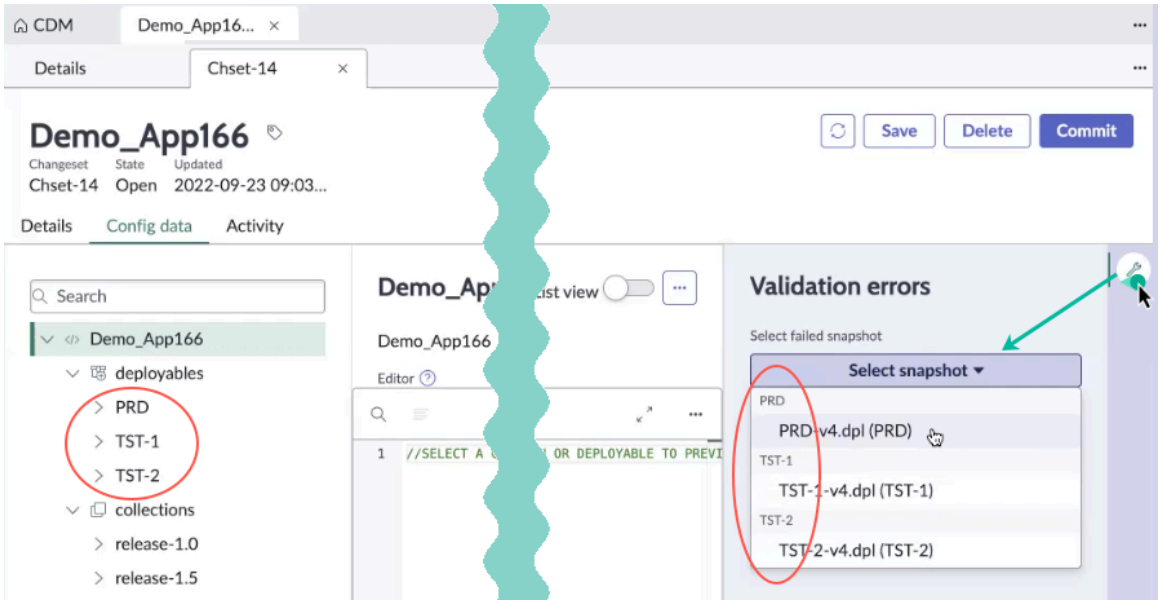
The Validation failures panel appears on the application tab whenever validation fails for any deployable in the application. The panel displays only snapshots with error, warning, or execution failure status for validation. Snapshots with not validated or in progress status do not appear.

Important:
The data changes and status settings that you update in this procedure apply only to the selected changeset. For that reason, be sure to coordinate your work with others on your team.

Procedure

1. While working in a changeset, select the validation failures icon ( ) to view the list of snapshots from the application that failed validation.
   In this example, the snapshots for all three deployables in the application failed validation in some way (error, warning, or execution failure).

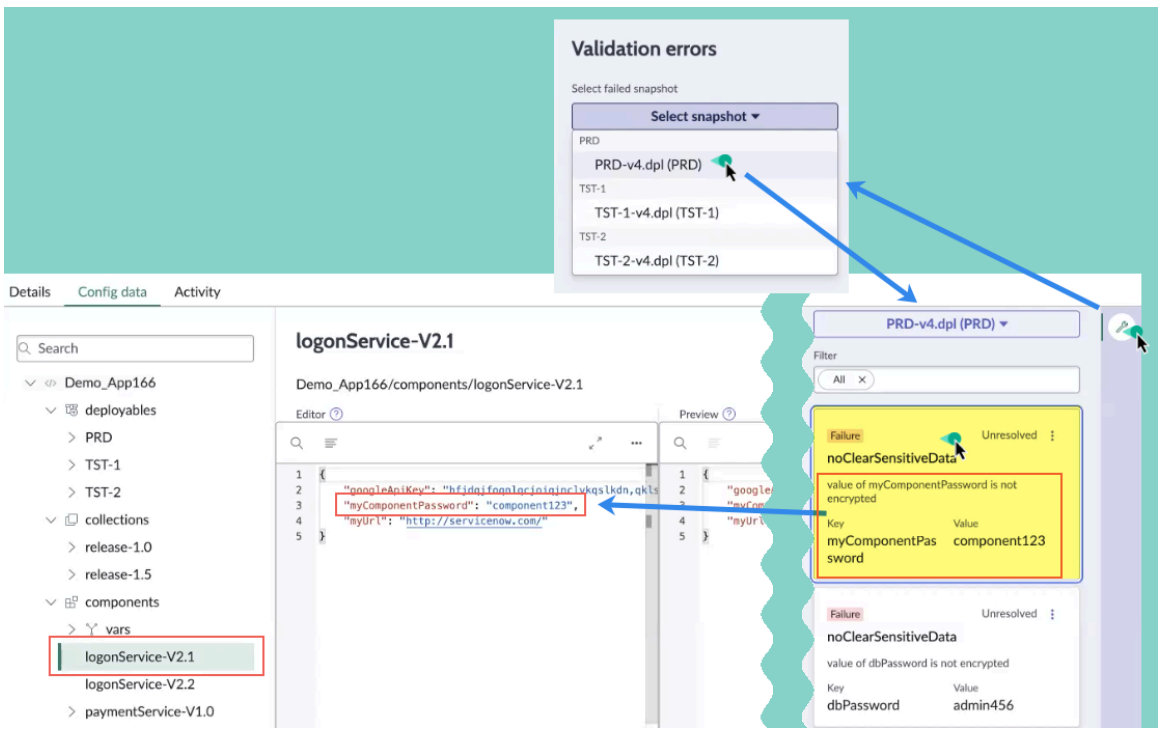
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Navigate to the failure.

   a. Select a snapshot to view the cards.
   Each card represents a policy validation failure. Use the filter to find a card with a particular validation result. If another user has worked on the issue, you might also filter on a resolution state (resolved, unresolved, or ignored).

   b. Select a card to open the editor directly to the problematic CDI.



3. Review the data and perform the necessary updates.
4. When you finish working on the data, update the status of the error.

   Open the more actions more actions icon (⋮) to update the status of the error.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Unresolved**: This status is the initial status for a validation error. Leave this status if you are unable to repair the data. You might work on the issue with another user.
- **Resolved**: You have fixed the error. Be sure to commit the changeset and validate the data to ensure that the data is correct.
- **Ignored**: This status indicates that no further actions will be taken.

CDM system properties

CDM system properties.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

CDM system properties

CDM system properties

Property	Description
sn_cdm.variable_regex	The regex used to capture variables referenced in a CDI value. With this value, the syntax to use a variable is: `@@name@@` Default: @@([^@].*?)@@
sn_cdm.cdm_queue_request_expiry_time_ms	The maximum time for a process to be available for processing before it is marked as expired. Default: 900000 ms (15 min)
sn_cdm.cdm_validation_timeout_ms	The maximum time limit for a validation of a snapshot. Default: 900000 ms (15 min)
sn_cdm.default_node_identifier_keys	The keys used to identify node objects within an array node. Default: (none)
sn_cdm.execute_exporter_async_for_standard_request	If set to `false`, exporter requests skip the request queue and their output is returned immediately. Changing this setting may decrease system performance if there are many export requests. Default: true

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CDM system properties (continued)

Property	Description
sn_cdm.exception_enabled	If set to false, the control exception functionality is disabled regardless of other policy settings. Default: true
sn_cdm.node_name_allowed_character_regex	The regex used to validate the name of a node. Default allowed characters are: `0-9, A-Z, a-z, _, -, ., %, $, whitespace, :, #` Default: `[\\w-.% :$#]`
sn_cdm.app_name_allowed_character_regex	The regex used to validate the name of an application. Default allowed characters are: `0-9, A-Z, a-z, _,-, ., whitespace, |, :, [], (), %, $, #` Default: `[\\w-.%$#() :|[\\]]`
sn_cdm.snapshot_name_allowed_character_regex	The regex used to validate the name of a snapshot. Default allowed characters are: `0-9, A-Z, a-z, _,-, ., %` Default: `[\\w-.%]`
sn_cdm.exporter_name_allowed_character_regex	The regex used to validate the name of an exporter. Default allowed characters are: `0-9, A-Z, a-z, _,-, .,%` Default: `[\\w-.%]`
sn_cdm.exporter_argument_name_allowed_character_regex	The regex used to validate the name of an exporter argument. Default allowed characters are: `0-9, A-Z, a-z, _` Default: `[\\w]`
sn_cdm.cdm_max_allowed_open_changesets	The maximum allowed number of open changesets. Default: 10

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CDM system properties (continued)

Property	Description
sn_cdm.preventative_duplicate_node_name_check	If set to true, validating for node name duplication will check name usage across all other open changesets as well (as opposed to limiting the check within the changeset). Default: false
sn_cdm.max_allowed_upload_file_size	The maximum payload size for upload of config data via the REST API. Default: 5 MB
sn_cdm.max_allowed_cdi_per_application	The maximum number of CDIs allowed per application. If the number is exceeded, further upload of config data via the REST APIs is blocked. Increasing this limit may significantly decrease performance and break UI functionality. If you change the value, you must recalculate the CDI usage data by running the following command: `new sn_cdm.CdmApplicationManager().updateCdiCountOfApplications();` Default: 100000
sn_cdm.max_allowed_cdi_per_deployable	The maximum number of CDIs allowed per deployable. If the number is exceeded, further upload of config data via the REST APIs is blocked. Increasing this limit may significantly decrease performance and break UI functionality. If you change the value, you must recalculate the CDI usage data by running the following command: `new sn_cdm.CdmApplicationManager().updateCdiCountOfApplications();` Default: 10000

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CDM system properties (continued)

Property	Description
sn_cdm.max_nodes_in_memory	The maximum number of nodes that can be supported when using the `queryTree` method of `CdmQuery`. Default: 10000
sn_cdm.reserved_node_names	Names that cannot be used for nodes. Default: vars, collections, deployables, components
sn_cdm.max_allowed_cdi_per_shared_component	The maximum number of CDIs allowed per shared component. If the number is exceeded, further upload of config data via the REST APIs is blocked. Increasing this limit may significantly decrease performance and break UI functionality. If you change the value, you must recalculate the CDI usage data by running the following command: `new sn_cdm.CdmApplicationManager().updateCdiCountOfApplications();` Default: 10000
sn_cdm.max_allowed_cdi_per_library	The maximum number of CDIs allowed per shared component library. If the number is exceeded, further upload of config data via the REST APIs is blocked. Increasing this limit may significantly decrease performance and break UI functionality. If you change the value, you must recalculate the CDI usage data by running the following command: `new sn_cdm.CdmApplicationManager().updateCdiCountOfApplications();` Default: 10000
sn_cdm.attachment.display_mime_types	File types for which the content preview is available on the Preview pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CDM system properties (continued)

Property	Description
	You can add additional MIME types to display in the Preview pane. However, the preview is not available for binary file MIME types, such as audio, image, and video. Default: `text/yaml,text/css,text/csv,text/html,text/javascript,text/plain,text/richtext,text/x-vcard,text/x-vcalendar,application/xml,application/javascript,application/json`

Integrating your pipeline in DevOps Config

Integrate your Argo CD, Azure DevOps, or Jenkins pipeline with DevOps Config to interact with your data model.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Validate application and infrastructure details against your organization policies, and commit config data the same way software code is committed to a code repository.

Configuration data is pulled in your CI/CD pipeline to deploy not just a code for an application, but all the related configuration with that code as well.

Note:
Pipeline integration requires plugin installation. See Configure your pipeline in DevOps Config for installation requirements.

DevOps Config and DevOps Change Acceleration

With the DevOps Change Velocity change control feature, a change request is created as part of the pipeline for DevOps Config configuration changes.

Set up change acceleration in your pipeline.

Argo CD

Azure DevOps

Using the `ServiceNow-DevOps-Server-Change-Acceleration` Azure DevOps task.

Jenkins

Using the `snDevOpsChange` Jenkins action.

In DevOps Change Velocity, navigate to **DevOps** > **Orchestrate** > **Pipeline Change Requests** to view and approve DevOps change requests created by DevOps Config changes.

See Accelerating your DevOps change process for more information regarding the DevOps Change Acceleration feature.

© 2026 ServiceNow, Inc. All rights reserved.

Azure DevOps pipeline tasks

Use these tasks in your Azure DevOps pipeline to interact with the DevOps Config data model.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

These tasks are provided to create a specific pipeline definition to achieve your goal.

- ServiceNow-DevOps-Config-Agent-Upload-Config

  Upload config data to a deployable in the data model via Agent Job.

- ServiceNow-DevOps-Config-Agent-Get-Snapshot

  Get the snapshots for an application.

- ServiceNow-DevOps-Config-Agent-Get-Snapshot-Name

  Extract the name of a snapshot.

- ServiceNow-DevOps-Config-Agent-Publish-Snapshot

  Publish a snapshot of your configuration data.

- ServiceNow-DevOps-Config-Agent-Export-Snapshot

  Export a subset of your configuration data.

- ServiceNow-DevOps-Config-Agent-Register-Pipeline

  Register a changeset and/or snapshot to a pipeline execution.

- ServiceNow-DevOps-Config-Agent-Validate-Snapshot

  Validate configuration data against organization policies.

- ServiceNow-DevOps-Server-Change-Acceleration

  Create a change request as part of the pipeline.

ServiceNow-DevOps-Config-Agent-Upload-Config

Task to upload a configuration file to a given location within an application data model.

This task is meant to be used in an iterative nature for all config files the user chooses to upload to their application data model during the pipeline run.

Note:
Pre-uploaded files must be in a compatible format.

Input variables

connectedServiceName	Specifies the DevOps pipeline endpoint connection.
applicationName	Specifies the application to where config data is uploaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

deployableName	Specifies the deployable for the application (required if target is deployable).
uploadTarget	Specifies the data model target to where config data is uploaded (for example, `component`, `collection`, `deployable`).
collectionName	(Optional) Specifies the collection to where config data will be uploaded (required if target is collection).
namePath	Specifies the data model path to where config data is uploaded. **Note:** When uploading to a vars folder, you must start the name path with "vars/" to specifiy the variable folder path.
configFilePath	Specifies the source folder from which config data is uploaded to the component or deployable path in the data model. Empty is the root of the repo. Use variables if files are not in the repo (for example, `$(agent.builddirectory)`).
convertPath	(Optional) Specifies whether to preserve the directory structure of the configuration files (with respect to the workspace), and convert the directory to paths within the data model. Default is false.
dataFormat	Specifies the data format of the config_file (for example, `JSON`, `YAML`, `XML`, etc.).
changesetNumber	(Optional) Specifies the (open) changeset to which this upload activity is associated. If not provided, a new changeset is created. **Note:** Only used for multiple upload scenarios.
autocommit	Specifies whether to commit configuration data after upload (true/ false). Default is false.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

autoValidate	Specifies whether to validate configuration data during commit (true/false). Default is true.

Output variable

changesetNumber	Changeset record created/committed during the upload. Provide a name to the task so it can be used later in the pipeline (per example, `componentUpload`).

Example - Upload config

```
-task: ServiceNow-DevOps-Config-Agent-Upload-Config
 name: componentUpload
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
   uploadTarget: 'component'
   namePath: 'wep-api-v1.0'
   configFilePath: 'k8s/helm/values.yml'
   dataFormat: 'yaml'
   autoCommit: true
   autoValidate: true
```

Example - Multiple uploads (component)

You can call the upload task more than once to upload configuration data in different file formats from different locations, while still keeping the uploads part of one changeset.

- In the first upload, name the task so the changesetNumber output variable can be reused in subsequent uploads.

  YAML file upload:

```
-task: ServiceNow-DevOps-Config-Agent-Upload-Config
   name: componentUpload
   inputs:
     connectedServiceName: 'MyServiceNowInstance'
     applicationName: 'PaymentDemo'
     uploadTarget: 'component'
     namePath: 'wep-api-v1.0'
     configFilePath: 'k8s/helm/values.yml'
     dataFormat: 'yaml'
     autoCommit: false
     autoValidate: false
```

- In subsequent uploads, reference the changesetNumber output variable from the first upload as an input variable.

  JSON file upload:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
-task: ServiceNow-DevOps-Config-Agent-Upload-Config
   inputs:
     connectedServiceName: 'MyServiceNowInstance'
     applicationName: 'PaymentDemo'
     uploadTarget: 'component'
     namePath: 'wep-api-v1.0'
     configFilePath: 'featureToggles/set1.json'
     dataFormat: 'json'
     autoCommit: true
     autoValidate: true
     changesetNumber:
 '$(componentUpload.changesetNumber)'
```

Example - Multiple uploads (collection and vars)

You can call the upload task more than once to upload configuration data in different file formats from different locations, while still keeping the uploads part of one changeset.

- In the first upload, make sure to name the task so the changesetNumber output variable can be reused in subsequent uploads.

  XML file upload:

```
-task: ServiceNow-DevOps-Config-Agent-Upload-Config
   name: componentUpload
   inputs:
     connectedServiceName: 'MyServiceNowInstance'
     applicationName: 'PaymentDemo'
     uploadTarget: 'collection'
     collectionName: 'release-1.0'
     namePath: 'v1-common-configs'
     configFilePath: 'infra/v1/config.xml'
     dataFormat: 'xml'
     autoCommit: false
     autoValidate: false
```

- In subsequent uploads, reference the changesetNumber output variable from the first upload as an input.

  JSON file upload:

```
-task: ServiceNow-DevOps-Config-Agent-Upload-Config
   inputs:
     connectedServiceName: 'MyServiceNowInstance'
     applicationName: 'PaymentDemo'
     uploadTarget: 'deployable'
     deployableName: 'Production-EMEA'
     namePath: 'vars/dbSettings'
     configFilePath: 'infra/prodc/dbSettings.json'
     dataFormat: 'json'
     autoCommit: true
     autoValidate: true
     changesetNumber:
 '$(componentUpload.changesetNumber)'
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To upload to a variable folder, uploadTarget must be set to `deployable`, and the correct values must be set for deployableName and changesetNumber.

ServiceNow-DevOps-Config-Agent-Get-Snapshot

This task is intended to be used in different scenarios:

- Retrieve a specific snapshot.

  Following the CD flow, a specific snapshot is retrieved so it can be published and then exported to be consumed downstream (for example, to provision out infrastructure or application).

- Retrieve latest validated snapshot.

  The latest validated snapshot is retrieved for the given application-deployable combination.

- Retrieve all snapshots for any impacted deployables.

  When config files are uploaded to an application data model, the system will create snapshots for any deployables determined to be impacted by the upload. Following along the CI flow, assuming the last Upload call had validation enabled, the next step would be to iterate through the list of snapshots and ensure they all passed validation.

- Retrieve the latest snapshots for a deployable of an application in the event an upload does not generate any snapshots.

  A set of config data is available to deploy to an environment for an application-deployable-changeset combination when no configuration changes are made.

- Show policy validation results in a pipeline execution.

  View policy validation results as test results on the ADO build tests results page, including compliant with exception, when getting a snapshot.

Input variables

connectedServiceName	Specifies the DevOps pipeline endpoint connection (defined in the service connection settings of the project).
applicationName	Specifies the application to upload config data to, or export data from.
deployableName	(Optional) Specifies the deployable (per the specified application) on which to get the latest snapshot data.
changesetNumber	(Optional) Specifies the changeset ID for the applicable set of config changes.
isValidated	(Optional) Specifies whether to return only snapshots that are passed, or passed with exception (true/false). Default is true.
continueWithLatest	(Optional) Specifies whether to return the latest snapshot per the `applicationName-deployableName-changesetNumb`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	combination if no snapshots are generated (true/false). Default is false.

Output variable

snapshotObject	A JSON object containing the requested snapshots. Provide a name to the task so it can be used later in the pipeline (per example, `getSnapshot`).

Example - Specific snapshot

```
-task: ServiceNow-DevOps-Config-Agent-Get-Snapshot
 name: getSnapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
   deployableName: 'Production'
   changesetNumber: 'Chset-16'
   isValidated: true
   continueWithLatest: true
```

Example - Latest validated snapshots (for a given application-deployable combination)

```
-task: ServiceNow-DevOps-Config-Agent-Get-Snapshot
 name: getSnapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
   deployableName: 'Production'
   isValidated: true
```

Example - All changeset snapshots

```
-task: ServiceNow-DevOps-Config-Agent-Get-Snapshot
 name: getSnapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
   changesetNumber: 'Chset-16'
```

Example - Show policy validation results

Assign a variable to the path of the file that contains the snapshot validation results generated during the `ServiceNow-DevOps-Config-Agent-Get-Snapshot` task.

To load the snapshot validation results in your pipeline execution, you need to leverage the ADO native Publish Test Results v2 task, using the variable as an input.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
stages:
- stage: Two
  jobs:
    - job: A
 variables:
      - name: validationResultsPath
        value:
 1/TEST_DATA_$(Build.DefinitionName)_$(Build.BuildNumbe
r)_*.xml
      steps:
        - task: PublishTestResults@2
          inputs:
             testResultsFormat: 'JUnit'
             testResultsFiles:
 '$(validationResultsPath)'
             searchFolder: '$(System.WorkFolder)'
```

ServiceNow-DevOps-Config-Agent-Get-Snapshot-Name

This task is used as a follow-up from the `ServiceNow-DevOps-Config-Agent-Get-Snapshot-Name` task to get the snapshot name from a particular snapshot. From here, the snapshot name can be used as an input to a downstream task, like publishing the snapshot.

Input variables

deployableName	Specifies the deployable to get the snapshot object that was returned from the `ServiceNow-DevOps-Config-Agent-Get-Snapshot` task.
script	Specifies the script to extract the snapshot name from the snapshot object.

Output variable

snapshotName	The snapshot name for the deployable. Provide a name to the task so it can be used later in the pipeline (per example, `getSnapshotName`).

Example - Get snapshot name

Use this script to extract the snapshot name retrieved from the `ServiceNow-DevOps-Config-Agent-Get-Snapshot` task.

```
-task: ServiceNow-DevOps-Config-Agent-Get-Snapshot-Name
 inputs:
   deployableName: 'PRD'
   script: |
 function run() {
        let name;
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        let deployableName = process.argv[2];
        let jsonObj = $(getSnapshot.snapshotObjects);
        let size = jsonObj.result.length;
        for(let i=0; i<size; i++) {
         obj = jsonObj.result[i];
         if(obj[“deployable_id.name”].toLowerCase() ==
 deployableName) {
           name = obj.name;
           console.log(name);
          }
         }
        }
        run();
```

Example - Get snapshot name used with get snapshot

Call the `ServiceNow-DevOps-Config-Agent-Get-Snapshot-Name` task right after the `ServiceNow-DevOps-Config-Agent-Get-Snapshot` task to return the snapshot name.

Get snapshots (returns a JSON object containing impacted snapshots):

```
-stage: Two
 jobs:
    -job: B
     steps:
        -task:
 ServiceNow-DevOps-Config-Agent-Get-Snapshot
         name: getSnapshot
         inputs:
            connectedServiceName:
 'MyServiceNowInstance'
           applicationName: 'PaymentDemo'
           deployableName: 'Production-2'
           changesetNumber: 'Chset-16'
```

Get snapshot name (returns snapshot name for a specific deployable):

```
-stage: Two
 jobs:
    - job: B
      steps:
        - task:
 ServiceNow-DevOps-Config-Agent-Get-Snapshot
          name: getSnapshotName
          inputs:
              deployableName: 'Production-2'
              script:|
              function run() {
               let name;
               let deployableName = process.argv[2];
               let jsonObj =
 $(getSnapshot.snapshotObjects);
               let size = jsonObj.result.length;
               for(let i=0; i<size ;i++) {
                obj = jsonObj.result[i];
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
if(obj["deployable_id.name"].toLowerCase() ==
deployableName) {
                name = obj.name;
                console.log(name); // This standard
output of inline script is given as the task output
              }
             }
            }
            run();
```

Use returned snapshot name in the pipeline (for example, publish):

```
-stage: Three
 jobs:
    -job: C
     variables:
       varSnapshotName:
 $[stageDependencies.Two.B.outputs['getSnapshotName.sna
pshotName']]
     steps:
        -task:
 ServiceNow-DevOps-Config-Agent-Publish-Snapshot
         inputs:
           connectedServiceName: 'MyServiceNowInstance'
           applicationName: 'PaymentDemo'
           deployableName: 'Production-2'
           snapshotName: '$(varSnapshotName)'
```

ServiceNow-DevOps-Config-Agent-Publish-Snapshot

This task publishes a snapshot for the given application and deployable. From here, the snapshot can be consumed through the Export process.

Input variables

connectedServiceName	Specifies the ServiceNow endpoint connection.
applicationName	Specifies the application to publish.
deployableName	Specifies the deployable for the application to publish config data.
snapshotName	Specifies the name of the snapshot to publish.

Output variable

Not applicable (returns true if successful, otherwise false).

Example

```
-task: ServiceNow-DevOps-Config-Agent-Publish-Snapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  deployableName: 'Production-2'
  snapshotName: 'Production-v23.dpl'
```

ServiceNow-DevOps-Config-Agent-Export-Snapshot

This task exports a snapshot for the given application and deployable. Specify the exporter, relevant exporter arguments, the export format (for example, YAML, JSON, etc.), and output location for the exported config data. From here, the config data can be used directly as an input for a deployment or provisioning tool downstream in the pipeline.

Input variables

connectedServiceName	Specifies the ServiceNow endpoint connection.
applicationName	Specifies the application from which to publish.
deployableName	Specifies the deployable for the application from which to export config data.
snapshotName	Specifies the name of the snapshot from which to export config data.
exporterName	Specifies the exporter to apply to the snapshot (for example, `UniqueCDIs`).
args	(Optional) Specifies arguments to be used along with the exporter.
exportFormat	Specifies the format to export the snapshot data (for example, `INI`, `YAML`, PROPS).
saveFile	Checks if file is to be saved to an Azure repository (true/false). Default is false. **Note:** Appropriate permission/OAuth token access to script is required. Otherwise the export file is created in the pipeline workspace directory.

Output variable

Not applicable (returns true if successful, otherwise false).

Example

```
-task: ServiceNow-DevOps-Config-Agent-Export-Snapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
   deployableName: 'Production-2'
   exporterName: 'returnAllData-nowPreview'
   dataFormat: 'yaml'
   args: ''
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   snapshotName: 'Production-v23.dpl'
   saveFile: true
   fileName:
 'ExporterOutput/ExportData_$(build.definitionName)_$(b
uild.buildNumber).yaml'
```

ServiceNow-DevOps-Config-Agent-Register-Pipeline

This task ties a changeset and a snapshot to the pipeline so that it can be tracked during the pipeline execution. In DevOps Change Velocity, this is shown in the Pipeline UI.

Input variables

connectedServiceName	Specifies the DevOps pipeline endpoint connection.
applicationName	Specifies the application name.
changesetNumber	(Optional) Specifies the ID of the changeset to associate to the pipeline execution.
snapshotName	(Optional) Specifies the name of the snapshot to associate to the pipeline execution.

Output variable

Not applicable (returns true if successful, otherwise false).

Example

```
-task: ServiceNow-DevOps-Config-Agent-Publish-Snapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   changesetNumber: 'Changeset-143'
```

ServiceNow-DevOps-Config-Agent-Validate-Snapshot

Validate config data against your organization policies.

Input variables

connectedServiceName	Specifies the ServiceNow endpoint connection.
applicationName	Specifies the application to validate.
deployableName	Specifies the deployable (per the specified application) to validate.
snapshotName	(Optional) Specifies the name of the snapshot to validate.
showResults	(Optional) Specifies to show validation results in the console log.

Output variable

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Not applicable (returns true if successful, otherwise false).

Example

```
-task: ServiceNow-DevOps-Config-Agent-Validate-Snapshot
 inputs:
   connectedServiceName: 'MyServiceNowInstance'
   applicationName: 'PaymentDemo'
   deployableName: 'Production-2'
   snapshotName: ''
   showResults: false
```

ServiceNow-DevOps-Server-Change-Acceleration

This task is required for agentless (server) jobs to automatically create a change request in ServiceNow Change Management as part of the Azure DevOps pipeline.

In DevOps Config, to associate multiple snapshots of the same changeset to a change request, use snapshot name and application name to track specific configuration data for a given application service.

See Accelerating your DevOps change process for more information regarding the DevOps Change Acceleration feature.

Input variables (related to DevOps Config)

connectedServiceName	Specifies the DevOps pipeline endpoint connection.
applicationName	Application associated with the snapshot being attached to the change request.
snapshotName	Name of the snapshot to attach to the change request.

Example

```
-stage: ChangeRequest
 jobs:
    -job: 'changerequestjob'
     pool: server
     steps:
        -task:
 ServiceNow-DevOps-Server-Change-Acceleration
         inputs:
            connectedServiceName:
 'MyServiceNowInstance'
            applicationName: 'PaymentDemo'
            snapshotName: 'Production-v23.dpl'
```

YAML pipeline example

```
trigger:
  branches:
    include:
    - none
```

Jenkins pipeline actions

Use these actions in your Jenkins pipeline to interact with the DevOps Config data model.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Jenkins scripted and declarative piplines are supported.

These actions are provided to create a specific pipeline definition to achieve your goal. Add a command to your Jenkins file to perform these actions.

- snDevOpsConfig

  Combined action to upload, validate, and publish config data.

- snDevOpsConfigUpload

  Upload config data to DevOps Config via Agent Job.

- snDevOpsConfigGetSnapshots

  Retrieve snapshots for a specific deployable, or all impacted deployables.

- snDevOpsConfigPublish

  Publish a snapshot for the given application and deployable.

- snDevOpsConfigExport

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Export a snapshot for a given application and deployable.

- snDevOpsConfigRegisterPipeline

  Tie a changeset and/or snapshot to a pipeline execution.

- snDevOpsConfigValidate

  Validate config data against your organization policies.

- snDevOpsChange

  Create a change request with associated snapshot attached.

snDevOpsConfig

Upload, validate, and publish config data changes in one step.

This action combines snDevOpsConfigUpload, snDevOpsConfigGetSnapshots, and snDevOpsConfigRegisterPipeline actions into one action, rather than having to execute each action separately.

Input variables

configFile	Specifies the configuration data file to upload to the component or deployable path in the data model.
applicationName	Specifies the application to where config data will be uploaded.
target	Specifies the data model target to where config data will be uploaded (for example, `component`, `collection`, `deployable`).
collectionName	(Optional) Name of the collection to upload to (required if target is collection).
deployableName	(Optional) Name of the deployable to upload to (required if target is deployable).
namePath	Specifies the name path in the data model to where config data will be uploaded. **Note:** When uploading to a vars folder, you must start the name path with "vars/" to specifiy the variable folder path.
dataFormat	Specifies the data format of the config file (for example, `JSON`, `YAML`, `XML`, etc.)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

autoCommit	Specifies whether to commit configuration data after upload (true/false). Default is true.
autoValidate	Specifies whether to validate configuration data during commit (true/false). Default is true.
autoPublish	Specifies whether to publish the configuration data after validation (true/false). Default is true.
changesetNumber	(Optional) Specifies the (open) changeset to which this upload activity is associated. If not provided, a new changeset is created. **Note:** Only used for multiple upload scenarios.
markFailed	(Optional) Fail the pipeline in the event that the validation attempt failed (due to a backend issue).
showResults	(Optional) Show validation results in the Jenkins job console log.
continueWithLatest	(Optional) Specifies whether to return the latest snapshot per the `applicatioName-deployableName-changesetNumbe` combination if no snapshots are generated (true/false). Default is false.

Output

- If successful, a snapshot or set of snapshots.
- If failure, an API/backend failure message is shown.

Example

- Input:

```
snapshotObj = snDevOpsConfig(
    applicationName: "PaymentDemo",
    configFile:
 "config/application/Collection/Collection2/*.json",
    target: "collection",
    collectionName: "release-1.0",
    namePath: "settings/infrastructure/database",
    dataFormat: "json",
    autoCommit: 'true',
    autoValidate: 'true',
    autoPublish: 'true',
    continueWithLatest: 'true',
    markFailed: 'true',
    showResults: 'false'
```

- Output

Example - collection

> **Note:**
> When uploading to a collection, the `collectionName` argument is required.

```
snDevOpsConfig(
     applicationName: 'PaymentDemo',
     target: 'collection',
     collectionName: 'release-1.0',
     namePath: 'web-api-v1.0',
     configFile: 'k8s/helm/*.yml',
     dataFormat: 'yaml',
     autoCommit: 'true',
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    autoValidate: 'true',
    autoPublish: 'true'
)
```

Example - deployable

> **Note:**
> When uploading to a deployable, the `deployableName` argument is required.

```
snDevOpsConfig(
    applicationName: 'PaymentDemo',
    target: 'deployable',
    deployableName: 'Production',
    namePath: 'web-api-v1.0',
    configFile: 'k8s/helm/*.yml',
    dataFormat: 'yaml',
    autoCommit: 'true',
    autoValidate: 'true',
    autoPublish: 'true'
)
```

Multiple uploads in one commit

To upload configuration data from different locations, or to upload a set of data to multiple targets (for example, one component, one deployable) tracked as a single commit to your data model, you can call the `snDevOpsConfigUpload` action as many times as necessary for the first set of uploads, then call the `snDevOpsConfig` action for the final upload.

Here's an example.

- In the first upload, create a variable (for example, $changeset), and assign the return value of the step to it so it can be reused in subsequent uploads.

  Upload 1 - XML file to component:

```
$changeset = snDevOpsConfigUpload(
    applicationName: 'PaymentDemo',
    target: 'component',
    namePath: 'paymentService-v1.0',
    configFile: 'infra/v1/config.xml',
    dataFormat: 'xml',
    autoCommit: 'false',
    autoValidate: 'false',
    autoPublish: 'false'
)
```

- In subsequent uploads (and final upload), use the variable as an input.

  Upload 2 - JSON file to vars folder of deployable:

```
snDevOpsConfig(
    applicationName: 'PaymentDemo',
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    target: 'deployable',
    deployableName: 'Production',
    namePath: 'vars/dbSettings',
    configFile: 'infra/prod/dbConfig.json',
    dataFormat: 'json',
    changesetNumber: "${changeset}",
    autoCommit: 'false',
    autoValidate: 'false',
    autoPublish: 'false',
    continueWithLatest: 'true'
)
```

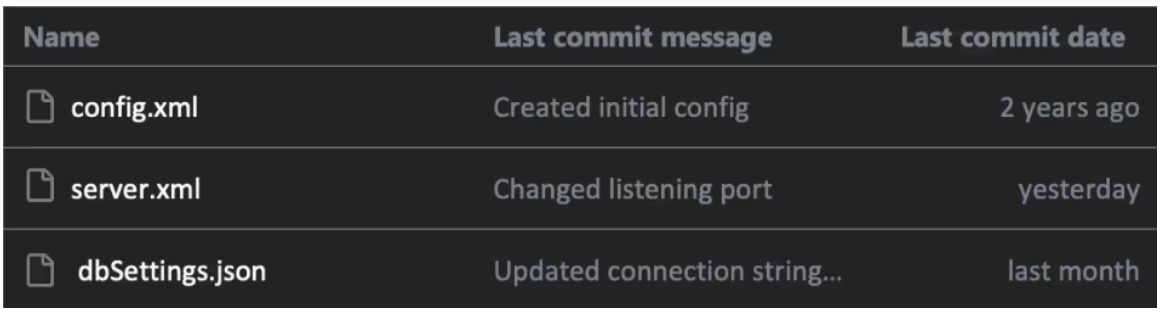
Upload multiple data formats

To upload configuration data in different file formats, you can call the `snDevOpsConfig` action with these specifications.

- Ensure the `configFile` argument is using a wildcard in the path.
- Do not specify the `dataFormat` argument.

Here's an example.

- Let's say we have these config files.



- This is how to upload the config files using `snDevOpsConfig`.

```
snDevOpsConfig(
    applicationName: 'PaymentDemo',
    target: 'component',
    namePath: 'paymentService-v1.0',
    configFile: 'infra/v1/*',
    autoCommit: 'true',
    autoValidate: 'true',
    autoPublish: 'true'
)
```

snDevOpsConfigUpload

This action uploads a configuration file to a given location within an application data model.

It is meant to be used in an iterative nature for all config files to upload to the application data model during the pipeline run.

Supports:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Upload to:
  - A component, collection, or deployable.
  - The variable (vars) folder of a component, collection, or deployable.
- Regex pattern for config file input.
- Ability to be called multiple times in the same pipeline.

Input variables

configFile	Specifies the configuration data file to upload to the component or deployable path in the data model.
applicationName	Specifies the application to where config data will be uploaded.
target	Specifies the data model target to where config data will be uploaded (for example, `component`, `collection`, `deployable`).
collectionName	(Optional) Name of the collection to upload to (required if target is collection).
deployableName	Name of the deployable to upload to (required if target is deployable).
namePath	Specifies the name path in the data model to where config data will be uploaded. **Note:** When uploading to a vars folder, you must start the name path with "vars/" to specifiy the variable folder path.
dataFormat	Specifies the data format of the config file (for example, `JSON`, `YAML`, `XML`, etc.)
convertPath	(Optional) Specifies whether to preserve the directory structure of configuration files (with respect to the workspace) and convert the directory to paths within the data model.
changesetNumber	(Optional) Specifies the (open) changeset to which this upload activity is associated. If not provided, a new changeset is created. **Note:** Only used for multiple upload scenarios.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

autoCommit	Specifies whether to commit configuration data after upload (true/false). Default is false.
autoValidate	Specifies whether to validate configuration data during commit (true/false). Default is false.

Output variable

changesetNumber	(Optional) Specifies the (open) changeset to which this upload activity is associated. If a changeset number is not provided, a new changeset is created.

Example

- Input:

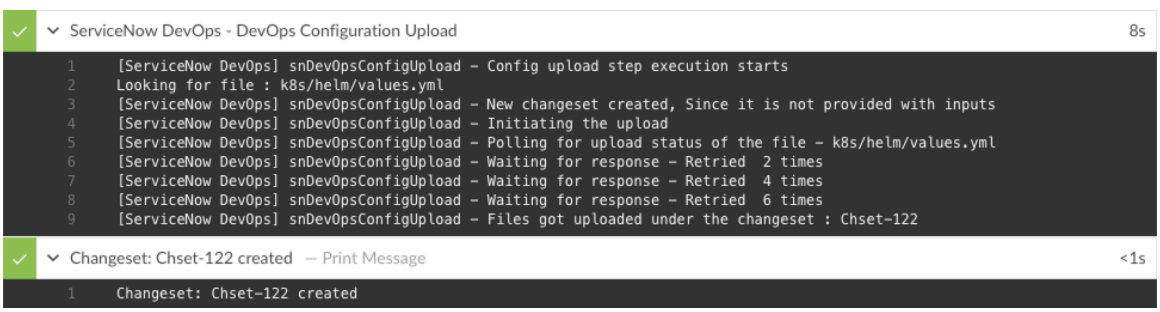
  Here is an example of the `snDevOpsConfigUpload` action. For the sake of illustration, we'll assign the response to a variable, `changeSetId`, which could be echoed out to our console log for debugging scenarios.

```
changeSetId = snDevOpsConfigUpload(
     applicationName: "PaymentDemo",
     target: 'component',
     namePath: "web-api-v1.0",
     configFile: "k8s/helm/values.yml",
     dataFormat: "json",
     autoCommit: 'true',
     autoValidate: 'true'
)

echo "Changeset: $changeSetId created"
```

- Output:

  In addition to the data being uploaded to our data model in DevOps Config, the output would look something like this (using the Blue Ocean plugin to visualize the console output).



Example - Multiple uploads (component)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can call the upload action more than once to upload configuration data in different file formats from different locations, while still keeping the uploads part of one changeset.

- In the first upload, name the action so the changesetNumber output variable can be reused in subsequent uploads.

  YAML file upload:

```
$changeset = snDevOpsConfigUpload(
     applicationName: 'PaymentDemo',
     target: 'component',
     namePath: 'wep-api-v1.0',
     configFile: 'k8s/helm/values.yml',
     dataFormat: 'yaml',
     autoCommit: 'false',
     autoValidate: 'false'
)
```

- In subsequent uploads, reference the changesetNumber output variable from the first upload as an input variable.

  3 JSON files upload:

```
snDevOpsConfigUpload(
     applicationName: 'PaymentDemo',
     target: 'component',
     namePath: 'wep-api-v1.0',
     configFile: 'infra/*.json',
     dataFormat: 'json',
     autoCommit: 'false',
     autoValidate: 'false',
     changesetNumber: "${changeset}"
)
```

- In the final call, in addition to referencing the changesetNumber output variable from the first upload as an input variable, set autoCommit and autoValidate to `true`.

  INI file upload:

```
snDevOpsConfigUpload(
     applicationName: 'PaymentDemo',
     target: 'component',
     namePath: 'wep-api-v1.0',
     configFile: 'featureToggles/set1.ini',
     dataFormat: 'ini',
     autoCommit: 'true',
     autoValidate: 'true',
     changesetNumber: "${changeset}"
)
```

Example - Multiple uploads (collection and vars)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can call the upload action more than once to upload configuration data in different file formats from different locations, while still keeping the uploads part of one changeset.

- In the first upload, create a variable (for example, $changeset), and assign the return value of the step to it so it can be reused in subsequent uploads.

  XML file upload:

```
$changeset = snDevOpsConfigUpload(
     applicationName: 'PaymentDemo',
     target: 'collection',
     collectionName: 'release-v1.0',
     namePath: 'v1-common-configs',
     configFile: 'infra/v1/config.xml',
     dataFormat: 'xml',
     autoCommit: 'false',
     autoValidate: 'false'
)
```

- In subsequent uploads, use the variable as an input.

  JSON file upload:

```
snDevOpsConfigUpload(
     applicationName: 'PaymentDemo',
     target: 'deployable',
     deployableName: 'Production',
     namePath: 'vars/dbSettings',
     configFile: 'infra/prod/dbConfig.json',
     dataFormat: 'json',
     autoCommit: 'true',
     autoValidate: 'true',
     changesetNumber: "${changeset}"
)
```

Note:
To upload to a variable folder, uploadTarget must be set to `deployable`, and the correct values must be set for deployableName and changesetNumber.

snDevOpsConfigGetSnapshots

This action is intended to be used in different scenarios:

- Retrieve all snapshots for any impacted deployables.

  When config files are uploaded to an application data model, the system will create snapshots for any deployables determined to be impacted by the upload. Following along the CI flow, assuming the last Upload call had validation enabled, the next step would be to iterate through the list of snapshots and ensure they all passed validation.

- Retrieve a specific snapshot.

  Following the CD flow, a specific snapshot is retrieved so it can be published and then exported to be consumed downstream (for example, to provision out infrastructure or application).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Retrieve the latest snapshots for a deployable of an application in the event an upload does not generate any snapshots.

  A set of config data is available to deploy to an environment for an application-deployable-changeset combination when no configuration changes are made.

- Show policy validation results in a pipeline execution.

  View policy validation results as test results on the Jenkins build tests results page, including compliant with exception, when getting a snapshot.

Input definitions

applicationName	Specifies the application to upload config data to or export data from.
deployableName	(Optional) Specifies the deployable for the application on which to get the latest snapshot data.
changesetNumber	(Optional) Specifies the changeset ID for the set of config changes the user is interested in.
isValidated	(Optional) Specifies whether to return only snapshots that are passed, or passed with exception (true/false). Default is true.
continueWithLatest	(Optional) Specifies whether to return the latest snapshot per the `applicatioName-deployableName-changesetNumbe` combination if no snapshots are generated (true/false). Default is false.

Output

- If successful, a snapshot or set of snapshots.
- If failure, an API/backend failure message is shown.

Example

- Specific snapshot (specified):

```
$snapshots = snDevOpsConfigGetSnapshots(
     applicationName: 'PaymentDemo',
     deployableName: 'Production',
     changesetNumber: 'Chset-16',
     isValidated: 'true',
     continueWithLatest: 'true'
)
```

- Latest validated snapshot (returns the latest snapshot for application and deployable combination):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
$snapshots = snDevOpsConfigGetSnapshots(
     applicationName: 'PaymentDemo',
     deployableName: 'Production',
     isValidated: 'true'
)
```

- All changeset snapshots (returns all snapshots for application and deployable combination):

```
$snapshots = snDevOpsConfigGetSnapshots(
     applicationName: 'PaymentDemo',
     changesetNumber: 'Chset-16'
)
```

- Show policy validation results in a pipeline execution.

1. Assign a variable to the path of the file that contains the snapshot validation results generated during the `snDevOpsConfigGetSnapshots` action.
2. Call the JUnit action to load the snapshot validation results into the pipeline execution test section.

```
stage('Validate') {
    steps {
 script {
           changeSetResults =
 snDevOpsConfigGetSnapshots( … )
           if (!changeSetResults) {
              echo "No snapshots were created"
           } else {
        def changeSetResultsObject = readJSON text:
 changeSetResults

        changeSetResultsObject.each {
                  snapshotName = it.name
                  snapshotObject = it
        }
        // STEP 1
  validationResultsPath =
 "${snapshotName}_${currentBuild.projectName}_${curren
tBuild.number}.xml"
     }
 }
    }
}

post {
    always {
        // STEP 2
        junit testResults: "${validationResultsPath}",
 skipPublishingChecks: true
    }
}
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

snDevOpsConfigPublish

This action publishes a snapshot for the given application and deployable. From here, the snapshot can be consumed through the Export process.

Input definitions

applicationName	Specifies the application from which to publish config data.
deployableName	Specifies the deployable for the application from which to publish config data.
snapshotName	Specifies the name of the snapshot to publish.

Output

- If successful, true.
- Otherwise false.

Example

```
snDevOpsConfigPublish(
     applicationName: 'PaymentDemo',
     deployableName: 'Production',
     snapshotName: 'Production-v23.dpl',
)
```

snDevOpsConfigExport

This action exports a snapshot for the given application and deployable.

The user should specify the exporter, relevant exporter arguments, the export format (for example, YAML, JSON, etc.), and output location for the exported config data.

From here, the config data can be used directly as an input for a deployment or provisioning tool downstream in the pipeline.

Input arguments

applicationName	Specifies the application from which to export data.
deployableName	Specifies the config deployable for the application from which to export data.
snapshotName	(Optional) Specifies snapshot from which to export data. If a snapshot is not specified, the latest snapshot for the deployable is used.
exporterName	Specifies the exporter to apply to the snapshot (for example, `UniqueCDIs`).

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

exporterArgs	(Optional) Specifies arguments to be used along with the exporter.
exportFormat	Specifies the format to export the snapshot data (For example, `INI`, `YAML`, `PROPS`).
fileName	Specifies the file to export data to (assumed to be in the workspace). If a filename is not specified, a concatenation of application name and deployable name (plus file extension) is used by default.

Output

- If successful, true.
- Otherwise false.

Example

```
snDevOpsConfigExport(
     applicationName: 'PaymentDemo',
     deployableName: 'Production',
     snapshotName: 'Production-v23.dpl',
     exporterFormat: 'yaml',
     exporterName: 'returnAllData-now',
     exporterArgs: '',
     fileName: 'exported_file-Production-20220302.yml'
)
```

snDevOpsConfigRegisterPipeline

This action ties a changeset and/or snapshot to the pipeline so that it can be tracked during the pipeline execution. In DevOps Change Velocity, this is shown in the Pipeline UI.

See Accelerating your DevOps change process for more information regarding the DevOps Change Acceleration feature.

Input arguments

applicationName	Specifies the name of the application.
changesetNumber	(Optional) Specifies the changeset to associate with the pipeline execution. **Note:** Specify either changesetNumber or snapshotName, but not both.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

snapshotName	(Optional) Specifies the name of the snapshot to associate to the pipeline execution. **Note:** Specify either changesetNumber or snapshotName, but not both.

Output

- If successful, true.
- Otherwise false.

Example

- Input:

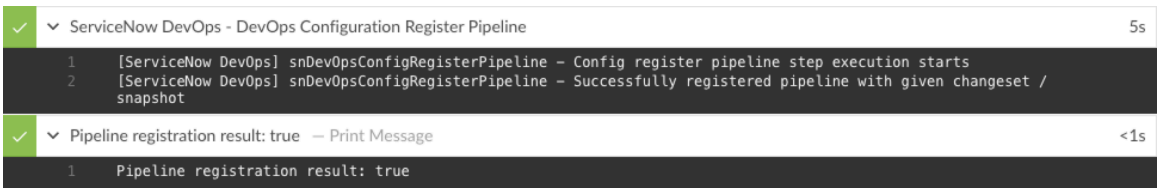
  Here is an example of the `snDevOpsConfigRegisterPipeline` action. For the sake of illustration, we'll assign the response to a variable, `changeSetRegResult`, which could be echoed out to our console log for debugging scenarios.

```
changeSetRegResult = snDevOpsConfigRegisterPipeline(
     applicationName: "PaymentDemo",
     changesetNumber: "Chset-122"
)

echo "Pipeline registration result:
 ${changeSetRegResult}"
```

- Output:

  In addition to the data being uploaded to our data model in DevOps Config, the output would look something like this (using the Blue Ocean plugin to visualize the console output).



snDevOpsConfigValidate

Validate config data against your organization policies.

Input arguments

applicationName	Application to validate.
deployableName	Deployable for the application to validate.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

snapshotName	(Optional) Name of the snapshot to validate.
markFailed	(Optional) Fail the pipeline in the event that the validation attempt failed (due to a backend issue).
showResults	(Optional) Show validation results in the Jenkins job console log.

Output

- If successful, no output.
- If failure, an API/backend failure message is shown.

Example

- Specific snapshot (specified):

```
snDevOpsConfigValidate(
     applicationName: 'PaymentDemo',
     deployableName: 'Production',
     snapshotName: 'Production-v23.dpl',
)
```

- Latest snapshot (retrieves and validates the latest snapshot for application and deployable combination):

```
$changeset = snDevOpsConfigValidate(
     applicationName: 'PaymentDemo',
     deployableName: 'Production'
)
```

snDevOpsChange

Create a change request and attach a snapshot for reference.

See Accelerating your DevOps change process for more information regarding the DevOps Change Acceleration feature.

Input arguments

applicationName	Specifies the name of the application.
snapshotName	Specifies the name of the snapshot to associate with the change request.

Example

```
snDevOpsChange(
     applicationName: 'PaymentDemo',
     snapshotName: 'Production-v23.dpl'
)
```

Jenkins pipeline example

```
pipeline {
    environment {
        buildArtifactsPath =
 "build_artifacts/${currentBuild.number}"
        validationResultsPath = ""
    }

    agent any

    stages {
        // Initialize pipeline
        stage('Initialize') {
            steps {
                script {
                    // DevOps Config application related
 information
                    appName = 'PaymentDemo'
                    deployableName = 'Production'
                    componentName = "web-api-v1.0"
                    collectionName = "release-1.0"
                    // Configuration file information
                    exportFormat = 'yaml'
                    configFilePath = "k8s/helm/values.yml"
                    // Exporter related information
                    exporterName = 'returnAllData-nowPreview'
                    exporterArgs = ''
                    // Jenkins variables declared to be used in
 pipeline
                    exportFileName =
 "${buildArtifactsPath}/export_file-${appName}-${deployableName}
-${currentBuild.number}.${exportFormat}"
                    changeSetId = ""
                    snapshotName = ""
                    snapshotObject = ""
                    isSnapshotValidateionRequired = false
                    isSnapshotPublisingRequired = false
                }
            }
        }

        // Validate configuration data changes
        stage('Validate') {
            parallel {
                stage('Config') {
                    stages('Config Steps') {
                        // Upload configuration data to DevOps
 Config
                        stage('Upload, Validate, & Publish') {
                            steps {
                                sh "echo uploading and
 auto-validating configuration file: ${configFilePath}"
                                script {
                                    changeSetResults =
 snDevOpsConfig(

```

GitHub pipeline actions

Use these actions in your GitHub pipeline to interact with the DevOps Config data model.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

GitHub scripted and declarative pipelines are supported.

The ServiceNow DevOps Config Validate (servicenow-devops-config-validate) and DevOps Config Export (servicenow-devops-config-export) GitHub Actions are provided to create a specific pipeline definition.

DevOps Config Validate (servicenow-devops-config-validate)

Upload and validate configuration data in a ServiceNow instance.

Input arguments

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Argument	Description
instance-url	ServiceNow instance URL.
devops-integration-username	DevOps Config integration username.
devops-integration-user-password	DevOps Config integration user password.
application-name	DevOps Config application name.
target	Data model target where configuration files are uploaded. Example data model targets are: • `component` • `collection` • `deployable`
deployable-name	Deployable name in the DevOps Config data model.
collection-name	(Optional) Collection name in the data model. Required when target is collection.
name-path	(Optional) Name path of the node in the data model where the configuration files are uploaded.
config-file-path	File path when uploading a single file or file path pattern based on the Ant-style pattern when uploading multiple files to the data model. See Directory-based Tasks for information on Ant-style patterns in the Apache Ant.1.10.14 Manual documentation.
data-format	Data format of the configuration files. Example data formats are: • `CSV` • `INI` • `JSON` • `Properties` • `RAW` • `XML` • `YAML`
data-format-attribute	(Optional) Extended data format attributes for parsing configuration data.
auto-commit	Boolean (true or false) input to commit configuration data after successful upload.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Argument	Description
	Default value: `true`
auto-validate	Boolean (true or false) input to validate configuration data after successful commit. Default value: `true`
auto-publish	Boolean (true or false) input to publish configuration data after successful validation. Default value: `true`
changeset	(Optional) Open changeset associated with the upload action. If not provided, a new changeset is created.
snapshot-validation-timeout	(Optional) Maximum time in minutes for validation to complete before failing the action. Default value: `60`
terminate-on-policy-validation-failures	(Optional) Boolean (true or false) input to terminate the GitHub workflow after policy validation failures. Default value: `false`

Outputs

changeset-number

Changeset number associated with the upload action.

snapshot-name

Name of the latest snapshot of the deployable.

validation-status

Validation status of the snapshot. Example: `passed`, `passed_with_exception`, `failed`, `execution_error`, `not_validated`

validation-results

Validation results in the JSON format for the snapshot.

Example — Uploading config files to a deployable

```
upload_and_validate_job:
    name: Upload and validate
    needs: <upstream job>
    runs-on: ubuntu-latest
    steps:
      - name: ServiceNow Devops Config Validate
```

          devops-integration-user-password:
 ${{ secrets.SN_DEVOPS_CONFIG_PASSWORD }}
          application-name: PaymentDemo
          target: deployable
          deployable-name: Production
          name-path: web-api-v1.0
          auto-commit: true
          auto-validate: true
          auto-publish: true
          config-file-path: data/k8s/helm/*.yml
          data-format: yaml
          snapshot-validation-timeout: 60
          terminate-on-policy-validation-failures: true
```

Example — Uploading config files to a collection

```
upload_and_validate_job:
    name: Upload and validate
    needs: <upstream job>
    runs-on: ubuntu-latest
    steps:
      - name: ServiceNow Devops Config Validate
        uses:
 ServiceNow/servicenow-devops-config-validate@v1.0.0-b
eta
        with:
          instance-url: ${{ secrets.SN_INSTANCE_URL }}
          devops-integration-username:
 ${{ secrets.SN_DEVOPS_CONFIG_USERNAME }}
          devops-integration-user-password:
 ${{ secrets.SN_DEVOPS_CONFIG_PASSWORD }}
          application-name: PaymentDemo
          target: collection
          deployable-name: Production
          collection-name: release-1.0
          name-path: web-api-v1.0
          auto-commit: true
          auto-validate: true
          auto-publish: true
          config-file-path: data/k8s/helm/*.yml
          data-format: yaml
          snapshot-validation-timeout: 60
          terminate-on-policy-validation-failures: true
```

Example — Uploading config files to a component

```
upload_and_validate_job:
    name: Upload and validate
    needs: <upstream job>
    runs-on: ubuntu-latest
    steps:
```

DevOps Config Export (servicenow-devops-config-export)

Export configuration data using ServiceNow DevOps Config.

Input arguments

Argument	Description
instance-url	ServiceNow instance URL.
devops-integration-username	DevOps Config integration username.
devops-integration-user-password	DevOps Config integration user password.
application-name	DevOps Config application name.
deployable-name	Deployable name in the DevOps Config data model.
exporter-name	Exporter name that exports configuration data from the DevOps Config data model.
snapshot-name	(Optional) Snapshot from which to export data. If a snapshot is not specified, the latest snapshot for the deployable is used.
exporter-data-format	(Optional) Format to export the snapshot data. Example data formats are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Argument	Description
	• `CSV` • `INI` • `JSON` • `Properties` • `RAW` • `XML` • `YAML`
exporter-arguments	(Optional) Arguments to be used along with the exporter. The value must be a JSON object represented as a string.

Output

exporter-content

Configuration data that the exporter exports.

Example — Export specific snapshot

```
export:
    name: Export config
    needs: <upstream job>
    runs-on: ubuntu-latest
    steps:
    - name: ServiceNow DevOps Config Export
      uses:
 ServiceNow/servicenow-devops-config-export@v1.0.0-beta
      with:
        instance-url: ${{ secrets.SN_INSTANCE_URL }}
        devops-integration-username:
 ${{ secrets.SN_DEVOPS_CONFIG_USERNAME }}
        devops-integration-password:
 ${{ secrets.SN_DEVOPS_CONFIG_PASSWORD }}
        application-name: PaymentDemo
        deployable-name: Production
        exporter-name: returnDataforNodeName-now
        snapshot-name: Production-v1.dpl
        exporter-arguments: '{ "nodeName": "node1" }'
```

Example — Export the latest deployed snapshot with additional parameters

```
export:
    name: Export config
    needs: <upstream job>
    runs-on: ubuntu-latest
    steps:
    - name: ServiceNow DevOps Config Export
      uses:
 ServiceNow/servicenow-devops-config-export@v1.0.0-beta
      with:
        instance-url: ${{ secrets.SN_INSTANCE_URL }}
        devops-integration-username:
 ${{ secrets.SN_DEVOPS_CONFIG_USERNAME }}
```

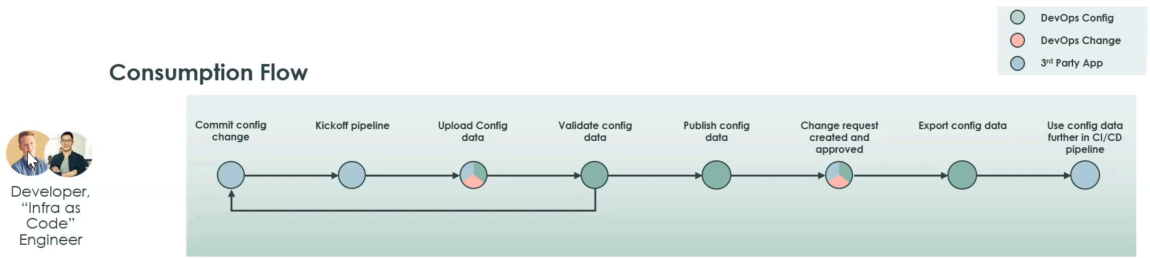
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        devops-integration-password:
${{ secrets.SN_DEVOPS_CONFIG_PASSWORD }}
        application-name: PaymentDemo
        deployable-name: Production
        exporter-name: returnDataforNodeName-now
        exporter-arguments: '{ "nodeName": "node1" }'
        exporter-data-format: XML
```

Using DevOps Config

The developer, or app engineer, role uses DevOps Config, once it's installed and set up by the DevOps engineer role, to validate and correct config data (that they commit) before it gets deployed.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.



Consumption process:

1. A configuration change is committed as part of the role of the developer, or app engineer.
2. The build process is kicked off in the pipeline.

   When a configuration change is committed in the source code repository, it typically kicks off the build process in the pipeline.

3. Upload configuration data using Azure DevOps pipeline tasks or Jenkins pipeline actions.

   DevOps Config pipeline tasks and actions are used to interact with your data model to upload config data for validation.

4. Get snapshot status of the uploaded configuration file.

   A snapshort (of configuration data) is created when the configuration change is committed.

5. Check validity of the snapshot using DevOps Config policies.

   Once config data is uploaded and the snapshot is created, it's validated in DevOps Config against a set of policies predefined for the specific deployment environment.

6. Publish snapshot after validation.

   Once validated by DevOps Config, the config data is then published and a DevOps change request is created by DevOps Change Velocity (change control).

   Snapshot information is shown in the DevOps change request **Config changes** tab for accelerated root cause analysis.

7. Approve the DevOps change request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once the DevOps change request is approved, the config data is used downstream in your CI/CD pipeline.

8. Deploy to your environment.

   Once the change is deployed to your environment, the change request is closed.

9. Use DevOps Config exporters to export your config data to be used by your deployment tools.

Viewing and editing config data

You can update the config data of an application by creating or opening a changeset on the **Config data** tab, where you update the structure and CDIs of the config data.

> **Important:**
> Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Tabs on the Application page

When you open an application, the header area for each tab displays administrative details for the application: Application name, name of the user that created the application, and timestamp of creation.

- **Overview**: Basic settings of the application and a **Manage deployables** button that enables you to edit config data.
- **Snapshots**: List of snapshots for each deployable in the application. Each entry includes validation and publication status. Policies that execute against a snapshot return validation result. Published snapshots are available for release to the CI/CD pipeline.
- **Config data**: Read-only view of the config data in a tree structure. Select a node in the tree to view the config data for that node in the application service or infrastructure service. (You can edit an open changeset or create a new or changeset. The tab then updates to show an Editor panel and a Preview panel where you can create, edit, and save the changeset. You cannot change an existing snapshot, but you can start with a snapshot changeset and save the changes in a new changeset.)

  > **Important:**
  > Save your changes whenever you are confident of the changes and before you leave the **Config data** tab.

- **Settings**: A list of policies that are mapped to the deployables. Select an item to open it.
- **Activity**: List of changesets. On this tab, you can open a changeset to continue editing or publish a changeset as a new version of the application config data.

Config data tab

After you open a changeset by selecting **Edit config data**, you can edit the config data on the Config Data tab. In the config data tree (A in the screenshot), select the node to edit. By default, the editing panel (C) displays the script view of the key-value pairs (the config data items or CDIs) in the selected node.

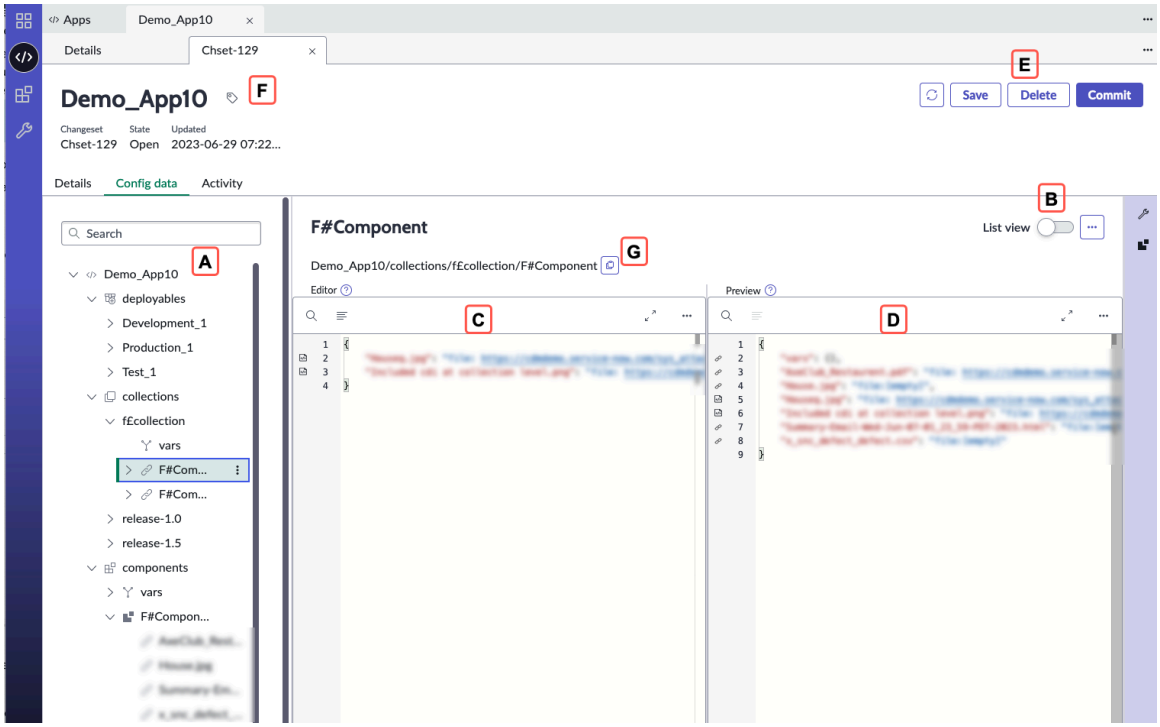
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A: Config data tree

The config data tree displays the structured config data. Select a node to edit the associated data.

B: View selector

To switch from the Script view (shown as panels C and D) to an editable list of CDIs and their values, slide the selector to **List view**.

C: Editor panel

The Editor panel displays the contents of the selected node. You can edit the config data directly in the Editor panel.

> **Important:**
> To ensure that you edit only the data that you intend to edit, the panel displays only data that is directly in the selected node. The Editor panel lists all included collection and component names but not their contents. This strategy reduces clutter and clarifies the structure of the deployable. To view the fully resolved config data, view the Preview panel (D).

D: Preview panel

The Preview panel displays the persisted state of the data in structured form. If you make any changes in the Editor panel and save the changes, the data in the Preview panel is updated to include the changes.

- To resolve variables and view the fully resolved data in the preview panel: In the More actions menu (⋮), select **Apply variables**.
- Encrypted data appears as ********. Users with the CDM Secrets [sn_cdm.cdm_secrets] role can view all encrypted values in the preview panel. In the More actions menu (⋮), select **View encrypted data**.
- To see nodes and CDIs that are excluded from inheritance: In the More actions menu (⋮), select **View excluded data**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

E: Actions

- **Refresh View**: Update data in the view.
- **Save Changes**: Save (persist) the current changes but do not commit the data. The Editor panel, List view, and Preview panel refreshes to reflect the resolved state of the changeset. The system updates the changeset but does not update the application. Changes appear on the **Activity** tab. You must commit a changeset to update the config data for the application. After saving, you can move on to other activities and return later to edit the changeset. The button appears only if you have made changes.
- **Delete Changeset**: Delete the record of the changeset.
- **Commit Changeset**: The system generates a snapshot of each deployable that is affected by the changes.

> **Note:**
> Because changes in two changesets that are open at the same time can conflict, the system blocks such commits. See Conflicts between changeset commits.

F: Header for the changeset

The header displays general read-only information about the changeset. You can view this information and additional information on the **Details** tab, as described in the next section.

G: Name path of the selected node

The name path is the complete folder path of the selected node in the list. Select the copy name path to clipboard icon ( ) to copy the name path of the node.

Changeset - Header and Details tab

Information on the Changeset Header and on the Details tab

Field	Description
Changeset number	Unique sequential changeset number that the system auto-assigns.
Description	Description that helps other users understand the purpose, scope, and intent of the changeset.
Application	Application on which the changeset is based.
State	• Committed: This draft of the changeset has been committed. • Open: The changeset is being updated and is not committed. • Blocked: Other commits conflict with this commit. The changeset cannot be committed. See Conflicts between changeset commits. • Commit in progress: A draft of the changeset that is currently being committed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information on the Changeset Header and on the Details tab (continued)

Field	Description
Created / Created by	User who created the changeset and the timestamp of creation.
Updated / Updated by	User who updated the changeset and the timestamp of the update.
Committed / Committed by	User who committed the changeset and the timestamp of the commit.

Define or update a component

Define or update a component while working in a changeset.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

Important:
Save your changes whenever you are confident of the changes and before you leave the **Config data** tab.

Procedure

1. Follow this procedure to add a component to an application:
   a. While working in a changeset, select the more actions icon ( ) for the **components** node and select **Create component**.
   b. Enter a unique and meaningful name and then select **Create**.
2. To perform other actions, select the more actions icon ( ) for a component and select the action, as follows.
3. Add a CDI: Select the more actions icon ( ) for the item and select **Create CDI**.

Create CDI

Name	Unique and meaningful name for the CDI.
Value	Value that the CDI has in the current context or define a variable.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	○ You can specify a direct `key : value` pair.
	○ You can define a variable and specify its default value. Variable definitions have the following form:
	`@@<variableName>@@: <value>`
	○ You can specify a value for a variable using the following form:
	`"<variableName>": "<value>"`
	○ You can specify a contextual variable. These are variables defined out-of-the-box that use the context of the node to set the variable value. The variable uses the following form:
	`"<variableName>": "(#<value>#)"`
	○ You can use recursive variables for a CDI value. Recursive variables use other variable values as parameters to set the CDI value. For example, each of these CDI values can resolve the same due to recursive variables:
	`cdi1: @(favorite_food/@(person)@)@`
	`cdi2: @(favorite_food/@(john)@)@`
	`cdi3: waffles`

Encrypted	Option to specify that the value of the CDI should be encrypted. This option appears only for users with the CDM Secrets [sn_cdm.cdm_secrets] role. After you create the CDI, the value appears in all views as `*******`. To view the value on any tab that displays the CDI, users with the CDM Secrets [sn_cdm.cdm_secrets] role can select the **View encrypted data** menu option.

Viewing and editing config data

How encrypted data is handled

Define or update a collection in an application

Define or update a collection while working in a changeset of a application.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

Important:
Save your changes whenever you are confident of the changes and before you leave the **Config data** tab.

Procedure

1. To add a collection to the application: While working in a changeset, select the more actions icon ( ) for the **collection** node and select **Create collection**.
2. To edit individual data items, you can either work directly in the code or select the more actions icon ( ) for an item and select an action, as follows.
3. Add a CDI: Select the more actions icon ( ) for the item and select **Create CDI**.

Create CDI

Name	Unique and meaningful name for the CDI.

Value	Value that the CDI has in the current context or define a variable.
	○ You can specify a direct `key : value` pair.
	○ You can define a variable and specify its default value. Variable definitions have the following form:
	`@@<variableName>@@: <value>`
	○ You can specify a value for a variable using the following form:
	`"<variableName>": "<value>"`
	○ You can specify a contextual variable. These are variables defined out-of-the-box that use the context of the node to set

Create or update a variable CDI

Define variables and set their values in components, collections, and deployables.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Important:
Save your changes whenever you are confident of the changes and before you leave the **Config data** tab.

- When you create an application, the system auto-generates an empty **vars** folder in each of the three top-level folders: **component**, **collection**, and **deployable**.
- When you add a collection or deployable, the system adds an empty **vars** folder to the item that you created.
- A **vars** folder can contain only variable CDIs or folders. Any subfolder can contain only variables or folders.
- The value of a variable in a collection overrides the value of the variable in a component.
- The value of a variable in a deployable overrides the value of the variable in a collection or component.

Procedure

1. Use either of the following methods to edit or add an instance of a variable while working in a changeset:
   - Edit directly in the editing panel. Use the following format to set the value of a variable:

     ```
     "<variableName>": "<value>"
     ```

     In this example, the *dbName* variable and several others reside in the *database* folder. In addition, the *backup* folder (a child of the *database* folder) holds the *dbServer* variable.

     ```
     {
         "database": {
             "dbName": "paymentX_dev22",
             "dbUserName": "root2",
             "dbPassword": "admin1",
             "dbServer": "db22.paymentx.be",
             "dbPort": "03306",
             "backup":{
                 "dbServer": "1625575668.paymentx.be"
             }
         }
     }
     ```

   - Create the variable in a dialog box. Follow the procedure in the next step.
2. Select the more actions menu icon (⋮) for the appropriate **vars** folder, select **Create variable**, and then specify its settings.

Create variable

Name	Unique and meaningful name for the variable.
Value	Value that the variable has in the current context.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	Tip: It is often useful to define a default value for a variable in a component or collection. This is a powerful strategy because you can create a broad variety of deployables from a small set of components and collections. Deployables that inherit a component or collection can use overrides, overlays, and variable settings to meet the needs of the environment type. For example, the `Development` deployable can use the same components and collections as the `Test` deployable. `Development` uses the default *`database`* variable value. `Test`, in contrast, uses a different value that is appropriate for the test environment.
Encrypted	Option to specify that the value of the variable should be encrypted. The option appears only for users with the CDM Secrets [sn_cdm.cdm_secrets] role. After you create the variable, the value appears in all views as `*******`. To view the value on any tab that displays the variable, users with the CDM Secrets [sn_cdm.cdm_secrets] role can select the **View encrypted data** menu option.

Manage files in the config data model using file nodes

Add and manage files using file nodes in the config data model of a CDM app or in a component library.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

When you attach a file to an applicable node, a file node is created under that node. The file node contains a link to the attached file that stores configuration data. For example, a properties file or a logo image file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In an app, you can add the file node to a node under the component, collection, or deployable folder. The file nodes in a component are also included when you include a component to a collection and the collection to the deployable in an app. You can override the file nodes included at the collection or deployable level, like any other config data item.
- In a component library, you can add a file node to a node under a shared component. When the shared component is used in an app, the file nodes are copied along with the file attached to them.

App developers and members of the authoring group of the app can access the file nodes and also download their attached files. They can manually validate the content of the file and then publish the snapshot. DevOps users can export the validated config data, including file nodes with URLs to the attached files hosted on the ServiceNow instance where the export was executed.

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Open a DevOps Config app or a component library to add a file node to its config data model. A changeset is opened with the **Config data** tab selected.
3. In the config data tree, select the more actions icon (⋮) next to a node to which you want to add a file node, and then select the **Add file** from the menu.

   Note:
   In an app, you can add a file node to a node under the component, collection, or deployable, but not directly to the component, collection, or deployment folder in an app. In a shared library, you can add a file node to a node under a shared component.

4. Add a file to create a file node.

   a. In the Add file dialog box, browse and select a file from your system, and select **Add file**. You can add a MIME-type file supported by the ServiceNow AI Platform with a maximum file size of 5 MB.

   b. In the **Node name** field, provide a name for the file node.
   By default, the attached file name is populated as the file node name. The **Content type** field is also populated with the content type of the attached file.

   c. Select **Add file**.

   The file node is added to the selected node. Select the file node in the config data tree to display its metadata in the File information pane and preview the file's content in the File content pane.

   Note:
   The content preview is available for the files with the following MIME types: `text/yaml,text/css,text/csv,text/html,text/javascript,text/plain,text/richtext,text/x-vcard,text/x-vcalendar,application/xml,application/javascript,application/json`. To view content for additional MIME type files, add them as a comma separated list to the system property *`sn_cdm.attachment.display_mime_types`*. The preview is not available for binary file MIME types, such as audio, image, and video.

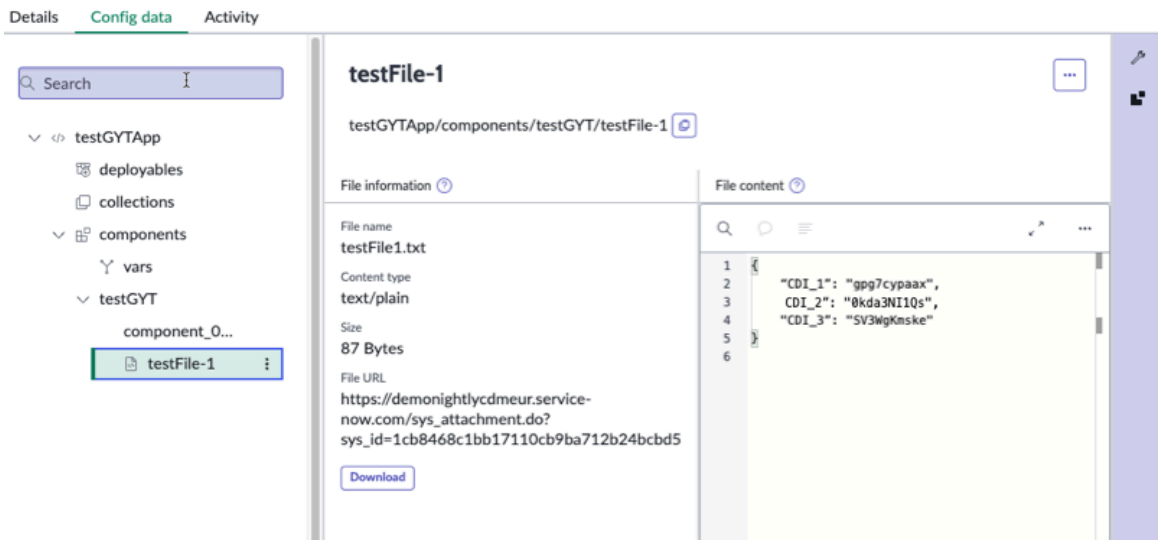
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. **Optional:** After the file node is added to the config data, you can perform the following actions on the file node or the file attachment within it.

Note:
All actions on the file node or its file attachment can only be done via the More actions menu on the file node.

Compare config data of two CDM applications

Use the Config Data Analyzer tool to find similarities and differences between the config data of two applications. You can compare either different applications or different changesets of a particular application.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

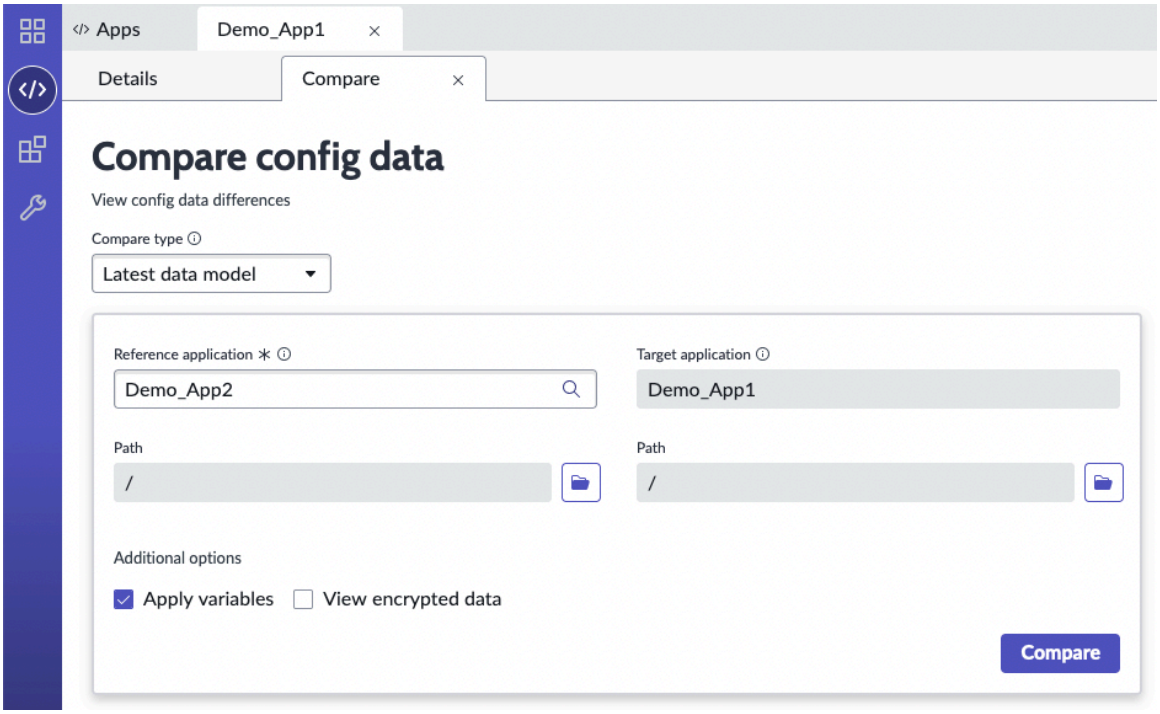
Role required:cdm_viewer, cdm_editor, or cdm_admin

Procedure

1. While viewing an application, select **Compare config data**.
   The **Compare config data** tab opens.

   The current application (the application that you started with, *Demo_App1* in the example) is called the target. The application to compare to the target is called the reference application. The **Target application** field is set as the latest committed data for the target and is read-only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select the **Latest data model** option in the **Compare type** field.
3. Select a reference application (*Demo_App2* in the example).
   The **Reference application** selection list includes the latest committed data for all applications except the target application.
4. **Optional:** Select the folder icon ( ) to specify a folder path for comparison.
5. **Optional:** Select **Apply variables** to display fully resolved variable values in the comparison results.
6. **Optional:** If you've the cdm_secrets role, you can select **View encrypted data** to view encrypted values in clear text in the comparison results.

   Note:
   The check box is inactive for users who do not have the cdm_secrets role. When the values in the target and reference differ, the comparison results indicate that the values differ, but the data itself still appears as ********.

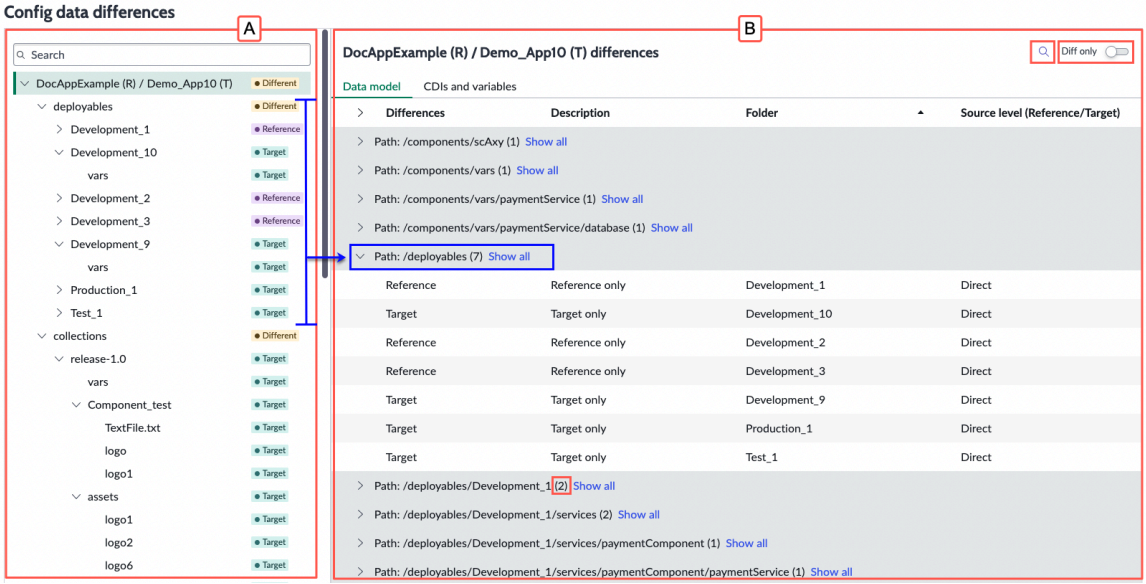
7. Select **Compare**.

   The Comparison results section displays the differences between the reference changeset and the target changeset.

   Important:
   If you commit changes to a reference application while the **Compare config data** tab is open: When you return to the **Compare config data** tab and select **Compare**, the comparison is performed on the most recently committed changeset, and the updated results are displayed in the results section.

   The letters in the following illustration identify the tools that you can use to analyze the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A. Navigation panel

The navigation panel displays the node structure of the applications.

- Nodes that include changed CDIs (either directly or in descendent nodes) are annotated with **Different**.
- Nodes that include newly added CDIs (either directly or in descendent nodes) are annotated with the identity of the application changeset that includes the new data, either **Reference** or **Target**.
- Use the **Search** field to search for text in the navigation panel.
- Select a node to view its contents in the Differences panel.

B: Differences panel

- By default, all config data is displayed. Select **Diff only** to view only data that differs between the two changesets.
- Use the **Search** icon ( ) to search for text in the Component differences panel.
- The panel offers two tabs: **Data model** and **CDIs and variables**. In either tab, expand and close groupings with the expansion icon ( ).
- If a selection includes more than 50 CDIs, then CDIs are organized into pages of 50.

The **Data model** tab displays changes to the structure of the application at the folder level, such as, adding, deleting, or renaming a folder.

Data model tab - List columns

Column	Description
Differences	The path of the structure for which differences are described.
Description	Text that describes any differences between the reference and target changesets.
Folder	The folder in the structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source level (Reference/Target)	○ Direct: The folder is explicitly specified or deleted in the node. ○ Included: The folder is included from a child folder.

The **CDIs and variables** tab displays changes to individual CDIs for the node that is selected in the navigation panel.

- By default, the root node is selected and the data panel includes all CDIs for both changesets. Select a node in the navigation panel to display data for only that node and its descendents.
- When **Diff only** is selected, the number of CDIs that differ appears after the node path.
- Node paths are displayed in gray. Use the expansion icon ( ) to view CDIs in a folder.

CDIs and variables tab - List columns

Column	Description
Differences	Indicator to show where the differences are. ○ Target: The CDI appears only in the target changeset. ○ Reference: The CDI appears only in the reference changeset. ○ Different: For the specified CDI, the values in the target and reference changesets differ.
Description	Statement of how the changesets differ. For example, the text might indicate that a CDI appears only in the reference changeset or that the values for variable differ between the changesets. See Types of differences between CDM applications for the full list of difference types and their causes.
Name	Name of the CDI.
Reference (R)	Value of the CDI in the reference changeset.
Target (T)	Value of the CDI in the target changeset.
Source level (R/T)	The node level in the code at which the CDI is defined. ○ Direct: The CDI is defined in the selected node. ○ Include: The value of the CDI is obtained from a node that is included in the selected node. ○ Override: The value of the CDI in an included node is overridden by a value that is specified in the including node. Values appear in the following formats:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ `<reference level / target level>` when a value appears in both target and reference. ○ `<reference level>` when a value appears in only the reference changeset. ○ `<target level>` when a value appears in only the target changeset. For example, when a CDI is defined in the reference changeset with the value `true` and the CDI does not appear in the target changeset, then the last three columns in **CDIs and variables** tab will have the following values: ○ **Reference (R)**: `true` ○ **Target (T)**: [Empty] ○ **Source level (R/T)**: `Direct`

If a file node is selected in the tree, the **File information** tab displays its metadata.

File information tab - List columns

Column	Description
Differences	Indicator to show where the differences are. ○ Target: The file node is available only in the target changeset. ○ Reference: The file node is available only in the reference changeset. ○ Different: The file node data differs in the target and reference changesets.
File metadata	Metadata of the file attached to the file node. ○ File name: Name of the attached file in the file node. ○ Content type: Content type of the file. ○ Content: Content of the attached file. Preview is not available on the list, but you can download the file to preview it. ○ File URL: Folder path where the file exists.
Reference (R)	Details of the file present in the reference changeset.
Target (T)	Details of the file present in the target changeset.

Types of differences between CDM applications

Descriptions and examples of differences between CDM applications when using the Config Data Analyzer tool.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of differences

On the **App compare** tab, the **CDIs and variables** tab displays changes to individual CDIs for the node that is selected in the navigation panel. The **Description** column displays one of the following values that describes how the changesets differ.

Values are different

Both the reference and target changesets include a particular CDI, but the values differ between the two changesets. See the **Reference** and **Target** columns for the values.

Encryption settings are different

The **View encrypted data** setting is selected for one changeset and not selected for the other changeset.

> **Note:**
> For users that do not have the CDM Secrets [sn_cdm.cdm_secrets] role, encrypted data always appears as ********.

Source levels are different

One of the following cases:

- The value is direct in one changeset and is overridden in the other changeset.
- The value is direct in one changeset and is included in the other changeset.

Source levels and values are different

In addition to the cases described in "Source levels are different", the value differs between changesets.

Target only

A CDI or the value for a CDI appears only in the target changeset.

Reference only

A CDI or the value for a CDI appears only in the reference changeset.

Examples of differences

Changesets and version control in CDM

A changeset is a draft copy of an application that you can update and save as often as needed. When you are satisfied with your changes, you can commit the changeset to apply the changes to the application. Committing

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

About changesets

To edit config data, you create a changeset and make changes in the changeset. You can perform the following actions:

- Create a new changeset: The changeset includes the full config dataset of the application.
- Save a changeset: The Editor panel, List view, and Preview panel refreshes to reflect the resolved state of the changeset. The system updates the changeset but does not update the application. Changes appear on the **Activity** tab. You must commit a changeset to update the config data for the application. After saving, you can move on to other activities and return later to edit the changeset.
- Update an existing changeset: Edit a changeset that had been saved but not committed.
- Commit a saved changeset: The system generates a snapshot of each deployable that is affected by the changes.

About conflicts with other changesets of the application that you are working on

Sometimes, UserA and UserB are working at the same time on two different changesets of the same application. If UserA commits a changeset that sets *`variableX`* to A and later, UserB tries to commit a changeset with *`variableX`* set to B, a conflict results.

An open changeset with conflicts is blocked—it cannot be committed. The system notifies you of conflicts with a warning message on the page. In addition, the **State** value in the header changes from **Open** to **Blocked**.

See Conflicts between changeset commits for descriptions of the types of conflicts that the system identifies.

Open a changeset to update config data

Update config data in an existing changeset or in a new changeset. You can save your changes for later updates or save and commit the changes. Committing the changes generates a snapshot for each deployable that is affected by the changes.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

- When you commit the changes that you have made to an application (commit the changeset), the system generates a snapshot of each deployable that has been updated. A snapshot is an exact record of the config data for a deployable. Snapshots are read-only — you cannot modify a snapshot. You can, however, start a new changeset that is based on a particular snapshot.
- Sometimes, another user has committed changes to a data set (thus creating a new snapshot) while you are working on a changeset of the same data. In this case, the data that you are working on is stale (the data is in the state it was in before the other user committed changes). This can result in data conflicts. Learn more about how you use changesets and how CDM manages version control at Changesets and version control in CDM.

Procedure

1. Use one of the following methods to open a changeset for editing:
   - On the **Activity** tab for an application, select a changeset number.
   - On the **Overview** or **Config data** tab for an application, select **Edit Config Data**.

   Important:
   Save your changes whenever you are confident of the changes and before you leave the **Config data** tab.

   The changeset opens on the **Config data** tab.
2. In the config data tree, select the item to edit in either the script view or the list view.

   By default, the Editor panel displays the script view of the key:value pairs (the config data items — CDIs) in the selected node. See Viewing and editing config data for details on operations in the **Config data** tab.
3. Add components, collections or deployables, see the instructions in Define or update a component, Define or update a collection in an application, and Create and update a deployable.
4. Select **Save** to save the changes in the changeset and ready the changes in the changeset to be committed.
   The Editor panel, List view, and Preview panel refreshes to reflect the resolved state of the changeset. The system updates the changeset but does not update the application. Changes appear on the **Activity** tab. You must commit a changeset to update the config data for the application. After saving, you can move on to other activities and return later to edit the changeset.
5. **Optional:** Select **Commit**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Commit changeset dialog box opens and lists each deployable that is affected by the changes.

Note:
After you commit a changeset, the changeset cannot be modified.

The system generates a snapshot of each deployable that is affected by the changes. The dialog box offers the following **Additional actions**:

- If no deployables are affected by the changes, select **No additional actions**. The system will update the application to persist the changes.
- Select **Validate snapshots** to perform the following operations on all generated snapshots:
  - The system executes all policies that are statically or dynamically mapped to the associated deployable.
  - If the snapshot passes all policies, then the Validation status value is set to **Passed** and no entries are listed on the **Validation Results** tab. If validation was invoked with the **Publish Valid** publish option, then valid snapshots are auto-published.
  - If any policy encounters issues, then the Validation status value is set to **Failed**. The **Validation Results** tab displays all failures or warnings returned by policies.
  - If any policy failed to run to completion, then the Validation status value is set to **Execution error** and the **Validation Results** tab indicates that validation failed due to error.
- Select **Validate and publish snapshots** to perform validation as described in the **Validate snapshots** action. Only snapshots that pass validation are published. Only published snapshots can be exported.

Select **Commit**.

- The system updates the application to persist the changes to config data.
- The changeset state changes to **Committed**.
- The changeset cannot be modified.
- If snapshots were created, the confirmation message includes a link to the snapshots.
- If an error occurs during the commit process, the changeset state is set to Commit failed.

Conflicts between changeset commits

Service delivery can include multiple teams working at the same time on config data with potentially hundreds of configuration changes every day. Because changes can be in conflict with earlier changes by a different user, CDM manages commits and snapshots to block commits that conflict. You are notified of changeset conflicts to help you to resolve them.

When a conflict happens

Every time you attempt to commit a changeset, the system determines whether there are conflicts with other earlier commits. If the system reports a conflict, you can choose to attempt to keep some of the changes or discard all conflicted changes and start from a new changeset. For this reason, to ease the task of recreating your work, you might copy-paste larger changes to a text editor before closing a conflicted changeset.

How to avoid conflicts

Follow these suggestions to avoid conflicts:

- Try to keep a changeset open for a brief period. If you need to do research, close the changeset and start a new changeset after you have the information.
- Coordinate your code editing tasks with coworkers. This enables you to avoid updating the same configuration item at the same time.

Types of conflicts

In each of the following examples of an identified conflict, the "item" being described is the configuration data item (CDI) in your changeset. Another user committed changes that your changes conflict with.

Stale data in your working changeset

- The value of the item was changed in another changeset.
- The item is no longer included in a collection or deployable in another changeset.
- Data corruption caused by an incorrect change in the data table: The newly added item in your open changeset was modified in the data table to incorrectly refer to a previous version. The item in your open changeset was superseded by a change in the data table. The updated or deleted item in your open changeset was incorrectly modified in the data table to not refer to the previous version.

Changed parent

The item is an orphan because its parent was deleted or renamed in another changeset.

Changed parent/child relationship

New items were added in another changeset while you made changes to the parent data item.

Changed references

- The Item was included in a collection or deployable in another changeset.
- The item cannot be deleted because it is included in a collection or deployable in another changeset.

Duplicate

An item with the same name already exists.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Invalid includes

- The component or collection to which the include referred was deleted in another changeset.
- The component or collection to which the include referred was renamed in another changeset.
- A descendent of the component to be included is already included in the collection in another changeset.

View the history of changes to a changeset

View the details of changes in each committed changeset on the **Activities** tab.

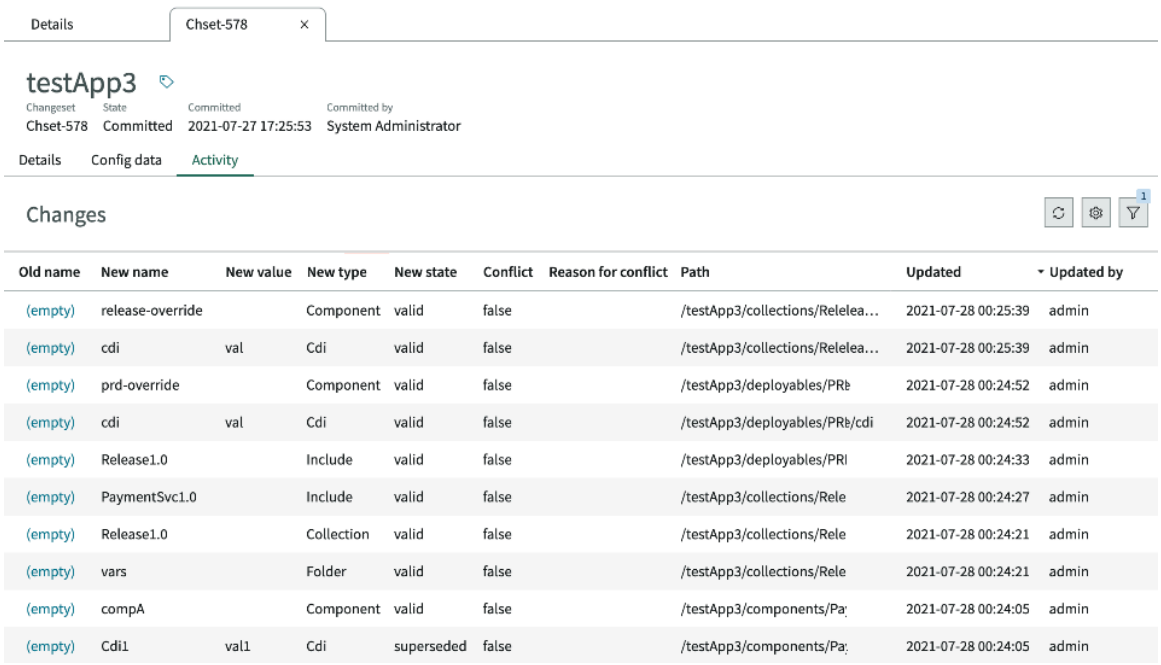
Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_viewer or cdm_editor or cdm_exporter_editor or cdm_policy_editor or cdm_admin

Procedure

1. While working on a changeset, select the **Activity** tab.
   The **Changes** section displays the list of individual nodes for which changes were committed.



Old name	New name	New value	New type	New state	Conflict	Reason for conflict	Path	Updated	Updated by

Fields on the Changes section of the Activity tab

Header	Description
Old name	The original name of the item. The entry is listed as "(empty)" when the name of the item

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Header	Description
	has not changed. Select the link to view a detailed list of changes.
New name / New value / New type / New state	The setting that the item was changed to in the changeset. For all items, a value appears only if the data changed.
Conflict / Reason for conflict	Boolean that indicates whether this changeset has settings in conflict with another committed changeset.
Path	Path to the item that changed.
Updated / Updated by	User that updated the changeset and timestamp when it was committed.

2. Select the **New name** link to view the new, old, and current setting of the name, value, type, and state of a CDI or variable.

   The Details dialog box displays the settings and indicates whether the changeset is in conflict with another changeset.

Details dialog box

Field	Description
New name, New value, New type, New state	The new setting that the item was changed to in this changeset. A value appears only if the data changed. **Important:** The value that appears in the **New name** column might represent a setting that has not changed. To determine whether the name has changed, select the link. If there is a **New name** value in the dialog box, then the name has changed.
Old name, Old value, Old type, Old state	The original setting that the item had before the changes in this changeset were committed.
Current name, Current value, Current type, Current state	The setting of the item in the case that a changeset was committed after this changeset was committed. A value appears only if a valued changed in the other changeset.

Delete a changeset

Select the changeset on the Activity tab and then select Delete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Admin [sn_cdm.cdm_admin]

Procedure

Select the changeset on the **Activity** tab and then select **Delete**.

Delete a CDM application

Delete a CDM application to delete all associated config data and snapshots.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Admin [sn_cdm.cdm_admin]

Procedure

1. Select the **Applications** icon ( ) and then select one or more applications.
2. Select **Delete** and then confirm the delete action.

Result

The system performs the following operations when you delete an application:

- Change the state of the application to "Deleted".
- Disconnect the application from its associated SDLC component.
- Disconnect deployables from CMDB services.
- Return an error for any attempt to query associated snapshots.

Compare changesets from the same or different CDM applications

Use the Config Data Analyzer tool to find similarities and differences between any two committed changesets from the same or different applications.

Before you begin

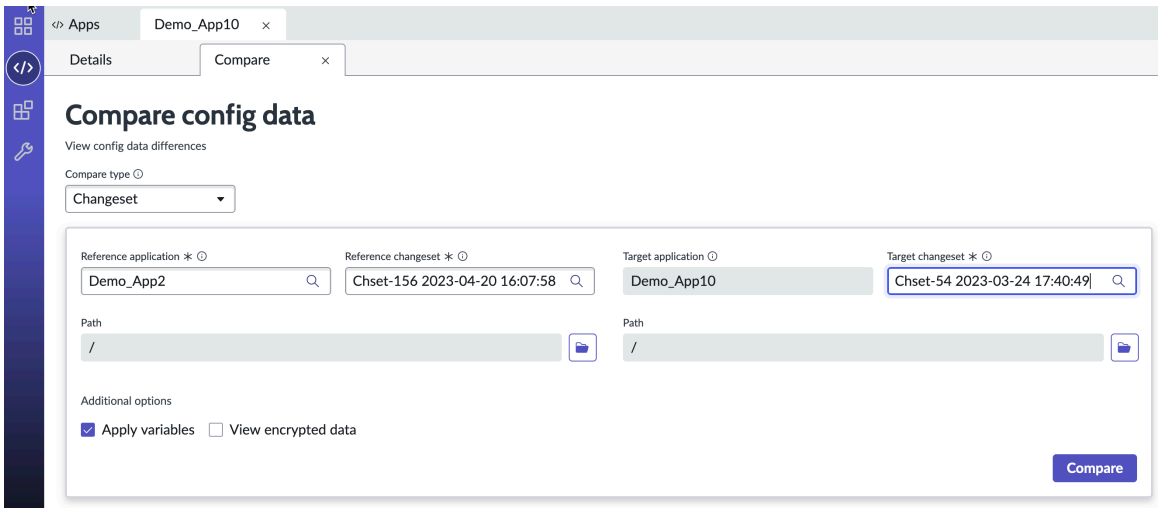
Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required:cdm_viewer, cdm_editor, or cdm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. While viewing an application, select **Compare config data**.
   The **Compare config data** tab opens. The current application is the target application, and its name is pre-populated in the **Target application**.



2. Select the **Changeset** option in the **Compare type** field.
3. Select an application and then their snapshots to compare.

Option	Description
Reference application	Application to compare with the target application. The field lists the latest committed data for all applications including the target application.
Reference snapshot	Snapshot of the reference application to compare.
Target snapshot	Snapshot of the target application against which the reference snapshot is compared.

4. **Optional:** Select the folder icon ( ) to specify a folder path for comparison.
5. **Optional:** Select **Apply variables** to display fully resolved variable values in the comparison results.
6. **Optional:** If you've the cdm_secrets role, you can select **View encrypted data** to view encrypted values in clear text in the comparison results.

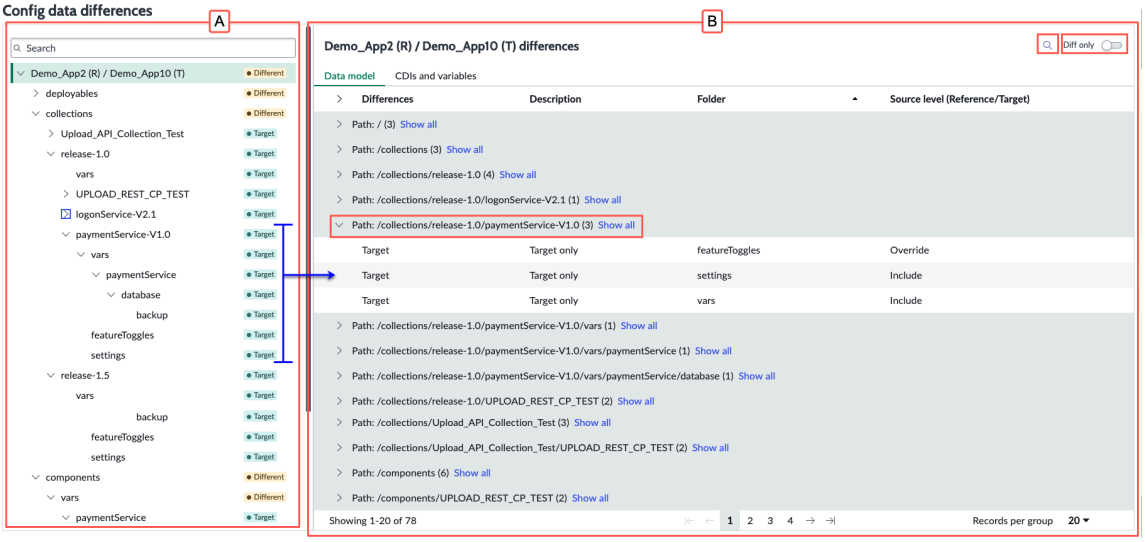
   Note:
   The check box is inactive for users who do not have the cdm_secrets role. When the values in the target and reference differ, the comparison results indicate that the values differ, but the data itself still appears as ********.

7. Select **Compare**.

   The Comparison results section displays the differences between the reference changeset and the target changeset.

   The letters in the following illustration identify the tools that you can use to analyze the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A. Navigation panel

The navigation panel displays the node structure of the applications.

- Nodes that include changed CDIs (either directly or in descendent nodes) are annotated with **Different**.
- Nodes that include newly added CDIs (either directly or in descendent nodes) are annotated with the identity of the application changeset that includes the new data, either **Reference** or **Target**.
- Use the **Search** field to search for text in the navigation panel.
- Select a node to view its contents in the Differences panel.

B: Differences panel

- By default, all config data is displayed. Select **Diff only** to view only data that differs between the two changesets.
- Use the **Search** icon ( ) to search for text in the Component differences panel.
- The panel offers two tabs: **Data model** and **CDIs and variables**. In either tab, expand and close groupings with the expansion icon ( ).
- If a selection includes more than 50 CDIs, then CDIs are organized into pages of 50.

The **Data model** tab displays changes to the structure of the application at the folder level, such as, adding, deleting, or renaming a folder.

Data model tab

Column	Description
Differences	The path of the structure for which differences are described.
Description	Text that describes any differences between the reference and target changesets.
Folder	The folder in the structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Source level (Reference/Target)	○ Direct: The folder is explicitly specified or deleted in the node. ○ Included: The folder is included from a child folder.

The **CDIs and variables** tab displays changes to individual CDIs for the node that is selected in the navigation panel.

- By default, the root node is selected and the data panel includes all CDIs for both changesets. Select a node in the navigation panel to display data for only that node and its descendents.
- When **Diff only** is selected, the number of CDIs that differ appears after the node path.
- Node paths are displayed in gray. Use the expansion icon ( ) to view CDIs in a folder.

CDIs and variables tab

Column	Description
Differences	Indicator to show what was the change type. ○ Target: The CDI appears only in the target changeset. ○ Reference: The CDI appears only in the reference changeset. ○ Different: For the specified CDI, the values in the target and reference changesets differ.
Description	Statement of how the changesets differ. For example, the text might indicate that a CDI appears only in the reference changeset or that the values for the variable differ between the changesets. See Types of differences between CDM applications for the full list of difference types and their causes.
Name	Name of the CDI.
Reference (R)	Value of the CDI in the reference changeset.
Target (T)	Value of the CDI in the target changeset.
Source level (R/T)	The node level in the code at which the CDI is defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ Direct: The CDI is defined in the selected node. ○ Include: The value of the CDI is obtained from a node that is included in the selected node. ○ Override: The value of the CDI in an included node is overridden by a value that is specified in the including node. Values appear in the following formats: ○ `<reference level / target level>` when a value appears in both target and reference. ○ `<reference level>` when a value appears in only the reference changeset. ○ `<target level>` when a value appears in only the target changeset. For example, when a CDI is defined in the reference changeset with the value `true` and the CDI does not appear in the target changeset, then the last three columns in the **CDIs and variables** tab will have the following values: ○ **Reference (R)**: `true` ○ **Target (T)**: [Empty] ○ **Source level (R/T)**: `Direct`

If a file node is selected in the tree, the **File information** tab displays its metadata.

File information tab - List columns

Column	Description
Differences	Indicator to show where the differences are. ○ Target: The file node is available only in the target changeset. ○ Reference: The file node is available only in the reference changeset. ○ Different: The file node data differs in the target and reference changesets.
File metadata	Metadata of the file attached to the file node. ○ File name: Name of the attached file in the file node. ○ Content type: Content type of the file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ Content: Content of the attached file. Preview is not available on the list, but you can download the file to preview it. ○ File URL: Folder path where the file exists.
Reference (R)	Details of the file present in the reference changeset.
Target (T)	Details of the file present in the target changeset.

Validating and correcting configuration data

For every change to an environment, there may be tens or hundreds of rules (policies) that need to be checked. CDM enables you to auto-validate configuration data to ensure that configuration changes are error-free and policy-compliant before the config data is consumed.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

CDM automates much of the validation process

When teams deploy an application, they typically need to ensure that no errors are introduced at the code and configuration level, and that compliance policies are respected. For every change to an environment, there may be tens or hundreds of rules (policies) that need to be checked. A manual validation process is prone to errors.

DevOps provides developers, IT admins, DevOps Config engineers, or team leads a way to ensure that configuration changes are error free and policy-compliant. In addition, after validation gives developers or IT admins enough contextual information to identify and fix issues. This means that after a user commits any changes to configuration data, all relevant policies are applied, results evaluated, and appropriate actions are triggered (for example, deploy or do not deploy).

Here's the CDM process that auto-validates configuration data before it is consumed.

1. You create a policy version based on an existing policy and then activate and publish the new version.
2. For dynamic mapping of policies to deployables, create a condition on the CDM Deployable [sn_cdm_deployable] table. Associate the condition with one or more policies. At runtime, these policies are executed to validate deployables that meet the defined conditions.
3. You map the policy to a deployable using static mapping or dynamic mapping to ensure that the policy executes against any snapshot of the deployable when requested (manual or automated request).

   For more information on policy mappings, see PaCE Static and Dynamic Mapping.
4. When you commit a changeset for the deployable, the system must validate the resulting snapshot. To auto-trigger execution of the mapped policies whenever a changeset is committed, select the **Validate** option when committing the changeset. You also have the option to validate the snapshot manually.

   In both cases, the policies mapped using static mapping and dynamic mapping are executed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you configured the automated process to be integrated with your pipeline, then the policies return the results of the validation process to the pipeline in JSON files. The pipeline decides whether to continue based on the validation decision: Compliant, Non-compliant.
- If the process is not integrated with your pipeline, or if validation failed or did not finish, then you review the validation decision and take appropriate action.

Use pre-defined policies as models for your custom policies

CDM includes policies that you can use as models for custom policies that meet specific needs. Note the following important patterns in the pre-defined policies;

- The policies all use the `CdmQuery` script include to retrieve config data.
- Use `CdmQuery` with Secrets to ensure all data is included.
- The `CdmPolicyUtil` script include adds warnings and failures.
- When all policies have run and a failure has been populated in the output, the decision is `non_compliant`.
- Use the logger for debugging. Remove the logs when the policy is ready to be published.
- Use mapping input parameters to supply dynamic input values.

Guidelines for validating snapshots

- Do not manually validate snapshots that have already been validated and published.
- If you select the **Validate snapshots** or **Validate and publish snapshots** option when committing a changeset, then the system auto-validates each snapshot when it is first generated.
- To view the current validation failures or warnings for a snapshot, open the snapshot and select the **Validation Results** tab. For details, see View the results of snapshot validation.
- Use the Policy Test Playground feature to revalidate snapshots while you develop a policy. The resulting validation results are flagged as test results and do not affect operations.
- If there is a requirement to revalidate all snapshots for a deployable, revalidate only after you have tested and published the policies.

Practices to avoid

- Do not use *`GlideRecord`* to retrieve config data records.
- To display policy decisions on the UI, CDM requires warning and failure data in a particular structure. Use `CdmPolicyUtil` to add warnings or failures (not manual insertions). (At least understand the structure that `CdmPolicyUtil` inserts into failures and warnings.)
- In policies, do not attempt to retrieve data that does not come from CDM data. This practice can result in cross-scope access issues.
- Do not write "always-compliant" or "always-non-compliant" policies.
- Do not hard-code any names or values in policies. Instead, use mapping input parameters to supply dynamic input values.

Snapshot status

- Not validated: This is the initial snapshot state where no policy has been executed against the snapshot.
- Requested: The validation flow has started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In progress: The validation flow is running and policies are currently executing.
- Passed: The snapshot has passed all policies.
- Failed: The snapshot has failed one or more policies.
- Execution error: A policy failed to run to completion due to an unexpected error, mostly when the CdmPolicyUtil script include is not used to provide warning and failure messages..

Example flow

A user commits changes to config data before a deployment.

Data is validated against all assigned policies.

If validation fails, then deployment is stopped. A list of errors pointing to their location in the config data is given to the user. Available actions should be determined in the context of the application itself and the environment where the application is deployed. For example:

- Allow deployment in a TEST environment regardless of the number of errors or warnings.
- Stop deployment in PROD if any error.
- Stop deployment in PROD if any warning and if the application is critical.
- Allow deployment in PROD regardless of the number of warnings if non-critical.

User fixes errors and recommits change.

Data is validated again and the results are ok.

A snapshot is taken.

Deployment is executed.

CdmQuery - Scoped

Validate a snapshot manually

Validate a snapshot from the **Snapshot** tab. For example, manually validate a snapshot to ensure that its valid for new policy requirements.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

- Do not manually validate snapshots that have already been validated and published.
- If you select the **Validate snapshots** or **Validate and publish snapshots** option when committing a changeset, then the system auto-validates each snapshot when it is first generated.
- To view the current validation failures or warnings for a snapshot, open the snapshot and select the **Validation Results** tab. For details, see View the results of snapshot validation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the Policy Test Playground feature to revalidate snapshots while you develop a policy. The resulting validation results are flagged as test results and do not affect operations.
- If there is a requirement to revalidate all snapshots for a deployable, revalidate only after you have tested and published the policies.

Procedure

1. Use either of the following methods to validate a snapshot:
   - Use the REST API endpoint to validate.
   - On the **Snapshots** tab for an application, select the name of the snapshot to validate and then select **Validate**.
   - On any tab for an open snapshot, select **Validate**.
2. Confirm the action on the Validate snapshot dialog box.

   The system follows this procedure to validate snapshots:

   - The system executes all policies that are statically or dynamically mapped to the associated deployable.
   - If the snapshot passes all policies, then the Validation status value is set to **Passed** and no entries are listed on the **Validation Results** tab. If validation was invoked with the **Publish Valid** publish option, then valid snapshots are auto-published.
   - If any policy encounters issues, then the Validation status value is set to **Failed**. The **Validation Results** tab displays all failures or warnings returned by policies.
   - If any policy failed to run to completion, then the Validation status value is set to **Execution error** and the **Validation Results** tab indicates that validation failed due to error.

What to do next

If the snapshot failed validation, you can view the issues to fix them. See View the results of snapshot validation.

Related topics

View the results of snapshot validation

View the results of snapshot validation

View validation failures and warnings on the **Validation results** tab for the snapshot.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

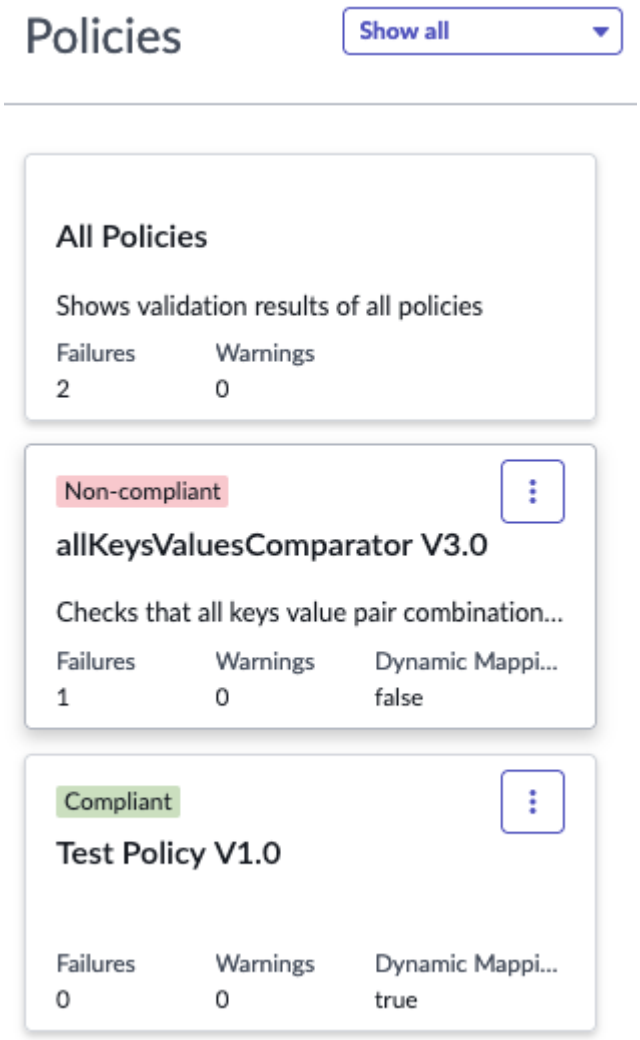
Role required: cdm_viewer or cdm_editor or cdm_exporter_editor or cdm_policy_editor or cdm_admin

Procedure

1. On the **Snapshots** tab for an application, select the snapshot to open the **Validation results** tab.
2. View failure and warning information on the **Validation results** tab for the snapshot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Policies** panel displays a card for each policy that is mapped to the associated deployable.



Cards in the Policies panel

Card label	Description
All Policies	The card displays the total number of failures and warnings for this validation run.
Name of the mapped policy	Each policy that has been executed for the deployable and its execution results with whether the snapshot is compliant with the policy. It also displays the following data: ○ Failures: Number of failures in the current execution. ○ Warnings: Number of warnings in the current execution. ○ Dynamic mapping: Value is **true** if the policy is dynamically mapped, or else **false**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select a card from the **Policies** panel to view the associated data in the **Failures and warnings** panel.
- Select the more actions icon (⋮) for a policy and select an action, as follows:

More actions menu options

Option	Description
Execution record	View execution information for this policy run. See View the execution record for a policy run for details.
Open policy	Open the policy.
Open business condition	Opens the condition set on the CDM Deployable [sn_cdm_deployable] table based on which the policy was dynamically mapped to the deployable and executed. **Note:** This menu option is available only for the dynamically mapped policy. For more information on conditions and dynamic mapping, see Map PaCE policies using Dynamic Mapping.

The **Failures and warnings** panel displays the list of all failures and warnings for the policy that is mapped to the associated deployable.

Failures and warnings panel - List columns

Column header	Description
Description	Text that provides information about the failure or warning result.
Type	Type of validation result: ○ (Empty) ○ Information ○ Failure ○ Warning
Policy	Name of the policy that returned a failure or warning. Select to open the policy.
Impacted data	The CDI (`name : value` pair) that resulted in the failure or warning.
Path	Path to the node in the data tree that includes the impacted data.

View the execution record for a policy run

View the execution record to analyze policy execution.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_viewer or cdm_editor or cdm_exporter_editor or cdm_policy_editor or cdm_admin

Procedure

On the **Validation results** tab for a snapshot, select the more actions icon (⋮) for a policy and select **Execution record**.

Policy execution information on the Details tab

Field	Description
Policy	Name of the policy that executed.
Version name	Version of the policy that executed.
End time	Timestamp when execution finished.
Decision	Result of policy execution. • Compliant • Non-compliant • Execution error • Compliant with exception

Adding warning and failure messages to validation results — CdmPolicyUtil

You use the `CdmPolicyUtil` script include to add warning and failure messages to validation results in the CDM Policy Validation Results table. CDM expects validation warnings and failures to contain a node path, a snapshot ID, and a reference to the impacted node.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

CdmPolicyUtil

- `CdmPolicyUtil` is a public script include.
- Because `CdmPolicyUtil` is a global script include, you do not need to invoke it like a new *`CdmPolicyUtil()`*.
- You can invoke `CdmPolicyUtil` in all scopes, but the expected invocation scope is PaCE (specifically, during the execution of PaCE policies).
- The proper call is `CdmPolicyUtil.methodName(parameters)`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you add warning and failure messages to validation results manually instead of using CdmPolicyUtil, the snapshot validation status will show Execution Error.

Methods

addFailure

Adds a failure message. The message appears on the **Validation results** tab for the snapshot.

Parameters:

- *Output*: Policy decision for the subject snapshot (*primarySnapshotId*).
- *cdmNode*: Node (*sn_cdm_node*) that caused the failure.
- *name*: Name of the failure.
- *description*: Description of the failure.

addWarning

Adds a policy warning message. The message appears on the **Validation results** tab for the snapshot.

Parameters:

- *Output*: Policy decision for the subject snapshot (*primarySnapshotId*).
- *cdmNode*: Node (*sn_cdm_node*) that caused the warning.
- *name*: Name of the warning.
- *description*: Description of the warning.

getLastCreatedSnapshotIds

Returns the latest created and published snapshot IDs for the supplied *additionalDeployables*. If no published snapshot is available for a particular deployable, adds a debug message.

Parameter:

additionalDeployables – can be passed directly as it comes to the policy.

getLastPublishedSnapshotIds

Retrieves the latest and published snapshot IDs for the supplied *additionalDeployables*. If no published snapshot is available for a particular deployable, adds a debug message.

Parameter:

additionalDeployables - can be passed directly as it comes to the policy.

Sharing components among applications — Component libraries

Some applications may share the same basic structure and require nearly identical configuration data. Shared components in CDM enables you to use a component across several applications. For better organization, these shared components are managed in component libraries.

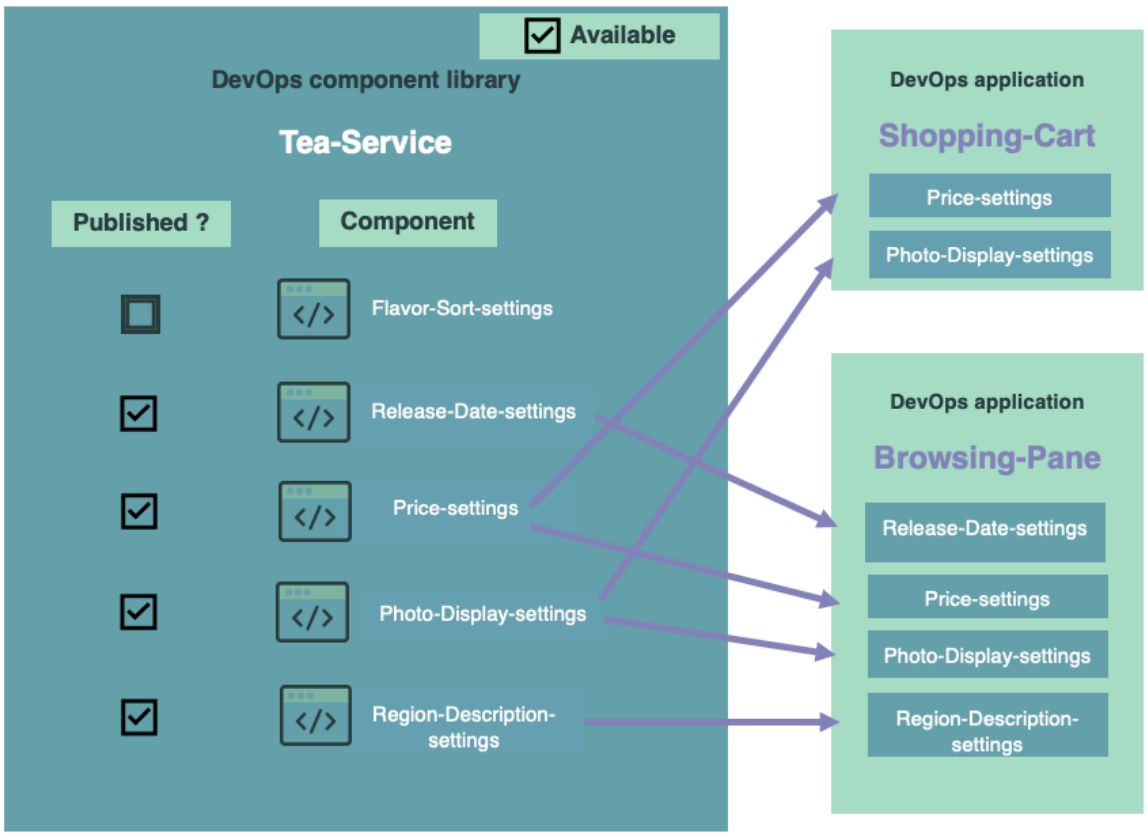
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Component libraries

Component libraries improve consistency and maintainability by ensuring a single source of truth for a component's config data across applications. You can use the unified view in the DevOps Config workspace or CdmSharedLibraryApi REST API to create and maintain these libraries.

In this example, an organization sells tea on its website. Both the *Shopping-Cart* and *Browsing-Pane* application services make use of config data for product prices and photo appearance. To ensure that the config data is identical in both DevOps applications, each application uses shared components from the *Tea-Service* component library. The components are managed in the library and the applications each use two of the components from the library.



Working with shared components

- A user with the sn_cdm.cdm_admin role can create and manage a component library and create, add, and delete shared components in the library.
- While working in an application changeset, you can add, update, or remove a shared component.
- Applications can use any mix of components: components that are defined in the application (direct components) and components from a component library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- While working in an application changeset, you cannot modify a shared component in the same way as you can modify a direct component. A collection in an application can, however, override any value in a shared component.

- For a shared component to be available for use in applications, the component must be in the **Published** state and the library that holds the component must be in the **Available** state.

  In the example, no application can use the *Flavor-Sort-settings* component because it has not been published.

Working on component libraries with a unified view

The unified view of component libraries in the DevOps Config Workspace provides a single location to view and manage component libraries and the components within them.

> **Important:**
> Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Using the unified view, you can:

- Search for a component library or shared component.
- Navigate quickly between different component libraries or shared components.
- View a list of all applications that use shared components of a library.
- Edit the config data of a library.
- View and create changesets for the library and components.
- View different versions of a shared component, and publish or unpublish them.

Users

The following users can view and manage the component libraries and shared components in the DevOps Config Workspace.

- CDM admin can view and manage the libraries and shared components.
- CDM editor can view and manage the shared components within the libraries.
- CDM viewers can view the libraries and shared components.

Accessing the component libraries

To open the Component libraries, navigate to **All** > **DevOps Config** > **DevOps Config Workspace** and select the component libraries icon ( ).

Component libraries list

On the Component libraries list, you can review all component libraries and shared components within them. The list pane has the following sections to enable you to access and manage the libraries and components quickly.

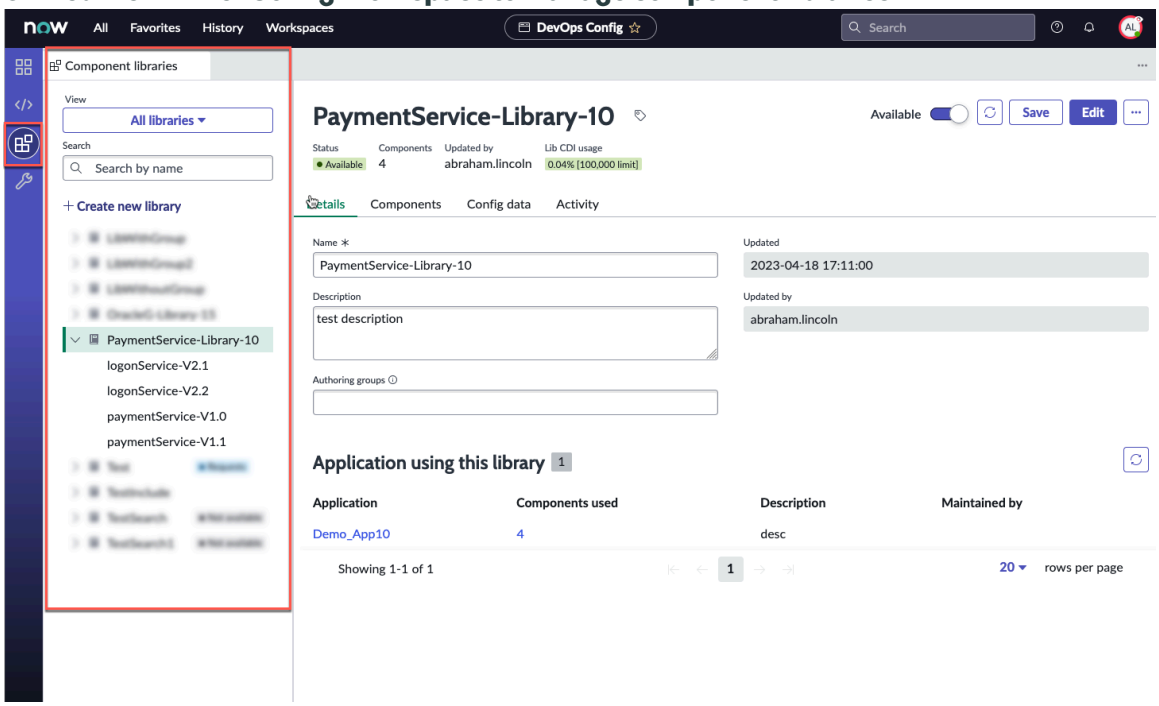
- **View**: Filter libraries by the categories: All libraries and Editable libraries. Editable libraries are the libraries that you create or that others create but grant you permission to view and edit through the associated authoring groups.
- **Search**: Search library or component by their names.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Create new library**: Create a library using this option.
- **Listing**: Select a library node or shared component node to view it in the form pane.

The following is an example of a unified view for Component libraries.

Unified view in DevConfig Workspace to manage component libraries



Component library form

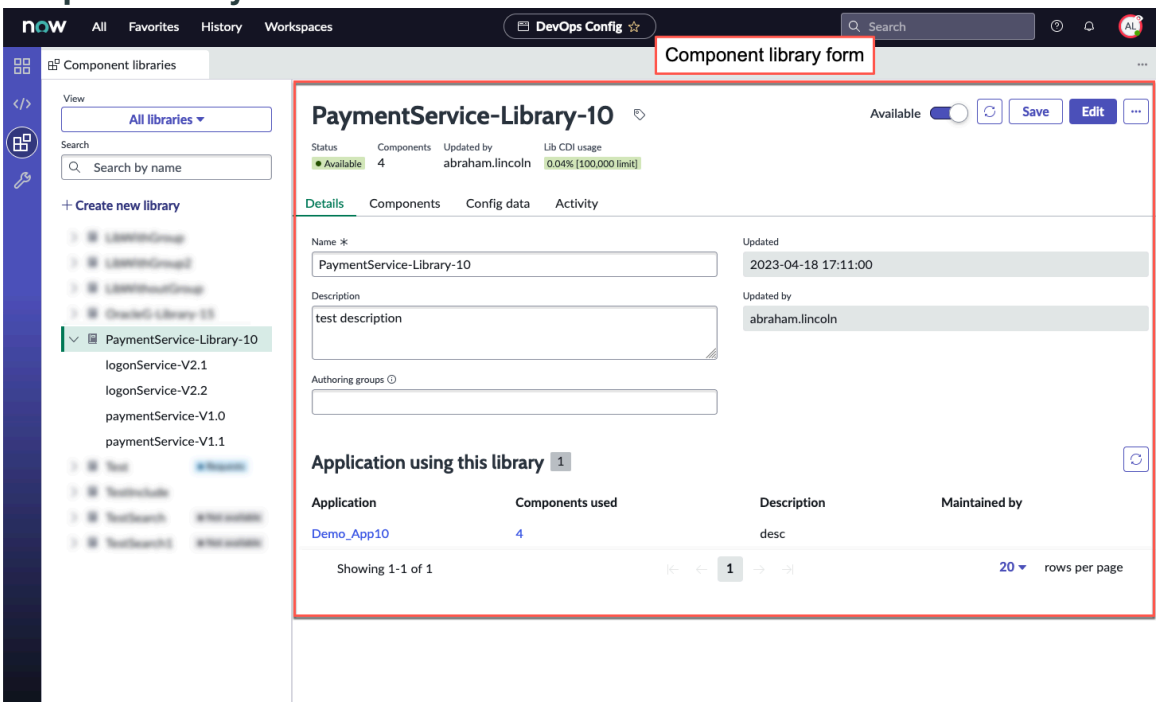
On the Component library form pane, you can review and manage your libraries and components within them. Select a library node in the left pane to view and edit the associated data.

- **Header**: The header section shows the status and other metadata of the component library. You can take the following actions:
  - Mark a library as available or unavailable for use by using the **Available** toggle switch.
  - Save the changes to the library.
  - Edit to create or open a changeset for updating shared components.
- **Tabs**: The following tabs are available:
  - **Details**: View and update a library's details such as name, description, and authoring groups. The tab also includes a list of all applications that are using one or more components of the library.
  - **Components**: View all the components available in the library.
  - **Config data**: Review the config data in each component of the library. You can switch between Editor and List view using the **List view** toggle switch.
  - **Activity**: View a list of all changesets created for updating the library, its components, and config data.

The following is an example of a component library form in the DevOps Config Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component library form



Shared component form

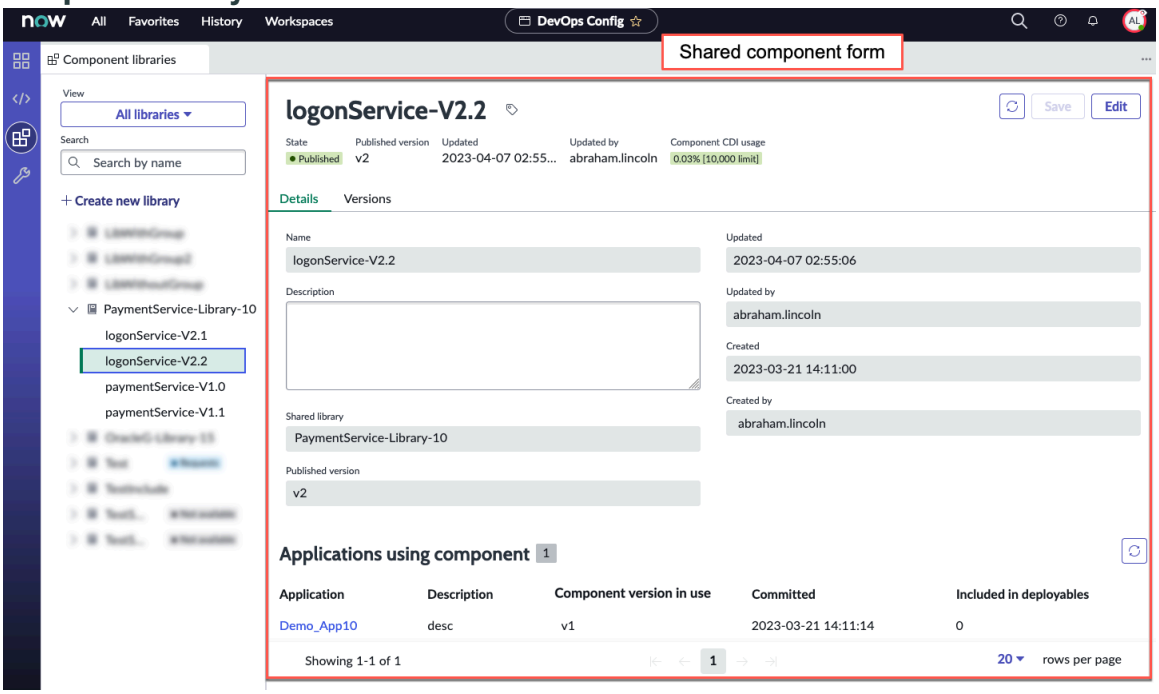
On the Shared component form pane, you can review and manage components within your libraries. Select a component node in the left pane to view and edit the associated data.

- **Header**: The header section shows the status and other metadata of the component library. You can take the following actions:
  - Save the changes to the component.
  - Edit to create or open a changeset for updating the component.
  - Refresh the form data.
- **Tabs**: The following tabs are available:
  - **Details**: View the component's details and update its description as required. The tab also includes a list of all applications that are using the components.
  - **Versions**: View all the published and unpublished versions of the component. You can also publish a component's version or unpublish a version.

The following is an example of a shared component form in the DevOps Config Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Component library form



Create or update a component library

Create a component library to manage components that can be reused across multiple applications.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_admin

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Click the component libraries icon ( ) in the left navigation to open the **Component libraries** tab.
3. Click **Create new library** to create a component library.
4. On the form, fill in the fields.

Create component library form

Field	Description
Library name	Name of the component library. This name must be unique across all CDM applications and libraries.
Description	Description about the component library, such as what type of components it includes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Authoring groups	User groups with access to edit the component library. Users in the groups with appropriate roles can view the component library. **Note:** If you choose an authoring group, make sure you're a member of that group, or you'll lose editing access to the library. However, if you have the cdm_all_app_access and cdm_admin roles, you will have full access to the component library, even if you're not a member of these authoring groups.

5. Click **Create**.

Result
A component library is created. The state of the library is set to Not Available, which means that any components added to the library cannot be used, updated, or exported.

What to do next
1. Add or update a shared component in a component library.
2. Activate a component library.

Activate a component library
Activate a component library to make all of its shared components available for use.

Before you begin
Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_admin

About this task
A library can be in the Unavailable state in the following situations:

- When a library is created for the first time
- When a library and its components are being created
- When a newer version of the library is being created

If a library is unavailable, no component within that library can be used, updated, or exported. However, it does not impact applications that are already using components within this library.

When the library is ready for use, you can activate it.

Procedure
1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Click the component libraries icon ( ) in the left navigation to open the **Component libraries** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the left pane, select a component library.
4. Select the **Available** toggle switch to make the library available so that its shared components can be used in applications.

Result

- The library and the shared components in it become available for use.
- The status of the library is set as Available.

Delete a component library

Delete a component library and all of its components if no application is using the library's components.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_admin

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Click the component libraries icon ( ) in the left navigation to open the **Component libraries** tab.
3. From the **Options** button ( ), select **Delete** and then confirm the delete action.

Note:
If a component is being used in any application, the **Delete** option is not available.

Result

The component library and all of its components are deleted.

Add or update a shared component in a component library

Add or update a shared component in a component library.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_editor or cdm_admin

About this task

You can also add a component to the library as a shared component from a request. For more information, see Accept or reject a component request for inclusion in a component library.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Select the component libraries icon ( ) in the left navigation pane to open the **Component libraries** tab.
3. Select a component library from the **Component libraries** list tab to which you want to add a shared component.
4. Select **Edit** to create a changeset or select an open changeset to work.
5. Add a shared component to the library.

   a. On the **Config data** tab of the changeset record, select the more actions icon ( ) for the **components** node and select **Create shared component**.

   b. In the Create shared component dialog box, enter a unique and meaningful name for the component.

   c. Select **Create**.
   A component is created.

6. Add config data items (CDIs) and values for the shared component.
   a. With the shared component node selected, add one or more CDIs and values in the Editor pane.
   b. Select **Save**.
7. Add a file node to the component.
   For more information on adding files, see Manage files in the config data model using file nodes.
8. **Optional:** Select the more actions icon ( ) for a component to rename or delete it.
   - To rename the component, select **Rename** from the menu.
   - To delete the component, select **Delete** from the menu.

   Note:
   These options are available only if the component is not being used in any application.

9. Select **Commit** to commit all changes for the shared component.
   A new version of the shared components is created.
10. In the **Additional actions** field, select an option to either publish the latest version or do it later.
    - **No additional actions**: Does not process anything for the latest version of the component.
    - **Publish latest version**: Publishes the latest version of the component.

      Note:
      For a shared component, only one version can be published at a time. So, any existing published version is unpublished and the new version is published.

Publish or unpublish a shared component version

Publish a version of a shared component in a library so that it can be used in an application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_admin

About this task

When a version is unpublished, it means that the component and its version can no longer be used in an application. However, it has no impact on applications that are already using the version.

Note:
A shared component can only have one published version at a time.

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Click the component libraries icon ( ) in the left navigation pane to open the **Component libraries** list tab.
3. Select a component library from the **Component libraries** list tab.
4. Select the **Components** tab and then select a component name to open.
5. Select the **Versions** tab.
6. Publish or unpublish a version of the component.

Request to include a component to a component library

Submit a request for a component in an application that could be reused across multiple applications to be added to a shared component library.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_admin or cdm_editor

About this task

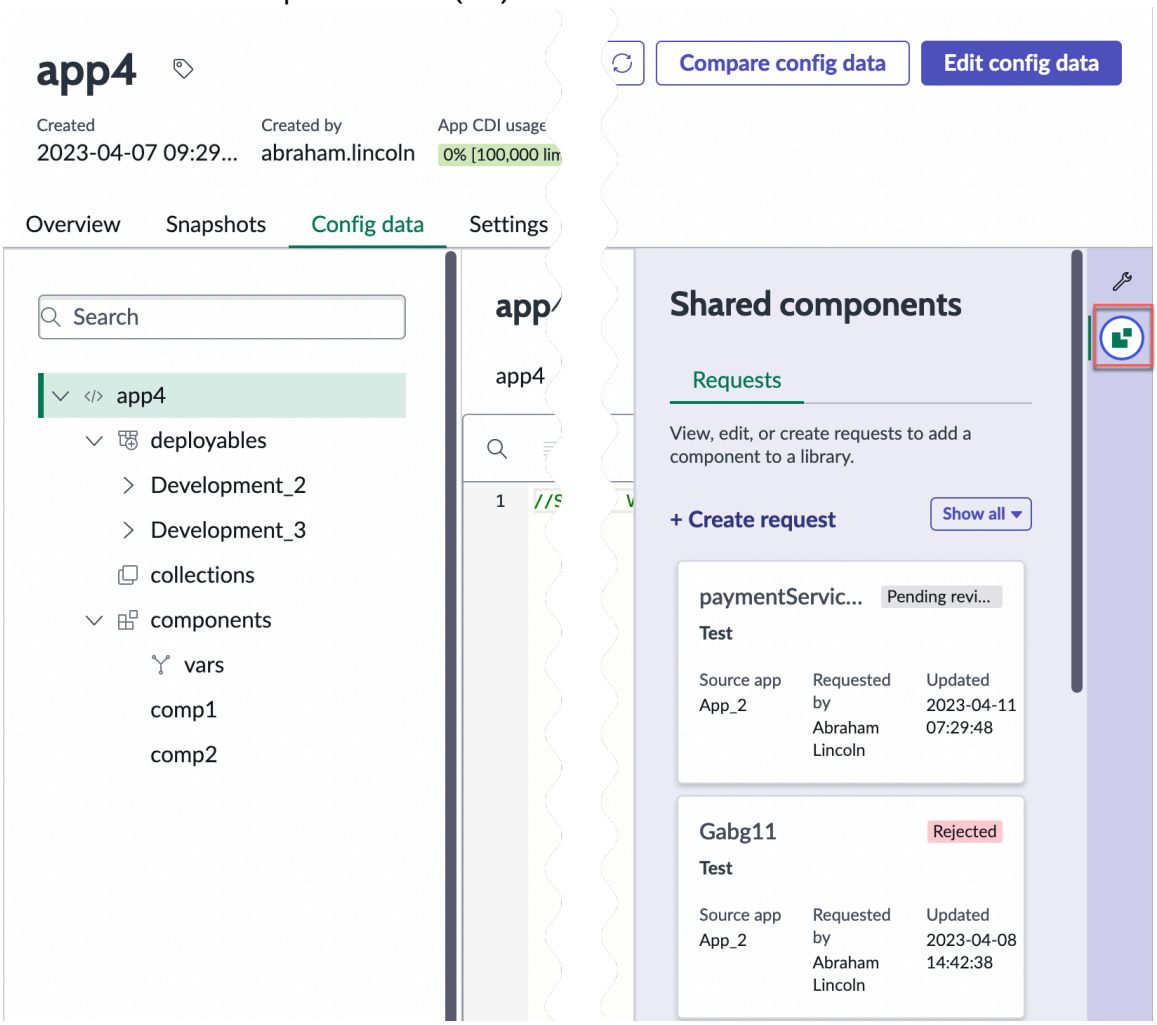
While creating data models for their applications, DevOps Config editors and administrators may identify certain components could be reused across multiple applications. They can submit a request to the component library owners to add those components to the library.

Note:
You can only submit one request for a component for the same library at a time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Select the apps icon ( ) in the left navigation to open the **Apps** tab.
3. Open an application and select the **Config data** tab.
4. Select the shared components icon ( ).



5. In the Shared components pane, select **+ Create request**.
6. Enter the details in the request form.

Create shared component request

Field	Description
Component	Name of the component to be added to the request. **Note:** Config data from the last committed changeset is added to the request, excluding any secret data values for keys, referenced variables, and file attachments in file nodes.
Target library	Component library to which the requested component should be added. Only existing and available libraries are listed in the field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Component description	Description about the component, such as how it works.
Additional details	More details about the component that could be helpful to the approver during approving.

7. Select **Submit**.
   A request is created for the library owner to add the selected component as a shared component in the target library. The state of the request is set as Pending review and is listed in the Shared components pane.

   You can see all of your requests from the last 30 days and filter them by their state.

What to do next

While a request is in the Pending review state, you can change its information or withdraw it by selecting the request card in the Shared components pane.

- To update the request, update the component's description or additional details in the respective fields and select **Update**.
- To withdraw the request, select **Withdraw**.

The library owner can review and approve or reject the request.

Accept or reject a component request for inclusion in a component library

Review a request for adding a component to a component library and approve or reject it.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Someone has requested to add a local component from an application to the component library as a shared component. If there are such requests in a library that need your approval, you see a **Requests** label ( ) beside the library name.

Role required: cdm_admin or cdm_editor

Procedure

1. Navigate to **All** > **DevOps Config** > **DevOps Config Workspace**.
2. Click the component libraries icon ( ) in the left navigation to open the **Component libraries** tab.
3. Open a component library and select the **Requests** tab.

   Note:
   The **Requests** tab is available only when there's an open request for adding a component to the library.

4. Click a requests card to review its config data.
   The config data of the selected card appears in the preview pane.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. As required, click accept or reject the request.

Result

- The request is removed from the **Requests** tab.
- Any comments added in the request can be seen by the requester in the app from where the request was submitted.
- If the request is approved:
  - The state of the request updates to Accepted.
  - The component is added to the selected component library as a shared component. Any secret data values (such as account id or passwords) for keys, referenced variables, and file attachments in file nodes are not included with the component. You have to replace the file attachments in all such file nodes.

    If the library is available, the component is ready for use in multiple CDM apps.
  - If you selected **Publish version** in the **Additional actions** field, then the shared component is published.
- If the request is rejected, the state of the request updates to Rejected.

Manage shared components in a CDM application

Add a shared component to an application, view shared components that are available to add, or remove a shared component from an application.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Roles required: CDM Editor [sn_cdm.cdm_editor]

About this task

- While working in an application changeset, you can add, update, or remove a shared component.
- While working in an application changeset, you cannot modify a shared component in the same way as you can modify a direct component. A collection in an application can, however, override any value in a shared component. Also, you cannot rename a shared component in an application. If such a change is needed, a new shared component with the required name must be created, and then added again in the application.

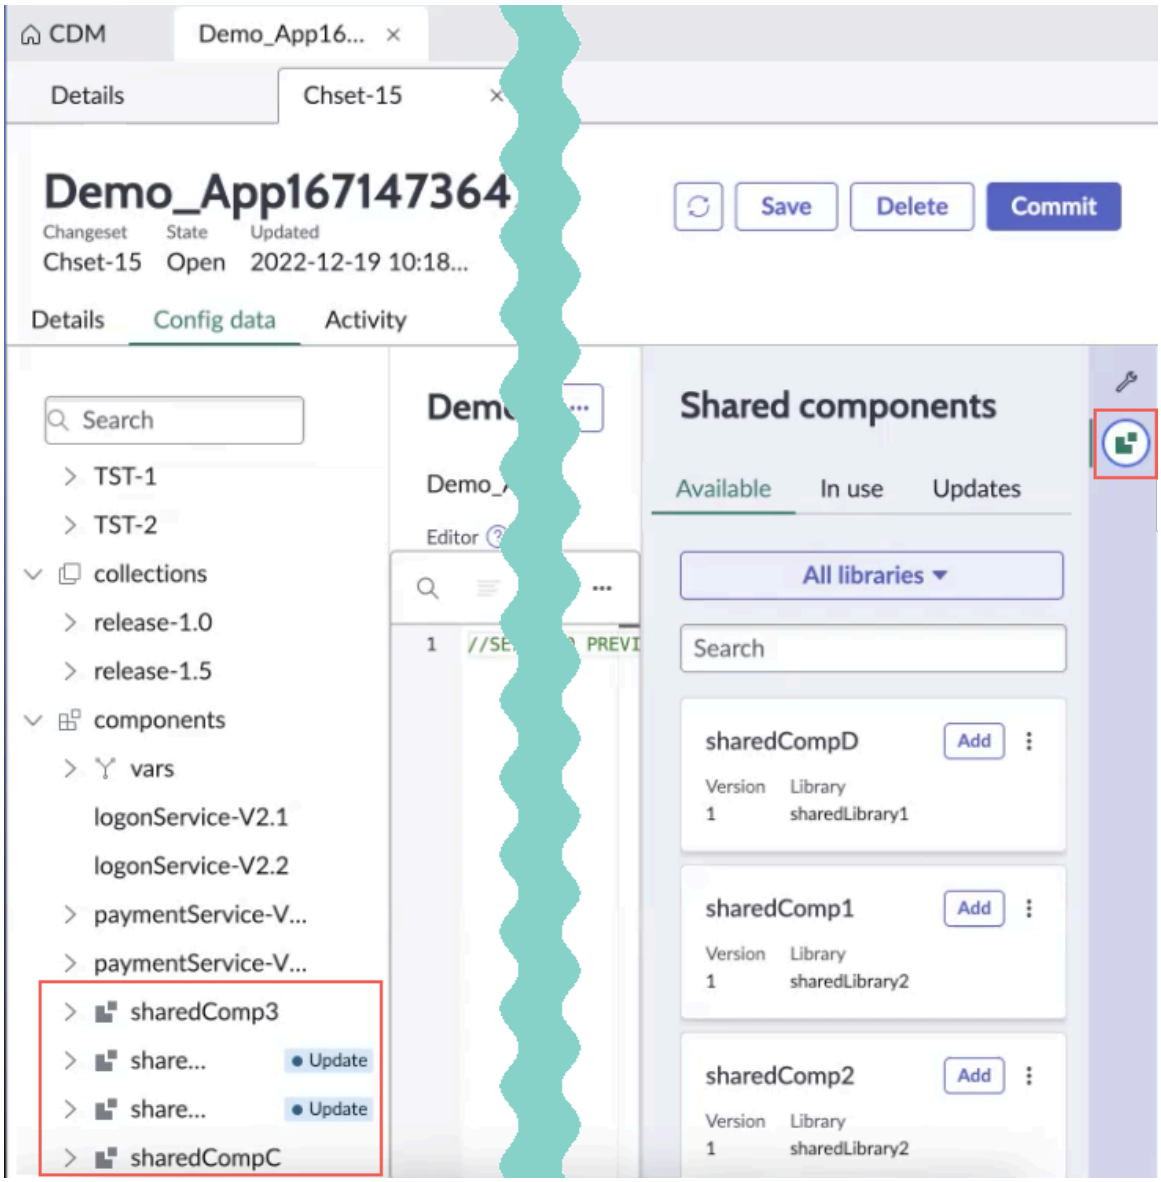
All of these changes are withing the application changeset.

Procedure

1. While working on the **Config data** tab for an application changeset, select the shared components icon ( ).
   - Each card on a Shared components tab displays the name, parent component library, and version for a shared component.
   - Components are grouped by library and are sorted alphabetically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the **Libraries** selector to display only components in the selected library.
- Use the **Search** text box to filter the list of components or libraries.



- **Available:** List of shared components that the application can include in its config data.

  For a shared component to be available for use in applications, the component must be in the **Published** state and the library that holds the component must be in the **Available** state.

- **In use:** List of shared components that are currently used in the application.
- **Updates:** A card appears when a newer published version of a component is available.

  Select the **refresh** icon ( ) to ensure that you're viewing all current updates.

2. Add a shared component to application data: On the **Available** tab, select **Add**.
   - The component is added to the **components** folder in the application.
   - The shared component icon ( ) indicates that the component comes from a component library.
   - The component is selected and the **Editor** and **Preview** panels display the code of the shared component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. View the config data in a shared component: On any card, select the additional actions menu ( ) and then select **View config data**.

   A pop-up displays the latest published version of the shared component code. Variables are not resolved and encrypted data is not decrypted in the pop-up view.

4. Remove a shared component: Use either of the following methods to remove a shared component from the application data.
   - On the **In use** tab, select the **X** in the component card and then confirm the action in the pop-up.
   - On the **Config data** tab for an application, select the **Actions** menu ( ) for the component and then select **Remove**. Confirm the action in the pop-up.

   Note:
   Removal is not deletion. Removal takes the component's config data out of the application, but the component remains unchanged in the component library. When you remove a component from an application, the component card reappears on the **Available** tab.

5. Update a shared component.

   Select the **refresh** icon ( ) to ensure that you're viewing all current updates. The system indicates that a newer published version of a component is available in the following ways:
   - Highlighted text "Update" appears next to the component in the **components** folder.
   - The **Updates** tab displays a card for the component.
   - The pop-up for committing a changeset includes a notification: "One or more of the shared components have updates available".

   Follow this procedure to review the updated config data and then update a component:

   a. On the **Updates** tab, select **Update** for the component.

   b. Review the information on the Update a shared component pop-up and then select **Update**.
      - The **Details** tab displays name and version information.
      - The **Latest config data** tab displays the latest version of the shared component code. In the view, variables are not resolved and encrypted data is not decrypted.

6. Commit the application changeset to generate a snapshot containing all these changes. The system generates a snapshot of each deployable that is affected by the changes.

Related topics

Sharing components among applications — Component libraries

View snapshots

View the snapshots of all deployables for an application on the **Details** tab for the application. The release pipeline can access only a snapshot that is the currently published version.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_viewer

Procedure

1. Open an application and select the **Snapshots** tab.
   The tab lists all deployables that are associated with the application. Each deployable displays a short list of its snapshots. Select **Show all** to view the full list of snapshots.

Snapshots tab - Columns of the Snapshots list

Column name	Description
Name	Unique name for the snapshot. When a snapshot is generated, the system uses the deployable name and the snapshot number to generate a default name (for example, `deployableName_1`, `deployableName_2`). You can edit the name. **Tip:** You can edit the name on the **Details** tab. Select the snapshot name to open the tab.
Description	Descriptive information that you supply to help other users. **Tip:** You can add a description on the **Details** tab. Select the snapshot name to open the tab.
Published	Boolean that indicates whether the snapshot is published. Only published snapshots can be exported. **Important:** By default, exporters use the most recently created published snapshot. While defining or updating a deployable, you can specify that only validated snapshots can be published. You can unpublish a snapshot. See Publish or unpublish a snapshot.
Deployable	Deployable on which the snapshot is based.
Validation	Validation status: ○ Not validated: This is the initial snapshot state where no policy has been executed against the snapshot. ○ Requested: The validation flow has started.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column name	Description
	○ In progress: The validation flow is running and policies are currently executing. ○ Passed: The snapshot has passed all policies. ○ Failed: The snapshot has failed one or more policies. ○ Execution error: A policy failed to run to completion due to an unexpected error, mostly when the CdmPolicyUtil script include is not used to provide warning and failure messages..
Last validated	Timestamp when the snapshot was validated last.
Created	Timestamp when the snapshot was created.
Created by	User who created the snapshot.
Changeset	Changeset containing the data of the snapshot. Select the icon to open the changeset.
Tags	Text tag that enables you to filter the snapshots in a list.

2. Select the snapshot name to view its details and set values on the **Details** tab.

Publish or unpublish a snapshot

Publish a snapshot so that it can be exported to enable the CI/CD pipeline to access and use the config data. Exporters can execute only on published snapshots.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Editor [sn_cdm.cdm_editor] or CDM Admin [sn_cdm.cdm_admin]

About this task

- You publish a snapshot when you feel that the deployable that it represents is ready to export to the pipeline.
- While defining or updating a deployable, you can specify that only validated snapshots can be published.
- A deployable must be connected to a service to publish its snapshots.
- If a published deployable is disconnected from services, then you can perform the following actions, but cannot publish snapshots of the deployable until it is connected to a service:
  - Edit config data.
  - Create snapshots.
  - Validate snapshots.
  - Fix validation errors.

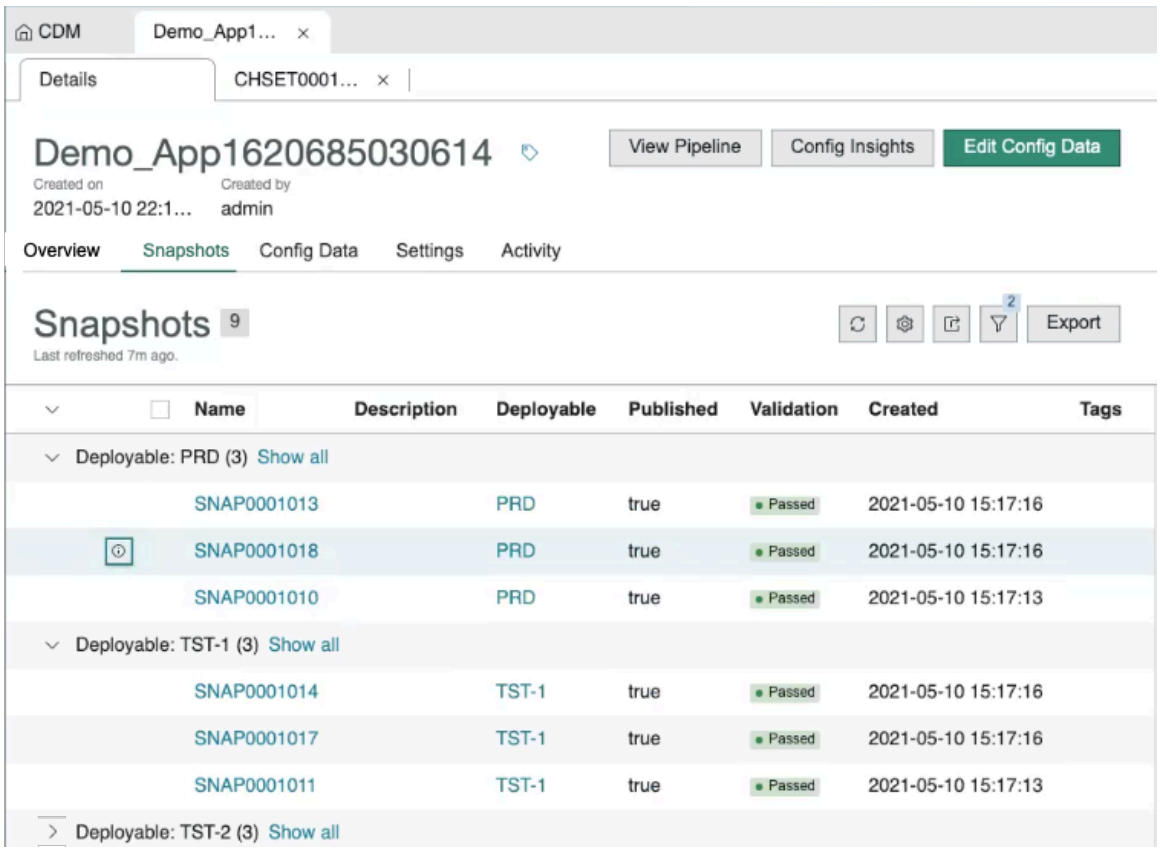
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
You can add a text description of a snapshot or rename it on the **Details** tab for the snapshot.

- When exporters look for the latest snapshot, they should look for the latest `created` snapshot that is published.
- The published_date is the data at which the publish happens.
- The unpublish snapshot action removes the publish flag and removes the published_date value.

Procedure

1. Use either of the following methods to publish a snapshot:
   - On any tab for an open snapshot, select **Publish**.
   - On the **Version** tab for an application, select **Publish** from the **Actions** menu for the snapshot.



2. View info

Information on the snapshot header and Details tab

Changeset number	The system auto-assigns the changeset number. The system uses the number as the default changeset name.

	more user-friendly name or by associating descriptive information with the changeset.
Deployable	Deployable on which the snapshot is based.
Validation status	○ Not validated: No policy has been executed against the snapshot. ○ Passed: The snapshot has passed all policy executions. ○ Failed: The snapshot has failed one or more policy executions. ○ In progress: Policies are currently executing. ○ Execution error: A policy failed to execute to completion.
Created / Created by	User that created the changeset and timestamp` of creation.
Published on	Timestamp when the snapshot was published.

3. Use either of the following methods to unpublish a snapshot:
   - On any tab for an open snapshot, select **Unpublish**.
   - On the **Version** tab for an application, select **Unpublish** from the **Actions** menu for the snapshot.

Compare snapshots from the same or different applications

Use the Config Data Analyzer tool to find similarities and differences between two snapshots from the same or different applications.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_viewer, cdm_editor, or cdm_admin

About this task

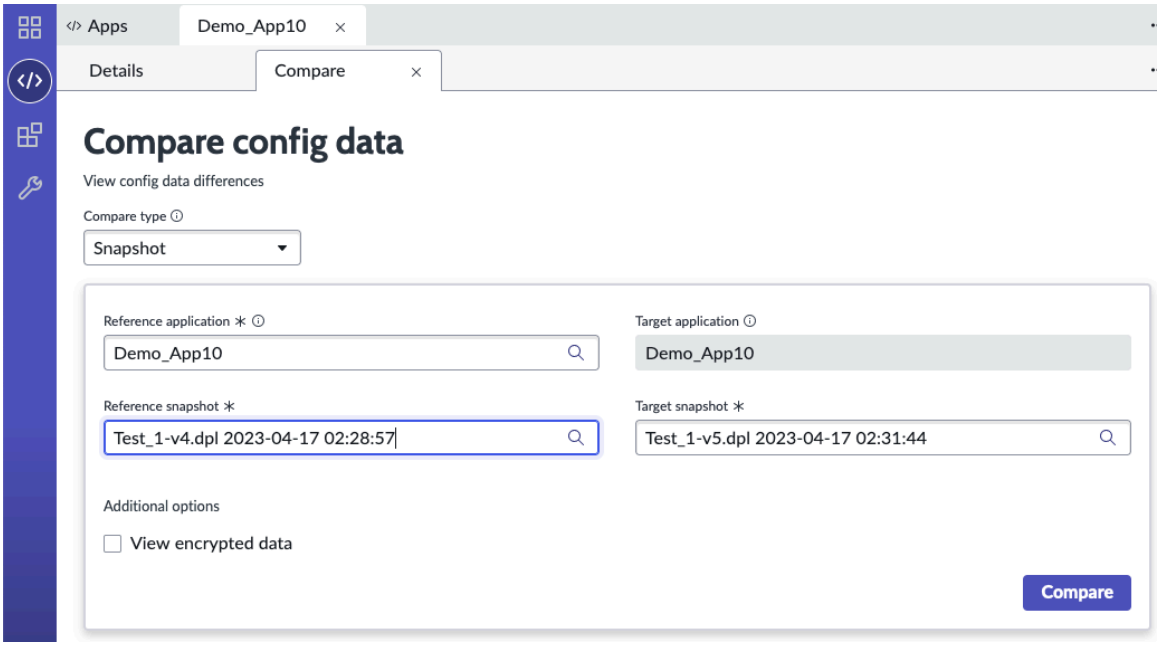
You can compare and contrast snapshots from any deployable of the same or different applications.

To see the changes between two snapshots from the same deployables, see Compare two snapshots of a deployable.

Procedure

1. While viewing an application, select **Compare config data**.
   The **Compare config data** tab opens. The current application is the target application, and its name is pre-populated in the **Target application**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Select the **Snapshot** option in the **Compare type** field.
3. Select an application and then their snapshots to compare.

Option	Description
Reference application	Application to compare with the target application. The field lists the latest committed data for all applications including the target application.
Reference snapshot	Snapshot of the reference application to compare.
Target snapshot	Snapshot of the target application against which the reference snapshot is compared.

4. **Optional:** If you've the cdm_secrets role, you can select **View encrypted data** to view encrypted values in clear text in the comparison results.

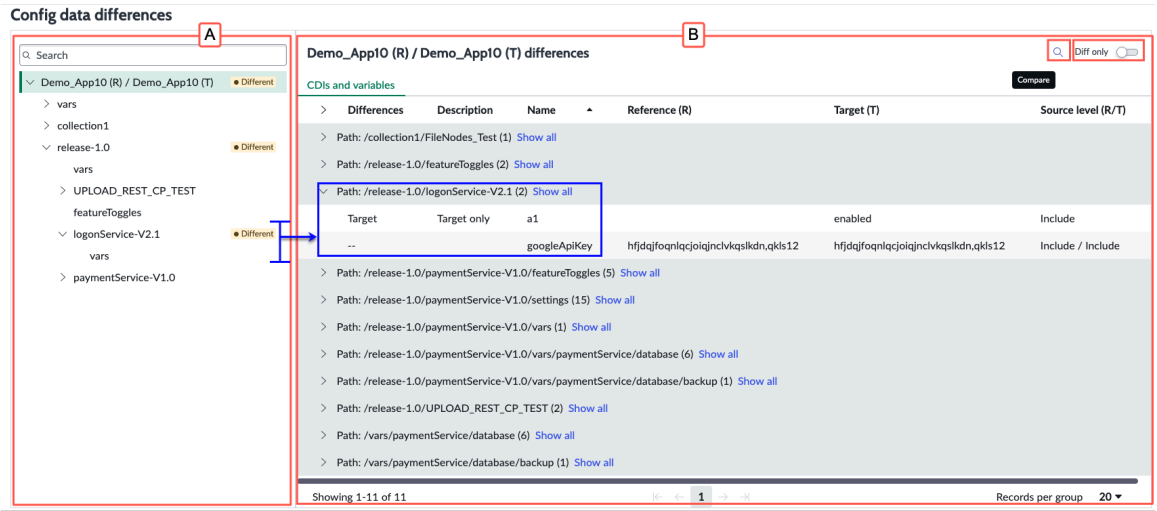
   Note:
   The check box is inactive for users who don't have the cdm_secrets role. When the values in the target and reference differ, the comparison results indicate that the values differ, but the data itself still appears as ********.

5. Select **Compare**.
   The Config data differences section displays the comparison results. It shows the differences between the selected reference and target snapshots.

   Important:
   If you commit changes to a reference application while the **Compare config data** tab is open: When you return to the **Compare config data** tab and select **Compare**, the system uses the most recent committed changeset, performs the comparison again, and then displays the new results in the results section.

   The letters in the following illustration identify the tools that you can use to analyze the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



A: Navigation panel

The navigation panel displays the node structure of the applications.

- Nodes that include changed CDIs (either directly or in descendent nodes) are annotated with **Different**.
- Nodes that include newly added CDIs (either directly or in descendent nodes) are annotated with the identity of the application changeset that includes the new data, either **Reference** or **Target**.

You can search for a node name in the **Search** field. Select a node to view its contents in the Differences panel.

B: Differences panel

The **CDIs and variables** tab displays changes to individual CDIs for the node that is selected in the navigation panel.

- By default, the root node is selected and the data panel includes all CDIs for both changesets. Select a node in the navigation panel to display data for only that node and its descendents.
- When **Diff only** is selected, the number of CDIs that differ appears after the node path.
- Node paths are displayed in gray. Use the expansion icon ( ) to view CDIs in a folder.

CDIs and variables tab

Column	Description
Differences	Indicator to show where the differences are. ○ Target: The CDI appears only in the target changeset. ○ Reference: The CDI appears only in the reference changeset. ○ Different: For the specified CDI, the values in the target and reference changesets differ.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Description	Statement of how the changesets differ. For example, the text might indicate that a CDI appears only in the reference changeset or that the values for a variable differ between the changesets. See Types of differences between CDM applications for the full list of difference types and their causes.
Name	Name of the CDI.
Reference (R)	Value of the CDI in the reference changeset.
Target (T)	Value of the CDI in the target changeset.
Source level (R/T)	The node level in the code at which the CDI is defined. ○ Direct: The CDI is defined in the selected node. ○ Include: The value of the CDI is obtained from a node that is included in the selected node. ○ Override: The value of the CDI in an included node is overridden by a value that is specified in the including node. Values appear in the following formats: ○ `<reference level / target level>` when a value appears in both target and reference. ○ `<reference level>` when a value appears in only the reference changeset. ○ `<target level>` when a value appears in only the target changeset. For example, when a CDI is defined in the reference changeset with the value `true` and the CDI doesn't appear in the target changeset, then the last three columns in the **CDIs and variables** tab will have the following values: ○ **Reference (R)**: `true` ○ **Target (T)**: [Empty] ○ **Source level (R/T)**: `Direct`

If a file node is selected in the tree, the **File information** tab displays its metadata.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File information tab - List columns

Column	Description
Differences	Indicator to show where the differences are. ○ Target: The file node is available only in the target changeset. ○ Reference: The file node is available only in the reference changeset. ○ Different: The file node data differs in the target and reference changesets.
File metadata	Metadata of the file attached to the file node. ○ File name: Name of the attached file in the file node. ○ Content type: Content type of the file. ○ Content: Content of the attached file. Preview is not available on the list, but you can download the file to preview it. ○ File URL: Folder path where the file exists.
Reference (R)	Details of the file present in the reference changeset.
Target (T)	Details of the file present in the target changeset.

Compare two snapshots of a deployable

Use the Config Data Analyzer tool to find changes between two snapshots of a deployable of an application.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

There must be more than one snapshot available in a deployable to compare and the target snapshot must not be the first snapshot in the deployable.

Role required: cdm_viewer, cdm_editor, or cdm_admin

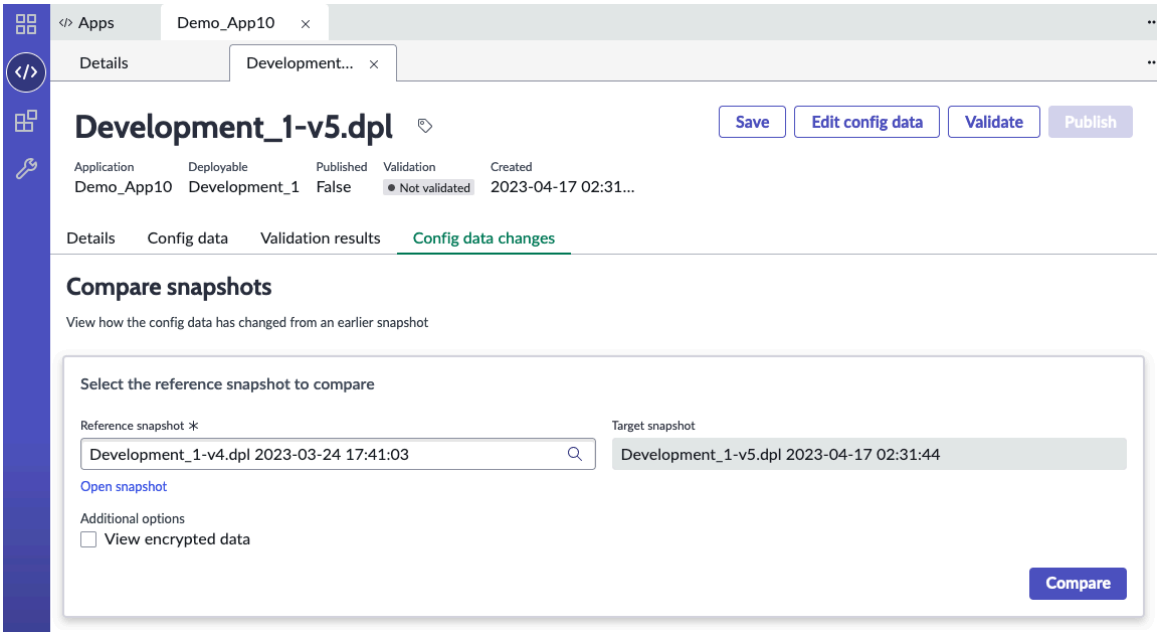
About this task

To compare snapshots from different deployables or applications, see Compare snapshots from the same or different applications.

Procedure

1. While viewing an application, select the **Snapshots** tab.
2. Open a snapshot of a deployable.
3. In the Snapshot record page, select the **Config data changes** tab.
   The current snapshot is auto-populated in the **Target snapshot** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

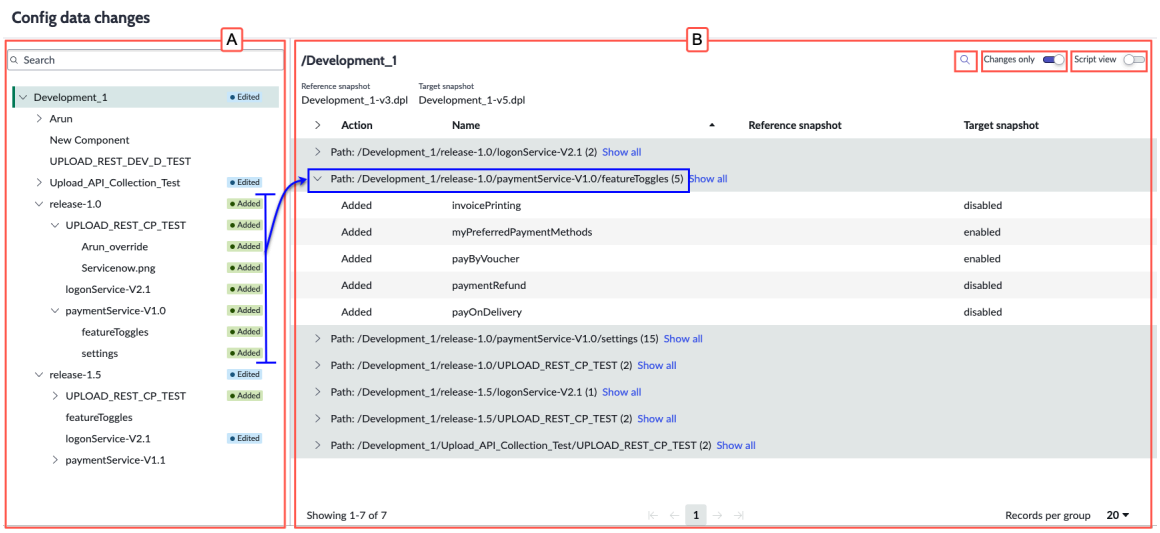


4. Select another snapshot in the **Reference snapshot** field.
   The **Reference snapshot** field lists all snapshots that are older than the target snapshot. The **Reference snapshot** field is inactive when older snapshots are not available. Even if newer snapshots created after the target snapshots exist in the deployable, they are not listed.
5. **Optional:** If you've the cdm_secrets role, you can select **View encrypted data** to view encrypted values in clear text in the comparison results.

   Note:
   The check box is inactive for users who don't have the cdm_secrets role. When the values in the target and reference differ, the comparison results indicate that the values differ, but the data itself still appears as ********.

6. Select **Compare**.
   The Config data changes section displays the comparison results. It shows the changes between the selected reference and target snapshots.

   The following image displays the Config data changes section that contains the comparison result that you can use to analyze the data.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A: Navigation panel

The navigation panel displays the node structure of the deployable.

- Nodes that include changed CDIs (either directly or in descendent nodes) are annotated with **Edited**.
- Nodes that include newly added CDIs (either directly or in descendent nodes) are annotated with **Added**.

You can search for a node name in the **Search** field. Select a node to view its contents in the Changes panel.

B: Changes panel

The panel displays a list of changes to individual CDIs for the node that is selected in the navigation panel.

- By default, the root node is selected and the data panel includes all CDIs for both snapshots. Select a node in the navigation panel to display data for only that node and its descendents.
- Node paths are displayed in gray. Use the expansion icon ( ) to view CDIs in a folder.
- When **Changes only** is selected, the number of CDIs that have changes appears after the node path.
- When **Script view** is selected, the list view toggles to editor view.

List columns in the Changes panel

Column	Description
Action	Indicator to show what was the change type. ○ Added: A CDI appears only in the target snapshot. ○ Deleted: A CDI appears only in the reference snapshot. ○ Edited: For the specified CDI, the values in the target and reference snapshots differ.
Name	Name of the CDI.
Reference snapshot	Value of the CDI in the reference snapshot.
Target snapshot	Value of the CDI in the target snapshot.

If a file node is selected in the tree, the comparison result displays the changes in the file between the selected reference and target snapshots.

List columns for a file node comparison

Column	Description
Action	Indicator to show what was the change type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
	○ Added: The file node is available only in the target snapshot. ○ Deleted: The file node is available only in the reference snapshot. ○ Edited: The file node data differs in the target and reference changesets.
File metadata	Metadata of the file attached to the file node. ○ File name: Name of the attached file in the file node. ○ Content type: Content type of the file. ○ Content: Content of the attached file. Preview is not available on the list, but you can download the file to preview it. ○ File URL: Folder path where the file exists.
Reference snapshot	Details of the file present in the reference changeset.
Target snapshot	Details of the file present in the target changeset.

Export a snapshot

Export a snapshot to generate config data for the pipeline to use.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

- The cdm_secrets role is required to export snapshots that include encrypted data.
- The cdm_viewer can export any snapshot that does not include encrypted data.
- The cdm_exporter_editor can create, edit, publish, activate, and delete exporters.

Role required: cdm_exporter_editor or cdm_editor or cdm_admin

About this task

- Exporters in the content pack have the **Source** value of **ServiceNow**. You can duplicate, but cannot delete or modify content pack exporters.
- You can execute only active published exporters.
- For export, snapshots cannot exceed 10,000 config data items (CDIs) per deployable or 100,000 CDIs per application.
- Records of exporter executions are deleted after a period of three years. For instructions on changing the default time period, see Set the purge period for records of exporter executions.

Procedure

1. Select the admin icon ( ) to open the **Administration** page.
2. On the **Exporters** tab, select the name of the exporter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tip:
Add commonly used exporters to the **My Exporters** list for quick access.

The **Versions** tab for the exporter opens, displaying the list of draft and published versions of the exporter.

3. Select a published version of the exporter to run.
The exporter opens on the **Exporter Builder** tab. The text of the exporter script appears in a view-only panel. Use the Test playground panel to specify the snapshot to export and test settings before you export the config data.
4. Specify the settings for the exporter execution on the **Select inputs** page.

Test playground settings

Field	Description
Deployable and published snapshot to export	Deployable for export and the particular published snapshot that you have validated and want to use. Deployables appear in the list using the format `<AppName/DeployableName>`. When you select a deployable, another field lists all published snapshots for the deployable. The most recently published snapshot appears first in the list. Select the snapshot to export.
Input arguments	The arguments that the exporter script uses to generate config data as output. The text box displays the default values for all arguments. Update values as needed.
Output format	Format in which to generate the config data.
Additional deployables	Deployables for which to generate config data in addition to the primary deployable that you specified in the **Deployable and published snapshot to export** field. Only the latest published snapshots appear for this optional setting.

5. Select **Save** to save your changes and then select **Evaluate**.
The exporter script runs using the settings that you specified and then displays the resulting config data in the Output box on the Review output page.
6. Review the results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To make changes, select **Select inputs**, specify new settings, and then select **Evaluate**. Repeat as often as needed.

Note:
When you are satisfied that the exporter generates complete config data and follows the required output format standards, you can publish it and activate it.

Test an exporter and export a snapshot

Set and validate input settings to test an exporter before you export the config data in a snapshot.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_exporter_editor or cdm_editor or cdm_admin

- The cdm_secrets role is required to export snapshots that include encrypted data.
- The cdm_viewer can export any snapshot that does not include encrypted data.
- The cdm_exporter_editor can create, edit, publish and delete exporters.

About this task

Be sure to install the exporter content pack for DevOps Config. Exporters in the content pack are good starting points for your custom exporters. Some content pack exporters generate subsets of config data and others generate data for full applications. For example, to export updated config data for a database, you might select the **returnAllDataforNodeName** exporter. In the input arguments for the exporter, you would specify the database deployable as the node and then specify the updated settings as input arguments. After you determine that the settings generate the desired config data, you can export the data to the pipeline.

- Exporters in the content pack have the **Source** value of **ServiceNow**. You can duplicate, but cannot delete or modify content pack exporters.
- You can run only published exporters.
- For export, snapshots cannot exceed 10,000 config data items (CDIs) per deployable or 100,000 CDIs per application.
- For information on creating a custom exporter, see Create a custom exporter.
- Records of exporter executions are deleted after a period of three years. For instructions on changing the default time period, see Set the purge period for records of exporter executions.

Procedure

1. Select the admin icon ( ) to open the **Administration** page.
2. On the **Exporters** tab, select the name of the exporter.

   Tip:
   Add commonly used exporters to the **My Exporters** list for quick access.

3. Select the exporter version on the **Versions** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The exporter opens on the **Exporter builder** tab. The text of the exporter script appears in a view-only panel. Use the **Test playground** panel to specify the snapshot to export and test settings before you export the config data.

4. Specify the settings for the exporter execution on the **Select inputs** page.

Test playground settings

Field	Description
Deployable and published snapshot to export	Deployable for export and the particular published snapshot that you have validated and want to use. Deployables appear in the list using the format `<AppName/DeployableName>`. When you select a deployable, another field lists all published snapshots for the deployable. The most recently published snapshot appears first in the list. Select the snapshot to export.
Input arguments	The arguments that the exporter script uses to generate config data as output. The text box displays the default values for all arguments. Update values as needed.
Output format	Format in which to generate the config data.
Additional deployables	Deployables for which to generate config data in addition to the primary deployable that you specified in the **Deployable and published snapshot to export** field. Only the latest published snapshots appear for this optional setting.

5. Select **Evaluate**.
   - The exporter script executes using the settings that you specified.
   - The **Test playground** panel displays the Review output page.
   - The config data that the exporter generates appears in the **Output** box.
   - The system lists information about the execution on the **Executions** tab.
6. Review the results.
   a. To make changes, select **Select inputs**, specify new settings, and then select **Evaluate**.
   b. Repeat the previous step as often as needed.

Note:
When you are satisfied that the exporter generates complete config data and follows the required output format standards, you can publish it and activate it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Publish the exporter by selecting **Publish** on the **Exporter builder** tab.

> **Note:**
> You must set an exporter to active to enable it to be executed in a pipeline.

Generate API invocation code for an exporter

Generate sample code of an API invocation for an exporter. The code can invoke the exporter. Select from several commonly used languages.

Before you begin

> **Important:**
> Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_exporter_editor or cdm_editor or cdm_admin

Procedure

1. Prepare an exporter for execution as described in Test an exporter and export a snapshot.

> **Tip:**
> Test the exporter to verify its operation.

2. In the **Evaluate** menu, select **Generate sample API**.
   The Exporter API invocation sample dialog box opens.
3. Select the language.
   The system applies the settings that you specify and displays the resulting API sample in the text box.
4. Select **Copy to clipboard**.
   You can now paste the code into an editor for use in your code.

Create a custom exporter

Copy an existing exporter script as a starting point for a custom exporter.

Before you begin

> **Important:**
> Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_exporter_editor or cdm_editor or cdm_admin

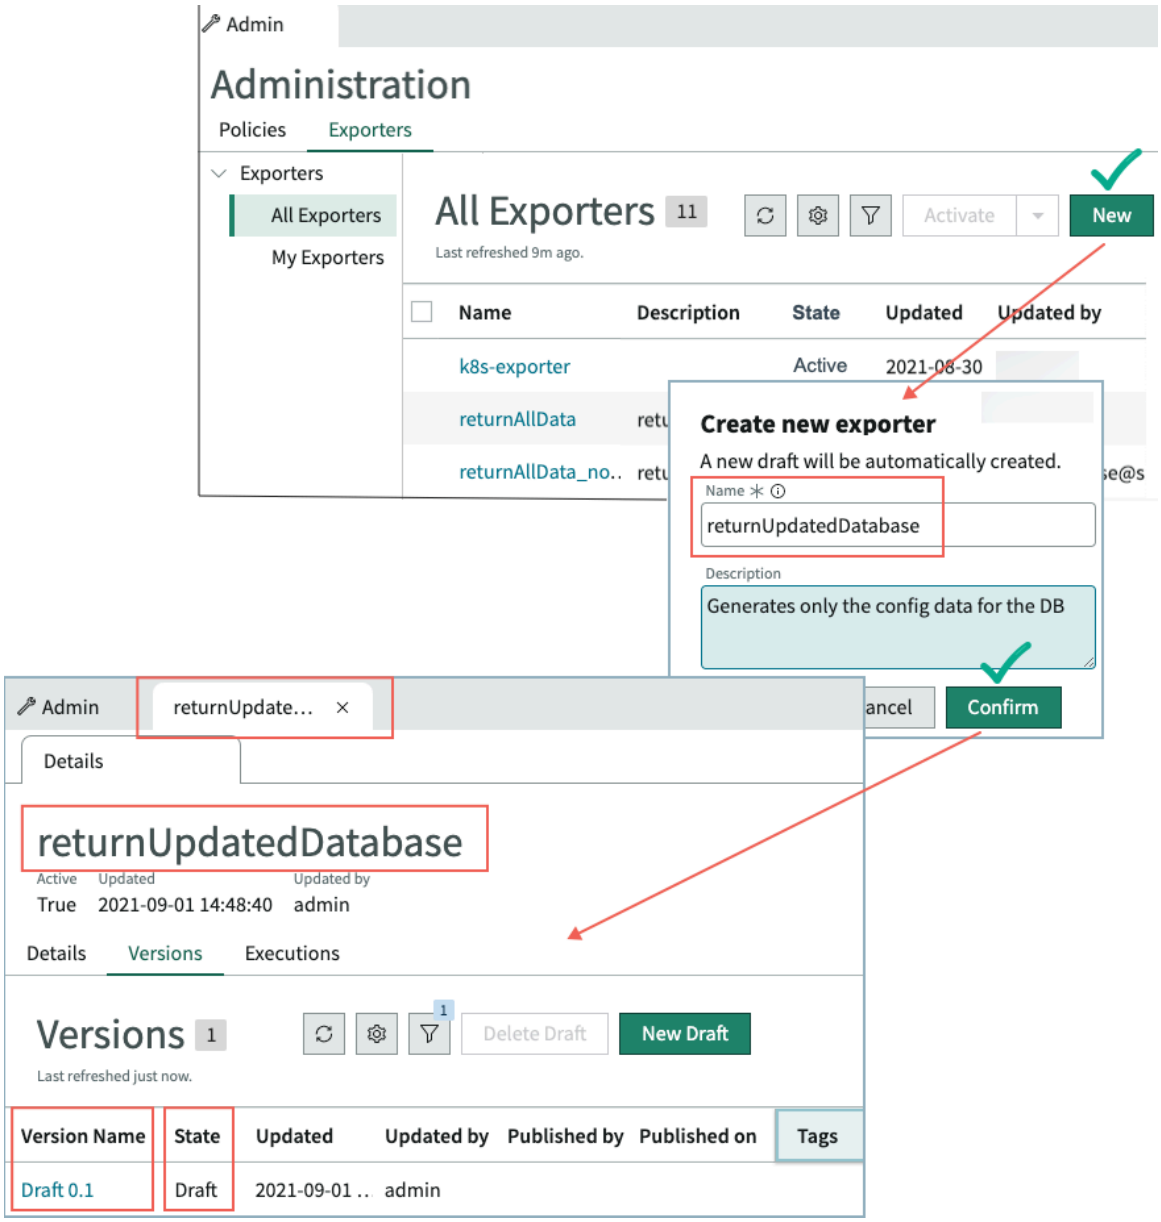
About this task

DevOps Config content packs provide a variety of exporters. You can use any of the provided exporter scripts as a starting point for a custom exporter that you design.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select the admin icon ( ) to open the **Administration** page.
2. On the **Exporters** tab, select **New**, enter a unique and meaningful name and description, and then select **Confirm**.
   The first draft version of the exporter is named **Draft 0.1** and is listed on the **Versions** tab.



3. Select the **Version name** to open default exporter script on the **Exporter builder** tab.

   The text of the exporter script appears in a view-only panel.
4. On the **Exporters** tab, select the name of the exporter that will act as the starting point for the new custom exporter.
5. Select the exporter version to use on the **Versions** tab for the exporter.
   The exporter opens on the **Exporter Builder** tab. The text of the exporter script appears in a view-only panel.
6. Copy the text of the script for use in the new exporter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** To enable users to specify dynamic execution conditions or CDI values when editing the exporter, create an input argument.

   a. On the **Input arguments** tab, click **New**.

   b. On the Create argument pop-up window, define the argument.

   Create argument pop-up window

Field	Description
(Optional) Name / Description	Meaningful name and description for the argument.
Default value	Value that the argument will have when a user opens the exporter for editing.
Mandatory	Select the check box to require that the argument value is specified.

   c. Select **Create**.
   The argument now appears in the **Input arguments** field on the Test Playground panel.

View the history of exporter executions

View a list of exporter executions to identify config updates that are successful and to isolate changes that caused failure in the pipeline.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

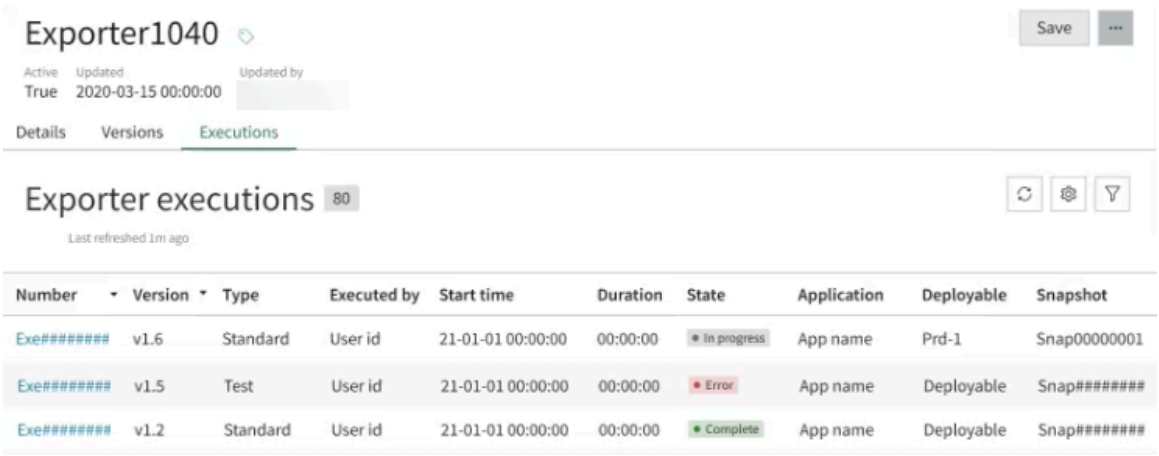
Role required: cdm_viewer or cdm_exporter_editor or cdm_editor or cdm_admin

About this task

Procedure

1. Select the Admin icon ( ) to open the **Administration** page.
2. On the **Exporters** tab, select the name of the exporter.
3. Select the **Executions** tab to view the list of executions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Exporter executions list

Column	Description
Number	Unique auto-generated identifier for the execution.
Version	Version of the exporter.
Type	○ Test: An execution in the test playground. ○ Standard: An execution that generates published config data.
Executed by	User that executed the exporter.
Start time / Duration	Timestamp when the execution started and the period of time that the exporter ran.
State	Result of the execution.
Application / Deployable / Snapshot	The application, deployable, and snapshot that the exporter used.

Delete an exporter

Delete an exporter to ensure that users cannot use it to generate config data.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_exporter_editor or cdm_editor or cdm_admin

About this task

- You cannot delete, modify, or activate exporters that are included in the CDM content pack. Exporters in the content pack have a **Source** value of **ServiceNow**.
- If an exporter has performed a standard execution, you cannot delete it. This ensures a complete and accurate audit trail. You can archive an exporter that has performed a standard execution. See Archive an exporter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If an exporter does not have a standard execution, then you can delete all draft versions and published versions by deleting the exporter.
- You can delete any draft version of an exporter.

Tip:
You cannot generate a draft version of a content pack exporter, but you can duplicate one and edit draft versions of the duplicate. Editing a duplicate of a content pack exporter is a good way to create a custom exporter. See Create a custom exporter.

Procedure

1. Use either of the following methods to delete all versions of an exporter: While working on an exporter on the **Exporter builder** tab or viewing a list of exporters, select the exporter and then select **Delete**.
   - While working on an exporter on the **Exporter builder** tab, select **Delete**.
   - While viewing a list of exporters, select the exporter and then select **Delete**.

   All versions of the exporter are deleted and the exporter is no longer listed on the **Versions** tab.
2. To delete only a particular draft version of an exporter, select the version, select **Delete draft**, and then confirm the action.

Archive an exporter

Archive an exporter to preserve its record and remove it from the lists that you use in your everyday work.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_exporter_editor, or cdm_editor, or cdm_admin

About this task

- You can archive only exporters that have standard runs.
- You can copy and test run an archived exporter. You cannot use the API to run an archived exporter.
- You cannot perform the export operation using an archived exporter.
- You cannot delete, modify, publish, or rename an archived exporter or any of its versions.
- You cannot create new draft of or reuse the name of an archived exporter.
- To restore an exporter for normal use, set its **State** value to **Active** and publish a version.

Procedure

While working on an exporter on the **Exporter builder** tab or while viewing a list of exporters, select the exporter and then select **Archive**.
The **State** value of the exporter is set to **Archived**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Set the purge period for records of exporter executions

Change the default deletion period. By default, records of exporter executions are deleted after a period of three years.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: CDM Admin [sn_cdm.cdm_admin]

Procedure

1. Navigate to **All** > **System Maintenance** > **Table Cleanup**.
2. In the **Tablename** column, select **sn_cdm_exporter_execution**.
3. Change the **Age** setting to the retention period in seconds and then save the record.

   Minimum: 1 year. For example:

   - 1 year = 31 536 000
   - 2 years = 63 072 000
   - 3 years = 94 608 000

Investigate an alert that involves a change to config data

A high percentage of alerts occur due to errors in config data. If the chain of events that resulted in an alert includes a change request that involves the same CI as the alert, then you can use a variety of tools to isolate the config changes that might have caused the alert.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Roles required: Both cdm_viewer and evt_mgmt_user.

About this task

You work in the **Config changes** tab while investigating the causes of an alert. The tab includes several tools that enable you to visualize the series of config changes that might have led to the alert. You can filter, sort, and organize config data to help you identify problematic changes to the configuration data item key:value pairs (CDIs).

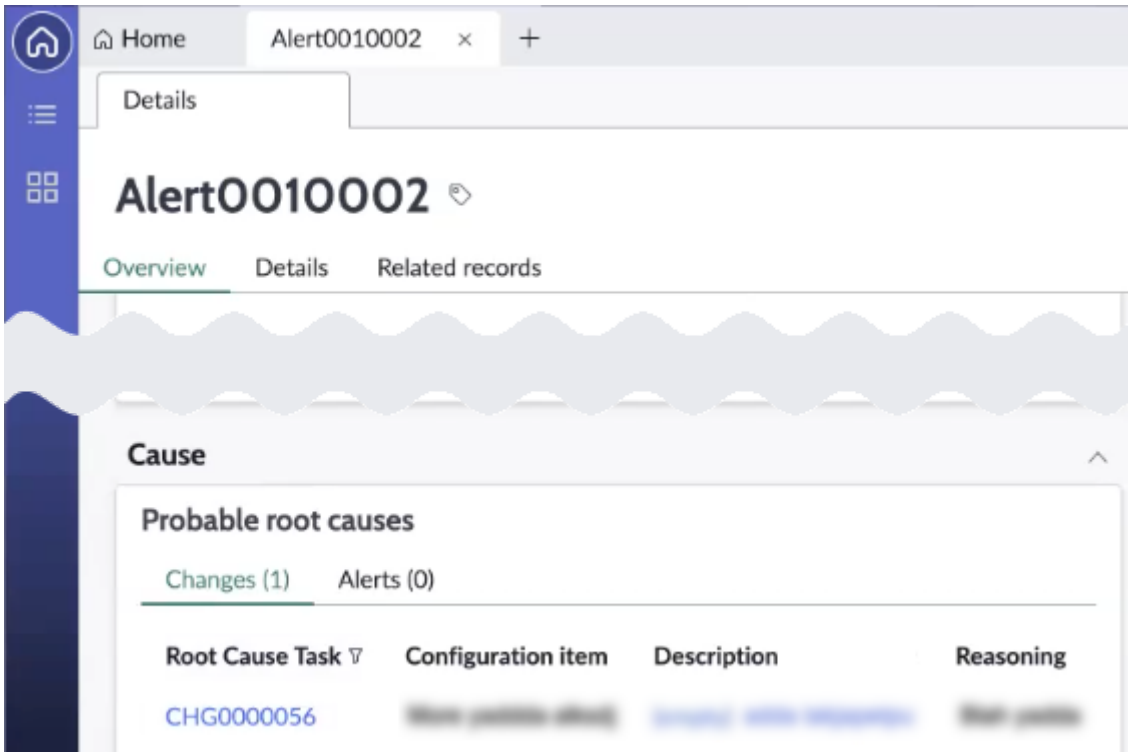
Procedure

1. Use either of the following methods to view an alert:

   - On the home page ( ) of the Service operations workspace, select an alert.
   - On the list page ( ) of the Service operations workspace, navigate to **Alerts** and then select an alert.

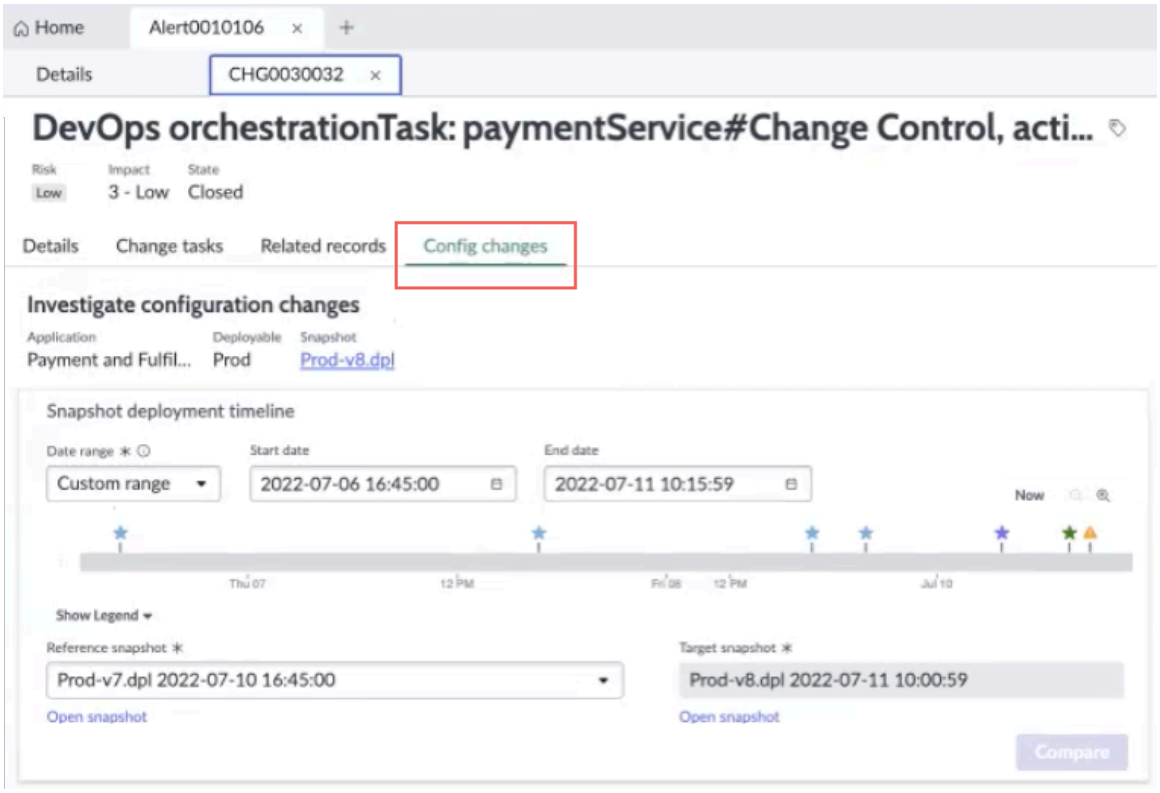
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The top five most likely causes of the alert are listed in the Cause section on the **Overview** tab. If the chain of events that resulted in the alert includes a change request that involves the same CI as the alert, then that CHG record appears in the list.



2. On the **Changes** tab, select a change request.
   The change request opens. If the change request involved a change to config data because a CDM snapshot was deployed, then the **Config changes** tab appears.
3. On the **Config changes** tab, work with the information in the Investigate configuration changes section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Investigate configuration changes section on the Config changes tab

Field	Description
Application	The CDM application that is affected by the alert.
Deployable	The CDM deployable whose snapshot was deployed.
Snapshot	The CDM snapshot that was deployed. To open the snapshot on a new tab in the Service Operations Workspace, select the snapshot.
Snapshot deployment timeline	
Date range / Start date / End date	The time period that the timeline displays. By default, the timeline displays the period that includes the alert, the target snapshot (the snapshot that is associated with the change request), and the five most recently deployed snapshots. Specify a predefined period in the **Date range** box or use the calendar tools to specify custom start and end times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Timeline / Show legend	The timeline displays snapshot deployments and the alert. Select **Show legend** to view the icons that identify snapshots and events on the timeline. In addition to the snapshot that immediately precedes the current (target) snapshot, you can compare the target snapshot to any earlier snapshot that appears on the timeline. To view additional snapshots, change the date range. Use the zoom icons ( ) to shrink or grow the portion of the date range that appears on the timeline. Zoom does not change any of the other timeline settings. Use the left and right arrows to view items that have scrolled out of view. Select a snapshot to view its name, associated change record, and deployment date. Select the link to open the associated change request.  Select an alert to view its alert ID and creation date. Reference snapshot / Target snapshot	The target snapshot is the snapshot that is associated with the change request. (The alert can be associated with multiple change requests, each of which is associated with a target snapshot). Most often, the target snapshot immediately precedes the alert.

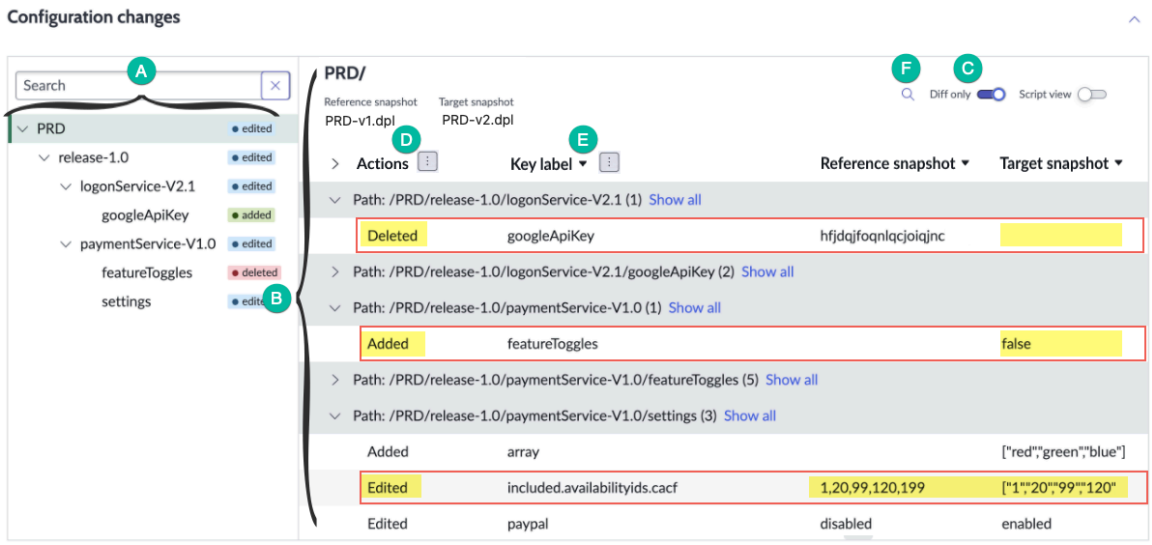
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	By default, the system selects the snapshot that immediately preceded the target snapshot as the reference snapshot. While investigating the cause of the alert, you can use the **Reference snapshot** list to select any snapshot that precedes the reference snapshot in the selected date range on the timeline. (Snapshots on the timeline after the target snapshot do not appear in the list.) If you select a different reference snapshot, select **Compare** to generate the list of differences between the two selected snapshots. The difference information appears in the Configuration changes section. For any snapshot on the timeline, follow these steps to open it in the Service Operations workspace. **a.** Choose the target snapshot or select a snapshot in the **Reference snapshot** list. **b.** Select **Open snapshot**.

4. Now work with the information in the Configuration changes section on the **Config changes** tab.

   When the **Config changes** tab opens, the system immediately identifies the differences in the CDIs between the reference snapshot and the target snapshot. The Configuration changes section displays the differences.

   The letters in the following illustration identify the tools you can use to analyze the data.



A. Navigation panel

The navigation panel displays the node structure of the snapshot. Select a node to view its contents in the data panel. Nodes that include changed CDIs (either

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

directly or in descendent nodes) are annotated with **added**, **deleted**, or **edited**, as appropriate. Use the **Search** field to search for text in the navigation panel.

B: Data panel

The data panel displays groups of CDIs for the selected node. By default, the root node is selected in the node tree, and the list includes all CDIs for both snapshots. Select a node in the navigation panel to display CDIs for only that node and its descendents. You can switch from this list view of the config data to a script view, as described in G: Script view.

Expand and close groupings with the expand icon ( ). If a selection includes more than 50 CDIs, then CDIs are organized into groups of 50.

C: Diff only

Select **Diff only** to view only CDIs that differ between the two snapshots.

D: Filter the types of changes that should appear in the list

The condition builder icon ( ) appears when you point to the **Actions** column name in the list view. Select the icon to specify the types of config data changes that should appear in the list.

"Types of changes" filters

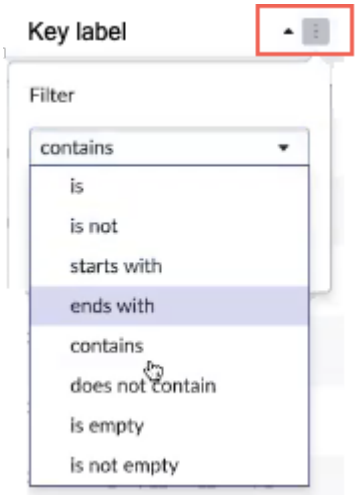
Filter	Meaning
(empty)	[Not used.]
--	No difference in this CDI between the reference and target snapshots.
Added	The CDI was added to the target snapshot.
Deleted	The CDI was deleted from the target snapshot.
Changed	The value of the CDI was changed in the target snapshot.

E: Filter the list based on CDI names and values

The condition builder icon ( ) appears when you point to the **Key label** column in the list view. Select the icon to filter the list of config data changes that should appear in the list.

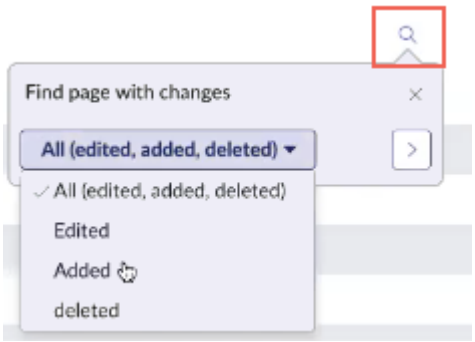
The sort indicator icon ( ) indicates that CDIs are sorted alphabetically by the label of the key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



F: Find nodes with a particular kind of change

In the list view, select the find icon ( ) and specify the type of change to isolate.



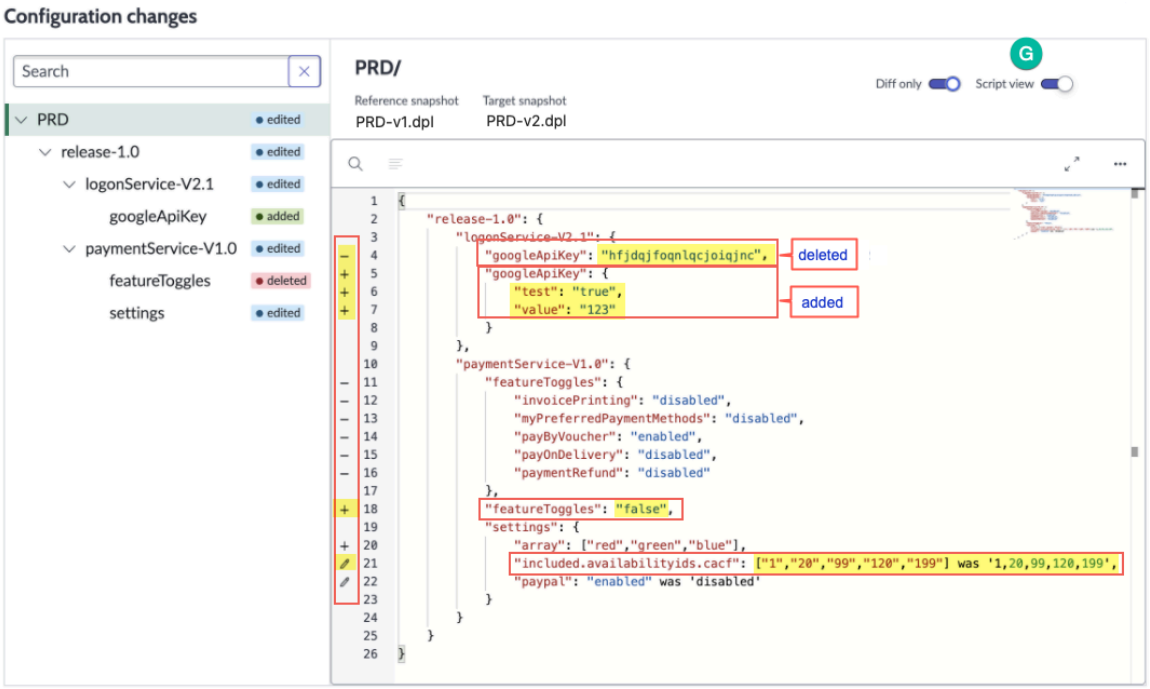
G: Script view

- The data initially appears in list form. Select **Script view** to view the config data as code.
- Differences are indicated by symbols next to the line number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Deletions are indicated by -
- Additions are indicated by +
- Edits are indicated by the pencil icon ( ) plus notes in the in-line text, as shown in this "Diff only" example.

- Conversions from text to array: In the example, because the data structure of the `googleApiKey` CDI changed from a text value to an array, the text form is deleted and the array form is added.



Analytics and reporting using the DevOps Config Insights dashboard

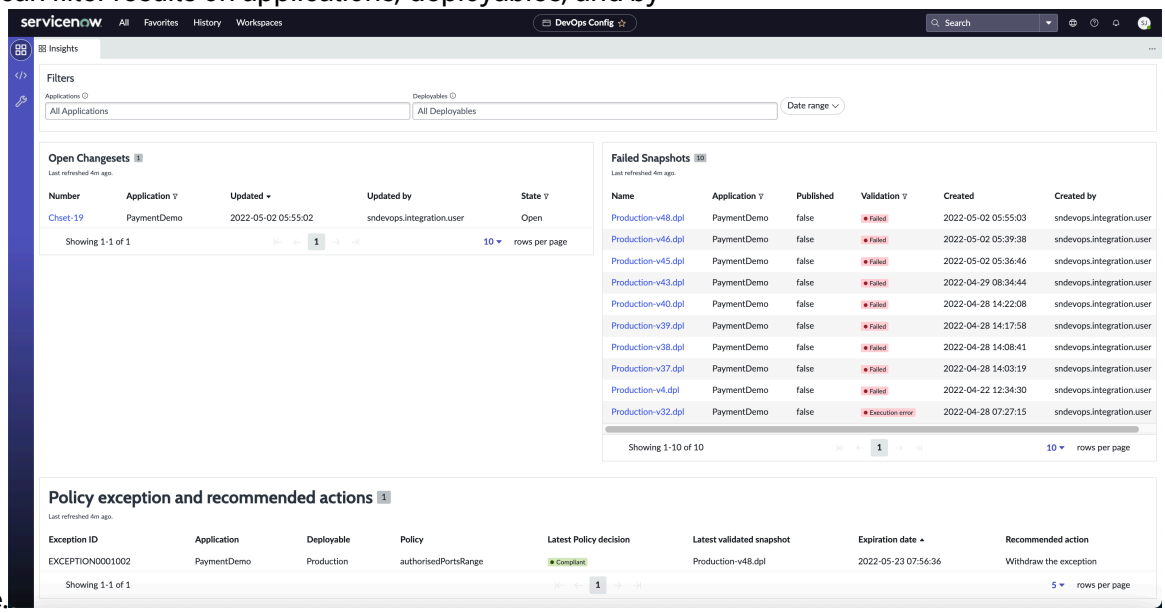
Use the DevOps Config Insights dashboard with Performance Analytics to quickly identify configuration errors and take action. View snapshot validation trend, open changesets, and failed snaphots for all applications and deployables.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Error thresholds are configurable and widgets are customizable (you can rearrange or hide them).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can filter results on applications, deployables, and by date.

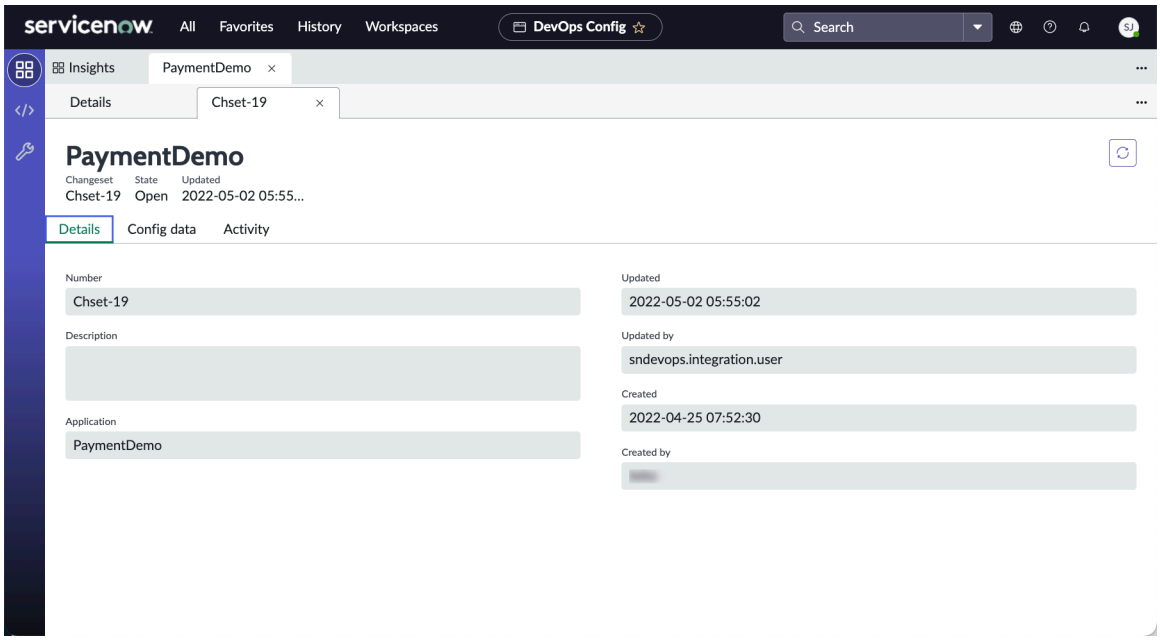


Report	Description and use case
Open changesets	Open changeset details. Use case: As a DevOps engineer or App Engineer, I want to review my open changesets so that I can take action on them right away and not let them get stale. Accidentally committing changesets later could add risk to my data model and, by consequence, the fleet.
Failed snapshots	Non-compliant snapshots for changes committed. Use case: As a DevOps engineer or App Engineer, I want to review non-compliant snapshots for changes I committed so that I ensure my changes are in line with company policies before pushing the data out to my production environment.
Policy exception and recommended actions	Recommended actions for policies that have exceptions. Use case: As a DevOps Config and GRC customer, I want to be able to see the list of active exceptions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

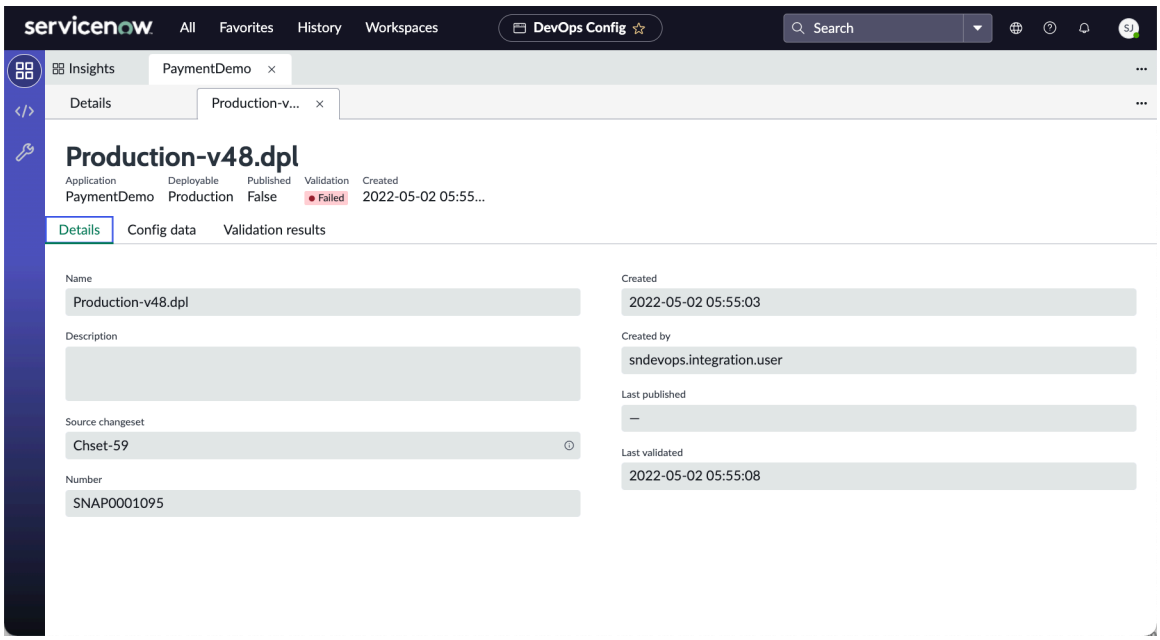
Report	Description and use case
	and, for ones that are expiring soon, what the recommended action is.

DevOps Config Insights Open changesets



Review the changeset details and either make changes to the config data and commit the changeset, or discard the changeset altogether. You generally want this number to be 0 on the dashboard.

DevOps Config Insights Failed snapshots



Investigate the snapshots and fix misconfigurations, or identify changes that need to be made to a policy. You generally want this number to be 0 on the dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DevOps Config Policy exceptions

Possible actions	
Nothing	If the issue is already resolved and the latest snapshot status passed; or withdraw the exception if it is no longer needed.
Fix the issue	If the latest snapshot validation status is passed with exception and there's time to fix the issue before the exception expires.
Extend the exception	If the latest snapshot validation status is passed with exception and there isn't enough time to fix the issue.

DevOps Config reference

DevOps Config reference content.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Update the associations for a deployable

Update the name and description of a deployable as well as its associations with applications and other items. This procedure is optional.

Before you begin

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Role required: cdm_policy_editor or cdm_editor or cdm_admin

About this task

This optional procedure explains how to update the details of a deployable definition. For information on configuring the data in a deployable, see Create and update a deployable.

Note:
You cannot change the SDLC environment type (development, test, or production) of a deployable because such a change would have significant impact. For example, mapped policies and their inputs might differ significantly between test and production versions of a config dataset.

Procedure

1. On the **Settings** tab for an application, select **Deployables** in the tree view.
2. Select the check box for the deployable, select **Edit**, and then update the settings for the deployable.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit deployable settings

Field	Description
Name	Unique and meaningful name for the deployable.
CDM Deployable Node	Deployable in the dataset.
Node Main	
CDM Application	CDM application that includes the deployable.
Domain	
Enforce Compliance	Option to ensure that only snapshots that pass validation can be exported.
CMDB CI	Configuration item in the CMDB.
Environment	SDLC environment that the deployable implements. ○ Development ○ Test ○ Production
Description	Text description that helps other users understand the purpose, scope, and intent of the deployable.

3. Select **Update**.

Create or update a variable CDI

Types of configuration data supported by DevOps Config

DevOps Config stores configuration data of every layer of the IT stack in a centralized location.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Configuration data includes:

- App and service configuration
- Middleware configuration (databases, message queues, load balancers, for example)
- Kubernetes and Service Mesh configuration
- Cloud resources configuration (AWS, GGP, Azure DevOps, for example)
- Traditional infra configuration (servers, VMs, network, for example)

API keys	passwords	usernames	feature toggles

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

install paths	load balancing methods	database connections	heap sizes
scaling rules	geo regions	host names	IPs
cluster settings	sizing	sudo user lists	ssh
patching levels	firewalls	URLs	certificates
versions	build numbers	hot fixes	--

Typically configuration data is stored in files (.json, .yaml, .properties, .ini, .xml, .csv) and is located in a variety of places, including GIT repos, network folders, third-party tools (JFrog artifactory, Sonatype Nexus) other databases.

DevOps Config manages and validates your configuration data in a centralized location as the single source of truth.

CDM data model

The CDM data model is a standardized data structure that supports the broader life cycle of software delivery — automation, quality validation, and CSDM. CDM imports existing config data, validates it using policies that you define, and exports valid config data to your organization's existing DevOps pipeline to implement applications, services, and infrastructure.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

CDM data model overview

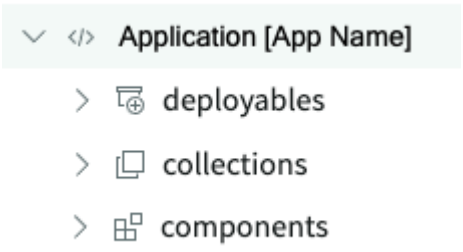
The CDM data model does not change the way you think about configuration. Rather, you use the CDM REST API and user interface to map your existing JSON, YAML, INI, XML, and other config data into an intuitive data structure that provides the following benefits:

- Implements rigorous and transparent version and change control.
- Enables you to encrypt sensitive data and ensures appropriate access control for the data.
- Enables automated validation of config data.
- Enables you to reuse config data structures by using variables, including values, and overlaying values.

Structure of the CDM data model

An application in CDM is the full collection of config data for an application service, application model, or dynamic CI group [infrastructure] in the CMDB. The CDM user creates an application record that includes the following empty folders in a standard hierarchical structure. After the system ingests your existing config data, you structure the data into components in the appropriate folder. You create collections of the components and then combine the collections into a deployable — a config dataset (for a development, test, or production environment) that can be deployed by your delivery process. Each component, collection, variable, and deployable is a node in the structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Components

Components are the building blocks that typically represent the config data for a logical element of an application or a part of an infrastructure service. For example, a monolithic app, a micro-service, a physical server, or a Docker template.

A component can include descendent components, either direct or included. A component can include variables that can take on different values in collections and deployables.

You can group components into a library of shared components.

> **Tip:**
> It is often useful to define a default value for a variable in a component or collection. This is a powerful strategy because you can create a broad variety of deployables from a small set of components and collections. Deployables that inherit a component or collection can use overrides, overlays, and variable settings to meet the needs of the environment type. For example, the `Development` deployable can use the same components and collections as the `Test` deployable. `Development` uses the default *`database`* variable value. `Test`, in contrast, uses a different value that is appropriate for the test environment.

Components Vars folder

The components **Vars** folder can contain variables that any CDI in the **Components** folder can use. There is only one components **Vars** folder.

Collections

A collection is the set of components that together define a release — You can think of a collection as a release composition.

A collection can include variable or override settings that are specific to the particular version. For example, the VM config data used in release-1 is different from the data used in release-2. release-1 might use the value 2Gb for the *`memory`* setting (`"memory": "2Gb"`) and release-2 might specify a different value (`"memory": "4Gb"`). In addition, a collection might include config settings that do not appear in its components. Such values are called overlays.

A collection might represent a particular version of an application, localization, or feature set. For example, a collection named `collection-2` might include the set of components or component versions that represent the `Release 2.0` functionality for the application. In contrast, a collection named `collection-3` that represents the `Release 3.0` functionality might include the same set of components or component versions, additional components or component versions, and other variable, override, and overlay settings.

Collections Vars folder

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The collection **Vars** folder can contain variables that any CDI in the **Collections** folder can use. Each collection has one collection **Vars** folder. A collection variable has higher precedence than a component variable.

Deployables

You add and configure deployables in the data structure. A deployable is a config dataset (for a DEV, TEST, or PROD environment) that can be deployed by your delivery process. Each deployable in an application represents the configuration of a service in the CMDB.

A deployable is made up of the collection or set of collections that define the release for a particular environment. The combination of collections+environment link to an application service in the CMDB or to an infrastructure service.

A deployable can include variable or override settings that are specific to the environment. For example, the `database` variable has one value in the development environment and a different value in the production environment. An override value in the production deployable might specify a required container parameter that is not needed in the development environment.

An example deployable named DEV-2 would include the `collection-2` collection and would specify variable, override, and overlay settings that are specific to the development environment for release 2.0. In contrast, the deployable named PROD-2 would also include the `collection-2` collection but, instead, would specify settings that are specific to the production environment for release 2.0.

When you are happy with a changeset, you can save and commit the changes. The system checks for conflicts with the committed changesets of other users. If there are no conflicts, the system persists the changes and then generates a snapshot of every deployable that is affected by the changes. A snapshot represents a potential exportable config data set. The system validates config data by executing policies against each snapshot and returning the validation results.

Deployable Vars folder

The deployable **Vars** folder can contain variables that any CDI in the **Deployables** folder can use. Each deployable has one deployable **Vars** folder. A deployable variable has higher precedence than a collection variable.

Example

In the following diagram of the example BookStore application, the numbers identify the relationships among components, collections, and deployables.

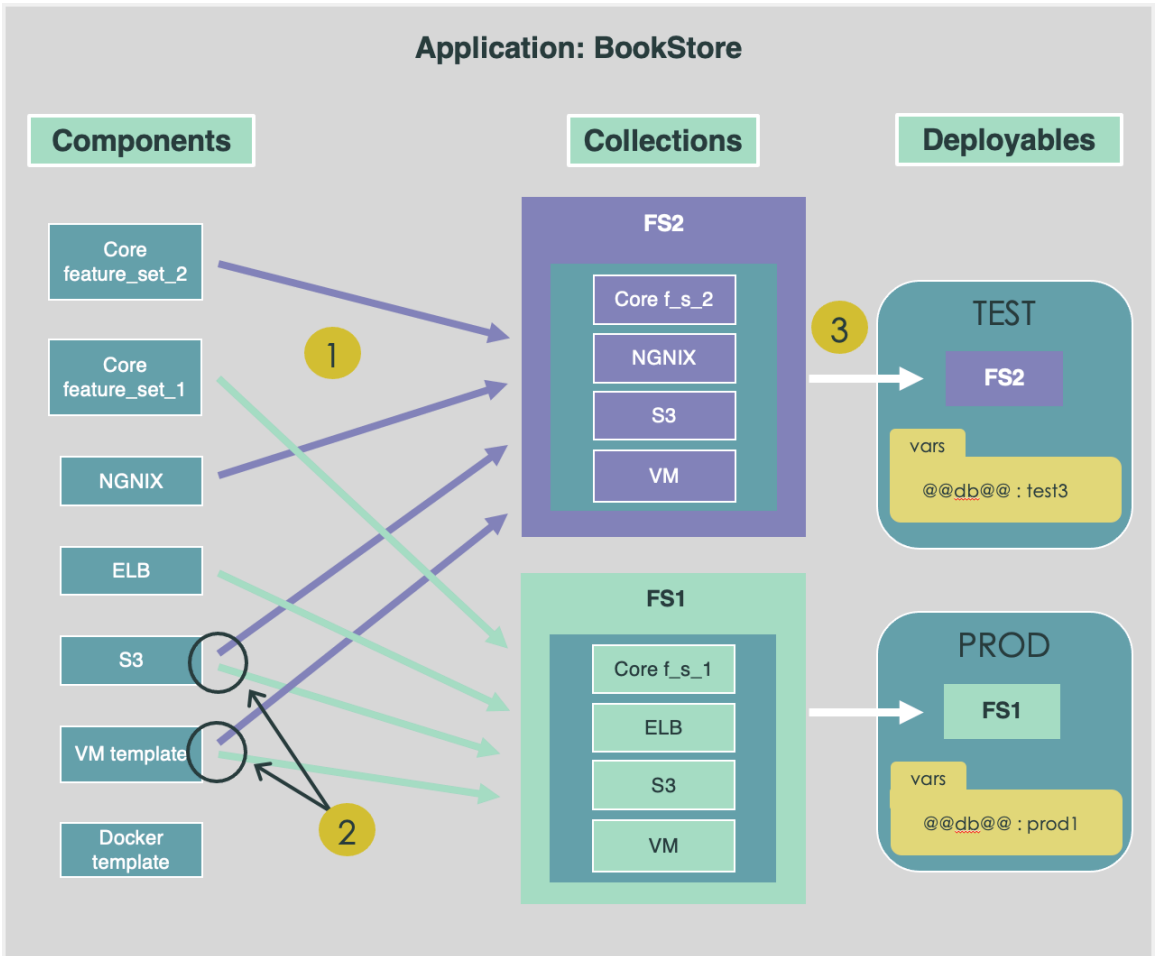
1. Components are grouped to form collections that represent environments or versions of environments. The FS2 (feature set 2) collection has config data for Core version 2 of the application that is currently being developed and tested. FS1, in contrast, holds the earlier Core version 1 that has been thoroughly tested and is currently running the application in the production environment.
2. In the example, both FS2 (the collection that is used in test environments) and FS1 (the collection that is used in the production environment) use config data for both *S3* and a particular *`VM template`*. Both the FS1 and FS2 collections, therefore, inherit these two components. Because the collections represent different feature sets, it is probably the case that FS1 and FS2 use variables or overrides to specify a few different settings for the components.
3. Each deployable includes the collection that is appropriate for its environment (development, test, or production). In the example, the TEST deployable uses the FS2 collection, the newer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

version of the feature set and other config settings that is used in test environments. The PROD deployable, in contrast, uses FS1 in the production environment. FS1 is the earlier version of the collection of config data that had been validated for production.

In each deployable, variables are set to values that are appropriate for the environment. For example, in PROD, the *`database`* variable is set to `prod1` (the production database). The TEST deployable, however, specifies one of the databases that is used by the testing team, `test3`.

This diagram is simplified. In your implementation, deployables can include multiple collections, variable and override settings, and overlay settings (settings that do not appear in the components and collections that make up the deployable). In addition, you might have several deployables for each environment type.



Definitions

CDI

A config data item (CDI) is simple a key-value node.

Variable

A variable is a key-value item that can be referenced within a CDI.

Parent nodes and child (leaf) nodes

- CDIs and variables are key-value items. CDIs and variables can only be child nodes.
- Components, collections, deployables, and folders nodes can be parent nodes—nodes that can have key-value items or other parent nodes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Starting with Configuration Data Management version 4.2, you can define a node using any UTF-8 character, including the forward slash (/).

Name path

The name path is the complete folder path of the selected node in the list. In REST API, you can provide name path in array in the following formats:

- Backslash format: For example - testApp/deployables/Development1/cdi1

  Note:
  If your node name contains a backslash ("/"), you can't use this format.

- Backend name path with replacement characters: For example - testApp#deployables#Development1#cdi1
- Array: For example - ['testApp','deployables','Development1','cdi1']

Components

Components are the building blocks that typically represent the config data for a logical element of an application or a part of an infrastructure service. For example, a monolithic app, a micro-service, a physical server, or a Docker template.

A component can contain variables that can take on different values in collections and deployables. More detailed instructions appear in Define or update a component.

Collections

A collection is the set of components that together define a release — You can think of a collection as a release composition.

A collection can contain variable or override settings that are specific to the particular version. For example, the VM config data used in release-1 is different from the data used in release-2. release-1 might use the value 2Gb for the *memory* setting (`"memory": "2Gb"`) and release-2 might specify a different value (`"memory": "4Gb"`). In addition, a collection might include config settings that do not appear in its components. You might think of such values as "overlays".

Deployables

A deployable is a config dataset (for a development, test, or production environment) that can be deployed into your CI/CD pipeline as a service. Each deployable in an application configures a service in the CMDB. For example, you might create three deployables, one for each environment type: Development, Test, and Production.

A deployable is made up of the collection or set of collections that define the release for a particular environment. The combination of collections+environment link to an application service in the CMDB or an infrastructure service.

A deployable can contain variable or override settings that are specific to the environment. For example, the `database` variable has one value in the development environment and a different value in the production environment. An override value in the production deployable might specify a required container parameter that is not needed in the development environment.

Changesets and Snapshots

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you commit changes to a CDM application, the system persists the changes as a changeset of the application. The system then also generates a snapshot of every deployable that is affected by the changes. A snapshot represents a potential exportable config data set. The system validates config data by executing policies against each snapshot and returning the validation results. Snapshots that pass validation and that are published can be exported to the release pipeline as config data.

Shared components and Component libraries

Shared components in Configuration Data Management enables you to use a component across several applications.

For better organization, these shared components are managed in Component libraries. These component libraries improve consistency and maintainability by ensuring a single source of truth for a component's config data across applications.

File nodes

A file node is created when you attach a file to the config data model of a CDM app or a component library. It contains a link to the attached file. Using file nodes, you can attach files of any MIME type supported on ServiceNow AI Platform.

Contextual variables for config data

Contextual variables are out-of-the-box variables delivered by ServiceNow that enable you to use the context of a node to define a variable.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

For example: CollectionA has defined these variables:

- "environment": "(#DEPLOYABLE.ENVIRONMENT_TYPE#)"
- "deployable": "(#DEPLOYABLE.NAME#)"

When you add the collection to a deployable, these variables are set to the values defined in the context, which would be the environment type and name of the deployable for CollectionA.

The available out-of-the-box contextual variables are:

Contextual Variables

Variable	Description
NAME	Name of the node.
APPLICATION.NAME	Name of the application.
DEPLOYABLE.NAME	Name of the deployable.
DEPLOYABLE.ENVIRONMENT_TYPE	Environment type of the deployable.
COLLECTION.NAME	Name of the collection.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contextual Variables (continued)

Variable	Description
FULL_PATH	The full file path of the collection.
RELATIVE_PATH	The file path of the collection, relative to the deployable.
RELATIVE_PARENT_PATH	The file path of the parent to the node.

APIs and DevOps Config

You can use DevOps Config and CDM APIs to access your config data.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

DevOps Config

DevOps Config API

Manage your application lifecycle, using delete, get, patch, and post operations.

CDM

CdmApplicationsApi

Upload configuration data to the component, collection, deployable, and component variable folders found in the DevOps Config Workspace UI. Export deployable configuration data to your DevOps pipeline and manage shared components and shared applications.

CdmChangesetsApi

Manage your changesets, including:

- Create new changesets.
- Deploy changesets.
- Retrieve lists of or individual changesets.
- Retrieve node changes within a changeset.
- Retrieve a list of applications or deployables impacted by a changeset.
- Delete changesets.
- Return a list of shared components associated with a specified changeset.

CdmEditorApi

Create nodes, update nodes, include existing nodes under other nodes, delete nodes, and retrieve nodes and node includes.

CdmPoliciesApi

Manage policy mappings of deployables in CDM. Policies that are properly mapped to a deployable are executed when a snapshot of the deployable is validated.

CdmSharedLibraryApi

Create and manage shared libraries and shared components. Upload and export the configuration data of a shared component.

CdmSnapshotApi

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Publish, unpublish, and revalidate snapshots in CDM.

CdmVersionApi

Publish, unpublish, and export versions (snapshots) in CDM for shared components under shared libraries.

DevOps Config roles

DevOps Config uses these roles.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Role title [name]	Description	Contains Roles
[sn_devops.app_admin]	DevOps Config app admin Can create/read/update/delete DevOps Config apps.	None
[sn_devops_config.viewer]	DevOps Config viewer Has read-only access in DevOps Config.	sn_cdm.cdm_viewer
[sn_devops_config.editor]	DevOps Config editor Can manage config data, create/commit changesets, and publish/unpublish snapshots.	• sn_devops_config.viewer • sn_cdm.cdm_editor
[sn_devops_config.secrets]	DevOps Config secrets Able to manage encrypted config data within an application.	sn_cdm.cdm_secrets
[sn_devops_config.admin]	DevOps Config admin Has editor role permissions plus ability to manage policies and exporters, and applications.	• sn_devops.app_admin • sn_devops_config.editor • sn_cdm.cdm_admin

Roles in CDM

List of roles and permissions in CDM.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

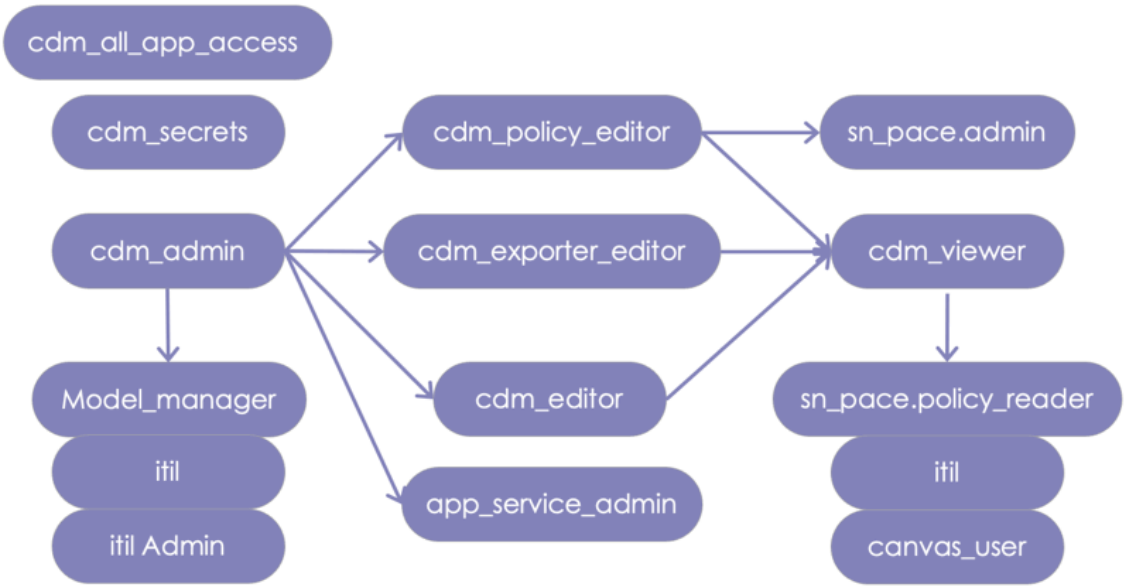
CDM roles



Role title [name]	Permissions	Contains roles
CDM Viewer [sn_cdm.cdm_viewer]	• Read config data from any application that they have access to (governed through user groups that are set by the **Maintained by** property). • View the list and content of component libraries as well as the shared components contained within them. • View the list and content of changesets. • View the list and content of snapshots and validation results. • Export snapshots. • View exporters. • View policies and policy mappings. • View the Investigate page for a change request (CHG) on the Service Operations Workspace.	• [sn_pace.policy_reader] • [itil] • [canvas_user]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Permissions	Contains roles
	Note: If the **Maintained by** group is set at the application level to view config data, then this user must be a member of the group.	
Event Management user [evt_mgmt_user]	• View the contents of the snapshots. • View the Investigate page for a change request (CHG) on the Service Operations Workspace. • View snapshots, nodes, and changesets, regardless of whether this user is a member of **Maintained by** groups set at the application level.	itil
CDM Editor [sn_cdm.cdm_editor]	• Create/update/delete config data within components and collections, including variables, overrides, and includes. • Create and commit changesets. • Validate snapshots. • Publish and unpublish snapshots. • Create, update, and delete config data withing CDM applications. • Add and manage component libraries. • Add and delete shared components in a component library.	cdm_viewer

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Permissions	Contains roles
	Note: The cdm_editor role doesn't grant permission to create/update/delete an application and its deployables, or to change the **Enforce validation** setting on deployables. If the **Maintained by** group is set at the application level to view config data, then this user must be a member of the group.	
CDM Exporter Editor [sn_cdm.cdm_exporter_editor]	Create/update/delete exporters.	cdm_viewer
CDM Policy Editor [sn_cdm.cdm_policy_editor]	• Create/update/delete policies. • Map policies to deployables.	• cdm_viewer • [sn_pace.admin]
CDM Secrets [sn_cdm.cdm_secrets]	• Read and export encrypted data (when granted to a user with the cdm_viewer role). • Permanently encrypt / decrypt data (when granted to a user with the cdm_editor role). • Edit encrypted data (when granted to a user with the cdm_editor role). **Note:** The cdm_secrets role is effective only with the cdm_viewer, cdm_editor, or cdm_admin role.	None
Application Service Admin [sn_cdm.app_service_admin]	Enables the CDM Admin to create an application service.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Permissions	Contains roles
CDM Admin [sn_cdm.cdm_admin]	• Create/update/delete applications. • Create/update/delete deployables. • Create/update/delete config data. • Change settings on deployables to enforce snapshot validation.	• cdm_editor • cdm_exporter_editor • cdm_policy_editor • app_service_admin • Model_manager (for create/update/delete of application model) • [itil] (for create/update/delete of SDLC components) • [itil admin]
CDM All App Access [sn_cdm.cdm_all_app_access]	**Note:** The cdm_all_app_access role is effective only with the cdm_admin, cdm_editor, or cdm_viewer roles. • Users with the cdm_all_app_access and cdm_admin role can update or delete an application or shared component library regardless of whether they're a member of the user groups that maintain the application (**Maintained by** field) or library (**Authoring groups** field). • Users with the cdm_all_app_access and cdm_editor role can edit an application or shared component library regardless of being a member of any of the user groups that maintain the application or library. • Users with the cdm_all_app_access and cdm_viewer role can view an application regardless of being a member of any of the user groups that maintain the application.	None

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How encrypted data is handled

By default, encrypted values appear in all views as `*******`. Only users with the CDM Secrets [sn_cdm.cdm_secrets] role can view, create, update, and delete encrypted values in config data. The system validates and exports encrypted data appropriately.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Permissions of users with the CDM Secrets [sn_cdm.cdm_secrets] role

- Encrypted values appear in all views as `*******` by default.
- Select the **View encrypted data** menu option to display encrypted values in any view.
- Validate and export a snapshot that includes encrypted data. All exported data is readable by the CI/CD pipeline apps.
- Create, update, delete abilities:
  - View an encrypted value.
  - Edit an encrypted value.
  - While creating a CDI, specify that the value should be encrypted.
  - Permanently encrypt a value that is currently not encrypted.
  - Permanently decrypt a value that is currently encrypted.
  - Delete a CDI that has an encrypted value.

Permissions of all other users

- Encrypted values always appear in all views as `*******`.
- Request manual validation of snapshots that include encrypted data.
- Delete encrypted values in config data.
- Cannot view, create, or update encrypted values in config data.
- Cannot export a snapshot that includes encrypted data.

Domain separation and DevOps Config

Domain separation is unsupported for DevOps Config. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

Support level: No support

- The domain field may exist on data tables but there is no business logic to manage the data.
- This level is not considered domain-separated.

For more information on support levels, see Application support for domain separation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and DevOps Config overview

The DevOps Config application validates and manages the configuration data of your enterprise applications across every stage of the DevOps pipeline. Domain separation is supported at the data segregation layer only.

Related topics

Domain separation for service providers

Domain separation and CDM

Domain separation is supported for CDM. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Important:
Starting with the Washington DC release, DevOps Config is being prepared for future deprecation. It will be hidden and no longer installed on new instances but will continue to be supported. For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Domain separation and CDM overview

Domain separation for CDM means that only a user in the application's domain or parent domain can access the data. All functionality for CDM works in a domain-separated environment as long as all of the following actions are performed by users within that domain:

- Create application
- Create/upload config data
- Commit changeset
- Create snapshots
- Validate snapshots
- Map policies
- Export snapshots

How domain separation works in CDM

To set up domain separation for CDM:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Create your domain and then create CDM users in that domain.
2. Only a specified user (CDM admin in that domain) should populate config data in the application's domain.
3. Only users in the application's domain should upload or create data in the domain.

Follow these guidelines for successful domain separation:

- Create a separate user for each domain to perform upload, edit, or export of config data.
- Only users in the application's domain should upload or create data in the domain.
- Avoid uploading or creating config data for a given application in multiple domains.
- Policies and exporters must be either in the application's domain or in the global domain.

Domain-separated tables in CDM

CDM tables include a **Domain** column.

- sn_cdm_application
- sn_cdm_changeset
- sn_cdm_deployable
- sn_cdm_exporter
- sn_cdm_exporter_execution
- sn_cdm_exporter_execution_log
- sn_cdm_exporter_version
- sn_cdm_exporter_version_argument
- sn_cdm_node
- sn_cdm_node_main
- sn_cdm_pace_policy_mapping
- sn_cdm_restricted_groups
- sn_cdm_snapshot

Generic policies in DevOps Config

By default, the DevOps Config Policy content pack contains a set of generic policies to validate your configuration data.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

You can use or customize these default DevOps Config policies to validate that your configuration data content is conformable, or administrate the full life cycle of PaCE policies.

Note:
You can't modify the default policies. However, you can make a copy of the policy and customize your copy.

First-letter navigation for policies on this page

A | C | D | F | G | K | L | M | N | S | U

All Key-Value Comparator (allKeysValuesComparator)

Checks whether all the key-value combinations of any additional deployables are the same as the main deployable.

Results into a non-compliant status for the following conditions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When a key is present in the main deployable but not in the additional deployables.
- When a key is present in the additional deployables but not in the main deployable.
- When a key is present in both the main and additional deployables but with different values

Use case: Detect any configuration drifts between staging and production environments.

Input arguments

- additionalDeployablesInput
  - A list of additional deployables to be compared with the main deployable.
  - Type: List
  - Mandatory: True
- includeNodes
  - A boolean value to indicate whether to include nodes other than the config data items (CDI) for the validation.
  - Default: `False`
  - Type: True | False
  - Mandatory: False
- exceptionList
  - A comma-separated list of key names that should be ignored during comparison.
  - Type: String
  - Mandatory: False

Authorized Email Domains (authorizedEmailDomains)

Checks whether an email domain value that is identified based on a regular expression are included in the authorized email domain list.

Results into a non-compliant status when an email domain isn't an authorized domain.

Use case: Prevent (sensitive) data from leaving a trusted company email domain.

Input arguments

- authorizedDomains
  - A comma-separated list of authorized email domains.
  - Example:

    ```
    gmail.com,servicenow.com
    ```

  - Type: String
  - Mandatory: True
- exceptionList
  - A comma-separated list of key names that are ignored by the policy.
  - Type: String
  - Mandatory: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Authorized Hosts in URLs (authorisedHostsInURLS)

Checks whether the format of the host component of the URL values in a snapshot are authorized.

Results into a non-compliant status when the URL values in a snapshot aren't according to the format specified for the host component.

Use case: Prevent exposure of (sensitive) data through unauthorized URLs.

Input arguments

- authorizedHostsRegex
  - A comma-separated list of regular expressions used for validating the host component in URLs.
  - Example:

    ```
    notpresent$,code.devsnc+,mydomain.com
    ```

  - Type: String
  - Mandatory: True
- exceptionList
  - A comma-separated list of key names that are ignored by the policy.
  - Type: String
  - Mandatory: False

Authorized Key-Value Combinations (authorisedKVCombinations)

Checks whether the input key values found in a snapshot are authorized.

Results into a non-complaint status when a key has an unauthorized value.

Input arguments

- authorisedList
  - A JSON list of keys with a list of authorized string values for each key.
  - Example:

    ```
    {

     "image":"k8s.example.io,gke.example.io,docker.examp
    le.com:8444",
      "domain":"example.service-now.com"
    }
    ```

  - Type: JSON
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the authorized keys and their key values used for the validation are case-sensitive.
  - Default value: `False`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: True | False
- Mandatory: False

Authorized Ports Range (authorisedPortsRange)

Checks whether the input port values found in a snapshot are authorized.

Results into a non-complaint status when a port value is not in the acceptable range.

Use case: Check that port names are within the acceptable range for the environment in which they're used. The policy can be used for any range value check, not just port numbers. For example, to check that all the parameters defining a heap size are within the appropriate range.

Input arguments

- keysRegexWithRange
  - A JSON list of port keys and port range with the minimum and maximum values. A key is identified as a port when the key matches the regular expressions specified in the input.
  - Example:

```
{
  "^web_port$": "5000-5003",
  "env.db.port": "10000-65535"
}
```

  - Type: JSON
  - Mandatory: True
- exceptionList
  - A comma-separated list of key names that are ignored by the policy.
  - Type: String
  - Mandatory: False

Certificate Validator (certificateValidator)

Checks whether certificates exist in a snapshot and whether the certificates have expired or are going to expire within the expiration period.

Results into a non-compliant status when the `expiration-date` key or the `certificate` key with the PEM-encoded format value in a snapshot has expired or will expire within the expiration period. The expiration period is calculated from the date on which the policy is executed plus the expiration days.

Input arguments

- certificatesNode
  - The name of the node that contains the certificates.
  - Default value: `certificates`
  - Type: String
  - Mandatory: True
- expirationDays

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The number of days to calculate the expiration period for the certificates. The expiration period is calculated from the date on which the policy is executed plus the expiration days.
- Type: Integer
- Mandatory: False

- exceptionList
  - A comma-separated list of certificate names that are ignored by the policy.
  - Type: String
  - Mandatory: False

Consistent Nodes Comparator (consistentNodesComparator)

Checks whether all the key-value combinations are the same for every first-level node in a snapshot.

Results into a non-complaint status when any two first-level nodes in a snapshot have different key-value combinations.

Use case: When all the nodes in a snapshot are a group of devices or virtual machines (VMs), they have the same configuration.

Input argument

exceptionList

- A comma-separated list of nodes or key-value combinations to be excluded from the validation.
- Type: String
- Mandatory: False

Correct Host Regex (correctHostRegex)

Checks the format for host-related keys to ensure that a host name is authorized to use.

Results into a non-complaint status when a key with a URL value in a snapshot doesn't match the regular expression provided for the authorized hosts.

Input arguments

- authorizedHostRegex
  - A regular expression used for validating the host component in the URLs.
  - Example:

    ```
    mydomain.com
    ```

  - Type: String
  - Mandatory: True
- exceptionList
  - A comma-separated list of keys with the URL values to be excluded from the comparison.
  - Type: String
  - Mandatory: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Detect Unused Variables (detectUnusedVariables)

Checks whether the `vars` folder of a deployable or a collection includes variables that are not used in a snapshot.

Results into a warning when a variable is declared but not used in a snapshot.

Different Key Names Same Values (differentKeyNamesSameValues)

Checks whether the values are the same for key pairs.

Results into a non-compliant status when the specified key pairs do not have the same value.

Use case: Obtain a finer grained control of conditions by checking that the values are the same for different keys.

Input argument

keyPairs

- An array of key pairs that should have the same values. A key pair should have different keys and should not consist of a single key (`[key1`) or more than two keys (`[key1=key2=key3]`).
- Example:

```
["key1=key3","key2=key4"]
```

- Type: Array of strings
- Mandatory: True

Different Values Nodes Comparator (differentValuesNodesComparator)

Checks whether the key value is different across all components when a key exists in multiple components of a snapshot.

Results into a non-compliant status when a key has the same value in multiple components.

Note:
If a key has multiple occurrences inside the same component, use the Unique Key Value (uniqueKeyValue) policy.

Input argument

keynameList

- A comma-separated list of key names that should have different values for first-level nodes.
- Example:

```
key1,key2
```

- Type: String
- Mandatory: True

Docker Image Format Validator (dockerImageFormatValidator)

Checks whether the docker image of a service follows the regex as specified in the input. For example, provide a regex value to ensure the tagging and versioning of docker images follow best practices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results into a non-compliant status when the image value does not match the regex input value in the `imageExpectedRegex` input argument.

Input arguments

- imageExpectedRegex
  - A regex value for a docker image.

    Example input value to ensure that the tag of an image is an alphanumeric value:

    ```
    ^.*:([0-9]+.?)+([-_]{1}[A-Za-z0-9.]+)?$
    ```

  - Type: String
  - Mandatory: True
- serviceExceptionList
  - A comma-separated list of services that are exempted from the validation.
  - Type: String
  - Mandatory: False

Docker Image Registry Validator (dockerImageRegistryValidator)

Checks whether the registry of a docker image is included in the authorized list of registries.

Parses the docker image for each service, fetches the value of a registry in an image, and then checks whether the fetched registry value is included in the *`authorizedRegistryList`* input.

Results into a non-compliant status when the image registry is not in the *`authorizedRegistryList`* input.

Input argument

authorizedRegistryList

- A comma-separated list of registries.

  Example:

  ```
  k8s.example.io,gke.example.io,docker.example.com:8444
  ```

- Type: String
- Mandatory: True

Docker Network Validator (dockerNetworkValidator)

Checks whether the network for a docker service is defined in the network sections.

Results into a non-compliant status when the network for a service is not defined in the top-level network section or the network for a service configured in the *`labels/com.docker.lb.network`* property is not defined in the service-level section and the top-level network section.

Duplicate Values (duplicateValues)

Checks for duplicate values within a snapshot.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results into a non-compliant status when there are duplicate key values in a snapshot except for the values defined in the exception list.

Use case: Obtain a finer-grained control of conditions by checking that snapshot values are different.

Input arguments

- includePath
  - A boolean value to indicate whether to include the full path of the node in the output.
  - Default value: `True`
  - Type: True | False
  - Mandatory: True
- pathSeparator
  - A string to indicate the path separator for nodes.
  - Default value: `/`
  - Type: String
  - Mandatory: True
- exceptionList
  - An array of strings to be excluded from the validation.
  - Default value: `["true", "false", "yes", "no", "enabled", "disabled"]`
  - Type: Array of strings
  - Mandatory: False

Forbidden Key-Value Combinations (forbiddenKVcombinations)

Checks whether there are any forbidden key-value combinations in a snapshot.

Results into a non-complaint status when any key found in a snapshot has a forbidden value as specified in the input list.

Input argument

forbiddenKV

- A JSON list of keys with a list of forbidden values for each key.
- Example:

```
{
  "username":"root,admin",
   "password":"qwerty123"
}
```

- Type: JSON
- Mandatory: True

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generic List Validator (genericListValidator)

Compares the key values of a snapshot with the list of values provided in the input. The key value might be a string, a list of comma-separated strings, an array of strings, or an object. When the key value is an object, the keys of the object are used in the comparison.

Note the following points for the policy compliance:

- When the operator is `IN`, the policy is compliant when all the strings in the key value are included in the input list.
- When the operator is `EQUALS`, the policy is compliant when all the strings in the key value match all the strings, listed in any order, in the input list.
- When the operator is `CONTAINS`, the policy is compliant when the key value contains all the strings in the input list.
- When the operator is `NOT CONTAINS`, the policy is compliant when none of the strings in the key value exist in the input list.

Input arguments

- keysToValidateObject
  - An array of objects where each object contains a key path, an operator, and a reference list.
  - Allowed operators are `IN`, `CONTAINS`, `NOT CONTAINS`, and `EQUALS`.
  - Example input value to enforce that a user defined in the system `/root/user path` is either `user1` or `user2`:

```
[
  {
   keyPath: ["system", “root”, "user"]

   operator: "IN"

   referenceList: [user1, user2]

   }
]
```

  - Default value: `[ ]`
  - Type: Array of objects
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the list comparison should be case-sensitive.
  - Default value: `True`
  - Type: True | False
  - Mandatory: False

Generic Validator (genericValidator)

Checks whether the value of a key is valid based on the operator and reference input value.

Note the following points for the policy compliance:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the operator is = or ==, the policy is compliant when the key value matches with the reference input value.
- When the operator is <, the policy is compliant when the key value is less than the reference input value.
- When the operator is >, the policy is compliant when the key value is greater than the reference input value.
- When the operator is <=, the policy is compliant when the key value is less than or equal to the reference input value.
- When the operator is >=, the policy is compliant when the key value is greater than or equal to the reference input value.
- When the operator is != or <>, the policy is compliant when the key value does not match the reference input value.
- When the operator is IN, the policy is compliant when the key value is included in the reference input list.
- When the operator is NOT IN, the policy is compliant when the key value is not included in the reference input list.
- When the operator is CONTAINS, the policy is compliant when the key value contains the reference input value.
- When the operator is NOT CONTAINS, the policy is compliant when the key value does not contain the reference input value.
- When the operator is REGEX, the policy is compliant when the key value matches the regular expression pattern as specified in the reference input value.

Input arguments

- keysToValidate
  - An array of objects where each object contains a key, an operator, and a reference value.
  - Allowed operators are <, <=, >, >=, = or ==, <> or !=, RANGE, CONTAINS, NOT CONTAINS, IN, NOT IN, and REGEX.
  - Example:

```
[
      {
        "key": "webport-KO",
        "operator": "RANGE",
        "refValue": "8000-9000"
      },
      {
        "key": "webport-OK",
        "operator": ">=",
        "refValue": 8000
      },
      {
        "key": "fqdn-OK",
        "operator": "REGEX",
        "refValue":
 ".francecentral.cloudapp.azure.com$"
      },
      {
        "key": "trace_level-KO",
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        "operator": "IN",
        "refValue": "INFO,ERROR,FATAL"
      },
      {
        "key": "trace_level-KO",
        "operator": "NOT IN",
        "refValue": "DEBUG,VERBOSE"
      },
      {
        "key": "trace-KO-ifcasesensitive",
        "operator": "CONTAINS",
        "refValue": "ERROR"
      }
    ]
```

  - Type: String
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the list comparison should be case-sensitive.
  - Default value: `True`
  - Type: True | False
  - Mandatory: False

Key Existence Comparator (keyExistenceComparator)

Checks whether all the keys from a main deployable also exist in the additional deployables provided in the input.

Results into a non-compliant status if a key is present in the main deployable but not in the additional deployables.

Use case: Compare your environment variables and check that they're consistent.

Input arguments

- additionalDeployablesInput
  - A list of additional deployables to be compared with the main deployable.
  - Type: List
  - Mandatory: True
- includeNodes
  - A boolean value to indicate whether to include child nodes of deployables during comparison.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: True | False
- Mandatory: False

- exceptionList
  - A comma-separated list of key names that should be ignored during comparison.
  - Type: String
  - Mandatory: False

Key Naming Convention (keyNamingConvention)

Checks whether key names follow a given naming pattern.

Results into a non-complaint status when keys don't follow the prefix-suffix naming pattern as specified in the input arguments.

Input arguments

- maxLength
  - An integer value indicating the maximum length for a key name.
  - Type: Integer
  - Mandatory: False
- approvedPrefixArray
  - An array of strings that indicate approved prefixes for a key name.
  - Type: Array of strings
  - Mandatory: False
- includePath
  - A boolean value to indicate whether to include the full path of the node in the output.
  - Default value: `True`
  - Type: True | False
  - Mandatory: True
- approvedSuffixArray
  - An array of strings that indicate approved suffixes for a key name.
  - Type: Array of strings
  - Mandatory: False
- exceptionList
  - A comma-separated list of keys to be excluded from validation.
  - Type: String
  - Mandatory: False

Key Path Validator (keyPathValidator)

Checks whether a key for the specified key path is found in a snapshot, and if found, the value of the key is valid based on the operator value and reference input value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results into a non-complaint status when the key for the specified key path has an invalid value. In addition, if the `ignoreIfNotFound` input argument is `False`, results into a non-complaint status when the key path specified in the input argument is not found in a snapshot.

Input arguments

- pathAndDesiredValues
  - A JSON object that contains a set of keys and a mapping of condition and value the keys must have.
  - Example:

```
{
    "release-1.0/paymentService-V1.0/integerValues":
 ["<","3"],

 "release-1.0/paymentService-V1.0/database/dbPort":
 [">","8000"]
}
```

  - Type: JSON
  - Mandatory: True
- pathSeparator
  - A string to indicate the path separator for nodes.
  - Default value: `/`
  - Type: String
  - Mandatory: True
- ignoreIfNotFound
  - A boolean value to indicate whether the key for the specified key path should exist in a snapshot.
  - Default value: `True`
  - Type: True | False
  - Mandatory: False

Key Value Substring Check (keyValueSubstringCheck)

Checks for the specified substring in a snapshot value for a specified key name.

Results into a non-complaint status when the value of a key name does not contain the substring as specified in the input argument.

Input argument

keyNameWithKeyValues

- A JSON object that contains a required substring set including key name substring, and key value substring pairs.
- Example:

```
{
  "live": "2022"
  "environment": "aws"
}
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: JSON
- Mandatory: True

List Comparator (listComparator)

Checks whether any two keys have the same values by comparing the list of values between the two keys. The comparison is case insensitive.

Results into a non-compliant status when all the list of values in the first key match all the values, listed in any order, in the second key.

Input arguments

- list1Node
  - The key name of the primary node.
  - Type: String
  - Mandatory: True
- list2Node
  - A key name of the node to be compared with the primary node.
  - Type: String
  - Mandatory: True

Mandatory Keys (mandatoryKeys)

Checks whether the list of key names specified in the input are present in a snapshot.

Results into a non-compliant status when the specified key name is not present in a snapshot.

Input arguments

- mandatoryKeys
  - A comma-separated list of key names.
  - Type: String
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False

Memory Limit Validator (memoryLimitValidator)

Checks whether the memory resources assigned to a key value are within the specified limits of a memory unit. #Compares case-insensitive key values of metric units (including KB, MB, and GB) and binary units (including KiB, MiB, and GiB). Converts a key value and its input values to bytes before comparing.

Results into a non-compliant status when a key value is not within the specified limits or is not a memory unit.

Input argument

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

pathAndLimitsArray

- An array of key paths and the minimum and maximum values for memory unit limits as min and max.
- Type: Array of objects
- Mandatory: True

Example:

```
[
  {
  keyPath: ["deploy", "resources", "limits", "cpu"],
  min: "250m",
  max: "500m"
  },
  {
  keyPath: ["deploy", "resources", "limits", "cpu"],
  min: "1GB",
  max: "8GB"
  }
]
```

Mandatory Tags List (mandatoryTagsList)

Checks whether the tag nodes found in a snapshot have authorized values.

Results into a non-complaint status when a tag node has a value not included in the authorized tag list.

Input arguments

- tagsNodeName
  - A comma-separated list of key names.
  - Type: String
  - Mandatory: True
- tagsList
  - A comma-separated list of authorized tag values.
  - Type: String
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False

Mandatory Value (mandatoryValue)

Checks whether all the keys provided as input have a non-empty value.

Results into a non-compliant status when the value of a key is null or empty, or results into a warning when the key name specified in the input is not found in a snapshot.

Input arguments

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- keysList
  - A comma-separated list of key names.
  - Type: String
  - Mandatory: True
- stopAtFirstFound
  - A boolean value to indicate whether to check only the first occurrence of the key value in a snapshot.
  - Default value: `True`
  - Type: True | False
  - Mandatory: True
- trimValue
  - A boolean value to indicate whether to remove any leading or trailing spaces from the key value before comparison.
  - Default value: `True`
  - Type: True | False
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False

Mandatory Value By Type (mandatoryValueByType)

Checks whether all the keys provided as input have a non-empty value.

Results into a non-compliant status for the following conditions:

- When the value of a key specified in the `keyNamesString` input argument is not a string value or is empty.
- When the value of a key specified in the `keyNamesInteger` input argument is not an integer value or is empty.
- When the value of a key specified in the `keyNamesBoolean` input argument is not a boolean value or is empty.

Input arguments

- keyNamesString
  - A comma-separated list of key names that must have a string value.
  - Type: String
  - Mandatory: False
- keyNamesInteger

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A comma-separated list of key names that must have an integer value.
- Type: String
- Mandatory: False

- keyNamesBoolean

- A comma-separated list of key names that must have a boolean value.
- Type: String
- Mandatory: False

No Clear Sensitive Data (noClearSensitiveData)

Checks whether the values are encrypted for the key names containing the specified keywords.

Results into a non-compliant status when the key name containing the specified keywords is not encrypted.

Use case: DevOps Config is used by organizations to manage and govern sensitive data (passwords, API keys, and tokens) through its permission-based access controls.

Input arguments

- keyWords
  - A comma-separated list of strings used for identifying sensitive keys in a snapshot. The policy uses the case insensitive comparison.
  - Default value: `pass,pwd,secret`
  - Type: String
  - Mandatory: True
- exceptionList
  - A comma-separated list of keys to be excluded from validation.
  - Type: String
  - Mandatory: False

No Duplicate Keys (noDuplicateKeys)

Checks whether there are no duplicate key names in a snapshot.

Results into a non-compliant status if a key name has multiple occurrences in a snapshot.

Use case: Deployment automation tools can handle multiple occurrences of settings badly resulting into downtime of services.

Input argument

keyNames

- A comma-separated list of key names.
- Default value:`#dbConnectionString,dbUserName`
- Type: String
- Mandatory: False

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

No Empty Values (noEmptyValues)

Checks whether all the keys have a non-empty value.

Results into a non-compliant status when the value of a key not included in the exception list is null or empty.

Input arguments

- trimValue
  - A boolean value to indicate whether to remove any leading or trailing spaces from the key value before comparison.
  - Default value: `True`
  - Type: True | False
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False
- exceptionList
  - A comma-separated list of keys to be excluded from validation.
  - Type: String
  - Mandatory: False

No Forbidden Values (noForbiddenValues)

Checks whether there are any key names with forbidden values in a snapshot.

Results into a non-complaint status when any key found in a snapshot has a forbidden value as specified in the input list.

Input arguments

- forbiddenValues
  - A comma-separated list of forbidden values.
  - Default value: `root`
  - Type: String
  - Mandatory: False
- excludedKeyNames
  - A comma-separated list of keys to be excluded from validation.
  - Default value: `name,*desc*`
  - Type: String
  - Mandatory: False

No FTP (noFTP)

Checks whether all the URLs in a snapshot use the FTPS protocol.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results into a non-compliant status when a URL contains FTP in a snapshot.

Input arguments

- searchValue
  - A search term that should not be present in the key value.
  - Default value: `FTP:/`
  - Type: String
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False
- exceptionList
  - A comma-separated list of keys to be excluded from validation.
  - Type: String
  - Mandatory: False

No HTTP (noHTTP)

Checks whether all the URLs in a snapshot use the HTTPS protocol.

Results into a non-compliant status when a URL contains HTTP in a snapshot.

Input arguments

- searchValue
  - A search term that should not be present in the key value.
  - Default value: `HTTP:/`
  - Type: String
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False
- exceptionList
  - A comma-separated list of keys to be excluded from validation.
  - Type: String
  - Mandatory: False

Node Keys Comparator (nodeKeysComparator)

Checks whether all the keys from the primary node are the same in the secondary node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results into a non-compliant status if a key is present in the primary node but not in the secondary node or vice versa.

Input arguments

- fromNode
  - An array of strings indicating the path of the primary node in a snapshot.
  - Default value: `[ ]`
  - Type: Array of strings
  - Mandatory: True
- toNode
  - An array of strings indicating the path of the secondary node in a snapshot.
  - Default value: `[ ]`
  - Type: Array of strings
  - Mandatory: True
- includePath
  - A boolean value to indicate whether to include the full path of the node in the output.
  - Default value: `True`
  - Type: True | False
  - Mandatory: False

No LDAP (noLDAP)

Checks whether all the URLs in a snapshot use the LDAPS protocol.

Results into a non-compliant status when a URL contains LDAP in a snapshot.

Input arguments

- searchValue
  - A search term that should not be present in the key value.
  - Default value: `LDAP : /`
  - Type: String
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `False`
  - Type: True | False
  - Mandatory: False
- exceptionList
  - A comma-separated list of keys to be excluded from validation.
  - Type: String
  - Mandatory: False

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nodes Value Comparator (nodesValueComparator)

Compares all key-value combinations between two nodes in a snapshot.

Results into a non-compliant status for the following conditions:

- When a key specified in the `sameValueKeys` input argument has a different value in two nodes.
- When a key specified in the `diffValueKeys` input argument has the same value in two nodes.
- When the `allowMissingKeys` input argument is set to `False` and if a key is present in the primary node but not in the secondary node or vice versa.

Use case: Ensure consistency between nodes by comparing the values for keys between two nodes.

Input arguments

- fromNode
  - An array of strings indicating the path of the primary node in a snapshot.
  - Default value: `[ ]`
  - Type: Array of strings
  - Mandatory: True
- toNode
  - An array of strings indicating the path of the secondary node in a snapshot.
  - Default value: `[ ]`
  - Type: Array of strings
  - Mandatory: True
- includePath
  - A boolean value to indicate whether to include the full path of the node in the output.
  - Default value: `True`
  - Type: True | False
  - Mandatory: False
- sameValueKeys
  - A comma-separated list of key names with the same values.
  - Type: String
  - Mandatory: False
- diffValueKeys
  - A comma-separated list of key names with different values.
  - Type: String
  - Mandatory: False
- allowMissingKeys
  - A boolean value indicating whether to check all the keys from the primary node are the same in the secondary node.
  - Default value: `False`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Type: True | False
- Mandatory: False

No White-Space Characters Allowed (noWhiteSpaceAllowed)

Checks whether the key values do not contain white-space characters including leading and trailing spaces.

Result into a non-compliant status when a key value includes a white-space character.

Use case: Prevent white-space characters from causing issues for tools or applications when settings are applied.

Input argument

excludedKeyNames

- A comma-separated list of keys to be excluded from validation.
- Default value: `description`
- Type: String
- Mandatory: False

Same Key Value (sameKeyValue)

Checks whether the values of a key if included in multiple components of a snapshot are the same across all components.

Results into a non-compliant status when a key has different values in multiple components.

Input argument

keyList

- A comma-separated list of key names
- Mandatory: True
- Type: String

Same Values Comparator (sameValuesComparator)

Checks whether all the keys provided as the `keyList` input argument have the same value across the deployables.

Results into a non-compliant status when the value of a key is different in multiple deployables, or results into a warning when the key name specified in the input is not found in any of the deployables.

Use case: Detect any configuration drifts between staging and production environments.

Input arguments

- additionalDeployablesInput
  - A list of additional deployables to be compared with the main deployable.
  - Type: List
  - Mandatory: True
- keysList

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A comma-separated list of key names.
- Type: String
- Mandatory: True

- stopAtFirstFound
  - A boolean value to indicate whether to check only the first occurrence of the key value in a snapshot.
  - Default value: `True`
  - Type: True | False
  - Mandatory: True
- caseSensitive
  - A boolean value to indicate whether the key comparison is case-sensitive.
  - Default value: `True`
  - Type: True | False
  - Mandatory: False

Unique Key Value (uniqueKeyValue)

Checks whether the key value is different for a key when the key has multiple occurrences in a snapshot.

Results into a non-compliant status when a key has the same value in more than one occurrence.

Input argument

keyList

- A comma-separated list of key names.
- Mandatory: True
- Type: String

Unique Values Across Deployables (checkUniqueKeyValue_crossDeployables)

Checks whether all the keys provided as the `keyName` input argument have different values across the deployables.

Results into a non-compliant status when the value of a key is the same in multiple deployables, or results into a warning when the key name specified in the input is not found in any of the deployables.

Use case: Detect any configuration drifts between staging and production environments.

Input arguments

- additionalDeployablesInput
  - A list of additional deployables to be compared with the main deployable.
  - Type: List
  - Mandatory: True
- keyName

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A comma-separated list of key names.
- Type: String
- Mandatory: True

Unresolved Variables (unresolvedVariables)

Checks whether there are any unresolved variables in a snapshot.

Results into a non-compliant status when a variable used in a key value cannot be resolved.

Use case: Ensure all the variables used in the configuration data settings are replaced with a value because any unresolved variables can break the deployment operation.

Kubernetes policies in DevOps Config

By default, the DevOps Config Policy content pack contains a set of policies to validate your Kubernetes configuration.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

You can use or customize these default DevOps Config policies to validate that your configuration data content is conformable, or administrate the full life cycle of PaCE policies.

Note:
You can't modify the default policies. However, you can make a copy of the policy and customize your copy.

First-letter navigation for policies on this page

A | B | C | D | I | K | M | N | P | R | S | T

Always Pull Images Admission Control Plugin Is Enabled (container_always_pull_images_plugin_is_enabled)

Checks whether the `AlwaysPullImages` admission controller plugin is enabled for the Kubernetes API server.

Results into a non-compliant status when the `AlwaysPullImages` plugin is not specified with the `--enable-admission-plugins` argument when using the `kube-apiserver` command.

Basic Auth File Isn't Set (container_basic_auth_file_is not_set)

Checks whether the Kubernetes API server is not using the basic user authentication mechanism.

Results into a non-compliant status when the `--basic-auth-file` argument is specified for a container when using the `kube-apiserver` command.

Bind Address Isn't Set (container_bind_address_not_set_to_localhost)

Checks whether the bind address of the Kubernetes scheduler or Kubernetes controller manager is not `127.0.0.1`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Results into a non-compliant status when the `--bind-address` argument is set to `127.0.0.1` for a container when using the `kube-controller-manager` or `kube-scheduler` command.

Containers Don't Run With Low UID (container_uid_minimum_limit)

Checks whether the UID of each container within a Kubernetes pod is greater than or equal to the specified minimum UID value.

Results into a non-compliant status if the UID defined for a container is less than the minimum UID value. If the UID is not defined for a container, the UID of the associated pod is validated.

Input argument

min_uid

- The minimum UID value required for the containers in a pod.
- Default value: `10000`
- Type: Integer
- Mandatory: False

Containers Require Drop Capabilities (container_requires_drop_capabilities)

Checks whether the drop capabilities are defined for containers within a Kubernetes pod.

Results into a non-compliant status when the drop capabilities for a container are not defined.

Containers Run as a Non-Root User (container_run_as_nonroot_user)

Checks whether the containers within a Kubernetes pod run only as a non-root user to limit the exploitability of security misconfiguration and to restrict an attacker's possibilities in case of compromise.

Results into a non-compliant status when the `runAsNonRoot` key for a container is set to `false` or the user ID (UID) of a container is zero.

Containers Run Without Privilege Access (container_is_not_privileged)

Checks whether the containers within a Kubernetes pod are run without privileged access.

Results into a non-compliant status when the privileged field for a container is set to `true`.

Containers Run Without Sys Admin Capability (container_is_without_sys_admin_capability)

Checks whether the containers within a Kubernetes pod are run without the SYS_ADMIN capability.

Results into a non-compliant status when the SYS_ADMIN privileges are assigned to a container.

CPU Requests Are Within Limits (container_cpu_request_within _limits)

Checks whether the containers within a Kubernetes pod are requesting the central processing unit (CPU) resources within the specified CPU limit.

Results into a non-compliant status when either the `limits.cpu` key is not defined or when the value of the `requests.cpu` key exceeds the value of the `limits.cpu` key.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Docker Daemon Socket Isn't Exposed (docker_daemon_socket_not_exposed)

Checks whether the Docker daemon socket is not exposed to containers.

Results into a non-compliant status when the `hostPath.path` key for a volume is set to `/var/run/docker.sock`.

Image Pull Policy Is Always (container_imagePullPolicy_is_always)

Checks whether the `imagePullPolicy` field for each container within a Kubernetes pod is set to `Always`.

Results into a non-compliant status if the `imagePullPolicy` field is not defined or the `Always` criterion is not met.

Insecure Bind Address Isn't Set (container_insecure_bind_address_is_not_set)

Checks whether the Kubernetes API server does not bind to an insecure address that otherwise could enable attackers to connect to the server over the insecure port and potentially read sensitive data in transit.

Results into a non-compliant status when the `insecure-bind-address` argument is specified when using the `kube-apiserver` command.

Kubelet HTTPS Is True (container_kubelet_https_is_true)

Checks whether the connections between the Kubernetes API server and the kubelet use the HTTPS protocol to secure data transfer.

Results into a non-compliant status when the `-kubelet-https` argument is set to false when using the `kube-apiserver` command.

Memory Requests Are Within Limits (container_memory_request_within_limits)

Checks whether the containers within a Kubernetes pod are consuming resources within the specified memory limit.

Results into a non-compliant status when either the `limits.memory` key is not defined or when the value of the `requests.memory` key exceeds the value of the `limits.memory` key.

No Wildcard in the RBAC Rule (rbac_no_wildcard_in_rule)

Checks whether the Role and ClusterRole resources are not using wildcards to refer to objects or actions for role-based access control (RBAC) rule.

Returns into a non-compliant status when the wildcards are used in `apiGroups`, `resources`, or `verbs` for the RBAC rule.

Privilege Escalation Not Allowed (container_privilege_escalation_not_allowed)

Checks whether the containers within a Kubernetes pod have less privileges than their parent process.

Results into a non-compliant status when the `allowPrivilegeEscalation` key for a container is either set to `true` or not defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Root Containers Admitted (container_read_only_root_file_system)

Checks whether the containers within a Kubernetes pod have the root file system set to read only.

Returns into a non-compliant status when the `readOnlyRootFilesystem` key for a container is not defined or set to `false`.

Seccomp Profile Is Configured (container_seccomp_profile_is_configured)

Checks whether the containers within a Kubernetes pod are configured with a secure computing mode (seccomp) profile to restrict potentially dangerous system calls (syscalls).

Results into a non-compliant status when the `seccompProfile.type` key for a container is either not defined or set to a value other than `Localhost` or `RuntimeDefault`.

Service Account Private Key File Is Specified (container_service_account_private_key_file_is_specified)

Checks whether the `--service-account-private-key-file` argument is specified with the `kube-controller-manager` command for a container.

Results into a non-compliant status when the `--service-account-private-key-file` argument is not specified for a container when using the `kube-controller-manager` command.

Secure Port Isn't Set to Zero (container_secure_port_not_set_to_zero)

Checks whether the Kubernetes API server is not using port 0 for the HTTPS authentication and authorization.

Results into a non-compliant status when the `--secure-port` argument is set to 0 for a container when using the `kube-apiserver` command.

Token Auth File Isn't Set (token_auth_file_is_not_set)

Checks whether the Kubernetes API server is not using a static token file for user authentication.

Results into a non-compliant status when the `token-auth-file` argument is specified when using the `kube-apiserver` command.

Red Hat OpenShift policies in DevOps Config

By default, the DevOps Config Policy content pack contains a set of policies to validate your Red Hat OpenShift configuration.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

You can use or customize these default DevOps Config policies to validate that your configuration data content is conformable, or administrate the full life cycle of PaCE policies.

Note:
You can't modify the default policies. However, you can make a copy of the policy and customize your copy.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

First-letter navigation for policies on this page

A | B | C | H | N | R | S | T

Audit Log Maximum Backup Is Set (openshift_audit_log_maxbackup_is_set)

Checks whether the maximum number of old audit log files to be retained for API servers is set.

Results into a non-compliant status when the `--audit-log-maxbackup` argument is either not set or not within the specified limits.

Input arguments

- lowerLimit
  - The lower limit of the `--audit-log-maxbackup` argument.
  - Type: Integer
  - Mandatory: False
- upperLimit
  - The upper limit of the `--audit-log-maxbackup` argument.
  - Type: Integer
  - Mandatory: False

Audit Log Maximum File Size Is Set (openshift_audit_log_maxsize_is_set)

Checks whether the maximum file size specified as the rollover threshold for audit log files is set. After an audit log file reaches the maximum file size, the original audit log file is renamed and a new log file with the original name is created.

Results into a non-compliant status when the `--audit-log-maxsize` argument is either not set or not within the specified limits.

Input arguments

- lowerLimit
  - The lower memory limit of the `--audit-log-maxsize` argument.
  - Type: Integer
  - Mandatory: True
- upperLimit
  - The upper memory limit of the `--audit-log-maxsize` argument.
  - Type: Integer
  - Mandatory: True

Audit Log Path Isn't Set (openshift_audit_log_path_is_not_set)

Checks whether the auditing is enabled in OpenShift and the audit log file path is set.

Results into a non-compliant status when either the `--audit-log-path` argument for *`openshift-kube-apiserver`* isn't set to `/var/log/kube-apiserver/audit.log`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

or the `--audit-log-path` argument for *`openshift-apiserver`* isn't set to `/var/log/openshift-apiserver/audit.log`.

Basic Auth File Isn't Set (openshift_basic_auth_file_is_not_set)

Checks whether OpenShift doesn't use the basic authentication mechanism to authenticate requests to the API server.

Results into a non-compliant status when the `--basic-auth-file` argument is set.

Containers Run Without Privilege Access (openshift_container_is_not_privileged)

Checks whether the containers within an OpenShift pod are run without privileged access.

Results into a non-compliant status when the privileged field for a container is set to `true`.

Host PID Namespace Is Disabled (openshift_scc_with_hostPID_namespace_disabled)

Checks whether there is at least one security context constraint (SCC) is defined that doesn't allow containers to share the host PID namespace.

Results into a warning when there's an SCC defined with the **allowHostPID** field set to `true`.

NamespaceLifecycle Plugin Is Enabled (openshift_namespacelifecycle_plugin_is_enabled)

Checks whether the admission control plugin NamespaceLifecycle is enabled.

Results into a non-compliant status when the NamespaceLifecycle plugin is disabled.

Read-Only Port Is Disabled (openshift_read_only_port_disabled)

Checks whether the Kubelet API server isn't using the read-only port or the read-only port is set to 0.

Results into a non-compliant status when the `kubelet-read-only-port` argument isn't set to 0.

Request Timeout Is Set (openshift_request_timeout_is_set)

Checks whether the global request timeout for API servers is set.

Results into a non-compliant status when the `--min-request-timeout` argument is either not set or not within the specified limits.

Input arguments

- lowerLimit
  - The lower limit of the `--min-request-timeout` argument.
  - Type: Integer
  - Mandatory: False
- upperLimit

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The upper limit of the `--min-request-timeout` argument.
- Type: Integer
- Mandatory: False

Streaming Connections Timeout Isn't Disabled (openshift_streaming_connections_timeout_not_disabled)

Checks whether the timeouts are set on streaming connections to ensure protection against denial-of-service attacks, inactive connections, and ephemeral ports exhaustion.

Results into a non-compliant status when the `streamingConnectionIdleTimeout` argument is set to 0 in the `Kubelet config` file.

Token Auth File Isn’t Set (openshift_token_auth_file_is_not_set)

Checks whether OpenShift doesn't use a static token file to authenticate requests to the API server.

Results into a non-compliant status when the `--token-auth-file` argument is set.

Default DevOps Config exporters

The DevOps Config Exporter content pack contains a set of default DevOps Config exporters of data that can be used as input for further deployment and provisioning activities.

Important:
DevOps Config is now deprecated and no longer supported or available for new activation.

DevOps Config exporters allow other tools to consume the data from deployable snapshots.

Note:
You cannot modify default exporters. However, you can make a copy of the exporter and customize your copy.

These exporters are contained in the DevOps Config Exporter content pack.

- returnAllData-now
- returnAllData_noVars-now
- returnDataforNodeName-now
- returnDataForNodeNames-now
- returnDataForPath-now
- returnNodeListForLevel-now
- returnNodeListForPath-now
- returnValueForKeyAtNodeName-now
- returnValueForKeyPath-now
- returnValueForUniqueKeyName-now

Return all data (returnAllData-now)

Returns the full content of the snapshot without any filtering or modifications, including the var system folder.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The exporter fails if the application/deployable is not in Active state (deleted).

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)

Special logic

None.

Error handling

None.

Return all data except vars (returnAllData_noVars-now)

Returns all of the configuration data for the deployable, except deployable name and variables.

Response does not include:

- `vars` folder at the deployable level
- `vars` folder at each of the included collections
- Deployable name at the root level of the response

Note:
This exporter does not work for deleted applications/deployables.

Arguments

Arguments (can be provided on the command line, or entered interactively in run mode).

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)

Special logic

None.

Error handling

None.

Return data for a node name (returnDataforNodeName-now)

Returns the subset of the snapshot data for a given node name, which is provided as an argument. The argument value must be passed as string text.

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- nodeName - Node name (string, in quotes)
- includeNodeInOutput - (string, default is true)

Special logic

- If nodeName is empty, all data is returned.
- If includeNodeInOutput is false, the node data is returned excluding the node name.

Error handling

- If the nodeName is not unique, `multiple instances of nodeName found`.
- If the nodeName is not found, `node not found: <nodeName>`.
- If includeNodeInOutput is false and node data is a key-value pair, an error is returned.

Return data for list of nodes (returnDataForNodeNames-now)

Returns the full data from the snapshot for a list of nodes. Same as `Return data for a node name` but returns a nested JSON with configuration data for a list of given node names (including any child nodes).

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)
- nodeNames - Node names (string, in quotes, comma-separated)

Special logic

If nodeNamesList is empty, returns all config data.

Error handling

None.

Response details

{“node1”:{“contentKey”:”contentValue”},”node2”:{ “error”:”nodeName not found”}}.

Error handling

- In case the nodeName is not unique the exporter returns an error response stating “multiple instances of nodeName found” for that specific nodeName. Other nodeNames contain the data
- If a nodeName is not found it should contain error message for that node

Return data for path (returnDataForPath-now)

Returns all of the configuration data for a given node path in the snapshot.

Arguments

- appName - Application name
- deployableName - Deployable name

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- requestedFormat - Requested format (json/yaml/xml/ini/raw)
- nodePath - Node path (string, in quotes)

Special logic

If nodePath is empty, return the whole content (similar to all config data).

Error handling

If nodePath is not found, the last node name that was not found is stated `path not found: <nodeName>`.

Return node list for level (returnNodeListForLevel-now)

Returns a list of names of nodes that are children of root node at specified level (depth) in the snapshot. For example, level 1 is a direct child of root node, level 2 is a grandchild, etc.

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)
- ExcludeVarsNode [true|false] - Exclude the vars node from the result (true or false, default is true)
- nodeLevel - Level of the node (integer, default is 0)

Special logic

If no level is specified, then exporter returns the value for level 0 (for example, the deployable root node name).

Error handling

None.

Response details

[“node1, “node2”, “node3”]

Return node list for path (returnNodeListForPath-now)

Returns the list of nodes for a given node path in the snapshot (not taking into account sub-nodes).

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)
- ExcludeVarsNode [true|false] - Exclude the vars node from the result (true or false, default is true)
- nodePath - Path to follow with list of nodes separated by pathSeparator (string, in quotes)
- pathSeparator - Character to separate list of nodePaths (string, default is ‘,’)

Special logic

None.

Error handling

None.

Response details

[“node1, “node2”, “node3”]

Return value for key within a node (returnValueForKeyAtNodeName-now)

Returns the value of a specific key that is part of a node in the snapshot. The key can either be directly defined to the node, or lower in the data model to one of the children of the node.

The difference between this exporter and `export value for unique keyName` is that the key name only needs to be unique within the subtree of the node.

Key/node combination is expected to be unique in the snapshot. If the key/node combination is found more than once, there is an error.

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)
- keyName - Key name (string, in quotes)
- nodeName - Node name (string, in quotes)

Special logic

None.

Error Handling

If keyName nodeName combination is not found an empty response is returned.

Return value for keyPath (returnValueForKeyPath-now)

Returns the value of a specific key in a specific path.

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/xml/ini/raw)
- keyPath - List of node names with key name at the end separated by pathSeparator (string, in quotes)
- pathSeparator - Character to separate list of keyPaths (string, default is ‘;’)

Special logic

None.

Error handling

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the keyPath is not provided, `no keyPath argument provided`.
- If the keyPath is not found, states the last node name not found `path not found: <path>/<nodeName>`.
- If the keyPath is found and is a node (not a key), `keyPath provided is a node and not a key`.

Return value for unique keyName (returnValueForUniqueKeyName-now)

Returns the value of a specific key based on its name in the snapshot. Unlike `export value for key within a node`, the key is expected to be unique across the snapshot data model. Multiple keys are supported.

Note:
Formats xml and ini are not supported for this exporter.

Arguments

- appName - Application name
- deployableName - Deployable name
- requestedFormat - Requested format (json/yaml/raw)
- keyName - Key name (data array)

Special logic

If the key is present multiple times in the snapshot, the exporter returns the first value found (returns error).

Error handling

- If the keyName is not provided, `no keyName argument provided`.
- If the key is not found, `key not found: <keyName>`.

Digital Product Release

Digital Product Release (DPR) is a release management solution that helps release managers, product managers, and program managers manage the release process.

Exploring Digital Product Release

The ServiceNow® Digital Product Release application enables you to streamline the process of delivering digital products and services by managing the process from planning to delivery.

Digital Product Release overview

Digital Product Release (DPR) is a release management solution that helps release managers, product managers, and program managers manage the release process. They can track the progress of releases while ensuring that the releases adhere to the company's policies.

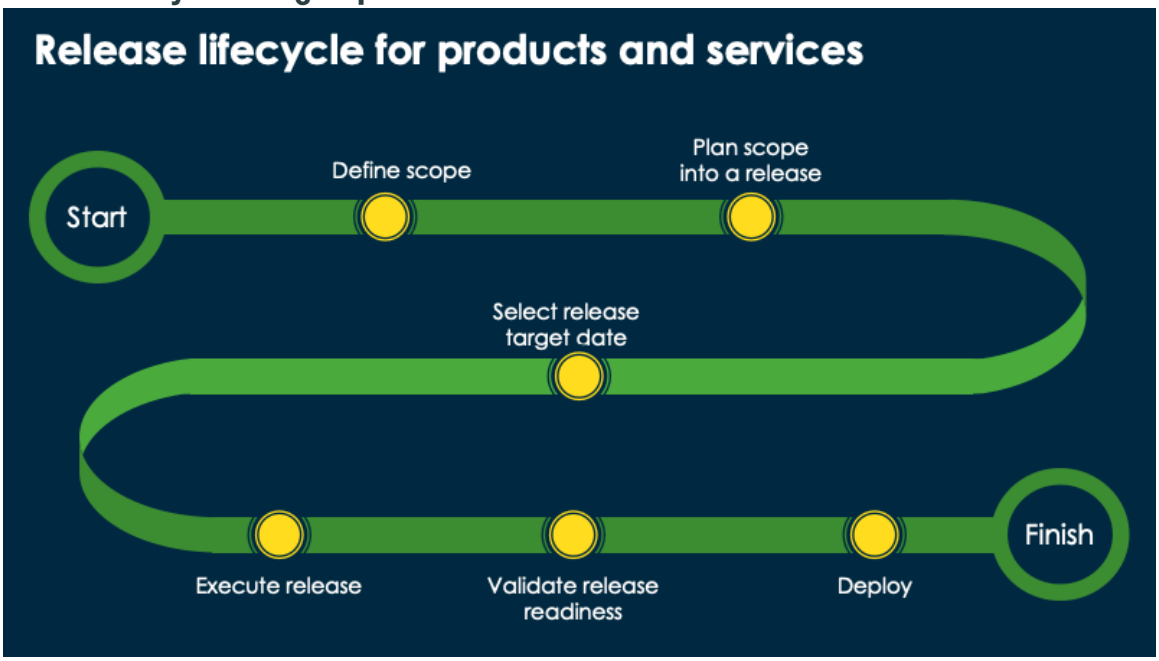
This solution automates processes that enable collaboration between stakeholders, so everyone can track release status, from start to finish.

Digital Product Release workflow

A digital product or service has a release life cycle that starts with planning, goes through development, and ends with delivery. There are many different phases to a release life cycle, and each phase can have its own set of activities. The following infographic illustrates the life cycle of digital products and services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Release life cycle for digital products and services



1. Create a product or service and add features, product enhancements, and releases.
2. Plan the scope of a release by moving product enhancements into releases.
3. Initiate a release and set its release readiness target date.
4. Execute the release by tracking its progress and completing phases and tasks within each phase.
5. Validate the release phase against mapped policies to ensure that the release adheres to organizational standards.
6. Get the product or service ready by the specified target date to make it available for deployment.

Personas

Digital Product Release is aimed at the following personas:

Release manager	• Manages a release calendar • Establishes a release process, including policy gates
Release coordinator or Program manager	• Communicates dependencies across a release • Approves the scope of a release • Provides status updates to the release team
Product manager	• Releases new products, services, enhancements, and features • Communicates updates to the development status

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

	• Plans the scope of a release • Initiates a release
Engineering lead	• Ensures development of new products, services, enhancements, and features • Connects development scope to a release

Digital Product Release benefits

Benefit	Feature	Users
Define release readiness targets for single or recurring release schedules.	Release readiness target	Release manager
Define release templates that include phases, tasks, policies, and approval tasks.	Release templates	Release manager
Create policies to automate the release process.	Policy administration	Release manager
Manage products, services, features, product enhancements, versions, and initiate a release.	Release planning	Product manager
Plan and manage the release process from start to finish.	Release execution	Release manager

Digital Product Release key terms

Approval definition

An approval definition is a set of rules that specify how tasks will be approved from a set of stakeholders for a release. For example, the QA team might approve code quality or the Security team might approve on the security aspects. An approval for a task can be requested from an individual user or a user group.

Included products

Included products help you organize and manage related digital products and services. By creating a product hierarchy using Included products, you can understand the relationships between different products and services and make informed decisions about product management.

Release bundle

A release bundle helps you to group multiple releases to track and manage them concurrently from a single place. They also help you to identify dependencies and potential conflicts, and make any necessary adjustments to ensure a smooth and coordinated release process.

Release execution

Release execution is a continuous process to track and monitor the progress of a release. It helps you ensure that all products in the release are ready by the release readiness target date.

Release calendar

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A release calendar helps you group multiple release readiness targets. It can also contain blackout, maintenance, and other user-defined schedules to avoid overlap of release targets on those dates.

Release readiness target

A release readiness target is when a release is ready to be released. It helps release managers to determine the dates at which the products and services should be ready for deployment by the team.

> **Note:**
> Release readiness target and Release target are used interchangeably in the documentation and application. Both terms refer to the same concept - release readiness target date.

Release template

A release template is like a blueprint for a release process, which includes a predefined set of phases, tasks, policies, and approval tasks.

Release teams can use these release templates to create a release. All phases, tasks, approvals, and phase gates from the template will be automatically applied to the newly created release. It helps the release teams avoid redundant activities and focus on tracking and performing all the necessary tasks to complete the release on schedule.

Stage-oriented release

A release that follows a stage-oriented process. This process doesn't have phases with predefined end dates. It is suitable for teams that work toward completing product enhancements and objectives. Teams can move to the next phase after they have completed tasks and met policy compliance for the current phase. Teams have the flexibility to restart any completed phase if they encounter an issue that requires them to go back.

Timeline-oriented release

A release that follows a timeline-oriented process. This process has defined end dates for each phase of the release. It is suitable for teams that work toward the planned deadlines and have phases with a specific duration.

Release planning

Release planning is an activity to plan a product or service's enhancements into releases to define the scope of work for each release.

The release must be associated with a release readiness target date, which determines the start and end dates for phases and tasks based on the target date.

Digital Product Release Workspace

The Digital Product Release Workspace provides a single location for release admins to define release processes and release readiness targets. Product managers can use it to create and manage products and features, define the scope in versions, and plan and execute releases.

Digital Product Release Workspace users

The following users can use the Digital Product Release Workspace. The workspace is personalized for different roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Digital Product Release Workspace users	
Release manager	• Manages a release calendar • Establishes a release process, including policy gates
Release coordinator or Program manager	• Communicates dependencies across a release • Approves the scope of a release • Provides status updates to the release team
Product manager	• Releases new products, services, enhancements, and features • Communicates updates to the development status • Plans the scope of a release • Initiates a release
Engineering lead	• Ensures development of new products, services, enhancements, and features • Connects development scope to a release

Accessing the workspace

To open the workspace, navigate to **Workspaces** > **Digital Product Release Workspace**.

Landing page

On the workspace landing page, get a quick overview of the active releases, open approval tasks, and policies compliance status.

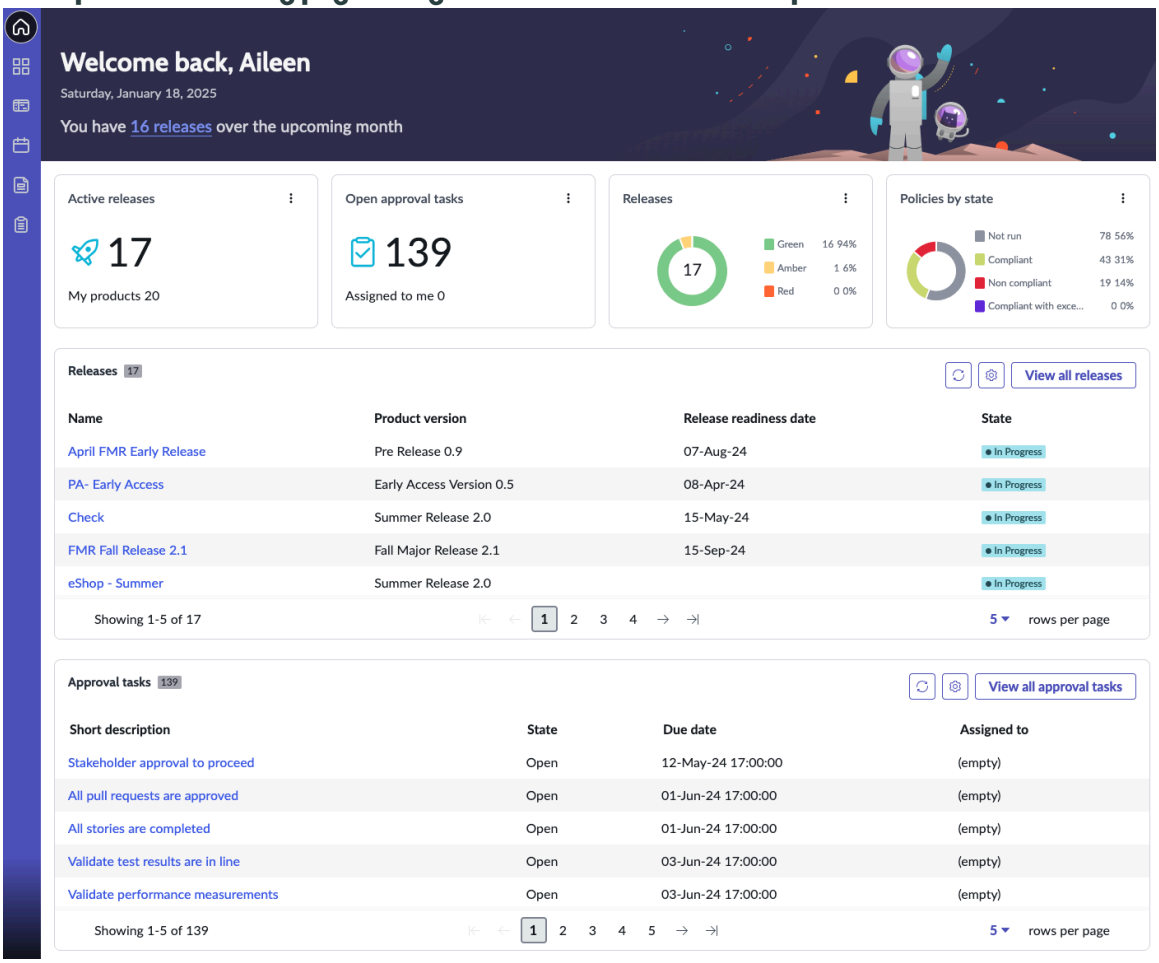
As a release manager, you can use the onboarding tool to create and manage release processes.

Note:
The widgets and the data that are displayed in the widgets depend on your role.

The following is an example of the workspace landing page for the Digital Product Release application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of the landing page of Digital Product Release Workspace



Release template Playbook

In the workspace, you can use the Playbook to create release templates.

The following is an example of a release template playbook. For more information, see Create a release template.

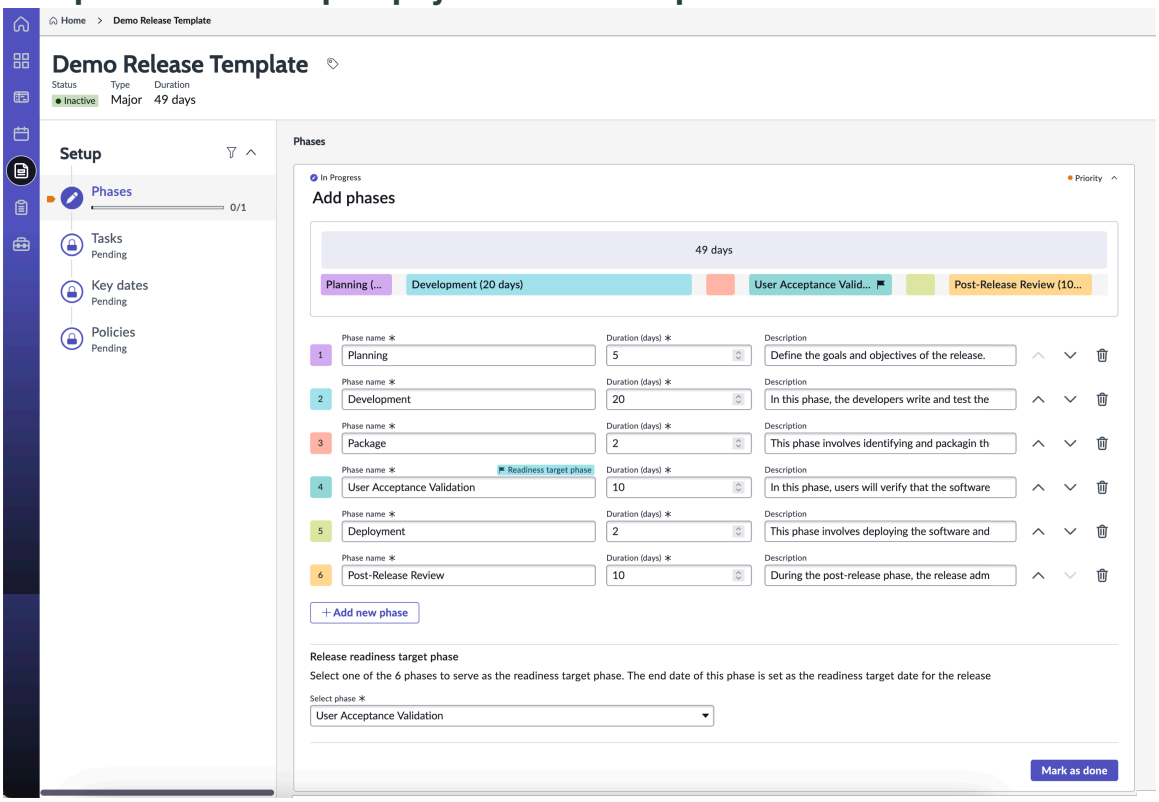
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of a release template playbook in the workspace



Release for a product or service

A release groups all the tasks (projects, epics, stories, enhancements, defects, problems, incidents, and so on) planned for a specific version of a product or service. Digital Product Release provides two different processes: timeline-oriented and stage-oriented, to help you in executing your releases.

A release is divided into a series of phases. During each phase, a defined list of tasks, approval processes, and policies must be fulfilled.

A defined release process ensures that the work items in releases are built, tested, and are ready for deployment.

Timeline-oriented release process

Timeline-oriented process is suitable for creating releases that have fixed deadlines and follow a strict schedule.

This process helps you prioritize tasks, allocate resources, and track progress against the timeline so you can make adjustments as needed to stay on track. Use this release process to:

- Set clear deadlines for each stage of your deployment, so you can plan and execute your rollout smoothly.
- Keep your team on track by defining clear goals, so you can manage your resources effectively.
- Track your progress against key dates, and adjust your plans as needed to stay on schedule.

The following is the general flow that a timeline-oriented release goes through:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The flow starts with the first phase in the Pending state, which is the default state. The state of the phase moves to In Progress when it starts on the planned start date.

  Tasks in the phase are processed based on the system property *sn_dpr.sequential_task_execution*:

  - **true**: Tasks in the phase are processed in sequential order. At the start of a phase, the task with the lowest order in it is set to the Open state. After this task is completed, the next task in the order is opened. This process continues for the remaining tasks in the phase. If the task is an approval task, the state is moved to the Requested state.
  - **false**: Tasks in the phase are not processed in a sequence. Instead, all its tasks are set to the Open state at the start of the phase.
- When all tasks are completed and policies are compliant, the phase ends automatically on its planned end date. The phase state updates to the Completed state.
- After the current phase is completed, the next phase moves to the In Progress state. Only one phase can be in progress at a given time.
- When all phases in the release are completed, the release moves to the Review state.
- When the review of the release is completed, the release moves to the Completed state.

Stage-oriented release process

Stage-oriented process is suitable for creating releases that prioritize completing objectives and features over following a strict timeline.

Certain products are not constrained by a specific time frame for how long they should remain in a particular phase. Releases for those products can follow the stage-oriented release process. This process focuses on making sure that the product is ready to be released, rather than following a strict schedule or phase.

You can finish a release as soon as the product meets the set criteria, instead of waiting for a specific timeline or phase to end. However, you must ensure that all aspects of the release, including development, testing, and quality assurance, are done well to keep the product high quality.

Use this release process to:

- Set priorities for features and goals, instead of deadlines, so that you can adjust your plans throughout the development process.
- Restart the release from any of the previous phases to adjust goals and features based on testing results and user feedback.
- Track your progress by ensuring features are completed and the goals are met for a high-quality result.

The following is the general flow that a stage-oriented release goes through:

- The flow starts with the first phase in the Pending state, which is the default state. The state of the phase moves to In Progress when you manually start it.

  Tasks in the phase are processed based on the system property *sn_dpr.sequential_task_execution*:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

  - **true**: Tasks in the phase are processed in sequential order. At the start of a phase, the task with the lowest order in it is set to the Open state. After this task is completed, the next task in the order is opened. This process continues for the remaining tasks in the phase. If the task is an approval task, the state is moved to the Requested state.
  - **false**: Tasks in the phase are not processed in a sequence. Instead, all its tasks are set to the Open state at the start of the phase.
- When the all tasks are completed and all policies are compliant or compliant with exceptions for the current phase, it automatically moves to the Completed state.
- After the current phase is completed, the next phase moves to the In Progress state. Only one phase can be in progress at a given time.
- If you encounter any issues at any point, you can restart from a previously completed phase. That phase and later phases are reset, including tasks and policy status.
- When all phases in the release are completed, the release moves to the Review state.
- When the review of the release is completed, the release moves to the Completed state.

Single product or service release

A single product or service release enables you to release one product or service at a time. This release approach can be useful for smaller or less complicated products or services, as it makes the release process more focused and easier to manage. For more information, see Work on a timeline-oriented release for a single product or service and Work on a stage-oriented release for a single product or service.

Multi-product release

A multi-product release enables you to release different products at the same time. You can do this by including several individual releases for each product, all tied to a main release of a primary product or service. You manage the phases and release readiness from the main release and track the collective progress. However, you can set the scope, track approvals, and run policies for each individual product or service release. This release approach differs from release bundles, where you monitor the progress of multiple releases together but manage them independently. For more information, see Work on a timeline-oriented release for multiple products and Work on a stage-oriented release for multiple products.

System properties to control the release processes

The following system properties control the initiation of automated actions during various stages of the release process.

- sn_dpr.stage_workflow_auto_transition
- sn_dpr.auto_transition_release_to_review
- sn_dpr.auto_transition_release_to_completed

For more information about these properties, see Digital Product Release properties.

Holiday schedules in a release

You can associate a holiday schedule with a release so that the phase and release durations are calculated considering non-working days.

The following example of a release shows how holiday schedules affect its overall timeline to keep important dates on working days.

Let's say a release has four phases: Planning, Development, Testing, and Implementation, with durations of 10, 25, 15, and 10 days, respectively, totaling 60 working days. The release readiness target date is set to Sep 5, 2025, and has a public and weekend holiday schedule (U.S. Federal + Weekend holidays in 2025) associated. So, the start and end dates of each phase are adjusted to account for non-working days (holidays and weekends on the schedule), to keep the phase durations intact. Key dates also follow the same adjustment rule.

Considerations:

- Total release duration: 60 working days
- Phases and durations: Planning: 10 days; Development: 25 days; Testing: 15 days; Implementation: 10 days
- Release readiness target date: Sep 5, 2025
- Working days in a week: Mon through Fri (5 days)
- Non-working days on the associated schedule:
  1. Weekends are non-working days so skipped.
  2. Federal holidays in 2025, relevant to the release period are as follows:
     - Jun 19: Juneteenth (Thu).
     - Jul 4: Independence Day (Fri).
     - Sep 1: Labour Day (Mon).
- Adjustment rules:
  - The original end date of the last phase is the release readiness target date, usually a working day so no adjustment needed. All remaining phases prior to the last phase get their original end and start dates by counting all calendar days, including both working and non-working. Their adjusted end and start dates are the actual dates on a working day, skipping non-working days.
  - The original start date is determined by counting all calendar days backward from the adjusted end date. The adjusted start date is the actual start date on a working day, skipping non-working days.
  - If a key date or the phase start or end date falls on a holiday or weekend, shift to the previous working day.
  - The duration of each phase (in days) remains fixed, but holidays and weekends within the phase period extend the calendar span.

With these considerations, let's calculate the working days in the release timeline and adjust the phase and release duration accordingly.

Calculation of release dates with holiday adjustments

Phase 4: Implementation

Option	Description
Phase	Phase 4: Implementation

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 4: Implementation (continued)

Option	Description
Original end date	Sep 5 (Fri) (Same as the release readiness target date)
Adjusted end date	Sep 5 (Fri) (A working day, no adjustment needed)
Original start date	Aug 27 (Wed) (10 days counted backward from the phase's adjusted end date, includes weekends and holidays)
Adjusted start date	Aug 22 (Fri) (excludes weekends and holidays, see the End date calculation)
Key dates	Deployment preparation: On 5th day from the phase's adjusted start – Aug 28 (Thu) (Excludes weekends and holidays. Falls on a working day, no adjustment needed)
Original duration	10 days Aug 27 (Wed) – Sep 5 (Fri)
Adjusted duration	15 calendar days (10 working days + 5 non-working days) Aug 22 (Fri) – Sep 5 (Fri)
End date calculation	Working days: 10 • Sep 5–2 (Fri-Tue): 4 days. • Aug 29–25 (Fri-Mon): 5 days (total 9 days). • Aug 22 (Fri): 1 day (total 10 days). Non-working days: 5 • 1 holiday skipped: Sep 1 (Labor day) • 2 weekends skipped: Aug 30-31; Aug 23-24

Phase 3: Testing

Option	Description
Phase	Phase 3: Testing
Original end date	Aug 21 (Thu) (The day before the Phase 4 start date)
Adjusted end date	Aug 21 (Thu)

© 2026 ServiceNow, Inc. All rights reserved.

Phase 3: Testing (continued)

Option	Description
	(A working day, no adjustment needed)
Original start date	Aug 7 (Thu) (15 days counted backward from the phase's adjusted end date, includes weekends and holidays)
Adjusted start date	Aug 1 (Fri) (Excludes weekends and holidays, see the End date calculation)
Key dates	Test plan approval: On 5th day from the phase's adjusted start – Aug 7 (Tue) (Excludes weekends and holidays. A working day, no adjustment needed)
Original duration	15 days Aug 7 (Thu) – Aug 21 (Thu)
Adjusted duration	21 calendar days (15 working days + 6 non-working days) Aug 1 (Fri) – Aug 21 (Thu)
End date calculation	Working days: 20 • Aug 21-18 (Thu-Mon): 4 days. • Aug 15–11 (Fri-Mon): 5 days (total 9 days). • Aug 8-Aug 4 (Fri-Mon): 5 days (total 14 days). • Aug 1 (Fri): 1 day (total 15 days). Non-working days: 6 • 0 holiday skipped • 3 weekends skipped: Aug 16–17; Aug 9–10; Aug 2–3

Phase 2: Development

Option	Description
Phase	Phase 2: Development
Original end date	Jul 31 (Thu) (The day before the Phase 3 start date)
Adjusted end date	Jul 31 (Thu) (a working day, no adjustment needed.)
Original start date	Jul 7 (Mon)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 2: Development (continued)

Option	Description
	(25 days from the phase's adjusted end date, includes weekends and holidays)
Adjusted start date	Jun 26 (Thu) (excludes weekends and holidays, see the End date calculation)
Key dates	Sprint end: Every 10 working days from the phase's adjusted start – Jul 10 (Thu), Jul 24 (Thu) (all working days, no adjustment needed)
Original duration	25 days Jul 7 (Mon) – Jul 31 (Thu)
Adjusted duration	36 days (25 working days + 11 non-working days) Jun 26 (Thu) – Jul 31 (Thu)
End date calculation	Working days: 25 • Jul 31-28 (Thu-Mon): 4 days. • Jul 25–21 (Fri-Mon): 5 days (total 9 days). • Jul 18–14 (Fri-Mon): 5 days (total 14 days). • Jul 11-7 (Fri-Mon): 5 days (total 19 days). • Jul 3-Jun 30 (Fri-Mon): 4 days (total 23 days). • Jun 27-26 (Fri-Thu): 2 days (total 25 days). Non-working days: 11 • 1 holiday skipped: Jul 4 (Independence Day) • 5 weekends skipped: Jul 26-27; Jul 19-20; Jul 12-13; Jul 5-6; Jun 28-29

Phase 1: Planning

Option	Description
Phase	Phase 1: Planning
Original end date	Jun 25 (Wed) (The day before the Phase 2 start date)
Adjusted end date	Jun 25 (Wed) (a working day, no adjustment needed)
Original start date	Jun 16 (Mon)

© 2026 ServiceNow, Inc. All rights reserved.

Phase 1: Planning (continued)

Option	Description
	(10 days from the phase's adjusted end date, includes weekends and holidays)
Adjusted start date	Jun 11 (Wed) (excludes weekends and holidays, see the End date calculation)
Key dates	Midpoint: On 5th working day from the phase's adjusted start – Jun 17 (Tue) (a working day, no adjustment needed)
Original duration	10 days Jun 16 (Wed) – Jun 25 (Wed)
Adjusted duration	15 days (10 working days + 5 non-working days) Jun 11 (Wed) – Jun 25 (Wed)
End date calculation	Working days: 10 • Jun 25–23 (Wed–Mon): 3 days. • Jun 20 (Fri): 1 day (total 4 days). • Jun 18–16 (Wed-Mon): 3 days (total 7 days). • Jun 13–11 (Fri-Wed): 3 days (total 10 days). Non-working days: 5 • 1 holiday skipped: Jun 19 (Juneteenth) • 2 weekends skipped: Jun 21-22; Jun 14-15

Summary Timeline

The timeline extends beyond the 70-days original duration to account for weekends and associated holiday schedule, but the phase durations remain fixed in working days.

Summary of release timeline

Option	Description
Original calendar span	Jul 8 to Sep 5 
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Summary of release timeline (continued)

Option	Description
Adjusted span, excluding non-working days	Jun 11 to Sep 5 Original release duration	60 working days
Adjusted release duration	87 calendar days
Non-Working Days	87 – 60 = 27 days (12 weekends + 3 holidays)

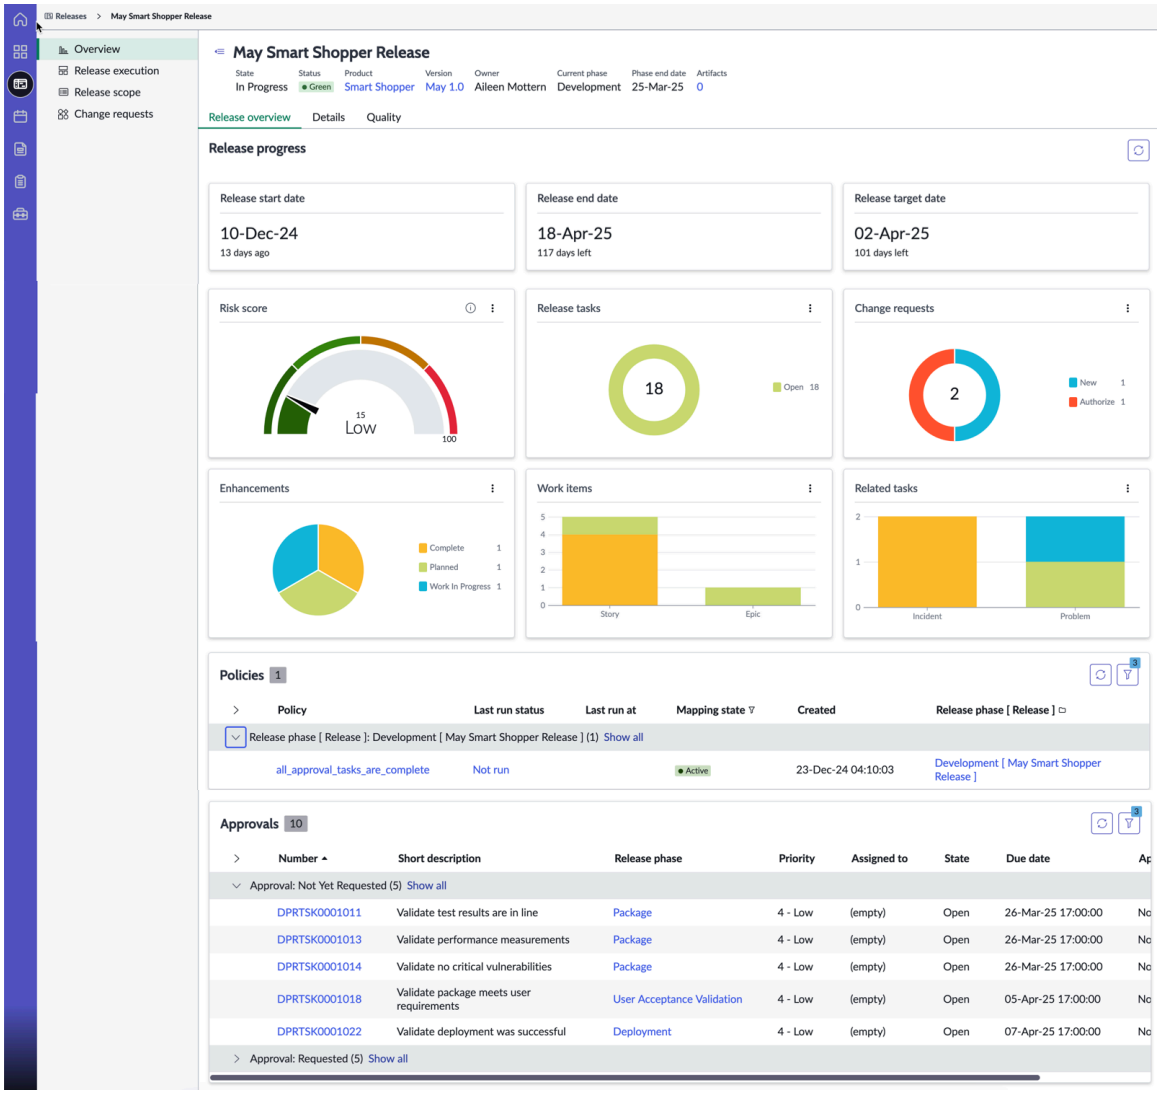
Digital Product Release dashboards

Release dashboards provide insights into your releases. You can see their progress, identify any potential risks, and track their software quality. This information can help you to make informed decisions about your releases and ensure their success.

Release Overview dashboard

The Release Overview dashboard provides an overview of all the information about a release, which the product team can use to assess its readiness.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Required ServiceNow AI Platform roles

sn_dpr_model.product_manager, sn_dpr_model.release_admin, sn_dpr_model.release_coordinator, or sn_dpr_model.release_user, needed to see the dashboard.

Access the Release Overview dashboard

To open the dashboard, navigate to **Workspaces** > **Digital Product Release Workspace**. Select the releases icon ( ) and then select a release from the Releases list.

Widgets

Widget	Description
Release start date	Start date of the release. If the release isn't started, the planned start date is shown. After the release starts, the actual start date is shown.
Release end date	End date of the release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widget	Description
	If the release isn't closed, the planned end date is shown. After the release is closed, the actual end date is shown.
Release target date	Readiness target date of the release.
Risk score	Risk level of a release. This score is calculated based on the overdue tasks and policy failures. For more information, see the calculation of the risk score in the following section.
Release tasks	Number of tasks in the release, grouped by their state.
Change requests	Total number of change requests in different phases of the release, grouped by their state.
Enhancements	Product enhancements in the release, grouped by their state.
Work items	Work items in the release, grouped by their type, and stacked by their state.
Related tasks	Related tasks linked to the release, grouped by their type, and stacked by their state.
Policies	List of all policies, grouped by the phases they're mapped to.
Approvals	List of all approval tasks, grouped by their approval status.

Calculation of risk score of a release

The risk score of a release combines overdue task scores and policy failure scores, weighted by their respective importance. The weight or priority to overdue tasks and policy failure determines their urgency or impact on a release. The overdue task score is categorized based on the percentage of overdue tasks. The policy failure score is determined by the percentage of failed policies.

Given `overdue_weight + policy_failure_weight = 1`, the risk score of a release is calculated according to the following formula:

```
Risk score = Round((Overdue task score * overdue_weight + Policy failure score * policy_failure_weight) * (Number of days elapsed in release / Total number of days in release))
```

Where each metric is calculated as follows:

Overdue task score:

- If <10% of tasks are overdue, the overdue task score is 0.
- If 10-40% of tasks are overdue, the overdue task score is 1.
- If >40% of tasks are overdue, the overdue task score is 2.

If a task has no end date, the phase's end date is used as the task's due date.

Policy failure score:

- If <10% of policies fail, the policy failure score is 0.
- If 10-40% of policies fail, the policy failure score is 1.
- If >40% of policies fail, the policy failure score is 2.

Based on the calculated risk score, the release is categorized into one of the following risk levels:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Low, if the value is 0 or 1
- Medium, if the value is 2
- High, if the value is 3
- Very high, if the value is 4

This categorization can help you determine the risks involved with the release, thus enabling you to take measures to reduce these risks in a timely manner.

Release Quality dashboard

The Release Quality dashboard provides insights into the quality of a release based on the software quality scan summaries and test summaries.

Note:
The Release Quality dashboard is available only for the product releases.

The software quality scan summaries give an overview of the code, highlighting any potential bugs or vulnerabilities that might impact the release. The test summaries provide a comprehensive view of the testing process, including the number of tests executed, passed, and failed.

Configuration required for tracking release quality

The data displayed on the **Quality** tab is pulled from the pipeline execution, task execution, and their associated test summaries and software quality summaries. You must configure pipelines through the external tools configuration before you can see the metrics from various data sources on the Release Quality dashboard.

For more information, see Integrate external tools from Digital Product Release Workspace.

Access the Release Quality dashboard

To open the Release Quality dashboard, navigate to **Workspaces** > **Digital Product Release Workspace**. Select the releases icon ( ) and then select a release from the Releases list. Select the **Quality** tab on the release record.

Note:
The **Quality** tab only appears for ongoing releases.

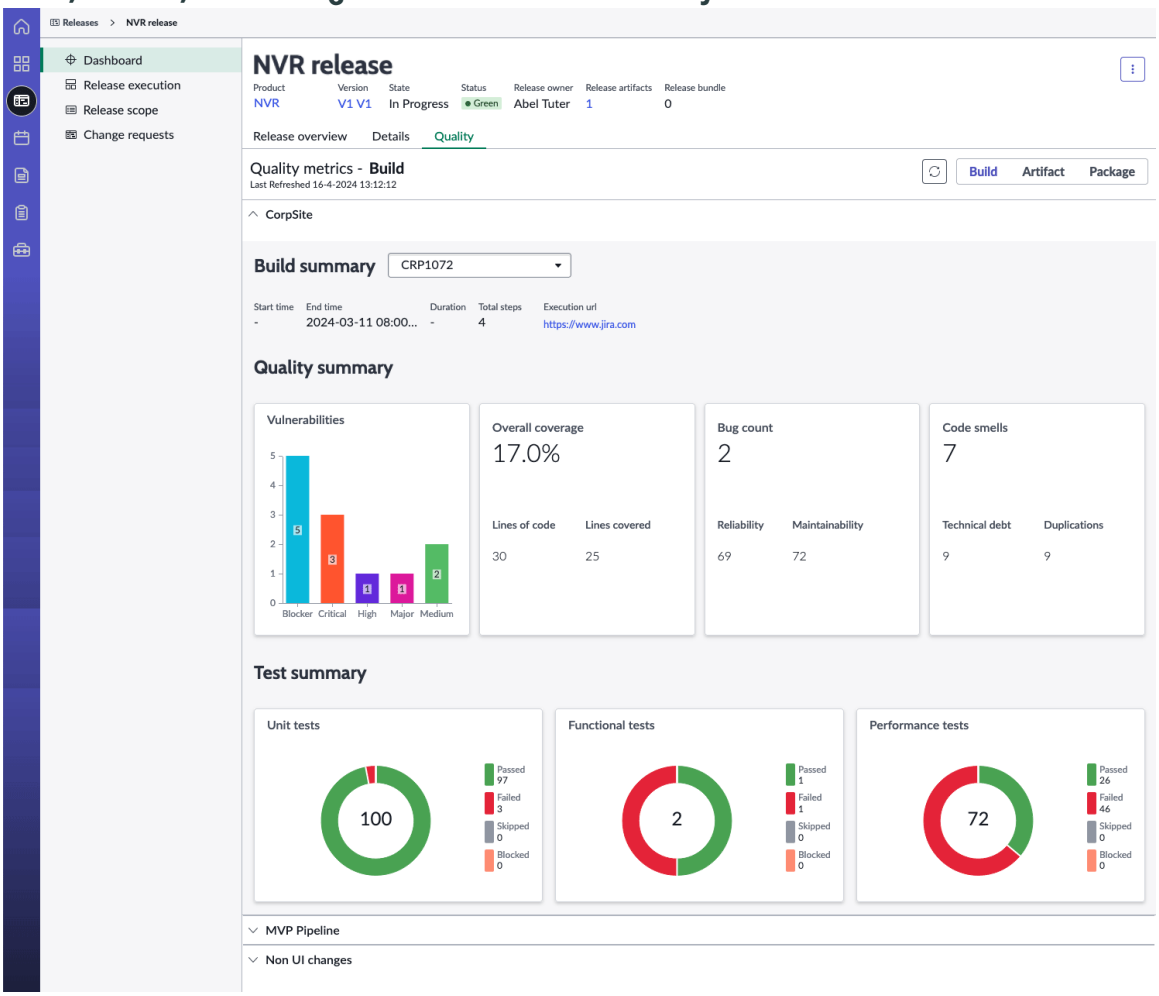
Build, Artifact, and Package tabs on the Release Quality dashboard



Data in Quality metrics

The data on the Quality dashboard is organized into two sections to summarize the software code quality and test results. You can filter the quality and test results using the following options:

- **Build**: This option shows all pipelines for the product associated with the release from the sn_devops_pipeline table.

  The **Build summary** list includes build numbers that represent pipeline executions from the sn_devops_pipeline_execution_list table.

  For an active release, **Build summary** shows all the pipeline executions of the selected pipeline within the past 30 days. For a completed release, **Build summary** shows pipeline executions up to 30 days before the actual end date of the release.

- **Artifact**: This option shows all the artifacts data from the sn_devops_artifact table.

  The **Artifact version** list shows all the artifact versions generated within the past 30 days for the artifact. If the artifact's **Use latest version** option is selected, the semantic versions are listed. For more information on the artifact version, see Manage artifacts in a release.

- **Package**: This option shows all the artifact versions associated with the latest package. The artifact version data comes from the sn_devops_m2m_artifact_version_package table and the package data comes from the sn_devops_package table. However, if a package is marked as a release candidate, that package is used even if it's not the latest.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The Artifact and Package options appear only when the release has an artifact and package associated with it.

Quality summary section

The Quality summary section shows you a summary of the scans that are run on the pipelines. The source of data on these widgets is the Software Quality Scan Summary related to Task Execution. This section contains the following metrics:

Quality summary section widgets

Widget	Description
Vulnerabilities	Total number of security vulnerabilities for the selected build. This data comes from the *Vulnerabilities* category in the Software Quality Scan Details. Use the *VulnerabilitiesTypeMapping* system property to normalize each type of vulnerability, mapping the custom values with the standard values. For more information, see Digital Product Release properties.
Overall coverage	Percentage of code covered by your test cases. This data comes from the *Coverage (%)* category in the Software Quality Scan Details. If there are multiple software quality summary results, then the percentage isn't available. Total number of lines of code and lines covered for all software quality summary results is shown on this widget.
Bug count	Total number of bugs and average ratings of reliability and maintainability data for all the software quality summary results. This data comes from the *Bugs* category in the Software Quality Scan Details.
Code smells	Total number of code smells and total number of technical debts and duplications for all the software quality summary results. This data comes from the *Code Smells* category in the Software Quality Scan Details.

Test summary section

The Test summary section shows you a summary of the test run results. The source of data on these widgets is the Test Summary related to Task Execution. The section contains the following metrics:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Test summary section widgets

Widget	Description
Unit tests	Total number of unit tests run across all task executions in a pipeline execution, including number of tests passed, failed, skipped, and blocked.
Functional tests	Total number of functional tests run across all task executions in a pipeline execution, including number of tests passed, failed, skipped, and blocked.
Performance tests	Total number of performance tests run across all task executions in a pipeline execution, including number of tests passed, failed, skipped, and blocked.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the Release Overview dashboard

To open the dashboard, navigate to **Workspaces** > **Digital Product Release Workspace**. Select the releases icon ( ) and then select a multi-product release from the Releases list. Select **All products** in the **View by** to view the Release dashboard.

Widgets

Widget	Description
Release start date	Start date of the release. If the release isn't started, the planned start date is shown. After the release starts, the actual start date is shown.
Release end date	End date of the release. If the release isn't closed, the planned end date is shown. After the release is closed, the actual end date is shown. **Note:** This widget is applicable only for timeline-oriented releases.
Release target date	Readiness target date of the release.
Release Tasks	Number of tasks across all releases, grouped by their state.
Policies	Number of policies across all releases, grouped by their run status.
Approvals	Number of approval tasks across all releases, grouped by their approval status.
Enhancements	Number of enhancements across all releases.

Release Overview dashboard for a multi-product release

The Release overview dashboard provides an overview of all the information about an individual product's release in a multi-product release, which the product team can use to assess its readiness.

Enhancements	Number of product enhancements in the release, grouped by their state.
Work items	Number of work items in the release, grouped by their type, and stacked by their state.
Related tasks	Number of related tasks (incidents, problems) linked to the release, grouped by their type, and stacked by their state.
Policies	List of all policies, grouped by the phases they're mapped to.
Approvals	List of all approval tasks, grouped by their approval status.

Configuring Digital Product Release

Plan and configure the Digital Product Release application.

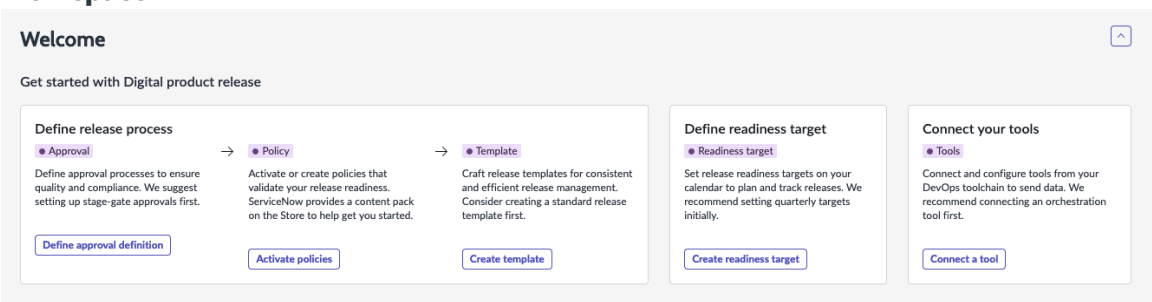
Configuration overview

- Install Digital Product Release
- Integrate external tools from Digital Product Release Workspace
- Create a release calendar
- Create a release readiness target
- Create an approval definition in Digital Product Release
- Define policies in Digital Product Release
- Create a release template

Get started with Digital Product Release through the Onboarding section

If you have the sn_dpr_model.release_admin or admin role, you see an Onboarding section on the home page of the Digital Product Release Workspace that helps you get started with configuration tasks.

Example of the Onboarding section on the homepage of Digital Product Release Workspace



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Install Digital Product Release

You can install the Digital Product Release application (sn_dpr) if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Digital Product Release application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Digital Product Release:

- Plugins:

  Global Ranking Application plugin (com.snc.sdlc.ranking)

- Store applications:
  - Digital Product Release Data Model (sn_dpr_model): Contains the core data model for Digital Product Release.
  - Digital Product Release Workspace (sn_dpr_workspace): Provides a single location for the program managers to plan the releases for the digital products and services and the release managers to manage the release processes.
  - Digital Product Release Policy Content Pack: Contains a set of policies and data collectors to enable automation of phase gate verification in your Digital Product Release.
  - Release Timeline Component: Timeline component for Digital Product Release to visualize phases in releases.

  The following apps are also installed:
  - Policy as Code Engine (sn_pace)
  - Policy as Code Engine UI (sn_pace_builder)
  - CMDB CI Class Models (sn_cmdb_ci_class)
  - Roadmap UI Builder Component (sn_roadmap)
  - Playbook Experience (sn_playbook_exp)
  - Playbook Experience Components (now_playbook_exp)
  - DevOps (sn_devops)
  - DevOps Workspace (sn_devops_ws)
  - DevOps Integrations (sn_devops_ints)
  - Quick filter component (sn_quick_filter)
  - Quick filter popover (sn_filter_popover)
- Roles
- Scheduled jobs
- Tables

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Components installed with Digital Product Release.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Digital Product Release application (sn_dpr) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Migrate data from Release Management v2 to Digital Product Release

If you have the Release Management v2 (RM v2) application installed, you can migrate your data from RM v2 to Digital Product Release.

Before you begin

Role required: admin

To provide access to additional roles, you can add comma-separated values of other roles installed with DPR in the system property *sn_dpr_model.rmv2.migration_roles*. For more information, see Digital Product Release properties.

About this task

The migration utility performs the following tasks:

- Migrate RM v2 product to Digital product: Copies data from rm_product into newly created Application Product Models.
- Create Release Template from RM v2 Release: Creates a DPR Release Template by leveraging the Phases and Tasks from an existing RM v2 Release record.

For more information about migrating data from Release Management V2 to Digital Product Release, see the RMV2 Product Migration [KB1644412] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Define your custom field mappings as needed.
2. Add any additional post-processing instructions after the creation of the cmdb_application_product_model record.
3. Perform the migration either from the rm_product list view or running the migration script from the sn_dpr_model app scope.

Integrate external tools from Digital Product Release Workspace

Integrate tools for orchestration, planning, coding, artifact, software quality, and security from the Digital Product Release Workspace for end-to-end change traceability and automation.

Before you begin

This integration with external tools is accessible as part of the DevOps Change Velocity. For more information, see DevOps Change Velocity integrations and Integrating DevOps Change Velocity with third party tools.

Role required: sn_dpr_model.release_admin

About this task

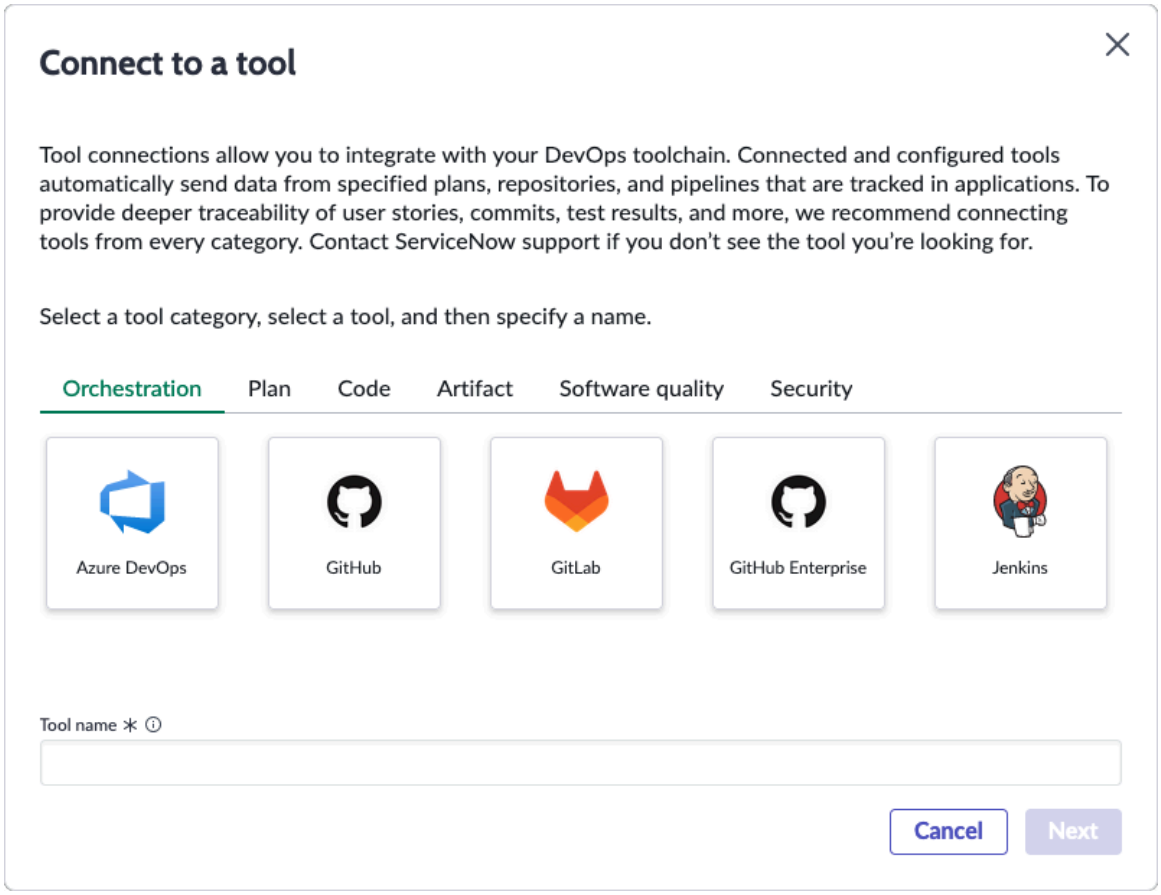
The data coming from the integrated external tools provide you with insights into the breakdown of product enhancements into epics and their stories. This data also enables you to create and automate policies and determine whether the release meets the release exit criteria. For more information, see View and manage data from external tools.

You can also track the software quality of your releases on the Release Quality dashboard that uses this data to show up on different widgets.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the tools icon ( ).
3. Select the **Connect a tool**.
   The Connect to a tool dialog box appears.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select a tool category, select a tool, and then give it a name.
5. Select **Next** and follow the guided experience to connect and configure the tool.
   For more information about configuring a tool, see its onboarding under Integrating DevOps Change Velocity with third party tools.

Create a release calendar

Create a release calendar to define release readiness targets within it.

Before you begin

Role required: sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the release calendar icon ( ).
3. Create a release calendar or update an existing one.
   - To create a release calendar, select the release calendar actions button ( ), and then select **Create release calendar**.
   - To modify an existing release calendar, open the release calendar from the drop-down list, select the release calendar actions button, and then select **Edit release calendar**.
4. In the dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Release calendar dialog box

Field	Description
Name	Name of the release calendar.
Release admin	Name of the release admin who will own the release calendar.
Description	Brief description of the release calendar.
Exclusion schedules	Schedules for blackouts, maintenance, or holidays are lists of dates for planned closures or business holidays. Add these schedules to the release calendar to avoid having release targets for certain dates. The blackouts and maintenance schedules are shown from the Schedule [cmn_schedule] table. For more information, see Define a schedule. To include user-defined exclusion schedules under **Others** category, you can configure the system property *sn_dpr.release_calendar_exclusions*. For more information, see Digital Product Release properties.

5. Save the release calendar.
   - Save a new release calendar by selecting **Create**.
   - Save the changes to an existing release calendar by selecting **Save**.

Result
The release calendar is saved and displayed in the calendar layout. Events for the exclusion schedules that are added to the release calendar are shown on specific dates on the calendar.

What to do next
Create a release readiness target

Note:
Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.

Create a release readiness target

Create release readiness targets to define the dates by which the releases must be ready for deployment. These targets help you to track and manage capacity and conflicts while ensuring a smooth delivery of your products.

Before you begin
Role required: sn_dpr_model.release_admin

About this task
- The release readiness target dates indicate when the products should be ready. They aren't the actual deployment dates.
- You can set either a single or recurring release readiness target on a release calendar.

Note:
Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the release calendar icon ( ).
3. Select a calendar on which you want to create release readiness targets.
4. Create a release readiness target or update an existing one.
   - To create a release readiness target, select **Create release target**.
   - To modify an existing release readiness target, open the release readiness target from the calendar or list.
5. In the dialog box, fill in the fields.
   For more information on release readiness target field descriptions, see Release readiness target form.
6. Select **Next**.
7. If your target dates conflict with scheduled events, you will see a list of those dates, and you can choose to create or not create targets on those dates.
   - To create release targets for conflicting dates, select the check box under the **Opt-in** column next to the dates.
   - If you don't want to create release targets for those dates, clear **Opt-in**.

   Note:
   By default, the **Opt-in** check boxes for all conflicting dates are clear, which means that the target dates will not be created for those dates.
8. Select **Create**.

Result

Release readiness targets are created and displayed on the selected calendar. Release targets that overlap with dates in the exclusion schedule are created only for the dates for which you selected to opt in to.

Create an approval definition in Digital Product Release

Create an approval definition that can be used in release tasks for getting approvals.

Before you begin

Role required: sn_dpr_model.product_manager, sn_dpr_model.release_coordinator, or sn_dpr_model.release_admin

About this task

An approval definition is a set of rules that specify how tasks will be approved from a set of stakeholders for a release. For example, the QA team might approve code quality or the Security team might approve on the security aspects. An approval for a task can be requested from an individual user or a user group.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the release administration icon ( ).
3. On the Release administration page, select the **Approval definitions** tab.
4. Create an approval definition or update an existing one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To create an approval definition, select **New**.
- To modify an existing approval definition, open the approval definition from the list.

5. On the form, fill in the fields.
   For more information on approval definition field descriptions, see Approval definition form.
6. Select **Submit**.

Define policies in Digital Product Release

Define policies to automate the release workflow based on the different states of the release.

Before you begin

Role required: sn_dpr_model.release_admin

About this task

The policies are defined using ServiceNow® Policy as Code Engine (PaCE), so make sure you're familiar with the basics. For more information, see Understanding PaCE.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the policy administration icon ( ).
3. Create a policy or update an existing one.
   - To create a policy, select **New**.

     For more information on creating a policy, see Create a PaCE policy.
   - To modify an existing policy, open the policy from the list.

   A policy is created in the inactive state and a draft version of the policy is added.
4. Select the **Version** tab and open the draft version.
5. On the Version record form, select the **Policy Builder** tab to write the policy.

   a. On the **Define Variables** pane, use API variables, config parameters, record references, and data collectors to write your policy.

   b. Process data from the DevOps application data model related to the product using the base system data collectors.
   The data collectors collect inputs by processing data from ServiceNow or an external data source to provide an output. The output can be used in the policy logic to take a decision.
   For more information, see Digital Product Release data collectors.

6. Test your policy in the **Test Playground** tab.
   For more information, see Use the Test Playground for PaCE policies.
7. Select **Save** to save the policy version.
   You can also save the version as a template by selecting the **Save as template**.
8. Select **Publish** to publish the policy version and make it available for use.
9. In the Publish draft dialog box, select **Activate this policy** to also activate the policy along with publishing the version.

Result

The policy version is updated as Current and is used the next time the policy is invoked.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Manage PaCE policy versions.

Create a release template

Create a release template to predefine the release process. The template contains templates for release phases, tasks, exit criteria for each of the phases, key dates, and approvals.

Before you begin

Identify phases, tasks within each phase, exit criteria for each phase, key dates, and required approvals for a release. If there are different processes followed for each kind of release or product, you should create multiple release templates.

Role required: sn_dpr_model.release_admin

About this task

The release teams can use these templates to create a release. All the phases, tasks, key dates, approvals, and phases' exit criteria from the template are applied to the new release. The release template helps the release team track and perform all the required tasks to complete the release on time.

Important:
After you mark an activity as done, you can't add or change phases, tasks, or map policies. So, be sure to review and verify all activity details before marking as done.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the release administration icon ( ).
3. On the Release administration page, select the **Release templates** tab.
4. Create a release template or update an existing one.
   - To create a release template, select **New**.
   - To modify an existing release template, open the release template from the list.
5. On the Create release template dialog box, add details like name and short description.
6. From the **Type** list, select a release type.
7. Select **Enable release to validate product versions** to determine if a release created from this template can validate a new product versions.
8. Select **Create**.
   A release template is created and opens in the release template's Setup playbook page to define the template.
9. In the Release Process activity, select between a timeline-oriented or stage-oriented release process.
10. In the Phases activity, add phases to the release template.
    a. Enter a unique phase name, the duration of the phase in days, and a short description. The **Duration** field appears only for the timeline-oriented process. The total duration for all phases in the template must be less than the duration set in the *sn_dpr.max_template_duration* system property.
    b. Select **Add new phase** to add another phase.
    Repeat the steps to add more phases as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **Release readiness target phase** section, choose a phase from the **Select phase** list to align it with the release readiness.
The selected phase's end date is considered as the release readiness target date.

d. In the **Schedule** section, choose a schedule from the **Select schedule** list as the default schedule.
The list shows the schedule entries from the Schedule [cmn_schedule] table that are of the type Excluded.

Adding a schedule considers holidays and weekends and adjusts the phase and release durations accordingly. This helps improve release planning accuracy by including actual working days. For more information, see Holiday schedules in a release.

Note:
This option is available only for the timeline-oriented release process.

e. Select **Mark as done** to complete adding all required phases to the release template.
The Phases activity is marked as complete and can't be edited further. The Tasks activity becomes editable, displaying each phase in separate tabs.

11. In the Tasks activity, add tasks to each phase.

a. Select a phase tab in which you want to add a task.

b. In the **Task name** field, enter a unique name for the task.

c. In the **Need approval** field, select whether the task requires approval.

d. If approval is required for the task, select an approval definition from the **Approval definition** list.
For more information, see Create an approval definition in Digital Product Release.

e. Select **Add new task** to add another task to the phase.

f. After all tasks are added to the current phase, select **Next phase**.
The tasks you added to the current phase are saved. The next available phase tab is selected so you can add tasks for that phase.

Repeat the steps to add more tasks as required for each phase.

g. After all tasks are added to all available phases, select **Save** on the last phase tab.

h. Select **Mark as done** to complete adding tasks to phases as needed.
The Tasks activity is marked as complete and can't be edited further. The next activity becomes editable.

12. In the Key dates activity, add key dates as needed.

Note:
This activity is available only for the timeline-oriented release process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select a phase tab in which you want to add a key date.

b. Select **Add new key date** to add a key date to the phase.
Alternatively, select anywhere on the timeline section. This action creates a key date with the number of days calculated and added to the new key date entry.

c. In the **Type** field, select the type of event to map to the phase.

d. In the **Key date** field, describe your key date.

e. Define your key date by selecting the number of days either from the beginning or before the end of the selected phase.

f. After all key dates are added, select **Mark as done** to complete adding key dates as needed.
The Key dates activity is marked as complete and can't be edited further. The Policies activity becomes editable, displaying each phase in separate tabs.

When you create a release using the template, these key dates help you track the progress of the important events of the release.

13. In the Policies activity, map policies to each phase as needed.

a. Select a phase tab to which you want to map policies.

b. Select **Map policies**.

c. In the Map Policies dialog box, select policies from the list to map to the phase, and then select **Map policies**.

d. Select **Next phase** to save the mapped policies for the current phase and move to the next phase.

e. After policies are mapped to available phases, select **Save** from the last phase tab.

f. Select **Mark as done** to complete the Policies activity.
The Policies activity is marked as complete and can't be edited further.

14. In the Publish template pop-up window, select whether to publish the template.
    - Select **Yes** to publish and activate the template.
    - Select **No** to keep the template unpublished. You can publish and activate it later from the release template record form.

Result

- The release template is created and opens in the release template record form.
- A published release template can be used for creating releases.

What to do next

On the release template record form, you can update, publish, delete, or duplicate it into a new template.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Steps
Publish the release template	Select **Publish template**. **Note:** The option to publish the template is only available if you didn't choose to publish it in the Publish template pop-up window.
Edit the release template	1. Select the more actions button ( ) and select **Edit**. 2. In the Edit template pop-up window, select **Yes** to confirm editing. The release template becomes inactive and can't be used for creating a release. The release template opens in the Playbook for editing. 3. Update the template to add or change the phases, tasks, key dates, and policies as needed. 4. To save all the changes in the template, select **Mark as done** in the Policies activity.
Duplicate the release template	1. Select **Clone template**. 2. In the Create release template pop-up window, enter the name, type, and description for the duplicate template and select **Create**. A new release template is created identical to the current release template and is opened in the Playbook for editing. 3. Update the template to add or change the phases, tasks, key dates, and policies as needed. 4. Select **Mark as done** in the Policies activity to save all the changes in the template.
Delete the release template	Select the more actions button ( ) and select **Delete**.

Work on a timeline-oriented release for a single product or service

Managing multiple releases through release bundles

Using Digital Product Release

Digital Product Release helps you streamline the process of delivering digital products and services by managing the entire release life cycle from planning to delivery.

Use Digital Product Release Workspace to perform these tasks to manage the release cycle of your digital products and services.

Request a new product or service

Request a new product or service to manage features and enhancements.

Before you begin

- Identify, prioritize, and create a backlog of features and enhancements required for the product or service.
- Define a roadmap of features and enhancements to be included across multiple ..

Role required: sn_dpr_model.product_manager

About this task

- The Product records are saved in the Application Models [cmdb_application_product_model] table.

  If the application model has a corresponding business application, the **View Business Application** related link is displayed on the Product form. Select **View Business Application** to view details of the corresponding business application.

- The Service records are saved in the Service Models [cmdb_service_product_model] table.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select **Request new** for a new product or service.
4. In the dialog box, fill in the fields.
   For more information on the field descriptions, see Request new product or service form.
5. Select **Submit**.

Result

- A request is submitted to create a product or service.
- The **DPR Service Catalog Request approval** flow is triggered that auto-approves the request and then triggers the **Request Product** flow that creates the product or service.

  Note:
  You can modify these flows in Workflow Studio according to your business needs.

- The new product or service is listed in the Products and Services list.
- A DevOps app corresponding to the product or service is also created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Manage product hierarchy using Included products.
- Select the product or service name from the list to see details, plan releases, and manage data from external tools.

Manage product hierarchy using Included products

Add products that you manage as Included products within a product or service to create a product hierarchy.

Before you begin

Role required: sn_dpr_model.product_manager

About this task

The product hierarchy created using Included products helps you see relationships between different products and services and make informed decisions about their development, management, and releases.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.
4. Select the **Included products** tab.
5. View and manage included products.
   - To add existing products, select **Add**, select products from the list, and then select **Confirm**.
   - To add a new product, select the more actions icon ( ) next to the **Add** button and then select **Request new product**. In the Request new product dialog box, fill in the fields, and select **Submit**. The new product appears in the list after it's created.
   - To remove an existing product from the hierarchy, select the product from the list, and then select **Remove**.
   - To view the details of a product, select the product from the list to open.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Releases can follow a timeline-oriented and stage-oriented release process. For more information, see Release for a product or service.

For creating a release for multiple products using the wizard, see Create a release with a wizard.

> **Note:**
> Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Create a release for a product version from the Release planning page or the Releases list view.
3. In the dialog box, fill in the fields.
   For more information on release field descriptions, see Release form.
4. Select **Confirm**.

Result

- A release is created in the Draft or Pending state based on the following conditions:
  - If all fields on the form are filled, the release is created in the Pending state and opens in the Release Dashboard page.
  - If either the **Release template** or **Release readiness target** fields, or both, are empty, the release is created in the Draft state.

    You can finish creating the release later from the Release Planning page or from the Releases list.
- If you have selected a timeline-oriented release template, then the following options might apply as defined in the template:
  - If available, the schedule from the template is applied to the release. The actual working days for the phase and release are calculated by considering the holidays and weekends in the schedule. When considering the holidays for calculating phase or release durations, a release is not created if:
    - The start date of the release or its phase falls in the past.
    - The duration exceeds the max duration defined in the system property.

    In that case, you have to select another schedule or adjust the holidays. For more information, see Holiday schedules in a release.
  - Any key dates from the template are added to the release. The date of each key date is calculated using the number of days from the start or end of the phase specified in the release template.

    > **Note:**
    > If the release has a holiday schedule and a key date from the template falls on a holiday, the last workday before or after the holiday is considered as the revised key date.
- If an out-of-band release is created on a date that already has a release target, it uses that release target. However, if there's no release target for that date, one is created, when the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

system property *sn_dpr.out_of_band_release_allowed* is set to true. The release admin for this new release target is the same as the one for the selected release calendar.

- Any artifacts associated with the product or release are added to the release. For more information, see View and manage data from external tools.

  You can add or remove artifacts from a release as needed. For more information, see Manage artifacts in a release.

Create a release with a wizard

Create a release for one or more products or services with the help of a wizard. The wizard guides you through the entire release creation process.

Before you begin

- Define release scope using product enhancements
- Complete the release planning by moving enhancements into different releases

Role required: sn_dpr_model.product_manager

About this task

Releases can follow a timeline-oriented and stage-oriented release process. For more information, see Release for a product or service.

Note:
When you edit releases that are in the Draft state, they open in the wizard where you can finish creating them.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select **Create release**.
4. In the **Release details** step, provide basic information about the release, including the release name, owner, and a brief description.
5. Select **Release validates a new product version** to determine whether the release validates a version.
   The versions and templates in the next step are determined by this field.
   - If this option is selected, the **Versions** list only shows only versions that are not validated by other releases. If this option is cleared, the list shows all product versions, regardless of whether they are already validated or not.
   - Templates with the validate version setting on are only available to select.
6. In the **Version details** step, select a product or service from the **Primary product or service** and select an existing version or enter a new version number.
   The existing versions listed for a product or service are based on the **Release validates a new product version** field.

   Note:
   If a new version number was entered, it's automatically created and associated with the release.

   Any Included products associated with the selected product or service are listed.

   You can add more related products or remove any listed related products and their versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To add more products, perform the following steps:

  a. Select **+ Add product**.

  b. Select one or more related products from the list as needed.

  c. Select **Add**.

  d. If any of the selected products also have their own Included products, you can choose to include or exclude them from being added to the release.

  - To add the selected products and their Included products, select **Yes, add Included products also**.
  - To add only the selected products without Included products, select **No, add selected products**.

- To remove an existing Included product from the list, select the remove included product icon (⊗) against the product.

  Note:
  The number of Included products that can be added to a release depends on the system property *sn_dpr.multi_product.included_products_limit*. A release admin can update the value of this property to increase or decrease the limit.

7. In the **Release template** step, select a release template to apply to the release.
   The templates listed are based on the **Release validates a new product version** field. If it's selected, the templates with the validate version setting on are only available to choose.
   A release structure is generated based on the selected release template. For more information about a release template, see Create a release template.
8. In the **Release target** step, select a release readiness target to determine when the release should be ready.

   Note:
   Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.

   A release target is needed for timeline-oriented releases, while it's not required for stage-oriented releases.

   a. Select a release calendar.

   b. Select a release target date on the calendar.

   - If release targets are available on the selected date, select a target to apply to the release.
   - If release targets are unavailable on the selected date, a new target is created and applied to the release.

9. Select **Create release**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- One or more releases are created depending on the number of products or services selected:
  - If you selected a single product or service, one release is created. The release is opened in the Release Dashboard page.
  - If you selected a primary product or service and added included products, the releases are created based on the value set in the *sn_dpr.multi_product.create_independent_releases* system property:
    - When the property is set to false, a main release is created for the primary product or service and individual releases for each included product are created and added to the main release as dependent releases.
    - When the property is set to true, a release bundle is created which contains all the individual releases created for the primary product or service and each included product. The release bundle is opened in the Release bundle's Overview page.

  In either case, the releases are created in the Pending state.
- If you have selected a timeline-oriented release template, then the following options might apply as defined in the template:
  - If available, the schedule from the template is applied to the release. The actual working days for the phase and release are calculated by considering the holidays and weekends in the schedule. When considering the holidays for calculating phase or release durations, a release is not created if:
    - The start date of the release or its phase falls in the past.
    - The duration exceeds the max duration defined in the system property.

    In that case, you have to select another schedule or adjust the holidays. For more information, see Holiday schedules in a release.
  - Any key dates from the template are added to the release. The date of each key date is calculated using the number of days from the start or end of the phase specified in the release template.

    Note:
    If the release has a holiday schedule and a key date from the template falls on a holiday, the last workday before or after the holiday is considered as the revised key date.
- Any artifacts associated with the product or release are added to the release. For more information, see View and manage data from external tools.

  You can add or remove artifacts from a release as needed. For more information, see Manage artifacts in a release.

Define release scope using product enhancements

Define the release scope of products and services by adding features, enhancements, and work items.

Before you begin

Role required: sn_dpr_model.product_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Note:
When a Plan Version from the DevOps data model is mapped to a Software Model in DPR, any Work Items associated with that Plan Version get automatically listed in the Release scope page. If a work item is associated with a product enhancement, it shows as a child under that product enhancement in the list. You can track these work items on the Release scope page of the release.

This option is available when you have selected the **Auto-create product versions from plan versions** while associating the product with a plan from ServiceNow® Agile Development 2.0, Jira, or GitLab.

The mappings between plan versions and software models are stored in the Plan Version to Software Models (sn_devops_m2m_plan_version_software_model) table. The mappings between work items and plan versions are stored in the Work Item to Release Versions (sn_devops_m2m_work_item_plan_version) table.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.
4. Add features and enhancements to the product.
   - Add a product feature to a product or service
   - Add an enhancement to a product or service
   - Add a product enhancement from an epic

Add a product feature to a product or service

Add a product feature to a product or service to help you plan and manage the scope of a release.

Before you begin

Role required: sn_dpr_model.product_manager

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.
4. Select the **Product features** tab.
5. Add or modify a product feature.
   - To add a new product feature, select **Add feature**.
   - To modify an existing product feature, select it from the list.
6. On the Add feature dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add feature form

Field	Description
Feature name	Name of the product feature.
Priority	Priority level for the feature. The level determines how much effort is needed to meet the feature's goals.
Description	Brief, high-level description of the product feature.

7. Select **Confirm**.
   The product feature is created and opened in the Product Feature record page.
8. **Optional:** On the **Details** tab, update the details about the feature, including its state, owner name, and assignment group.
9. **Optional:** On the **Product Enhancements** tab, manage enhancements to plan the product feature into multiple versions of the product.
   a. Select **New**.
   b. Enter details for the enhancement on the **Details** tab.
   c. Select **Save**.
10. **Optional:** Add artifacts for the product feature.
    a. Select the attachment icon ( ) on the contextual menu to open the **Attachments** pane.
    b. Select the **Select** button to upload and attach a file.

Add an enhancement to a product or service

Add a product enhancement to a product or service to help you plan and manage the scope of its release.

Before you begin
Role required: sn_dpr_model.product_manager

About this task
You can also add enhancement from an epic. For more information, see Add a product enhancement from an epic.

Procedure
1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.
4. Select the **Product enhancements** tab.
5. Select **Add enhancement**.
   Alternatively, you can also add enhancements or manage existing ones from the Release planning page of the product or service. For more information, see Plan product enhancements into different releases.
6. On the Add enhancement dialog box, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Add enhancement form

Field	Description
Name	Name of the product enhancement.
Product feature	Name of the product feature to which this enhancement will be associated to.
Release	Release to which the enhancement is associated. The list displays releases of the product that have the validates version set to true and are in the Pending state. **Note:** If you don't select a release, the enhancement is added to the product backlog.
Priority	Priority level for the enhancement. The level determines how much effort is needed to meet the enhancement's goals.
Description	Short description of the enhancement.

7. Select **Confirm**.
   The product enhancement is created and opened in the Product Enhancement record page.
8. **Optional:** On the **Details** tab, update the details about the enhancement, including its state, owner name, assignment group, assigned to person, and start and end dates.
9. Select **Link Epics** to associate all the top-level epics being worked on by the development team.
10. On the Link Epics dialog box, select the epics from the list, and select the **Link Epics** button.
    The selected epics are associated with the product enhancement and are listed in the **Work Items** tab.
11. **Optional:** On the **Work Items** tab, select an epic to review its details and related records.
12. **Optional:** Select the attachment icon ( ) to open the **Attachments** pane to upload and attach a file related to the feature.

Add a product enhancement from an epic

Add a product enhancement from an epic to a product or service manually.

Before you begin

Role required: sn_dpr_model.product_manager

About this task

Product enhancements can also be generated automatically from the main epics imported into the ServiceNow instance through the DevOps data model if the following settings have been completed:

- The integration with the external planning tool is done.
- The validates version option of the release is set to true.
- A project from the Planning tool is linked with the product or service. For more information, see View and manage data from external tools.
- The system property *sn_dpr_workspace.auto_create_product_enhancement_for_primary_epic* is set to **true**. For more information, see Digital Product Release properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.
4. Select the **Product enhancements** tab.
5. Select the more actions icon next to the **Add enhancement** button and then select **Add enhancement from epic**.

   The Add enhancements from epics dialog box appears. It has a list of all top-level epics from the linked project that don't have a product enhancement.
6. On the Add enhancements from epics dialog box, select the epics from the list, and then select **Add enhancements**.
   The product enhancements are created for the selected epics and listed in the Product enhancements list.

Related topics

Add an enhancement to a product or service

Add a product feature to a product or service

View and manage data from external tools

View and manage data coming from the DevOps application corresponding to your product that has been imported through external tools.

Before you begin

Role required: sn_dpr_model.product_manager

About this task

This data coming from the external tools provide you with insights into the breakdown of product features into epics and their stories. This data also enables you to create and automate policies and determine whether the release meets the release exit criteria.

The data also provides an overview of the software quality of your releases in the Release Quality dashboard. For more information, see Release Quality dashboard.

This integration with external tools is accessible as part of the DevOps Change Velocity. For more information, see DevOps Change Velocity integrations and Integrating DevOps Change Velocity with third party tools.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.
4. Select the **External tools** tab.
5. Associate plans, repositories, and pipelines from the **Plans**, **Repositories**, and **Pipelines** tabs respectively.
   For more information, see Associate tool objects to applications - Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Only the **Plans** tab is available for services.

6. To create product versions in DPR for each Release imported from ServiceNow® Agile Development 2.0, Fix Version imported from Jira, or Milestones imported from GitLab automatically, select the **Auto-create product versions from plan versions** option when associating plans from these planning tools.

   Note:
   This option is only available when you select only one record (release, plan, or milestone) for association. Make sure you have completed the mapping between the apps in DevOps and the products in DPR. For all new Releases created in Agile Development 2.0, Fix versions created in Jira, or Milestones created in GitLab for the associated plan, a product version and a corresponding release are automatically created in DPR.

7. Select the **Artifact repositories** tab to associate an artifact repository to the product.
8. Select the **Artifacts** tab to establish a relation between the artifacts and the product. When you create a release for the product, a relationship is established between the artifact version and the release so that policies can be run against the release.

Plan product enhancements into different releases

Move product enhancements into different releases of the product or service to plan the scope of your release.

Before you begin

You can only plan releases that have the validates version option set to true.

Role required: sn_dpr_model.product_manager

About this task

Release planning is done using the Kanban board. The vertical lanes represent releases that are in the Draft or Pending state. The cards in each release lane represent product enhancements associated with the release.

When linking a plan version from ServiceNow® Agile Development 2.0, Jira, or GitLab, you can select the **Auto-create product versions from plan versions** option. Selecting this option automatically creates a release associated with one of the following, depending on the tool you select:

- A Fix version created in Jira.
- A Milestone created in GitLab.
- A Release created in Agile Development 2.0.

When a release is created from a version from one of these planning tools, the product enhancements are planned for the appropriate release as well. This option verifies that the release planning in DPR reflects the planning state from the planning tool.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the products and services icon ( ).
3. Select a product or service from the list to open.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Release planning**.
   The Release planning page shows a Kanban board with lanes for the backlog and each product release. Only the releases that validate versions and are in Draft or Pending states are shown. You can identify the draft releases by the lane header color or the word (Draft) at the end of the release name. The release lanes are sorted by the order of the release creation date, from the most recent to the oldest.

   Enhancements are displayed as cards in the release lane they are associated with.

5. View a release in the Pending state by selecting the sub menu icon ( ) of a release lane and select the **View release** option.
6. On the Kanban board, complete your release planning.

Manage releases for digital products and services

Track the progress of your releases, and work on them to release products and services faster and more efficiently.

Before you begin

Role required: sn_dpr_model.release_coordinator, sn_dpr_model.product_manager, or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. If the release isn't in progress, select **Start release**.

Managing a timeline-oriented release

Managing a timeline-oriented release involves following a series of deadlines and milestones and adjusting as necessary to keep your release on track.

Timeline-oriented release process

Timeline-oriented process is suitable for creating releases that have fixed deadlines and follow a strict schedule.

The following is the general flow that a timeline-oriented release goes through:

- The flow starts with the first phase in the Pending state, which is the default state. The state of the phase moves to In Progress when it starts on the planned start date.

  Tasks in the phase are processed based on the system property *sn_dpr.sequential_task_execution*:

  - **true**: Tasks in the phase are processed in sequential order. At the start of a phase, the task with the lowest order in it is set to the Open state. After this task is completed, the next task in the order is opened. This process continues for the remaining tasks in the phase. If the task is an approval task, the state is moved to the Requested state.
  - **false**: Tasks in the phase are not processed in a sequence. Instead, all its tasks are set to the Open state at the start of the phase.

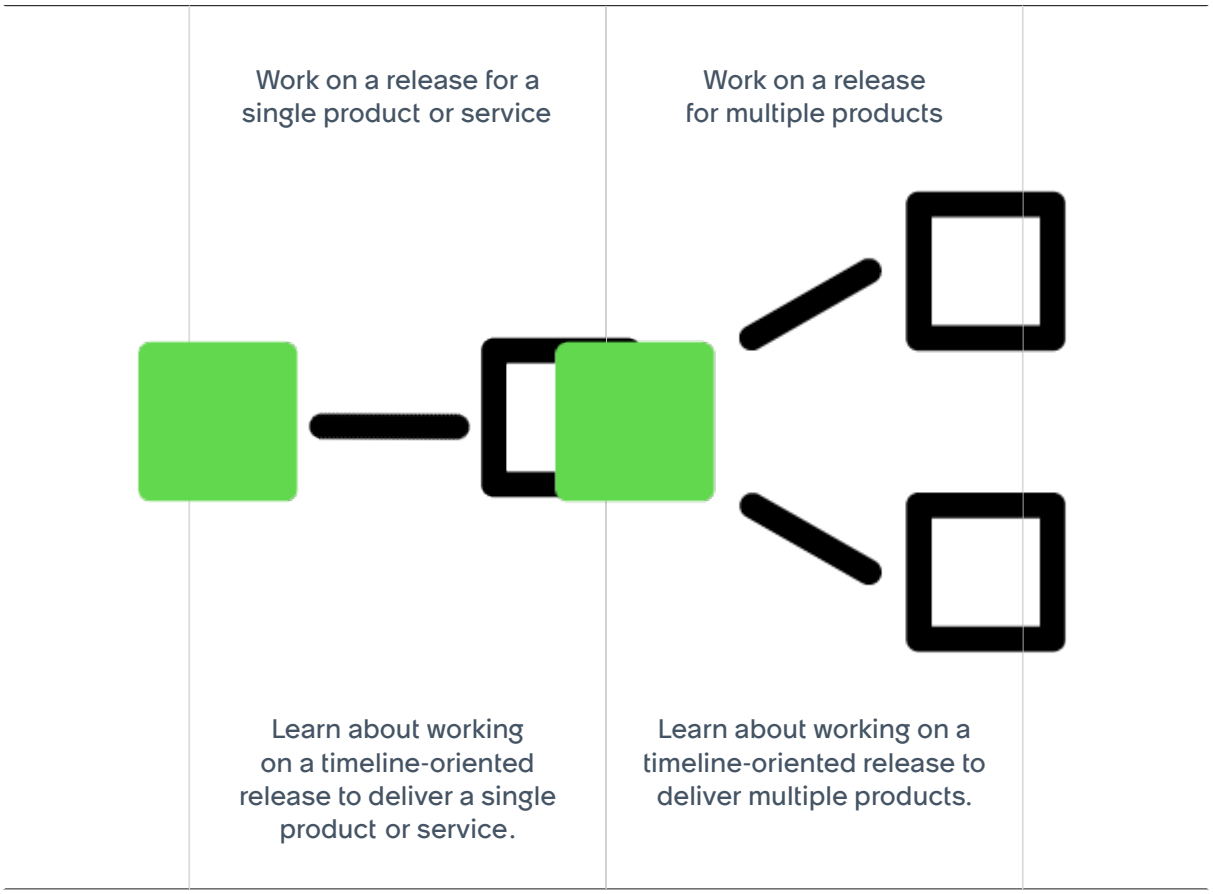
- When all tasks are completed and policies are compliant, the phase ends automatically on its planned end date. The phase state updates to the Completed state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- After the current phase is completed, the next phase moves to the In Progress state. Only one phase can be in progress at a given time.
- When all phases in the release are completed, the release moves to the Review state.
- When the review of the release is completed, the release moves to the Completed state.

For more information, see Release for a product or service.

Working on a timeline-oriented release



Work on a timeline-oriented release for a single product or service

Monitor and work on a release that follows the timeline-oriented release process to release a single product or service.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. **Optional:** Select the **Details** tab and add or update the schedule in the **Schedule** list to account for holidays during the release period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

(Optional) The list shows schedule entries that are of the type Excluded from the Schedule [cmn_schedule] table.

> **Note:**
> The selected schedule must be within the release duration (release target date).

The phase start and end dates are updated and the release duration is recalculated by considering the non-working days in the schedule. For more information on how schedules impact the dates of phases and release target, see Holiday schedules in a release.

5. If the release isn't in progress, select **Start release**.
6. Select the **Overview** section to review and modify release details, get an overview of its status, or change its readiness target date.
   For more information, see Review and update release details and Retarget a release.
7. Select the **Release scope** section to review and update the scope of the release by adding or removing the product features and enhancements.
   For more information, see Update the scope of a release.
8. Select the **Configuration items** section to review and manage the configuration items in the release.
   You can add more configuration items or remove the existing ones as needed. For more information, see Manage configuration items in a release.
9. Select the **Change requests** section to review and manage the change requests in the release.
   You can add new or existing change requests or remove the existing ones as needed. For more information, see Manage change requests in a release.
10. From the Release form header, select the number under the Artifacts to manage artifacts added to the release.
    For more information, see Manage artifacts in a release.

Execute the release

View the release status and work on its phases and tasks, and policies.

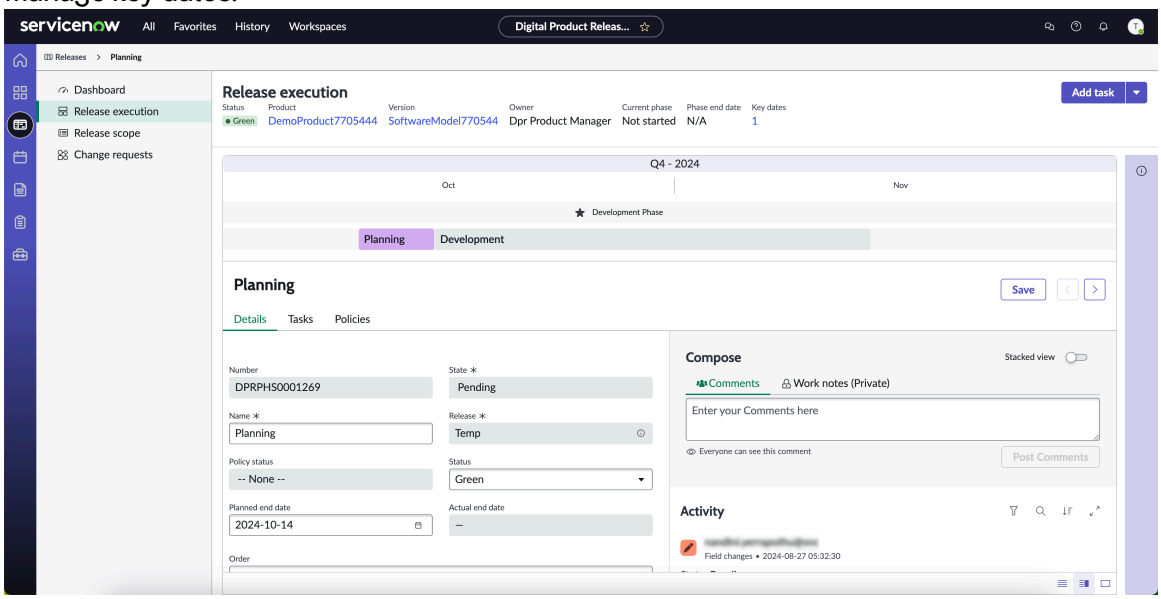
Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Select **Release execution** to view the release status and work on its phases and tasks, and manage key dates.



2. Update a release phase.

   a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

   b. When all tasks in the current phase are complete and mapped policies comply, mark the phase as complete by selecting **Complete phase**.

      Note:
      Only a release admin can manually complete the phase.

      The state of the current phase is updated to Completed and the next phase is started. The actual end date of the current phase is updated to the current date.

3. **Optional:** Add a task to a release phase.

   a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

   b. Select **Add task**.

   c. On the Create task dialog box, add details for the task like its name, phase it belongs to, end date, and description.

   d. If the task needs approval, perform the following steps:

      Note:
      You can select whether the task needs approval when creating it. This option can't be changed after it's saved.

      i. Select **Yes** in the **Need approval** field.

         The **Assigned to** and **Approval definition** fields appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ii. From the **Assigned to** list, select the user who would approve the task.

iii. From the **Approval definition** list, select an approval definition to trigger the approval based on the predefined condition.

e. Select **Create task**.

The task is created in the Pending state and added to the selected phase.

For an approval task, an approval record is created for the approver to review and take action. For more information, see Approve or reject a release task.

4. Track and manage the progress of tasks for the selected phase.

a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

b. Select the **Tasks** tab to view all tasks in the phase.
You can apply filters to view specific tasks or change the view type by selecting the **Kanban** or **List** option.

c. Select a task to open in the Task details pane.

d. Review the task in the Task details pane, or select **Full details** to open the task record in the form view.

e. Assign the task in the **Assigned to** field to the user who will work on it.

f. Review the approval status for an approval task in the **Approval** field.

g. Update the **State** field with the status of the task that doesn't need any approval.
The state of an approval task is automatically updated when approved.

h. Select **Save** to save the changes.
If you complete the current task and the system property *sn_dpr.sequential_task_execution* is set to true, the next task in the order moves to the Open state.

5. **Optional:** Map policies to a release phase to validate it.

a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

Note:
Policies can’t be mapped to a completed or cancelled phase.

b. Select the **Policies** tab, and then select **Add**.

c. On the Map Policies dialog box, select one or more policies from the list to map to the phase.

d. Select **Map policies**.

6. Select **Run policies** to run policies on the current phase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All mapped policies are executed in the background for the current phase (**In Progress** state). You can check the execution status by refreshing the list on the **Policies** tab.

A scheduled job runs daily to execute the policies that are mapped to the phase. The Execution status column on the Policies list for each phase is updated to show the compliance status after each run.

7. **Optional:** Add or update key dates in a timeline-oriented release that should be in relation to the release target date.
   These key dates help you define and track important events that can happen during the release period.
   - Add a new key date to the release:
     a. Select the more actions icon next to the **Add task** button and then select **Add key date**.

     b. In the Add key date dialog box, fill in the fields.

     (Optional) For more information, see Release key date form.

     c. Select **Save**.
   - Update the existing key dates in the release:
     a. Select a key date in the timeline bar to open the Key date details form in the side-panel.

     (Optional) Alternatively, you can select the number under **Key dates** in the form header to view a list of key dates for the release, and then open a key date.

     b. On the Key date form, update the fields.

     c. Select **Save**.
8. Close a release after verifying its completeness.
   For more information, see Close a release.

Work on a timeline-oriented release for multiple products

Monitor and work on a release that follows the timeline-oriented release process for multiple products.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

About this task

When working on a release for multiple products, you can choose to work with the main release (for the primary product or service) or a specific release (for an Included product). The main release controls and executes all activities for each product release under it.

- Perform primary activities, like starting the release and managing phases and tasks in the main release.
- Define the release scope and manage change requests in each product release.
- Run policies for the current phase either from the main release level or an individual product release. The policy statuses from the individual product releases are aggregated into the policy status of the main release. For more information about how the aggregated status is derived, see Policy status aggregation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can monitor the progress of an individual product release, or you can track the overall progress at the main release level.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. **Optional:** Select the **Details** tab and add or update the schedule in the **Schedule** list to account for holidays during the release period.

   (Optional) The list shows schedule entries that are of the type Excluded from the Schedule [cmn_schedule] table.

   Note:
   The selected schedule must be within the release duration (release target date).

   The phase start and end dates are updated and the release duration is recalculated by considering the non-working days in the schedule. For more information on how schedules impact the dates of phases and release target, see Holiday schedules in a release.
5. If the release isn't in progress, select **Start release**.
6. Select **Dashboard** to monitor the overall status of the release, see the details and all products that have their individual releases.
   - Select the **Release dashboard** tab to view important dates of the release, release tasks, policies, related tasks, and approvals by their state for all releases together.

     For more information, see Release dashboard for a multi-product release.
   - Select the **Details** tab to make any necessary changes to the release details, such as the release name, owner, status, or description.
   - Select the **Products** tab to view a list of all products, including their release versions and statuses.
7. Select a product or service to work on its release from the **View by** drop-down list.
   Based on the selected option, you can see different sections as follows:

View by option	Description
All products or services	You can see the following sections: ○ **Release execution**: Work on the main release, which involves starting the release, retargeting the release, and executing the release to manage phases, tasks, key dates, policies, and approvals. All of these actions apply to all releases. ○ **Change requests**: View a list of all change requests across releases for all products or service.
Included product	You can see the following sections for the selected product's release: ○ **Overview**: View the progress and quality of the release on the respective dashboards. For more information, see Release Overview dashboard for a multi-product release and Release Quality dashboard. ○ **Release execution**: View the details of phases of the release or run policies mapped to its phases for compliance checks. For more information, see Execute the release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View by option	Description
	Note: In the **Details** tab, the **Policy status** field displays a combined compliance status for all releases. ○ **Release scope**: View and update the scope of the release, including product enhancements, planning items, and related tasks such as incidents and problems associated with the release. ○ **Configuration items**: View and manage configuration items related to the release. ○ **Change requests**: View and manage change requests related to the release. On the Release form header, select the number under the **Artifacts** label to manage artifacts in the release. The **Artifacts** label is available in the **Overview**, **Release scope**, **Configuration items**, and **Change requests** section. For more information, see Manage artifacts in a release.

8. Close a release after verifying its completeness.
   For more information, see Close a release.

Managing a stage-oriented release

Managing a stage-oriented release involves completing objectives and closing the release when the work is done and meets the defined release criteria, rather than waiting for the planned end date.

Stage-oriented release process

Stage-oriented process is suitable for creating releases that prioritize completing objectives and features over following a strict timeline.

The following is the general flow that a stage-oriented release goes through:

- The flow starts with the first phase in the Pending state, which is the default state. The state of the phase moves to In Progress when you manually start it.

  Tasks in the phase are processed based on the system property *sn_dpr.sequential_task_execution*:

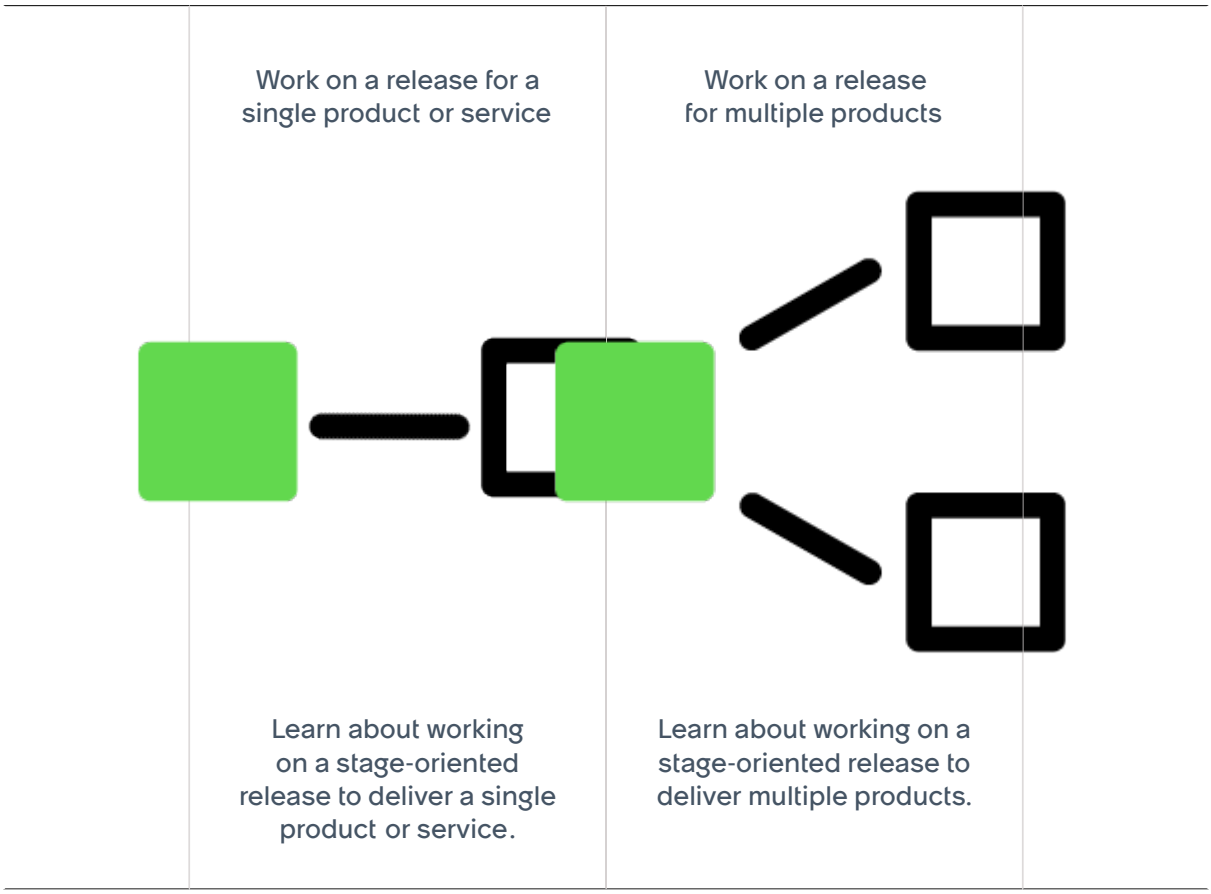
  - **true**: Tasks in the phase are processed in sequential order. At the start of a phase, the task with the lowest order in it is set to the Open state. After this task is completed, the next task in the order is opened. This process continues for the remaining tasks in the phase. If the task is an approval task, the state is moved to the Requested state.
  - **false**: Tasks in the phase are not processed in a sequence. Instead, all its tasks are set to the Open state at the start of the phase.
- When the all tasks are completed and all policies are compliant or compliant with exceptions for the current phase, it automatically moves to the Completed state.
- After the current phase is completed, the next phase moves to the In Progress state. Only one phase can be in progress at a given time.
- If you encounter any issues at any point, you can restart from a previously completed phase. That phase and later phases are reset, including tasks and policy status.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When all phases in the release are completed, the release moves to the Review state.
- When the review of the release is completed, the release moves to the Completed state.

For more information, see Release for a product or service.

Working on a stage-oriented release



Work on a stage-oriented release for a single product or service

Monitor and work on a release that follows the stage-oriented release process to release a single product or service.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. If the release isn't in progress, select **Start release**.
5. Select the **Overview** section to review and modify release details, get an overview of its status, or change its readiness target date.
   For more information, see Review and update release details and Retarget a release.
6. Select the **Release scope** section to review and update the scope of the release by adding or removing the product features and enhancements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Update the scope of a release.

7. Select the **Configuration items** section to review and manage the configuration items in the release.
   You can add more configuration items or remove the existing ones as needed. For more information, see Manage configuration items in a release.
8. Select the **Change requests** section to review and manage the change requests in the release.
   You can add new or existing change requests or remove the existing ones as needed. For more information, see Manage change requests in a release.
9. From the Release form header, select the number under the Artifacts to manage artifacts added to the release.
   For more information, see Manage artifacts in a release.

Restart the release phase

You can start over a stage-oriented release from any previously completed phase if you encounter an issue that requires you to go back.

Before you begin

Note:
When you restart a release from a completed phase, it resets that phase and any later phases up to the current one. It also resets the status of tasks, approval requests, and policies linked to each affected phase.

Role required: sn_dpr_model.release_admin

About this task

By restarting a phase, you can reassess and adjust the plan to overcome the new issues, ensuring that the release stays on track and meets its overall goals. For example, if a certain version of an artifact is being certified during the release process and it doesn't pass the validation, a new version of the artifact can be chosen. Then, you can restart the release from an earlier phase to repeat the same tasks, mapped policies, configuration items, and approvals from those phases.

Procedure

1. On the Release execution page, select the release phase action button (⋮) and then select **Restart phase**.
2. On the Restart phase dialog box, select a phase from where you want to restart.
   The list displays the completed phases.
3. Select **Restart**.

Result

- The state of the selected phase updates to In Progress and of all the later phases updates to Pending.
- The state of the current phase updates to Restarted.
- The state of all tasks in the affected phases updates to Open.
- The configuration items associated with the affected phases are reassociated with the newly created corresponding phases.
- The last run status of the policies mapped to theses phases updates to Not run.

Execute the release

View the release status and work on its phases and tasks, and policies.

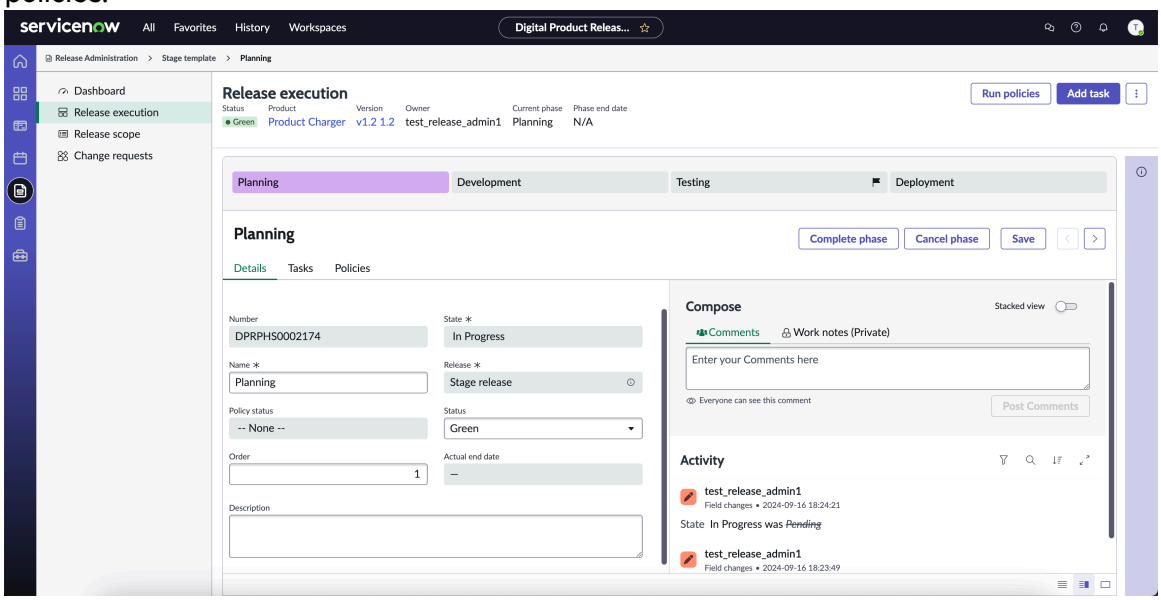
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

Procedure

1. Select **Release execution** to view the release status and work on its phases, tasks, and policies.



2. Update a release phase.

> **Note:**
> If the *stage_workflow_auto_transition* system property is set to true, the phases are automatically closed when all tasks in it are closed and policies comply.

   a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

   b. When all tasks in the current phase are complete and mapped policies comply, mark the phase as complete by selecting **Complete phase**.

> **Note:**
> If any of the mapped policies is noncompliant, you can complete a phase only when you have either the sn_dpr_model.release_admin role or any of the roles defined in the system property *sn_dpr.complete_phase_override*.

   The state of the current phase is updated to Completed and the next phase is started. The actual end date of the current phase is updated to the current date.

3. **Optional:** Add a task to a release phase.

   a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

   b. Select **Add task**.

   c. On the Create task dialog box, add details for the task like its name, phase it belongs to, end date, and description.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. If the task needs approval, perform the following steps:

> **Note:**
> You can select whether the task needs approval when creating it. This option can't be changed after it's saved.

i. Select **Yes** in the **Need approval** field.

The **Assigned to** and **Approval definition** fields appear.

ii. From the **Assigned to** list, select the user who would approve the task.

iii. From the **Approval definition** list, select an approval definition to trigger the approval based on the predefined condition.

e. Select **Create task**.

The task is created in the Pending state and added to the selected phase.

For an approval task, an approval record is created for the approver to review and take action. For more information, see Approve or reject a release task.

4. Track and manage the progress of tasks for the selected phase.

a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

b. Select the **Tasks** tab to view all tasks in the phase.
You can apply filters to view specific tasks or change the view type by selecting the **Kanban** or **List** option.

c. Select a task to open in the Task details pane.

d. Review the task in the Task details pane, or select **Full details** to open the task record in the form view.

e. Assign the task in the **Assigned to** field to the user who will work on it.

f. Review the approval status for an approval task in the **Approval** field.

g. Update the **State** field with the status of the task that doesn't need any approval.
The state of an approval task is automatically updated when approved.

h. Select **Save** to save the changes.
If you complete the current task and the system property *sn_dpr.sequential_task_execution* is set to true, the next task in the order moves to the Open state.

5. Optional: Map policies to a release phase to validate it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the timeline, select a phase or use the arrow buttons to navigate to the previous or next phase.

Note:
Policies can't be mapped to a completed or cancelled phase.

b. Select the **Policies** tab, and then select **Add**.

c. On the Map Policies dialog box, select one or more policies from the list to map to the phase.

d. Select **Map policies**.

6. Select **Run policies** to run policies on the current phase.
   All mapped policies are executed in the background for the current phase (**In Progress** state).
   You can check the execution status by refreshing the list on the **Policies** tab.
7. Close a release after verifying its completeness.
   For more information, see Close a release.

Work on a stage-oriented release for multiple products

Monitor and work on a release that follows the stage-oriented release process for multiple products.

Before you begin
Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

About this task
When working on a release for multiple products, you can choose to work with the main release (for the primary product or service) or a specific release (for an Included product). The main release controls and executes all activities for each product release under it.

- Perform primary activities, like starting the release and managing phases and tasks in the main release.
- Define the release scope and manage change requests in each product release.
- Run policies for the current phase either from the main release level or an individual product release. The policy statuses from the individual product releases are aggregated into the policy status of the main release. For more information about how the aggregated status is derived, see Policy status aggregation.

You can monitor the progress of an individual product release, or you can track the overall progress at the main release level.

Procedure
1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. If the release isn't in progress, select **Start release**.
5. Select **Dashboard** to monitor the overall status of the release, see the details and all the products that have their individual releases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the **Release dashboard** tab to view important dates of the release, release tasks, policies, related tasks, and approvals by their state for all releases together.

  For more information, see Release dashboard for a multi-product release.

- Select the **Details** tab to make any necessary changes to the release details, such as the release name, owner, status, or description.
- Select the **Products** tab to view a list of all products, including their release versions and statuses.

6. Select a product or service to work on the release from the **View by** drop-down list.
   Based on the selected option, you can see different sections as follows:

View by option	Description
All products or services	You can see the following sections: - **Release execution**: Work on the main release which involves starting the release, retargeting the release, executing the release to manage phases, tasks, policies, and approvals, and restarting the release from a previously completed phase. All of these actions apply to all releases. - **Change requests**: View a list of all change requests across releases for all products or service.
Included product	You can see the following sections for the selected product's release: - **Overview**: View the progress and quality of the release on the respective dashboards. For more information, see Release Overview dashboard for a multi-product release and Release Quality dashboard. - **Release execution**: View the details of phases of the release or run policies mapped to its phases for compliance checks. For more information, see Execute the release. **Note:** In the **Details** tab, the **Policy status** field displays a combined compliance status for all releases. - **Release scope**: View and update the scope of the release, including product enhancements, planning items, and related tasks such as incidents and problems associated with the release. - **Configuration items**: View and manage configuration items related to the release. - **Change requests**: View and manage change requests related to the release. On the Release form header, select the number under the **Artifacts** label to manage artifacts in the product's release. The **Artifacts** label is available in the **Overview**, **Release scope**, **Configuration items**, and **Change requests** section. For more information, see Manage artifacts in a release.

7. Close a release after verifying its completeness.
   For more information, see Close a release.

Managing multiple releases through release bundles

Release bundles help you to group multiple releases to track and manage them concurrently from a single place.

Release coordinators and product managers can easily track the progress of each release using release bundles. Release bundles help to identify dependencies and potential conflicts, and make any necessary adjustments to ensure a smooth and coordinated release process. They also enable communication and collaboration among team members, as everyone can access the same information and stay updated on the status of each release.

Note:
You cannot add releases that are in the Draft state to a release bundle.

You can include a release in multiple release bundles, which can be useful for larger projects. It can help in better coordination between multiple teams working on different features. It can also help with managing and prioritizing updates.

Features and benefits

Release bundles offer the following features and benefits:

Centralized management

Provides release coordinators and project managers to manage multiple releases concurrently from one place.

Progress and quality monitoring

Monitor progress of releases across multiple teams and projects and ensure the quality of releases within the bundle.

Change request tracking

Track all change requests in releases.

Create a release bundle

Create a release bundle to manage and track multiple releases from a single place. These releases can have different release readiness targets. However grouping them together in bundles helps you manage them all efficiently.

Before you begin

Role required: sn_dpr_model.release_coordinator, sn_dpr_model.product_manager, or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ), and then select **Bundles**.
3. Select **New**.
4. On the Create release bundle dialog box, provide the name, owner, and a description for the release bundle.
5. Select **Next**.
6. Add releases to the bundle or skip to add them later.

Note:
You can’t add releases that are in the Draft state to a release bundle.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To add releases to the bundle, select them from the list, and select **Add**.
- To add releases to the bundle later, select **Skip**.

Track multiple releases from a release bundle

Track the progress of releases in a release bundle concurrently to improve efficiency and streamline the release management process. You can also identify dependencies and potential conflicts in your releases and coordinate with team members working on different releases.

Before you begin

Role required: sn_dpr_model.release_coordinator, sn_dpr_model.product_manager, or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ), and then select **Bundles**.
3. Select a release bundle from the list to open.
4. On the **Overview** tab, review key metrics for all releases in the bundle.

Widget	Description
Releases by state	Total number of releases in the bundle, grouped by their state.
Tasks	Total number of tasks across all releases in the bundle, grouped by their state.
Policies	Total number of policies across all releases in the bundle, grouped by their compliant status.
Approvals	List of all approval tasks across all releases in the bundle, grouped by their approval status.
Enhancements	Total number of product enhancements across all releases in the bundle, grouped by their state.

5. **Optional:** On the **Details** tab, view and edit the release bundle details.
6. On the **Releases** tab, view and manage releases in the bundle.
   - To add a release to the bundle, select **Add** and then select from the list of releases.
   - To remove an existing release from the bundle, select the release from the list, and then select **Remove**.
   - To view the details of a release, select the release name from the list.
7. On the **Change requests** tab, view change requests across all releases in the bundle. To view the details of a change request, select it from the list.

Review and update release details

Review and modify the details of a release. You can also retarget the readiness date of the release as required.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. Select **Overview** to review the release's progress and quality at a glance, take any necessary steps, or review and change its details.
5. Select the **Release overview** tab to review the important dates, change requests, risk scores, tasks, and policy and approval statuses.
   For more information, see Release Overview dashboard.
6. Select the **Details** tab to make any necessary changes to the release details, such as the release name, owner, status, or description.
7. Select the **Quality** tab to review the software and test quality summaries for an ongoing release.
   This tab is available only for the release of a product. For more information, see Release Quality dashboard.

   Note:
   You must configure pipelines to track software quality of your release. For more information about setting up pipelines using external tools configuration, see Integrate external tools from Digital Product Release Workspace.

Update the scope of a release

Review and update the scope of the release by adding or removing product enhancements, planning items, and related tasks like incidents and problems.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. Select **Release scope** to manage product enhancements, work items, planning items, and tasks in the release.

   Note:
   The tabs for task types that you see depend on the permissions required to view those task type records and the system property *sn_dpr.release_related_record_types*. For more information, see Digital Product Release properties.

5. Select the **Product enhancements and Work items** tab to manage product enhancements and work items in the release.
   - Add an enhancement to a product or service
   - Add a product enhancement from an epic

   The product enhancements added to the release are listed in the Product enhancements and Work items tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select the **Planning Items** tab to view planning items associated with the product enhancements in the release.

   Note:
   The **Planning Items** tab is available only when the following conditions are met:
   - You have one of the following roles required to view those items
     - sn_dpr_model.product_enhancement_read
     - sn_dpr_model.release_admin
     - sn_dpr_model.release_user
     - sn_dpr_model.product_manager
     - sn_dpr_model.release_coordinator
   - ServiceNow® Strategic Planning Workspace is installed with the Digital Product lens configured

     For more information about the lenses and portfolio plans, see Lenses in Strategic Planning and Portfolio plans in Strategic Planning.

   a. Select a planning item number to view its details.
   A list of the planning items associated with the product enhancements displays.

7. Manage related tasks in the release.
   - To add a related task, select **Add**.
     a. Select the tab in which you would like to add a task.

        A list of the records of the selected task type displays.

     b. Select one or more records from the list and then select **Add**.

        The selected task records are added to the release.
   - To remove a related task, select it from the list and select **Remove**.

Manage configuration items in a release

View and manage the configuration items (CIs) in a release phase to manage the release effectively. These associated CIs can be used for managing change requests and future tasks through the release.

Before you begin
Role required: sn_dpr_model.product_manager, sn_dpr_model.release_coordinator, or sn_dpr_model.release_admin

About this task
You can add a specific configuration item to a phase only once, although it can be added to multiple phases in the release.

Procedure
1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. Select **Configuration items** to manage configuration items in the release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The list displays all CIs that are associated with the selected phase.

5. Select a phase from the **Phase** list to add or remove configuration items of any CI class.

Manage change requests in a release

View and manage change requests in a release. You can create and add new change requests to the release or add existing ones.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

About this task

You can associate a change request to a phase only once, although it can be added to multiple phases in the release.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. Select **Change requests** to manage change requests in the release.
   The Change requests list displays all change requests that are associated with the selected phase of the release.
5. Select a phase from the **Phase** list.
6. Create change requests and add them to the phase, add existing change requests to the phase, or remove the ones that are already associated with the phase.

7. Import the configuration items (CIs) from the attached phases into the change request as affected CIs.
   a. Select the **Affected CIs** tab.
   b. Selecting **Add CIs from release phases**.

Result

- If the change request is associated with a single phase, the **Attached to phases** in the header section of the Change Request record shows the name of that phase. Select the link to open the phase.
- If the change request is associated with more than one phase of the release, the **Attached to phases** shows the count of those phases. Select the link to open the list of those phases.

Manage artifacts in a release

Add or remove artifacts from a release.

Before you begin

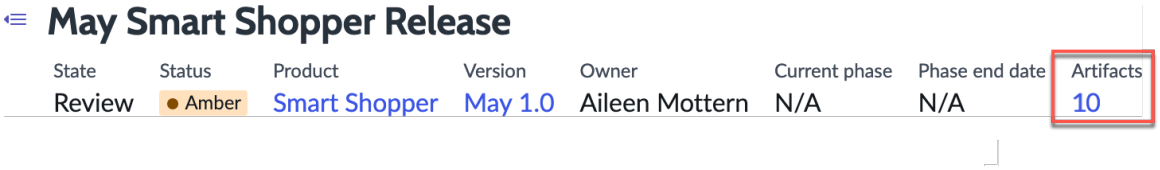
Make sure you have associated an artifact repository with the product. For more information, see View and manage data from external tools.

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. On the Release form header, select the number under the **Artifacts** label.
   The **Artifacts** label is available when you select **Overview**, **Release scope**, or **Change requests**.



5. On the Release Artifacts list view, add or remove artifacts.

Approve or reject a release task

Review a release task and approve or reject it.

Before you begin

Role required: approver_user

Procedure

1. Navigate to **All** > **Service Desk** > **My Approvals**.
2. In the My Approvals list, click a record to open for approval.
3. Review the record and either approve or reject:
   - To approve the record, click **Approve**.
   - To reject the record, enter comments for rejection in the **Comments** field and click **Reject**.

Result

The following table shows the result of approve and reject actions on the approval record of a release task.

Result of approving or rejecting a release task

Approve	Reject
• The approval record's state updates from Requested to Approved. If the requested item was assigned to a user group for approval, then the state of the approval records for the remaining users updates from Requested to No Longer Required.	• The approval record's state updates from Requested to Rejected. If the requested item was assigned to a user group for approval, then the state of the approval records for the remaining users updates from Requested to No Longer Required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result of approving or rejecting a release task (continued)

Approve	Reject
• The **State** field on the release task updates from Open to Closed Complete. • The **Approval** field on the release task updates from Requested to Approved.	• The **State** field on the release task remains Open. • The **Approval** field on the release task updates from Requested to Rejected. • The rejection comments posted by the approver is added to the release task's Activities section.

Retarget a release

Change the release readiness target to reschedule the release period.

Before you begin

Role required: sn_dpr_model.product_manager or sn_dpr_model.release_admin

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. On the Release form, select **Overview**.
5. Select the release action icon ( ) and then select **Retarget release**.

   Note:
   Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.

6. On the Retarget release dialog box, select a different release readiness target from **Release readiness target**.

   Note:
   The new release readiness target date must be within the defined schedule of the release.

7. You can also make the release as an out-of-band release by selecting **Out of band**. This option depends on the system properties—*out_of_band_release_allowed* and *out_of_band_release_roles*. For more information, see Digital Product Release properties.
8. If you selected the out-of-band option, then select a release calendar from the **Release calendar** to tag the release and use its release target.
9. Select **Confirm**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

- The readiness target date of the release is updated to the new date.
- For timeline-oriented releases, the key dates impacted are adjusted based on the retargeted date. This adjustment is made after recalculating the number of days that have changed from the original schedule.

Note:
If a holiday schedule is attached to the release and the revised key dates fall on a holiday, the last workday before the holiday is considered as the revised key date.

What to do next
Update the planned dates on the associated change requests manually because they are not automatically updated when you retarget the release.

Close a release

Complete a release after all tasks have been completed and all phases are in compliance with the mapped policies.

Before you begin
A release must be in the Review state to mark it as complete.

Role required: sn_dpr_model.release_admin

About this task

Note:
A release that follows a stage-oriented process automatically moves to Completed when it's compliant, provided that the *stage_workflow_auto_transition* system property is set to true.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the releases icon ( ).
3. Select a release from the list to open.
4. Review the completeness of the release to determine if all the release work is complete.
5. Close the release.
   - In a single product or service release, on the Overview page, select **Complete release**.
   - In a multi-product release, on the Dashboard page, select **Complete release**.

Result
The release is closed and its state is updated to Completed.

View releases planned in a release readiness target

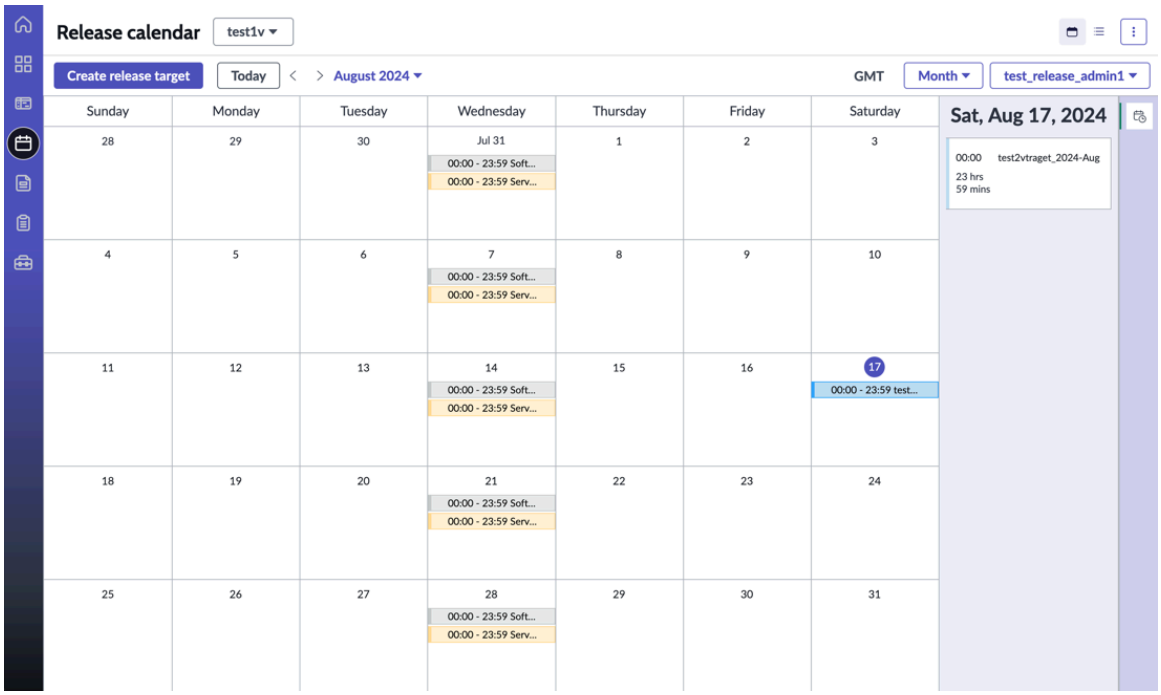
View and track all product releases that are planned in a release readiness target and track their progress.

Before you begin
Role required: sn_dpr_model.release_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Digital Product Release Workspace**.
2. Select the release calendar icon ( ).
   The release calendar appears.



3. Select a release calendar on which you want to view the releases.
4. **Optional:** Filter the release calendars by selecting a release manager from the filter list.
   Release targets are displayed for all release managers by default.
5. Select a release readiness target from the calendar, list view, or agenda view pane, to open.
6. On the Release target form, select the **Releases** tab to view all releases planned in the readiness target.
   The list displays all releases attached to this readiness target.
7. Select a release from the list to review its status and other details.

Digital Product Release Policy Content Pack

The Digital Product Release Policy Content Pack includes data collectors and policies for automating the verification of phase gate in Digital Product Release.

- Data collectors enable you to create low-code policies for the DevOps data model application.

  For more information, see Digital Product Release data collectors.

- Policies enable you to automate phase gate verification and continuous evaluation of software artifacts to ensure they meet the business requirements and standards.

  For more information, see Digital Product Release policies.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Digital Product Release data collectors

The Digital Product Release Policy Content Pack contains a set of data collectors to collect DevOps data to be validated against policies.

Approval Task Completeness

The Approval Task Completeness data collector checks if all approval release tasks associated with a release phase are complete.

Input: Release phase.

Output:

- true: All approval tasks are approved.
- false: One or more approval tasks aren't approved, or there are no approval tasks for the release phase.

Artifact Story Complete

The Artifact Story Complete data collector returns the percent of stories completed that are associated with a release artifact. The formula used to calculate the percentage is: `Percentage of stories completed = (Number of completed Stories / (Total number of stories - Number of stories in cancelled state - Number of stories in deleted state)) * 100`.

Input: List of artifacts for a release phase.

Output: % of stories that are complete.

Change Request State Validation

The Change Request State Validation data collector returns the number of change requests in the specified states. It can check at change requests in one phase or all phases of a release, based on the input.

Input: List of states to validate, Validates all phases, Release ID, and Phase ID.

Output: Total number of change requests in the given states.

Code Coverage

The Code Coverage data collector returns the current code coverage calculated based on the artifact versions.

Input: List of artifacts for a release phase.

Output: % of code coverage.

Commits Without Work Item

The Commits Without Work Item data collector returns the percent of commits that don't have an associated Work Item. The formula used to calculate the percentage is: `Percentage of commits without work item = (Number of commits without work item / Total number of commits in artifact) * 100`.

Input: List of artifacts for a release phase.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Output: % of commits without Work Item.

Planned Story Completeness

The Planned Story Completeness data collector returns the percent of planned stories that are marked as complete. Stories from the Epics that are associated with the release are considered. The data collector also checks if the product version is associated with plan version. If it's associated with plan version, it also considers all stories associated with plan version.The formula used to calculate the percentage is: `Percentage of stories completed = (Number of completed Stories / (Total number of stories - Number of stories in cancelled state - Number of stories in deleted state)) * 100;`.

Input: List of Epics associated with a release.

Output: % of planned stories that are marked as complete.

Security Vulnerability

The Security Vulnerability data collector returns the number of security vulnerabilities that are associated with a particular category. Security vulnerabilities are identified based on the artifact versions and the category of vulnerability as follows:

- Blocker: Returns the sum of blocker issues. Valid only for DevOps data.
- Critical priority issues: For DevOps data, returns the sum of Critical issues. For SecOps data, returns the sum of Very High Priority issues. For both DevOps and SecOps data, returns the cumulative of the Critical and Very High Priority issues.
- High priority issues: Returns the sum of High Priority issues from both DevOps and SecOps data.
- Medium priority issues: Returns the sum of Medium Priority issues from both DevOps and SecOps data.
- Major issues: Return the sum of Major issues from all artifacts. Valid only for DevOps data.
- Minor issues: Return the sum of Minor issues from all artifacts. Valid only for DevOps data.

Input: List of artifacts for a release phase.

Output: Total number of vulnerabilities.

Test Pass

The Test Pass data collector returns the percent of passed tests based on artifact versions. If the test type is provided, it returns the test results only for the given test type, otherwise for all test types for the artifact version. The formula used to calculate the percentage is: `Percentage of tests passed = (Number of tests passed / (Total number of tests - Number of skipped tests)) * 100`.

Input: List of artifacts for a release phase and Test type (optional).

Output: % of tests passed.

Work Items Have Commits

The Work Items Have Commits data collector returns whether all Work Items have a related commit. The Work Items are identified based on the Epics related with the release. The data collector also checks if the product version is associated with plan version. If it's associated

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

with plan version, it also considers all stories associated with plan version. The formula used to calculate the percentage is: `Percentage of stories without commits = (Number of completed stories without commits / Total number of stories in completed state) * 100`.

Input: List of artifacts for a release phase.

Output: % of commits without Work Item.

Digital Product Release policies

The Digital Product Release Policy Content Pack contains a set of policies to automate phase gate verification and continuous evaluation of software artifacts.

You can use or customize these default DPR policies to validate that your configuration data content is conformable, or administrate the full life cycle of PaCE policies. For more information, see Policy as Code Engine (PaCE).

Note:
You can't modify the base system policies. However, you can create a copy of the policy and customize it.

These policies are for both product and service releases. However, a few don't apply to service releases. For more information about those policies, see Policies not applicable to service releases.

All Completed Stories Have Associated Commits (all_completed_stories_have_associated_commits)

This policy checks whether all the completed stories of a release have associated commits.

The policy results into a non-compliant status when a completed story of a release has no associated commits.

All Planned Stories Are Completed (all_planned_stories_are_completed)

This policy checks whether all the planned stories of a release are completed. This policy also checks if the product version is associated with plan version. If it's associated with plan version, it checks all stories associated with plan version in addition to the stories associated with epics in features or enhancements.

The policy results into a non-compliant status when the completion percentage of stories planned for a release isn't `100%`. The completion percentage of planned stories is calculated as `(Total completed stories/Total planned stories) * 100`.

Code Coverage Exceeds Threshold (code_coverage_threshold)

This policy checks whether the percentage of code coverage exceeds the threshold value.

The policy results into a non-compliant status when the percentage of code coverage is less than the specified threshold value. The percentage of code coverage for a release is the average code coverage calculated for all artifact versions included in the release.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The artifact versions with no code coverage data are excluded from the average code coverage calculation.

Input arguments

minCodeCoverageThreshold

- The minimum accepted value for the code coverage for a release.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

Integration Test Pass Exceeds Threshold (integration_test_pass_threshold)

This policy checks whether the percentage of passed integration tests is not less than the threshold value.

The policy results into a non-compliant status when the percentage of passed integration tests is less than the specified threshold value. The passed integration tests percentage is calculated as `(Total passed integration tests for all artifact versions/Total integration tests for all artifact versions) * 100`.

Input arguments

minTestPassThreshold

- The minimum accepted value for the percentage of passed integration tests.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

Load Test Pass Exceeds Threshold (load_test_pass_threshold)

This policy checks whether the percentage of passed load tests is not less than the threshold value.

The policy results into a non-compliant status when the percentage of passed load tests is less than the specified threshold value. The passed load tests percentage is calculated as `(Total passed load tests for all artifact versions/Total load tests for all artifact versions) * 100`.

Input arguments

minTestPassThreshold

- The minimum accepted value for the percentage of passed load tests.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

No Critical Vulnerabilities Found (no_critical_vulnerabilities)

This policy checks whether there are no critical vulnerabilities found in a release.

The policy results into a non-compliant status when the total number of vulnerabilities categorized as blocker, critical, high, or major is greater than zero.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Regression Test Pass Exceeds Threshold (regression_test_pass_threshold)

This policy checks whether the percentage of passed regression tests isn't less than the threshold value.

The policy results into a non-compliant status when the percentage of passed regression tests is less than the specified threshold value. The passed regression tests percentage is calculated as `(Total passed regression tests for all artifact versions/Total regression tests for all artifact versions) * 100`.

Input arguments

minTestPassThreshold

- The minimum accepted value for the percentage of passed regression tests.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

Smoke Test Pass Exceeds Threshold (smoke_test_pass_threshold)

This policy checks whether the percentage of passed smoke tests is not less than the threshold value.

The policy results into a non-compliant status when the percentage of passed smoke tests is less than the specified threshold value. The passed smoke tests percentage is calculated as `(Total passed smoke tests for all artifact versions/Total smoke tests for all artifact versions) * 100`.

Input arguments

minTestPassThreshold

- The minimum accepted value for the percentage of passed smoke tests.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

System Test Pass Exceeds Threshold (system_test_pass_threshold)

This policy checks whether the percentage of passed system tests is not less than the threshold value.

The policy results into a non-compliant status when the percentage of passed system tests is less than the specified threshold value. The passed system tests percentage is calculated as `(Total passed system tests for all artifact versions/Total system tests for all artifact versions) * 100`.

Input arguments

minTestPassThreshold

- The minimum accepted value for the percentage of passed system tests.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User Acceptance Test Pass Exceeds Threshold (user_acceptance_test_pass_threshold)

This policy checks whether the percentage of passed user acceptance tests is not lower than the threshold value.

The policy results into a non-compliant status when the percentage of passed user acceptance tests is less than the specified threshold value. The passed user acceptance tests percentage is calculated as `(Total passed user acceptance tests for all artifact versions/Total user acceptance tests for all artifact versions) * 100`.

Input arguments

minTestPassThreshold

- The minimum accepted value for the percentage of passed user acceptance tests.
- Default value: `100`
- Type: Integer
- Usage: Mandatory

Validate change requests (validate_change_requests)

This policy checks whether all change requests are in the given states, across all phases or a single phase of a release.

The policy results into a non-compliant status when at least one change request is not in any of the given states.

Input arguments

Validate all phases: Determines whether to check the state of change requests in all phases or in a single phase of a release.

- Default value: `False`
- Type: Boolean
- Usage: Mandatory

States to validate: An array of states of change requests to validate. It accepts comma-separated numeric values corresponding to the states.

- Default value: Empty
- Type: Data Array
- Usage: Mandatory

Policies not applicable to service releases

The following policies don't apply to service releases.

- all_completed_stories_have_associated_commits
- integration_test_pass_threshold
- regression_test_pass_threshold
- system_test_pass_threshold
- code_coverage_threshold
- no_critical_vulnerabilities

Scheduled jobs installed

Scheduled job	Description
Clean 6 month old unused release target	Deletes release target records older than six months and unused. Runs: Daily
DPR Execute policies for all active release phases	Runs policies that are mapped to phases that are currently in progress for all releases. Runs: Daily
Release phase state transition	Manages the state of phases for ongoing releases. This job checks all in-progress releases and their phases. If a phase is in progress and its planned end date is today, and its policy status is compliant, it will be marked as completed and the next phase will begin. Runs: Every hour
Release state transition	Manages the states of Pending or In progress releases. • If a release is in the Pending state and its planned start date is today, its state is updated to In progress. • If a release is in the In progress state and all its phases are completed, its state is updated to Review. Runs: Every hour

Tables installed

Table	Description
Approval Definition [sn_dpr_model_approval_definition]	Approval definitions that are used to direct approval requests for release tasks to a user or user group.
Key Date [sn_dpr_model_release_key_date]	Release key dates that define milestones, key events, deadlines, and important dates for single or recurring releases.
Policy [sn_dpr_pace_policy_mapping]	Policies mapped to a release. Extends the Policy Mapping table [sn_pace_policy_mapping] from PaCE.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Product Enhancement [sn_dpr_model_product_enhancement]	Product enhancements of a product feature. Use these product enhancements to release a product feature in phases across multiple versions.
Product Feature [sn_dpr_model_product_feature]	A product feature is a function or capability that adds value to a product or service for the customer. You can break down a product feature into product enhancements to release it in phases across multiple versions.
Related Tasks [sn_dpr_model_release_related_task_m2m]	Mapping between records from the Task table (task) and release records in the Release table (sn_dpr_model_release).
Release [sn_dpr_model_release]	A product or service release is the process of releasing a new version of a product or service. It involves several phases, tasks, policies, and approvals.
Release Artifact [sn_dpr_model_release_artifact]	Artifacts in a release for a product.
Release Association [sn_dpr_release_association]	Relationships between a release and the associated release template.
Release Bundle [sn_dpr_model_release_bundle]	Release bundles are groupings of releases that can be tracked concurrently.
Release Bundle M2M [sn_dpr_model_release_bundle_m2m]	Relationships of releases that are grouped into various release bundles.
Release Calendar [sn_dpr_model.release_calendar]	Calendars that can contain related release readiness targets within them. Release

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	calendars can have exclusion schedules attached to them so that no release targets are created on dates that fall within those exclusion schedules.
Release Phase [sn_dpr_model_release_phase]	Phases in a release for a product or service.
Release Phase CI [sn_dpr_model_release_phase_ci_m2m]	Mapping of configuration items and phases of a release.
Release Phase CR [sn_dpr_model_release_phase_cr]	Mapping of change requests and phases of a release.
Release Phase M2M [sn_dpr_release_phase_m2m]	Mapping of releases and phases to the policies that are mapped to each phase.
Release Policy Execution [sn_dpr_policy_execution]	Results of policies run on a phase of a release.
Release Readiness Target [sn_dpr_model_release_target]	Release readiness target that defines schedules for a single or recurring releases. Release targets are added to a release calendar.
Release Task [sn_dpr_model_release_task]	Tasks in phases for a release.
Release Template [sn_dpr_model_release_template]	Release templates containing predefined phases, tasks, approvals, and policies. While creating a release, you can apply a release template to pre-populate these phases, tasks, approvals, and policies.
Work Item [sn_dpr_model_product_enhancement_work_item_mapping]	Mapping between product enhancements and work items (records in the Work Item table (sn_devops_work_item)).

Digital Product Release properties

Configure the system properties to customize various features of Digital Product Release according to your organization's needs.

These properties are available for Digital Product Release.

Note:
To open the System Properties [sys_properties] table, enter `sys_properties.list` in the navigation filter.

Properties for Digital Product Release

Property	Description
sn_dpr.auto_transition_release_to_completed	Determines whether a release can from the Review state to Completed finished. • Type: true|false • Default value: false • Other possible values: true
sn_dpr.auto_transition_release_to_review	Determines whether a release can from the In Progress state to Review are completed. • Type: true|false • Default value: true • Other possible values: false
sn_dpr.complete_phase_override	Enables users with specific roles to The default role, sn_dpr_model.rele **Value** field. You can append additio access to the release phase state, s • Type: string • Default value: sn_dpr_model.rele • Other possible values: Roles that release phase state.
sn_dpr.max_template_duration	Specifies the maximum number of release template. It is the total dura in the template. • Type: Integer • Default value: 730 days • Other possible values: An integer
sn_dpr.multi_product.create_independent_releases	Determines whether to create indiv managed independently for each p release creation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Properties for Digital Product Release (continued)

Property	Description
	• Type: string • Default value: `[ {"table":"incident", "label": "Incidents"} {"table":"problem", "label": "Problems"} {"table":"sc_request", "default", "label": "requests"} ]` • Other possible values: Other Tas format as provided in the default
sn_dpr_workspace.allowed_states_for_create_auto_product_enhancement	States of primary epics that are con creation of product enhancements. • Type: string • Default value: created,planned,wip,complete,pr • Other possible values: You can p the list of existing states.
sn_dpr_workspace.auto_create_product_enhancement_for_primary_epic	Determines whether product enhar automatically created for primary ep • Type: true|false • Default value: false • Other possible values: true
sn_dpr_workspace.cmdb_model_creation.supported_ci_types	Specifies the comma-separated list types that can be associated with p requesting them. For more informat product or service.

Approval definition form

Release admins can create approval definitions to get approvals of phase tasks for a release.

For more information, see Create an approval definition in Digital Product Release.

Approval Definition form

Field	Description
Name	Name of the approval definition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Definition form (continued)

Field	Description
	Providing a meaningful name that helps to identify the purpose of the approval.
Active	Option for marking the approval definition active. Only active approval definitions are available for selection when creating a task or task template.
Approver source	Source of the user or group who approves the tasks. • **Approval Definition**: Selects a specific user or group. • **Digital Product**: Selects the user or group determined dynamically through a user reference field from the Application Models [cmdb_application_product_model] table. • **Service**: Selects the user or group determined dynamically through a user reference field from the Service Models [cmdb_service_product_model] table.
Approval action	Options for directing the approval to: • An individual user based on the role • A user group
User field	Fields from the User [sys_user] table. Select a user field. When an approval is initiated from a task, the approval request is directed to the person whose name is in that **User** field. For example, if you select the **Manager** user field, the approval record is assigned to the manager of the individual assigned with the task. This field appears only when **User** is selected from **Approval action**.
Group field	Fields from the Groups [sys_user_group] table. Select a group field. When an approval is initiated from a task, the approval request is directed to members of the group listed in the **Group** field. This field appears only when **Group** is selected from **Approval action**.
Wait for	Option to determine when an approval request should be considered approved. • All responses: The request is considered approved when all group members approve it. • First response: The request is considered approved when any one of the group members approves it.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Approval Definition form (continued)

Field	Description
	• Percentage of users: The request is considered approved when the minimum specified percentage of group members approves it. When you select this option, enter the percentage in the **Percentage** field. This field appears only when **Group** is selected from **Approval action**.

Release readiness target form

Release admins can create release readiness targets on a release calendar to define the dates by which the releases must be ready for deployment.

Note:
Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.

For more information, see Create a release readiness target.

Release readiness target form

Field	Description
Name	Name of the release readiness target.
Release admin	Name of the release admin who manages the release process. Your name is pre-populated by default; however, you can select another user with appropriate role as the release admin for the readiness target.
Description	Brief description of the release readiness target.
Date	Date by when the product or service must be ready for release. **Note:** This field isn't available for release readiness targets that have a release associated. The **Date** field is replaced by the **Start date** field when you select the **Recurring** option.
Recurring	Option to set the recurring target. Select an option from **Repeat**, choose the start date, recurrence options, and end date to set the recurring targets.
Schedules excluded from target	Schedules when the release readiness targets are excluded from creation that overlaps with blackout, maintenance, or other schedules. These schedules are auto-populated from the selected calendar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request new product or service form

Product managers or release admins can request for a new product or service in Digital Product Release.

For more information, see Request a new product or service.

Request new product or service form

Field	Description
Name	Unique name of the product or service.
Owner	User who owns the product or service.
Configuration item	Configuration item (CI) to which this product or service is linked to. You can associate the product or service with configuration item of types as listed in the system property, *sn_dpr_workspace.cmdb_model_creation.suppor* For example, CI of type Technology Management Service, Business Service, Service Instance, or Business Application can be linked.
Type	Request is for a product or service.
Short description	Short description about the product or service is being requested.

Release form

Product managers or release admins can create a release for a product or service version in Digital Product Release.

For more information, see Create a release for a product or service.

Create release form

Field	Description
Release name	Unique release name to identify the release.

Release validates a new product version	Option to determine whether the release can validate the version.
	• If selected, the version and template selections are impacted as below:
	  ○ Existing versions that are not validated by other releases are listed in the **Version** field for selection.
	  ○ Only templates with the **Validates version** set to true are shown in the **Release template** list.
	• If cleared, the version and template selections are impacted as below:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create release form (continued)

Field	Description
	○ All existing versions, whether validated or not, are listed in the **Version** field for selection. You can also add a new version as needed. ○ Templates created with the **Validates version** set to false are shown in the **Release template** list.
Product or service	Product or service for which the release is created.
Version	Version of the product or service that is included in the release. The list of available versions is filtered based on the **Release validates a new product version** field. • If selected, the list displays only versions that have not been used in a previous release. • If clear, the list displays all versions, including those with active releases. • If you enter a new version, it will be created and associated with the release.
Release template	Template that defines the release process. The template applies the predefined phases, tasks, policies, and approvals to this release. The list of available templates is filtered based on the **Release validates a new product version** field. • If selected, the list displays only templates with the validates version option set to true. • If clear, the list displays only templates with the validates version option set to false. For more information, see Create a release template. Based on the template you select, the release follows either a timeline-oriented or stage-oriented release process. For more information, see Release for a product or service.
Release readiness target	Release readiness target to indicate when the product or service should be ready for the release. **Note:** This field is optional for the stage-oriented releases. For more information, see Create a release readiness target. This field appears only when **Out of band** is clear. **Note:** Release readiness target and Release target are used interchangeably. Both terms refer to the same concept - release readiness target date.
Out of band	Option to make this release as an out-of-band release, which means it isn't associated with any existing release readiness target. Instead, a new release readiness target is created for the selected date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create release form (continued)

Field	Description
	The option to create out-of-band releases depends on the following system properties configuration: • *out_of_band_release_allowed* is set to **true**. • You have one of the roles listed in *out_of_band_release_roles*. For more information, see Digital Product Release properties.
Release date	Date of release for an out-of-band release. This field appears only when **Out of band** is selected.
Release calendar	Release calendar on which the release is targeted. If a release target exists on the selected date in the release calendar, the release is added to it. If not, a release target is created and the release is added to it. For more information, see Create a release calendar. This field appears only when **Out of band** is selected.

Release key date form

Manage your release key dates for a timeline-oriented release.

Release key date

For more information about adding key dates to a release, see Add key dates to a timeline-oriented release.

For more information about viewing and managing key dates in a release, see Work on a timeline-oriented release for a single product or service.

Release key date form

Field	Description
Name	Unique name of the key date.
Type	Type of key date. Select one of the options: • Milestone: An event used to mark the progress toward the overall goal. For example, dev complete. • Key event: Any release activity that holds strategic significance. • Deadline: The latest date by which a task or activity must be completed. For example, code freeze date. • Important date: Any date that holds significance in the release timeline.
Due date	Date and time of the release key date.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Release key date form (continued)

Field	Description
	This date must be between the release start date and end date. **Note:** You can only add a future date and it must not be a holiday according to the selected holiday schedule in the release.
Assigned to	The person that is responsible for achieving the key date event.
Description	Short description of the key date.

Policy status aggregation

In a multi-product release, the policy run status of releases for all primary and included products are rolled up to the policy status of the main release.

Example of a policy status aggregation

Consider a release with a primary product or service and three related products. Each phase has policies mapped to it. You can run policies on the current phase from the main release or from an included product release.

The following table shows how the aggregated status is calculated from the status of each release.

Policy status in a multi-product release

Status for primary product or service	Status for Included product 1	Status for Included product 2	Status for Included product 3	Aggregated status
Not run	Not run	Not run	Not run	**Not run**
Not run	Non-compliant	Non-compliant	Non-compliant	**Not run**
Not run	Compliant	Compliant	Compliant	**Not run**
Non-compliant	Compliant	Compliant	Compliant	**Non-compliant**
Compliant	Compliant	Compliant	Compliant	**Compliant**
Compliant	Compliant	Compliant	Compliant with exception	**Compliant with exception**

Domain separation and Digital Product Release

Domain separation is supported for Digital Product Release. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Overview of domain separation in Digital Product Release

All tables in Digital Product Release can be domain-separated and include the required domain separation field.

How domain separation works in Digital Product Release

- Each table in Digital Product Release includes the domain separation field called **Domain**.
- Customers can use this field to configure domain separation in their implementation of Digital Product Release.

Domain separation for service providers

Digital End-User Experience

ServiceNow® Digital End-User Experience (DEX) offers comprehensive monitoring for applications, networks, and devices, promoting optimal performance across all channels. DEX includes Application and Device Health for monitoring performance and compliance, DEX Content Playbook for facilitating remediation with policies and metrics checks, and Desktop Assistant for integrating ServiceNow functionalities into the daily end-user workflows.

DEX Overview

ServiceNow DEX empowers you as IT professionals with proactive oversight of end-user applications, devices, and networks. The DEX capabilities enable your organization to improve the technology experience for its employees, make it simple for them to self-solve issues and engage with a knowledgeable IT team when extra support is needed.

DEX Application and Device Health collects and tracks user experience data and performance metrics, supporting application, user, and device management.

Desktop Assistant enables employees to troubleshoot issues, receive notifications, and interact with the Virtual Agent. The application provides a convenient access for the employees to monitor local applications, requests, and perform network tests.

The Digital End-user Experience Self-service functionality is available through a widget in Desktop Assistant and Employee Center, as well as through the Virtual Agent. You can check device issues, resolve them based on suggested resolutions, and initiate device actions to maintain optimal device performance. With Virtual Agent, you can get answers to your questions

quickly and seamlessly, without having to wait on hold or speak to a representative over the phone.

DEX Content Playbook typically includes web or installed application monitoring, user device health monitoring, remediation, as well as diagnostic actions for users to run on their connected devices for troubleshooting.

For a unified monitoring workspace and relevant content (policies, check definitions, and actions), refer to Application and Device Health and DEX Content Playbook.

Proactive Engagement can assist your organization to improve employee productivity and satisfaction by proactively detecting digital experience issues and enabling employees to self-solve on a day-to-day basis.

Get started with DEX

Explore Leverage the system for monitoring and remediation objectives	Configure Configure Digital End-User Experience.
Manage Monitor and manage the digital workplace with Digital End-User Experience.	Reference Get information about the DEX Workspace administration.

Troubleshoot and get help

Contact Now Support.

Configuring Digital End-User Experience

Set up and configure Digital End-User Experience. Learn how to integrate web/SaaS or installed applications and to make modifications or removals from the Application and Device Health monitoring system. Customize the Desktop Assistant by organizing the Home page into sections and adding cards to these sections, enhancing your efficiency and accessibility.

Before setting up and using Digital End-User Experience (DEX), confirm that the system meets the minimum requirements to guarantee optimal performance. For more information, see DEX system requirements.

To set up DEX and begin exploring the workspace, you must complete the following configurations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Install Application and Device Health.
2. Create an ACC registration key.
3. Install ACC for DEX on Windows or Install ACC for DEX on macOS.
   - If you want to install Agent Client Collector (ACC) on Windows and Mac manually, see Install the Agent Client Collector on a Windows machine manually or Manually install Agent Client Collector on macOS. Verify you configure MID-less ACC before proceeding to the next configuration step.
   - If you have a MID-based ACC, you must convert it to a MID-less ACC. For more information regarding conversion, see Convert MID-based ACC to MID-less.
   - If you want to fetch the complete playbook content data for a Windows device, see Run ACC as a local system account user.
4. Enable DEX browser extension.
5. Onboard for Application and Device Health.
6. Explore Application & Device Health interface.

   Note:
   DEX Content Playbook provides policies, check definitions, and actions that can be used by Application and Device Health to facilitate the monitoring of applications and devices, and to support application remediation. You can also refer to DEX Content Playbook reference to learn the content it provides.

7. Setting up DEX Desktop Assistant.

DEX system requirements

System requirements are the fundamental specifications and configuration needed to install and run DEX effectively.

Vancouver Patch 6 is the minimum version required for DEX.

Supported ACC versions

DEX supports Agent Client Collector Framework (ACC-F) versions 3.4.1 and 3.5.1.

DEX browser extension requirements

The minimum required browser versions for DEX browser extension are Google Chrome 114 or higher, and Microsoft Edge version 96 or higher.

Operating system compatibility

DEX is compatible with the following operating systems:

- Microsoft Windows
  - Windows 10 Enterprise Edition
  - Windows 11 Professional
  - Windows 11 Enterprise
  - Windows 11 Surface on ARM64
- Apple macOS

- Sequoia

DEX installation and initial configuration

Install and configure required plugins to start monitoring and administering your organization's devices using Digital End-User Experience.

Install and configure the Digital End-User Experience (DEX) plugin and Agent Client Collector (ACC) to enable comprehensive monitoring of devices and web applications. Follow these procedures to generate the ACC registration key, install ACC on Windows and macOS, verify connectivity, configure proxy, optionally switch from MID-based to MID-less architecture, and enable the DEX browser extension. Complete these steps to make sure that devices are properly onboarded for Application and Device Health, laying the foundation for reliable experience data collection across your environment.

DEX guided setup

After installing DEX, use the DEX guided setup experience to install and configure the associated plugins.

In the primary navigation pane, select the DEX Administration icon ( ) and access-guided setup through the following cards:

Agent deployment on Windows devices

Install Agent Client Collector for DEX on Windows.

Agent deployment on macOS devices

Install Agent Client Collector for DEX on macOS.

Deploy browser extension

Enable DEX browser extension.

Desktop Assistant deployment

Activate Desktop Assistant on the employee's device.

Digital End-user Experience Self-service configuration

Configure the DEX Self-service on your ServiceNow® instance.

Install Digital End-User Experience

Digital End-User Experience (DEX) is available with activation of the Digital End-User Experience [sn_dex] plugin. You can install the DEX product [sn_dex] if you have the admin role. During installation, Application and Device Health is included as a component in DEX.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application .
- Review the DEX Application & Device Health application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following items are installed with Digital End-User Experience:

- Roles
- Tables

For more information, see Installed with DEX.

For information about DEX data migration, see the KB1646364 article in the knowledge base.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Digital End-User Experience application [sn_dex] using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Create an ACC registration key

Set up an Agent Client Collector (ACC) by creating an agent registration key to identify and authenticate agents that are enabled to send data to the collector. The key helps promote the security and integrity of the data collected from the system.

Before you begin

Role required: sn_dex.admin

About this task

Important:
By default, the registration key you generated expires in 90 days. Update the sn_agent.registration_key_validity.days property to change the validity duration.

Procedure

1. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
2. Select **New**.
3. In the **Name** field, enter a descriptive name for the registration key.
4. **Optional:** To receive notifications when a registration key is soon to expire, select a group with a valid email address in the **Ownership Group** field.

When keys are deleted via the Cleanup Agent Registration Keys scheduled job, the indicated group receives an email notification.

5. Select **Submit**.

What to do next

Install ACC for DEX on Windows or Install ACC for DEX on macOS.

Install ACC for DEX on macOS

Install Agent Client Collector (ACC) to monitor and collect data in a centralized and organized manner, provide insights into system performance, identify issues, and enable proactive maintenance.

Before you begin

- Install the ITOM Cloud Services Core (sn_itom_cloud_svc) plugin.
- Onboard your instance to use ITOM Cloud Services. For details, contact Customer Support.
- Configure an agent registration key.
- Role required: root

About this task

Procedure

1. Retrieve the agent registration key:
   a. Navigate to **All** > **Agent Client Collector** > **Deployment** > **Agent Registration Key**.
   b. Select the relevant agent registration key.
   c. Copy the registration key value and store it in a place where you can easily retrieve it when needed.
2. Retrieve the publicly accessible gateway URL, based on your location:
   - AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`
3. On the server where you're installing the Agent Client Collector, enter the following command:

```
CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>" bash -c "$(curl -L
 https://<instance_url>/api/sn_agent/agents/install_agent)"
```

The following table describes the parameter values in the command.

Command-line parameter values

Parameter	Value
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Public gateway endpoint for Agent Client Collector that you can specify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Value
REGISTRATION_KEY	Active and valid agent registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registering with.
ACC_ALLOW_LIST	Optional *ACC_ALLOW_LIST=0* string that you can add to disable the allow list. Default: The allow list is enabled. **Note:** When you disable the allow list, you compromise your system's security. This action is intended as a temporary measure while you're updating the allow list. After you complete the update, remove *ACC_ALLOW_LIST=0* from the command line.
ACC_VALIDATE_SIG	Optional *ACC_VALIDATE_SIG=0* string that you can add to disable the verification of the installer certification validation. Default: Validation is enabled. **Note:** Disable the certification validation only when you're using non-standard signature validation tools.

Related topics

Create an ACC registration key

DEX Architecture

Install ACC for DEX on Windows

Install Agent Client Collector (ACC) to work with Digital End-User Experience (DEX) to monitor and collect data, provide insights into system performance, identify issues, and enable proactive maintenance.

Before you begin

Install the ITOM Cloud Services plugin.

Create an agent registration key.

Role required: agent_client_collector_admin

Procedure

1. Retrieve the publicly accessible gateway URL, based on your location.
   - AMER (Americas): `itomcnc-prod-gateway.amer.sncapps.service-now.com:443`
   - EMEA (Europe): `itomcnc-prod-gateway.emea.sncapps.service-now.com:443`
   - APAC (Asia Pacific): `itomcnc-prod-gateway.apac.sncapps.service-now.com:443`
2. On the Windows server where the agent is installed, enter the following command:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
msiexec /i <msi_file_path> /quiet /qn /norestart
 CONNECT_WITHOUT_MID="true" ACC_CNC="<gateway_endpoint>"
 REGISTRATION_KEY="<registration_key>"
 INSTANCE_URL="https://<instance_url>"
```

The following table shows the parameter values in the command.

Installation command-line parameters

Parameter	Description
CONNECT_WITHOUT_MID	Specify **true** to enable MID-less Agent Client Collector installation. If you don't specify a value, the regular MID Server websocket installation is invoked.
ACC_CNC	Specify a public gateway endpoint for Agent Client Collector.
REGISTRATION_KEY	Active and valid registration key for the agent to communicate with.
INSTANCE_URL	ServiceNow instance that the agent is registered with.
ACC_ALLOW_LIST	Optional string. To disable the allow list, set *ACC_ALLOW_LIST=0*. By default, the allow list is enabled. **Note:** Disabling the allow list compromises your system's security and is intended as a temporary measure while you're updating the allow list. After completing the update, enable the allow list by setting **ACC_ALLOW_LIST=1**.
ACC_VALIDATE_SIG	Optional string. To disable verification of the installer certification validation, set *ACC_VALIDATE_SIG=0* that you can add to disable the verification of the installer certification validation. By default, validation is enabled. **Note:** Disable the certification validation only when using non-standard signature validation tools.

3. Start the Agent Client Collector service using the default ServiceNow user role created during this installation.

   The default ServiceNow user role has the following privileges:

   - Performance Monitor: Viewing all performance counters in the system.
   - Log on as a service: Starting network services and services that run continuously, even when no one is logged in to the console.
   - Debug program: Monitoring the installed applications and collecting in-depth metrics and remedial actions, such as restart and stop.

4. To collect DEX metrics, restart the ACC service using one of the following methods:

   - Add **Remote Desktop user** to ServiceNow user.
   - Run as a local system account user.
   - Run as a managed group user.

5. Restart the Agent Client Collector service.

Run ACC as a local system account user

To fetch the complete playbook content data for a Windows device, the Agent Client Collector (ACC) must run as a local system account.

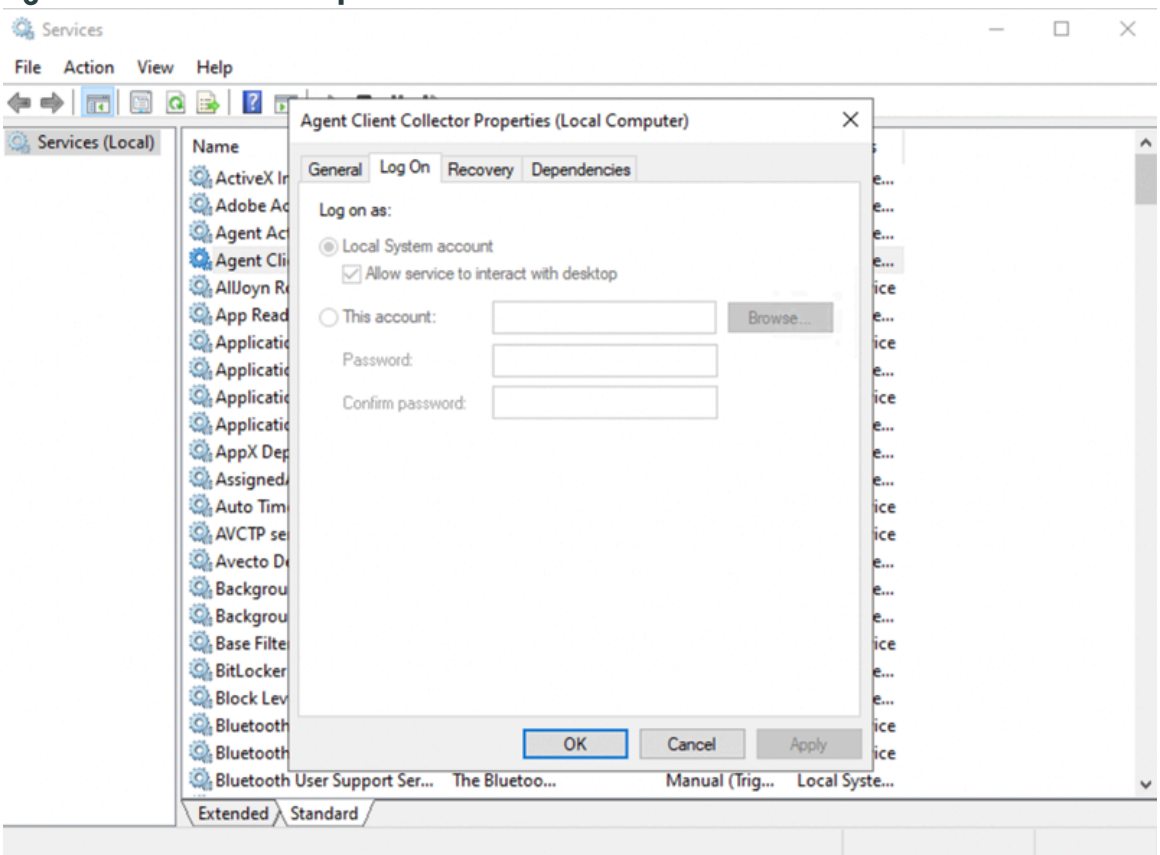
Before you begin

Role required: sn_dex.admin

Procedure

1. From the Windows task bar, navigate to **Services** > **Run as administrator**.
2. Open the Agent Client Collector service and select the **Log On** tab.
3. Select **Local System account** and select **OK**.

Agent Client Collector Properties window



Run ACC as a managed group user

Run Agent Client Collector (ACC) from a managed group account to meet your organization's security, manageability, and auditability requirements.

Before you begin

Create a user and add the user to the following groups:

- Remote Desktop users: Required to fetch the logged-in user details.
- Performance Monitor users: Required to fetch all performance-related metrics of application and device level.
- ServiceNow users: Has privileges to Performance Monitor, Log on as a service, and Debug program.
- Administrator users: Equivalent to a local system user, provides access to fetch information on Bit locker, energy consumption, and so on.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

Procedure

1. On the Windows host, navigate to **Services**.
2. Select and hold (or right-click) **Agent Client Collector**.
3. Select **Properties**.
4. Select the **Log on** tab.
5. Select the user that you created.
6. Select **OK**.

Enable DEX browser extension

Activate the DEX Chrome or Edge Extension on your system to collect different operational or performance-based metrics for the web applications.

Before you begin
Confirm that the DEX plugin [sn_dex] is installed.

Confirm that the browser versions are Google Chrome 114 or higher, and Microsoft Edge version 96 or higher.

Role required: sn_dex.admin

Procedure

Perform the following steps to install DEX Browser Extension based on your browser.

Result
The Google Chrome or Microsoft Edge extension is enabled by default, and when monitoring of the web applications begins, the collected metrics are sent to the ServiceNow instance.

What to do next
Onboard for DEX Application and Device Health.

Onboard for DEX Application and Device Health

During the onboarding process, when there's no application listed to be monitored, you can begin by accessing a list of available applications. You can also add your own custom applications and enable them for monitoring along with any existing applications.

Before you begin
To add an application to be monitored, verify you have completed the following tasks:

- Create an ACC registration key
- Install ACC:
  - Install ACC for DEX on macOS
  - Install ACC for DEX on Windows
- Enable DEX browser extension

Role required: sn_dex.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Application management**.

   A pre-existing list of monitoring-enabled applications is provided, initially turned off. You can add your own application to the list.
4. To add a new application, perform the following steps.
   a. Select **+ New application**.
   b. On the form, fill in the fields and select **Save**.

      For more information on each field, see New web or installed application form.
5. To monitor an application from the pre-existing list, turn on the application monitoring.
   For more information on how to turn on an application, see Enable application monitoring.

What to do next

You can explore the product and learn about the various pages and their offerings by accessing Application & Device Health.

Convert MID-based ACC to MID-less

Convert MID-based Agent Client Collector (ACC) to MID-less ACC by adjusting the configuration in acc.yml, decoupling from a specific MID to enhance flexibility and adaptability.

Before you begin

Verify that the ACC registration key was set up and the ACC was installed. For more information, see the following:

- Create an ACC registration key.
- Install ACC for DEX on Windows or Install ACC for DEX on macOS.

Role required: agent_admin and agent_client_collector_admin

For more information, see Agent Client Collector user roles.

Procedure

1. Stop ACC based on your operating system:
   - For Windows, access Services as administrator and stop the Agent Client Collector Service.
   - For macOS, execute the command: `sudo launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist;`.
2. Open the `acc.yml` file.
3. Edit the instance URL.
4. Edit the *`backend-url`* parameter to point to `<ITOM Cloud Services Gateway>`.

   Use one of the following gateways based on the instance location:
   - AMER: `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
   - EMEA: `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
   - APAC: `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on how the Agent uses the ITOM Cloud Services Gateway, see DEX Architecture.

5. Configure the following parameters:
   - connect-without-mid: true
   - instance-url: <full_instance_url>

     For example: https://dex.servicenow.com.
   - insecure-skip-tls-verify: false
   - registration-key: <registration key value>

     For more information, see Create an ACC registration key.
6. Comment out the API key parameter:
   `api-key: "encrypted...”`
7. Save the file.
8. Delete files based on your operating system:
   - On Windows, navigate to `/agent-client-collector/config/cert/cnc` and remove the following files: `cnc_chain.crt` and `priv_key.pem.go`.
   - On macOS, access `/Library/Application Support/servicenow/agent-client-collector/cert/cnc` and delete the files: `cnc_chain.crt` and `priv_key.pem`.
9. Delete `assets.db`, `queue.db`, and all subdirectories in the cache folder based on your operating system:
   - On Windows: `/agent-client-collector/cache`.
   - On macOS:
     - For Agent 3.4.1 or above: `/Library/Application Support/servicenow/agent-client-collector/cache`.
     - For Agent 3.4.0 or below: `/Library/Caches/servicenow/agent-client-collector`.

   Important:
   Keep `agent_now_id` in the cache folder.
10. Initiate the ACC service based on your operating system.
    - On Windows, open Services as administrator, then start the Agent Client Collector Service.
    - On macOS, use the command: `sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist`.

Configure ACC to use a proxy for all traffic

Configure the Agent Client Collector (ACC) to use a proxy for all traffic by setting environment variables. Using a proxy helps you enhance security, monitor and control internet usage, improve performance through caching, protect privacy, and enforce compliance with your organization's policies.

Before you begin

Consider the following aspects before configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Ports, protocols, and firewall/proxy configurations required to enable ACC to reach the ServiceNow cloud
- Network-based security tools (IDS, proxy, SSL interception, NAC) that might block ACC connectivity
- DNS resolution and routing for stable connectivity and failover support
- Support of WebSockets by the proxy
- Firewall rules that prohibit access to ITOM gateway

Role required: admin

About this task

Proxy setup is needed in the following use cases:

- You're using ACC for DEX or ACC-V without a MID Server.
- You must route traffic through an internal proxy to reach the ServiceNow cloud.

Procedure

1. Run diagnostics to verify that the endpoint can reach ServiceNow before making changes.

2. Open the acc.yml file from the following location.

3. In acc.yml with a version of ACC greater than 4.3.0, set the proxy as shown in the following example:
   `https-proxy: "http://intproxy0.your-corp.com:8080"`
4. **Optional:** Set up proxy authentication by setting the user name and password in the environment variable itself:
   `HTTPS_PROXY="http://username:password@intproxy0.your-corp.com:8080"`
5. **Optional:** Set the NO_PROXY environment using a comma-separated list of hosts to not proxy. For example, `localhost`.
6. Test connectivity using a proxy server with mTLS used by ITOM Cloud Services.
   You need the following files from your local endpoint:
   - `cacert.pem` - Certificate Authority certificate file used to validate the server identity (downloaded from ServiceNow with openssl)
     - Windows:

       ```
       openssl s_client -showcerts -connect
        itomcnc-prod-gateway-amer.sncapps.service-now.com:443 <NUL
        | findstr /B /C:"-----BEGIN CERTIFICATE-----" /C:"-----END
        CERTIFICATE-----" > cacert.pem
       ```

     - macOS:

       ```
       openssl s_client -showcerts -connect
        itomcnc-prod-gateway-amer.sncapps.service-now.com:443
        </dev/null | sed -ne '/-BEGIN CERTIFICATE-/,/-END
        CERTIFICATE-/p' > cacert.pem
       ```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `cnc_chain.crt` - client certificate file to present to the server for mutual TLS authentication (`agent-client-collector/cert/cnc`).
- `priv_key.pem` - private key associated with the client certificate (`agent-client-collector/cert/cnc`).

7. Fetch assets using a proxy with mTLS.

```
# Will attempt to fetch an asset used by ACC-V using a proxy.
 The file is not saved.
# Remember, replace intproxy0.your-corp.com:8080 with your
 internal host and port.
curl -v --proxy http://intproxy0.your-corp.com:8080
 --cacert cacert.pem --cert cnc_chain.crt
 --key priv_key.pem --request GET --output NUL
 https://itomcnc-prod-gateway-amer.sncapps.service-now.com:4
43/content/v1/assets/afaa52edc32f7150f640f2ff050131c8/a4ef65d00
adbab1659f460f8d4e311d8db65f519994f63d176951ce1e0297e08
```

8. Inspect the output of the cURL to see if the command succeeded using the proxy.

Switch ACC from one instance to another

Switch Agent Client Collector (ACC) to a different instance.

Before you begin

Confirm you have installed the Agent Client Collector (ACC) and set up the ACC registration key. For information on how to set up and install, see:

- Create an ACC registration key.
- Install the Agent Client Collector on a Windows machine manually or Manually install Agent Client Collector on macOS.

Role required: agent_admin and agent_client_collector_admin

For more information on roles, see Agent Client Collector user roles.

About this task

If ACC is already connected to one instance, you can switch the agent to another instance by changing the configuration in `acc.yml`.

Procedure

1. Stop ACC with the steps appropriate for your operating system.
   - For Windows, access Services as Administrator and stop the Agent Client Collector service.
   - For macOS, execute the command: `sudo launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist;`
2. Open the `acc.yml` file.
   - Windows: `C:\ProgramData\ServiceNow\agent-client-collector\config`
   - macOS: `/Library/Application\ Support/servicenow/agent-client-collector/`
3. Edit the *`backend-url`* parameter to point to `<ITOM Cloud Services Gateway>`.

   Use any of the following gateways based on the instance location:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- AMER: `itomcnc-prod-gateway-amer.sncapps.service-now.com:443`
- EMEA: `itomcnc-prod-gateway-emea.sncapps.service-now.com:443`
- APAC: `itomcnc-prod-gateway-apac.sncapps.service-now.com:443`

For more information on how the Agent uses the ITOM Cloud Services Gateway, see DEX Architecture.

4. Update the following parameters:
   - connect-without-mid: true
   - instance-url: <full_instance_url>, example: https://dex.servicenow.com
   - registration-key: <registration key value>

     For more information on how to create a registration key, see Create an ACC registration key.
5. Save the file.
6. Delete files based on your operating system.
   - On Windows, navigate to `/agent-client-collector/config/cert/cnc` and remove the following files: `cnc_chain.crt` and `priv_key.pem.go`.
   - On macOS, access `/Library/Application Support/servicenow/agent-client-collector/cert/cnc` and delete the files: `cnc_chain.crt` and `priv_key.pem`.
7. Delete the following folders based on your operating system.
   - On Windows, delete the folder: `/agent-client-collector/cache`.
   - On macOS:
     - For Agent 3.4.1 or above, delete the folder: `/Library/Application Support/servicenow/agent-client-collector/cache`.
     - For Agent 3.4.0 or below, delete the folder: `/Library/Caches/servicenow/agent-client-collector`.
8. **Optional:** If you have connected this ACC to another instance before, do the following:

   a. Copy your device serial number.

   b. In the Agent Client Collectors table (sn_agent_cmdb_ci_agent), search using your device serial number.

   Note:
   Add the **Agent ID** column to the list view if it isn't available.

   c. If you find a record, copy the record Agent ID.

   d. In the Agent Registrations table (sn_agent_agent_registration), search using the record Agent ID.

   e. Delete any records resulting from the search.
9. Initiate the ACC service by following the steps specific to your operating system.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- On Windows, open Services as Administrator, then start Agent Client Collector.
- On macOS, use the command: `sudo launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist`.

Add an application for monitoring

Add an application to the list of all the applications that are being monitored. With a comprehensive view of your applications, you can quickly identify and address issues as they arise.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

To add an application to be monitored, verify you have completed the following tasks:

- Create an ACC registration key
- Install ACC:
  - Install ACC for DEX on macOS
  - Install ACC for DEX on Windows
- Enable DEX browser extension

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. On the Application management card, select **Configure applications**.
   The list of monitored applications appears.
4. Select **New** > **Installed app** or **New** > **Web app**.
5. On the form, fill in the fields.
   For more information on each field, see New web or installed application form.
6. Move the monitoring toggle switch ( ) to turn on the reporting.
7. Select **Save**.

Result

The application is added to the list of monitored applications.

Edit application details

Edit various details about the application, such as its name, monitored processes, and so on.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Application management card, select **Configure applications**.
   The list of monitored applications appears.
4. Select the name of the application that you want to modify.
   The Edit installed application or Edit web application form appears.
5. On the form, edit the required fields.
   For more information on each field, see Edit web or installed application form.
6. Select **Save**.

Result
Application details are updated.

Add a logo for your application

Add a logo to improve the visual appeal of your application and to distinguish it from others.

Before you begin
Role required: sn_dex.admin

About this task
You can only add a logo for an existing application.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace** and from the left pane, select the DEX Administration icon ( ).
2. Select the **Manage Applications** card.
   The list of monitored application appears.
3. Select the name of the application for which you'd like to add a logo.
   The Edit Application form appears.
4. Select the **Add/Edit image** link.
   The Application form opens in a new window.
5. On the **Logo** field, select **Click to add**.
6. Select **Choose file**, select **Open**, and then select **OK**.
7. Close the window.

What to do next
To see the new application logo, perform the following steps.

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the left pane, select the Applications icon ( ).
3. Open the application for which you have added the logo.

   The logo appears before the name of the application.

Enable application monitoring

Enable application monitoring to gain insights into performance metrics, diagnose issues, and promote optimal functionality, enhancing performance and proactively addressing potential bottlenecks or failures.

Before you begin
Confirm that the DEX plugin (sn_dex) is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. On the Application management card, select **Configure applications**.
   The list of monitored applications appears.
4. Select the name of the application for which you want to enable monitoring.
   To enable monitoring for more than one application, you can select the check boxes next to an application and select **Turn on metrics monitoring** under **Actions**.
5. **Optional:** Only when enabling the Microsoft Configuration Manager (MCM), Microsoft Teams, or DEX for Zoom include **Advanced monitoring** by selecting **MCM - Only choose this option for MCM** or **Microsoft Teams** from the drop-down list.

   Note:

   - For more details on the MCM monitoring, see Advanced app metrics page.
   - For more details on Microsoft teams call quality, see Monitor Microsoft Teams call quality.
   - For more details on Zoom calls monitoring, see .

6. Select **Save**.

Turn off application monitoring

Disable the monitoring of an application in situations where monitoring is causing performance issues or interfering with the functionality of the application.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. On the Application management card, select **Configure applications**.
   The list of monitored applications appears.
4. Select the check box next to the application name that you want to turn off.
5. Select **Turn off metrics monitoring** in the **Actions** drop-down list.
   The monitoring of the application is turned off.

Delete an application from the monitoring list

Delete an application from the monitoring list when there's no longer a need to track its performance or activity. If necessary, you can add the application in the monitoring list later.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. On the Application management card, select **Configure applications**.
   The list of monitored applications appears.
4. Select the check box next to the application name that you want to delete.
5. Select **Delete selected applications** in the **Actions** drop-down list.
6. On the confirmation window, select **Delete**.

Result
The application is deleted from the list of monitored applications.

View DEX administrators

Look up the application administrators who are responsible for managing the application, promoting its proper functioning, and handling any issues that might arise.

Before you begin
Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Configure** on the User roles card.
   The User Roles table opens in a new window, with users grouped by a role.
4. Select **Role: sn_dex.admin** to see the list of DEX admins.

Result
The list displays all the administrators available for DEX.

Metric rules for Digital End-User Experience

Metric rules set criteria and thresholds, triggering alerts when performance metrics deviate from specified parameters and facilitating effective system monitoring and management. This comprehensive approach to generating alerts enables you to identify and address potential issues, which helps enhance system reliability and operational efficiency.

To access the metric rules page, navigate to **Workspaces** > **Service Operations Workspace** and, in the primary navigation, select the Administration icon ( ). Select the **Metric rules** card.

Note:
When you initially install Digital End-User Experience (DEX), a set of preconfigured metric rules is available with the base system. These rules remain inactive on installation. For more information on how to activate them, see Activate or deactivate metric rules. If you delete these rules, they're permanently removed and can't be retrieved.

If you installed the DEX Proactive Engagement application and added an alert action for any of the rules, the **Action** field shows the action that you added for that metric rule.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For details about the fields and their descriptions on the metric rules page, see Metric rules page.

Create metric rules

Create metric rules to establish criteria and thresholds for performance metrics, enabling timely alerts and proactive system management.

To create a metric rule, you must perform the following steps.

1. Specify the configuration item for metric rules.
2. Define alert metric criteria.
3. Add an alert action.
4. Define metric rule name and status.

Specify the configuration item for metric rules

Choose application or device and define filter conditions for the metric rule.

Before you begin

Ensure that the DEX plugin [sn_dex] is installed and you are on the Metric rules page.

Role required: sn_dex.admin

Procedure

1. Select **Create new rule**.

   A new tab opens for the Create metric rule window, with the the **Select the CI** option pre-selected in the left pane.

2. Select any one of the following types of configuration items you want to monitor.
   - Saas/web application
   - Installed application (.exe, .app, etc.)
   - Device
3. For **Saas/web application** or **Installed application**, select the application to monitor.

   Note:
   If you select **Device**, the option to choose an application would not be available.

4. **Optional:** Apply conditional filtering on the configuration items.
   The predetermined filtering choices include Department, Location, OS, User, and Version, with the Version option specifically designed for installed applications.

   (Optional) To add additional filters, select **+ New condition set**.

5. Select **Next**.
   The **Add criteria** option is selected in the left pane.

What to do next

Define alert metric criteria.

Define alert metric criteria

Specify alert metric criteria by choosing alert severity, defining thresholds, and specifying conditions for when the alert must be triggered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: sn_dex.admin

Procedure

1. In the **Alert severity** field, select a severity for the alert.
2. Define the thresholds for the alert.
   The predetermined metrics are based on the configuration item (CI) type, such as SaaS/web, Installed, or Device.

   Note:
   You can select the following network stability metrics on Windows devices:
   - Application Crashes
   - Application Domain Jitter
   - Application Domain Network Latency
   - Application Domain Packet Loss

3. **Optional:** Add another alert severity level by selecting **Add another alert severity**.
4. Select the **Set the threshold for users** check box and define the criteria based on the number of impacted users to trigger the alert.
5. In the Alert when section, perform one of the following steps.
   - Select **All sampled values must breach the criteria in the following time period** and define the time period.
   - Select **Average of sampled values in the following time period must breach the criteria** and define the time period.
6. **Optional:** If you want to define the conditions when to clear the alert, under **Clear the alert when**, define the conditions.

   (Optional) The condition fields are enabled when you create at least one condition.

7. Select **Next**.
   The **Set alert action (optional)** option is selected in the left pane.

What to do next

Define metric rule name and status.

Add an alert action

Set up an alert action with Proactive Engagement for Digital End-User Experience to detect the digital experience issues and automate resolution actions.

Before you begin

- Confirm that the Proactive Engagement plugin (sn_pren) for Digital End-User Experience (DEX) is installed.
- Make sure that the configuration items for the metric rule are specified and the alert metric criteria are defined. For more information, see Specify the configuration item for metric rules and Define alert metric criteria.

Role required: sn_dex.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the **Add alert action (optional)** page, select **Add resolution**.
2. On the Proactive resolution content page, fill in the fields.

   For a description of the field values, see Resolution for Proactive Engagement.
3. Select **Continue to Engagement Settings**.
4. Configure the engagement settings to facilitate self-resolution of issues through predefined solutions.

   For more details about the engagement settings, see Engagement Settings for Proactive Engagement.
5. Select **Add Resolution**.

Define metric rule name and status

Define metric rule attributes, including the name and state, such as active or inactive.

Before you begin

Role required: sn_dex.admin

Procedure

1. In the **Name** field, enter a name for the rule.
   The metric rule is active by default.
2. For setting the status of the metric rule, use the **Active** slider ( ) to enable or disable the rule.
3. Select **Finish**.

   A metric rule is created and displayed in the Metric rules window.

Edit metric rules

Modify metric rules to fine-tune monitoring criteria and thresholds.

Before you begin

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Configure** on the Metric rules card.
   The list of metric rules appears.
4. Select the name of the metric rule that you want to update.
5. Modify the values as needed, selecting **Next** to navigate between the pages.
6. Select **Update**.

> **Note:**
> If you edit an existing alert action or proactive resolution, the changes are saved even if the metric rule is closed without saving.

Result

The metric rule is updated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View alerts generated from metric rules

Easily track performance insights with alerts from metric rules.

Before you begin
Role required: sn_dex.user or sn_dex.admin

Procedure

Navigate to **Workspaces** > **Service Operations Workspace** and from the left-hand pane, select the Express list icon ( ).

Note:
When multiple alerts are triggered for events that are part of the same rule, these alerts are automatically grouped together.

For more information on alert grouping, see DEX alert grouping.

DEX alert grouping

When several alerts are triggered from events governed by the same metric rule in DEX, the alert grouping mechanism automatically consolidates them. This mechanism reduces the need for users to manage individual alerts, streamline their response process, and enable faster issue resolution.

When alerts are grouped together, you see the total count of secondary alerts grouped next to the primary alert number.

DEX events and alerts representation

In the Events table [em_event], any event with the **Source** field value as DEX is classified as a DEX event. For DEX, the **Type** field displays **DEX Metric Rules** as DEX alerts are generated based on DEX metric rules. When for any event, the **State** of the event is **Processed**, an alert is generated and saved in the Alerts table [em_alert].

In the Alerts table [em_alert], select any alert to access its details. An alert that is created from a DEX event, displays the **Source** field value as DEX. The **Metric name** field value appears as either DEX App Metric or DEX Device Metric. For an alert, the **Metric name** field value is DEX Device Metric. The **Configuration item** field shows the name of the corresponding application or device. For the alert whose corresponding **Group** field shows **Rules-based**, are the DEX alert groups.

Rule for alert correlation

In **All** > **Event Management** > **Rules** > **Alert Correlation Rules**, the DEX Metric Correlation Rule determines when alerts must be grouped and provides necessary details.

Note:
For one application and one metric rule, there is only one alert in DEX. DEX creates alert groups when the metric rule is the same, regardless of whether the configuration items are the same or different. When the problem is resolved, closing the primary alert also closes the secondary alerts within the same group.

Time-based alert grouping

Time-based alert grouping automatically groups alerts according to predefined time intervals, which is advantageous for services generating numerous alerts. Consolidated alerts result in fewer disruptions for responders and contribute to shorter resolution times.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In the System Properties table [sys_properties], the property *sn_dex.alert.correlation_rule.device.period* defines the time period in seconds for grouping and correlating similar metric rule-based DEX alerts. In the **Value** field, you can enter the desired time duration in seconds. For example, to set a 5-minute gap between alert groupings, enter 300. Entering 0 disables the rule.

Let's consider an example: Alert A1 is generated for rule R1 from device D1. After two minutes, alerts A2 and A3 are generated for the same rule R1, but from devices D2 and D3 respectively. With A1 being the first alert, it's designated as the primary alert, and A2 and A3 are grouped as secondary alerts under A1.

Now, suppose you have set the time duration to 300 seconds (5 minutes). If no alerts for rule R1 are generated within five minutes, and then after this period, alerts A4, A5, and A6 are generated for the same rule, a new group is formed. Alert A4 becomes the primary alert, and A5 and A6 are grouped under A4.

However, if any alert is generated for rule R1 within five minutes, it's considered a secondary alert to A1 and grouped accordingly.

Deactivate DEX alert grouping

Deactivating DEX alert grouping allows for individual alert visibility, aiding in detailed analysis and targeted response.

Before you begin

Role required: sn_dex.admin

Procedure

Perform one of the following options.

Activate or deactivate metric rules

Activate or deactivate metric rules to streamline monitoring and adapt to changing needs, enhancing operational efficiency.

Before you begin

Role required: sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Configure** on the Metric rules card.
   The list of metric rules appears.
4. On the Update metric rule page, select **Name the rule**.
5. Under Rule status, use the **Active** slider ( ) to enable the rule.

   If you want to deactivate an active metric rule, simply slide the toggle switch to the off position.
6. Select **Update**.

Delete metric rules

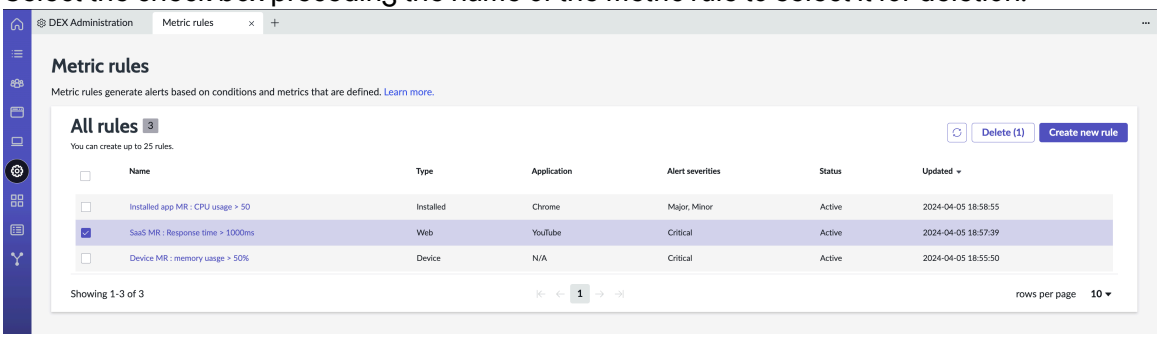
Remove metric rules to adjust monitoring criteria and thresholds.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: sn_dex.admin

About this task
Deleting any rules results in their permanent removal, and they cannot be retrieved.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace** and from the left pane, select the Administration icon ( ).
2. Select the **Metric rules** card.
   The metric rules home page appears.
3. Select the check box preceding the name of the metric rule to select it for deletion.



4. Select **Delete**.
5. In the confirmation window, select **Delete**.
   The metric rule is removed from the list.

Set up file management

Set up files you want to track and manage with DEX on your organization devices. For example, you can identify and remove any dangerous .exe files that pose a security risk.

Before you begin
Role required: admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Configure** on the File management card.
4. On the File management page, select **Add files**.
5. In the Add files form, enter a file name and select one of the following categories for the file:
   - Application
   - Malicious
   - Security
   - Development tools
   - System
   - Others

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Installers
- Potentially Unwanted Programs

Note:
Files you want to monitor must end in `.exe`. The maximum character limit for the file name is 256 characters, including the `.exe` extension.

6. Add one or more files by selecting **Add**.
   You can manage up to 20 files.
7. Select **Save**.

Result
The data for the files you set up appears after the next policy run.

Set up Windows registry keys

Track and manage the Windows registry keys that are configured for monitoring with DEX on end-user devices.

Before you begin
Role required: admin

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Configure** on the Windows registry management card.
4. On the Windows registry management page, select **Add registry keys**.
5. In the Add registry keys form, enter a full path name for a registry key and an expected value. The expected value can't be a JSON object and must be a single primitive value, such as a string or integer.

   Note:
   The maximum character limit for a registry key path and an expected value is 1024.

6. Add one or more keys by selecting **Add**.
   You can manage up to 20 keys.
7. Select **Save**.

Manage your system compliance report

Configure the DEX policy metrics and the applications to monitor for your organization's compliance report. Set up the compliance-related rules and actions for your organization's devices based on defined thresholds.

Before you begin
Confirm that the DEX plugin (sn_dex) is installed.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **System compliance**.
4. Choose one or more of the following options to configure how you want to monitor the compliance of your organization's IT devices.

> **Note:**
> You can enable multiple compliance policy values simultaneously by selecting a check box next to **Metric name**. Adjust your selection as needed by selecting individual check boxes for each value.

For more information on the compliance report, see DEX Insights.

Build custom queries

Build and run custom queries to uncover insights across your digital workspace. Use custom query builder to generate reports on any of the performance metrics on your device.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Insights icon ( ).
3. Select **Query builder** on the **Insights** page.
4. Select the option to filter the query.
5. Add the custom metrics to generate the query output.
6. Select **View results**.

Result

The custom query results appear.

> **Note:**
> You can choose to export the query result and access the download file from the downloaded reports.

Monitoring non-persistent VDIs

Monitoring non-persistent Virtual Desktop Infrastructures (VDIs) with Digital End-User Experience (DEX) enables your organization to track performance issues and troubleshoot efficiently.

Non-persistent VDIs provide end users with a fresh desktop environment each time they log in. VDIs are an attractive choice for organizations requiring standardized and secure desktops, such as those in healthcare, education, or customer support.

When a VDI is initialized for the first time, it completes the standard registration process and downloads a certificate from the ServiceNow cloud. The certificate is then backed up to the persistent storage for future sessions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

During subsequent active sessions, the Agent Client Collector (ACC) continuously collects performance and usage data. Before a session ends, the log-off script pushes any residual metrics to the ServiceNow cloud, helping to prevent data loss. In subsequent sessions, the log-on script restores the certificate from persistent storage, enabling local authentication and eliminating the need to download certificates again. This process minimizes the load on the ServiceNow instance and promotes efficient operation.

Benefits of monitoring non-persistent VDIs

Monitoring non-persistent VDIs with Digital End-User Experience addresses these challenges by enabling the following.

Enhanced user experience

You can identify performance issues such as slow logging in, crashes, or sluggish application and device performance, even after the desktop session has ended.

Efficient troubleshooting

You can analyze device and application metrics data to pinpoint issues reported by employees, reducing guesswork in problem resolution.

Configure non-persistent VDIs monitoring

Learn how to start non-persistent Virtual Desktop infrastructure (VDI) monitoring by creating a golden image on the base instance. This process enables DEX Service Desk agents to collect and view non-persistent data from VDIs.

Before you begin

Make sure you have the following on the reference device:

- Installed DEX plugin
- Installed Agent Client Collector plugin
- Retrieved login and logout scripts provided by ServiceNow

Role required: admin

About this task

When a VDI starts for the first time, the standard registration process is completed and a certificate is downloaded from the ServiceNow cloud. The certificate is then backed up to the persistent storage for future sessions.

Procedure

1. On the reference device, update the `acc.yml` file as follows:
   ```
   persistence_type = non_persistent
   ```
2. Create a golden image and configure the VDI pool with post-synchronization and power-off scripts.
3. Depending on the tool your organization uses for authentication, modify authentication steps in the login and logout scripts.

Setting up DEX Desktop Assistant

Download Desktop Assistant and customize the Home page by dividing the page into sections of cards to access applications more efficiently.

With a Desktop Assistant administrator role [sn_dex_desktop.admin], you can configure the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refer to the OAuth documentation for instructions on configuring the SSO provider in the instance.

Note:
If you experience issues with Desktop Assistant, troubleshoot them by accessing the logs at these locations:

- macOS: `Users/[username]/Library/Application Support/desktop_assistant_app/logs`
- Windows: `Users\[username]\AppData\Roaming\desktop_assistant_app\logs`

Download and install Desktop Assistant

Download and install Desktop Assistant by using operating system-specific installer commands, Desktop Assistant installers, or endpoint management solutions.

Before you begin
Make sure that you have installed the Digital End-User Experience application. For more information, see Install Digital End-User Experience.

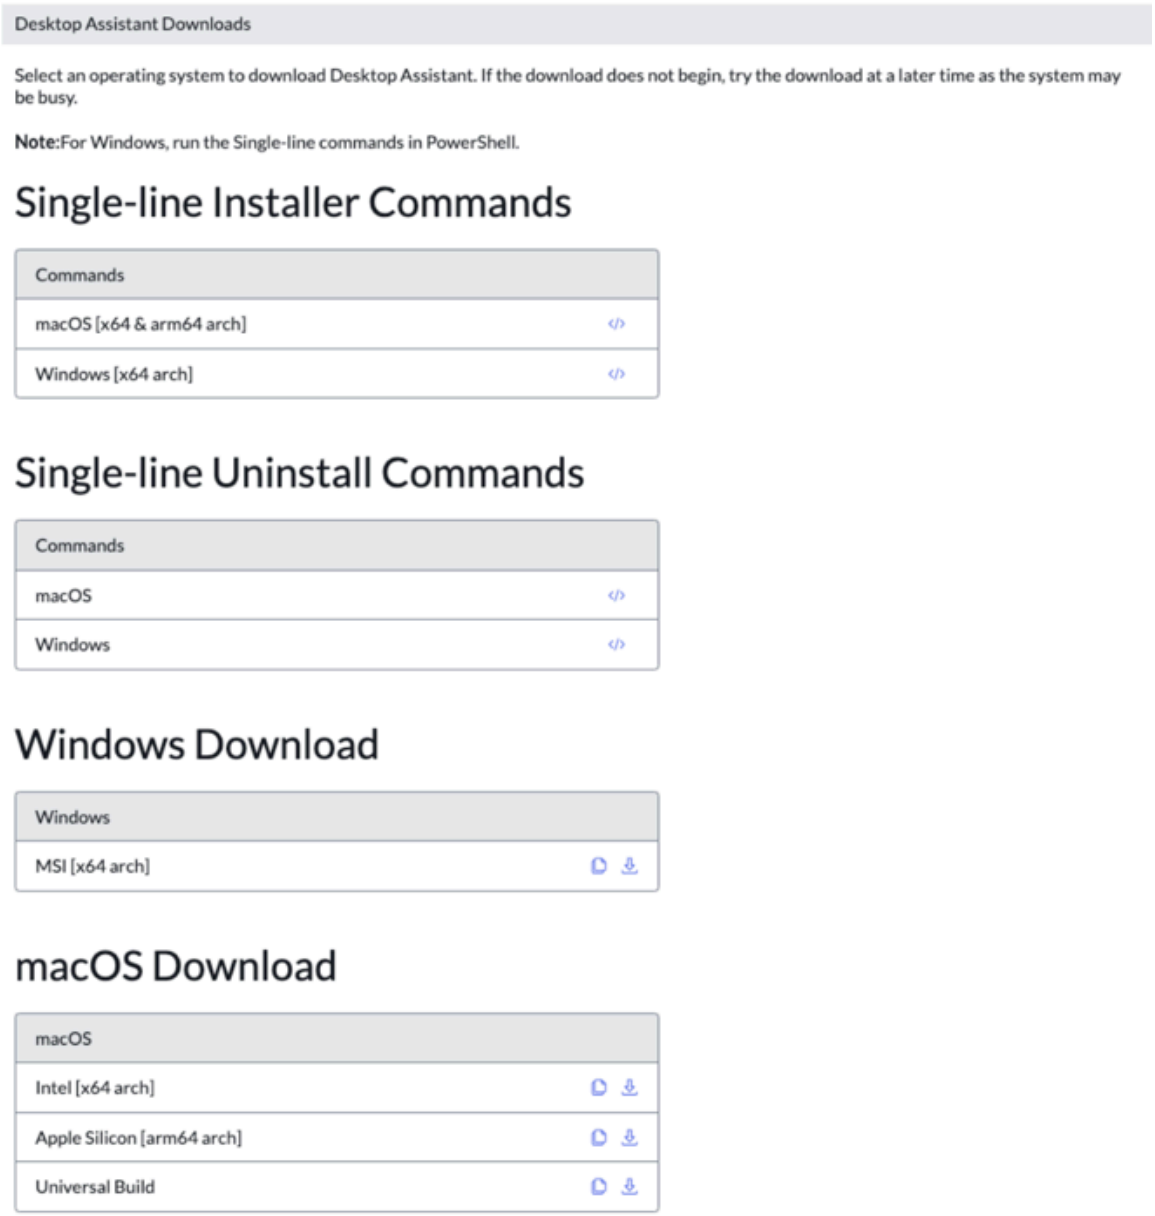
Note:
You can install Desktop Assistant on 75000 devices for each instance.

Role required: sn_dex_desktop.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Desktop Assistant** > **Deployment** > **Installer and Uninstaller**.



2. Download and install Desktop Assistant by using installer commands, Desktop Assistant installers, or endpoint management solutions.
   - Download and install Desktop Assistant by executing OS-specific single-line installer commands.

     Note:
     You must have administrator privileges to run the single-line installer commands.

     a. Select the copy command icon (</>) to copy the command or script to execute.

     b. On your computer, open Terminal.app (macOS) or run PowerShell (Windows) as administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Paste the command and press Enter.

d. When prompted for a password, enter your active directory password and press Enter.

Desktop Assistant is installed, and the instance URL from the installer is automatically populated in the **Instance URL** field of the Desktop Assistant login page.

- Download and install Desktop Assistant by using the Desktop Assistant installer specific to your operating system.

  a. For Windows devices, see Download Desktop Assistant for Windows.

  b. For macOS devices, see Download Desktop Assistant for Mac.

- Install Desktop Assistant on multiple devices using endpoint management solutions such as Jamf and Microsoft Endpoint Configuration Manager (MECM).

  Note:
  You must have administrator privileges to install Desktop Assistant on multiple devices using endpoint management solutions.

  a. Log in to your ServiceNow instance and download Desktop Assistant.

  b. Deploy the Desktop Assistant file on multiple devices using an endpoint management solution.

  c. Update the Desktop Assistant instance URL for all the devices on which you have installed Desktop Assistant.

  For more information, see Update instance URL in the Desktop Assistant configuration file.

Result
Desktop Assistant is downloaded and installed.

Download Desktop Assistant for Windows

Download the Desktop Assistant installer on your Windows device to install the Desktop Assistant application.

Before you begin
Role required: sn_dex_desktop.admin

Procedure
1. Navigate to **All** > **Desktop Assistant** > **Deployment** > **Installer and Uninstaller**.
2. In the Windows Download section of the Desktop Assistant Downloads page, select the download icon ( ) for the **MSI [x64 arch]** installer.
   The `Desktop_Assistant_<Version>.msi` file is downloaded to your computer.
3. Double-click the setup file and follow the steps in the installation wizard to complete the installation.

Result
Desktop Assistant is installed. You see the Desktop Assistant application on the Start Menu and the Desktop Assistant icon ( ) on the system tray.

When you install Desktop Assistant by using the installer, the instance URL field on the login page is not populated automatically. As a system administrator, you can update the instance URL in the Desktop Assistant configuration file. For more information, see Update instance URL in the Desktop Assistant configuration file.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Only the system administrator must update the configuration file or make changes to it while deploying Desktop Assistant on devices.

Download Desktop Assistant for Mac

Download the Desktop Assistant installer on your macOS device to install the Desktop Assistant application.

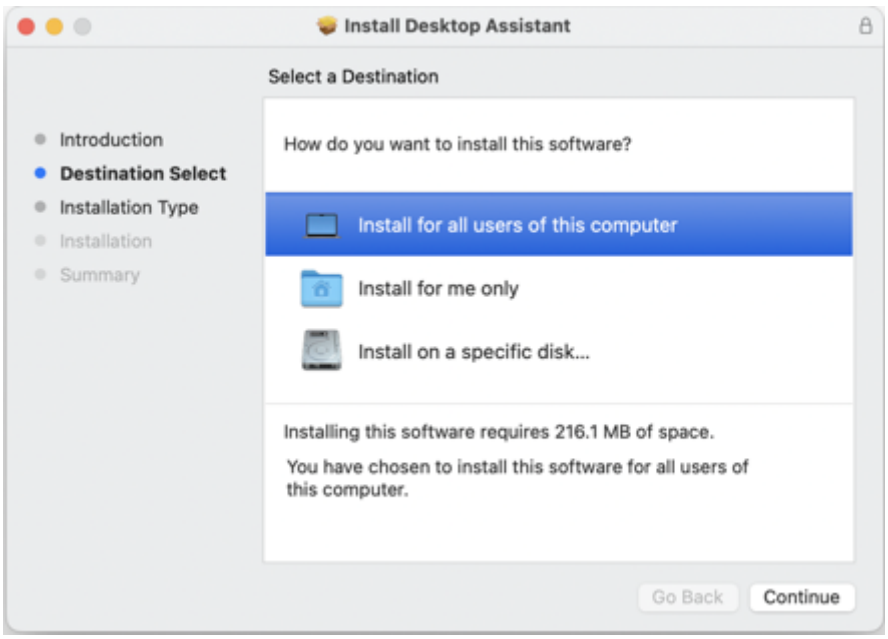
Before you begin

Role required: sn_dex_desktop.admin

Procedure

1. Navigate to **All** > **Desktop Assistant** > **Deployment** > **Installer and Uninstaller**.
2. In the macOS Download section of the Desktop Assistant Downloads page, select the download icon ( ) for the installer you want to download.
   - For macOS devices with Intel chips: Select the **Intel [x64 arch]** installer.
   - For macOS devices with Apple Silicon chips: Select the **Apple Silicon [x64 arch]** installer.
   - For macOS devices with either Intel or Apple Silicon chips: Select the **Universal Build** installer.

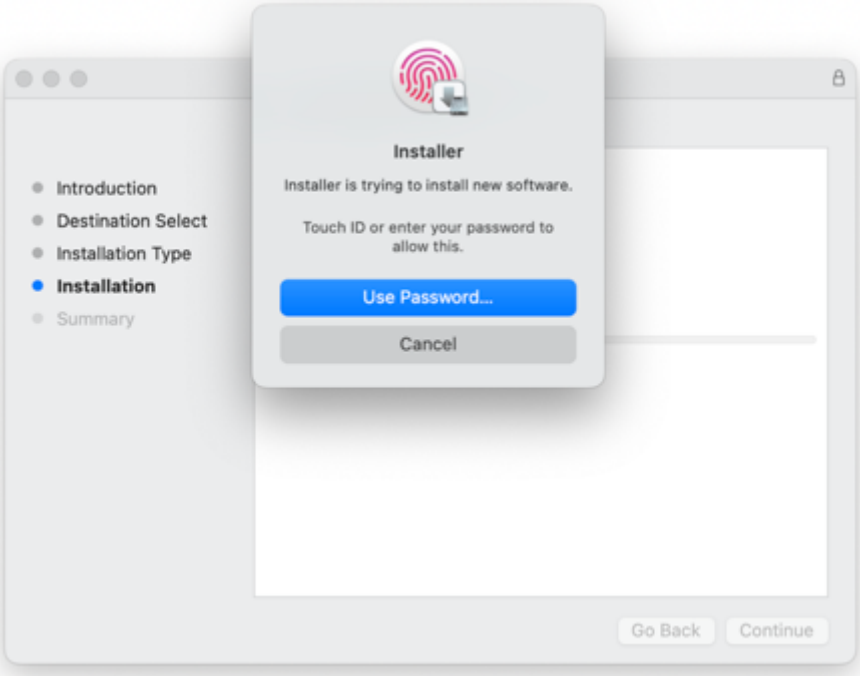
   The installer is downloaded to your computer.
3. Double-click and open the downloaded installer file.
   - For macOS devices with Intel chips: Open the `.x64.pkg` file.
   - For macOS devices with Apple Silicon chips: Open the `-arm64.pkg` file.
   - For macOS devices with either Intel or Apple Silicon chips: Open the `-universal.pkg` file.
4. On the installation wizard, select **Continue** to proceed with the installation.
5. Select the destination folder and then select **Continue**.



6. In Installation Type, select **Install**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. When prompted for a password, select **Use Password**, enter your password, and then select **Continue**.



Result
The Desktop Assistant application is installed on your macOS device.

When you install Desktop Assistant by using the installer, the instance URL field on the login page is not populated automatically. As a system administrator, you can update the instance URL in the Desktop Assistant configuration file. For more information, see Update instance URL in the Desktop Assistant configuration file.

Note:
Only the system administrator must update the configuration file or make changes to it while deploying Desktop Assistant on devices.

Update instance URL in the Desktop Assistant configuration file

Update the instance URL in the Desktop Assistant configuration file to automatically populate the Desktop Assistant login page instance URL on devices on which it is installed.

Before you begin
Role required: admin

Note:
Only the system administrator must update the configuration file or make changes to it while deploying Desktop Assistant on devices.

Desktop Assistant users can update the instance URL when logging in to the application. For more information, see Open Desktop Assistant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On your computer, navigate to the folder that contains the `settings.json` file.
   - On Windows devices: Navigate to the `C:\Users\user_name\AppData\Roaming\desktop_assistant_app` folder.
   - On macOS devices: Navigate to the `Users/user_name/Library/Application Support/desktop_assistant_app` folder.

   Note:
   If you don't see a folder, use Command+Shift+period (.) key to show hidden folders.

2. Find and open the `settings.json` file.
3. Enter the Desktop Assistant instance URL in the *`instanceURL`* field of the JSON file.
4. Save and close the JSON file.

Configure OAuth details

Edit OAuth field values, as required.

Before you begin

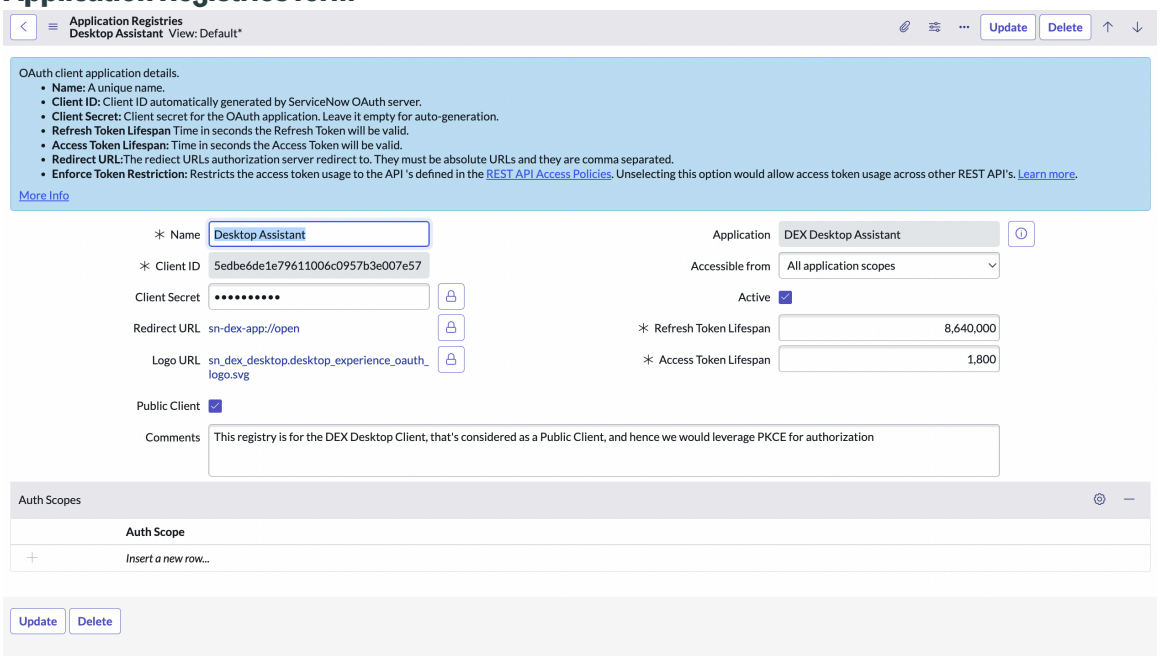
Confirm you have set up the SSO provider and configure it in the instance to ensure its functionality.

Role required: sn_dex_desktop.admin

Procedure

1. In your instance, navigate to **System OAuth** > **Application Registry**.
2. From the list, select **Desktop Assistant**.

Application Registries form



3. On the form, edit the required fields.
   To learn about each field and the corresponding descriptions, see Application Registries form.
4. **Optional:** Customize to avoid SSO Screen during logging in to DEX Desktop Assistant:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Include oauth_login.do in the login_url field.

b. Remove the client secret and save the page.

> **Note:**
> If the Login URL field doesn't appear on the form by default, select and hold (or right-click) the header, select **Configure** > **Form Layout**, then add **Login URL**.

5. Select **Update**.

Result
The OAuth client application details are updated.

Uninstall DEX Desktop Assistant

Remove Desktop Assistant effortlessly using single-line uninstaller commands for a clean system.

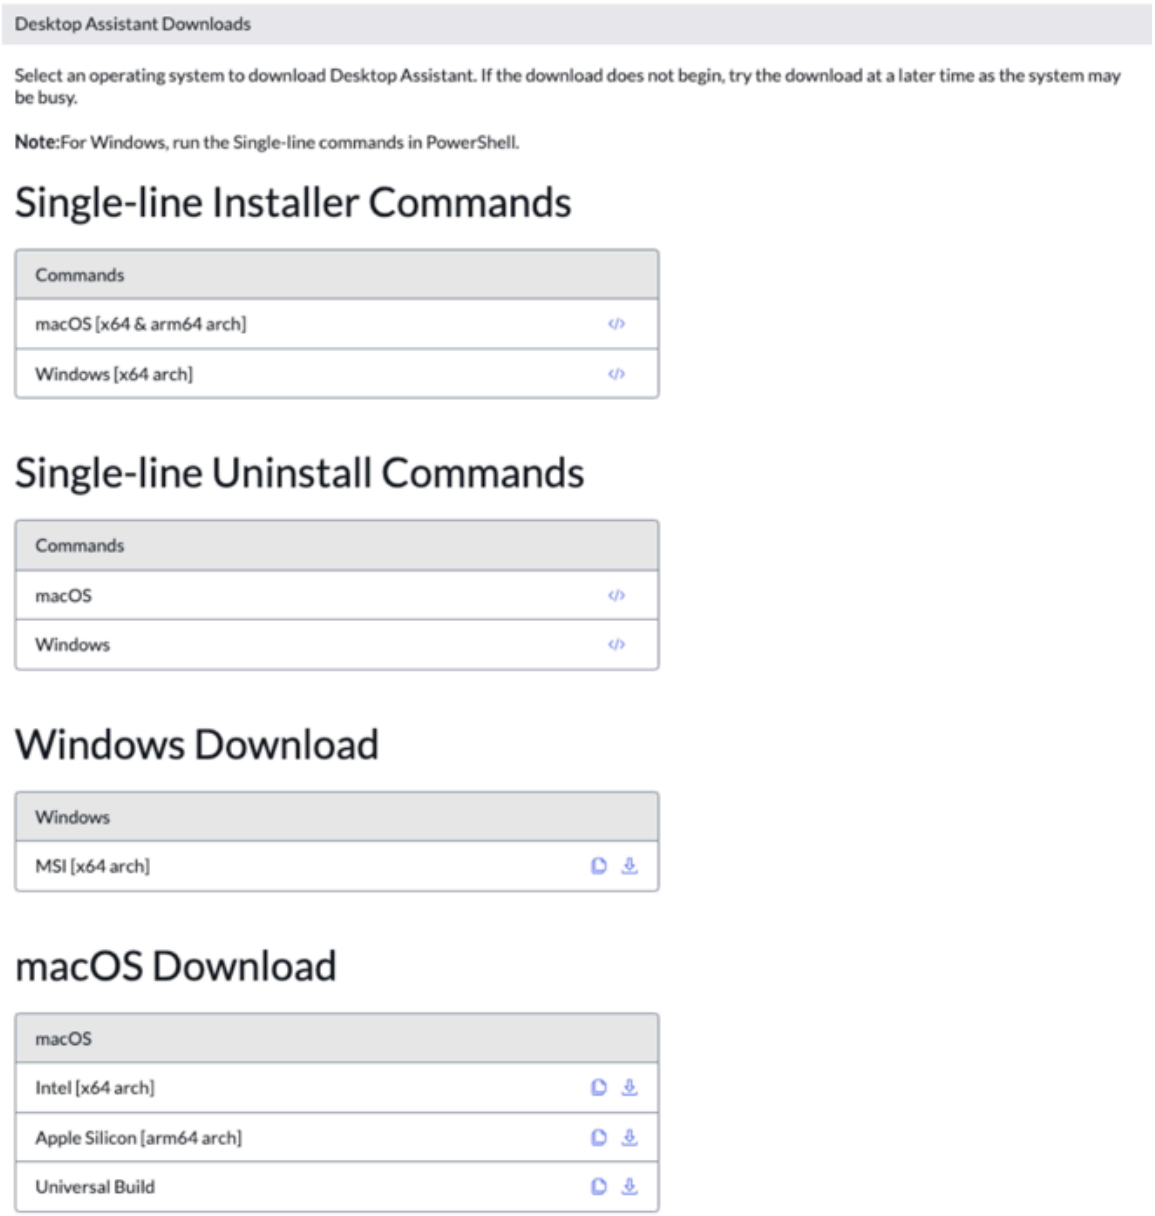
Before you begin
Ensure you have administrator privileges for the operating system to run the one-liner script.

Role required: sn_dex_desktop.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to *Desktop Assistant* > **Deployment** > **Installer and Uninstaller**.



2. Under the Single-line Uninstall Commands section, perform the following steps:
   a. Select the command icon (</>) to copy the command or script to execute.
   b. On your system, open Terminal.app (Mac) or PowerShell (Windows).
   c. Paste the command and press Enter.
   d. When prompted for a password, enter your active directory password and press Enter.

Result

The Desktop Assistant app is uninstalled.

Change Home page title and description

Change the title and description of the Home page, as required.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

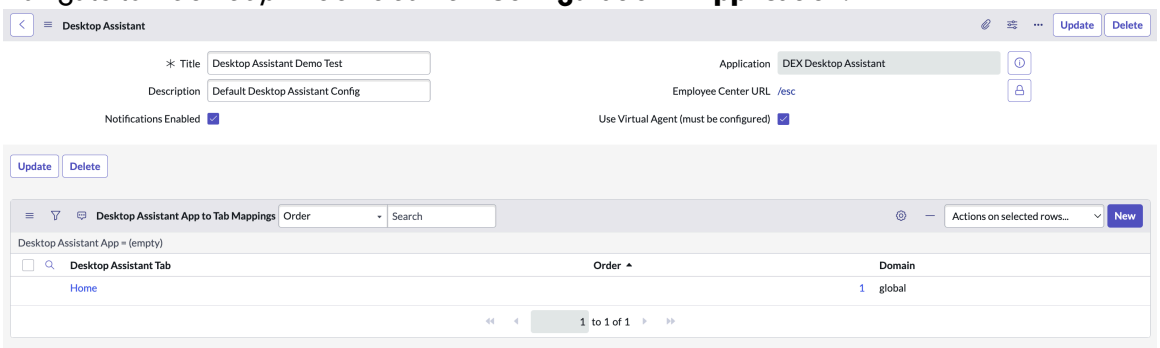
Before you begin

Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.admin

Procedure

1. Navigate to *Desktop Assistant* > **Configuration** > **Application**.



2. On the form, edit the required fields.

Field	Description
Title	Title of the Home page.
Description	Brief overview of the content and purpose of the product.
Employee Center URL	URL to the Employee Center where employees can access important resources, information, and tools related to their work.
Notifications Enabled	Option to enable or disable the notification bell icon.
Use Virtual Agent (must be configured)	Option to enable or disable the chat icon.

3. Select **Update**.

Result

The Home page information is updated.

Enable or disable notifications

Enable notifications to stay informed and engaged receiving timely updates and notifications about important events and activities within the system.

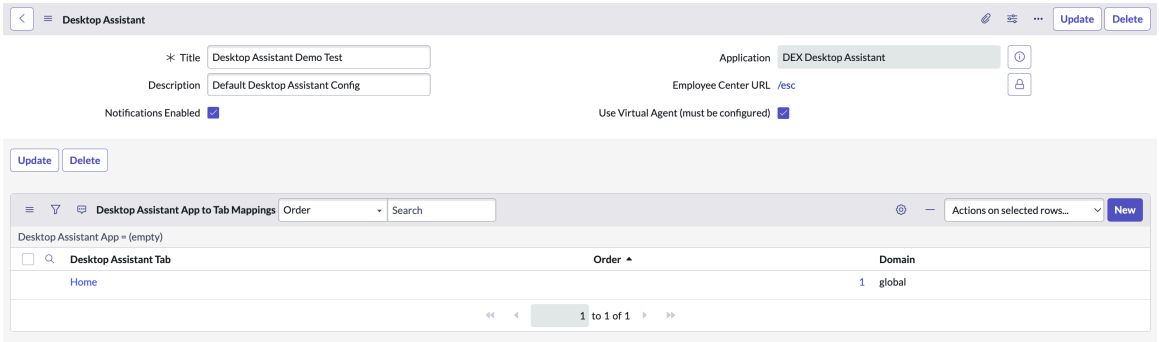
Before you begin

Role required: sn_dex_desktop.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to *Desktop Assistant* > **Configuration** > **Application**.



2. On the Desktop Assistant page, select or clear **Notifications Enabled**.
3. Select **Update**.

Result

If you enable notifications, a bell icon ( ) appears on the Desktop Assistant header. If you disable notifications, a bell icon disappears from the header.

When enabled, push notifications are sent to employees using Desktop Assistant.

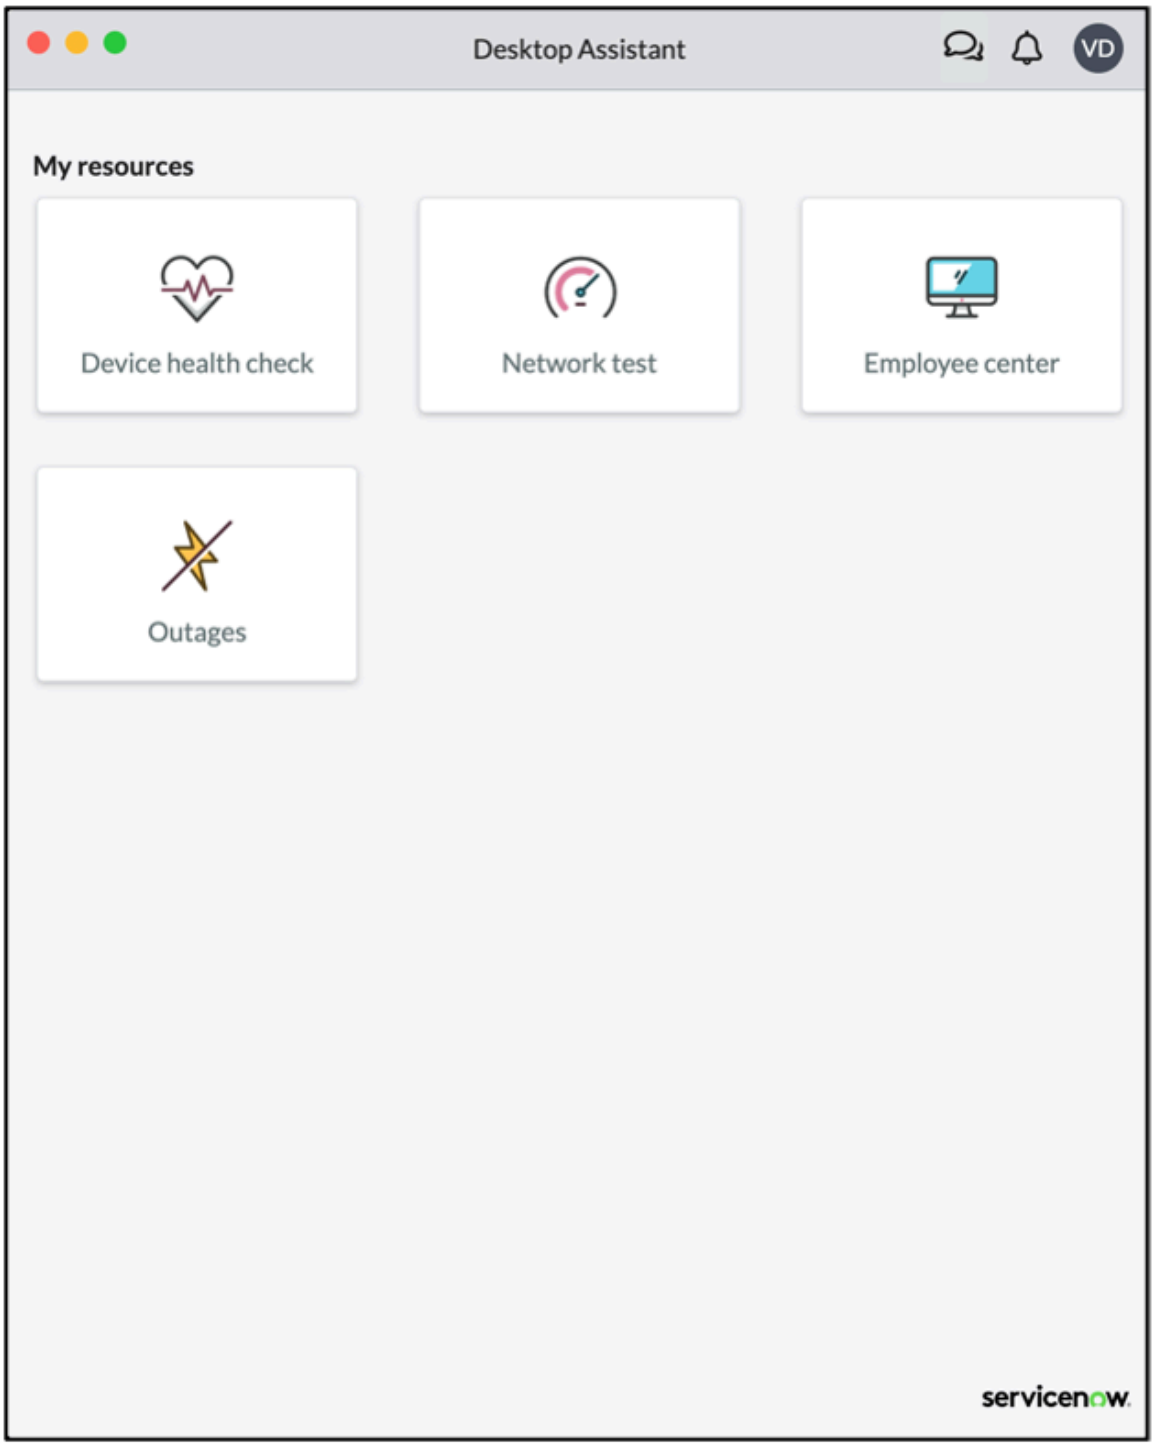
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more information, see Desktop Assistant notifications. To view notifications and stay up to date with important information and events, see View notifications.

Enable Virtual Agent or chat

Enable Virtual Agent so that you can find solutions to your inquiries quickly and seamlessly, without having to wait on hold or speak to a representative over the phone.

Before you begin

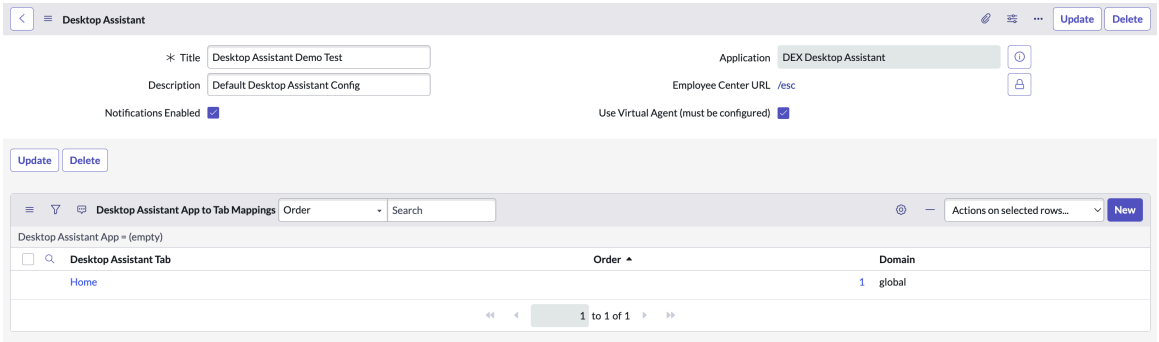
Ensure you have installed the Glide Virtual Agent plugin [com.glide.cs.chatbot] and the plugin is active.

Role required: sn_dex_desktop.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to *Desktop Assistant* > **Configuration** > **Application**.



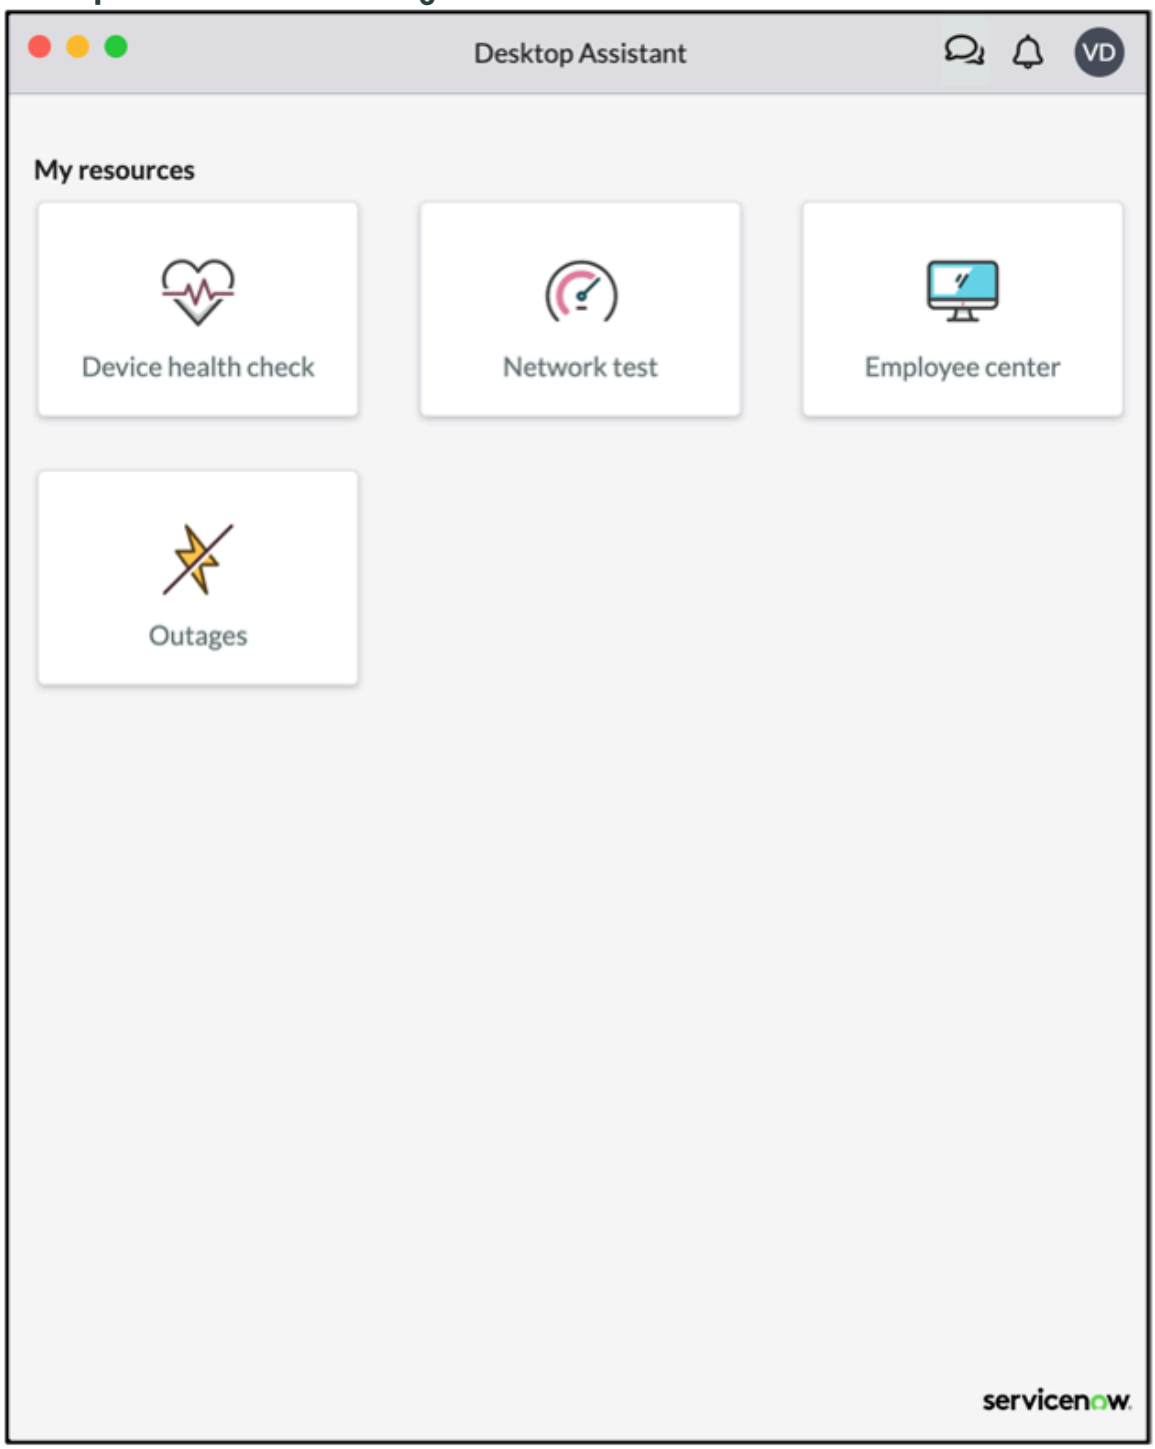
2. On the Desktop Assistant page, select **Use Virtual Agent (must be configured)**.
   For information on how to configure Virtual Agent, see Configuring Virtual Agent.
3. Select **Update**.

Result

The virtual agent or chat icon ( ) appears on the Desktop Assistant header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

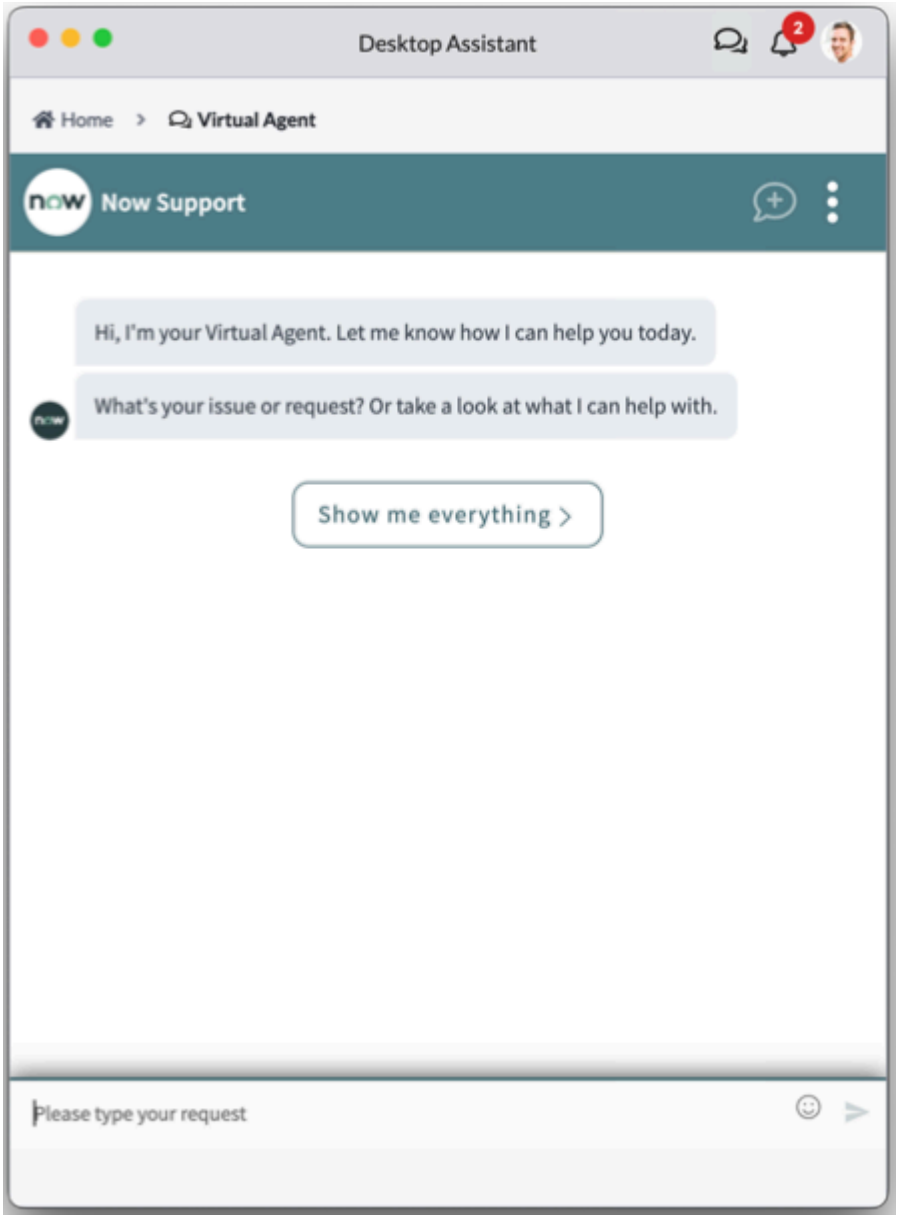
Desktop Assistant with Virtual Agent icon



To open the chat window, select the virtual agent or chat icon ( ).

The chat window opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
To configure the chat branding, see Set up your Virtual Agent bot's branding.

Map a card to a section

Map the card to the section under which it must appear.

Before you begin

Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.admin

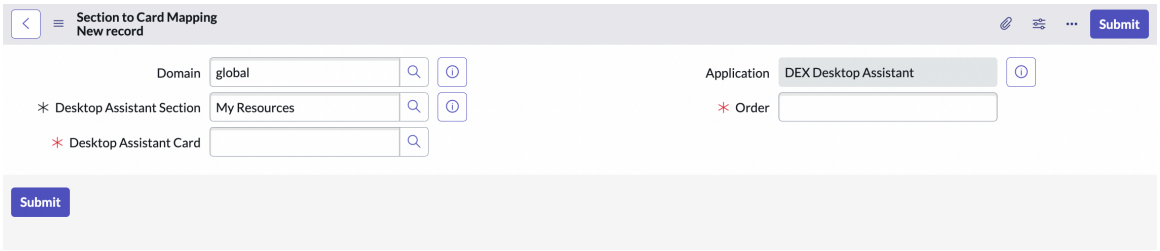
About this task

By default, Desktop Assistant provides: My Resources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to *Desktop Assistant* > **Configuration** > **<section_name>**.
2. In the Section to Card Mappings section, select **New**.



3. In the *Desktop Assistant* **Card** field, select the card you have created.
4. In the **Order** field, select an order number for the card.
   The order number is the sequence in which the card is positioned in the section.
5. Select **Submit**.

Result

The card is displayed under the specific section that you have selected.

Delete a card from the Home page

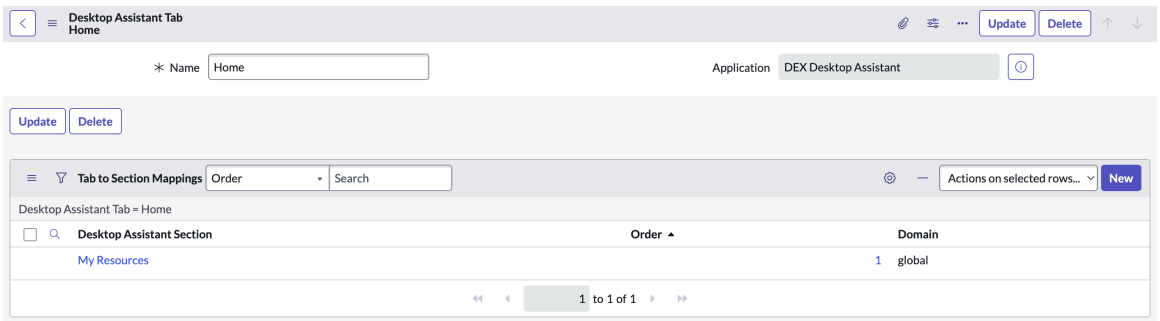
Delete a card when you no longer need it.

Before you begin

Role required: sn_dex_desktop.admin

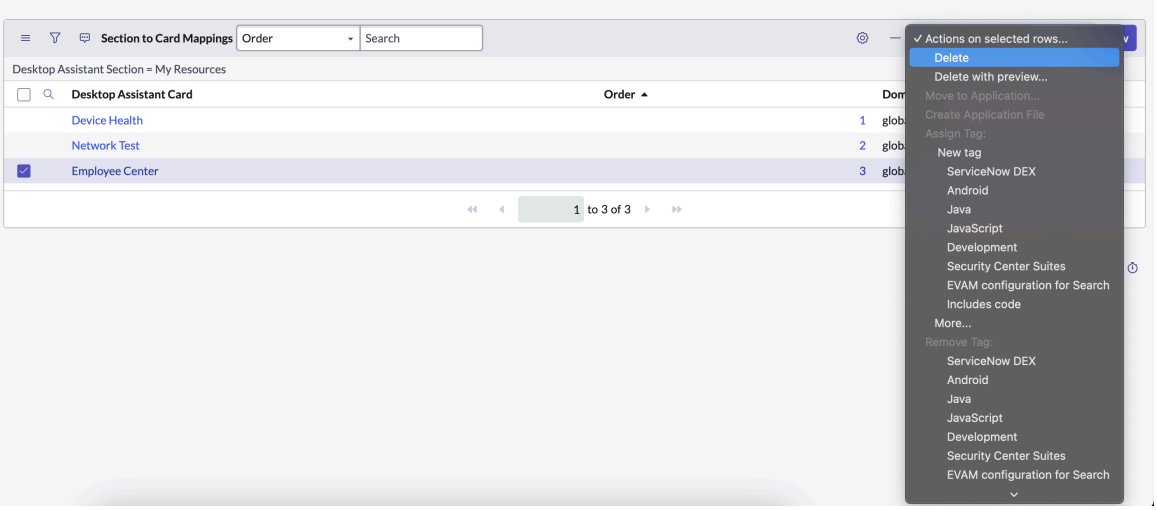
Procedure

1. Navigate to *Desktop Assistant* > **Configuration** > **Home**.
2. Select the home page name from which you want to remove the card.
3. Under *Desktop Assistant* **Section**, select the section name under which the card is positioned.



4. From the *Desktop Assistant* **Card** column, select the check box that appears before the name of the card that you want to remove.
5. From the Actions on selected rows drop-down list, select **Delete**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. In the Confirmation window, select **Delete**.

Result
The card is deleted.

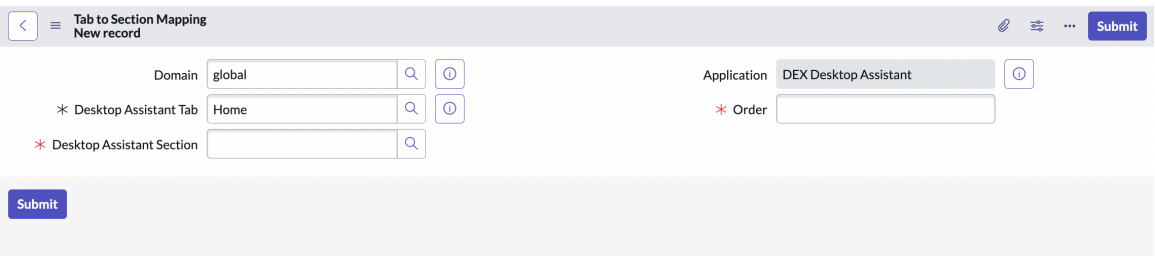
Add a section in the Home page

Add a section so that you can organize related cards under that section for easy navigation.

Before you begin
Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.admin

Procedure
1. Navigate to *Desktop Assistant* > **Configuration** > **Home**.
2. Select the name of the home page for which you want to add a section.
3. In the Tab to Sections Mappings section, select **New**.



4. Perform any of the following actions:
   - If you want to select an already existing section, perform the following steps:
     a. In the *Desktop Assistant* **Section** field, select the magnifying glass icon ( ).
     b. Select the section name and select **Submit**.

     The section is created on the Desktop Assistant home page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you want to create a new section, perform the following steps:

  a. In the *Desktop Assistant* **Section** field, select the magnifying glass icon ( ) and then select **New**.

  b. In the **Name** field, enter the name of the section.

  c. Select **Submit**.

  You are directed to the Tab to Section Mapping page where you can see the section name in the *Desktop Assistant* **Section** field.

  d. Select **Submit**.

Result
The section is created on the *Desktop Assistant* home page.

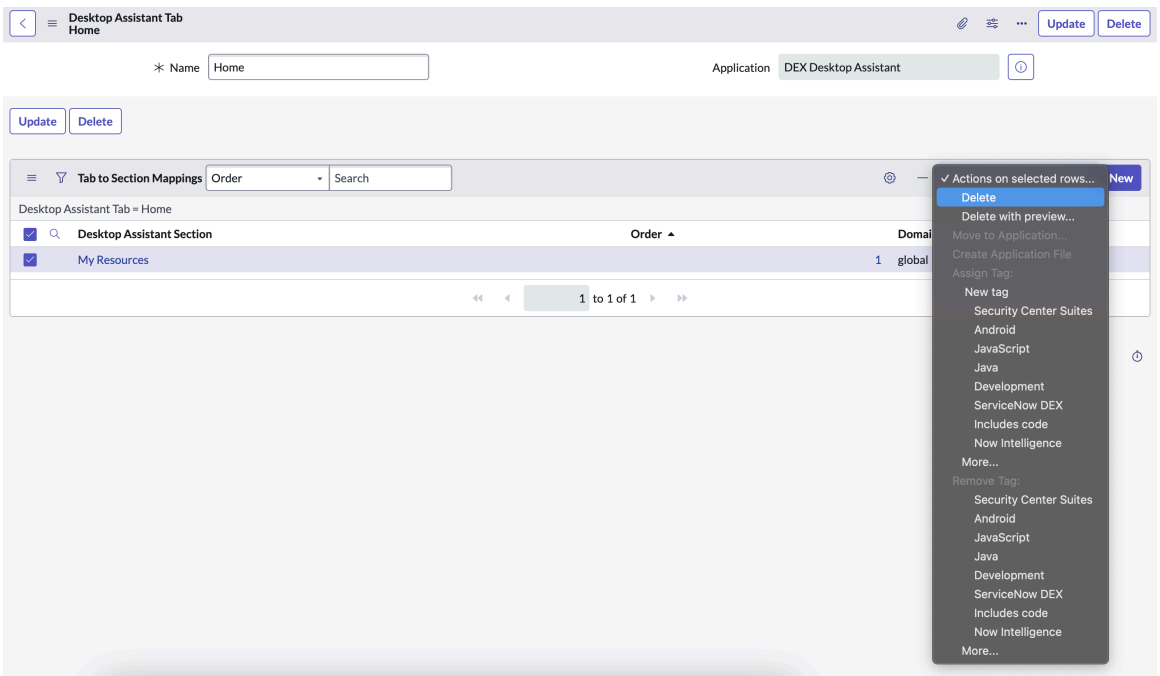
Delete a section from the Home page

Delete a section when you no longer need it in.

Before you begin
Role required: sn_dex_desktop.admin

Procedure

1. Navigate to *Desktop Assistant* > **Configuration** > **Home**.
2. Under *Desktop Assistant* Section, select the check box that appears before the name of the section that you want to remove.
3. From the Actions on selected rows drop-down list, select **Delete**.



4. In the Confirmation window, select **Delete**.

Result
The section is removed from the home page.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuring DEX for Microsoft 365

DEX for Microsoft 365 gets installed automatically when you install Digital End-User Experience.

Configuration overview

1. Integrate the ServiceNow instance and Microsoft Azure by creating a custom application in Microsoft Azure portal to authenticate ServiceNow requests. To enable call quality monitoring for Microsoft Teams, do the following:
   - Register a custom application in Microsoft Azure portal
   - Configure a connection for DEX for Microsoft 365
2. Enable application monitoring

   Enable application monitoring to gain insights into call quality metrics and diagnose issues to enhance performance.

Register a custom application in Microsoft Azure portal

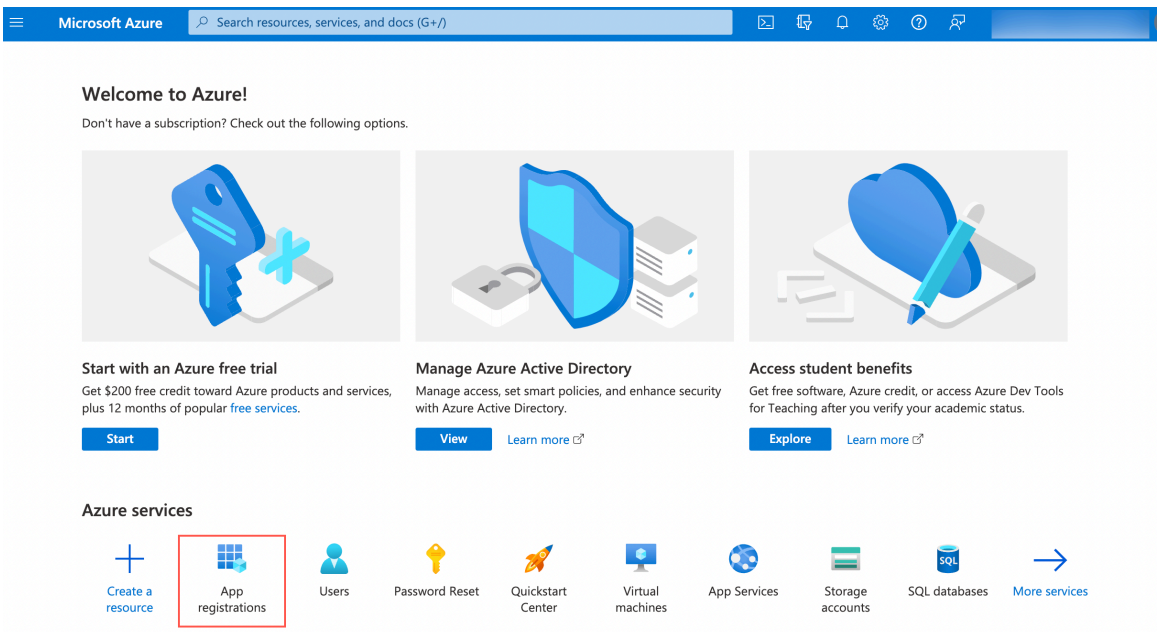
Provide authorization for the ServiceNow instance by registering a custom application with Azure Active Directory.

Before you begin

Role required: Azure Active Directory admin

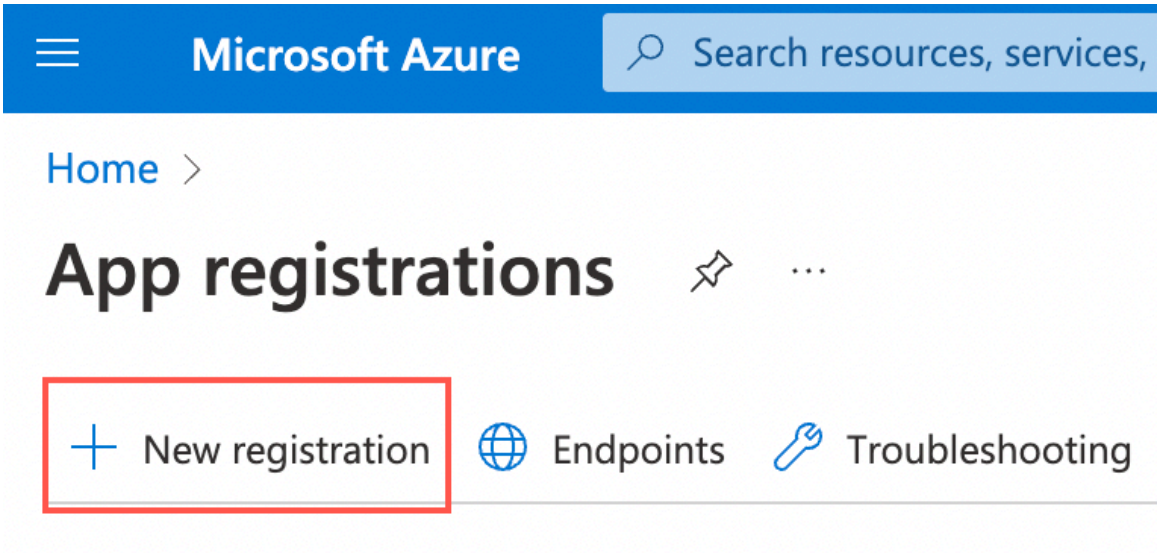
Procedure

1. Log in to the Microsoft Azure portal.
2. Under **Azure services**, select **App registrations**.

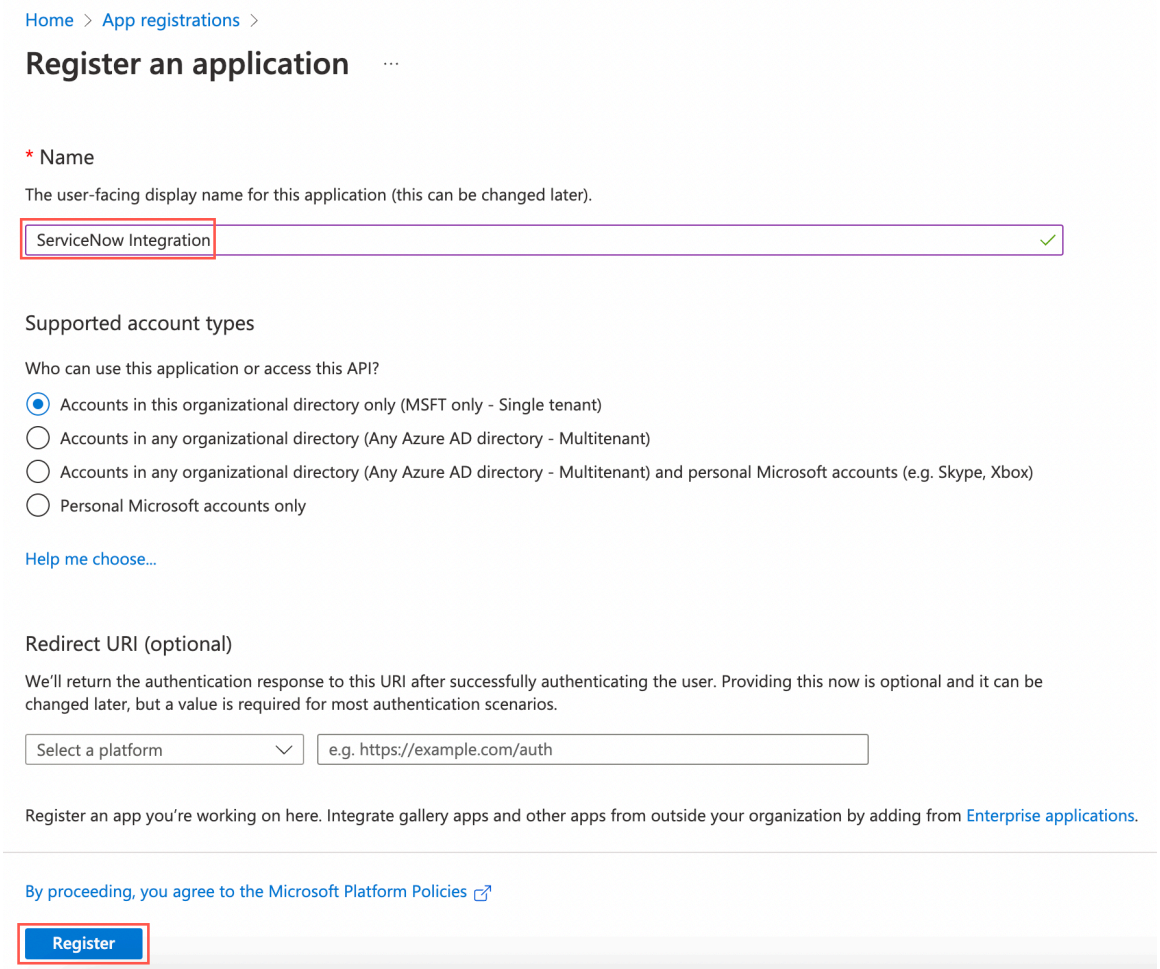


3. Under **App Registrations**, select **New registration**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



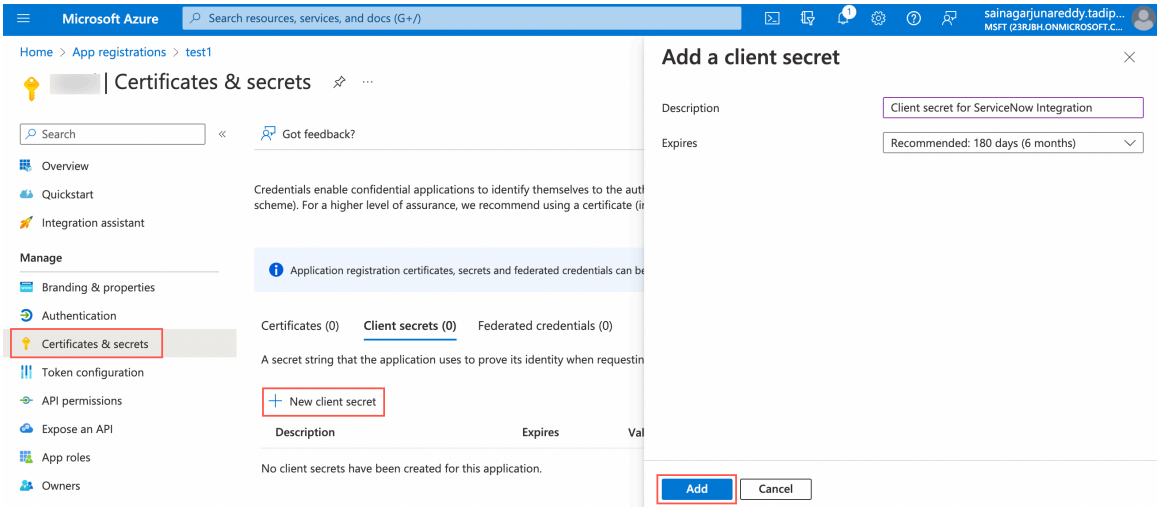
4. Provide a name and select **Register**.



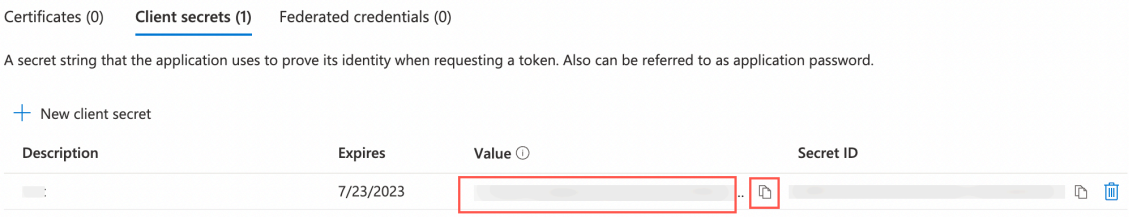
The application is registered and essential application details are displayed.

5. Copy and record the value of **Application (client) ID** and **Directory (tenant) ID** for later use.
6. Select **Certificates & secrets**, and select **New client secret**.
7. In the form, provide the **Description** and select **Add**.

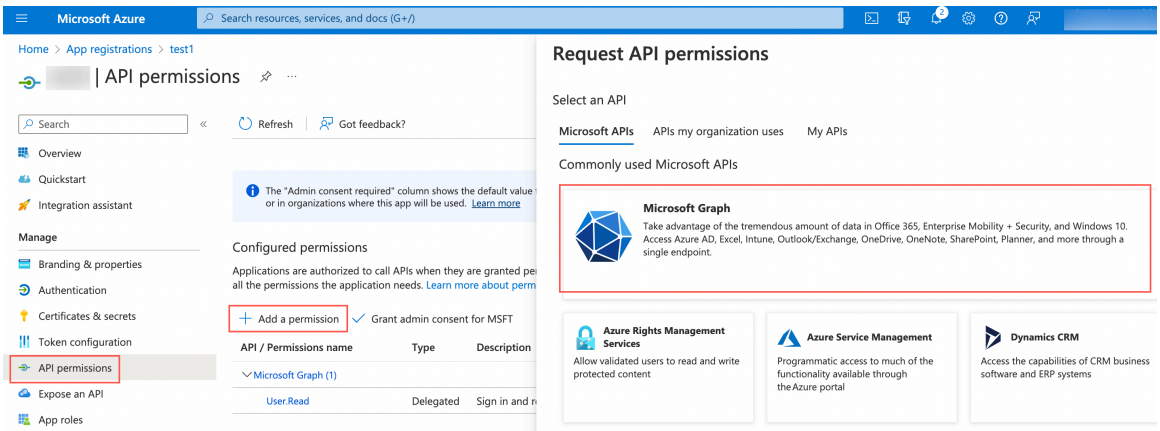
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Copy the **Value** of client secret for later use.



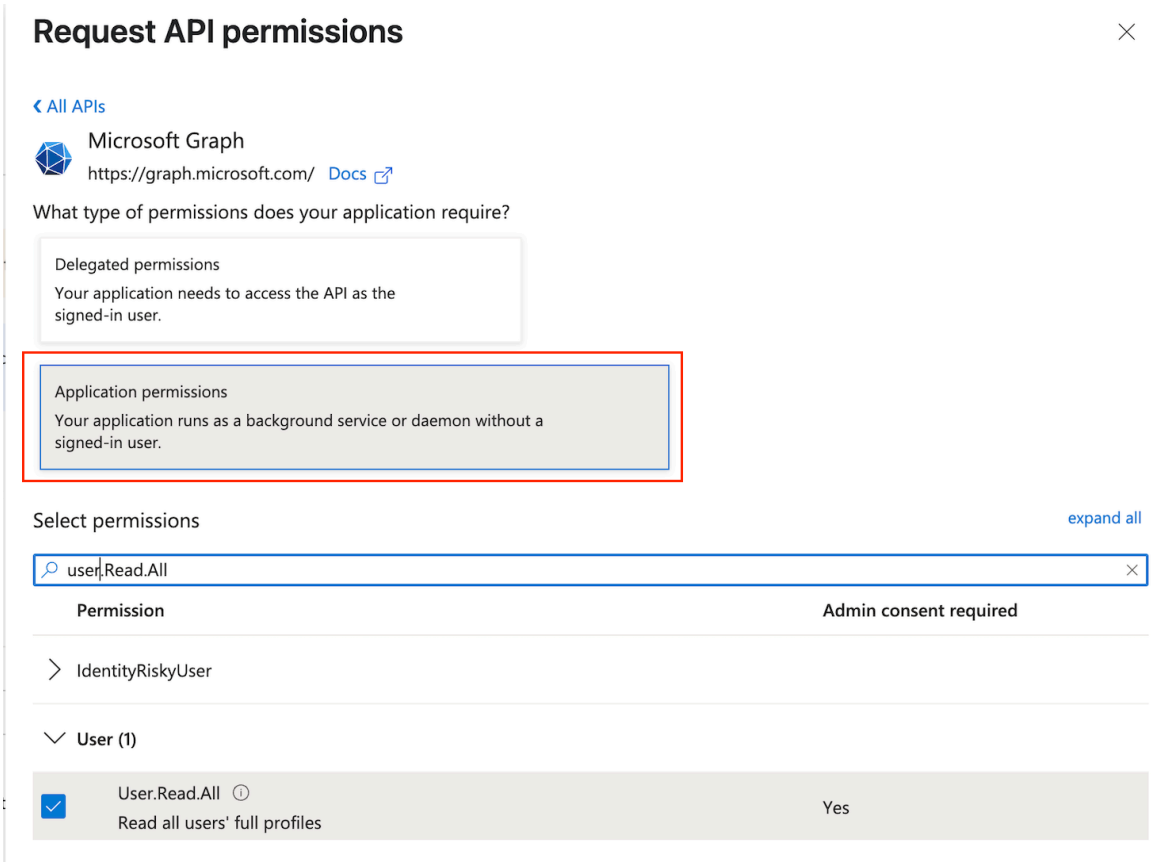
9. Select **API permissions**.
10. Under **Configured permissions**, select **Add a permission**.
11. Under **Request API permissions**, select **Microsoft Graph**.



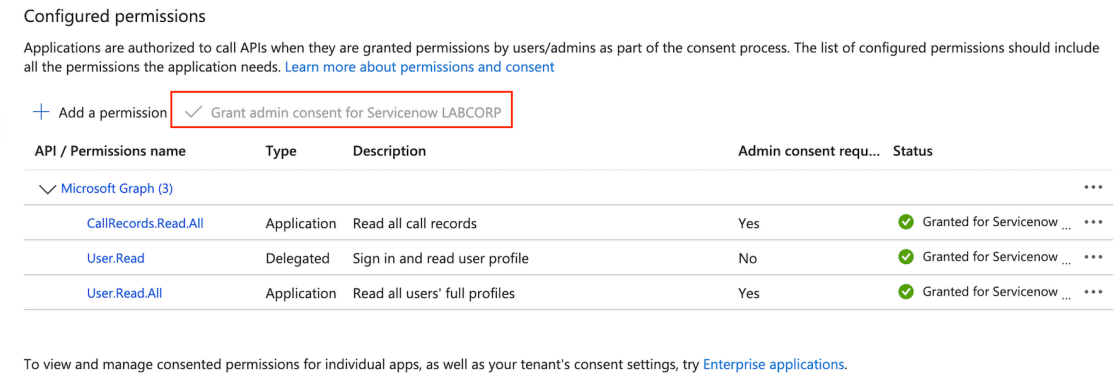
12. Select **Application permissions**.
13. Ensure that these permissions are provided to your custom app:
    - User.Read.All
    - CallRecords.Read.All

    For more information about the API permissions, see Add permissions to access your web API in Microsoft Learn.
14. Select **Add permissions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



15. Select **Grant admin consent**.

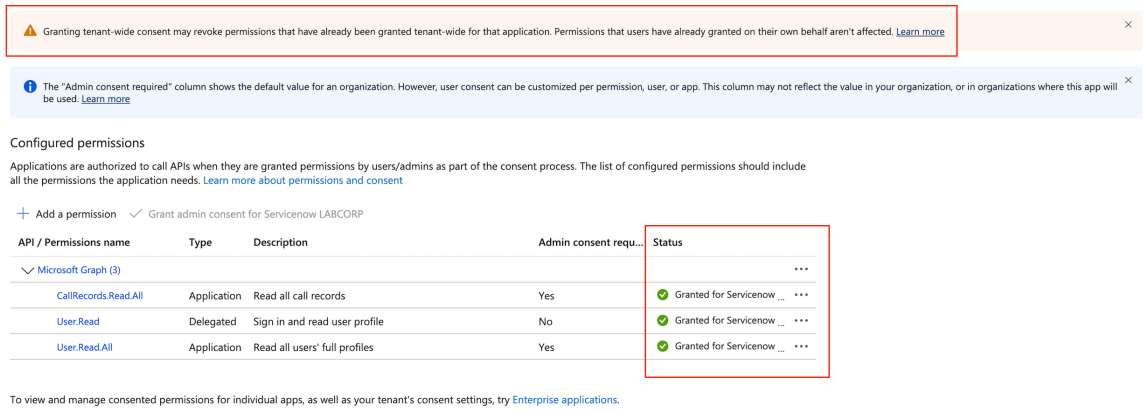


The system prompts you to confirm your consent.

16. Select **Yes**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A confirmation message is displayed that admin consent is granted for the requested permissions.



Configure a connection for DEX for Microsoft 365

Add and configure the Microsoft Teams connections to authenticate ServiceNow requests in the DEX for Microsoft 365.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. Select the **Integrations** tab.
3. Select the **Connections** tab.
4. Configure the **DEX for Microsoft 365** connection.

   a. Locate the **DEX for Microsoft 365** connection alias and select **View Details**.

   > **Note:**
   > Don't select **Add Connection**.

   b. Select **Edit** or, if you are configuring the DEX for Microsoft 365 for the first time, select **Configure**.

   c. In the **Configure Connection** form, fill in the fields.

Field	Description
Name	Name to identify the alias record associated with this connection. This is set to DEX for Microsoft 365.
Connection URL	Connection URL. Enter `https://graph.microsoft.com`.
API Version	The value is set to **v1.0** by default. If you are using any other API version, update the version number here.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Token URL	OAuth server token endpoint. Enter `https://login.microsoftonline.com/<Directory-ID>/oauth2/v2.0/token`.
Client ID	Application ID created during application registration.
OAuth Client Secret	Client secret created during application registration.

d. Select **Configure and Get OAuth Token**.

DEX remedial actions

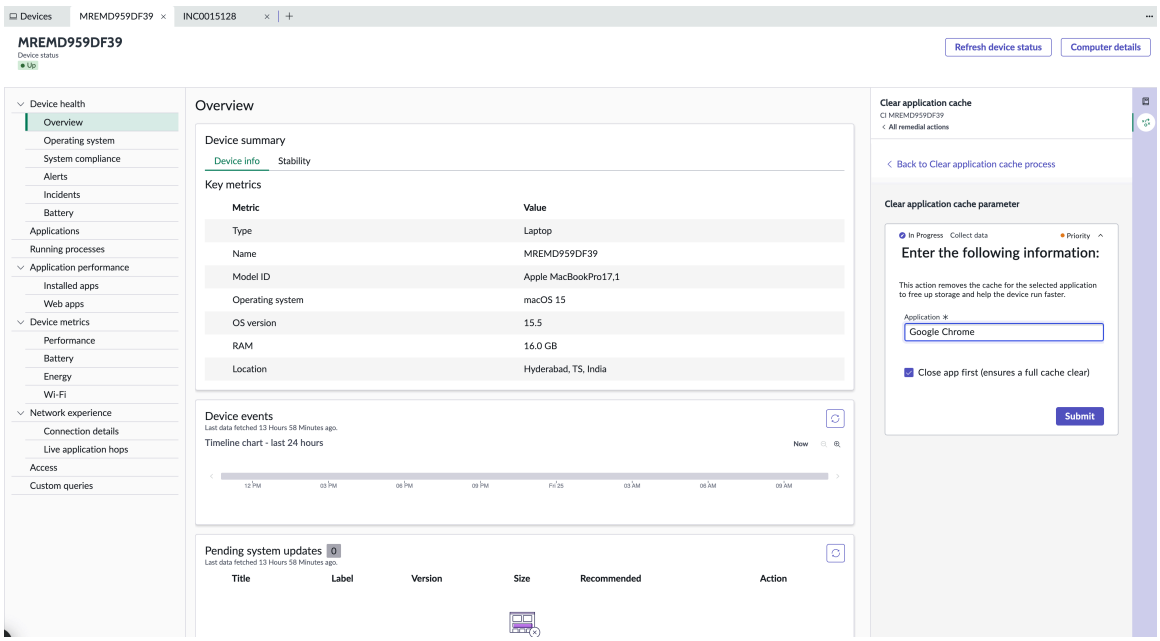
Create and manage your custom remedial actions from Check Definitions.

Remediate an issue on the device

You can create a remedial action or modify an existing one once you configure the remedial action framework. Remedial action enables you to trigger an action on the impacted device.

Single device remedial action

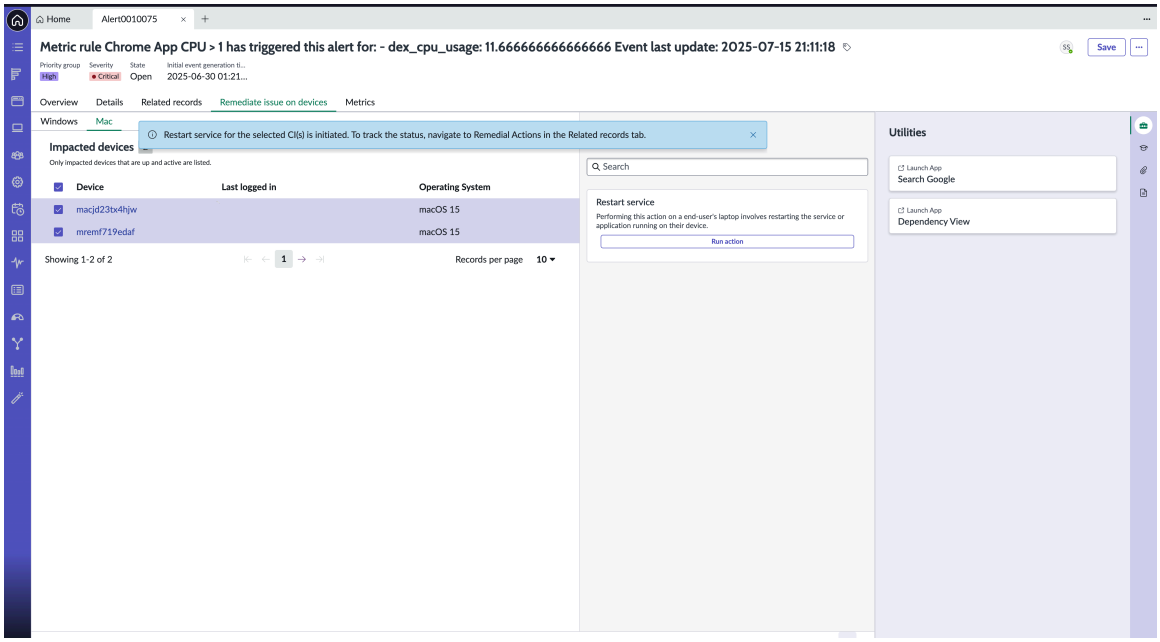
You can execute a remedial action on a single device by navigating to the device health page to resolve the issue. You can view the details of all the remedial actions applied and their status.



Bulk remedial action

Remedial actions on multiple devices enable DEX engineers and the computing teams to manage the health of the end-user experience proactively. The DEX engineers can select multiple devices to execute the remedial action at the same time. Remedial actions are available for bulk remediation when DEX Admin configures the option **Available for bulk remediation** for a remedial action. Once the bulk remedial action is executed, the DEX engineers should be able to view the status of the remedial action executed on the selected devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Create a remedial action

Create your custom remedial actions from Check Definitions to resolve end-point related issues using Playbook.

Before you begin

Role required: admin, dex_admin

> **Note:**
> To learn more about different remedial actions, see .

Procedure

1. Navigate to **All** > **Workspaces** > **Services Operations Workspace** > **DEX Administration**.
2. Select **Create new** in the Create Remedial Actions section.
3. Select **Create new** or **Map to an existing remedial action** according to the requirement.
4. Enter a name in **Remedial action name** if you choose to create a net new action.
5. If you choose to map to an existing remedial action, select from the existing remedial actions.
6. Add a short description.
7. Select the roles for those who can execute the remedial action.
   This option is available for sn_dex.engineer and sn_dex.service_desk_user.
8. Select the origin of remediation.

   This setting indicates where the remedial action should be executed from the device health page or alert details.
9. Select the **Remedial Action** check box if it's available for bulk remediation.
10. Select the operating system of the impacted device from the drop-down menu.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

11. Select the base Check Definition for this remedial action and select **Save**.

Note:

- Confirm that the selected Check Definition is applicable for the selected OS.
- Depending on the Check Definition selected, the related Check Definition parameters are listed.

DEX system tables for remedial actions

Definitions for any remedial action are predetermined based on the rules and criteria that store configuration settings for remedial actions. Each execution of the remedial action is maintained in the DEX tables to track the progress of remedial action executions.

Remedial action configuration

Stores the configuration settings for remedial actions.

dex_remedial_action_configuration

Field	Description
OS	Operating system compatibility (macOS, Windows, all)
source	Origin of the remedial action (alert, configuration_item)
playbook_type	Type of playbook (generic, tailored)
check_definition	Reference to associated check definitions
is_bulk_action	Flag for bulk action capability
active	Status of the configuration

Remedial action execution

Tracks the progress of remedial action executions.

dex_remedial_action_execution

Field	Description
state	UI progress state
device_list	List of target devices
source_record_table	Source table reference
source_record_id	Source record identifier

M2M remedial action execution

Maps the relationship between tracking and actual execution.

dex_remedial_action_execution_m2m

dex_remedial_action_execution	Links to UI execution record
remedial_action_execution	Links to actual execution record

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
For more information on the base system remedial actions, see .

Terminate a process on your device

Terminate a process on your device to boost performance and free up valuable resources for smoother operation.

Before you begin

Role required: sn_dex.engineer or sn_dex.admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and from the primary navigation pane, select the Devices icon ( ).
2. Select the device for which you want to terminate a process.
3. Select **Running processes**.
4. From the contextual side panel, select the Action library icon ( ).
5. In the End process card, select **Start**.
6. Select the End process card that now shows the process state as **New**.
7. Under Get user approval card, select the **I received approval to trigger this action** check box and select **Submit**.
8. In the **Process ID** field, enter the corresponding process ID obtained from the PID column.
9. Select **Submit**.

   The process is terminated.

What to do next

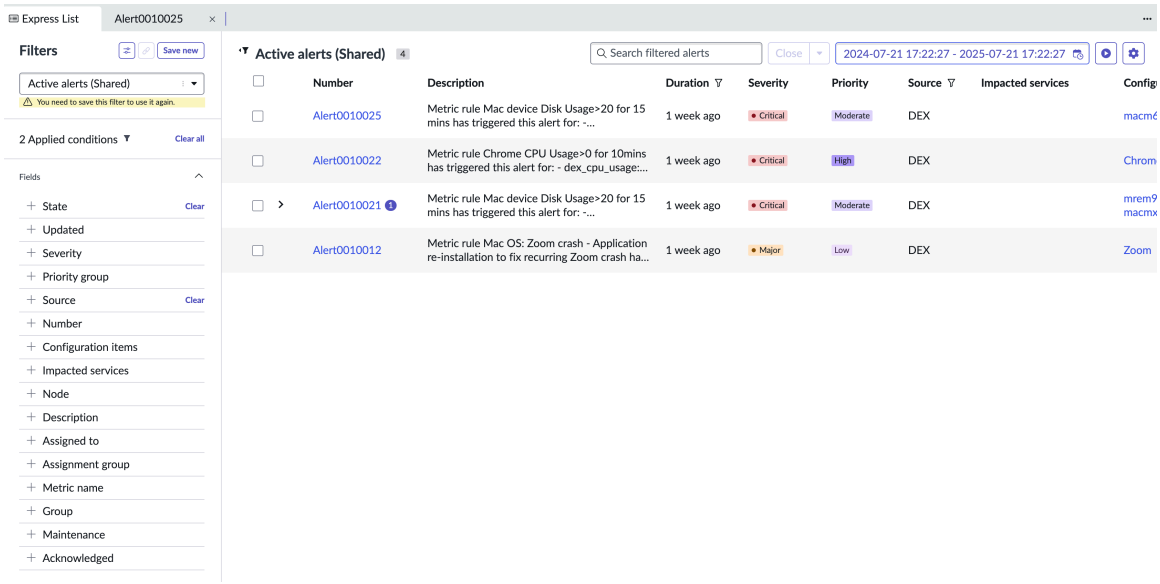
On the contextual side panel, select the Playbook icon ( ) to access the current action of the device and also to review the device's action execution history.

DEX Alerts

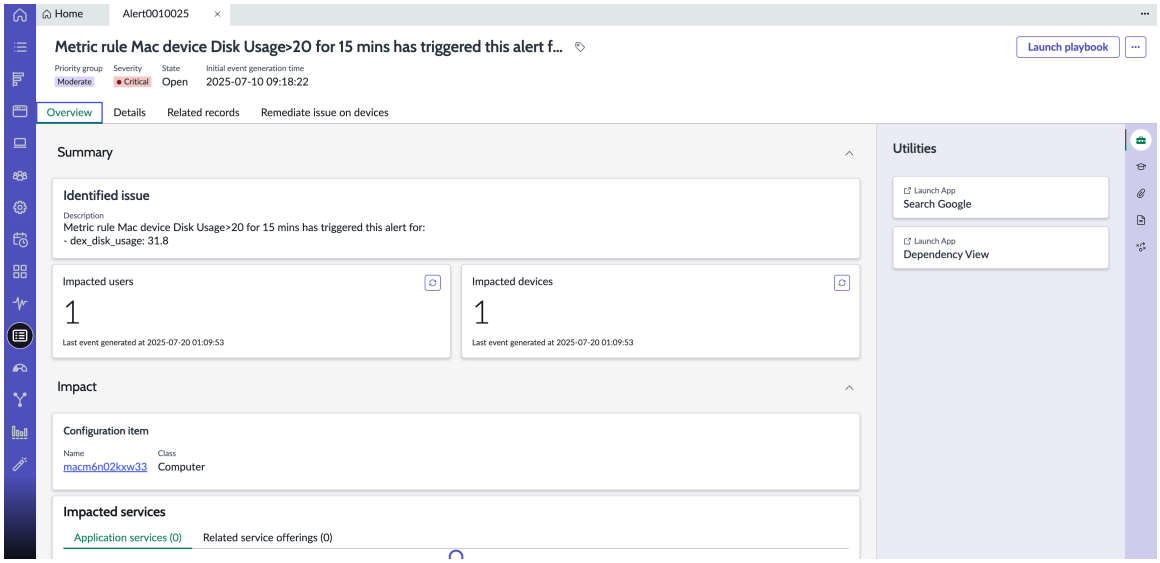
Digital End-User Experience (DEX) Alerts provide details on the active alerts, their severity, impacted services, and the duration.

On the Service Operations Workspace home page, Active alerts, Impacted devices, and Active devices are displayed. The Active alerts section displays the number of active alerts as of that selected time. Select the Active alerts section to view all the active alerts list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



By selecting a specific alert, you can find the details of the alert in different tabs that are listed in the table.



Tab name	Description
The Overview tab	Provides a summary, impact, and cause of the alert.
The Details tab	Provides alert details like the alert name, metric name, history.
The Related records	Provides details on the affected services, remediation tasks, impacted devices, and possible root causes.
The Remediate issue on devices	Lists all the available remedial actions for the impacted device.

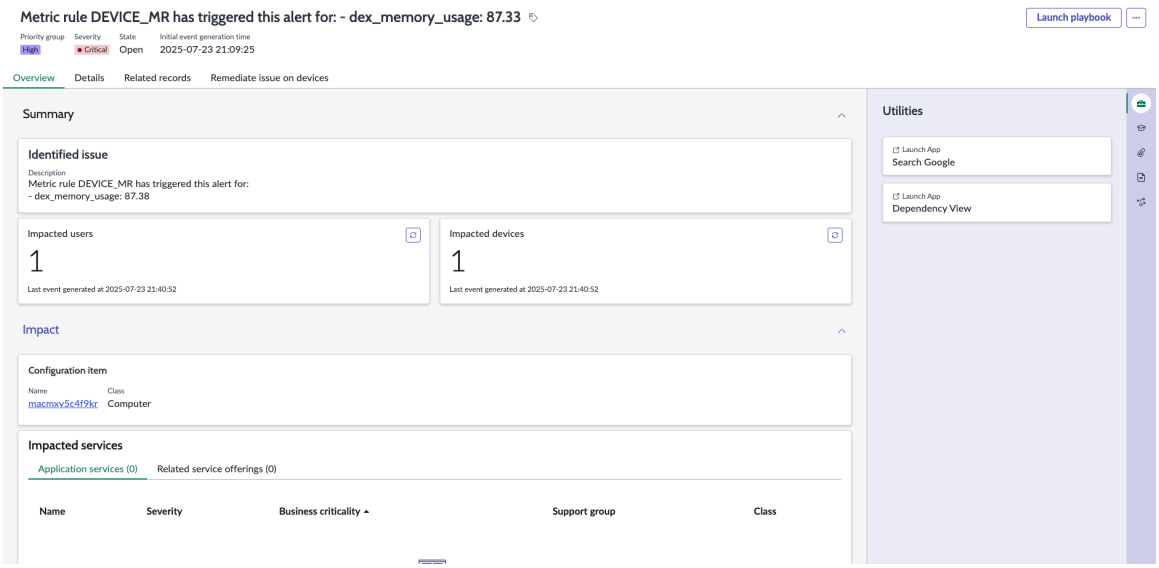
View alerts for both your device and its applications in the Alerts section of the Devices page.

Note:
For details on the active alerts listed see, Monitor incoming alerts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

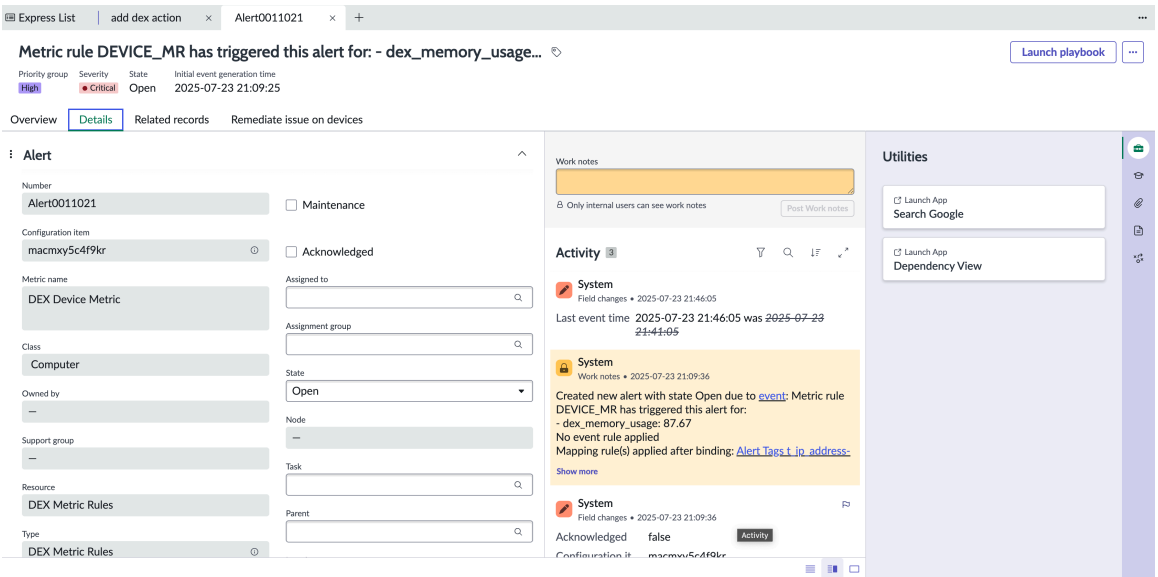
The Overview tab

- Displays an overview of the alert, the summary, impact of the alert, and the cause for the alert created.
- You can view the impacted devices and impacted users section. When you select the refresh icon on the Impacted devices or Impacted users, refresh the number impacted at that selected time.
- Details related to the impacted Configuration Item (CI) are displayed under the impact section and opens up to the related records.
- It displays any impacted services caused due to the alert.
- The cause section displays the probable root cause and also shows the number of alerts created due to this cause.



The Details tab

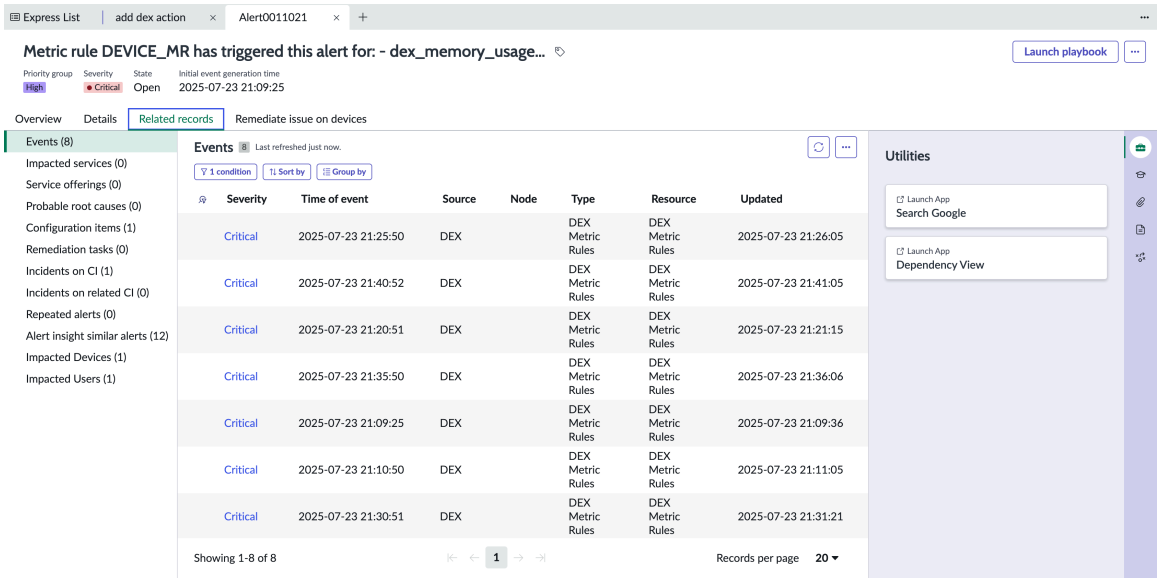
Access the Details tab to learn more about the history of the alert, metric name, and other metrics.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related records tab

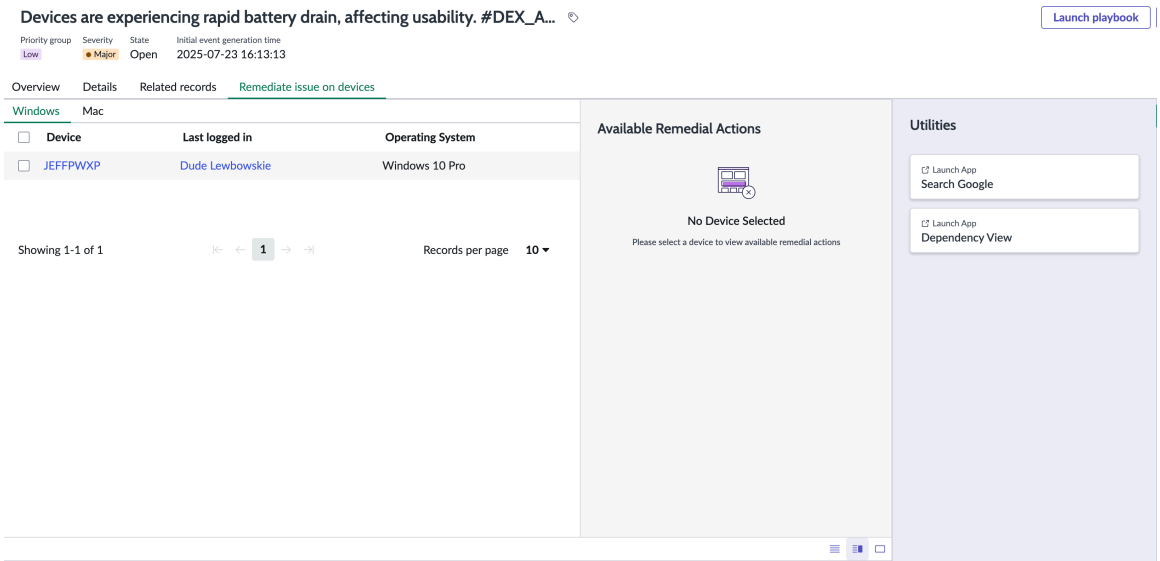
- All the related record information (Impacted services, configuration items, Impacted devices, Impacted users, repeated alerts, and so on) is displayed.
- To access the related lists information displayed on the impacted devices and impacted users tabs, install the latest version (26.3.1) of the Service Operations Workspace alert management plugin `(sn_sow_em)` store plugin.
- You can view the history of the bulk remedial action from the related records. All the remedial actions executed and their respective states are displayed.



Remediate issue on devices

- Displays all the impacted devices that are up and active for the DEX engineer to remediate issues on multiple devices at once.
- Categorizes the impacted devices based on the operating system and the status.
- Based on the device selected. If one device is selected, remedial actions applicable for a single device are displayed. If multiple devices are selected, it displays all the available remedial actions for bulk remediation.
- Enables you to execute a remedial action for a single device or multiple devices. To view the history of remedial action execution, access the related records tab (remedial action history).

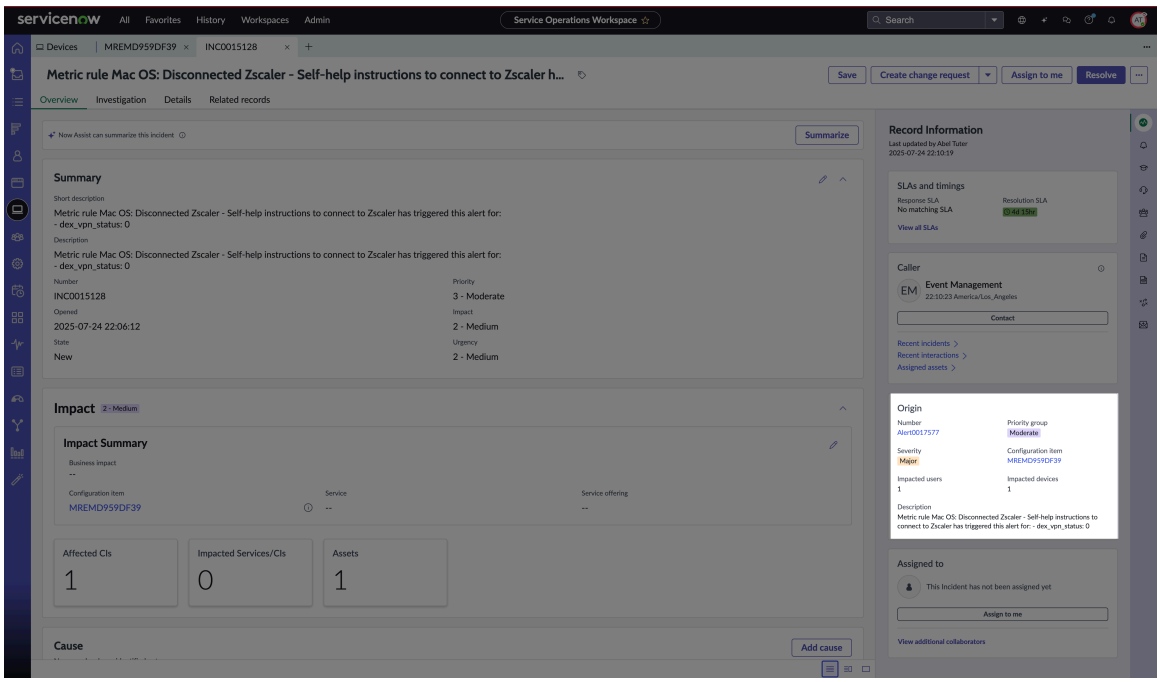
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Incidents from alerts

As an agent or IT operator, you can create an incident from the Digital End-User Experience (DEX) alerts which is addressed by the L1 agent.

As a response to the alerts, you can create an incident. The DEX alert-related information is available on the origin card of the incident. You can view the number of Impacted devices and impacted users. To access the DEX alert information, you need the Incident management for Service Operations Workspace plugin (`com.snc.uib.sow_incident`) version 7.1.0 and above.



DEX alert grouping

When several alerts are triggered from events governed by the same metric rule in DEX, the alert grouping mechanism automatically consolidates them. This mechanism reduces the need for users to manage individual alerts, streamline their response process, and enable faster issue resolution.

When alerts are grouped together, you see the total count of secondary alerts grouped next to the primary alert number.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DEX events and alerts representation

In the Events table [em_event], any event with the **Source** field value as DEX is classified as a DEX event. For DEX, the **Type** field displays **DEX Metric Rules** as DEX alerts are generated based on DEX metric rules. When for any event, the **State** of the event is **Processed**, an alert is generated and saved in the Alerts table [em_alert].

In the Alerts table [em_alert], select any alert to access its details. An alert that is created from a DEX event, displays the **Source** field value as DEX. The **Metric name** field value appears as either DEX App Metric or DEX Device Metric. For an alert, the **Metric name** field value is DEX Device Metric. The **Configuration item** field shows the name of the corresponding application or device. For the alert whose corresponding **Group** field shows **Rules-based**, are the DEX alert groups.

Rule for alert correlation

In **All** > **Event Management** > **Rules** > **Alert Correlation Rules**, the DEX Metric Correlation Rule determines when alerts must be grouped and provides necessary details.

Note:
For one application and one metric rule, there is only one alert in DEX. DEX creates alert groups when the metric rule is the same, regardless of whether the configuration items are the same or different. When the problem is resolved, closing the primary alert also closes the secondary alerts within the same group.

Time-based alert grouping

Time-based alert grouping automatically groups alerts according to predefined time intervals, which is advantageous for services generating numerous alerts. Consolidated alerts result in fewer disruptions for responders and contribute to shorter resolution times.

In the System Properties table [sys_properties], the property *`sn_dex.alert.correlation_rule.device.period`* defines the time period in seconds for grouping and correlating similar metric rule-based DEX alerts. In the **Value** field, you can enter the desired time duration in seconds. For example, to set a 5-minute gap between alert groupings, enter 300. Entering 0 disables the rule.

Let's consider an example: Alert A1 is generated for rule R1 from device D1. After two minutes, alerts A2 and A3 are generated for the same rule R1, but from devices D2 and D3 respectively. With A1 being the first alert, it's designated as the primary alert, and A2 and A3 are grouped as secondary alerts under A1.

Now, suppose you have set the time duration to 300 seconds (5 minutes). If no alerts for rule R1 are generated within five minutes, and then after this period, alerts A4, A5, and A6 are generated for the same rule, a new group is formed. Alert A4 becomes the primary alert, and A5 and A6 are grouped under A4.

However, if any alert is generated for rule R1 within five minutes, it's considered a secondary alert to A1 and grouped accordingly.

Deactivate DEX alert grouping

Deactivating DEX alert grouping allows for individual alert visibility, aiding in detailed analysis and targeted response.

Before you begin
Role required: sn_dex.admin

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Perform one of the following options.

Monitoring devices and applications with DEX Application and Device Health

Application and Device Health is a powerful solution for monitoring and managing your IT environment from an end-user perspective. It offers a variety of features that provide valuable insights into how users interact with the technology they rely on every day.

The DEX Application and Device Health product enables IT to monitor applications, networks, and devices on end-user systems, allowing proactive issue detection to minimize downtime and productivity loss.

The Application and Device Health addresses the challenge of limited visibility into end-user experiences by providing insights to identify and resolve performance issues before they impact users. The suite includes tools for self-service diagnostics, IT notifications, and streamlined support to enhance both monitoring and user engagement.

DEX Application and Device Health

Get information and entry point into different Digital End-User Experience Application and Device Health features by exploring tabs within the application.

Navigate to **Workspaces** > **Service Operations Workspace** and select one of the tabs in the primary navigation pane.

Digital End-User Experience Application and Device Health pages

Page	Description
Landing page	The landing page offers access to information on active alerts, impacted devices, active devices, and the devices world map.
DEX Insights	The Insights page provides a simplified view for device performance, compliance, user interactions, and network health to help you identify issues and remedies before they slow users down.
Applications	The Application list provides insight into monitored installed and web applications, the quantity of incidents and alerts linked to each application, and impacted devices for each application.
Devices	The Device list provides information on the device, its assigned user, last login, matching assignments, status, active alerts, and incidents.
Device details	The Device details page provides information on the device, its assigned user, last logged-in user details and location, matching assignments, status, active alerts, incidents, and host data collection.
DEX Administration	The Administration page provides tools for application management, agent policies, metric rules, active users, administrator count, agent downloads, service status, usage metrics, and system compliance.

Landing page

The DEX landing page serves as the starting point for the information on the total number of alerts, impacted devices, and a device world map.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To access the landing page, navigate to **Workspaces** > **Service Operations Workspace**.

The Home icon ( ) is selected by default and you can view the landing page of the Service Operations Workspace Performance Analytics dashboard.

Note:
The graphs display the latest data from the last two hours.

For more details on each card, see Landing page cards.

Employee experience overview

The Employee experience overview section provides details such as active alerts, impacted devices, and active devices.

Devices

The devices world map shows device counts by location, allows you to drill down into specific regions, and redirects to the Devices page for detailed insights.

DEX Insights

The Digital End-User Experience (DEX) Insights tab provides access to the battery health, compliance, system performance, and system time reports, enabling you to track user devices and take remedial actions. Use the Insights reports to gain early information about issues before they can slow down the users.

To access the Insights tab, navigate to **Workspaces** > **Service Operations Workspace** and select the Insights icon ( ) in the primary navigation pane.

DEX Insights reports

Category	Description
Query builder	Helps you build and run custom queries to uncover insights across your digital workplace.
Battery health	Provides information about the battery of the monitored devices, including its capacity, serial number, and condition.
File management	Lists the files that you set up to be monitored on the user devices. The list identifies the file name, the category to which it belongs, and the number of devices that have the file. This page appears on Windows machines only. **Note:** If you select the number in the **Device count** column, you can see the list of all devices where that file is present.
System compliance	Helps you monitor whether the devices across your organization are adhering to the established application and policy metric compliance rules.
System performance	Provides a view into device performance across your organization, including the CPU, memory, and disk usage over the last 7 or 14 days.
System time	Provides information about the various time-related metrics, including boot time, up time, and device age.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DEX Insights reports (continued)

Category	Description
Windows registry	Provides you a view of the Windows registry keys on your organization devices set up for monitoring. Set up Windows registry keys to receive this report. This page appears on Windows machines only. **Note:** If you select the number in the **Device count** column, you can see the list of all devices where that key is present.

For more details on fields in each report category, see DEX Insights reports.

Applications

Manage the active applications in your organization to enhance user productivity and engagement. The Application list serves as a central hub, offering visibility into monitored applications. Access details such as the name of an application, its type, the number of alerts and incidents associated with each of those applications, and impacted users.

To access the Applications list, navigate to **Workspaces** > **Service Operations Workspace** and select the Applications icon ( ) in the primary navigation pane.

You can also access the application health from an incident platform view by selecting a service or a service offering.

To refine your search based on applications, use the Applications filter. The application data is sorted in a decreasing order based on the number of impacted users.

Select the column filtering row icon ( ) to choose the desired filter condition from the drop-down list of the filter section and enter the desired value. In the following field, select **Web** or **Installed** and then select **Apply**. For example, if you want to choose all applications that begin with the letter "M", select the "starts with" option from the drop-down menu. Then enter "M" in the subsequent field and select **Apply**.

To learn details of any application, select the name of the application. For more details on each field, see Applications list.

Web application details

Enjoy a comprehensive visibility into application performance, user engagement, and trends, promoting a positive digital experience.

Web application overview

Monitor the performance of your application in real-time to verify that your application is available and responding to requests. To refine your search based on specific locations, use the **Location** filter. By default, the graphs display the latest data from the last two hours.

For more information on each card, see Web application — Overview page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web application metrics

Monitor the performance of your application. Watching Web application performance metrics like active users, started sessions, average response time, and web requests helps you promote optimal application functionality and user experience.

For more information on each card, see Web application — Performance page

Users

Monitor your active and impacted users to gain an accurate measure of how many users are engaged with the application. Active users are an important metric to identify trends in user behaviors.

- On the All users page, two filters are available to refine your search: **Users** and **Status**. The **Status** provides an overview of user statuses, indicating whether they're active, impacted, or you can opt to view all users.

  Note:
  The All users list displays all system users with Agent Client Collector (ACC) installed on their devices. If a user hasn't used the application in the last three days, the value of the **App last accessed** field is denoted as **-**. By default, sorting is applied on the **App last accessed** field and data is sorted for the latest 1000 records.

- On the Impacted users page, use the **Users** filter to view an impacted user's details.

For more information on each field, see Web application — Devices page.

Trends

Get a graphical view of your application metrics to see how the value of one or more metrics changes over time. Values along the horizontal axis of the trend report represent the time measurement. Values on the vertical axis represent the changes to the metric being monitored.

For more information on the card, see Web application — Trends page.

Installed application details

Gain complete insight into application performance, device utilization, and patterns to identify performance issues, optimize device usage, and improve user experience.

Installed application overview

Monitor the application performance in real time to view active alerts, incidents, current users, and time to resolve incidents.

For more details on the health cards, see Installed application Performance page.

Installed application metrics

The Application metrics section promotes the smooth functioning of applications by monitoring their real-time health and promptly resolving any potential issues to maintain a seamless user experience. Additionally, it assesses the system's performance in terms of efficiently carrying out its intended tasks and delivering prompt and reliable responses to user requests.

Refine your search based on the **Locations**, or **App version** filter.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Access application performance data spanning the past 2 hours, 24 hours, or 30 days by choosing your preferred timeframe from the provided drop-down list.

View the number of crashes of an application over time, reflecting its resilience, sustainability, and reliability.

Note:
The number of crashes pertains to applications that emit a window app crash event (event id = 1000) on crashing such as Microsoft OneDrive, Microsoft Teams, Microsoft Excel, Microsoft OneNote, Microsoft PowerPoint, Microsoft Outlook, and Microsoft Word.

For more information on the cards, see Installed application — Number of crashes section.

Find out how well your system performs its intended function and how quickly and reliably it responds to user requests.

For more information on the performance cards, see Installed application — CPU, memory and I/O performance section.

Users

End users can use different devices to connect to an application. Get an overview of the active and impacted users for the following:

- Last logged in device and location
- Total duration of time the user spends interacting with the application on the current day
- Last access time of the application

This information can assist in troubleshooting and support, optimizing performance, and enhancing security.

Refine your search based on the **Users**, **Status**, or **App version** filter.

Note:
The user list displays all system users with Agent Client Collector (ACC) installed on their devices. If a user hasn't used the application in the last three days, the value of the **App last accessed** field is denoted as **-**. By default, sorting is applied on the **App last accessed** field and data is sorted for the latest 1000 records. The **App last accessed** field is not applicable to the Mac-installed applications. Therefore, the **App version** drop-down list displays application versions only for Windows.

Selecting the user name takes you to the details page of that user. For detailed information on a user and associated applications, see Device details.

For more information on each field, see Installed application — Users section.

Devices

Access the Device tab to obtain detailed information on each device, including user assignment status, last login timestamp, matching assignments, device status, active alerts, and incidents.

To access the Devices tab, navigate to **Workspaces** > **Service Operations Workspace** and select the **Devices** icon ( ) in the primary navigation pane.

The device view is segregated into **All devices** and#**Devices by ACC status** tab. The **All devices** tab provides the device details such as its assigned user, last logged user details, last logged-in user location, matching assignments, active alerts, and incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Devices by ACC status** tab displays device status, indicating whether each device is active or inactive, the status of host data collection, and other relevant device information.

Use the#**View agents table** button to see detailed agent lists and attributes.

For more details on each field, see Devices list.

Note:
Select a device to view the device details page. Similarly, select a device on the user details page to view specific information about the device. For more details on a user's device, see Device details and related subtopics.

Device details

Monitor the health of the user device, installed or web applications, running processes on the device, application and device performance metrics, network configuration, user access details, and the ability to run custom SQL queries to retrieve OS information.

To access a user and device details, **Workspaces** > **Service Operations Workspace** and select the Devices icon ( ) in the primary navigation pane, then select a device from the list.

Note:

- Devices are categorized as **Up** or **Down** based on their current operational status.
- Select **Computer details** to access comprehensive information about the device. The information includes the asset tag, serial number, model ID, manufacturer, and configuration details of connected components.

To learn more, see Device details pages.

Device health

View the overall operational status and performance of a user's device. Assess the performance using key metrics and indicators such as system uptime, pending updates and patches, recent crashes or blue/black screens, battery health, and application stability.

The system updates the device data using policies every 72 hours. Additionally, you can manually populate the on-demand data by selecting the refresh icon ( ). To learn more about the policies, see DEX policies for macOS and DEX policies for Windows.

Device health overview

The Overview section provides device details such as type, name, OS, model ID, current location, CPU, and RAM specifications. Device Metrics show key info such as pending updates, battery health, BSOD causes, and crashes, offering a comprehensive view of device performance and health. Device events in the last 24 hours include activities like software installations, providing insights into usage patterns and performance history. Pending system updates offer version details and necessary actions for improved functionality and security, while OS details provide information on the device's operating system.

Device health alerts

Navigate the Alerts section to discover the open device alerts. Each alert is distinguished by a unique identifier (Number) and features a summary of the issue, severity, and the timestamp of its creation (Created).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device health incidents

Look up the incidents for device. Each incident has a unique identifier (Number) and features a summary of the incident, priority, and the timestamp for when it was created (Opened).

Device health security

The Security section applies to Windows OS only, providing crucial insights into the device protection, specifically focusing on Windows disk encryption tool Bitlocker. The section highlights key specifics like volume type, protection status, mount point, capacity, volume status, and encryption percentage. The section provides a comprehensive overview of the device's encrypted volumes and security status.

Device health battery

The Battery health assesses the overall condition, efficiency, and potential lifespan of the device battery. The section offers insights into its current capacity, cycle count, and remaining charge percentage. Use the information to optimize performance, prolong lifespan, and promote uninterrupted device usability.

Device health hardware

The Hardware section provides key details about the hard drive, offering insights into its crucial specifications. The section includes the following details:

- Drive assigned name for identification purposes
- Status denoting its operational condition
- Manufacturer indicating the producing company
- Media loaded showing if any storage media is inserted
- Model number specifying the drive specific version
- Partitions showcasing the number of distinct sections on the drive
- Size revealing the total storage capacity available on the hard drive

These details collectively offer a comprehensive overview of the hard drive characteristics and functionalities and are essential for maintenance, troubleshooting, compatibility, capacity planning, and overall system management.

For information on each field, see Device health page.

Applications

Monitor the details of the user's installed and Web applications.

The Applications section offers insights into application, aiding effective device management. Track details such as name, version, type, today’s usage, and last accessed time, facilitating streamlined monitoring and optimization.

For information on each field, see Applications page.

Running processes

View the device CPU and memory usage, idle CPU percentage, and number of processes along with other data points on the performance and behavior of running processes. By monitoring these metrics, you can gain insights into how running processes are performing and identify performance bottlenecks or issues that might be impacting the digital experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The system updates the running processes data using policies every 72 hours. Additionally, you can manually populate the data on demand by selecting the refresh icon ( ). To learn more about the policies, see DEX policies for macOS and DEX policies for Windows.

For more information on each card, see Running processes page.

Users — Application Performance

View the 10 applications with the most memory and CPU usage and the performance and usage data associated with a specific application.

Application performance provides valuable insights into how the application is used, and how well it's performing. Use this information to decide where you can make improvements to enhance the user experience and achieve business objectives.

For more information on the application performance and usage cards, see Application performance pages.

Network monitoring

The Network monitoring page in the displays information about multiple facets of a user's network configuration. This information includes connection details, performance metrics, and application network hops.

Connection details

The Connection details section has information about the user's network connection, including the connection status, WiFi and wired connection signal strength, WiFi protocol, and WiFi BSSID (Basic Service Set Identifier).

Under WiFi details, you can find metric names and the corresponding values that provide a comprehensive overview of their WiFi performance, including signal strength, WiFi protocol, and WiFi BSSID (Basic Service Set Identifier).

The Wired connection details contain metric names and values related to the user's wired network connection, including the MAC address, connection speed, connection duplex mode (full or half), and data usage. Additional metrics may include latency, packet loss, and jitter.

Performance metrics

The Performance metrics section applies to Windows OS only. The section evaluates network stability using the following key factors:

- Latency: The delay between sending and receiving data. High latency results in noticeable delays and slower application response times, impacting overall performance.
- Packet loss: The loss that occurs when data packets fail to reach their destination, leading to missing information. High packet loss causes communication disruptions like dropped calls, distorted audio, or incomplete videos and files.
- Jitter: The variation in time between data packet arrivals. In stable networks, packets arrive at regular intervals. High jitter causes inconsistent delivery, leading to choppy audio, video, or performance.

Improving these metrics promotes network consistency and reliability, which help create smooth user experiences and data-intensive application use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application hops

This section showcases the applications drop-down menu, domain name, and address of the hop domain, as well as the round-trip times (RTT1, RTT2, RTT3). You can use this information to work on the network configuration performance.

Use the **Applications** drop-down menu to select an application to view its hop information. To get the latest information, select **Run**.

For more information on the network card, see Network monitoring page.

Access

View essential information regarding the user login details. This tab provides the user name, user type, login type, and the timestamp of the last login.

The user name serves as a unique identifier within the system, enabling users to identify themselves. The user type field indicates whether the user is active. The login type field reveals the method or protocol used for the login process, such as a standard user name and password. Finally, the last login timestamp indicates the date and time of the user's most recent login activity, empowering users to track and effectively manage their login information.

The system updates the login data using policies every 72 hours. Additionally, you can populate the data manually on demand by selecting the refresh icon ( ). To learn more about the policies, see DEX policies for macOS and DEX policies for Windows.

Note:
The **Host** field is visible only when you access the device remotely via RDP (Windows) or SSH (Mac). The **User profiles** section is exclusive to Windows OS.

For more information on the user logins card, see Access page.

Custom queries

Use the custom queries to access operating system information using SQL, enabling in-depth system analysis and issue resolution.

Troubleshoot problems or collaborate with administrators by utilizing predefined Operation system instrumentation framework queries (OSQuery) or write a custom query if necessary.

You can choose a query from the **Queries** drop-down list and select **Run** to obtain the most recent response from the device.

Note:
Custom queries are stored in the Device Custom Query [dex_ci_device_custom_query] table. When you execute a query, the list displays a maximum of 100 entries retrieved from that table. For the complete set of response entries, refer to the Device Custom Query Response [dex_ci_device_custom_query_response] table.

DEX Administration

The DEX Application and Device Health Administration tab provides you with essential tools to manage and monitor the system.

To access the Administration tab, navigate to **Workspaces** > **Service Operations Workspace** and select the Administration icon ( ) in the primary navigation pane.

Note:
To view the **Administration** tab, you must have the sn_dex.admin role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the DEX Administration tab to monitor and manage applications. Use Application management, Agent policies, User roles, System compliance, Metric rules, File management, Windows registry management, Remedial Actions, and Administrator cards to find more information. Track Agent Client Collector installations in Agent health. For more information on each card, see Administration cards.

View Desktop Assistant usage metrics to monitor your Desktop Assistant connection status verifying communication with the ServiceNow instance. For more information on Desktop Assistant, see Using DEX Desktop Assistant.

Open DEX Application and Device Health

DEX Application and Device Health provides proactive visibility that helps you understand your organization end-user experience and diagnose any issues. With features such as application and user navigation, trend analysis, and other useful metrics, the DEX Application and Device Health enables you to identify the root cause of an issue, rather than just treating the symptoms.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user

Procedure

Navigate to **Workspaces** > **Service Operations Workspace**.

Result

The home page icon ( ) is selected by default. For more information, see Landing page cards.

View system compliance

View whether the devices are adhering to your organization's application and policy compliance rules. Use this data to identify potential security risks.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the Insights icon ( ).
3. Select **System compliance**.
   For more information on the system compliance metrics, see DEX Insights reports.

Monitor system performance

Monitor how your organization's systems are performing. Tracking CPU and memory usage helps prevent bottlenecks that slow down applications and helps ensure that the system can handle workloads without running out of resources. Disk performance monitoring identifies potential storage issues, such as slow read or write speeds, while I/O monitoring helps detect delays in data transfer.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Insights icon ( ) in the primary navigation pane.
3. Select **System performance**.
   For more information on the system performance metrics, see DEX Insights reports.

View actions in the Digital End-User Experience Action Library

View and use various pre-installed services available for a device in the Digital End-User Experience Action Library.

Before you begin

Role required:

- sn_dex.user
- sn_dex.admin
- sn_dex.service_desk_user and itil
- sn_dex.user
- sn_dex.engineer

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and select the **Devices** icon( ) from the primary navigation pane.
2. Select a device from the list.
3. On the contextual side panel, select the Action Library icon ( ) and view the following actions:

Action	Description	Local System account required
Add a registry key	Adds a registry key to this device, which stores settings and configuration data for the device OS and apps. Windows only.	Yes
Clear application cache	Removes the stored application data, which forces the app to retrieve fresh files from the internet. The default applications that support clearing app cache are Microsoft Teams, Zoom, and Microsoft Outlook. Use the dex_action_app_config table to add more applications that support this action. Configure the corresponding cache URL to be cleared for each application in the same table. Separate cache URLs by a comma if entering multiple URLs for an app.	Yes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description	Local System account required
	Note: Select the field auto-close, which closes the application before clearing the cache to confirm all the cache files are cleared.	
Clear browser cache	Removes temporary data stored on your laptop, such as cookies and website files.	Yes
Clear DNS Cache	Clears the DNS cache.	
Clear Google Chrome browsing data	Clears the browsing data, deleting all the saved addresses, payment methods, and auto-fill data.	
Clear Recycle Bin	Clears contents of the recycle bin on the device.	Yes for Windows
Delete a file	Permanently deletes the specified file. Submit one file at a time for deletion.	
Delete Network Drive	Removes a mapped network drive from your system and disconnects access to the shared location.	
Elevate temporary admin access	Provides temporary administrative privileges to perform specific tasks.	Yes for Windows
End process	Forcefully stops a running process.	Yes
Map Network Drive	Connects a shared network location to a local drive letter for an easy access to the device files and folders. Windows only.	
Modify a registry key value	Updates the value of the registry key monitored on the device. Windows only.	Yes
Modify Device Battery Power Plan	Adjusts device power plan settings using PowerShell scripts to optimize performance, energy efficiency, and battery life. Windows only.	
Configure device power scheme	Configures the power scheme settings and optimizes the performance, energy efficiency, and battery life of the device. macOS only.	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description	Local System account required
Modify USB storage access: Execute	Modifies the Execute permission, which enables programs or scripts to run directly from the USB storage device.	Yes
Modify USB storage access: Read	Modifies the Read permission enabling the device to read directly from the USB storage device.	Yes
Modify USB storage access: Write	Modifies the Write permission enabling the device to write directly to the USB storage device.	Yes
Perform disk cleanup	Deletes the temporary internet, memory, log, and cache files, similar to the following: ○ `C:\Windows"="*.dmp` ○ `"C:\Windows\Downloaded Program Files"="*.*"` ○ `"$env:UserProfile\Appdata\Local\Microsoft \Windows\Temporary Internet Files"="*.*"` ○ `"C:\Windows\Temp"="*.*"` ○ `"C:\Windows\System32\LogFiles"="*.*"` ○ `"C:\ProgramData\Microsoft\Windows\WER \ReportQueue"= "*.*"` Windows only.	
Remediate Zscaler connectivity	Fixes any connectivity issues with Zscaler Private Access.	Yes
Repair corrupt Outlook files	Detects and repairs OST and PST file types in Microsoft Classic Outlook to help enhance its performance and synchronization.	Yes
Reset Google Chrome browser settings	Resets Google Chrome browser settings.	
Restart Audio Services	Restarts audio services to restore sound and microphone functionality, fixing common playback and recording issues on the device.	Yes
Restart Microsoft OneDrive	Restart Microsoft OneDrive to resolve any synchronization issues and update all recent changes. The device user must be signed in to Microsoft OneDrive for this action.	Yes for Windows

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description	Local System account required
Restart Microsoft Outlook	Restarts Microsoft Outlook on the device.	Yes
Execute Jamf policy	Execute the Jamf policy either with a policy ID or with a predefined action. Predefined actions, configured by DEX admins in the `dex_jamf_policy_table`, can be selected and executed by service desk agents, who don't have access to the policy IDs. The predefined actions must be set in the table `dex_jamf_policy` and update the fields Action name, Application, Policy ID, and Active. The detailed information on the fields is listed in the following table. macOS only.	
Restart service	Restarts the service or application running on the device.	Yes
Uninstall an application	Uninstalls the chosen application from the action library. Only applications installed via .exe or .msi files can be uninstalled. Core OS and system applications don't get uninstalled, even if the action is executed successfully.	Yes

Field names for a Jamf policy

Field name	Description
Action name	Name of the action that is defined in the policy. Admins can predefine an action name so that SD agents don't need the policy ID to execute any action. The format is <action> <application name> <version>. For example, Reinstall Zoom 3.4.1 or Uninstall Firefox 134.2.
Active true/false	Enables the action to appear in action library.
Application	Identifies the application for which the policy is defined.
Policy ID	ID of the policy defined in Jamf server for the corresponding action.

The following are the Jamf limitations:

- As DEX Admin, you must know the Jamf pro features and have knowledge about the policies configured for applications at the customer Jamf server.
- Some policies when run, notify the user to update the application instead of automatically updating it. For example, Zoom doesn't automatically update. In cases like these, the policy is executed successfully only if the employee approves the update of the application. Otherwise, the remedial action execution fails.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor your user apps network

Monitor your app's network to ensure top performance, reduce latency, and improve security. Track key metrics to spot issues early, optimize resource use, and fix problems before they impact users.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and select the **Devices** icon( ) from the primary navigation pane.
2. Select a device from the list.
3. In the **Network experience** section, select one of the following options:
   - Connection details: Information about the user's Wi-Fi, wired, and VPN connection.
   - App connection stability: Information about the network stability related to latency, packet loss, and jitter.

     This option is applicable only to Windows OS.
   - App connection path: Network path data for a selected application.

     This option is applicable only to Windows OS.
   - Application hops: List of hops between the user's device and an application server that can help you identify and fix network bottlenecks.

View the support group for an application

View the support group for the application to quickly identify who to contact when you encounter issues. The support group is typically responsible for managing incidents, troubleshooting problems, and providing technical support for the application.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user or ITIL

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and from the left pane, select the Applications icon ( ).
2. Select the application name whose support group you want to view.
   The support group appears in the **Support group** field.

   To edit a support group, change the support group and select **Save**.

View metrics of an installed application

View and monitor the CPU and memory usage of your applications to optimize performance and promoting efficient resource allocation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the Applications icon ( ).
3. Select an installed application name.
4. Select **Performance** under **Application metrics**.
   You can view information on the number of crashes, CPU usage, memory and I/O performance, and memory usage trends. For more information on the metrics, see Installed application Performance page.

View metrics of a web application

View metrics of a web application to get a comprehensive view of the performance of the application. Tracking these metrics over time can help you gauge the impact of changes made to the application and monitor its long-term performance.

Before you begin
Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the Applications icon ( ).
3. Select a web application name.
4. Select **Performance** under **Application metrics**.

   You can view information on the users, sessions, response time, page load time, and availability. For more information on the metrics, see Web application — Performance page.

   Note:
   If you set up a page-level monitoring for specific application pages, you can see the collected metrics in the Metrics analyzer. Select one or more pages under **Pages** and narrow down your data by location, OS, or date range.

View collected metrics with Metrics analyzer

Use the Metrics analyzer to view metrics collected for a given device or application during a specific time.

Before you begin
Role required: sn_dex.admin

About this task
Use DEX Metrics analyzer to view key performance metrics collected for specific Configuration Items (CIs), in a single location. The Metrics analyzer enables you to select specific metrics for a device or application and see the aggregated metrics in a single consolidated time series.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the Devices icon ( ) or the Applications icon ( ).
3. Select a device or an application from the list.
4. Select the **Open in Metrics Analyzer** button.
5. In the Metrics analyzer window, search for or select up to five metrics to display as a graph.
   To learn more, see Metrics analyzer form.
6. **Optional:** Filter your data by page name, location, OS, or date range.
   The **Location** and **OS** fields are available only on the Metrics analyzer page for applications.
7. **Optional:** Select **Unselect all** to remove the results.

View the details of a user device

View the health of a device to get an overview of its status and identify any potential issues. You can use this information to optimize the device's performance and ensure that it continues to function efficiently.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user or ITIL

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and from the left pane, select the Users icon ( ).
2. Select the user name whose device health information you want to view.
3. From the **Device** drop-down list, select the device for which you want to get details.
   For more information on metrics, see Device health.

View client health with MCM

View client health metrics with the Microsoft Configuration Manager (MCM) application. The metrics include MCM metrics by device count, MCM versions installed on user devices, and device count where MCM action hasn't run in the last 24 hours.

Before you begin

- Add or enable MCM for monitoring.

  For more details, see Add an application for monitoring.

- Configure Advanced monitoring for MCM.

  For more details, see Enable application monitoring.

Enable application monitoring.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the Applications icon ( ).
3. Select *Microsoft* **Configuration Manager (MCM)**.
4. Select **Client health**.
   For more information, see Installed application Performance page.

View the domain or URL for a web/SaaS application

View the domain or web address of a web/SaaS application to access the application and use it effectively.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user or ITIL

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and from the left pane, select the DEX Administration icon ( ).
2. Select the **Manage applications** card.
   The list of monitored application appears.
3. Select the application for which you want to view the application URL.
   The URL appears in the **Domain/URL** field.

View agent policies

View the agent policies used during check runs on the associated Configuration Items (CI).

Before you begin

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Select **Manage policies** on the Agent policies card.

View application publisher

View the application publisher to know the organization who has the rights to distribute and support the application.

Before you begin

Confirm that the DEX plugin (sn_dex) is installed.

Role required: sn_dex.user or ITIL

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace** and from the left pane, select the DEX Administration icon ( ).
2. Select the **Manage applications** card.
   The list of monitored application appears.
3. Select the application for which you want to view the publisher.
   The publisher name appears in the **Publisher** field.

Monitor Microsoft Teams call quality

Enable advanced monitoring of Microsoft Teams call quality with DEX for Microsoft 365. Track and analyze call performance for a specific user.

Before you begin

Role required: admin

- Configure advanced monitoring for Microsoft Teams. For more details, see Enable application monitoring.
- Set up DEX for Microsoft 365 application. For more information, see Configuring DEX for Microsoft 365.

About this task

View detailed metrics for a employee's Microsoft Teams calls, including call quality, network metrics, and session data for a particular user.

Note:
All the data displayed in this page are based on the information received from Microsoft.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the Applications icon ( ).
3. Select **Teams**.
4. Select **Call quality** under **Application metrics**.
5. Select a **User**.

   Note:
   Only users with a valid email address can be selected.

6. Select a **Start date/time** and **End date/time**, then select **Go**.

   Note:
   The date range is limited to a maximum of 48 hours within the past 30 days.

7. Select **Summary**.
   The following details appear:
   - **Call Quality**: A Pie chart shows the percentage of calls with Good quality, Poor quality, or Unclassified.
   - **Call Types**: A Pie chart shows the percentage of calls types: audio, video, or other.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Calls over time**: A line graph shows the number of Good, Poor, or Unclassified quality calls over the selected time period.
- **Network Experience**: A line graph shows average packet loss and average jitter over the selected period.
- **Metrics**: The following metrics appear in a table.

Metric	Description
Average jitter	Measure of the variation in packet delay over a network.
Average packet loss rate	Shows how often data disappears on its way. Lower loss means better sound, video, and performance.
Average round-trip time	Average time it takes for a data packet to travel from the source to the destination and back again. The lower the round-time trip, the faster the network.
Average audio degradation	Average decline in audio quality experienced during a call or voice transmission, due to network issues like packet loss, jitter, latency, or codec problems.
Average video frame loss percentage	Average percentage of video frames lost as is displayed to the user.
Average bandwidth estimate	Average estimated bandwidth available between two endpoints in bits per second.

8. Select **call quality metrics** to get session details.
   A number of total calls, good calls, and poor calls appears with a timeline chart of calls. The following session details appear:
   - **Session Quality Breakdown**: A pie chart shows the percentage of Microsoft Teams sessions with Good, Poor, or Unclassified quality.
   - **Connection Type**: A bar chart shows calls from various connection types.
   - **Media Type**: A bar chart shows audio and video calls.
   - **Video codecs used**: A bar chart based on the video codecs used.
   - **Audio codecs used**: A bar chart based on the audio codecs used.
   - **Operating system**: A bar chart based on the user's operating system.

Using DEX Desktop Assistant

DEX Desktop Assistant provides you with a quick access to some of the popular apps and services. It gives access to your requests, device health, outages, local applications, and also helps you to perform network tests.

The DEX Desktop Assistant provides a dedicated communication interface for employees, enabling access to self-service options, IT notifications, and support resources.

Desktop Assistant facilitates streamlined workflows by enabling employees to perform network diagnostics, access IT catalogs, use the ServiceNow® Employee Center, and interact with virtual agents for assistance. IT teams can use the tool to issue outage notifications or critical announcements, promoting timely communication and efficient support delivery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Device health** card is now replaced by **Device health check**.It allows you to check the real-time performance of your devices through the Device health check card. To know more, see Check your device's health using Desktop Assistant.

Desktop Assistant now provides the following cards out of the box.

Use of each card in Desktop Assistant

Card	Use
Device health check	Check your device's health using Desktop Assistant
Network test	Test the internet connection of your system
Employee center	Open Employee Center
Outages	View outages

Note:
If you experience issues with Desktop Assistant, troubleshoot them by accessing the logs at these locations:

- macOS: `Users/[username]/Library/Application Support/desktop_assistant_app/logs`
- Windows: `Users\[username]\AppData\Roaming\desktop_assistant_app\logs`

Accessing Desktop Assistant

Get insights across different Desktop Assistant features by exploring components within the application.

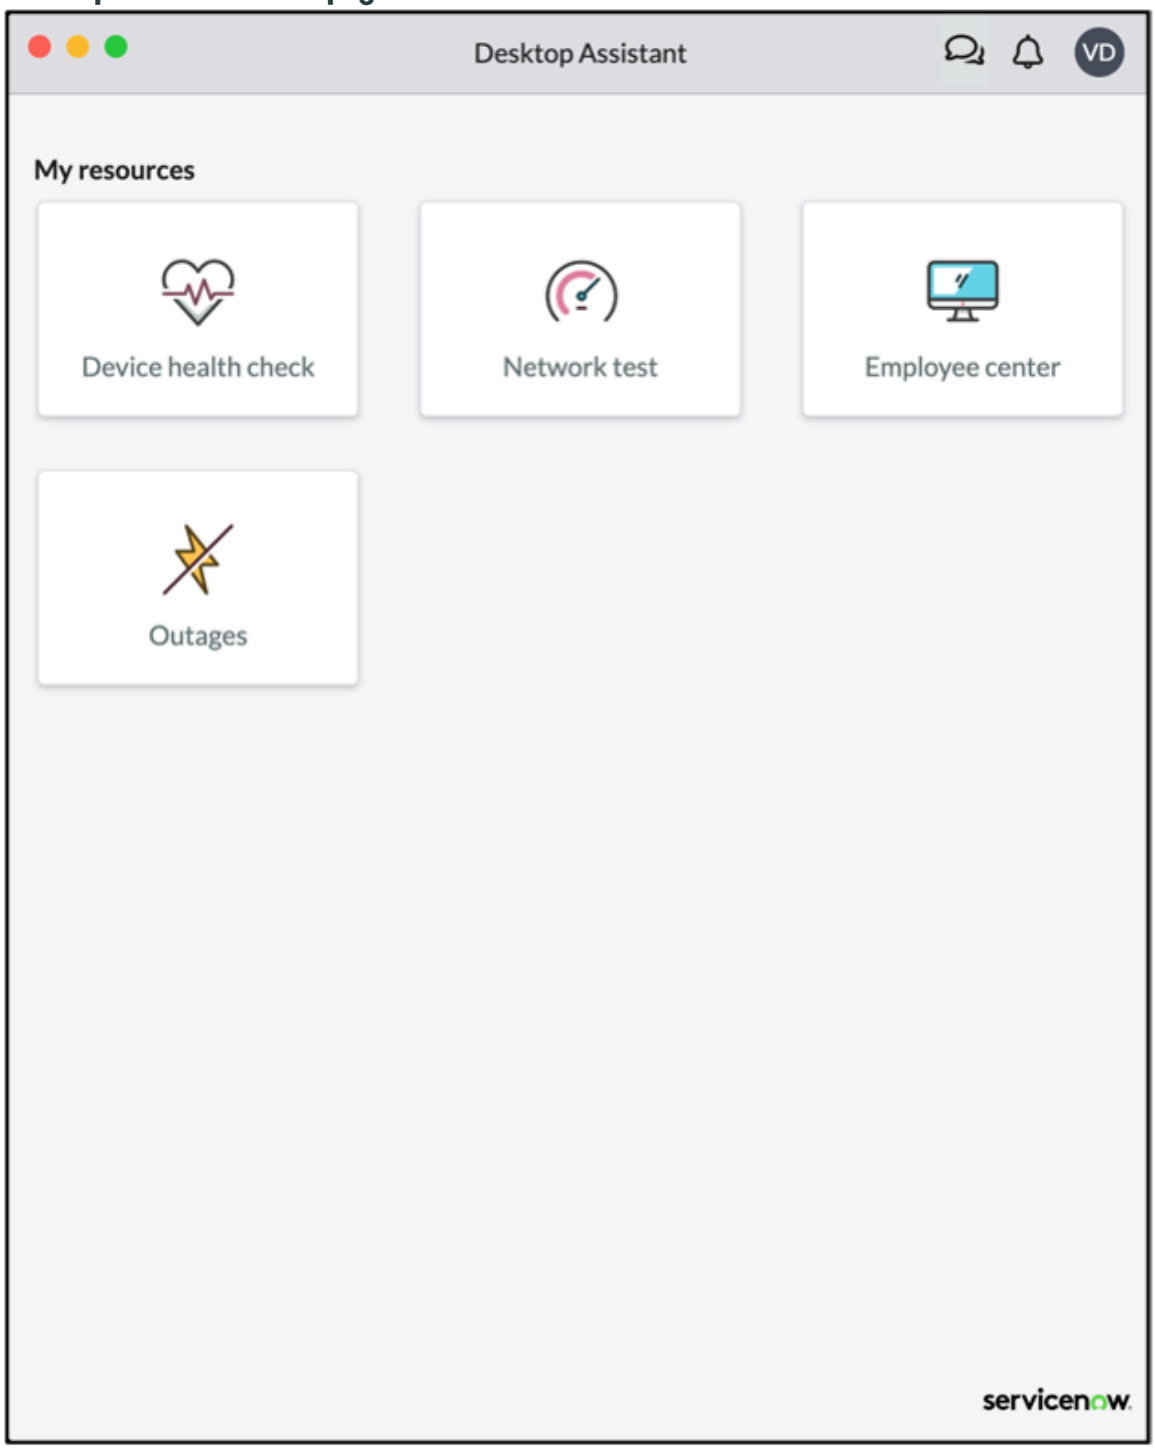
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desktop Assistant Home page



Home page components

Components	Description
Header	Header includes the name of the home page, the notification icon and the user icon. The notification bell icon ( ) displays a small red dot with number to indicate the number of new notifications. The user's profile icon ( ) is the user log off icon.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Home page components (continued)

Components	Description
Sections	Sections make it easy for you to search for items by arranging items sequentially and in logical groups. By default, ServiceNow provides My Resources. Desktop Assistant administrator can configure the section. For more information, see Add a section in the Home page.
Cards	Application shortcuts that help you to access applications quickly. Desktop Assistant administrator can map a card to any section or remove cards from any section. For more information, see Delete a card from the Home page.

Open Desktop Assistant

Open or log in to Desktop Assistant to get an easy access to ServiceNow functionalities such as your applications, device health, your requests, network speed of your system, and Employee Center.

Before you begin

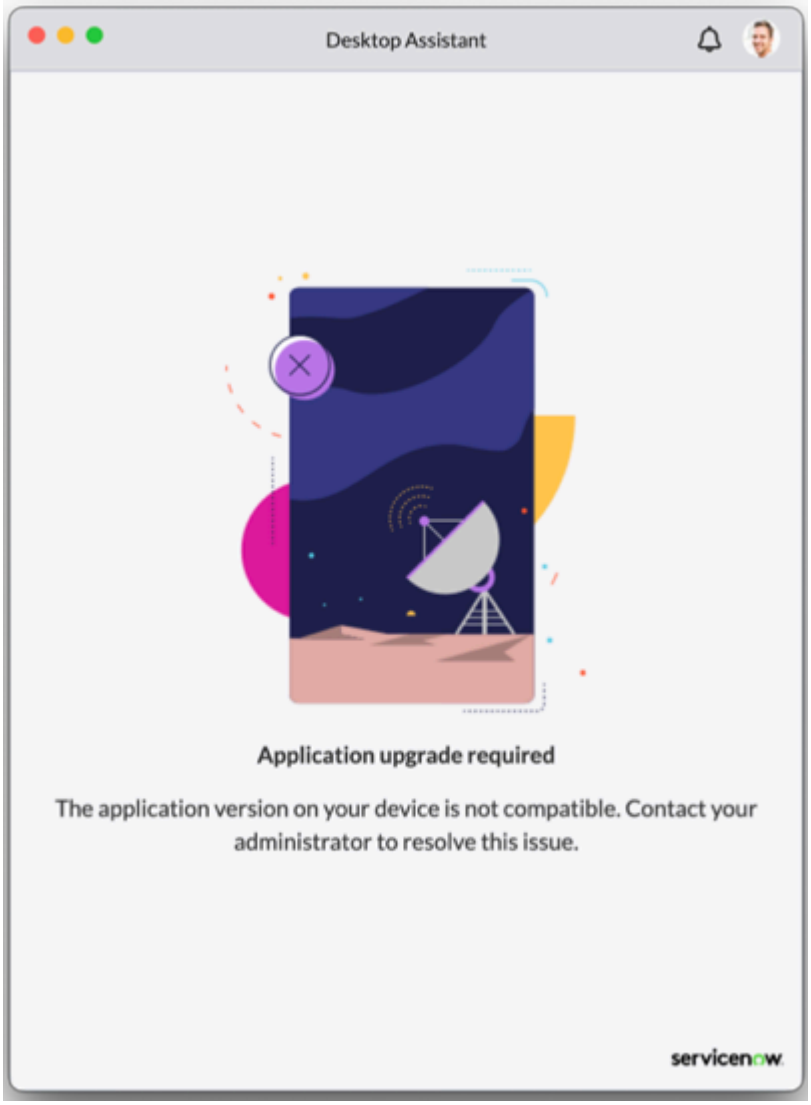
Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.user or sn_dex_desktop.admin

About this task

If you see the `Incompatibility application version detected` message, contact the administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



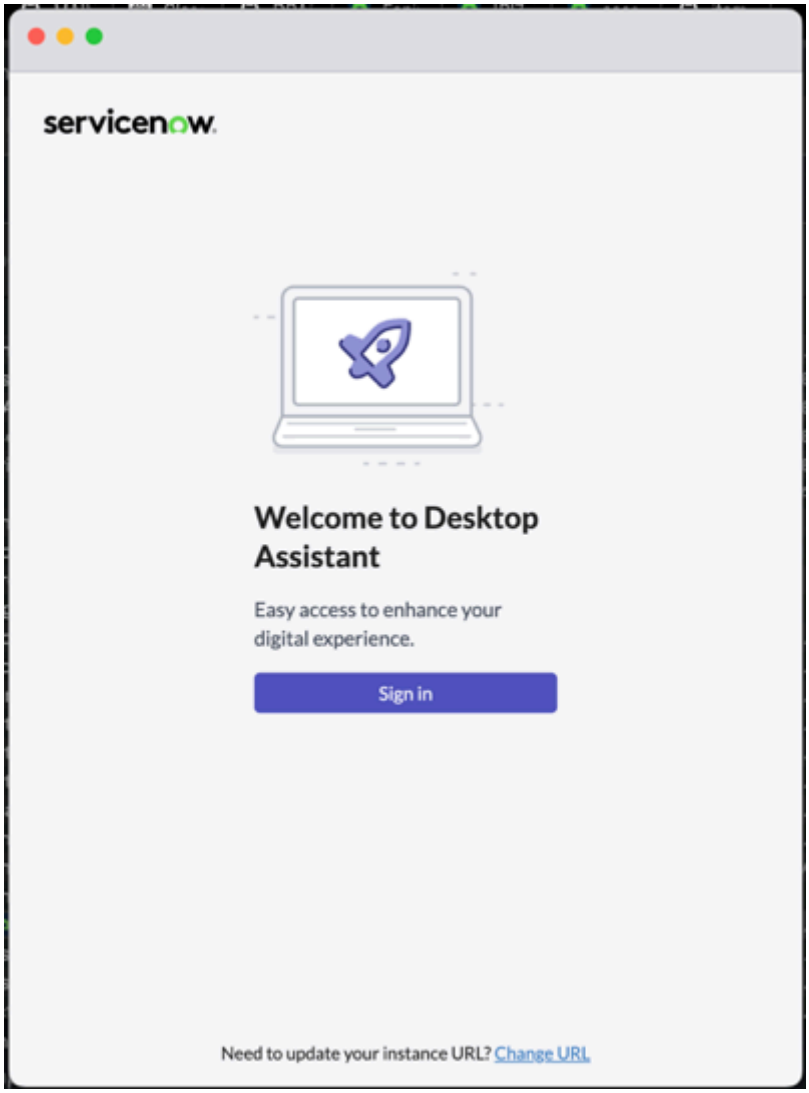
Procedure

1. From your system tray, select and hold (or right-click) the Desktop Assistant icon ( ) and then select **Open**.
2. Select **Sign in**.

   You can customize the login page by changing the following values in the settings.json file:

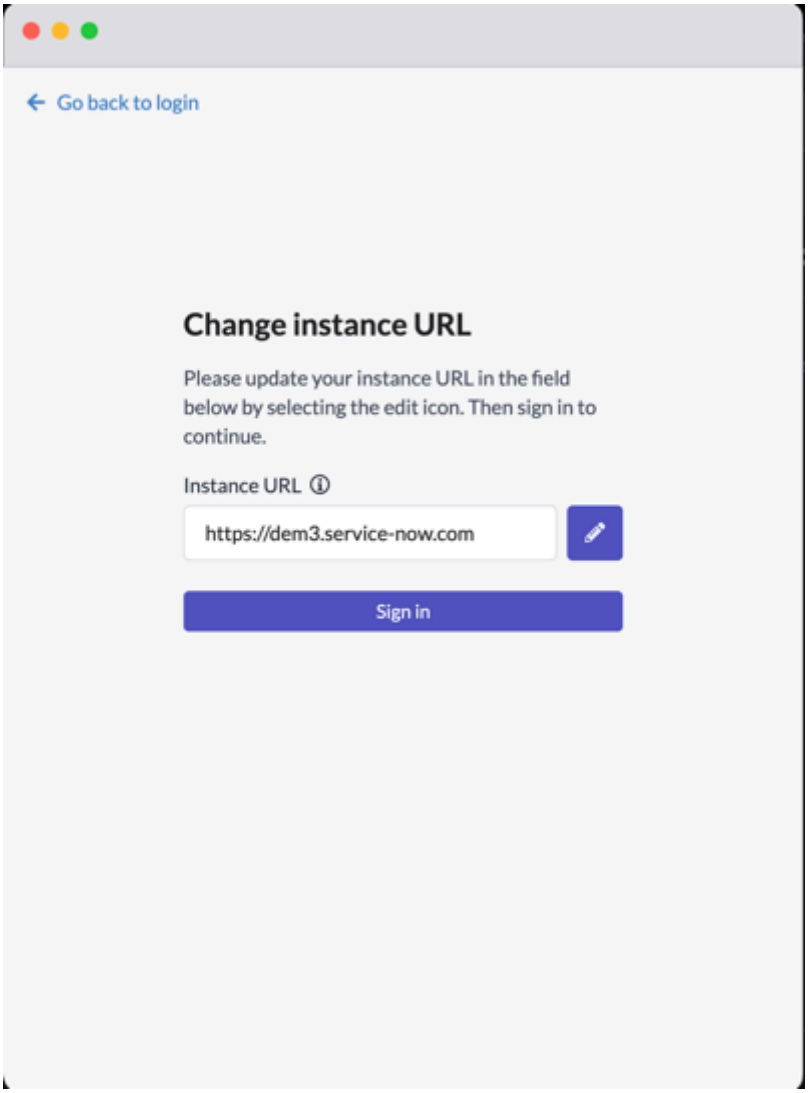
   - loginHeader
   - loginBody
   - companyLogoSvg

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



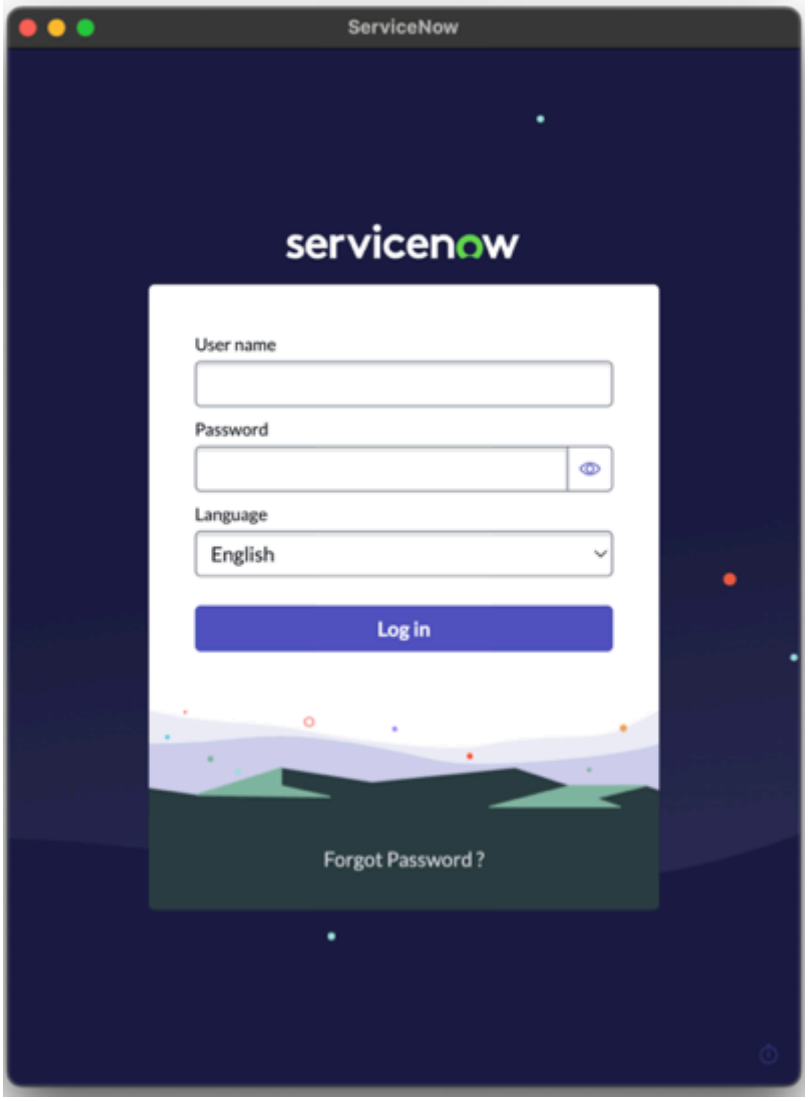
3. In the **Instance URL** field, enter the ServiceNow instance URL.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Sign in**.
   The authentication window opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you can't remember your login details, use the **Forgot password** feature to reset your password.

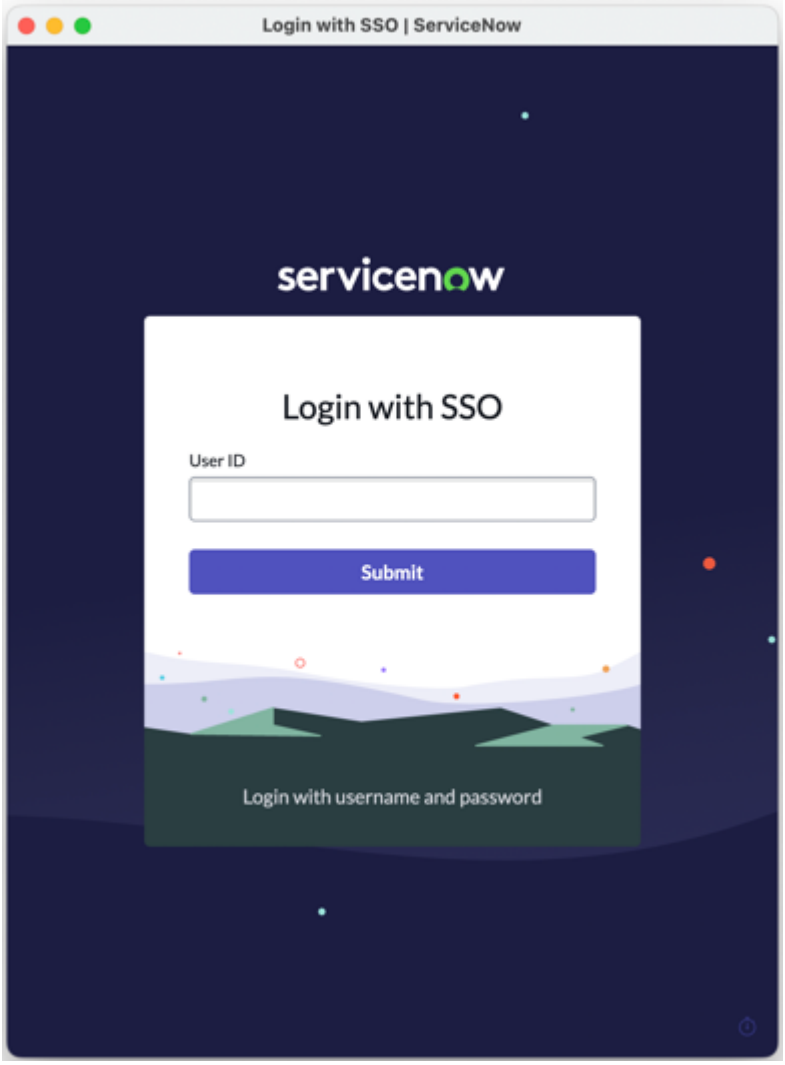
5. Perform any one of the following actions to log in:
   - When you don't have a Single Sign-On (SSO):
     - Enter the user name and password for the instance in the **User name** and **Password** field.
     - Select **Log in**.
     - Allow Desktop Assistant to connect to your ServiceNow account by selecting **Allow**.

       Note:
       To have an SSO login, you should set up the SSO provider and configure SSO in the instance. To learn more about configuring SSO, see Configure OAuth details.

   - When you have Single Sign-On (SSO):

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

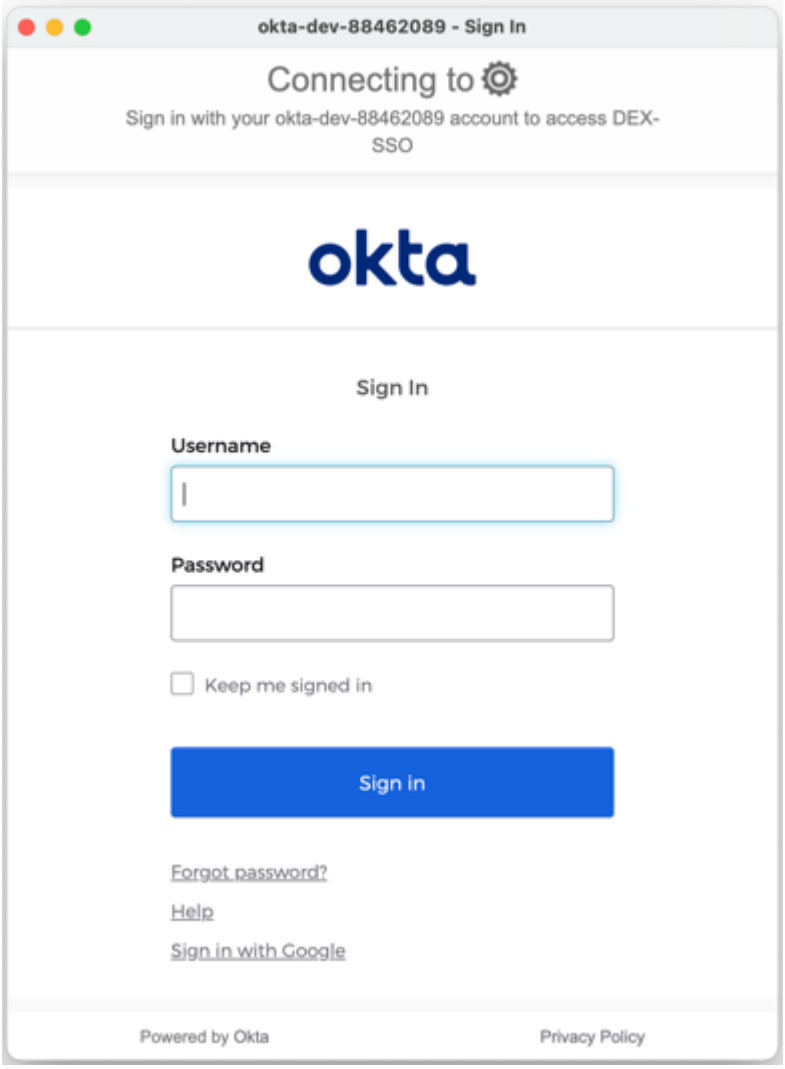
- Select the **Login with SSO** link.



- Enter your user ID in the **User ID** field.
- Select **Submit**.

  You're redirected to the SSO login screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Enter your user name and password in the **User name** and **Password** field.
- Select **Sign in**.
- Allow Desktop Assistant to connect to your ServiceNow account by selecting **Allow**.

Result
The Desktop Assistant Home page opens.

Trouble?
If you get an unintended page when logging in, quit the application and reopen it to resolve the issue.

Desktop Assistant notifications

Desktop Assistant notifications enable your organization to communicate important updates to end users instantly, regardless of their device activity. This feature enables delivering critical information, supporting Major Incident Management and Proactive Engagement

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The administrators can now use Desktop Assistant as a channel to send notifications for any update or activity. This can be done by configuring the API (Application Programming Interfaces) with required parameters. For more information, see API parameters to customize Desktop Assistant notifications

Desktop Assistant notifications provide a reliable way to inform end users of critical updates with minimal effort. These notifications provide updates for awareness but aren't directly actionable.

Notifications are sent as system push notifications on Windows and macOS devices. You can also access notifications through the Desktop Assistant notification panel.

To learn more about viewing notifications in your Desktop Assistant, see View notifications.

Desktop Assistant supports notifications from the following applications in these ways:

- Major Incident Management sends real-time updates about critical incidents to all configured recipients, with each notification delivered once per logged-in device. Major Incident Management provides updates to two recipient lists out of the box:
  - All users in affected location(s): Major Incident Management sends the updates all the configured recipients in the affected locations. For example, a Major Incident Management notification informs all employees in affected locations of a sudden network outage, ensuring they're aware of the issue.
  - All users based on the application usage in the affected location(s): Major Incident Management sends the updates only to the configured recipients based the application usage in the affected locations. The recipient list consists of only users whose aggregated application usage is greater than zero during the selected aggregation period and aggregation frequency. The aggregation period and aggregation frequency can be any of the following:
    - Daily: 1-7 days
    - Weekly: 1-4 weeks
    - Monthly: 1-12 months

    For example, if the aggregation frequency is set to daily and the aggregation period is 7, a message is sent to users in the affected location(s) whose aggregation application usage is greater than 0 over the last 7 days. Similarly, if the aggregation frequency is set to weekly and the aggregation period is 4, the message is sent to users in the affected location(s) whose aggregated application usage is greater than 0 over the last 4 weeks.

    By default, the aggregation frequency is set to **Daily**, and the aggregation period is **7**.

    This ensures that only relevant users receive useful updates, avoiding unnecessary notifications.

    To customize this out of box recipient list, **All users based on the application usage in the affected location(s)**, see Update the recipient list for Major Incident Management updates based on application usage .

    To create a notification for a particular incident using this recipient list, see Compose communications for incidents and major incidents.

- Proactive Engagement alerts users about updates specific to affected devices. A notification from Proactive Engagement alerts users about events like upcoming maintenance on their devices to help them prepare in advance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can define how long the system attempts to deliver notifications by configuring the Time-to-Live (TTL) value using the *sn_dex_desktop.sn_desktop_assistant.notification_time_to_live* property. Older notifications exceeding the TTL are discarded.

Note:
The Time-to-Live (TTL) value can be set to a maximum of seven days.

You can also disable notifications by following the steps in Enable or disable notifications.

Note:
Notifications should appear on the end user's devices within two minutes after generation.

Chat using Now Assist with Virtual Agent

Use Digital End-User Experience (DEX) Virtual Agent to access a convenient chat-based support powered by Now Assist to find answers and guidance.

Before you begin

Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.user or sn_dex_desktop.admin

Procedure

1. On the Desktop Assistant homepage, select the virtual agent or chat icon ( ) that appears on the Desktop Assistant header.
2. In the chat window, enter your question in the **Please type your request** field and press Enter.
3. Use the prompts from Now Assist to create a ticket, check on the status of an existing ticket, or resolve other issues you might have.

Note:

- To customize the topics that must be displayed and available on the **Show me everything** window, see Getting started with Virtual Agent Designer
- To monitor and improve your device performance using Now Assist in Virtual Agent, see

Update the recipient list for Major Incident Management updates based on application usage

Customize the attributes of the recipient list.

About this task

You can edit the recipient list **All users based on the application usage in the affected location(s)**, which is provided by the DEX application with the base system. You can update the required attributes of the recipient list.

Before you begin

- Install the DEX Score application.
- Have data available in the installed or web application tables in the DEX Score. This data is tracked based on which recipient list is filtered.
- Verify that the Orchestrate Generator Aggregation scheduled job in DEX Score is run. This job runs daily and collects the data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

Procedure

1. Navigate to **All** > **Targetted Communication** > **Recipient list**.
2. Open the **All users based on the application usage in the affected location(s)** recipient list.
3. Edit the following details in the script:

Parameter list	Description
Aggregation Frequency	Enter the aggregation frequency: ○ Daily ○ Weekly ○ Monthly .
Aggregation Period	Enter the aggregation period: ○ 1 to 7 ○ 1 to 4 ○ 1 to 12 . **Note:** By default, the aggregation frequency is set to daily, and the aggregation period is 7.
Application type	Enter either installed or web, based on this it filters the users.
Application	Enter a sys_id of an application. For example, a sys_id of the Microsoft PowerPoint application.
Metric	Enter a metric. For example, Application Usage.
Metric value	Enter a metric value. The API checks if the selected metric is greater than the metric value, based on this it filters the users.
Location id	Enter the sys_id of the location.

4. Select **Update**.

View notifications

View notifications to stay up to date with important information and events in real time.

Before you begin

Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

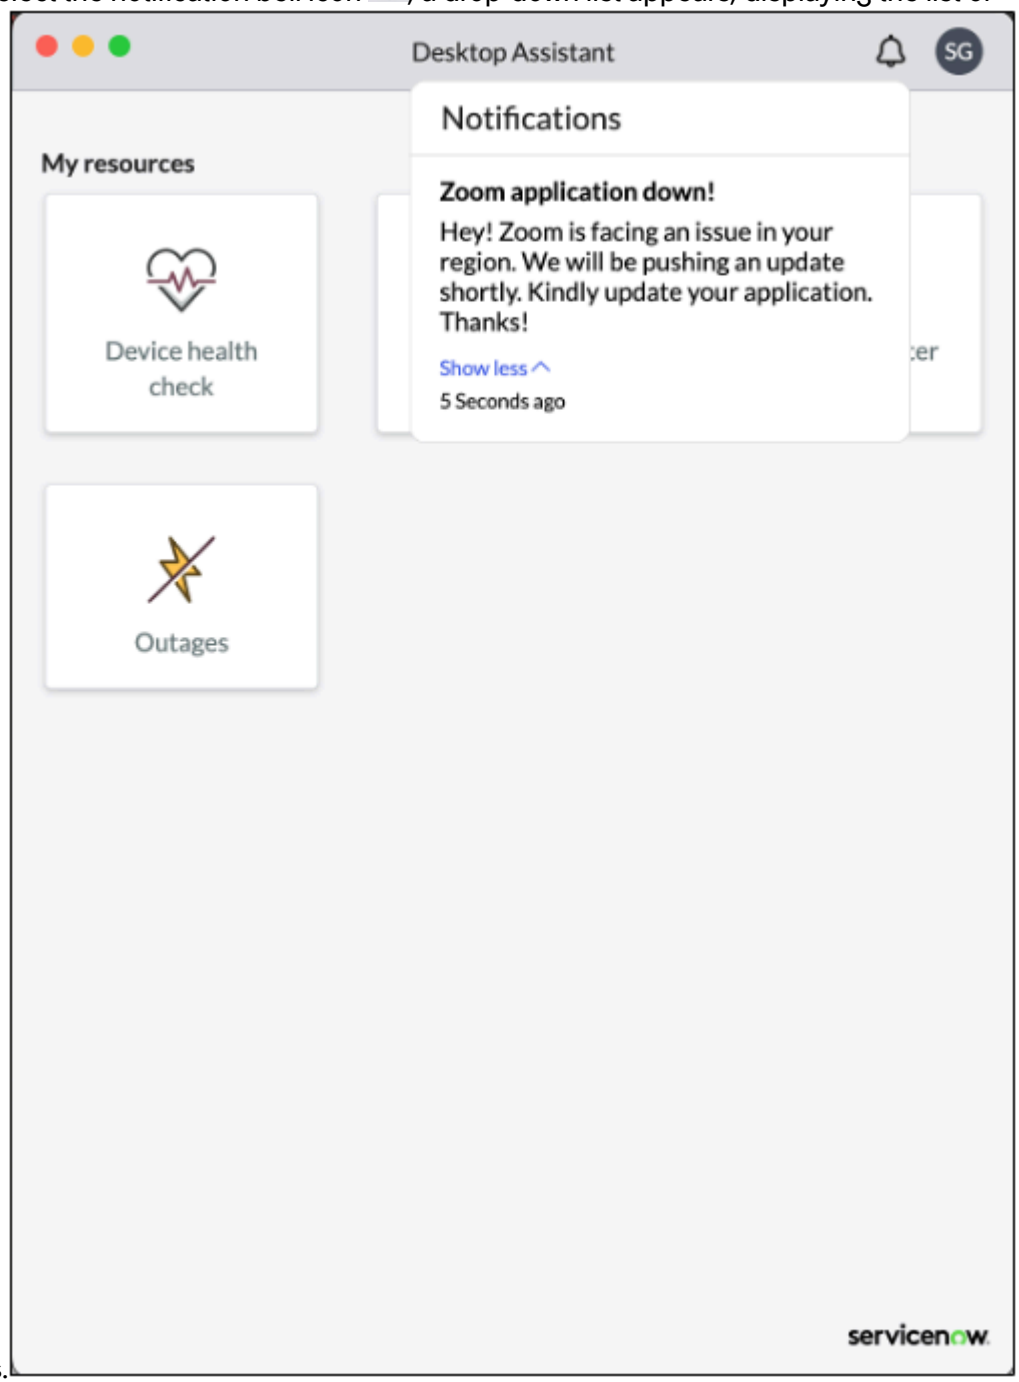
Role required: sn_dex_desktop.user or sn_dex_desktop.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

On the Desktop Assistant home page, select the notifications bell icon ( ).

When you select the notification bell icon , a drop-down list appears, displaying the list of notifications.



Note:
With DEX Washington DC release, if a user logs in to Desktop Assistant on a new device, any existing unexpired notifications don't appear in the notifications list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Test the internet connection of your system

Conduct an internet speed test to evaluate the performance of your internet service. If it seems like your internet is slower than it should be, running a speed test is the quickest way to find out if something is wrong on your end, or if the problem is with your internet service provider.

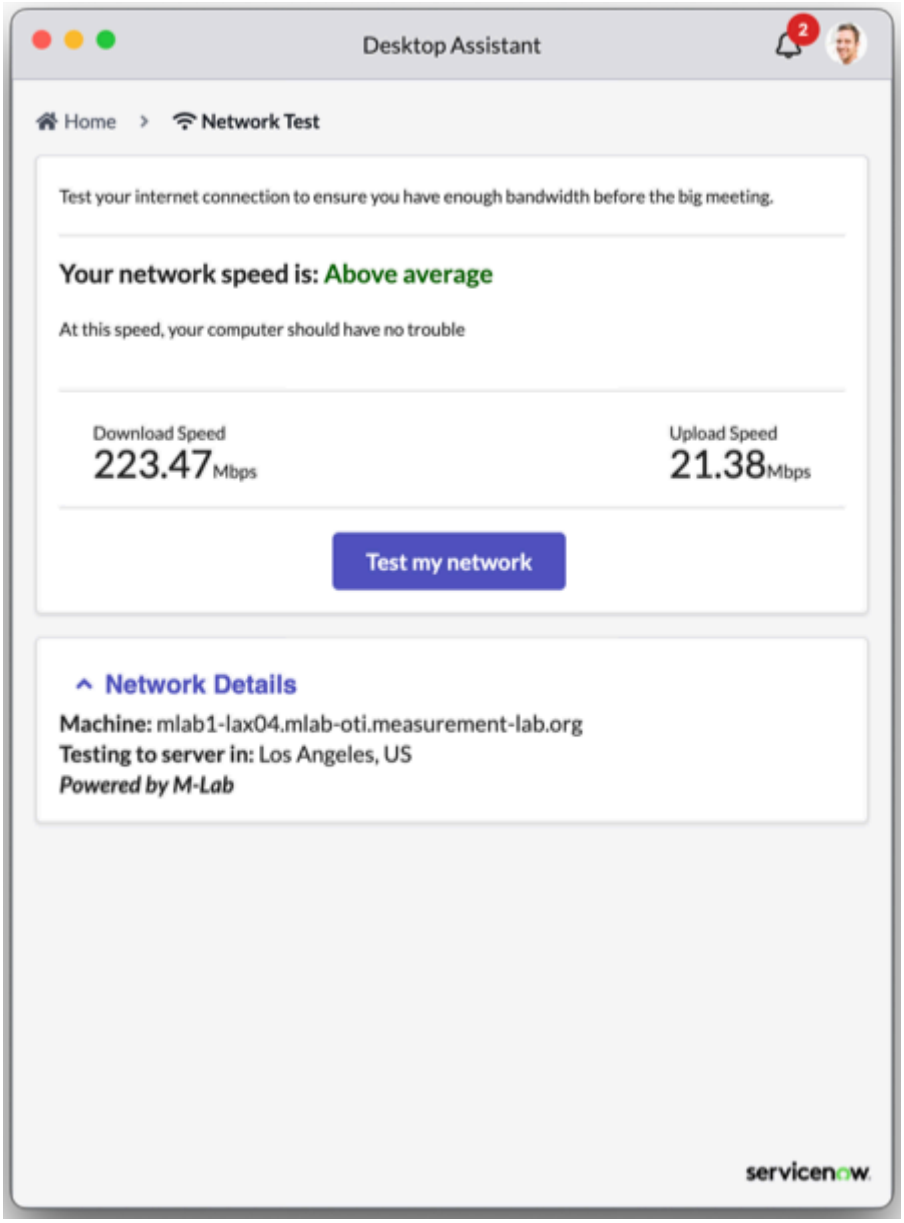
Before you begin

Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.user or sn_dex_desktop.admin

Procedure

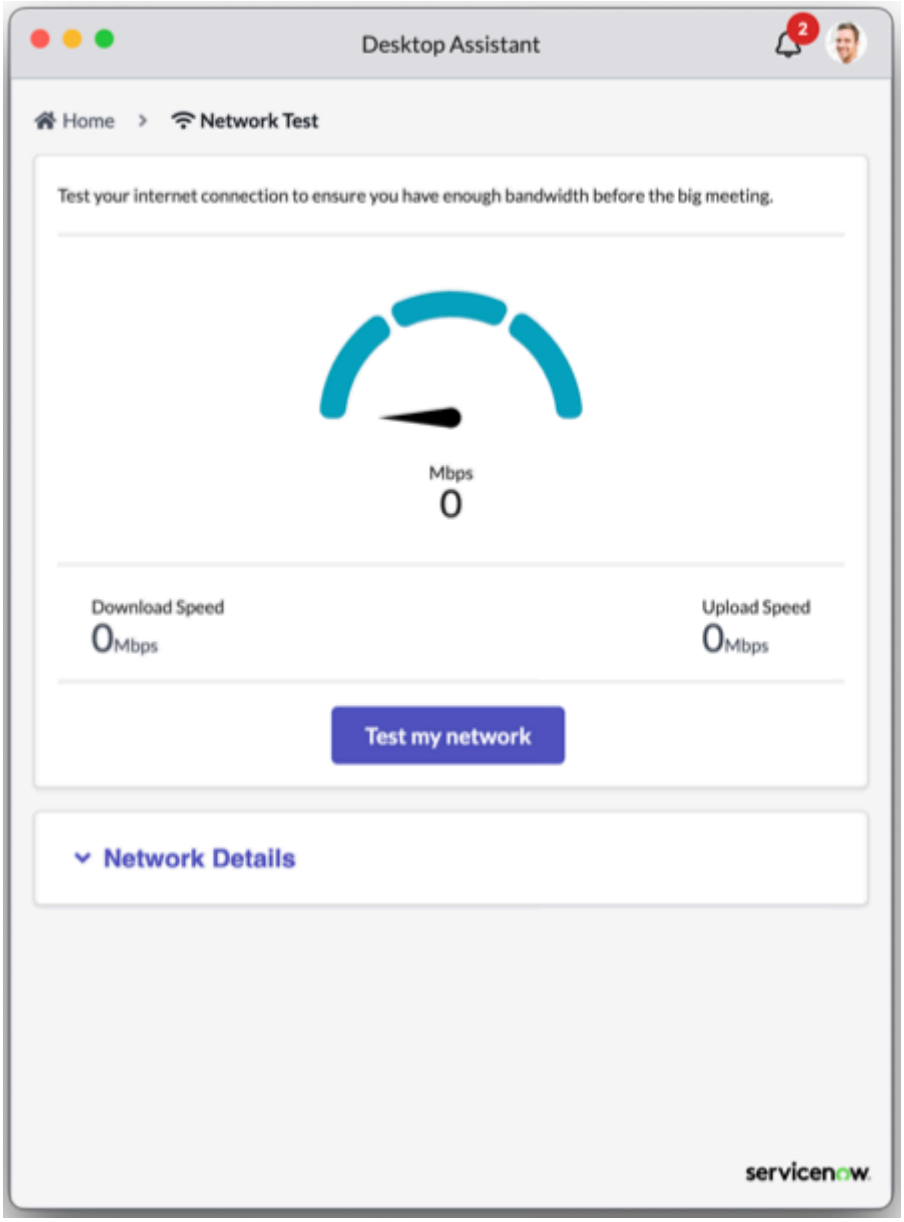
1. On the Desktop Assistant home page, click the **Network Test** card.
   The Network test page opens.



2. Click **Test my network**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The test provides the network speed (download and upload speed) of the device where the Desktop Assistant is installed. Under the Network Details section, you can find the machine name and the server details.



If the network speed is below average, you can check the details for the troubleshooting steps.

Open Employee Center

Open Employee Center to get a single, unified portal to find information, get help, and request the services you need.

Before you begin

Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

You must also map the Employee Center card to the Employee Center portal of your organization.

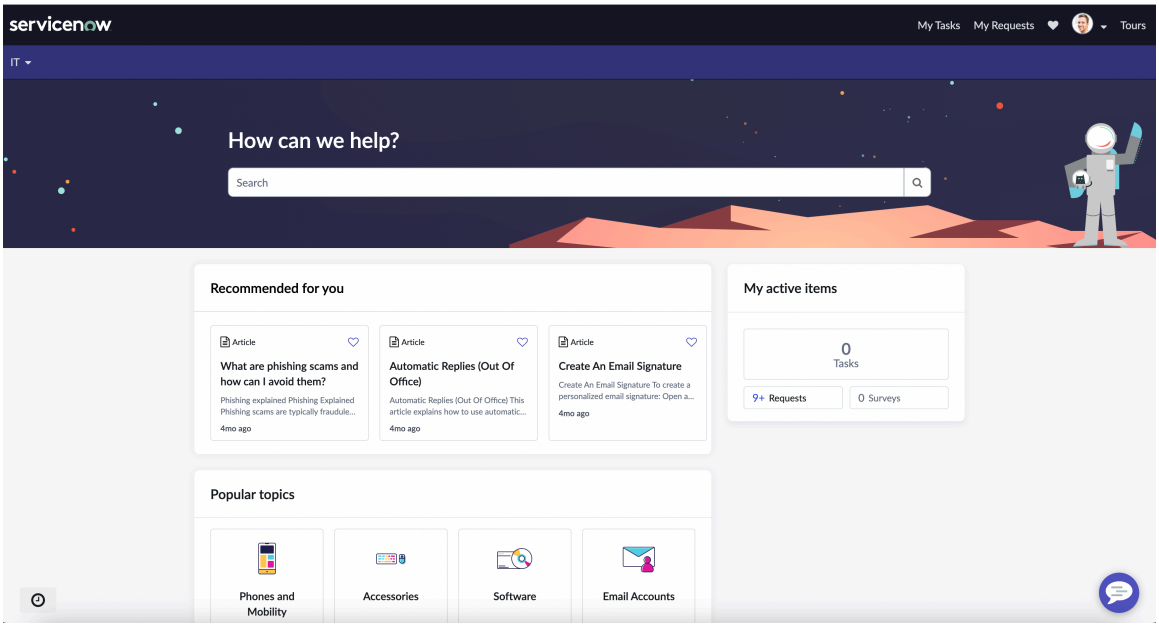
Role required: sn_dex_desktop.user or sn_dex_desktop.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

On the Desktop Assistant home page, click the **Employee Center** card.

The Employee Center page opens.



View outages

View planned outages that are currently active so that you can identify task hazards and plan your work execution accordingly. Outages can be planned outages, unplanned outages, or degradation.

Before you begin

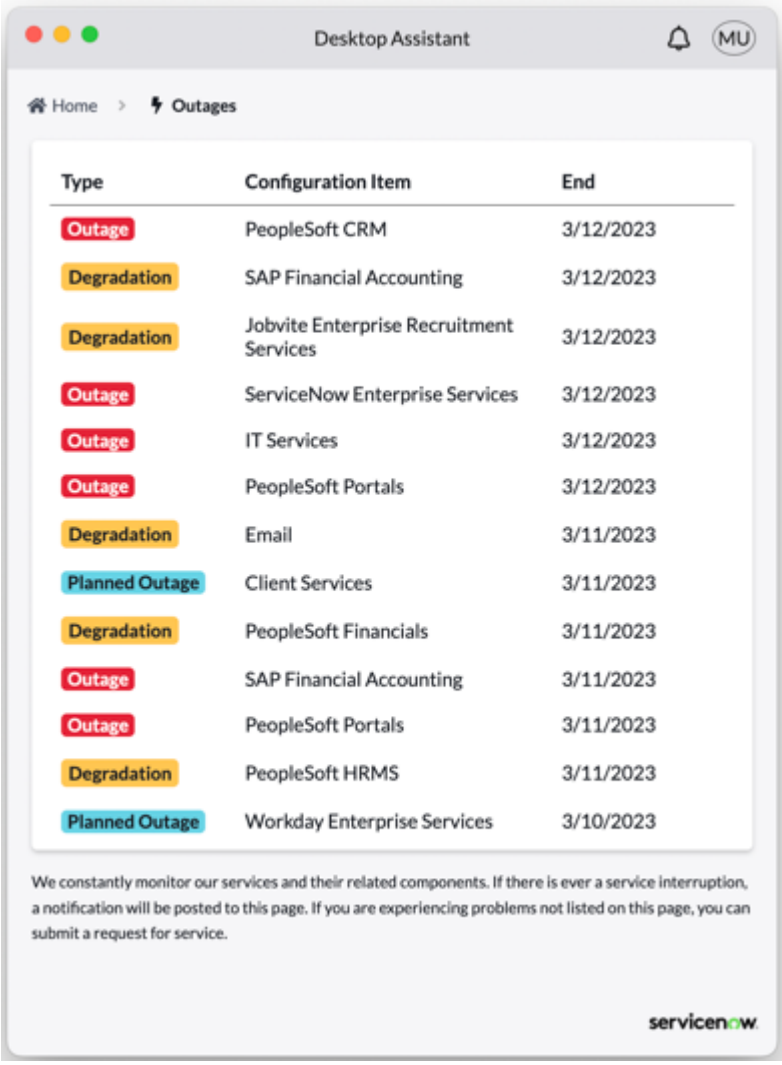
Confirm that the DEX Desktop Assistant [sn_dex_desktop] application has been installed. For more information, see Install Application and Device Health and Download and install Desktop Assistant.

Role required: sn_dex_desktop.user or sn_dex_desktop.admin

Procedure

On the Desktop Assistant home page, click the **Outages** card.
View the list of active outages. Clicking any of the records takes you to the outage details page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



View Desktop Assistant usage metrics

Access the end user's Desktop Assistant usage metrics with your DEX admin role.

Before you begin

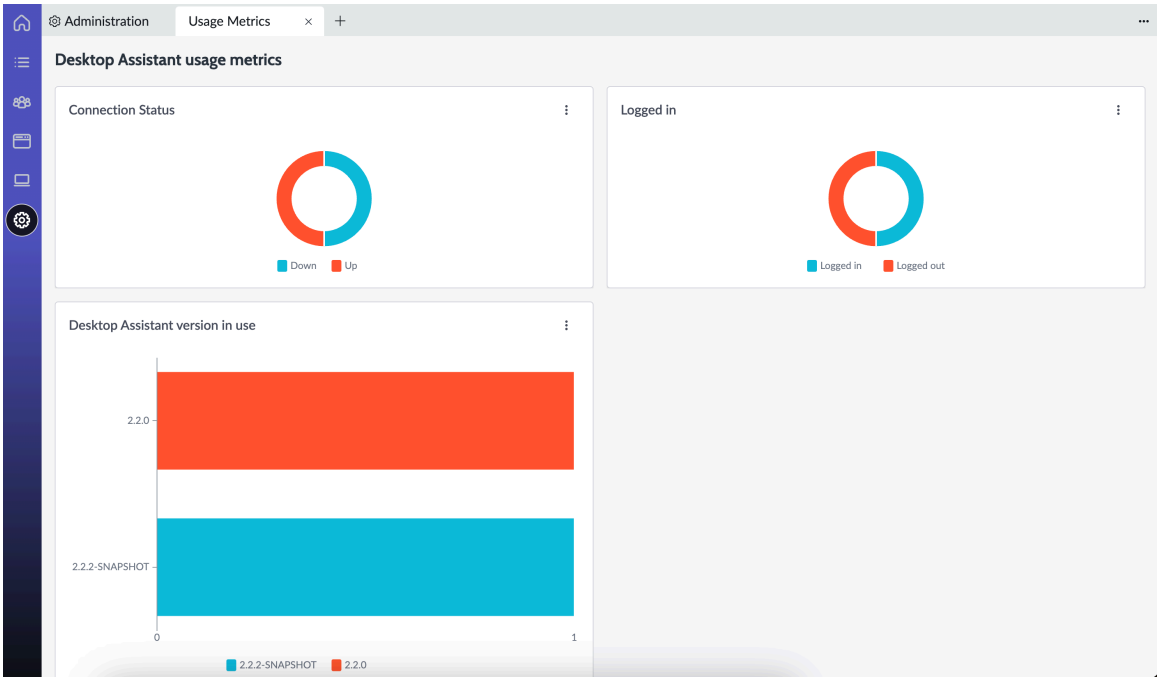
Confirm that the DEX plugin (sn_dex) is installed.

Role required: admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. In the primary navigation pane, select the DEX Administration icon ( ).
3. Under Desktop Assistant, select **Usage metrics**.
   You can view the Desktop Assistant users who are logged in, their connection status, and the Desktop Assistant versions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For more details on the usage metrics, see Desktop Assistant usage metrics.

Digital End-User Experience reference

These reference sections provide more information about monitoring and managing your devices and apps with Digital End-User Experience and its components.

DEX Application and Device Health reference

Reference topics provide additional information about the cards, lists, and forms that helps you to configure and use DEX Application and Device Health.

Installed with DEX

Several types of components are installed with activation of the DEX application [sn_dex] plugin, including user roles and tables.

Roles installed

Users and responsibilities

Role title [name]	Description	Contains roles
DEX administrator [sn_dex.admin]	Responsible for managing user access to DEX, managing the applications that are being monitored, and handling onboarding/offboarding-related tasks. They also troubleshoot any issues that arise within the application.	• agent_client_collector_admin • report_admin • sn_dex.user • sn_dex.engineer • sn_cmdb_editor
DEX engineer [sn_dex.engineer]	Responsible for accessing and executing the remedial actions.	sn_dex.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users and responsibilities (continued)

Role title [name]	Description	Contains roles
DEX user [sn_dex.user]	Responsible for accessing and using the features provided by DEX.	• agent_client_collector_user • cmdb_read • dependency_views • mbplus_reader • sam_user • sn_cmdb_editor • sn_incident_read • sn_sow.sow_home • sn_sow.sow_list • sn_sow.sow_user
DEX Service Desk agent [sn_dex.service_desk_user]	Responsible for L1 or L2 support representatives accessing DEX from the incident platform to explore and investigate the details of the devices linked to the incident.	Not applicable

Tables installed

Table	Description
DEX Application [dex_application]	Parent table that stores a list of all the applications configured for monitoring on the **Administration** > **Applications** page. The table extends the parent table sn_acc_vis_content_application in the Agent Client Collector for Visibility - Content scoped app.
Metric Rules [dex_metric_rules]	Table that stores all the DEX metric rules.
Alert Metadata [dex_alert_metadata]	Table that stores data about incoming events from the metric rules.
Alert Impacted Users [dex_alert_impacted_users]	Table that stores data about users or devices, which are impacted for a given metric rule.
Alert Locations [dex_alert_location]	Table that stores data about locations, which are impacted for a given metric rule.
Action App Config [dex_action_app_config]	Table that stores applications, which support the clear app cache action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
CI Device Configuration [dex_ci_device_config]	Table that stores the device configuration data including the logged-in user information. For information on the related policies and check definitions, see DEX Content Playbook reference.

Landing page cards

The landing page cards provide a visual summary of active and impacted devices, and alerts for monitored applications, facilitating efficient data analysis across various categories.

Note:
The graphs display the latest data from the last two hours.

Home page cards

Cards	Description
Active alerts	Total number of active alerts. **Note:** The active alerts details page also shares the details of the impacted users and impacted devices.
Impacted devices	Displays the count of impacted users based on the alerts of both the devices and the applications running on that device.
Active devices	Total number of active devices in the last 5 minutes. The graph indicates the trend of last 2 hours.
Devices	The devices world map shows device counts by location, enables you to drill down into specific regions, and redirects to the Devices page for detailed insights.

To return to the main page, see Landing page.

DEX Insights reports

The Digital End-User Experience (DEX) Insights tab provides reports on the user device battery health, system compliance, system performance, and system time, which enables efficient monitoring and issue identification.

Battery health

Field	Description
Device	Name of the monitored digital device, like a laptop or a desktop.
User	Owner of the device.
Operating system	OS that manages and controls the device hardware, as well as enables the execution of applications such as Windows or macOS.
Battery health	State of the battery health. States include the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Good • Moderate • Poor • Unknown
Battery condition	Battery condition values vary by OS. Each OS has the following values: • Windows: Degraded, Error, Lost Comm, No Contact, NonRecover, OK, Pred Fail, Service, Starting, Stopping, Stressed, Unknown • macOS: Normal, Service Needed, Permanent Failure, Check Battery
Fully charged capacity	Capacity of the battery when fully charged.
Percent of designed capacity	Current capacity divided by the designed capacity.
Cycle count	Cycle count before replacement.
Battery serial number	Serial number of the battery.
Last refresh time	Last time the record was updated.

System compliance

Field	Description
Device	Name of the monitored digital device, like a laptop or a desktop.
User	Owner of the device.
Compliance rating	Device's adherence to tracked applications and policy metrics, measured in percentage. It's calculated by dividing the number of compliant applications and policy metrics by the total number of applications monitored.
Noncompliant applications	Applications monitored for compliance but not currently running on this device.
Noncompliant metric values	System policies that don't return the expected or compliant values as required by your organization's compliance standards.
Alert	Alert triggered by a noncompliance event.
Operating system	OS that manages and controls the device hardware, as well as enables the execution of applications such as Windows or macOS.
Location	Physical location of the device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System performance

Field	Description
Device	Name of the monitored digital device, like a laptop or a desktop.
User	Owner of the device.
CPU usage	Amount of processing power consumed by an application, measured in percentage. High CPU usage might result in degraded application performance, slower response times, and decreased user satisfaction. Identifying performance bottlenecks can help optimize application performance.
Memory usage (%)	Amount of memory or RAM consumed by an application, measured in percentage. High memory usage might result in degraded application performance, slower response times, crashes, and system instability. Monitoring memory usage can help optimize resource allocation and capacity planning.
Disk usage (%)	Proportion of storage capacity consumed by data and applications on a disk drive, measured in percentage. Elevated disk usage might lead to slower system performance, increased loading times, and potential storage-related issues. Monitoring disk usage can help optimize storage resources, avoid data bottlenecks, and promote efficient data management.
IO usage read (kbps)	Process of reading data from storage devices, such as hard drives or solid-state drives, within a computer system. Excessive I/O read operations might lead to performance bottlenecks, increased latency, and slower system response times. Monitoring I/O read activities can verify that the data retrieval processes don't limit application performance. This field appears only for installed applications.
IO usage write (kbps)	Process of writing data to storage devices, like hard drives or solid-state drives, within a computer system. Excessive I/O write operations might lead to performance bottlenecks, increased latency, and slower system response times. Monitoring I/O write activities can verify that the data storage processes don't limit application performance. This field appears only for installed applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System time

Field	Description
Device	Monitored digital devices, like laptops and desktops.
User	Owner of the device.
Boot time	Time when the device last rebooted.
Up time	Amount of time that the device has been running.
Device serial number	Serial number of the device.
Device age	Age of the device.
Operating system	OS that manages and controls the device hardware, as well as enables the execution of applications, such as Windows or macOS.
Last refresh time	Last time the device record was updated.

Applications list

The applications list provides details about an application, including its name and classification as either an installed or Web-based application, counts of alerts and incidents, and impacted users.

Applications list

Fields	Description
Name	Name of the application.
Type	The category of the application - whether it's Web or installed.
Alerts	Total count of alerts in either the **Open**, **Reopen**, or **Flapping** state for an application with source as DEX. Selecting any alert number directs you to the Express list, where you can view detailed information about that alert.
Impacted devices	Devices that are impacted by service or performance failure, resulting in the creation of an incident.
Incidents	Total count of active incidents for an application.

To return to the Application page, see Applications.

Web application — Overview page

The overview page for a Web application provides information on the active alerts, active devices, incidents, impacted devices, and the average-to-resolve time for the incidents.

Web application Overview page

Field	Description
Active devices	Total count of active devices for the application.
Active alerts	Total count of active alerts for the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web application Overview page (continued)

Field	Description
Active incidents	Total count of active incidents for the application.
Current impacted devices	Total number of devices impacted due to the application service or performance failure with open alert created.
Active alerts and incidents (last 7 days)	Number of open alerts (P1-P5) and incidents (P1-P5) created for the application in the last 7 days.
Average MTTR incidents (all time)	Mean time to resolve (MTTR) incidents created due to this application.

Web application — Performance page

Monitor the application performance to enable proactive detection and resolution of issues, maintain optimal performance, improve user experience, troubleshoot the performance issues, and confirm that the application meets its intended purpose.

Web application performance - Engagement

Field	Description
Started Sessions	Total number of active user sessions for the application over the last 2 hours, specifically the latest 5 minutes. **Note:** Active user sessions information is vital for determining the server load. It also helps you to determine the perfect time for server maintenance.
Average session duration	Average amount of time spent according to user in the application over the last 2 hours, specifically the latest 5 minutes. It's calculated by dividing total time spent across sessions by the total number of users.
Page views	Frequency with which the users access or view a specific page within the application. Each visit to a page is recorded as one page view, whether it is by a first-time visitor or a returning user.

Web application performance - Metrics

Field	Description
Average response time	Total time taken to respond during the selected time period.
Average page load time	Average amount of time it takes to load the page, from initiation to load completion during the selected time period.
Average DNS lookup	Average amount of time it takes for a Domain Name System (DNS) lookup to be completed during the selected time period.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web application performance - Metrics (continued)

Field	Description
	A lower average DNS lookup time is desirable, as it contributes to faster web page loading and improved overall internet performance.
Failed web requests	Set of all requests that either return an Error Code or an HTTP 408 status code or fail to return a Success Code during the selected time period.
Successful web requests	Number of times the HTTP requests made by the client (such as a web browser) to a server that result in a positive and expected response.
Availability	Measure of the system's operational performance and its ability to be accessible and usable when needed. It's typically expressed as a percentage, representing the proportion of time the application is functional and available for use.

Note:
If you set up a page-level monitoring for specific application pages, you can see the collected metrics in the Metrics analyzer. Select one or more pages under **Pages** and narrow down your data by location, OS, or date range.

Web application — Devices page

The Active and Impacted devices list captures data about the devices, latest logged-in user, last logged in location, and time when the application was last accessed on the device. This information helps with security, access control, and provides insights into user behavior and application usage.

Active and impacted devices

Field	Description
Name	Active or Impacted device that is connected to DEX.
Last logged-in user	Last logged-in user that accessed the device.
Last logged in location	The geographical position or physical location of the device where the application was recently accessed. **Note:** The device location is important in an outage or emergency situation when it's important to be able to locate impacted devices and users to assist. Device location data can be used to identify the extent and severity of the outage, prioritize restoration efforts, and direct resources to the affected areas.
App last accessed	Date and time when the application was last accessed on the device. Only Active devices page has this field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The Active devices list displays the Agent Client Collector (ACC) installed on their devices.
- By default, sorting is available only on the Impacted devices page and displays all devices on with ACC is installed for the latest 1000 records.
- The list displays active devices and refreshes every five minutes, a maximum of 1000 devices listed. If no new data is available, the last available data is displayed.
- Only device name filter is available on web applications.

Web application — Trends page

The trends page captures metrics such as alert trends, average page load time, average response time, metrics for failed web requests, total usage, and mean time to resolve incidents. This information is essential for evaluating system performance, identifying areas for improvement, and making data-driven decisions.

Trends

Cards	Description
Alert trends	Patterns or changes in the frequency and severity of alerts generated by a monitoring application over the last 11 months.
Mean time to resolve incidents	Average time taken to resolve an incident.
Metrics (For last 11 months)	
Average page load time	Option to view the trend of average amount of time it takes to load the page, from initiation to load completion.
Average response time	Option to view the trend of the average response time for the application.
Failed web requests	Option to view the trend of total number of requests that have failed.
Total usage	Option to view the total amount of time spent on the application by all users.

Installed application — Overview page

The overview page for an installed application provides information on the active alerts, incidents, impacted devices, and the average-time-to-resolve for the incidents. Tracking the total active incidents can help you to monitor and manage the overall health of the application.

Installed application Overview page

Field	Description
Active alerts	Number of ongoing notifications or warnings related to the performance of DEX. These alerts might include issues with system availability, network connectivity, security threats, or other potential disruptions to business operations.
Active incidents	Number of ongoing issues or problems reported by users. These incidents might include issues with hardware or software, slow system performance, or other technical problems that are affecting their ability to work efficiently.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installed application Overview page (continued)

Field	Description
Current impacted devices	Total number of devices impacted due to the application service or performance failure with open alert created.
Active alerts and incidents last 7 days	Patterns in the type of incidents and alerts that are reported in a particular context over the last 7 days.
Average MTTR incidents, all time	Mean time to resolve (MTTR) incidents created for this application.

Installed application Performance page

The installed application overview section presents details on the total number of active incidents and alerts and also displays patterns in the type of reported issues. This information is crucial for effective incident management, resource allocation, and proactive identification of potential application vulnerabilities.

Installed application performance

Field	Description
Location	Location of the device running the application.
App version	Version of the application.
Number of crashes	
Current number of crashes	Current number of crashes by version.
Number of crashes - Last 2 hours	Number of application crashes over the last 2 hours by version.
CPU, Memory and I/O performance	
Current CPU usage	Amount of processing power consumed by an application in percentage.
CPU usage - Last 2 hours	Amount of processing power consumed by an application over the last 2 hours in percentage.
Current memory usage	Amount of memory or RAM (Random Access Memory) consumed by an application in percentage.
Memory usage - Last 2 hours	Amount of memory or RAM (Random Access Memory) consumed by an application over the last 2 hours in percentage.
Current I/O read	Process of reading data from storage devices, such as hard drives or solid-state drives, within a computer system.
I/O read - Last 2 hours	Process of reading data from storage devices over the last 2 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installed application performance (continued)

Field	Description
Current I/O write	Process of storing or writing data to storage devices like hard drives or solid-state drives, within a computer system.
I/O write - Last 2 hours	Process of storing or writing data to storage devices over the last 2 hours.

To return to the Installed application details page, see Installed application details.

Advanced app metrics page

Access the advanced app metrics for the Microsoft Configuration Manager (MCM).

Advanced app metrics — MCM

Field	Description
MCM installed	Indicates whether the MCM client is installed on the device. Value *`True`* or *`False`*
General	
MCM running	Indicates whether the MCM client service is active.
Site code	Assigned Configuration Manager site the client belongs to.
Free cache size	Unused space available in the client cache.
MCM version	Installed version of the MCM client.
Total cache size	Full capacity allocated for MCM caching.
Provisioning mode state	Shows if the client is in provisioning mode during setup.
MCM eval	Timestamp of the most recent client health evaluation.
Client health status	Overall status of the client's health.
Number of client crashes	Count of crashes related to the MCM client.
Management points	
Pending management point update	Indicates if there are any pending updates for the client from the management point.
Current management point	Main server the client communicates with.
Internet management point FQDN	Cloud-based server endpoint (fully qualified domain name) for internet-managed devices.
DP management point	Distribution point server used for content downloads.
Log related	
Log max history	Number of log versions retained.
Log max size (KB)	Maximum log file size before rollover.
Log level	Detail level of the logs being captured.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Is log enabled	Indicates if logging is turned on.
Inventory actions	
Data Discovery Record cycle	Gathers system and user discovery data for the CM database.
Software Inventory cycle	Collects details about installed software.
Hardware Inventory cycle	Gathers information about hardware specs.
File Collection cycle	Copies designated files from the client to the server.
Scheduled task details	
Configuration Manager Idle Detection	Identifies idle times for running background tasks.
Configuration Manager Health Evaluation	Validates client health and auto-fixes known issues.

Installed application — Number of crashes section

View the number of crashes to gauge the application's stability, identify performance trends, and make informed decisions to enhance its reliability and user experience.

Number of crashes in your application

Cards	Description
Current number of crashes	Measure of the application's stability and reliability. A lower count indicates a smoother and more dependable device, as it suggests that the application experiences fewer unexpected failures or interruptions. **Note:** The metric supports the Zoom application as well as applications that emit a window app crash event (event id = 1000) on crashing such as Microsoft OneDrive, Microsoft Teams, Microsoft Excel, Microsoft PowerPoint, Microsoft OneNote, Microsoft PowerPoint, Microsoft Outlook, and Microsoft Word.
Number of crashes - <time> **Note:** The <time> range of the performance data can cover the past 2 hours, 24 hours, or 15 days, depending on the timeframe you select from the provided drop-down list in the Performance section.	Trend of crash count over a specific duration. The trend reflects the application's stability and reliability, with fluctuations indicating changes in performance.

To return to the Installed application details page, see Installed application details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Installed application — CPU, memory and I/O performance section

The installed application performance section provides information on CPU usage, CPU usage trends, memory usage, and memory usage trends. This information is important for optimizing system performance, resource allocation, capacity planning, and troubleshooting.

CPU, memory and I/O performance of your application

Cards	Description
Current CPU usage	Amount of processing power consumed by an application in percentage. **Note:** High CPU usage can result in degraded application performance, slower response times, and decreased user satisfaction. Identify performance bottlenecks and take proactive steps to optimize application performance.
CPU usage - <time> **Note:** The <time> range of the performance data can cover the past 2 hours, 24 hours, or 15 days, depending on the timeframe you select from the provided drop-down list in the Performance section.	Trend of how much processing power is being used to execute the application's instructions and how your system's CPU usage changed over a specified period. **Note:** By tracking CPU usage over time, you can identify potential performance issues and take steps to optimize system resources and improve the overall digital end-user experience.
Current memory usage	Amount of memory (RAM) consumed by an application in percentage. **Note:** High memory usage can result in degraded application performance, slower response times, and potentially lead to crashes or system instability. Monitor memory usage to optimize resource allocation and capacity planning, ensuring that applications have sufficient resources to meet user demands.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CPU, memory and I/O performance of your application (continued)

Cards	Description
Memory usage - <time> **Note:** The <time> range of the performance data can cover the past 2 hours, 24 hours, or 15 days, depending on the timeframe you select from the provided drop-down list in the Performance section.	Trend of how much memory (RAM) your application or system is using over a specific period. **Note:** By optimizing memory usage, you can reduce the risk of downtime, improve application performance, and maximize employee productivity.
Current I/O read	Retrieval of data from storage devices, impacting application speed and responsiveness. **Note:** Monitoring I/O read can reveal performance differences between different versions of the app.
I/O read - <time> **Note:** The <time> range of the performance data can cover the past 2 hours, 24 hours, or 15 days, depending on the timeframe you select from the provided drop-down list in the Performance section.	Tracks the history of data retrieval operations, providing insights into performance trends and potential bottlenecks.
Current I/O write	Process of storing data to storage devices, influencing application performance and data integrity.
I/O write - <time> **Note:** The <time> range of the performance data can cover the past 2 hours, 24 hours, or 15 days, depending on the timeframe you select from the provided drop-down list in the Performance section.	Tracks the history of data storage operations, facilitating performance analysis and data management assessment.

To return to the Installed application details page, see Installed application details.

Installed application — Users section

The All users and Impacted users lists capture data regarding the active users, impacted users, the last logged in device, and the location of the user. This information helps with security and access control, as well as providing insights into user behavior and application usage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All and impacted application users

Field	Description
Name	Active user who is connected to DEX using the monitored devices.
Last logged in device	Digital devices like laptops and desktops that users most recently used.
Last logged in location	Location of the device that the user most recently used. **Note:** The device location is important in an outage or emergency situation. When there's an outage or emergency, it's important to be able to locate affected devices and users to assist and support. Device location data can be used to identify the extent and severity of the outage, prioritize restoration efforts, and direct resources to the affected areas.
App last accessed	Date and time when the application was last accessed by the user with respect to a device. Only All users page has this field. **Note:** User can access the application using different devices. The **App Last accessed** field displays the date and time for a specific device.

Selecting the user name takes you to the details page of that user. For detailed information on a user and associated applications, see Device details.

To return to the Installed application details page, see Installed application details.

Devices list

The Devices page provides information on your organization devices, the device assigned user, last login, matching assignments, status, active alerts, and incidents.

Field	Description
Device	Actual physical or virtual hardware, such as a laptop or mobile device.
Assigned to	Name of the person to whom the device is assigned. When the device owner isn't a ServiceNow user, the name appears as " - ". **Note:** When you select the user's link, it redirects to the Users page in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Last logged in name	Name of the person who had last logged in to the device. When the user isn't a ServiceNow user, the name appears as " - ". **Note:** When you select the user's link, it redirects to the Users page in Service Operations Workspace.
Last logged in user ID	User ID of the person who had last logged in to the device. When the user isn't a ServiceNow user, the name appears as " - ". **Note:** When you select the user's link, it redirects to the Users page in Service Operations Workspace.
Matches assigned to	Indicates whether the device that the user is using to connect to DEX is assigned to the user's name. **Note:** The field displays **Yes** when the user is the owner of the device. For shared devices, **Yes** is displayed as the value only when the user is the owner of the device.
Status	Status of the device such as Up, Down, or Unknown. **Note:** This field appears only in **Devices by ACC status** tab.
Host data collection	Status of data collection from the device. **Note:** This field appears only in **Devices by ACC status** tab.
Last logged in location	Location where the device was last logged in.
Alerts	Total count of active alerts for the device.
Incidents	Total count of active incidents for the device.

To return to the main devices page, see Devices.

Device details pages

The user and device details provide a comprehensive view of device health, including alerts, incidents, battery status, and hardware details. It also tracks applications, running processes, app and device performance, battery, and Wi-Fi data. Network monitoring offers connection details, performance metrics, and application hops. Additionally, users can access custom queries for more detailed insights.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device health page

The health of a device includes critical device specifics like type, name, OS, model, location, and CPU. Additionally, it includes metrics like device and battery health, events from the last 24 hours, OS details, pending updates, incident, and alert specifics.

Device health — Overview

Monitoring and managing the following aspects promotes optimal device performance and enables timely resolution of any issues.

Device summary

Field	Description
Device info	
Type	Category of the device, such as laptop or desktop computer.
Name	Unique name of the device.
Model ID	Unique identifier assigned to a specific model of a device for internal tracking, system recognition, or management purposes.
Operating system	OS that manages and controls the device hardware and enables the execution of applications, such as Windows or macOS.
OS version	Current operating system version of the device, essential for compatibility, security, and verifying optimal performance.
RAM	RAM capacity of the device.
Location	Physical place where the device is located, indicating its position or network address. **Note:** To identify and determine the number of impacted devices based on the location, define a custom logic. The available options to determine the location of the device are: • Consider the device assigned to location or logged-in user location (`sn_dex.location_determination`). • Consider the default gateway (router) IP of the device to determine whether it's connected from office location or connected remotely (`sn_dex.remote_location_config`).
CPU processor ID	Unique identifier assigned to a specific CPU processor. This field appears on Windows machines only.
Computer details	
This tab appears on Windows machines only.	
Computer Asset Details	Name of the device.
Computer Asset Tag	Unique identifier for tracking and asset management
Computer DNS/ FQDN	Fully Qualified Domain Name for network identification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device summary (continued)

Field	Description
Computer domain	Identifies the network domain to which the computer belongs.
UUID Serial Number	Globally unique ID assigned to the system by the manufacturer for identification.
BIOS Serial Number	Unique identifier assigned to system firmware for tracking and support.
System Serial Number	Unique serial number for the entire system used for warranty and service.
BaseBoard Serial Number	Serial number of the motherboard used for hardware identification.
Chassis Serial Number	Serial number of the system physical case or enclosure.
Memory	
This tab appears on Windows machines only.	
Name	Unique name of the physical memory unit to track the specific modules for troubleshooting or upgrades. For example, Physical Memory 0, Physical Memory 1.
Device locator	Physical location of the memory module. For example, Motherboard.
Capacity(MB)	Capacity of each memory module in MBs.
Speed(MHz)	Memory module speed in MHz to confirm compatibility with other hardware components and optimize performance.
Form factor	Physical size, shape, and pin layout of a RAM module. For example, Dual In-Line Memory Module (DIMM) and Small Outline Dual In-line Memory Module (SO-DIMM).
Type	Type of the memory module. For example, DIMMs (Dual In-line Memory Module) for desktops and SODIMMs (Small Outline DIMM) for laptops.
Type details	Additional details on the memory module type. For example, Synchronous.
CPU	
This tab appears on Windows machines only.	
Name	Unique name of the Computer Processing Unit (CPU).
Architecture	Design and organization of the CPU that defines how it interacts with other components to run instructions and process data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device summary (continued)

Field	Description
	For example, x86, x64.
Cores	Number of processing units within the CPU responsible for running instructions and performing calculations.
Processors	Number of physical processors installed on the device.
Device ID	Unique name assigned to a specific CPU processor.
Manufacturer	CPU manufacturer. For example, GenuineIntel or AMD.
Current Clock Speed	Rate measured in gigahertz (GHz), at which the CPU executes instructions.
Max Clock Speed	Maximum achievable clock speed for the CPU.
Stability	
Battery health	State of the battery health. The battery states include the following: • Good • Moderate • Poor • Unknown This field appears on macOS machines only.
Firewall	Indication of whether your organization's firewall software is enabled.
Uptime	Amount of time the computer has been continuously running since it was last restarted.
Stability index	Value that indicates how consistently a device performs over time, indicating its reliability and resistance to crashes and unexpected behavior. This field appears on Windows machines only.
Anti-virus	Indication of whether your organization's anti-virus software is enabled. This field appears on Windows machines only.
BSOD cause	Cause of the blue/black screen of death (BSOD) event. This field appears on Windows machines only.
Last BSOD - Blue/black screen of death	Last time that the BSOD event happened.
Last access time	Last time the device was accessed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device summary (continued)

Field	Description
Power plan	Settings that control how the device uses power. Monitor and manage power plans to optimize energy use and reduce costs. Confirm that the devices are set to an appropriate power plan. The available options are: • Balanced: Adjusts CPU speed and system components dynamically based on workload, balancing performance, and energy consumption. • Power Saver: Reduces performance and energy consumption by lowering CPU speed and dimming the display. Useful for extending battery life on laptops. • High Performance: Maximizes system performance by keeping the CPU at a higher speed for longer periods, increasing power consumption. This field appears on Windows machines only.
BIOS	
This tab appears on Windows machines only.	
SMBIOS BIOS Version	Version of the BIOS installed, enabling IT to track whether the device is up to date with the latest firmware.
Manufacturer	Name of the BIOS manufacturer, useful for identifying compatible firmware updates. For example, "Dell Inc."
Name	A quick reference to the BIOS name and version for easier identification.
Serial Number	Unique identifier for the device, supporting asset tracking and inventory management.
Version	String indicating version details, useful for maintenance records. For example, "DELL - 2."
Computer Status	Health indicator for the overall system status, which helps IT proactively monitor device functionality.

Device events

Field	Description
Timeline chart	Illustration of events generated by devices within the past 24 hours according to your local time zone. You can view the following device events on the timeline chart: • System events such as software installation and updates, new user addition, user login, password reset, and last system reboot. Selecting the icon for a system event displays a pop-up window with details such as the event name and the date and time of the event.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device events (continued)

Field	Description
	Note: System events data isn't updated on the timeline chart in real time. To see the latest data, select the Refresh icon ( ). • Service management events such as alerts, change requests, and incidents impacting a device. Data for these events is updated real time on the timeline chart. Selecting the icon for a service management event displays a pop-up window that provides information such as the event record link, state, priority, and the time when the event was created. Select the record link to open the event record and view more details. Selecting the **Show events** drop-down displays the device event icons and the event names that they represent. You can measure device events using metrics such as event frequency, event duration, event occurrence patterns, event reliability, and event impact on the system performance.

Pending system updates

Field	Description
Windows OS updates	
Title	Name or description of the pending system update.
KB	Related knowledge base article for the update.
Mandatory	Indicates whether the update is required.
Uninstallable	Indicates whether the update can be uninstalled after installation.
Max download	Maximum download size of the update.
Reboot required	Indicates whether a system restart is necessary to complete the update installation.
macOS updates	
Title	Name or description of the pending system update.
Label	Label for the update.
Version	Version of the update.
Size	Size of the update.
Recommended	Indication of whether the update is recommended.
Action	Recommended action to be taken for the pending system update, such as **Install** or **Restart**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device health — Operating system

Field	Description
Name	Name of the operating system installed on the device, such as Windows 10 or macOS.
Architecture	System architecture of the operating system, such as 32-bit/64-bit or arm64.
Version	Specific version of the operating system, including major and minor release numbers.
Install date	Date when the operating system was installed on the device.
Platform	Underlying platform on which the operating system runs, such as Windows or Darwin.
Locale	Represents the regional and language settings configured for the operating system. This field appears on Windows machines only.
Free physical memory	Amount of unused physical RAM available on the device. This field appears on Windows machines only.
Total virtual memory	Combined amount of physical RAM and the space allocated on your hard drive that the operating system can use as temporary storage when the physical RAM is full. This field appears on Windows machines only.
Free virtual memory	Amount of virtual memory that is available for use.
Status	Current operational status of the operating system. For example, OK. This field appears on Windows machines only.
Code set	Character encoding used by the operating system, which specifies how text is represented. For example, Windows-1252, UTF-8, ANSI. This field appears on Windows machines only.
Country code	Numeric or alphanumeric code representing the country or region configured in the operating system settings. This field appears on Windows machines only.
System device	Primary hardware device where the operating system is installed, such as the system drive. This field appears on Windows machines only.
System directory	Directory where the core operating system files are located. For example, C:\Windows\System32.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears on Windows machines only.
Build number	Specific build identifier of the operating system, which denotes updates or patches applied. This field appears on Windows machines only.
Build type	Type of operating system build. This field appears on Windows machines only.
Service pack major version	Major version number of the service pack installed on the operating system. This field appears on Windows machines only.
Service pack minor version	Minor version number of the service pack installed on the operating system. This field appears on Windows machines only.
Serial number	Unique identifier assigned to the operating system instance, which is used for licensing and registration purposes. This field appears on Windows machines only.

Device health — System compliance

Note:
The data appears on this page only after the System compliance functionality has been configured. For more information, see Manage your system compliance report.

Field	Description
Compliance rating	Adherence of the device to tracked applications and policy metrics, measured in percentage. The rating is calculated by dividing the number of compliant applications and policy metrics by the total number of applications monitored.
Compliance rating - past 7 days	Compliance rating during the last seven days.
Noncompliant applications	Applications monitored for compliance but not currently running on this device.
Noncompliant policy metrics	System policies that don't return the expected or compliant values as required by your organization's compliance standards.

Device health — Alerts

View alerts for both your device and its applications in the Alerts section.

Field	Description
Alert	Unique identifier assigned to an alert for reference purposes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The data appears on this page only after System compliance has been configured.
Type	Categorize the alert based on whether it's generated for a web app, installed app, or device.
Configuration item	Displays the name of the configuration item, such as SAP, Zoom, Figma, and others.
Description	Summary of the alert, providing details about the nature of the issue.
Severity	Severity of the alert.
Impacted user	Displays the users affected by this alert.

Device health — Incidents

Field	Description
Number	Number of an incident.
Short description	Summary of the incident.
Priority	Incident priority, from the highest priority of one to the lowest priority of five.
Opened	Date and time when the incident was opened.

Device health — Security

The Security section is exclusive to the Windows OS.

Field	Description
Volume type	Type of volume that the BitLocker can protect, such as Data or Operating System.
Protection status	Indication of whether BitLocker currently uses a key protector to encrypt the volume encryption key. The Protection status can be **On** or **Off**, indicating whether the volume is protected or not.
Mount point	Drive letter or volume path assigned to the BitLocker-protected volume after it has been unlocked. The mount point specifies the location where you can access the decrypted contents of the encrypted volume. For example, a mount point might be something like `C:` or a volume path like `C:\EncryptedVolumes\SecretDrive`.
Capacity	Storage size of the volume or the drive.
Volume status	Indication of whether BitLocker currently protects some, all, or none of the data on the volume.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The possible values are FullyEncrypted, FullyDecrypted, EncryptionInProgress, DecryptionInProgress, and EncryptionSuspended.
Encryption percentage	Percent of the volume protected by BitLocker.
EncryptionMethod	Indicates the algorithm used by BitLocker to encrypt the disk. For example, `XtsAes128` – Uses XTS-AES encryption with a 128-bit key (secure and standard for devices).
KeyProtector	Lists the methods used to protect the BitLocker encryption key. Multiple protectors can be applied to a volume: • RecoveryPassword: 48-digit password generated for recovery • TPM: Trusted Platform Module is hardware-based protection to unlock the drive automatically when booting securely

Device health – Battery

Field	Description
Metric	Name of the metric used to evaluate the battery health of a device. Battery health of a device is typically measured using metrics such as battery capacity, cycle count, and impedance.
Value	Data associated with a given metric.

Device health – Hardware

Field	Description
Hard drive	
Name	Identification label for the hard drive. For example, `\\\\.\\PHYSICALDRIVE2`.
Status	Current state of the hard drive. For example, OK or Error.
Description	Additional details or notes about the hard drive.
Model	Manufacturer model number of the disk drive.
Manufacturer	Company that manufactured the hard drive.
Serial number	Serial number of the hard drive assigned by the manufacturer.
Media Loaded	Indication of whether the device has the disk drive media loaded.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If TRUE, the media for a disk drive is loaded, which means that the device has a readable file system and is accessible. For fixed disk drives, this property is TRUE.
Size	Total storage capacity available on the hard drive.
Partitions	Number of partitions on this physical disk drive that are recognized by the operating system.
Hard drive partitions	
Name	Identification label for the partition.
Partition number	Numerical identifier for the partition on the physical disk.
Drive letter	Assigned letter used by the operating system to access the partition. For example, "C:" or "D:"
Partition size	Total storage capacity of the partition.
Partition type	Type or format of the partition, such as NTFS, FAT32, or EFI System Partition.
Peripheral devices	
Name	Identification label for the peripheral device.
Status	Current state of the peripheral device. For example, OK or Error.
Manufacturer	Company that manufactured the peripheral device.
Description	Additional details or notes about the device, such as model or type.
Service	Name of the service associated with the device, if applicable.
Class	Device classification type, such as Printer, USB, or Network Adapter.

Device health — File management

Field	Description
File name	Name of the file set up for monitoring.
Category	One of the following categories assigned to the file: • Application • Malicious • Security • Development tools • System • Others • Installers • Potentially Unwanted Programs

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The data appears on this page only after File management has been set up.

Device health — Windows registry

Registry key lookup	
Registry key path	Field to enter a full Windows registry key path to look up. **Note:** If the path is incomplete, you receive the error message `No results found. Make sure your registry key path is valid.`
Registry key value	Result of the search for a registry key containing the following items: • Path: Windows registry key path entered for lookup. • Value: Value that is reported for the entered Windows registry path.
Monitored registry keys	
Path	Windows registry key path set up for monitoring on the user devices.
Expected value	Registry path value that is configured for the monitored Windows registry path by the admin.
Reported value	Registry path value that is reported for the monitored Windows registry path for this device **Note:** The error message `No value (check the configuration)` appears in this field when the path is incomplete or the key path configured for monitoring isn't present on the device.

Applications page

View essential details for managing applications such as name, version, type, daily usage, and the last access date and time.

Users — applications

Field	Description
Name	Name of the application.
Version	Application version for compatibility and updates.
Type	Type of the application such as installed or Web.
Today's usage	Duration of application usage on a specific device within a given day. Knowing the usage of an application according to day can be useful for several reasons. For example, the app usage enables your organization to track end-user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users — applications (continued)

Field	Description
	productivity, assess application popularity, identify potential performance issues, and decide about software licensing and resource allocation.
Last access time	Date/time of the most recent access of the application. Knowing when an application was last accessed can help identify potential security risks or unauthorized access to an application. It can also provide insights into the performance of the application. If the user hasn't accessed the app in a while, it might suggest that it's no longer needed, underused, or causing user difficulties.

To return to the users details page, see Device details and to return to the user's application page, see Applications.

Running processes page

Observe running process metrics to gain insights into how running processes are performing and identify performance bottlenecks or issues that might be impacting the digital experience.

Device — Usage metrics

Card	Description
CPU usage	Percentage of current CPU utilization indicates the proportion of the CPU's total processing capacity that is currently in use.
Idle CPU	Percentage of the CPU's capacity that is not being actively utilized or is in an idle state.
Memory usage	Amount of computer memory (RAM) currently being utilized by running processes and applications.

Device — Processes

Field	Description
Name	Name for the process.
CPU usage %	Amount of processing power consumed in percentage for a specific program or process. **Note:** High CPU usage can result in degraded application performance, slower response times, and decreased user satisfaction. Identify performance bottlenecks and take proactive steps to optimize application performance.
CPU time in seconds	Exact amount of time that the CPU spends for processing data for a specific program or process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device — Processes (continued)

Field	Description
	Note: By tracking CPU usage over time, your organization can identify potential performance issues and take steps to optimize system resources and improve the overall digital end-user experience.
Memory in KB	Amount of memory (RAM) consumed in kilobytes (KB) for a specific program or process. **Note:** High memory usage can result in degraded application performance, slower response times, and potentially lead to crashes or system instability. Monitor memory usage to optimize resource allocation and capacity planning, ensuring that applications have sufficient resources to meet user demands.
PID	Process ID (PID) is a unique numerical identifier assigned to each running process. **Note:** The PID can be used to monitor and manage running processes. The PID can also be used to terminate or kill a specific process if necessary.
PPID	Parent Process ID (PPID) is the unique numerical identifier assigned to the parent process of a running process. **Note:** The PPID is useful for process management because it enables administrators to identify the processes that spawned child processes and track the flow of processes in the system. The PPID is also used to manage the resources allocated to a process and confirm that child processes have access to the necessary resources.

To return to the users details page, see Device details.

Application performance pages

Access performance and usage data for a specific application to evaluate its efficiency, identify bottlenecks, and make informed optimization decisions.

Device — Installed application performance

Field	Description
Start date	Start date and time within 7 days from current date and time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
End date	End date and time that can’t exceed the current date and time.
Top memory and CPU usage tab	
Memory usage	Amount of memory or RAM (Random Access Memory) consumed by the top 10 applications in MB.
CPU usage	Amount of processing power consumed by the top 10 applications in percentage.
App performance tab	
CPU usage	Amount of processing power consumed by an application in percentage. **Note:** High CPU usage can result in degraded application performance, slower response times, and decreased user satisfaction. Therefore, identify performance bottlenecks and take proactive steps to optimize application performance.
Memory usage	Amount of memory or RAM (Random Access Memory) consumed by an application in percentage. **Note:** High memory usage can result in degraded application performance, slower response times, and potentially lead to crashes or system instability. Therefore, monitor memory usage to optimize resource allocation and capacity planning, verifying that applications have sufficient resources to meet user demands.
I/O read	Process of reading data from storage devices, such as hard drives or solid-state drives, within a computer system. **Note:** Excessive I/O read operations can lead to performance bottlenecks, increased latency, and result in slower system response times. Therefore, monitor I/O read activities to verify that the data retrieval processes aren't a limiting factor for application performance.
I/O write	Process of storing or writing data to storage devices like hard drives or solid-state drives, within a computer system. **Note:** Excessive I/O write operations can also lead to performance bottlenecks, increased latency, and potentially result in slower system response times. Therefore, monitor I/O write activities to verify that data storage processes don't hinder application performance.
Number of crashes	Trend of the application's crashes on the device over the last 2 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Analyzing this graph enables you to identify potential issues, pinpoint trends, and take proactive measures to enhance the application's reliability and user experience.

To return to the application metrics main page, see Users — Application Performance.

Device — Web application performance

Field	Description
Response time	Time it takes for the application to respond to a user request in milliseconds. **Note:** A slow response time can result in frustrated users, decreased engagement, and lower productivity, while a fast response time can lead to improved user satisfaction and increased engagement. Therefore, it's essential to track response time as a key application metric and continuously monitor and optimize it to promote optimal user experience.
DNS lookup (Only Web applications have this field.)	Time (in milliseconds) it takes for a user's device to resolve a domain name into an IP address. **Note:** If DNS lookup identifies an error in the mapping of DNS entries on the user's system, the user can’t access the internet or the intended website.
Page load time	Time taken for a web page to display its content fully and get interactive on a user's request.
Failed web requests	Instances where requested web content or resources couldn't be successfully retrieved or loaded by the server. **Note:** The failed web requests result provides insights into potential issues affecting web performance. It helps in identifying problems such as server errors, broken links, or network issues that could hinder user experience. Identifying the frequency, type, and reasons behind failed requests helps in troubleshooting, optimizing web infrastructure, and promoting a smoother browsing experience for users.
Availability	Percentage of time that a service is operational and accessible to users.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device metrics page

Access real-time metrics like CPU, memory, disk usage, I/O operations, battery, and energy consumption for insights into system resource utilization, performance, and improvement areas.

Device metrics — Performance

Cards	Description
CPU usage	Amount of processing power consumed by an application in percentage. **Note:** High CPU usage can result in degraded application performance, slower response times, and decreased user satisfaction. Therefore, identify performance bottlenecks and take proactive steps to optimize application performance.
Memory usage	Amount of memory or RAM (Random Access Memory) consumed by an application in percentage. **Note:** High memory usage can result in degraded application performance, slower response times, and potentially lead to crashes or system instability. Therefore, monitor memory usage to optimize resource allocation and capacity planning, ensuring that applications have sufficient resources to meet user demands.
Disk usage	Proportion of storage capacity consumed by data and applications on a disk drive, measured in percentage. Elevated disk usage may lead to slower system performance, increased loading times, and potential storage-related issues. Monitoring disk usage is crucial for optimizing storage resources, preventing data bottlenecks, and ensuring efficient data management, contributing to overall system stability and responsiveness.
I/O read & write	Rate at which data is read from or written to a storage device. This metric provides insights into the data transfer speed and efficiency of the storage system.

Device metrics — Battery

Field	Description
Battery percentage	Remaining charge percentage of the battery.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Device metrics — Energy

Field	Description
Total energy consumption	Overall energy usage, essential for efficient resource management.
Energy loss	Wasted energy, crucial for implementing efficiency improvements.
CPU energy consumption	Energy usage by the CPU, providing insights for performance optimization.
Disk energy consumption	Energy consumed by disk operations, guiding storage efficiency strategies.
Network energy consumption	Energy usage in network activities, informing power-saving measures.
Display energy consumption	Energy usage by the display, facilitating energy-efficient display settings.
SOC energy consumption	Energy consumed by the system-on-chip, aiding in hardware optimization.
MBB energy consumption	Energy utilized by mobile broadband, guiding mobile device power management.
EMI energy consumption	Energy consumed by electromagnetic interference, crucial for interference reduction.
Other energy consumption	Energy usage not covered by specific categories, offering comprehensive insights.

To return to the main device metrics page, see #unique_1209.

Network monitoring page

View the various aspects of the Network monitoring section of a user or device. This section includes network server information, connection details, performance metrics, and application network hops. Use this information to assess the user's network performance.

Connection details

Field	Description
WiFi details	WiFi connection details, including network name, signal strength, WiFi protocol, transmit rate, and BSSID (Basic Service Set Identifier).
Wired connection details	Wired connection information, including network name, status, speed, and driver version.

Performance metrics

Field	Description
Network stability	Currently applicable to Windows OS only, information about the network stability expressed graphically by the following metrics:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Performance metrics (continued)

Field	Description
	• Latency • Packet loss • Jitter
Network path	Route that consists of several hops between a user's device and a destination. The data packets travel through various networking devices such as routers, switches, and gateways. You can enable this field to test and validate the feature. **Note:** For information on how to enable Network path, see the Enabling network path for windows devices [KB1705499] article in the Now Support Knowledge Base.

Application hops

Field	Description
Hop	Specific stop that data packets take when they travel from one network node or router to another on their way to a destination.
Domain Name	Name that identifies the network domain on the internet.
Address	The IP address assigned to the specific router.
RTT1	Duration in milliseconds (ms) that it takes for the first packet to get to a hop and back.
RTT2	Duration in milliseconds (ms) that it takes for the second packet to get to a hop and back.
RTT3	Duration in milliseconds (ms) that it takes for the third packet to get to a hop and back.

To return to the main network page, see Network monitoring.

Access page

View essential user login details, including the username, user type, login type, the timestamp of the last login, and the host. By displaying these crucial pieces of information, users can easily identify themselves, understand their assigned user type and login method, and effectively manage their login information.

Some of the crucial information that the Access page offers are:

User — Access page

Field	Description
Logins	
Username	Unique identifier used by a user to access the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

User — Access page (continued)

Field	Description
User type	Role assigned to a user based on their level of access or privileges within a system.
Login type	Authentication mechanism used by a user to log into a system, such as password-based, multi-factor authentication, or single sign-on.
Last login	Date and time indicating the most recent instance when a user successfully accessed the device.
User profiles (only for Windows)	
Local path	Path to the device onboard storage or filesystem.
Last used	Date and time when the device was last actively used or accessed for any operation or activity.
SID	Unique alphanumeric identifier used to identify devices.
Loaded	Indicates whether the device's operating system or software is successfully initialized or started.

To return to the main access page, see Access.

Administration cards

The administration cards provide you with the capability to monitor and manage applications, where you can add, enable, or disable as necessary. You can get insights into the policies applied for compliance, view the list of DEX users and DEX administrators, manage the metric rules and devices with Agent Client Collector installed for data analysis.

Administration page cards

Cards	Description
Roles and Access	
User roles	View and configure different DEX user roles based on their respective access requirements.
Application and Device Health	
Agent deployment on Windows devices	Install Agent Client Collector (ACC) to monitor and collect data in a centralized and organized manner, provide insights into system performance, identify issues, and enable proactive maintenance.
Agent deployment on macOS devices	Install ACC to monitor and collect data in a centralized and organized manner, provide insights into system performance, identify issues, and enable proactive maintenance.
Applications management	Look up and configure web and installed applications that are currently being monitored
Desktop Assistant deployment	Deploy Desktop Assistant (DA) using guided steps on the end-user devices.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administration page cards (continued)

Cards	Description
	DA is an interface for employees, enabling access to self-service options, IT notifications, and support resources.
Deploy browser extension	Activate the DEX Google ChromeOS or Microsoft Edge extension on your device to collect different operational or performance-based metrics for the web or SaaS applications.
Digital End-user Experience Self-service configuration	Configure and customize Digital End-user Experience Self-service experience to enable employees to check the performance of their device and self-solve issues.
System compliance	Configure compliance system policies, manage applications, and set up metric rules for compliance-related thresholds. For more information, see Manage your system compliance report.
File management	Configure and manage the executable files available on the end-user devices. For more information, see Set up file management.
Windows registry configuration	Configure the Windows registry keys to identify and manage any mismatch in end-user devices. **Note:** Select the registry key path to edit the key by modifying the path or expected value. You can also delete the key. For more information, see Set up Windows registry keys.
Agent policies	Manage which DEX metrics are collected based on the device criteria defined.
Metric rules	Create and manage DEX metric rules to establish criteria and thresholds for metrics. Configuring metric rules enables timely alerts and proactive system management.
Create Remedial Actions	Create your custom remedial actions from check definitions to resolve end-point related issues using the Playbook.
Usage and Health Monitoring	
Agent health	Review and manage user devices on which ACC is installed. Agent health also displays the number of agents that are up and the number that are down.
Proactive Engagement workbench	View Proactive Engagement resolutions available to you in the base system. Get an overview of all the PE resolutions and notifications active in your instance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Administration page cards (continued)

Cards	Description
Desktop Assistant usage	Get an insight of Desktop Assistant usage across all your organization's employees. For more information, see View Desktop Assistant usage metrics.

To return to the administration details page, see DEX Administration.

Application management card

The Application management card shows the list of the used applications, application type, end-user OS, and whether an application is included in the metrics or compliance monitoring.

Application management

Field	Description
Name	Name of the application.
Metrics monitoring	Indication whether application monitoring is turned on. You can turn the application monitoring on or off, as well as delete an application from the list, by selecting the check box next to an application and selecting an appropriate option under the **Actions** drop-down list.
Compliance monitoring	Indication whether application compliance monitoring is turned on. You can turn the compliance monitoring on or off, as well as delete the application from the list, by selecting the check box next to an application and selecting an appropriate option under the **Actions** drop-down list.
Type	Category that shows whether the application is accessed through a web browser or installed.
Domains	Web address that is used to launch the application and access its features and functions.
Windows/mac process	OS Operating system associated with the application.

To learn more about adding an application, see Add an application for monitoring.

New web or installed application form

Using a custom form, you can add an application to be monitored for compliance or performance metrics.

Field	Description
Select an application service	List of application services that references the Service (cmdb_ci_service) table to select an application service added for monitoring. You can open the list of available services by selecting the magnifying glass icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
What domains should be monitored?	Web address that is used to launch the application and access its features and functions. You can add a domain by selecting **+ Add**. Add one or more domains, separated by a comma. You can enable metrics monitoring on each domain name you add. This field appears only if you select **Web application** under the **New** drop-down list.
What processes should be monitored?	Processes that you want to monitor. This field has the following subfields: • **Windows: Enter the process name (ex. process.exe)**: A unique identifier for the primary running instance of the Windows application. • **Windows: Secondary processes separated by a comma**: A unique identifier for the secondary running instance of the Windows application. • **Mac: Enter the process name (ex. process.dmg)**: A unique identifier for the primary running instance of the macOS application. • **Mac: Secondary processes separated by a comma**: A unique identifier for the secondary or more running instance of the macOS application. • **Web Endpoint Connection**: A comma-separated list of domains used for measuring network latency. Example: company-name.zoom.us, company-name.outlook.com. **Note:** Typically, you fill in this field for the applications you have installed that connect to the cloud. This field appears only if you select **Installed application** under the **New** drop-down list.
Monitoring	Toggle switch to enable or disable monitoring for the application performance and system compliance. This field has the following options: • **Compliance**: Enables reporting on whether this application is running on your organization's devices. • **Metrics**: Enables performance reporting for this application. Move the monitoring toggle switch ( ) to turn the reporting on or off. **Note:** You can also enable monitoring for multiple applications simultaneously. From the Application management page, use the bulk check box to select multiple applications, and adjust your selection as needed with the individual check boxes for each app. This field appears only if you're editing an installed application. This field doesn't appear when you're onboarding Application and Device Health.
Advanced monitoring	Option available for the Microsoft Configuration Manager (MCM) application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select the MCM app from the drop-down list to enable advanced monitoring. This field appears only if you select **Installed application** under the **New** drop-down list.

Edit web or installed application form

Using a custom form, you can edit an application to be monitored for compliance or performance metrics.

Field	Description
Select an application service	Application service associated with the application added for monitoring.
What domains should be monitored	Web address that is used to launch the application and access its features and functions. This field appears only if you're editing a web application.
What processes should be monitored?	Processes that you want to monitor. This field has the following subfields: • **Windows: Enter the process name (ex. process.exe)**: A unique identifier for the primary running instance of the Windows application. • **Windows: Secondary processes separated by a comma**: A unique identifier for the secondary running instance of the Windows application. • **Mac: Enter the process name (ex. process.dmg)**: A unique identifier for the primary running instance of the macOS application. • **Mac: Secondary processes separated by a comma**: A unique identifier for the secondary or more running instance of the macOS application. • **Web Endpoint Connection**: A comma-separated list of domains used for measuring network latency. Example: company-name.zoom.us, company-name.outlook.com. **Note:** Typically, you fill in this field for the applications you have installed that connect to the cloud. This field appears only if you're editing an installed application. The primary and secondary processes might be automatically populated for the selected application.
Upload a logo	Link to upload or edit the logo of an application.
Monitoring	Toggle switch to enable or disable monitoring for the application performance and system compliance. This field has the following options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• **Compliance**: Enables reporting on whether this application is running on your organization's devices. • **Metrics**: Enables performance reporting for this application. Move the monitoring toggle switch ( ) to turn the reporting on or off. **Note:** You can also enable monitoring for multiple applications simultaneously. From the Application management page, use the bulk check box to select multiple applications, and adjust your selection as needed with the individual check boxes for each app. This field appears only if you select an installed application to edit. This field doesn't appear when you're onboarding Application and Device Health.

Metric rules page

The metric rules page shows information about a specific rule, including its name, CI type, application name, alert severity, and alert status.

Metric rules — Fields and Descriptions

Field	Description
Name	Name of the metric rule.
Type	CI type, such as Saas/web, installed, or device, to which the metric rule is applied.
Application	Application name to which the metric rule is applied. If the CI type is Device, then the application name is marked as N/A.
Alert severities	Level of urgency or importance assigned to the alert.
Status	Current state of the alert rule, indicating whether it's active or inactive.
Action	Alert action for the metric rule that triggers the remedial action for the alert.
Updated	Date and time when the metric rule is last updated.

To return to the metric rules page, see Metric rules for Digital End-User Experience.

Agent policies list

The agent policies list shows information about each agent policy including its name, status, cron expressions, and updated time.

Agent policies fields and descriptions

Field	Description
Name	Name of the policy.
Hierarchy	Policy hierarchical state.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent policies fields and descriptions (continued)

Field	Description
	When the policy is part of a hierarchy, the values are Parent or Child. Otherwise, the value is None.
Active	Option to indicate that the policy is in use. The values are True or False.
Publish status	Publish status of the policy. The values are Draft, Ready to publish, Queued, and Published.
Interval(sec)	The frequency in seconds according to which the policy checks are executed. This field applies only to checks with an empty cron expression value.
Cron expressions	Expressions according to which the policy checks are executed. This field applies only to checks with an empty interval value.
Updated	Last time the policy was updated.

Metrics analyzer form

DEX Metrics analyzer provides you with an ability to look up metrics collected for specific devices and applications.

Field	Description
Device or application drop-down menu	Drop-down list to select a device or application.
Explore	List of available metrics.
Metrics list	Metrics available for a specific application or device. • Web application metrics • Installed application metrics • Device metrics This list appears only for devices.
Pages	Names of specific Web app pages set up for monitoring. This field appears only for a Web application.
Location	List of locations where the application is used. This field appears only for an application.
OS	Operating system that manages and controls the device hardware and enables the execution of applications, such as Windows or macOS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only for an application.
Date range	List of time period options. • Last 2 hours • Last 8 hours • Last 24 hours • Last 7 days • Last 30 days This option is only available for an application. • Last year This option is only available or an application. • Custom date range

DEX Content Playbook reference

Reference topics provide additional information about policies and check definitions provided by DEX Content Playbook.

DEX policies for macOS

Policies for macOS are guidelines and rules to promote that the application is used in a consistent, secure, and conforming manner. DEX policies your organization to reduce the risk of data breaches, improve data quality and accuracy, and optimize application performance and availability.

For macOS systems, to retrieve the entire data, include the subsequent content to /etc/sudoers.

For Agent version 3.4.0 or earlier:

```
_servicenow ALL=NOPASSWD:
 SETENV: /
Library/Caches/servicenow/agent-client-collector/osquery/bin/osq
ueryi
 *, /usr/bin/mdls, /usr/bin/log, /usr/local/bin/jamf, /
bin/kill, /bin/launchctl
Defaults:_servicenow !requiretty
```

For Agent version 3.4.1 or later:

```
_servicenow ALL=NOPASSWD: SETENV: /Library/Application\
 Support/servicenow/agent-client-collector/cache/osquery/bin/osq
ueryi
 *, /usr/bin/mdls, /usr/bin/log, /usr/local/bin/jamf, /
bin/kill, /bin/launchctl
Defaults:_servicenow !requiretty
```

Note:
The historical data for an application or device is the information that is kept in the MetricBase database for the past 7 days, while the latest data pertains to the most recent information available.

Policies for Mac — Application

DEX provides the following policies for applications.

Policy name	Description	Check instances	Frequency	Historical or latest	Check instance parameters
DEX Mac Apps Metrics	Collects the application metrics in the Mac device and sends metric data to Metric Base.	os.mac.check-app-historical	5 mins	Historical	cpu_usage, memory_usage, uptime, io_usage_read, io_usage_write, is_running, last_access_time, crashes

Policies for Mac — Device

DEX provides the following policies for devices.

Policy name	Description	Check instances	Frequency	Historical or latest	Check instance parameters
DEX Mac Device Metrics	Collects macOS device metrics and sends the metric data to the ServiceNow instance.	os.mac.check-system-metrics-latest	24 hours	Latest	uptime, logged_in, firewall_enabled, session_details, disk_details, os_details, cpu_details, battery_details, device_details, network_details, pending_updates, device_events, cpu_usage, memory_details, os_setup_details, last_access_time, reboot_details
DEX Mac Device Metrics	Collects macOS device metrics and sends the metric data to MetricBase.	os.mac.check-system-metrics-historical	5 mins	Historical	disk_usage, io_usage_write, io_usage_read, memory_usage, cpu_usage, memory_details, uptime, crashes, battery_charge_percentage, wifi_transmit_rate, wifi_rssi
DEX Mac Device Metrics	Collects data for running macOS processes and sends the data to the ServiceNow instance.	os.mac.check-process-data	24 hours	N/A	N/A

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description	Check instances	Frequency	Historical or latest	Check instance parameters
DEX Mac Device Metrics	Collects macOS device metrics and sends the metric data to the ServiceNow instance.	os.mac.check-sys-compliance-historical	5 minutes	Historical	N/A
DEX Mac Device Metrics	Collects macOS device metrics and sends the metric data to the ServiceNow instance.	os.mac.check-sys-compliance-latest	24 Hours	Latest	N/A
DEX Mac Device Metrics	Collects macOS device metrics and sends the metric data to the ServiceNow instance. **Note:** If the previous check runs for more than five minutes, the current check gets skipped.	os.mac.check-energy-consum-historical	5 minutes	Historical	energy_consumption
DEX Mac Device Metrics	Collects macOS device metrics and sends the metric data to the ServiceNow instance.	os.mac.check-system-metrics-historical	30 minutes	Historical	vpn_details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description	Check instances	Frequency	Historical or latest	Check instance parameters
DEX Get online macOS user on change	Gets a logged-in user's data on a macOS device whenever there's a change.	os.mac.check-system-custom-query-on-chan	60 secs	Latest	query,query_sys_id, query_type
DEX Get device configuration on change	Gets a logged-in user's device configuration whenever there's a change.	os.all.check.internal.get-device-configu	60 secs	Latest	N/A

Note:
If you upgrade the Content Playbook plugin on an instance and encounter unexpected policy update issues, see the Troubleshooting: Policy update issues post DEX plugin upgrade [KB1586917] article in the Now Support knowledge base.

DEX policies for Windows

Use policies for Windows are guidelines and rules to confirm that the application is used consistently, securely, and in compliance. DEX policies help organizations to reduce the risk of data breaches, improve data quality and accuracy, and optimize application performance and availability.

To fetch the complete playbook data for a Windows device, the Agent Client Collector (ACC) must run as a local system account. For more details on how to set up the ACC service as a local system account, see Run ACC as a local system account user.

Note:
The historical data for an application or device is the information that is kept in the MetricBase database for the past 7 days, while the latest data pertains to the most recent information available.

Policies for Windows — Application

DEX provides the following policies for applications.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters*
DEX Windows Apps Metrics	Collects the application metrics in the Windows device and sends the metric data to Metric Base.	os.win.check-app-historical	5 mins	Historical	cpu_usage, memory_usage, uptime, last_access_time, crashes, io_usage_read, io_usage_write, is_running

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters*

Important:
* DEX Windows Apps Metrics with the uptime check instance parameter only runs with the Local System account.

Policies for Windows — Application Network Experience

Before configuring the following policies, make sure that the Agent Client Collector is version 4.2 or higher to display the network path for applications. Additionally, the DEX browser extension plugin must be installed and should be version 2.5.0 or higher to fetch network metrics for web applications.

Note:
These policies have the following limitations:

- A tracert command is used to get the network path.
- ANE doesn't work for path in the domain URL. Example: <domain>/<path>

DEX provides the following policies for applications.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters
DEX Windows Apps Domain Network Monitoring Metrics	Collects Windows installed apps network monitoring metrics like latency, packet loss, and jitter and sends monitoring data to Metric Base and the ServiceNow® instance.	os.win.check-app-dom-network-historical	10 mins	Historical	domain_network_details
DEX Windows Apps Domain Network Monitoring Metrics	Collects Windows Web apps network monitoring metrics like latency, packet loss, and jitter and sends monitoring data to	os.win.check-web-app-dom-net-historical	10 mins	Historical	domain_network_details

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters
	Metric Base and the ServiceNow instance.				
DEX Windows Apps Domain Network Monitoring Metrics	Collects Windows Web apps network monitoring metrics like latency, packet loss, and jitter and sends monitoring data to Metric Base and the ServiceNow instance.	os.win.check-app-dom-network-latest	30 mins	Latest	source_details, domain_network_route_details

Policies for Windows — Device

DEX provides the following policies for devices.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters*
DEX Windows Device Metrics	Collects Windows device metrics and sends the metric data to the ServiceNow instance.	os.win.check-system-metrics-latest	24 hours	Latest	uptime, logged_in, antivirus_enabled, firewall_enabled, disk_details, device_details, battery_details, bsod_details, cpu_details, os_details, power_plan, stability_index, pending_updates, network_details, bitlocker_details, user_profiles, antimalware_details, hard_drive_status, peripheral_devices_details, cpu_usage, memory_details, device_events, last_access_time, os_setup_details, reboot_details, energy_consumption

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters*
Important: * DEX Windows Device Metrics with the following check instance parameters runs only with a Local System account: • energy_consumption • bitlocker_details • last_access_time • pending_updates • user_profiles					
DEX Windows Device Metrics	Collects Windows device metrics and sends the metric data to MetricBase.	os.win.check-system-metrics-historical	30 mins	Historical	network_connection_profiles
DEX Windows Device Metrics	Collects Windows device metrics and sends the metric data to MetricBase.	os.win.check-system-metrics-historical	5 mins	Historical	disk_usage, io_usage_write, io_usage_read, memory_usage, cpu_usage, battery_charge_percentage, energy_consumption, memory_details, uptime, disk_details, cpu_performance_details, crashes, power_consumption, wifi_transmit_rate, wifi_receive_rate, wifi_signal_strength
DEX Windows Device Metrics	Collects data for running Windows processes and sends the data to the ServiceNow instance.	os.win.check-process-data	24 hours	N/A	N/A
DEX Windows Device Metrics	Collects Windows device metrics and sends the metric data to the ServiceNow instance.	os.win.check-sys-compliance-historical	5 mins	Historical	N/A

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Policy name	Description	Check instance	Frequency	Historical or latest	Check instance parameters*
DEX Windows Device Metrics	Collects Windows device metrics and sends the metric data to the ServiceNow instance.	os.win.check-sys-compliance-latest	24 hours	Latest	N/A
DEX Get online Windows user on change	Gets a logged-in user's data on a Windows device whenever there's a change.	os.win.check-system-custom-query-on-chan	60 secs	Latest	query,query_sys_id, query_type
DEX Get device configuration on change	Gets a logged-in user's device configuration whenever there's a change.	os.all.check.internal.get-device-configu	60 secs	Latest	N/A

Note:
If you upgrade the DEX Content Playbook plugin on an instance and encounter unexpected policy update issues, see the Troubleshooting: Policy update issues post DEX plugin upgrade [KB1586917] article in the Now Support knowledge base.

DEX check definitions for macOS

Check definitions for macOS are predetermined sets of rules and criteria that assess the performance, security, and conformance of macOS devices. These checks can cover various aspects such as CPU usage, memory usage, battery details, and firewall status.

For macOS systems, to retrieve the entire data, include subsequent content to /etc/sudoers.

For Agent version 3.4.0 or earlier:

```
_servicenow ALL=NOPASSWD:
 SETENV: /
Library/Caches/servicenow/agent-client-collector/osquery/bin/osq
ueryi *, /usr/bin/mdls, /usr/bin/log, /bin/kill, /bin/launchctl
Defaults:_servicenow !requiretty
```

For Agent version 3.4.1 or later:

```
_servicenow ALL=NOPASSWD: SETENV: /Library/Application\
 Support/servicenow/agent-client-collector/cache/osquery/bin/osq
ueryi *, /usr/bin/mdls, /usr/bin/log, /bin/kill, /bin/launchctl
 Defaults:_servicenow !requiretty
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can configure the check definitions and associated retrievable data. Some of the listed check definitions might retrieve data that contains or is considered personal information.

To promote proper sudo configuration, remove the following file:

```
/private/etc/sudoers.d/_servicenow
```

Check definitions — Application (Metrics)

DEX provides the following check definitions, available while the application is running, except these listed below, which remain accessible even when the application isn't running:

- os.mac.check-app-version
- os.mac.check-app-is-installed
- os.mac.check-app-last-access-time
- os.mac.check-app-last-updated

In the check definition parameters:

- appName = application name. For example, Webex.
- appSysId = sys_id of the application.
- primaryProcess = list of primary processes for the application separated by a pipe symbol (|). The first process that exists on the endpoint device is given priority. For example: Webex.app or Microsoft Teams.app | Microsoft Teams Classic.app.

  Note:
  When determining priority based on process availability on an endpoint device, follow this logic: If the primary process for the Teams application is Microsoft Teams.app on one end-point device and it's Microsoft Teams classic.app on another end-point device, then the process that is present on the endpoint device first is given precedence.

- secondaryProcesses = list of secondary processes for the application separated by a pipe symbol (|). For example: Cisco WebEx Start.app | webexmtaV2.app.

Check definition name	Check definition parameters	Description
os.mac.check-app-cpu-usage	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the amount of CPU resources being used by the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.mac.check-app-memory-usage	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the amount of memory resources being used by the application.
os.mac.check-app-listening-ports	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Retrieves the port numbers that are open and through which incoming network traffic can reach the application.
os.mac.check-app-last-updated	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the time and date of the latest application update installation. **Note:** This check definition doesn't require the application to be in a running state.
os.mac.check-app-version	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Retrieves the version number of the application. **Note:** • This check definition doesn't require the application to be in a running state. • If an application doesn't have a version, the check definition returns the string "unversioned" for that application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.mac.check-app-is-installed	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks if the application is installed or not on the device. **Note:** This check definition doesn't require the application to be in a running state.
os.mac.check-app-is-running	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks whether the application is in a running state or not.
os.mac.check-app-uptime	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the uptime of the given application.
os.mac.check-app-last-access-time	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the most recent time when the application was executed or run. **Note:** • This check definition doesn't require the application to be in a running state. • If the application hasn't been run by the user within the last 7 days, the last access time is empty.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.mac.check-app-io-usage-read	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the application's usage of Read I/O (Input/Output) operations.
os.mac.check-app-io-usage-write	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the application's usage of Write I/O (Input/Output) operations.
os.mac.check-app-domain-network-latency	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application> • --domain=<domain of the application>	Fetches network latency of the application domain.
os.mac.check-app-crashes	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Fetches number of crashes and crash details of the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.mac.check-app-freezes	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Fetches number of app freezes in the last 5 minutes and freeze details of the application.

Check definitions — Device (Metrics)

DEX provides the following types of check definitions for device.

Check definition name	Description
os.mac.check-system-cpu-usage	Checks the CPU utilization.
os.mac.check-system-cpu-details	Retrieves the CPU name, number of physical and logical cores, and architecture information.
os.mac.check-system-memory-usage	Checks system memory utilization.
os.mac.check-system-last-access-time	Checks the last time that the current device was accessed. **Note:** This check definition works on locked and unlocked devices.
os.mac.check-system-uptime	Checks the amount of time elapsed since the system was last booted.
os.mac.check-system-time	Checks the current time in Coordinated Universal Time (UTC) using UNIX timestamp.
os.mac.check-system-device-crashes	Retrieves details of different crashes on your device. **Note:** This check fetches Kernel Panics present in the device logs in the last five minutes.
os.mac.check-system-device-details	Retrieves the type, model, and serial number of the chassis.
os.mac.check-system-device-events	Retrieves the details of events that occurred on the device during the specified time interval. Events for macOS include: Last boot, logged-in users, installed software, updated software, added users, and reset passwords.
os.mac.check-system-disk-details	Retrieves disk details such as total space, used space, and free space in bytes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Description
os.mac.check-system-disk-io-usage-read	Retrieves disk bytes read per second.
os.mac.check-system-disk-io-usage-write	Retrieves disk bytes written per second.
os.mac.check-system-disk-usage	Retrieves the disk used space as a percentage of the total space.
os.mac.check-system-os-details	Retrieves the name, version, platform, architecture, and installation date of the operating system.
os.mac.check-system-net-bytes-incoming	Retrieves the incoming network bytes per second across all network devices.
os.mac.check-system-net-bytes-outgoing	Retrieves the outgoing network bytes per second across all network devices.
os.mac.check-system-logged-in-users	Retrieves the detail of users currently logged in to the device.
os.mac.check-system-session-details	Retrieves the session time of currently logged-in users in minutes.
os.mac.check-system-network-details	Retrieves the network details, including Ethernet, Wi-Fi, and other relevant information.
os.mac.check-system-battery-details	Retrieves battery-related data, including the remaining battery percentage, the designed voltage, the estimated run time, and the battery's maximum capacity. **Note:** • This check definition doesn't apply to virtual machines (VMs) or desktops because they don't have batteries. • If current capacity is greater than designed capacity, the battery is rounded off to 100%.
os.mac.check-system-battery-charge-percentage	Retrieves the charge percentage of batteries present on the device. **Note:** • This check definition doesn't apply to virtual machines (VMs) or desktops because they don't have batteries. • If current capacity is greater than designed capacity, the battery is rounded off to 100%.
os.mac.check-system-firewall-enabled	Checks if the operating system firewall is active and enabled.
os.mac.check-system-pending-updates	Checks the status of pending software updates.
os.mac.check-system-admin-users	Retrieves all user accounts with local administrative privileges.
os.mac.check-system-reboot-details	Retrieves the reboot details for the device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Description
os.mac.check-system-os-setup-details	Retrieves the approximate OS age for the device.
os.mac.check-system-compliance-details	Retrieves the system's compliance details. This includes the list of all configured apps and metric values that are non-compliant, and calculates a compliance rating based on that. **Note:** • This check definition provides the following details: ○ **Condition for app to be said as compliant**: Every process mentioned in primary process should be running. ○ **Condition for metric value to be said as compliant**: Value should be matching with the configured expected value. • The score is then calculated using this formula: Score = (Complaint Application + Compliant metric value) / (Total Applications and metric value - Failed Ones) *100
os.mac.check-system-vpn-details	Get the VPN details for your device.
os.mac.check-system-energy-consumption	Gets Energy consumed by Mac machine in coming 5 minutes. **Note:** It's important to consider the following: • /usr/bin/powermetrics must be added to sudo Permissions. • The check takes approximately five minutes to get completed as it's calculating energy consumed in the coming five minutes • This check definition doesn't work if agent is installed with rosetta enabled on M1, M2, M3 machines.
os.mac.check-system-power-consumption	Gets Power consumption for mac device.
os.mac.check-system-custom-query-on-change	Executes the custom query provided in the parameters. Returns value only when changed.
os.all.check.internal.get-device-configuration-on-change	Gets the configurations of a device. For example: sudo configured, debug on, agent user, and so on. Runs only if value changes.

Check definitions — Diagnostic Actions

DEX provides the following types of check definitions for Diagnostic actions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.mac.check-app-process-ids	--process_name=<process name>	Retrieves the Process IDs (PIDs) of both the parent and all the child processes associated with the application.
os.mac.check-process-cpu	N/A	Retrieves a list of all running processes along with their CPU usage percentage, CPU time, Process ID (PID), Parent Process ID (PPID), and name.
os.mac.check-process-memory	N/A	Retrieves a list of all running processes along with their memory usage in kilobytes (KB), Process ID (PID), Parent Process ID (PPID), and name.
os.mac.check-process-data	N/A	Retrieves the CPU usage, memory usage, and disk usage of all currently running processes.
os.mac.check-process-disk	N/A	Retrieves a list of all running processes along with their disk usage in Bytes, Process ID (PID), Parent Process ID (PPID), and name.
os.mac.check-traceroute	--url=<url> --max_hops = <default value is 65> --timeout = <default value is 5>	Retrieves the IP address, domain name, and round-trip time (RTT) for each network hop.
os.mac.check-ping-test	--url=<url>	Sends a ping request to the provided URL and returns the connectivity status, indicating whether the URL is reachable or not.
os.mac.check-services-data	service_type =<Type of service(one of user, system or all)	Retrieves the list of all services with PID, Service Name, Status, Service Type.

Check definitions — Remedial Actions

DEX provides the following types of check definitions for Remedial actions.

Check definition name	Check definition parameters	Description
os.mac.action-kill-process	--pid=<process id> OR --process_name=<executable file name> **Note:** The process ID takes priority over the application name.	Terminates a running process or multiple processes specified by their Process ID (PID) or executable (.app) file name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.mac.action-restart-service	--service_name=<service name>	Restarts logged user services that take a service name as input to the system.
os.mac.action-execute-jamf-policy	--Policy ID - policy_id	Execute the Jamf policy either with a policy ID or with a predefined action. Predefined actions are set by the DEX admins in dex_jamf_policy table. The service desk agents are able to select and run the predefined actions as they might not have access to Jamf policy IDs. Jamf policy has information about the application name, package version information, action to be performed (for example, install or uninstall), information on enabled on self service, defined in the Jamf server. **Note:** Jamf client must be installed on the device to execute the Jamf policy.
os.mac.action-clear-app-cache	auto_close = <True/False whether you want the process to be closed before clearing the cache> process_name = <Process name> app_name = <Application name> cache_path = <Path to the cache folder>	Clears the application cache. **Note:** Cache path is supported for Zoom, Microsoft Outlook, and Microsoft Teams. Enter cache path without the path to the user. For example, if the cache is at path C:\User\<UserName>\AppData\Roaming\Zoom\data enter AppData\Roaming\Zoom\data.

DEX check definitions for Windows

Check definitions for Windows are predetermined sets of rules and criteria that assess the performance, security, and conformance of Windows devices. These checks can cover various aspects such as CPU usage, memory usage, network tests, network bytes, and logged-in users.

To fetch the complete playbook data for a Windows device, the Agent Client Collector (ACC) must run as a local system account. For more details on how to set up the ACC service as a local system account, see Run ACC as a local system account user.

Note:
You can configure the check definitions and associated retrievable data. Some of the listed check definitions might retrieve data that contains or is considered personal information.

Check definitions — Application (Metrics)

DEX offers the following check definitions that are accessible solely when the application is running, except for the os.win.check-app-crash-rate and os.win.check-app-last-access-time check definitions, which are accessible even when the application isn't running. In the check definition parameters:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- appName = application name. Example, Zoom.
- appSysId= sys_id of the application.
- primaryProcess = list of primary processes for the application separated by a pipe symbol (|). The first process that exists on the endpoint device is given priority. Example 1: chrome.exe. Example 2: teams.exe|msteams.exe.

Note:
If the primary process for the Microsoft Teams application in Windows 10 is teams.exe and in Windows 11 it's msteams.exe, then when determining priority based on process availability on the endpoint device, the process that is present on the endpoint device first is given precedence.

- secondaryProcesses = list of secondary processes for the application separated by a pipe symbol (|). Example, cpthost.exe|cptservice.exe.

Check definition name	Check definition parameters	Description
os.win.check-app-cpu-usage	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the amount of CPU resources being used by the application.
os.win.check-app-memory-usage	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the amount of memory used by the application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.win.check-app-last-access-time	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the most recent time when the application was executed or run. **Note:** • This check definition doesn't require the application to be in a running state. • If the application hasn't been run within the last 7 days, the last access time is empty. • If the application's process path changes within 7 days (which can occur during app updates), the last access time is empty until you run the app again. • To modify the 7-day retention policy, you can change the registry path in the following way: ○ Registry Key: "HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager\BAM" ○ Registry Name: "UserSettingsLifetimeMs" ○ Registry Type: REG_DWORD (32-bit value) ○ Registry Value: Duration in milliseconds
os.win.check-app-last-updated	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the time and date of the latest application update installation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.win.check-app-crashes	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Retrieves crash rate of the application. This check definition supports applications that emit a Window Error Reporting (WER) events (event id = 1001 or 1002) on freezing. **Note:** This check definition doesn't require the application to be running.
os.win.check.app.freezes	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Retrieves freeze rate of the application in the last 5 minutes. This check definition supports applications that emit a Window Error Reporting (WER) events (event id = 1001 or 1002) on freezing. **Note:** This check definition doesn't require the application to be running.
os.win.check-app-uptime	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application>	Checks the uptime of the given application.
os.win.check-app-incoming-network-bytes	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list	Retrieves the incoming network bytes of an application for IPv4 and IPv6 networks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
	of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application> • sleep_time =<Duration of time from now for which you must calculate the average incoming network byte/sec>	
os.win.check-app-outgoing-network-bytes	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application> • sleep_time =<Duration of time from now for which you must calculate the average incoming network byte/sec>	Retrieves the outgoing network bytes of an application for IPv4 and IPv6 networks.
os.win.check-app-domain-network-details	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application> • domain=<Domain of the application>	Retrieves the network latency, packet loss, and jitter for installed application domain.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.win.check-app-domain-network-route-details	• --appName=<application name> • --primaryProcess=<primary process name> • --secondaryProcesses=<list of secondary processes separated by a pipe symbol> • --appSysId=<sys id of the application> • domain=<Domain of the application>	Retrieves the complete network route details for application domain.
os.win.check-app-sccm	N/A	Fetches application-specific metrics for the App - Microsoft System Center Configuration Manager.

Check definitions — Device (Metrics)

DEX provides the following types of check definitions for the device.

Check definition name	Description
os.win.check-system-cpu-usage	Checks the current CPU utilization.
os.win.check-system-cpu-details	Retrieves the CPU id, CPU name, number of physical and logical cores, and architecture information.
os.win.check-system-memory-usage	Checks the current system memory utilization.
os.win.check-system-last-access-time	Checks the last time the current device was accessed. **Note:** This check definition works on locked and unlocked devices. The first time this check definition runs, the events are captured and an error message is produced due to no data.
os.win.check-system-uptime	Checks the time elapsed since the last boot of the system.
os.win.check-system-disk-io-usage-read	Retrieves disk bytes read per second.
os.win.check-system-disk-io-usage-write	Retrieves disk bytes written according to second.
os.win.check-system-energy-consumption	Retrieves the energy consumption values for CPU, SoC, display, disk, network, MBB, EMI, other, total, and loss of a Windows device in milliwatt-hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Description
	Note: This check definition isn't compatible with virtual machines that don't have energy sensors. Unlike other check definitions that retrieve latest data, this check definition retrieves the sum of last 5 minutes of data.
os.win.check-system-time	Checks the current time in Coordinated Universal Time (UTC) using UNIX timestamp.
os.win.check-system-power-plan	Retrieves the name of the active power plan.
os.win.check-system-os-details	Retrieves the name, version, platform, architecture, and installation date of the operating system.
os.win.check-system-device-crashes	Retrieves details of different crashes on your device. **Note:** This check definition supports BSOD that emits system events with event ids = 41,1001.
os.win.check-system-device-events	Retrieves the details of events that occurred on the device during the specified time interval. Events for Windows include: last boot and logged-in users.
os.win.check-system-disk-usage	Retrieves the disk used space as a percentage of the total space.
os.win.check-system-battery-details	Retrieves battery-related data, including the remaining battery percentage, the designed voltage, the estimated run time, and the battery's maximum capacity. **Note:** • This check definition doesn't apply to virtual machines (VMs) or desktops because they don't have batteries. • If current capacity is greater than designed capacity, the battery is rounded off to 100%.
os.win.check-system-network-details	Retrieves the network details, including Ethernet, Wi-Fi, and other relevant information.
os.win.check-system-logged-in-users	Checks the login user ID of the users who are currently logged in to the device.
os.win.check-system-power-consumption	Retrieves the power consumption of the device in milliwatt. **Note:** This check definition is exclusively compatible with physical machines and doesn't support virtual machines (VMs).
os.win.check-system-admin-users	Retrieves all user accounts with local administrative privileges.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Description
os.win.check-system-bsod	Retrieves the count, message, ID, level, and time of Blue Screen of Death (BSOD) occurrences. **Note:** This check definition supports BSOD that emits system events with event ids = 1001.
os.win.check-system-firewall-enabled	Checks if the operating system firewall is active and enabled.
os.win.check-system-antimalware-details	Retrieves the details of the anti-malware software on the device.
os.win.check-system-reboot-details	Retrieves the reboot duration in seconds and the last reboot timestamp (in UNIX epoch time). **Note:** The displayed values might not accurately reflect cases where system reboots were interrupted, such as during system updates, power loss, or manual intervention.
os.win.check-system-os-setup-details	Retrieves the approximate OS age for the device.
os.win.check-system-network-adapter-details	Retrieves the network adapter details for the device.
os.win.check-system-network-connection-profiles	Retrieves the network connection profile details for the device. **Note:** This check definition retrieves the network type, which can be used to check the vpn status.

os.win.check-system-compliance-details	Retrieves the system's compliance details. This includes the list of all configured apps and metric values that are non-compliant, and calculates a compliance rating based on that.
	
	Note:
	• This check definition provides the following details:
	  ○ **Condition for app to be said as compliant**: Every process mentioned in primary process should be running.
	  ○ **Condition for metric value to be said as compliant**: Value should be matching with the configured expected value.
	• The score is then calculated using this formula: Score = (Complaint Application + Compliant metric value) / (Total Applications and metric value - Failed Ones) *100

os.win.check-system-battery-charge-percentage	Retrieves the battery charge percentage on windows device. **Note:** If current capacity is greater than designed capacity, the battery is rounded off to 100%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Description
os.win.check-system-windows-registry	Retrieves the windows registry data.
os.win.check-system-memory-details	Retrieves the system memory details like and virtual memory details.
os.win.check-system-bios-details	Retrieves the System Bios details.
os.win.check-system-executables	Fetches all the executables (*.exe) present on windows machine.
os.win.check-system-custom-query-on-change	Execute the custom query provided in the parameters. Runs only if value changes.
os.all.check.internal.get-device-configuration-on-change	Gets the configurations of a device. Example: sudo configured, debug on, agent user, and so on. Runs only if value changes.

Check definitions — Diagnostic Actions

DEX provides the following types of check definitions for Diagnostic actions.

Check definition name	Check definition parameters	Description
Diagnostic action		
os.win.check-app-process-ids	--process_name=<process name>	Retrieves the Process IDs (PIDs) of both the parent and all the child processes associated with the application.
os.win.check-process-cpu	N/A	Retrieves a list of all running processes along with their CPU usage percentage, CPU time, Process ID (PID), Parent Process ID (PPID), and name.
os.win.check-process-memory	N/A	Retrieves a list of all running processes along with their memory usage in kilobytes (KB), Process ID (PID), Parent Process ID (PPID), and name.
os.win.check-process-disk	N/A	Retrieves a list of all running processes along with their disk usage in Bytes, Process ID (PID), Parent Process ID (PPID), and name.
os.win.check-rssi-value	N/A	Retrieves the Received Signal Strength Indicator (RSSI) value for the currently connected WiFi interface. RSSI indicates the signal strength between the wireless access point (AP) and the device, with higher RSSI values indicating stronger signal strength. **Note:** This check definition can't be applied to a virtual machine.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
os.win.check-services-data	service_type =<Type of service(one of user, system or all)	Retrieves the list of all services with PID, Service Name, Service Display Name, Status, Service Type.

Check definitions — Remedial Actions

DEX provides the following types of check definitions for Remedial actions.

Check definition name	Check definition parameters	Description
os.win.action-kill-process	--pid=<process id> OR --process_name=<list of comma separated executable file names> **Note:** The process ID takes priority over the application name.	Terminates a running process or multiple processes specified by their Process ID (PID) or a list of executable (.exe) file names.
os.win.action-restart-service	--service_name=<service name>	Restarts logged user services that take a service name as input to the system.
os.win.action-flush-dns-cache	N/A	Flushes DNS cache on a Windows device.
os.win.action-clear-browser-cache	--auto_close = <true/false> **Note:** When auto-close is enabled, while clearing the browser cache, the browser is closed and vice versa. --browsers = <List of comma separated browsers>	Clears cache of the supported browsers such as Google Chrome,Mozilla Firefox, and Microsoft Edge. **Note:** Before executing this check definition, save your browser work.
os.win.action-clear-app-cache	auto_close = <True/False whether you want the process to be closed before clearing the cache> process_name = <Process name> app_name = <Application name>	Clears the application cache.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Check definition name	Check definition parameters	Description
	cache_path = <Path to the cache folder> **Note:** The cache path is supported for Zoom, Microsoft Outlook, and Microsoft Teams. Cache path should be entered without the path to the user. For example, if the cache is at path C:\User\<UserName>\AppData\Roaming\Zoom\data enter AppData\Roaming\Zoom\data.	
os.win.action-disk-cleanup	None	Clears unwanted files or cache using Windows disk cleanup: • Internet cache files • System error memory dump files • System error mini-dump files • Temporary files • Windows error reporting

DEX Desktop Assistant reference

Reference topics provide additional information about forms and dashboard that you use to configure and administer Desktop Assistant.

Desktop Assistant usage metrics

Usage metrics dashboard enables you to monitor the connection status of your device, user login status, application version, and the number of incidents created using the Desktop Assistant application, ensuring smooth communication with the ServiceNow instance.

Desktop Assistant usage metrics dashboard

Cards	Description	Source table
Connection Status	Shows whether the device is currently connected to a ServiceNow instance.	DEX Desktop Assistant [sn_dex_desktop_exp]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Desktop Assistant usage metrics dashboard (continued)

Cards	Description	Source table
	Note: If a user remains inactive for 6 hours, their connection status is considered as "down", even if they're still logged in but not active. This information helps you troubleshoot connectivity issues and ensure that the device is able to access the resources it needs.	
Logged in	Indicates whether a user is currently logged in to the device or not. The login status of a user is updated when they either log in or log out. This information helps you determine whether the device is currently in use or not and track user activity over time.	DEX Desktop Assistant [sn_dex_desktop_exp]
Desktop Assistant Version in use	Displays the current version of Desktop Assistant running on user devices. This information can help you ensure that the application is up to date and identify any potential compatibility issues with the OS or other applications.	DEX Desktop Assistant [sn_dex_desktop_exp]

To return to the usage metrics page or the administration page, where you can access usage metrics, see View Desktop Assistant usage metrics or DEX Administration.

Components installed with Desktop Assistant

Several types of components are installed with activation of the Desktop Assistant [sn_dex_desktop] plugin, including user roles and tables.

Roles installed

Role title [name]	Description	Contains roles
Desktop Assistant administrator	Responsible for managing configurations and resolving any issues that may arise within the application.	sn_dex_desktop.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
[sn_dex_desktop.admin]		
Desktop Assistant user [sn_dex_desktop.user]	Responsible for using Desktop Assistant. They do not have the ability to configure any items within the application.	• sn_incident_read • sn_change_read

Tables installed

Table	Description
Desktop Assistant [sn_dex_desktop_app]	Registry of the application. Administrators can go to this table to update the title of Desktop Assistant.
Desktop Assistant Card [sn_dex_desktop_app_card]	Records the card that is shown on Desktop Assistant. This is a base table for all card types.
Desktop Assistant Section [sn_dex_desktop_app_section]	Defines a section of the UI that acts as a container for the cards.
Desktop Assistant Tab [sn_dex_desktop_app_tab]	Defines different tabs that are present on the UI app, where each tab contains multiple sections.
Desktop Assistant App to Tab Mapping [sn_dex_desktop_app_to_tab_mapping]	Records a mapping between application and tabs.
Desktop Assistant Installation [sn_dex_desktop_exp]	Records information about installation and usage of the Desktop Assistant application.
Hyperlink Card [sn_dex_desktop_hyperlink_card]	Card type to define hyperlinks.
Records View Card [sn_dex_desktop_records_view_card]	Card type to define what records to view.
Record Creator Card [sn_dex_desktop_record_creator_card]	Card type to define record creator with intended fields.
Section to Card Mapping [sn_dex_desktop_section_to_card_mapping]	Specifies all the cards in the given section.
Tab to Section Mapping [sn_dex_desktop_tab_to_section_mapping]	Specifies all the sections with in a page in a tab content.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Records View cards form

The Records View cards form presents elaborate data on the form's fields and their corresponding descriptions.

You must have the Desktop Assistant administrator [sn_dex_desktop.admin] role to access the form.

Records View card form fields and description

Field	Description
Name	Unique name for the card title.
Header	Unique name for individual pages in the card. When you select a card, it takes you to the details page. The name in the **Header** field appears as the header or title of that detailed page.
Description	Short description of the card.
Table	Table from which you want to pull the data to display.
Query	Filter conditions to display the data.
Application	Scope of the application.
Visible Fields	Fields from the selected table that should appear on the card details page. Use the Unlock Visible Fields icon ( ) and under the **Available** section, select the fields to be visible and then select the right arrow icon ( ) to move it to the **Selected** section. You can also use the up arrow icon ( ) or the down arrow icon ( ) to customize the column position. When you have added all the required fields, select the lock visible fields icon ( ) to ensure these fields are always visible on the form, regardless of any changes made to the form.
Icon	Image that appears on the card. Use the **Click to add** link and select **Choose File** to select an image from your system.

Record Creator card form

The Record Creator Card form presents elaborate description on the fields that you use to create a record rather than view.

You must have the Desktop Assistant administrator [sn_dex_desktop.admin] role to access the form.

Records Creator Cards form fields and description

Field	Description
Name	Unique name for the card title.
Header	Unique name for individual pages in the card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Records Creator Cards form fields and description (continued)

Field	Description
	When you select a card, it takes you to the details page. The name in the **Header** field appears as the header or title of that detailed page.
Description	Short description of the card.
Visible Fields	Fields from the selected table that should appear on the card details page. Use the Unlock Visible Fields icon ( ) and under the **Available** section, select the fields to be visible and then select the right arrow icon ( ) to move it to the **Selected** section. You can also use the up arrow icon ( ) or the down arrow icon ( ) to customize the column position. When you have added all the required fields, select the lock visible fields icon ( ) to ensure these fields are always visible on the form, regardless of any changes made to the form.
Application	Scope of the application.
Icon	Image that appears on the card. Use the **Click to add** link and select **Choose File** to select an image from your system.
Table	Table from which you want to pull the data to display.
Mandatory Fields	Fields from the selected table that are mandatory in the card details page. Use the Unlock Visible Fields icon ( ) and under the **Available** section, select the mandatory fields and then select the right arrow icon ( ) to move it to the **Selected**section. You can also use the up arrow icon ( ) or the down arrow icon ( ) to customize the column position. When you have added all the required fields, select the lock visible fields icon ( ) to ensure these fields are always visible on the form, regardless of any changes made to the form.

Hyperlink card form

The Hyperlink form presents elaborate data on the form's fields and their corresponding descriptions.

You must have the Desktop Assistant administrator [sn_dex_desktop.admin] role to access the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Hyperlink Cards form fields and description

Field	Description
Name	Unique name for the card title.
Header	Unique name for individual pages in the card. When you select a card, it takes you to the details page. The name in the **Header** field appears as the header or title of that detailed page.
URL	URL of the site or page that opens when you select the card. **Note:** There are two options for the URL: • Relative URL: "/esc" launches in reference to the current instance. • Public URL: Needs a full name with protocol such as https://www.servicenow.com/ . Use the Unlock Visible Fields icon ( ) and under the **Available** section, select the fields to be visible and then select the right arrow icon ( ) to move it to the **Selected** section. You can also use the up arrow icon ( ) or the down arrow icon ( ) to customize the column position.
Description	Short description of the card.
Icon	Image that appears on the card. Use the **Click to add** link and select **Choose File** to select an image from your system.

Application Registries form

The Application Registries form presents elaborate data on the form's fields and their corresponding descriptions.

You must have the Desktop Assistant administrator [sn_dex_desktop.admin] role to access the form.

Application registries form fields and description

Field	Description
Name	Name of the application.
Client ID	Unique identifier for your application that is issued by the service provider.
Client Secret	Secret key that is used to authenticate your application with the service provider's API.
Redirect URL	URIs that the service provider should redirect the user to after authentication is complete. This is where your application receives the authorization code or access token.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application registries form fields and description (continued)

Field	Description
Logo URL	URL of your application's logo image.
Public Client	Option to indicate whether the application is publicly accessible. Examples of public clients include mobile apps, web applications, and JavaScript-based applications.
Comments	Additional context or information about a particular request or response.
Application	Client application that is requesting authorization to access a protected resource or service on behalf of a user.
Accessible from	IP addresses or domains that are authorized to access your OAuth client. When you register your OAuth client with a service provider, you may be required to provide a list of IP addresses or domains that are allowed to make requests to the service provider's API on behalf of your client.
Active	Status of an access token. When you grant your application permission to access your resources using OAuth, the service provider issues an access token that your application uses to make API requests.
Refresh Token Lifespan	The duration of a user's session before requiring reauthentication in your application.
Access Token Lifespan	Refers to the period of time during which an access token is considered valid for use by an application.
Default Grant type	Refers to the default method used by an OAuth 2.0 authorization server to grant access tokens to client applications.

To return to the oauth details page, see Configure OAuth details.

Resolve the loading failure of your DEX Desktop Assistant screen

Symptom

My DEX Desktop Assistant screen is empty or in a continuously loading state.

Cause

The DEX Desktop Assistant is not loading because the user is not a valid DEX user or the settings.json file is corrupted.

Resolution

Procedure

1. Refresh the application.
2. Quit and relaunch the application.
3. Clear the Electron settings file at the following location:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- macOS: `~/Library/Application\ Support/desktop_assistant_app/settings.json`
- Windows OS: `~\AppData\Roaming\desktop_assistant_app\settings.json`

4. Verify you're logged in with the sn_dex_desktop.user role.
5. Verify that the DEX Desktop Assistant application is installed on the instance to which you're connecting.

API parameters to customize Desktop Assistant notifications

Use these parameters in the API to customize the Desktop Assistant notifications.

Parameter list	Description
Notification message	Enter the notification message you would like to send.
Notification title	Enter a title to the notification.
Recipient list	Add the receipt list of users who can receive this notification.
Referrer id	Enter the corresponding sys_id of the referred table selected.
Referrer table	Select a type for record on which the notification should be triggered.
Source	Indicates the application from which it got triggered. **Note:** • Desktop Assistant supports only Major Incident Management and Proactive Engagement sources out of the box. • The notifications will be sent successfully for new sources, only if the new source is added as the new choice value for **Notification source** column in **sn_dex_desktop_assistant_notification** table, which will allow the Desktop Assistant to track the new source.

The following example illustrates the API parameters to customize the Desktop Assistant notifications.

```
var notificationObj = {
  notification_message: "Notification Message",
   notification_title: "DA MIM Notification",
  recipient_list: "Receiving sys_user sysid",
   referrer_id: "referrer record sys_id",
   referrer_table: "incident",
   source: "MIM"
};
```

```
var notifyUtils = new
 sn_dex_desktop.DesktopAppNotificationUtils();
notifyUtils.sendDANotification(notificationObj);
```

Digital End-user Experience Self-service

Digital End-user Experience Self-service (DEX Self-service) enables you to check the real-time performance of your devices through the Device health check.

This functionality is available via a widget in Desktop Assistant and Employee Center, as well as through the Now Assist-enabled Virtual Agent. Using DEX Self-service, you can check device issues, resolve them based on suggested resolutions, and initiate device actions to maintain optimal device performance.

Get started

Assistant and Employee Center, or conversationally through the Now Assist-enabled Virtual Agent.

Digital End-user Experience Self-service overview

Using DEX Self-service you can check the device health on demand and address any detected issues by DEX by leveraging recommended resolutions, which can either be remedial actions, self-help instructions, or URLs. Additionally, the widget offers Device Actions that can be triggered even when no issues are detected on the device, allowing you to maintain good performance of the devices and applications.

You can access Device health check from the following sources:

DEX Self-service sources

Source	Feature
Employee Center	Check your device's health using Employee Center
Desktop Assistant	Check your device's health using Desktop Assistant
Now Assist for ITSM Virtual Agent	

DEX Self-service provides the following device health categories and sub-categories in the base system.:

- Device performance
  - Computer last restart
  - Disk space
  - Battery health
- Application(s) performance
  - MS Teams application stability
  - Outlook application stability
  - Zoom application stability
- Network stability
  - Wifi signal strength
  - VPN connectivity

Note:
To configure the categories, see Configure DEX Self-service categories and subcategories.

DEX Self-service provides the following Issue configurations which are mapped to the relevant sub-categories:

- Computer restart pending on macOS and Windows device
- Low disk space on Windows device
- Low disk space on macOS device
- MS Teams application crash on Windows device
- MS Teams application crash on macOS device
- Outlook application crash on Windows device

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Outlook application crash on macOS device
- Poor device battery health on macOS and Windows device
- Poor WiFi signal on Windows device
- Poor WiFi signal on macOS device
- VPN Disconnected in Windows and macOS device
- Zoom application crash on macOS device
- Zoom application crash on Windows device

Note:

- By default, DEX Self-service is inactive in the base system. To activate the DEX Self-service, enable the base system content provided in the **Issue Configuration** screen. For more information, see Enable DEX Self-service for issue configurations.
- To edit these issue configurations, see Customize DEX Self-service issue configurations.
- For more information on issue configurations, see Issue config in Digital End-user Experience Self-service.

The DEX Self-service provides the following device actions in the base system:

- MAC OS- The device action **Reinstall application** is available for Microsoft Teams, Microsoft Outlook, and Zoom applications.
- Windows OS- The device action **Clear disk space** is available.

Note:
To update the device actions, see Configure DEX Self-service device actions.

DEX Self-service Employee experience

The Employee experience includes the following:

1. Access the device health from any of following sources:
   - Employee Center
   - Desktop Assistant
   - Now Assist for ITSM Virtual Agent

   Note:
   To learn how the virtual agent enables you to check your device health, see .
2. (Optional) Select the device to check its health if there are multiple devices.
3. View the health of the device by category. It could be Good, Average, or Poor To know about how the device health is calculated, see Device heath check calculation .

   Note:
   Additionally, you can access the Device actions tab irrespective of the device performance. The **Device actions** tab is available if you are accessing Device health check from the Employee Center or Desktop Assistant.
4. Take action based on the suggested resolution for any issues detected per category. A resolution can be any of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Remedial action button
- Self-help instructions
- URL

5. Based on the result of the resolution, the following options are provided:
   - If the resolution is successful, then a feedback question appears where you can select Yes or No to confirm that process was helpful in resolving the issue. If the user selects No, then the fall back action is provided.
   - If the resolution fails which means if there is no improvement in device performance or user marked issue as unresolved, then a fallback action is provided.

> **Note:**
> Fallback options can be configured by the DEX admin as part of the issue configurations.

Configuring Digital End-user Experience Self-service

The DEX Self-service plugin gets installed automatically with the Digital End-User Experience application. This plugin provides the Device health check capability, enabling employees to check device health based on configurations set by DEX admins.

Configuration overview

1. Configuring Digital End-User Experience

   DEX Self-service gets installed automatically when you install the Digital End-User Experience application.

   Important:
   DEX Self-service is inactive in the base system. To activate DEX Self-service, enable the base system issue configurations. For more information, see Enable DEX Self-service for issue configurations.

2. Activate Proactive Engagement resolutions for DEX Self-service

   Activate base system Proactive Engagement resolutions to enable end users to self-solve issues using DEX Self-service.

3. Enable DEX Self-service for issue configurations.

   Enable base system issue configurations for DEX Self-service to enable end users to self-solve issues using the Device health check capability.

4. Customize DEX Self-service issue configurations.

   Link issues with device health subcategories and categories and define metrics evaluation criteria and issue resolutions. Based on these configurations, issues and their related resolutions display in DEX Self-service. You can access DEX Self-service through the Employee Center, Desktop Assistant, or Now Assist Virtual Agent.

5. Configure DEX Self-service categories and subcategories

   Configure or customize device health categories and subcategories for issues to enable end users to troubleshoot and resolve issues.

6. Configure DEX Self-service device actions

   Configure device actions that end users can initiate from DEX Self-service even when no issues are detected.

Activate Proactive Engagement resolutions for DEX Self-service

Review and activate base system Proactive Engagement resolutions to enable end users to self-solve device and application issues by using DEX Self-service.

Before you begin

Role required: sn_dex.admin

Procedure

1. Navigate to **All** > **Proactive Engagement** > **Issue Registries**.
2. Open an issue registry record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the **Active** check box.
4. Select **Update**.
   For more information about Proactive Engagement, see the Proactive Engagement documentation.

Enable DEX Self-service for issue configurations

Enable issue resolutions for DEX Self-service to enable end users to self-solve device, application, and connectivity issues.

Before you begin
Role required: sn_dex.admin

Procedure
1. Navigate to **All** > **Digital Experience Self-Service** > **Issue Configurations**.
   The base system issue configurations are displayed.

   The default value for the **Enabled in EC self-service** and **Enabled in DEX Now Assist topic** columns is **false**.
2. Open an issue configuration record.
3. Select the **Enabled in EC self-service** check box to enable the issue in Employee Center portal and Desktop Assistant.
4. Select the **Enabled in DEX Now Assist topic** check box to enable the issue in Now Assist for ITSM.
   The ITSM Virtual Agent enables you to check your device's health using prebuilt Large Language Model (LLM) topic conversation. For more information, see ITSM Virtual Agent pre-built LLM topics.
5. Verify that the issue code in the **Resolution** field is active.

   a. Select the reference icon near the **Resolution** field.

   b. On the Issue Registry preview pop-up, confirm that the **Active** check box is selected.

   c. If the **Active** check box isn't selected, activate the issue resolution.
      For information about how to activate an issue resolution, see Activate Proactive Engagement resolutions for DEX Self-service.
6. Select **Update**.

Customize DEX Self-service issue configurations

Customize device health categories, metric evaluation criteria, and resolutions for issues, to make sure that appropriate resolutions display in DEX Self-service and enable end users to self-solve issues.

Before you begin
Role required: sn_dex.admin

About this task
Device, application, and network issues and metric details displayed in DEX Self-service are based on evaluation criteria configured in issue configuration records. If metrics in the evaluation criteria of an issue resolution are defined as **Poor**, the corresponding DEX Self-

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

service subcategory is also marked as **Poor**. DEX Self-service displays resolutions for **Poor** subcategories as configured in issue configuration records.

For information about how device health is calculated, see Device heath check calculation.

Procedure

1. Navigate to **All** > **Digital Experience Self-Service** > **Issue Configurations**.
2. Open the issue configuration record that you want to modify.
3. Update the fields on the form.

   Note:
   For more information on DEX Self-service issue configuration form field descriptions, see DEX Self-service issue configuration form.

4. Select **Update**.

Create DEX Self-service issue configurations

Create issue configurations for DEX Self-service to self-solve issues specific to your organization that are not included in the base system resolutions.

Before you begin
Role required: sn_dex.admin

Procedure

1. Navigate to **All** > **Digital Experience Self-Service** > **Issue Configurations**.
2. On the DEX self-service issue configurations page, select **New**.
3. Enter information about the issue, evaluation criteria, and resolution in the issue configuration form fields.
   For descriptions about the issue configuration form fields, see DEX Self-service issue configuration form.
4. Verify that the issue code in the **Resolution** field is active.

   a. Select the reference icon ( ) near the **Resolution** field.

   b. On the Issue Registry preview pop-up, confirm that the **Active** check box is selected.

   c. If the **Active** check box isn't selected, activate the issue resolution.
   For information about how to activate an issue resolution, see Activate Proactive Engagement resolutions for DEX Self-service.

5. Select **Submit**.

Configure DEX Self-service categories and subcategories

Configure or customize device health categories and subcategories for issue configurations to enable end users in your organization to self-solve device, application, and connectivity issues by using DEX Self-service.

Before you begin
Role required: sn_dex.admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Digital Experience Self-Service** > **Device Health Categories**.
2. Select **New** to add a category or open an existing category to modify its details.
3. Enter relevant information in the DEX Self-service category form fields.
   For descriptions about the DEX Self-service category form fields, see DEX Self-service categories form.
4. Select **Submit** to add new categories, and **Update** to modify existing categories.

Configure DEX Self-service device actions

Configure device actions that end users can trigger to maintain optimal device and application performance even when no issues are detected.

Before you begin

Role required: sn_dex.admin

Procedure

1. Navigate to **All** > **Digital Experience Self-Service** > **Device Actions**.
2. Select **New** to add a device action or open an existing device action record to modify its details.
3. Enter relevant information in the DEX Self-service device action form fields.

   Note:
   For more information on DEX Self-service device actions form field descriptions, see DEX Self-service device actions form.

4. Select **Submit** to add new device actions, and **Update** to modify existing device actions.

Using Digital End-user Experience Self-service

Digital End-user Experience Self-service allows you to monitor your device's performance through the **Device health check**, which is available as a widget in Desktop Assistant and Employee Center, or conversationally through the Now Assist-enabled Virtual Agent.

Overview of Device health check

You can access Device health check from the following sources:

- Employee Center: The employees can now check their device health using Employee Center portal. For more information, see Check your device's health using Employee Center.
- Desktop Assistant: The employees can now check their device health using Desktop Assistant. For more information, see Check your device's health using Desktop Assistant.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Now Assist for ITSM Virtual Agent: Employees can open the Now Assist chatbot and either directly search for 'Device Health Check' or search for device or application performance-related queries to access it. For more information, see .

Note:

- If there are no DEX monitored devices assigned to the user, Device health check widget will not be visible on the page and the Device health page cannot be accessed.
- If devices are offline, the device list drop-down will be disabled, and a message will appear **All devices are currently offline**.
- If a Device Is online but no recent data is available then the Device health check page is disabled and a following message appears **Device health check is currently unavailable. If you've recently restarted your device, please try again later. If you continue to see this message, please open an IT ticket**.

Check your device's health using Employee Center

The employees can monitor and resolve common performance issues on their devices independently using Employee Center portal.

Before you begin

Role required: none

About this task

Using Device health check you can check the device health on demand and resolve the issues by providing the recommended resolutions for the issues. The resolutions can either be remedial actions, self-help instructions, or URL. You can also use Device actions which can be triggered even when no issues are detected on the device.##These actions enable you to maintain good performance of the devices and applications.

Procedure

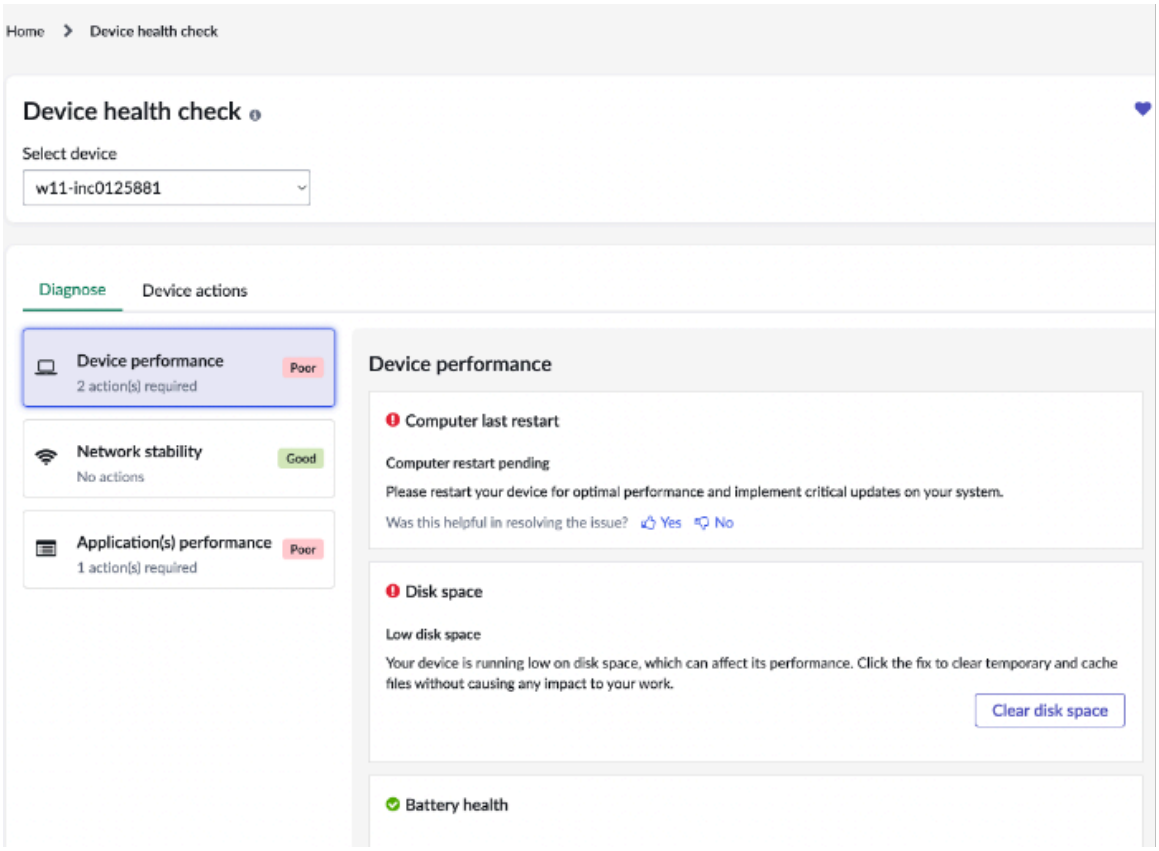
1. Open Device health check from Employee center using any of the following options.

Note:

- On the Device health check page, you can select the **Favorite** (♡) icon to add Device health check card in **My Favorites** section.
- In the search box, if you search for Device Health Check, one result appears under **Catalog** > **Hardware** when AI search is disabled. If AI search is enabled, multiple results appear for Device Health Check in both Hardware and Software.

2. To check the device performance, click the **Diagnose** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Select the poor performing categories in the **Diagnose** tab.
   The details appear with poor performing sub-categories highlighting the detected issue and resolution to resolve the issue.
4. View and use the resolution to improve the category.

Note:

- The resolution can be remedial action button, a Self-help instruction, or an URL. For more information, see Resolution for Proactive Engagement.
- If a remedial action has already been triggered in the last 24 hours either from the **Diagnose** or **Device actions** tab, the remedial action button will be disabled. It will be reactivated after 24hours post action trigger.

For resolutions of type remedial action, if the resolution is successful (if there is improvement in evaluation metric) or for resolution of type URL, self-help instructions, a feedback question appears. You can select **Yes** or **No** to confirm if this process was helpful is resolving the issue.

In case the answer is **No**, the fallback option to open an IT ticket appears based on configuration. After you open a ticket, the ticket Id is visible for employees to access the details and status of the ticket. For resolutions of type remedial action, If the resolution fails, then automatically the fallback option to open an IT ticket appears based on configuration. After you open a ticket, the ticket Id is visible for employees to access the details and status of the ticket.

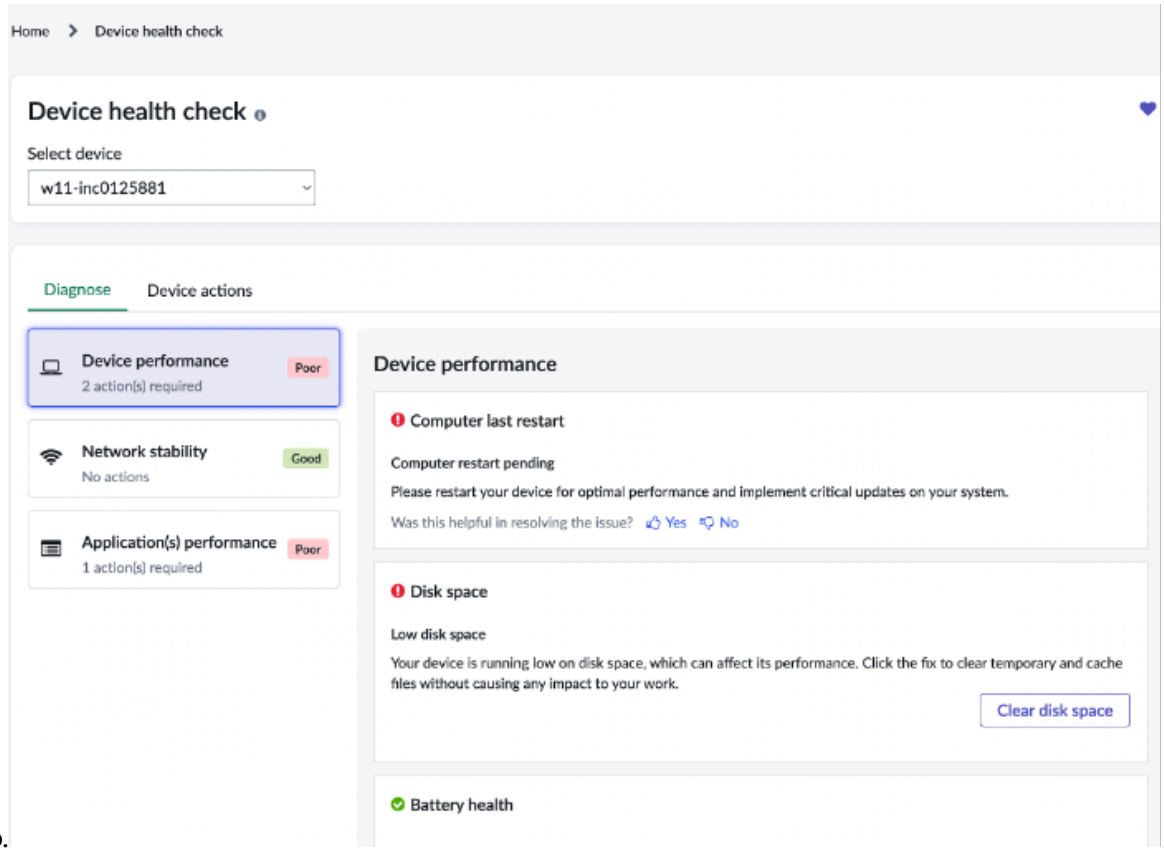
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To trigger any device actions independent of the device performance, select the **Device actions** tab.



Note:

- These actions can be used without having any issue associated with it.
- If you select a device action related to an application, then you must click **Select item** to select a specific application on which you can run the remedial action button.
- If an action is in progress for a specific application, then the status says **1 action is progress**, and the action button allows you to select any other application.

6. Select the remedial action button to run.

Note:

- If the action is successful, then it shows the status as **Completed**.
- If the action is not yet started, then it shows the status as **No action history**.
- If the action is in progress, then it says **In-progress** and the action button is disabled.
- If the action fails, then the status appears as **Failed**.
- If the action has already been triggered in the last 24 hours either from the **Diagnose** or **Device actions** tab, the remedial action button will be disabled.

Check your device's health using Desktop Assistant

Use DEX Self-service capability to check your device health.

Before you begin

Role required: sn_dex_desktop.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Zoom application crash	Application(s) performance	Zoom application stability	FALSE	FALSE	Windo

Device heath check calculation

Device health calculation and categorization of performance as Good, Average, or Poor.

Calculating Device health check

Each category of the selected device is marked as Good, Average, or Poor by calculating the weighted average of the subcategories associated with the parent category.

Each subcategory's performance is marked as Good, Average, or Poor by calculating the weighted average of the performance indicators of associated device metrics.

Performance indicators

Performance Indicators	Weight	Upper bound	Lower bound
Good	1	1.67	1
Average	2	2.33	1.67
Poor	5	5	2.33

Formula used to calculate the subcategory performance indicators

```
Sub-category performance indicator= (weight of evaluation metrics performance indicator)/total number of evaluation metrics for the subcategory)
```

where,

- Evaluation metric performance indicator: Performance indicator (Good, Average, Poor) of the evaluation metrics' value as defined in the metric definition table.
- Weight: Weight of the performance indicator. After all the subcategories are marked as Good, Average, and Poor. The performance of the category is calculated by the weighted average of subcategories performance indicator.

Score range definition

The following defines the performance range and its corresponding classification:

- Good if the performance indicator average value lies in the range of (1, 1.67)
- Average performance indicator average value lies in the range of (1.67, 2.33)
- Poor performance indicator average value lies in the range of (2.33, 5)

Formula used to calculate the parent category performance indicator:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
Category performance indicator= (sum of sub-category
performance indicator weights)/total number of sub-
categories)
```

Example

Consider the following example for the calculating the performance indicator for **Device performance category** that has the following subcategories:

Sample Device health check calculation

Subcategory	Metric	Metric value	Subcategory performance metric calculation	Subcategory Performance indicator
Disk Space	Disk Usage	90	Subcategory performance indicator = 5 (Weight of Poor indicator) / 1 (total no. of evaluation metrics for the subcategory)	Poor
Battery Health	Battery health	Good	Subcategory performance indicator = 1 (Weight of Good indicator) / 1 (total no. of evaluation metrics for the subcategory)	Good
Computer Restart	Device uptime	1	Subcategory performance indicator = 1 (Weight of Good indicator) / 1 (total no. of evaluation metrics for the subcategory)	Good

Performance indicator for Device performance category.

- Subcategory performance indicators = Poor, Average, Good
- Sum of weight of subcategory performance indicators: (5 + 1 + 1) = 7 Performance indicator = 7 / 3 (no. Of subcategories) = 2.33
- Device performance category is Poor (as 2.33 falls under the Poor range)

Digital Portfolio Management

Manage and maintain all your solutions (services, service offerings, business applications, and application services) from a single location using the ServiceNow® Digital Portfolio Management (DPM) Workspace. DPM pulls in data from across the ServiceNow platform so you see impacts in the context of solutions that you own or care about.

https://player.vimeo.com/video/995348445?badge=0&autopause=0&player_id=0&app_id=58479

This video provides an overview to manage your service-related data in the DPM Workspace using the plan, build, run life cycle.

Exploring Digital Portfolio Management

Learn about the Digital Portfolio Management (DPM) Workspace features and benefits to manage all of your solutions in one place. Solutions in the context of DPM are services, service offerings, business applications, and application services.

Digital Portfolio Management overview

The DPM Workspace is one of several configurable workspaces that ServiceNow provides. For information about workspaces, see the following topics.

- List of workspaces
- Open a Configurable Workspace experience in UI Builder

The DPM Workspace enables you to:

- View and manage all your solutions in a central workspace through the full life cycle of plan, build, run, and optimize.
- Use key performance indicator (KPI) groups to track how each solution is performing.
- Drill down to the details of each solution to see the impacts.

Digital Portfolio Management users

Users

User	Description
DPM admin	The DPM admin role sets up the DPM Workspace environment, including the tabs that show, key performance indicator (KPI) groups and thresholds, and integrations with other ServiceNow and third party applications.
DPM manager	The DPM manager role works in the DPM Workspace environment to view all solutions and their KPI metrics.

Digital Portfolio Management workflow

Both DPM admins and DPM managers benefit from working in the DPM Workspace.

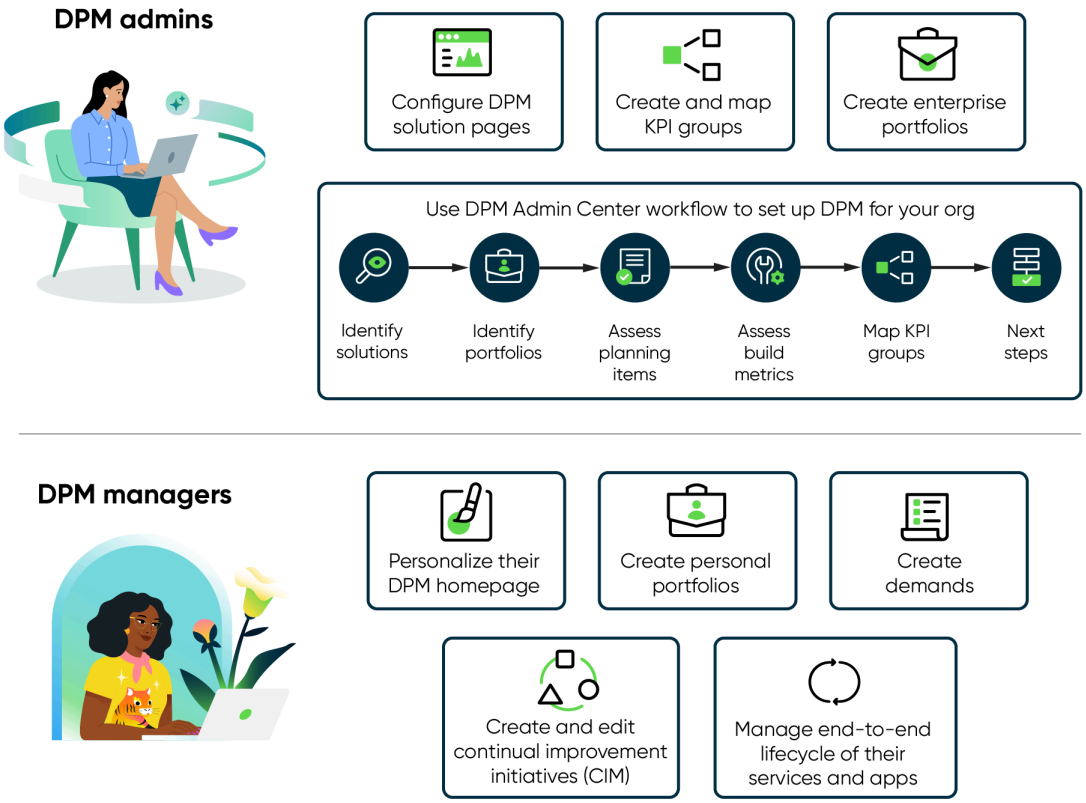
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DPM Workspace overview



- With a DPM admin role, you can:
  - Configure DPM Workspace solution pages.
  - Create and map key performance indicator (KPI) groups.
  - Create enterprise portfolios.
  - Use the DPM Admin Center guided walk-through to:
    - Identify solutions to configure
    - Identify portfolios
    - Assess planning items
    - Assess build metrics
    - Map KPI groups
    - Learn about the next steps that you can take
- With a DPM manager role, you can:
  - Personalize your DPM Workspace homepage.
  - Create and manage personal portfolios.
  - Create demands and continual improvement initiatives (CIM).
  - Manage the end-to-end life cycle of your services and applications.

Digital Portfolio Management benefits

The Digital Portfolio Management Workspace provides several benefits to help you manage the life cycle of services, service offerings, business applications, and application services.

- Digital Portfolio Management reference

Digital Portfolio Management Workspace homepage

The Digital Portfolio Management (DPM) Workspace homepage is the starting point where you navigate to all aspects of your solutions and portfolios. You're encouraged to personalize your Digital Portfolio Management (DPM) homepage so you can view and track the solutions that matter to you most.

DPM Workspace overview

The DPM homepage ( ) is the central area where you see the status of all your solutions. To access DPM, log in to your provided ServiceNow instance and then select **Workspaces > Digital Portfolio Management**. When you first log in to the DPM Workspace, the system uses certain fields to generate a set of default solution cards that display on your homepage. After you personalize your homepage, the system remembers your updates in the *dpm_home_page_item* table so that next time you log in to the workspace, your personalized homepage displays. For information on the first login solution cards, see Digital Portfolio Management homepage default solution cards.

The homepage includes the following main areas.

- A personalized message that welcomes you and a link to an overview video about DPM.
- A Current status section that contains solution cards with solutions that you're associated with based on system-defined fields. You're encouraged to personalize the solutions in this section. The layout enables you to see a holistic picture of all solutions you care about.

  Tip:
  If you don't see any solution cards (an empty state), select **Add items** to add solutions to your homepage.

- Solution cards list needs attention attributes, which vary depending on the type of solution. At a glance, you can see each attribute name and the number of times it affects the solution. Also, the color and status icon determine if the needs attention attribute marks the solution as good, moderate, or critical.

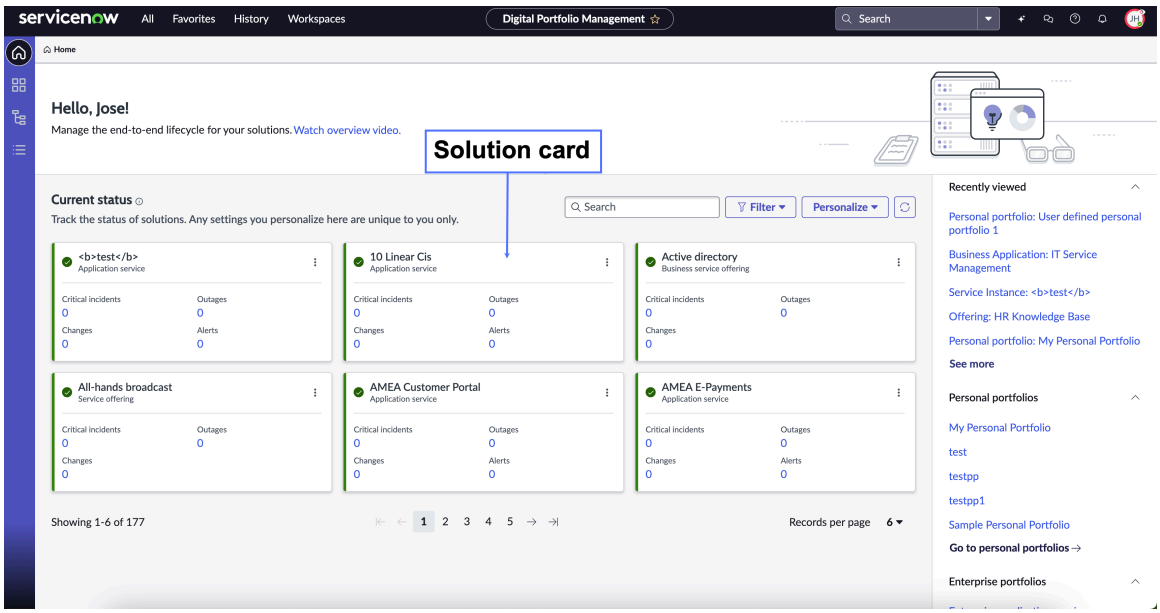
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The data on each solution card reflects current data at the time that you view the page. Refresh the page ( ) to update the data.

- Fields to enable you to search, filter, and personalize what you see on your DPM Workspace homepage. For more information, see Personalize the Digital Portfolio Management Workspace homepage.
- A Personal portfolios section that shows personal portfolios that you recently visited in DPM. You can also select the link to go to the personal portfolios page.
- An Enterprise portfolios section that shows enterprise portfolios that you recently visited in DPM. You can also select the link to go to the enterprise portfolios page.
- A Recently viewed section that shows items that you recently visited in DPM.

Current status solution cards

You're encouraged to personalize the Current status section to see those solutions that matter to you most. Each solution card provides you with detailed information about your solutions. See the image and corresponding numbers for more information.



1. Solution name and type (service, service offering, business application, or application service).
2. Actions menu to view the solution's details, its relationship map, or remove the item from your homepage. For more information, see Personalize the Digital Portfolio Management Workspace homepage.
3. Needs attention attributes that determine the status of each card. Needs attention attributes differ based on the solution type.

Needs attention default thresholds

DPM comes with default thresholds for Needs attention attributes. You're encouraged to personalize the thresholds to define your metrics for good, moderate, and severe. See Personalize the Digital Portfolio Management Workspace homepage.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Needs attention default thresholds

Color	Symbol	Meaning	Default threshold
Green		Good	No value (empty)
Orange		Moderate	• Critical incidents: Empty • Outages: Empty • Changes: Empty • Alerts: 3 • Risks: 1 • Audits: Empty
Red		Severe	• Critical incidents: 1 • Outages: 1 • Changes: Empty • Alerts: 10 • Risks: 3 • Audits: Empty

Browser support for workspaces

Important:
Due to significant performance issues, ServiceNow recommends that customers migrate away from Internet Explorer 11. For more information, refer to KB0683275.

Digital Portfolio Management life-cycle management

The Digital Portfolio Management (DPM) Workspace enables you to work in the plan-build-run life-cycle model. You can manage solutions that you own and view solutions that may have an impact on services or products that you care about.

The DPM plan-build-run life cycle surfaces data from other ServiceNow® products in a central location. To view data and take basic actions in the DPM experience, you must install the plugins and roles. For more information, see Digital Portfolio Management related applications and data sources.

Listen to an overview of the DPM team, the application, and how it works for solution owners in the plan-build-run life cycle.

Digital Portfolio Management overview.

The life-cycle management phases come standard with DPM but all records are fully configurable to match how you work. For information on how Admins can control the

configuration in DPM, see Configure the Digital Portfolio Management experience. For information about other configurations, see UI Builder.

Life-cycle management phases in DPM

Plan	Build	Run
Plan within the context of your solutions (services, applications, or products).	Track the progress of work being delivered for your solutions, including epics and stories in the current sprint.	Monitor critical key performance indicator (KPI) results and operational performance of your solutions.

• View the roadmap and roadmap dependencies (launches Strategic Planning).
• View the backlog and rearrange each planning type to prioritize and move some into the pipeline.
• View the summary of what's been planned for the solution:
  ○ Review ideas and their state, and promote new ideas.
  ○ See demands within the solution's planning organization and hierarchy.
  ○ View projects and improvement initiatives.
	• View the status of current projects.
	  ○ View active projects with percent complete metrics (with a color grid and a list view).
	  ○ See projects that are overdue or have missed key milestones.
	  ○ View projects with critical issues.
	  ○ Assess how teams are delivering on the volume of work.
	• View changes and improvement initiatives:
	  ○ View status with a color grid and a list view.
	  ○ See what's overdue by month.
	  ○ View upcoming changes.
	  ○ View change backlog growth in the last 30 days.
	• View DevOps information for business applications:
	  ○ View flow metrics from DevOps Insights to view details on epics, bugs, stories, and works in progress in the context of your business applications.
	  ○ View accelerate metrics from the DevOps Change workspace to manage scrum and waterfall development
		• View a performance snapshot and details of your solutions using Performance Analytics indicators.
		Note: If you have a standard license for Performance Analytics, then you see historical data (the last 6 months), and you can't edit the Performance Analytics indicators. See KB1637474 for information about KPI results on DPM pages.
		  ○ Gauge performance against commitments.
		  ○ See the availability of the solution as a percentage.
		  ○ See the number of new incidents.
		  ○ View the number of subscribers.
		  ○ See the customer satisfaction score.
		  ○ View child offering breakdowns.
		• Receive alerts to current and ongoing impacts.
		• View business application deployments:
		  ○ Assess hardware and software models and technology risk using data from ServiceNow® Governance, Risk, and Compliance.
		  ○ Confirm risk conformance and act on risk remediation tasks.
		  ○ View accelerate metrics from the DevOps Change Workspace to manage scrum and waterfall development and to gain visibility

- View application service details

View service and service offering details

View information about services and service offerings that may impact your solutions. Each Digital Portfolio Management (DPM) page presents the life-cycle phase information in tabs — Plan, Build, Run, and Info.

Status of services and service offerings

When viewing the service and service offering details in DPM, the **Phase** and **Status** of each item is listed on the workspace view and on the list view.

When viewing details of a service or service offering that's retired, an alert banner along the top of the workspace view states that it's retired. In the list view, the Phase is listed as **Retired**, the life-cycle stage is **End of Life**, and the life-cycle stage status is **Retired**.

Important:
If your organization transitioned from the traditional Service Portfolio Management fields to the CSDM life-cycle fields, then the field names differ from this document. For more information, see Apply the CSDM guidelines to Digital Portfolio Management.

Services and service offerings display information in DPM via the Plan, Build, Run, and Info tabs. If your organization opts to inactivate one or more of the tabs, then the inactivated tabs aren't visible to you. For example, if your organization doesn't work on planning activities and they inactivate the Plan tab, then the Plan tab isn't visible for you. For more information on how Admins can hide or show tabs, see Configure the Digital Portfolio Management experience.

Keep in mind that what you are able to see in DPM depends on what your product license permits from the source application. See Digital Portfolio Management related applications and data sources for the required installations and plugins to see each data element.

	The total number of active improvement initiatives on the service or service offering. The number of active improvement initiatives is in the gray box. You can select an active improvement initiative for its details, including its Continual Improvement Management (CIM) phase, CIM tasks, impacted key performance indicators (KPIs), and approvers.

Run tab

Some of the fields on the Run tab are different for services and for service offerings, as noted in the following table. See KB1637474 for more information about KPI results on DPM pages.

Service and service offering Run tab

Section	Description
Service performance or **Offering performance**	The Performance snapshot KPI group that comes with the base system. The indicators typically show availability, open incidents, and new requests. Each indicator has an information icon ( ) that when selected, provides a tooltip description for that indicator. For information on KPIs that come with the base system, see KPI groups installed with Digital Portfolio Management. Admins can modify KPI groups, create KPIs, and create KPI group mappings so you may see more than the Performance snapshot on the Run tab. For information, see Create KPI groups and mappings in Digital Portfolio Management. For information on configuring KPIs, see Configure KPIs in Digital Portfolio Management with service availability example.
Offering breakdown (services only)	List of the offering breakdowns for the service, including each offering's: • Availability • Open incidents • Incidents not updated for 5 days • New requests
Application service dependences (service offerings only)	List of the application services that the service offering depends on. The number of application services is in a gray box. You can select an application service for its details. For more information, see View application service details.
Commitments (service offerings only)	Information about the service offering availability commitments such as the commitment name, type, and target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service and service offering Run tab (continued)

Section	Description
SLA commitments (service offerings only)	Information about the service level agreement (SLA) commitments for the service offering.

Info tab

The Info tab provides general information about the service or service offering. Some of the fields are different for services and for service offerings, as noted in the following table. You can't edit the fields in the Info tab.

Service and service offering Info tab

Section	Description
Service description or **Service offering description**	Description of the service or the service offering.
General Info	General information about the service or the service offering. • Service portfolio • Taxonomy node • Service classification (business or technical) • Phase and Status (if using the Service Portfolio Management fields) or • Stage and Status (if using the CSDM life-cycle fields) • Consumer type • Last review date • Start and end dates
Personal portfolios	The personal portfolios for the service or offering. The number of personal portfolios is in a gray box. Select a personal portfolio for its details.
Subscribers	General information about the subscribers on the service or service offering. You can select each card for detailed subscriber information on the following: • Locations • Departments • Groups • Companies • Individual users

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service and service offering Info tab (continued)

Section	Description
Price (service offerings only)	General price information about the service offering, like price model, unit, cost, and description.
Offering commitments (service offerings only)	The service commitment for the offering, for example, 95% 24x7. The number of the commitments is in a gray box. Select a commitment for its details.
Offerings (services only)	The offerings for the service. The number of service offerings is in a gray box. Select an offering for details.
Service scope (services only)	• The business case criticality for the service. Criticality levels are: **1.** Most critical **2.** Somewhat critical **3.** Less critical **4.** Not critical • The business capabilities for the service. The number of business capabilities is in a gray box. Select a business capability for details.
Service Contracts (for services) or **Contracts** (for service offerings)	The list of contracts for the service or the service offering. If available, you can select a contract for its details.

Needs attention panel icons

The Needs attention panel includes the following icons for services and service offerings:

- Needs attention icon ( ) to show or hide the Needs attention panel. For information on needs attention values, see Work with Needs attention panels in Digital Portfolio Management.
- Contacts icon ( ) to view team members and teams for the record.
- Catalog items icon ( ) to search for catalog items on a service or a service offering record.
- Knowledge articles icon ( ) to search for related knowledge articles.
- Attachments icon ( ) to view and add attachments to the record.

Related topics

Work with Needs attention panels in Digital Portfolio Management

View business application details

View information about business applications that may impact your solutions. Each Digital Portfolio Management (DPM) page presents the business application life-cycle phase information in tabs — Plan, Build, Run, Risk, and Info.

Roadmap	When selected, see roadmap details in the Strategic Planning or the Portfolio Planning Workspace.

Projects	Project information related to the service or service offering.
	• A donut graph shows the active projects by current status. You can hover over each status of the donut to see its number of projects and percentage. You can also select each status to access a list of the projects records in that status.
	• A bar graph shows projects overdue by month. You can hover over each status of the bar graph to see the month, year, and the number of projects. You can also select each bar to access a list of the projects for that month.
	• A set of cards enable you to select the number (count) to see a list of projects for the service or service offering.
	  ○ Projects with status work in progress
	  ○ Projects with missed key milestones
	  ○ Projects with critical issues
	Note:
	Both the Active projects by current status and the Projects overdue by month graphs include the following:
	• Project updates that are directly related to the business application.
	• Project updates of the related application services that roll up to the business application.
	Active projects
	Total number of active projects on the service or service offering. The number of active projects is in a gray box. Select an active project record to view its details.

Epics	Epic cards provide the count of each of the following for the business application. You can select a card to go to a list of the items. • Epics in backlog that are ready • Epics in progress
Stories	Story cards provide the count of each of the following for your business application. You can select a card to go to a list of the items.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business application Build tab without the DevOps system property enabled (continued)

Section	Description
	• Stories in backlog that are ready • Stories in progress • Blocked stories
Sprints	Current sprints related to the business application. The number of sprints is in a gray box. You can select a sprint to see its details.
Releases	Current releases related to the business application. The number of current releases is in a gray box. You can select a current release to see its scrum release details.

Changes	**Change graphs**
	• A donut graph shows the changes by status:
	  ○ New
	  ○ Assess
	  ○ Authorize
	  ○ Scheduled
	  ○ Implement
	  ○ Review
	  ○ Closed
	  ○ Canceled
	• A bar graph shows the changes overdue by month.

Build tab with DevOps enabled

After a DPM Admin enables the DevOps system property, you can see the flow metrics and accelerate metrics on the Build tab. The epics, stories, sprints, and releases don't show when DevOps is enabled. For Admin instructions to turn on or off the DevOps system property, see Configure the Digital Portfolio Management experience.

Info tab

The Info tab provides general information about the business application. You can't edit fields in the Info tab.

Business application Info tab

Section	Description
Application description	Description of the business application.
General Info	General information about the business application. • Enterprise portfolio • Taxonomy node • Department • Business unit • Application family • Application category • Architecture type • Status • Lifecycle stage • Lifecycle stage status • Install type • User base count • Active user count
Personal portfolios	The personal portfolios that contain the business application. The number of the personal portfolios is in a gray box. You can select a personal portfolio to view its details.
Business capabilities and **Application services**	Cards that show the number of business capabilities and application services that are related to the business application. You can select each card to go to a list of each item respectively.
Contract	General information about the contract related to the business application: • Vendor • Support vendor • Contract end date
Additional information	Cards that show the number of the following additional information related to the business application. You can select each card to go to a list of the items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business application Info tab (continued)

Section	Description
	• Business Unit Strategy • Goals • Information objects

Needs attention panel icons

The Needs attention panel includes the following icons for business applications:

- Needs attention icon ( ) to show or hide the Needs attention panel.
- Contacts icon ( ) to view team members and teams for the record.
- Attachments icon ( ) to view and add attachments to the record.

Related topics

Enterprise portfolios

Create enterprise portfolios in Digital Portfolio Management

View application service details

View information about application services that may impact your solutions. Each Digital Portfolio Management (DPM) page presents the application service life-cycle phase information in tabs, primarily Run and Info. The Risk tab displays when you have the Technology Portfolio Management plugin [sn_apm_tpm] installed.

As you view the following tables, keep in mind that what you are able to see in DPM depends on what your product license permits from the source application. See Digital Portfolio Management related applications and data sources for the required installs and plugins to see each data element.

KPI groups for application services

If your organization uses the enterprise portfolio module with the latest enterprise portfolio tables, then an application service rolls up to its related business application. This enables you to create a portfolio with business applications that will have the application services. You could also create a separate portfolio for application services which contains the application service. In both cases, the application services inherit KPI groups from both portfolios.

- An application service can be in a business application portfolio because:
  - Application services roll up to business applications.
  - Run data from the application service shows at the business application level.
- An application service can be added to an application-type portfolio.

Incidents, problems, and changes can be added to an application service's Impacted services or the Affected CIs related list. After this addition, you see the rolled up data in the following areas when you:

- Select **View details** on any affected solution page.
- View the Run tab of any solution page to view the KPI indicators.
- View the KPIs and Needs attention panels of the affected business applications.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also see the rolled up data in the following areas.

- Enterprise application portfolios
- Enterprise application service portfolios
- Any business application or application service that is added to your personal portfolios

Since application services can be in two different types of portfolios, the application service inherits KPI groups from two different places. See the table for how KPI groups work in the following use cases.

KPI groups for portfolios

View	KPIs shown	Conditions
Enterprise portfolio application service preview	The inherited KPI groups from the enterprise portfolio. If there isn't an enterprise portfolio KPI group, then an empty state is shown.	The application service enterprise portfolio type contains application services and isn't linked to a business application type. You can link an application service to a business application enterprise portfolio type using cmdb_rel_ci. The parent should be a business application and the supporting item should be an application service. The required relationship is *`Consumes: Consumed by`*.
Application services detail page (Run tab) from an enterprise portfolio	• All inherited KPI groups display, regardless from where you navigated. • Also, the KPI groups added directly to that application service display.	Application service is added and its parent enterprise portfolio is mapped with its KPI group type.
Application service from a personal portfolio or from a list	All KPI groups	No conditions.

Run tab

See KB1637474 for more information about KPI results on DPM pages.

Application service Run tab

Section	Description

Application service performance	Performance details about the application service. You can select the graphs and cards for each section to view more details. Each indicator has an information icon ( ) that when selected, provides a tooltip description for that indicator.The following KPI groups and indicators are in this section.
	• **Portfolio success metrics**
	  ○ Availability
	  ○ Incidents with a breached service level agreement (SLA)
	  ○ Incidents caused by changes
	  ○ Successful changes
	• **Business application performance**
	  ○ Number of incidents
	  ○ Number of problems
	  ○ Number of changes
	• **Service health**
	  ○ Critical incidents
	  ○ Critical alerts
	  ○ Closed changes
	• **Service impact**
	  ○ Impacted rate
	  ○ Critical severity over time
	• **Alert trends**
	  ○ Incidents caused by alerts
	  ○ Alerts by severity
	• **Availability insights**
	  ○ Availability
	  ○ Unplanned outages
	  ○ Average outage duration

Commitments	Commitment data for the application service. You can select a commitment to view its details.
Service reliability management (with sn_sow_srm plugin installed)	Service reliability management information data for the application service. To see reliability indicators, the sn_sow_srm plugin must be installed. You can select a reliability indicator to view its details.
Offerings that depend on this	A list of the offerings that depend on this application service. The number of offerings is in a gray box. Select an offering for its details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application service Run tab (continued)

Section	Description
application service	For information on offering details, see View service and service offering details.

Risk tab

To see the Risk tab, you must have the Technology Portfolio Management plugin [sn_apm_tpm] installed. The Risk tab displays the Technology Lifecycle Risk using donut reports and lists for application services software and hardware models.

Note:
The Technology Portfolio Management plugin [sn_apm_tpm] has two dependency plugins:

- Application Portfolio Management [com.snc.apn]
- Software Asset Management [com.snc.sams]

Info tab

The Info tab provides general information about the application service. You can't edit the fields in the Info tab.

Application service Info tab

Section	Description
Application service description	Description about the application service.
General Info	General information about the application service. • Business criticality • Version • Environment • Operational status • Managed by group • Support group • Approval group • Change group
Personal portfolios	The personal portfolios for the application service. The number of personal portfolios is in a gray box. Select a personal portfolio for its details.
Application service commitments	The service commitments for the application service. The number of commitments is in a gray box. Select a commitment for its details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application service Info tab (continued)

Section	Description
Software and hardware models	The software and hardware models for the application service. The number of each is in a gray box. Select a software or hardware model for its details.
Relationships	The configuration items (CIs) for the application service. The number of CIs is in a gray box. Select a CI for its details.

Needs attention panel icons

The Needs attention panel includes the following icons for application services:

- Needs attention icon ( ) to show or hide the Needs attention panel.
- Contacts icon ( ) to view team members and teams for the record.
- Attachments icon ( ) to view and add attachments to the record.

KPI groups in Digital Portfolio Management

Define and configure the key performance indicator (KPI) groups in DPM that matter most to you. When you associate KPI groups with your services and applications, you can analyze their performance in a centralized area.

https://player.vimeo.com/video/1022208039?h=78848fb963&badge=0&autopause=0&player_id=0&app_id=58479

With KPI groups, you can analyze the performance of each solution in several ways:

- See a detailed description of a KPI indicator by selecting on the KPI indicator card.
- Drill down to view trends and historical performance on vendors, a KPI group, or an individual KPI.
- Select a supporting KPI to see its related record details.
- View and drill down into the KPI spark lines to see more details. When you select a chart value, the result is filtered to display the details of the value that you selected. If you select the whole chart (not a value), then the KPI details page displays.
- See the latest (or last) KPI score when the **Latest score** system property (*sn_dpm.kpi_groups.show_latest_score*) is enabled.

  View KPI group data in the way that most interests you. Admins can update the system property anytime so you can view KPI group data by the latest score or by the aggregate score. When an admin enables the Latest score system property, the following shows in the DPM:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Last collected score for a KPI indicator in all KPI groups in DPM, without an aggregation layer (by sum or by average).
- Last collected scores for all values in each KPI breakdown grid.
- Last 30 days of scores for trends and time series visualizations. You can set different time rangers per KPI.
- The date the score was collected (shows on each KPI indicator card).

Note:
Starting with the June 2024 release of DPM, the latest score system property is set to true for new and zBoot customers. If not applicable, then the DPM admin can enable the latest score system property by navigating to **All** > **Digital Portfolio Management** > **Administration** > **KPI groups properties**. For more admin information, see Configure the Digital Portfolio Management experience.

When you access KPI drill down information in DPM, the system adds a timestamp at the end of the URL in the browser address field. The timestamp is in milliseconds and is based off epoch time.

The DPM base system comes with KPI groups that provide valuable indicators to evaluate overall performance and individual metrics for services and other solutions. You can also create your own KPI groups but you're encouraged to explore the base system options.

KPI groups for enterprise portfolios

Two KPI groups enable flexible reporting on solutions in enterprise portfolios.

- **Enterprise portfolio**

  The enterprise portfolio KPI group [*Portfolio success metrics*] enables you to map to any enterprise portfolio type to view its portfolio performance. You can track availability, mean time to resolve (MMTR), incidents caused by changes, and successful changes. You can see these performance metrics when you view the details of any enterprise portfolio.

- **Business applications**

  The business application KPI group type [*Business application performance*] enables you to track the number of incidents, problems, and changes for a business application. You can see these performance metrics in the **Run** tab of a business application on the DPM Workspace.

Important:
You must map the business application performance KPI group to your business applications to show the data on the **Run** tab. For more information, see Create KPI groups and mappings in Digital Portfolio Management.

Note:
The business application performance KPI group replaces the metrics used prior to the Utah release. Since you can create and edit KPI groups and map them to business applications, it provides more flexibility to configure your reporting. You don't need to edit the page in UIB to change the metrics.

KPI groups for application services

KPI groups aren't inherited for application services, but you can do the following with the *Availability insights* KPI group for application services:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View and assess the availability for application services that you own or are responsible for.
- Map the Availability insights KPI group to one-to-many applications services.
- View availability commitments and commitment performance on the Run tab of your application service.
- View all commitments listed on the Info tab of the application service.

DevOps value stream metrics in Digital Portfolio Management

View key metrics related to the performance of your solutions in Digital Portfolio Management (DPM). If you manage your solutions in a DevOps model, then you can view DevOps data for your business applications as well as link to the DevOps Change Workspace directly from DPM.

Key metrics help you evaluate the impact on the performance of work being done on your solutions. View DevOps value stream metrics in the context of your business applications in DPM, for example, mean time to restore from changes, change failure rates, and lead time. You can also access the DevOps Change Workspace directly from your business applications in DPM to make data-driven decisions. Accelerate metrics are displayed on both the **Build** tab and the **Run** tab so that you can view the data in the context of your business applications for each phase. You can see flow metrics data on the **Build** tab of your business applications.

Note:
To view DevOps accelerate metrics and flow metrics in DPM, admins must enable the DevOps system property. See Configure the Digital Portfolio Management experience for more information.

On the **Build** tab of your business applications, view the following data in numeric forms and in charts:

- Accelerate metrics
  - Average lead time to deploy over the last 30 days
  - Commit to deploy lead time
  - Average deployment frequency over the last 30 days
  - Production deployments frequency
- Flow metrics
  - Average flow time for epics
  - Average flow time for epics and features
  - Average number of bugs and stories
  - Distribution of bugs and stories
  - Work in progress cycle time for epics, stories, and bugs (each has their own widget)
  - Work in progress items

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the **Run** tab of your business applications, view the following accelerate metrics data in numeric form and in charts:

- Average mean time to restore from incident caused by changes (over the last 30 days)
- Mean time to restore from incidents caused by changes, broken out by DevOps changes and non- DevOps changes

> **Note:**
> Non- DevOps changes are other changes listed on the Change table.

- Average change failure rates over the last 30 days
- Change failure rate over time, broken out by DevOps changes and non- DevOps changes
- Mean time to restore

Configuring Digital Portfolio Management

Enable the Digital Portfolio Management (DPM) Workspace and configure the settings for your organization. Set it up to show data so you can monitor services, service offerings, business applications, and application services. All configuration tasks require the DPM admin role [sn_dpm.dpm_admin].

Using guided setup to implement Digital Portfolio Management (DPM)

Guided setup provides a sequence of tasks that help you configure the DPM Workspace on your ServiceNow instance. To open the guided setup for DPM, navigate to **All** > **Digital Portfolio Management** > **DPM Admin Center**.

For more information, see Use the Admin Center in Digital Portfolio Management.

> **Note:**
> The DPM Workspace uses the taxonomy structures from the Service Portfolio Management application. For more information, see Service Portfolio Management taxonomy.

Configuration overview

Configuring the DPM Workspace involves setting up environments, tools, and user access. To configure, you must have the DPM admin role [sn_dpm.dpm_admin]. You perform most of these configuration tasks in each instance that you're using.

1. Activate Digital Portfolio Management.

   You can activate DPM by searching for it on the ServiceNow® Store.

2. Use the Admin Center in Digital Portfolio Management.

   Use the DPM Admin Center for a guided walk-through to do the following configuration tasks.

   a. Identify the solutions that are ready to configure for the organization. Solutions could be services, service offerings, business applications, and application services.

   b. Identify the service portfolios or the enterprise portfolios that are ready to configure for the organization.

   c. Assess planning items for the plan portion of the solution life cycle. If your organization doesn't use the planning portion of the life cycle, then follow the prompts to remove the plan view for the organization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Assess build metrics to show a solution's performance in the build portion of the solution life cycle.

e. Map key performance indicator (KPI) groups to track the performance of the solutions.

3. Apply the CSDM guidelines to Digital Portfolio Management.

   Service data relates to each other using different applications and in different ways. DPM references the Common Service Data Model (CSDM) to bring service-related data together in a single view.

Even though you can return to the DPM Admin Center at any time to update configuration settings, you can also complete most of the following configuration tasks independently.

Related topics

Use the Admin Center in Digital Portfolio Management

Activate Digital Portfolio Management

The Digital Portfolio Management plugin is available from the ServiceNow® ServiceNow Store.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

When you install the Digital Portfolio Management (DPM) application from the ServiceNow Store, it automatically installs the necessary plugins. For a list of other application plugins that you must install to surface other application data in DPM, see Digital Portfolio Management related applications and data sources.

Procedure

1. Navigate to **System Application** > **All Available Applications** > **All**.
2. Find the plugin.
   Use the filter criteria and search bar to search by name or by ID. If you can't find the plugin you want, see Request a plugin.
3. Select **Install**, and then in the Activate Plugin dialog box, select **Activate**.

Use the Admin Center in Digital Portfolio Management

The Admin Center in Digital Portfolio Management (DPM) provides administrators a guided walk-through to set up and configure the DPM Workspace for the organization. The provided information and configuration prompts enable visibility into the end-to-end service and application life-cycle.

With a DPM admin role [sn_dpm.dpm_admin], access the DPM Admin Center to set up and configure the DPM experience for the organization. The Admin Center provides easy to follow setup steps and includes tooltips and links to resources, plugins, and configuration tables.

Note:
An administrator [admin] must install plugins.

Access the DPM Admin Center

To access the DPM Admin Center, you must have the DPM Admin role [sn_dpm.dpm_admin].

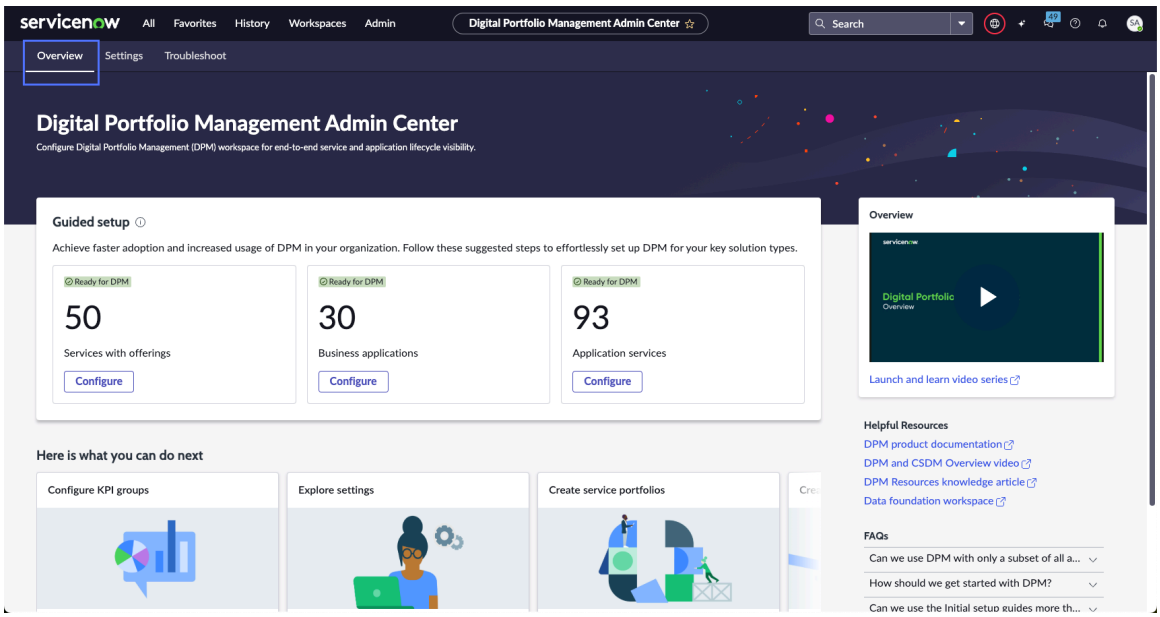
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Demo data users that come with the base system have been assigned the Admin role [sn_dpm.dpm_admin]. You can impersonate one of the demo data users to test the Admin Center.

Navigate to **All** > **Digital Portfolio Management** > **DPM Admin Center**.

The Admin Center has two tabs: **Overview** and **Settings**.

Overview tab



The **Overview** tab enables you to do the following:

- Follow the guided setup to configure services with offerings, business applications, and application services.
- Configure key performance indicator (KPI) groups.
- Explore the settings.
- Create and review service portfolios.
- Create and review business application portfolios.
- Access helpful resources for more information.

Navigate the configuration steps

- Select **Configure** on a solution card from the **Overview** tab.
- Follow the guided walk-though. Each step has its own prompts, instructions, and conditions to set up your data in the DPM Workspace.

Note:
When you see the information icon (ⓘ) next to a step heading, select it to view more information about that step.

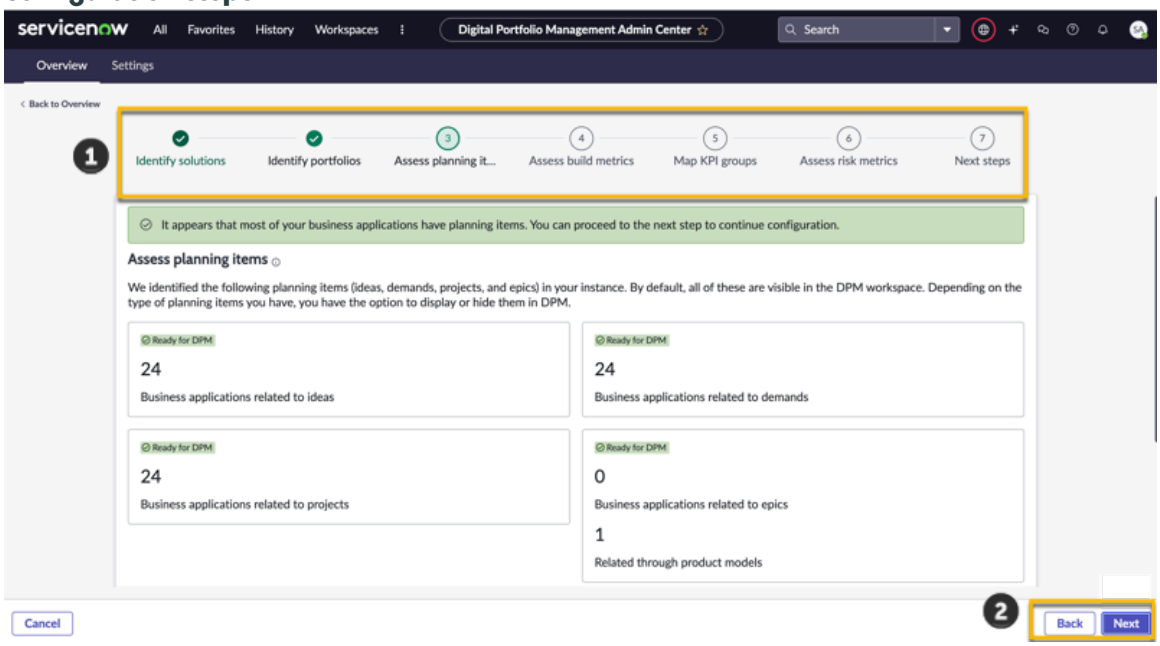
DPM Admin Center configuration steps for solutions

Services with offerings	Business applications	Application services
1. Identify solutions	**1.** Identify solutions	**1.** Identify solutions
2. Identify portfolios	**2.** Identify portfolios	**2.** Identify portfolios
3. Assess planning items	**3.** Assess planning items	**3.** Map KPI groups
4. Assess build metrics	**4.** Assess build metrics	**4.** Assess risk metrics
5. Map KPI groups	**5.** Map KPI groups	**5.** Next steps
6. Next steps	**6.** Assess risk metrics	
	7. Next steps	

- Navigate through the setup steps in one of two ways.
  1. Select the step number and title to perform the configuration for that step.

     A completed step shows a check mark instead of a number.
  2. Select **Next** to move to the next step and **Back** to return to the previous step.

Example DPM Admin Center navigation using the business applications configuration steps

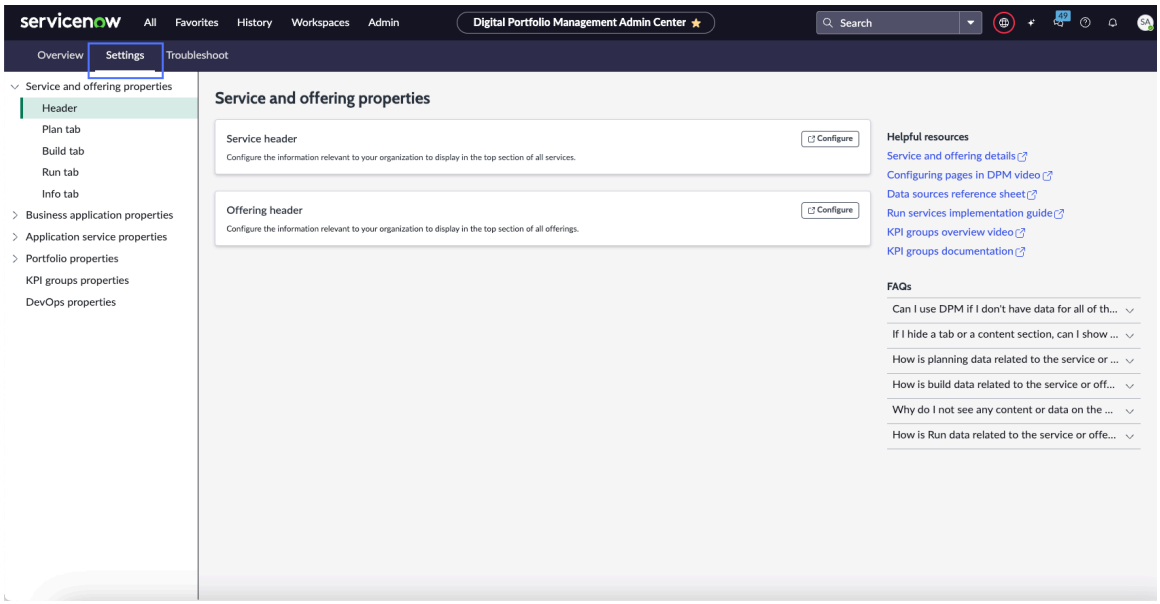


You can navigate to any step at any time to update the configuration settings.

Important:
If you see an empty screen while configuring, you most likely don't have access for that action. To resolve access issues, contact your administrator.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Settings tab

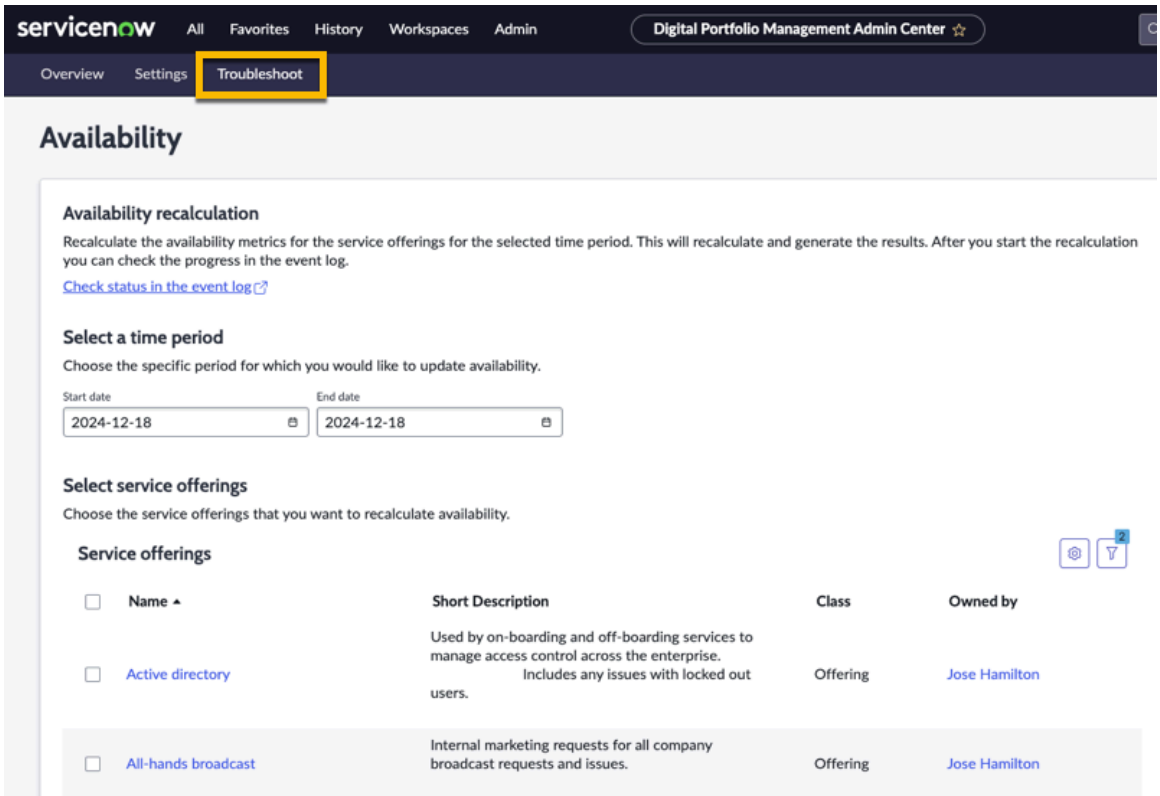


The **Settings** tab enables you to do the following for solutions (services, service offerings, business applications, and application services):

- Configure the following for each solution page.
  - Personal portfolio solution cards
  - Header fields
  - Plan fields
  - Build fields
  - Run fields
  - Risk fields
  - Portfolio properties
  - General information fields on the Info tab
  - KPI group properties
  - DevOps properties
- Show or hide the Plan, Build, Run and Info tabs.
- Show or hide fields from each of the main tabs.
- Access resources for additional help.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Troubleshoot tab



The **Troubleshoot** tab enables you to recalculate availability results and indicators for service offerings.

1. Select the services and offerings that you'd like to recalculate availability.
2. Set the start and end dates for the recalculation period.
3. Select **Recalculate availability** to generate the results.

There's no limit to how many times you can run the recalculation. You can also check the recalculation progress by selecting **Check status in the event log**.

More options in the DPM Admin Center

Configure page headers in the DPM Admin Center

Configure the page header fields for your solutions in the DPM Admin Center. Your configuration determines how the header fields are displayed in the DPM Workspace.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

Each solution displays header information for that solution. For example, for a service, the header information may display the owner name, the consumer type, the phase, the status, and the business criticality. You can configure the header information to best suit the needs of your organization. The DPM Admin Center enables you to configure the header information for the following solutions:

- Services and service offerings (both business and technical)
- Business applications
- Application services

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service portfolios and taxonomies
- Enterprise portfolios and taxonomies

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **DPM Admin Center** > **Settings**.
2. Select **Header** for the solution that you want to configure the header information.
3. Select **Configure**.
   You must be in the correct application scope to edit the record. If you're in a different scope, then a text banner displays for you to select a link to edit the record.
4. Review the field names in the **Secondary Values** tab.
   The field names represent the information displayed on the solution header in the DPM Workspace.
5. Configure the fields from the list view.
   You can do some minor configuring in the list view.
   - You can set the **Active** value to true or false. After a field is set to false, it doesn't display on the solution header in the DPM Workspace.
   - You can change the order that the active fields display on the solution header in the DPM Workspace.
6. Configure the fields individually.
   - Select a field to configure. You must be in the correct application scope to edit the record. If you're in a different scope, then a text banner displays for you to select a link to edit the record.
   - Review or change the information.

Secondary Values

Field	Description	Editable
Table	The table name for the item.	No
Field	The field name for the item that displays in the DPM Workspace.	Yes
Order	The order that the item displays on the solution header in the DPM Workspace.	Yes
Application	The application for the item.	No
Workspace	The workspace for the item.	No
Active	The flag that determines if the item displays (or not) on the solution header of the DPM Workspace.	Yes
Conditions	Configuration options where you can set conditions for the item.	Yes

7. Select **Update**.

Configure the Info tab in the DPM Admin Center

Configure the general information fields for your solutions in the DPM Admin Center. Your configuration determines how the fields are displayed in the **General info** section of the **Info** tab in the DPM Workspace.

Before you begin

Role required: sn_dpm.dpm_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Each solution has an **Info** tab that displays general information about the solution. For example, for a service, the **Info** tab **General info** section may display the associated service portfolio, the taxonomy node, the service classification (technical or business), the phase, the status, and more. You can configure the **General info** section to best suit the needs of your organization. The DPM Admin Center enables you to configure the **General info** fields for the following solutions:

- Services and service offerings (both business and technical)
- Business applications
- Application services
- Service portfolios and taxonomies
- Enterprise portfolios and taxonomies

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **DPM Admin Center** > **Settings**.
2. Select the **Info** tab for the solution that you want to configure the **General info** fields.

   Note:
   For the **Portfolio properties** option, select **General info**.

3. Select **Configure**.
   You must be in the correct application scope to edit the record. If you're in a different scope, then a text banner displays for you to select a link to edit the record.
4. Review the field names in the **Secondary Values** tab.
   The field names represent the information displayed in the **General info** section of the **Info** tab in the DPM Workspace.
5. Configure the fields from the list view.
   You can do some minor configuring in the list view to affect the **General info** display in a solution's **Info** tab.
   - You can set the **Active** value to true or false. After a field is set to false, it doesn't display in the **General info** section.
   - You can change the order in which the active fields are displayed in the **General info** section.
6. Configure the fields individually.
   - Select a field to configure. You must be in the correct application scope to edit the record. If you're in a different scope, then a text banner displays for you to select a link to edit the record.
   - Review or change the information.

Secondary Values

Field	Description	Editable
Table	The table name for the item.	No
Field	The field name for the item that displays on the **General info** section of the DPM Workspace.	Yes
Order	The order that the item displays on the **General info** section of the DPM Workspace.	Yes
Application	The application for the item.	No

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description	Editable
Workspace	The workspace for the item.	No
Active	The flag that determines if the item displays (or not) on the **General info** section of the **Info** tab in the DPM Workspace.	Yes
Conditions	Configuration options where you can set conditions for the item.	Yes

7. Select **Update**.

Configure personal portfolio solution cards in the DPM Admin Center

Configure the fields that display on the personal portfolio solution cards in the DPM Admin Center. Your configuration determines the fields that display on each solution card in the DPM Workspace.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

You can configure the personal portfolio solution card fields to display information on the DPM Workspace homepage:

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **DPM Admin Center** > **Settings**.
2. Open **Portfolio properties** and then select **Solution Cards**.
   You have the option to configure the following types of solution cards:
   - Service
   - Business service
   - Technical service
   - Service offering
   - Business application
   - Application service
3. Select **Configure** for the card that you want to configure.
   You must be in the correct application scope to edit the record. If you're in a different scope, then a text banner displays for you to select a link to edit the record.
4. Review the field names in the **Secondary Values** tab.
   The field names represent the information displayed on the personal portfolio card in the DPM Workspace.
5. Configure the fields from the list view.
   You can do some minor configuring in the list view.
   - You can set the **Active** value to true or false. After a field is set to false, it doesn't display on the solution header in the DPM Workspace.
   - You can change the order that the active fields display on the solution header in the DPM Workspace.
6. Configure the fields individually.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select a field to configure. You must be in the correct application scope to edit the record. If you're in a different scope, then a text banner displays for you to select a link to edit the record.
- Review or change the information.

Secondary Values

Field	Description	Editable
Table	The table name for the item.	No
Field	The field name for the item that displays in the DPM Workspace.	Yes
Order	The order that the item displays on the solution header in the DPM Workspace.	Yes
Application	The application for the item.	No
Workspace	The workspace for the item.	No
Active	The flag that determines if the item displays (or not) on the solution header of the DPM Workspace.	Yes
Conditions	Configuration options where you can set conditions for the item.	Yes

7. Select **Update**.

View relationships of business applications and application services in the DPM Admin Center

In the DPM Admin Center, you can see a comprehensive view of your business applications and application services. You can see incidents, problems, and changes that are related to your business applications and incidents and changes that are related to your application services.

The relationships of business applications and application services enable you to see a full picture of your solutions. For example, business applications consume multiple application services. So if you set a configuration item (CI) for an incident, you must select the application service that the incident belongs to. After that CI is set up, the incident rolls up to the business application that consumes that application service. You can see all the relationships from the DPM Admin Center.

Important:
To access the DPM Admin Center, you must have the DPM admin [sn_dpm.dpm_admin] role.

View business applications related to changes for build metrics

- Access the **Overview** tab in the DPM Admin Center, and then select **Configure** in the Business applications card.
- Select **4 Assess build metrics** in the navigation bar.
- View the **Business applications related to changes** card.
- Select a numbered item on the card to see the business applications related to changes through the following criteria.
  - The business application field
  - The configuration item field

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The affected CIs
- The impacted services

Note:
A card is set to *Ready for DPM* when any one of the listed criteria is greater than zero. If you select zero (0) on a card, then an empty state displays.

After you select a numbered item on the card, another tab opens with a grouped list of each business application that's related to changes according to the criterion that you selected. You can open a business application on the list and drill down to each record number to see the related items details (consumes, depends on, and so on).

View business applications related to incidents, problems, and changes for operational metrics

- Access the **Overview** tab in the DPM Admin Center, and then select **Configure** in the Business applications card.
- Select **5 Map KPI groups** in the navigation bar.
- View the cards under the **Map KPI groups** heading. Each card shows the following with numbered items.
  - Business applications related to incidents
  - Business applications related to problems
  - Business applications related to changes
- Select a numbered item in any of the cards to see the business applications related to incidents, problems, or changes through the following criteria.
  - The configuration item field
  - The affected CIs
  - The impacted services

Note:
A card is set to *Ready for DPM* when any one of the listed criteria is greater than zero. If you select zero (0) on a card, then an empty state displays.

After you select a numbered item on the card, another tab opens and displays a grouped list of each business application that's related to that criterion. You can open a business application on the list and drill down to each record number to see the related items details (consumes, depends on, and so on).

View applications services related to incidents and changes for operational metrics

- Access the **Overview** tab in the DPM Admin Center, and then select **Configure** in the Application services card.
- Select **3 Map KPI groups** in the navigation bar.
- View the cards under the **Map KPI groups** heading. Each card shows the following with numbered items.
  - Application services related to incidents
  - Application services related to changes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select a numbered item in either of the cards to see the business applications related to incidents or changes through the following criteria.
  - The configuration item field
  - The affected CIs
  - The impacted services

Note:
A card is set to *Ready for DPM* when any one of the listed criteria is greater than zero. If you select zero (0) on a card, then an empty state displays.

After you select a numbered item on the card, another tab opens and displays all the application services related to your selected criterion. For example, you could see all application services related to incidents through affected CIs. In this example, you can drill down to see the source incident record.

Use the Admin Center in Digital Portfolio Management

Apply the CSDM guidelines to Digital Portfolio Management

Service data relates to each other using different applications and in different ways. Digital Portfolio Management (DPM) references the Common Service Data Model (CSDM) framework to bring service-related data together in a single view.

DPM enables you to organize service data in logical sequences that make sense for your business. You can see details about your own services as well as services that you don't own but may impact your business.

Tip:
For CSDM set-up information, see Implementing the CSDM framework in stages.

Personal portfolios and CSDM

See how DPM aligns with the CSDM framework to provide a holistic view of your IT landscape.

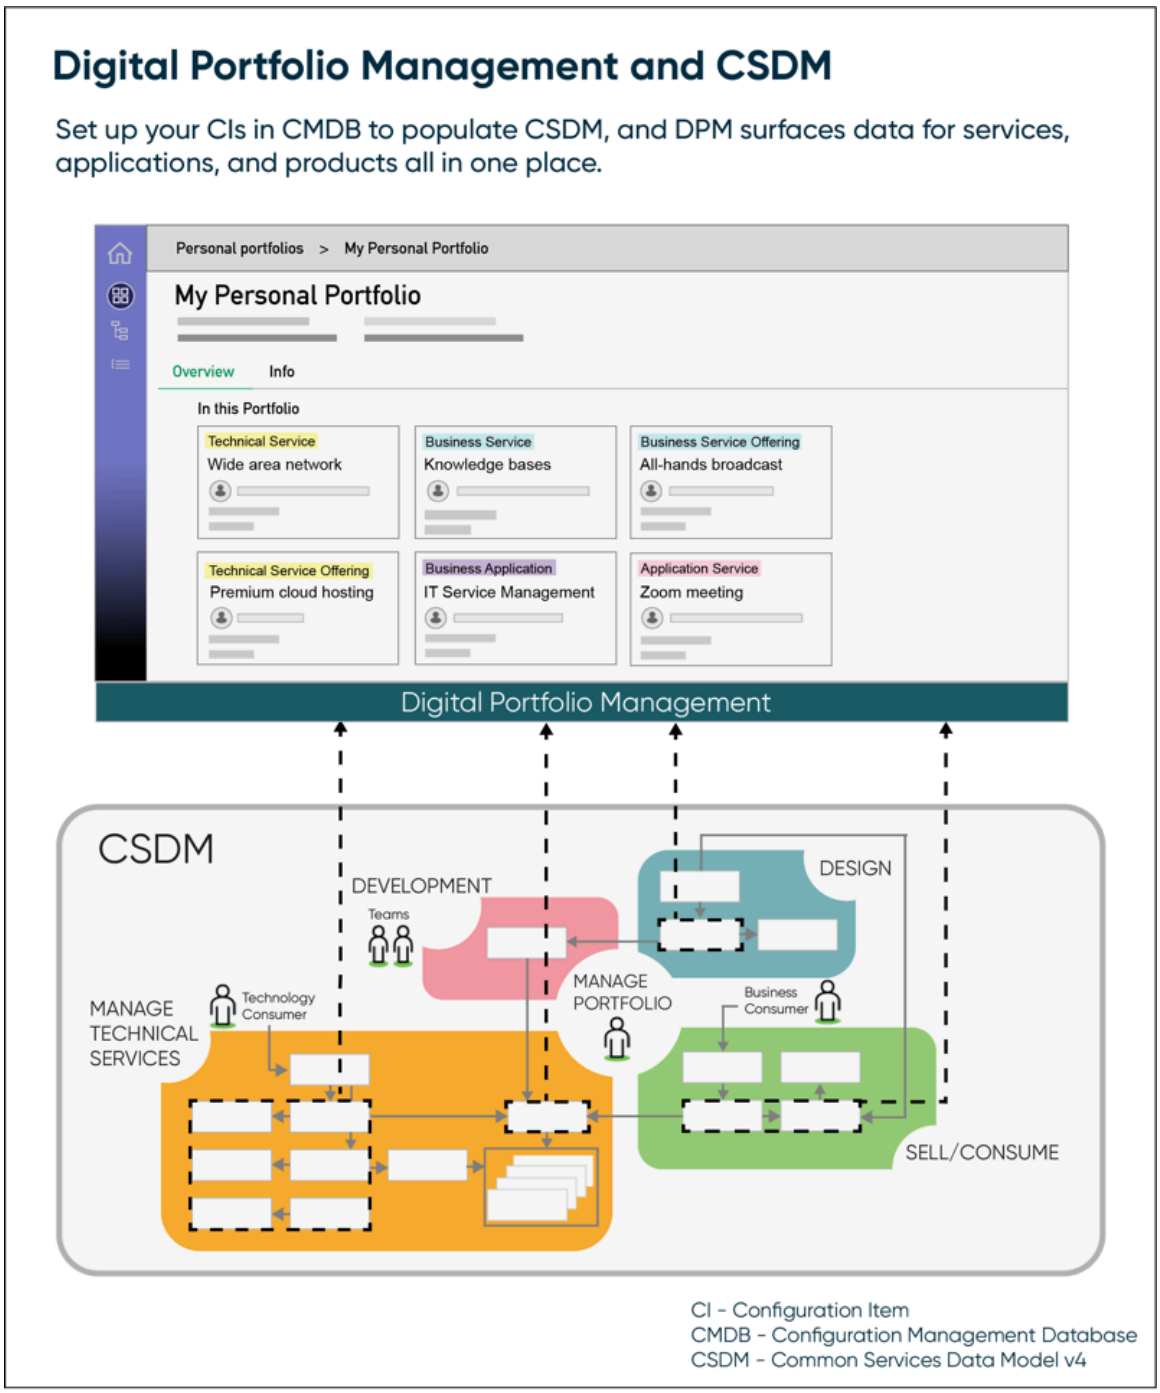
DPM and CSDM



CSDM life-cycle fields for business and technical services

Service portfolios viewed in DPM display the phase (or stage) field and the status field in the header of each business and technical service and service offering. The field values come from the service table [cmdb_ci_service].

The following comparison shows the differences from the traditional Service Portfolio Management phase and status fields to the CSDM life-cycle stage and status fields.

These fields also display when you use the Performance Analytics (PA) indicators.

Service table [cmdb_ci_service] mapping of Service Portfolio Management and CSDM

Service Portfolio Management Phase and Status field names	CSDM life-cycle Stage and life-cycle Status field names
Pipeline | Requirements	Ideation | Under evaluation
Pipeline | Definition	Ideation | Under evaluation
Pipeline | Analysis	Ideation | Under evaluation
Pipeline | Approved	Ideation | Under evaluation
Pipeline| Chartered	Design | Chartered
Catalog| Design	Design | Design
Catalog | Development	Design | Design
Catalog | Build/Test/Release	Deploy | Test
Catalog | Operational	Operational | In-use
Catalog | Retiring	Operational | Pending Retirement
Retired | Retired	End of life | Retired
Retired | Obsolete	End of life | Obsolete

CSDM relationships in DPM

To confirm that you see the data that you want in DPM, you must establish the correct CSDM relationships.

How you establish relationships between your solutions and configuration items (CIs) varies depending on your situation. For more information, see CI relationships in the CSDM.

CSDM terms for Digital Portfolio Management

Because both ServiceNow® products of Digital Portfolio Management (DPM) and Service Portfolio Management closely align with the Common Service Data Model (CSDM), it's helpful to know the common terms when working in these applications.

Common CSDM terms used in DPM and Service Portfolio Management

Term	Definition	Notes
Portfolio	Collection of services, products, projects, or applications.	Used to manage like items together for a business. Portfolios may be grouped by objective, capabilities, organization, like projects or services.
Business capability	High-level capability that an organization requires to execute its business model or fulfill its mission.	Typically described in the context of performing one or more specific tasks to achieve business outcomes. For example, demand management or financial planning.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common CSDM terms used in DPM and Service Portfolio Management (continued)

Term	Definition	Notes
Service	Means of delivering value to customers by facilitating outcomes customers want to achieve without the ownership of specific costs and risks.	Typically has three aspects: • Interaction • Offering • Service system ServiceNow provides three base service types: • Business • Technical • Application Customers can extend the base types to align with the service types in their organization.
Business service	A service type that is published to business users and it typically underpins one or more business capabilities.	Typically orderable by business users. Business users are able to select the desired offering and service commitment levels via the ServiceNow® Service Catalog. For example, procurement, shipping, and finance.
Technical service	A service type that is published to service owners and typically underpins a business or application service.	Typically orderable by service owners. Service owners are able to select the desired offering and service commitment levels via the Service Catalog. For example, computers, storage, and networks).
Application service	A service type that is a logical representation of a deployed application stack.	Examples of application services are hosting, data backup, and recovery. **Note:** There is not a 1-to-1 relationship between application and application services.
Application	Any deployed program, module, or group of programs that is designed to provide specific functionality on a computer infrastructure.	Defines behavior and has specific functionality associated with it. Applications are typically discoverable functionality, like Apache Web Server.
Business Application	Represents all software and infrastructure environments (dev, test, prod) configured to provide functionality.	Used to increase productivity and perform other business functions accurately. For example, Dell Online.
Service catalog	Provides consumable view of available products, services, service commitment options, and offerings.	Helps manage what services a user may have access to. Also, catalogs are the initiation point for access to available services. For example, IT services catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common CSDM terms used in DPM and Service Portfolio Management (continued)

Term	Definition	Notes
Service offering	A stratification of a service into capability, availability, pricing, and packaging options.	Different levels of performance and features for a given service can be made available. For example, ITSM Standard and ITSM Pro.
Service commitment	Defines service delivery obligations agreed to between the consumer and the provider.	Often manifested in the form of contracts such as service level agreements, operational level agreements, and underpinning contracts. Service commitments include specific performance characteristics that differentiate one offering from another.
Configuration item (CI)	Physical and logical components of an infrastructure that are currently or soon will be under configuration management.	May be a single module such as a server, database, or router or a more complex item, such as a complete system. For example, a web server, database, or infrastructure.
Asset	An item whose financial value is tracked.	Many assets are CIs and vice versa, but that is not always the case. Assets have a life cycle with financial considerations, for example, Microsoft Office 365.
Operating model	An abstract and ideally visual representation (model) of how an organization delivers value to its customers or beneficiaries.	Typically represents the various elements of how an organization operates. It usually incorporates strategy positions such as the innovation model, degree of intelligent automation, industry alignment, provider delivery models, and the business expectations of IT.

Integrate Digital Portfolio Management with other ServiceNow applications

Bring in data from other ServiceNow applications to see a comprehensive view of your solutions in the Digital Portfolio Management (DPM) Workspace. You can see data for services and service offerings, for business applications, and for application services.

Configure KPI groups in Digital Portfolio Management

Configure key performance indicator (KPI) groups in Digital Portfolio Management (DPM) to surface performance information in the context of your organization's solutions.

https://player.vimeo.com/video/1022212851?h=c6e80e1d83&badge=0&autopause=0&player_id=0&app_id=58479

With a DPM admin role [sn_dpm.dpm_admin], you can define and configure the key performance indicator (KPI) groups in DPM. With KPI groups, your organization can analyze the performance of services, offerings, business services, and application services in a centralized area.

Important:
KPI data in DPM comes from portfolios in the Service Portfolio Management application. The Service Offering Metric Data [service_offering_metric_data] table along with the following four indicators have been deprecated in the Utah release:

- Average SLA Achievement [ServiceOffering.MetricData.SLA.Daily]
- Average Customer Satisfaction [ServiceOffering.MetricData.CSAT.Daily]
- Average Availability [ServiceOffering.MetricData.Availability.Daily]
- Average Request Activity [ServiceOffering.MetricData.Activity.Daily]

Therefore, if you have the Service Portfolio Management standard portfolio (the most recent version), then the metric data from the legacy indicators are no longer available. For more information, see Service Portfolio Management portfolios.

Create KPI groups and mappings in Digital Portfolio Management

Create key performance indicator (KPI) groups and mappings in Digital Portfolio Management (DPM) to monitor the overall health and progress of all your services and offerings.

Before you begin

- Plugins required: sn_dpm, com.sn_team_perf, and com.snc.service_portfolio
- Role required: sn_dpm.dpm_admin

About this task

Create KPI groups and associate each group's type with its corresponding record. Here are the record types:

- Service portfolios
- Taxonomy nodes
- Services
- Offerings
- Application services
- Business applications
- Enterprise portfolios
- Enterprise taxonomy nodes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In addition to creating your own KPI groups, you can use and configure the KPI groups that come with the base DPM application. For details, see KPI groups in Digital Portfolio Management.

This procedure includes the following tasks:

1. Create a KPI group.
2. Add indicators to a KPI group.
3. Create a KPI group mapping.

Procedure

1. Create a KPI group.
   a. Navigate to **All** > **Digital Portfolio Management** > **KPI Groups**.
   b. Select **New**.
   c. On the form, fill in the fields.

KPI Group form

Field	Description
Name	The name of the KPI group.
Description	The description of the KPI group.
Type	The type that you want to create: ▪ Service portfolios ▪ Taxonomy nodes ▪ Services ▪ Offerings ▪ Application services **Note:** The type must correlate to the record. For example, you can only associate a service portfolio type to a portfolio record. You can only associate an offering type to an offering record.
Order	Determines the page layout of the KPI groups in the Digital Portfolio Management workspace.

   d. Select **Submit**

Tip: You can also create a KPI group by copying an existing KPI group. For more information, see Copy a KPI group to create a new KPI group in Digital Portfolio Management.

2. Add indicators to a KPI group.
   a. Navigate to **All** > **Digital Portfolio Management** > **KPI Groups**.
   b. Select the KPI group that you want to add indicators to.
   c. On the **KPIs** tab, select **New**.
   d. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPIs form

Field	Description
KPI Group	KPI group to add indicators.
KPI	KPI indicator that you want to measure.
Label	Name of the KPI indicator. You can edit the label.
Parent KPI	Parent KPI, if this KPI is a supporting KPI.
Display Aggregate	KPI display aggregate: Average or Sum. **Note:** This field applies when the latest score property [sn_dpm.kpi_groups.show_latest_score] is false. For information, see Configure the Digital Portfolio Management experience.
Order	Page layout of the KPI groups in the Digital Portfolio Management workspace.
Description	The description of the indicator. For more information on KPI results, see KB1123710.
Chart type	The chart type for the KPI group. The options are: ▪ **Single score** ▪ **Time series: Line** ▪ **Time series: Column** ▪ **Time series: Area** ▪ **Time series: Spline** ▪ **Time series: Step line** ▪ **Group By** **Note:** The **Group By** option enables you to select the results breakdown. For example, incidents by priority.

e. Select **Submit**.

3. Create a KPI group mapping.

a. Navigate to **All** > **Digital Portfolio Management** > **KPI Group Mappings**.

Note:
You can also map a KPI group by navigating to **All** > **Digital Portfolio Management** > **KPI Groups**. Select a KPI group to view, and then select the **KPI Group Mappings** tab.

b. Select **New**.

c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

KPI Group Mapping form

Field	Description
KPI Group	KPI group name to add the mapping.
Mapping	Mapping type associated with the KPI group. Depending on which KPI Group you select, one of the following displays as the Mapping field. ▪ Service portfolio ▪ Taxonomy node ▪ Service ▪ Offering ▪ Application service ▪ Business application ▪ Enterprise portfolio ▪ Enterprise taxonomy node

d. Select **Submit**.

Configure KPI groups in Digital Portfolio Management

Configure KPIs in Digital Portfolio Management with service availability example

Configure KPIs in Digital Portfolio Management with service availability example

Configure key performance indicators (KPIs) in Digital Portfolio Management (DPM) to surface performance information in the context of your solutions. This procedure uses the example of configuring service availability to display the availability score in the Run life-cycle phase.

Before you begin

- Plugins required: sn_team_perf_kpi_group and com.snc.service_portfolio
- Role required: sn_dpm.dpm_admin

About this task

As a user with the sn_dpm.dpm_admin role, you can configure KPIs to display in DPM. This task uses the Outage and Availability KPI group to show how to configure the service availability KPI.

Note:
You must have Service Portfolio Management premium subscription to perform this task. This premium subscription automatically installs if you have DPM installed.

For general information about KPI groups, see KPI groups in Digital Portfolio Management.

To create KPI groups, see Create KPI groups, mappings, and visualizations.

This procedure includes the following tasks:

1. Create the KPI group mapping.
2. Create the service commitment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Associate the service commitment to the service offering.
4. Create an outage for the service offering.
5. Run the data collection job and verify.
6. Ensure that the KPI displays in DPM.

Procedure

1. Create the KPI group mapping.
   The mapping you create sets up the service offering that you want to view availability.
   a. Navigate to **Digital Portfolio Management Workspace** > **KPI Group Mappings**.
   b. Select **New**.
   c. On the form, fill in the fields.

KPI Group Mapping form

Field	Description
KPI Group	KPI group name to add the mapping. For this example, map to the Outage and Availability KPI group. This mapping may already be done as part of the base DPM system.
▪ Service portfolio ▪ Taxonomy node ▪ Service ▪ Offering ▪ Application service	Mapping that you want to associate with this KPI group. The fields that are displayed depend on the type of KPI group that you selected. For this example, the mapping is **Offering**.

   d. Select **Submit**.
2. Create the service commitment.
   For this example, select a service portfolio that you want to configure the service availability KPI. You can select a personal portfolio or an enterprise portfolio.
   a. Navigate to **All** > **Service Portfolio Management** > **Commitments**.
   b. Select **New** to set up availability data.
   c. On the form, fill in the fields.

Commitment form

Field	Description
Name	Commitment name.
Type	Type of commitment. The **Availability** type sets up availability data.
Percentage available	Percentage that the commitment is available. For example, 90%.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Schedule	Duration that the commitment is available. For example, 24 x 7 sets the commitment for every day.
Time zone	Time zone for the commitment.
Description	Description of the commitment.

d. Select **Submit**.

3. Associate the service commitment to the service offering.

a. Navigate to **All** > **Service Portfolio Management** > **Service commitment**.

Note:
If the plugin is not installed, then enter the table name in the filter navigator: **service_offering_commitment.list**, and then press **Enter**.

b. Select **New**.

c. On the form, fill in the fields.

Service commitments form

Field	Description
Service offering	The service offering associated with the service commitment.
Service commitment	The service commitment associated to the service offering.

d. Select **Submit**.

4. Create an outage for the service offering.
Set the service availability for the past seven days prior to creating the outage record.

a. Navigate to **All** > **Service Portfolio Management** > **Outages**.

b. Select **New**.

c. On the form, fill in the fields.

Outage form

Field	Description
Number	System-generated number for the outage record.
Configuration Item	The service offering associated with the outage.
Begin	The start date of the outage.
End	The end date of the outage.

d. Select **Submit**.

Note:
The outage that you create for the service offering also generates a service availability record for the service offering.

5. Run the data collection job and verify.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The job collects data from all Performance Analytics indicators on the scheduled jobs list. This step also provides you with verification steps to ensure that the job ran successfully.

a. Navigate to **All** > **System Definition** > **Scheduled Jobs**.

b. In the Name column, search for **SPM Data Collection job for PA**.

c. Select **edit**.

d. Ensure that the **Relative start** is set to the number of days to collect data (default is **1**).

e. Select **Execute now**.

f. Refresh the screen to see your job log on the **Job Logs** tab. Review the created date and ensure that the **State** is **Collected**.

g. Open the **Indicators** tab and under the Name column, search for the **SPM Availability** indicator.

h. Select **SPM Availability**, and then select **edit**.

i. On the form, open the SPM Availability indicator record to verify that you created the job successfully.

j. Select the **Show Analytics Hub** related link to verify that the availability score is displayed for the offering. If several values are displayed, then search for the offering name to verify that you set the availability score properly for that offering.

6. Ensure that the KPI is displayed in DPM.

a. Navigate to **Workspace** > **Digital Portfolio Management**.

b. Find the service portfolio that has the availability KPI that you created.

- If you created the availability KPI for a personal portfolio, then open the personal portfolio card that has the availability KPI.
- If you created the availability KPI for an enterprise portfolio, then use the enterprise portfolio tree structure to find the service offering record.

c. On the **Run** tab, ensure that the Performance snapshot Availability card displays the correct percentage value.

Create KPI groups and mappings in Digital Portfolio Management

Copy a KPI group to create a new KPI group in Digital Portfolio Management

Create a new key performance indicator (KPI) group by copying an existing KPI group in Digital Portfolio Management (DPM). All the KPI records, supporting KPIs, and mappings of the KPI group are copied as well. After you copy the KPI group, you can modify all aspects of it so the new group best fits your needs.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

This procedure uses the KPI groups **Copy** button. To see the **Copy** button on the KPI groups page, you must have the Team Performance [sn_team_perf] plugin activated.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **KPI groups**.
2. Open the KPI group in the list that you want to copy.
3. Select **Copy**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can update the KPI group after you copy it, as specified in Step 5.

4. Return to the KPI group list to find the copied KPI group.
   The copied KPI group name is the same as the one that you copied with *Copy of* in the front of the name.
5. Open the copied KPI group.
   You can change the name, description, and order. You can also change the supporting KPIs and the KPI group mappings.
6. **Optional:** Delete a KPI group.
   When you delete a KPI group, you delete the KPIs, supporting KPIs, and mappings of the KPI group. There are a few ways that you can delete your copied KPI group (or any KPI group):
   - Select **Delete** while viewing the KPI group (it's next to **Copy**).
   - Select the box next to the KPI group name in the KPI group list, and then navigate to **Actions on selected rows** > **Delete**.

Update KPIs in Digital Portfolio Management

You can update the key performance indicator (KPI) fields in Digital Portfolio Management (DPM). The KPI data is shown in the DPM Workspace.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

This procedure accesses KPIs via the KPI group in DPM. To see a list of all KPI indicators without the context of its parent KPI group, enter `sn_team_perf_kpi_group_m2m_pa_indicators.list` in the Filter navigator, and then press **Enter**.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **KPI Groups**.
2. Open a KPI group to view its details.
3. On the KPIs related list (tab), select the item in the **Label** column to open it.

   Note:
   Be sure to select the item in the **Label** column and not in the **KPI** column.

4. On the form, update the fields.

KPI fields

Field	Description
KPI Group	Name of the KPI group.
KPI	Name of the Performance Analytics (PA) indicator. **Note:** The KPI field pulls information from the Indicator table [pa_indicators].
Label	The KPI label shown in the DPM Workspace.
Parent KPI	The Parent KPI for the KPI.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Display aggregate	The method for how KPIs are displayed in the DPM Workspace. The entry can be Average or Sum. **Note:** This field applies when the latest score property [sn_dpm.kpi_groups.show_latest_score] is set to false. For information, see Configure the Digital Portfolio Management experience.
Order	The order the KPI is displayed within the KPI group.
Description	The description of the KPI. In the DPM Workspace, selecting the tooltip on the KPI card reveals the description. You access the KPI cards in the following areas: ○ On the Run tab for services, service offerings, business applications, and application services. ○ On the Overview tab for portfolios and taxonomy nodes. For more information on the data shown in KPI charts and graphs, see KB1123710.
Chart type	The chart type for the KPI group. The options are: ○ **Single score** ○ **Time series: Line** ○ **Time series: Column** ○ **Time series: Area** ○ **Time series: Spline** ○ **Time series: Step line** ○ **Group By** **Note:** The **Group By** option enables you to select the results breakdown. For example, incidents by priority.
Time range	The time range for the KPI to display. ○ Last 7 days ○ Last 30 days ○ Last 90 days ○ Last 180 days
Active flag	The flag that determines if the KPI displays in the KPI group. KPI groups can display in several places in the DPM Workspace — The enterprise portfolio page, the Overview tab of portfolios and nodes, and the Run tab of services and offerings, business applications, and application services. The flag for all KPIs that come with the base system is set to active. As an admin, you can clear the flag so it's inactive.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ When checked, the flag is active and the KPI displays in the KPI group. ○ When cleared, the flag is inactive and the KPI doesn't display in the KPI group. **Important:** Two KPIs can use the same indicator. If both indicators are in a KPI group that is displayed, then both show the same indicator in the KPI groups. If one KPI is set to inactive, then that one is hidden from display, but the other one still displays.

5. Select **Update**.

KPI groups in Digital Portfolio Management

Configure Needs attention panels in Digital Portfolio Management

Each solution page in Digital Portfolio Management (DPM) has a Needs attention panel with items that need attention in the context of the page. You can configure the Needs attention attributes to meet your organization's needs.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

Configurable Needs attention panels and its attributes table were introduced in the Utah Store release, November 2023. The following are general guidelines but for more Admin configuration steps, see KB1519343.

Default thresholds apply to the DPM Workspace homepage. Solutions use the default attributes and thresholds from the attributes table until users decide to personalize their DPM Workspace homepage experience. See Personalize the Digital Portfolio Management Workspace homepage.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **Needs attention** > **Needs attention attributes**.
   The Needs attention attributes display in a table — Critical incidents, Outages, Changes, Alerts, Risks, Audits, and Critical problems.

   Note: To see Critical problems in the Needs attention panel, you must be using the DPM August 2024 release or a later release.

2. **Optional:** Use the Personalize List icon ( ) to add the following column fields to the table.
   - Name
   - Description
   - Solution type
   - Order

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Active
- Show on homepage
- Show on needs attention
- Threshold for moderate
- Threshold for severe

3. Update the field settings.

Column field	Setting
Order	○ The order of the attributes on the user's homepage solution cards. ○ The order of the attributes when the user personalizes the **Edit status conditions** on the homepage. **Note:** When editing the status conditions, the first four attributes of each type display. You can select the drop-down list to select different status conditions.
○ Active ○ Show on homepage ○ Show on needs attention	Set to true or false. If set to true, then the logged-in user can choose to show the attribute on their homepage solution cards and then personalize the thresholds for that attribute.
○ Threshold for moderate ○ Threshold for severe	Change the number from the default threshold to the threshold that you want to set for each attribute. **Note:** If a threshold is set to zero (0), then that attribute field is empty.

Work with Needs attention panels in Digital Portfolio Management

Configure the Digital Portfolio Management experience

If your organization doesn't use certain modules or life-cycle phases in Digital Portfolio Management (DPM), then configure the experience by hiding those elements from user views.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

Configure the user experience in the DPM Workspace. You can also configure it using the UI Builder application but there's so much you can do in DPM. As a DPM admin, you can:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Hide entire tabs, certain sections of a tab, and solutions types (for example, business applications) from user views. After a tab or solution type is hidden, that item is also hidden in searches and filters.
- Hide available item types — services, technical services, business services, application services, service offerings, and business applications.
- Enable system properties to show:
  - Standard Needs attention panels.

    Note:
    Standard Needs attention panels are set to true for new customers. Existing customers must enable the system property. For more information, see Work with Needs attention panels in Digital Portfolio Management.

  - Latest (or last) key performance indicator (KPI) scores. When enabled, KPIs no longer display as a sum or average across a date range. This feature is only available with the Utah release and later.
  - DevOps data. For more information, see DevOps value stream metrics in Digital Portfolio Management.

Note:
You can enable and disable these configurations at any time.

See configuring DPM user views in action.

https://player.vimeo.com/video/1022258649?h=1f96ee0b3c&badge=0&autopause=0&player_id=0&app_id=58479

Configuration options in DPM

Services and offerings	Business applications	Application services	KPI latest score	DevOps data
Hide the following tabs: • **Plan** • **Build** • **Run** Hide the following sections from the **Plan** tab: • Demands • Backlog • Roadmap Hide the following sections from the **Build** tab:	Hide the following tabs: • **Plan** • **Build** • **Run** • **Risk** Hide the following sections from the **Plan** tab: • Demands • Backlog • Roadmap Hide the following	Hide the **Run** tab.	Enable the **Latest score** option to show the latest or last KPI score. When enabled, KPIs aren't shown as a sum or an average across a date range.	Enable the **DevOps properties** option to show DevOps data such as flow metrics and accelerate metrics in DPM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configuration options in DPM (continued)

Services and offerings	Business applications	Application services	KPI latest score	DevOps data
• Roadmap • Projects • Changes • Improvement initiatives By default, DevOps data are hidden on the **Run** tab. Enable the DevOps system property for users to see DevOps accelerated metrics on the **Run** tab.	sections from the **Build** tab: • Roadmap • Projects • DevOps flow metrics • DevOps accelerated metrics By default, DevOps data are hidden on the **Build** tab. Enable the DevOps system property for users to see flow metrics and accelerated metrics on the **Build** tab.			

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **Administration**.
2. Select the menu item that you want to configure for users.
   - **Application service properties**
   - **Business application properties**
   - **Service and offering properties**
   - **DevOps properties**
   - **KPI groups properties** (option to set the Latest score system property)
   - **Available item types** (go to Step 6)
3. If applicable, follow the provided instructions to edit the selected record. For some properties, there's a link for you to select.
4. Follow the provided instructions to edit each configuration.
5. Select **Save**.
6. **Optional:** Hide or show available item types.
   - Navigate to **All** > **Digital Portfolio Management** > **Administration** > **Available item types**.
   - Set the item type to `false` (to hide) or to `true` (to show) in the **Active** column. When a solution type is hidden, that solution is omitted from the following areas:
     - The auto-generated solution card results.
     - The personalization options of add and remove items.

Relate business capabilities to view in Digital Portfolio Management

You can relate business capabilities for a service or for a business application to see them in the Digital Portfolio Management (DPM) Workspace.

Before you begin

Role required: sn_dpm.dpm_admin

About this task

There are two conditions to create a CI relationship in DPM.

1. The business capability must be created.
2. The business capability must be related to a service.

You can create a business capability by navigating to **All** > **CSDM** > **Design** > **Business Capability**. For information about configuration item (CI) relationships, see Create or edit a CI relationship.

Procedure

1. Confirm the business capability name and the solution name that you want to relate.
2. Create the CI relationship.
   a. Enter `cmdb_rel_ci.list` in the filter navigator, and then press **Enter**.
   b. Select **New**.
   c. On the form, fill in the fields.

Field	Description
Parent	The business capability that is to be related to the service or business application. Use the search icon ( ) to select the business capability.
Type	The type of CI relationship. Use the search icon ( ) to select **Provided By:: Provides**.
Child	The service or business application to be related to the business capability. Use the search icon ( ).

   d. **Submit**.
3. Confirm the CI relationship.
   You can confirm the CI relationship in one of two ways:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- On the business capability record, in the Related Items section.
- In the DPM Workspace, on the Info tab of a service or business application.

Configure Digital Portfolio Management to integrate with Process Mining

Use Process Mining in Digital Portfolio Management (DPM) to see the status of a key performance indicators (KPI) on your solutions, and adjust as needed.

Process Mining enables you to analyze and address KPI outputs for your solutions in DPM.

Administrators must complete a few steps to set up Process Mining.

Set up Process Mining in DPM

In general, to use Process Mining in DPM, you access the KPI group and select **Initiate Process Mining**. To see that option, administrators with the dpm_admin role must do the following.

1. Install the ITSM Process Mining Content Pack from the ServiceNow Store. The content pack provides the following project insights and system property for Process Mining in DPM:
   - Team performance
   - Process Mining
   - System property *sn_dpm.enable.po.dpm*
2. Set the system property *sn_dpm.enable.po.dpm* to true. By default, the system property is set to false. Admins [sn_dpm.dpm_admin] must set the system property to true.
   a. Navigate to **All** > **Digital Portfolio Management** > **Administration** > **Settings**.
   b. Enter ***enable** in the **System Properties Name** search field, and then press **Enter**.
   c. Verify that the system property *sn_dpm.enable.po.dpm* is set to true. If not, then select it, and set the Value field to true (you may get a text banner that provides a link to edit the record).
   d. Select **Update**.

The primary role to use Process Mining is Process Mining Analyst [process_optimization_analyst]. For details about properties, roles, and scheduled jobs, see Process Mining components for Digital Portfolio Management.

Create Process Mining projects for KPI groups in Digital Portfolio Management

Create Process Mining projects for each key performance indicator (KPI) group in Digital Portfolio Management (DPM) to see KPI performance and analyze anomalies.

Before you begin

- Role required: sn_process_optimization_analyst
- Enable Process Mining

About this task

Use Process Mining to analyze and improve KPI performance in DPM.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The KPI assignment group manager must have the required role to create Process Mining projects for their KPI groups: Process Mining analyst [sn_process_optimization_analyst].

For information about properties, roles, and scheduled jobs, see Process Mining components for Digital Portfolio Management.

Several project templates come with the base DPM system:

- Incident
- Problems
- Changes
- Requests

If you want different templates, then your administrator must create them on the tables that correspond to what you want to see insights for. For information on creating templates, see Create Process Mining templates.

A scheduled job runs to remine the projects when additional data is added so that you get the most updated insights for your projects.

Procedure

1. Mine the project to create Process Mining projects for each KPI group.

   a. Navigate to **All** > **Digital Portfolio Management** > **KPI Groups**.

   b. Open a KPI group that you want to mine for.

   c. Select **Initiate Process Mining**.

      After you select **Initiate Process Mining**, a project is created in the background for each KPI table in the KPI group. If you're using a formula indicator for Process Mining, you can select any indicator source that is used in the formula.

      Note:
      The system property *sn_dpm.enable.po.dpm* must be enabled. For more information, see Configure Digital Portfolio Management to integrate with Process Mining.

2. **Optional:** Open the project and check the mining.
   If you don't want users to filter on retired projects, then make sure the project definition status is set to Retired.

   a. To find the project, navigate to **All** > **Digital Portfolio Management** > **DPM Projects**.

   b. Check the mining state by opening the project and selecting **Generate model (Full)**.

3. **Optional:** Remine the KPI group again if you added additional assignment groups to the KPI group after you did the process mining.

   a. In the Assignment Group related list for the selected KPI group, select **Edit**.

   b. Add the desired assignment group to the KPI group.
   A process is automatically created for the assignment group. If you add an assignment group to the KPI group, then the assignment group is updated in the filter condition. If you remove any assignment group, then it's removed from the project filter condition. An informational message is displayed when an assignment group is added to the KPI group only if the KPI group is already mined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. See the Process Mining insights and variations for selected KPI records.

   a. Open the DPM Workspace.

   b. Select the enterprise portfolios icon (, and then open an enterprise portfolio.

   c. Select **View Details**.

   d. Select an incident KPI single score.
   On the KPI drill down page, select the **Process analysis** tab to see the insights and variations for the selected KPI records. By default, the data shown is from the last 30 days.

Process Mining components for Digital Portfolio Management

Getting started with Digital Portfolio Management

The Digital Portfolio Management (DPM) Workspace is a unified environment to view all your services, service offerings, business applications, and application services. With the proper access, you can also view details and edit the solutions without having to leave the DPM experience.

Getting started with the DPM Workspace

https://player.vimeo.com/video/974352474?badge=0&autopause=0&player_id=0&app_id=58479

This video provides getting started steps to use the DPM Workspace.

Perform tasks and customize views

The DPM Workspace provides basic roles to create personal portfolios. To see portfolio details, you must install the proper plugins and roles from the products that you want to view.

For example, viewing and editing roadmaps comes from the Strategic Planning application. If you want to see roadmaps in the context of your service or service offering while in the DPM experience, then you must install the plugins and roles for Strategic Planning.

Also, DPM enables administrators to customize user views by hiding certain tabs and tab sections (even roadmaps as mentioned in the previous example). For more information, see Configure the Digital Portfolio Management experience.

To learn about the plugins and roles required to view data from other ServiceNow applications in the DPM experience, see Digital Portfolio Management related applications and data sources.

Note:
In the DPM experience, the data you pull in from other applications is limited to the license that you have from the other applications. For example, if you have a standard license for Strategic Planning, then you see standard Strategic Planning data in DPM. Likewise, if you have a pro license for Strategic Planning, then you see pro Strategic Planning data in the DPM experience.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The DPM base roles and plugins enable some actions like create demand and improvement initiatives. To make more substantial actions or edits, you must have the proper access control list (ACL) permissions from the applications that you want to work with in DPM.

Personalize the Digital Portfolio Management Workspace homepage

Personalize your Digital Portfolio Management (DPM) Workspace homepage to meet your needs. You can edit the status conditions of each solution, add solutions, search for solutions, and filter solutions by status and by type.

Before you begin

Role required: sn_dpm.dpm_manager

About this task

You can personalize your homepage ( ) to set the attributes and thresholds that you want to track on your solutions. After you personalize your status conditions, the system will no longer use the default attributes and thresholds that come with the base DPM system. Instead, your personalizations are saved in your user preference record (*dpm_home_page_item_list*) to provide you with the homepage view that you want to see.

You can also customize your personal view by using the search and filter options on the homepage.

Procedure

1. Navigate to the **Digital Portfolio Management Workspace**.
2. Personalize the homepage.
   - Select **Personalize**.
   - Select the option to personalize your solution cards.
     - Select **Edit status conditions** to set your own thresholds for Needs attention attributes on business applications, services/offerings, and application services on your homepage. For default values, see Digital Portfolio Management Workspace homepage.
     - Select **Add items** to add business applications, services/offerings, and application services to your homepage.
     - Select **Remove items** to remove business applications, services/offerings, and application services from your homepage.

       Tip:
       If there aren't any items in your homepage when you login, then select **Add items** to add solutions to your homepage. For the limit on the number of solution cards you can have on your homepage, see Digital Portfolio Management homepage default solution cards.
3. Search for a solution on the homepage.
   In the **Search** field, enter any part of the solution name that you want to find. For example, to find all solutions pertaining to knowledge bases, enter `knowledge` in the **Search** field. Your search term must contain part of a solution name. You can't search for a solution owner's name.
4. Filter the solution list on the homepage.

   Select **Filter** to filter all the solutions by status or by type. The status options are severe, moderate, and good. For information on the status meanings, see Digital Portfolio Management Workspace homepage (Needs attention default thresholds section).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The type options to filter are:

- Services
- Technical services
- Technical service offerings
- Business services
- Business service offerings
- Business applications
- Application services

Create custom record views

Create a UX custom form view to show any record for a given table in Digital Portfolio Management (DPM).

Before you begin

Role required: sn_dpm.dpm_admin

About this task

Create a UX custom form view to determine the view to show for a given table in DPM.

Note:
Clear the cache to see the change results of this procedure.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Configuration Settings** > **UX Form View Rules**.
2. Select **New**.
3. On the form, fill in the fields.

View rule form

Field Set	Description
Name	Unique name of the custom form view.
Table	Table name associated with the custom form view. **Tip:** Enter a key word like service or offering.
View	The custom UI view. You can select default or workspace, or new.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field Set	Description
Application	The application for the view rule. This field should default to the application that you're in.
Execution Order	The order in which your view displays.

4. Select **Submit**.

Navigate portfolio types in Digital Portfolio Management

Navigate three types of enterprise portfolios in the Digital Portfolio Management (DPM) application — service, business applications, and application service. Even though you can view service enterprise portfolios in DPM, they're created using Service Portfolio Management tables. Enterprise portfolios for business applications and application services are created from enterprise portfolio tables.

Enterprise portfolios are structured in a nesting content tree format so you can easily navigate each type of enterprise portfolio. Access Enterprise portfolios using the Enterprise portfolio icon ( ). For more information about accessing enterprise portfolios, see Navigate enterprise portfolios in Digital Portfolio Management.

Each type of enterprise portfolio offers unique data pertinent to its type. See the DPM Academy Learning Resources, especially the video series, for more information about the difference between each portfolio, how they should be used, and who they are for.

Service portfolios

Service enterprise portfolios are created from Service Portfolio Management tables. The DPM Workspace displays service portfolios in a nested content tree with the taxonomy node, and then the services that are in the service portfolio.

Portfolio structure for services

Section	Description

Taxonomy node	• The first level in the content tree under the service enterprise portfolio.
	• The following information is provided for the taxonomy node:
	  ○ Header with a short description, owned by name, and total subscribers.
	  ○ Performance snapshot metrics for availability, open incidents, incidents not updated for 5 days, and new requests.
	  ○ Needs attention cards for critical incidents, outages, and changes.
	• The **View details** link provides the following information about the taxonomy node.
	  ○ Header with the service portfolio name, manager name, and total subscribers.
	  ○ **Overview** tab with performance snapshot metrics and the breakdown of services in the category.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Portfolio structure for services (continued)

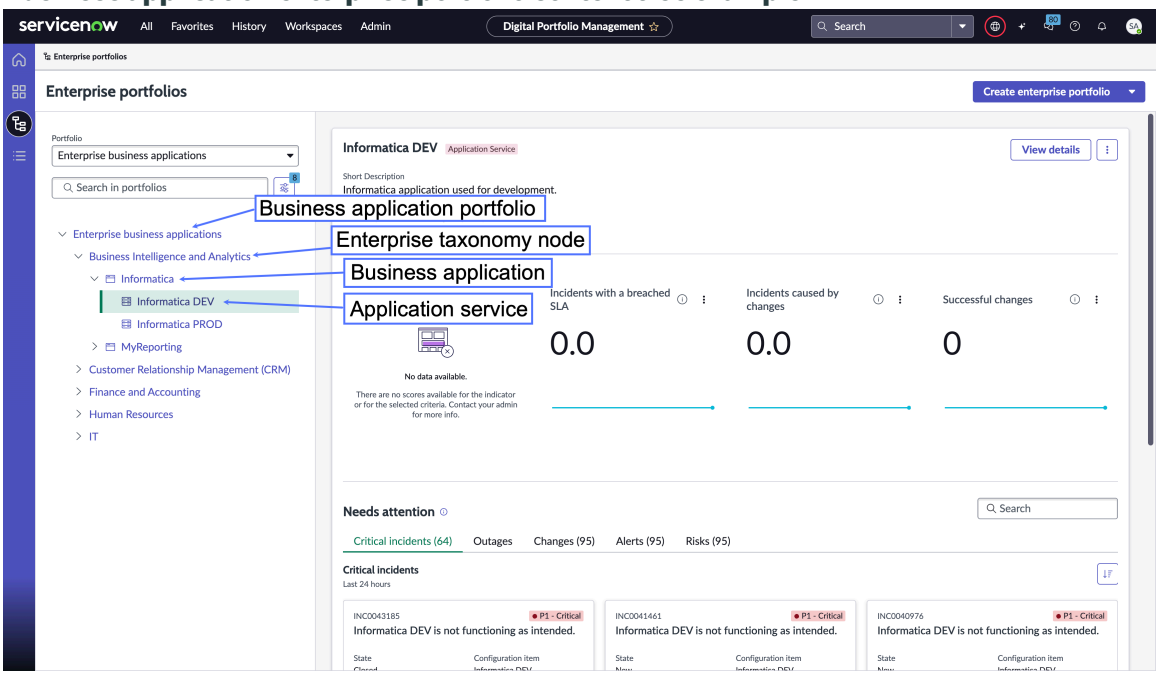
Section	Description
	Note: DPM versions prior to 2.2.15 may have duplicate services showing in the Service breakdown section. For information, see KB1123710. ○ **Taxonomy node** tab with all the taxonomy nodes related to the portfolio. ○ **Services** tab that lists all services in the portfolio, with their parent, classification (business or technical), phase, status, criticality, and owned by name. You can also select **Create business service** or **Create technical service** to perform those tasks in Service Builder. ○ **Info** tab with a description and general information about the taxonomy node. ○ **Needs attention** panel that lists critical incidents, outages, and changes.
Service and service offering	• The next two levels in the content tree under the taxonomy node. Services and service offerings can be either technical or business. • The header: ○ Short description. ○ Owned by name. ○ Delivery manager name. ○ Total subscribers. ○ Phase (if using CSDM fields, then life-cycle Stage) ○ Status (if using CSDM fields, then life-cycle Status) **Note:** For information about CSDM life-cycle field names, see Apply the CSDM guidelines to Digital Portfolio Management. • The performance snapshot metrics for availability, open incidents, incidents not updated for 5 days, and new requests. • The Needs attention cards for critical incidents,outages, and changes. • The **More menu** icon ( ) enables you to: ○ Add the service or service offering to a personal portfolio. For more information, see Create a personal portfolio in Digital Portfolio Management. ○ Add the service to your DPM homepage. For more information, see Digital Portfolio Management Workspace homepage. ○ Edit the service or service offering in Service Builder. For more information, see Create a service in Service Builder. • The **View details** link launches the service or service offering details. For more information, see the Service and service offerings section in Digital Portfolio Management related applications and data sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business application portfolios

Business application enterprise portfolios are created using the enterprise portfolio tables. The DPM Workspace displays enterprise portfolios in a nested content tree starting with the enterprise taxonomy node at the top level (there could be more than one). After the top node, it lists the business applications that are in the enterprise portfolio. Here's an example of a business application enterprise portfolio content tree.

Business application enterprise portfolio content tree example



Important:
The image shows the **Portfolio** field as Enterprise business applications. To select a different type of enterprise portfolio from the one you're in, delete the value in the **Portfolio** field, and then select the field (again) to see the other portfolio types (service, business, or application service).

Portfolio structure for business application

Section	Description

Enterprise taxonomy node	• The first level in the content tree under the business application enterprise portfolio. Could contain a second or third level if it has child enterprise taxonomy nodes.
	• The header:
	  ○ Short description.
	  ○ Owned by name.
	  ○ Managed by name.
	  ○ Total subscribers
	• The portfolio success metrics for availability, incidents with a breached service level agreement (SLA), incidents caused by changes, and successful changes.
	• Needs attention cards for critical incidents, outages, changes,alerts, risks, and audits.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Portfolio structure for business application (continued)

Section	Description

	• The **View details** link provides the following information about the enterprise taxonomy node.
	  ○ Header with the Owned by name and the Managed by name.
	  ○ **Overview** tab with portfolio success metrics and the breakdown of business applications in the enterprise taxonomy node.
	  ○ **Taxonomy nodes** tab that lists all the related taxonomy nodes.
	  ○ **Business applications** tab with a list of the business applications that are in the enterprise taxonomy node.
	  ○ **Info** tab with a description and general information about the enterprise taxonomy node.
	  ○ **Needs attention** panel that lists critical incidents, outages, changes, alerts, risks, and audits, for the enterprise taxonomy node.

Business application	• The next level in the content tree under the enterprise taxonomy node.
	• The header:
	  ○ Short description.
	  ○ Application owner name.
	  ○ Business owner name.
	  ○ Total subscribers.
	  ○ Status.
	  The Overall risk is empty.
	• The portfolio success metrics for availability, incidents with a breached SLA, incidents caused by changes, and successful changes.
	• The Needs attention cards for critical incidents, changes, risks, and audits.
	• The **More menu** icon (⋮) enables you to add the business application to a personal portfolio. For more information, see Create a personal portfolio in Digital Portfolio Management.
	• The **View details** link launches the business application details. For more information, see the Business applications section in Digital Portfolio Management related applications and data sources.

Application service portfolios

Application service enterprise portfolios are created using the enterprise portfolio tables. The information in application service portfolios is similar to that of business application portfolios with some differences that pertain to application services.

For information about KPI groups in application service portfolios, see View application service details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Portfolio structure for application service

Section	Description

Enterprise taxonomy node	• The first level in the content tree under the application service enterprise portfolio. Could contain a second or third level if it has child enterprise taxonomy nodes.
	• The header:
	  ○ Short description.
	  ○ Owned by name.
	  ○ Managed by name.
	  ○ Total subscribers.
	• The portfolio success metrics for availability, mean days to resolve (MTTR), incidents caused by changes, and successful changes.
	• The Needs attention cards for critical incidents, outages, changes, alerts, risks, and audits.
	• The **View details** link provides the following information about the enterprise taxonomy node.
	  ○ Header with the Owned by name and the Managed by name.
	  ○ **Overview** tab with portfolio success metrics and the breakdown of application services in the enterprise taxonomy node.
	  ○ **Application services** tab with a list of the application services that are in the enterprise taxonomy node.
	  ○ **Info** tab with a description and general information about the enterprise taxonomy node.
	  ○ **Needs attention** panel that lists critical incidents, outages, changes, alerts, risks, and audits for the enterprise taxonomy node.

Application service	• The next level in the content tree under the enterprise taxonomy node.
	• The header:
	  ○ Short description.
	  ○ Owned by name.
	  ○ Managed by name.
	  ○ Operational status.
	  The Overall risk is empty.
	• The portfolio success metrics for availability, incidents with a breached SLA, incidents caused by changes, and successful changes.
	• The Needs attention cards for critical incidents, changes, outages, risks, and alerts.

Enterprise portfolios

Navigate enterprise portfolios in Digital Portfolio Management

Work with portfolios in Digital Portfolio Management

You can create and organize personal portfolios to see several solutions in one place. Administrators create enterprise portfolios. The service-type enterprise portfolios are created using Service Portfolio Management tables. Business application and application service portfolios are created using enterprise portfolio tables. You can also see list modules of services and applications that aren't in a portfolio by using list modules.

Personal portfolios

Personal portfolios contain data from services, offerings, business applications, and application services into one space for you to view and report on. You can see how each item is progressing according to the assigned roadmap and evaluate its performance based on key performance indicators (KPIs) that interest you.

Personal portfolios overview

With a DPM manager role [sn_dpm.dpm_manager], you can see the personal portfolios that you created and those portfolios that are shared with you. When you create a personal portfolio, you pull in solution data from service and business applications, services, and service offerings into one space for you to view. You don't have to own any of the items that you pull in to create a personal portfolio. You can view how each item is progressing according to the assigned roadmap and evaluate its performance based on key performance indicators (KPIs) that interest you. You can also view a relationship map, as well as summaries, and current issues.

You can share a personal portfolio that you created with individuals or with a group. To share with a group, the group must have the DPM [dpm_manager] role. To assign the DPM manager role to groups, see Roles for Digital Portfolio Management.

You may be interested in services that your solutions depend on, for example, an outage or a delay in a service. Personal portfolios surface the information so that you don't have to check on the service status in its respective ServiceNow application.

Filtering personal portfolios

When you open a personal portfolio, a list of solution cards display with items that are in the portfolio. The displayed cards depend on what is in the personal portfolio. If there are too many items to view, you can select **All items** to filter the cards to display.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following list provides all the possible solution types that you can filter on by selecting **All items**. If you don't have one or more of these solution types in your personal portfolio, then that solution type won't show up in the filter list.

- All services
- All offerings
- Technical services
- Technical service offerings
- Business services
- Business services offerings
- Application services

Editing personal portfolios

To edit a solution that you open from the personal portfolio, you must have edit access based on the access control list (ACL) for each solution that makes up the portfolio. For example, if you're assigned a service editor role and you own a specific service and offering, then you can edit those specific records that you open from the personal portfolio. But if you don’t have those access rights, then you can only view the services and offerings in the personal portfolio and see KPIs.

Tip:
With a DPM admin role [sn_dpm.dpm_admin], you can hide certain tabs and tab sections of solutions in a personal portfolio. For more information, see Configure the Digital Portfolio Management experience.

Configuring personal portfolio solution cards

You can determine the information on each personal portfolio solution card through configuration. To configure the solution cards, you must have the DPM admin role [sn_dpm.dpm_admin]. For more information, see Configure personal portfolio solution cards in the DPM Admin Center.

Create a personal portfolio in Digital Portfolio Management

Create a personal portfolio using the Digital Portfolio Management (DPM) application. DPM enables you to create, edit, and share personalized, unstructured portfolios of the services and applications that you own or don't own but care about.

Before you begin
Role required: sn_dpm.dpm_manager

About this task
DPM supports services, service offerings, business applications, and application services so you can populate your personal portfolios with any of these items. Each item type is tagged and color-coded as you drill into your personal portfolio.

- View personal portfolios that you created and those portfolios that are shared with you.
- Assign editors and viewers for the personal portfolios that you created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Edit your personal portfolio anytime when you want to add or remove solutions (business services, technical services, offerings, business applications, and application services).
- See all items that need attention, view their details to learn more, and take action if you have proper permissions according to the item's access control list (ACL).

As you navigate the DPM landscape, you may find services, offerings, business applications, and application services that interest you. You can add those solutions to your personal portfolio immediately, without having to return to the personal portfolio menu. You can also share your personal portfolio with individuals and with groups.

Note:
The information on each personal portfolio solution card can be altered by configuration. To configure the solution cards, you must have the DPM admin role [sn_dpm.dpm_admin]. For more information, see Configure personal portfolio solution cards in the DPM Admin Center.

Procedure

1. Navigate to **Workspaces** > **Digital Portfolio Management**.
2. Select the personal portfolios icon ( ).
3. Select **Create personal portfolio**.
4. On the form, fill in the fields.

New personal portfolio form

Field	Description
Name	The name for the personal portfolio.
Owned by	The owner name of the personal portfolio.
Description	A clear description that makes sense to others that share this portfolio.
Add collaborators	○ Editors are users or groups that you select to edit the personal portfolio. ○ Viewers are users or groups that you select to view the personal portfolio.

Note:
You can only edit each item within a personal portfolio if you have edit access based on the ACL for each item that makes up the portfolio. For groups to edit or view personal portfolios, the group must have the DPM manager [dpm_manager] role. See Roles for Digital Portfolio Management.

5. Select **Next**.
6. Add business applications, services, service offerings, and application services to your personal portfolio.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select each tabbed item to find the solution that you want to add to your personal portfolio, or **Search** to find items. You can search for a solution title or an owner name to find all items owned by that name.
- Select the items that you want to add, and then select **Add selected items** to add them to your personal portfolio.

Note:
Review each tab. Your search term may show results in one or more of the three tabs: **Business applications**, **Services/Offerings**, or **Application services**.

7. Select **Review portfolio (total)**.
   The Portfolio details provide two cards. One with a summary that contains the personal portfolio name, description, and owner name and one with the list of collaborators.
8. Review the items in your personal portfolio and then select **Create**.
   To add more items, select **Back**.

Note:
If you select **Back**, review each tab to confirm your selections.

9. **Optional: Edit** or **Share** your personal portfolio.
   When you edit a personal portfolio, only those solutions that aren't already in the personal portfolio are in the selection list to add. **Share** gives you the option to share your personal portfolio with individuals, with groups, or with a combination of both.

Personal and enterprise portfolio reference

Enterprise portfolios

Admins create enterprise portfolios for business applications and application services using the enterprise portfolio tables. You can view enterprise portfolios for services as they're created with the Service Portfolio Management tables. Enterprise portfolios are structured in a nesting tree format to navigate service-related items and taxonomy nodes.

https://player.vimeo.com/video/1022205557?h=0df9f9affe&badge=0&autopause=0&player_id=0&app_id=58479

Enterprise Portfolios enable you to roll up key metrics through each level of the portfolio taxonomy. You can see the overall performance at the node and portfolio levels. Breakdowns of key metrics enable you to see which areas of the portfolio are contributing to good or poor performance.

Similar to personal portfolios, you can see performance snapshot information in enterprise portfolios. You don't have to own any solutions to view enterprise portfolios.

Admins create enterprise portfolios. For more information, see Create enterprise portfolios in Digital Portfolio Management.

Types of enterprise portfolios

You can create, view, and search across three different types of enterprise portfolios in DPM:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Service portfolios (view only)
- Business application portfolios
- Application service portfolios

Each enterprise portfolio type is clearly marked when you search for an enterprise portfolio. For information about for each type, see Navigate portfolio types in Digital Portfolio Management.

Note:
Even though service portfolios are visible in DPM, they're still created using Service Portfolio Management tables. Use the enterprise portfolio tables to create business application portfolios and application service portfolios.

Life-cycle stages

You can filter an enterprise portfolio by life-cycle stage. Service portfolios and business application portfolios include the following life-cycle stages:

- Pre-operational — The solution doesn't yet have operational data.
- Operational — The solution has operational data.
- Retired — The solution is no longer operational and isn't tracking new data, so data isn't up to date.

The life-cycle stages for Application service portfolios are Operational or Retired.

Needs attention details

When viewing an enterprise portfolio, you can see the Needs attention details broken out by tabs at the bottom of the portfolio view. For example, in a business application portfolio, the Needs attention tabs include critical incidents, problems, outages, alerts, and tech risks.

Admins can show or hide business applications in a portfolio based on its life-cycle stage. For more information, see Configure the Digital Portfolio Management experience.

Navigate enterprise portfolios in Digital Portfolio Management

Create enterprise portfolios in Digital Portfolio Management

Navigate enterprise portfolios in Digital Portfolio Management

You can work with three types of enterprise portfolios in the Digital Portfolio Management (DPM) Workspace — service, business application, and application service. Even though you can view service enterprise portfolios in DPM, they're created with Service Portfolio Management tables. Enterprise portfolios for business applications and application services are created with the enterprise portfolio tables.

Before you begin

Role required: sn_dpm.dpm_manager

About this task

Using enterprise portfolios, you can view traditional service portfolios created from the Service Portfolio Management tables. You can also view portfolios for business applications and application services that are created with enterprise portfolio tables. The search function in the Digital Portfolio Management experience enables you to search across all enterprise portfolios to find the one you seek. You can view a performance snapshot of key performance indicators (KPIs) like availability, new incidents, subscribers, and customer satisfaction scores.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also see items that need attention and select parts of the portfolio to see more details.

Procedure

1. Navigate to **Workspaces** > **Digital Portfolio Management**.
2. Select the enterprise portfolios icon ( ).
3. Select the **Portfolio** search field.
   Different types of portfolios are displayed in groupings — Service portfolios, Business application portfolios, and Application service portfolios.
4. Select a portfolio from one of the groupings.
   After you select a portfolio, a list of Enterprise taxonomy nodes are nested in a tree structure, at the top level.
5. Select an Enterprise taxonomy node that interests you, and then select **View Details**.
   The details of the Enterprise taxonomy node include several tabs — Generally an overview, a tab (or two) for the type of portfolio you selected, and a general information tab. To learn more about enterprise portfolio screens, see Navigate portfolio types in Digital Portfolio Management.
6. Follow the breadcrumb path to return to the tree structure of the enterprise portfolio.
7. Expand the Enterprise taxonomy node to see its child nodes, and then its solutions (services, business applications, or application services).
   Selecting each item in the tree structure displays high-level information of that item. All child nodes and solutions have their own **View details** option. To learn more about enterprise portfolio screens, see Navigate portfolio types in Digital Portfolio Management.
8. View information about a different type of enterprise portfolio.

> **Important:**
> To select a different type of enterprise portfolio from the one you're in, you must delete the value in the **Portfolio** field. When the **Portfolio** field is empty, then select it (again) to see the other portfolio types. For example, if you're navigating a service portfolio and want to see to a business portfolio, you must delete the name of the service portfolio in the **Portfolio** field. After you delete it, select the **Portfolio** field (again) to see the other enterprise portfolio options (service, business, or application service).

Create enterprise portfolios in Digital Portfolio Management

Admins create enterprise portfolios for business applications and application services. Enterprise portfolios are structured in a nesting tree format to navigate service-related items and taxonomy nodes. Similar to personal portfolios, you can see metrics to assess the portfolio performance.

Before you begin

- Plugin required: enterprise portfolios
- Role required: sn_dpm.dpm_admin

About this task

Create enterprise portfolios to monitor business applications and application services. Enterprise Portfolios enable you to roll up key metrics through each level of the portfolio

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

taxonomy. You can see the overall performance at the node and portfolio levels. A breakdown of key metrics enables you to see which areas of the portfolio are contributing to good or to poor performance.

For overview information, see Enterprise portfolios. For more detailed information, see Navigate portfolio types in Digital Portfolio Management.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **DPM Enterprise Portfolios** > **Create new**.
2. On the form, fill in the fields.

Create Enterprise Portfolio form

Field	Description
Name	Portfolio name in the **Enterprise portfolios** tab of the DPM Workspace.
Short description	Short description of the portfolio in the header area of the DPM Workspace.
Description	Description of the portfolio in the service header in the DPM Workspace.
Portfolio type	The type of enterprise portfolio. ○ Business Application Portfolio ○ Application Service Portfolio
Portfolio owner	Name that is responsible for the portfolio.
Portfolio manager	Name that manages the portfolio.
Portfolio Stakeholders	Individuals or groups that have an interest in the enterprise portfolio.

3. **Submit** the enterprise portfolio.

   After you submit, access the portfolio by navigating to **All** > **Digital Portfolio Management** > **DPM Enterprise Portfolios**, and then selecting the type (Business Application or Application Service).

Navigate enterprise portfolios in Digital Portfolio Management

Work with solution data in Digital Portfolio Management

After you create and organize personal portfolios and review the available enterprise portfolios, you can do several actions with the DPM manager role to monitor the progress of solutions.

Work with Needs attention panels in Digital Portfolio Management

Digital Portfolio Management (DPM) enables you to view items that need attention in the context of your solutions. Categories in each Needs attention panel differ based on the solution type. You may not act on an item that needs attention, but you can see its status and severity to make data-driven decisions about your solutions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Each DPM Workspace page has a Needs attention panel that presents items that need attention in the context of the page. You can search items that need attention on the DPM home page but it's more useful to search while viewing a portfolio or a solution.

Important:
This topic applies to Standard Needs attention panels.

Standard Needs attention panels were introduced in the Utah release (May 2023). The Standard version is more flexible than its legacy counterpart. The Standard system property is set to true by default. Existing customers can set it to false to return to the former Needs attention functionality. There isn't a limit to changing the value from true to false (and back). New customers can't set the system property to false, so they'll only see the Standard version.

Standard Needs attention panels system property

Admins update the system property with the DPM admin [sn_dpm.dpm_admin] role.

- Navigate to **All** > **Digital Portfolio Management** > **Administration** > **Settings**.
- Enter `*needs` in the **System Properties Name** search field, and then press **Enter**.
- Select the system property [sn_dpm.standard_needs_attention].
- Release the record to edit it, and then set the property to false or true.
- Select **Update**.

Problems option in the Needs attention panel

To see problems in the Needs attention panel, you must be using the DPM August 2024 release or a later release.

You can identify problems on the following solutions.

- Services and service offerings. Problems are related to the service offering via the service offering record on the form, impacted services related list, and on the affected CIs related list. Problems are then rolled up to the parent service and should be deduplicated at the parent service level.
- Business applications. Problems are related to the application service via the configuration item field on the form. Problems are then rolled up from the application service to the business application and should be deduplicated at the parent service level.
- Application services. Problems are related to the application service via the configuration item field on the form.

Application service considerations

Prior to the November 2024 Store release, you could see the records of incidents, problems, and changes in the Needs attention panel only if the application service is added to the Configuration item field of a related item (for example, to an incident record).

As of the November 2024 Store release, items or records are reflected in the Needs attention panel when an incident, problem, or change includes the application service in the Impacted services or the Affected CIs related list, in addition to the Configuration item field.

After the application services are added to the Configuration item field, Impacted services, or the Affected CIs related list, you can see them under the Needs attention section in the base level (application service). The data also rolls up to the following levels in the DPM Workspace:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Business application
- Taxonomy node
- Portfolio

Also, after the application services are added, the data is rolled up in the following areas when you:

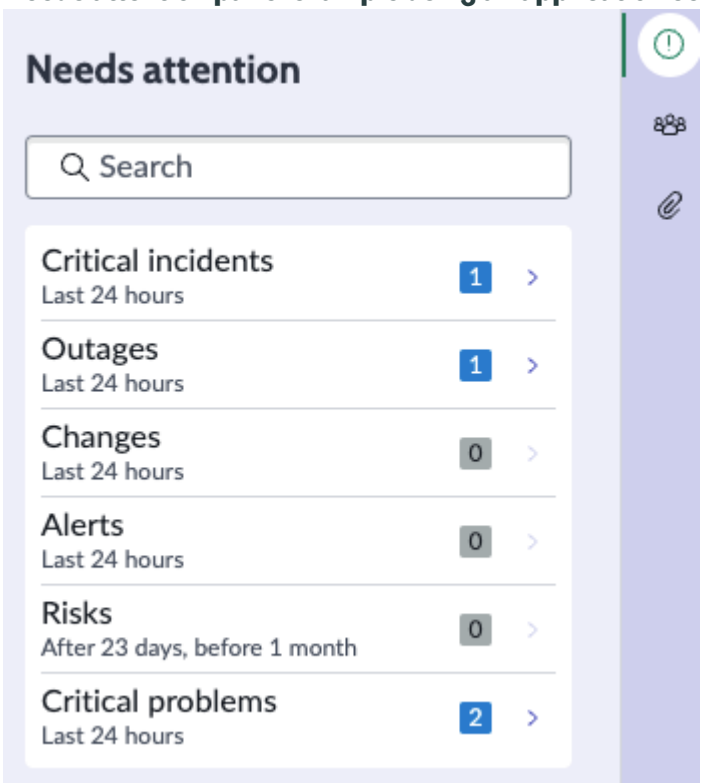
- Select **View details** on any affected solution page.
- View the Run tab of any solution page to view the KPI indicators.

This functionality applies to enterprise business application portfolios, enterprise application service portfolios, and to any business application or application service added to your personal portfolios.

Panel attributes and icons

Even though the Needs attention panel categories differ for each portfolio and solution, the basic navigation is the same. All panels enable you to search, see a list of Needs attention cards, paginate through the cards, and drill down to a record from the card list.

Needs attention panel example using an application service



- Each Needs attention category includes a number that indicates the number of items in that category. If there are no Needs attention items in a category, then the number is zero (0).
- Select the forward arrow (>) next to a number in the category to see a list of record cards that need attention. From the card list, you can select a card to access its record. You can also go back by selecting the Needs attention back arrow (<).
- The Needs attention **Search** field enables you to enter a number, a part of a word, or a whole word to find Needs attention items that contain your search criteria. After you view and open a record that needs attention, you can return to the **Search** field. Your search criteria remain in the **Search** field until you clear the field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following table shows the Needs attention panel icons that display for each solution type.

Needs attention panel icons per solution type

Solution type	Needs attention panel icons
Services and service offerings	○ Needs attention icon ( ) to show or hide the Needs attention panels. This toggle isn't on the DPM Workspace home page. ○ Contacts icon ( ) to view team members and the all the teams that support the service offering. ○ Knowledge articles icon( ) to search for related knowledge articles. ○ Attachments icon ( ) to view and add attachments to the record. ○ Catalog items icon ( ) to search for catalog items on a service or service offering record.
Business applications and application services	○ Needs attention icon ( ) to show or hide the Needs attention panels. This toggle isn't on the DPM Workspace home page. ○ Contacts icon ( ) to view team members and all the teams that support the business application or the application service. ○ Attachments icon ( ) to view and add attachments to the record.

Service considerations

- A record is linked to the offering and rolled up to the service. You can see incidents, outages, and changes when the incident is linked directly to the service (not to the offering).
- An incident, outage, or change can impact multiple offerings.
- A record is first displayed on the offering, and then it's rolled up to the parent service.
- An incident displays once (not twice) if two offerings are added to an incident and they roll up to the same service.

Service offering considerations

Critical incidents, outages, and changes are linked to the offering to display in the Needs attention panel when the offering is:

- Listed in the service offering field on the incident record or the change record.
- Included in the affected services or the affected CI related lists, or both.
- Rolled up to the parent service level when an incident or change is related to an offering (via a related list or directly on the form).

Note:
By default, you see critical incidents. To see critical and major incidents, the Major Incident Management plugin [com.snc.incident.mim] must be installed.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Panel options per DPM solution

Records included on each DPM solution page are the ones created "today."

Needs attention panels for each DPM solution page

Services and service offerings	Application services	Business applications
• Critical and major incidents • Outages • Changes For new and zBoot customers, all the above plus Audit and Risks.	• Critical and major incidents • Outages • Changes • Alerts • Risks For new and zBoot customers, all the above plus Audits.	• Critical and major incidents • Changes • Risks • Audits

Note:

To see Risk data, you must have the Technology Portfolio Management plugin installed [sn_apm_tpm]. This plugin has two dependency plugins:

- Application Portfolio Management [com.snc.apn]
- Software Asset Management [com.snc.sams]

Configure Needs attention panels in Digital Portfolio Management

View relationship maps in Digital Portfolio Management

View a relationship map in Digital Portfolio Management (DPM) to see all relationships that make up a given solution. DPM uses the ServiceNow Unified Map to display a graphical hierarchical map based on the CMDB.

Access a relationship map

While in a DPM solution (business application, application service, service, or service offering), select **View relationships**.

The Unified Map displays with the selected solution at the top, indicating it's the highest level in the map. Branched from the highest level are other relationships that make up the highest level solution.

Navigate a relationship map

For details on the Unified Map panels and navigation, see Unified Map.

On the map page, use the panels for more information about the mapped solutions.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select to view a summary of the selected solution.
- Select to view contact information for team members and teams that are associated with the selected solution.
- Select to view all current issues in the context of the selected solution, for example, critical incidents, current outages, or critical alerts.

Note:
The options change for the current issues depending on the solution type.

- Select to see the application services associated with the selected solution.

Create demand from Digital Portfolio Management

Create demand from the Digital Portfolio Management (DPM) Workspace. DPM enables you to create demand for any business or technical services that you own.

Before you begin

For the required plugins to create a demand in Digital Portfolio Management, see the Demand Management area of Digital Portfolio Management related applications and data sources.

Role required: sn_dpm.dpm_manager

About this task

You can manage and create demands for services or service offerings that you own, right in the workspace without having to go to the service or offering's native application.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **Digital Portfolio Management Workspace** > **Personal Portfolios**
2. To create demand, select a business or technical service.
3. From the list, select the **Create** option and then select **Demand**.
4. On the form, fill in the fields.
   For more details on demand entries, see Create a demand.

Create demand form

Field Set	Description
Dates	Start and end dates for the demand.
Details	The details fields change, depending on the type of service that you are creating demand for. Follow the prompts to complete each field entry.
Business case	The business case fields change, depending on the type of service that you are creating demand for. Follow the prompts to complete each field entry.
Financials	Cost information, return on investment (ROI), and planned benefit.
Assessment data	Impact and risk of the proposed demand.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field Set	Description
Demand	Owner and organization information to assign to the demand.

5. **Save** the demand.

   The service **Plan** tab shows the new demand.

Create an improvement initiative from Digital Portfolio Management

Create an improvement initiative from the Digital Portfolio Management (DPM) Workspace. DPM enables you to create an improvement initiative for any business or technical services that you own.

Before you begin

For the required plugins to create improvement initiatives in Digital Portfolio Management, see the Continual Improvement Management area of Digital Portfolio Management related applications and data sources.

Role required: sn_dpm.dpm_manager

About this task

You can manage and create improvement initiatives for services or service offerings that you own, right in the workspace without having to go to the service or offering's native application.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **Digital Portfolio Management Workspace** > **Personal Portfolios**.
2. To create an improvement initiative, select a business or technical service.
3. From the list, select the **Create** option and then select **Improvement initiative**.
4. On the form, fill in the fields.
   For details on the improvement initiative process, see Create an improvement request.

Improvement Initiative form

Field	Description
Number	Unique number for the improvement initiative.
Business service	Business service where you created the improvement initiative from in DPM.
Service offering	Service offering where you created the improvement initiative from in DPM.
Business Process	Business offering where you created the improvement initiative from in DPM.
CIM Coordinator	The Continual Improvement Management coordinator.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Percent complete	Percentage complete for the improvement initiative.
Short description	Short description of the improvement initiative.
Business justification	Elaboration of the short description to include rationale and research conducted.

Goals tab

Field	Description
Success measurement method	Performance Analytics (PA) Indicator. Automated entry.
Improvement KPI	State the key performance indicator (KPI) for the improvement initiative.
Base value	Percentage value, not to exceed 100%.
Percentage improvement	Percentage value, not to exceed 100%.
Target value	Percentage value, not to exceed 100%.
Target review date	Expected date the improvement initiative is reviewed.
Expected outcomes	Description of expected outcomes that support the provided KPI.

Details tab

Field	Description
Requested for	Name of the person creating the improvement initiative.
Type	The type of improvement initiative: ○ People ○ Process ○ Technology

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Watch list	Others that are watching this improvement initiative.
Parent initiative	The parent initiative if there is one.

Schedule tab

Field	Description
Planned start date	Planned date to start the improvement initiative.
Planned end date	Planned date to end the improvement initiative.
Actual start date	Actual start date of the improvement initiative.
Actual end date	Actual end date of the improvement initiative.

Notes tab

Field	Description
Additional comments	Customer visible comments on the improvement initiative.
Work notes	Any notes that you want to add to the improvement initiative (these notes are not customer visible).

5. **Save** the improvement initiative.

List modules

List modules in Digital Portfolio Management (DPM) provide information that may or may not be in personal portfolios or enterprise portfolios. You don't have to own solutions to view or create list modules.

The list module in the DPM Workspace includes two tabs - **Lists** and **My Lists**. The following categories are in the **Lists** tab, each with the options of **Owned by me** and **All**.

- Services
- Offerings
- Business applications
- Application services

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Demands
- Projects
- Contracts

When you select **All** for a given category, you see all the records for that category, even if you don't own them. Like any list of records, you can sort, filter, and change the columns in view. You can also add them to your own personal list, called **My Lists**.

Create a personal list by adding any records that interest you, like service offerings, roadmaps, projects, demands, ideas, contracts, incidents, team members, or teams. When you create a list, you can start it from an existing list or create your own list. After you create a list, you see them in the **My Lists** tab in the list module. After you create more than one list, you can select **Reorder** to help you organize your lists.

Related topics

Work with lists in Digital Portfolio Management

Work with lists in Digital Portfolio Management

Work with lists in the Digital Portfolio Management Workspace. Lists enable you to view service and application information that is not in a personal portfolio or an enterprise portfolio.

Before you begin

Role required: sn_dpm.dpm_manager

About this task

Use the **List** tab in Digital Portfolio Management (DPM), to view lists of services, service offerings, business applications, application services, demands, projects, and contracts. You can view the solutions that you own as well as the solutions that you don't own. You can also create custom lists to see any items that interest you like services, incidents, and users. The table column names in lists change depending on the type of list that you create. You can also send a link to a specific list item and add or hide columns from your list view.

Procedure

1. Navigate to **All** > **Digital Portfolio Management** > **Digital Portfolio Management Workspace**.
2. Select the list icon ( ).
3. View a list.

   The Lists tab contains lists of all available solutions in your DPM Workspace.

   - Select the **Lists** tab to view existing lists.

     Select **Owned by me** to see the lists that you own or select **All** to see all the solutions in your DPM Workspace (for example, all services).

   - Select the **My Lists** tab to view the lists that you created.
4. **Optional:** Create a list.
   a. In the **My Lists** tab, select **Add new List**.
   b. In the New Lists window, select an option — **Start from existing** or **Create your own**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you select **Start from existing**, then select an existing list from the **List Name** field. Depending on the list name that you select, you can opt to keep or remove the list columns and adjust the filters. When finished, select **Create**.
- If you select **Create your own**, then complete the **List Name** field. In the **Select Source** field, select the source for your list. Depending on the type that you select, you can opt to keep or remove the list columns and adjust the filters. When finished, select **Create**.

5. **Optional:** Update a list.
   - Select **Refresh List** ( ) to refresh the list results.
   - Select **List Actions** ( ) to edit the list columns and to save the list.
   - Select **Show filter panel** ( ) to add or remove filters for the list.
   - Select **Export** to export the displayed list.
   - Select **New** to create a list.
6. **Optional:** Share a list.
   - Navigate to the list that you want to share.
   - Copy the browser address (URL) of the list that you want to share.
   - Paste that copied address in your sharing application (email or internal messaging system) to share it with others.

     (Optional) The copied link contains a unique list ID so when selected, it goes directly to the list that you want to share.

Digital Portfolio Management reference

Reference topics provide additional information about administering Digital Portfolio Management (DPM).

Roles for Digital Portfolio Management

Several types of components are installed with Digital Portfolio Management (DPM) when you activate the application from the ServiceNow® ServiceNow Store. DPM has two roles - admin and user.

Roles installed with DPM

There are two roles for DPM.

- The DPM admin [sn_dpm.dpm_admin] role configures the DPM Workspace for users. The DPM admin role can create, retrieve, update, and delete (CRUD) all personal portfolios created by anyone. The DPM admin role can also assign the DPM manager role to groups so a personal portfolio owner can select groups to view or edit personal portfolios.
- The DPM manager [sn_dpm.dpm_manager] role is the end user of the DPM Workspace. The DPM manager role can only CRUD personal portfolios that they create.

See the following table for information about each role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DPM roles

Role title [name]	Description	Contains roles

DPM admin [sn_dpm.dpm_admin]	• View all DPM system properties and admin pages.
	• Update all DPM system properties.
	Note: The DPM Admin role can't CRUD service portfolios unless they have the appropriate service portfolio admin or manager roles from Service Portfolio Management.
	• Use Key performance indicator (KPI) functions:
	  ○ View KPI group tables for KPI groups and KPI group mappings.
	  ○ Create KPI groups.
	  ○ Update and delete all KPI groups.
	  ○ Map KPI groups.
		• sn_dpm.dpm_manager
		• sn_ep.enterprise_portfolio_admin (can CRUD enterprise portfolios that are created using the enterprise portfolio tables).
		Important: The DPM admin only gets this role if you install the enterprise portfolio plugin. After you install the plugin:
		  ○ The DPM admin role inherits the enterprise portfolio admin role.
		  ○ The DPM manager role inherits the enterprise portfolio viewer role.
