   Iterate through all add-on event mapping of the found DA and add them to the migrated DA.

d. If the record isn't found with the table, remove the table filter and search for targetPayload contains route=mra or interceptor.
   For **List** and **Field** decorator, you must add the mra and interceptor add-on event mappings manually. For more information, see Create a UX add-on event mapping.

Note:

The Change_request interceptor record in ITSM Agent Workspace exists in SOW.

Migrating workspace space record type selector for the interceptor type of declarative action are:

- ITSM Agent Workspace table: aw_record_type_selector
- SOW table: sn_sow_interceptor_record_type_selector

For a change_request table that has a value as standard, Active is set as False when migrating the records from ITSM Agent Workspace to SOW.

Perform post-migration tasks for field decorators form actions

Verify that the field decorators form actions in Service Operations Workspace (SOW) are consistent with the field declarative form actions in ITSM Agent Workspace (ITSM AW) and they're ready for use in SOW. You can update the migrated field declarative form actions settings in SOW based on your requirements.

Before you begin

When performing the migration, you must have selected the **Field decorators form actions** option for ITSM Agent Workspace features. For example, the **Field decorators form actions** option for Incident Management. For information about the migration process, see Migrate from ITSM Agent Workspace to Service Operations Workspace for ITSM.

Role required: admin

About this task

At the end of the migration process, a confirmation message specifies if the migration is successful or not. You can review the migration information and perform the post-migration steps to ensure successful migration of your configuration or customization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If the migration is successful, perform the following steps to verify the field decorator are visible on the forms.

   a. Open SOW for ITSM and ITSM Agent Workspace instances.

   - To open SOW, navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
   - To open ITSM Agent Workspace, enter `<instance-name>.service-now/workspace` in the web browser.

   b. Open the forms in ITSM Agent Workspace and SOW.

   The migrated field decorator actions are shown on the forms.

   Duplicate field decorator actions might be displayed on the form when you don't migrate the view rule. So, SOW field declarative actions still show up even after migration if the view isn't changed.

   If the migration is successfully completed and not visible in the UI or not working properly the cross-check the conditions in Advance view.

2. If the migration fails, perform the following steps.

   a. On the migration completion page in SOW Admin Center, select **View migration details**.

   b. Select the **Go to system logs** (⚠) icon.

   c. Review the logs to determine which items failed during migration.

   d. Based on each failed item, identify which step has failed and perform the steps mentioned in the following topics.

   - Migrate the client script from ITSM Agent Workspace to Service Operations Workspace for field decorators actions
   - Migrate the server script from ITSM Agent Workspace to Service Operations Workspace for field decorators actions
   - Migrate the client action from ITSM Agent Workspace to Service Operations Workspace for field decorators actions
   - Migrate the UI component from ITSM Agent Workspace to Service Operations Workspace for field decorators actions

Getting started with Service Operations Workspace for ITSM

Quickly understand how you can implement the essential setup to get started with Service Operations Workspace.

Procure the ITSM Standard license or above for ServiceNow IT Service Management applications.

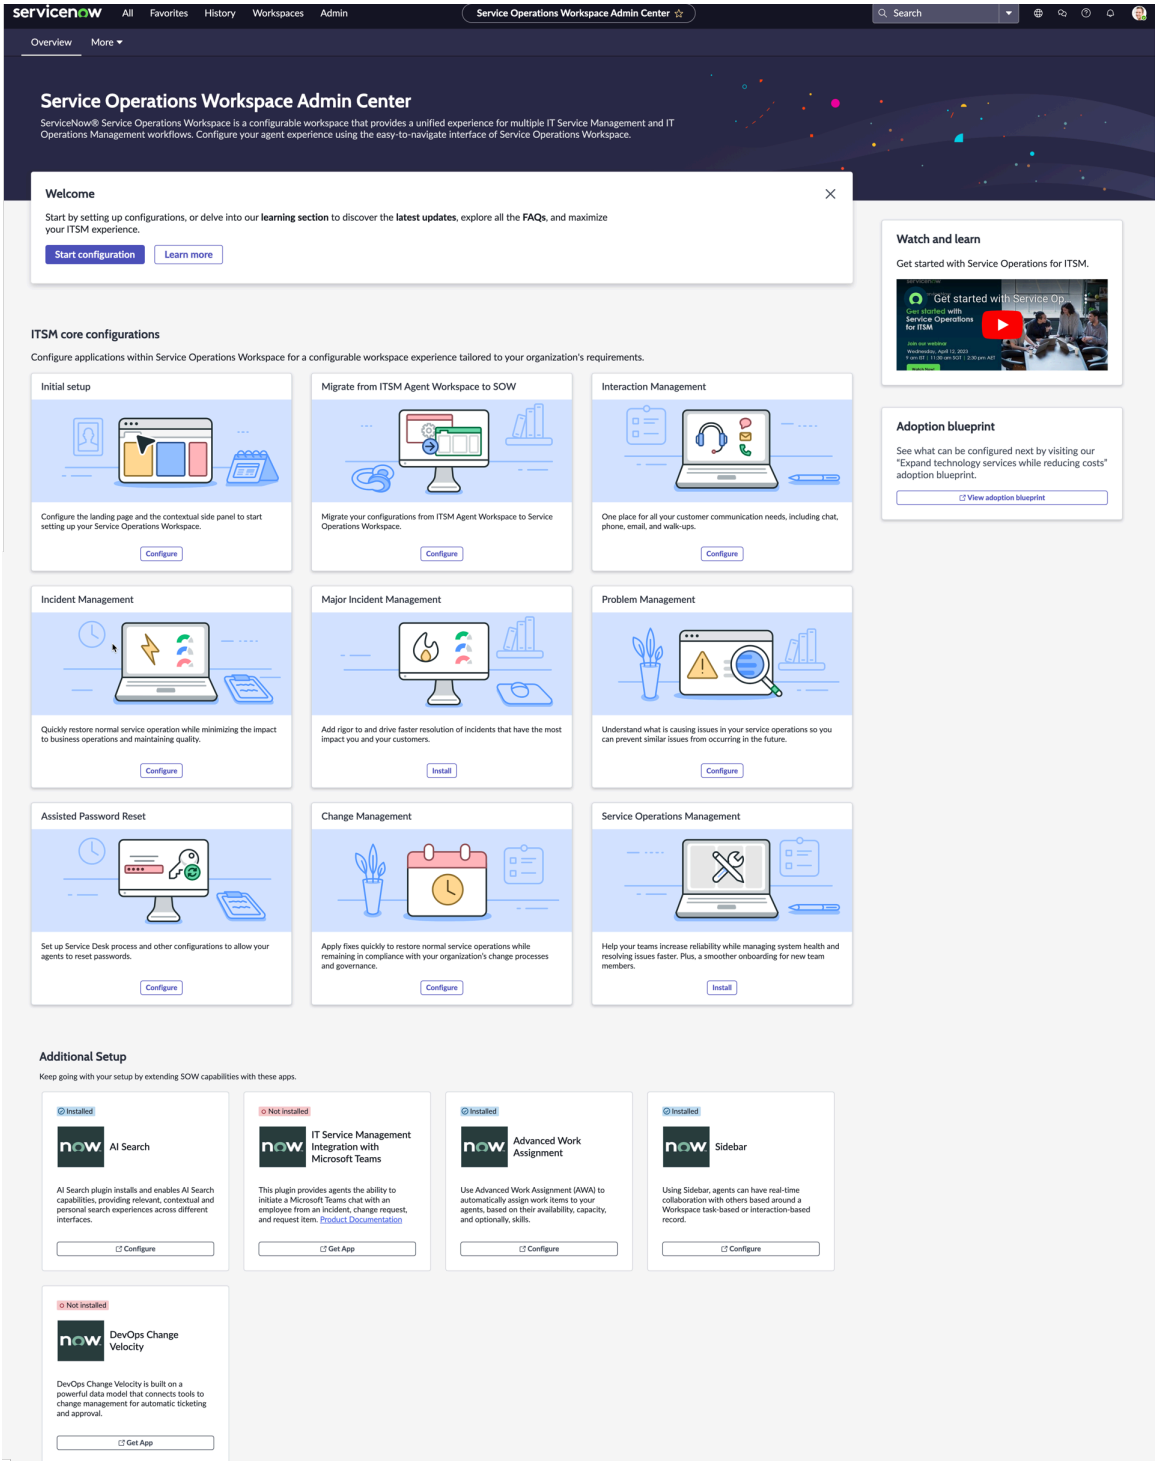
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace Admin Center

It provides effortless and quick access to manage most configurations in Service Operations Workspace for IT Service Management (ITSM). It also provides centralized control of the instance to admins.



Roles in Service Operations Workspace for ITSM

You can configure the user access for Service Operations Workspace (SOW) pages using various roles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles in Service Operations Workspace for ITSM

Role	Description	Inherited roles
itil	Provides access to all SOW pages.	sn_sow.sow_user
sn_sow.sow_user	Provides access to SOW. By default, the itil role contains the sn_sow.sow_user. In case a user has roles other than itil, ensure that sn_sow.sow_user role is assigned to the user to access SOW.	None
sn_sow.sow_home	Provides access to SOW home (landing) page.	sn_sow.sow_user
sn_sow.sow_list	Provides access to SOW list pages.	sn_sow.sow_user
admin	Provides access to all the pages in SOW including SOW Admin Center. A user with this role can perform configurations for all modules in SOW Admin Center.	None
sn_sow_itsm_admin.sow_admin_user	Provides access to SOW Admin Center pages for SOW configuration. A user with this role can perform configurations related to Incident Management only.	None
sn_sow_admin.sow_admin_center_user	Enables change managers to access the SOW Admin Center	sn_ace.ace_user

Roles in Service Operations Workspace for ITSM (continued)

Role	Description	Inherited roles
	Change Management in SOW Admin Center.	• sn_chg_soc.change_soc_admin • personalize_decision_table_input • sn_sow_admin.sow_admin_center_user • itil
sn_devops.viewer	Provides access to view or add DevOps data to a change request.	None
Request Management		
sn_request_read	Provides the read access to request record pages.	sn_sow.sow_home and sn_sow.sow_list So, users with the sn_request_read role can access the SOW home (landing) and list pages.
sn_request_write	Provides the write access to request record pages.	sn_sow.sow_home and sn_sow.sow_list So, users with the sn_request_read role can access the SOW home (landing) and list pages.
On-call Scheduling		
oc_read	Provides the read access to Schedules page.	Users with the oc_read role can access the On-call Schedules, Experts On-call, Escalation Tracking, and other On-call features in Service Operations Workspace.
Password Reset		
password_reset_service_desk	Resets passwords on behalf of users, tracks password reset requests, and views logs.	None

Users in Service Operations Workspace for ITSM

Users can access various Service Operations Workspace for ITSM pages based on assigned roles and associated service desk groups and audiences.

Users in SOW

User	Description
Tier 1 agent	User who has the itil or sn_sow.sow_home role and belongs to a service desk group.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users in SOW (continued)

User	Description
	Primarily focused on the life cycle of the following records: • Interaction • Incident • Request
Tier 2 agent	User with the itil role. Primarily focused on the life cycle of the following records: • Incident • Request • Change • Problem • Major incident

Configure the theme for Service Operations Workspace for ITSM

Configure the visual experience in Service Operations Workspace for ITSM for your users, helping to update the look and feel to be more like your brand.

Before you begin

Role required: admin

Procedure

1. Install the Theme Builder store application.
   a. Navigate to **All** > **System Definition** > **Plugins**.
   b. Search for the Theme Builder (sn_theme_builder) application and install it.
2. Create a theme using Theme Builder by referring to Create a theme with Theme Builder.
   Polaris is the default theme for Next Experience, and this theme cannot be copied. So, we must create a theme and publish it for use.
3. Use the experience preview to preview the theme in the workspace.
4. Select **Apply theme** form the drop-down in the top-right corner.
   Theme is deployed at the instance level.
5. Select **View issues** to review accessibility issues if the theme does not meet accessibility requirements.
   For example, issues with contrast between colors and text for backgrounds and buttons.
6. Select **Apply**.

Access controls in Service Operations Workspace for ITSM

You can determine which users can access Service Operations Workspace for ITSM after logging in to the ServiceNow instance or access the Service Operations Workspace for ITSM landing page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

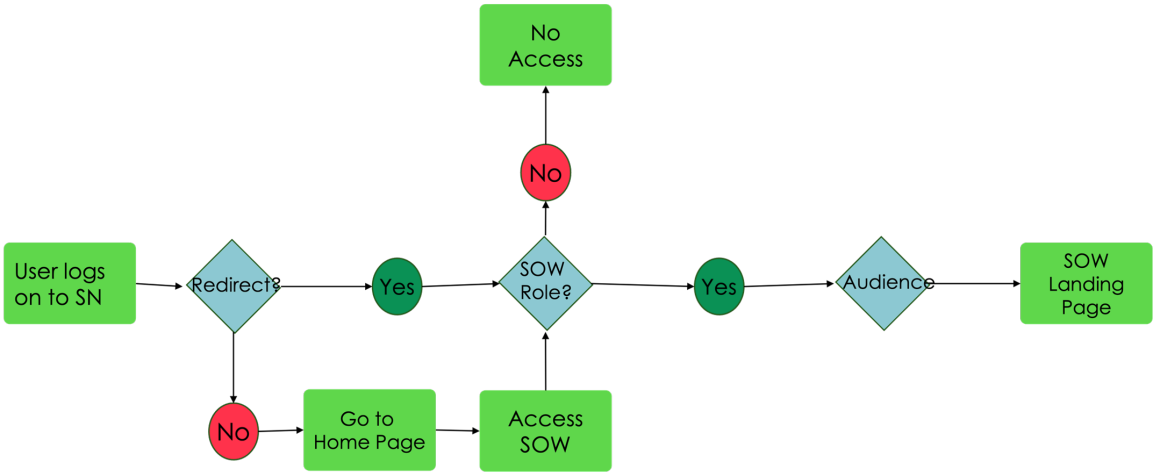
For a user, access to Service Operations Workspace for ITSM is based on the following criteria:

- Is the redirection upon login enabled to the Service Operations Workspace landing page.
- Does the user have the sn_sow.sow_user role to access SOW manually or when redirected upon login.

Note:

- The itil role contains the sn_sow.sow_user role. But if the user has any custom or granular roles other than itil, then the sn_sow.sow_user role should be assigned to the user and the audiences should be updated with custom roles.
- Custom roles require updates to ACLs (access control lists) that restrict access to certain functionality.

- First audience that the user belongs to.



Types of landing pages in Service Operations Workspace for ITSM

Landing pages provide an agent with quick visibility into the work assigned, announcements, upcoming tasks, and so on.

Following landing pages are available by default for the Service Operations Workspace ITSM Applications (sn_sow_itsm_cont) application.

- Tier 1 landing page
- Tier 2 landing page

Other landing pages are available if you have the corresponding plugins installed, for example, Service Operations Workspace ITOM Apps (sn_sow_itom_cont).

Important:

- A user's access to the landing page is based on the audience associated with that page. Configure the audiences with the required service desk groups and the users that are part of these service desk groups can then access the landing page. For information about audiences, see Learn about audiences.
- When multiple audiences are available for the landing page, the audience with the least order is considered.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Criteria to access the tier 1 landing page

Any user that meets one of the following audience criteria is redirected by default to the tier 1 landing page.

Audience criteria for tier 1 landing page

Audience	Role	User criteria inclusion
SOW Common Audience	admin	None
SOW Service Desk Audience Granular	sn_incident_write	User should belong to a user group included in the *`Service Desk Group Inclusion`* user criteria inclusion of the audience.
SOW Service Desk Audience	itil	User should belong to a user group included in the *`Service Desk Group Inclusion`* user criteria inclusion of the audience.

Criteria to access the tier 2 landing page

Any user that meets the following audience criteria is redirected by default to the tier 2 landing page.

Audience criteria for tier 2 landing page

Audience	Role	User criteria inclusion
SOW Tier 2/3 landing page Audience	itil	None

Configure the audience for the SOW landing page

Define who can access your SOW landing pages. You can targeted experiences for audiences such as agents and managers.

Before you begin

Role required: admin

About this task

You can configure the audiences that define who can access the SOW landing pages. For information about audiences, see Learn about audiences.

By default, the SOW landing page is associated with the following audiences. To access SOW, a user must align with the following criteria.

- The user has the admin role
- The user has the sn_incident_write role and belongs to the Service Desk user group.
- The user has the itil role and belongs to Service Desk user group.

Procedure

1. **Optional:** Create an audience if required.

   a. Navigate to **All** > **Now Experience Framework** > **Building Blocks** > **Audiences**.

   b. On the Audiences page, select **New**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Specify the required data.
For example, specify the following:
   - Name: SOW Service Desk T1
   - Roles: itil
   - Any user criteria inclusions. For this, add a user criteria and then add user groups to it.

d. Select **Save**.

2. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
3. From the **Experiences** section, select **Service Operations Workspace**.
4. From the **Pages and Variants** section, select **Settings** for **Home Landing Page**.
5. On the Variant: Service desk landing page SNC page, from the **Pages and variants** section, select **Service Desk landing page SNC**.
6. Change the application scope to Incident management for Service Operations Workspace.
7. From the **Audiences** section, select **Edit all audiences**.
8. In the Edit Audiences window, select **Add**.
9. Search for your audience and select **Save**.

Configure service desk groups to access the Service Operations Workspace landing page

Ensure that the right users have access to the Service Operations Workspace landing page.

Before you begin
Role required: admin

About this task
The landing page's access is based on the audience associated with that page. Configure the audiences with the required service desk groups and the users that are part of these service desk groups can then access the landing page. If you want users from multiple service desk groups to access the landing page, you should configure the landing page's audience with all those service desk groups.

It is applicable only for an instance that has Service Operations Workspace 1.1 installed and has upgraded to Xanadu.

Procedure
1. Configure the system property for landing page access by performing the following steps.
   a. From the **All** menu, navigate to **sys_properties.list**.
   b. To ensure that the user criteria records are used instead of roles to access the landing page, set the *glide.ux.user_criteria_enabled* property to `true`.
   c. Select **Update**.
2. Add the user's service desk groups to the audience's user criteria by performing the following steps.
   a. Navigate to **All** > **Now Experience Framework** > **Building Blocks** > **Audiences**.
   b. Select an audience and perform the following steps, for example, **SOW Service Desk Audience**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. From the **User Criteria Inclusions** related list, open the audience, for example, **Service Desk Group Inclusion**.

ii. For the **Groups** field, add the required service desk group that the user is part of.

iii. Select **Update**.

Landing page redirection in SOW for ITSM

Redirection enables you to automatically route users to the SOW landing page upon login.

Landing page redirection can be configured in any of the following ways:

- Conditional, based on user criteria, for example, Service Desk groups.
- Blanket. All users are first redirected to the SOW home page and the audience configuration determines which landing page should be used.
- Optional. In this case, users can opt out of the redirection.

Redirect non-admin users to Service Operations Workspace

Enable a non-admin user to start prioritizing tasks quickly by redirecting to Service Operations Workspace after logging in to the ServiceNow instance.

Before you begin

Role required: admin

Ensure that Next Experience is enabled on your instance. For information about its activation, see Considerations for activating Next Experience.

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. Select **Initial setup** > **Landing page redirection**.
4. Configure the SOW redirection property.
   a. From the **Homepage Destination Rule** section, select **Configure** for SOW Landing Page.
   b. Select the **Active** check box.
   c. Select **Update**.
5. If required, configure the other SOW landing page redirection properties.

   a. From the **System Properties** section, select **Configure** for the required property.
      - glide.login.home: If set to true, the default homepage is displayed upon login. If left blank, the last page visited is used. This property is overwritten by the Homepage Destination Rule for the SOW landing page.
      - glide.next_experience.user_selected_landing_page_enabled: Sets the user selected landing page preference to true.
      - glide.ux.user_criteria_enabled: Enables use of user criteria records instead of **Roles** fields for UX Framework variants.

   b. Modify the property and select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Redirect agents of a specific group to Service Operations Workspace

Enable only agents of specific user groups to be automatically redirected to Service Operations Workspace after logging in to the ServiceNow instance.

Before you begin
Role required: admin

About this task
Only the agents who are part of specified user groups are redirected to Service Operations Workspace. All other agents are redirected either to the agent-configured landing page or ServiceNow AI Platform landing page.

Procedure
1. From the **All** menu, navigate to **user_criteria.list**.
2. Select the **ITIL non-admin** user criteria record.
3. For the **Groups** field, select the required user groups whose agents must access Service Operations Workspace.
4. Select **Update**.
5. Ensure that the itil role is assigned to each agent.
   a. Navigate to **All** > **User Administration** > **Users** and then open the user record for the agent.
   b. In the **Roles** list, ensure that the **itil** role is added and active.
   c. If the itil role isn't already added to the user record, add the itil role by following these steps.
      i. In the **Roles** list, select **Edit**.
      ii. On the **Edit Members** form, add the itil role from the **Collection** list to the **Roles List** list.
      iii. Select **Save**.

Disable auto-redirection for all agents to Service Operations Workspace

Verify that the agents aren't automatically redirected to Service Operations Workspace after logging in to the ServiceNow instance.

Before you begin
Role required: admin

Procedure
1. From the **All** menu, navigate to sys_homepage_destination_rule.list.
2. Select the **SOW Landing Page** record.
3. Clear the **Active** check box.
4. Select **Update**.
5. Clear the browser cache by using the following steps:
   a. Enter `<instance-name>.service-now.com/cache.do` in the web browser.
   b. Select **Clear Cache**.

      The browser page is refreshed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Select **Clear All Browser Caches**.

The browser page shows the `Unified Cache Cleared` message.

Note:

If the Homepage Destination Rules [sys_homepage_destination_rule] table contains other records that redirect to SOW, use these steps to clear the **Active**#check box for each record.

Landing page configurations in SOW for ITSM

You can configure the data on the landing page from Admin Center in Service Operations Workspace for ITSM.

Configure record creation from the new tab menu in Service Operations Workspace

Customize the records that can be created from the new tab menu in all pages of Service Operations Workspace.

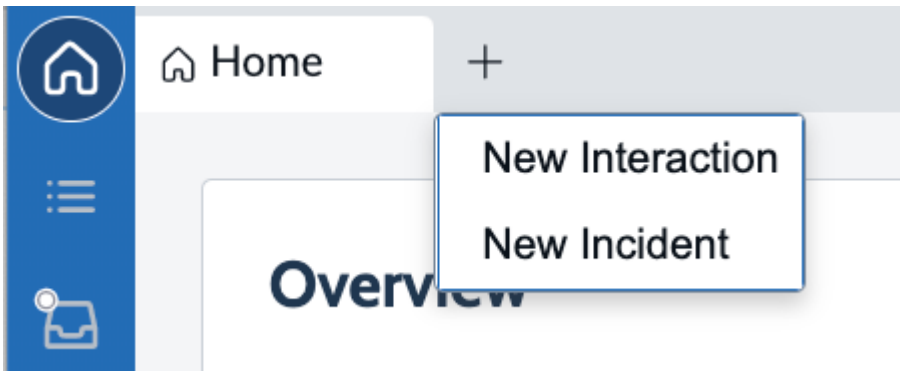
Before you begin

Role required: admin

About this task

By default, an interaction or incident record can be created from the new tab menu in all pages of Service Operations Workspace.

Record creation from tab



You can customize the JSON value to provide a variety of options. For example, use this method to create a knowledge article directly from the new tab menu. For more information about knowledge article creation, go to Knowledge Management in Service Operations Workspace.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. From the list of UX applications, select **Service Operations Workspace**.
3. On the UX Application form, from the UX Page Properties related list, select the *chrome_tab* property.
4. On the UX Page Property page, when the **Type** field is set to **json**, edit the **Value** field, for example, to add or delete routes or tables.
   To add a new option, for example, to create a knowledge article, add a new JSON object inside the *newTabMenu* object. Provide the name and the action performed when you select the option as a key-value pair inside the *newTabMenu* object. Following is an example for creating a problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"label": {
"translatable": true,
"message": "New Problem"
},
"routeInfo": {
"route": "record",
"fields": {
"table": "problem",
"sysId": "-1"
},
"multiInstField": "sysId"
},
"condition": {
"tableDescription": {
"table": "problem",
"canCreate": true
}
}
},
```

5. Click **Update**.

Restore the greeting banner on the landing page

If the greeting banner is closed, restore it to view the agent's shift information.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **User Administration** > **User Preferences**.
2. From the list of user preferences, open **sow.incident.landing_page_header_collapsed**.
3. Ensure that the **User** field refers to the user for whom you want to restore the banner.
4. In the **Value** field, specify **false**.
5. Select **Update**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the header message on the landing page

Configure the header message that is part of the greeting text on the landing page. For example, You are on-call until Monday, Mar 21.

Before you begin

Role required: admin

About this task

The Get service desk agent shift data broker server script calls the `SOWServiceDeskAgentShift` script includes to display the shift information in the greeting text.

While the display text can be customized for the default landing page, the visual styling changes to the text can be done only by creating a copy of the landing page.

Header section

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, select **Configure** next to **Greetings**.
   The Script Includes form is displayed for SOWServiceDeskAgentShift, which internally calls the SOWServiceDeskAgentShiftSNC
4. Copy the **Script** value of SOWServiceDeskAgentShiftSNC.
   a. Navigate to **All** > **System Definition** > **Script Includes**.
   b. From the list of Script Includes, open SOWServiceDeskAgentShiftSNC.
   c. Copy the **Script** field value.
5. Edit the SOWServiceDeskAgentShift script.
   a. Navigate to **All** > **System Definition** > **Script Includes**.
   b. From the list of Script Includes, open SOWServiceDeskAgentShift.
   c. Paste the **Script** field value that you copied from SOWServiceDeskAgentShiftSNC.

```
initialize: function() {

    this.PLUGINS = {

      ON_CALL: "com.snc.on_call_rotation",

      SHIFT_PLANNING: "com.sn_shift_planning"

    };
```

6. Select **Update**.

Configure the space man on the landing page

Change the image of the space man to an image your choice.

Before you begin

Role required: admin

Procedure

1. From the **All** menu, navigate to **db_image.list**.
2. Search for sow_banner.svg.
3. Change the image to an image of your choice.
   Ensure the image dimensions are 700 x 160 pixels.

Configure the donut color in the Overview section

Create a visual experience that works the best for donuts in the **Overview** section.

Before you begin

Role required: admin

About this task

Donut area colors are based on the element that the donut is grouped by.

- Tier-1 landing page
  - In the **Incidents assigned to me** card, the donut is grouped by the state of incidents.
  - In the **Unassigned incidents** card, the donut is grouped by the priority of incidents.
  - In the **Catalog tasks assigned to me** card, the donut is grouped by the state of catalog tasks.
  - In the **Incident SLAs** card, the donut is grouped by the time left after which the incidents will breach SLA.
- Tier-2 landing page
  - In the **Incidents assigned to me** card, the donut is grouped by the state of incidents.
  - In the **Problems assigned to me** card, the donut is grouped by the state of problems.
  - In the **Changes assigned to me** card, the donut is grouped by the state of change requests.
  - In the **Tasks assigned to me** card, the donut is grouped by the state of catalog tasks.

Procedure

1. To change the donut area colors for the following cards in the tier-1 landing page, perform these steps.
   - Incidents assigned to me
   - Unassigned incidents
   - Catalog tasks assigned to me

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Reports** > **Administration** > **Chart Colors**

b. In the Chart Colors list, filter records based on the card that you want to customize and select a record.

i. To customize the color of the **Incidents assigned to me** card, filter records with **Name** as **incident** and **Element** as **state**.

ii. To customize the color of the **Unassigned incidents** card, filter records with **Name** as **incident** and **Element** as **priority**.

iii. To customize the color of the **Catalog tasks assigned to me** card, filter records with **Name** as **sc_task** and **Element** as **state**.

c. On the Chart Colors form, select the required color in the **Color name** field.

d. Click **Update**.

2. To change the donut area color for the Incident SLAs card in the tier-1 landing page, perform the following steps.

a. Navigate to **Reports** > **Administration** > **Report Ranges**.

b. In the Ranges list, filter records with **Name** as **task_sla** and **Element** as **time_left**.

c. Select the required record.

d. On the Range form, select the required color in the **Color name** field.

e. Click **Update**.

3. To change the donut area colors for the tier-2 landing page, perform the following steps.

a. Navigate to **Reports** > **Administration** > **Chart Colors**

b. In the Chart Colors list, filter records based on the card that you want to customize and select a record.

i. To customize the color of the **Incidents assigned to me** card, filter records with **Name** as **incident** and **Element** as **state**.

ii. To customize the color of the **Problems assigned to me** card, filter records with **Name** as **problem** and **Element** as **state**.

iii. To customize the color of the **Changes assigned to me** card, filter records with **Name** as **change_request** and **Element** as **state**.

iv. To customize the color of the **Tasks assigned to me** card, filter records with **Name** as **sc_task** and **Element** as **state**.

c. On the Chart Colors form, select the required color in the **Color name** field.

d. Click **Update**.

Configure the donuts in the tier 1 landing page

Configure the data displayed in donuts in the **Overview** section of the tier 1 landing page.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

You can customize header label, data source, metric, group by field, and viewAllQuery for all donuts. For example, Problems assigned to me donut.

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, under **Tier 1** section, select **Configure** next to **Donut configurations**.
4. **Optional:** If the PAR dashboard is active on the landing page, do the following:
   a. Configure the tier 1 dashboard configuration.

      Note:
      If you're creating a dashboard, you can use the saved visualizations to create a card for the dashboard. The data visualization is visible only to the users based on the respective roles.

      Ensure that you have added the value as Service Operations Workspace in the **Dashboard Visibility**.

   b. Select the default dashboard for the SOW landing page from the **Dashboard loaded on the Landing Page** drop-down option. Select **Save**.
   c. After modifying the elements in the dashboard, select **Save**.
5. **Optional:** If the PAR dashboard isn't active on the landing page, edit the **Script** field add the code inside the class *ServiceDeskLandingPageUtils*.

   Note:
   This method is copied from *SowIncidentLandingPageUtilsSNC*. To add a new donut or to remove an existing one you need to copy *getVisualizationConfig* method to *SowIncidentLandingPageUtils* and modify as per your requirement.

```
static async getVisualizationConfig(helpers, mode,
 conditionalRecordCount=0) {
            const evamDef = this.getEvamDef();
            const visualizationConfig = [{

```
                    'state': {
                        'all':'Incidents',
                        '1': 'New incidents',
                        '2': 'In Progress incidents',
                        '3': 'On Hold incidents',
                        '6': 'Resolved incidents'
                    },
                    'priority': {
                        'all':'Unassigned incidents',
                        '1': 'P1 unassigned incidents',
                        '2': 'P2 unassigned incidents',
                        '3': 'P3 unassigned incidents',
                        '4': 'P4 unassigned incidents',
                        '5': 'P5 unassigned incidents'
                    }
                },
                'sc_task': {
                    'state': {
                        'all':'Catalog tasks',
                        '-5': 'Pending catalog tasks',
                        '1': 'Open catalog tasks',
                        '2': 'Work in progress catalog tasks'
                    }
                },
                'task': {
                    'sys_class_name': {
                        'sc_task': 'Catalog tasks delegated to
you',
                        'incident': 'Incidents delegated to
you'
                    }
                }
            };

            if((table == 'incident' && groupByField ==
'priority') || table == 'task')
                return
labelMap[table][groupByField][selectedField];

            if (groupMode)
                return
labelMap[table][groupByField][selectedField] + ' assigned to
your team';
            return labelMap[table][groupByField][selectedField]
+ ' assigned to you';
        }
```

Add the labels as mentioned in the below example code block to view them as a list heading when you click on the donut.

```
   'problem': {
'state' :{
     '101': 'New problems',
                    '102': 'Assess problems',
                    '106': 'Resolved problems',
                    '104': 'Fix in Progress problems',
                    '103': 'Root Cause Analysis problems',
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                    'all':'Problems'
        }
                },
```

6. Select **Update**.

Configure the donuts in the tier 2 landing page

Configure the data displayed in donuts in the **Overview** section of the tier 2 landing page.

Before you begin
Role required: admin

About this task
You can customize header label, data source, metric, group by field, and viewAllQuery for all donuts. For example, Catalog tasks assigned to me donut.

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, under **Tier 2** section, select **Configure** next to **Donut configurations**.
4. **Optional:** If the PAR dashboard is active on the landing page, do the following:
   a. Configure the tier 2 dashboard configuration.

      Note:
      If you're creating a dashboard, you can use the saved visualizations to create a card for the dashboard. The data visualization is visible only to the users based on the respective roles.

      Ensure that you have added the value as Service Operations Workspace in the **Dashboard Visibility**.

   b. Select the default dashboard for the SOW landing page from the **Dashboard loaded on the Landing Page** drop-down option. Select **Save**.
   c. After modifying the elements in the dashboard, select **Save**.
5. **Optional:** If the PAR dashboard isn't active on the landing page, edit the **Script** field add the code inside the class *SOWLandingPageTier2Utils*.

```
static async getVisualizationConfig(helpers, mode,
 conditionalRecordCount) {
            const visualizationConfig = [{
                "id": "incidentAssigned",
                "tableName": "incident",
                "tableDisplayValue": "Incident",
                "myWorkQuery":

Copy *getLabelMaps* and/or fetchTitle method from *SOWLandingPageTier2UtilsSNC* to add labels for list that is displayed when you click on the donut.

```
static async fetchTitle(table, nameValueMap, groupMode = false,
 elementId) {
           if(table === "task") {
               return this.getLabelMaps(table,
 nameValueMap['sys_class_name'], groupMode, elementId);
           }
           return this.getLabelMaps(table,
 nameValueMap['state'], groupMode, elementId);
       }

       static getLabelMaps(table, selectedField, groupMode =
 false, elementId) {
           if(selectedField == undefined){
               selectedField = 'all';
            }
           const labelMap = {
               'incident': {
                   '1': 'New incidents',
                   '2': 'In Progress incidents',
                   '3': 'On Hold incidents',
                   '6': 'Resolved incidents',
                   'all':'Incidents'
               },
               'change_request': {
                   '0': 'In Review changes',
                   '-1': 'Implement changes',
                   '-2': 'Scheduled changes',
                   '-3': 'Authorize changes',
                   '-4': 'Assess changes',
                   '-5': 'New changes',
                   'all':'Changes'
               },
               'problem': {
                   '101': 'New problems',
                   '102': 'Assess problems',
                   '106': 'Resolved problems',
                   '104': 'Fix in Progress problems',
                   '103': 'Root Cause Analysis problems',
                   'all':'Problems'
               },
               'task': {
                   'incident_task': 'Incident tasks',
                   'problem_task': 'Problem tasks',
                   'change_task': 'Change tasks',
                   'sc_task': 'Catalog tasks',
                   'incident': 'Incidents',
                   'problem': 'Problems',
                   'change_request': 'Change requests',
                   'all':'Tasks'
               }
           };
           if(elementId === 'delegated_task')
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
                return labelMap[table][selectedField] + '
delegated to you';
            if (groupMode)
                return labelMap[table][selectedField] + '
assigned to your team';
            return labelMap[table][selectedField] + ' assigned
to you';
        }
```

Catalog task labels can be added to the code snippet below to view them on the donut.

```
                'sc_task': {
                        'all':'Catalog tasks',
                        '-5': 'Pending catalog tasks',
                        '1': 'Open catalog tasks',
                        '2': 'Work in progress catalog tasks'
                },
```

6. Select **Update**.

Configure the visibility of landing page sections

Configure if few sections of the landing page should be visible or hidden. For example, **Quick links** and **Upcoming** sections.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, use the toggle to make the required landing page section visible or hidden.
   A toggle appears next to every section that can be hidden or made visible. For example, **Quick links**, **Upcoming**, **Announcements**, and so on.

Configure the Announcements section on the landing page

Customize an existing announcement or add an announcement for additional tables.

Before you begin
Role required: admin

About this task
You can customize how the Entity View Action Mapper (EVAM) component is configured for the **Announcements** section. While the data can be customized for the default landing page, the visual styling changes can be done only by creating a copy of the landing page. In the base system, announcements and the corresponding data sources are defined for the following tables:

- Outage [cmdb_ci_outage]
- Banner Announcement [sys_ux_banner_announcement]
- Incident [incident]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can add announcements for additional tables by defining additional data sources in the EVAM definition.

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Overview** tab, from the **Initial Setup** section, select the **Configure the landing page** option.
3. On the Landing Page form, under **Tier 1** or **Tier 2** sections, select **Configure** next to the **Announcements** option.
   The SOW - Announcements EVAM definition is displayed. For information on EVAM definition, see Create an EVAM definition.
4. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **EVAM Definitions**.
5. To edit the data source of an announcement, navigate to the EVAM Datasource M2Ms related list and edit the required data source.
   For information on data source, see Define a datasource.
6. To create an announcement for an additional table, add a data source for that table.
   For information on data source, see Define a data source. For information on defining a data source, see Define a datasource.
7. **Optional:** To source custom announcements into the **Announcements** section, create an additional banner announcement configuration for the Banner Announcement [sys_ux_banner_announcement] table by performing the following steps.

   a. Create a banner announcement configuration and the corresponding banner announcements.
      For information on creating a banner announcement configuration, see Next Experience banner announcements.

   b. Associate the banner announcement configuration with the *sn_sow.banner_announcements_config_id* property.

      i. Navigate to sys_properties.list

      ii. Select the *sn_sow.banner_announcements_config_id* property.

      iii. On the System Property form, specify the sys_id of the banner configuration as the property value.

8. To configure how an announcement should be displayed for a data source, edit an EVAM view configuration and template by performing these steps.

   a. Navigate to the EVAM View Config Bundle M2Ms related list and select the required configuration bundle.

   b. On the EVAM View Config Bundle form, navigate to the EVAM View Configs related list and select a configuration for the required data source.

   c. On the EVAM View Config form, open the template from the **View Template** field.

   d. On the View Template form, edit the **Template** field.
      For information on editing a template, see Define an EVAM view template.

   e. Select **Update**.

Configure the Upcoming section on the landing page

Configure the data displayed in the **Upcoming** section.

Before you begin

Role required: admin

About this task

Using an extension point, you can call the custom scripts to extend the functionality of the **Upcoming** section and also easily integrate customizations without having to alter the base code. For information about extension points, see Creating and adding a scripted extension point.

Scripted extension points for the Upcoming section in the base system

Extension point	Description
sn_sow.UpcomingLinkProvider	Gets a list of upcoming task records (changes, incident, requests, and overdue tasks) for the same day and the next day.

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. From the Extension Points list, select **sn_sow.UpcomingLinkProvider**.
3. Create an implementation using the **Create Implementation** related link or edit an implementation from the Implementations related list.

   Following is an example of how to add a new announcement type for change tasks.

   - Name: MyCustomUpcomingLinkProvider_ChangeTask
   - Script:

```
#var PREFIX_QUERY = 'active=true^' + assginToQuery;

    var TODAY_QUERY =
 '^planned_start_dateONToday@javascript:gs.beginningOfToday()
@javascript:gs.endOfToday()';

    var TOMORROW_QUERY =
 '^splanned_start_dateONTomorrow@javascript:gs.beginningOfTom
orrow()@javascript:gs.endOfTomorrow()';

    var encodedQuery = null;

    var listTitle = gs.getMessage("Change_Task");

    if ('beginningOfToday' == request.from && 'endOfToday' ==
 request.to) {

      encodedQuery = PREFIX_QUERY + TODAY_QUERY;

    } else if ('beginningOfTomorrow' == request.from &&
 'endOfTomorrow' == request.to) {

      encodedQuery = PREFIX_QUERY + TOMORROW_QUERY;

    } else {
```

```
      throw gs.getMessage("Unsupported date range");
    }
    var LIMIT = 10;
    var changeTaskGr = new GlideRecordSecure('change_task');
    changeTaskGr.addEncodedQuery(encodedQuery);
    changeTaskGr.setLimit(LIMIT + 1);
    changeTaskGr.query();
    var count = changeTaskGr.next() ?
changeTaskGr.getRowCount() : 0;
    var items = [];
    if (count > 0) {
      var msg = null;
      if (1 == count) {
        msg = gs.getMessage("{0} change task", [count]) + "";
      } else {
        if (count > LIMIT) {
          msg = gs.getMessage("More than {0} change task(s)",
[LIMIT.toString()]) + "";
        } else {
          msg = gs.getMessage("{0} change task(s)", [count])
+ "";
        }
      }
      var route = {
        route: 'simplelist',
        fields: {
          table: changeTaskGr.getTableName()
        },
        params: {
          listTitle: listTitle,
```

```
        query: changeTaskGr.getEncodedQuery()
      }
    };
    if (1 == count) {
      route = {
        route: 'record',
        fields: {
          table: changeTaskGr.getTableName(),
          sysId: changeTaskGr.getUniqueValue()
        }
      };
    }
    var item = {
      label: msg,
      type: 'route',
      value: route,
      "startsWith": {
        "icon": "change-outline",
        "align": "center"
      },
      "opensWindow": false,
      "configAria": {},
      "download": false
    };
    items.push(item);
  }
  return items;
```

4. Select **Update** and save the script include record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Create a task to verify if it is displayed as an upcoming task.
   For example, create a change task.

   a. From the **All** menu, navigate to **change_task.list**.

   b. Select **New**.

   c. Specify the required information.
      - Short Description
      - Description
      - Planned start date. You can specify today's date.
      - Assigned to. Specify the user for whom the upcoming task should appear.

   d. Select **Submit**.

   e. Verify that the task appears in the **Upcoming** section of the Service Operations Workspace landing page for the selected user.

Record page configurations in SOW for ITSM

You can configure the data available in record pages in Service Operations Workspace for ITSM.

Configure the incident record page in SOW for ITSM

Configure the data displayed in various incident tabs such as **Overview** and **Details** tabs.

Before you begin

Role required: workspace_admin, ui_builder_admin, or admin

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Configurations** tab, select the **Incident Management** option.
3. Select **Incident record** and then select **Configure** to configure any of the following tabs.
   - Overview: Configure any of the following options for the **Overview** tab.
     - Tab visibility for tier 1 agents: Configure the visibility settings to display the **Overview** tab for the tier-1 agents. You can also configure the user criteria to include or exclude users with other roles and user groups.

       Note:
       - By default, the **Overview** tab is displayed for the tier-1 agents.
       - When you choose to hide the **Overview** tab for the tier-1 agents, the **Details** tab opens by default.
       - This option is available only if the *glide.ux.user_criteria_enabled* property is **true**. For more information, see Enable the user criteria property.

     - Summary: Configure the fields layout, UI elements and the visible data content on the Summary section of the **Overview** tab.
     - Impact: Configure the fields layout, UI elements and the visible data content on the Impact section of the **Overview** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Cause: Configure the fields layout, UI elements and the visible data content on the Cause section of the **Overview** tab.
- Resolution: Configure the fields layout, UI elements and the visible data content on the Resolution section of the **Overview** tab.

- Details: Configure any of the following options for the **Details** tab.
  - Record: Provides further details on the incident record. Configure the fields layout, UI elements, and the visible data content of the **Details** tab using form builder.
  - New record: This layout appears when an agent creates an incident record. Configure the fields layout, UI elements, and the visible data content of the **Details** tab using form builder.

  For more information about configuring the field layout, UI elements and the visible data content using form builder, see Customize forms within a form component.

Configure the change record page in SOW for ITSM

Configure the data displayed in various Change record tabs such as **Overview** and **Details** tabs.

Before you begin
Role required: workspace_admin, ui_builder_admin, or admin

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. On the **Configurations** tab, select the **Change Management** option.
3. Select **Change record** and then select **Configure** to configure any of the following tabs.
   - Overview: Configure any of the following options for the **Overview** tab.
     - Containers: Defines how the dynamic overview page renders throughout the change lifecycle. This includes the visibility and the order of the sections in the overview page and whether to include the activity stream bar.
     - Section fields: Define the fields that are shown for each section in the change overview.
   - Details: Defines the form view that lets users see all details related to the change.

   For information about configuring the field layout, UI elements and the visible data content using form builder, see Customize forms within a form component.

Contextual side panel configurations in SOW for ITSM

You can configure the tabs available in the contextual side panel in Service Operations Workspace for ITSM.

Configure contextual side panel tabs in Service Operations Workspace

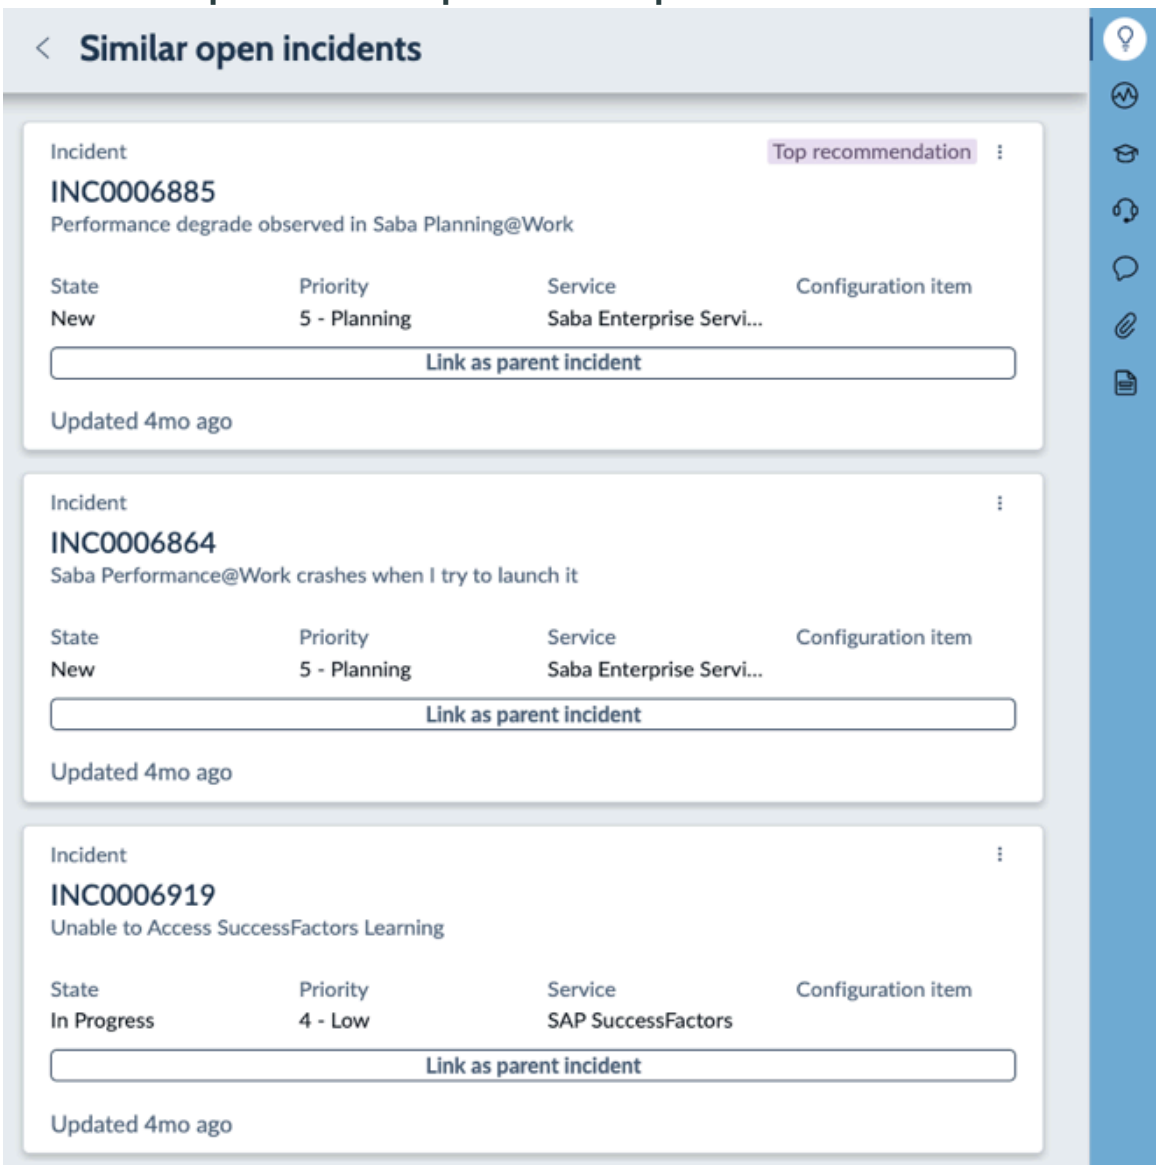
Add or delete tabs from the contextual side panel that is available in all record pages in Service Operations Workspace.

Before you begin
Role required: admin, workspace_admin, or ui_builder_admin

About this task
By default, all record pages such as an incident and interaction record page have a contextual side panel with multiple tabs in Service Operations Workspace. From these tabs, you can perform multiple tasks such as viewing the record information, collaborating through Microsoft Teams, viewing recommendations and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contextual side panel in Service Operations Workspace



Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the Experiences list, select **Service Operations Workspace**.
3. Under the Pages and variants list, select **SRP Record**.
4. From the left of the UI Builder area, navigate to **Body** > **Resizable panes** > **right**, and select **Tab sidebar**.
5. From the right of the UI builder, navigate to the **Config** > **Tabs**, and select the **SOW - sidebar tabs top**.
6. Select the icon to open the tab configuration.
   The pages and variants associated with contextual sidebar appears. For example, select the Agent assist SNC to add the Agent assist option in the sidebar.
7. Edit the screen condition for the UX screen.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the left of the page, select ☰ and navigate to **Developer** > **Open variant record**.

b. On the UX screen form, edit the **Screen Condition** field to add or delete records to get the tab to the required position.

c. Select **Update**.
You're redirected to the Dashboards page.

8. Edit the screen condition script for the UX screen by performing the following steps.

a. Select the previously opened tab of the UI Builder page, for example, the Agent assist SNC tab page.

b. From the left of the page, select ☰ and navigate to **Developer** > **Open variant record**.

c. From the UX Screen Conditions related list on the UX screen form, open the associated record.

d. Edit the **Script** field to add or delete conditions for records where you want the tab to be available.

e. Select **Update**.

Configuring Recommended Actions for ITSM in Service Operations Workspace

Enable an agent working on the relevant recommendations provided by Recommended Actions for ITSM.

The standard version of Recommended Actions for ITSM is provided as a new feature in Incident Management for the Service Operations Workspace application that is a part of Service Operations Workspace 3.0.

Existing users who upgrade to Service Operations Workspace 3.0 get the standard version of Recommended Actions for ITSM by default as a new feature. New users get the standard version of Recommended Actions for ITSM after installing the Service Operations Workspace ITSM Applications (sn_sow_itsm_cont) application from the ServiceNow Store.

Users on Service Operations Workspace 6.0 will receive the new standard plugin, Recommended Actions for ITSM (sn_itsm_ra), which includes its standard features.

For more information, see Getting started with Service Operations Workspace for ITSM. This plugin enables the standard recommended actions and offers the following recommendations:

- Open incidents (CI & Service)
- Similar Resolved incidents (CI & Service)
- Open PRBs (CI & Service)
- AI Search Recommendation

Note:
AI Search Recommendation is available for users using Service Operations Workspace version 5.0 and above versions.

To get the advanced version of Recommended Actions for ITSM, you must install the Advanced Recommended actions for ITSM (sn_sow_itsm_ra_adv) plugin, and you must procure the ITSM Pro package subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The best practice to get the advanced version is to install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription.

This plugin provides two Task Intelligence-based recommendations for Incidents: **Incident Fields value prediction (TI)** and **Similar Incidents (TI)**.

Note:
The Advanced Recommended actions for ITSM (sn_sow_itsm_ra_adv) and Task Intelligence Admin Console (com.sn_ti_admin) plugins are installed as a dependency.

Additionally, to get Predictive Intelligence -based recommendations, install the following plugins:

- Install the Predictive Intelligence for Incident (com.snc.incident.ml) plugin to install the Relevant problems solution definition-Similar open PRBs (Similarity). For information about this plugin installation, see Request Predictive Intelligence for Incident.
- Install the Problem Management for Service Operations Workspace (**com.snc.uib.sow_problem**) plugin to install the solution definition-Create Problem for Major incident.
- Install the Predictive Intelligence for Major Incident Management (com.snc.incident.mim.ml_solution) plugin to install the following IT Service Management solution definitions.
  - Propose major incident (Trend)
  - Similar major incident (Trend)

  For information about this plugin installation, see Request Predictive Intelligence for Major Incident Management.
- Install the Predictive Intelligence for Incident Management (com.snc.incident.ml_solution) plugin to install the following IT Service Management solution definitions.
  - Assignment group (Classification)
  - Configuration item (Classification)
  - Service (Classification)
  - Similar open incidents (Similarity)
  - Similar KB articles (Similarity)
  - Similar resolved incidents (Similarity)
  - Similar Incidents (TI)

  Note:
  Similar Incidents (TI) recommendation is available only from Service Operations Workspace version 6.0.

  For more information, see Request Predictive Intelligence for Incident Management.

Train solution definitions to predict recommendations for an incident. For information about training solution definitions, see Predictive Intelligence for Incident Management

For information about the training solution definition of Incident Fields value prediction (TI), see Task Intelligence for ITSM.

Recommendation Framework Deprecation

Recommendation Framework is now deprecated and no longer supported or available for new activation. Recommended Actions for ITSM feature provides the latest experience for this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

functionality. To get the advanced version, you must install the Advanced Recommended actions for ITSM (com.snc.uib.sow_itsm_ra_advanced) plugin and you must procure ITSM Pro package subscription.

Note:
The best practice to get the advanced version is to install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription. For more information, see Exploring Recommended Actions for ITSM in Service Operations Workspace.

Setting up Recommended Actions for ITSM

Set up recommended actions to display relevant recommendations in Service Operations Workspace.

Before you begin
Role required: admin

Procedure

1. Create a rule in Recommended Actions for ITSM.
   ITSM enables you to create new rules. For more information, see Create a rule in Recommended Actions.
2. Create a recommendation.

   ITSM enables you to create new recommendations. For more information, see Create a recommendation in Recommended Actions.
3. Create a resource generator.

   ITSM enables you to create new resource generators. For more information, see Create a resource generator in Recommended Actions.
4. Create Guidance and field recommendations.
   ITSM enables you to configure or create guidance and field recommendations. For more information, see Creating guidance and field recommendation in Recommended Actions.

Configure the Agent Assist tab in Service Operations Workspace

Enable or disable the Agent Assist tab in the contextual side panel for the required record type.

Before you begin
Role required: admin

Note:
Admin should be in Global Domain to edit the table configurations of Agent Assist in Service Operations Workspace.

About this task
Add or remove a record table from the screen condition and update the sys_id for the record to enable or disable the Agent Assist tab for that table.

Important:
Use this process if you're using a SOW version prior to 4.0. If you're using the version after 4.0, you can use **SOW Sidebar tabs top** Page collection to enable or disable the Agent Assist tab. For more information, see Configure the Agent Assist tab in Service Operations Workspace using the Standard Record Page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All**.
2. In the search box, enter `sys_ux_screen_type.list` and press Enter.
3. Select the filter icon ( ), enter **[Name] [contains] [Agent Assist]** and **[Application] [is] [Service Operations Workspace]**, and select **Run**.
4. Select the **Agent Assist** link.
5. From the **UX Screens** tab, select **Agent assist SNC**.
6. To update the Screen Condition and sys_id, do the following:

   a. On the UX Screen form, edit the **Screen Condition** field and add the record tables where you want the tab to appear.
   For example, you could add the following code for the interaction record.

   ```
   controller.sowrecordctrl.table=incident^ORcontroller.sowrecordctrl.table=problem^ORcontroller.sowrecordctrl.table=problem_task^ORcontroller.sowrecordctrl.table=change_request^ORcontroller.sowrecordctrl.table=change_task^ORcontroller.sowrecordctrl.table=kb_knowledge^ORcontroller.sowrecordctrl.table=interaction
   ```

   b. If you want to enable the Agent Assist tab, add the sys_id of the relevant table configuration in **Macroponent Configuration**.

   For more information, see Edit the table configuration for Agent Assist in Service Operations Workspace.

   c. Select **Update**.

7. To disable the Agent Assist tab for a record table, remove the record table from the **Screen Condition** field and sys_id of the relevant table configuration from the **Macroponent Configuration** field, and then select **Update**.

Edit the table configuration for Agent Assist in Service Operations Workspace

Edit the table configuration for Agent Assist to see the required search results in the Agent Assist tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

> **Note:**
> Admin should always be in Global Domain to edit the table configurations of Agent Assist in Service Operations Workspace.

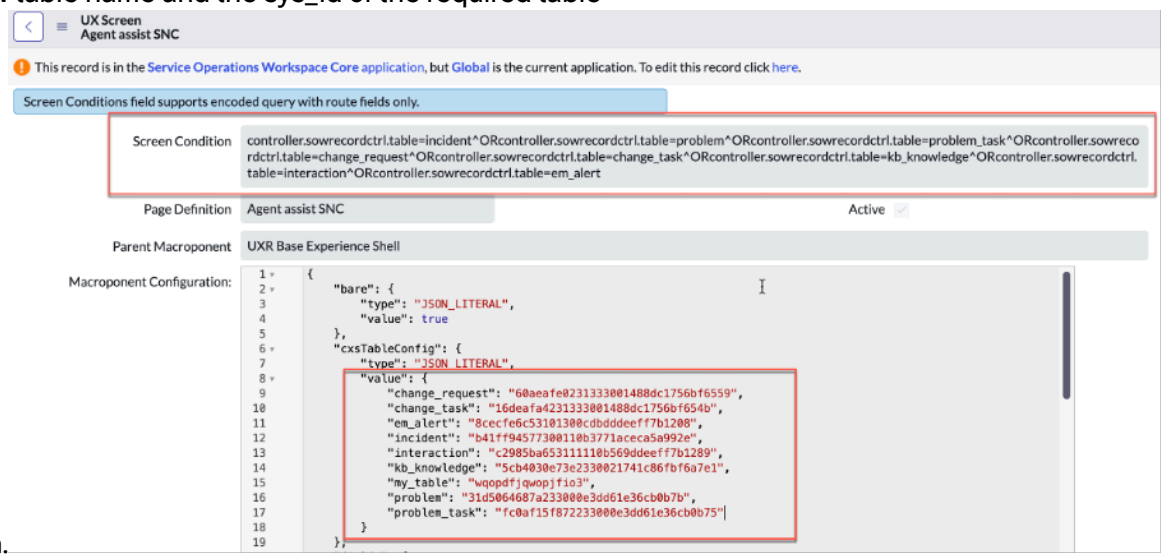
About this task
Update the table configuration to get the required search results.

To create a table configuration, see Configure table for a contextual search.

> **Important:**
> Use this process if you're using a SOW version prior to 4.0. If you're using the version after 4.0, you can use **SOW Sidebar tabs top** Page collection to enable or disable the Agent Assist tab. For more information, see Edit the table configuration for Agent Assist in Service Operations Workspace using the Standard Record Page.

Procedure
1. Navigate to **All**.
2. In the search box, enter `sys_ux_screen_type.list` and press Enter.
3. Select the filter icon ( ), enter **[Name] [contains] [Agent Assist]** and **[Application] [is] [Service Operations Workspace]**, and select **Run**.
4. Search for name containing: **Agent Assist** and Application is the workspace name: **Service Operations Workspace**.
5. Select the **Agent Assist** link.
6. From the **UX Screens** tab, select **Agent assist SNC**.
7. To add the property and relevant sys ID of the table configuration in the **Macroponent Configuration**, do the following:

   a. Enter the new table name and the sys_id of the required table configuration.



> **Note:**
> To copy the sys_id, navigate to **Table Configuration** > **Copy_sysid**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Select **Update**.
To enable or disable Agent Assist tab, see Configure the Agent Assist tab in Service Operations Workspace.

Customize the on-call support group recommendations

Configure the support group recommendations that should be displayed in the **Experts on-call** panel for an incident.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. From the Script Includes list, select **OnCallUtilsSow**.
3. To configure the support group recommendations, modify the **Script** field.
For information about how these groups are available for an incident, see Experts on-call in Service Operations Workspace.

```
getRecommendedGroups: function(table, sysId, fieldWatchList) {
  if(!table || !sysId) {
   return {};
  }

  var recommendedGroups = {};
  var gr = new GlideRecord(table);
  if (gr.get(sysId)) {
   var self = this;

   if (table == this.TABLES.INCIDENT) {
    fieldWatchList.forEach(function(watchField) {
     if (watchField.field == "assignment_group"
 && !recommendedGroups[watchField.value + ""] &&
 self._isOnCallDefinedForTheGroup(watchField.value)) {
      recommendedGroups[watchField.value + ""] =
 gs.getMessage("Recommended based on assignment group");
     } else if (watchField.field == "cmdb_ci") {
      var cmdbCiGr = new GlideRecord(self.TABLES.CMDB_CI);
      if (cmdbCiGr.get(watchField.value + "")) {
       if (cmdbCiGr.support_group
 && !recommendedGroups[cmdbCiGr.support_group + ""] &&
 self._isOnCallDefinedForTheGroup(cmdbCiGr.support_group + ""))
 {
        recommendedGroups[cmdbCiGr.support_group + ""] =
 gs.getMessage("Recommended based on affected CI");
       }
      }
     } else if (watchField.field == "business_service") {
      var businessServiceGr = new
 GlideRecord(self.TABLES.CMDB_CI_SERVICE);
      if (businessServiceGr.get(watchField.value + "")) {
       if (businessServiceGr.support_group
 && !recommendedGroups[businessServiceGr.support_group + ""] &&
 self._isOnCallDefinedForTheGroup(businessServiceGr.support_gr
oup + "")) {
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        recommendedGroups[businessServiceGr.support_group + ""]
= gs.getMessage("Recommended based on impacted service");
       }
      }
     }
    });
   }
  }

 return recommendedGroups;
}
```

4. Click **Update**.

Configure notifications in Service Operations Workspace

Customize notifications that are sent to an agent to update about various changes.

Before you begin

Role required: workspace_admin, notification_provider_admin, or admin

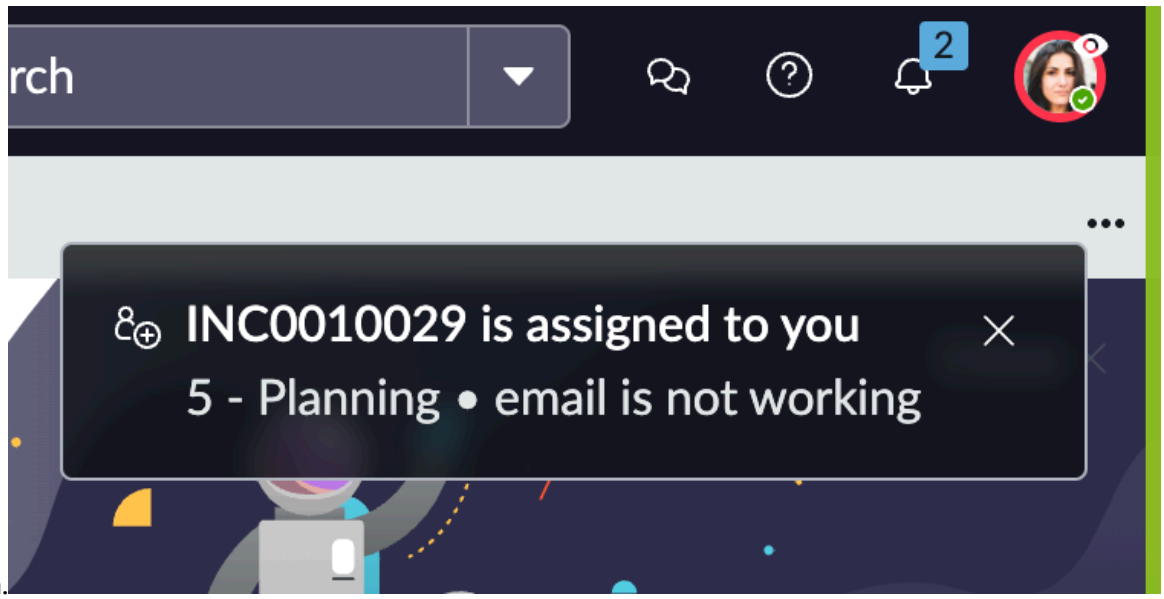
For delegation notifications, the Notification Provider for Next Experience plugin (com.glide.notification.provider.next.experience) must be installed.

About this task

An agent is notified in the following scenarios:

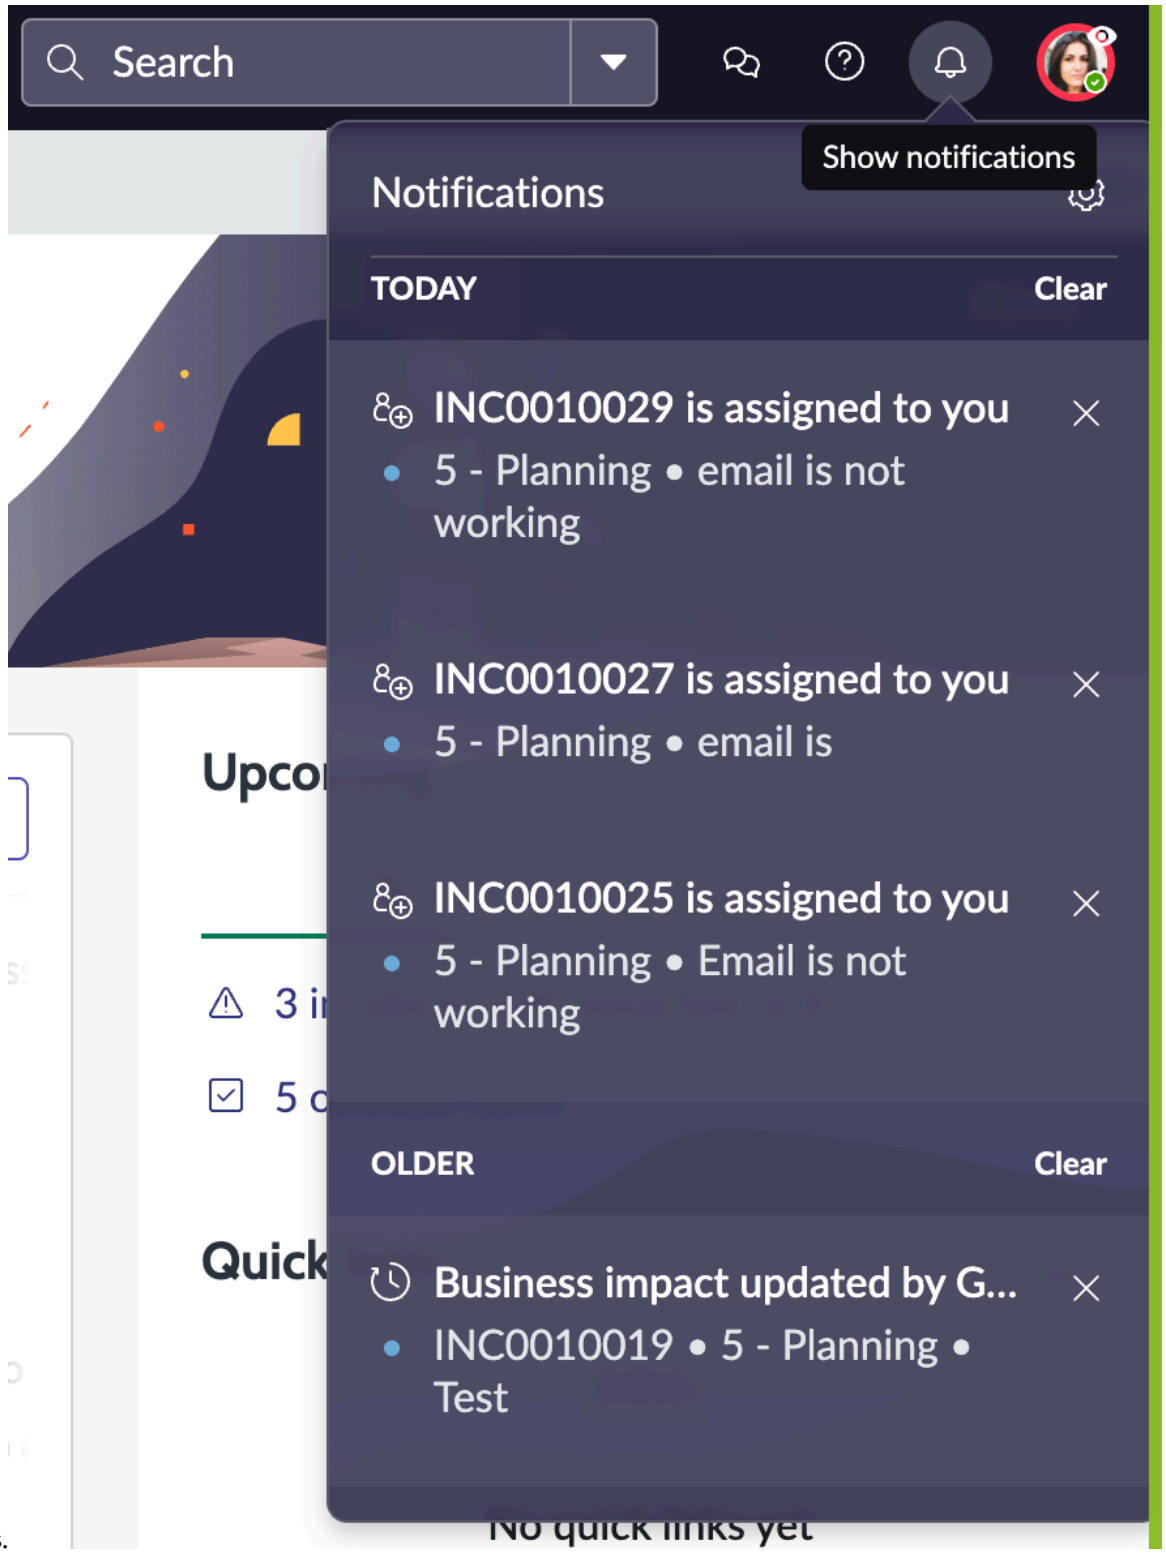
- A change request, incident, or problem assigned to an agent has any updates.
- A task is delegated to the agent.

The notification icon shows notification alerts. The icon shows a badge with notification count and new notifications for a short duration.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the notification icon to view the



notifications.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Administration** > **Notification triggers**.
2. To modify the notifications for incident, problem, and change updates, perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. From the list of notification triggers, select one of the following:
   - Incident notification
   - Problem notification
   - Change notification

   For information about default notification formats, see Default notification formats.

b. Edit the required information, such as the notification category, who to send it to and when to send it.

   Who to send and **When will receive** tabs contain the notification settings.

   Note:
   Keep in mind the following information when editing these notifications:
   - You can't edit the notification header.
   - The **Category** field of each type of notification must match that notification type so the notifications are categorized correctly for agents. For example, the **Category** field must be **Incident** for incident notifications. This step confirms that the notification is categorized in the notification preferences and agents can easily turn on and off all the notifications categorized under a category.

c. Select **Update**.

3. To modify the delegation notification, perform the following steps:

a. From the list of notification triggers, select **Delegation notification**.

b. Edit the required notification information, such as who to send it to, when to send it, its header and content.
   Who to send and **When will receive** tabs contain the notification settings.

c. Select **Update**.

What to do next

In email notifications, you can decide where the link to a record is redirected. Instead of a record automatically opening in the classic UI16 interface, the record can be opened in Service Operations Workspace (SOW). The ITSM Notifications Redirection (com.snc.itsm.notifications_redirection) plugin is installed and activated automatically to support this behavior. The record link in an email notification opens in SOW only if the following conditions are met:

- The **Redirect SOW Email notification** (*sow_email_notification_redirect*) system property is set to true.
- The user selecting the incident record link has the sn_sow_user role.

This feature is applicable for the following record types:

- Incident
- Problem
- Request

Configure search resources for an interaction

You can configure additional search resources for an interaction to assist agents with quick resolution of the interaction.

Before you begin

Role required: itil or interaction_agent

Procedure

1. Navigate to **All** > **Contextual Search** > **Search Contexts** > **Interaction (SOW)**.
2. Edit the Search Context Interaction (SOW) record.
   a. Search for a resource or combination of resources in the **Searcher** field and select the search resource that you want to add.
   b. Update the Searcher text field with the name that you want to give to the search resource.
   c. Save or update the record.
   The newly added search resource is available to be selected from the search resource filter in the Agent Assist window.

Setting up Major Incident Management in Service Operations Workspace

Set up Major Incident Management (MIM) to manage major incidents from the incident record page in Service Operations Workspace. A major incident (MI) is an incident that results in significant disruption to the business and has a high business impact.

A major incident demands a response beyond the routine incident management process. Major incidents have a separate procedure with shorter timescales and higher priority so there's a faster resolution process for incidents with high business impact.

Configuration overview

Setting up Major Incident Management in Service Operations Workspace involves installing Major Incident Management using Admin Center in Service Operations Workspace.

Admin Center in Service Operations Workspace gives admins centralized control of the instance. It provides quick access to manage all customizations in Service Operations Workspace for IT Service Management (ITSM) and additional plugins that extend the Service Operations Workspace for ITSM capabilities. For more information on Admin Center, see Admin Center in Service Operations Workspace for ITSM.

Activate Major Incident Management in Service Operations Workspace

Activate the Major Incident Management (app-sow-mim) plugin in Service Operations Workspace using Admin Center.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center **Overview** tab, in the Configure ITSM Core section, select the **Install** button under Major Incident Management.
3. In the pop-up window that lists plugins to be installed, select **Start Install**.

What to do next

After Major Incident Management has been activated, you can configure the available features by selecting the Configure option, which redirects you to the **Configuration** tab of the Admin Center. For more information, see Configuring Major Incident Management in Service Operations Workspace.

Configuring Major Incident Management in Service Operations Workspace

Configure the features in Major Incident Management to use and manage major incidents in Service Operations Workspace.

Configuration overview

Admin Center enables you to configure the following features in Major Incident Management:

- Major incident manager roles
- Major incident trigger rules
- Communication templates and plans
- Playbooks
- Email notifications
- Timeline configurations for a post incident report

Configure major incident trigger rules

Create and configure the trigger rules for a major incident to define the conditions for when a trigger action is executed. You can create major incident trigger rules to define the conditions under which an incident is automatically considered as a major incident candidate.

About this task

Major incident trigger rules are evaluated asynchronously each time a major incident is created or promoted from an incident, provided the following conditions are met:

- The incident record doesn't have the Parent Incident populated, which means that the current incident isn't a child incident.
- The major incident isn't proposed or accepted.
- The incident is active.

You can also configure major incident trigger rules to directly create a major incident, bypassing the candidate step.

Note:
Base system trigger rules are available.

Before you begin

The Major Incident Management plugin must be activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Overview** tab, select the **Configure** button in the Major Incident Management section.
- In the **Configurations** tab, select **Major Incident Management**.

The configuration page displays all configurable features in Major Incident Management. In the Trigger rules section, you can view the number of trigger rules that are configured and are currently active.

3. On the Trigger rule section, select **Configure**.
   The Trigger rules page displays a list of available trigger rules. You can select any available trigger rule and select the following actions:
   - Activate: Activates the selected trigger rule. The base system major incident trigger rules are inactive by default.
   - Delete: Deletes the selected trigger rule.
   - Deactivate: Deactivates the selected active trigger rule.
   - Copy: Copies the trigger rule along with the information. This option helps in creating a trigger rule using the data of an existing trigger rule.
4. Select **New**.
5. On the form, fill in the fields.

Trigger rules form

Field	Description
Name	Name of the trigger rule.
Table name	Table where the trigger rule is executed.
Action to take	Action taken on the incident when the trigger rule is executed. Possible values: ○ **Propose Major Incident**: Incident is proposed as a major incident candidate when the trigger rule is executed. After it's approved, the incident is promoted to a major incident. ○ **Promote Major Incident**: Incident is promoted directly to a major incident when the trigger rule is executed. **Note:** The **Create major incident from candidate** (*sn_major_inc_mgmt.com.snc.incident .min* system property creates different behaviors depending on which options are selected. When the system property is set to **Create new**, the following behaviors occur in relation to the **Action to take values**: ○ **Propose Major Incident**: The incident is proposed as a major incident candidate. After it's approved, a new major incident is

Field	Description
	created and the existing incident is marked as its child. ○ **Promote Major Incident**: A new incident is created and promoted to a major incident. The existing incident is marked as its child. When the system property is set to **Promote**, the following behaviors occur in relation to the **Action to take** values: ○ **Propose Major Incident**: The incident is proposed as a major incident candidate. After it's approved, it's promoted to a major incident. ○ **Promote Major Incident**: The existing incident is promoted to a major incident.
Application	Application scope of the trigger rule. The trigger rule is available for all applications or for scoped applications.
Execution order	The sequence that the rules are triggered. The rule with lowest execution order is triggered first. For example, a rule with order = 100 is executed first then a rule with order = 200. **Note:** If any of the existing trigger rule conditions are met, the incident is considered to be a major incident candidate. Verification of the remaining rules isn't required. Otherwise, all the rules are verified based on the execution order.
Active	Option to activate the trigger rule.
Conditions	Condition builder to set conditions that must be met to execute the trigger rule.

6. Select **Save**.
   The trigger rule is created and added to the list of available trigger rules.

Setting up communication templates and plans in Major Incident Management

Set up the communication templates and plans in Major Incident Management to help reduce the efforts and time spent in creating and composing communication at the various stages of a major incident. Effective communications with stakeholders help resolve major incidents.

Configure a communication template for email in Major Incident Management

Configure a communication templates for email in Major Incident Management to help reduce the efforts and time spent in creating and composing communication emails.

Before you begin

The Major Incident Management plugin must be activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.
   - In the **Overview** tab, select **Configure** for Major Incident Management.
   - In the **Configurations** tab, select **Major Incident Management**.

   The configuration page displays all configurable features in Major Incident Management.
3. In the **Communication Template** section, select **Configure email** to display a list of available communication email templates.
4. Select **New**.
5. On the form, fill in the details.

Configure Email form

Field	Description
Name	Name of the email template.
Table	Table where the email template is applicable. **Note:** By default, the value is the Incident Communication Task [incident_alert_task] table.
Application	Application scope of the email template. The email template is available for all applications or for scoped applications.
Execution order	The sequence that the templates are applied. The template with lowest execution order is applied first. For example, a template with execution order = 100 is applied first then a template with execution order = 200.
Condition	Condition builder that sets the conditions that must be met to apply the email template when composing email communications.
Content	
Subject	Subject line of the email.
Content Type	Content type of the email. Possible values:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **HTML**: Enables you to add links, multimedia, and other HTML content to the email. ○ **Plain Text**: Enables you to add only text and other text-related features, such as bold and italics.
Body	Content for the body of the email. **Note:** Based on the option chosen in the **Content Type** field, the **Body** field enables you to add text or HTML-related content.
Select Variables	Add field variables to the **Body**.
Recipients	
To	Users or recipient list to be added in the **To** section of the email.
Cc	Users or recipient list to be added in the **Cc** section of the email.
Bcc	Users or recipient list to be added in the **Bcc** section of the email.
Sender configuration	
From Generation Type	Generation type of the email sent. This value provides information about the email sender displayed on the **From** section of the email. Possible values: ○ **SMTP Email Account**: Email is generated and sent using the SMTP email account of the sender.The **From** section of the email sent displays the SMTP email account of the sender. ○ **Select from List**: The **From** section of the email sent displays the list of email addresses specified in the **Email Client from Address** field. ○ **Script**: Email is generated and sent using the script specified in the **Script For From** field. The From section of the email sent displays the sender name based on the script. ○ **Text**: The From section of the email displays the value specified in the **From** field. ○ **None**: The **From** section of the email sent displays no value.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Email Client from Address	Email address that is displayed on the **From** section of the email. You can add multiple email addresses. **Note:** This field is visible only if **From Generation Type** is set to **Select from List**.
Script For From	Script that is responsible for creating and sending the email. **Note:** This field is visible only if **From Generation Type** is set to **Select from List**.
From	Name or user that is displayed on the **From** section of the email. **Note:** This field is visible only if **From Generation Type** is set to **Select from List**.

6. Select **Submit**.

Configure a communications template for SMS in Major Incident Management

Configure a communication template for SMS in Major Incident Management to help reduce the efforts and time spent in creating and composing communication SMS.

Before you begin

Major Incident Management must be installed and activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.
   - In the **Overview** tab, select **Configure** for Major Incident Management.
   - In the **Configurations** tab, select **Major Incident Management**.

   The configuration page displays all configurable features in Major Incident Management.
3. In the **Communications Template** section, select **Configure SMS**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Notify SMS template page displays a list of available communication SMS templates. For more information on Notify, see Notify.

4. Select **New**.
5. On the form, fill in the details.

SMS configuration form

Field	Description
Name	Name of the SMS template.
Table	Table on which the SMS template is used. **Note:** By default, the value is the Incident Communication Task [incident_alert_task] table.
Template	Content added in the body of the SMS.
Select Variables	Field variables added to the **Template**.

6. Select **Submit**.
The SMS template record is added to the list of available communication SMS templates.

Configure a communication plan in Major Incident Management

Configure a communication plan and tasks for effective communication with various stakeholders about the progress, milestones, and issues related to the different stages of a major incident record.

Before you begin

The Major Incident Management plugin must be activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.
   - In the **Overview** tab, select **Configure** for Major Incident Management.
   - In the **Configurations** tab, select **Major Incident Management**.

   The configuration page displays all configurable features in Major Incident Management. In the Communication Plan subsection of the Communications section, you can view the number of configured communication plans and active communication plans.
3. In the Communication Plan section, select **Configure**.
The Communications plan page displays a list of available communications plan definitions. You can select any available communications plan and then select any of the following actions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Activate**: Activates the selected communications plans.
- **Delete**: Deletes the selected communications plan.
- **Deactivate**: Deactivates the selected active communications plan.
- **Copy**: Copies the communications plans along with the task information. This option helps when creating a communications plan using the data of an existing communication plan.

In case if no communication plans exist, the **Create a communication plan** option is displayed.

4. Select **New** to create a communication plan definition.

   For more information on creating a communication plan, see Define a communication plan.

   After a communication plan definition is created, the following related lists appear in the communication plan definition record:

   - Communication Task Definitions
   - Communication Contact Definitions

5. Select the Communication Task Definitions related list and then select **New** to create a communication task.

   For more information on creating a communication task, see Define a communication task.

6. On the Communication task record, select the required communication channel related link and define the communication channel.

   For more information on creating a communication channel, see Define a communication channel.

7. On the Communication plan definition record, select the Communication contact definition related list.
8. Select **New** to create a communication contact definition.

   For more information on creating a communication contact definition, see Define a communication contact.

Assign a playbook to Major Incident Management

Configure and assign playbooks to manage the major incidents process.

Before you begin

The Major Incident Management (MIM) plugin must be activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.
   - In the **Overview** tab, select **Configure** for Major Incident Management.
   - In the **Configurations** tab, select **Major Incident Management**.

   The configuration page displays all configurable features in Major Incident Management. In the Playbook section, you can view the number of assigned playbooks.
3. Select **Configure**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Playbook page displays the following tabs:

- **Assigned playbooks**: List of playbooks that are assigned to Major Incident Management.

  In the case that no playbook is assigned, the **Assign playbook** option is available so you can assign a playbook to Major Incident Management.

- **Available Playbooks**: List of playbooks that are available to be assigned to Major Incident Management.

4. On the configuration page, you can use the following options to assign a playbook to Major Incident Management.

Option	Description
Recommended playbooks	The recommended playbooks section dis plays the following two base system play books that are shipped with Major Incident Management: ○ **MI playbook**: Provides a simple and con cise interface for communication and col laboration, as well as for unplanned commu nication or collaboration features in sepa rate sections in a task-oriented view. This playbook is suggested for and can be used by upgrade customers. ○ **Advanced MI playbook**: Provides a simi lar interface to the MI Playbook but has ad vanced, configurable capabilities for com munication and collaboration, as well as un planned communication or collaboration placed under a single section. You can con figure the unplanned communication or col laboration section of the playbook to cre ate, add, and configure the communication plans, tasks, collaboration channels, and channel types as required using the Play books. For more information, see Designing a major incident playbook. Playbooks enables you to make the Advanced MI Playbook more flexi ble to use. This playbook is suggested for and can be used by new or zBoot customers. For more information, see Managing major inci dents using playbooks. You can assign and use any or both play books with Major Incident Management based on your requirements and usage. Use the *sn_sow.mim_playbook_ids* proper ty to add the sys_id of the playbook that you want to display under the playbook section and use for Major Incident Management. Select **View details** to view the playbook infor mation and then select **Assign to MIM** to as

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	sign the playbook to Major Incident Manage ment.
Available playbooks	Select the **Available playbooks** tab, then se lect **Playbook** and then select **Assign**. The selected playbook is assigned to Major Inci dent Management and is added to the list of assigned playbooks.
Create new playbook	Select the **Process Automation Designer** link in the Create new playbook section on the side panel to create a playbook or configure an existing playbook. For more information, see Designing a major incident playbook.

Designing a major incident playbook

Use Playbooks to design your own playbook by creating custom flows, and then configure trigger rules to activate the playbook for Major Incident Management.

Select the **Process Automation Designer** link in the Create new playbook section of the Assign Playbook page in Admin Center to open the Playbooks page. For more information on how to assign a playbook, see Assign a playbook to Major Incident Management.

The Playbooks home page displays a list of available processes including the following playbooks that are available in the base system:

- **MI Playbook** – This playbook is available in the **Published** state.
- **Advanced MI playbook** – This playbook is available in the **Draft** state. You can select the playbook and then select **Activate** to change the status of the playbook.

You can select **New** to create a playbook or select an existing playbook, such as the Advanced MI playbook, to add and configure the flows, activity, and trigger rules. You can do the following actions using Playbooks:

- Trigger rules - Select **Trigger** to set the trigger conditions in the condition builder under which a playbook gets attached to a major incident.
- Flows and UI layout – Use the options on the side panel to set the properties, create automation tasks and activities, add details and flows, and configure the playbook UI layout.
- Activity – Add activities to the playbook, such as unplanned communication or collaboration steps. Use the custom activity that is shipped as part of the base system to add and configure activities.
- Activate – Activate the playbook on the instance.
- Test – Test the playbook on the instance.

Configure email notifications in Major Incident Management

Configure the automated email notification alerts that are sent to major incident managers in the various stages of the major incident process. These stages include a change of state, assignment, or user group for a major incident.

Before you begin

The Major Incident Management plugin must be activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consider the following items when you create or update a notification:

- Your notification recipients must be active users and have a valid email address defined.

  ServiceNow® users or members of groups must be defined as active users in the User [sys_user] table. They must also have a valid email address defined for their primary device in the Notification Device [cmn_notif_device] table. If users don't have an active profile and a valid email address, they don't receive notifications.

- Your notification recipients must have the appropriate notification preferences enabled.

  Each user or group member must have the option to subscribe to the notification. They should have that option enabled in their notification preferences, along with the devices through which they want to receive the notification. Admins can impersonate users to review and configure their notification preferences. For more information, see Setting notification preferences in Core UI.

- To have your email notification also send as an SMS notification, recipients must subscribe to the notification on an SMS channel. For more information on creating an SMS channel, see Create notification channels.
- After you create or update the notification, use the **Preview Notification** option to examine it. For example, you can test links that you have added and verify the notification recipients. For details, see Preview email notifications.

Role required: admin

About this task

Use the following tabs in the Notification form to configure an email notification:

- When to send — Conditions required to send the notification.
- Who will receive — Recipients of the notification.
- What it will contain — Contents of the notification.
- What a digest will contain — Contents of the email digests if the notification can be delivered in a digest. For more information, see Email digests.

Note:
If you don't see all the fields on the form, select the **Advanced** view option in the related link section.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.
   - In the **Overview** tab, select **Configure** for Major Incident Management.
   - In the **Configurations** tab, select **Major Incident Management**.

   The configuration page displays all configurable features in Major Incident Management. In the Email notifications section, you can view the number of email notifications configured and in active status.
3. On the Email notification section, select **Configure** to display the list of available email notifications.
4. Select **New**.
5. On the Notification form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For a description of the field values, see Create an email notification.

6. Select **Submit**.

What to do next

Use the **Preview Notification** option to preview what notifications look like before you actually enable the instance to send them. For example, you can see:

- How the **Subject** and **Message** fields are displayed.
- Which users do or don't receive the notification, including the reasons why the users don't receive it.

For more information, see Preview email notifications.

Configure the timeline events for a Post Incident Report

Configure the incident information displayed as the event on the post incident report that is generated after a major incident is resolved. You can configure what information a post incident report must contain and how the information is arranged.

Before you begin

The Major Incident Management plugin must be activated in Service Operations Workspace. For more information, see Activate Major Incident Management in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, navigate to the configuration page for Major Incident Management through either the **Overview** tab or the **Configurations** tab.
   - In the **Overview** tab, select **Configure** for Major Incident Management.
   - In the **Configurations** tab, select **Major Incident Management**.

   The configuration page displays all configurable features in Major Incident Management.
3. On the Timeline configuration section, select **Configure**.
4. On the Timeline configuration page, configure the options.

   Review the sample timeline events displayed on the Preview (sample timeline) section. Based on the data, you can use the following options to modify the default settings of the timeline.

Timeline configuration

Option	Description
Incident Milestones	Option to include the following critical incident milestones in the timeline events of the post incident report: ○ Incident accepted as a Major Incident by an MI manager ○ Incident marked as Resolved
Order of events	Option to arrange the order of the incident events in a post incident report. Available options:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	○ Ascending – Order of events where the first event is placed at the top of the post incident report and the last event is displayed at the bottom of the post incident report. ○ Descending – Order of events where the last event is placed at the top of the post incident report and the first event is placed at the bottom of the post incident report. **Note:** The first and last event displays the date along with the time.
Event grouping	Option to group the events, which are within a short time interval. This option enables you to have a more concise post incident report.
Group events within	Time duration within which events that exist must be grouped.

Configuring Problem Management in Service Operations Workspace

Configure the features of Problem Management to manage problems and problem tasks in Service Operations Workspace

Configuration overview

It is recommended that you activate the Problem Management Best Practice — Madrid — State Model plugin (com.snc.best_practice.problem.madrid.state_model). For information about the plugin activation, see Activate Problem Management Best Practice — Madrid — State Model.

Note:

- The best practice states introduced in this plugin are not compatible with previous versions of Problem Management and require verification before this plugin can be activated.
- This plugin is activated by default for the new instances. If the plugin is not active on your instance, use the Problem Management migration utility to verify and migrate to this plugin. For information about the migration utility, see Migration Utility.

You can configure the problem record overview tab and its UI elements in the Service Operations Workspace Admin Center. For more information, see Manage configurations in Service Operations Workspace for ITSM.

Configure the problem form layout in Service Operations Workspace

Configure the problem form so that the information it collects is relevant to your organization's processes. You can easily modify the form to show only the fields, related lists, and other elements that you need.

Before you begin

Role required: admin or personalize_form

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > > **Problem** > **Create New**.
2. On the form context menu, select **Configure**, and then select **Form Builder**.
3. From the Default view list, select one of the following.
   - To customize the layouts of existing problem forms, select **Service Operations Workspace**.
   - To customize the layouts of new problem forms, select **Service Operations Workspace New Record**.
4. If the form is in a different application scope, select **Edit in original scope** before you start editing.

Configure the problem task form layout in Service Operations Workspace

Configure the problem task form so that the information it collects is relevant to your organization's processes. You can easily modify the form to show only the fields, related lists, and other elements that you need.

Before you begin

Role required: admin or personalize_form

Procedure

1. Navigate to **All** > > **Problem** > **Create New**.
2. On the form context menu, select **Configure**, and then select **Form Builder**.
3. From the Problem list, select **Problem Task**.
4. From the Default view list, select one of the following.
   - To customize the layouts of existing problem task forms, select **Service Operations Workspace**.
   - To customize the layouts of new problem task forms, select **Service Operations Workspace New Record**.
5. If the form is in a different application scope, select **Edit in original scope** before you start editing.

Configure problem modals shown during state transitions

Add the optional and mandatory fields necessary to move a problem record through its life cycle using the Form Builder.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > > **Problem** > **Create New**.
2. On the form context menu, select **Configure**, and then select **Form Builder**.
3. From the Default view list, select any of the following.

4. If the form is in a different application scope, select **Edit in original scope** before you start editing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure problem task modals shown during state transitions

Add the optional and mandatory fields necessary to move a problem task record through its life cycle using the Form Builder.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > > **Problem** > **Create New**.
2. On the form context menu, select **Configure**, and then select **Form Builder**.
3. From the Problem list, select **Problem Task**.
4. From the Default view list, select any of the following.

5. If the form is in a different application scope, select **Edit in original scope** before you start editing.

Configure properties for Problem Management in Service Operations Workspace

Configure the properties used to control process-related features, such as creating a problem task on a closed problem and re-analyzing a closed or a canceled problem.

Before you begin
Role required: admin or problem_manager

Procedure

1. Navigate to **All** > **Problem** > **Administration** > **Problem Properties**.
2. Adjust the properties as needed.
   For more information about the available options, see Problem management properties.

Create a task type for problem or change in Service Operations Workspace

Configure a task type that can be used during problem or change creation.

Before you begin
Role required: admin

About this task
If you extend problem task or change task to add your own task type, you can set the child of problem or change task as the target table. Depending on the default values you set in the child of problem task or change task, you need not pass any values.

For information about creating a change task, see Create a change task in Service Operations Workspace.

For information about creating a problem task, see Create a problem task in Service Operations Workspace.

Procedure

1. In the navigation filter, enter `sn_sow_interceptor_record_type_selector.list`.
2. From the Record Type Selectors list, select **New**.
3. On the Record Type Selector form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record Type Selector form

Field	Description
Applies to	Table that the task type applies to. Select Problem task [problem_task] or Change Task [change_task].
Order	Order of the task type in the Create problem task or Create change task dialog box.
Application	Scope of the application.
Active	Option for enabling the task type.
Title	Card title that is displayed in the Create problem task or Create change task dialog box.
Description	Card description.
Target table	Table where the record should be created when using this task type. **Note:** This field is not displayed if the table selected in the **Applies to** field does not have any child tables.
Values	Default values that are populated when creating a record using this task type.

Define priority lookup rules for Problem Management in Service Operations Workspace

Define the impact and urgency of the problem to calculate its priority. Use the priority calculation to prioritize your work and to drive service level agreements.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Policy** > **Rules** > **Priority Lookup Rules**.
2. Select **New**.
3. On the form, fill in the fields.
   For more information about the available fields, see Data lookup for prioritizing problems.

Enable Problem Management models in Service Operations Workspace

Enable the Problem Management models system property so that you can create and use custom models.

Before you begin

See considerations for enabling and disabling Problem Management models at Problem Management models in Service Operations Workspace.

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. From the Name column, search for `*models`.
3. Select the *com.snc.problem_management.models.enabled* system property.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Set the **Value** field to **True**.
5. Select **Update**.

Result
Problem Management models are enabled.

Create a problem model in Service Operations Workspace

Create custom Problem Management models with states and transitions tailored to your use cases.

Before you begin
See considerations for enabling Problem Management models at Problem Management models in Service Operations Workspace.

Enable the system property *com.snc.problem_management.models.enabled*. For more information, see Enable Problem Management models in Service Operations Workspace.

Role required: admin

Procedure
1. Open the Problem Models table in one of the following ways.
   - In the navigation filter, enter `prb_model.list`.
   - Navigate to **All** > **Problem** > **Administration** > **Problem Models**.

   Note:
   For more information about enabling menu items for Problem Management models, see Enable or disable an application menu or module.

2. Create a problem model.
   a. Select **New**.
   b. On the Problem Model form, fill in the fields.

      For more information, see Problem model form.

3. Choose the states for your custom model by selecting **Save** from the form context menu icon ( ).
   a. From the Model States context menu that appears, select **New**.
   b. On the Model State form, fill in the fields.

Model State form

Field	Description
State	State that you want to include in your model.
Initial state	Option to enable this state as the initial state for your model. This field is automatically

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	selected when you add the first state to your model.

c. Select **Submit** for each state you choose.

4. Apply a transition to each model state by selecting the display/hide hierarchical lists icon ( ).

a. From the Model State Transitions context menu, select **New**.

b. On the Model State Transitions form, fill in the fields.

Model State Transition form

Field	Description
From	State that the problem record is moving from.
To	State that the problem record is moving to.
Automatic transition	Option for enabling automatic transition to the problem record when the defined conditions are met. Selecting this option also prevents you from manually selecting the **State** field on the problem record.

c. Select **Submit** for each model state transition that you add.

5. **Optional:** Apply transition conditions by selecting any of your model state transitions.

a. From the Transition Conditions context menu, select **New**.

b. On the Model State Transition Condition form, fill in the fields.

(Optional) For more information, see Problem Management model state transition condition form.

c. Select **Submit** for each transition condition that you add.

Result

If you selected the **Default problem model** option in the Problem Model form, your custom problem model is used when new problems are created.

Create a problem task model in Service Operations Workspace

Create custom Problem Management models with states and transitions tailored to your use cases.

Before you begin

See considerations for enabling Problem Management models at Problem Management models in Service Operations Workspace.

Enable the system property *com.snc.problem_management.models.enabled*. For more information, see Enable Problem Management models in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

Procedure

1. Open the Problem Task Models table in one of the following ways.
   - In the navigation filter, enter `prb_task_model.list`.
   - Navigate to **All** > **Problem** > **Administration** > **Problem Task Models**.

   Note:
   For more information about enabling menu items for Problem Management models, see Enable or disable an application menu or module.

2. Create a task model.

   a. Select **New**.

   b. On the Problem Task Model form, fill in the fields.

   For more information, see Problem task model form.

3. Choose the states for your custom model by selecting **Save** from the form context menu icon ( ).

   a. From the Model States context menu that appears, select **New**.

   b. On the Model State form, fill in the fields.

Model State form

Field	Description
State	State that you want to include in your model.
Initial state	Option to enable this state as the initial state for your model. This field is automatically selected when you add the first state to your model.

   c. Select **Submit** for each state you choose.

4. Apply a transition to each model state by selecting the display/hide hierarchical lists icon ( ).

   a. From the Model State Transitions context menu, select **New**.

   b. On the Model State Transitions form, fill in the fields.

Model State Transition form

Field	Description
From	State that the problem task record is moving from.

Field	Description
To	State that the problem task record is moving to.
Automatic transition	Option for enabling automatic transition to the problem task record when the defined conditions are met. Selecting this option also prevents you from manually selecting the **State** field on the problem task record.

c. Select **Submit** for each model state transition that you add.

5. **Optional:** Apply transition conditions by selecting any of your model state transitions.

   a. From the Transition Conditions context menu, select **New**.

   b. On the Model State Transition Condition form, fill in the fields.

   (Optional) For more information, see Problem Management model state transition condition form.

   c. Select **Submit** for each transition condition that you add.

6. Create an interceptor for your model by entering `sn_sow_interceptor_record_type_selector.list` in the navigation filter.

   a. From the Applies to column, search for `=problem_task`.

   b. Select **New**.

   c. On the Record Type Selector form, fill in the fields.

   Record Type Selector form

Field	Description
Applies to	Set to **Problem Task [problem-task]** for creating problem task models.
Order	Order in which the associated model is displayed.
Title	Name of the model displayed on the button when creating problem tasks.
Description	Description of the model displayed on the button when creating problem task.
Active	Option to make the record type selector active.

   d. From the drop-down **Values** list, select **Model**.

   e. Select the search icon ( ) and select your custom problem task model from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. From the Condition list, select **Show Related Fields** at the bottom of the list.

g. From the Condition list of related fields, select **Problem → Problem fields**.

h. From the Condition list of **Problem → Problem fields** fields, select **Model**.

i. From the Condition list of operators, select **is not empty**.

j. Select **Submit**.

Result
Your custom problem task model is available as a choice in Service Operations Workspace for the roles specified in your model.

View the SLA details for problems

View the SLA details of a problem in the contextual side panel of Service Operations Workspace so that you can prioritize the problem and resolve it within the defined SLA timeline.

Before you begin
You must configure the Service Level Agreement (SLA) timer for Problem Management. Select from the existing **Problem resolution** and **Problem response** configurations, or create your own. For more information, see Configure the SLA timer and Create an SLA definition.

Role required: admin

Procedure

1. Navigate to **All** > **Problem** > **Workspace Configuration** > **Contextual Sidebar**.
2. From the **SLAs and timings** row, set the Active column value to **true**.

Result
The **SLAs and timings** card is visible within **Record information** in the Service Operations Workspace contextual sidebar.

Configure IT Agent Dashboard in SOW for ITSM

Configure the dashboard that provides performance over time metrics for both the logged-on user and their groups.

Before you begin
Role required: admin

Procedure

1. Navigate to the Service Operations Workspace landing page and select **IT Agent Dashboard**.
2. Duplicate the dashboard.
3. Select **Edit** to edit the dashboard.
4. Select **Add a tab**.
   For example, Demo tab.
5. Navigate to the **Your tasks** tab.
6. Select **Average Resolution time**.
7. Duplicate the data visualization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Scroll down to the duplicated widget and select **Move to a different tab**.
9. Select the tab that you have created, for example, the Demo tab.
10. Under the configuration side panel, select data sources.
    Th Edit data source screen is displayed where you can change the data of this widget.
11. In search sources, type problem, select problem table.
12. In filters, select the predefined filter.
    The predefined filter is PA. Source.Problems.Open.Notupdated90d.
13. Select **Apply**.
14. Update the metric to count.
15. Update Header & description to 'Problems not updated in 90 days'.
16. Save the dashboard and share it.

Configuring Service Operations Workspace for ITSM

Configure Service Operations Workspace so that agents can manage IT fulfillment volume efficiently.

For information about configuring Service Operations Workspace for ITOM, see Configuring Service Operations Workspace for ITOM.

Admin Center in Service Operations Workspace for ITSM

The Admin Center provides centralized control of the instance to admins. It provides effortless, quick access to manage all customizations in Service Operations Workspace (SOW) for IT Service Management (ITSM), and additional plugins that extend the Service Operations Workspace for ITSM capabilities.

The Admin Center provides a single page where an admin can access all platform capabilities, applications, plugins, and help. It consists of the following tabs:

- **Overview**: Provides access to all customizations available in Service Operations Workspace for ITSM.
- **Configurations**: Provides access to page-related customizations available in Service Operations Workspace for ITSM. For example, the landing page, incident record page, change management page.
- **Learning**: Provides access to learning resources to assist the admins in gaining a deeper understanding of SOW configuration. These resources are designed to provide users with the necessary knowledge and skills to effectively configure and manage SOW.

Manage configurations in Service Operations Workspace for ITSM

From a single page, quickly access and manage the configurations in Service Operations Workspace (SOW) for ITSM, access additional plugins that extend the Service Operations Workspace for ITSM capabilities, and access ServiceNow help.

Before you begin
Role required: sn_sow_itsm_admin.sow_admin_user, admin, change_manager

About this task
The Admin Center consists of the following tabs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Overview**: Provides access to all configurations available in Service Operations Workspace for ITSM.
- **Configurations**: Provides access to page-related configurations available in Service Operations Workspace for ITSM. For example, the landing page, incident record page, and modern change management page.
- **Learning**: Provides access to learning resources to assist the admins in gaining a deeper understanding of SOW configuration. These resources are designed to provide users with the necessary knowledge and skills to effectively configure and manage ITSM.

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. **Optional:** If not already installed, from the **Configure ITSM Core** section, install applications such as Incident Management.
3. Select any of the following options.

Migrate the existing charts to PAR dashboard in Service Operations Workspace for ITSM

You can migrate the common customizations and configurations of the existing dashboard to the Performance Analytics dashboard(PAR dashboard) using the on-screen migration utility. With this migration, you won't have to re-do the customizations for the PAR dashboard in Service Operations Workspace for ITSM to view the data.

Before you begin

Ensure that the scope is set as Service Operations Workspace ITSM Common before you perform the migration.

Note:
If you haven't customized the landing page, the system will be automatically migrated to the PAR dashboard. Once migrated, you can leverage the configuration options and features provided by the PAR dashboard.

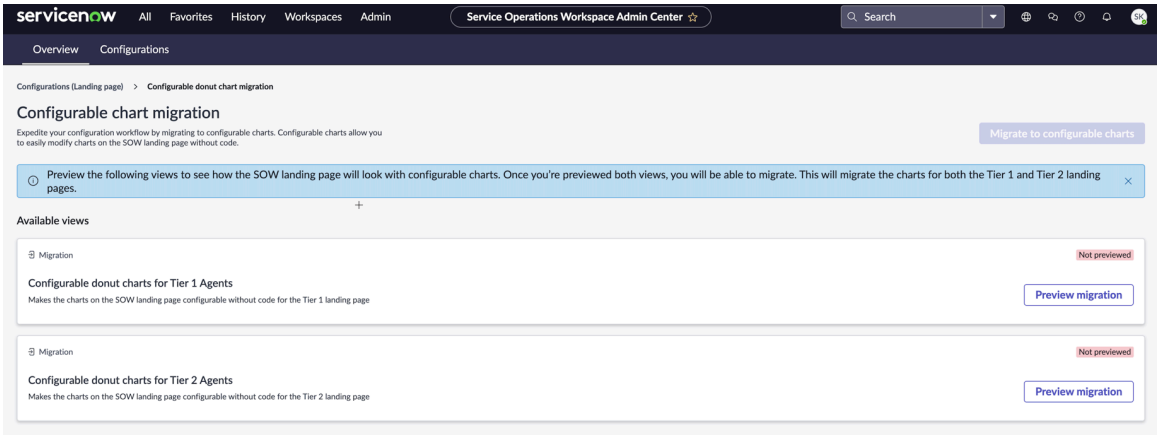
The modifications made by overriding the `sys_ux_client_script_include` methods for `SowIncidentLandingPageUtilsSNC` and `SOWLandingPageTier2UtilsSNC` are considered for migration. These changes are applied to `SowIncidentLandingPageUtils` for Tier 1 and `SOWLandingPageTier2Utils` for Tier 2 dashboards. If you've created the scripts to override the methods in the SNC version, you must copy those changes to the corresponding non-SNC scripts.

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. Select **Initial setup** > **Landing page**.
3. Select **Learn more** on the alert message that displays.
4. Select **Preview migration** to preview the chart that will be migrated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The preview of the dashboard containing the customized charts opens in a new tab. Once you preview the dashboard, the label is updated from **Not previewed** to **Previewed**.

5. Select **Migrate to configurable charts**.

   On the confirmation dialog box, select **Yes, migrate** to migrate the charts to the PAR dashboard.

   Upon successfully migration, the label is updated as **Complete**. You can view the updated charts in the PAR dashboard in the SOW landing page.

> **Note:**
> You can perform the migration only once.

Customize the Service Operations Workspace for ITSM landing page

You can customize the data displayed in sub pages of the landing page that is available in the base system. For any visual styling changes, you need to create a copy of that landing page and edit it.

Create a copy of the Service Operations Workspace landing page

Make visual styling changes to the sub pages in the Service Operations Workspace landing page.

Before you begin

Role required: admin or ui_builder_admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the **Experiences** list, select **Service Operations Workspace**.
3. Under **Pages and Variants** section, under **Home**, point to **Service desk landing page SNC**, and select ⋮.
4. Select **Duplicate variant** .
   - A copy of the Service Operations Workspace landing page, along with its subpages, is created under the **Variants** section.
   - The copy of the landing page is created in the scope of the current logged-in user.
5. To edit the page or any of its subpages, customize its components.
   For information about components, see Work with components .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure Service Operations Workspace landing page

Modify the landing page of the Service Operations Workspace to ensure that the customers can view the page that they use regularly.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. From the UX Applications list, select **Service Operations Workspace**.
3. For the Admin Panel field, select the ⓘ icon.
4. Select **Open Record**.
5. On the UX App Configuration Service Operations Workspace page, edit the **Landing Path** field to modify the landing page.
   To redirect the user to the Service Operations Workspace home page, enter the value *`home`*.
   To redirect the user to the Service Operations Workspace list page, enter the value *`list`*.

Assign the service desk agent role to the user in Service Operations Workspace

Assign the service desk agent role to users to enable them to manage incidents, fulfill service requests, and offer user support.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. On the Admin Center page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Initial setup** section.
   - In the **Configurations** tab, select **Initial setup** > **Service desk agent role**.

   The Service Desk Agents page displays the following tabs:
   - **Service Desk Agents**: List of users who have the service desk agent role.
   - **Available groups and users**: List of all available users in the system.
3. Select the **Available groups and users** tab.
4. Select a group to assign all the users in the group with the service desk agent role.

   Select a user to assign the service desk agent role.
5. Select **Assign service desk agent role**.

Result
The selected users are assigned with a service desk agent role.

Reorder the navigation pane modules in Service Operations Workspace for ITSM

Quickly access the navigation pane modules in Service Operations Workspace for ITSM. For example, Home, List, Inbox, and so on.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the **Experiences** list, select **Service Operations Workspace**.
3. On the Service Operations Workspace page, select **Settings** at the top.
4. On the Experience Settings: Service Operations Workspace page, navigate to the **Side navigation** section.
   This section displays all modules left navigation pane modules in Service Operations Workspace for ITSM.
5. Drag the modules in the required order.

Configure a record page tab in Service Operations Workspace

Configure the display order of a record page tab in Service Operations Workspace.

Before you begin
Role required: workspace_admin, ui_builder_admin, or admin

About this task
The record pages (incident, problem, change, and so on) in Service Operations Workspace have multiple tabs. Few tabs such as the **Overview** tab of the incident record page are specific to a record page. Few other tabs are common across multiple record pages in multiple workspaces, for example, the **Details** tab. The Details tab is associated with incident, change, problem, and other record pages in multiple workspaces.

When you modify the order of a common tab in multiple record pages and workspaces, the changes are applicable in all those records and workspaces.

Procedure

1. From the **All** menu, navigate to **sys_ux_app_route.list**.
2. From the UX App Routes list, select the tab record that you want to modify.
   - To modify the order of a common tab. For example, the **Details** tab, select **Record Details Tab**. Any changes that you make are applicable to the **Details** tab in all associated record pages in multiple workspaces.
   - To modify the order of a record page-specific tab. For example, the **Overview** tab of the incident record page in Service Operations Workspace, select **Overview** whose **App Configuration** is **Service Operations Workspace** and **Parent macroponent** is **Record Page Tabs**. Any changes made are applicable only to the **Overview** tab of the incident record page in Service Operations Workspace.
3. On the UX App Route form, modify the **Order** field.
   If the UX App Route form doesn't contain the Order field, add the Order field to the form. For more information about adding a field to the form, see Show or hide fields on a form.
4. Select **Update**.

Configure a task record form in Service Operations Workspace

Configure a task record form in Service Operations Workspace by modifying the form layout or related lists from the classic ServiceNow AI Platform user interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
A task record, for example, problem or incident, has the following editable views in Service Operations Workspace.

- The view while creating the record.
- The **Details** tab view after the record is saved.

Procedure
1. Open a task record, for example, in an incident or problem, in the classic ServiceNow AI Platform user interface.
2. Perform any of the following actions.

3. On the task record form, for example, in an incident form, select the additional actions icon (☰) and perform any of the following actions.

4. Move the required fields and related lists from the **Available** list to the **Selected** list.
5. Select **Save**.

Configure the inbox in Service Operations Workspace

Enable an agent to receive and respond to chat conversations initiated from Service Portal.

Before you begin
Role required: admin

Procedure
1. Install the Advanced Work Assignment plugin (com.glide.awa).
2. Install the Agent Chat plugin (com.glide.interaction.awa).
3. Configure the Agent Chat Queue.
   For example, to add agent groups who can handle the incoming chat conversations. For information about configuring queues, see Work item queues and Set up Agent Chat.

Enable automatic assignment of interactions to an agent

Automatically accept chat conversations for an agent without having to accept or reject them in the inbox.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Advanced Work Assignment** > **Settings** > **Assignment Rules**.
2. Select the Chat - Most Capacity assignment rule.
   For information about AWA assignment rules, see Configure agent assignment rules.
3. In the Auto-assign handling related list, perform the following tasks.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the **Enable auto-assign work items** check box.

b. From the **Display options** list, select the required value.

- Inbox card: Accepts the interactions and adds them to the agent inbox. Agent can open the accepted interaction from the inbox.
- Inbox card and workspace tab: Accepts the interactions and opens a tab for each accepted interaction.

4. Click **Update**.

AI Search in Service Operations Workspace for ITSM

Intelligent query features enable you to quickly find the answers that you require. The Next Experience Unified Navigation search field enables you to search multiple record types and switch between global search results and results from the workspace applications that you can access.

For information about AI Search, see AI Search.

For information about installing and configuring AI Search in Next Experience, see Install AI Search for Next Experience.

The following configurations are added for the AI Search experience in Service Operations Workspace.

- A search application configuration, [AIS]. For information about search application configurations, see Search application configurations. To modify the card layout of the AI Search results, you can modify its EVAM definition, AI Search for Next Experience. Search for and add an EVAM configuration bundle. For information about the EVAM definition, see Configuring EVAM definition.
- A search profile. For information about search profiles, see AI search profiles.

Note:

- AI Search experience is available in Service Operations Workspace starting in version 1.3.
- AI Search for Service Operations Workspace version 1.3 is compatible with the SR - PlatformX - Search - AI Search for Next Experience Bundle - v2.0. For all upgrade scenarios, use the Guided Setup for Zing to AI Search Migration module and ensure that the following conditions are met:
  - New search sources should be indexed.
  - The search profile should be published.
  - AI Search should be enabled.

  For information about using Guided Setup for Zing to AI Search Migration, see Configuring AI Search for Next Experience.
- Ensure that the search engine is set to AI Search. To set the AI Search, ensure that the *globalSearchDataConfigId* UX page property value is set to the sys_id of the AI Search, `6fcaa8d770a45110f877edb72a2fbd2f`.

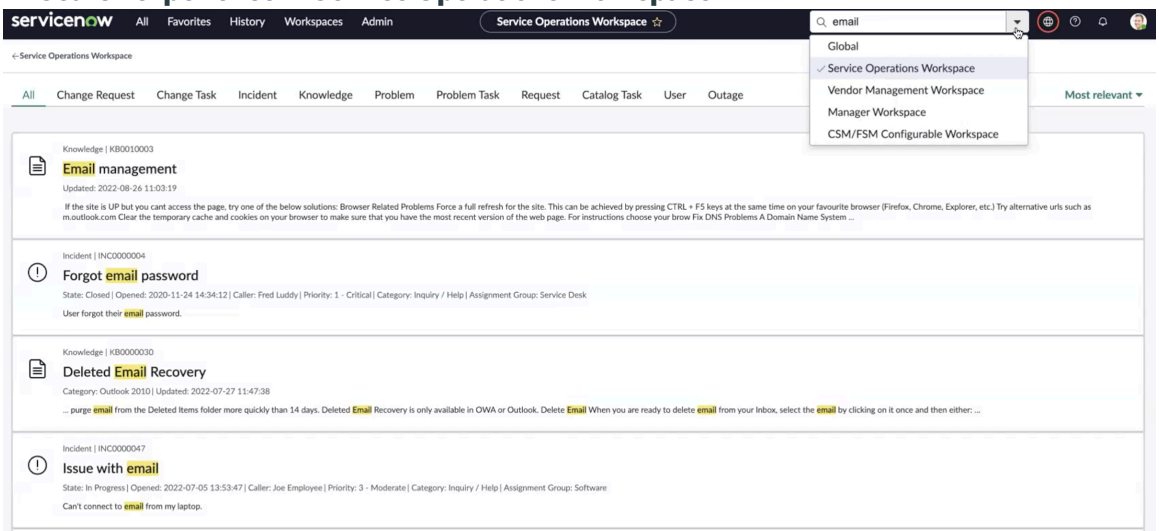
- Genius results display the most relevant information and actions for a search query using Genius Result cards. The genius result cards appear alongside the regular search results. For

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

more information about genius results, see Genius Results. By default, Service Operations Workspace supports the Q&A genius result configuration. If it isn't active, ensure the following:

- Ensure that the version of AI Search for Next Experience is 3.0 or later.
- Ensure that the Q&A genius result configuration is in an Active state. For more information about the Q&A genius result configurations, see Q&A Genius Results.

AI Search experience in Service Operations Workspace



You can customize the AI Search experience by adding a data source, editing a search profile, and so on, by using the AI Search Guided Setup. For information on using this guided setup, see Configuring AI Search.

Configure Standard Record Page in Service Operations Workspace

Configure individual record pages to display information and help them to update the customization easily.

A Standard Record Page (SRP) is the basic format in which records appear in the Service Operations Workspace. These record pages have containers, components, modals, and other layouts that display the record information.

Service Operations Workspace contains incidents, cases, and tasks that an agent requires for daily work. SRP provides a basic structure that displays record information, such as a communication interface and suggestions for resolution. It provides the following constructs that help in customization:

- Presets: Presets are the pre-configured mappings inside the record pages. When you add a new component to the record page, the presets associated with the component are also added to the record page. You can configure presets to components by selecting the lock icon of a configuration. A copy or duplicate of the component contains these preset values.
- Controllers: Controllers are the base scripts that help implement a record page's functionality. When you create a copy or duplicate of the record page, SRP establishes a reference to the original controller. You can't modify the base functionality of the record page. However, you can modify the record page using the scripts and states according to your requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If you are on a version prior to 4.0, you can change the Incident record page using **Record SNC** in the UI Builder.
- ServiceNow doesn't recommend customizing the Incident record page using methods such as **Record SNC** or **SRP Record**. So, no support is provided for record page customizations.

Adding Declarative Actions on the Standard Record Page

Adding declarative actions on the Incident page and the tabs inside the incident record page using the Standard Record Page (SRP) in the Service Operations Workspace.

Before you begin

Role required: admin

About this task

Declarative actions help you to modify the list actions, related list actions, and field decorators available in the Service Operations Workspace. For more information about creating declarative actions and how to use them, see Declarative actions.

Along with the declarative actions customizations, the SRP or Standard Record Page also modifies the add-on events in the Incident records and the tabs inside the records.

Procedure

1. Navigate to **All** > **sys_ux_addon_event_mapping.list**.
2. From the UX Add-on Event Mappings list, go to the required event mapping.
   You can add two types of declarative actions mappings.
   - Declarative action mappings without using the parent macroponent. This option uses the controllers for the mappings.
   - Declarative action mapping using the source element ID and the parent macroponent. This option doesn't use the controllers.

   For example, to modify the form declarative action to create a change, go to the **Form Create Change task** for which the **Parent Macroponent** is empty. Similarly, you can add the declarative action for inline tabs inside an incident. For example, to add a declarative action to add a change request to the Related Records list, go to **SOW Related list Add Change Request** for which the **Parent Macroponent** is empty.

   Note:
   To add declarative action to page collection tabs such as Overview, add Handled events in the UI Builder. Map this event to the event in the UX Add-on Event Mappings list using the Source element ID.

3. Add the following information to modify the action.

Field	Description
Source Component	The component emits the source event. For example, the Action bar.
Source Declarative Action	Declarative actions used as the source event
Controller	A controller that handles the target event. For example, Form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Target Event	Handled event that the mapping in *`Target Payload mapping`* targets
Target Payload Mapping	The binding of the container and the type of the event

Custom Modal Migration in Standard Record Page

Modify the modal containers inside a record page in the Service Operations Workspace.

Before you begin
Role required: admin

About this task
Standard Record Page (SRP) provides options to modify the different modals used inside Service Operations Workspace. You can duplicate the modals in the page collection and modify them according to your requirement.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Under the Experiences list, select **Service Operations Workspace**.
3. Under the **Pages and Variants** section, under **Record**, select **SRP Record**.

   Note:
   If you are on a version prior to 4.0, you can navigate from **Record SNC** in **UI Builder** to modify the **Overview** tab of an Incident record page.

4. From the left of the UI Builder, navigate to **Modals and popovers** > **Modals**, and select **Modal Container (Viewport)**.
5. From the right of the UI Builder, navigate to **Configs** > **Page collection**.
   There are two options available under Page collections.
   - Record Page Modals: Select this option to modify modals across all experiences.
   - SOW Record Page Modals: Select this option to modify the modals used in Service Operations Workspace.
6. Select the icon to open the variants provided.
7. Select the icon to create a page or to add a new variant to a page.
   For more information about creating a page and variant, see Learn UI Builder by example

Modify the Record Page in the Service Operations Workspace using the Standard Record Page

Configure the order number and screen conditions of a record page using the Standard Record Page (SRP) in the Service Operations Workspace.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Every record page contains an order number, which can be active or inactive. A default record page must be active and have the lowest order number. Service Operations Workspace displays the record with the lowest active order number as the default record page.

SRP also provides ways to add screen condition mappings when a page appears.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Under the Experiences list, select **Service Operations Workspace**.
3. Under the **Pages and Variants** section, under **Record**, select **SRP Record**.

   Note:
   If you are on a version prior to 4.0, you can navigate from **Record SNC** in **UI Builder** to modify a record page.

4. Under **Contents**, in the **Body** level, select **Main Tab**.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. If the new copy is in a different application scope, select **Edit in original scope** before editing.

6. From the right of the page, navigate to **Config** > **Tabs**.
   SRP record has four types of tabs for customization.
   - Page Collection: Contains the pages and variants associated with the record page.
   - Inline tabs: Inline tabs and the Page collection tab contain the code related to a page.
   - Related List: Contains the details of the records associated with the record. The related list is a static tab, and you can't modify the order of this tab.
   - Repeater tabs: Contains the details of the tabs that recur throughout the page. The repeater tab is a static tab, and you can't modify the order of this tab.

   These tabs help in changing of the page layout. For example, if you want to add a tab that appears before the **Details** tab, you can change the **SOW - Record tabs left**. Similarly, to add a tab after the **Details** tab, you can modify the **SOW - Record tabs middle**.

7. To modify and view the pages and variants inside each tab, select the ⊡.
8. Under the Pages and Variants list, select the required page.
   For example, inside the Page collection tab, select Incident Overview SNC.

   Note:
   The data, events, and mappings in the **Config** and **Events** tabs can't be modified.

9. From the top of the page, select the ☰ open menu icon.
10. To modify the order of the record, perform the following steps.

    a. Select the **Settings** tab

    .

    b. To modify the display order of the record, edit the **Order** value.
    The variant with the lowest order is considered the default configuration.

11. To modify the variant ordering, perform the following steps.

    a. Navigate to **Developer** > **Open variant collection record**.

    b. Under the UX Screens list, modify the *Order* field.
    The default variant has the lowest order value.

    c. Select **Update**.

12. To modify the **Screen Conditions** of the record page, perform the following steps.

    a. Navigate to **Developer** > **Open variant record**.
    The conditions of the screen appear in the *Screen Condition* field.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. To modify or add a new UX Screen condition, navigate to the UX Screens conditions list.

c. Select the screen condition.

d. Enable the *Scripted Condition* field.

e. Modify the *Script* and *Parameter Mapping* fields to set the screen conditions according to your requirements.

f. Select **Update**.

Configure the Agent Assist tab in Service Operations Workspace using the Standard Record Page

Enable or disable the Agent Assist tab in the contextual side panel for the required record type using the Standard Record Page (SRP) in Service Operations Workspace.

Before you begin

Role required: admin

Note:
Admin should be in Global Domain to edit the table configurations of Agent Assist in Service Operations Workspace.

About this task

Add or remove a record table from the screen condition, update the sys_id for the record, and update the script conditions to enable or disable the Agent Assist tab for that table.

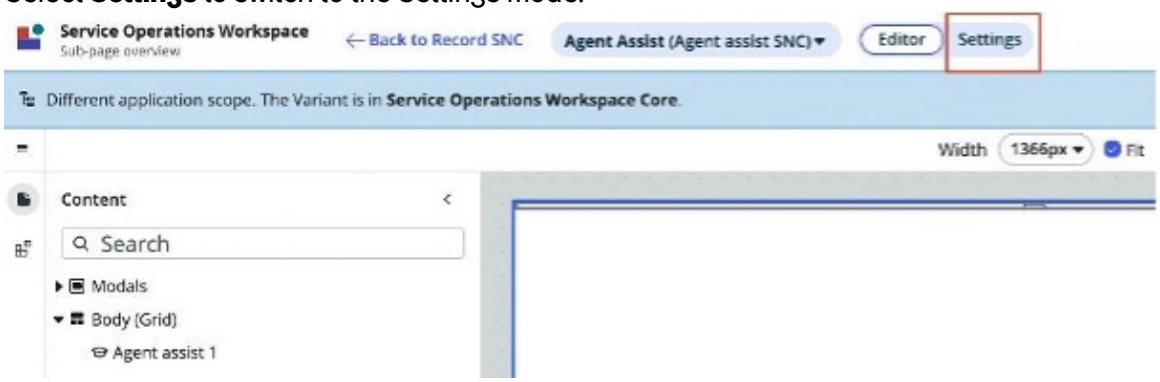
Important:
If you are on a version prior to 4.0, see Configure the Agent Assist tab in Service Operations Workspace.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the Page Collections list, select **SOW Sidebar tabs top**.

   Note:
   The **SOW Sidebar tabs top** Page collection is used in the Service Operations Workspace SRP record page.

3. From the Pages and variants list in the Record section, select **Agent Assist SNC**.
4. Select **Settings** to switch to the Settings mode.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. To update the Script Conditions, do the following:

   a. Select the **Scripted Screen Conditions** icon ( ) to open the script conditions.

   b. Under **Active** column, select **True**.

   c. If you want to enable the Agent Assist tab for a record table, add the required script to the **Script** field and select **Update**.

   d. If you want to disable the Agent Assist tab for a record table, remove the script from the **Script** field and select **Update**.

6. To update the Screen Conditions and sys_id, do the following:

   a. From the **Open records** drop-down list, select **Variant record**.

   b. On the UX Screen form, edit the **Screen Condition** field and add the record tables where you want the tab to appear.
   For example, you could add the following code for the interaction record.

```
controller.sowrecordctrl.table=incident^ORcontroller.sowrecordctrl.table=problem^ORcontroller.sowrecordctrl.table=problem_task^ORcontroller.sowrecordctrl.table=change_request^ORcontroller.sowrecordctrl.table=change_task^ORcontroller.sowrecordctrl.table=kb_knowledge^ORcontroller.sowrecordctrl.table=interaction
```

   c. If you want to enable the Agent Assist tab, add the relevant sys_id of the table configuration in **Macroponent Configuration**.
   For more information, see Edit the table configuration for Agent Assist in Service Operations Workspace using the Standard Record Page.

   d. If you want to disable the Agent Assist tab, remove the sys_id of the relevant table configuration in **Macroponent Configuration**.

   e. Select **Update**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Edit the table configuration for Agent Assist in Service Operations Workspace using the Standard Record Page

Edit the table configuration for Agent Assist to see the required search results in the Agent Assist tab using Standard Record Page (SRP) in Service Operations Workspace.

Before you begin

Role required: admin

About this task

Update the table configuration using to get the required search results.

To create a table configuration, see Configure table for a contextual search.

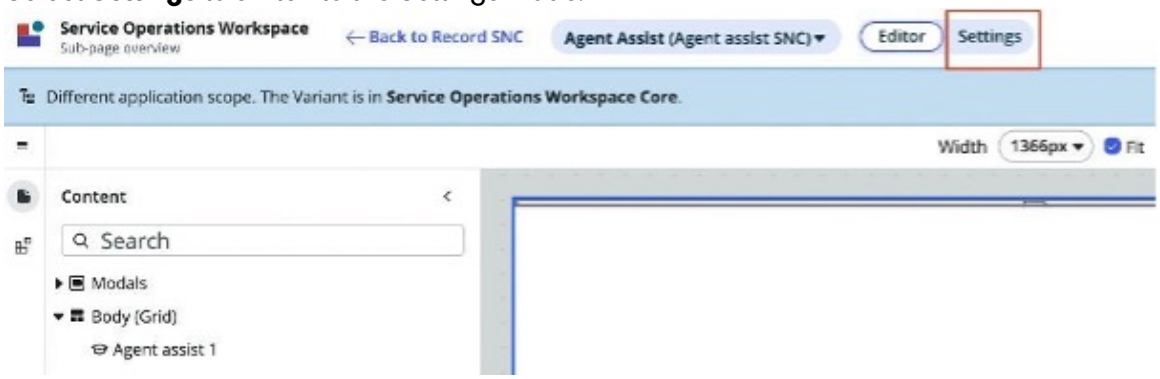
Important:
If you are on version which is prior to 4.0, Edit the table configuration for Agent Assist in Service Operations Workspace.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the Page Collections list, select **SOW Sidebar tabs top**.

   Note:
   The **SOW Sidebar tabs top** Page collection is used in Service Operations Workspace SRP record page.

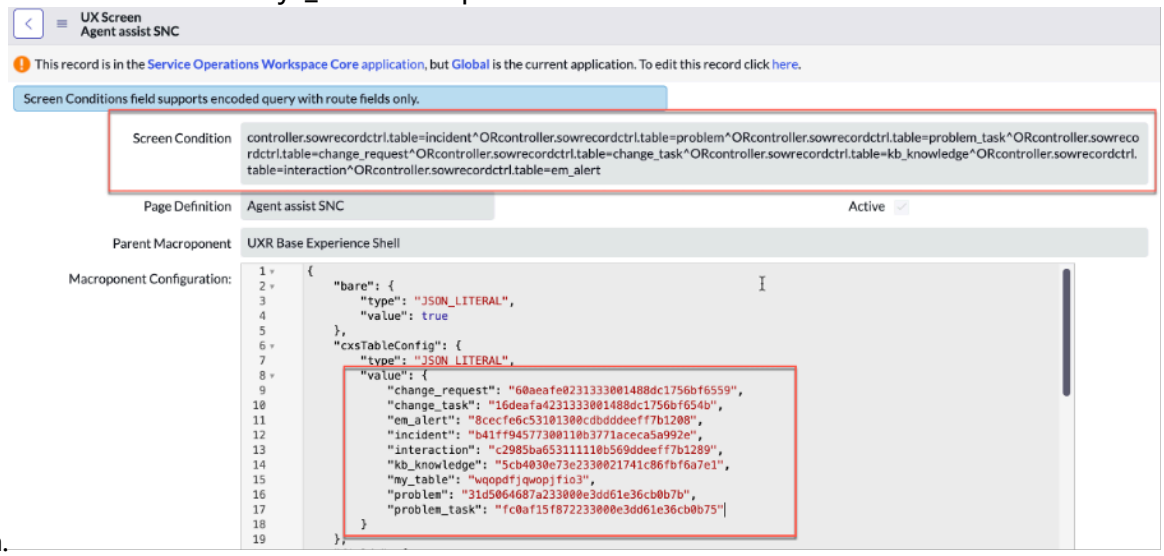
3. From the Pages and variants list in the Record section, select **Agent Assist SNC**.
4. Select **Settings** to switch to the Settings mode.



5. From the Open records drop-down list, select **Variant record**.
6. In the UX screen form, add the property and sys ID in the **Macroponent Configuration** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter the new table name and the sys_id of the required table configuration.



> **Note:**
> To copy the sys_id, navigate to **Table Configuration** > **Copy_sysid**.

b. Select **Update**.

> **Note:**
> To enable or disable Agent Assist tab, see Configure the Agent Assist tab in Service Operations Workspace using the Standard Record Page.

Configure the SOW list page

Configure the *fuzzyCount* property to modify how the number of records is displayed on the SOW list page thus improving system performance.

About this task

On the SOW list page, right-click on a record to use the following options:

- Copy URL: Copy the URL of the record to a clipboard and share the record URL with other stakeholders.
- Copy sys ID: Copy the sys ID of the record to a clipboard and share the sys ID of the record with other stakeholders

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. From the list of UX applications, select **Service Operations Workspace**.
3. On the UX Application form, from the UX Page Properties related list, select the *fuzzyCount* property.
4. On the UX Page Property page, edit the **Value** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

fuzzyCount

Value	Description
{"default":-1}.	Displays the count of the total number of records in an application. {"default":<integer>}.	Displays the count of the number of records in an application as <integer+>. For example, if the incident has 124 records, if you configure the value of the property as 10, the system displays the count of incidents as 10+. 
5. Select **Update**.

Define and customize activity stream tags

Define and customize the activity stream tags for the record pages in Service Operations Workspace. The tags helps in filtering the activity from the activity streams as required.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Now Experience Framework** > **Experiences**.
2. Search and select Service Operations Workspace.
3. On the Service Operations Workspace UX registry record, from the UX Page Properties related list, select **activityStreamProps**.
   By default, the activity stream UX page property record contains no tag information.
4. Edit the activity stream UX page property record.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Enter the following tag information in the **Value** field to define and customize your tags.

   - Color - Color of the tag.
   - Icon - Icon type of the tag.
   - Labels - Label name of the tag.
   - Tables - Table to which the tag is applied such as incident or interaction.

   For more information on how to use the correct values to customize the tags, see Create tags for the Activity stream.

6. Select **Update**.

Configure the Assign or Resolve dialog box for an incident or change request in Service Operations Workspace

Customize the fields displayed in the Assign and Resolve dialog box for an incident in Service Operations Workspace. Customize the fields displayed in the Assign dialog box for a change request in Service Operations Workspace.

Before you begin

Role required: admin

About this task

Important:

- For an incident, you can customize the fields in the Assign and Resolve dialog boxes.
- For a change request, you can customize the fields in the Assign box.
- Only the fields that are configured in the Service Operations Workspace view can be added to the Resolve or Assign dialog boxes.
- Any pre-configured client scripts and UI policies configured for the customized fields are also applicable on the Resolve or Assign dialog boxes.
- The fields in the Assign, Reassign and Resolve dialog boxes do not support field decorators.

Procedure

1. Configure the Assign dialog box.

   a. Open an incident or change request in Core UI.

   b. On the incident form or the change request form, select the additional actions icon (☰) on the header.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Navigate to **View** > **SOW Assign Modal**.
The record is opened in the SOW Assign Modal view.

d. Select the additional actions icon (☰) on the header.

e. Navigate to **Configure** > **Form Layout**.

f. Move the required fields from the **Available** list to the **Selected** list.

g. Select **Save**.

2. Configure the Resolve dialog box.

a. Open an incident in Core UI.

b. On the incident form, select the additional actions icon (☰) on the header.

c. Navigate to **View** > **SOW Incident Resolve Modal**.
The record is opened in the SOW Incident Resolve Modal view.

d. Select the additional actions icon (☰) on the header.

e. Navigate to **Configure** > **Form Layout**.

f. Move the required fields from the **Available** list to the **Selected** list.

g. Select **Save**.

Customize the incident record page

You can customize the **Overview** tab and the contextual side panel for an incident.

Customize the Overview tab for an incident

Modify the **Overview** tab of an incident record page to display the summary and other information of the incident for an agent.

Before you begin

The demo data should be installed.

Role required: workspace_admin, ui_builder_admin, or admin

About this task

You can customize which fields are displayed on the various sections, such as Summary, Cause, and Resolution, in the **Overview** tab. Customize the fields by configuring the **SOW-Incident-Overview** view on the Incident form using the form layout or form design feature in the ServiceNow AI Platform.

Note:
You must only configure the fields on the **SOW-Incident-Overview** view that are also available on the **Service Operation Workspace** view on the Incident form in the ServiceNow AI Platform.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For advanced customization of the **Overview** tab with SRP record, use the following procedure.

Procedure

1. Navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. From the Experiences list, select **Service Operations Workspace**.
3. In the Pages and Variants section under **Record**, select **SRP Record**.

   Note:
   If you're on a version prior to 4.0, you must navigate from **Record SNC** in UI Builder to customize the **Overview** tab of an Incident record page.

4. Under **Contents** in the **Body** level, select **Main Tab**.

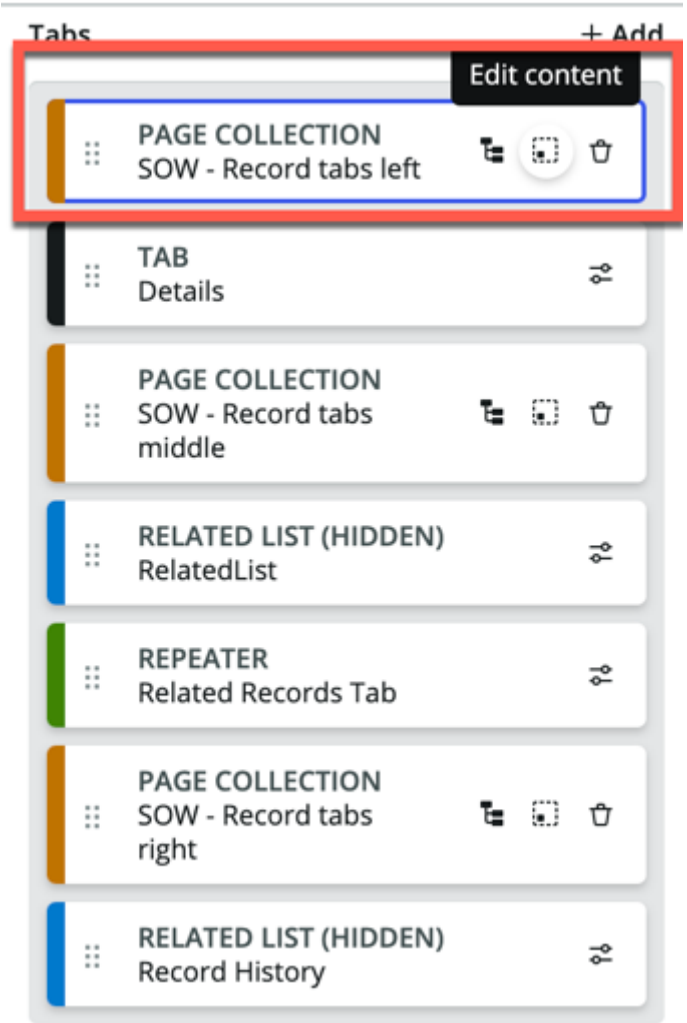
If the new copy is in a different application scope, select **Edit in original scope** before you start editing.

5. In the Config section under Tabs, point to the **Page Collection SOW - Record tabs left** tab and select the Edit content icon ( ).



6. Under **Overview**, point to the **Incident Overview SNC** variant and select the options icon ( ).
7. Select the duplicate variant icon ( ).
   The Variant creation page is displayed.
8. Enter the Name as `Incident Overview SNC Copy`.

   An error is displayed for the **Conditions** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Resolve this error by performing the following steps:

   a. Close the Variant creation page.

   b. Under **Overview**, point to the **Incident Overview SNC** variant, select the options icon (⋮), then select **View settings**.

   c. Select **Open records**, then select **Variant record**.
   The Incident Overview SNC record is displayed.

   d. Edit the record, copy, and store the information from the **Screen Condition** field, then remove the information.
   You use the information from the **Screen Condition** field in the later steps.

   e. Select **Save** and close the record.

   f. Repeat steps 6 through 9.
   No error is displayed for the **Conditions** field.

   g. Open the Incident Overview SNC record again.

   h. Edit the record and paste the **Screen Condition** information copied previously.

   i. Select **Save** and close the record.

10. On the Variant creation page, select the **Settings** tab.
    If the new copy is in a different application scope, select **Edit in original scope** before you start editing.
11. Edit the **Order** value to modify the display order of the variants,
    The variant with the lowest number is the default configuration.
12. **Optional:** Add the criteria to display a page or tab in **Variant conditions**.
13. Select **Save**.
14. Select the **Editor** tab to start editing the page components for customizing the **Overview** tab.
    a. Select the **Body** level of the **Content** tree next to the main page area of UI Builder.
    b. Edit the page by configuring components as required.

    For more information on working with pages, see Work with pages.

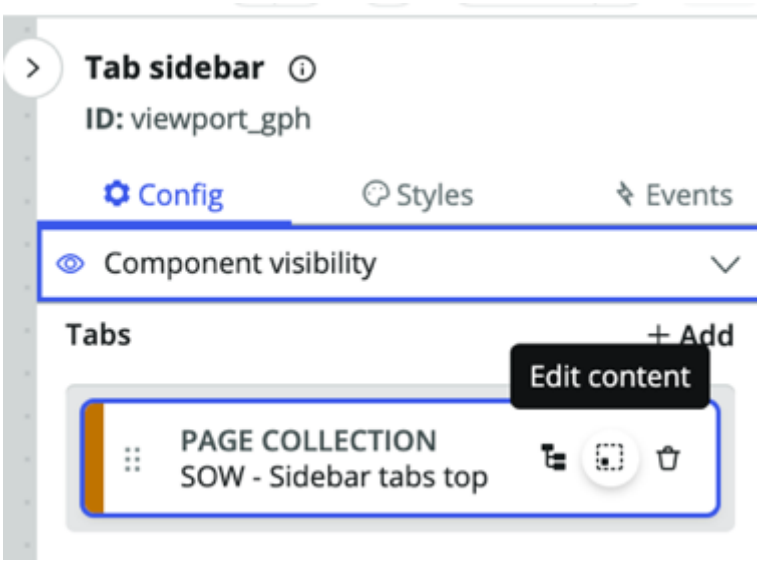
5. In the Config section under Tabs, point to the **Page Collection SOW - Sidebar tabs top** tab and select the edit content icon ( ).



6. Under **Record Information**, point to the **Record Information SNC** variant and select the options icon ( ).

7. Select the duplicate variant icon ( ).
   The Variant creation page is displayed.

8. Enter the Name as `Record Information SNC copy`.

   An error is displayed for the **Conditions** field.

9. To resolve this error, perform the following steps:

   a. Close the Variant creation page.

   b. Under **Record Information**, point to the **Record Information SNC** variant, select the options icon ( ), and then select **View settings**.

   c. Select **Open records** then select **Variant record**.
      The Record Information SNC record is displayed.

   d. Edit the record, copy and store the information in the **Screen Condition** field, and then remove the information.
      You use the information from the **Screen Condition** field in the later steps.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Save**.

f. Repeat steps 6 to 9.
No error is displayed for the **Conditions** field.

g. Open the Record Information SNC record again.

h. Edit the record and paste the **Screen Condition** information copied previously.

i. Select **Save** and close the record.

10. On the Variant creation page, select the **Settings** tab.
If the new copy is in a different application scope, select **Edit in original scope** before you start editing.
11. Edit the **Order** value to modify the display order of the variants.
The variant with the lowest number is considered as the default configuration.
12. **Optional:** Add the criteria to display a page or tab in **Variant conditions**.
13. Select **Save**.
14. Select the **Editor** tab to start editing the page components for customizing the incident information in the contextual side panel.
    a. Select the **Body** level of the **Content** tree next to the main page area of UI Builder.
    b. Edit the page by configuring components as required.

    For information on working with pages, see Work with pages.

Customize the display of service level agreements for an incident

Configure the display of service level agreement (SLA) information in the incident record page.

Before you begin

Role required: admin

The following SLA timer configurations display the response and resolution SLA for an incident.

- Incident Response
- Incident Resolution

You should configure SLA timer configuration mappings for these timer configurations. For information on how you can configure these mappings, see Configure the SLA timer.

Procedure

1. Navigate to **System Definition** > **Script Includes**.
2. From the Script Includes list, select **SOWIncidentInfo**.
3. In the **Script** field, modify the display information for SLAs.

```
getSLAConfig: function() {
        var config = [{
                "configId": "af871ab3532730102d05ddeeff7b124f",
                "slaTimerLabel": gs.getMessage("Response SLA"),
                "timeLabel": gs.getMessage("Time to respond")
            },
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            {
                "configId": "aca7d6b3532730102d05ddeeff7b12ec",
                "slaTimerLabel": gs.getMessage("Resolution
SLA"),
                "timeLabel": gs.getMessage("Time to resolve")
            }
        ];
        return config;
    },
```

For information about how the SLA information is displayed for an incident, see View service level agreement information for an incident.

Enable inline editing for lists in Service Operations Workspace

Enable quick updates for field values in a list in Service Operations Workspace.

Before you begin

Role required: admin

About this task

If the Hardware Asset Management Professional plugin (com.sn_hamp) is installed, you should enable inline list editing to specify asset actions for a configuration item (CI) from the Affected CI related list of an incident.

Procedure

1. From the **All** menu, navigate to **sys_properties.list**.
2. For the *glide.lists.inline_editing_enabled* property, set the **Value** field to `true`.
3. Click **Update**.

Customize the Investigate tab

Customize on how the CI related metrics information is displayed on the **Investigate** tab of the Incident record.

Before you begin

Role required: script_include_admin

About this task

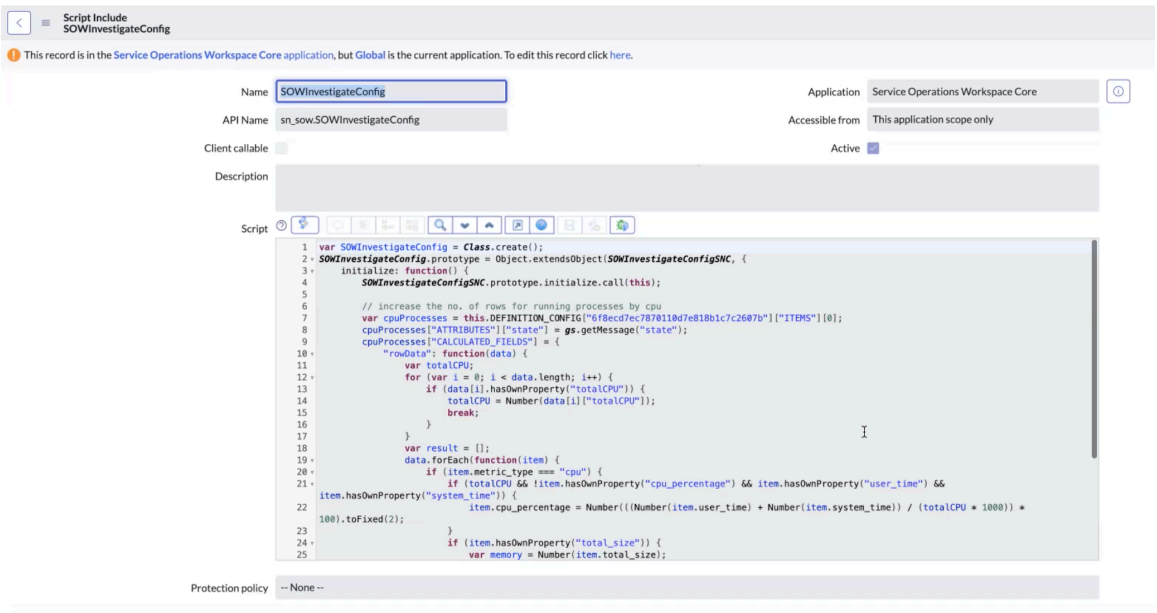
Use this task to customize and configure the **Investigate** tab of the Incident record to do the following:

- Add, remove or customize the view of the CI metrics information on the Investigate tab. For example, remove Asset Utilization metrics or add a new metric to the Investigation tab.
- Modify the threshold (warning or critical) values of the metrics.
- Modify the label names of the metrics.
- Change the units in which the metric values are displayed.
- Add or remove rows and columns from the metric information cards.
- Add, remove or rename the remedial action labels.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

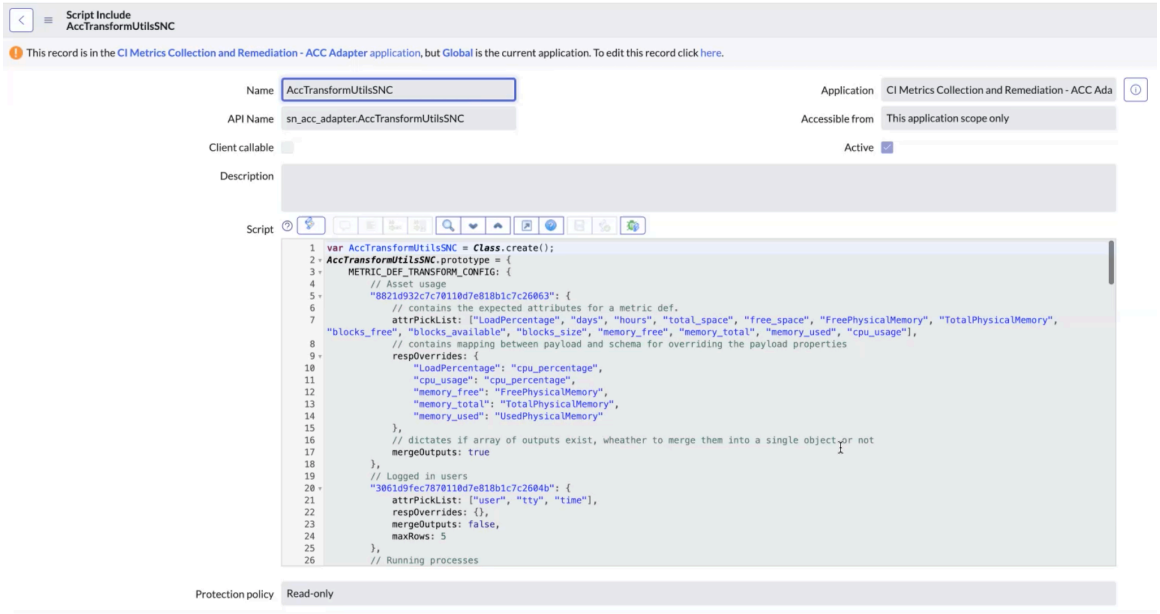
1. Navigate to **All** > **System Definition** > **Script Includes**.
2. From the script Include list, select **sn_sow.SOWInvestigateConfigSNC**.
3. Copy the required function from the **Script** field.
4. From the Script Includes list, select **sn_sow.SOWInvestigateConfig**.
   For example, refer the screen shot for sn_sow.SOWInvestigateConfig script include record.



5. In the **Script** field, paste the required function and edit to customize the UI elements that are displayed on the different sections of the **Investigate** tab.
   The `sn_sow.SOWInvestigateConfigSNC` script include record contains the configuration that is required to render the Investigate tab UI. Use this script include record as a reference to override the configuration as required, using the `sn_sow.SOWInvestigateConfig` script include record.
6. Click **Save**.
7. From the Script Includes list, select the provider specific script include SNC record.
   - **sn_acc_adapter.AccTransformUtilsSNC** for Agent Client Collector for Investigation (ACC).
   - **sn_mecm_adapter.MecmTransformUtilsSNC** for Microsoft Endpoint Configuration Manager for Investigation (MECM).
8. Copy the required function from the **Script** field.
9. From the Script Includes list, select the provider specific script include record.
   - **sn_acc_adapter.AccTransformUtils** for Agent Client Collector for Investigation (ACC).
   - **sn_mecm_adapter.MecmTransformUtils** for Microsoft Endpoint Configuration Manager for Investigation (MECM).

   For example, refer the screen shot for sn_acc_adapter.AccTransformUtils script include record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



10. In the **Script** field, paste and edit the script to configure the display of the metrics information on the customized UI of the **Investigate** tab.
    The `sn_acc_adapter.AccTransformUtilsSNC` script include record contains the configuration such as which data to store and how much data must be displayed on the Investigate tab UI. Use this script include record as a reference to override the configuration as required, using the `sn_acc_adapter.AccTransformUtils` script include record.
11. Click **Save**.

What to do next

On the **Investigate** tab of the Incident record in the Service Operations Workspace, click the get latest metrics icon ( ) to refresh and view the customizations. For more information, see Incident Management in Service Operations Workspace.

Configure the collection rules for the Investigate tab

Configure the collection rules and map the rules to the metric definitions in the Investigate Framework module. This configuration enables you to define when the CI related metrics information is automatically retrieved on the **Investigate** tab of the Incident record.

Before you begin

Agent Client Collector for Investigation (sn_acc_adapter) and Investigation Framework (sn_invest_fwk) must be installed on the instance to view the Investigate Framework module. For more information, see Install Agent Client Collector for Investigation.

The Agent Client Collector framework (sn_agent) plugin must be installed on the instance, and Agent Client Collector must be installed to the affected CI. These installations are required to view the **Investigate** tab on the Incident record and the CI related metrics information displayed on the **Investigate** tab of the Incident record. For more information on the Agent Client Collector framework plugin and the installation, see Agent Client Collector Framework and Agent Client Collector installation.

Role required: sn_cimaf.sn_cimaf_admin or sn_invest_fwk.sn_investigate_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Metrics and CI Actions Framework** > **Administration** > **Collection Rules**.
2. Click **New**.
3. On the form, fill in the fields.
   Trigger conditions are conditions under which the collection rule is activated. These conditions trigger the automatic retrieval of the CI related metrics information on the **Investigate** tab of the Incident record.

Collection Rule form

Field	Description
Name	Name of the collection rule.
Active	Option to activate the collection rule. This option is selected by default.
Trigger Conditions	
Source table	Table where the collection rule is applicable. For this task, select **Incident**.
CI field	Type of CI applicable to the source table. For this task, select **Configuration item**.
Table conditions	Condition builder to define the criteria for the fields related to the incidents under which the collection rule is triggered.
CI class	Class of the affected CI associated with the incident.
CI conditions	Condition builder to define the criteria for the fields related to the CI under which the collection rule is triggered.
Allow matching CI extensions	Option to enable the selection of the child CI classes associated with the selected CI class. For example, if the **CI class** is set as **cmbi_ci_computer**, and if the **Allow matching CI extensions** option is selected, then you can select CI classes such as the cmbi_ci_computer server that is a child CI of cmbi_ci_computer.

4. Click **Submit**.
   The collection rule is created.
5. Click the collection rule record.
6. On the Collection Rule Metric Associations related list, click **New**.
   Use the Collection Rule Metric Associations related list to associate and map the collection rule with the metric definition (information).
7. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Collection Rule Metric Associations form

Field	Description
Collection rule	Collection rule that you want to map with the metric definition.
Metric definition	Metric definition that you want to map with the collection rule. Metric definition is the CI related metrics information for which you want to implement the collection rule.

Note:
You can configure multiple collection rules with multiple metric definitions.

8. Click **Submit**.

Result
The collection rule is created and mapped to the metric definition. When the collection rule is triggered, the mapped metric definition is retrieved and displayed on the **Investigate** tab of the Incident record. The configured collection rule is triggered only when the **Configuration Item** field is modified on the Incident record.

Setting up Investigation Framework in Service Operations Workspace

Set up the Investigation Framework in Service Operations Workspace to enable the display of the CI metrics information on the **Investigation** tab of the Incident records.

Setting up investigation framework using Agent Client Collector for Investigation

Set up the Investigation Framework in Service Operations Workspace using the Agent Client Collector for Investigation adapter to enable the display of the CI metrics information on the **Investigation** tab of the Incident records.

You must ensure that the following requirements are met:

- Service Operations Workspace for ITSM (sn_sow_itsm_cont) application set up is complete and configured as per your requirement. For more information, see Getting started with Service Operations Workspace for ITSM
- Install the Agent Client Collector for Investigation Application. For more information, see Install Agent Client Collector for Investigation.

Note:
Installing the Agent Client Collector for Investigation application requires the ITSM Pro package subscription.

Install Agent Client Collector for Investigation

Install the Agent Client Collector for Investigation application (sn_acc_adapter) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Service Operations Workspace ITSM Applications application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.
- Installing the Agent Client Collector for Investigation application requires ITSM Pro package subscription.

Role required: admin

About this task

The Agent Client Collector for Investigation application enables you to retrieve and display the CI metrics information for the affected CIs with ci_computer or ci_server class. You can customize and configure the display of the CI metrics data using the Investigate Framework module, which is installed along with this application. The CI metrics information of the affected CIs helps you to analyze and resolve the issue.

The following items are installed with the Agent Client Collector for Investigation application:

- Store applications
- Roles

For more information, see Components installed with Agent Client Collector for Investigation.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Agent Client Collector for Investigation application (sn_acc_adapter) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Setting up investigation framework using Microsoft Endpoint Configuration Manager for Investigation

Set up the Investigation Framework in Service Operations Workspace using Microsoft Endpoint Configuration Manager for Investigation to enable the display of the CI metrics information on the **Investigation** tab of the Incident records.

You must ensure that the following requirements are met:

- Service Operations Workspace for ITSM (sn_sow_itsm_cont) application set up is complete and configured as per your requirement. For more information, see Getting started with Service Operations Workspace for ITSM
- Install and configure Microsoft Endpoint Configuration Manager Spoke (sn_ms_epcfgmgr_spk) application. For more information, see Microsoft Endpoint Configuration Manager spoke and Microsoft SCCM integration.
- Install the Microsoft Endpoint Configuration Manager for Investigation application.

  For more information, see Install Microsoft Endpoint Configuration Manager for Investigation.

Install Microsoft Endpoint Configuration Manager for Investigation

You can install the Microsoft Endpoint Configuration Manager for Investigation (sn_mecm_adapter) application if you have the admin role. The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Service Operations Workspace ITSM Applications application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The Microsoft Endpoint Configuration Manager for Investigation (sn_mecm_adapter) application enables you to retrieve and display the CI metrics information for the affected CIs with the ci_computer or ci_server class on the **Investigation** tab of the Incident record. You can configure the display of the CI metrics data using the Investigate Framework module, which is installed along with this application. The CI metrics information of the affected CIs helps you to analyze and resolve the issue.

The following items are installed with Microsoft Endpoint Configuration Manager for Investigation (sn_mecm_adapter) application:

- Store applications
- Roles

For more information, see Components installed with Microsoft Endpoint Configuration Manager for Investigation.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Microsoft Endpoint Configuration Manager for Investigation (sn_mecm_adapter) application using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.

You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Configuring CI metrics for Microsoft Endpoint Configuration Manager for Investigation

Configure the display of the metrics for Microsoft Endpoint Configuration Manager for Investigation.

You must ensure the following requirements:

- Microsoft Endpoint Configuration Manager for Investigation (sn_mecm_adapter) application must be installed along with the investigation framework applications. For more information, see Install Microsoft Endpoint Configuration Manager for Investigation and Components installed with Microsoft Endpoint Configuration Manager for Investigation.
- Microsoft Endpoint Configuration Manager Spoke [sn_ms_epcfgmgr_spk] must be installed and configured. For more information, see Microsoft Endpoint Configuration Manager spoke and Microsoft SCCM integration.
- Microsoft Endpoint Configuration Manager server must be logged in using the Microsoft remote desktop.

Note:
You can configure the delay time in milliseconds between two consecutive Microsoft Endpoint Configuration Manager queries that are submitted to the Microsoft Endpoint Configuration Manager server to fetch and display the metrics, using the property **Specify the delay in milliseconds between two MECM query submissions.** (*sn_mecm_adapter.request_query_delay*). The default value is 10000.

Configure system overview - msinfo32 metrics

Configure the system overview - msinfo32 metrics for Microsoft Endpoint Configuration Manager for Investigation (MECM).

Before you begin
Role required: sn_cimaf.sn_cimaf_admin

Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. Create a MECM script with the name `createMSInfo32File`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Provide the following code in the script block.

```
Param(
[Parameter(Mandatory=$True)]
[string]$scriptName
)

$filePath = ".\" + $scriptName + ".txt";

#invoke msinfo32 and save data into file
msinfo32 /report $filePath;
```

4. Create a MECM script with the name `checkMsInfo32FileExist`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.
5. Provide the following code in the script block.

```
Param(
[Parameter(Mandatory=$True)]
[string]$scriptName
)

$filePath = ".\" + $scriptName + ".txt";

#check if file exist
$fileExist = Test-Path -Path $filePath;

#read msinfo32 data
if($fileExist) {
    Write-Host "True"
}else {
    Write-Host "False";
}
```

6. Create a MECM script with the name `fetchMsInfo32File`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.
7. Provide the following code in the script block.

```
Param(
[Parameter(Mandatory=$True)]
[string]$scriptName
)

$filePath = ".\" + $scriptName + ".txt";

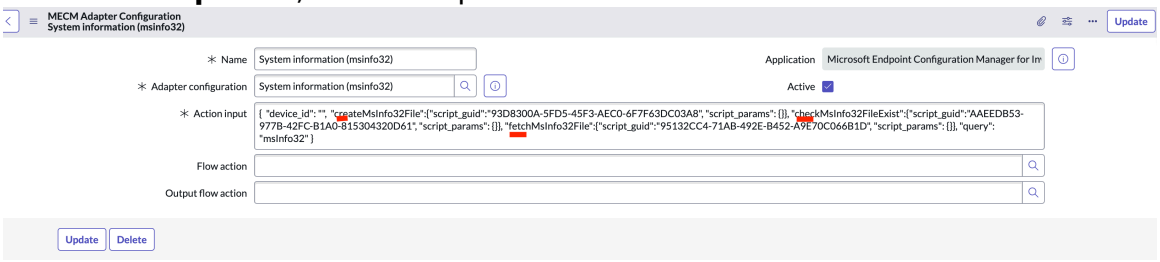
#check if file exist
$fileExist = Test-Path -Path $filePath;

#read msinfo32 data
if($fileExist) {
    Get-Content $filePath;
    Remove-Item $filePath
}else {
    Write-Host "File doesn't exist";
}
```

8. Retrieve and copy the script GUID.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Open the MECM Adapter Configuration [sn_mecm_adapter_config] table.
   The MECM Adapter Configuration table displays the list of adapter configurations.
10. From the list of configurations, select and edit **System information (msinfo32)**.
11. In the **Action input** field, add the script GUID.



12. Click **Update**.

Configure system overview - dsregcmd metrics

Configure the system overview - dsregcmd metrics for Microsoft Endpoint Configuration Manager for Investigation (MECM).

Before you begin

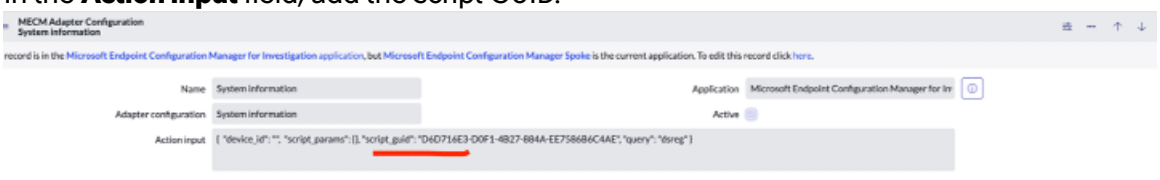
Role required: sn_cimaf.sn_cimaf_admin

Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. Create a MECM script with the name `dsregcmd`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.
3. Provide the following code in the script block.

```
dsregcmd /status
```

4. Retrieve and copy the script GUID.
5. Open the MECM Adapter Configuration [sn_mecm_adapter_config] table.
   The MECM Adapter Configuration table displays the list of adapter configurations.
6. From the list of configurations, select and edit **System information**.
7. In the **Action input** field, add the script GUID.



8. Click **Update**.

Configure asset utilization metrics

Configure the display of the asset utilization metrics for Microsoft Endpoint Configuration Manager for Investigation.

Before you begin

Role required: sn_cimaf.sn_cimaf_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. Select the required CI device, and verify the CMPivot entities and attributes.
   For more information, see Verify a CMPivot entity.
3. Configure the Disk Utilization metrics by verifying that the **Disk** CMPivot entity exists and has the attributes **Size** and **Free Space**.
4. Configure the Memory Utilization metrics.
   a. Verify that the **Memory** CMPivot entity exists and has the attribute **TotalPhysicalMemory**.
   b. Verify that the **OS** CMPivot entity exists and has the attribute **FreePhysicalMemory**.
5. Configure the CPU Utilization metrics by verifying that the **Processor** CMPivot entity exists and has the attribute **LoadPercentage**.
   If the **Processor** CMPivot entity doesn't exist, you must add the entity to the hardware inventory. For more information, see Extend hardware inventory.
6. Configure the Uptime metrics by verifying that the **OperatingSystem** CMPivot entity exists and has the attribute **LastBootUpTime**.

Result

The asset utilization metrics is displayed on the **Investigation** tab of the incident record in Service Operations Workspace.

Configure processes metrics

Configure the top processes by CPU and top processes by memory metrics for Microsoft Endpoint Configuration Manager for Investigation.

Before you begin

Role required: sn_cimaf.sn_cimaf_admin

Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. Create a MECM script with the name `GetProcess`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.
3. Provide the following code in the script block.

```
Param(
[Parameter(Mandatory=$True)]
[string]$orderBy,
[Parameter(Mandatory=$True)]
[string]$top
)

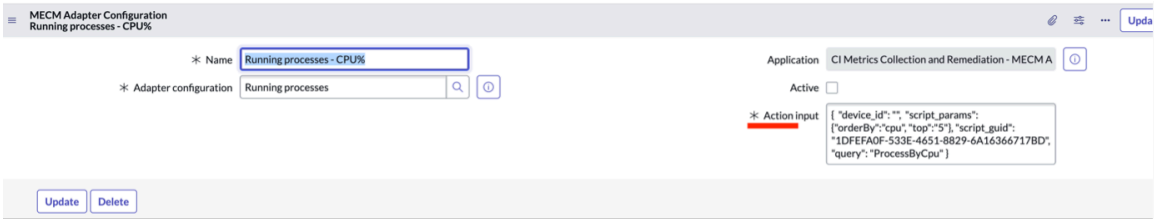
$processes = get-process

$Total = 0;
ForEach ($process in $processes) {
    $Total += $process.cpu;
}

$processes | Sort-Object $orderBy -Descending | select
 processname,id,ws,cpu -First $top | select processname,id,
 @{l="mem"; e={$_.ws}}, @{l="cpu"; e={($_.cpu / $Total) *
 100}};
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Retrieve and copy the script GUID.
5. Open the MECM Adapter Configuration [sn_mecm_adapter_config] table.
   The MECM Adapter Configuration table displays the list of adapter configurations.
6. From the list of configurations, select and edit **Running processes - CPU%**.
7. In the **Action input** field, add the script GUID.



8. Click **Save**.
9. From the list of configurations, select and edit **Running processes - MEM**.
10. In the **Action input** field, add the script GUID.
11. Click **Save**.

Result
The top processes by CPU and top processes by memory metrics are displayed on the **Investigation** tab of the incident record in Service Operations Workspace.

Configure services metrics

Configure the services metrics for Microsoft Endpoint Configuration Manager for Investigation (MECM).

Before you begin
Role required: sn_cimaf.sn_cimaf_admin

Procedure
1. Open the Microsoft Endpoint Configuration Manager.
2. Select the required CI device, and verify the CMPivot entities and attributes.
   For more information, see Verify a CMPivot entity.
3. Configure the services metrics by verifying that the **Services** CMPivot entity exists and has the attributes **Name**, **DisplayName**, **State**, and **ProcessId**.

Result
The services metrics are displayed on the **Investigation** tab of the incident record in Service Operations Workspace.

Configure logged in users metrics

Configure the display of the logged in users metrics for Microsoft Endpoint Configuration Manager for Investigation.

Before you begin
Role required: sn_cimaf.sn_cimaf_admin

Procedure
1. Open the Microsoft Endpoint Configuration Manager.
2. Select the required CI device, and verify the CMPivot entities and attributes.
   For more information, see Verify a CMPivot entity.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Verify that the **LogonSession** CMPivot entity exists and has the attributes **LogonId**, **LogonType**, and **StartTime**.
4. Verify that the **LoggedOnUser** CMPivot entity exists and has the attributes **Antecedent** and **Dependent**.

> **Note:**
> If either the **LogonSession** or **LoggedOnUser** CMPivot entities aren't available, you must add them to the hardware inventory. For more information, see Extend hardware inventory.

Result
The logged in users metrics is displayed on the **Investigation** tab of the incident record in Service Operations Workspace.

Configure Installed application metrics

Configure the display of the installed application metrics for Microsoft Endpoint Configuration Manager for Investigation.

Before you begin
Role required: sn_cimaf.sn_cimaf_admin

Procedure
1. Open the Microsoft Endpoint Configuration Manager.
2. Select the required CI device, and verify the CMPivot entities and attributes.
   For more information, see Verify a CMPivot entity.
3. Verify that the **InstalledSoftware** CMPivot entity exists and has the attributes **ProductName**, **ProductVersion**, and **Publisher**.

> **Note:**
> If the **InstalledSoftware** CMPivot entity isn't available, you must add the entity to the hardware inventory. For more information, see Extend hardware inventory.

Result
The installed application metrics is displayed on the **Investigation** tab of the incident record in Service Operations Workspace.

Configure remedial action - Restart Service

Configure the Restart Service remedial action for Microsoft Endpoint Configuration Manager for Investigation (MECM).

Before you begin
Role required: sn_cimaf.sn_cimaf_admin

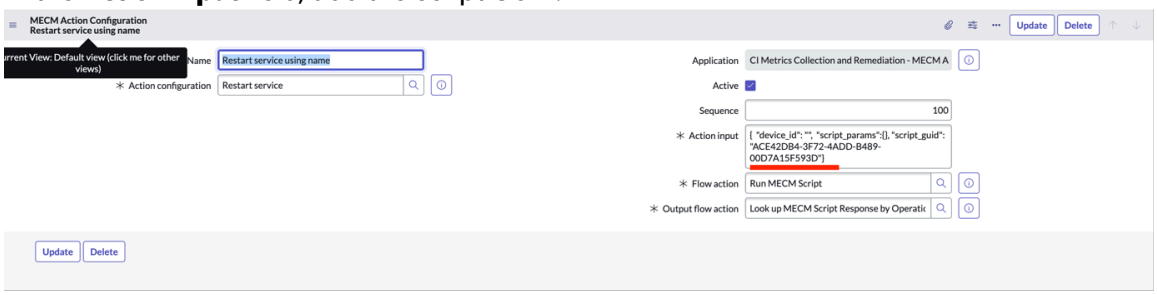
Procedure
1. Open the Microsoft Endpoint Configuration Manager.
2. Create a MECM script with the name `RestartService`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.
3. Provide the following code in the script block.

```
Param(
[Parameter(Mandatory=$True)]
[string]$service_name
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
)
Restart-Service -Force -Name $service_name -PassThru
```

4. Retrieve and copy the script GUID.
5. Open the MECM Action Configuration [sn_mecm_action_config] table.
   The MECM Action Configuration table displays the list of action configurations.
6. From the list of configurations, select and edit **Restart service using name**.
7. In the **Action input** field, add the script GUID.



8. Click **Save**.

Configure remedial actions - End Process

Configure the End Process remedial action for Microsoft Endpoint Configuration Manager for Investigation (MECM).

Before you begin

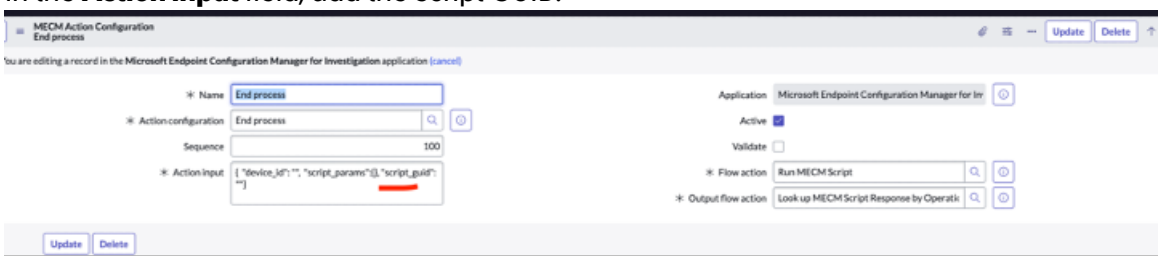
Role required: sn_cimaf.sn_cimaf_admin

Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. Create a MECM script with the name `EndProcess`.
   For more information, see Create a script in Microsoft Endpoint Configuration Manager.
3. Provide the following code in the script block.

```
Param(
[Parameter(Mandatory=$True)]
[string]$process_id
)
Get-Process -Id $process_id | Stop-Process -Force -PassThru
```

4. Retrieve and copy the script GUID.
5. Open the MECM Action Configuration [sn_mecm_action_config] table.
   The MECM Action Configuration table displays the list of action configurations.
6. From the list of configurations, select and edit **End Process**.
7. In the **Action input** field, add the script GUID.



8. Click **Save**.

Create a script in Microsoft Endpoint Configuration Manager

Create a script in the Microsoft Endpoint Configuration Manager to configure the display of the processes metrics on the **Investigation** tab of the Incident record.

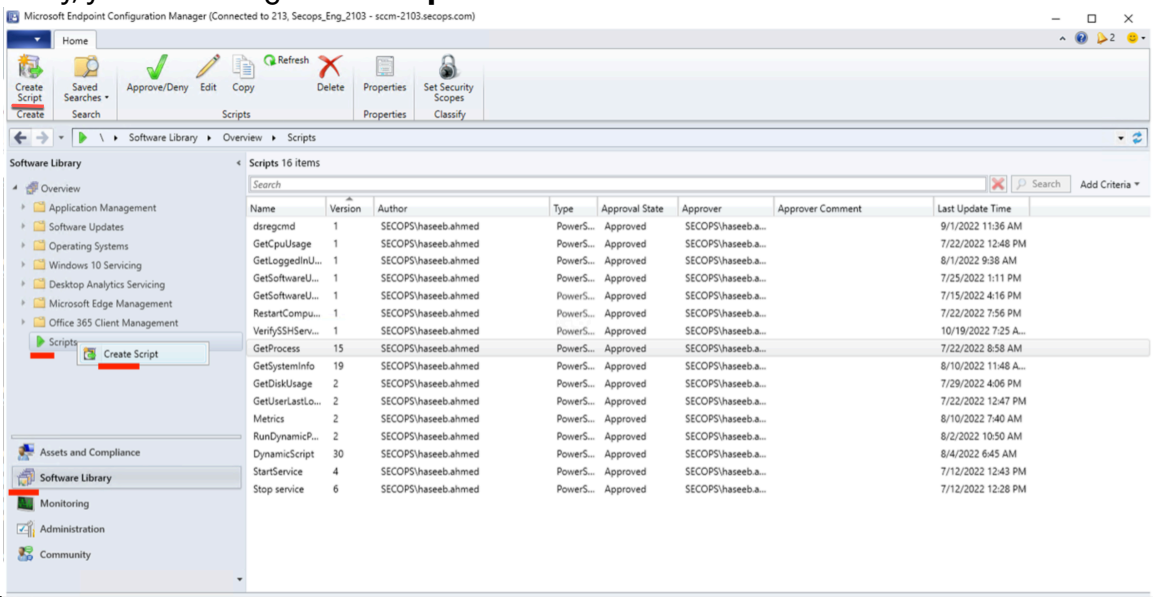
Before you begin

The Microsoft Endpoint Configuration Manager server must be logged in using the Microsoft Remote Desktop.

Role required: admin

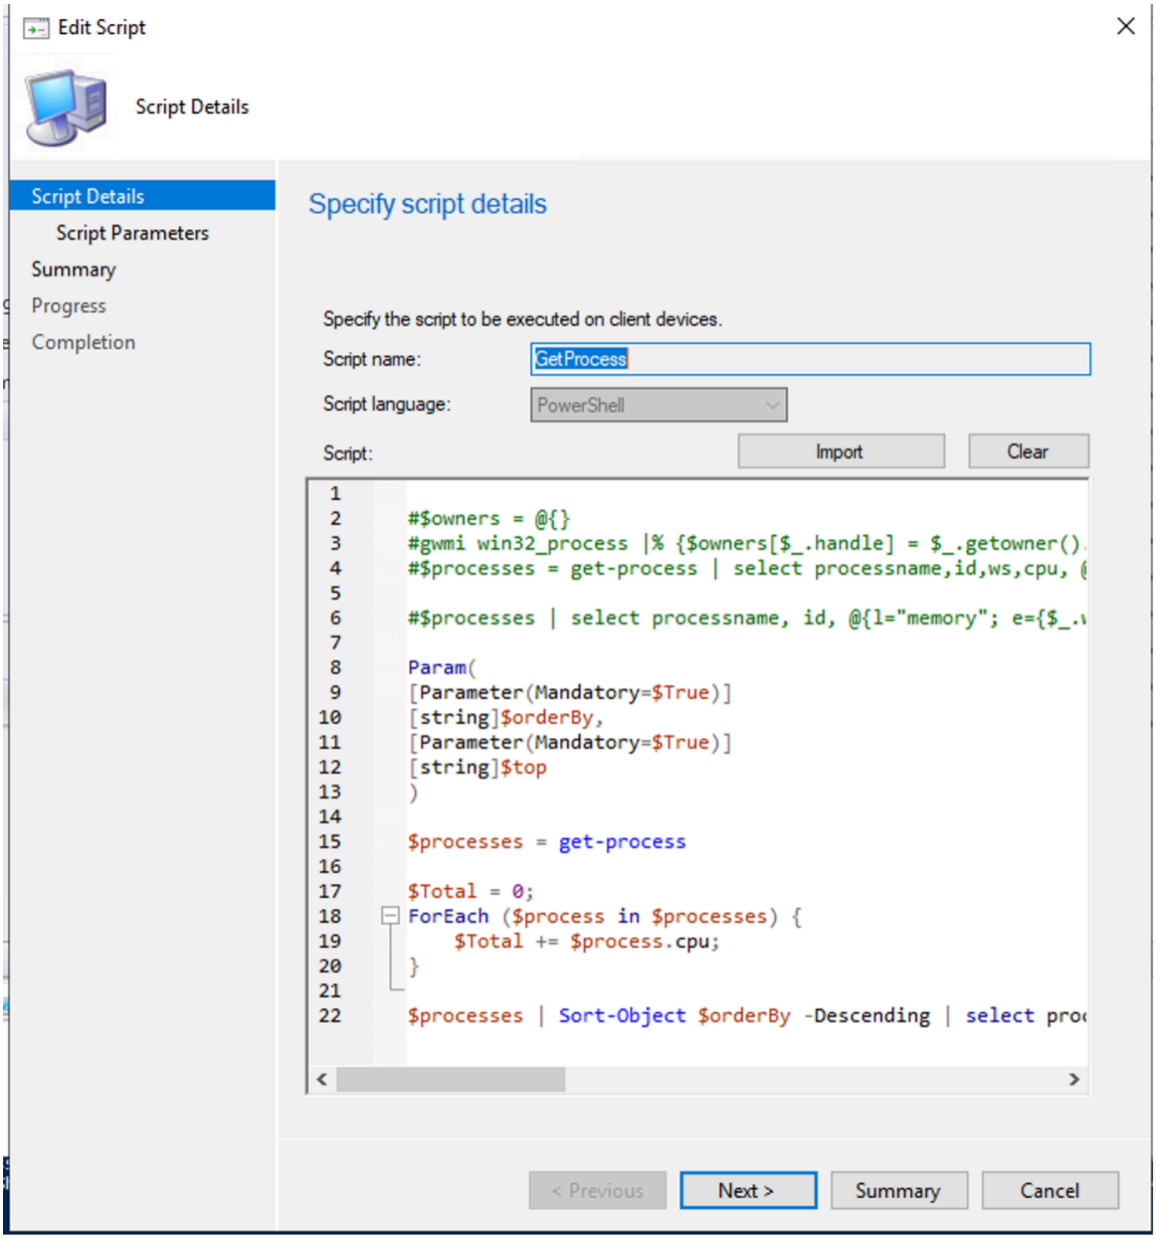
Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. On the Microsoft Endpoint Configuration Manager, select **Software Library**.
3. On the Software Library section, select **Scripts** and click **Create Script**.
   Alternatively, you can also right-click **Scripts** and select **Create Script**.



4. Specify **Script name**.
5. Add the script on the script field (block).

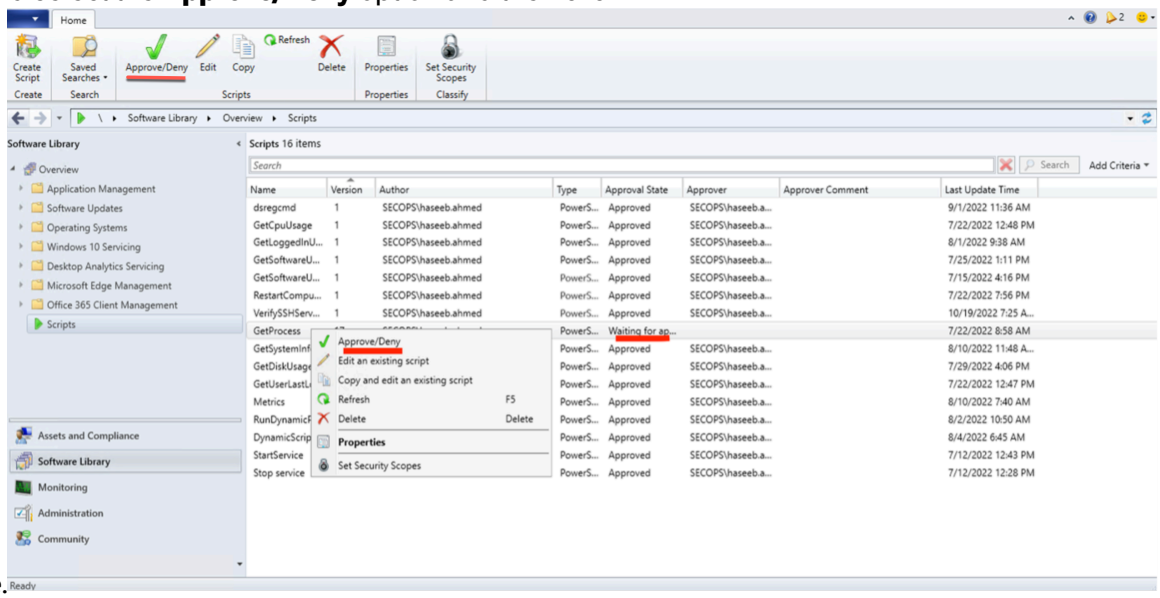
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Click **Next**.
7. Click **Next & Close**.
   A script record is created with **Approval State** as **Waiting for Approval**.
8. Select the script record.
9. Select the **Approve/Deny** option and then click **Approve** to approve the script.

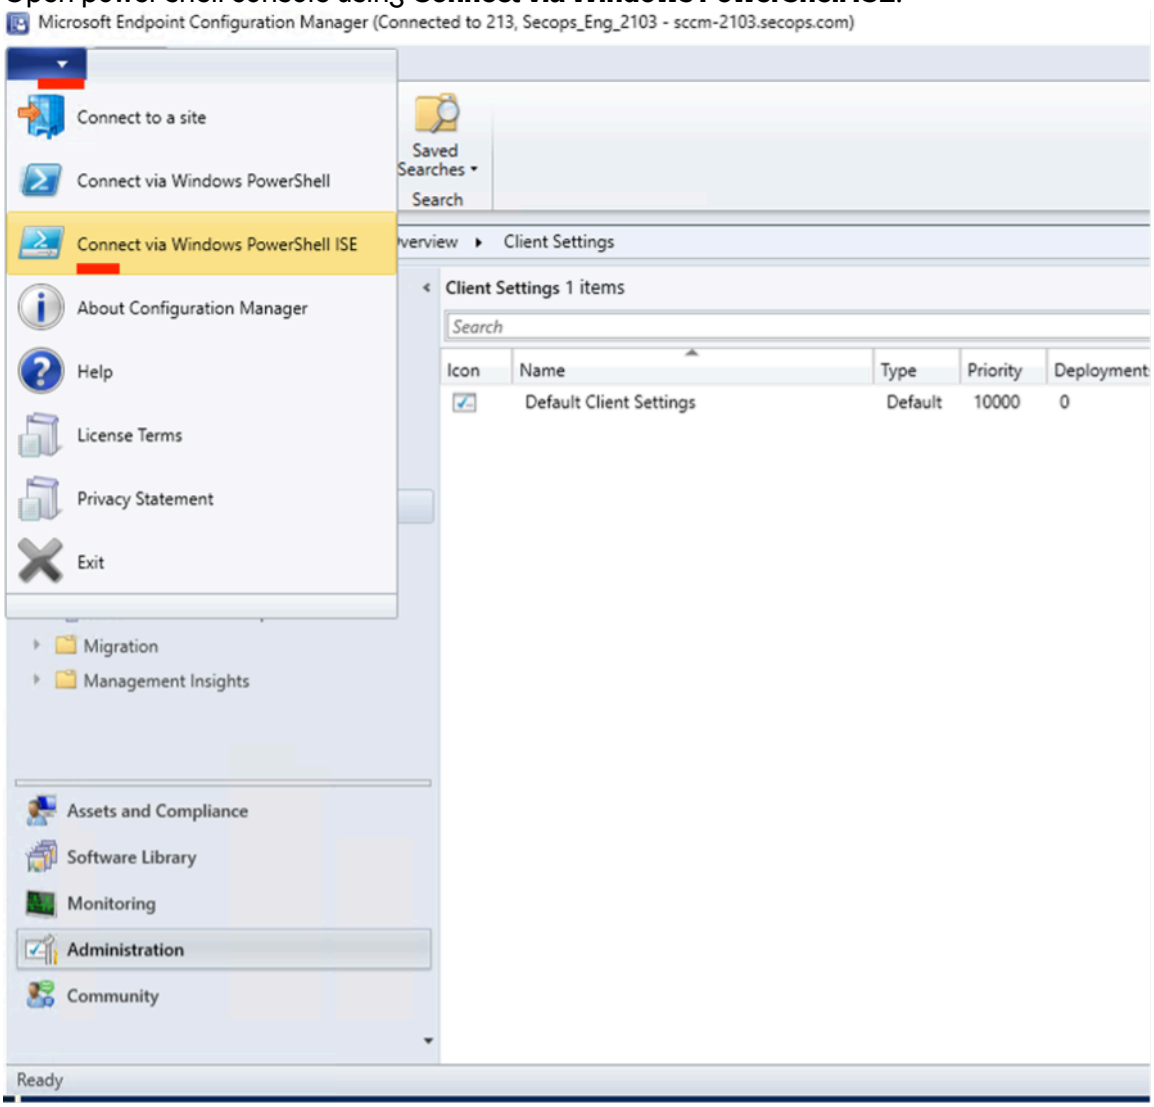
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alternatively, you can also right-click on the created script record and select the **Approve/Deny** option and then click **Approve**.



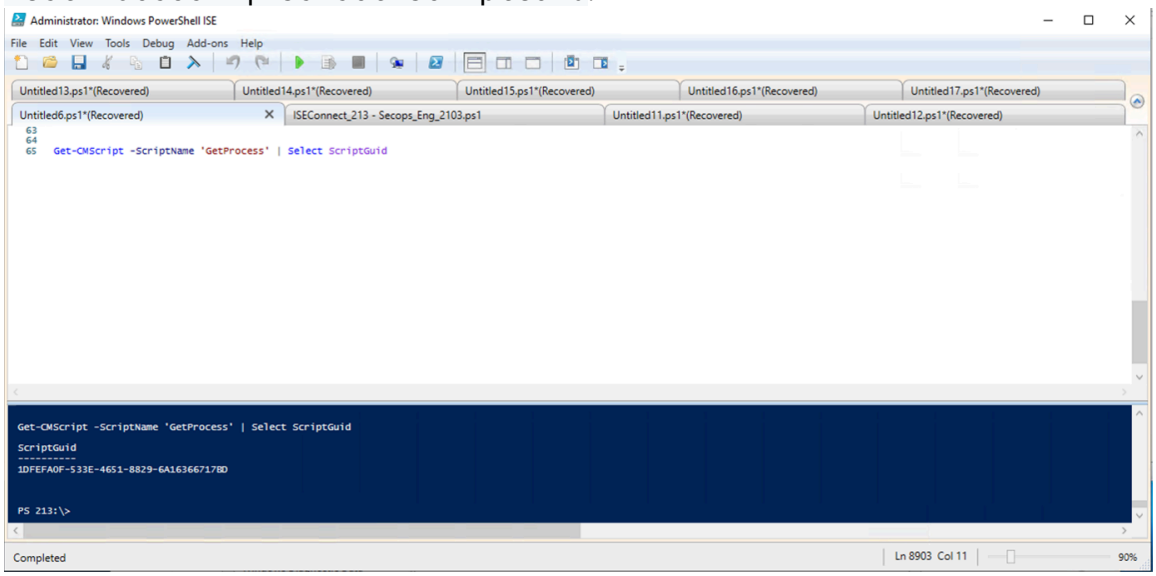
10. Get the script GUID.

a. Open power shell console using **Connect via Windows PowerShell ISE**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Get the script GUID by running the command `Get-CMScript -ScriptName 'GetProcess' | Select ScriptGuid`.



Extend hardware inventory

Extend the hardware inventory to add the CMPivot entity on the CMPivot entity list in the Microsoft Endpoint Configuration Manager.

Before you begin

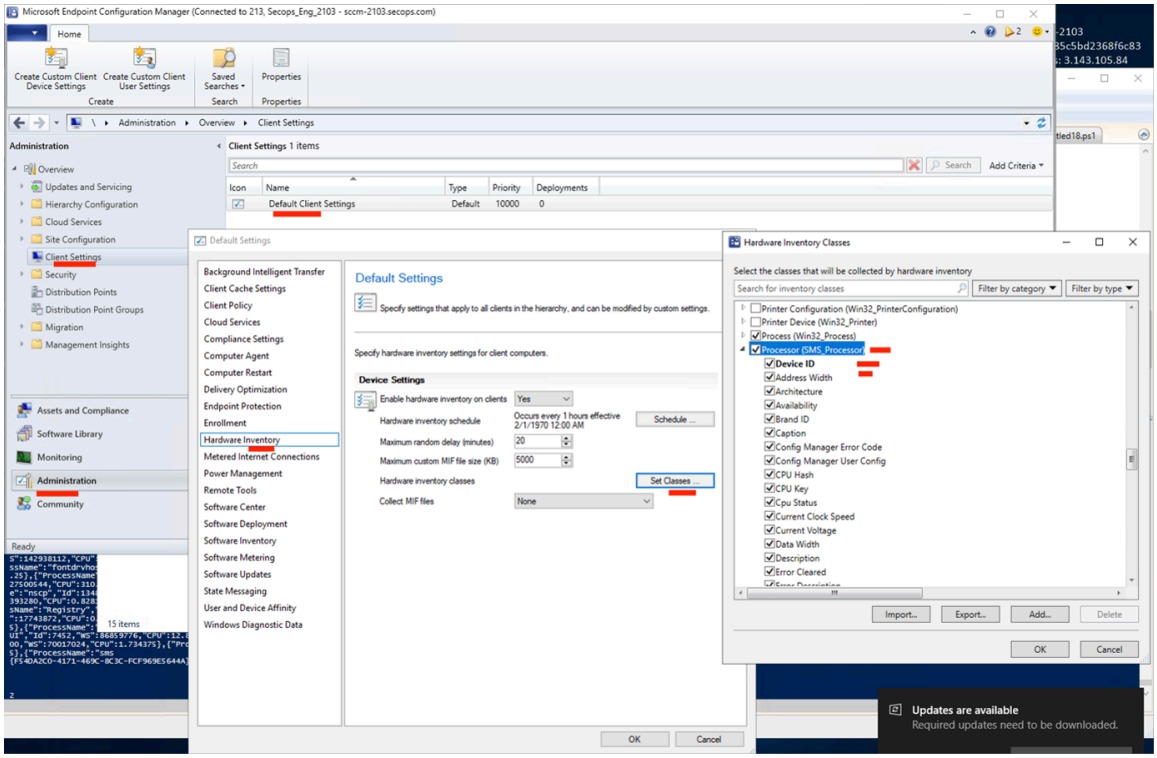
The Microsoft Endpoint Configuration Manager server must be logged in using the Microsoft Remote Desktop.

Role required: admin

Procedure

1. Open the Microsoft Endpoint Configuration Manager.
2. On the Microsoft Endpoint Configuration Manager, select **Administration**.
3. On the Administration section, click **Client Settings**.
4. Double-click the **Default Client Settings** that is displayed on the right pane of the window.
   The Default Settings pop-up window is displayed.
5. On the Default Settings window, select **Hardware Inventory**.
6. Click **Set Classes**.
   A Hardware Inventory Classes pop-up window containing the list of Hardware Inventory Classes is displayed.
7. On the Hardware Inventory Classes window, select the entity and required attributes from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Click **OK**.

Result

The added hardware inventory is displayed in the CMPivot entity list to verify the required attributes. For more information on verifying the CMPivot entity and the required attributes, see Verify a CMPivot entity.

Verify a CMPivot entity

Verify a CMPivot entity and its attributes to configure the display of the CI metrics information on the Investigation tab of the Incident record.

Before you begin

The Microsoft Endpoint Configuration Manager server must be logged in using the Microsoft Remote Desktop.

Role required: admin

Procedure

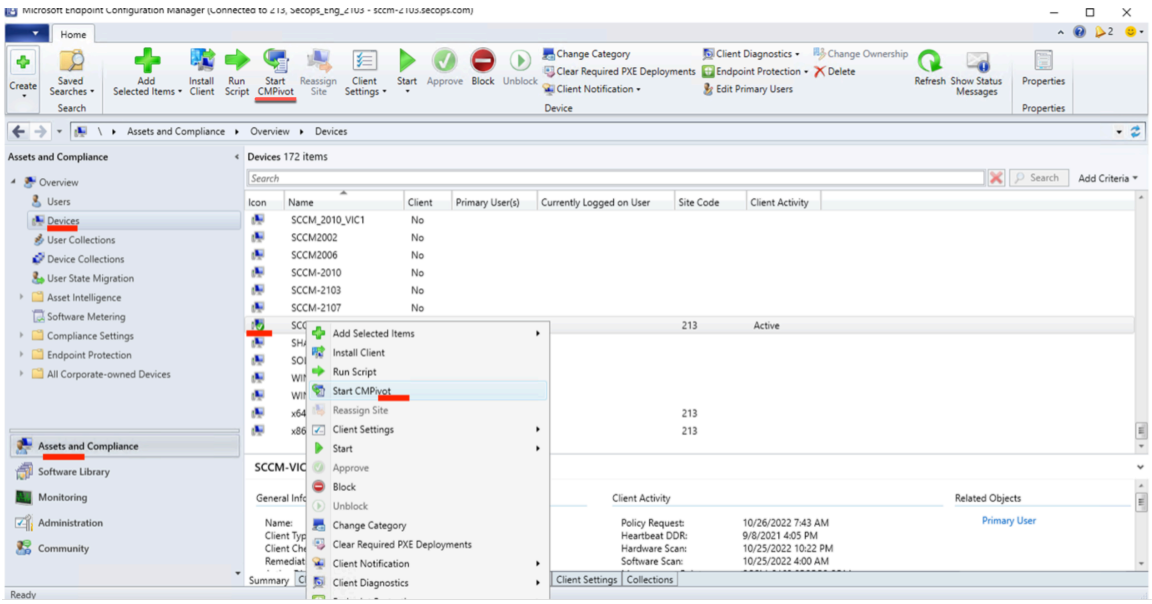
1. Open the Microsoft Endpoint Configuration Manager.
2. On the Microsoft Endpoint Configuration Manager, select **Assets and Compliance**.
3. On the Assets and Compliance section, select **Devices**.
   The list of devices are displayed on the right pane of the window.
4. Select the required CI device from the list.

Note:
The selected CI device must be Active.

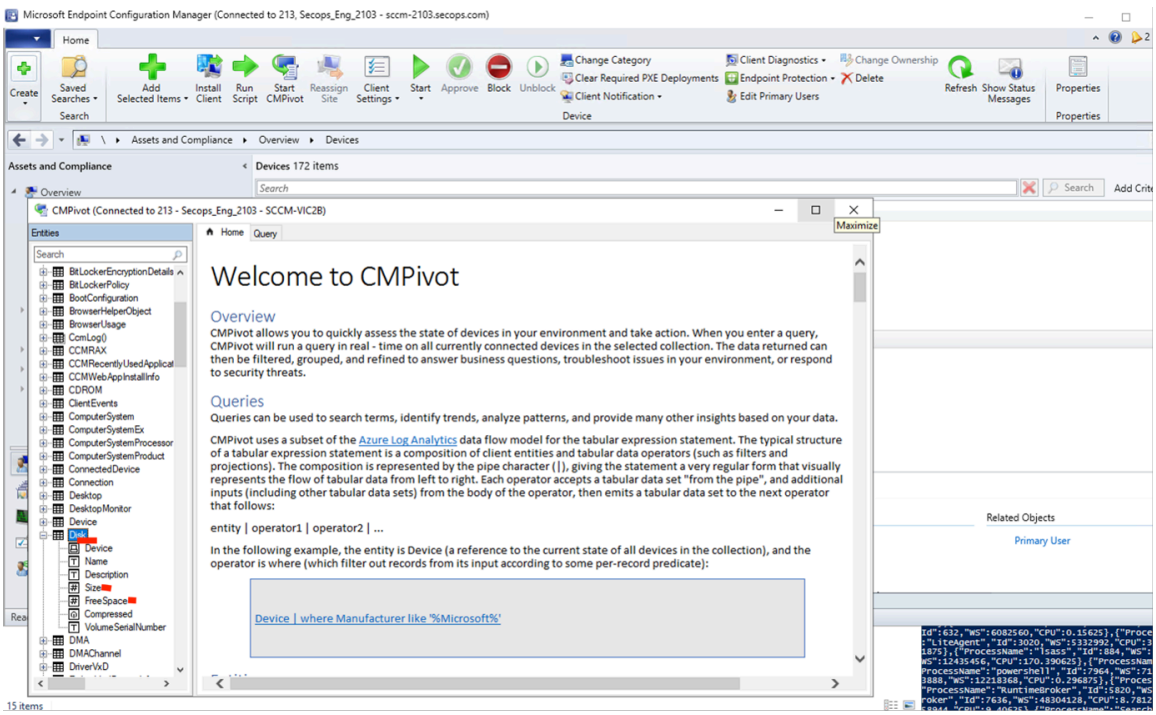
In case the required CMPivot entity isn't displayed on the list, extend the hardware inventory to add the CMPivot entity to the list. For more information, see Extend hardware inventory.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click **Start CMPivot**.
   Alternatively, you can also right-click on the device and select **Start CMPivot**.



6. Verify the CMPivot entity and attributes.



Configure a metric definition

Configure a metric definition to create or modify the existing base system CI metrics displayed on the Investigation tab.

Before you begin

Role required: sn_cimaf.sn_cimaf_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Metrics and CI Actions Framework** > **Administration** > **Metric Definitions**.
   These following existing metric definition tables are displayed:
   - Asset usage
   - Installed Applications
   - Logged-in users
   - Running processes
   - Services
   - System Information (dsregcmd)
   - System Information (msinfo32)
   - System overview
2. Create a metric definition record.
   You can also select an existing metric definition record to modify the record.

   a. Select **New**.

   b. On the Metric definition form, fill in the fields.

   Metric definition form

Field	Description
Name	Name of the metric.
Active	Option to activate the metric definition.
CI Class	Particular CI class for which the metric is applicable.
Description	Description of the metric definition.
Schema	High-level structure in which the metrics retrieved from the provider are stored in the metric table.

   c. Select **Submit**.

3. On the Adapter Configuration related list, create a record.
   Adapter configuration for the metric definition enables you to define the provider and the query, as well as transform flows or scripts.

   a. Select **New**.
   You can also select an existing adapter configuration record to modify the record.

   b. On the Adapter Configuration form, fill in the fields.

   Adapter Configuration form

Field	Description
Name	Name of the adapter configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Metric Definition	Metric definition for which the adapter configuration is created.
Provider	Provider for metrics, such as Agent Client Collector or Microsoft Endpoint Configuration Manager for Investigation.
Order	Sequence order in which the adapter configuration record applies to the metric definition when there are multiple configurations available. **Note:** The first applicable adapter configuration that is based on the **Order** value is only considered for fetching the metrics.
Duplicate request time limit (seconds)	Sets the number of seconds to prevent duplicate metric requests when one is already in progress.
Query	
Query Action	Type of action that is used to retrieve the metric data from the provider. The value can be a flow or script.
Query Flow/script	Flow or script that is used to retrieve the metric from the provider. **Note:** In case no flow or script is defined, the default query flow of the provider is considered.
Transform	
Transform Action	Type of action that is used to transform the metric data, which is retrieved by the provider, to output. The value can be a flow or script.
Transform Flow/script	Flow or script that is used to transform the metric data, which is retrieved by the provider, to output. **Note:** In case no flow or script is defined, the default transform flow of the provider is considered.

c. Select **Submit**.

4. On the Provider Specific Adapter Configuration related list, create a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Provider Specific Adapter Configuration table enables you to define and configure adapter configuration, such as query or command, for a specific provider, such as Agent Client Collector (ACC) or Microsoft Endpoint Configuration Manager (MECM) for Investigation.

a. Select **New**.
You can also select an existing provider specific adapter configuration record to modify the record.
A list of specific provider action configuration table is displayed, such as ACC Action Configuration and MECM Action Configuration.

b. Select the provider for which you want to create an adapter configuration.

c. On the Provider Specific Adapter Configuration form, fill in the fields.

Provider Specific Adapter Configuration

Field	Option
Name	Name of the provider specific adapter configuration.
Adapter Configuration	Adapter configuration for which the provider specific adapter configuration is created.
Active	Option to activate the configuration.
Check Definition	Check definition that is used for the execution and handling the output of the command or query. For example, app-ci-metrics-acc-adapter.osquery. **Note:** This is applicable only if the provider is Agent Client Collector for Investigation.
Query/Command	Query or command that the provider runs on the end machine. **Note:** This is applicable only if the provider is Agent Client Collector for Investigation.
Action Input	Input parameters required by flow action. **Note:** This field is applicable only if the provider is Microsoft Endpoint Configuration Manager for Investigation.
Flow Action	MECM spoke flow action to perform the read operation on the MECM device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Option
	Note: This field is applicable only if the provider is Microsoft Endpoint Configuration Manager for Investigation.
Output Flow Action	MECM spoke flow action to look up the read operation response from the MECM server. **Note:** This field is applicable only if the provider is Microsoft Endpoint Configuration Manager for Investigation.

d. Select **Submit**.

5. On the Adapter Applicability Rule related list, create a rule.
Adapter Applicability Rule table enables you to configure which CIs apply to the selected adapter configuration.

a. Select **New**.
You can also select an existing adapter applicability rule record to modify the record.

b. On the Adapter Applicability Rule form, fill in the fields.

Adapter Applicability Rule form

Field	Description
Adapter Configuration	Adapter configuration that applies to the adapter applicability rule.
CI Conditions	
CI Class	CI class that applies the adapter configuration.
Allow matching CI class extension	Option to apply the configurations to the child of a CI class.
CI conditions	Condition builder to configure which CIs apply to the adapter configuration.

c. Select **Submit**.

What to do next

After the new metric definition is created, perform the UI configuration for displaying the metric definition on the Investigate tab of the incident record page. You must get the sys_id of the metric definition and add it to the `sn_sow.SOWInvestigateConfig` script. You can also customize the display of the metric definition, such as the labels, units, and threshold values. For more information, see Customize the Investigate tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure CI Actions

Configure the CI Action Framework to add a new CI action or modify an existing one.

Before you begin

Role required: sn_cimaf.sn_cimaf_admin

Procedure

1. Navigate to **All** > **Metrics and CI Actions Framework** > **Administration** > **Actions**.
   This table contains the list of all CI actions.
2. Create a CI Action.
   a. Select **New** to create a record.
   You can also select an existing action record to modify the record.
   b. On the Action form, fill in the fields.

Action form

Field	Description
Name	Name of the CI action.
CI Class	CI class for which the CI action is applicable, such as computer [cmdb_ci_computer].
Active	Option to activate the CI action.
Description	Brief description of the CI action.

   c. Select **Submit**.
3. On the Action Role related list, add a role.
   The Action Role related list contains the list of roles required to access and execute the CI actions.
   a. Select **New**.
   b. Choose a **Role**.
   c. Select **Submit**.
4. On the User Criteria Action Inclusion related list, add a user criteria.

   The User Criteria Action Inclusion related list contains the list of user criteria that are allowed to execute the CI action.
   a. Select **New**.
   b. Choose a **User Criteria**.
   c. Select **Submit**.
5. On the User Criteria Action Exclusion related list, add a user criteria.

   The User Criteria Action Exclusion related list contains the list of user criteria that aren't permitted to execute the CI action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New**.

b. Choose a **User Criteria**.

c. Select **Submit**.

6. On the Action Configuration related list, create a record.
   The Action Configuration related list contains a list of action configurations applicable to CI. You can create multiple configurations for a CI action based on different providers or CI class.

   a. Select **New** to create a record.
      You can also select an existing action record to modify the action configuration record.

   b. On the Action Configuration form, fill in the fields.

Action Configuration form

Field	Description
Name	Name of the action configuration for the CI action.
Provider	Provider for which you want to create the action configuration.
CI Class	CI class applicable to the action configuration.
Allow matching CI Class extension	Option to apply the configuration to the child of CI class, such as device or server.
CI Condition	Condition builder to configure the CIs where the action configuration is applicable.
Action Type	Action type that is used to execute the CI action. It can be a flow or a script.
Action execution flow	A flow that is used to execute the CI action.
Order	Sequence in which the configuration is applicable in case there are multiple configurations available for a CI action. **Note:** The first applicable adapter configuration that is based on the **Order** value is only considered for executing the CI action.
Duplicate request time limit (seconds)	Sets the number of seconds to prevent the execution of duplicate action requests when one with the same parameters is already in progress.

   c. Select **Submit**.

7. On the Action Configuration Step related list, create or modify a record.
   The Action Configuration Step related list contains the list of steps applicable for the action configuration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New** to create a record.
You can also select an existing record to modify the steps record.
A list of provider-specific action configuration table is displayed, such as Agent Client Collector (ACC) Action Configuration and Microsoft Endpoint Configuration Manager (MECM) Action Configuration.

b. Select the provider for which you want to create an adapter configuration.
For example, ACC Action Configuration for Agent Client Collector for Investigation.

c. On the Action configuration step form, fill in the fields.

Action configuration step form

Field	Description
Name	Name of the step that you want to create for the action configuration.
Active	Option to activate the action configuration step.
Sequence	Step sequence that is executed if multiple steps exist for an action configuration record.
Check definition	Check definition that is used for the execution and handling the output of the command. For example, remedial-action. **Note:** This is applicable only if the provider is Agent Client Collector for Investigation.
Command	Command that is executed. **Note:** This field is applicable only if the provider is Agent Client Collector for Investigation.
Action Input	Input parameters required by flow action. **Note:** This field is applicable only if the provider is Microsoft Endpoint Configuration Manager for Investigation.
Flow Action	MECM spoke flow action to perform the write operation on the MECM device.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This field is applicable only if the provider is Microsoft Endpoint Configuration Manager for Investigation.
Output Flow Action	MECM spoke flow action to look up the write operation response from the MECM server. **Note:** This field is applicable only if the provider is Microsoft Endpoint Configuration Manager for Investigation.
Validate	Option to validate the command.
Validation script	Script that is run to check if the command has a valid execution and output. **Note:** This field is visible only if the **Validate** option is selected.
Run	Values for how and when the command must be validated. You can select the following values: ▪ Once: Validation must be run once. ▪ Poll: Validation must be run more than once. **Note:** This field is visible only if the **Validate** option is selected.
Polling count	Maximum number of times the validation is run for the command. **Note:** This field is visible only if **Run** field is set to **Poll**.
Polling interval	Time interval in which the validation must be rerun for the command execution. **Note:** This field is visible only if **Run** field is set to **Poll**.

8. On the Action Parameter related list, create a record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Action Parameter related list contains the list of parameters required to execute the CI action.

a. Select **New** to create a record.
You can also select an existing record to modify the parameter record.

b. On the Action Parameter form, fill in the fields.

Action Parameter form

Field	Description
Type	Type of the parameter, such as integer or reference. **Note:** If you select reference, you must also specify the reference table.
Label	Name of the parameter.
Mandatory	Option to mark the applicability of the parameter as required.
Active	Option to activate the action parameter.
Default value	
Default value	Default value of the parameter.
Choice list specification	
Choices	Type of choice list that must be applicable for the parameter. **Note:** This field is enabled only if the **Type** field is set to **Choice list**.

c. Select **Submit**.

What to do next
You must configure the Remedial Actions Framework. For more information, see Configure the Remedial Actions Framework.

Configure the Remedial Actions Framework

Configure the Remedial Actions Framework to add a new remedial action or modify an existing one.

Before you begin
Role required: sn_reacf.sn_remedial_action_admin

Procedure
1. Navigate to **All** > **Remedial Actions Framework** > **Administration** > **Remedial Actions**.
   This table contains the list of the remedial actions available at the base system.
2. Create a remedial action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select **New** to create a record.
You can also select an existing action record to modify the action record.

b. On the Remedial Action form, fill in the fields.

Remedial Action form

Field	Description
Name	Name of the remedial action.
Action	Action that is performed. You must select a table name and a record in that table. **Note:** You must select the action table that is defined for the **Applicability** field of the Remedial Action Type record.
Type	Type of the remedial action or flow, such as CI action and standard change.
Description	Brief description of the remedial action.
Active	Option to activate the remedial action.
Target Table	Table for which the remedial action is applicable.
Match Target Extensions	Option to apply the remedial action to the child of the target table.
Target Conditions	Condition builder to configure the applicable remedial action for the target records.

c. Select **Submit**.

3. On the Remedial Action Parameters related list, add a parameter to the remedial action.
The Remedial Action Parameters related list contains the list of parameters, such as *`Process ID`* and *`Assigned to`*, required to execute the remedial actions.

a. Select **New**.

b. On the Remedial Action Parameters form, fill in the fields.

Remedial Action Parameter form

Field	Description
Type	Type of parameter, such as integer, boolean, or reference. **Note:** If you select reference, you must also specify the reference table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Label	Name of the parameter.
Mandatory	Option to mark the parameter as required.
Active	Option to activate the parameter.
Consider for concurrency check	Option to determine whether the parameter should be considered for the duplicate check of the remedial action.
Default Value	
Default value	Default value of the parameter. **Note:** If this value isn't defined, the default value that is specified in the CI Actions Framework tables is considered.
List specification	
Choices	Type of list that must be applicable for the parameter. **Note:** This field is enabled only if the **Type** field is set to **Choice list**.

   c. Select **Submit**.

4. On the Remedial Action Roles related list, add a role.
   Remedial Action Roles contains the list of roles required to access and execute the remedial actions.
   a. Select **New**.
   b. Choose a **Role**.
   c. Select **Submit**.
5. On the User Criteria Action Inclusions related list, add a user criteria.
   The User Criteria Action Inclusion related list contains the list of user criteria that are permitted to execute the remedial action.
   a. Select **New**.
   b. Choose a **User Criteria**.
   c. Select **Submit**.
6. On the User Criteria Action Exclusions related list, add a user criteria.
   The User Criteria Action Exclusion related list contains the list of user criteria that aren't permitted to execute the remedial action.
   a. Select **New**.
   b. Choose a **User Criteria**.
   c. Select **Submit**.
7. Navigate to **All** > **Remedial Actions Framework** > **Administration** > **Remedial Action Types**.
   This table contains the list of remedial action types, such as CI action and standard change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Create a remedial action type.

   a. Select **New**.

   b. On the Remedial Action Type form, fill in the fields.

   Remedial Action Type

Field	Description
Name	Name of the remedial action type.
Applicability	List of Action tables where the remedial action type is applicable.
Processor	Script include that is used for the implementation of the extension point *`RemedialActionProvider`* to execute the remedial action.
Allow concurrent execution	Option to allow duplicate concurrent execution of remedial actions. **Note:** If the **Consider for concurrency check** option is set to false for all the parameters, then the duplicate actions are allowed by default.

   c. Select **Submit**.

9. Navigate to **All** > **Remedial Actions Framework** > **Administration** > **Remedial Action Origin**. This table contains the list of applications where you can use the Remedial Actions Framework.
10. Add an application.

    a. Select **New**.

    b. Add the name of an application that you want to use for the Remedial Actions Framework.

    c. Select **Submit**.

What to do next

When a Remedial Action Type is created, you must create an implementation or do the necessary changes in the existing implementation of the **RemedialActionProvider** scripted extension point. To view and use the new or modified remedial actions, you must configure the Investigate UI to display the remedial actions. For more information, see Customize the Investigate tab.

Create a task type for problem or change in Service Operations Workspace

Configure a task type that can be used during problem or change creation.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

If you extend problem task or change task to add your own task type, you can set the child of problem or change task as the target table. Depending on the default values you set in the child of problem task or change task, you need not pass any values.

For information about creating a change task, see Create a change task in Service Operations Workspace.

For information about creating a problem task, see Create a problem task in Service Operations Workspace.

Procedure

1. In the navigation filter, enter `sn_sow_interceptor_record_type_selector.list`.
2. From the Record Type Selectors list, select **New**.
3. On the Record Type Selector form, fill in the fields.

Record Type Selector form

Field	Description
Applies to	Table that the task type applies to. Select Problem task [problem_task] or Change Task [change_task].
Order	Order of the task type in the Create problem task or Create change task dialog box.
Application	Scope of the application.
Active	Option for enabling the task type.
Title	Card title that is displayed in the Create problem task or Create change task dialog box.
Description	Card description.
Target table	Table where the record should be created when using this task type. **Note:** This field is not displayed if the table selected in the **Applies to** field does not have any child tables.
Values	Default values that are populated when creating a record using this task type.

Configuring Recommendation Framework in Service Operations Workspace

You can enable an agent working on an incident to view predictions provided by Recommendation Framework.

Recommendation Framework is now deprecated and no longer supported or available for new activation. Recommended Actions for ITSM feature provides the latest experience for this functionality. To get the advanced version, you must install the Advanced Recommended actions for ITSM (com.snc.uib.sow_itsm_ra_advanced) plugin and you must procure ITSM Pro package subscription.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The best practice to get the advanced version is to install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription. For more information, see Exploring Recommended Actions for ITSM in Service Operations Workspace.

You must ensure that the following requirements are met:

- Install the Service Operations Workspace ITSM Applications (sn_sow_itsm_cont) application from ServiceNow Store. For information about this installation, see Getting started with Service Operations Workspace for ITSM. With this installation, the following Recommendation Framework applications are also installed.

Recommendation Framework store applications

Application	Description
Recommendation Framework (sn_rf)	Provides the framework for dynamic and contextual recommendations in a configurable workspace.
Recommendations for Incident Management (sn_sow_incident_rf)	Provides configurations, for example, recommendation rules, to predict recommendations for an incident in Service Operations Workspace.

- Install the Predictive Intelligence for Incident plugin (com.snc.incident.ml) to install the Relevant problems solution definition. For information about this plugin installation, see Request Predictive Intelligence for Incident.
- Install the Predictive Intelligence for Major Incident Management plugin (com.snc.incident.mim.ml_solution) to install the following IT Service Management solution definitions. For information about this plugin installation, see Request Predictive Intelligence for Major Incident Management.
- Install the Predictive Intelligence for Incident Management plugin (com.snc.incident.ml_solution) to install the following IT Service Management solution definitions. For information about this plugin installation, see Request Predictive Intelligence for Incident Management.
  - Similar Knowledge Articles
  - Similar Open Incidents
  - Incident Service
  - Incident Configuration Item
  - Incident Assignment
  - Similar Resolved Incidents
- Train solution definitions to predict recommendations for an incident. For information about training solution definitions, see Predictive Intelligence.

Configure Recommendation Framework for an incident in Service Operations Workspace

Enable recommendations at field level or from the contextual sidebar for an incident in Service Operations Workspace.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Recommendation Framework** > **Administration** > **Recommendation Properties**.
2. From the Recommendation Properties page, configure the recommendation framework settings.

Recommendation Framework properties

Property	Description
Activate/Deactivate Recommendation Rule	
Assignment group recommendation for Incident	Enables the field-level recommendation for the **Assignment group** field of an incident.
Configuration item recommendation for Incident	Enables the field-level recommendation for the **Configuration item** field of an incident.
Knowledge articles for Incident	Enables the **Knowledge articles** card when you access recommendations from the sidebar.
Propose major incident for Incident	Enables the **Propose major incident** card when you access recommendations from the sidebar.
Relevant problems for Incident	Enables the **Relevant problems** card when you access recommendations from the sidebar.
Service recommendation for Incident	Enables the field-level recommendation for the **Service** field of an incident.
Similar major incidents for Incident	Enables the **Similar major incidents** card when you access recommendations from the sidebar.
Similar open incidents for Incident	Enables the **Similar open incidents** card when you access recommendations from the sidebar.
Similar resolved incidents for Incident	Enables the **Similar resolved incidents** card when you access recommendations from the sidebar.
Set threshold value for field level stamping	
Assignment group recommendation for Assignment group	Threshold value for auto-populating a recommendation in the **Assignment group** field. When the prediction value is greater than or equal to the specified threshold value, the recommendation is auto-populated as the field value.
Configuration item recommendation	Threshold value for auto-populating a recommendation in the **Configuration item** field. When the prediction value is greater than or

Property	Description
for Configuration item	equal to the specified threshold value, the recommendation is auto-populated as the field value.
Service recommendation for Service	Threshold value for auto-populating a recommendation in the **Service** field. When the prediction value is greater than or equal to the specified threshold value, the recommendation is auto-populated as the field value.

For information on recommendation rules, see Recommendation rules for an incident in Service Operations Workspace.

3. Click **Save**.

Configure the display of requester related records in an interaction

For an interaction, ensure that related records of a requester are displayed as intended for Service Operations Workspace.

Before you begin

Role required: admin

View the order of the My Requests - Requested item predicate EVAM view config.

About this task

The records related to a requester are displayed when an agent views the requester information in an interaction. For information about agent actions on an interaction, see Work on an interaction in Service Operations Workspace.

Procedure

1. Navigate to **All** > **Entity View Action Mapper (EVAM)** > **View Definitions** > **View Configurations**.
2. From the list of EVAM View Configs, select **SOW Related Tasks**.
3. Edit the order such that it is less than that of the My Requests - Requested item predicate EVAM view config.
4. Click **Update**.

On-call Scheduling in Service Operations Workspace

On-Call Scheduling ensures that dedicated support team members are always available to resolve issues as they arise. You can set up on-call schedules, roster rotations, and escalation policies, escalate notifications for a group, and determine the current contact for an escalation.

You can access your shifts and schedules within Service Operations Workspace using **Schedules** options.

Managers can also use the **Teams** menu to perform all the administrative tasks.

See On-Call Scheduling in Service Operations Workspace for more details.

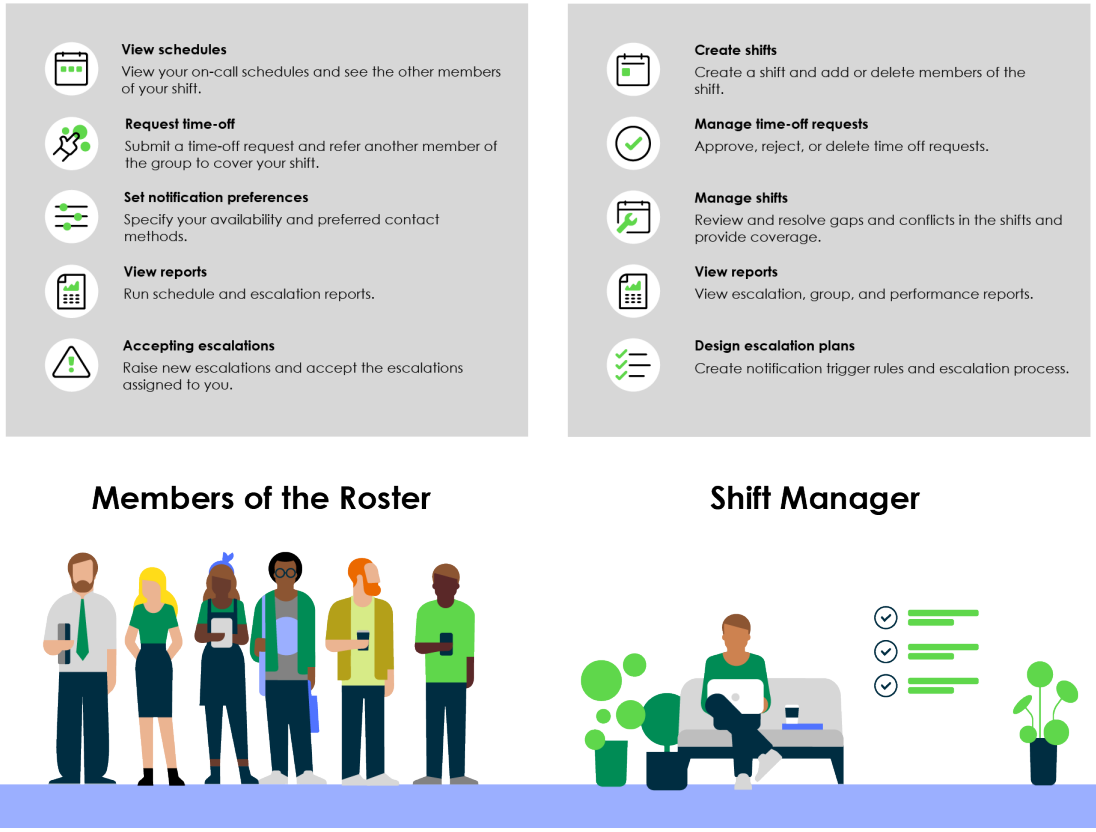
On-Call Scheduling in Service Operations Workspace workflow

The various members of an organisation use On-Call Scheduling to work together. See a sample end-to-end



workflow:

1. Shift admin creates shift and group templates.
2. Shift admin assigns role and configures escalation trigger rules. See Roles in Service Operations Workspace for ITSM and Assigning On-Call Scheduling roles
3. The shift manager creates a shift and add or delete members to the shift.
4. Shift manager designs the entire escalation process for the new shift.
5. Roster member views their on-call schedules and find out who the other members on their shift are.
6. Roster member can specify their availability and preferred contact methods from the methods set up by Shift admin.
7. Roster members can submit a time-off request and refer another member of the group to cover the shift.
8. Roster members views the roster and escalation details for a shift.
9. Roster members view on-call reports and receive reminders.
10. The shift manager approves or rejects the time-off requests.
11. Shift manager reviews the on-call schedules for their groups for any gaps and time-off requests.
12. Shift manager provides, replace, or delete coverage and time-off requests.
13. Roster members receive on-call escalation notifications to acknowledge tasks or conference requests.
14. Shift manager views escalation, group, and performance reports of their on-call teams.

Note:
To view version compatibility matrix, view the latest release notes.

On-Call Scheduling benefits

Benefit	Feature	Users
Create a new shift, assign members to the shift, set the shift preferences like rotations and responder levels.	Create and edit shift in Service Operations Workspace	itil, rota_manager (Shift Manager)
Manage your shift by accepting or rejecting time-off requests. Resolve gaps and conflicts by providing coverage. Assign extra-time to the members to the shift.	Manage shifts in service operation workspace	itil, rota_manager (Shift Manager), rota_admin
Create your own escalation policies and path. On-Call Scheduling allows you to create an escalation trigger rule using the templates available, based on your requirement.	Escalation triggers and policies	itil, rota_manager (Shift Manager), rota_admin, admin
Create and edit Notification preferences for an entire team.	Edit On-call team preference using Teams menu	itil, rota_manager (Shift Manager), rota_admin
Use any one of the multiple channels such as Slack, Microsoft Teams, mobile push messages, SMS, and voice messages to set as the preferred contact method for receiving notifications.	Edit delivery channel To configure delivery channels, see: • For Slack: Setting up Slack as a contact method • For SMS and voice message: Setting up SMS and voice messaging as contact methods • For teams: Microsoft Teams • For mobile push notifications: Set up mobile push as a contact method for an on-call escalation	rota_admin, admin

Note:
For more details on user roles, see Assigning On-Call Scheduling roles.

Configure the experts On-call panel

Configure the **Experts on-call** panel for an incident.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To configure the Experts On-call panel, ensure that you have added an implementation for the *sn_sow_on_call.ExpertsOnCallTabConfig* extension point.

Note:

- Incident table extension point implementation is added by default. To customize it, edit the script to include *ExpertsOnCallTabConfigForIncident*.
- Example: If you want to display only the assignment group in the Experts On-call panel, then update the *getRecommendedFieldWatchList* in the script.

About this task

To add Experts On-call for Problem table, follow the steps:

Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. Select and open the **sn_sow_on_call.ExpertsOnCallTabConfig** extension point.
3. Select **Create implementation** from the related links section.
4. Modify the **Script** as required:

Extension point APIs

Method	Inputs	Return
getTableName	None	String – Table name for which an extension point is implemented
getRecommendedFieldWatchList	None	Array – List of fields that you want to show on the Experts On-call recommended groups panel. For example: *["assignment_group", "cmdb_ci"]*
getRecommendedGroups	○ recordGr – GlideRecord reference ○ fieldWatchList – Object containing all the fields and their respective values. For example: *{ "assignment_group": <assignment_group_sys_id> }*	Array – List of objects containing recommended group, sys_id, and the respective message. For example: *[{ : "Recommended based on assignment group" }]*
isExpertOnCallTabSupported	None	Boolean – return true to enable the Expert On-call for this table.

5. Select **Update**.

Setting up Service Desk assisted Password Reset in Service Operations Workspace

The Password Reset application provides a mechanism for end users to either unlock the account or reset their password with the help of service desk support. This feature enables a secure and an efficient password management system. The users must reach out to the service desk agents to update their login credentials.

Before you configure the password reset, you must define the password reset process. For more information, see Plan your Password Reset processes.

The password reset feature is available in the base system. Alternatively, you can customize the password reset process to meet your organization's needs.

Assign the Password Reset Service Desk role to the user

Assign the password reset service desk agent (password_reset_service_desk) role to the users to work on the incidents or interactions related to the password reset issues.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Password reset agents** card, select **Configure**.
   A new tab containing the list of users who have the service desk assisted password reset role(password_reset_service_desk) is displayed.
4. Select **New**.
5. On the form, fill in the fields.

Password Reset service desk role

Field	Description
User	Users whom the password reset role (password_reset_service_desk) must be assigned.
Role	Password reset service desk role to be assigned.

6. Select **Submit**.

Create credential store for Password Reset in Service Operations Workspace

Create a password reset credential store record to configure access to your credential store server while a user is changing or resetting a password.

About this task

In addition to host connection information, you can specify the password hints that users should see, restrictions on password reuse, the allowed number of failed reset attempts, and other settings.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Credential stores** card, select **Configure**.
   The default credential store is displayed.
4. On the form, fill in the fields.

Credential store

Field	Description
Name	Name of the credential store for service desk assisted password reset.
Description	Detailed information about the credential store.
Type	Type of credential store that you are connecting to. A ServiceNow credential store type is a template that provides the required set of capabilities for a particular kind of credential store. Credential stores inherit the functionality of the credential store type.
Auto generate password	Script include that generates a temporary password for use during the reset process. If you select the **Enforce history policy** check box, then you must specify a value for **Auto-generate password** that is compliant with the password policy.
Child Alias	Child aliases are associated with the base alias. After creating a connection and credential alias, you can create a child alias to configure multiple connections for a password reset credential store. When a password reset request is made, the flow checks whether there are child alias connections at the process level. If the child alias is configured at the credential store level, the flow picks the aliases connections and proceeds with the request.
Enable password policy	See Enable password policies on your instance
Enable password strength	Select the check box to:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Option to display the text box for the strength rule script so that you can update the script. ○ Display the graphical password strength bar to the user while the user changes or resets the password.
Password policy	Default password policy.
Enforce history policy	Option to ensure that the users don't reuse passwords. For example, you might configure the history policy to not allow the user to reuse any of the previous 10 passwords. Follow this procedure to use the feature: **a.** Select the **Enforce history policy** check box. **b.** In the **Password Reset Credential Store Parameters** related list, create a *password_history_limit* parameter. **c.** Set the value of the parameter to the number of previous passwords that cannot be used (maximum 10). The default value of 0 (zero) enables use of any previous password.

5. Select **Submit**.
6. Select **Test Connection**.
   You must test the connection to a credential store after you configure a new credential store.

Create password reset process in Service Operations Workspace

Create configure credentials, verification methods and settings, and enrollment settings to create a password reset process.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Password reset process** card, select **Configure**.
   The default password process is displayed.
4. To create a new password reset process, select **New**.
5. On the form, fill in the fields.

Password reset process

Field	Description
Name	Name of the password reset process
Description	Detailed information about the credential store.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential store	Credential store that contains user credentials and information.
Password reset	Option to apply the password reset process to a specific group or all users.
Enable account unlock	Option to unlock the account for all the users.
Apply to all users	Option to apply the password reset process to all the users. You can also select a specific group by deselecting this option, and add a group from **Groups** related list.

6. Select **Submit**.
7. Select the created password reset process.
8. On the **Password Reset Details** tab, configure the following settings.

Password Reset details

Field	Description
Minimum verifications	Number of verifications that a user must successfully submit to reset the password. If the number exceeds the number of required verifications, then the user must submit additional verifications to match the number specified for **Minimum verifications**.
Allow user to choose from optional verifications	Option to enable a user on the Verifications page during the process of resetting the password. The choice of optional verifications appears only if the **Minimum verifications** setting is greater than the number of mandatory verifications.
Auto-generate password	Option to auto-generate a new password for the user. When this check box is selected, you must select the **Email/SMS password** or **Display password** check box, or both.
User must reset password	Option to reset the user password immediately after logging in with the auto-generated password.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This check box is available only when the Auto-generate password check box is selected.
Display password	Option to display the new password on the screen. **Note:** Note: This check box is available only when the **Auto-generate password** check box is selected.
Email/SMS password	Option to send an email or SMS the new password to the user. **Note:** Note: This check box is available only when the **Auto-generate password** check box is selected.

9. Right-click on the form header, and select **Save**.
10. For **Password Reset**, enter the required fields in the **Enrollment Reminder** tab.
11. Save your changes on the **Password Reset Process** form.
12. **Optional:** From the **Password Reset Process Groups** related list, select the user groups that use the process.

    (Optional) The **Password Reset Process Groups** related list appears only if the **Apply to all users** check box is not selected.
13. Select the **Active** check box to enable the Password Reset process.
14. Right-click on the form header, and select **Save**.
    For more information on password reset process, see Configure your Password Reset process.

Configure the verification methods for service desk process in Service Operations Workspace

Create and edit verification methods to ensure they align with service desk processes, and map each verification to a specific process. Upon mapping the processes, integrate them with UXF routes to complete an end-to-end flow for resetting a password in Service Operations Workspace.

Create verification settings

Create a verification type in the base system to authenticate the user credentials while resetting the password.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Verification Settings** card, select **Configure** for Verification(s).
   The default password reset verifications are displayed.
4. Select **New** to create a new password reset verification method.
5. On the form, fill in the fields.

Password verification settings

Field	Description
Name	Name for the password verification method.
Description	Detailed information of the password verification method.
Label	Option to provide a label for the verification method.
Type	Verification types available in the base system. Password Reset supports the following types. ○ Personal Data Confirmation Verification ○ Personal Data Verification ○ Security Question Verification ○ SMS Code Verification ○ Email code verification
Password Reset Verification Parameters	Parameters used by a verification to configure specific behaviors, like number of questions required to enroll, request expiration time, and columns used. Set parameters for any behavior that should be different from the value that is specified in the Password Reset properties.

6. Select **Submit**.

Map the password reset process

Map the password reset process to verify the identity of the user requesting a password reset.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
- In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.

3. On the **Verification Settings** card, select **Process mapping** for Verification(s).
   The default process mappings are displayed.
4. Select **New** to create a new process mapping.
5. On the form, fill in the fields.

Process mapping

Field	Description
Process	Option to select the process for password reset verification.
Verification	Option to select the verification method.

6. Select **Submit**.

Map the UXF routes

Create a route for the verification method to map the verification process.

About this task

The administrator can customize the verification page at the specified route. The UI page should be configured with a verification type that allows the service desk agent to verify the identity of the user requesting a password reset.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Verification Settings** card, select **UXF routes mapping**.
   The default UXF routes are displayed.
4. Select **New** to create a new UXF route.
5. On the form, fill in the fields.

UXF routes

Field	Description
Order	Order of the UXF route
Workspace	Option where the UXF route will be applicable to. If there is no value in this field, the system picks the Workspace as Service Operations Workspace.
Verification type	Verification type to authenticate the user during the password reset process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Route	Path for the code to reach the destination.

6. Select **Submit**.

Configure the password policies

Create a password policy to ensure that all passwords are strong and secure.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Password policies** card, select **Configure**.
   The default password policy is displayed.
4. Select **New** to create a new password policy.
5. On the form, fill in the fields.

Password policy

Field	Description
Name	Name of the password policy.
Password Strength Preset	Default password strength.
Minimum Password Length	Minimum number of characters for a password.
Maximum Password Length	Maximum number of characters for a password.
Excluded Special Characters	List of special characters not to be included in a password.
Disallow User Data	Option to exclude the user related data from the password.
Sequence Length Threshold	Maximum number of sequential characters allowed in the password.
Repetition Length Threshold	Maximum number of times a character can be repeated in the password.

6. Select **Submit**.

Configure the session properties

Configure the password reset properties based on the requirement.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Overview**.
2. On the **Admin Center** page, do one of the following:
   - In the **Overview** tab, select the **Configure** button in the **Service Desk Assisted Password Reset** card.
   - In the **Configurations** tab, select **Service Desk Assisted Password Reset** card.
3. On the **Session properties** card, select **Configure**.
4. On the form, fill in the fields.

Password reset session properties

Field	Description
Password Reset Global Properties	
Email template for enrollment reminder emails. The instance can send email reminders to users who are not yet enrolled in the Password Reset process.	Template to use for the email messages that remind users to enroll for the password reset process.
Workflow polling frequency (frequency, in milliseconds, that the application polls the password reset/change workflow for completion)	Time period in milliseconds between checks on status of the Password Reset workflow. ○ Type: integer ○ Default value: 500
Workflow expiration (time, in milliseconds, before the password reset/change workflow expires)	Maximum wait time in milliseconds for the workflow to complete. The workflow is triggered during the password reset request when the user clicks **Submit**. ○ Type: integer ○ Default value: 90000
Password Reset Request Properties	
Number of unsuccessful attempts allowed for resetting/changing password	Number of password reset attempts a user is allowed before they are locked out for a period determined by the value in max_attempt_window. ○ Type: integer ○ Default value: 3 (attempts)
Number of minutes a user needs to wait to reset/change password after the last successful reset/change	Time period that users are blocked or prevented from changing their passwords after trying the maximum number of times. ○ Type: integer ○ Default value: 1440 (minutes)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Number of minutes a user needs to wait to start a reset request after the last successful unlock account.	Time period that a user must wait after successfully resetting the password to reset the password again. ○ Type: integer ○ Default value: 1440 (minutes)
Number of minutes before a password reset request expires	Time period during which a user must perform the Password Reset process. ○ Type: integer ○ Default value: 10 (minutes)
Maximum number of times that a user can receive "Reset Password" link via email, in a span of 24 hours. The upper limit is 5.	Maximum number of times a user can receive emails containing a link for resetting a password in a duration of 24 hours.
Password Reset Security Question Properties	
Number of security questions required during the password reset request	Number of security questions that are displayed on the Verify page while a user is attempting to reset the password. The user must answer all questions correctly to verify identity.
Number of security questions required during enrollment	Number of questions that a user must provide answers to while enrolling for the Password Reset process.
Minimum length requirement for security answers	Minimum number of alphanumeric characters that the user must enter in the answer text box for any security question.
Password Reset SMS Code Properties	
Maximum number of SMS codes sent for verification per day	Maximum number of SMS codes that are sent to a user within one 24-hour period. The 24-hour period begins when a user clicks **Send Code**.
Number of minutes before the user can attempt to send another SMS code for verification	Time that must pass before another SMS code can be sent to a user.
Number of digits in the SMS code sent to the user	Number of characters required for a user to reset their password.
Number of minutes before the SMS code expires	Time, in minutes, until the SMS code sent to the user expires.
Use Notify for SMS code notification for enrollment and verification	Support for SMS channel used for notifying users for password reset enrollment and verification.

5. Select **Save**.

Enable Computer Telephony Integration providers to interact with the Service Operations Workspace

Enable an agent (with the sn_openframe_user role) to receive inbound calls and place outbound calls using the Computer Telephony Integration (CTI) interface.

Before you begin

Enable the following plugins.

- com.snc.notify
- com.snc.cti
- com.sn_openframe

For more information about installing and enabling a plugin, see Activate a plugin.

Role required: admin

About this task

The CTI integration helps an agent call a user using the phone number in the user profile and contact cards. The ServiceNow application uses the OpenFrame API when an agent initiates a call. The OpenFrame API helps the ServiceNow AI Platform® communicate with the connectors, such as an Amazon connector, already configured in the application.

For more information about CTI integration, see Integrating with Computer Telephony Integration (CTI).

For more information on the various OpenFrame APIs, see openFrameAPI - Client.

Procedure

1. From the **All** > **sys_properties.list**.
2. Open the *sn_sow.default_call_from_contact_page* property.
3. In the **Value** field, specify `CTI`.
4. Select **Update**.

Configure the task record information in the MS Teams Import tab

Customize the task record fields displayed when you view or import a Microsoft Teams chat conversation.

Before you begin

Role required: admin

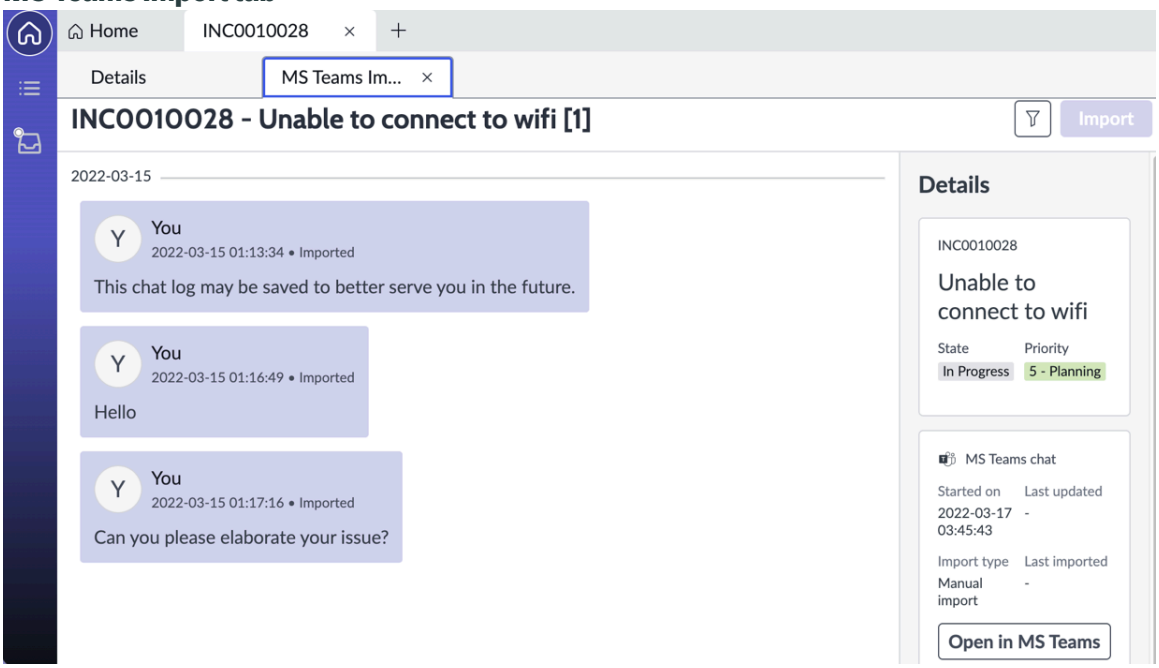
About this task

When you view or import a Microsoft Teams chat conversation for a task record, the record details are displayed in the **Details** section of the **MS Teams Import** tab. These details are configured in the **Script** field of an implementation corresponding to the task record in the sn_tcm_collab_hook.MSTeamsTaskInfoCardHandler extension point.

For information about collaborating on a task record using Microsoft Teams chat, see Collaborate on a task record using Microsoft Teams in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MS Teams Import tab



Procedure

1. Navigate to **All** > **System Extension Points** > **Scripted Extension Points**.
2. From the Extension Points list, select **sn_tcm_collab_hook.MSTeamsTaskInfoCardHandler**.
3. From the Implementations related list, select an implementation associated with the task record and modify the **Script** field.
4. Edit the **Script** field.
5. Click **Update**.

Specify the refresh duration for user presence in Service Operations Workspace

Define the duration after which the user presence should be refreshed for all collaboration channels in Service Operations Workspace.

Before you begin

Role required: admin

About this task

The *sn_sow_collab.user_presence_refresh_duration* property specifies the refresh duration of user presence for all collaboration channels in Service Operations Workspace. However, if the user presence refresh duration is also defined for an individual collaboration channel, then the maximum of these two values is considered for that channel.

For example, consider the following scenario where the user presence refresh duration is defined individually for Microsoft Teams and also for all collaboration channels in Service Operations Workspace.

- The *sn_tcm_collab_hook.teams.presence_status_cache_invalidate_duration* property value is set to 240 secs. For information about defining the user presence refresh duration for Microsoft Teams, see Configure cache duration for the user presence status.
- The *sn_sow_collab.user_presence_refresh_duration* property value is set to 180 secs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this case, the value specified for the *sn_tcm_collab_hook.teams.presence_status_cache_invalidate_duration* property is considered to refresh the user presence in Microsoft Teams.

Procedure

1. From the **All** menu, navigate to **sys_properties.list**.
2. Select the *sn_sow_collab.user_presence_refresh_duration* property.
3. In the **Value** field, specify the duration after which you want the user presence to refresh.
4. Click **Update**.

Install Universal Request for Service Operations Workspace

You can install the Universal Request for Service Operations Workspace application (com.snc.universal_request) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Universal Request:

- Plugins
- Store applications
- Roles

For more information, see Components installed with Universal Request for Service Operations Workspace.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Universal Request application (com.snc.universal_request) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you're displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Install Universal Task for Service Operations Workspace

You can install the Universal Task application (sn_uni_task) if you have the admin role.The application includes demo data and installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

The following items are installed with Universal Task:

- Plugins
- Store applications
- Roles

For more information, see Components installed with Universal Task for Service Operations Workspace.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Universal Task application (sn_uni_task) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.

6. Select **Install**.

Configuring Interaction Management in Service Operations Workspace

Configure the features of Interaction Management to manage the interactions in Service Operations Workspace.

Configure the duration to view the requester's activities for an interaction in Service Operations Workspace

Configure the duration to display requester’s history, consisting of tasks, interactions, and assets. These details are displayed in the Requester Information side panel of Interaction Management record

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace Admin Center** > **Overview**.
2. Select **Configure** of **Interaction Management** from the **ITSM core configurations** section.
3. Enter the number of days to fetch the data in **Days to display data** section.
   Maximum limit is 7 days.
4. Select **Update**.

Automatically close an interaction in Service Operations Workspace

Automatically close the interaction when an incident linked is closed in Service Operations Workspace.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **Service Operations Workspace** > **Configurations**.
2. Select **Interaction Management.**
3. Toggle the **Close Interaction when linked Incident is resolved** option.

Result
The interaction record will be automatically closed in the Service Operations Workspace once the linked incident is closed.

Using Service Operations Workspace for ITSM

Service Operations Workspace provides a unified experience for multiple IT Service Management workflows by integrating with various applications.

For information about using Service Operations Workspace for ITOM, see Using Service Operations Workspace for ITOM.

Add a user-specific quick link on the ITSM landing page

Refer to a URL quickly from the Service Operations Workspace landing page.

Before you begin

Role required: itil

Procedure

1. Navigate to the Service Operations Workspace landing page.
2. Under the **Quick links** section, select add quick link (+).
3. In the **URL** field, specify the URL that you want to refer to.
4. In the **Display text** field, specify the text that you want to display for the URL.
5. Select **Add**.

Create a list in Service Operations Workspace

Create a list or use an existing list to create a list.

Before you begin

Role required: itil

Procedure

1. From the primary navigation in Service Operations Workspace, select the **List** menu and select the **My Lists** tab.
2. Select **Add new list**.
3. To create a different version of the existing list, perform the following steps.
   a. In the New List dialog box, select the **Start from existing** tab.
   b. Specify the required details.
4. To create your own list, perform the following steps.
   a. In the New List dialog box, select the **Create your own** tab.
   b. Specify the required details.
5. Select **Create**.

View and approve records in Service Operations Workspace

Access the My Approvals in SOW to manage the approval requests for change, request, catalog task, and requested item.

Before you begin

Role required: itil, sn_change_read, sn_request_read

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Navigate to **List** > **Approvals** > **My Approvals**.
3. Select a record to approve or reject the request.
4. **Optional:** Select **Approve** to approve the request.
5. **Optional:** Select **Reject** to reject the request.

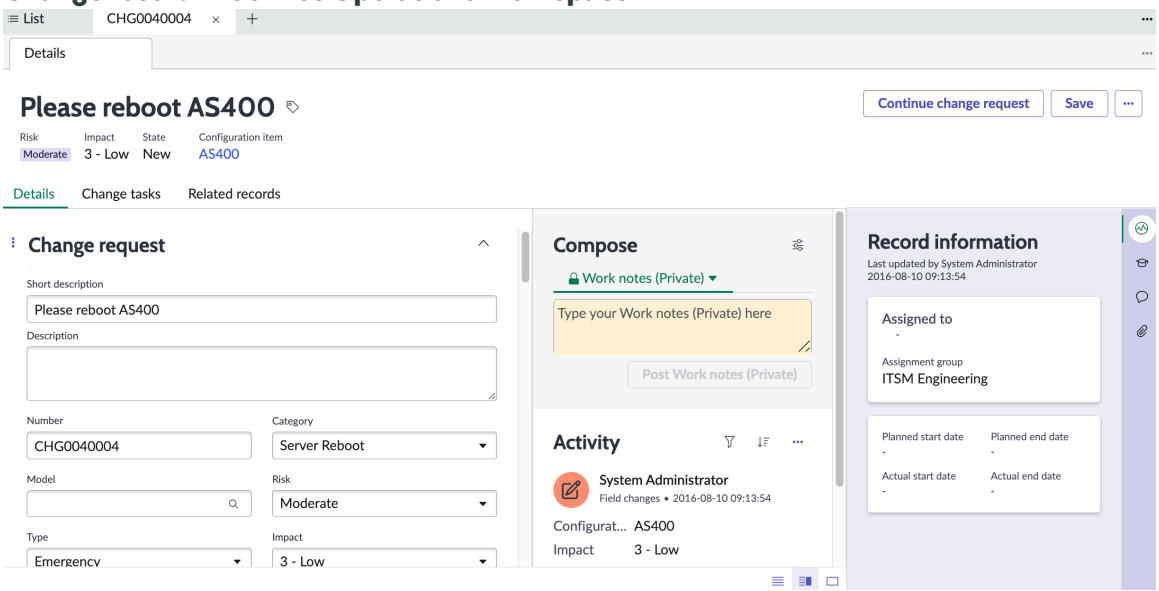
Change Management in Service Operations Workspace

When a change to your infrastructure or a business service is required, you can create a change request and track it in Service Operations Workspace.

Change record in Service Operations Workspace



Details tab

This section displays the detailed information of a change request. For information about fields in this section, see Create a change request in Service Operations Workspace.

For information about how you can configure fields in this tab, see Configure a task record form in Service Operations Workspace.

From the **Compose** section, you can add work notes for the change request.

Change tasks tab

This section displays change tasks associated with the change request. For information about creating a change task, see Create a change task in Service Operations Workspace.

Related records tab

This section provides a list view of the records associated with the change request, for example, affected CIs and outages. You can add a record, create a record, or remove it from the change request.

Contextual side panel

From this section, you can access the following information:

- Record information for the change request.
- Agent Assist and search for relevant records and perform the required actions.

For information about Change Management, see Change Management.

Create a change request in Service Operations Workspace

Track modifications to a supported configuration item (CI). Use a change request form to record information such as the reason for the change, type, priority, and risk.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: itil or admin

Note:
You must have the sn_devops.viewer role to view or add DevOps data to a change request.

Procedure

1. Perform one of the following actions to start creating a change request.

2. Select the change model that you want to create, and select **Next**.

   For information about change models, see Change models.

Option	Description
Normal	Any service change that is not a pre-ap proved change or an emergency change.
Pre-approved	A pre-authorized change that is low risk, rela tively common, and follows a specified proce dure or work instruction.
Emergency	An emergency change that bypasses group and peer review and approval, and goes straight to the authorization state for approval by the CAB approval group.
DevOps or DevOps Simplified	Change model used for DevOps change re quests. For more information on the DevOps model change, see DevOps change models. **Note:** You must activate the DevOps Change Velocity application to use the DevOps models.

Note:

- You can filter and search for the change type.
- When you create a change request from an interaction, only pre-approved change types are available.

3. In the Overview tab, fill in the fields.

   You must provide the initial details of the change in the Overview tab.

Field	Description
Short description	Brief description of the change.
Description	Detailed description of the change.
Justification	Reason for the planned change request, which helps approvers determine their decision.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Save**.

   The change request is created along with **Scope and impact**, **Assignment**, **Schedule**, **Risk evaluation**, and **Change task** sections.

5. Select **Add scope** in **Scope and impact** section.

   a. On the form, fill in the fields.

Add scope form

Field	Description
Configuration item	Configuration item (CI) that the change applies to. You can associate any type of CI with a change request, including service offerings. It also provides detailed access to SLA and availability requirements.
Service offering	Consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Service offering enables you to receive different features and their levels of performance for a given service.
Service	The business service that you want to make available for the change request.
Category	The category of the change, for example,**Hardware**,#**Network**, **Software**, **Other**, **DevOps**, and so on. **Note:** The section to **Add DevOps data** (step 8 in this procedure) is enabled only when the category is selected as **DevOps**. For DevOps models, the category is automatically set to DevOps.
Affected CIs	Associate CIs with a single change request.
Propose mass CI update	Apply the same update to a set of CIs for a specific CI class.
Propose single change	Propose a change to one CI from your list of affected CIs.
Refresh impact services	When you refresh impacted services, the Impacted Services/CIs, Business Applications, and Service Offerings related lists get updated based on the affected CIs. The records in each of the related list are

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	unique even though the impact can be from a single affected CI.

b. Select **Save**.

6. Select **Assign** in the **Assignment** section.

a. On the form, fill the fields.

Field	Description
Assignment group	Group assigned to the change. You can populate the **Assignment group** field automatically based on the support group available for the respective configuration item (CI). If the CI does not have any change group, then the field gets populated with the change group available for service offerings. The business rule **Populate Assignment Group based on CI/SO** triggers the functionality when an incident, problem, or change request is created or updated and when the **Assignment group** and the **Assigned to** field is empty. The following properties identify the field whose value populates the **Assignment group** field: ▪ *com.snc.change_request.ci_assignment_gro* This change property identifies which CI field populates the **Assignment group** field. ▪ *com.snc.change_request.service_offering_* This change property identifies which service offering field populates the **Assignment group** field. **Note:** The default value for the properties is support group for incident or problem and change group for change request respectively. The business rule **Populate Assignment Group based on CI/SO** is shipped as part of the development plugin ITSM CSDM Best Practice – Quebec plugin (com.snc.best_practice.itsm_csdm.quebec) and is available only for the new customers.
Assigned to	User assigned to the change request. If an assignment rule applies, the change is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	automatically assigned to the appropriate user or group.
Work notes	Information about how to resolve the change or steps taken to resolve it, if applicable. This note is for internal use. The work notes information is not visible to your customer.

b. Select **Save**.

7. Select **Schedule** to schedule the implementation for the change.

a. On the form, fill in the fields.

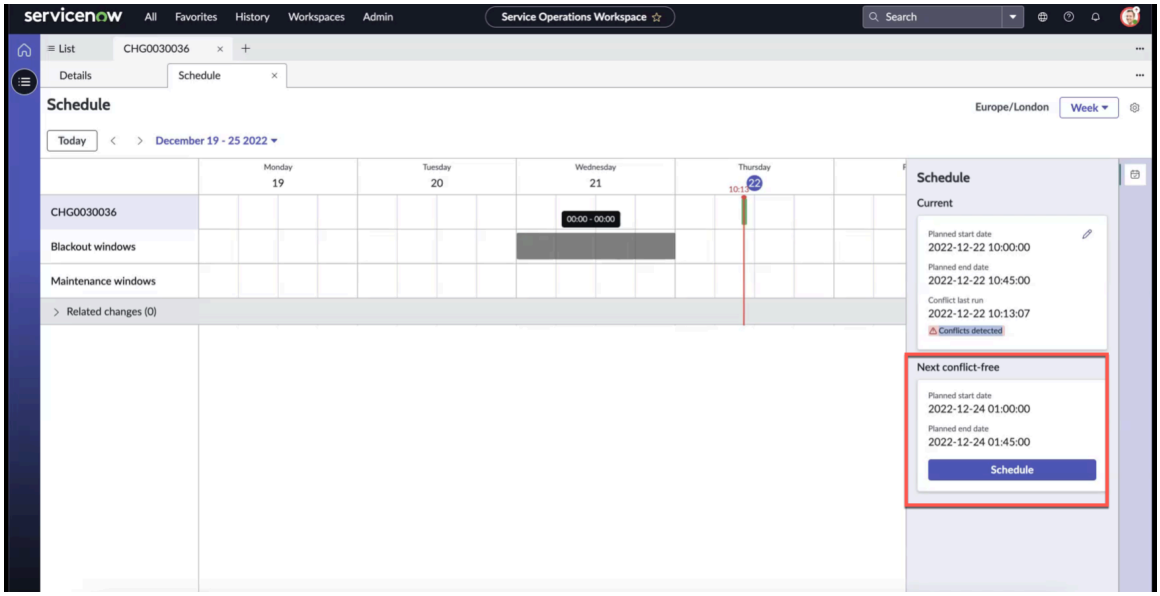
Schedule

Field	Description
Planned start date	Date to begin working on the change.
Planned end date	Date the change is planned to be completed. If the task type is#**Implementation**, the**Planned start date** #and **Planned end date**#values must fall within the planned start and end dates specified in the change request.
Actual start date	Start date of the implementation.
Conflict status	Status of the conflict.
Actual end date	Date when the change was implemented.
Conflict last run	Date when the conflict was last run.

b. Select **Schedule**.

Select **Schedule** under **Next conflict-free card** to re-schedule the implementation of the change if there is any conflict.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

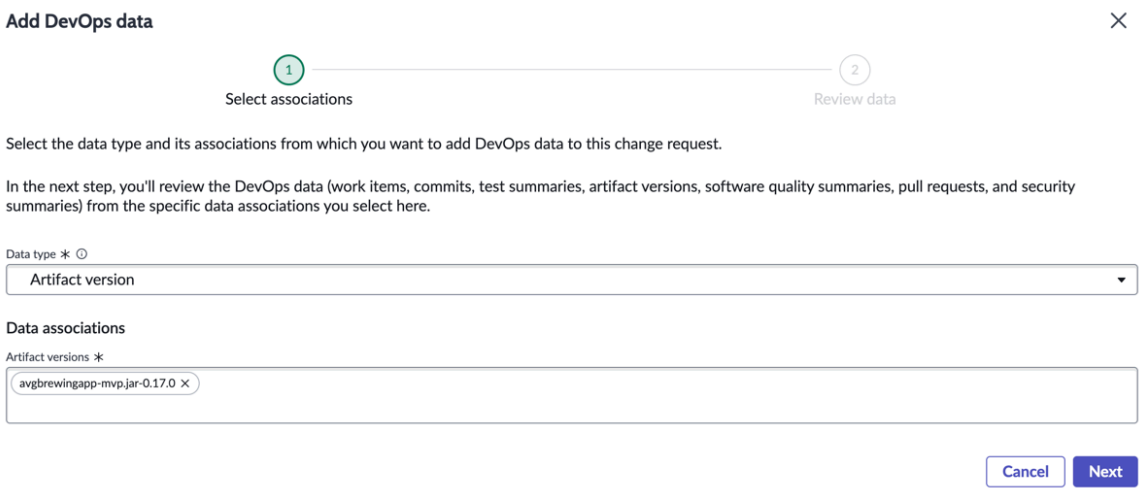


c. Select **Details** tab to view the Change details.

8. **Optional:** Select **Add data** in the **DevOps data** section to add DevOps data to the change request.

> **Note:**
> You must have the sn_devops.viewer role to add DevOps data to a change request or view DevOps data in an already created change record.

a. Specify the following values on the **Select associations** step:



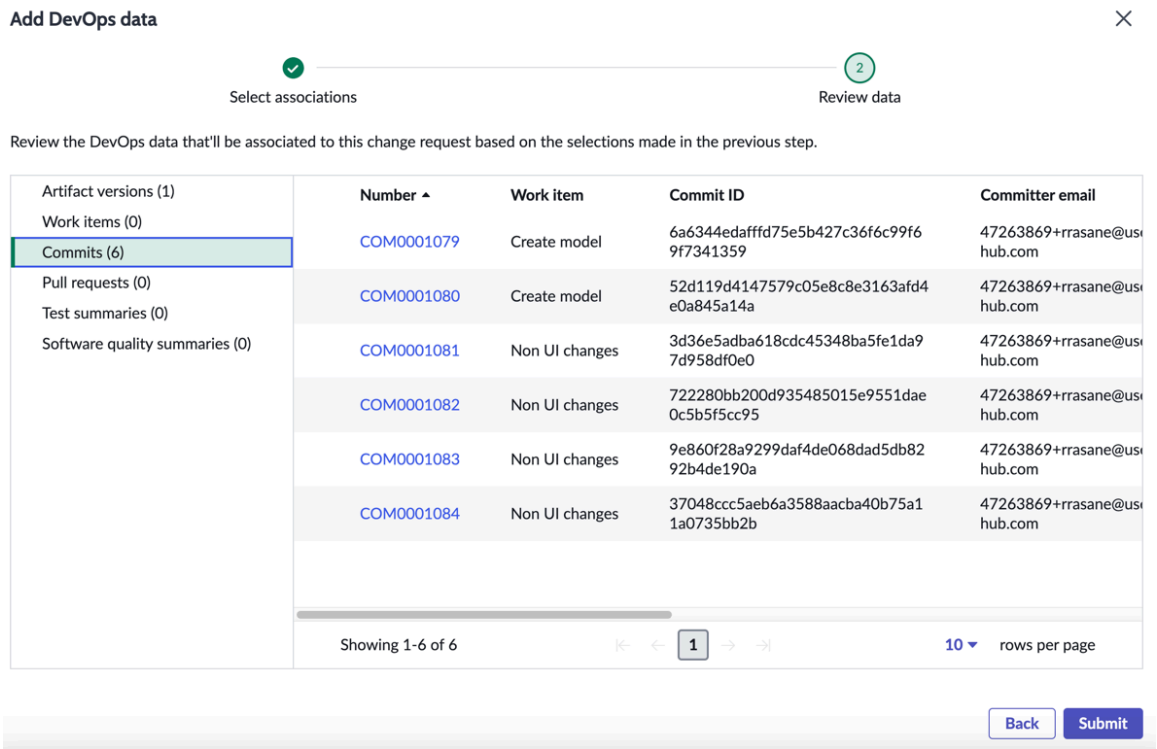
Select associations

Field	Description
Data type	(Optional) The type of data to associate with the change request. ▪ Artifact version ▪ Release version

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Build number ▪ Work item
Data associations	(Optional) The specific data to associate with the change request. You can select multiple artifact versions, build numbers, and work items. If you select *Build number* as the **Data type**, then you must also specify the application name and corresponding pipelines and build numbers. If you select *Work item* as the **Data type**, then you can filter the list of work items available for selection by applications and plans. You can search for build numbers by the branch name as well.

b. Select **Next** to open the **Review data** step.



c. Navigate the tabs to verify that the associated data is mapped accurately. Update settings as needed.

- Work Items
- Commits
- Pull Requests
- Test Summaries
- Artifact Versions

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Software Quality Summaries
- Security Scan Summaries

d. Select **Submit**.

> **Note:**
> Once the commits are added in the DevOps data section, you can select **View source** corresponding to the Commits tile to view the source details of the commit like pipeline execution, branch, repository, and so on.

e. Optional: To modify the data that is associated with the change request, select **Edit DevOps data**.

i. Edit the data type and its associations from which DevOps data has been added in the **Select associations** step.

ii. Review the DevOps data that'll be associated to or removed from this change request in **Review data** step.

iii. Select **Submit**.

9. Select **Risk evaluation** to evaluate the risk for the change.

The risk is calculated and is shown in Record information.

The last evaluated risk value is displayed along with the timestamp.

10. Select **New** in **Change task** section.
For more information to create a change task, refer Create a change task in Service Operations Workspace.

11. Select#**Request Approval** when the change request is ready to move to the next state.

The state is moved forward based on the type of change request:

- Assess state: Group level approval for a normal change request. Approval records are automatically generated based on the#Change approval policies. You can conduct peer and technical reviews of the proposed change.
- Authorize state: Approval required by the business stakeholders, or by the Change Advisory Board.
- Scheduled state: Pre-approved standard changes.

> **Note:**
>
> To mail the change record, select the more options icon ( ) in the content frame and select **Email**. Both the user who requested the change and the user who is assigned to the change are automatically populated in the list of recipients.
>
> To view the calendar, select **View Calendar** in the title bar of the Change Request form.

12. Select **Save**.

Work on a change request in Service Operations Workspace

Modify a supported configuration item (CI) if required and close the change request.

Before you begin
Role required: itil

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a change request.

   For information about creating a change request in Service Operations Workspace, see Create a change request in Service Operations Workspace.

2. Perform any of the following actions on the change record page.

Standard change catalog

Standard changes are pre-approved, low-risk changes with a proven history of success. The standard change catalog contains the changes that have been approved by the Change Management application as standard changes.

The standard change catalog enables you to perform the following activities:

- Request, review, and approve standard change templates.
- Request pre-approved standard changes.
- Determine access to standard change templates at the user level.

You can propose, modify, and retire standard change templates based on the requirements of your organization.

Propose a standard change template

Propose a new standard change template when you identify a need while creating a change request.

Before you begin
Role required: admin, change_manager

About this task
As an IT technician, you can propose a standard change template for a change request that you frequently create. This new template is sent for approval to the Change Management team, which reviews the proposal and approves the template as part of the approval process.

Procedure

1. Create a new change request to open the standard change catalog.
2. From the **More Actions** icon (⋮), select **Propose a new template**.
3. Fill the fields of the Standard Change Proposal form.
4. Select **Save**.
   The proposal is created with the status **New**.
5. Select **Request Approval**.

Result
The proposal for a new standard change template is created with the status **In Progress**.

Modify a standard change template

You can modify standard change templates based on your organization's requirements.

Before you begin
Role required: admin, change_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Create a new change request to open the standard change catalog.
2. Select the template you want to modify.
3. From the **More Actions** icon (⋮), select **Edit template**.
4. Enter your edits in the **Modify a Standard Change Template** form.
5. Perform one of the following actions:
   - Save edits, but do not send for approval by selecting **Save**.
   - Send edits for approval to the change management team by selecting **Request Approval**.

Create a change task in Service Operations Workspace

When you need to engage another team or agent for help, create and assign change task. For example, there can be tasks to plan the change, implement the change, and test, and review the work.

Before you begin

Role required: itil or admin

Procedure

1. Open a change request.
2. On the change record page, Click the more actions icon (···) and select **Create Change Task**.
3. In the Create Change task dialog box, select the task type.
   By default, the following task types are available. To create additional task types, see Create a task type for problem or change in Service Operations Workspace.
   - Planning
   - Implementation
   - Testing
   - Review
4. Click **Create**.
5. On the form, fill in the fields.

Create New Change Task form

Name	Definition
Short description	A summary of the task.
Description	Detailed description of the task.
Number	Auto-generated identification number for the task.
Change request	Associated change request.
State	State of the change task: ○ **Pending**: Open and unassigned ○ **Open**: Open and unassigned ○ **In progress**: Open and actively being worked on

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Definition
	○ **Closed**: Inactive and closed. Requires close code and close notes to be provided. ○ **Canceled**
Configuration item	Configuration item (CI) or service that the change task applies to.
Type	Type of change task, **Planning**, **Implementation**, **Testing**, or **Review**. The default workflow generates tasks in type **Review**.
On hold	Option to indicate whether the change task is on hold. Provide an **On hold reason** if a change task is placed on hold.
Assignment	
Assignment group	Group that the change task is assigned to.
Assigned to	User that the change task is assigned to. If an assignment rule applies, the change task is automatically assigned to the appropriate user or group.
Schedule	
Planned start date	Date you plan to begin working on the task.
Planned end date	Date the change task is planned to be completed. If the task type is **Implementation**, the **Planned start date** and **Planned end date** values must fall within the planned start and end dates specified in the change request.

6. Click **Save**.

Work on a change task in Service Operations Workspace

Complete the change task that in turn helps in resolving the associated change.

Before you begin

Role required: itil or admin

Procedure

1. Open a change.
2. From the **Change tasks** tab, open the required change task.
3. To find and work on records that help in quick resolution of the change task, perform the following actions.
   a. From the contextual side panel, click the agent assist icon ( ).
   b. Search for a resource and perform the required action.
4. To delete the change task, Click the more actions icon ( ) and select **Delete**.

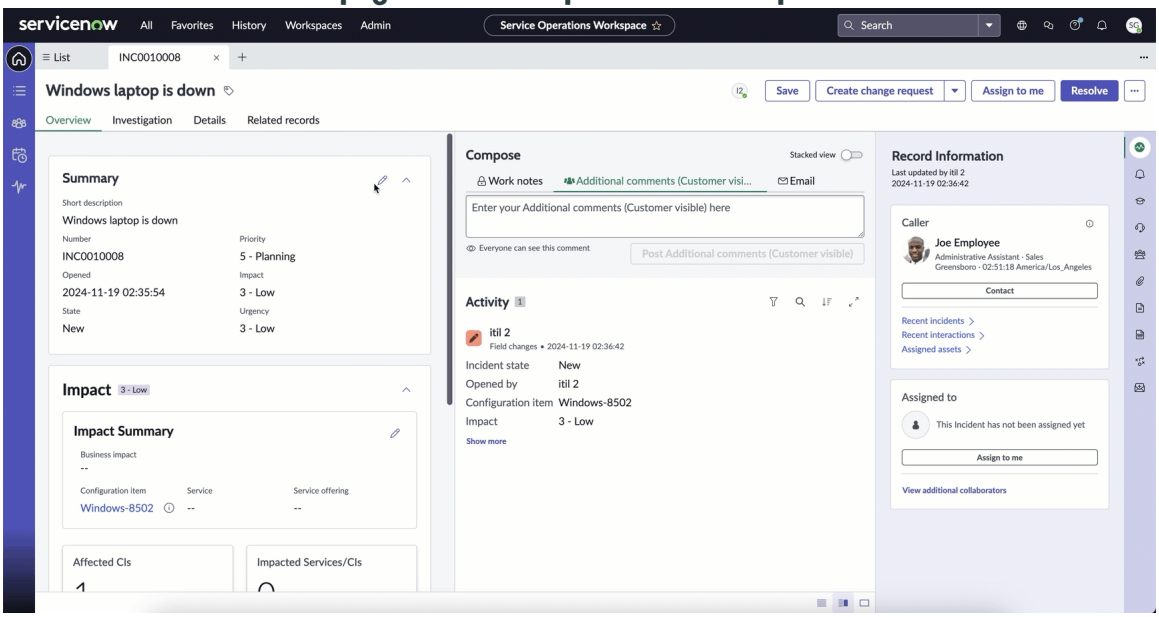
Incident Management in Service Operations Workspace

You can create and manage your incidents in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Introduction to incident management in Service Operations Workspace

Tabs of an incident record page in Service Operations Workspace



Overview tab

This tab displays the following information about an incident:

- Summary
- Impact
- Cause
- Resolution

From the Compose section, you can add comments and work notes for the incident.

The Overview tab displays the field information along with the field labels, including when you're in read mode.

For more information on the fields displayed on the **Overview** tab, see View and update incident information on the Overview tab.

You can customize the display of the information on the **Overview** tab. For more information, see Customize the Overview tab for an incident.

Investigation tab

This tab enables you to investigate any affected CIs with the `ci_computer` or `ci_server` class associated with the incidents. The tab displays the metrics information of the associated primary CI or any affected CI that is selected, which helps you to analyze and resolve the issue. You can use the various remedial actions on this tab to resolve the CI-related issues.

By default, the tab displays metrics information of the primary affected CI associated with the incident. But you can also select and view the information for any affected CI with the `ci_computer` or `ci_server` class that is associated with the incident. For information about how you can set up Investigation Framework, see Setting up Investigation Framework in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- The tab is visible only if the Agent Client Collector (ACC) or Microsoft Endpoint Configuration Manager (MECM) adapters are installed and configured.
- The tab displays the metrics information for the CI only in the following conditions:
  - Agent Client Collector or Microsoft Endpoint Configuration Manager (MECM) is installed for the associated CI. This helps to retrieve the metrics data for the CI.
  - The associated CI class is a CMDB CI computer.
- This feature supports only the macOS, Windows, and Linux operating systems.

You can also customize the display of the metrics information on this tab. For more information, see Customize the Investigate tab.

For more information on the metrics displayed on this tab, see Features of the Investigation tab.

Communicate tab

This tab displays all the communication tasks and options that enable you to communicate with the stakeholders in the various phases of an incident. This tab is available only if any of the following conditions are met:

- For a major incident - The Major Incident Management (sn-sow-mim) plugin is active and configured in Admin Center, for Service Operations Workspace. For more information, see Setting up Major Incident Management in Service Operations Workspace.
- For Incident – The Task Communications Management and Incident Communications Management applications are installed, active, and configured in the instance and you select the **New Communication** option from the **More Actions** (...) icon of the Incident record page. For more information, see Task Communications Management and Incident Communications Management.

For more information on the features of the **Communicate** tab, see Communicating with stakeholders about incidents and major incidents.

Post incident report tab

This tab enables you to generate, configure, publish, and export a post incident report for a major incident after it's resolved. The post incident report enables you to review the cause and resolution of the major incident and also identify potential process gaps. Based on this information, you can take preventive measures to avoid the issue in the future or to handle the major incident in a better way. This tab is available only if the following conditions are met:

- Major Incident Management is active and configured in Admin Center for Service Operations Workspace. For more information, see Setting up Major Incident Management in Service Operations Workspace.
- The major incident is in the **Resolved** state.

For more information on the features of the **Post incident report** tab, see Review and update a post incident report.

Details tab

This tab displays detailed information about the incident. For example, the short description, assignment details, and related records. For more information on how you can configure fields in this tab, see Configure a task record form in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related records tab

This tab provides a list view of the records associated with the incident. For example, task SLAs, affected CIs and related interaction list.

Contextual side panel

From this section, you can view record information and recommendations, collaborate using Microsoft Teams, and reach out to experts on-call to resolve incidents quickly.

For more information about Incident Management, see Incident Management.

Create an incident in Service Operations Workspace

Track the investigation, possible solutions, and resolution of a problem for a customer.

Before you begin
Role required: itil or admin

Procedure

1. Perform one of the following actions to start creating an incident.

2. On the form, fill the fields in the **Details** tab.

Create New Incident form

Field	Description
Incident	
Short description	Brief description of the incident.
Description	Detailed explanation of the incident.
Number	Auto-generated unique number to identify the incident record.
Caller	User who contacted you with an issue. Begin typing the first name of the caller to select from a list of matching names, or look up and select the user.
Location	Location of the caller.
Channel	Mode of communication taken by the user to create the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
State	Different states through which the incident proceeds during its life cycle.
Impact	The effect of an incident, problem, or change on the business processes.
Urgency	How long the resolution can be delayed until an incident, problem, or change has a significant business impact.
Priority	How quickly the service desk should address the task. Priority is based on impact and urgency.
Impact	
Service	Business service that is affected.
Configuration item	Configuration item that is affected.
Service Offering	Consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Service offering enables you to receive different features and their levels of performance for a given service.
Business impact	Impact of the incident.
Assignment	
Assignment group	Group to work on this incident. If you do not provide a value, the incident is automatically assigned based on assignment rules.
Assigned to	The user to work on this incident. **Note:** If the **Assignment group** changes, the **Assigned to** field is cleared.
Notes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Additional comments (Customer visible)	More information about the issue as needed. All users who can view incidents can also see additional comments.
Work notes	Information about how to resolve the incident or steps taken to resolve it, if applicable.
Related Records	
Parent Incident	Associated parent incident that makes the current incident a child incident. **Note:** When the parent incident is resolved, the child incident is also marked as resolved.
Problem	Any related problem record.
Change Request	Any related change request.
Caused by Change	Associated change request that prompted the creation of the incident.

3. Click **Save**.

View and update incident information on the Overview tab

View and update the incident information, such as summary, impact, cause, and resolution, from the **Overview** tab. This incident information helps you analyze the issue and resolve the incident quickly.

Before you begin

An incident must be created. For more information, see Create an incident in Service Operations Workspace.

Role required: itil

About this task

Review the incident information on the **Overview** tab. If necessary, you can edit or add information.

Procedure

1. On an incident record, select the **Overview** tab.
2. On the Summary section, add or edit the information as needed.
   a. Select the **Edit summary** ( ) icon to edit the fields.
   b. On the form, fill in the details.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident summary

Field	Description
Short description	Brief description of the incident.
Description	Detailed explanation on the incident.
Number	The unique system-generated incident number. This is a read-only field.
Priority	How quickly the service desk should address the task. The **Priority** field is calculated based on the **Impact** and **Urgency** fields.
Opened	The date and time when the incident was created. This is a read-only field.
Impact	Level of impact that the incident has on the business. Possible values: ▪ 1-High ▪ 2-Medium ▪ 3-Low **Note:** When you modify the value in the **Impact** and **Urgency** fields and save the record, a Record update pop-up window is displayed where you must enter the **Work notes** information to proceed further.
Urgency	Level of urgency the incident requires to be resolved. Possible values: ▪ 1-High ▪ 2-Medium ▪ 3-Low **Note:** When you modify the value in the **Impact** and **Urgency** fields and save the record, a Record update pop-up window is displayed where you must enter the **Work notes** information to proceed further.
State	Different states through which the incident proceeds during its life cycle. Possible values: ▪ New ▪ In progress ▪ On Hold

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ Resolved ▪ Canceled **Note:** ▪ When you select the **On Hold** state and save the record, a Record update pop-up window appears where you must select the **On hold reason** field and enter the **Additional comments**. ▪ When you select the **Resolved** state and save the record, a Record update pop-up window appears where you must select the **Resolution code** field and enter the **Resolution notes** to proceed further.
Major Incident state	State of the Major incident. **Note:** This field is available only if the Major Incident Management for Service Operations Workspace (sn_sow_mim) plugin is installed and active. For more information, see Setting up Major Incident Management in Service Operations Workspace.
Caller	User who reported the incident.

c. Select the **Save Summary** ( ) icon.

3. On the Impact Summary section, edit the information as needed.

a. Select the **Edit impact summary** ( ) icon.

b. On the form, fill in the details.

Impact summary

Field	Description
Business impact	Impact of the incident on the business.
Configuration item	Primary configuration item that is impacted.
Service	Primary business service that is impacted.
Service offering	Consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Service

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	offering enables you to receive different features and their levels of performance for a given service.

For the reference fields such as **Configuration item**, **Service offering** and **Service**, you can do the following actions:

- Select the **Preview record** icon (ⓘ) to display a preview of that record information on the same page. If necessary, you can also select **Open record** to open the record on a separate tab.
- Select the **Dependency view** icon ( ) to view the dependency map of the configuration item (CI) in a modal view experience.

c. Select the **Save Impact Summary** ( ) icon.

4. On the **Location** field of the Impact section, select **View impacted locations** to view the impacted locations and users on a world map in a separate tab.
The **Impacted location** tab displays the following information:

- Number of impacted users – Number of users impacted by the incident.

  Note:
  The number of impacted users is calculated based on the following data sources:
  - Caller of the incident.
  - Callers of the child incidents.
  - Service offerings associated with the Incident. This source is only used if Service Portfolio Management Foundation is activated and being used. For more information, see Activate Service Portfolio Management.

- Number of impacted locations – Number of unique locations calculated based on the number of users.
- Impact world map – Map of impacted locations marked on the world map along with the impacted users. You can view the impacted users counts and details at these locations. You can further narrow down to the continent, country, state, or city level.

Note:
The Location section is available only if the Major Incident Management for Service Operations Workspace (sn_sow_mim) plugin is installed and active, and if the incident is a major incident. For more information, see Major Incident Management in Service Operations Workspace.

5. Select the following cards to add or update the configuration items associated with the Incident.

a. Select the **Affected CIs** card to add or remove the configuration items (CI) that are affected by the incident.

b. Select the **Impacted Services/CIs** card to add or remove the Configurations items or Services impacted by the incident.

c. Select the **Assets** card to add or remove the configuration items that users use as assets. You can search and filter the Configuration Items (CI) based on the configuration class when you add the affected CIs to an incident record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the Cause section, add or update the cause of the incident.
   a. Select **Add cause**.
   b. Enter **Probable cause** of the incident.
   c. Select **Save cause** ( ) icon.
7. On the Resolution section, add the resolution information to resolve the incident.

   Note:
   Populate the values in this section only when the incident is ready to be resolved.

   a. Select **Add resolution**.
   b. On the form, fill in the details.

   Resolution section

Field	Description
Resolution code	Category in which the incident is resolved.
Resolution notes	Details on how the incident is resolved.

   c. Select the **Save resolution** ( ) icon.
8. On the Compose section, post messages to the activity stream and send emails to stakeholders.
   a. Enter and post the **Work notes (Private)** message to the activity stream.

   Note:

   By default, the **Work notes (Private)** option is selected for you to enter and post the message.

   b. Enter and post the **Additional comments (Customer visible)** message to the activity stream.
   c. Enter and post the **Action taken** on the major incident to the activity stream.
   d. **Compose** and then **send Email** to the stakeholders.

   The activity stream supports the following features:

   - The activity stream in the **Overview** and **Details** tab displays the activity information in tiles that are collapsible. By default, the latest event activity tile, if a work note or additional comment, is expanded and the other consecutive event activity tiles are collapsed. The collapsed tile only displays the time stamp and the activity event source name. This ensures a clean UI and enables you to expand and view the activity information when required. To enable this feature, set the **Enable the expandable activity stream tiles** (*`enableExpandableActivityStreamTiles`*) UX page property to `true`.
   - An internal tag is added for the work notes.
   - You can define, customize, and apply tags to the activity streams. These tags help you search and filter the activity based on the tags. By default, no pre-defined tags

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

are available in the base system. However, you can use the **Activity stream property** (*activitystreamprops*) UX Page Properties for SOW to define and customize your tags for incident records. For more information, see Define and customize activity stream tags.

Viewing incident record information using the Contextual side panel

View the incident record information, such as caller details and assets, from the Contextual side panel. Use this information to help manage an incident more efficiently.

Select the **Record information** ( ) icon on the Contextual side panel to view the incident information. The record information side panel includes this following information.

Active calls

The Active calls card displays active conference calls that are currently in progress for major incidents. This card is displayed only for major incident records and if the Major Incident Management for Service Operations Workspace (sn_sow_mim) plugin is installed and active. For more information, see Setting up Major Incident Management in Service Operations Workspace.

A maximum of five collaboration records are displayed on this card. You can select the call record links displayed on this card to join the calls. You can use the **Collaborate** side panel tab to view and manage additional call record information.

Note:

For Twilio calls, plain text is displayed instead of a link. In such case, you can join the call using the **Collaborate** side panel tab.

The collaboration information is retrieved from the Collaboration services integration with Service Operations Workspace.

SLAs and timings

The SLAs and timings card includes the following information:

- Major incident duration – Time duration since the incident has been promoted, created, or accepted as a major incident. This field is visible only if Major Incident Management for Service Operations Workspace is installed and active.
- Response SLA – The Task service level agreement (SLA) stage according to the configured Incident Response SLA timer configuration. Displays the time left to respond to an incident before the task SLA is breached.
- Resolution SLA – The Task SLA stage according to the configured Incident Resolution SLA timer configuration. Displays the time left to resolve an incident before the task SLA is breached.
- View all SLAs – All SLAs associated with the incident record.

Note:
This option is visible only if there is at least one SLA associated with the current incident task.

Caller

The Caller card displays quick information about the caller, such as name, local time, department, and location. You can also select the **Preview caller** (ⓘ) icon to preview the caller record. Select **Open record** to open the caller record on a separate tab. You can also select **Contact** to view all details about the caller.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the VIP field decorator if the caller is a VIP user. The VIP field decorator also appears for the **Caller** field in the **Details** tab.

You can select the following links to get additional record information specific to the caller, if necessary:

- Assigned assets – List of the caller's assets (CIs).

  You can now view the device health of the user's assets to provide a resolution to the user. Select **Assigned assets** > **View device health**. This option is available only if the DEX plugin[sn_dex] is installed and DEX monitoring is enabled for the asset. For more information on Digital End-User Experience, refer Digital End-User Experience.

- Recent interaction – List of recent interactions with the caller that have been created in the last seven days.#You can view up to ten interaction records on the card. Select **View all** to view the list of all interactions on a separate tab.

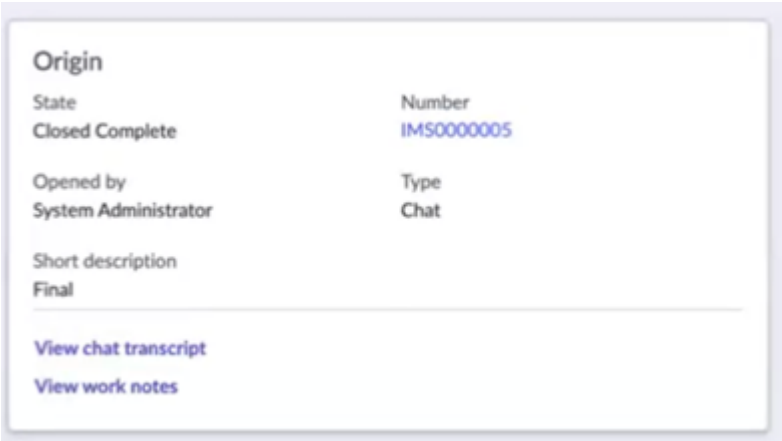
  Note:
  For interaction records, the **Assigned to** user is considered as the caller.

- Recent incidents - List of recent incidents associated with the caller that have been created in the last seven days. You can view up to ten incident records on the card. Select **View all** to view the list of all incidents on a separate tab.

Origin

The origin card displays the information related to the origin record. An origin record is the record from which the incident record is created such as change request, interaction or problem.

Origin card



The card displays the following information about the origin record:

- State - State of the origin record.
- Number - Number of the origin record.
- Opened by - User who created or opened the origin record
- Type - Channel type of origin record. For example, if the origin is an interaction record, the type can be Chat
- Short description - Short description of the origin record.
- The following options are available if the incident is created from an interaction record:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View chat transcript - Select **View chat transcript** to view the chat history with the caller of the interaction record. You can perform additional activities such as maximize or minimize the chat window. This option is available only if the interaction record is of **Chat** type and in **Closed complete** or **Closed Abandoned** state.
- View work notes - Select **View work notes** to view the work notes activity history of the interaction record.

When an incident is created from an interaction record, the following features are applicable:

- When an incident record created from an interaction record is resolved, the interaction record is automatically set to **Wrap up** or **Closed complete** state. An admin role user must set the **Auto close the origin interaction** (*sn_sow_inc.autoclose_origin.interaction*) system property to `true` to enable this feature. The **Close interaction from incident** business rule checks the following conditions and updates the interaction record to **Wrap up** or **Closed complete** state:
  - When the **Auto close the origin interaction** (*sn_sow_inc.autoclose_origin.interaction*) system property is set to `true` and the **Fallback Timeout for interactions in Wrap Up** scheduled script is active, the interaction record is moved to **Wrap up** state.
  - When the **Auto close the origin interaction** (*sn_sow_inc.autoclose_origin.interaction*) system property is set to `true` and the **Fallback Timeout for interactions in Wrap Up** scheduled script is inactive, interaction record is moved to **Closed complete** state.
- You can add multiple related interaction records to an incident using the **Add** option on the Interaction related list in the **Related records** tab of an Incident record page.

Assigned to

The Assigned to card displays the assignment status of the incident record. Select **Assign to** to assign the incident record to you. You can select the **View additional collaborators** link to view the list of collaborators associated with the incident record in a modal experience. The list of collaborators is retrieved from the following data sources:

- Historical **Assigned to** users for the incident or incident tasks except the current **Assigned to** user.
- Users who have added comments and work notes to the major incident record. This data source is applicable only for major incidents.
- Collaborators from the collaboration channels that are initiated from the **Collaborate** side panel. This information is retrieved using the collaboration APIs.

You can view a list of five collaborators on a page at a time.

Work on an incident in Service Operations Workspace

If resolving the incident involves creating a problem, change, service request, and so on, you can create them directly from the incident record.

Before you begin

Role required: itil

Procedure

1. Open an incident.

   For information about creating an incident in Service Operations Workspace, see Create an incident in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Perform any of the following actions on the incident record page.

Remedial actions using Playbook

Resolve the CI-related issues using the remedial actions using Playbook in the Investigate tab.

The Investigate tab includes the following types of remedial action to resolve CI-related issues:

- End process
- Restart service

These remedial actions are available on the Investigate tab only if the following conditions are met:

- The Investigation Framework [sn_invest_fwk] application is installed and configured. For more information, see Setting up Investigation Framework in Service Operations Workspace and Configure the Remedial Actions Framework.
- The remedial actions are configured to display on the UI. For more information, see Customize the Investigate tab.

Remedial actions use playbooks to resolve CI issues. Playbook provides you with an interactive UI to guide and execute the remedial actions step by step. With a playbook, you can control every execution step of the remediation process. Playbook is available on the contextual side panel of the Incident record page. When any remedial action is performed, that remediation process is added to a playbook. You can then select the playbook ( ) icon on the contextual side panel to open the playbook on a separate panel and execute the process. The playbook panel displays the following tabs:

- Current: Displays the current list of playbooks that trigger the remedial action, including both processes and services that have the status New and In Progress.
- History: Displays the historical list of playbooks, including both processes and services that have the status **Completed**, **Canceled**, or **Failed**.

You can cancel an ongoing End process or Restart service remedial action playbook. To cancel a remedial action playbook, select the remedial action playbook and select the menu ( ) icon and then select **Cancel action** option. After the remedial action playbook is canceled, the corresponding action is also canceled. Then, the status of the remedial action is displayed as **Canceled** in the History tab of the playbook panel. To view the reason for cancellation, select the **View reason** option on the playbook. This option isn't available if any of the following are true:

- The remedial action is already in **Canceled** status.
- The corresponding CI action record of the remedial action is already in progress.
- The change request has already moved to implement state for actions associated to CIs of type server.

The Remedial actions section on the Investigate tab also contains the **Current** and **History** tab to display the list of remedial actions performed. By default, this section displays the list of remedial actions for the primary CI or current CI. You can switch the **Show actions performed on all CIs in this incident** toggle to display the list of remedial actions for all the CIs associated with the Incident.

Playbook is available only if both the Remedial Action Framework [com.snc.sn_reacf] application and the Investigation Framework [sn_invest_fwk] application are installed and configured, as well as if the remedial actions are triggered. For more information on Playbook, see .

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can't execute concurrent or duplicate remedial actions when a remedial action is in progress on a process or service for a CI type device or server. You also can't execute concurrent or duplicate remedial actions on the same CI until the previous remedial action execution is completed. You can change this behavior and allow concurrent execution of the remedial action by selecting the **Allow concurrent execution** option for Remedial Action Type. For more information, see Configure the Remedial Actions Framework.

End process

The **End process** remedial action is available with the following metric information cards:

- Top processes By Memory
- Top processes By CPU

Select the CI and then select **End process** to stop the process running on the CI. The remediation process then is added to the playbook. Select the Playbook ( ) icon from the contextual side panel to open the playbook on a separate panel and execute the process. You can execute the End process remedial action for the following CI classes:

- Device: For this CI class, a two-step process is executed where you must get the user approval before the End process remediation process can be executed. After it's approved, you can directly stop the process on the device, which is also known as the endpoint.
- Server: For this CI class, you must create a change request before the End process remedial action can be executed using a standard change request. You must also provide additional information to create a change request.

Restart service

The **Restart service** remedial action is available with the Services metric information card.

Select the CI and then select **Restart service** to restart the services running on the CI. The remediation process then is added to the playbook. Select the Playbook ( ) icon on the contextual side panel to open the playbook on a separate panel and execute the process. You can execute the Restart service remedial action for the following CI classes:

- Device: For this CI class, a two-step process is executed where you must get the user approval before the Restart service remediation process is executed. After it's approved, you can directly restart the services on the device, which is also known as the endpoint.
- Server: For this CI class, you must create a change request before you can execute the remedial action using a standard change request. You must also provide additional information to create a change request.

Major Incident Management in Service Operations Workspace

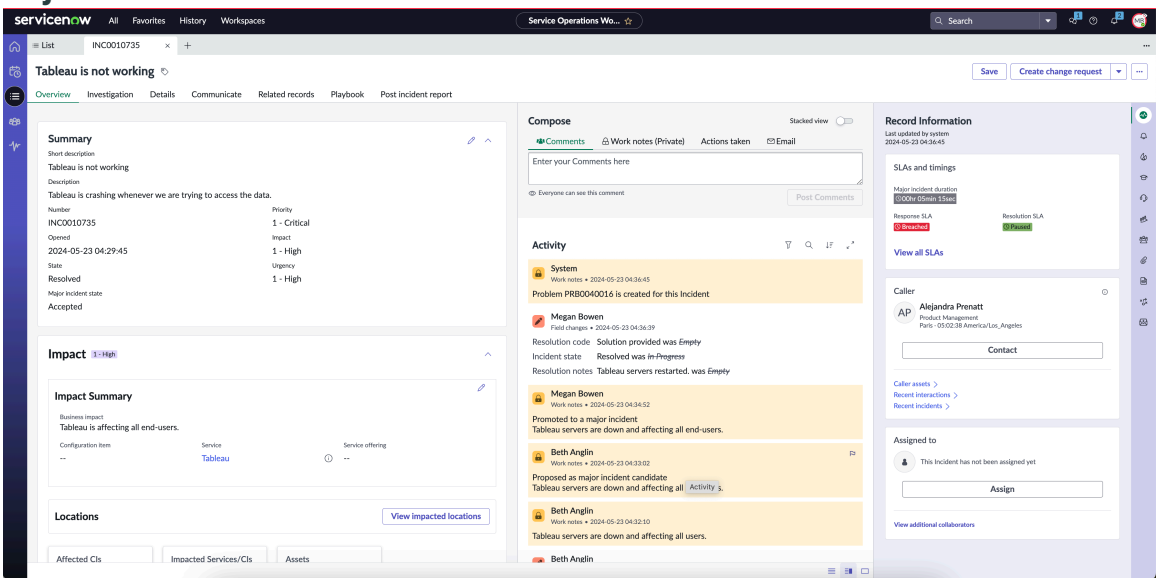
Create and manage major incidents in Service Operations Workspace.

Major Incident Management overview

https://player.vimeo.com/video/990305784?h=fa145c9c15&badge=0&autopause=0&player_id=0&app_id=58479

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Major incident record



A major incident (MI) is created when an issue occurs that results in significant disruption to the business and demands a response beyond the normal incident management process.

Major incidents have a separate procedure with shorter timescales and higher priorities to encourage a faster resolution process for the incidents with a high business impact.

The definition of what constitutes a major incident must be determined based on your requirements. For example, a major incident can be created if a critical business service is impacted or if there's a service outage that affects many users.

Major incident user roles

The major incident manager (major_incident_manager) user role is available in the base system and enables you to manage and resolve major incidents. As a major incident manager, you can do the following:

- Promote a major incident candidate to a major incident.
- Create a major incident.
- Directly promote an incident to a major incident without going through the proposal process.

Major incident creation

A major incident is created or promoted from a major incident candidate. A major incident candidate can be created from the incident record page in Service Operations Workspace in the following ways:

- Propose an incident as a major incident candidate.
- Create a major incident candidate.
- Use major incident trigger rules to propose an incident as a major incident candidate or promote directly to a major incident automatically.

Major incident response and handling

When responding to a major incident, some crucial actions include the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Finding the correct resources
- Communicating updates to users and stakeholders
- Setting up conference calls to investigate and resolve the incident
- Escalating the incident when required

You must define the communication plans that are associated with a major incident based on pre-defined conditions. Incident communication plans and related communication tasks are created for a major incident based on the communication plan definitions. Afterwards, tasks get executed as defined in the associated incident communication.

Major Incident Management process in Service Operations Workspace

A major incident has a high impact and urgency that affects a large number of users and deprives the business of one or more crucial services. Given the urgency of the situation, a well-coordinated response process is required to accelerate the resolution and minimize the business impact.

When responding to major incidents, an effective and efficient system is needed to minimize the high impact of service interruption. An efficient system involves the following actions:

- Minimize the impact of service interruptions.
- Ensure that an appropriate incident manager, major incident team, or management group is in place to manage a major incident.
- Communicate to the stakeholders about the service interruptions, degradations, resolutions, and other major incident updates.
- Collaborate with stakeholders to resolve the major incident and restore service.
- Create a problem record to analyze the root cause.
- Generate a post incident report (PIR) to review each major incident once the service is restored.

The Major Incident Management process can be classified in the following phases.

Major Incident identification and detection

The first phase in the process is to identify a potential major incident candidate. You can detect and identify major incidents in the following ways:

- An incident is detected based on the configured major incident trigger rules and is either proposed as a major incident candidate or promoted directly to a major incident automatically.
- An agent reviews the incident information to identify if the incident should be proposed to a major incident candidate. If proposed, a major incident manager reviews the information of the major incident candidate and promotes it to a major incident.
- A major incident manager creates a major incident directly without the proposal process.

Communication and collaboration

The second phase is communication. Proper communication during a major incident is crucial to ensure that the IT teams, business stakeholders, and end users are informed about the impact and progress of the major incident.

Communicating throughout a major incident requires a comprehensive communication plan, including whom to contact, the methods and frequency of

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

communication, and messaging channels used to support, such as email and SMS. A communication plan enables the incident response team to focus their efforts on the resolution process and to set expectations for any future communications.

You can define one or more communication plans based on the communication type, the priority of the incident, and the target audience of the major incident. Throughout the life cycle of the major incident, notifications and status updates are sent to the stakeholders to keep them informed and involved.

Along with communications, effective collaboration with IT teams and other business stakeholders is also important when resolving a major incident. You can use communication channels, such as Microsoft Teams conference calls, to collaborate and work toward issue resolution. The Incident record page in Service Operations Workspace provides various controls for collaboration. For more information, see Collaborate with stakeholders during a major incident.

Resolution

The next phase in the major incident life cycle is resolving the major incident. Resolving a major incident also involves resolving all associated child incidents, and the individual callers receive a notification about incident resolution.

Problem record creation

A problem record must be created to analyze the root cause of the major incident. You can configure the **Create problem from major incident** flow to create a problem record automatically after a major incident is resolved or manually create a problem record, as required. You can also configure if the major incident information is automatically copied to a problem record when a problem record is created.

Post incident report review

The final phase of a major incident life cycle is generating a post incident report (PIR). After the major incident is resolved, a PIR is generated. You can use a PIR to analyze the incident and understand how to help prevent a similar incident in the future. This review also provides an opportunity to evaluate the incident response process and identify areas for improvement. The report contains the timeline of events that occurred after an incident is created. You can review and update the PIR during the review process before it's shared with stakeholders.

Managing a major incident record

Manage a major incident record with a playbook or the various tabs on the major incident record page.

Based on the information displayed on different tabs, an agent can propose a major incident using the **Propose Major Incident** option. A major incident manager reviews the information on the **Overview** tab, such as the location information, and then accepts or rejects the major incident proposal. After a proposal is accepted, the major incident manager uses the **Promote Major Incident** option to promote the candidate to a major incident.

After an incident is promoted to a major incident, each tab on a Major Incident record page contains information about the major incident. You can use the various options and the action menu to manage the major incident process and view incident information on the following:

- Overview tab
- Details tab
- Communicate tab
- Related tab

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Playbook tab
- Contextual side panel

Overview tab

The **Overview** tab displays the incident information in the following sections:

- Summary – Basic incident information, such as short description, description, impact, urgency, and state.
- Impact:
  - Impact summary - Impact summary information, such as business impact, configuration item, service, and service offering.
  - Location – The location of the caller on the world map, the number of locations, and the number of users. This information is only displayed for a major incident and if you have the major_incident_manager role.
  - Affected CIs – The number of CIs affected by the incident.
  - Impacted Services/CIs – The number of CIs and services impacted by the incident.
  - Assets – The number of assets associated with the incident.
- Cause – The probable cause of the incident.
- Resolution – Incident resolution-related information, such as resolution code and resolution notes, once the incident is resolved.

On the Activity section, you can view all comments, work notes, actions taken, and composed emails. This section also includes user activities, such as a change in the state and the assignment group. In the Compose section, you can add comments, work notes, and actions taken, as well as compose emails.

For more information on the **Overview** tab, see View and update incident information on the Overview tab.

Details tab

The **Details** tab displays detailed information about the incident, such as category, subcategory, impact, related record, assignment group, watch list, cause, and resolution. For more information on the **Details** tab, see Incident Management in Service Operations Workspace.

Communicate tab

The **Communicate** tab displays the list of communication tasks with various options that are used to maintain communications with the stakeholders for major incidents. For more information on the options available on the **Communicate** tab, see Communicating with stakeholders about incidents and major incidents.

Related records tab

The **Related records** tab provides a list view of the records associated with the major incident. For example, task SLAs and affected CIs.

Playbook tab

The **Playbook** tab displays the information of the playbooks available for Major Incident Management. For each playbook, you can select to work with the playbook to manage major incidents. For more information, see Managing major incidents using playbooks.

Contextual side panel options

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the Contextual side panel, you can use the following options:

- Major Incident Playbook – Select the **Major Incident Playbook** ( ) icon to launch the playbook side panel. The playbook provides a guided approach to the entire major incident process. It provides a way to visualize business process workflows for major incidents in a simple, task-oriented view. The playbook contains the following two tabs:
  - Current – List of major incident playbooks running currently.
  - History – Historical list of major incident playbooks.
- Recommended actions – Select the **Recommended Actions** ( ) icon to launch the **View recommendation** side panel. The side panel lists all the recommended actions for major incidents. When an incident is promoted to a major incident and doesn't have a problem record associated with it, this tab displays a card with the **Create a problem** option to create a problem record.

  You can also configure whether the incident field information is copied automatically when a problem record is created by using the **List of attributes (comma-separated) that will be copied from the incident to create a new problem** (*com.snc.problem.create_from_incident.attributes*) system property. For more information, see Create a problem.
- Record Information – Select the **Record information** ( ) icon to view the incident record information on the side panel. The record information side panel includes the following information:
  - Active calls – Details of the active conference calls for major incidents. You can select the call record to start a conference call.
  - Caller details – Name, local time, address, email id, and other caller information. Select the **Contact** option to view the caller details and caller assets. You can also see recent interactions and incidents with the caller.
  - SLAs and timing – Duration of time since a major incident has occurred, as well as the state of the response and the resolution SLAs for the major incident. You can select **View all SLA** to see all the task SLAs associated with the incident.
  - Assign to – The assignment status of the incident. You can select the **Assign to** option to assign the incident to yourself. You can select the **View additional collaborators** option to view the list of collaborators associated with the incident.

  For more information on the record information in the Contextual side panel, see Viewing incident record information using the Contextual side panel.
- Collaborate – Select the **Collaborate** ( ) icon to open the **Collaborate** side panel tab. This tab displays the following tabs:
  - Call – Call-related information for the upcoming, pending, overdue, or active calls with the collaborators such as status and due date with time duration. You can select **Start** to initiate that call. You can also select the **Initiate collaboration** ( ) icon to create a call using various communication channels such as Zoom and Webex.
  - Chat - Chat-related information, such as name, number of participants, and due date, for upcoming, pending, overdue, or active chats with collaborators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can select **Open discussion** to start that chat. You can select the **Initiate collaboration** ( ) icon to create a chat using various communication channels, such as Microsoft Teams and Slack.

- On call – Select the **Experts on-call** ( ) icon to identify and contact available on-call members of a support group to resolve an issue.

Propose a major incident

Propose an incident to a major incident candidate based on the incident information.

Before you begin

Role required: itil

Procedure

1. Open an incident record.
   For information about creating an incident in Service Operations Workspace, see Create an incident in Service Operations Workspace.
2. On the incident record, use the following information to decide if you want to propose this incident:
   - Incident information on the **Overview** tab
   - Incident information on the **Details** tab
   - Incident information on the **Related records** tab
   - Record information on the Contextual side panel

   For more information on the tabs, see Managing a major incident record.
3. On the incident record for the incident that you want to propose, select **Propose Major incident.**
4. On the Propose Major incident window, fill in the details.

Propose Major incident

Field	Description
Work notes	Reason for proposing the incident as major incident candidate.
Business Impact	Details of the impact created by the incident on the business.

5. Select **Propose Major incident**.

Managing major incidents using playbooks

Manage the major incident life cycle and process using Major Incident Playbooks from the contextual side panel of an incident record page.

A Major Incident Playbook in Service Operations Workspace provides a guided approach to the entire major incident process. It provides a way to visualize business process workflows for major incidents in a simple, concise, and task-oriented view. You can access the Major Incident Playbook using the **Major Incident Playbooks** ( ) icon on the contextual side panel of an incident record page.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following playbooks are available in the base system for Major Incident Management:

- **MI playbook** - Provides a simple and concise interface in separate sections for planned and unplanned communication or collaboration features in a task-oriented view. This playbook is suggested for upgrade customers.
- **Advanced MI playbook** - Provides a similar interface to the MI playbook but has more advanced, configurable capabilities for planned and unplanned communication or collaboration, as well as collaboration placed under a single section. You can configure the unplanned communication or collaboration section to create, add, and configure the communication plans and tasks, and the collaboration channels or channel types using Playbooks. For more information, see Designing a major incident playbook. This playbook is suggested for new or zBoot customers.

You can select and assign one or more of the playbooks to Major Incident Management as needed. The **Playbook** tab displays all the playbooks that are assigned to Major Incident Management. For more information on assigning playbooks to major incidents, see Assign a playbook to Major Incident Management.

Manage major incidents using the MI playbook

Manage major incidents using the MI playbook from the contextual side panel or the **Playbook** tab of an incident record page. This playbook provides a simple, concise, and task-oriented interface for managing the major incident process.

Before you begin

The incident must be proposed as a major incident candidate. For more information, see Propose a major incident.

The MI playbook must be assigned to Major Incident Management. For more information, see Assign a playbook to Major Incident Management.

Role required: major_incident_manager or admin

About this task

The MI playbook in Service Operations Workspace provides a guided approach to the entire major incident process. It provides a way to visualize business process workflows for major incidents in a simple, concise, and task-oriented view.

Procedure

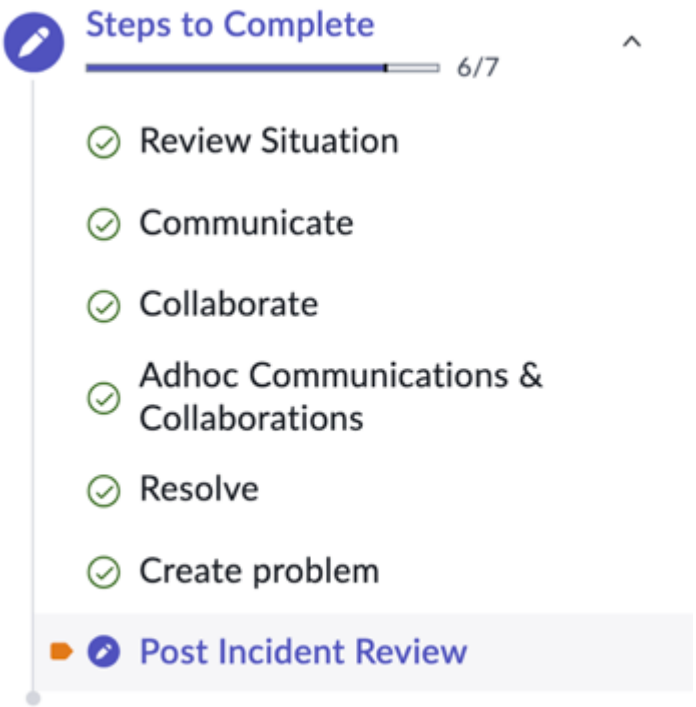
1. Open an incident record that has been proposed as a major incident candidate.
2. Select the **Major Incident Playbooks** ( ) icon on a contextual side panel to launch the major incident playbook.

   The Major Incident Playbook panel opens on the side panel. The panel includes the following tabs:

   - Current
   - History
3. On the **Current** tab, select **MI playbook**.
   You can view the major incident process steps and your progress along the following steps:
   - Review Situation
   - Communicate
   - Collaborate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Adhoc Communications & Collaborations
- Resolve
- Create problem
- Post Incident Review



4. Review the incident information and then promote the major incident.

   a. Select **Review Situation**.

   b. Review the incident information.

   c. Select **Promote** to promote the incident to a major incident based on the incident information.
   For more information, see Promote a major incident.

5. Communicate with stakeholders by composing a communication message, such as email or SMS.

   a. Select **Communicate**.

   b. On a communication task that you want to complete, select **Compose** to compose a communication message, such as email or SMS.
   For more information, see Compose communications for incidents and major incidents.

   c. **Optional:** Select the **More actions** (⋮) icon for a communication task and then select **Manage Recipients** to add or manage the recipients for communications.
   For more information, see Manage recipients in a communication task.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Compose communications for incidents and major incidents. You can also add or manage recipients for the communications. For more information, see Manage recipients in a communication task.

6. Collaborate with stakeholders.

   a. Select **Collaborate**.

   b. Select a collaboration record, and then select one of the following options based on the selected type of collaboration channel:

      - Start - To start a call.
      - Open discussion - To start a chat.

      For more information on how to use these collaboration channels, see Collaborate with stakeholders during a major incident.

7. Perform unplanned communications and collaborations.

   a. Select **Adhoc collaboration and communication**.
   This section contains the following collaboration and communication records that are created separately than pre-defined and configured communications and collaboration plans:

      - Communications – All the communications that you create using the **New communication** option from the **Communicate** tab or using the Incident communication plan related list on the **Related records** tab are displayed in this section. For more information on creating unplanned communications, see Create an adhoc communication task and Create adhoc communication and collaboration using the Related record tab.
      - Collaboration – All the collaboration records that you create using the Incident Communications plan related list on the **Related records** tab are displayed in this section. For more information on creating unplanned communications and collaboration, see Create adhoc communication and collaboration using the Related record tab.

   b. Select the one of the following options for unplanned communications and collaboration.

      - For unplanned communications, you can do one of the following actions:
        - Select **Compose** to compose a communication message such as email or SMS. For more information, see Compose communications for incidents and major incidents.
        - Select the **More actions** (⋮) icon for a communication task and then select **Manage Recipients** to add or manage the recipients list for the communication task. For more information, see Manage recipients in a communication task.
      - For unplanned collaboration, you can do one of the following actions:
        - Start a call - Select **Start** on a collaboration record to start a call with the stakeholders. For more information, see Collaborate with stakeholders during a major incident.
        - Start a chat – Select **Open discussion** to start a chat with the stakeholders. For more information, see Collaborate with stakeholders during a major incident.

8. Select **Resolve**.
   For information on how to resolve a major incident, see, Resolve and close a major incident.
9. Select **Create Problem**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This section is visible in the playbook only if:

- The incident doesn't have a problem record associated with it.
- The Problem Management Best Practice - Madrid - State Model (com.snc.best_practice.problem.madrid.state_model) plugin is activated on the instance.
- The **Create problem from major incident** flow is inactive on the instance. This flow is shipped as part of the base system in the **Inactive** status. Once activated, it creates a problem record automatically when an incident is promoted to a major incident.

You can also configure if the incident field information is copied automatically to the respective fields in a problem record using the **List of attributes (comma-separated) that will be copied from the incident to create a new problem** (*com.snc.problem.create_from_incident.attributes*) system property when a problem record is created. For more information, see Create a problem.

A problem record is created automatically. You can select **View Problem** to view the problem record on a separate tab.

10. Mark the post incident review as complete.

    a. Select **Post Incident Review**.

    b. Select **Mark Complete** to end the major incident process in the **Playbook** side panel. You can continue to work on the post incident report review from the **Post Incident Report** tab on the Incident record page. For more information, see Review and update a post incident report.

Manage major incidents using the Advanced MI playbook

Manage a major incident using the Advanced MI playbook that's available on the contextual side panel or the **Playbook** tab of an incident record page. This playbook provides a similar interface to the MI playbook but has advanced, configurable capabilities for communication and collaboration steps.

Before you begin

The incident must be proposed as a major incident candidate. For more information, see Propose a major incident.

The Advanced MI playbook must be assigned to Major Incident Management. For more information, see Assign a playbook to Major Incident Management.

Role required: major_incident_manager or admin

About this task

The Advanced MI playbook in Service Operations Workspace provides a guided approach to the entire major incident process. It provides a way to visualize business process workflows for major incidents in a simple, concise, and task-oriented view interface.

Procedure

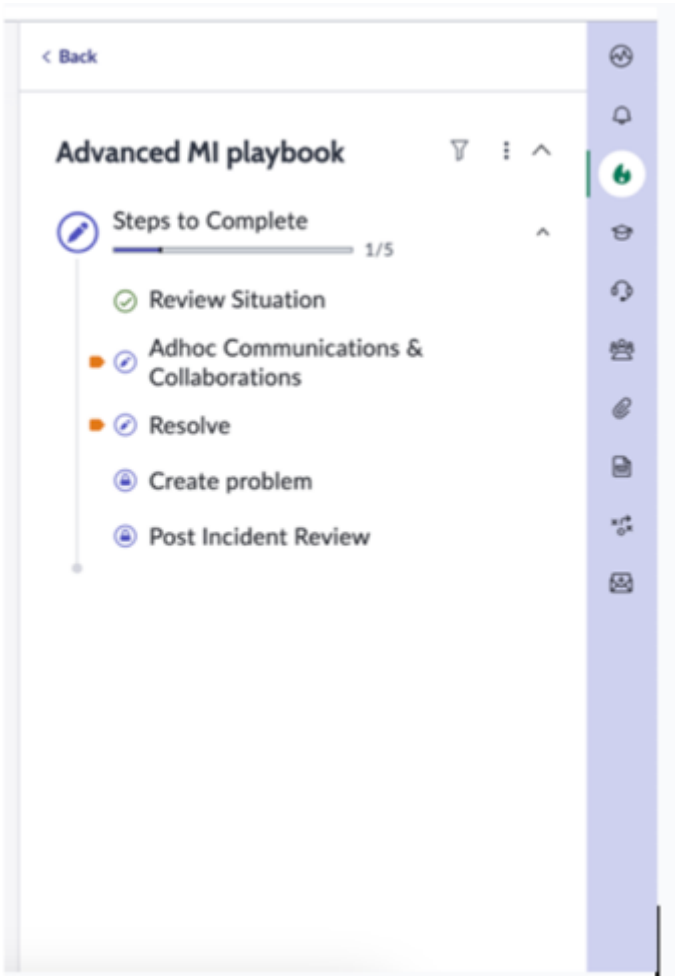
1. Open an incident record that has been proposed as a major incident candidate.
2. Select the **Major Incident Playbooks** ( ) icon on a contextual side panel to launch the major incident playbook.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Major Incident Playbook panel opens on the side panel. The panel includes the following tabs:

- Current
- History

3. On the **Current** tab, select **Advanced MI playbook**.
   You can view the major incident process steps and your progress along the following steps:
   - Review Situation
   - Adhoc Communications & Collaborations
   - Resolve
   - Create problem
   - Post Incident Review



4. Review the incident information and then promote the major incident.

   a. Select **Review Situation**.

   b. Review the incident information.

   c. Select **Promote** to promote the incident to a major incident based on the incident information.
   For more information, see Promote a major incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Perform unplanned communication and collaboration.

   a. Select **Adhoc collaboration and communication**.
   This section contains the following communication and collaboration plans and records:

   - The pre-defined and configured communication and collaboration include all the communications and collaborations plans configured as part of Major Incident Management communications in the Admin Center. For more information, see Setting up communication templates and plans in Major Incident Management.
   - The separately created communication and collaborations include the following:
     - Communications – All the communications tasks that you create using the **New communication** option from the **Communicate** tab are displayed in this section. All the communication plans and tasks that you create using the Incident communication plan related list from the **Related record** tab are displayed also. For more information, see Create an adhoc communication task and Create adhoc communication and collaboration using the Related record tab.
     - Collaboration – All the collaboration records that you create using the Incident Communications plan related list from the **Related record**s tab are displayed in this section. For more information, see Create adhoc communication and collaboration using the Related record tab.

   b. Select the one of the following options for unplanned communications and collaboration.

   - For adhoc communications, you can do the following actions:
     - Select **Compose** to compose a communication message, such as email or SMS. For more information, see Compose communications for incidents and major incidents.
     - Select the **More actions** (⋮) icon for a communication task and then select **Manage Recipients** to add or manage the recipient lists for the communication task. For more information, see Manage recipients in a communication task.
   - For adhoc collaboration, you can do the following actions:
     - Start a call - Select **Start** on a collaboration record to start a call with the stakeholders. For more information, see Collaborate with stakeholders during a major incident.
     - Start a chat – Select **Open discussion** to start a chat. For more information, see Collaborate with stakeholders during a major incident.

6. Select **Resolve**.
   For information on how to resolve a major incident, see, Resolve and close a major incident.
7. Select **Create Problem**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
This section is visible in the playbook only if:

- The incident doesn't have a problem record associated with it.
- The Problem Management Best Practice - Madrid - State Model (com.snc.best_practice.problem.madrid.state_model) plugin is activated on the instance.
- The **Create problem from major incident** flow is inactive on the instance. This flow is shipped as part of the base system in the **Inactive** status. Once activated, it creates a problem record automatically when an incident is promoted to a major incident.

You can also configure if the incident field information is copied automatically to the respective fields in a problem record using the **List of attributes (comma-separated) that will be copied from the incident to create a new problem** (*com.snc.problem.create_from_incident.attributes*) system property when a problem record is created. For more information, see Create a problem.

A problem record is created automatically. You can select **View Problem** to view the problem record on a separate tab.

8. Mark the post incident review as complete.

   a. Select **Post Incident Review**.

   b. Select **Mark Complete** to end the major incident process in the **Playbook** side panel. You can then continue work on the post incident report review from the **Post Incident Report** tab on the Incident record page. For more information, see Review and update a post incident report.

Promote a major incident

Review the information of the proposed major incident candidate and promote it to major incident using the Major Incident Playbook.

Before you begin

You must propose the incident as a major incident candidate. For more information, see Propose a major incident.

Role required: major_incident_manager or admin

Procedure

1. Open an incident record.
2. Select the **Major Incident Playbooks** ( ) icon on a contextual side panel to launch the major incident playbook.

   The Major Incident Playbook panel appears on the side panel. It includes the following tabs:

   - Current
   - History
3. On the **Current** tab, select the current Major Incident Process playbook.
4. Select **Review situation**.
5. On the **Overview** tab, review the business impact, work notes, and other incident information.
6. Select **Promote** to promote the major incident candidate to a major incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you want to reject the major incident proposal, you can select **Reject**. This action would convert the major incident candidate back into an incident.

7. On the Promote to Major Incident pop-up window, fill in the details.

Promote to Major Incident

Field	Description
Reason	Reason for promoting the incident as major incident candidate.
Business Impact	Impact the incident creates on the business. By default, the business impact stated by the agent to propose major incident is displayed. You can modify the value.

8. Select **Promote to Major Incident**.

Note:

You can also promote a major incident by selecting the **More actions** ( ) icon and then selecting **Promote to Major Incident**.

Communicating with stakeholders about incidents and major incidents

Use the **Communicate** tab to create and manage all communications with stakeholders during the various phases of an incident or a major incident.

The **Communicate** tab contains the following options to create and manage communications:

Group By

Group communication tasks the following ways:

- Communication plan – The communication tasks that are associated with a particular communication plan are grouped.
- Completion status - The communication tasks are grouped based on the completion status and due dates. You can choose to list the tasks from the following group sections:
  - Overdue – Communication tasks with past due dates.
  - Upcoming – Communications tasks with an upcoming due date.
  - Completed – Communication tasks that are completed.
  - Skipped – Communication tasks that are skipped.

Filter by communication plan

Filter the communication task by a communication plan.

Compose

Compose a communication message, such as an email, SMS, Microsoft Teams, or Slack message.

Manage recipients

Add and manage recipients for a communications task. You can add a user role and a user in the recipient list. You can also access this option by selecting the

More actions ( ) icon on the communication task and then selecting **Manage recipients**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New Communication

Create a communication task. This option is available only to the following users:

- User with the major_incident_manager role
- User with both the ia_admin and itil roles

Manage announcements

Create and manage an announcement to broadcast messages for Service Portal users to keep them informed about the ongoing major incident.

View Record

View detailed information about the incident communication task (ICT) record.

Select the **More actions** (⋮) icon on the communication task and then select **View record**.

On the ICT record, you can also initiate a call or chat from the collaborate tab on the side panel using the **Collaborate** ( ) icon on the contextual side panel. For more information, see Collaborate with stakeholders during a major incident.

Close

Close the communication task. Select the **More actions** (⋮) icon on the communication task and then select **Close**. The communication task is then moved to either the Completed or Skipped section of the **Communicate** tab based on the following scenarios:

- If a communication task has the **Frequency** field set to **Recurring** and at least one communication has been composed and sent, selecting **Close** moves the communication task to the Completed section.
- If a communication task has the **Frequency** field set to **One time** or **Recurring** and no communication has been composed and sent, selecting **Close** moves the communication task to the Skipped section.

Start

Start the communication task with the **Pending** status. Select the **More actions** (⋮) icon on the communication task and then select **Start**.

Snooze

Increase the **Due in** time for a communication task. Select the **More actions** (⋮) icon on the communication task and then select **Snooze**.

Compose communications for incidents and major incidents

Compose communication messages for incidents and major incidents using communication channels such as email and SMS.

About this task

The **Communicate** tab displays the list of communication tasks with various options that are used to maintain communications with the stakeholders for an incident. For each communication task, you can view the following information:

- Communication plan - Name of the communication plan.
- Communication task – Name of the communication task.
- Status – Status of the communication task.
- Channels – Communication channel of the task, such as email or SMS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Past due – Time duration since the due date has passed. This information is applicable for communication tasks that have a past due date in the overdue section.
- Due in – Duration of time left until the due date.

Before you begin

You must configure the communication plans and tasks in one of the following ways:

- For major incidents, you must configure communication plans and tasks for Major Incident Management in Admin Center. For more information, see Configure a communication plan in Major Incident Management.
- For incidents, you must activate and then configure communication plans and tasks in Task Communications Management. For more information, see Task Communications Management.

Role required: major_incident_manager, ia_admin, itil, or admin

Procedure

1. On the incident record, select the **Communicate** tab.
   The **Communicate** tab displays the list of communication tasks based on the communications configured for major incidents or incidents.
2. Select the communication task where you want to compose the communication message.

   Note:
   Select the communication task based on the due dates to avoid breaching of any due date for communications. For example, communication tasks from the Overdue section.

3. On the communication task, select **Compose**.
   The communication task record opens on a new tab within the incident view with the configured communication channels, such as email and SMS.

   Note:
   - Based on the channel selected on the communication task, any or all of the following sections are displayed:
     - Email
     - SMS
     - SMS notification
     - Microsoft Teams notification
     - Slack
     - Slack notifications
   - For major incident SMS communications, you can select or change the SMS templates with any of the following user roles:
     - major_incident_manager
     - sn_incident_write user who has the required communication related roles
     - ITIL user to whom the major incident is assigned

4. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Email form

Field	Description
Email template	Email template used for composing the email.
To	List of users to whom the email is sent.
Cc	List of users to whom the email is sent as Cc.
Bcc	List of users to whom the email is sent as Bcc.
Subject	Subject of the email.
Body	Content of the email.
Attach file	Attachments for the email.

SMS notifications/SMS/Microsoft Teams notification/Slack/Slack notifications form

Field	Description
From	Number from which the message is sent.
To	User to whom the message is sent.
Message	Content of the message.

Note:

- Depending on the channel selected on the communication task, options such as email or SMS are displayed.
- SMS communication is sent to the recipient only if the recipient has a phone number linked to the recipient record.

5. Select **Send**.

Manage recipients in a communication task

Manage the recipients list for a communication task to create flexible and effective communication with the required stakeholders.

Before you begin

Role required: major_incident_manager, ia_admin, itil, or admin

Procedure

1. On an incident record, select the **Communicate** tab.
2. Select **Manage recipients**.

   You can also select the **More actions** (⋮) icon for a communication task and then select **Manage recipients**.
3. On the Manage recipients pop-up window, fill in the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Manage recipients

Field	Description
Communication	Communication plan that is associated with the communication task for which you want to manage recipients. **Note:** When you select the **More actions** icon (⋮) for a communication task and then select **Manage recipients**, the communication plan associated the selected communication task is selected by default. When you select the **Manage recipients** option directly from the **Communicate** tab, you must select the communication plan.
Add recipients	User, user group, or list of recipients to whom the communication is sent.
Designate role	User role of the recipients.
Add	Button to add the recipients and the user role to the **Recipients** field.
Recipients	User, user group, or list of recipients with the user role. You must use the **Add** button to add the recipients and the user role to this field.

4. Select **Save**.

Create an adhoc communication task

Create an adhoc communication task as required during the various phases of an incident in Major Incident Management.

Before you begin

Role required: major_incident_manager, itil, ia_admin, or admin

Procedure

1. On the incident record page, select the **Communicate** tab.
2. Select **New communication**.
3. On the New communication pop-up window, fill in the details.

New communication

Field	Description
Compose and sent communication	Indicates when the communication message must be composed and sent. Possible values are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Now – The communication message is composed and sent immediately. ○ Later – The communication message is composed and sent later after a definite time interval.
Frequency	Frequency at which the communication must be composed and sent. Possible values are: ○ One time – The communication message is composed and sent only once. ○ Recurring - The communication message is composed and sent after a repeated time interval.
Due in (minutes)	Duration of time in minutes after which the communication message must be composed and sent. **Note:** This field is displayed only if the **Frequency** field is set to **Recurring**.
Short description	Brief description of the communication task.
Channels	Channel that must be used to compose and sent communication messages. Possible options are: ○ Email – Compose and send the communication message as an email. ○ SMS – Compose and send the communication message as SMS. ○ Microsoft Teams notification - Compose and send communication messages as Microsoft Teams notifications. ○ Slack - Compose and send communication message to a Slack channel. ○ SMS notifications- Compose and send communication message as SMS notifications. ○ Slack notifications – Option to compose and send communication messages as Slack notifications.
Recipients	User, user groups, or list of recipients to whom the communication message must be sent.

4. Either save your communication or compose your communication, depending on whether the **Compose and sent communication** field has been set to **Later** or **Now**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If the **Compose and sent communication** field is set to **Later**, select **Save**. The communication task is saved and displayed in the list of communication tasks on the **Communicate** tab.
- If the **Compose and sent communication** field is set to **Now**, select **Compose communication** to compose your messages within your selected communication channels. The communication task record opens on a new tab within the incident view. For more information, see Compose communications for incidents and major incidents.

Manage an announcement for communicating about major incidents

Create and manage an announcement to broadcast messages for Service Portal users to keep them informed about the ongoing major incident. Major incident managers can create and deploy announcements from Service Operations Workspace (SOW).

Before you begin

Role required: announcement_admin, sp_admin or admin

As a major_incident_manager, you must inherit any of the required roles to create and manage announcements in Major Incident Management.

About this task

Announcements can be displayed in an announcement banner or an announcement widget instance. For more information, see Posting announcements to portal users.

Procedure

1. On the incident record page, select the **Communicate** tab.
2. Select **Manage announcements**.
   A list of all major incident announcement records, is displayed. You can select any announcement record and modify the record. Else, create a new announcement record.
3. Select **New**.
4. On the **Details** tab of the form, fill in the fields.

Field	Description
Announcement	
Name	Internal title that isn't displayed in an announcement.
Active	Option to activate the announcement. To hide an announcement, clear the **Active** check box.
Title	Title that appears in the announcement.
From	Date and time at which the announcement begins to appear.
To	Date and time at which the announcement ends. If no date and time is entered, the announcement continues to appear until it's deactivated.
Summary	Text to appear in the announcement.
Display style	Defines the background color, text color, and text alignment of banner announcements. Base system styles include: ○ **Normal**: Blue background and left-aligned, white text. ○ **Urgent**: Red background and left-aligned, white text.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Announcements that appear in a banner use the display style defined in the Announcement record, by default. To use the display style in an instance of the Announcements widget, you can select the **Use Display Style** instance option.
Type	Defines where an announcement displays. By default, announcements appear in the following locations: ○ **Banner**: Announcement banner above the banner frame in the Service Portal. ○ **Widget**: Instance of the announcement widget. You can create an announcement type to define other widget instances to display an announcement.
Glyph	Glyph to display to the left of the title in banner announcements.
Glyph alt text	Alternative text for the glyph icon used with screen readers.
Public	Option to display the announcement to users before and after they've logged in.
Display first	Option to display the announcement before all other announcements. **Note:** If two records set to **Display first** exist, the sort order defined in the *glide.service_portal.announcement.default_sort_order* system property is implemented. For more information, see Service Portal properties.
Roles	User roles to whom the announcement is visible. If left empty, the announcement is visible to all roles. **Note:** ○ If the **Public** check box is cleared, you can define the user roles to whom the announcement is visible. ○ Alternatively, you can define user criteria for the announcement instead. To do so, set up User criteria for Service Portal and clear the **Public** check box. Announcements are displayed to only the users who pass the access criteria.
Unauthenticated only	Option to display the announcement only to users who haven't logged in. **Note:** This option appears only if the **Public** check box is selected.
Behaviour	
Click target	Creates a link below the announcement body that opens to a target page or URL. Possible values: ○ **None**: Announcement doesn't include a link. ○ **Page**: Opens a Service Portal page in the current browser tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **URL in current browser tab**: Opens a URL in the current browser tab. ○ **URL in new browser tab**: Opens a URL in a new browser tab.
Details page	Page that opens in the current browser tab. **Note:** This option is applicable only if the **Click target** field is set to **Page**. Available if
Details URL	URL that opens in the current or new browser tab. **Note:** This option is applicable only if the **Click target** is set to **URL in current browser tab** or **URL in new browser tab**.
Details link text	Link text for the page or URL click target. If you leave this field empty and define a click target, the title of the announcement is "Learn More".
Dismiss options	Determines whether the user can dismiss the announcement. Possible values: ○ User can dismiss - no redisplay ○ User can dismiss for current session only ○ User cannot dismiss
Portals	Portals that display the announcement. If this field is empty, the announcement displays in all portals.

5. Select **Save**.
   A **Related records** tab appears.
6. On the **Related records** tab, you use the following related links.
   - Can View: Contains a list of user criteria to enable the users to view the announcements based on role, department, group, location, or company.
   - Cannot View: Contains a list of user criteria to block users from viewing the announcements based on role, department, group, location, or company.

   You can select an existing user criteria or select **New** to create a user criteria. For more information, see User criteria for Service Portal.

What to do next

If the **Type** is **Banner**, test your announcement by navigating to the portal defined in the **Portals** field. If the **Type** is **Widget** or a custom type, test your announcement by navigating to the page with the associated widget instance.

Collaborate with stakeholders during a major incident

Collaborate with the required stakeholders during the various phases of a major incident to discuss and resolve the incident quickly. You can initiate a chat or make conference calls using a service provider to communicate with stakeholders.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Collaboration services provide a way to communicate and collaborate in real time to resolve incidents. For more information on the integration and features of Collaboration services available in Service Operations Workspace, see Collaboration in Service Operations Workspace.

Before you begin

Role required: major_incident_manager, itil, ia_admin, or admin

Procedure

1. On the incident record, select the **Collaborate** ( ) icon on the contextual side panel to open the collaborate tab on the side panel.
   The collaborate tab displays the following tabs:
   - Call – Includes a list of call records and call-related information, such as status and due date with time duration, for the upcoming, pending, overdue, and active calls with the collaborators.
   - Chat - Includes a list of chat records and chat-related information, such as name and number of participants and due date with time duration, for upcoming, pending, overdue, and active chats with collaborators.
2. Select the **Initiate collaboration** ( ) icon.
3. Collaborate using chat.
   a. Select any one of the following chat options:
      - Select **Start Sidebar discussion** to open the conversation on a sidebar chat.
      - Select **MS Teams chat** to open the conversation on Microsoft Teams.

      Note:
      - The chat application must be configured with Service Operations Workspace.
      - Slack channels aren't supported.

   b. On the pop-up window, fill in the details.

Collaborate using chat

Field	Description
Record number	Incident record number associated with the collaboration chat. The incident record is selected by default.
Subject	Subject or title for the collaboration chat.
Add participants	User, user group, or list of recipients who must attend the collaboration chat.
Include a brief message for participants	Brief description about the issue to be discussed in the chat.

   c. Select **Start Discussion**.

   The chat application opens with the selected participants.
4. Collaborate using call.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select one of the following call options.

- Start Webex meeting
- Start MS teams meeting
- Start Twilio meeting
- Start Zoom meeting

> **Note:**
> The selected call channel applications must be configured for Service Operations Workspace.

.

b. On the pop-up window, fill in the details.

Collaborate using call

Field	Description
Conference bridge	Call channel used for collaboration.
Title	Subject or title for the collaboration call.
Add participants	User, user group, or list of recipients who must attend the collaboration call.
Provide a brief description, this note will be stored in the conference record	Brief description about the issue to be discussed in the call.

c. Select **Start**.
The call starts with the selected participants.

Create adhoc communication and collaboration using the Related record tab

Create adhoc communication and collaboration using the incident communication plan related list on the **Related records** tab of an incident record page.

Before you begin

Role required: major_incident_manager, itil, ia_admin, or admin

Procedure

1. On an incident record, select the **Related records** tab.
2. In the related list, select the **Incident communications Plans** button to open a list of the existing communication plans associated with the incident record.
3. Select **New** to create an incident communication plan.
   For more information on the form fields of an incident communication plan, see Create adhoc incident communication plan from incident.
   The Incident communication plan record opens on a separate tab.
4. On the Incident communication plan record, select the **Related records** tab.
5. In the related links section, select **Incident Communication task**.
6. Select **New** to create an incident communication task.
   For more information on the form fields of an incident communication task, see Create adhoc incident communication task from Incident Communications Management.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the Incident communication task record, add a communication channel.

   a. Select the **More actions** (⋮) icon and then select **Add communication channel**.

   b. On the pop-up window, select **Channel type**.
   The possible values are:
   - Communication
   - Collaboration

   c. Select **Channel**.
   The possible values change depending on the selected **Channel type**:
   - If **Channel type** is set to **Communication**, you can set one of the following values:
     - Email
     - SMS
     - Microsoft Teams
     - Slack
     - Slack notification
   - If **Channel type** is set to **Collaboration**, you can set one of the following values:
     - Sidebar discussion
     - Conference

   d. Select **Save**.
   The communication channel record opens on a separate tab.

   e. On the communication channel record, fill in the required details based on the selected **Channel**.
   For more information on the form fields, see Define a communication channel.

   f. Select **Save**.

Resolve and close a major incident

Resolve a major incident to reinstate service after the interruption.

Before you begin

Role required: major_incident_manager or admin

Procedure

1. Open a major incident record.
2. Review the major incident record to ensure that the issue associated with the major incident is resolved.
3. Select **Resolve**.
4. On the Resolve major incident pop-up window, fill in the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resolve major incident

Field	Description
Resolution code	Category of how the major incident was resolved. Possible values are: ○ Duplicate ○ Known error ○ No resolution provided ○ Resolved by caller ○ Resolved by change ○ Resolved by problem ○ Resolved by request ○ Solution provided ○ Workaround provided
Resolution note	Brief description on how the major incident was resolved.

5. Select **Resolve**.
   The state of the major incident is set to **Resolved**.
6. Select **Close**.

Result
The state of the major incident is set to **Closed**.

Review and update a post incident report

Review a post incident report (PIR) using the **Post Incident Report** tab. A PIR helps you review and understand the cause of the major incident and the actions taken by the teams to resolve the incident. This helps prevent the issue in the future.

Before you begin
The major incident must be in the **Resolved** state. For more information, see Resolve and close a major incident.

Role required:

- For PIR review: sn_incident_read or sn_incident_write
- For PIR update, generate and download: major_incident_manager or admin

About this task
Reviewing the post incident report (PIR) also provides an opportunity to evaluate the incident response process and identify areas for improvement. The PIR can be reviewed and updated during the review process before it's shared with stakeholders.

After you resolve a major incident, you must publish the PIR for the major incident and share it with the stakeholders within a specified time duration as defined in the SLA. You can configure the SLA by specifying the value in hours in the **PIR publish hours** (*sn_sow_inc.pir.publish.hours*) system property.

The following events are captured in the timeline of the PIR:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Incident created
- Incident proposed as major incident
- Incident accepted as major incident
- Incident resolved
- Incident closed
- Custom events
- Incident task created
- Incident task closed

Note:
When an event is flagged on the activity stream of the **Overview** tab of a major incident record, the event is added to the events timeline of the PIR.

Procedure

1. Open a major incident record that is in the **Resolved** state.
2. Select the **Post incident report** tab.
3. On the Incident Response Timing section, review the time duration for the following fields.

Incident Response Timing

Field	Description

Time to identify	Duration of time taken to identify an incident as major incident.
	
	The **Time to identify** field is displayed based on this calculation:
	`Time to identify = (incident created time) - (incident proposed time)`
	or
	`Time to identify = (incident created time) - (incident promoted time)`

Time to response	Duration of time taken to respond to the proposed major incident. The **Time to response** field is displayed based on this calculation: `Time to response = (incident proposed time) - (incident promoted time)`
Time to resolve	Duration of time taken to resolve the major incident. The **Time to resolve** field is displayed based on this calculation:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	`Time to resolve = (incident promoted time) - (incident resolved time)`

4. On the Contributors section, add users to help with creating and publishing the PIR.
   a. Select the **Edit Co-contributors** ( ) icon to add users as contributors.
   b. In the **Co-contributors** field, enter users or user groups.
   c. Select the **Save Co-contributors** ( ) icon to save the changes.
5. On the Incident summary section, review the incident summary information and edit as needed.

   Note:

   By default, this section retrieves the incident summary information from the **Overview** tab. You can modify the values.

   a. Select the **Edit report** ( ) icon to edit the incident summary field of this section.
   b. Edit the following information.
      - Summary
      - Impact
      - Resolution
   c. Select the **Save report** ( ) icon to save the changes.
6. On the Timeline section, review the incident events timeline and edit as needed.
   a. Select the **Edit Timeline** ( ) icon to edit the event timeline.
   b. Select the **Add event** option, enter the following information, and then select **Add** to add a new event to the timeline.

      Add event

Field	Description
Select date and time of the event	Date and time of the event.
Enter short description of the event	Brief description of the event.

   c. Edit the event timeline with the following setting options.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event timeline setting options

Options	Description
Hide	Select the **Hide** ( ) icon to hide an event from the timeline.
Show	Select the **Show** ( ) icon to show a hidden event on the timeline.
Edit	Select the **Edit** ( ) icon to edit the description or the date and time of an event. This option is available only for the events added using the **Add event** option.
Delete	Select the **Delete** ( ) icon to delete an event from the event timeline. This option is available only for the events added using the **Add event** option.
Order of events	Option to set the chronological order of events. Possible options: ▪ Ascending – The event that occurred first is placed at the top, and the event that occurred last is placed at the bottom. ▪ Descending – The event that occurred last is placed at the top, and the event that occurred first is placed at the bottom.
Event Grouping	Option to enable the grouping of the events that occur within a specified time duration.
Group events with--of each other	Time duration that groups events if the events occur within this value.
Visibility settings	
Show hidden events in edit view	Option to show the events that are hidden when the **Edit Timeline** ( ) icon is selected.
Show manually events in edit view	Option to show the events that are added manually when the **Edit Timeline** ( ) icon is selected.
Show time line events in edit view	Option to show the timeline events when the **Edit Timeline** ( ) icon is selected.
Reset settings	Select the **Reset settings** ( ) icon to reset the settings back to the default settings.

d. Select the **Save settings** ( ) icon to save the changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. On the Related records section, review the information of the records associated with the incident and update as needed.

   a. Select **Edit**.
   You're redirected to the Related records section of the **Details** tab in the major incident record.

   b. On the Related records section, edit the following fields.

   Related records

Fields	Description
Parent incident	Incident record that is associated as the parent to the incident record.
Problem	Problem record associated with the incident record.
Change request	Change request associated with the incident record.
Caused by change	Change request for which the incident is created.

   c. Select **Save**.
   The information is updated in the fields of the Related records section of the Post incident report tab.

8. Select **Preview**.

   Note:
   This option is available only if the **PIR SOW preview page** (*sn_sow_inc.pir_pdf_preview_sow_page*) system property is set to **true**.

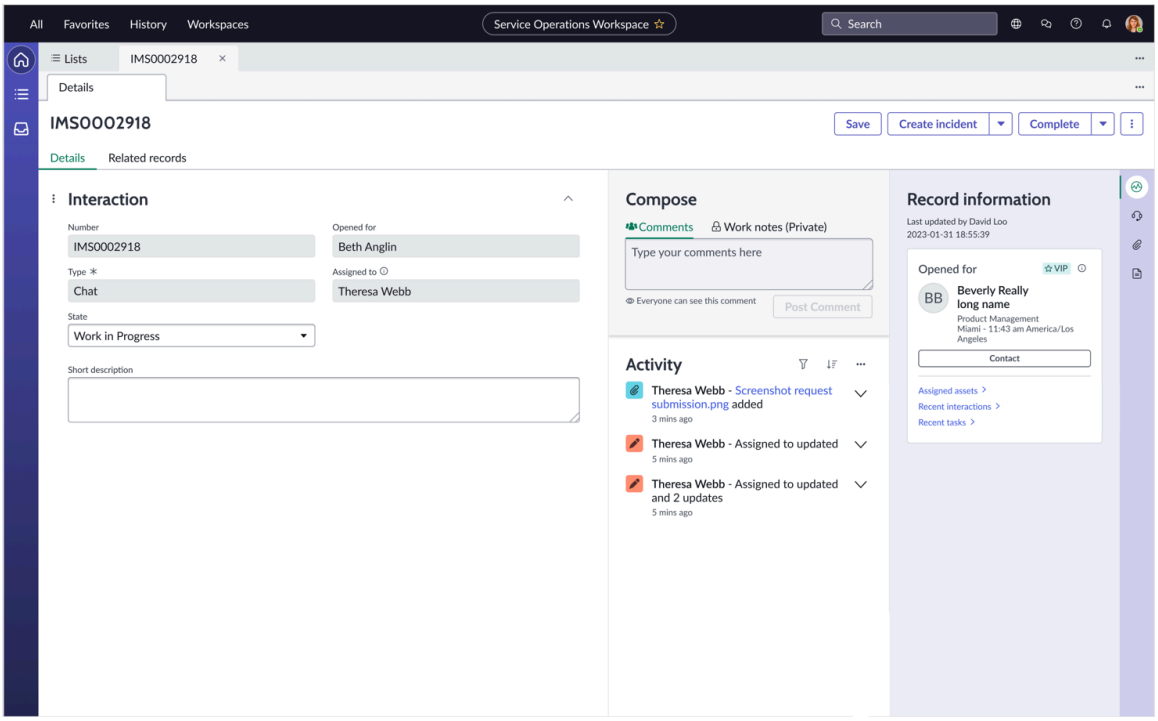
9. Select **Download**.
   A pop window displays the post incident report export in progress. Once the export process is completed, a **Download** option appears on the pop-up window.
10. Select **Download**.

Result
The post incident report is downloaded to your system in PDF format. You can send the PDF file to the required stakeholders.

Interaction Management in Service Operations Workspace

Interactions are a centralized location for all communication channels in Service Operations Workspace. You can respond to an incoming chat, phone, walk-up, or messaging interactions faster.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Details tab

This tab displays the detailed information of an interaction. For information about fields in this section, see Create an interaction in Service Operations Workspace.

From the **Compose** section, you can add work notes for the interaction.

For information about how you can configure fields in this tab, see Configure a task record form in Service Operations Workspace.

Related records tab

This tab provides a list view of the records associated with the interaction, for example, tasks related to this interaction, incidents related to the requester, and tasks related to the requester. You can add a record, create a record, or remove it from the interaction.

Contextual side panel

From this section, you can view record information, requester information, add attachments, and create templates for reuse.

For information about Interaction Management, see Interaction Management.

Create an interaction in Service Operations Workspace

Track an interaction that is a centralized location for all communication channels. Each interaction represents a request for assistance through a communication channel, for example, a phone call or a chat.

Before you begin

Role required: itil or admin

Procedure

1. Perform one of the following actions to start creating an interaction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. On the form, fill the fields in the **Details** tab.

Create New Interaction form

Field	Description
Number	Auto-generated identification number for the interaction.
Type	Mode through which the interaction started. For example, chat, phone, or walk-up.
State	State of the interaction.
Opened for	Name of the user starting the interaction.
Assigned to	User to whom the interaction is assigned to.
Short description	Detailed description of the interaction
Work notes	Work notes related to the interaction.

Note:
If the Now Assist plugin isn't activated, you must enter the values for **Opened for**, and **Short description** fields to create an interaction.

3. Click **Save**.

Work on an interaction in Service Operations Workspace

Work on customer conversations to resolve issues.

Before you begin
Role required: itil or admin

Procedure

1. Open an interaction.
2. Perform any of the following actions on the interaction record page.

Collaborate using Microsoft Teams from an interaction record in Service Operations Workspace

You can initiate a chat or make conference calls using Microsoft Teams to communicate with stakeholders to resolve the issue.

Before you begin
Role required: itil or admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Interactions** > **Open**.
4. Select the interaction record.
5. Select the **Collaborate** icon ( ) from the contextual side panel.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Start Microsoft Teams chat**.
7. In the **Start Microsoft Teams chat** dialog box, specify the participants.
8. To start a chat conversation, perform the following actions.

   a. In the **Collaborate** panel, click the plus sign (+), and select **Start Microsoft Teams chat**.

   b. In the **Start Microsoft Teams chat** dialog box, specify the participants.

   c. **Optional:** To specify more chat options, click **Show more chat options** and specify a client.

   (Optional) You can choose Microsoft Teams application or the Microsoft Teams web application.

   d. Click **Start Chat**.
   - A chat conversation is initiated in Microsoft Teams.
   - All automatic chats are automatically imported to the **Collaborate** panel.

9. To view a chat conversation, click the more options icon (⋮) on the chat and select **View chat**.
10. To import a chat conversation, perform one of the following actions.

Associate an interaction with a task record

Associating a record to an interaction leverages data to streamline processes, enhance the customer experience, and improve resolution time.

Before you begin

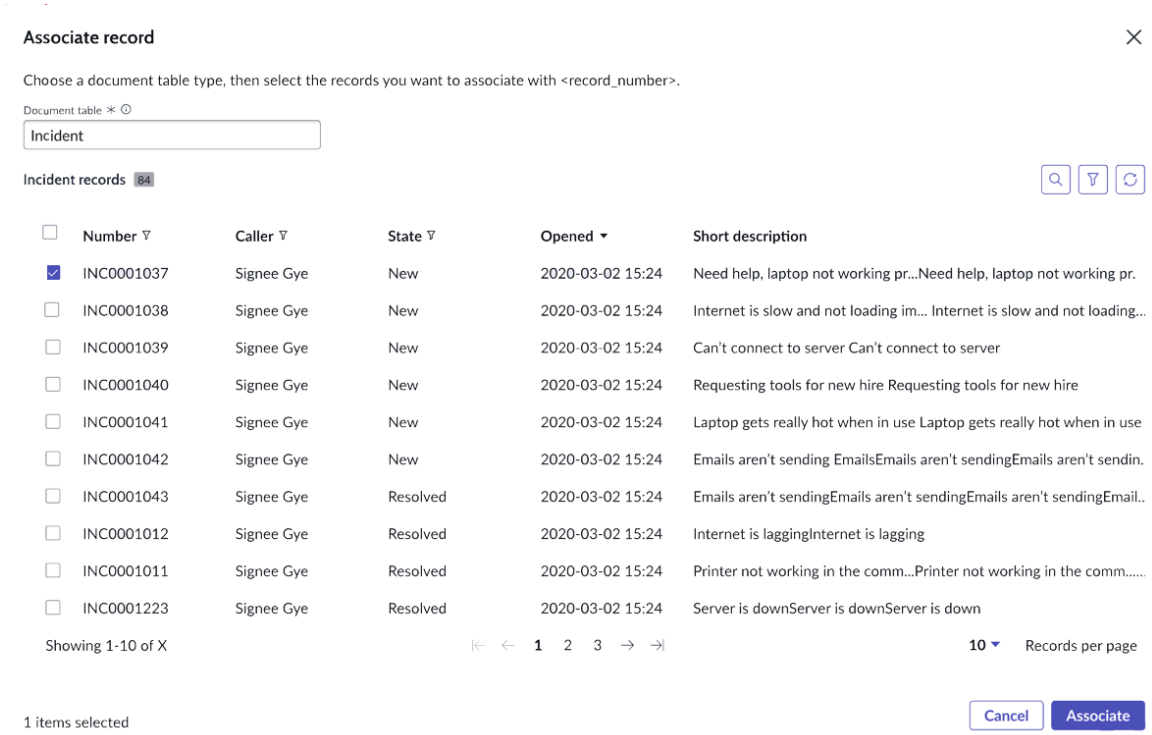
Role required: itil or admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Interactions** > **Open**.
4. Select the interaction record.
5. Select More Actions (⋮) icon, and then select **Associate record**.

   A modal is displayed with the list of records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select the record that must be associated to the interaction.

   You can select multiple records at once.

7. Select **Associate**.

   The selected records are associated with the interaction.

Knowledge Management in Service Operations Workspace

Knowledge articles provide agents with information such as self-help, troubleshooting, and task resolution.

An agent can work on the agent's published and unpublished articles, feedback tasks, flagged tasks, and translation tasks. For information about knowledge articles, see Using Knowledge Management.

Note:
The list of agent's translation tasks is available only when the I18N: Knowledge Management Internationalization Plugin v2 plugin (com.glideapp.knowledge.i18n2) is activated.

Agents can also use knowledge blocks to reuse content within knowledge articles. For information about knowledge blocks, see Knowledge blocks.

Note:
The list of knowledge blocks is available only when the Knowledge Blocks plugin (com.snc.knowledge_blocks) is activated.

Work on a knowledge article in Service Operations Workspace

Share information across your organization using a knowledge article.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: itil

Procedure

1. Open a knowledge article in Service Operations Workspace.
2. Perform any of the following actions on the record page.

On-Call Scheduling in Service Operations Workspace

Use On-Call Scheduling in Service Operations Workspace to view and manage your shifts and schedules.

On-Call Scheduling overview

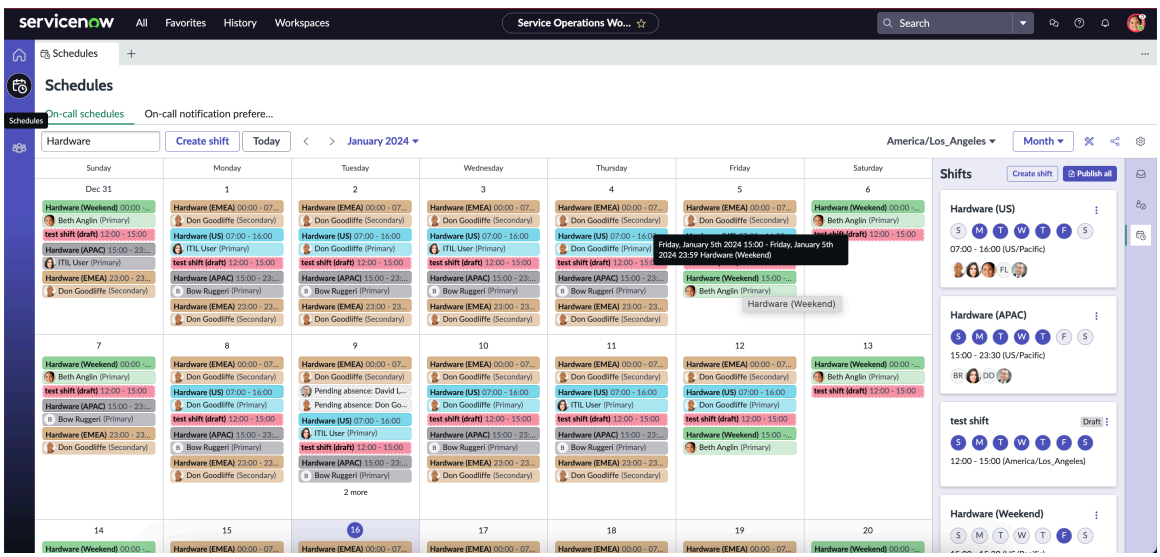
As an agent, view your schedule and your peer's schedules, request an absence, propose coverage, and set your notification preferences.

As a Shift Manager, view, and manage shifts, approve or reject absence requests, and resolve gaps and conflicts. You can also manage notification preferences, delivery channels, escalation trigger rules, and policies for your group.

As an On-call Admin, view, and manage shifts, approve or reject absence requests, and resolve gaps and conflicts. You can also manage notification preferences, delivery channels, escalation trigger rules, and policies for any group.

Schedules in Service Operations Workspace

Use the Schedules menu on the home page to access On-Call Scheduling in Service Operations Workspace.



On-call Schedules tab

This tab displays all the user's schedules and shifts in a calendar or time-line view. You can customize the view as a day, week, or month view, and filter the calendar based on your groups or time zones.

You can manage your work, shifts, and time-off requests on this tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On-call notification preferences

On this tab, you can define your preferred notification methods to receive alerts when a ticket is escalated to you.

You can define the escalation notification rules and the delivery channels that are used to receive these notifications.

Teams in Service Operations Workspace

Use the Teams menu ( ) in Service Operations Workspace to view all teams. Select a team card to view and manage a team's schedule, define escalation policies, and team preferences for the selected shift. This feature verifies that your team knows who is on call, is accountable, and is confident that critical alerts or incidents are acknowledged.

Use the **Schedule** tab to create and manage shifts for your team. This feature verifies that the right person is available to respond to incidents and critical alerts. You can also add or edit team members, description, and the contact information of your team.

Use the **Escalation triggers and policies** tab to set an escalation policy and the trigger rules to be followed if there's an incident. You assign these policies and trigger rules, along with notification preferences, to a team.

Use the **On-call Team preferences** tab to edit shift preferences for a group. You can add a Shift Manager and the start day of the week, set preferences for absence requests and shift overlap, and escalation rules for shift overlap.

Contextual side panel

Use On-Call Scheduling from the Contextual side panel, when you open an incident. You can also configure experts on call and escalation tracking for any other record, if necessary.

Select the Experts On-call icon ( ) from the Contextual side panel to view and contact the recommended subject matter experts for help.

To view the escalation details and dynamic tracking of an on-call escalation, select the on-call escalations icon ( ) from the Contextual side panel.

Scheduling in service operation workspace

View and manage schedules, shifts and time-off request.

Schedules menu helps Agents view and manage day-to-day work, request for time-offs and propose coverage for absence.

Shift manager can create and manage schedules, shifts, team members, escalation trigger rules and policies for their group. They can also approve or reject time-off requests, and resolve

Field	Description
	Note: This option available for Washington DC and later releases only. For Vancouver and previous releases, you have the option to send an email with subscription link.
Shift card	Select a shift or right-click to view shift detail and access: • Edit shift ( ) • More options ( )
Edit shift ( )	• To view and edit shift details like start time, date, timezone, etc. • To add, delete and edit the members in a shift. You can also add/ delete responder levels and rotation details. • To open and edit the escalation policies in team record.
More options ( )	• To provide coverage • To schedule extra time • To schedule absence
Required actions	Displays list of upcoming tasks assigned to you. • For agent it might be upcoming shift or absence that they have scheduled. • For Manager, this might be a list of gaps and conflicts, time-off request for upcoming shift.

Manage your work and schedule absence

Request absence and provide coverage for a shift. You can also request over-time for a shift.

About this task

You can schedule your own time off and suggest a suitable cover from among the fellow roster members. This helps the shift manager and on-call admin in planning shifts and making sure that members are available to respond to incidents and escalations at all times.

Get an overview of how to schedule an absence with this video. Schedule absence

Before you begin

Role required: itil

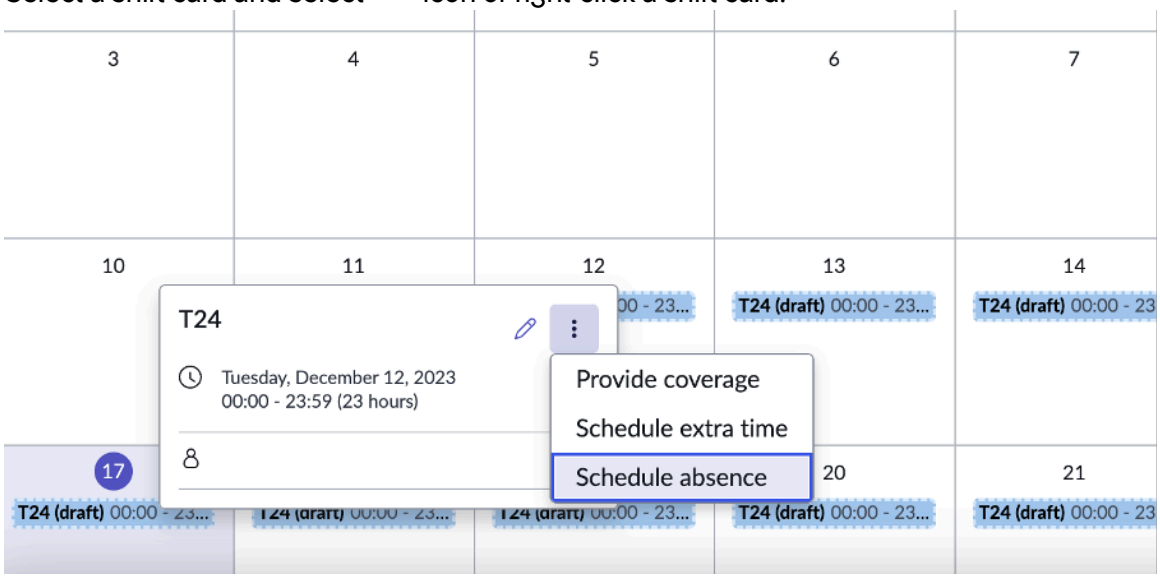
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operation Workspace**.
2. Select the **Schedule** menu to view your calendar.
   You can also do the following to view your calendar:
   - Navigate to **Workspaces** > **Service Operation Workspace**.
   - Select **Teams** menu from home page and select a team.
   - Select **Schedule** tab to view all the schedules for the team.
3. Select a shift card and select ⋮ icon or right-click a shift card.



4. Select **Schedule absence** to request absence for the shift and provide the following details:
   - Member
   - All day toggle button
   - Start time and End time
   - Proposed cover
   - Notes

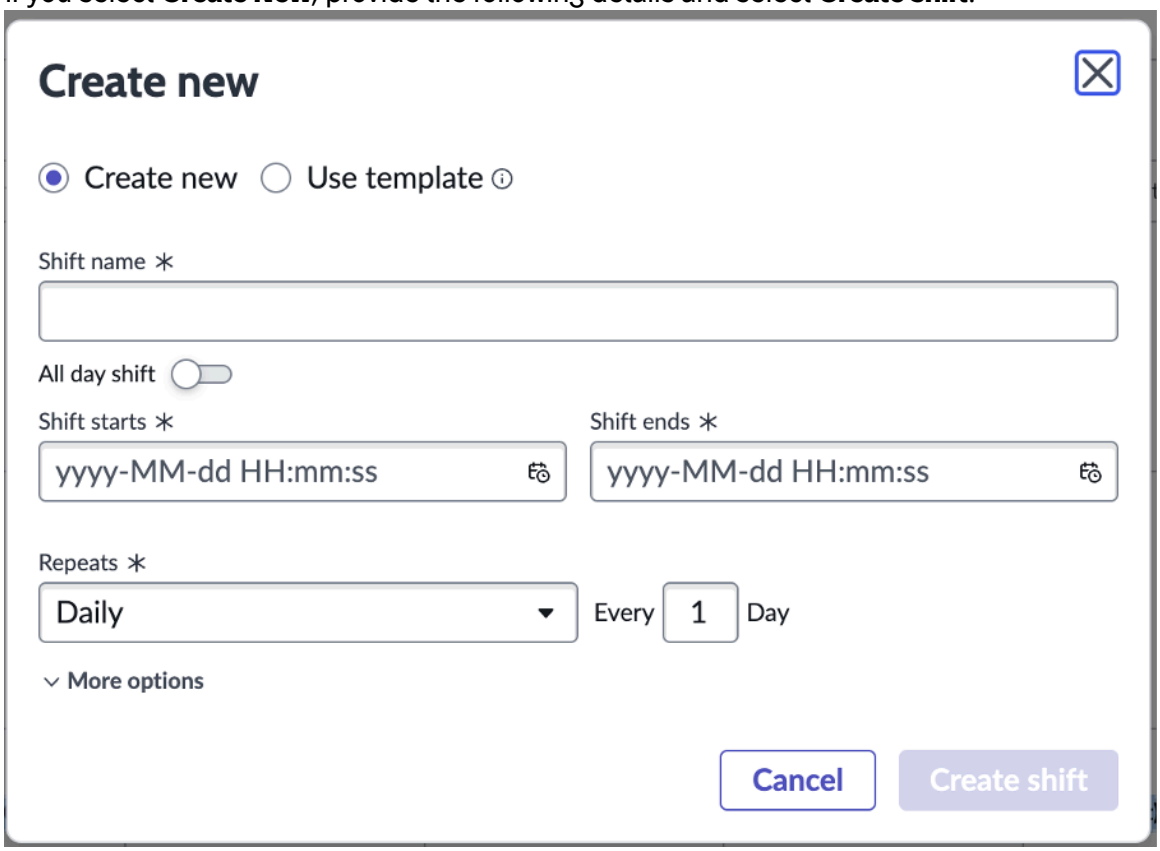
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. On **Schedules** page, select **Create shift** and provide values for the following fields on the **Create new** shift form:

   If you select **Create New**, provide the following details and select **Create shift**:



Create Shift

Field	Description
Shift name	Name for the shift.
All day shift	Toggle for all day commitment.
Shift starts	Date and time the shift begins.
Shift ends	Date and time the shift ends.
Repeats	Shift repetition. Choices are: ○ Never ○ Daily ○ Weekly
Every	How often to repeat. Display depends on the time frame chosen.
More options	
Timezone	User timezone.
Holiday schedule	Schedule to use for the holiday.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Repeats until	Date and time to end repetition.

For **Use shift template**, fill in the fields, as appropriate.

Create shift using shift template

Field	Description
Shift name	Name for the shift.
Template/Schedule	Existing templates for shifts. Choices are: ○ 24 x 7 ○ Off hours (workday 8:00 - 5:00) ○ Off hours (workday 9:00 - 5:00) ○ Workday 8:00 - 5:00 ○ Workday 9:00 - 5:00

You have successfully created a new shift.

2. To edit a shift, right-click the shift card and select the icon
   Shift details open up in the side panel.
3. From the shift details in the side panel, you can update the following shift details:

Edit shift

Field	Description
Details tab	Update the shift details:

Create new form (continued)

Field	Description
Every	Repetition of the shift. The display depends on the time frame selected in the **Repeats** field.
More options	
Timezone	User timezone.
Holiday schedule	Schedule to use for the holiday.
Repeats until	Date and time to end repetition.

Manage shifts in service operation workspace

Accept or reject absences requests, resolve gaps and conflicts by providing coverage and scheduling extra time for a shift.

Before you begin

Get an overview of how to manage shifts in this video.

https://player.vimeo.com/video/989602605?badge=0&autopause=0&player_id=0&app_id=58479

Role required: rota_manager, rota_admin

Procedure

1. Navigate to **Workspaces** > **Service Operation Workspace**.
2. Click the **Schedule** icon to view all the absence requests, gaps and conflicts in a shift.
   All the absence requests are displayed in the **Required actions** section.
3. Click **Approve** or **Reject** and confirm the same when prompted.
4. For gaps or conflicts, select the shift card and click icon or right-click a shift card.
5. Click **Provide coverage** to replace a member of the shift.
   Provide the following details and click **Provide coverage**:
   - Member: name of the member
   - Start
   - End

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operation Workspace**.
2. Select the **Schedule** icon.
3. On **Schedules** page, select **Notification preferences** and select **Edit** to add or edit Delivery channels.
4. Select **Add New** to add a new channel and provide name and email ID.
5. Select **Phone numbers** tab to add and edit phone numbers.
6. Select **Save** to apply your changes.

Escalation triggers and policies

Create and edit trigger rules.

About this task

There are two ways to create and edit escalation triggers and policies. Navigate to **Workspaces** > **Service Operation Workspace** and:

- Schedules menu:
  - Select the **Schedule** menu, select a shift card and click icon.
  - Select **Escalation policies** tab and click **Open Team Record**.
- Teams menu:
  - Select the **Teams** menu, select **All Shifts** from the drop-down and select a shift card.
  - Select **Escalation triggers and policies** tab.

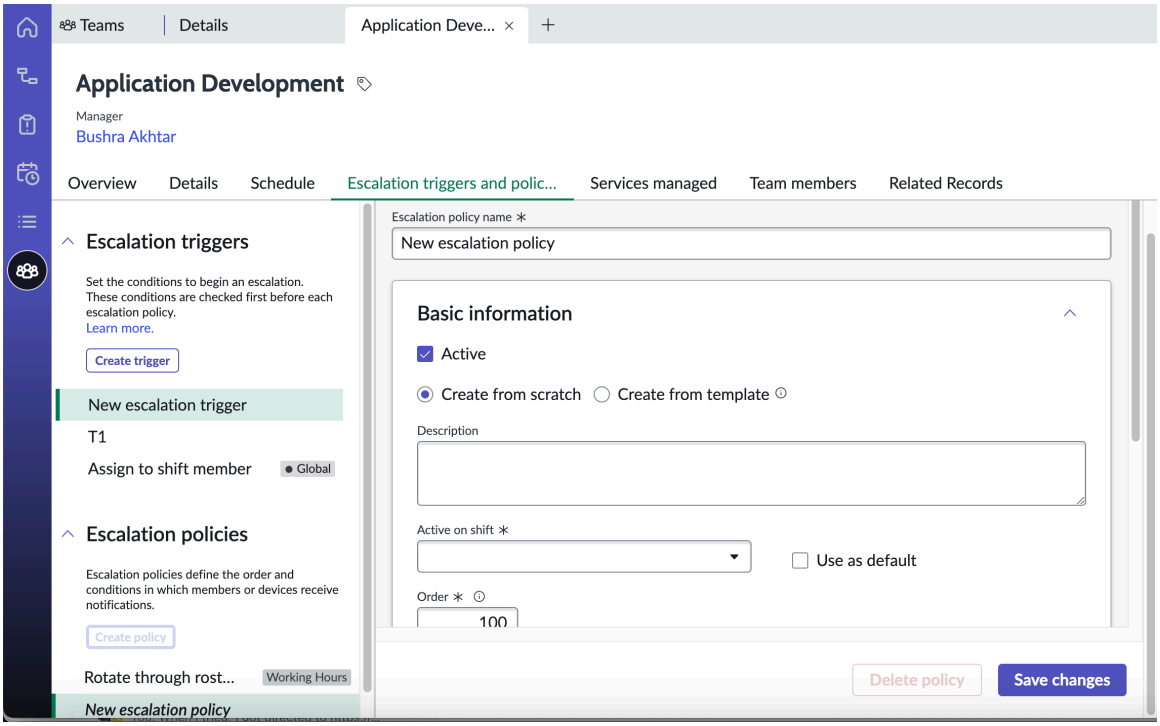
Before you begin

Role required: rota_manager, rota_admin

Procedure

1. Under **Escalation policies** in the left panel, select **Create policy**.
2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Field	Description
Active	Check the box to activate or deactivate the policy.
Create from scratch or Create from template	Create your own policy or use a template created by your admin.
Description	Enter text describing the policy.
Active on shift	Select from the list menu. Set this as the default using the check box.
Order	Select an order of execution. When there are multiple escalation triggers in a team, The one with smaller order number is checked first.
Conditions	Set the conditions for the policy by selecting a table and condition set. These conditions are checked after the escalation is started by an escalation trigger. If the conditions are met, the policy is run.
Escalation steps	Using the modal, add escalation steps. Select **Done** when you are finished.
Escalation notifications	Set the notification conditions for the policy. Toggle user preference override, manual set or use a template.
Add notification step	Select email, call, or SMS. You can add as many attempts as you like. Select **Done** when you are finished.

3. To add more escalation levels to the policy, select **Add an escalation level**.

Role required: rota_manager, rota_admin

Procedure

1. Navigate to **Workspaces** > **Service Operation Workspace**.
2. Click the **Schedule** icon.
3. On the **Schedules** page, right-click the shift span and click icon.

On-call support for an incident in Service Operations Workspace

You can identify available on-call members of a support group and contact them to resolve an issue.

On-call support for an incident

Based on support groups associated with all services and CIs of the incident, the **Experts on-call** panel displays three on-call recommendations in the following order:

- Support group associated with the primary service, that is, the **Service** field.
- Top support group of impacted services from the Impacted Services/CIs related list.
- Support group associated with the primary configuration item, that is, the **Configuration item** field.
- Top support group of affected CIs from the Affected CIs related list.
- Assignment group of an agent, that is, the **Assignment group** field.

For each of these fields, on-call information such as shift names and on-call members is displayed. For each on-call member, you can view the contact information.

© 2026 ServiceNow, Inc. All rights reserved.

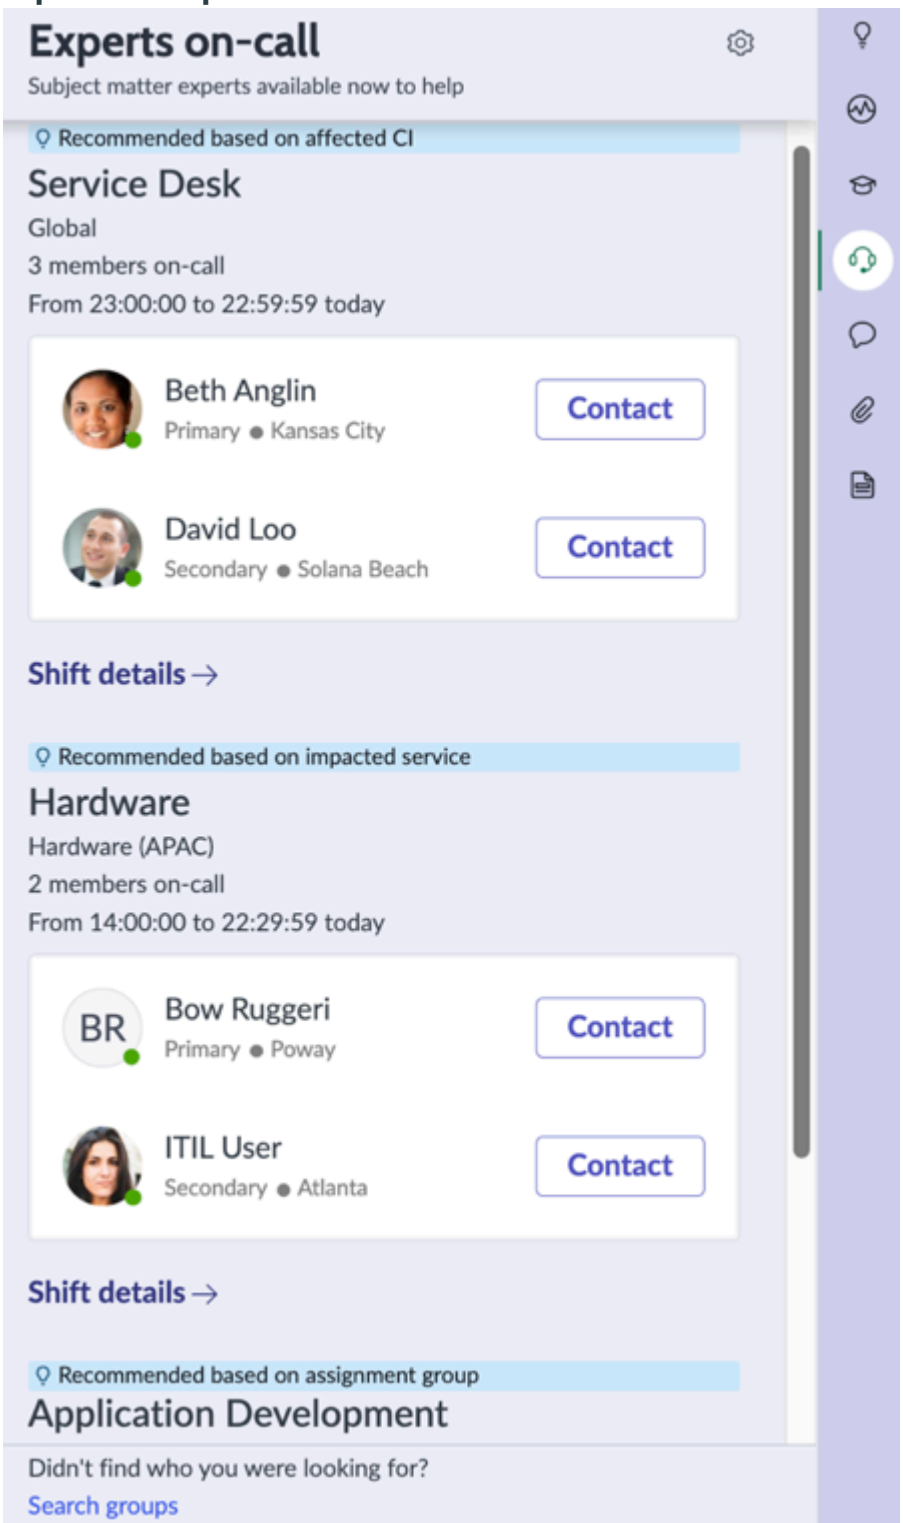
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Experts on-call panel



For information about On-Call Scheduling, see On-Call Scheduling.

Experts on-call in Service Operations Workspace

View the relevant shift details and contact on-call members for issue resolution and dynamically track the on-call escalation.

Before you begin

Role required: itil, admin, sn_incident_read, sn_change_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ensure that the escalation logging, that is, the *com.snc.on_call_rotation.log_escalations* property is enabled to view the on-call escalation tracking page. For information about this property, see System properties for On-Call Scheduling.

Procedure

1. Open an incident.
2. To view the relevant shift details, contact on-call members, and do other relevant tasks, perform the following steps.

   a. From the contextual side panel, click the experts on-call icon ( ).
   For information about how on-call recommendations can be configured, see Customize the on-call support group recommendations.
   Three on-call recommendations are displayed based on support groups associated with all services and CIs of the incident in the following order:
   - Support group associated with the primary service, that is, the **Service** field.
   - Top support group of impacted services from the Impacted Services/CIs related list.
   - Support group associated with the primary configuration item, that is, the **Configuration item** field.
   - Top support group of affected CIs from the Affected CIs related list.
   - Assignment group of the agent, that is, the **Assignment group** field.

   b. To view detailed shift information such as all on-call members and start time and end time and, click **Shift details**.
   When no on-call member is available for a support group in that shift, you can view the next shift with on-call members.

   c. To start a Microsoft Teams chat conversation with an on-call member, click **Contact** next to the member details and click **Start Teams chat**.

   Note:
   You can view the user presence before contacting the on-call member.

   For information about Microsoft Teams chat, see Collaborate on a task record using Microsoft Teams in Service Operations Workspace.

   d. To configure display preferences in the **Experts on-call** panel, click the preferences icon ( ) and perform any of the following actions.
   - To hide shifts with no on-call members, use the **Hide shifts with no on-call** toggle switch.
   If no on-call members are available for all support groups, you can search for other groups and view its on-call members.
   - To use the default date and time format configured for the current user, use the **Use default date and time formats** toggle switch.

3. To view dynamic tracking of an on-call escalation, click the on-call escalations icon ( )

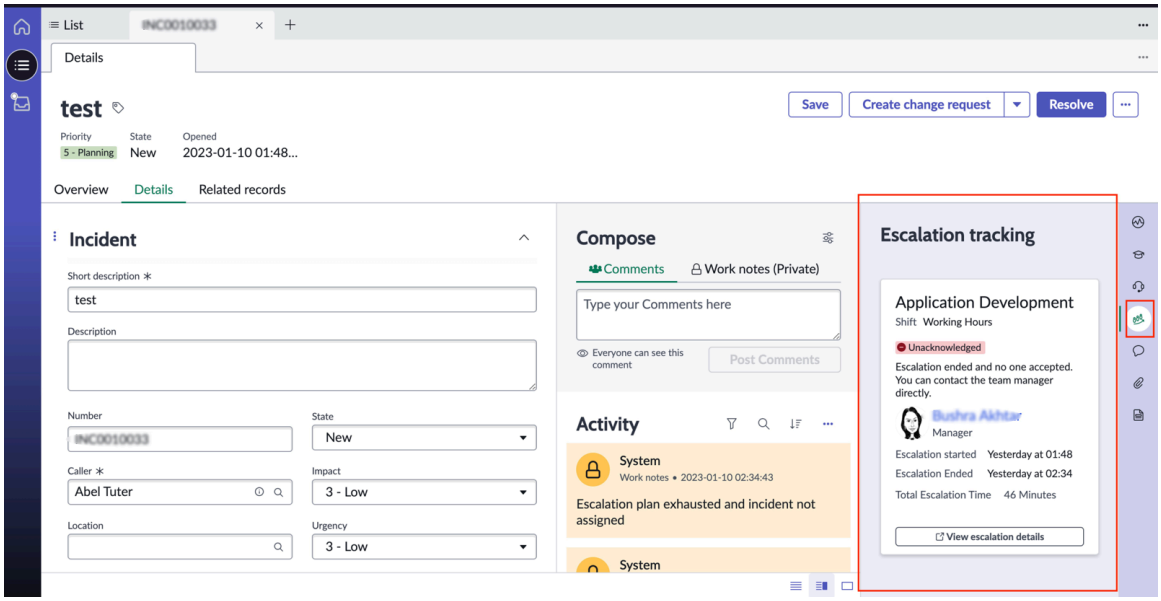
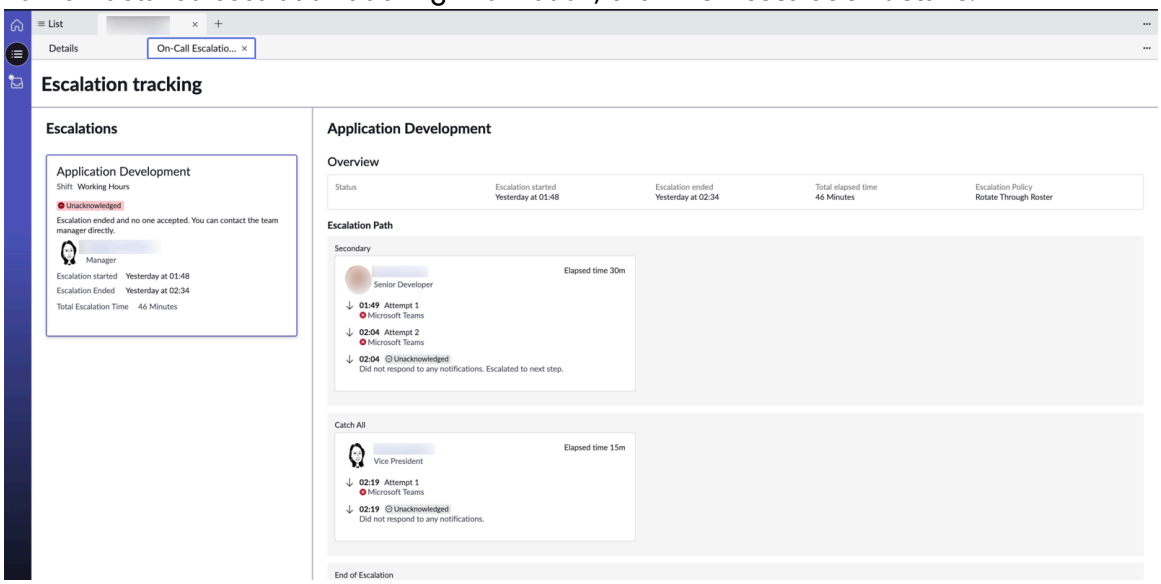
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. To view detailed escalation tracking information, click **View escalation details**.

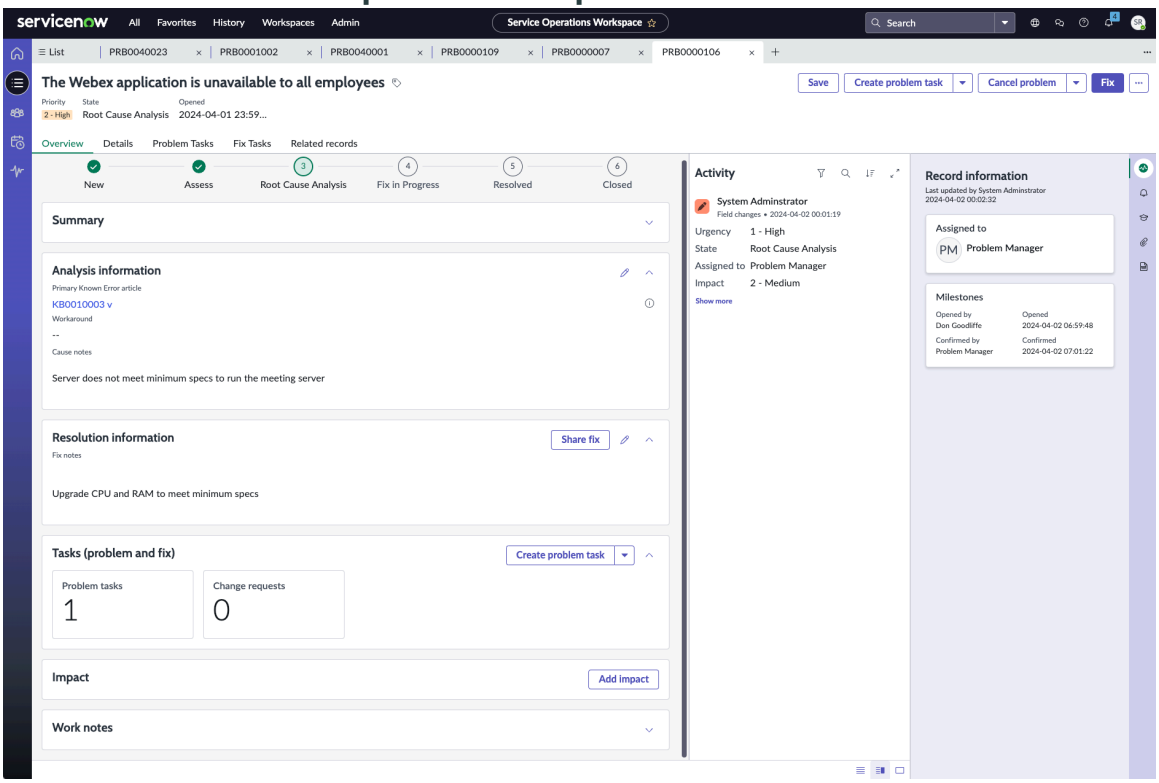


Problem Management in Service Operations Workspace

When you have recurring incidents or a major incident, you can create a problem to identify the root cause of the incidents and help prevent them from happening again. Use Service Operations Workspace to manage problems through their life cycle, share workarounds or fixes with related incidents, and create known error articles to help deflect incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem record in Service Operations Workspace



Overview tab

This tab displays the following information about a problem:

- Summary
- Analysis information
- Resolution information
- Problem tasks and fix tasks
- Impact
- Work notes

You can configure the problem record overview tab and its UI elements in the Service Operations Workspace Admin Center. For more information, see Manage configurations in Service Operations Workspace for ITSM.

You can optionally enable the following shortcuts, accessible from both the header and **Tasks (problem and fix)** drop-down menus:

- **Create defect** (for more information and requirements, see Agile Development 2.0)
- **Create enhancement** (for more information and requirements, see Agile Development 2.0)
- **Create improvement initiative** (for more information and requirements, see Continual Improvement Management)

For all other configuration options, see Configuring Problem Management in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Details tab

This section displays the detailed information of a problem. For information about fields in this section, see Create a problem in Service Operations Workspace.

From the **Compose** section, you can add work notes for the problem.

All fields that are available on the Problem form in ServiceNow AI Platform are available in Service Operations Workspace. However, on the problem form in Service Operations Workspace, the **State** field is read-only. For information about state transitions of a problem, see Life cycle of a problem.

For information on how you can configure fields in this tab, see Configuring Problem Management in Service Operations Workspace.

Problem Tasks tab

This section displays problems tasks associated with this problem. Problem tasks are created when you need help from other teams to identify a fix for the problem. For information about creating a problem task, see Create a problem task in Service Operations Workspace.

Fix Tasks tab

This section displays fix tasks associated with the problem. In Service Operations Workspace, only change requests are configured as fix tasks. For information about the **List of related task records (comma-separated) to track as fixes for this Problem** property where the fix tasks are configured, see Configure properties for Problem Management in Service Operations Workspace.

Related records tab

This section displays the following records related to the problem. You can add a record, create a record, or remove it from the problem.

- Incidents
- Affected CIs
- Outages
- Knowledge attached from Agent Assist

Contextual side panel

From this section, you can access Agent assist and search for relevant records and perform the required actions.

For more information about Problem Management, see Problem Management.

Create a problem in Service Operations Workspace

Investigate the root cause of recurring incidents or a major incident. Provide a permanent fix to help prevent them from happening again.

Before you begin

Role required: itil or problem_coordinator

Procedure

1. Create a problem from any of the following sources.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. On the problem form, fill the fields in the **Details** tab.
   For a description of the field values, see Problem form.
3. Select **Save**.

Work on a problem in Service Operations Workspace

Manage problems and problem tasks through their life cycle, share workarounds or fixes with related incidents, and create known error articles to help deflect incidents.

Before you begin

If you aren't using the base problem life cycle, you will continue to use the classic experience to manage problems or problem tasks through their life cycle. From the problem record page, select **Continue problem** to be redirected to the ServiceNow AI Platform user interface where you can make state transitions. For information about state transitions of a problem, see Life cycle of a problem.

The base problem life cycle is included with the Problem Management#Best Practice - Madrid - State Model (com.snc.best_practice.problem.madrid.state_model) plugin. Use the Problem Management Migration Utility store application to enable this plugin and migrate your records to the base problem life cycle.

Role required: itil, problem_coordinator or higher (for managing the life cycle of the problem), problem_admin (for deleting the problem)

Procedure

1. Open a problem.
   For information about creating a problem in Service Operations Workspace, see Create a problem in Service Operations Workspace.
2. Perform any of the following actions on the problem record page.

Problem Management models in Service Operations Workspace

You can use Problem Management models to tailor processes for specific use cases.

You can create custom models for problems and problem tasks to extend their default models without compromising on existing capabilities. To use these capabilities, enable the *com.snc.problem_management.models.enabled* system property introduced in the Xanadu release. Enabling Problem Management models is optional.

Problem Management models enable you to define:

- States for specific use cases
- State transitions
- State transition conditions

The following default models are provided to replicate the non-model versions included as part of the base problem life cycle. The base problem life cycle is included with the Problem Management#Best Practice - Madrid - State Model (com.snc.best_practice.problem.madrid.state_model) plugin. Use the Problem Management Migration Utility store application to enable this plugin and migrate your records to the base problem life cycle.

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem model

Model	Description
General	Problem process equivalent to the non-model base problem life cycle.

Problem task models

Model	Description
Root cause analysis	Problem task process equivalent to the non-model base problem life cycle.
General	Problem task process equivalent to the non-model base problem life cycle.

Enabling Problem Management models

Test Problem Management models in a non-production instance first. If you have changed the base problem life cycle or life cycle actions, you must make the equivalent changes to your custom models.

To begin working with custom models, see the following topics:

- Enable Problem Management models in Service Operations Workspace
- Create a problem model in Service Operations Workspace
- Create a problem task model in Service Operations Workspace

Note:
Any problems or problem tasks that were created before you enable Problem Management models will continue to use the non-model life cycle.

Disabling Problem Management models

Before disabling Problem Management models, you must apply any additional features you have added through custom Problem Management models to your non-model life cycle.

Considerations for Problem Management models and Service Operations Workspace

Service Operations Workspace 6.x is based on the Xanadu release and it supports Problem Management models.

Service Operations Workspace 5.x is based on the Washington DC release and it doesn't support Problem Management models.

If you are using Service Operations Workspace 5.x and you enable Problem Management models, you will manage problems and problem tasks in the classic UI16 experience, rather than in Service Operations Workspace.

Create a problem task in Service Operations Workspace

When you need to engage another team or agent for help, create and assign a problem task.

Before you begin
Role required: itil or problem_coordinator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a problem.
2. From the problem record page, create a problem task in the one of the following ways.
   - Select **Create problem task**.
   - From the **Problem Tasks** tab, select **New**.
3. In the Create problem task dialog box, select the problem task type.
   - **Root cause analysis**: Tasks to investigate the root cause of a problem and to find a resolution for the problem.
   - **General**: Tasks other than root cause analysis tasks.

   For information about creating additional task types, see Create a task type for problem or change in Service Operations Workspace.
4. Select **Create**.
5. On the problem task form, fill in the fields.
   For a description of the field values, see Problem task form.
6. Select **Save**.

Work on a problem task in Service Operations Workspace

Manage problems and problem tasks through their life cycle, share workarounds or fixes with related incidents, and create known error articles to help deflect incidents.

Before you begin

If you aren't using the base problem life cycle, you will continue to use the classic experience to manage problems or problem tasks through their life cycle. From the problem task record page, select **Continue problem task** to be redirected to the ServiceNow AI Platform user interface where you can make state transitions. For information about state transitions of a problem, see Life cycle of a problem.

The base problem life cycle is included with the Problem Management#Best Practice - Madrid - State Model (com.snc.best_practice.problem.madrid.state_model) plugin. Use the Problem Management Migration Utility store application to enable this plugin and migrate your records to the base problem life cycle.

Role required: itil or problem_task_analyst (for changing the state of the problem task or deleting it)

Procedure

1. Open a problem.
   For information about creating a problem in Service Operations Workspace, see Create a problem in Service Operations Workspace.
2. From the **Problem Tasks** tab, open the required problem task.
3. Perform any of the following actions on the problem task record page.

Recommendation Framework in Service Operations Workspace

An agent can view dynamic and contextual recommendations and perform a relevant action.

Recommendation Framework is now deprecated and no longer supported or available for new activation. Recommended Actions for ITSM feature provides the latest experience for this

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

functionality. To get the advanced version, you must install the Advanced Recommended actions for ITSM (com.snc.uib.sow_itsm_ra_advanced) plugin and you must procure ITSM Pro package subscription.

Note:
The best practice to get the advanced version is to install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription. For more information, see Exploring Recommended Actions for ITSM in Service Operations Workspace.

Recommendations are available in multiple areas for an incident in Service Operations Workspace.

Recommendations from the sidebar for an incident

From the sidebar of an incident, you can access the **Recommendations** panel where you can configure and group recommendations in any of the following formats.

- Record card: Relevant record details of a table and corresponding actions are available.
- Message card: A message derived from the recommendation and corresponding actions is available. For example, **Propose major incident** card.

Note:
All cards of the same recommendation rule are grouped. For example, for the Similar open incidents rule for an incident in Service Operations Workspace, all relevant incidents are grouped as cards under **Similar open incidents**.

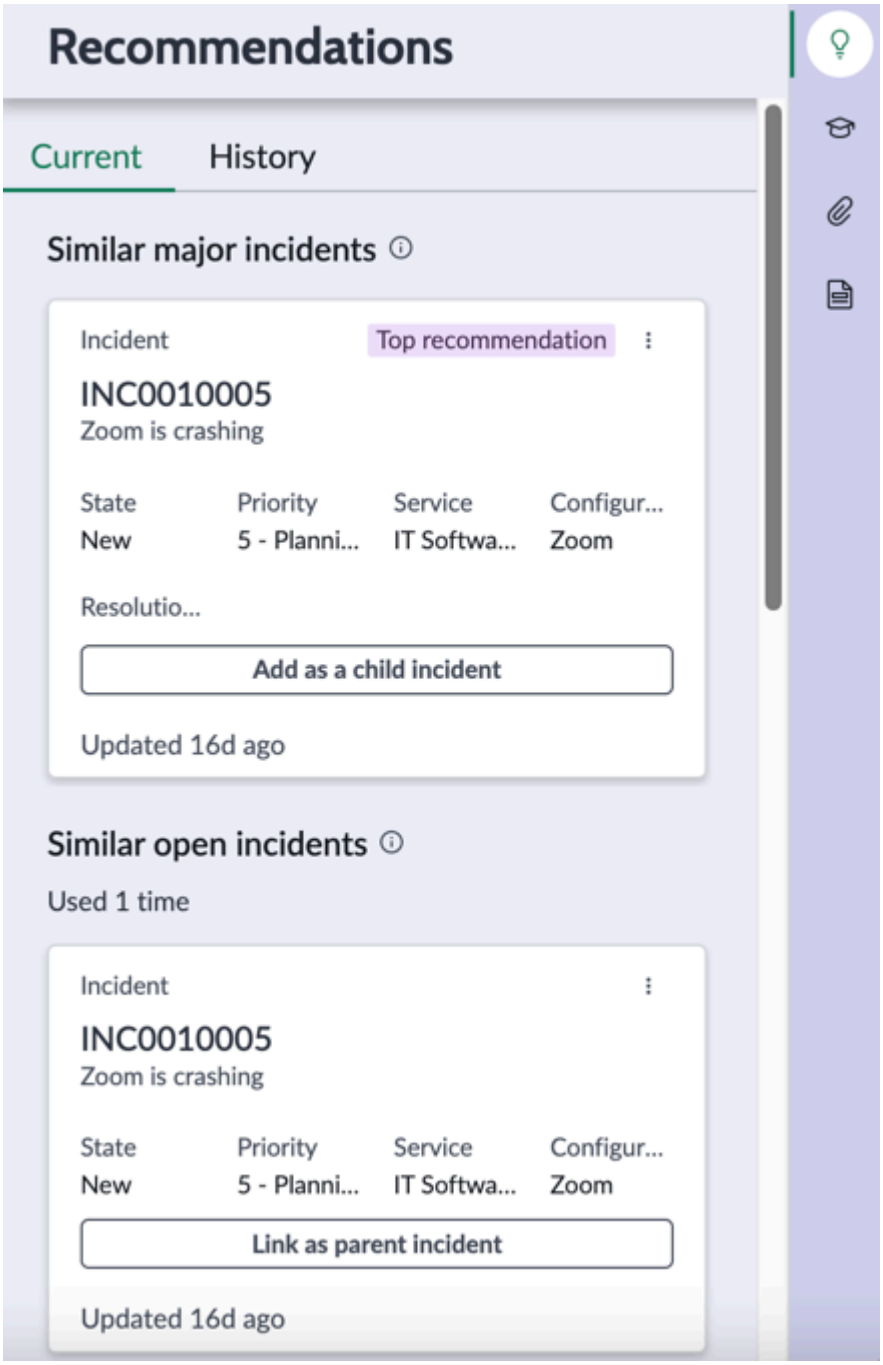
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Recommendations from the sidebar



For information on available card groups for an incident and their dependencies on recommendation rules, see Recommendation rules for an incident in Service Operations Workspace.

When you click a card or its record number, detailed information about that card and its actions is displayed in a new tab.

Every card has a primary action and multiple other actions. For every action you perform on the card, the recommendations are recomputed. You can discard a recommendation if not relevant. Also, when you perform a primary action on a card, it moves from the **Current** tab to the **History** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Based on the priority, the first card of the top card group is displayed as the top recommendation at the top of the **Recommendations** panel.

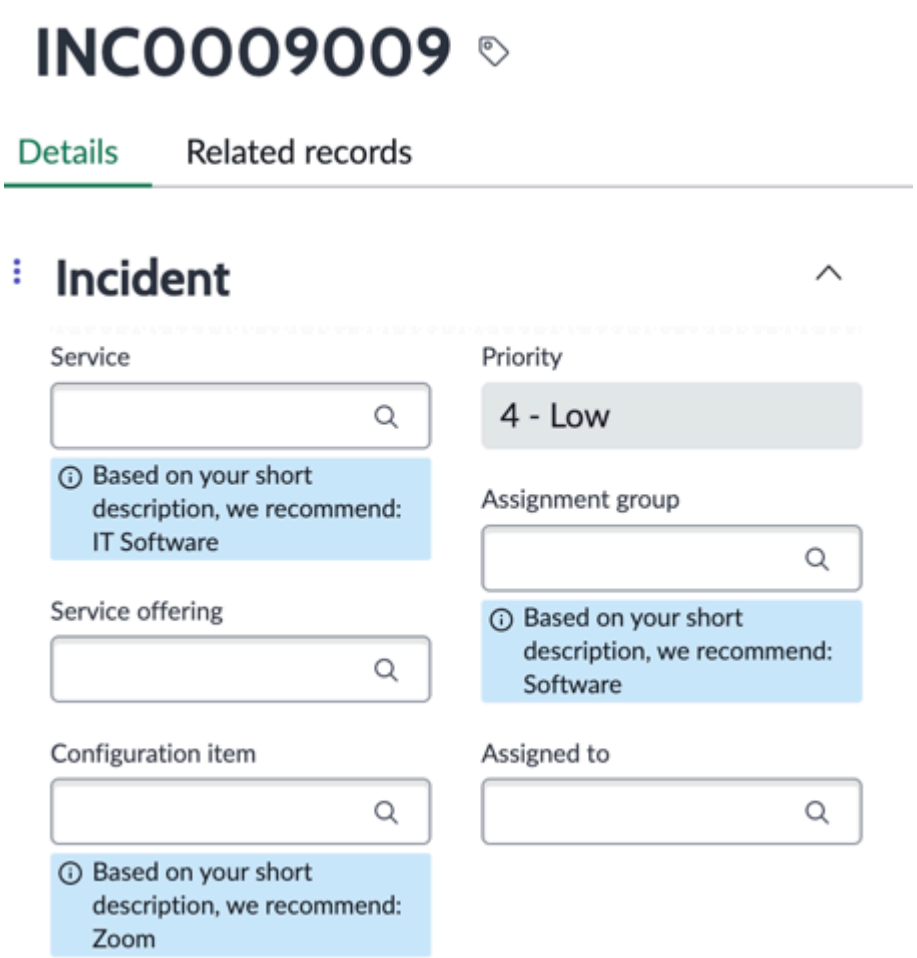
Recommendations at the field level for an incident

A predicted value is displayed for these fields in the **Details** tab of an incident.

- Assignment group
- Configuration item
- Service

These values are predicted based on a recommendation rule for each field. For information about these rules, see Recommendation rules for an incident in Service Operations Workspace. When a threshold value is configured, the recommended value can be stamped or auto-populated as the field value. For information about this configuration, see Configure Recommendation Framework for an incident in Service Operations Workspace.

Recommendations at field level



Recommended Actions for ITSM in Service Operations Workspace

Get guidance-based or field-level recommendations for records in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get Guidance based recommendations

Get actionable real-time recommendations in the side panel to help address customer issues and resolve issues quickly.

Before you begin

Important:
Users who have itil or sn_incident_write in the ITSM base system, can see and use the recommendations. These roles (itil and sn_incident_write) also include the following two roles:

- sn_nb_action.next_best_action_user: To view the recommendation.
- sn_gd_guidance.guidance_user: To use the recommendation

Role required: itil, admin, sn_incident_write

About this task

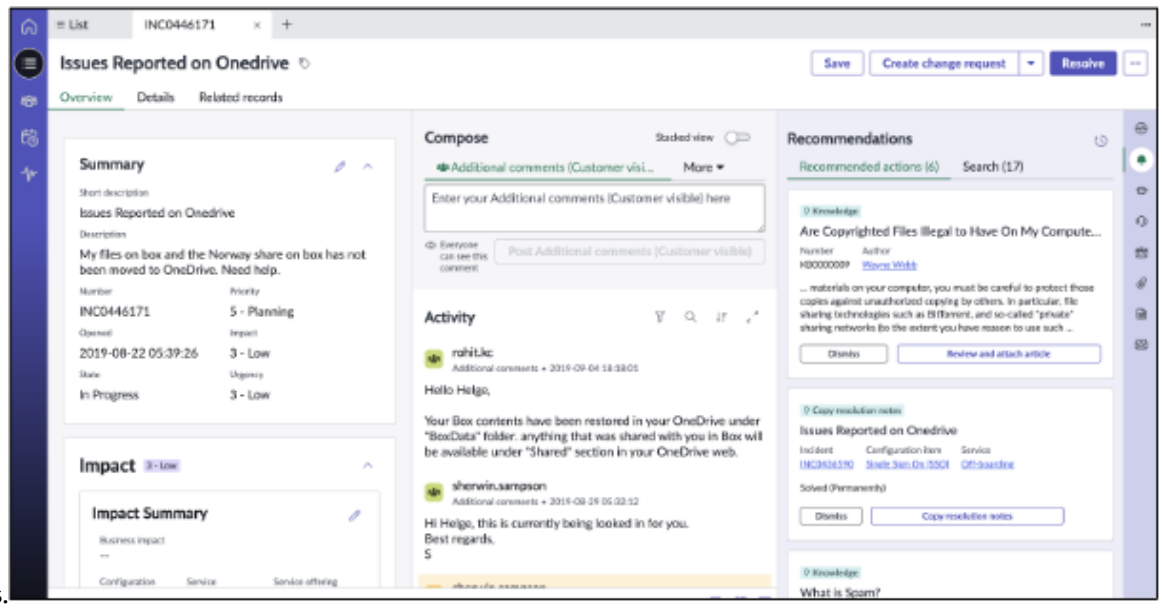
The guidance based recommendations appear for various records in the Service Operations Workspace, including Incident, Incident task, Problem, Problem task, Change request, Change task, Interaction, and Request.

For incident records, clicking the **Recommendations** icon( ) displays the **Recommended actions** and **Search** sub-tabs. The **Search** sub-tab allows you to manually search for AI-powered recommendations.

For records other than incidents (such as Incident Tasks, Problems, Problem tasks, Change requests, Change tasks, Interactions, and Requests), recommendations do not appear directly. Instead, you can use AI-powered search to find the recommendations.

Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace.**.
2. Open a record that you want to work on.
3. Select the **Recommendations** icon( ) in the contextual side panel.
4. Select the Recommended actions to review the actionable recommendation cards.



5. Review the Recommended Actions cards and do one of the following:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To accept a recommendation, select the action button on the card.
- To remove a recommendation from the contextual side panel, select **Dismiss** on the card.

6. Select the **Search** tab to manually search for AI-powered recommendations.

   The AI-powered search results in the following eight record types: Incident, Incident Tasks, Problem, Problem tasks, Change request, Change task, Interaction, and Request.

Get field recommendations

Get incident field recommendations in Service Operations Workspace while creating or updating incidents.

Before you begin

Role required: admin

About this task

- Field recommendations are only available in the Advanced Recommended actions for ITSM application, which requires the ITSM Pro package subscription.
- The recommendations associated with field recommendations must be active.
- The field recommendations must be configured in the Recommended Actions. For more information, see Create a field recommendation in Recommended Actions.

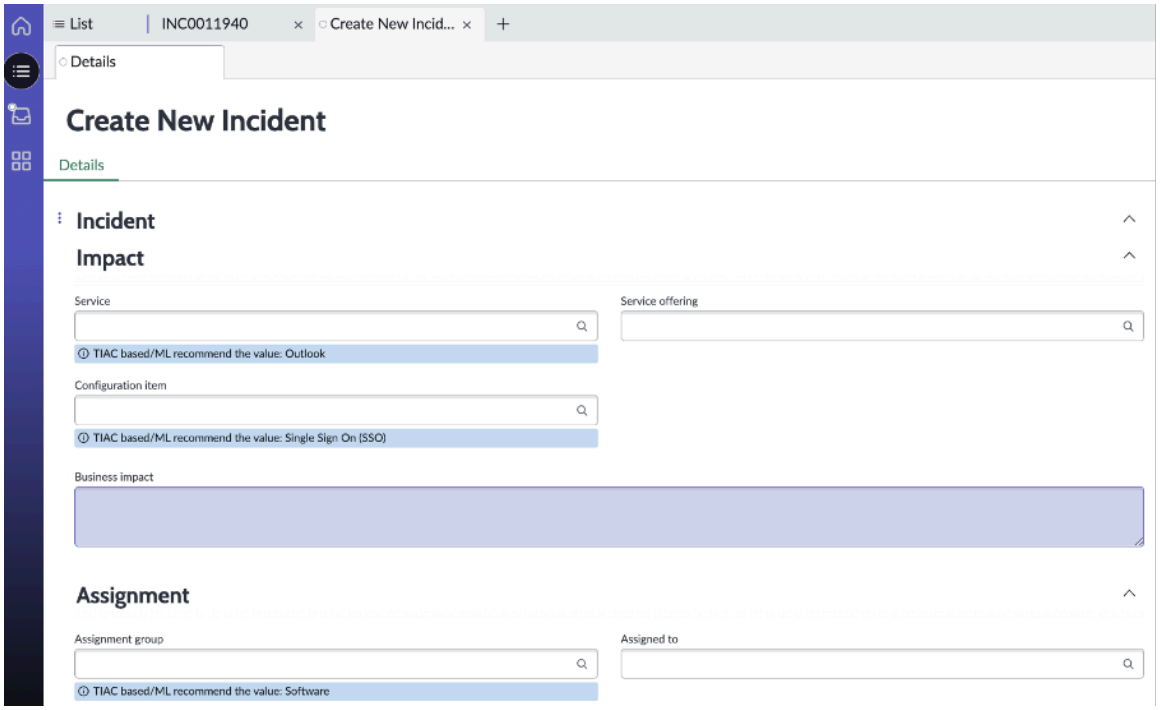
Procedure

1. Navigate to **All** > **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Perform one of the following actions to start creating an incident.

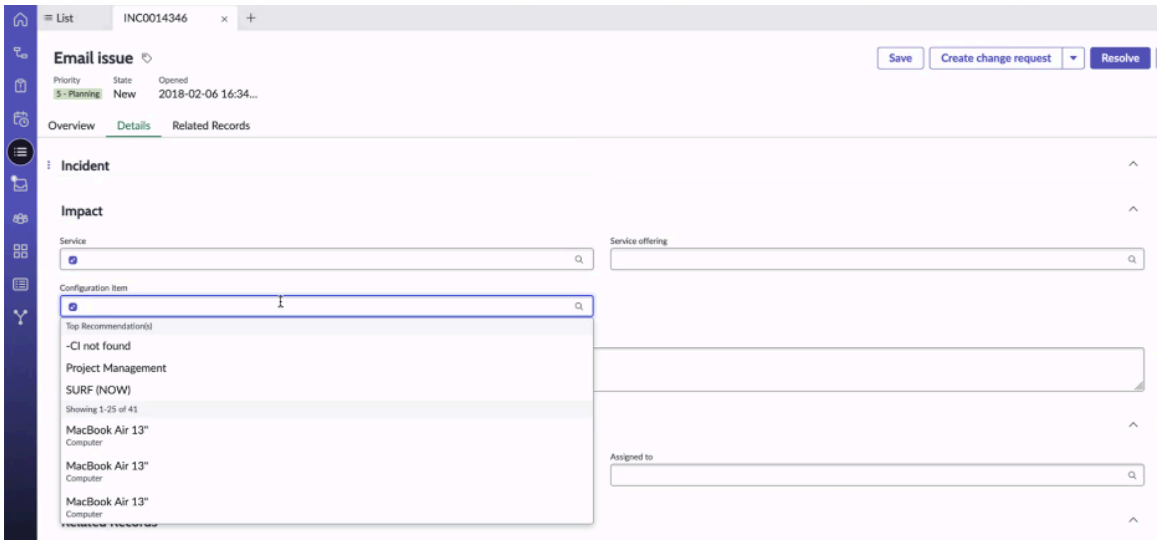
3. In the **Description** field and the **Short description** field, enter a description and a short description for the incident.
4. Perform one of the following actions to get the field recommendations:
   - If you're on a version prior to 4.2, then press the tab key to get the field recommendations.

     The fields are auto-filled or recommended based on the output defined in the recommendation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- If you're using a version after 4.2, select the required fields to see the field recommendations in the drop-down list.



Request Management in Service Operations Workspace

Service Operations Workspace for Request Management integrates the platform functionality for tier 1 agents into a multi-tab interface that helps agents efficiently manage multiple incidents, catalog requests, and catalog tasks.

As an agent, you can create a catalog request in Service Operations Workspace to initiate a catalog request flow from a different IT Service Management flow. For example, from an incident flow, you can create a request, and associate the request with the incident to help track requests associated with an incident and vice versa. You can also work on catalog tasks and update the state of the tasks, and manage approvals of requests and requested items.

The Service Operations Workspace ITSM Applications application (sn-sow-itsm-cont) that automatically installs the Request Management for Service Operations Workspace (sn_sow_req)

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

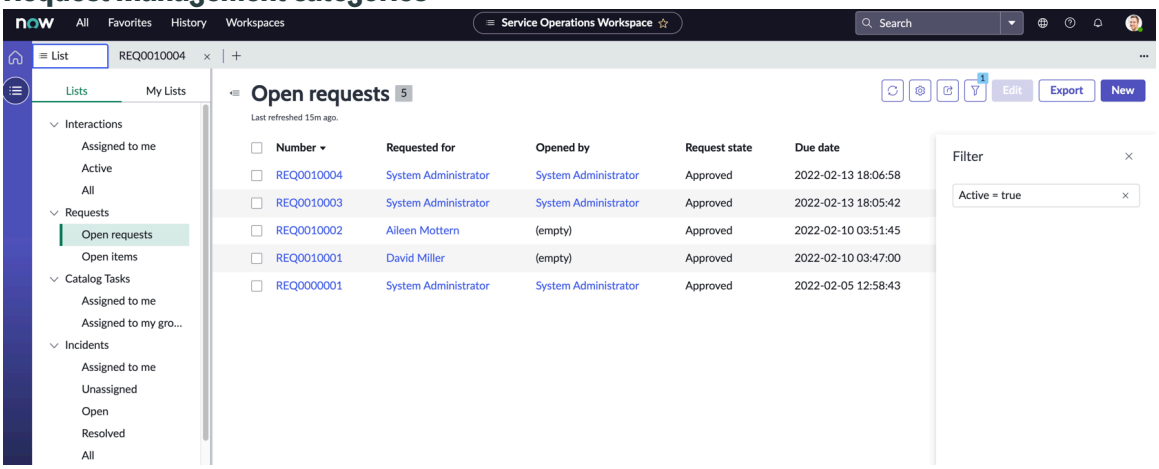
application should be installed for the Request Management flows in Service Operations Workspace. For more information, see Getting started with Service Operations Workspace for ITSM.

Request Management categories in Service Operations Workspace

The following Request Management categories are available in Service Operations Workspace:

- **Request**: Enables you to view active requests and requested items.
- **Catalog Task**: Enables you to view the active tasks assigned to the current user and active tasks assigned to the current user's assignment groups.

Request Management categories



Request Management forms in Service Operations Workspace

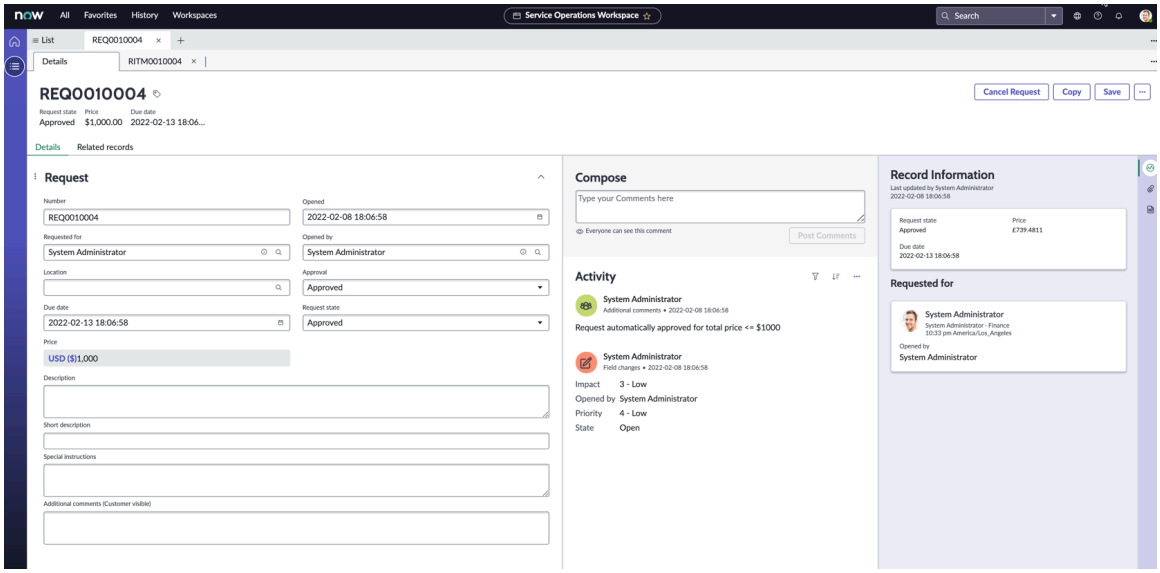
The form layouts, UI actions, UI policies, and client scripts available on the following Request Management forms in the ServiceNow AI Platform UI are also available on the corresponding Service Operations Workspace forms.

- Request
- Request Item
- Catalog Task

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request form

You can view the request form in Service Operations Workspace and track the record information like the request state, price, due date for a request, requested item, or task in the Record Information section.



Note:
A variable editor is displayed as a pop-up window for request items and catalog tasks only if it is included in the platform forms.

You can change the view of any Service Operations Workspace form by customizing the Service Operations Workspace view from the corresponding Request Management form in the ServiceNow AI Platform UI.

Create a catalog request in Service Operations Workspace

Create a catalog request in Service Operations Workspace to initiate a catalog request flow from a different IT Service Management flow. For example, from an incident flow, you can create a request and associate the request with the incident to help track requests associated with an incident and vice versa.

Before you begin

Role required: itil or sn_request_write

Procedure

1. Navigate to **Workspaces** > *`Service Operations Workspace`*.
2. Initiate a catalog request from an incident or from an interaction record.
3. Select **Order Now**.
   The value in the **Request for** field is set by default depending on where the request is created:
   - If the request is created from an incident, the value is set to the person who called in the incident.
   - If the request was started from an interaction, the value is set to the person with whom the interaction is happening.
4. **Optional:** On the Order Confirmation page, specify the shipping address in the **Delivery Information** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. **Optional:** On the Order Confirmation page, provide any additional information in the **Special Instructions** field.
6. Select **Checkout**.
   The request is created and associated with the parent incident.
7. Select **Close**.
8. **Optional:** View the created request by selecting **View Details**.

Add approvers to approve a request in SOW

Assign one or more approvers to the request or requested items to expedite the process and ensure that the user's request is handled quickly.

Before you begin

Role required: sn_request_write, admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Navigate to **List** > **Requests** > **Open requests**.
3. Select a request item.
4. Select the **Related records** tab.
5. In the navigation menu, select **Approvers**.
6. Select **Add**.

   A modal appears that contains the list of users.
7. Select the user who must be added as an approver.
8. Select **Add**.

ServiceNow integrations with Microsoft Teams in Service Operations Workspace

You can create a connected experience for users in Service Operations Workspace through ServiceNow integrations with Microsoft Teams.

Collaboration using Microsoft Teams is available for the following task records in Service Operations Workspace.

- Incident
- Problem
- Change
- Request
- Interaction

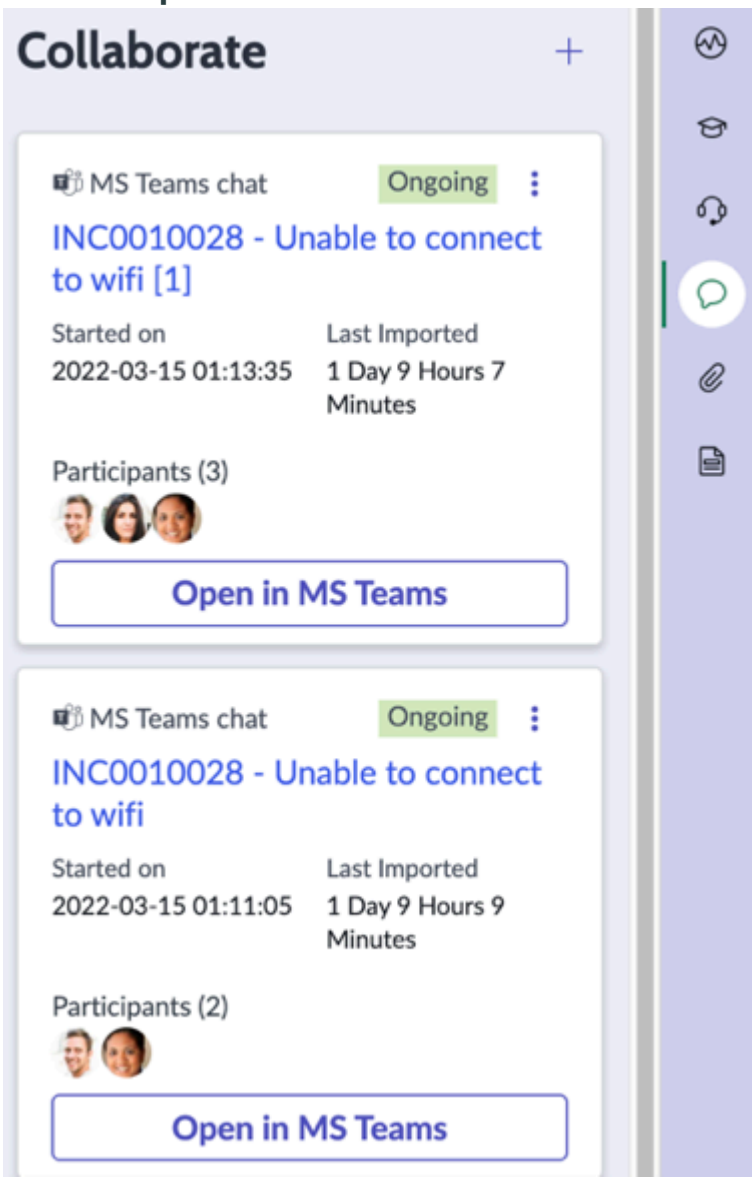
From the **Collaborate** panel of the task record, you can perform any of the following actions:

- View the history of chat conversations related to the record.
- Initiate a chat conversation from the record.
- Import messages from an existing chat conversation to the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

An agent can view the user presence before contacting the user. For information about the refresh duration for user presence in Service Operations Workspace, see Specify the refresh duration for user presence in Service Operations Workspace.

Collaborate panel from the sidebar



For more information about Service Operations Workspace through ServiceNow integrations with Microsoft Teams, see ServiceNow for Microsoft Teams.

Collaborate on a task record using Microsoft Teams in Service Operations Workspace

Provide a connected experience for users by starting a Microsoft Teams chat conversation from a task record or importing the chat to the task record.

Before you begin

Role required: itil or admin

About this task

When you view or import a Microsoft Teams chat conversation for a task record, the record details are displayed in the **Details** section of the **MS Teams Import** tab. For information about configuring these details, see Configure the task record information in the MS Teams Import tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Open a task record, for example, incident.
2. From the Sidebar, click the collaborate icon ( ).
3. To view a chat conversation, click the more options icon (⋮) on the chat and select **View chat**.
4. To start a chat conversation, perform the following actions.
   a. In the **Collaborate** panel, click the plus sign (+), and select **Start Microsoft Teams chat**.
   b. In the **Start Microsoft Teams chat** dialog box, specify the participants.
   c. **Optional:** To specify more chat options, click **Show more chat options** and specify a client.

      (Optional) You can choose Microsoft Teams application or the Microsoft Teams web application.
   d. Click **Start Chat**.
      - A chat conversation is initiated in Microsoft Teams.
      - All automatic chats are automatically imported to the **Collaborate** panel.
5. To view a chat conversation, click the more options icon (⋮) on the chat and select **View chat**.
6. To import a chat conversation, perform one of the following actions.

   Imported chats are reflected in the activity stream of the task record.

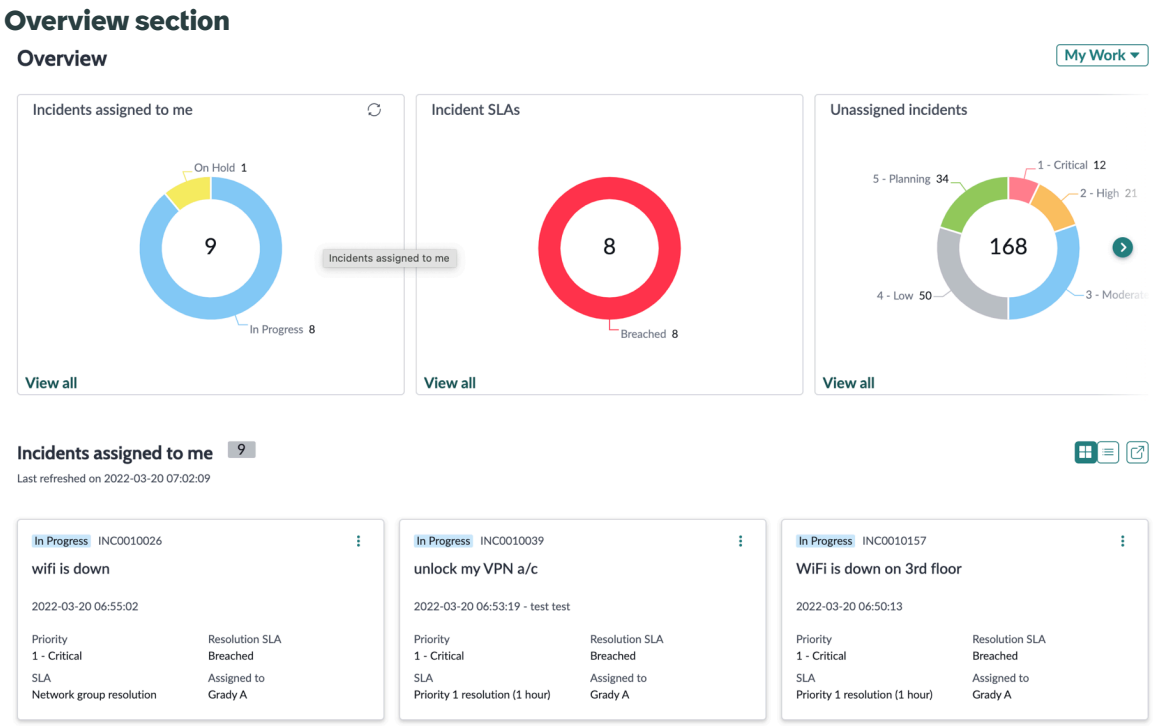
Service Level Management in Service Operations Workspace

You can access the service level agreement (SLA) information for an incident on the Service Operations Workspace landing page and incident record page.

SLA information on the Service Operations Workspace landing page

On the Service Operations Workspace landing page, you can click the **Incident SLAs** card to view incidents grouped by their SLAs. This card displays SLA details only for incidents assigned to the agent. For information on possible customizations for this card, see Configure the donut color in the Overview section.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



For information about monitoring SLAs, see Monitoring Service Level Agreement (SLA).

View service level agreement information for an incident

Monitor task service level agreements (SLAs) displayed on an incident record page.

Before you begin

Role required: itil or admin

The following SLA timer configurations display the response and resolution SLA for an incident.

- Incident Response
- Incident Resolution

You should configure SLA timer configuration mappings for these timer configurations. For information on how you can configure these mappings, see Configure the SLA timer.

Procedure

1. Open an incident record page.
2. From the contextual side panel, select the record Information icon ( ).
   - The response and resolution SLAs are displayed.
   - In case of multiple SLA timer configuration mappings for Incident Response and Incident Resolution timer configurations, only one response and resolution SLA record associated with the mapping with the least order is displayed.
   - After the SLA is complete, the time taken to respond and resolve the incident are displayed.

   For information about configuring the display of SLA information, see Customize the display of service level agreements for an incident.

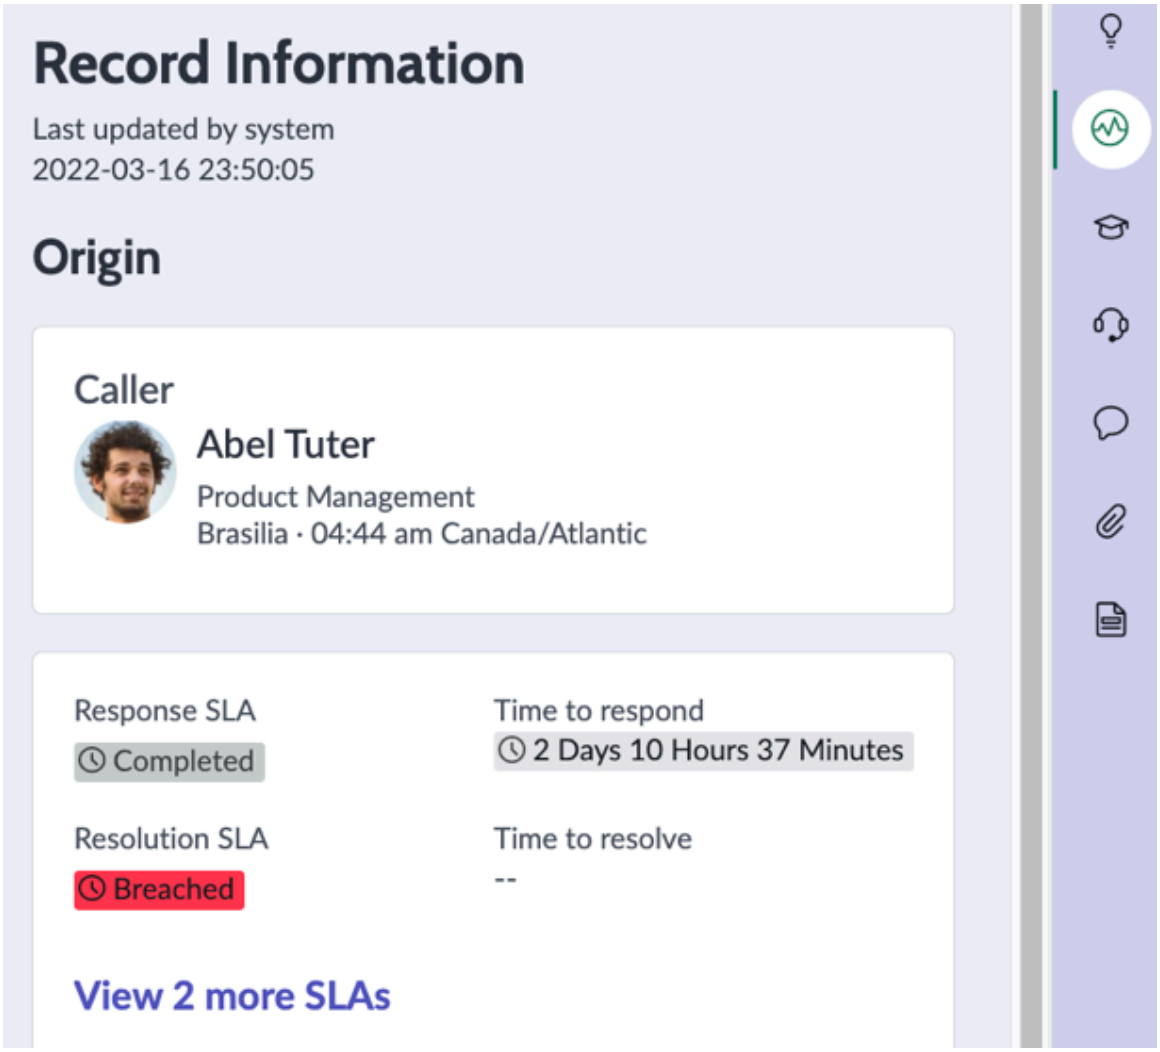
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA information for an incident



3. **Optional:** To view all SLAs related to the incident, click **View more SLAs**.
   A list of all task SLAs is displayed.

Walk-up Experience management in Service Operations Workspace

Manage your Walk-up interactions and queues in Service Operations Workspace.

As a Walk-up agent, you can use Service Operations Workspace to manage your assigned walk-up interactions. You can open incidents when an issue is not resolved at the walk-up location. You can also directly create a request for hardware or software through the Service Catalog when an asset is not available at the walk-up location stockroom.

As a Walk-up agent, you can do the following activities.

- Access personal inbox to view Walk-up channel assignments.
- Work on concurrent or multiple interactions at the same time.
- Promote interactions to incidents or requests.
- Randomly pull and work on a Walk-up interaction from the queue.
- Use Agent Assist to expedite fulfillment.
- View your assigned walk-up interactions, scheduled and upcoming appointments, walk-up locations and kiosks assigned to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- View available assets and fulfill requests from a local stockroom.
- Create incidents and requests when necessary.
- Reassign, transfer, and modify walk-up interactions when necessary.

Walk-up Experience lists

List item	Description
My Stockrooms	Stockrooms and assets associated with the walk-up locations assigned to you.
Walk-up Locations	Walk-up locations assigned to you.
Location Kiosks	Available kiosks at a Walk-up location. Select a kiosk to check in.
My Assigned Walk-ups	Walk-up interactions you are assigned to resolve or fulfill requests. These interactions are in a Work in Progress state.
Open - Unassigned	List of all open and unassigned walk-up interactions for all locations. These interactions are in New, Queued, or Work in Progress state.
Closed Walk-ups	All closed walk-up interactions. Closed interactions have either Closed Complete or Closed Abandoned state.
Appointments	All upcoming Walk-up appointments.

Work on Walk-up interaction in Service Operations Workspace

Manage your Walk-up appointments in Service Operations Workspace.

Before you begin
Role required: itil or admin

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select **Inbox** from the side bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Set your status as **Available**.
   A Walk-up interaction task is automatically pushed in your inbox, if you do not already have any walk-up interactions assigned to you.
4. Select **Accept**.
5. On the details page, select one of the following options.

6. If you already have interactions assigned to you, navigate to **Lists** > **Walk-up** > **My Assigned Walk-ups**.
7. From the Walk-up list, select **Location Kiosk**.
8. Select a kiosk assigned to the location from the list.
9. On the **Walk-up Location Kiosk** page, select **Check-in**.

   Note:
   Walk-up location kiosks are displayed only when the Show kiosk option is enabled.

10. On the **My Assigned Walk-ups** page, select the Walk-up interaction assigned to you.
11. After you have fulfilled or resolved the request, set the state of the Walk-up interaction to **Closed Complete**.

Create an appointment through incident

Schedule an appointment on behalf of a requester through an incident record.

Before you begin
Role required: itil or admin

Procedure

1. From the navigation list, select **List**.
2. Under **Incidents**, select **Open** or **Assigned to me**.
3. Select the incident for which you want to schedule an appointment.
4. Select the More actions icon.
5. From the drop-down list, select the option **Book Walk-up Appointment**.
6. In the Walk-up Appointment Booking window, enter the required details to book an appointment on behalf of the requester.
7. Select **Submit**.

Result

- A walk-up appointment record is created.
- The **Walk-up Appointment** option appears under the **Related records** tab for that incident. You can see all the Walk-up appointments related to the incident.
- The requester is notified of the appointment. The requester can also see the appointment created on the home page under the My active items widget.

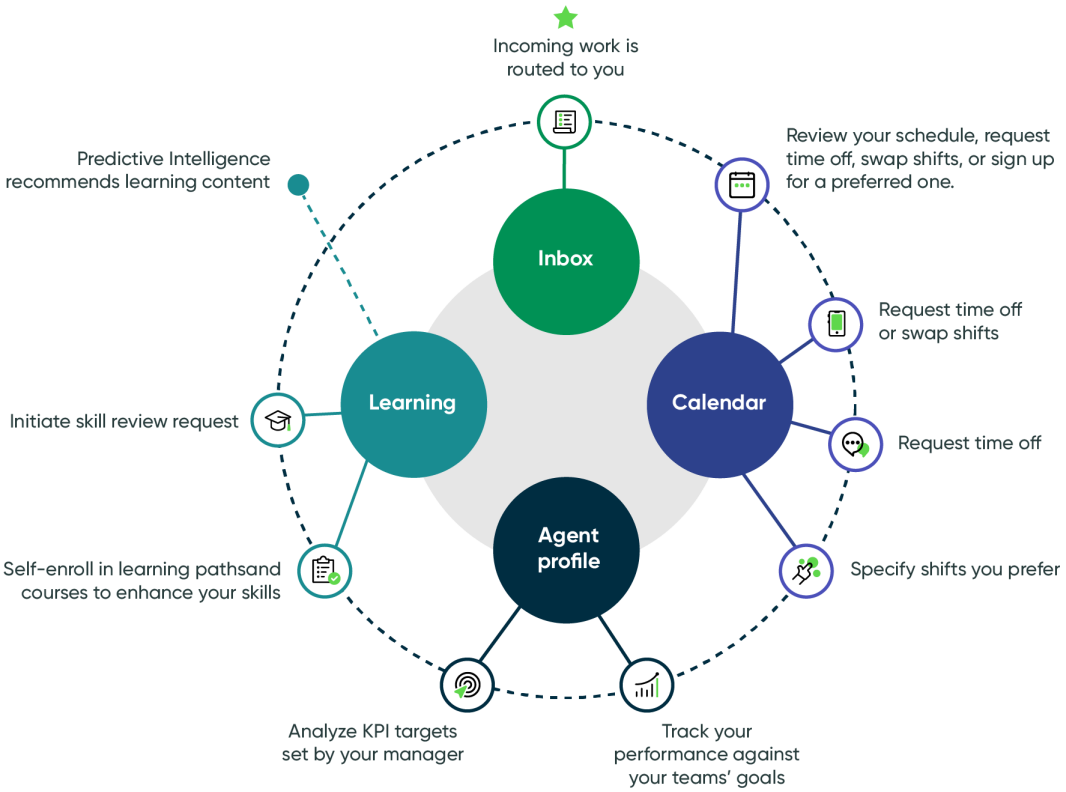
Workforce Optimization for ITSM in the Service Operations Workspace

Manage your schedule using Workforce Optimization for ITSM Scheduling in Service Operations Workspace. Use Coaching to review and complete assigned training.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
You must activate the Workforce Optimization for ITSM Configurable Workspace (sn_wfo_cfg_itsm) plugin to use Workforce Optimization for ITSM for Service Operations Workspace. For more information, see Activate Workforce Optimization for ITSM.

The image below displays the agent work flow between the different modules in Workforce Optimization for ITSM.



Monitor targets set by your manager, view learning tasks that you need to complete, and keep track of upcoming items in the Service Operations Workspace landing page. For more information, see Service Operations Workspace landing page.

Access your profile in Service Operations Workspace

Track and monitor the real-time status of your work by accessing your profile in Service Operations Workspace. You can track how many incidents and interactions you have closed and how many you are actively working on. You can also view the roles and groups to which you belong and see information about your manager and teammates.

Before you begin

Role required: sn_wfo_cfg_itsm.employee

About this task

Access your profile to analyze information such as:

- Key performance indicators that matter most to you and Performance Analytics targets set for you by your manager. For information on Performance Analytics, see Performance Analytics targets.
- Pending training that has been assigned to you and when they're due.
- Service channels that you are assigned to and their current utilization.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Skills and skill levels that you currently use and skill gaps that you may want to address.
- Upcoming PTO.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.

   When you click the home icon (), you can view the status of your work, organizational performance, current status of incidents, and unassigned incidents in the Service Operations Workspace landing page.

2. Click the lists icon ().

Service Operations Workspace - Scheduling

Use Service Operations Workspace to manage your schedule.

As an agent, you can use the Service Operations Workspace dashboard to see events such as training and time-off that's related to the agent's shifts, or how many work shifts you have on the current day and the day after the current day.

Note:
If you have an upcoming PTO on the day after the current day, in the **Upcoming** section, the **Today** list will display that you have an upcoming PTO the next day. If you are on PTO the current day, this list will not display that you have a PTO.

Manage your schedule using the Service Operations Workspace

Look up your schedule, create an event of custom event type, request time off for an on-call or work shift, or swap your shift with your peers using the calendar in Service Operations Workspace.

Before you begin

- If your system administrator has enabled the *sn_uib_agent_sp.allow_agent_edit_break* system property, you can edit the start and end time of your break time in a shift span.
- If your system administrator has enabled the *sn_uib_agent_sp.allow_agent_add_remove_break* system property, you can add or remove your break time in a shift span.

Role required: sn_shift_planning.agent

About this task

If you can work during the requested shift, you can also approve your peer's request for shift swap. When you request time off for an on-call shift, you can also propose an agent to cover the shift. You can also filter agents in the team calendar based on team member, location, skills, shift plan or events.

You can:

- Swap shifts with agents that are within your assignment group.
- Add attendees to the meeting or training event types.
- Edit or delete meeting or training event types that you have created.
- Edit or delete work event types if you're the logged-in user and if the event has been assigned to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- If the agent's calendar in Workforce Optimization for ITSM is integrated with their Microsoft Outlook calendar, they can view their shifts, schedules, and events such as meetings, trainings, and time-off in your Microsoft Outlook calendar. For more information, see Synchronize agent calendar in Workforce Optimization for ITSM with the Microsoft Outlook calendar.
- When you create an event of types meeting or training, the logged-in user will always be part of the attendees list and cannot be removed.

Procedure

1. Navigate to **Workspaces** > *Service Operations Workspace*.
2. Click the Schedule icon.
   Access the schedule:
   - View your schedule by clicking the **My Calendar** tab. Then, use the list to select the schedule that you want to view by day, week, or month.
   - View another agent's schedule by clicking the **Team Calendar** tab. Then, click an agent's schedule to see that agent's work and break times.

   Note:
   You can view the schedule for the primary assignment group and the on-call group you're part of.

3. Create an event of custom event type.
   You can create, edit, or delete events of custom event types that your system administrator has enabled for agent access.
   a. Click **New** and select the name of the custom event type.
   b. In the custom event type form, fill in the fields as required.
   c. Click **Save**.

   To edit the event, select the event, and then the edit icon ( ) to make the necessary changes and save the event. To delete it, select the delete icon.
4. Make a request.
   - You can use the **Compose** field in the time-off request to communicate with your manager.
   - You can use the **Compose** field in the shift swap request to communicate with your peers.

To	Do this
Request a shift swap	Create a shift swap or swap by selecting a shift. To create a shift swap: a. Click **New** and select **Shift Swap**. b. Fill in the requestor details. Your name is automatically populated in the **Requestor** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To	Do this
	i. In the **Date** field, select the date for which you want to swap the shift. ii. In the **Shift** field, select the shift to swap. If you have only one shift for the selected date, this field is auto-populated. **c.** Fill in the details for the agent with whom you want to swap the shift. i. In the **Agent** field, select the name of the agent. ii. In the **Date** field, select the date for which you want to swap the shift. iii. In the **Shift** field, select the shift to swap. If you have only one shift for the selected date, this field is auto-populated. **d.** Click **Submit**. To swap by selecting a shift: **a.** Select a shift on the calendar and click the swap shift icon. **b.** From the Shift menu for your shift, select the shift that you want to swap with another agent. This information is auto-populated when you open the request using the swap shift icon. **c.** In the **Agent** field for the requested shift, select the agent that you want to swap with. **d.** From the Shift menu for the requested shift, select the agent's shift that you want to swap with. **e.** Click **Submit**.
Request time off for a work shift	Create a new time-off request or select a work shift for which you want to take time off. To create a new time-off request: **a.** Click **New** and select **Time Off**. **b.** In the **Start date** field, click the calendar icon and select the date to start taking time off. **c.** In the **End date** field, click the calendar icon and select the date you want to the end time off. **d.** Click **Save**. To create a request from a work shift: **a.** Select the work shift in the calendar for which you want to take time off and click the Request Time-off icon ( ). The start date and time and the end date and time are automatically populated. **b.** In the **Title** field, enter a name for the work shift. **c.** In the Description field, enter a reason for the time-off. **d.** Click **Save**.

Approve or reject a shift-swap in Service Operations Workspace

You can approve a shift swap requested by your peer if you are available to work for that time period. You can reject it if you are unable to work then.

Before you begin

Role required: sn_shift_planning.agent

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Click the Schedule icon.
3. Click the **Shift Approvals** tab.
4. Select the request you want to approve or reject.
5. Review the details of the shift swap request and do one of the following:
   - To approve the request, click **Approve**.
   - To reject the request, click **Reject**.
     If you approve a shift-swap, the application moves the request to your manager's approval queue. For more information, go to Track and manage your teams' schedule.

Request time off using ITSM Virtual Agent

Automate your request for time off using the ITSM Virtual Agent. Type keywords into the chatbot to create and submit your request, which then gets automatically routed to your manager for approval. You can also use Natural Language Understanding to make your time-off request.

Before you begin

The ITSM Virtual Agent Conversation Topics (com.snc.itsm.virtualagent) plugin must be enabled.

Note:
To search shifts and schedules, you must generate the text index for the Topic [sys_cs_topic] table before you start using the ITSM Virtual Agent for making time off requests.

Before you can use Natural Language Understanding to make time-off requests, the Time Off Request NLU model must be trained and published.

Role required: sn_shift_planning.agent

Procedure

1. Navigate to **All** > **Service Portal** > **Service Portal Home**.
2. Click the chat icon.
3. In the chat window, do one of the following to create the request:
   - To use keywords, enter *`time off`*, *`vacation`*, or similar keywords.
   - To use Natural Language Understanding, enter an utterance.
4. Select the Time Off Request topic.
   The calendar appears with the message, "When do you want to start your time off?"
5. Select the start date and time for your time-off request and click **Select**.
   The calendar appears with the message, "When do you want to end your time off?"
6. Select the end date and time for your time-off request and click **Select**.
   The "Would you like to enter the reason for your time off?" message appears.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. **Optional:** Click **Yes** and enter the reason for taking time off and click **Enter**.
   The message, "Your time-off request has been submitted and is in your manager's approval queue," appears.
8. To view the submitted request on your calendar, click **View submitted request (Request Number)**.

Clock-in and clock-out your work shift in Service Operations Workspace

Clock in and clock out your work shifts using Service Operations Workspace. You can track details, such as time attendance and time worked summary to know how close you are adhering to your schedules.

Before you begin
Role required: sn_shift_planning.agent

About this task
The clock-in event is generated when you either login or set your status as **Available** in Service Operations Workspace. The clock-out event is generated when you either logout from Service Operations Workspace or set your status as **Offline** or **Break**.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Click the Inbox icon ( ).
   - To clock-in your shift, set your status to **Available**.
   - To clock-out from your shift, set your status to **Offline** or **Break**.

Result
You can view your time attendance and adherence in **Lists** > **Schedule Adherence** > **Time Attendance** > **Time Worked Summary** lists.

Sign up for your preferred shifts

Specify one or more shifts in a schedule plan for which you would prefer to sign up.

Before you begin
Role required: sn_shift_planning.agent

About this task
You can receive notifications when your manager makes a schedule plan available for sign up. You can also receive notifications when the schedule plan that's open for sign up is due on the current day or when it's due soon.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Schedule icon ( ).
3. Select the **Sign up shifts** tab.

   You can use keywords to search the schedule plans, and view all schedules with active shifts for your assignment groups that you can sign up for. Use the pagination to scroll through all available schedule plans.

   The current state of each schedule plan displays as a highlight in each card. The table below describes the highlighted value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Highlighted value	Description
Available	Shifts for the schedule plan are available for sign up.
Draft	Shifts you've considered for sign-up but have not completed the sign-up process.
Completed	Submitted one or more preferred shifts within the schedule plan.
Closed Incomplete	The schedule plan currently does not have shifts for which you could sign up.
Closed Complete	The schedule plan has at least one preferred shift for which you've signed up.

4. Select the Overlapping time off icon ( ) to analyze if the time off you have requested or the ones that have been approved overlap with the schedule plan available to you for sign up.
5. To sign up for your preferred shifts, select **Add shifts**.
   You can only sign up for shifts in the schedule plan that have not been published yet.
   The Add shifts pop-up appears. You can search for shift using the search bar and select shifts to save as draft.

   You can sign up for a maximum number of shifts that your administrator has set up in the *sn_shift_planning.max_shifts_allowed_for_signup* system property.
6. To save the selected shifts for sign-up, select **Save Shifts** and then select **Save as draft**.
7. Select the plus (+) sign and sign up for additional shifts.
   When you have more than one shift, you can reorder them by using the up or down arrows in card for each shift.
8. Select **Submit**.
   All shifts you have added for sign up will be submitted.

Service Operations Workspace - Learning

Use Service Operations Workspace Learning to review learning courses and paths and complete them.

As an agent, you can get recommendations on courses or paths that you may want to take, complete learning paths and courses, and add skills to your skills set when you complete them.

Overview tab

Use the **Overview** tab to view your active or completed learning tasks, skills you've used recently, and recommendations based on your past activities.

Section	Description
My active learning	View the learning tasks, which could include learning paths and courses.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Section	Description
	• These include the ones that your manager has assigned to you and the ones you chose to self-enroll. • They're sorted by the due date and display the duration to complete the task and the completion progress. • You can select **View all active learning** to view all of your active tasks.
Completed learning tasks in the last 90 days	Monitor the status of enrolled learning paths and courses that you've completed in the last 90 days.
My skills	Analyze how many skills that you have in your skills set at a given time including the skills you've recently used.
You may like	See recommendations that you may like based on your past activities or your teams' activities, what's trending, and courses that were added recently to your library.

Discover

Use the **Discover** tab to:

- Browse the course catalog or filter them based on set criteria narrow down the display of them to what's relevant to you.
- Analyze details for a course and path such as the time that it takes to complete them, or the skills you have gained recently.
- Get learning recommended to you based on your past activities or the activities of your teams to which you belong. The content is grouped into different categories. For more information, see Recommendation grouping.
- Select **Browse recommended learning**, and then select and enroll in the desired course item.

My learning

Use the **My learning** tab to:

- Analyze courses or paths that are still pending completion and when they're due. You can also sort them by due date.
- See courses, which were assigned to you or the ones you've enrolled in that you've have completed.
- Use the **Assigned & enrolled** filter to narrow down the search.

Take a survey or review skills to add to your skill set. You can receive surveys available for any group to which you belong. You can make a copy of the survey and work on it to complete them.

Learning path and course item discovery in Service Operations Workspace

Browse courses or learning paths and take the ones that are of interest to you. You can also discover them using Predictive Intelligence that provides recommendations based on past activities.

Service Operations Workspace uses Predictive Intelligence to discover and suggest all courses and learning paths that you might want to take based on the learning activities of the teams you belong to and your previous learning activities.

Enroll in Learning to take a learning course or complete a learning path

When you enroll in a learning course or learning path, the application creates a learning task. You can track the progress of the course or path using the learning task.

Before you begin

Role required: sn_wfo_cfg_itsm.employee

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Learning icon .
3. Select the **Discover** tab.
4. Select a course or a path in which you'd like to enroll.
5. Select **Enroll**.

Complete learning tasks using the Service Operations Workspace

Enhance your skills set by completing learning tasks from internal or external learning content.

Before you begin

Role required: sn_wfo_cfg_itsm.employee

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Learning icon .
3. Select the **My learning** tab.
   You can view the details of the path and course items that you are working on.
   - Select the **Active** tab to view all tasks that you have not yet started or the ones that are in progress.
     - The tasks display a highlight to show which tasks are due on the current day, due soon, or are overdue. It also shows how long the course has been overdue. The most recently created tasks are highlighted as **New**.
     - You can also see which tasks you've self-enrolled and which tasks were assigned to you and also the progress of each course or path.
     - You can filter the tasks to display either all tasks that were assigned to you or all the ones you enrolled in or both.
     - You can sort the task by the date the task is due.
   - Select the **Completed** tab to view the list of tasks sorted by the date they were completed.
4. Complete a learning task.
   The skills associated with the tasks are added to your skill set.

Review skills to add to your skill set

Evaluate the skill proficiency for an existing skill or add a new skill and request approval to update those skills in your skill set. Get notified when your manager requests a skill review.

Before you begin

Role required:sn_wfo_skillreview.user

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You will receive a notification when your manager initiates or approves a skill review request.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the List icon ( ).
3. Send a request to review an updated skill proficiency or to review a new skill to be added to your skill set.
4. Select **Submit for review**.
   When your manager approves or rejects the skill review request and completes it, you will receive a notification.

Take a survey in Service Operations Workspace

Get notified when a survey is assigned to you. Complete the survey to provide feedback.

Before you begin
Role required: sn_wfo_cfg_itsm.employee

About this task
You can respond to surveys or your assessments. You can access surveys available for any group to which you belong.

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Access your profile.
   For more information accessing your profile, see Access your profile in Service Operations Workspace.
3. Select the **Assessments** tab.
4. Go to **Surveys** > **Open**.
5. In the **Metric type** field, select the survey you would like to take.

   Note:
   You can also select the Notifications icon and select the survey.

   You will get notified 7 days before, the day before, and on the day when the survey will be available for you to complete.

6. Select **Take a survey**.
7. Complete the survey.

Collaboration in Service Operations Workspace

Collaboration services provide a way to communicate and collaborate in real time to resolve the incidents. You can initiate a chat or make conference calls using a service provider to communicate with stakeholders.

To start a Microsoft Teams chat, refer Collaborate on a task record using Microsoft Teams in Service Operations Workspace.

Notify in Service Operations Workspace

Notify in Service Operations Workspace provides support for SMS, telephone, and the service providers on the ServiceNow AI Platform for communicating internally with team members and externally with customers and contractors.

For more information about configuring Notify, see Notify.

Use Twilio to make conference calls in Service Operations Workspace

Use Twilio to schedule conference calls with stakeholders to resolve incidents in Service Operations Workspace.

Ensure that Twilio is configured to make conference calls from Service Operations Workspace. To configure Twilio, refer Configure Notify with Twilio.

Start and end a conference call from Twilio in Service Operations Workspace

Start a conference call using Twilio to collaborate with others to work toward the resolution of an incident. End the call when the discussion is over.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select the incident record.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab, and then select the plus (+) icon.
7. Select **Start Telephony meeting**.
8. On the form, fill in the fields.

Start Conference Call form

Field	Description
Title	Title for the conference call
Add participants	Provide the list of participants for the conference call.
Include a brief message for participants	Provide a brief summary about the issue to be discussed in the conference call.

9. Select **Start**.

   If there are more than 50 participants, the conference call will be initiated in asynchronous mode and a few additional participants will be added to the conference call soon in background, this enables you to continue work without any interruption.

10. At the conclusion of the discussion, end the call.

Start a conference call using Microsoft Teams in Service Operations Workspace

Start a conference call from Microsoft Teams to work towards the resolution of an incident.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select the incident record.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab, and then select the plus (+) icon.
7. Select **Start MS Teams meeting**.
8. On the form, fill in the fields.

Start Conference Call

Field	Description
Conference bridge	Option to choose the conference bridge.
Title	Option to provide a title for the conference call
Add participants	Options to add participants for the conference call.
Include a brief message for participants	Provide a brief summary about the issue to be discussed in the conference call.

9. Select **Start**.

Manage Microsoft Teams conference calls in Service Operations Workspace

Add or mute participants in a Microsoft Teams conference call in Service Operations Workspace.

Add participants to an existing Microsoft Teams call in Service Operations Workspace

Add a participant to a conference call to participate in the discussion to resolve the incident.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select an incident that has an active conference call.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the active call card.
8. Select **Meeting options**.
9. Select **Add participants**.
10. On the form, fill in the fields.

Add participants

Field	Description
Add participants	Options to add participants for the conference call.
Include a brief message for participants	Provide a brief summary about the issue to be discussed in the conference call.

11. Select **Add participants**.

Join a conference call from Microsoft Teams in Service Operations Workspace

Join an existing conference call to participate in the discussion to resolve an incident.

Before you begin
Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select an incident that has an active conference call.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab.
7. On the **Active** card, select **Join call**.

Mute participants from a Microsoft Teams conference call in Service Operations Workspace

Mute a participant from the conference call to avoid unnecessary background disruption.

Before you begin
Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select an incident that has an active conference call.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Select the active call card.
8. Mute participants to avoid background noise by selecting the Mute icon ( ).

Leave a Microsoft Teams conference call in Service Operations Workspace

Leave an active conference call. The call will still be active with other participants.

Before you begin
Role required: itil

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select an incident that has an active conference call.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab.
7. Select the active call card.
8. Select **Leave call**.

End a Microsoft Teams conference call in Service Operations Workspace

As a host or a user with the incident manager role, you can end the conference call.

Before you begin
Role required: itil

Procedure
1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select an incident that has an active conference call.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab.
7. Select the active call card.
8. Select **Leave call** drop-down menu.
9. Select **End call**.

Reinitiate a conference call from Microsoft Teams in Service Operations Workspace

Reinitiate a conference call to discuss about the resolution of an incident.

Before you begin
Role required: itil

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select an incident that has an active conference call.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. Select the **Calls** tab.
7. In the **Completed** calls, select **Reinitiate call**.

View a conference call recording from Microsoft Teams in Service Operations Workspace

View details for a recorded conference call in Service Operations Workspace by accessing the associated conference record as a reference.

Before you begin

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the **List** ( ) icon.
3. Select **Incidents** > **Open**.
4. Select the incident record.
5. Select the **Collaborate** icon ( ) from the contextual side panel.
6. On the **Calls** tab in the **Completed calls** section, select the **View Recording** button.

Initiate a chat from Sidebar in Service Operations Workspace

Initiate a Sidebar chat to work towards the resolution of an incident.

Before you begin

To know more about configuring Sidebar, refer Sidebar.

Role required: itil

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. Navigate to **Incidents** > **Open**.
4. Select an incident.
5. Select **Collaborate** from the contextual side panel.
6. Select **Chat** tab, and then select plus(+) icon.
7. Select **Start Sidebar discussion**.
8. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Start Sidebar discussion

Field	Description
Subject	Option to provide a title for the sidebar discussion. **Note:** The chat count will be displayed at the beginning of the subject.
Add participants	Options to add participants for the sidebar discussion. **Note:** If On-Call Scheduling is defined for a group, only members who are on-call will be added as participants. If it is not set up, then all members of the group will be included as participants. Additionally, if On-Call Scheduling is active, and no members are available in a shift, no one will be added to the chat. The Sidebar discussion is applicable only for incident, change, and problem.
Include a brief message for participants	Provide a brief summary about the issue to be discussed in the sidebar discussion.

9. Select **Start discussion**.

Note:
If the caller doesn't read the messages within 24 hours, an email is sent as a reminder to view the messages and resume the discussion.

Computer Telephony Integration in Service Operations Workspace

Service Operations Workspace provides an agent (with the sn_openframe_user role) to receive inbound calls and place outbound calls using the Computer Telephony Integration (CTI) interface.

The OpenFrame window is available to agents with the following roles.

- sn_openframe_user
- sn_customerservice_agent
- sn_customerservice.consumer_agent
- admin

After getting the required role, CTI must be enabled in the Service Operations Workspace by the admin. For more information about enabling CTI in the Service Operations Workspace, see Enable Computer Telephony Integration providers to interact with the Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After the CTI integration, the agent can call a user using the phone number in the user profile and contact cards through any of these options:

Note:

The application's default CTI windows in the following images are provided for demo purposes only.

Ensure that your instance contains the required connectors for communication.

- Record information from the contextual side panel of a record.

CTI call from record information

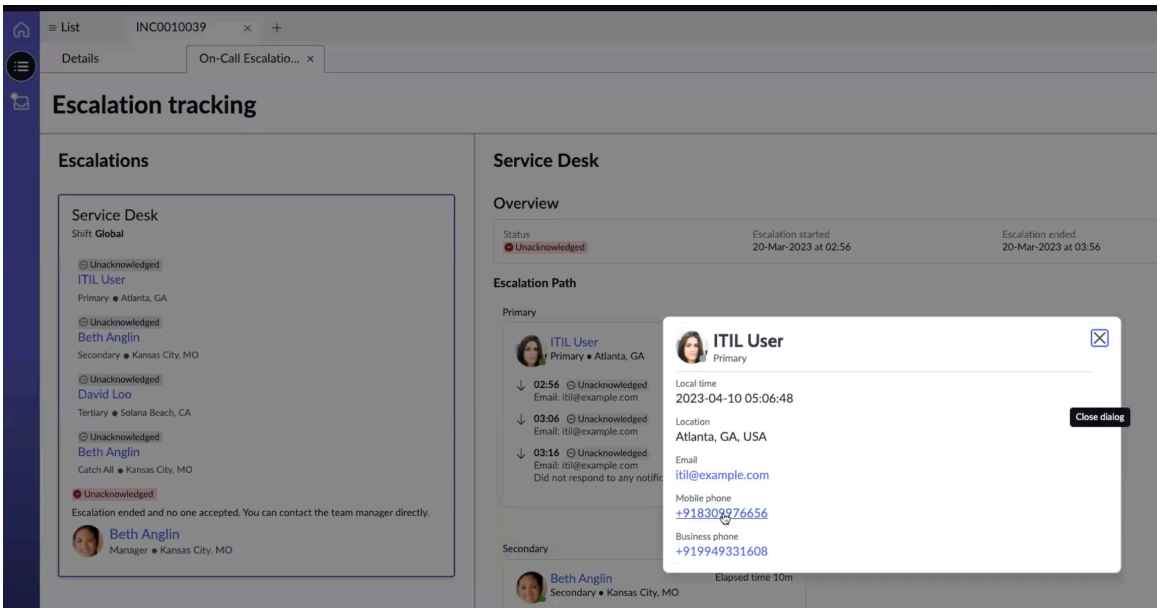
- On-call escalation.

CTI call from an on-call escalation



Live Agent chat in Service Operations Workspace

Service Operations Workspace enables agents to work on any incident created using Live Agent chat.

An application admin can integrate the Live Agent into the ServiceNow application by installing the com.glide.interaction.awa plugin. For more information about installing and enabling a plugin, see Activate a plugin.

After the plugin installation, an inbox icon appears in the sidebar of the Service Operations Workspace window.

By default, the status of the agent is Offline. To start the communication, the agent must modify the status to Available.

When the customer reports an incident through Live Agent (for example, through the Service Portal), an incident is created automatically in the Inbox. The agent can then work on the incident and chat with the user simultaneously to resolve the issue.

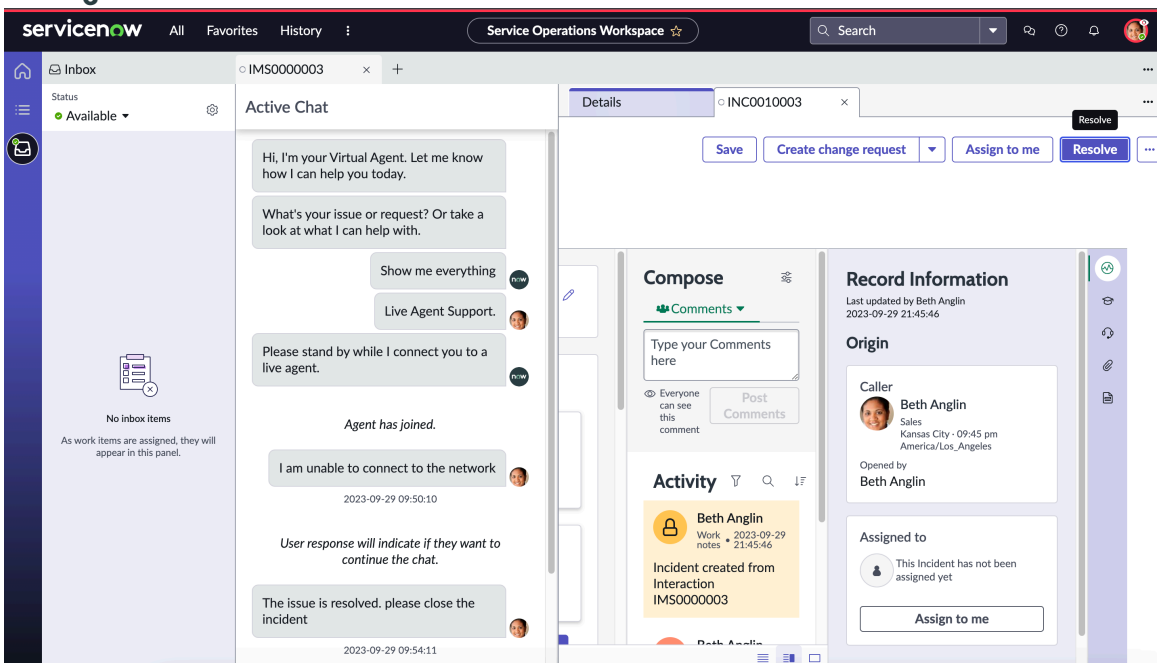
Live Agent in SOW



For more information about Live Agent chat integration, see Move from Connect Support to Advanced Work Assignment and Agent Chat.

Using Universal Request in Service Operations Workspace

The Universal Request is a task that a requester creates from any of the sources that include: Agent Workspace, Service Operations Workspace, or using a Virtual Agent chat.

Use the Universal Request in Service Operations Workspace to view, create, edit, and resolve universal requests.

Create a Universal Request in Service Operations Workspace

As an agent, you can create universal requests from the Universal Request application on behalf of the requester to track and resolve issues.

Before you begin

Role required: itil, sn_uni_req.routing_agent, or admin

Procedure

1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. Navigate to **Universal Request** > **Open**.
4. Select **New**.
5. On the form, fill in the fields.

Universal Request form

Field	Description
Number	The unique number generated for the universal request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Opened	The date and time when the universal request was created.
Opened by	The agent who created the universal request.
Opened for	The user who requested for this universal request.
Primary task	The task number, for example, an incident or HR case number that is associated with the universal request.
Contact type	The contact medium from which the universal request was created.
Priority	It identifies how quickly the service desk should address the request.
State	State of the universal request.
Impact	Impact value indicates a measure of the effect of an incident, problem, or change on business processes.
Assignment group	Group assigned to the universal request.
Assigned to	User assigned to the universal request.
Needs resolution review	When checked, and when the department agent closes the primary ticket, the Universal Request doesn't get closed. Universal Request state remains in **In Progress** and the state reason changes to **Confirm Response**. This notifies the tier 1 agent (Routing agent) to either Accept or Reject the resolution provided in the primary ticket before closing the Universal Request for the requester.
Short description	A brief description of the request.
Description	Detailed description of the request.
Notes section	
Watch list	Users to receive notifications when work notes are added.
Work notes list	Users to receive notifications when work notes are added. **Note:** The administrator must create an email notification for the work notes list.
Additional comments (Customer visible)	More information about the change.
Work notes	Information about how to resolve the universal request or steps taken to resolve it, if applicable. This note is for internal use. The work notes information isn't visible to your customer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Closure Information section	
Closed	The date and time when the universal request was closed.
Closed by	The agent that closed the request.
Close notes	How or why the universal request was closed.

6. Select **Submit**.

Cancel a Universal Request in Service Operations Workspace

Cancel the Universal Request if the issue is resolved already or you no longer require the request.

Before you begin
Role required: admin

About this task
You can cancel a universal request only if there are no active or closed primary tickets attached to it. You can cancel a universal request in **New** or **In Progress** state's only. When the universal request is canceled, email notifications are sent to the stakeholders associated with the request.

Procedure
1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. From the navigation list, select **Universal Request** > **Open**.
4. From the list of open universal requests, select the request you want to cancel.
5. Select **Canceled** from the **State** field.

> **Note:**
> If the person in **Opened for** tries to cancel the request, then they must enter the reason for canceling.

6. Select **Update**.

Use Agent assist in Service Operations Workspace

Use the Agent assist in Service Operations Workspace to find similar Universal Requests that are open and closed, Knowledge articles, Catalog items, and Pinned articles.

Before you begin
Role required: itil, sn_uni_req.routing_agent, or admin

Procedure
1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. From the navigation list, select **Universal Request** > **Open**.
4. Select the universal request from the list.
5. In **Agent Assist**, select the settings icon ( ) and select your resource from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Similar Closed Universal Request: To display all similar Universal Requests that are closed.
- Universal Request: To display all similar Universal Requests that are available.
- Knowledge and Catalog: To display all related knowledge articles and catalog items.
- Knowledge Articles: To display all related knowledge articles.
- Catalog Items: To display all related catalog items.
- Pinned articles: To display all related pinned articles.

Transfer a primary ticket in Service Operations Workspace

You can transfer a primary ticket to Universal Request, service set (department), or service either with resolution or without resolution.

Before you begin

Role required: itil, the agents part of the assignment group or the agents on the primary ticket can perform this task.

Procedure

1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. From the navigation list, select **Universal Request** > **Open**.
4. Open the primary task that you want to route to a Universal Request.
5. Select **Transfer**.
6. In the **Transfer Ticket** dialog, provide the following details.
   - **Department**: Select the department from the list.
   - **Service**: Select the specific service of the chosen department.
   - **Transfer reason**: Select the reason from the list.
   - **Transfer notes**: A brief description for routing the primary ticket that you want to pass to the agent.
   - **Copy additional comments and attachments**: Deselect if you do not want to transfer the ticket with additional comments and attachments. By default, all attachments and comments are transferred.

     Note:
     Work notes aren't copied while transferring.

7. Select **Transfer**.

Restrict or unrestrict universal request access in Service Operations Workspace

Mark a universal request as restricted or unrestricted when you identify that the request contains sensitive information.

Before you begin

Role required: routing agents, sn_uni_req.sensitiveinfo_agent or service-specific assignment group members

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. From the navigation list, select **Universal Request** > **Open**.
4. Navigate to the universal request that you want to mark as restricted.
5. On the form, select the **Restrict** button.

Mark the universal request as unrestricted in Service Operations Workspace

You can mark a restricted universal request as unrestricted if you identify that the request doesn't have any sensitive information.

Before you begin

Role required: sn_uni_req.sensitiveinfo_agent or service specific assignment group members

Procedure

1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. From the navigation list, select **Universal Request** > **Open**.
4. Navigate to the universal request that you want to mark as unrestricted.
5. On the form, select the **Unrestrict** button.

Using Universal Task in Service Operations Workspace

Agents can use the Universal Task application to create tasks for employees and to manage the request resolution.

Create a universal task for a universal request in Service Operations Workspace

Create a universal task for a request and assign it to the employee or create multiple tasks for a request by using Universal Task.

Before you begin

Role required: admin

Procedure

1. Open the ticket that you want to create a universal task for.
2. Click the UI action for creating a universal task.
3. On the form, fill in the fields.

Universal Task form fields

Field	Description
Number	Unique number that is generated for the Universal Task.
Parent	Number of the parent case or request.
Parent Assignment Group	Group assigned to the parent case or request.
Parent Assigned to	Agent primarily responsible for working on the parent case or request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Type	Type of task being assigned.
Employee form	Mandatory employee form. **Note:** This field appears only if the Collect Employee Input task is selected in the **Type** field.
Survey instance	Link to the completed employee form. **Note:** This field appears only if the Collect Employee Input task is selected in **Type** field, and the value of the **State** field is complete.
Template	Task template to auto-fill the task form.
State	State of the Universal Task.
Priority	Value that identifies how quickly the service desk should address the request.
Assignment group	Group assigned to the Universal Task. This field is available for the **Mark When Complete** and **Checklist** task types. Other tasks types require a mandatory update of the **Assigned to** field with the **Assignment group**. **Note:** Email notifications are sent only for the two task types.
Assigned to	Employee assigned to the Universal Task.
Due date	Expected date for the employee to complete the task.
Watch list	Users to receive notifications when there is any change in the task status.
Short description	Brief description of the request
Description	Detailed description of the request
Additional comments (Customer visible)	More information about the change. The information in this field is visible to the customer.
Work notes	Information about how to resolve the Universal Task or steps taken to resolve it, if applicable. This note is for internal use. The work notes information is not visible to customers.

4. Select one of the following.

Resetting password using Service-desk assisted Password Reset in Service Operations Workspace

The Password Reset for Service Operations Workspace application enforces strong and secure passwords by enabling end users to reset or change their passwords by requesting the service desk agent.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reset password using service-desk assistance

Resetting the password enables the user to log in to their system and resume their work.

About this task

Resetting the password will both unlock the account and set a new password if the user account is locked.

https://player.vimeo.com/video/1032446102?h=4e8d792d7f&badge=0&autopause=0&player_id=0&app_id=58479

Before you begin

Role required: password_reset_service_desk or password_reset_admin

Procedure

1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. Do one of the following:
   - Navigate to list of incidents, and select an incident record.
   - Navigate to list of interactions, and select an interaction record.
4. Select the **More actions** icon, and then select **Reset password**.

   Note:
   This option is displayed only to the agent having password reset service desk role who are assigned to the incident or an interaction.

5. Identify the user.

   a. In the **Identify** section, select the user from the drop-down menu.

   b. Select the password reset process for the user.

   Note:
   You can only reset the password using a specified process for three times in a 24-hour time interval.

   c. Select **Continue to verify**.

6. Verify the user.

Verification of user

Verification method	Description
Email verification	A verification code is sent to the registered email address displayed. Select Send verification code and enter the code in the code in Enter verification code field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verification method	Description
	Note: You have only three attempts to perform an email verification.
SMS verification	A verification code is sent to the registered mobile numbers. The same verification code is sent to all the registered mobile numbers of the user. Select **Send verification code** and enter the code in the code in **Enter verification code field**. **Note:** You have only three attempts to perform an SMS verification. If the Notify plugin isn't active in your instance, you must select the service provider for the registered mobile number.
Security question verification	You must ask the security questions to the user and enter the answer of the security question in the respective fields.
Personal data verification	Enter the email address of the user in the Enter user's email address field.
Personal data confirmation	The email address of the user is displayed. You must ask the email address of the user and confirm if the email address is correct.

7. Select **continue to reset**.
8. Reset the password.

Reset password

Password reset method	Description
Send email with instructions	An email is sent to the user with the password reset details.
Auto-generate new password	The system automatically generates a new password for the user. You must read the password to the user.
Reset password manually	You must enter a new password in Enter new password and Re-enter new password fields. Select Reset password. You must read the password to the user.

9. Select **Close**.

10. Select **Exit** in the confirmation modal displays to indicate that the password has been shared with the user.

    To know about errors that you encounter while you reset the password, refer Password Reset Reference.

Unlock the user account

You can unlock a blocked user to enable them to log in to their system.

About this task

This option is available only if the account is locked.

Before you begin

Role required: password_reset_admin or password_reset_service_desk

Procedure

1. Navigate to **All** > **Workspaces** > **Service Operations Workspace**.
2. From the navigation list, select **List**.
3. Do one of the following:
   - Navigate to list of incidents, and select an incident record.
   - Navigate to list of interactions, and select an interaction record.
4. Select the **More actions** icon, and then select **Reset password**.

   Note:
   - Incident: The option is displayed only if the category of the incident is **Password Reset**, and is assigned to an agent having password reset service desk role.
   - Interaction: The option is displayed only if an interaction is assigned to the agent having password reset service desk role.

5. Identify the user.

   a. In the **Identify** section, select the user from the drop-down menu.

   b. Select the password reset process for the user.

      Note:
      You can only reset the password using a specified process for three times in a 24-hour time interval.

   c. Select **Continue to verify**.

6. Verify the user.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Store applications installed

Store application	Description
Record Page for Service Operations Workspace [sn_sow_record]	Record view that is used across various applications in Service Operations Workspace. This view includes detailed record information such as actions and related records.
Quick links component for Service Operations Workspace [sn_sow_quick_links]	Framework to create and maintain a list of customized hyperlinks in Service Operations Workspace.
Service Operations Workspace Core [sn_sow]	Core capabilities and workspace configurations for Service Operations Workspace.
Change Management for Service Operations Workspace [sn_sow_chg]	Change creation process in Service Operations Workspace.
Collaboration services for Service Operations Workspace [sn_sow_collab]	Collaboration between peers and requester using Microsoft Teams in Service Operations Workspace.
Incident Management for Service Operations Workspace [sn_sow_inc]	Streamlined and automated incident response process to respond to an unplanned event or service interruption and to restore services in Service Operations Workspace.
Recommendations for Incident Management [sn_sow_incident_rf]	Configurations to predict recommendations for an incident, for example, recommendation rules, in Service Operations Workspace. Use information from similar incidents and knowledge articles to resolve incidents faster.
Interaction Management for Service Operations Workspace [sn_sow_interaction]	Streamlined interaction process to respond through a communication channel (chat, phone conversation, or walk-up) in Service Operations Workspace.
Interceptor UI for Service Operations Workspace [sn_sow_interceptor]	Interceptor user interface to create a task type for change and problem in Service Operations Workspace.

Store application	Description
Service Operations Workspace ITSM Common [sn_sow_itsm_common]	Common configurations shared across IT Service Management applications in Service Operations Workspace.
On Call Scheduling for Service Operations Workspace [sn_sow_on_call]	On-call support for incidents in Service Operations Workspace.
Problem Management for Service Operations Workspace [sn_sow_problem]	Problem creation process to identify the cause of a service interruption reported by a significant or recurring incidents in Service Operations Workspace.
Request Management for Service Operations Workspace [sn_sow_req]	Request creation process and support for the entire life cycle of requests in Service Operations Workspace.
Walk-up Experience for Service Operations Workspace [sn_sow_walkup]	Setup for walk-up queues, stockroom, and appointments in Service Operations Workspace.
Recommendation Framework [sn_rf]	Framework to generate contextual, actionable, and dynamic recommendations in a configurable workspace.
Service Level Management Experience for Workspace [sn_sla]	Gathers service requirements and monitors and reports with reference to agreed service levels (SLAs) in a configurable workspace.
Service Operations Workspace Admin Center [sn_sow_admin]	Provides quick access to configurations of customisable pages in Service Operations Workspace and recommends the additional setup needed to extend Service Operations Workspace capabilities.
Service Operations Workspace ITSM Admin Center [sn_sow_itsm_admin]	Provides quick access to ITSM related configurations in Service Operations Workspace.

Components installed with Agent Client Collector for Investigation

Several types of components are installed with activation of the Agent Client Collector for Investigation (sn_acc_adapter) application, including user roles and ServiceNow Store applications.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
Metrics user [sn_cimaf.sn_cimaf_read]	Enables users to access and perform basic operations in the Metrics Collector Framework such as view metric definition.	None
Metrics admin [sn_cimaf.sn_cimaf_admin]	Enables users to install the application, add, configure the tables, and also view the metric definition.	[sn_cimaf.sn_cimaf_read]
Investigate Framework Admin [sn_invest_fwk.sn_investigate_admin]	Enables users to install the Investigation Framework application and manage the Investigate Framework modules.	[sn_cimaf.sn_cimaf_admin]

Store applications installed

Store application	Description
Metrics and CI Actions Framework [sn_cimaf]	Core framework capabilities and configurations for Agent Client Collector for Investigation application, including API data and CI actions framework. For more information on the roles and tables installed, see Components installed with Metrics and CI Actions Framework
Investigation Framework [sn_invest_fwk]	Framework to analyze the affected CIs using the metrics information.
Remedial Actions Framework [com.snc.sn_reacf]	Framework to remediate or resolve the CI related issues. For more information on the roles and tables installed, see Components installed with Remedial Actions Framework.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Components installed with Microsoft Endpoint Configuration Manager for Investigation

Several types of components are installed with activation of the Microsoft Endpoint Configuration Manager for Investigation (sn_mecm_adapter) application, including user roles and ServiceNow Store applications.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Demo data is available for this feature.

Roles installed

Role title [name]	Description	Contains roles
Metrics user [sn_cimaf.sn_cimaf_read]	Enables users to access and perform basic operations in the Metrics Collector Framework such as view metric definition.	None
Metrics admin [sn_cimaf.sn_cimaf_admin]	Enables users to install the application, add, configure the tables, and also view the metric definition.	[sn_cimaf.sn_cimaf_read]
Investigate Framework Admin [sn_invest_fwk.sn_investigate_admin]	Enables users to install the Investigation Framework application and manage the Investigate Framework modules.	[sn_cimaf.sn_cimaf_admin]

Store applications installed

Store application	Description
Metrics and CI Actions Framework [sn_cimaf]	Core framework capabilities and configurations for Microsoft Endpoint Configuration Manager for Investigation application, including API data and CI actions framework. For more information on the roles and tables installed, see Components installed with Metrics and CI Actions Framework.
Investigation Framework [sn_invest_fwk]	Framework to analyze the affected CIs using the metrics information.
Remedial Actions Framework [com.snc.sn_reacf]	Framework to remediate or resolve the CI related issues. For more information on the roles and tables installed, see Components installed with Remedial Actions Framework.

© 2026 ServiceNow, Inc. All rights reserved.

Components installed with Remedial Actions Framework

Several types of components are installed with activation of the Remedial Actions Framework (com.snc.sn_reacf) application, including user roles and tables.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Remedial action user [sn_reacf.sn_remedial_action_read]	Enables users to access and read the Remedial Action Execution table and remediate CI related issues using remedial actions. **Note:** itil role contains this role.	cmdb_read
Remedial action admin [sn_reacf.sn_remedial_action_admin]	Enables users with read and write access to all Remedial Action configuration tables.	• sn_reacf.sn_remedial_action_read • flow_operator

Tables installed

Tables	Description
Remedial action [sn_reacf_remedial_action]	List of remedial actions (definitions) such as End Process - Device, Restart Service - Server and so on.
Remedial action parameter [sn_reacf_remedial_action_parameter]	List of parameters required to execute the remedial actions such as process ID, assigned to and so on.
Remedial action role [sn_reacf_remedial_role]	List of roles required to access and execute the remedial actions.
User criteria action inclusion	List of user criteria which are allowed to execute the Remedial Action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables	Description
[sn_reacf_remedial_user_criteria_mtom]	
User criteria action exclusion [sn_reacf_remedial_user_criteria_no_mtom]	List of user criteria which aren't allowed to execute the Remedial Action.
Remedial action type [sn_reacf_remedial_action_type]	List of remedial action types such as CI action and standard change.
Remedial action origin [sn_reacf_remedial_action_origin]	List of applications where the Remedial Action Framework is used.
Remedial action execution [sn_reacf_remedial_action_execution]	List of execution records that are created for each remedial action when executed. The record is used to track the progress and maintain the information. The record includes information such as executed remedial action, parameter values, action execution record, parent record, target record, current state, user who executed the remedial action and origin. **Note:** This table is read only.

Components installed with Metrics and CI Actions Framework

Several types of components are installed with activation of the Metrics and CI Actions Framework (sn_cimaf) application, including user roles and ServiceNow Store applications.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed

Role title [name]	Description	Contains roles
Metrics and CI Actions user [sn_cimaf.sn_cimaf_read]	Enables users to access and read Metric, Action Request and Action Output tables. **Note:** itil role contains this role.	cmdb_read
Metrics and CI Actions admin [sn_cimaf.sn_cimaf_admin]	Enables users with read and write access to all Metrics and CI Actions configuration tables.	• sn_cimaf.sn_cimaf_read • flow_operator

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Tables	Description
Provider [sn_cimaf_provider]	List of providers such as Agent Client Collector (ACC) or Microsoft Endpoint Configuration Manager (MECM).
Metric Definition [sn_cimaf_metric_definition]	List of metric definitions such as Asset usage, Running processes and so on.
Adapter Configuration [sn_cimaf_adapter_config]	List of configurations for the adapter. You can define the provider such as Agent Client Collector (ACC) or Microsoft Endpoint Configuration Manager (MECM), query and transform flows or scripts.
Adapter Applicability Rule [sn_cimaf_adapter_applicability_rule]	List of adapter applicability rules that enables you to configure on which CIs, the selected adapter configuration is applicable.
Provider Specific Adapter Configuration [sn_cimaf_provider_specific_adapter_config]	List of adapter configuration for a specific provider such as Agent Client Collector (ACC) or Microsoft Endpoint Configuration Manager (MECM).
Collection Rule [sn_cimaf_collection_rule]	List of collection rules that enables you to configure when the metrics should be auto-collected.
Collection Rule Metric Association [sn_cimaf_collection_rule_metric_asscn]	List of records that are created for the association of the collection rules with metric definitions.
Metric [n_cimaf_metric]	List of metrics fetched. The metric record contains the information such as metric definition, CI, timestamp and the actual metric payload. **Note:** This table is read only.
Action [sn_cimaf_action]	List of CI actions such as End Process or Restart service and so on.
Action Role [sn_cimaf_action_role]	List of roles required to access and execute the CI actions. **Note:** One CI action can be mapped to multiple roles.
User Criteria Action Inclusion [sn_cimaf_action_user_criteria_mtom]	List of user criteria which are allowed to execute the CI Action.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables	Description
User Criteria Action Exclusion [sn_cimaf_action_user_criteria_no_mtom]	List of user criteria which aren't allowed to execute the action. **Note:** This table is prioritized over the Action Role and User Criteria Action Inclusion configuration tables.
Action Configuration [sn_cimaf_action_config]	List of action configurations applicable to CI. You can create multiple configurations for a CI action based on different providers or CI class.
Action Parameter [sn_cimaf_action_parameter]	List of parameters required to execute the CI action.
Action Configuration Step [sn_cimaf_provider_specific_action_config]	List of sequential steps to be executed for any Action Configuration.
Action Request [sn_cimaf_action_request]	List of the CI action execution records. The record includes information such as parameters, CI details, and CI action and current status. **Note:** This table is read only.
Action Output [sn_cimaf_action_output]	List of the CI action output records. Each record is linked to the record in action request table. The record includes information such as action request record, action configuration step, payload, state, and request ID. **Note:** This table is read only.

Recommendation rules for an incident in Service Operations Workspace

Recommendations for an incident are based on rules defined in Recommendation Framework.

Recommendation Framework is now deprecated and no longer supported or available for new activation. Recommended Actions for ITSM feature provides the latest experience for this functionality. To get the advanced version, you must install the Advanced Recommended actions for ITSM (com.snc.uib.sow_itsm_ra_advanced) plugin and you must procure ITSM Pro package subscription.

Note:
The best practice to get the advanced version is to install the Task Intelligence for ITSM (com.snc.itsm_ml_task) plugin and procure the ITSM Pro package subscription. For more information, see Exploring Recommended Actions for ITSM in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For each recommendation rule to work, install the relevant plugin that installs the corresponding solution definition. Based on this solution definition, the recommendation rule predicts values or records for an incident.

For information about the plugins and the corresponding solution definitions, see Configuring Recommendation Framework in Service Operations Workspace.

Recommendation rules for field-level recommendations on an incident form

Recommendation rule	Solution definition	Incident field where the recommendation is available
Assignment group recommendation	Incident Assignment Predicts values for the **Assignment group** field based on the short description of the incident.	Assignment group
Configuration item	Incident Configuration Item Predicts values for the **Configuration Item** field based on the short description of the incident.	Configuration item
Service recommendation rule	Incident Service Predicts values for the **Incident Configuration Item** field based on the short description of the incident.	Service

Recommendation rules for card groups in the Recommendations panel

Recommendation rule	Solution definition	Associated card group in the Recommendations panel	Primary action for the card group	Other actions for the card group
Knowledge articles	Similar Knowledge Articles Predicts knowledge articles that the current incident can be linked to.	Knowledge articles	Attach: Attaches the recommended knowledge article to the current incident. On the incident record page, this article is displayed in the Attached Knowledge list of the **Related records** tab.	Discard: Discards the recommendation and moves it to the **History** tab in the **Recommendations** panel.
Propose major incident	Major Incident Recommendation	Propose major incident	Propose major incident: Proposes the current incident as a major	View similar incidents: Displays a list of similar incidents related to the current

			section of the **Details** tab.	
Similar resolved incidents	Similar Resolved Incidents Predicts similar resolved incidents to help with incident investigation and resolution processes.	Similar resolved incidents	Link incident: Links the recommended incident to the current incident. On the current incident record page, the linked incident is then displayed as the parent incident in the **Related Records** section of the **Details** tab.	Discard: Discards the recommendation and moves it to the **History** tab in the **Recommendations** panel.

Recommended Actions for ITSM reference

Reference topics provide additional information about various form fields and components installed with Recommended Actions for ITSM.

Contexts in Recommended Actions for ITSM

The ITSM base system includes the following context.

Contexts description

Context	Description
Incident context	This will show all valid recommendations on incidents based on the active recommendations in the Service Operations Workspace.
Incident task	This will allow you to search for AI powered recommendations for incident tasks in Service Operations Workspace.
Problem	This will allow you to search for AI powered recommendations for problems in Service Operations Workspace.
Problem task	This will allow you to search for AI powered recommendations for problem tasks in Service Operations Workspace.
Change request	This will allow you to search for AI powered recommendations for change requests in Service Operations Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contexts description (continued)

Context	Description
Change task	This will allow you to search for AI powered recommendations for change tasks in Service Operations Workspace.
Interaction	This will allow you to search for AI powered recommendations for interactions in Service Operations Workspace.
Request	This will allow you to search for AI powered recommendations for requests in Service Operations Workspace.

Rules in Recommended Actions for ITSM

ITSM base system includes the following rules.

Rules description

Rule	Description
Active incident	This will show all valid recommendations if the incident is active.
Active non-child non-MI Incident	This will show all valid recommendations if the incident is active, with no child incident, and which is not a major incident.
AI Search	This will allow you to search for AI powered recommendations across various records in the Service Operations Workspace, including Incident, Incident task, Problem, Problem task, Change Request, Change task, Interaction, and Request.
Major Incident with no Problem record	This will show all valid recommendations for the major incidents with no problem record.

Guidance based recommendations in Recommended Actions for ITSM

ITSM base system includes the following guidance based recommendations.

Guidance based recommendations description

Recommendation	Description
AI Search Recommendation	Returns AI-powered recommendations across various records in the Service Operations Workspace, including Incident, Incident task, Problem, Problem task, Change request, Change task, Interaction, and Request.
Create Problem Record for a major incident	Returns guidance-based recommendation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidance based recommendations description (continued)

Recommendation	Description
	Select **Create Problem** action to create a problem record for major incident.
Open incidents (CI & Service)	Returns guidance-based recommendations. The open incidents which have matching Configuration item or Service with the current incident record and which were created within the last six months appear. Atmost five recommendations for such type for an incident appear. Select **Make parent** action to make the incident as the parent to the recommended incident.
Open PRBs (CI & Service)	Returns guidance-based recommendations. The problems which have matching Configuration item or Service with the current incident record and which were created within last seven days appear. Atmost five recommendations for such type for an incident appear. Select **Link to Problem** action- to associate the incident with the recommended problem.
Similar Change Requests (TI)	Returns similar change request records as guidance-based recommendations, with up to five suggestions provided. Change requests with matching CI fields are prioritized, followed by those with matching fields. Lastly, change requests linked to open incidents with matching fields are displayed.
Similar Problems (TI)	Returns problem records as guidance-based recommendations, with up to five suggestions provided. Problems with similar fields are prioritized, followed by problems associated with open incidents are displayed.
Similar Incidents (TI)	Returns guidance-based recommendations. The records with similar fields appear.
Similar KB Articles (Similarity)	Returns guidance-based recommendations. Based on the similarity, this returns KB articles as recommendations. Select **Attach KB** to attach the KB article to the current incident.
Propose Major Incident (Trend)	Returns guidance-based recommendations. Based on the similarity with Trend, this returns incidents as recommendations. Select **Propose as Major Incident** to propose the incident as major incident.
Similar Major Incident (Trend)	Returns guidance-based recommendations. Based on the similarity with Trend, this returns major incidents as recommendations. Select **Link Major incident as Parent** to link the recommended major incident to the current incident. The current incident becomes child of the recommended major incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidance based recommendations description (continued)

Recommendation	Description
Similar Open Incidents (Similarity)	Returns guidance-based recommendations. Based on the similarity, this returns open incidents. Select **Link as parent** to link the recommended incident to current incident. The current incident becomes child of the recommended open incident.
Similar Open PRBs (Similarity)	Returns guidance-based recommendations. Based on the similarity model, this returns open problems. Select **Link Problem as Parent** to link the current incident to the recommended open problem. The current incident has a problem field, which gets linked to the recommended problem.
Similar Resolved Incidents (Similarity)	Returns guidance-based recommendations. Based on the similarity, this returns resolved incidents. Select **Copy resolution** to copy the resolution of the resolved recommended incidents to the current incident.
Similar Resolved incidents (CI & Service)	Returns guidance-based recommendations. The resolved incidents which have matching Configuration item or Service with the current incident and which were created within the last six months appear. Atmost five recommendations for such type for an incident appear. Select **Copy resolution** action to copy the resolution and associate the incident with the recommended resolved incident.

Field level recommendations in Recommended Actions for ITSM

ITSM base system includes the following field level recommendations for incidents.

Field level recommendation description

Recommendation	Description
Service (Classification)	Returns Predictive Intelligence based field recommendations. This will give field predictions in the Service field of the current incident.
Assignment group (Classification)	Returns Predictive Intelligence based field predictions in the Assignment Group field of the current incident.
Configuration item (Classification)	Returns Predictive Intelligence based field predictions in the Configuration item field of the current incident.
Incident Fields value prediction (TI)	Returns Task Intelligence for ITSM based field predictions in the Service Assignment Group, Configuration item fields of the current incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidances in Recommended Actions for ITSM

ITSM base system includes the following guidances.

Guidances description

Guidance	Description
Link to major incident	Enables agents to link the current incident to an existing major incident by clicking on Link to this major incident link on a recommended record, which sets the major incident as the parent of the current incident.
Propose Major Incident	Enables agents to propose a recommended incidents as major incidents.
Review and attach article for incident	Enables agents to review and attach an article for an Incident.
Show change request [No Action]	Enables agents to view change request details.
Show genius result [No Action]	Enables agents to view details of a genius result with no action.
Show Problem [No Action]	Enables agents to view details of a problem with no action.
[Incident] Attach KB	Enables agents to view relevant information and attach the KB article to the current incident.
[Incident] Copy resolution	Enables agent to copy the resolution of the resolved resolution to the current incident.
[Incident] Link open incident	Enables agents to link the current incident to an existing open incident by clicking on Link to this incident link on recommended record, which sets the open incident as the parent of the current incident.
[Incident] Link open problem	Enables agents to link the current incident to an existing open problem by clicking on Link to this problem link on recommended record, which sets the open problem as the parent of the current incident.
[Interaction] Review and attach article	Enables the agent to view relevant information and action for attaching KB to interaction.
[Non-ML] Copy resolution	This guidance is used only for Non-ML recommendations. Enables agents to copy resolutions of the resolved incidents to the current incident.
[Non-ML] Create Problem	This Guidance action creates a problem record for the Major Incident.
[Non-ML] Link open incident	This guidance is specially used only for Non-ML recommendations. Enables agents to link the open incidents to the current incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Guidances description (continued)

Guidance	Description
[Non-ML] Link open problem	This guidance is specially used only for Non-ML recommendations. Enables agents to link the open problems to the current incident.
[Task] Link change request	Enables agents to link change request to task.
[Task] Link incident	Enables agents to view the relevant information and action for incidents.
[Task] Link outage	Enables agents to view the relevant information and action for linking an outage to task.
[Task] Link problem	Enables agents to view the relevant information and action for problems.
[Task] Order item	This guidance action shows relevant information and action of catalog item. This guidance can be shown on any task type.

Resource generators in Recommended Actions for ITSM

ITSM base system includes the following resource generators.

Resource generator description

Resource Generator	Description
Assignment group using Classification	The recommendation- **Assignment group (Classification)**,uses this resource generator to return field predictions in the Assignment group field of the current incident.
Configuration item using Classification	The recommendation- **Configuration item (Classification)**, uses this resource generator to return field predictions in the configuration item field of the current incident.
Incident Fields predictions TI	The recommendation- **Incident Fields value prediction (TI)**, uses this resource generator to return field predictions in the Assignment group, configuration item, and service fields of the current incident.
Open PRBs using CI & Service	The recommendation- **Open PRBs (CI & service)**, uses this resource generator to return problems with same CI & Service, which can be linked to current incident.
Propose major incident using trend	The recommendation- **Propose Major Incident (Trend)**,uses this resource generator to return incidents which can be proposed as a major incident.
Resolved Incidents with same CI & Service	The recommendation- **Similar Resolved incidents (CI & Service)**, uses this resource generator to return resolved incidents with same CI & Service, whose resolution can be linked to current incident.
Service using Classification	The recommendation- **Service (Classification)**, uses this resource generator to return field predictions in the Service field of the current incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resource generator description (continued)

Resource Generator	Description
Similar KBs using similarity	The recommendation- **Similar KB Articles (Similarity)**, uses this resource generator to return KB articles as recommendations which can be attached to the current incident.
Similar major incident using trends	The recommendation- **Similar Major Incident (Trend)**, uses this resource generator to return major incidents which can be linked to the current incident.
Similar open incidents using similarity	The recommendation- **Similar Open Incidents (Similarity)**, uses this resource generator to return open incidents which can be linked to the current incident.
Similar Open Incidents with same CI & Service	The recommendation- **Similar Resolved incidents (CI & Service)**, uses this resource generator to return open incidents with same CI & Service.
Similar PRBs using similarity	The recommendation- **Similar Open PRBs (Similarity)**, uses this resource generator to return problems which can be linked to the current incident.
AI Search Resource Generator	The recommendation- **AI Search**, uses this resource generator to return AI-powered search results as recommendations.
Similar incidents using TI similarity	The recommendation- **Similar Incidents (TI)**, uses this resource generator to return similar records for incidents.
Similar resolved incidents using similarity	The recommendation- **Similar Resolved Incidents (Similarity)**, uses this resource generator to return resolved incidents whose resolution can be copied to the current incident.

Reference section for Problem Management in Service Operations Workspace

Reference topics provide additional information about Problem Management in Service Operations Workspace.

Problem form

Description of the field values for the problem form in Service Operations Workspace.

Create New Problem form

Field	Description
Problem	
Problem statement	Brief description of the problem.
Description	Detailed description of the problem.
Number	Unique number that identifies the problem record.
Origin task	Task that first identified this problem.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Problem form (continued)

Field	Description
Category and Subcategory	Group to which the problem belongs, such as software or hardware. After selecting the category, select the subcategory, if applicable.
State	Value that changes as the problem proceeds from one state to another state. For information about state transitions of a problem, see Life cycle of a problem.
Impact	Effect that the problem has on business operations.
Urgency	Extent to which the problem resolution can bear delay.
Priority	How quickly the service desk should address the problem. The **Priority** field is automatically set to the **Impact** and **Urgency** values.
Impact	
Service	Business service, such as email or IT Services, that the problem applies to.
Service Offering	Consists of one or more service commitments that uniquely define the level of service in terms of availability, scope, pricing, and packaging options. Service offering enables you to receive different features and their levels of performance for a given service.
Configuration item	Configuration item (CI) that the problem applies to. The CI class of the selected configuration item identifies the type of problem, for example, hardware, network, or database.
Assignment	
Assignment group	Group to which the problem is assigned. You can populate the **Assignment group** field automatically based on the support group available for the respective configuration item (CI). If the CI does not have any support group, then the field gets populated with the support group available for service offerings. The business rule **Populate Assignment Group based on CI/SO** triggers the functionality when an incident, problem, or change request is created or updated and when the **Assignment group** and the **Assigned to** field is empty. The following properties identify the field whose value populates the **Assignment group** field:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Problem form (continued)

Field	Description
	• *com.snc.problem.ci_assignment_group.field_* This problem property identifies which CI field populates the **Assignment group** field. • *com.snc.problem.service_offering_assignmen* This problem property identifies which service offering field populates the **Assignment group** field.
Assigned to	Problem coordinator to whom the problem is assigned. If an assignment rule applies, the problem is automatically assigned to the appropriate user or group.
Notes	
Work notes	Informative notes about the work performed on the problem.

Problem task form

Description of the field values for the problem task form in Service Operations Workspace.

Create New Problem Task form

Field	Description
Problem Task	
Short description	Brief description of the problem task.
Description	Detailed description of the problem task.
Number	Number that identifies the problem task record.
Type	The problem task type.
Problem	ID number of the problem for which the problem task is created.
Order	Order in which the problem tasks must be associated with the problem.
State	Value that changes as the problem proceeds from one state to another state. For information about state transitions of a problem task, see Life cycle of a problem task.
Priority	How quickly the service desk should address the problem.
Due date	Date by which the problem task must be completed.
Configuration Item	

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create New Problem Task form (continued)

Field	Description
Configuration item	Configuration item (CI) that the problem task applies to. The CI class of the selected configuration item identifies the type of problem, for example, hardware, network, or database.
Assignment	
Assignment group	Group to which the problem task is assigned.
Assigned to	Problem analyst to whom the task is assigned.
Notes	
Work notes (Private)	Information about the work performed on the problem task.

Features of the Investigation tab

The **Investigation** tab displays CI metrics information along with various options. Use the options and the metrics information to view the data that helps to resolve the CI-related issues.

You can select the following drop-down options to view the metrics information for the CI:

- Initial metrics: Metrics information of the affected CI that is retrieved from 30 minutes before to 30 minutes after the incident is created. The metrics information of the CI is displayed only if the CI is populated in that one hour time period. You can configure the *sn_sow.initial_metric_fetch_window* property to change the one hour time period.

  Note:
  Initial Metrics is available only for the primary CI.

- Recent metrics: Latest metrics information that is available for the affected CI. By default, the **Recent Metric** option is selected.

Note:
The metrics information for the CI is retrieved in any one of the following conditions:

- When the primary CI is updated or added to the incident. You can also configure when and how the metric information is retrieved for a CI by configuring the collection rule. For more information, see Configure the collection rules for the Investigate tab.
- When you select the Get latest metrics icon ( ), it refreshes, retrieves, and displays the latest metrics on demand. This option is available only when you're viewing data in the Recent Metrics.

The metrics data includes the following information:

- Overview: Displays overview information of the CI, such as name, operating system, and model number, from the ServiceNow database records and CMDB CI computer using the glide record query. The **Name** field contains a hyperlinked value, which displays the CI record on a separate tab when selected.
- System information: Select to display the system information for the selected CI on a separate modal. The system information modal includes the following data:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Microsoft system (msinfo32): Displays information about the computer and a comprehensive view of the hardware resources, system summary, components, and software environments, which can be used to diagnose the computer issues. You can also search and view any specific system parameter, if necessary.
- Azure (dsregcmd): Displays information on the state of the CI device that is managed by the Azure Active Directory (Azure AD). This information is used to diagnose and troubleshoot the device. The date and time when the information is last retrieved is also displayed. You can also search and view any device parameter, if necessary.

  Note:
  You can only use this option when the Agent Client Collector for Investigation (sn_acc_adapter) adapter is integrated with the Investigation Framework.

- Device health: Select the **Device health** link to launch the Digital End-User Experience application and device health page for the selected CI on a separate tab, within the incident view. This tab enables agents to view all the available metrics and the device health for the selected CI, which were collected by DEX. You can also access this feature using the **View device health** option on the CI record in Service Operations Workspace.

  Note:
  DEX requires a separate entitlement.

  This link is available to the agent only if the following conditions are met:

  - The selected CI is of type Device, which is also known as Endpoint.
  - The DEX plugin is installed on the instance. For more information on DEX, see Digital End-User Experience.
  - The DEX agent is installed on the selected CI.

- Asset utilization: Utilization of the assets for the CI. The following information is displayed along with the date and time:
  - Memory utilization: Amount of the memory used on the CI. The value is displayed in percentage.
  - Disk utilization: Disk utilization of the logical drives for the affected CI. The value is displayed in percentage.
  - CPU utilization: CPU utilization for the CI. The value is displayed in percentage.
  - Uptime: Uptime (boot time) of the assets. The days and time since when the assets are up and running.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The following metrics are color-coded based on the threshold values to highlight the warning or critical level:

Color coding metrics for Asset utilization metrics

Asset utilization metrics	Warning (Yellow color code)	Critical (Red color code)
Memory utilization	Greater or equal to 80	Greater or equal to 95
Disk utilization	Greater or equal to 80	Greater or equal to 95
CPU utilization	Greater or equal to 80	Greater or equal to 95

However, you can also customize these threshold values, if necessary. For more information, see Customize the Investigate tab.

- Top processes by CPU: Top processes sorted based on the CPU utilization of the processes in the affected CI.

Note:
The Top processes by CPU metrics are color-coded based on the threshold values to highlight the critical level when the value is greater or equal to 90. However, you can also customize these values, if necessary.

- Top processes by memory: Top processes sorted based on the memory consumed by the processes in the affected CI.

Note:
The Top processes by memory metrics are color-coded based on the threshold values to highlight the critical level when the value is greater or equal to 90. However, you can also customize these values, if necessary.

- Services: List of services (device or server) running on the affected CI.
- Logged in users: List of the logged-in users in the affected CI.
- Installed applications: List of the applications installed on the CI.

Note:
For devices with the Windows OS, the Installed applications don't include a list of pre-packed application.

Use the **View History** button to view the historical metrics data for the CI on a separate tab. You can select the time range from the drop-down options to view the historical data for that time range. For more information, see Viewing the historical data of CI metrics.

Viewing the historical data of CI metrics

View the historical data of the CI metrics for the selected time range.

Use the **View History** option on the Investigate tab to view the historical data of the various CI metrics on a separate tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

You can use the features of the history tab only if the following conditions are met:

- The application version must be Tokyo patch 8 or later releases.
- The Data Visualizations Core application must be upgraded to version 23.2.4 if you are on version Utah or later releases.

You can do the following on the history tab:

- Select the time range to view the historical data of the CI metrics.
- View the graphical representation of the following CI metrics (color-coded) in scatter plots for the selected time range along with the critical threshold values:
  - CPU utilization
  - Disk utilization
  - Memory utilization

  Point your mouse device device over a data point (represents specific date or time) on the scatter plot to view the values of the metrics along with the date when the metrics data is retrieved.
- Click a data point (represents specific date or time) on the scatter plot to display the data of all the CI metrics on the Metrics snapshot section along with the date and time.

Extension points for batch processing in Service Operations Workspace

Use the implementation extension point to create implementations and execute batch processing to update multiple records, which improves the performance of the system.

The Multiple Record Associator (MRA) component enables you to create implementation extension points for batch processing of multiple records.

To view the extension points that are available by default, navigate to**All** > **System Extension Points** > **Scripted Extension Points**. You can select the **Create implementation** option to create an implementation extension point.

When you have multiple records to update, a business rule executes and updates once for each record, which can affect the performance of the system. Instead of executing the business rule for each record, you can use the `RelatedListIncidentItemUpdateHandler` script include to execute batch processing for updating multiple records.

You can use the `RelatedListIncidentItemUpdateHandler` script include to update multiple records with batch processing. For example, you could use this script include when associating and updating multiple child incidents with a parent incident.

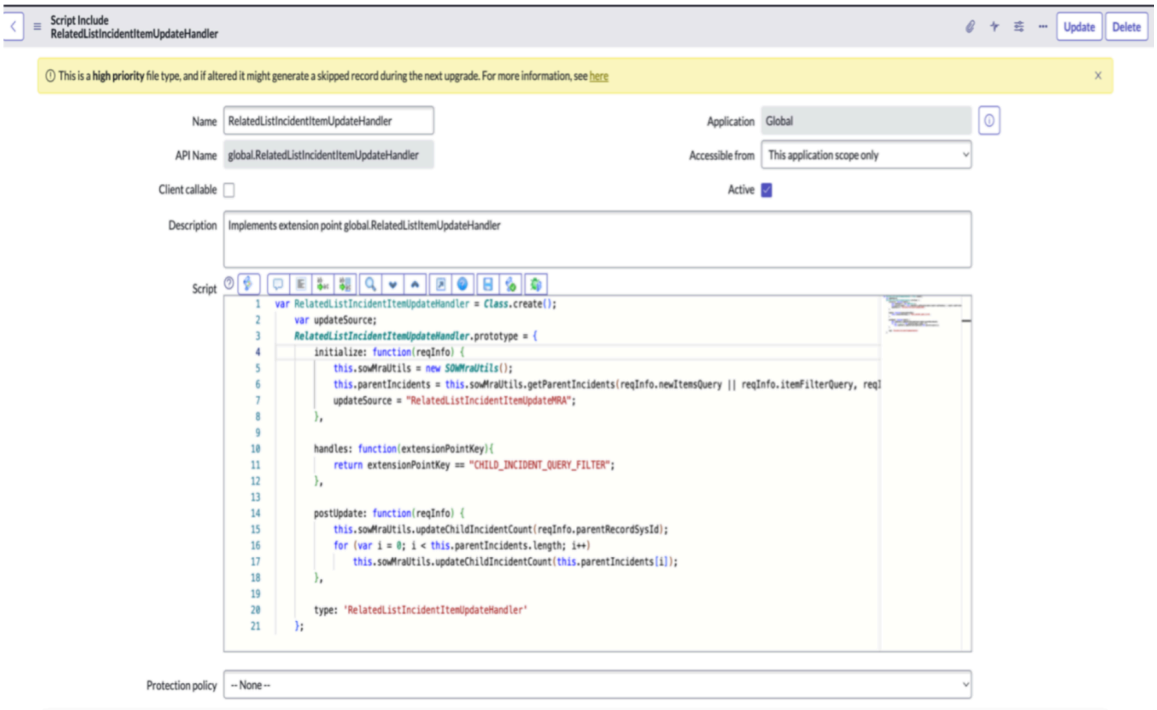
The **RelatedListIncidentItemUpdateHandler** script include contains the `global.RelatedListItemUpdateHandler` implementation extension point and is used when batch processing multiple records on a related list.

The extension point used in the **related_list_edit_helper** script include uses API to facilitate invoking custom code. This extension point overrides the execution of the business rule to ensure that the implementation extension point is executed when updating multiple records instead of the business rule. You can also add a business rule that must be overridden. When multiple records are updated, this script include is triggered, and batch processing occurs that bypasses that business rule.

The `RelatedListIncidentItemUpdateHandler` script include contains the following functions:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Initialize – Executes before multiple records are updated.
- Post update – Executes after multiple records are updated.



Quick start tests for Incident Management in Service Operations Workspace

Validate that Incident Management in Service Operations Workspace still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Incident Management in Service Operations Workspace

Incident Management in Service Operations Workspace quick start tests are available in the base system when you install or update to Service Operations Workspace ITSM Applications (sn-sow-itsm-cont) 6.0 version.

Incident Management in Service Operations Workspace test suite

Test	Description	Release version
SOW Incident: Create problem from incident	Test to verify the creation of a problem record from an Incident using the **Create Problem** UI action on the Incident form.	Xanadu (August store release, 6.0 version)
SOW Incident: Verify Assign to me button functionality	Test to verify the assignment of the incident record to the logged-in user using the **Assign to me** UI option on the Record information side panel of the Incident form.	Xanadu (August store release, 6.0 version)

Exploring Service Portfolio Management

The Service Portfolio Management application enables you to document and manage your services, service offerings, and portfolios using a standardized, structured format.

Service Portfolio Management overview

The Service Portfolio Management application enables you to create, organize, and manage portfolios of IT services. It optimizes the value of services and reduces their costs to help you to streamline your IT business operations and meet customer demands. A service portfolio includes information related to the organization of services and data about each service, including status and related items.

Service portfolios typically have three phases:

- Service pipeline: Services that aren't yet operational or available for use. These services are typically proposed or services in review for suitability. In this phase, you can analyze and manage the future growth and time line for each service.
- Service catalog: Services that are operational and available for use, as well as design and development. These services typically have representation in a request catalog.
- Retired services: Services that are no longer operational or available for use. These services can include essential historical information.

Service Portfolio Management users

The following table presents the most common users for Service Portfolio Management. For more information about core roles and tables, see Installed with Service Portfolio Management.

Users

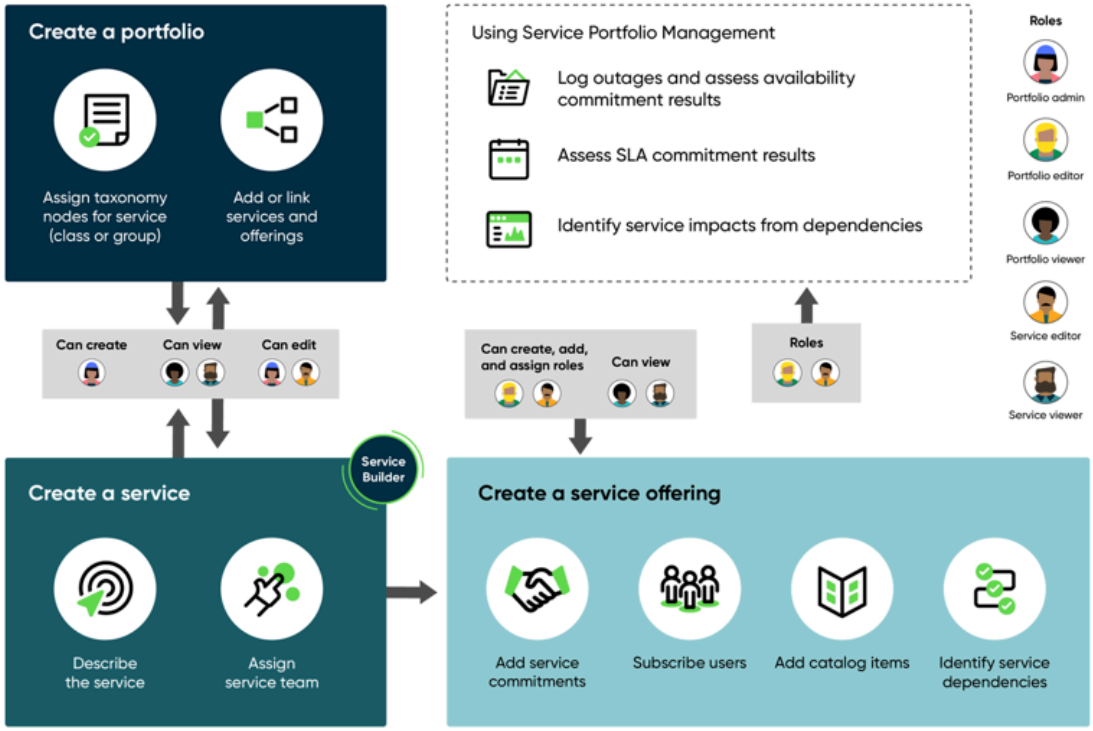
User	Description
Portfolio admin	Set up, create, edit, and delete services and service portfolios. Manage portfolios including related commitments and availability. Update taxonomy nodes, services, service offerings, and reparent services.
Portfolio editor	Edit and delete services and service portfolios. Update portfolios, taxonomy nodes, services, service offerings, and reparent services.
Portfolio viewer	View portfolios, taxonomy nodes, services, and service offerings.
Service admin	Set up, create, edit, and delete services and service offerings.
Service editor	Edit services and service offerings that they own or are a delegate of.
Service viewer	View all service portfolios, services, and service offerings.

Service Portfolio Management workflow

Depending on your role, you can use Service Portfolio Management for a variety of use cases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Portfolio Management overview



- Portfolio admins create service portfolios, services, and service offerings. Portfolio admins can also use the ServiceNow® Service Builder application to create and edit services and service offerings.
- Portfolio editors and service editors create, add, and assign roles to service offerings. Portfolio editors and service editors can also log outages, assess availability commitment results, assess service level agreements (SLA) commitment results, and identify service impacts from dependencies.
- Portfolio viewers and service viewers can view service portfolios, services, and service offerings in both Service Portfolio Management and in Service Builder.

Service Portfolio Management benefits

The Service Portfolio Management application provides several benefits to help you organize services and other solutions.

Service Portfolio Management benefits

Benefit	Feature	Users
Create and manage service portfolios and add services and offerings to the portfolios.	Create portfolios in Service Portfolio Management	Portfolio admin
Create and manage the overall portfolio taxonomy, including service nodes.	Service Portfolio Management taxonomy	Portfolio admin
Create taxonomy nodes	Create taxonomy nodes in Service Portfolio Management	Portfolio admin

Log outages	Log outages in Service Portfolio Management	Service editor
View availability results	View availability results in Service Portfolio Management	All Service Portfolio Management roles
Set the time zone for availability results	Set the time zone for availability results in Service Portfolio Management	Portfolio admin
Integrates with the Common Service Data Model (CSDM)	Applying the CSDM guidelines to Service Portfolio Management	Admin

What to explore next

To learn more about configuring and using Service Portfolio Management, see:

- Configuring Service Portfolio Management
- Using Service Portfolio Management
- Service Portfolio Management reference

Use Service Portfolio Management services

Configure IT services within your portfolios to add the most value to your organization. The IT services defined in your portfolios may, or may not be, specifically aligned to an application. IT services defined in your portfolios may, or may not be, represented in a request catalog.

The phase and status of a service indicates the life-cycle position of the service. You can view, track, and monitor the services by phase and status with platform lists and reports. The lists can also include retired services for viewing purposes.

Each service record has a unique number to identify the record.

To reflect the importance or impact of each service on the operations of your organization, you can select a criticality level for them. For example, you might select a high level for a service that

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

supports sales functionality using the organization's website. You might then select a lower level for a service that provides internal printing for the organization's employees.

Business services

Business services make up the structure of your service portfolio taxonomy. You can manage associated service and offering details via the dependency tabs of the related list on the Service and Service Offering forms. Business services reside in the [cmdb_ci_service_business] table.

Create offerings as children of services. Offerings are created in the Service Offering [service_offering] table. Refer to Service offerings in Service Portfolio Management for more details.

You can designate services as **Services I depend On** or **Services Dependent On Me** via form related lists.

Technical services

You can add technical services as part of your service portfolio taxonomy. Even if you don't, you can still gain insight into these services by adding them as **Services I depend On** or **Services Dependent On Me** in the related list section of the Service form.

Starting with the Xanadu release, technical services align with the Common Service Data Model (CSDM), version 5. With this alignment, technical services remain in the [cmdb_ci_service_technical] table and are labeled in the user interface as Technology Management Service. Service offerings remain in the [service_offering] table and are labeled Service Offering.

Table and label for technical services

Table name	Label in Xanadu and prior releases	Label in Xanadu and later releases
[cmdb_ci_service_technical]	Technical Service	Technology Management Service

To create or modify services, see Create or modify Service Portfolio Management services.

To learn about service offerings, see Service Portfolio Management service offerings.

To subscribe users to a service offering, see Subscribe users to a service offering in Service Portfolio Management.

Service Portfolio Management portfolios

A service portfolio presents an overall top-level view of your currently available services, possible future services, and services that existed in the past. Evaluate the impact that services have on your business and manage them in a single portfolio or multiple portfolios with unique taxonomy structures, owners, and market scope.

Portfolio overview

Gain valuable knowledge about your service portfolios, including an overall performance score and estimated spend. This knowledge helps you budget for your services and make informed decisions about adding new services and retiring services that no longer benefit your business.

Think of a service portfolio as a container that holds a hierarchical organization of definable nodes, services, and service offerings. Taxonomy in Service Portfolio Management refers to the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

classification of your portfolio layers and associated services (legacy portfolios use layers; see the **Note**). Typically, taxonomy is structured from a general, high-level perspective to a specific level, such as a service offering. With this dynamic taxonomy structure, you can organize your service portfolios in various ways.

Standard and legacy portfolio structures

Prior to the Utah release, Service Portfolio Management provided one portfolio structure. With the Utah release and after, existing customers can move from the legacy structure to the improved standard structure by opting in via a system property.

As an existing customer, opting in to the standard portfolio structure upgrades all your service portfolios. Your existing portfolios remain intact, but performance metrics, scores, and weights are no longer available. With the improved standard service portfolios, you can use key performance indicator (KPI) groups in Digital Portfolio Management (DPM) to report on services, nodes, and portfolio performance.

The standard portfolio structure provides new features and capabilities for your service portfolios so that you can:

- Create portfolio structures that have multiple different depths in the same portfolio.
- Update your portfolio structure over time to add or remove depth in areas of the portfolio, as needed.
- Work in your existing portfolio in the new structure, even though "layers" are removed.

The portfolio_admin can navigate to **All** > **Service Portfolio Management** > **Administration** > **Upgrade to Standard Portfolio** to access the system property [standard_portfolio_construct.turn_on]. Only existing customers see this menu path. New customers get the standard portfolio structure by default so this menu path isn't available.

Important:
After you upgrade to the standard portfolio:

- You can't revert to the legacy portfolio structure.
- You don't have access to the performance score in Service Owner Workspace because weights and performance metrics are no longer available.

Standard and legacy service portfolio structure considerations

Opt in to the standard service portfolios	Don't opt in — keep legacy service portfolios
• Use node-to-node relationships to create service portfolios with different levels of depth in a single portfolio (no more layers). • Report on services, nodes, and portfolio performance using KPI groups in DPM.	• Layered records are required, so you assign nodes to a layer and then reference the parent/child node. • Report using portfolio performance metrics, scores, and weights from Service Owner Workspace (and not KPI groups from DPM).

When you opt in, a dialog box provides these important aspects and considerations. Select the check box if you want to opt in or not (Yes or No).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
The Service Offering Metric Data [service_offering_metric_data] table along with the following four indicators have been deprecated in the Utah release:

- Average SLA Achievement [ServiceOffering.MetricData.SLA.Daily]
- Average Customer Satisfaction [ServiceOffering.MetricData.CSAT.Daily]
- Average Availability [ServiceOffering.MetricData.Availability.Daily]
- Average Request Activity [ServiceOffering.MetricData.Activity.Daily]

Therefore, if you have the Vendor Management Workspace application integrated with Service Portfolio Management, and if you are upgrading to the Service Portfolio Management standard portfolio, the metric data from the legacy indicators are no longer available. For information on vendor scores, see Vendor KPI Groups in Vendor Management Workspace reference.

Portfolio administration

As a portfolio_admin user, you can create a single service portfolio or multiple portfolios. If your organization has multiple businesses, you can define multiple portfolios to segregate them by business location, by vendor, or by Chief Information Officer (CIO). You can also:

- Add and remove services from portfolios.
- Determine how the services in a portfolio are categorized.
- Update portfolio taxonomy.
- Update portfolio details.
- Update services and service offerings (the service_editor role also has access).
- Reparent services (the service_editor role also has access).

Configuring Service Portfolio Management

Configuring topics provide information about how to set up and configure the Service Portfolio Management application.

Configuration overview

To activate Service Portfolio Management, its plugins, and the sample content pack, you must have the admin role. To set up services and commitments, you must have the portfolio admin role or the service editor role.

Activate Service Portfolio Management

The Service Portfolio Management Core plugin (com.snc.service_portfolio_core) is available by default for ITSM licensed customers. You can activate additional available related plugins for enhanced features and functionality.

Before you begin

Role required: admin

About this task

The Service Portfolio Management Foundation plugin [com.snc.service_portfolio] enables your organization to document portfolios, taxonomies, services, and service offerings using a standardized, structured format. It contains demo data and activates related plugins. The Foundation plugin is activated out of the box and activates related plugins, if they're not already active. For general information, see Service Portfolio Management.

Related plugins for Service Portfolio Management Foundation

Plugin	Description
Service Portfolio Management Core [com.snc.service_portfolio_core]	Adds the Service Offering table [service_offering] to the Configuration Management Database (CMDB). Available by default for users with ITSM SKUs.
Service Catalog core applications [com.glideapp.servicecatalog]	Enables integrations with the Service Catalog application and its capabilities.
Report Engine- use summary table for reports [com.glideapp.summary_report_engine]	Adds the glide.report_summary_engine system property and enables the Summary Sets reporting engine for all reports within Service Portfolio Management.

Several additional plugins offer increased functionality to Service Portfolio Management Foundation. Activate these plugins to enhance your experience.

Additional plugins for Service Portfolio Management Foundation functionality

Plugin	Description
Service Portfolio Management SLA Commitments [com.snc.service_portfolio.sla_commitment]	Adds SLA Commitment support to Service Portfolio Management. Includes demo data.
Service Portfolio Management Taxonomy Content Pack [com.snc.spm.content]	Provides sample taxonomy metadata, complete with portfolio, layers, and nodes. Demo data includes services and service offerings, including related items, such as SLAs, incidents, changes, and more. Includes demo data.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Installed with Service Portfolio Management

Service Portfolio Management activation administration

Service Portfolio Management includes several plugins to enable the organization, documentation, and management of service portfolios within your IT business department.

Administrators can activate plugins and assign specific Service Portfolio Management roles to system users.

Service Portfolio Management product applications

The following product application plugins are available:

Name	Description
Service Portfolio Management Core [com.snc.service_portfolio_core]	Adds the Service Offering table [service_offering] to the Configuration Management Database (CMDB). Available by default for ITSM SKUs.
Service Portfolio Management Foundation (com.snc.service_portfolio)	Enables your organization to document portfolios, taxonomies, services, and service offerings using a standard and structured format. You can install this plugin from the ServiceNow AI Platform user interface.
Service Portfolio Management Foundation Demo Data (com.snc.service_portfolio.demo_data)	Adds demo data for Service Portfolio Management and service level agreement commitments. **Note:** If you installed the Service Portfolio Management SLA Commitments plugin (com.snc.service_portfolio.sla_commitment) before the New York release, this plugin activates the newer version.

Service Portfolio Management Taxonomy Content Pack

You can also activate the Service Portfolio Management Taxonomy Content Pack plugin [com.snc.spm.content]. This plugin contains demo data and provides sample taxonomy metadata, complete with portfolio, taxonomy layers, and nodes. Users can view services and service offerings, including related items, such as SLAs, incidents, changes, and more as a demonstration.

Portfolio managers benefit from the Service Portfolio Management Taxonomy Content Pack because it provides a useful example of how service portfolios and services are constructed within the application. This example results in faster modeling of an organization's service portfolio. Also, often portfolio managers must quickly provide the organization an example of a portfolio structure to accelerate decision making regarding business approach.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Applying the CSDM guidelines to Service Portfolio Management

Service data relates to each other using different applications in different ways. Service Portfolio Management references the Common Service Data Model (CSDM) framework to bring service-related data together in a single view.

Since both ServiceNow® products of Service Portfolio Management and Digital Portfolio Management (DPM) closely align with the CSDM, it's helpful to know the common terms and life-cycle fields when working in these applications.

Tip:
For CSDM set-up information, see Implementing the CSDM framework in stages.

CSDM life-cycle fields for business and technical services

After the CSDM activation plugin is installed [*com.snc.cmdb.csdm.activation*], you can use the CSDM life-cycle fields in Service Portfolio Management. To see the field names, navigate to **All** > **Service Portfolio Management** > **Services**, and set the view to Service Portfolio.

Using the CSDM life-cycle fields helps you manage the end-to-end life cycle of services and service offerings. The shared field names provide you with consistency and alignment as you use other ServiceNow applications. For more information about the CSDM, see Enabling CSDM life-cycle sync between legacy fields and related assets.

The following comparison shows the differences from the traditional Service Portfolio Management phase and status fields to the CSDM life-cycle stage and status fields.

These fields also display when you use the Performance Analytics (PA) indicators.

Service table [cmdb_ci_service] mapping of Service Portfolio Management and CSDM

Common CSDM terms used in Service Portfolio Management and in DPM

Common CSDM terms used in Service Portfolio Management and in DPM

Term	Definition	Notes
Portfolio	Collection of services, products, projects, or applications.	Used to manage like items together for a business. Portfolios may be grouped by objective, capabilities, organization, like projects or services.
Business capability	High-level capability that an organization requires to execute its business model or fulfill its mission.	Typically described in the context of performing one or more specific tasks to achieve business outcomes. For example, demand management or financial planning.
Service	Means of delivering value to customers by facilitating outcomes customers want to achieve without the ownership of specific costs and risks.	Typically has three aspects: • Interaction • Offering • Service system ServiceNow provides three base service types: • Business • Technical • Application Customers can extend the base types to align with the service types in their organization.
Business service	A service type that is published to business users and it typically underpins one or more business capabilities.	Typically orderable by business users. Business users are able to select the desired offering and service commitment levels via the ServiceNow Service Catalog. For example, procurement, shipping, and finance.
Technical service	A service type that is published to service owners and typically underpins a business or application service.	Typically orderable by service owners. Service owners are able to select the desired offering and service commitment levels via the Service Catalog. For example, computers, storage, and networks).
Application service	A service type that is a logical representation of a deployed application stack.	Examples of application services are hosting, data backup, and recovery. **Note:** There isn't a 1-to-1 relationship between application and application services.
Application	Any deployed program, module, or group of programs that is designed to provide specific functionality on a computer infrastructure.	Defines behavior and has specific functionality associated with it. Applications are typically discoverable functionality, like Apache Web Server.

Common CSDM terms used in Service Portfolio Management and in DPM (continued)

Term	Definition	Notes
Business Application	Represents all software and infrastructure environments (dev, test, prod) configured to provide functionality.	Used to increase productivity and perform other business functions accurately. For example, Dell Online.
Service catalog	Provides a consumable view of available products, services, service commitment options, and offerings.	Helps manage what services a user may have access to. Also, catalogs are the initiation point for access to available services. For example, the IT services catalog.
Service offering	A stratification of a service into capability, availability, pricing, and packaging options.	Different levels of performance and features for a given service can be made available. For example, ITSM Standard and ITSM Pro.
Service commitment	Defines service delivery obligations agreed to between the consumer and the provider.	Often manifested in the form of contracts such as service level agreements, operational level agreements, and underpinning contracts. Service commitments include specific performance characteristics that differentiate one offering from another.
Configuration item (CI)	Physical and logical components of an infrastructure that are currently or soon will be under configuration management.	A single module such as a server, database, or router or a more complex item, such as a complete system. For example, a web server, database, or infrastructure.
Asset	An item whose financial value is tracked.	Many assets are CIs and vice versa, but that's not always the case. Assets have a life cycle with financial considerations, for example Microsoft Office 365.
Operating model	An abstract and ideally visual representation (model) of how an organization delivers value to its customers or beneficiaries.	Typically represents the various elements of how an organization operates. It usually incorporates strategy positions such as the innovation model, degree of intelligent automation, industry alignment, provider delivery models, and the business expectations of IT.

Implementing the CSDM framework in stages

Set up services and commitments in Service Portfolio Management

Set up services and commitments in Service Portfolio Management to define services and track their performance against availability commitments. You can relay the performance information in real-time to your stakeholders.

Before you begin

Role required: portfolio_admin or service_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Define the service offerings and commitments.
   Create service offering records that define different levels of service for an existing service. For example, you might offer two levels of desktop support in your organization. You offer a standard offering for upgrades and virus protection and an executive offering that also includes availability guarantee. Create a complete set of service offerings with service commitments that define the specifics of the offering.
2. Define the scope of the service offerings.
   Scope in Service Portfolio Management refers to the detailed service parameters that define the limits of a service. Define specific additional services related to the service as **In Scope** or **Out of Scope**. For instructions to apply scope definitions to services, refer to Apply scope to a service in Service Portfolio Management.
3. Configure the price of the service offering.
   Each service offering may have a pricing model and a price unit. Values are set on the parent service and inherited by the offerings. The actual price per unit that is charged for the service is established in the offering. For information about price modeling, refer to Service Portfolio Management service offering price.
4. Configure the service catalog for the end user.
   All the data created in the previous steps display on the service catalog page for a service. The layout is not configurable, but an administrator can control how the service is categorized and who can view the service in the catalog. For more information, see Service Catalog administration .
5. Subscribe to service offerings.
   With Service Portfolio Management, service owners can subscribe various business entities to Service offerings in Service Portfolio Management.
6. **Optional:** Opt in to the updated availability calculator system property [com.snc.availability.v2].
   This updated availability system property [com.snc.availability.v2] offers improved calculations and maintenance. For more information, see ..

Activate Service Portfolio Management Sample Content Pack

Activate the Service Portfolio Management Taxonomy Content Pack plugin (com.snc.spm.content) to access a sample portfolio structure and service taxonomy. This sample data offers a demonstration users can adopt to accelerate the creation and management of a service portfolio.

Before you begin

Role required: admin or portfolio_admin

About this task

Note:
The Service Portfolio Management Taxonomy Content Pack data is best viewed in Service Owner Workspace. For details about accessing this workspace through a Service Owner Workspace subscription, refer to Service Owner Workspace.

The Service Portfolio Management Taxonomy Content Pack plugin (com.snc.spm.content), contains demo data and provides sample taxonomy structure metadata. Users can quickly and efficiently implement portfolios and associated taxonomies.

Gain access to a sample list of services that provides examples of service data, offerings, catalog items, and the relationships they share. Link to periphery example data, such as vendors and contracts, SLA definitions, cost models, and more.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

After sample data loads, use it as a starting point to create and manage your service portfolios. You can view sample content in the **Service Portfolios** module of the Service Portfolio Management application as **Sample IT Services Portfolio**. Alternatively, if subscribed to and activated, users can view this data in Service Owner Workspace.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

View Service Portfolio Management sample IT services portfolio content

Access, view, and analyze the Service Portfolio Management sample IT services portfolio content to plan and create your service portfolio. Consider the sample structure as a starting point. You can add to it or modify it to suit the specific needs of your organization.

Before you begin

Role required: portfolio_admin, service_editor, or service_viewer

About this task

The Sample IT service portfolio provides usable data in the form of portfolios, taxonomy layers, and taxonomy nodes. It also provides demo data in the form of services, service offerings, incidents, commitments, and more.
You can view the Sample IT service portfolio content with any Service Portfolio Management role. To create portfolios or to manage the taxonomy nodes, you must have either the portfolio_admin role or the service_editor role.

You can view the sample content in both the Service Portfolio Management application and in the Digital Portfolio Management (DPM) Workspace.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Portfolios**.
2. Select **Sample IT Services Portfolio** to open the portfolio details.
3. Review the taxonomy nodes.
   A list of sample IT service-related nodes appear including but not limited to the following.
   - Software Management
   - Hardware Support
   - IT Management and Consulting
   - Network Support

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Data Center Management
- Software Support

4. Select a service type taxonomy node.
5. Review the sample IT service portfolio and its taxonomy nodes to understand the basic structure.
   Look at several service type taxonomy nodes to find the structure that best fits you your needs. You can use them as guidance as you build your own portfolio content structure.

Related topics

Using Service Portfolio Management

Work with portfolios in Digital Portfolio Management

Using Service Portfolio Management

Service Portfolio Management enables you to create services and service offerings, and assign them to service portfolios. You can also view service-related data including service availability results.

Overview of Service Portfolio Management

The following topics provide guidance on how to use Service Portfolio Management.

Create portfolios in Service Portfolio Management

You can create a single service portfolio or multiple service portfolios, each with its own taxonomy structure. The service portfolio enables you to see an overall view of your current IT services. You can also see services that may be available in the future and services that existed in the past.

Before you begin

Role required: portfolio_admin

About this task

Create a service portfolio before you define taxonomy nodes. After you create the service portfolio, you can edit it within the platform and monitor its performance in Digital Portfolio Management (DPM).

Important:
Existing customers can opt in to the improved portfolio structure by navigating to **Service Portfolio Management** > **Administration** > **Configuration** > **New Portfolio Opt-In**. The improved structure uses nodes and doesn't use layers and weighted scores from the Service Owner Workspace. After customers opt in for the improved portfolio structure, there isn't an option to revert to the former structure. For more information, see Service Portfolio Management portfolios. New customers have the improved portfolio structure by default.

Note:
The following procedure reflects the **SPM Advanced** user view.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Portfolios** and select **New**.
2. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Portfolio form

Field	Description
Name	Unique name that reflects the nature of the service portfolio, for example, IT Service Portfolio.
Short description	Brief details about the service portfolio.
Description	Comprehensive details about the service portfolio, such as, Software and Network Support Tiers.
Market scope	Detailed service parameters that define the limits of a service. For example, who uses the portfolio services.
Service portfolio owner	Person who owns the portfolio, usually at the Chief Information Officer (CIO) level. This person has the portfolio_editor role and can view and update owned portfolios only.
Service portfolio manager	Person who has the portfolio_admin role and is authorized to manage the service portfolio. The portfolio_admin can create, read, update, and delete portfolio records of all types, including: ○ Portfolios ○ Taxonomy levels and nodes ○ Services and service offerings ○ Relationships ○ Performance criteria
Auto-create service offerings	When checked, the **Number of offerings per service** field displays, enabling you to select the number of service offerings to auto-create. Every service must have a service offering. When you create a service offering using the auto-create check box, the following happens: ○ Service offerings are created with the naming convention of *<service name> Offering1*. The number represents the number of offerings that you created. If you created two, then the second offering name is *<service name> Offering2*. ○ The service offering inherits the following fields from the parent service: ▪ Owned by ▪ Delivery manager ▪ Delegate

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	▪ State ▪ Service classification ○ The auto-created service offerings are located in the Offerings related link of the service.
Important: The following performance fields only appear if you're using the deprecated Service Owner Workspace plugin. For more information on the deprecation of Service Owner Workspace, see Service Owner Workspace.	
Upper performance score threshold	Designated high threshold percentage point above which the indicators change from amber to green in Service Owner Workspace. In addition to the color change, the default percentage is **80**.
Lower performance score threshold	Designated low threshold percentage point below which the indicators change from amber to red in Service Owner Workspace. In addition to the color change, the default percentage is **60**.
Add default performance metrics	Option to add five metrics when you create a service portfolio. You can choose not to add the metrics by clearing the check box. Default metrics added include: ○ Availability ○ Customer Satisfaction ○ Critical Incidents ○ Activity ○ Breached service level agreement (SLA) **Note:** This field is hidden on Service Portfolio records. It only appears when you create a record.
Evenly weight performance metrics for new offerings	When active, each time an offering is created as part of this portfolio, the performance weight of each metric is evenly distributed. For example, each default metric is weighted at 20%.

Note:
If your instance is integrated with Financial Management and the **Estimated Spend Cost model** fields are configured on the Service Offering form, then you 'd see the **Estimated Spend** details for the portfolio.

3. Select **Submit** to save your service portfolio or select **Update** after editing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The newly created service portfolio appears in the **Service Portfolios** module list.

4. Select the newly created service portfolio name in the list.
   The Taxonomy Nodes, Portfolio Metrics, and Taxonomy Node Weights related lists appear on the Service Portfolio form. See Service Portfolio Management taxonomy for detailed information regarding creating and adding taxonomy nodes within your service portfolio structure.

Service Portfolio Management taxonomy

Service Portfolio Management uses a taxonomy framework to organize and manage services in a portfolio.

Portfolio structures

Prior to the Utah release, Service Portfolio Management provided one portfolio structure with taxonomy layers and nodes. With the Utah release and beyond, existing customers can move from the legacy structure to the improved standard structure by opting in via a system property. The improved standard portfolio structure no longer uses layers in the taxonomy framework. Rather, it only uses nodes. For more information on the two types of portfolio structures, see Service Portfolio Management portfolios.

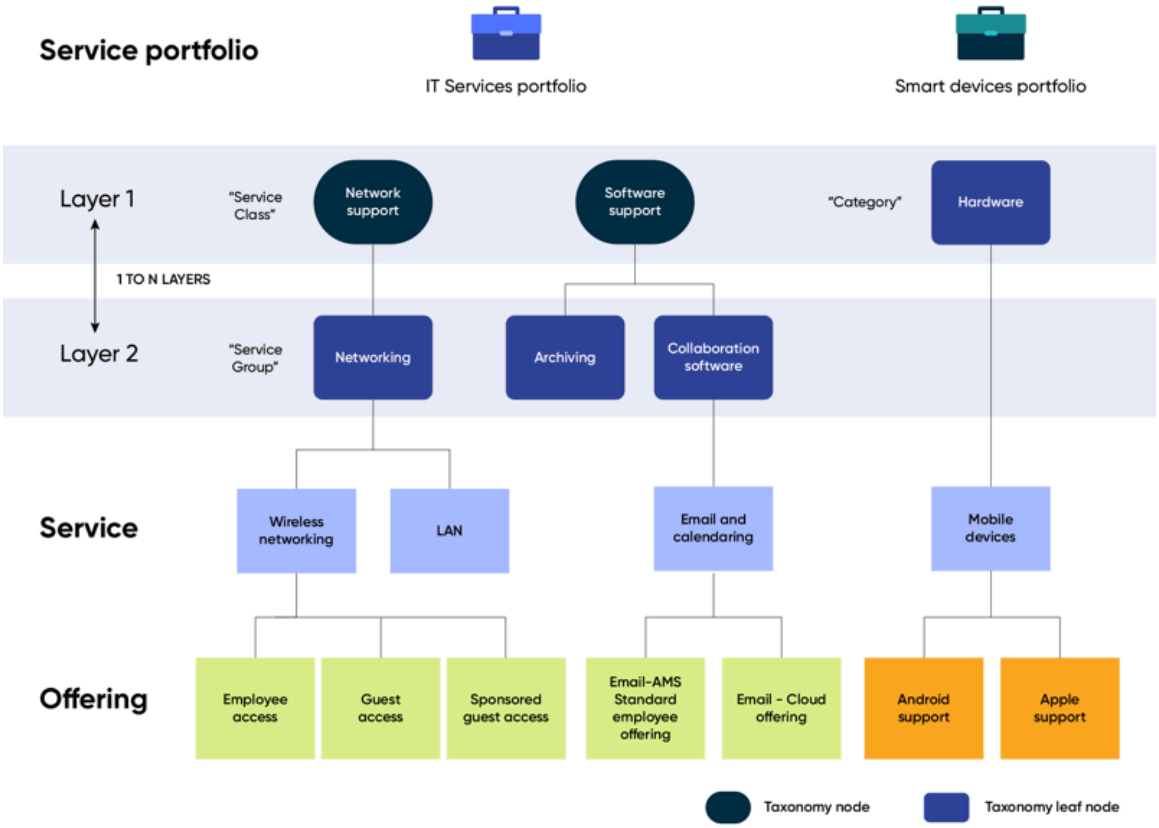
To upgrade to the standard portfolio structure, the portfolio_admin navigates to **Service Portfolio Management > Administration > Upgrade to Standard Portfolio** to access the system property [standard_portfolio_construct.turn_on]. Only existing customers see this menu path. New customers get the standard portfolio structure by default so this menu path isn't available.

Legacy portfolio structure taxonomy

If you’re working in a legacy portfolio structure, then your taxonomy framework may look something like this example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Legacy portfolio structure taxonomy example



In this example, there are two service portfolios - IT Service portfolio and Smart devices portfolio.

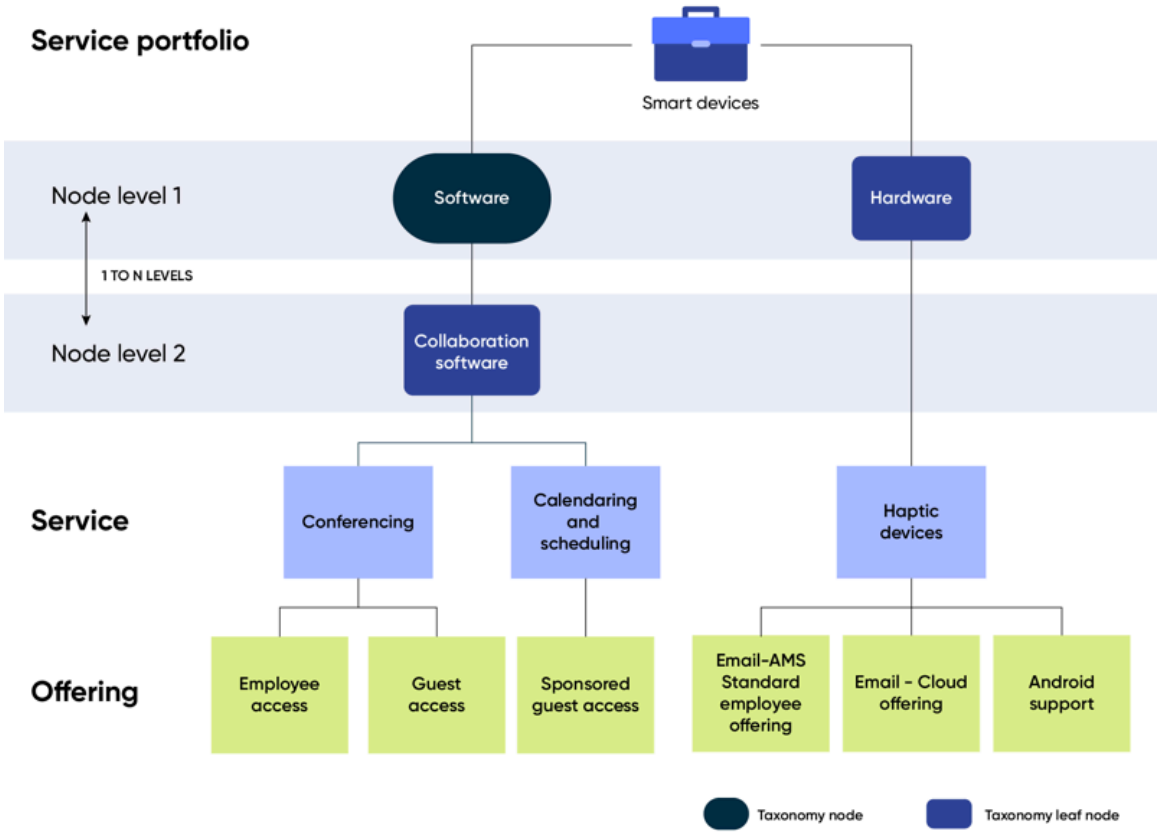
- Below the service portfolios are the layers. You can have 1 to N layers and they can be a taxonomy node or a taxonomy leaf node, or both.
- Below the layers and leaf nodes are the services and service offerings.

Standard portfolio structure taxonomy

If you're using the improved, standard portfolio structure, then your taxonomy framework may look something like this example.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard portfolio structure taxonomy example



In this example, there's one service portfolio at the top — Smart devices.

- Below the service portfolio, is the node level.
  - You can have 1 to N node levels.
  - A node level can contain both a taxonomy node and a leaf node.
  - Assign multiple nodes (rather than layers) for more flexibility as you structure your service portfolios. For example, a single portfolio can have multiple levels of depth via node-to-node relationships.
- Below the taxonomy node levels are the services and service offerings.

Note:
You can see a visual relationship map of nodes, services, and service offerings in Digital Portfolio Management (DPM). For more information, see Getting started with Digital Portfolio Management.

Related topics

Create taxonomy nodes in Service Portfolio Management

Create taxonomy layer definitions in Service Portfolio Management

View relationship maps in Digital Portfolio Management

Create taxonomy layer definitions in Service Portfolio Management

Create an unlimited number of taxonomy layers to organize, label, and manage your service portfolio. Taxonomy layers represent the highest containment levels of your service portfolio. Each level supports branches, or nodes, that contain child nodes or services in a hierarchical top-to-bottom structure.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Important:
This task applies if you are using the legacy portfolio structure. For information on the legacy and standard portfolio structures, see Service Portfolio Management taxonomy.

Role required: portfolio_admin

About this task

Opening the **Taxonomy Layer Definitions** module displays a list of all existing layers defined for all service portfolios.

By default, the service portfolio name associated with the taxonomy layer is listed in the first **Service portfolio** column of the list. The service portfolio is the parent element to the taxonomy layer. Existing taxonomy layers appear in the **Name** column, and are chronologically sorted in the **Order** column. Your layer with order number 100 is always at the top, followed by order number 200, and so on.

Always associated taxonomy layers with a parent service portfolio. Example layers for an IT services portfolio might include the following taxonomy layers:

- Service Class
- Service Group

If the Service Portfolio Management Taxonomy Content Pack [com.snc.spm.content] plugin sample data is activated on your instance, review the provided taxonomy data to gain an understanding of how to best define your taxonomy layers. Refer to Activate Service Portfolio Management Sample Content Pack for more details.

Procedure

1. Navigate to **Service Portfolio ManagementTaxonomy Layer Definitions**.
2. Select **New**.
   Alternatively, to edit an existing taxonomy layer definition, select the name of the taxonomy layer definition to open the form. Change any of the form field data as needed.
3. Fill in or edit the form fields.

Taxonomy Layer Definitions

Field	Description
Name	Unique name that defines the purpose of the taxonomy layer, for example, Tier, as in software support tier or network support tier.
Order	Value that represents the hierarchical level where the taxonomy layer will exist. 1 is the highest level, with each chronological number following at a lower level. **Note:** Layer ordering is locked and cannot be changed when a node is created for any layer in a service portfolio. Nodes cannot be added to layers if there is a gap in the layer order.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service Portfolio	Service portfolio for which the taxonomy layer is associated.
Short description	Brief detail about the taxonomy layer purpose.

4. Click **Submit** to save your service portfolio or click **Update** after editing a taxonomy layer.
5. Click the newly created taxonomy layer definition in the list.
   The Taxonomy Nodes and Portfolio Metrics Related Lists appear on the Service Portfolio form. Refer to Service Portfolio Management taxonomy for detailed information regarding creating and adding taxonomy nodes within your service portfolio structure.

Create taxonomy nodes in Service Portfolio Management

Create an unlimited number of nodes, or branches, and add them to your service portfolio taxonomy layers. By configuring taxonomy nodes, you can successfully achieve a highly detailed and organized service portfolio containing multiple elemental layers—from general to specific.

Before you begin

Role required: portfolio_admin

About this task

Add new nodes as needed and edit existing nodes, as well as reparent nodes or delete nodes. You can reparent a node to another node at the same taxonomy layer.
In Service Portfolio Management, taxonomy nodes typically represent service types within the configured taxonomy layers. These types act as containers for child nodes or services. Examples for an IT services portfolio could include the following taxonomy nodes:

- Data Center Management
- Hardware Support
- Software Management

If the Service Portfolio Management Taxonomy Content Pack [com.snc.spm.content] plugin sample data is activated on your instance, review the provided taxonomy data to gain an understanding of how to best define your taxonomy layers. Refer to Activate Service Portfolio Management Sample Content Pack for more details.

Procedure

1. Navigate to **Service Portfolio Management** > **Taxonomy Nodes** and select **New**.
   To edit an existing taxonomy node, select the name of the taxonomy node to open the form. Change any of the form field data as needed. To delete an existing node, select **Delete**.
2. Fill in or edit the form fields.

Taxonomy Node

Field	Description
Name	Unique name that defines the purpose of the node.
Short description	Brief detail about the taxonomy node purpose.
Description	In-depth details about the node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service portfolio	Service portfolio this taxonomy node is associated with.
Taxonomy layer	Taxonomy layer this node is associated with.
Parent	Taxonomy node to which the taxonomy node is associated. Use this form field to reparent a node at the same taxonomy level.
Owned by	Owner of the taxonomy node.
Valid from	The date the taxonomy code is valid.
Valid to	The date the taxonomy code is no longer valid.
Performance score **Note:** Appears with a Service Owner Workspace subscription.	Most recent performance score for this node. The performance score is calculated by a nightly script. **Note:** Only an admin can change the score, if necessary.

3. **Submit** your taxonomy node.
   Alternatively, you can select **Update** after editing an existing taxonomy node.
4. Edit or define the taxonomy node weights.
   If available, select the **Edit Weights** related link to edit existing child service weights or child node weights. Alternatively, you can navigate to **Service Portfolio Management** > **Taxonomy Nodes** and find a node in the list. Select to open the form.

   Note:
   The **Edit Weights** related link appears with a Service Owner Workspace subscription. Weight values for associated child nodes are specified at the service offering level via the **Edit Metric Weights** related link on the Service Offering form.

5. Specify weight values for each associated child node.
   Total weight must equal 100 percent. For more information on weights and specifying weight values, refer to Service Owner Workspace performance metrics.
6. Review the related list records.
   Depending on the type of node, whether it is a leaf node or a non-leaf node, related lists display the following associated data.

Option	Description
Taxonomy Nodes	List of all associated child nodes. You can ed it an existing child node by selecting a Taxon omy Node name. Create a new child node by clicking **New** and completing the **Taxonomy Node** form.
Services	List of all associated services shown for leaf nodes. Edit the list by selecting **Edit** and mak ing changes to the form. You can select a ser vice in the Related List to modify and update. Create a new associated service by clicking

Role required: portfolio_admin or service_editor

About this task

All occurrences of the table and reference field label **Business Service** throughout the product have changed to **Service**. For example, the Business Service form has changed to Service form. This change is for new instances only and doesn't affect existing upgraded instances.

Note:
You can also create and edit services and service offerings by using the Service Builder application. Service Builder provides a walk-through experience with contextual help along the way. For more information, see Service Builder.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Services** and select **New**.
   Alternatively, to edit an existing service, select the name of the service to open the form. Change any of the form field data as needed. To delete an existing service, select the **Delete** button in the form header.
2. On the form, fill in the fields.

Service form header

Field	Description
Name	A unique name that reflects the nature of the service.
Service portfolio	Service portfolio this service is associated with.
Taxonomy node	Taxonomy leaf node within a portfolio this service is associated with.
Phase	Phase that the service is in. Available values are: **Pipeline**, **Catalog**, and **Retired**.
Status	That status of the service phase.
Short Description	Type of service. Available values are: **Business Service**, **Technical Service**, and **Application Service**.
Owned by	The service owner responsible for this service in the organization.
Delivery manager	The delivery manager for the service.
Business relation manager	Relationship manager for this service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Important: The following two fields only appear if you're using the deprecated Service Owner Workspace plugin. For more information on the deprecation of Service Owner Workspace, see Service Owner Workspace.	
Performance score	Most recent performance score. Populated after the service is active. The performance score is calculated by a nightly script and can't be changed.
CSAT score	Customer service feedback score.

3. Select the **General** tab.
4. On the form, fill in the fields.

Service form General tab

Field	Description
Number	Automatically generated unique identification for a new service record. Its value consists of a 'BSN' string and a unique number. Other forms and scripts can reference this identification. The **Number** field is visible with the Service Portfolio form view. **Note:** The **Number** field in service records that were created before the field was added, is null.
Version	Version of the service.
Aliases	Other names used for this service.
Service classification	Type of service. Available values are: **Business Service**, **Technical Service**, and **Application Service**.
Consumer type	Type of consumer. Available values are: **Internal**, **External**, and **Internal and External**.
Start date	Date the service is available.
End date	The date the service is retired.
Last review date	The date the service was last reviewed.

5. Select the **Team** tab.
6. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service form Team tab

Field	Description
Delegate	A person authorized to manage the service on behalf of the service owner.
Business contact	Person to contact for issues related to this service.
Vendor	The vendor providing this service.
Stakeholders	People with an interest or concern regarding this service.

7. Select the **Business Need** tab.
8. On the form, fill in the fields.

Service form Business Need tab

Field	Description
Business need	Business need this service supports.
Business criticality	Criticality level that defines the importance of the service in your organization.

9. After completing the form, select and hold (or right-click) the header bar and select **Save** from the pop-up menu.
   The related lists for the service appear. View associated or create the following:
   - Offerings
   - In Scope
   - Out of Scope
   - Services I depend On
   - Services Dependent On Me
   - Incidents
   - Problems
   - Change Requests
   - Other tasks
   - Knowledge Articles
   - Service Offering Node Weights
   - Improvement Initiatives
10. Select **Submit** to save your service or select **Update** after editing a service.

Apply scope to a service in Service Portfolio Management

Define the limits of a service with scope details to grant or deny specific service views. Out of Scope items define what a service cannot provide and In Scope items define what a service provides. For example, nightly backups may be In Scope for the Desktop Support service, but Out of Scope for the Disaster Recovery service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: portfolio_admin or service_editor

About this task
The In Scope and Out of Scope definitions appear in the service catalog page that users see when they access the service catalog.

To view the list of scope entries in your system, enter `service_scope.list` in the navigator and press the Enter key.

Procedure
1. Navigate to **All** > **Service Portfolio Management** > **Services**.
2. Select the name of a service for which you want to define scope.
   Only a parent service can have scope.
3. In the In Scope or Out of Scope related list, select **New** to create a new definition or select **Edit** to add the scope to the In Scope or Out of Scope list for the service.
   Configure scope with anything that is pertinent to the service and helps define the limits of the service.
4. Give the scope item a descriptive name and provide details in the **Description** field.
5. Select **Submit**.

Edit and manage service portfolios in Service Portfolio Management

Manage the CSDM life cycle fields of your portfolio taxonomy nodes in the Service Portfolio Management application. You can move taxonomy nodes easily from one portfolio to another to confirm that your portfolios are synchronized. You can also decide to show or hide the life cycle fields in the complimentary Digital Portfolio Management (DPM) Workspace.

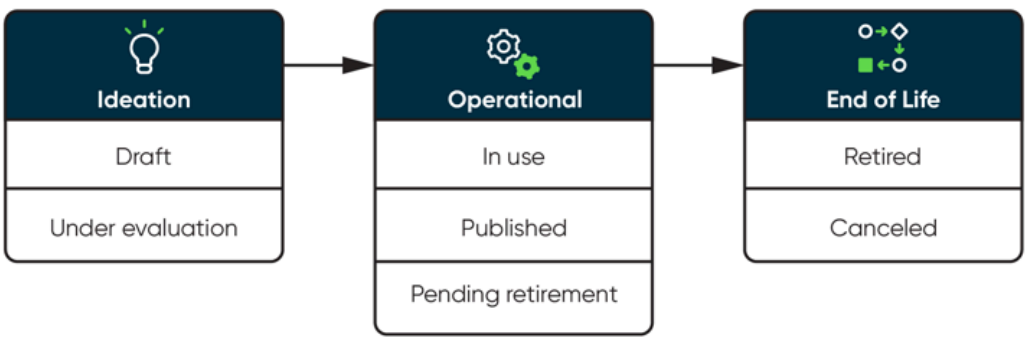
Manage the CSDM life cycle fields in Service Portfolio Management

Manage the CSDM life cycle fields for the taxonomy nodes of your service portfolios. You can also use the Active check box to display or hide the life cycle fields in the Digital Portfolio Management (DPM) Workspace.

Before you begin
Role required: portfolio_admin or service_editor

About this task

Taxonomy node CSDM life cycle stages for service portfolios



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Stage	Status
Ideation	• Draft • Under evaluation
Operational	• In Use • Published • Pending retirement
End of Life	• Retired • Canceled **Note:** An end of life state would never be set to Expired.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Taxonomy nodes**.
   Use the Service Portfolio view.
2. Open the taxonomy node that you want to activate the CSDM life-cycle fields.
3. Enter or update the following fields.

Field	Description
Lifecycle stage	The stage of the life cycle for the taxonomy node. The stages could be **Ideation**, **Operational**, or **End of Life**.
Lifecycle stage status	The status of the life cycle for the taxonomy node. The system offers many options but a few of the most common are **Draft**, **Design**, **In Use**, **On Hold**, and **Available**.
Active check box	The **Active** check box determines if the portfolio is displayed in the DPM Workspace. The check box is active (checked) by default but you can clear it anytime.

Remap service portfolio taxonomy nodes in Service Portfolio Management

Use the flexible options when you remap (or reparent) taxonomy nodes from one portfolio to another. You can move an entire branch of a taxonomy from one portfolio to another, including the automatic move of its child nodes.

Before you begin

Role required: portfolio_admin or service_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

When you move taxonomy nodes from one portfolio to another, all its associated child nodes and their services and offerings move as well. This smooth transition confirms that your service portfolios are synchronized. Following the procedure, you may find it helpful to open the two portfolios in their own tab.

Procedure

1. Determine the service portfolio name that you want to add taxonomy nodes to.
2. Open the service portfolio to take the taxonomy node from.
   - Select the taxonomy node that you want to move.
   - Change the **Service portfolio** field value to the name of the portfolio that you want to move the taxonomy node to. A message explains the impact of changing the portfolio name.
   - Save the record.
   - Refresh the Taxonomy Node list to see the updated portfolio display in the Service portfolio column.
3. Verify the change in the DPM Workspace.
   - Navigate to the Enterprise portfolios in the DPM Workspace.
   - Find the portfolio that you added the taxonomy nodes to.
   - Verify that the taxonomy nodes were added as well as their child nodes, services, and service offerings.

> **Important:**
> Service portfolios contain the Performance snapshot key performance indicator (KPI) values. If the KPI data is set to "latest score," the new node takes a day to reflect the updated KPI data. For more information, see KPI groups in Digital Portfolio Management.

Service offerings in Service Portfolio Management

A service offering derives from a service, refining the parent service to a specific business need and performance level.

Service offerings and commitments

Offering records define different levels of performance for an existing service. For example, you might offer two levels of desktop support in your organization. You can offer a standard offering for upgrades and virus protection and an executive offering that also includes availability guarantee.

Service offering types include business service offerings and technical service offerings.

Create a complete set of service offerings defined by commitments that define the specifics of the offering. Each service must have at least one defined offering to move to the Catalog phase. This is because service offerings are where you define Service Level Agreements (SLAs) and where metrics are collated.

For detailed information about SLAs, including SLA definitions and results, refer to Service Level Management.

Service offering pricing

Each service offering may have a pricing model and a price unit. Use this pricing data towards creating catalog items.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service offering subscriptions

You can subscribe different entities to a service offering. This data is then used to determine the total subscriber count on the offering form.

Technical service offerings

Technical service offerings can be shown as inherited relationships to business services and offerings. They are not included in metric models and do not use the weighting model.

Re-parenting service offering types

You can change a service offering parent from one type of service to another. For example, changing an offering parent from a business service to a technical service or vice versa. Offerings cannot be re-parented to an application service. Some important information and guidelines concerning re-parenting service offering types, include:

- When you change the offering parent from a business service to a technical service you will receive a message alerting you that performance scoring is not available with technical service offerings.
- When you re-parent from one service type to another, existing weighting rules will apply.
- If you try to re-parent and the parent service is in Catalog phase with only one offering, you will receive a message that you cannot make this change.
- If the metric weight on the parent service is >0, you will receive a message alerting you to adjust the data before re-parenting the offering. You cannot re-parent the offering to a different service type until the weight for the offering on the former service type is set to zero.

Service offering topics in this section

View a service offering in Service Portfolio Management

View service offerings in Service Portfolio Management to find offerings that add value to your organization and external users. You can also view service offerings in the Service Builder application.

Before you begin
Role required: service_editor

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Offerings**.
2. Find the service offering by scrolling through the list or select the filter ( ) to adjust the filter conditions.
3. Select the service offering to open it.

   Before you open an offering, you may see one of the following symbols in front of its name.

   - The word [DRAFT] indicates that the offering is checked out and is in a draft state.
   - A clear triangle warning symbol ( ) indicates that it's the new copy [DRAFT] that's being worked on.
   - A red dot ( ) indicates that the offering is read only.

   As you view the offering, you can use the first set of tabs to see its general information, supporting teams, and information about price and operations. Use the second set of tabs

(Related Links) for more details about the offering. Also, a button enables you to edit the offering in the Service Builder application.

4. **Optional:** View a service offering using the Service Builder application.

   a. Navigate to **All** > **Service Portfolio Management** > **Service Builder**.

   b. Select the **Services** tab.

   c. Find and open the service for the service offering that you seek.

   Tip:
   You can narrow your search by using the filter options on the column headings.

   d. After the service opens, select **Manage Offerings** in the navigation panel to see the list of offerings.

   You can also select **New** to create a service offering for that service.

   Note:
   The same symbols apply as previously described.

Create a service offering in Service Portfolio Management

Create a service offering in Service Builder

Create a service offering in Service Portfolio Management

Create service offerings to define services, document them, track performance against defined availability commitments, and relay the performance information in real time to your end users.

Before you begin
Role required: portfolio_admin

About this task
Often the data that's defined on a service and on its child offerings are identical. For example, the same person may own a service and its offerings, as defined in the **Owned by** field on the **Service** form. However, flexibility exists for defined data to be different between services and child offerings if the organization desires. For example, one person may own the service while another person owns the child offering.

Link service offerings to catalog items required to provision a service. Each service offering has commitments, which in turn, have service level agreements.

A service offering consists of a set of service commitments, which uniquely define the level of service in terms of availability, scope, and pricing. For example, an organization may offer two levels of Desktop Support in your organization. A Standard offering of upgrades and virus protection. And an Executive offering with the standard commitments plus some type of availability guarantee, such as 98% availability from 8-5 on weekdays.

When an offering is added to a service for the first time, some Offering form field values are inherited from the parent Service record. These form fields are: **Owned by**, **Business criticality**, **Delivery Manager**, and **Delegate**. When an offering is added and the parent Service record has empty field values, these fields are also empty on the Offering record. When you first insert an offering into a service, the parent Service record field values overwrite any existing values in the Offering record. You can update the fields after you've added the offering, if necessary.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also auto-create service offerings when creating a service portfolio. For more information, see Create portfolios in Service Portfolio Management.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Offerings** and select **New**. Alternatively, to edit an existing service offering, select the name of the service offering to open the form. Change any of the form field data as needed. To delete an existing service, select the **Delete** button in the form header.
2. Fill in the form fields.

Offering form

Field	Description
Name	Unique name that reflects the nature of the service.
Parent	The parent service.
Phase	Phase that the service is in. Available values are: **Pipeline**, **Catalog**, and **Retired**.
Status	Status of the service per phase.
Short description	Brief details about the service portfolio.
Description	Comprehensive details about the service offering.
CSAT score	Customer satisfaction feedback score.
Total Subscribers	Number of subscriptions for this service offering. Total subscribers are calculated by a nightly script. **Note:** Only an admin can change the score, if necessary.
Owned by	Service owner responsible for this service in the organization. **Note:** This value is inherited from the parent Service record, but you can update.
Performance score **Note:** This field displays if you're using the deprecated Service Owner Workspace plugin. For more information on the deprecation of Service Owner Workspace, see Service Owner Workspace.	Most recent performance score. Populated after the service is active. The performance score is calculated by a nightly script. **Note:** Only an admin can change the score, if necessary.

3. Select the **General** tab to complete the General section of the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Aliases	Other names used for this service.
Business criticality	Degree of how critical this service offering is to the business. You can base a demand response strategy off this value. **Note:** This value is inherited from the parent Service record, but you can update.
Consumer type	Type of consumer. Available values are: **Internal** and **External**.
Service classification	Type of service. Available values are: **Business Service**, **Technical Service**, and **Application Service**.
Version	Version of the service offering.
Start date	Date the service is available.
End date	Date the service is retired.
Location	Physical location of the service.
CSAT Survey Frequency	How often a customer survey is sent.
CSAT Survey Last Sent	Last time a customer satisfaction survey was sent.

4. Select the **Team** tab to complete the Team section of the form.
   The Teams related list enables you to assign different group types to support a service offering. For more information, see Teams related list and Assign multiple teams to support a service offering in Service Portfolio Management.

Field	Description
Delivery Manager	The delivery manager for this service. **Note:** This value is inherited from the parent Service record, but you can update.
Delegate	Person authorized to manage the service along with the service owner. **Note:** This value is inherited from the parent Service record, but you can update.
Support group	Group managing the service. See Assign multiple teams to support a service offering in Service Portfolio Management.
Vendor	The vendor providing this service.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Stakeholders	People with an interest or concern regarding this service.

5. Select the **Price** tab to complete the Price section of the form.

Field	Description
Price model	Pricing structure for a service offering as defined in the parent service. The **Price model** field is read only. This value is set in the parent service.
Price unit	Short name of the unit for this service. Appears when **Per Unit** is chosen for the **Price Model** type in the parent service. The **Price unit** field is read only. This value is set in the parent service.
Price	Price and currency.
Unit Description	Longer description of a unit of this offering.

6. Select the **Operations** tab to complete the Operations section of the form.

Field	Description
Contract	Associated contract number.
Maintenance schedule	Time during which maintenance is scheduled.
Service level requirement	Field captures the requirements, which include the service level agreements and service level targets, for the service.
Prerequisites	Prerequisites for this service offering.
Compatibility dependencies	Compatibility dependencies for this service offering.
Monitoring requirements	Requirements to monitor this service offering.

7. **Optional:** Select the **Estimated Spend** tab to view the Estimated Spend section.

> **Important:**
> This step and the next one are optional because they only apply if you're using the deprecated Service Owner Workspace plugin. For more information on the deprecation of Service Owner Workspace, see Service Owner Workspace.

8. **Optional:** Choose a value for the **Cost model** field.
Choices include the default **None**, **Fixed**, and **Per unit**. View read-only data in the **Estimated spend** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. After completing the form, select and hold (or right-click) the header bar and select **Save** from the pop-up menu.
   The **Related Links** and related lists for the offering appear.
10. **Optional:** In **Related Links** you can create an offering improvement initiative, edit offering metric weights, and subscribe to the offering by selecting the associated link.

    Important:
    This step is optional because it only applies if you're using the deprecated Service Owner Workspace plugin. For more information on the deprecation of Service Owner Workspace, see Service Owner Workspace.

11. View associated related lists and items.
    View associated or create new:
    - Service Commitments
    - Service Offerings I Depend On
    - Service Offerings Dependent On Me
    - Outages
    - Incidents
    - Problems

Teams related list

Assign multiple teams to support a service offering in Service Portfolio Management

Add a commitment to a service offering in Service Portfolio Management

Service commitments are specific services that define the unique availability guarantees, scope, and pricing for a service offering.

Before you begin
Role required: service_editor

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Service commitments define the expected level of a service. A service offering derives from a service, tailoring the parent service to a specific business need. A service offering consists of a set of service commitments which uniquely define the service offerings.
To create service commitments, each service needs at least one associated service offering.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Offerings**.
   Alternatively, you can navigate to **Service Portfolio Management** > **Commitments**.
2. Open a service offering record.
3. In the Service Commitments related list, select **New**.
4. Give the commitment a descriptive name.
   You can specify any kind of service.
5. Select the **Type** of commitment from the list.

Option	Description
Availability or Maintenance Window	Used in system processing. If you select **Main tenance Window**, the **Schedule** field is re quired. Creates Availability records for the service of fering based on the outages for that offering. If an Availability commitment exists, when an Outage is created against a service offering with the Availability commitment, it will begin tracking down time and availability.
Response Time, Delivery or Other	Display additional information in the service catalog. This information details the type of service commitment the user may expect from a given service offering. These service commitment types do not provide additional functionality or a homepage gauge.
Recovery time objective	Guarantee of how long it takes to recover the system from the recovery point. Set the re covery time in the **Time Amount** field that ap pears when you select this commitment type. This field is available with vendor ticketing. **Note:** These service commitment types do not provide additional functionality or a homepage gauge.
Recovery point objective	Guarantee of how often backups are per formed. Set the backup interval in the **Time amount** field that appears when you select this commitment type. This field is available with vendor ticketing.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: These service commitment types do not provide additional functionality or a homepage gauge.
SLA	Allows commitments defined by a service lev el agreement (SLA) that tracks whether a ven dor provides a level of service for a defined percentage of the time. The SLA results are calculated automatically and can be viewed on the My Services - SLAs homepage or by navigating to **Services** > **Service Offering SLAs** > **SLA Results**.

6. **Optional:** Select a **Contract** for this service commitment.
   This information is used when creating vendor credit records.

   Tip:
   If you don't see task (SLAs for incidents related to service commitments), then contact your Administrator. When **Contract** is entered in the Reference field of the incident, then the Use reference qualifier field should be set to **Advanced**, and the global business rule *`contractFilter`* must be entered in the **Reference qual** field.

7. Enter the information to calculate credit owed by the vendor for any contract breaches.
   These fields are available with vendor ticketing:
   - **Breach penalty amount**: Amount assessed per unit of time for a breach.
   - **Per**: Unit of time used to calculate the total credit owed for a breach.
   - **Breach penalty time**: Amount of free time provided by the vendor per breach.
8. Complete the form and select **Submit**.
   The Service Offering form opens, and the new commitment appears in the Service Commitment related list.
9. Select **New** to add another service commitment or select **Edit** to add an existing commitment to this offering.

Assign multiple teams to support a service offering in Service Portfolio Management

You can assign multiple teams to support a single service offering when several teams are responsible for that offering.

Before you begin

Role required: service_editor

About this task

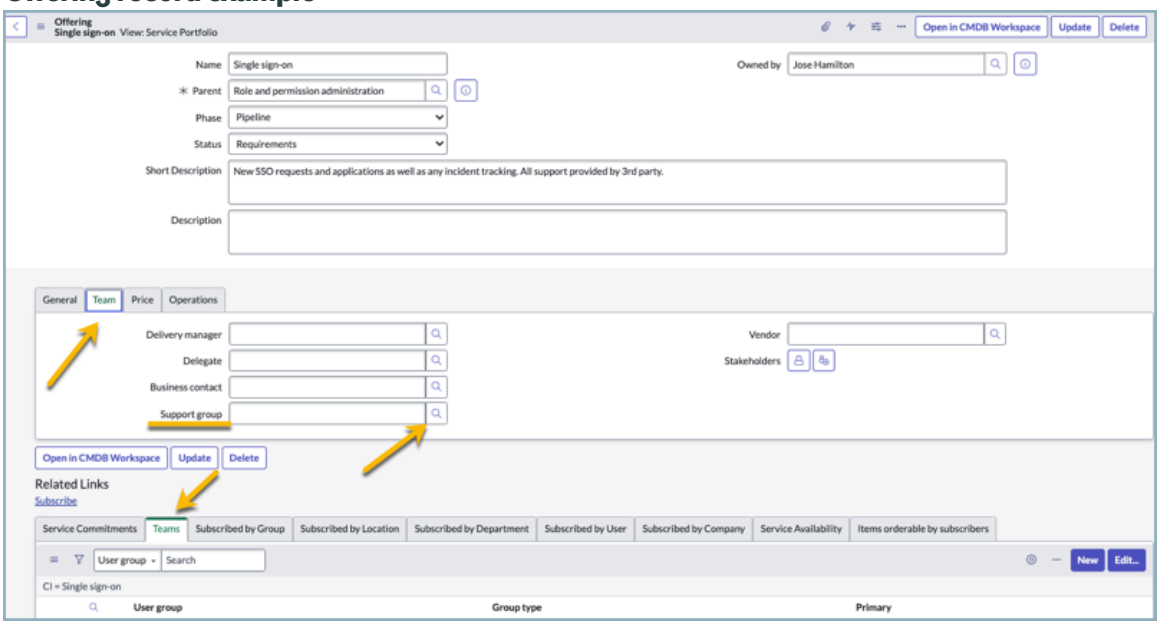
The service offering team table [cmdb_rel_team] enables multiple groups to be related to a single service offering. While in the offering record, use the **Team** tab to assign a support group to the offering. Use the Related Links **Teams** tab to add more support groups to the service offering. You can also edit the group type of the teams that you add in the Related Links **Teams** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Offerings**.
2. Open the service offering that you want to assign support teams.

Offering record example



3. In the first **Team** tab on the offering record, use the Search icon ( ) to select the support group for this service offering, and then **Save** the page.
   After you save the page, the support group that you selected displays in the second **Teams** tab, in the Related Links area. The Related Links **Teams** tab has three columns: **User group** (the support group name that you selected in the first teams tab), **Group type**, and **Primary**. You can set the primary entry to true or false, indicating that the user group is the primary support group.
4. In the Related Links **Teams** tab, add more support groups to the **User group** list.
   a. Select **Edit**.
   b. Move one or more groups from the **Collection** to the **Teams List**, and then **Save**.
5. **Save** the offering record.
6. The Related Links **Teams** tab contains all the teams that you added.
   You can select any team in the **User group** column to change the team. You can also select any **Group type** to change it to one of the other options: Support Group, Approver Group, Change Group, or Managed By Group.

Subscribe users to a service offering in Service Portfolio Management

Subscribe users to a service offering so they can order it from the catalog. You can also subscribe offerings for companies, locations, groups, and departments.

Before you begin

Role required: com.snc.service_portfolio

Role required: service_editor

About this task

Subscribers define who a service offering is for. Subscribe users to service offerings so they can view and request catalog items related to the service offering. For example, if a service is

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

for video teleconferencing, it might have two offerings — one for a personal communications platform and one for a webinar. To select either option, users must order the option from the catalog. To order, they must be added as a subscriber to that service offering.

The base system counts the number of subscribers per offering and per service. It also enables you to send customer satisfaction (CSAT) surveys to subscribers to gain feedback about the service offering. You can choose the cadence for how often to send the surveys per interval.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service Offerings**.
2. Select a service offering that you want to add subscribers.
3. Select the *Subscribed by User* related list (tab), and then select **Edit**.
   Alternatively, you can select one of the other related lists (tabs) to subscribe groups, locations, departments, or companies.
4. Select the subscriber name from the **Collection** and move it to the **Subscribed by User List**.
5. Select **Save**.

Create catalog items for service offering subscribers in Service Portfolio Management

As a service owner or service offering subscriber, you can create one or more catalog items for your service regardless of the offering phase or status. You can also relate an existing catalog item to a service offering.

Before you begin

Role required: com.snc.service_portfolio or service_editor

About this task

Use the **Items orderable by subscribers** related list (tab) on a service offering to:

- Relate an existing catalog item to a service offering.
- Create catalog items for a service offering.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Service offerings**.
2. Open a service offering that you want to relate a catalog item to or add a catalog item to.
3. Select the **Items orderable by subscribers** tab.
4. **Optional:** Relate a catalog item to an existing service offering.
   a. Select **Edit** to see a list of catalog items that you can relate to the service offering. The list of catalog items includes record producers. To see a list of record producers, open a new tab and type *`sc_cat_item_producer.list`* in the Filter navigation field.
   b. Move the catalog item from the **Collection** list to the **Items orderable by subscribers List**.
   c. After you have moved all the catalog items that you want to relate to the service offering, select **Save**.
5. Create a catalog item for the service offering.
   a. Select **New**.
   b. On the form, fill in the fields.

Catalog Item form

Field	Description
Name	Unique name for the catalog item.
Catalogs	The catalogs that this item is related with.
Category	Category for the item. Adding the catalog enables others to search for this item.
State	State of the catalog item. When creating a catalog item, you can't edit the **State** field. The state changes to **Draft** after you select **Submit**.
Checked out	Name of the person who has the catalog item checked out for editing.
Owner	Owner of the catalog item.
Fulfillment automation level	The fulfillment level of the catalog item.
Item Details	
Short Description	Short description that is viewed on the service catalog homepage, search results, and the title bar of the order form.
Description	Full description of the catalog item. You can embed videos, images, links to internal Knowledge Base (KB) articles, and links to external sources of information.
Meta	Comma-separated list of tags used to search for the catalog item. Use commas between keywords for better results when searching. For more information, see Configure keyword search for catalog items.
Process Engine **Note:** You can specify a value for only one of these fields.	
Flow	Flow that defines the fulfillment of the catalog item.
Workflow	Workflow that defines the fulfillment of the catalog item.
Execution plan	Execution plan that defines the delivery of the catalog item.
Picture	
Icon	Image next to the catalog item in the catalog. The icon dimensions are 27x27 pixels. If no image is uploaded, the default icon is next to the catalog item. Your uploaded image overwrites the default image stored in `images/service_catalog/generic_small.gif`.
Picture	Image of the item.
Pricing	
Price	Price for the catalog item. Select the currency from the list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Recurring Price	Price for the catalog item that recurs. For example, a maintenance service could have a monthly recurring price.
Recurring Price Frequency	Time frame for recurrence, such as **Monthly** or **Annually**.
Portal Settings	
Use these settings to configure the catalog item behavior in the Service Portal.	
Request method	Setting that controls the label for the **Order Now** button and the order submission experience. ▪ **Order**: ▪ Button label: **Order Now** ▪ Confirmation dialog box: Displayed ▪ Delivery information: Editable **Note:** This setting is the default setting. ▪ **Request**: ▪ Button label: **Request** ▪ Confirmation dialog box: Displayed ▪ Delivery information: Not displayed This setting can be used in scenarios such as a code access request where the delivery information is pre-determined. ▪ **Submit**: ▪ Button label: **Submit** ▪ Confirmation dialog box: Not displayed ▪ Delivery information: Not displayed This setting can be used in scenarios such as a reset password request where no further request information is required.
Hide 'Add to Cart'	If selected, the **Add to Cart** button isn't displayed for the item. If the **Show Add to Cart** instance option of the widget is set to **false**, then this setting is ignored. This setting is selected by default if the **Request method** is **Request** or **Submit**. For upgrade scenarios, if the **No cart** field is selected in Platform, then run the *CatalogPortalSettingsMigration* script include to update this setting to the **Hide 'Add to Cart'** field on the **Portal Settings** tab. **Note:** This field is applicable for a catalog item and order guide.
Hide Quantity	If selected, the **Quantity** list isn't displayed for the catalog item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Hide Quantity is selected by default if the **Request method** is **Request** or **Submit**. For upgrade customers, if the **No quantity** field is selected in Platform, run the *CatalogPortalSettingsMigration* migration script to update this setting to the **Hide Quantity** field on the **Portal Settings** tab. **Note:** ▪ Applicable for a catalog item. ▪ An order guide inherits this setting from the included catalog item.
Hide Delivery time	If selected, the **Delivery Time** field isn't displayed for the catalog item. **Hide Delivery time** is selected by default if the **Request method** is **Submit**. **Note:** ▪ Applicable for a catalog item. ▪ An order guide inherits this setting from the included catalog item.
Hide 'Add to Wish List'	If selected, the **Add to wish list** button isn't displayed for the catalog item. If the wish list is inactive for the catalog item or the portal widget instance option is set to **false**, then this setting is overridden for the item. **Note:** Applicable for a catalog item and record producer.
Hide Attachment	If selected, the **Add attachments** button isn't displayed for the catalog item. **Note:** ▪ Applicable for a catalog item and record producer. ▪ An order guide inherits this setting from the included catalog item.
Mandatory Attachment	If selected, adding an attachment is required for the catalog item. **Note:** Applicable for a catalog item and record producer.

6. **Submit**.
   Before you submit, select **Try It** to see the result.

Reporting for services and service offerings

See what's impacting your services and service offerings and report on them by using related list information in Service Portfolio Management.

Service owners can track service level agreements (SLA) when an incident (or a problem or a change) references their service offering in one of these related lists: Impacted services or Affected configuration items (CIs). Portfolio admins can create indicators and reports for service offerings to get a comprehensive view of what is impacting each service offering.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Offering record related lists

On the service offering record, there are three related lists that impact your service offerings:

- All Incidents
- All Problems
- All Changes

As implied, each related list retrieves all the incidents, all the problems, and all the changes where the service offering has them added as part of these areas:

- Service offering field on the record
- Affected CIs related list on the record
- Impacted services related list of the record

You can also filter on each related list to find specific items.

SLA commitment reporting

When a service offering is added to the impacted service or to the affected CI related list, the SLA breach reporting is triggered for that offering. The trigger happens even if the offering isn't listed in the service offering field on the record.

View availability results in Service Portfolio Management

Service Portfolio Management service offering price

Service offerings inherit the pricing structure of the associated parent service. If the price model for each service offering in Service Portfolio Management is defined in the parent service as per unit, then each service offering must also have an associated price unit. The actual price for that unit is established in the service offering record.

You can review service offering information regularly as a part of Data Certification and workflow. For example, you can set up a certification to validate pricing for your service offerings.

Forecast service usage and cost for a fiscal period to plan your future business using the Showback functionality of Financial Management.

To set a service offering price, navigate to **Service Portfolio Management** > **Service Offerings** and select an offering for which a defined pricing structure exists. Enter the **Price** for the service price unit and update the record. You can also type an optional description in the **Unit description** field of the service offering record.

Log outages in Service Portfolio Management

Log outages to adjust your business or technical service commitment availability.

Before you begin

Role required: service_editor

About this task

Service Portfolio Management tracks and reports on outages for all business or technical service offerings that include availability commitments.

The outage is used to evaluate the availability of the offering and appears in the reports generated for this offering. There are three types of outages:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Outage**: An unplanned outage that could be caused by hardware or network issues. The only type of outage that's considered when calculating the availability of a business or a technical service.
- **Planned Outage**: A necessary, expected outage caused by planned maintenance or an upgrade.
- **Degradation**: A problem that affects a business or technical service but doesn't result in a disruption of that service.

Outage records can relate to multiple configuration items (CIs). You can link a single outage to multiple CI records using the Affected CIs related list.

Note:
An outage must be created and saved before you can add a CI relation or link an outage to multiple CI records using the Affected CIs related list.

View a unique **Outage Number** identifier for your outage records. View the Outage Number column in the Outage table records list and on the Outage form.

Note:
The Outage Numbering plugin (com.snc.outage_numbering) must be activated to introduce number data. The plugin is automatically activated for all instances and upgrades except those instances that already have a number prefix column on the Outage table. If the plugin isn't active and you want to move to the base system field, see the Activate Outage Numbering plugin [KB0823685] article in the HI Knowledge Base or contact Customer Service and Support.

When an outage is opened against a business or technical service, all child offerings are added to the Affected CI related list on the outage form. A pop-up message notifies you that the outage affects all child offerings. If needed, the offerings can be removed from the Affected CIs related list.

Procedure

1. Navigate to **Service Portfolio Management** > **Outages**.
2. Select **New** to create an outage or find the business or technical service offering in the Outages records list **Configuration item** field to edit.
   - If creating an outage, the Outage form opens.
   - If editing an existing outage, select the outage in the **Type** field.
3. Edit the **Type** field as necessary or choose **None**.
4. **Optional:** Enter text in the **Message** field.
5. Enter the length of the outage.
   - Select the **Begin** and **End** dates and times with the calendar or
   - Enter the **Duration** as a function of days and hours.
6. Select and hold (or right-click) in the form header to save the record or select **Submit** or **Update** if editing an existing outage record.

   Note:

   If a single outage impacts multiple business or technical service offerings, you can add those offerings to the Affected CIs related list.

7. To add an associated affected CI, select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All affected CIs are listed in the **Service Offering** configuration class.

8. Select a single CI or group of CIs.
   Select the box next to the CI name and then select **Add Selected**. Alternatively, you can choose to add all the listed affected CIs to the outage record by selecting **Add All**.
9. Close the Add Affected Configuration Items list window.
   The CI or CIs are added to the Affected CIs related list.
10. Select **Update**.

View availability results in Service Portfolio Management

View availability calculations for commitments on service offerings and application services. After the commitments are set up in Service Portfolio Management, you can view the results by an automated report that you set up.

After an availability commitment is added to a service offering or to an application service, Service Portfolio Management generates a year of availability records for that item and commitment, starting from the previous year. Service availability is based on the availability of the offerings, rolled up to the service. If an outage is updated, then the related availability records are updated as well so you can assess outage impacts and manage outage records.

Service Portfolio Management runs a daily job to generate the commitment availability reports and uses the system time zone.

For information on adding availability commitments, see Add a commitment to a service offering.

Availability calculator

Starting with the Xanadu release, you can use an availability calculator *[com.snc.availability.v2]* for improved performance, calculations, and maintenance.

The availability calculator is redesigned from its predecessor to ensure that you see the most updated and accurate availability data in the period that you want.

Service Portfolio Management creates availability records on the first of the period so you can see the availability as the period progresses. This real-time data is especially valuable when you've committed to a specific level of availability for your customers.

Also, the improved calculator updates the record as outages are created. For example, you can start off with 100% availability, and then when an outage happens, it updates to 99.95% based on the outage duration. You and your customers can rely on accurate availability data during outages, without repeated outage recalculations with no end date (as with the previous calculator).

Here are the availability period options that you can choose from when using the updated availability calculator:

- Daily
- Weekly
- Monthly
- Annually
- Last 7 Days
- Last 30 Days
- Last 12 Months

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New customers automatically get the updated availability calculator, but existing customers must set the property to 'true' to opt in.

To set the updated system property to 'true,' admins must do the following:

- Type `sys_properties.list` in the Filter navigator, and then press **Enter**.
- Select the **for text** search option.
- Type **availability** in the **Search** field, and then press **Enter**.
- Find the *[com.snc.availability.v2]* option, and then set its value to true.

Availability reporting for application services

To view availability reporting for application services, you must create and map availability commitments to an application service using the *[cmdb_ci_service_auto table]*.

In the *[cmdb_ci_service_auto table]*, use the *cmdb_ci* field in the *service_offering_commitment* field to associate an application service to an availability commitment.

Generate availability results

To view availability results, navigate to **All** > **Service Portfolio Management** > **Availability**, and then select the related record from the list.

Service availability fields and calculations

Field	Description	Calculations
Display name	Name of the configuration item (CI) and the availability for the commitment. You can't edit this field.	Not applicable.
Service offering	The affected offering for this availability.	Not applicable.
Service commitment	The affected commitment for this availability.	Not applicable.
Start	Start of the availability interval. Mouse device pointing over this field displays the duration.	Not applicable.
End	End of the availability interval. Mouse device pointing over this field displays the duration.	Not applicable.
Committed uptime	Total expected service availability for this commitment, given in days, hours, minutes, and seconds.	Period end to period start.
Acceptable downtime	Acceptable amount of downtime against the commitment's schedule for this interval, given in days, hours, minutes, and seconds.	Scheduled period end to scheduled period start, multiplied by commitment percentage.
Total downtime	Wall clock downtime (independent of the schedule), given in days, hours minutes, and seconds.	Outage end to outage start.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service availability fields and calculations (continued)

Field	Description	Calculations
Total availability %	Availability percentage for the entire interval (independent of the schedule).	(Available uptime minus the total downtime) divided by the available uptime.
Total outages	Total number of outage periods in this interval (independent of the schedule). **Note:** If an unplanned outage (in full or in part) overlaps with a planned outage, then the unplanned outage time that overlaps doesn't count toward the total outage time. This logic applies to the CI and affected CIs on the outage record.	Number of outages.
Commitment availability %	Availability within this commitment's schedule.	(Committed uptime minus commitment downtime) divided by the committed uptime.
Commitment downtime	Downtime that counts against this commitment's schedule, given in days, hours, minutes, and seconds.	(Outage start minus outage end) in scheduled up time.
Commitment outages	Number of outage periods against this commitment's schedule in this interval.	Number of outages in scheduled uptime.
Met commitment	When checked, indicates that the availability commitment has been met.	True or false depending on if commitment availability percentage is higher than the service commitment.
Mean time between failures (MTBF)	Average time between commitment outages for a CI.	Basic formula: Total uptime in period divided by the number of outages in period (Commitment outage periods), where total uptime in period = (Committed uptime minus Committed downtime).
Mean time to restore service (MTRS)	Average duration of commitment outages for a CI.	Basic formula: Total duration (Commitment downtime) divided by the number of outages in period (Commitment outage periods).

Note: For more information about calculations for MTBF and MTRS, see KB1505841.

Archival rules for better performance

Starting with the Vancouver release, archival rules are activated by default. Service Portfolio Management uses a scheduled job called table cleaner to archive older records from tables in the instance to keep table sizes and query performance manageable. To ensure you get quicker

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

data results, Service Portfolio Management uses the table cleaner job to archive availability data that is older than three years.

Set the time zone for availability results in Service Portfolio Management

By default, the time zone to calculate availability for services and commitments is set to the global (system) time zone. You can change the global time zone or you can set the time zone for service commitments. With either option, you can recalculate the availability results based on the time zone that you set.

Before you begin

Role required: portfolio_admin or admin

About this task

The following system properties work in the background for you to set the time zone for availability results:

- spm.availability.global.tz — The default time zone, also called the system time zone. This system property enables you to select a time zone from a list to calculate availability results for all commitments using this global time zone.
- spm.availability.commitment.tz — When set to true (or to Yes in the interface), this system property enables you to calculate availability results using the time zone that you select for a commitment record.

To set the time zone, the availability system property [com.snc.availability.v2] must be set to true.

1. In the Filter navigator, enter `sys_properties.list`.
2. Enter `*avail` in the **System Properties Name** search field, and then press **Enter**.
3. Verify that the availability system property [com.snc.availability.v2] is set to true.

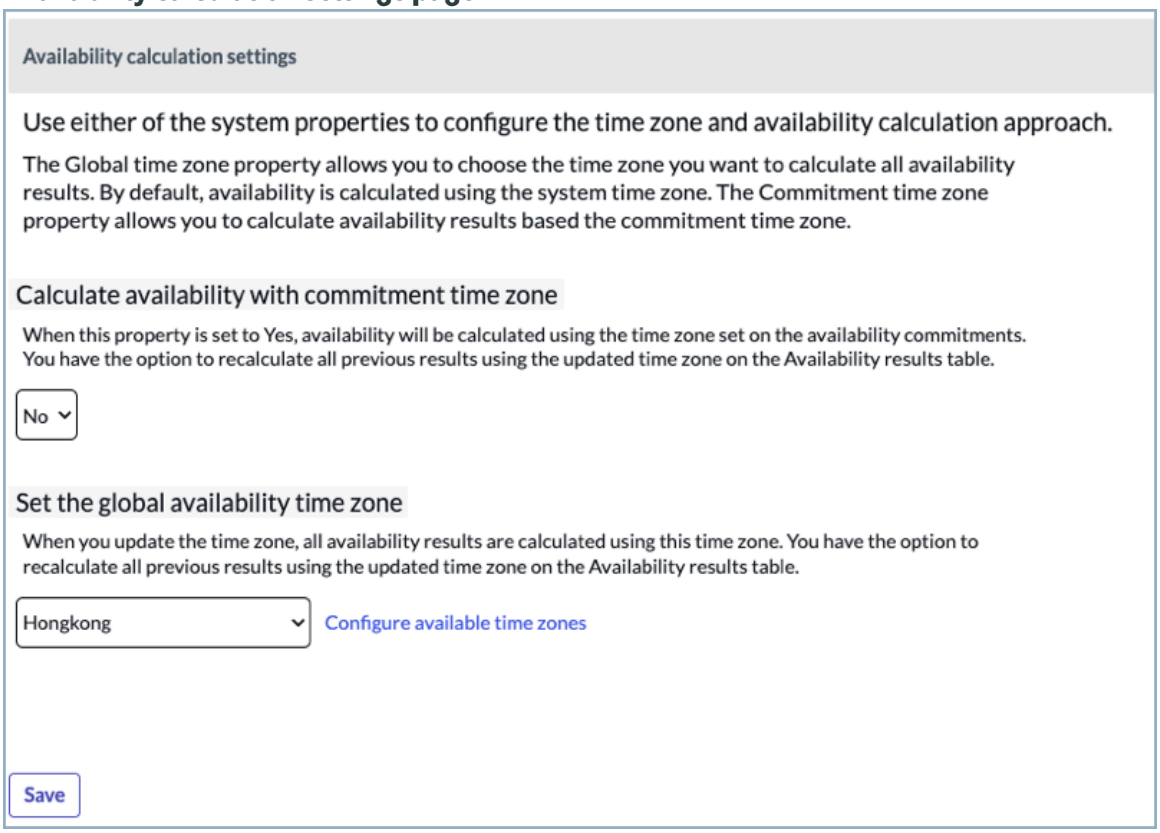
> **Note:**
> If the availability system property isn't set to true, then select the system property name, set the Value field to true, and then select **Update**. A banner might display with a link to edit the record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Administration** > **Availability calculation settings**.

Availability calculation settings page



2. Decide how you want to calculate availability.
   - **Calculate availability with commitment time zone** or
   - **Set the global availability time zone**.

   Refer to the **Availability calculations settings page** image for the next steps.
3. **Optional: Calculate availability with commitment time zone**.
   a. On the **Availability calculations settings** page, select **Yes** to **Calculate availability with commitment time zone**, and then **Save**.

   Note:
   Notice that the global availability time zone can't be set.

   b. In the Core UI tab, navigate to the list of service commitments.

   Tip:
   To see a list of service commitments, enter `service_commitment.list` in the Filter navigator, and then press **Enter**.

   c. Open a service commitment that you want to change the time zone. In the **Time zone** field, use the down arrow to select a different time zone, and then select **Update**.
   d. The **Time zone** column of the Service commitment table shows the time zone that you updated.
4. **Optional: Set the global availability time zone**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the **Availability calculations settings** page, select **No** to **Calculate availability with commitment time zone**.

b. Use the down arrow to **Set the global availability time zone**, and then **Save**.

c. In the Core UI tab, navigate to the service availability list.

> **Tip:**
> To see the service availability list, enter `service_availability.list` in the Filter navigator, and then press **Enter**.

d. Select **Recalculate results**, and then select **Recalculate** on the **Confirmation** page.

e. Select **Refresh** ( ) on the service availability list to see the updated time zone in the **Time zone** column.

> **Note:**
> It takes a few minutes for all the records to recalculate and show the updated time zone field.

5. **Optional:** Configure the available time zones.

a. On the **Availability calculations settings** page, select **Configure available time zones** to open it in another tab.

b. In the opened tab, select the time zone from the **Available** field and move it to the **Selected** field.

> **Note:**
> You can also add a time zone to the **Available** field. Enter a time zone in the **Enter new item** field, and then select **Add**.

c. Select **Save**.

d. To return to the **Availability calculation settings** page, select its tab.

6. Select **Save**.

Convert services in bulk in Service Portfolio Management

Convert multiple services from the Configuration Management Database (CMDB) service table to one of the dedicated child tables. You can convert to a business service or to a technical service.

Before you begin

Role required: admin

About this task

You can convert services individually but to reduce manual overhead, convert multiple services at once from the CMDB service table [cmdb_ci_service] to one of the dedicated child tables:

- Business service table [cmdb_ci_service_business]
- Technical service table [cmdb_ci_service_technical]

When you convert a service, the record and all its relationships remain intact.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Service offerings can't be converted but they inherit the parent type (Service classification if your organization uses that field).

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Services**.
2. Select the services that you want to convert.
   If your organization uses the Service classification field for business and technical services, then you can filter by Service classification.
3. Select **Actions on selected rows**, and then select **Convert to business service** or **Convert to technical service**.
4. At the prompt, select **OK** to continue to convert the services or select **Cancel**.

   Note:
   If a selected item can't be converted, a warning message is displayed.

5. **Optional:** Convert a service while in the service record.
   To convert a service wile in the service record, find the convert options under **Related Links**. If you don't see the convert options, then you might be in a record that isn't in the CMDB service table [cmdb_ci_service].

View Service Level Agreement (SLA) results in Service Portfolio Management

Service Portfolio Management leverages the Service Level Management application and includes a module to manage your Service Level Agreement (SLA) definitions and results.

You can view, modify, or create SLA definitions from the Service Portfolio Management application. You can also view, modify, or create SLA results. Refer to Service Level Agreement (SLA) definition and Create an SLA definition for information about SLA definitions and configuration. For complete detailed information about SLAs, refer to Service Level Management.

After you define service commitments for your offerings, you can monitor the SLA results to manage performance by the running a daily job that generates the SLA results.

To enable Service Level Agreement (SLA) commitment support to Service Portfolio Management, activate the com.snc.service_portfolio.sla_commitment plugin. For more information, see Activate Service Portfolio Management.

To view the SLA results, navigate to **Service Portfolio Management** > **Service Level Management** > **SLA Results**. To edit an SLA result, select the name of the SLA result to open the SLA Result form. Change any of the form field data as needed.

SLA Result form

Field	Description
Service offering	Select the service offering for which you want to create or modify an SLA Result record.
Service commitment	Select the service commitment to apply the SLA Result record.
Start	Specify the start date for this SLA Result interval.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Result form (continued)

Field	Description
End	Specify the end date for this SLA Result interval.
Company	Specify the company for which the SLA Result record is created.
Required SLA percentage	Enter the percentage of tasks that must meet this SLA.

Note:
The following fields display SLA result data when available:

- **Total tasks** — Total number of incidents that are opened against the service offering.
- **Breached** — Number of tasks that breached this SLA for this interval.
- **Achieved** — Number of tasks that achieved this SLA for this interval.
- **Total achieved %** — SLA percentage achieved for the entire interval.

Note:
When an SLA definition is triggered against a particular task, a task SLA record generates and contains all the tracking data for the specific SLA on that record. To create an SLA task or modify an existing task, refer to Task SLA table.

Service Portfolio Management reference

Reference topics provide additional information about the roles, lists, and forms to configure and administer Service Portfolio Management.

Installed with Service Portfolio Management

Service Portfolio Management Core is active by default for users with ITSM licences. Service Portfolio Management Foundation is administrator activated and enables you to document portfolios, taxonomies, services, and service offerings using a standardized, structured format.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Service Portfolio Management plugins

The following two plugins enable you to use the full functionality of Service Portfolio Management:

- Service Portfolio Management Core [com.snc.service_portfolio_core]
- Service Portfolio Management Foundation [com.snc.service_portfolio]

The Service Portfolio Management Foundation plugin automatically activates the Service Portfolio Management Core plugin. Each plugin independently installs a set of roles and tables.

If you install Service Builder from the ServiceNow Store, its plugin [com.snc.service_builder] automatically installs. Service Builder uses the same role set as Service Portfolio Management. See Service Builder for more information.

Role	Role actions	Contains roles
	of which they're an owner or have created.	

Tables installed with Service Portfolio Management Foundation

Table	Description
[spm_service_portfolio]	Used to create or modify a service portfolio.
[spm_taxonomy_layer_definition]	Used to define the order of a taxonomy layer associated with a service portfolio. **Note:** Use this table with the legacy portfolio structure. The standard portfolio structure doesn't have taxonomy layers. For more information, see Service Portfolio Management portfolios.
[spm_taxonomy_node]	Used to create or modify a taxonomy node associated with a service portfolio.
[service_subscribe_company]	Used to associate service offering subscriptions to a specific company.
[service_scope]	Used to store user-defined limits to the service levels of a service.
[service_subscribe_department]	Used to associate service offering subscriptions to a specific department.
[service_availability]	Used to store the calculated availability records of a service.
[service_subscribe_sys_user]	Used to create a module enabling you to categorize subscribers by individual users.
sc_cat_item_subscribe_mtom	Used to create a catalog item and make it available for subscription.
sc_cat_item_subscribe_no_mtom	Used to create an item while not making it available for subscription.
service_subscribe_location	Used to specify where a service offering is located, by actual physical address.
sc_cat_item_service	Used to enter an item in the Service Catalog.
service_offering_commitment	Used to create and configure service commitments by specifying orders and associating service offerings.

service_out_scope	Used to create and define services Out of Scope and specify the scope parameters.

Domain separation and Service Portfolio Management

Domain separation is supported in Service Portfolio Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic*

The support level is Basic but has some exceptions or special conditions.

- Business logic: Ensure that data goes into the proper domain for the application's service provider (SP) use cases.
- The user interface, cache keys, reporting, rollups, and aggregations all use the domain at production run time.
- The owner of the instance must be able to set up the application to function across multiple tenants.

Sample use case: When an SP uses chat to respond to a tenant-customer's message, the client must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

*All components of Service Portfolio Management (SPM) and Service Owner Workspace (SOW) are domain-separated in releases of New York and forward. If using Financial Management for the SPM plugin for estimated spend, there can be only one fiscal calendar defined per instance. When this plugin is activated, there can be only one approach for service offering cost modeling per instance (using either the Financial Management engine or local data. Different domains cannot choose their own spend model.

Domain separation for service providers

Service Owner Workspace

ServiceNow® Service Owner Workspace provides an integrated Service Portfolio Management experience. If you're a portfolio manager or service owner, you can manage and monitor portfolios and services in an integrated user interface.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace but customers who opt in for the new standard portfolio structure must implement Digital Portfolio Management (DPM). See Digital Portfolio Management. For information on the deprecation process, see Deprecation Process [KB0867184].

Service Owner Workspace is available as a separate subscription and is part of the Service Portfolio Management Premium experience.

Track and analyze how your services are performing and which services need attention. You can also integrate data from the Vendor Management Workspace, Contract Management, SLA Contracts, Risk Management, and Continual Improvement Management (CIM) applications to quickly access data from one place.

Key features

Data all in one place

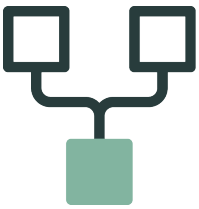
Manage the performance of your services. Evaluate performance against value to ensure your services merit the investment.

Comprehensive service performance layout

Analyze service performance metrics using a comprehensive layout of all information that is related to a service and its offerings.

Integrated application data

Use aggregated data from multiple applications and measure service performance using qualitative and quantitative metrics.



Get started

Select a tile to get started.

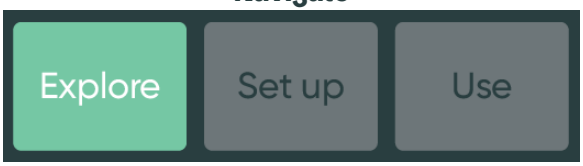
Exploring Service Owner Workspace

The Service Owner Workspace provides portfolio and service owners with an integrated and graphically intuitive user experience to manage and monitor portfolios and services.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate



How Service Owner Workspace works

Service Owner Workspace is a read only user interface driven by Service Portfolio Management Premium plugin (com.snc.spm) functionality. Service Portfolio Management Premium collects service offering metrics and rolls these calculations up to parent services and taxonomy nodes for performance scores and other metrics viewed via Service Owner Workspace. Performance Analytics indicators capture this data and Service Portfolio Management Premium uses the Performance Analytics data as input metrics to calculate a service offering performance score. These indicators can also track data about a service offering without including it in the offering performance score.

Users can create new metric definitions or use the metric definitions provided in the base system application. Assign metrics to service portfolios and define weights for every metric at an offering level to provide more granularity into performance. Daily jobs then calculate the offering performance score and roll the scores up to the service and other associated taxonomy nodes to monitor in Service Owner Workspace.

Service Owner Workspace browser requirements

ServiceNow workspaces do not support mobile devices, and, starting with the Orlando release, Internet Explorer, or Microsoft Edge. Instead, use Microsoft Edge-Chromium or one of the other supported browsers listed in Browser support. If you're using New York or an earlier release and you're using Internet Explorer 11 or Microsoft Edge with any workspace, such as ServiceNow® CSM Agent Workspace or ServiceNow® Vendor Manager Workspace, you must migrate to a newer browser before you upgrade to at least the Orlando release. See the Internet Explorer 11 Performance [KB0683275] article in the Now Support Knowledge Base for more information.

Service Owner Workspace overview

Manage and monitor your services with premium features. View service offering details in the workspace:

© 2026 ServiceNow, Inc. All rights reserved.

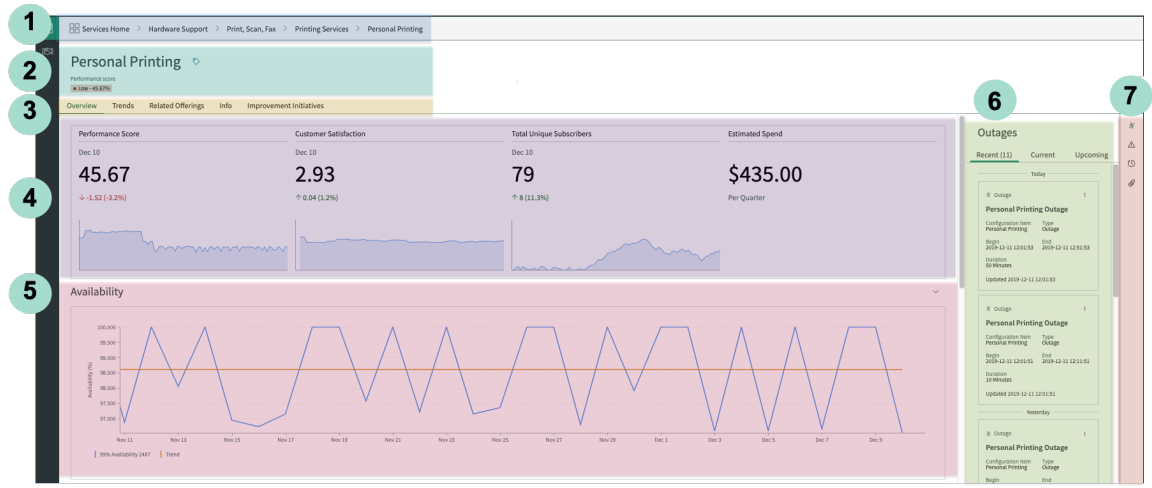
Service offering details



Number	Agent Workspace feature	Description
1	Tabs	The multi-tab interface enables you to easily navigate between service-related records. • All services open in the **Services Home** tab. • Associated service offering details open in subtabs. Drill down to the lowest hierarchical level to view details about all related service offerings.
2	Form header	The form header provides you with a quick summary of the service offering and an associated performance score. Estimated spend details appear in the form header when available.
3	Related items menu	Service-related information is available to view in the related items menu. Click an item to see the related information.
4	Ribbon	Ribbon components display service offering performance score, customer satisfaction, and total subscriber trends. Estimated spend data is also viewable when available.
5	Form pane	Additional service-related information is displayed as you scroll down the page and drill deeper into the data. Information includes, service-offering availability, breached SLAs, customer satisfaction, stability, and activity.
6	Contextual side panel details	Unique data details are displayed. Click icons to display **Outages**, **Critical Incidents**, **Change Requests**, or **Attachments** details.
7	Contextual side panel	The contextual side panel displays unique data depending on which icon you select.

Integration with Common Service Data Model

Improve your measurement and evaluation by using services and offering references on multiple IT Service Management task forms, including:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Problem
- Change
- Continual Improvement Management
- Incident

Directly reference a service offering as the target of a problem, change, or incident for consistency with the Common Service Data Model (CSDM). The system filters available offerings based on the service selected.

View and define the service model **Model ID** reference field on the Service and Offering forms to integrate with the CSDM.

Service Owner Workspace performance metrics

Service Owner Workspace includes a metrics model in the platform Service Portfolio Management Premium application for measuring the performance of services offerings. These performance metrics are then aggregated to services and taxonomy nodes via a weighting mechanism.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. Customers who opt in for the new standard portfolio structure use metrics calculated from key performance indicators (KPIs) in Digital Portfolio Management (DPM). For more information, see Digital Portfolio Management.

Navigate

Metric Definitions

When activated, Service Portfolio Management Premium collects service offering metrics which permit calculations to roll up to parent services and taxonomy nodes for performance scores and other metrics. All metric configurations are performed in the platform application. Service owners can view these performance scores and metrics via Service Owner Workspace. The following **Metric Definitions** are installed with the Service Portfolio Management Premium plugin (com.snc.spm):

Activity

The metric indicator is from service portfolio-related catalog activity. The metric is calculated from fulfilled request items derived from catalog items, which are connected to service offerings.

Availability

The metric indicator is Service Portfolio Management availability as calculated from outage records.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If more than one Availability commitment exists for a service offering, at least one must be set as the Primary for trending purposes. Only one availability commitment is considered for performance score calculation, determined by the **Use in performance score** flag. Additional features include:

- Creation of Availability definitions specific to describe Availabilities for service offerings.
- Directly link a service offering commitment to an Availability definition.
- Maintain Availability statistics regarding outages.

Breached SLA

The metric indicator is from an SLA record, based on a breached SLA. Calculations depend on activation of the Service Portfolio Management SLA Commitments plugin (com.snc.service_portfolio.sla_commitment), which enables the following features:

- Creation of SLA definitions specific to describe the SLAs in place for service offerings.
- Directly link a service offering commitment to an SLA definition.
- Maintain SLA statistics regarding breaches.

Note:
If more than one SLA commitment exists for an offering, at least one must be set as the Primary for use in performance scoring. Only one SLA commitment is considered for performance score calculation, determined by the**Use in performance score** flag.

Customer Satisfaction

Calculations are tabulated from surveys sent to unique subscribers to an offering.

Critical Incidents

The metric indicator is calculated from a combination of daily P1 and major incident counts. You will need to update the lower and upper boundary for this metric. For details refer to Service offering performance weighting.

Note:
Prior to the Quebec release, the **Critical Incidents** metric was called **Stability** and was depicted as a single score widget on the **Trends** tab the workspace. The data currently appears as a time series chart. The default time frame for Service Owner Workspace metric performance is 30 days, except for the **Critical Incidents** metric, which shows all open major and P1 incidents per day.

Service offering performance weighting

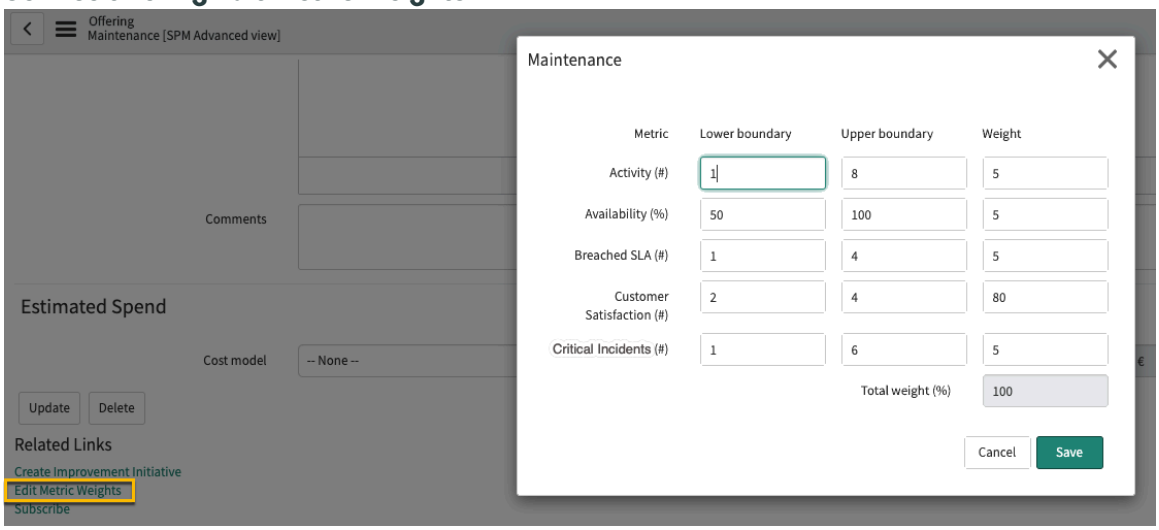
Service owners can vary the inclusion and weighting of service offering metrics to reflect the business needs and perspectives of their stakeholders. Metrics are normalized and weighted to determine the performance of an offering. Metrics are only maintained for service offerings with an operational status. Weights must equal 100 percent.

To disable a service offering metric with unavailable or unreliable data from performance calculations, you can set the metric weight to 0 in the platform Service Portfolio Management Premium application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Click the **Edit Metric Weights** Related Link on the **Service Offering** form to edit the upper and lower boundaries for each metric. The **Maintenance** pop-up window appears for you to customize per service offering. The upper and lower boundaries define how a metric is measured against a 0 through 100 percent scale and normalized together. To obtain a 100% score for negative metrics, such as for Critical Incidents, the score must be below or equal to the lower boundary.

Service offering Edit Metric Weights



Service offering to service performance weighting

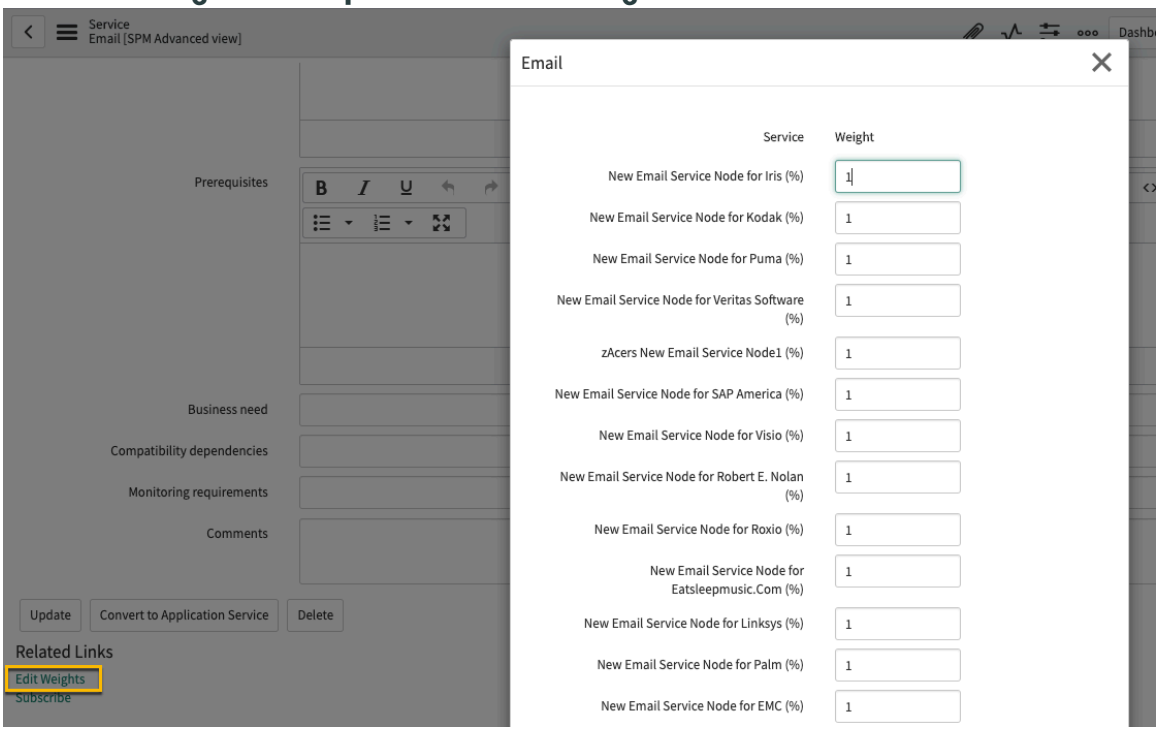
Service owners can vary the inclusion and weighting of the service offering in service performance to reflect the business needs and perspectives of their stakeholders. Service offering performance is weighted and combined to determine the performance of a service. Only offerings with an operational status are used to contribute to service performance.

Set a service offering weight to 0 to disable it from the performance calculations of its parent service.

Click the **Edit Weights** Related Link on the **Services** form to edit the weights for associated offerings. Weights are valued against a 0 through 100 percent scale and normalized together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service offering to service performance Edit Weights



Note:
Upper and lower weight boundaries can be anything, from negative numbers to thousands of numbers. They do not have to be 0 to 100. But the outcome of the linear ranging math is to use those boundaries to make a normalized number between 0% and 100%.

For example, the normalization process dictates, that if you choose -20 and 150 as lower and upper boundaries, then anything at -20 or below will get normalized to 0% and anything at or above 150 will get normalized to 100%. Every number in between -20 and 150 is scaled to within the 0 through 100 range.

Another way to describe the normalization process is, for example, if you choose 5 and 150 as lower and upper boundaries and the metric is negative (minimize). With this metric anything below or equal to 5 gets a normalized score of 100%. Therefore, for a negative metric, the lower the raw score is, the higher the normalized score, which is capped at 100%. If you choose 5 and 150 as lower and upper boundaries and the metric is positive (maximize), then anything below or equal to 5 will get a normalized score of 0%.

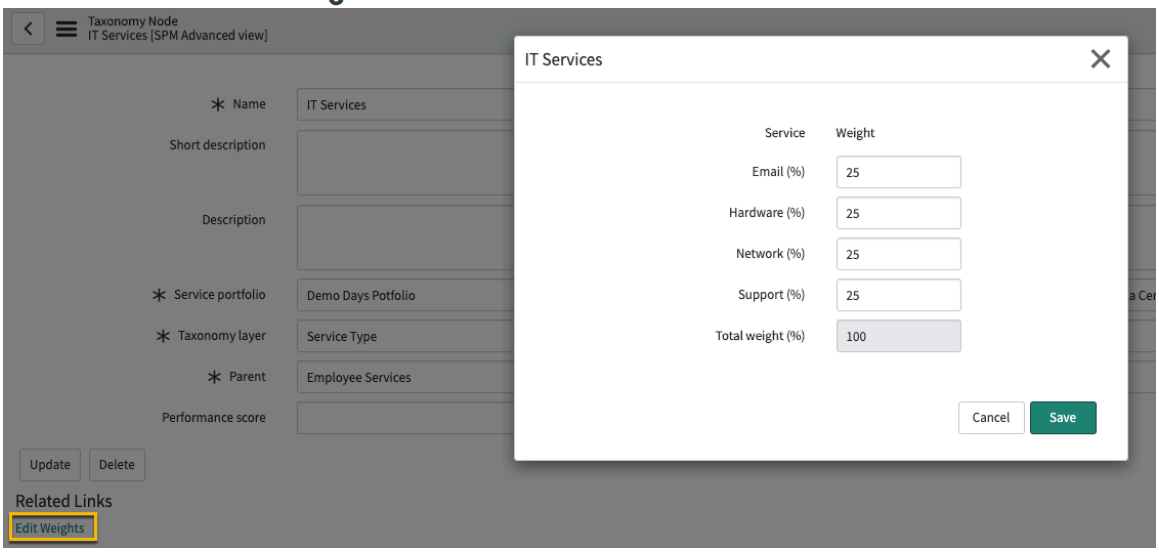
Service to nodes performance weighting

Portfolio owners and editors can vary the inclusion and weighting of services in node performance to reflect the business needs and perspectives of their stakeholders. Service performance is weighted and combined to determine the performance of sublevel taxonomy nodes, also called child nodes.

Use the **Edit Weights** Related Link on the **Taxonomy Nodes** form to edit the associated service weights. Service weights are valued against a 0 through 100 percent scale and normalized together.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service to nodes Edit Weights



Node to node performance weighting

Portfolio owners and editors can vary the inclusion and weighting of node in node performance to reflect the business needs and perspectives of their stakeholders. Node performance is weighted and combined to determine the performance of taxonomy parent nodes.

Performance scores

The performance score for services and offerings are highlighted with a different color in Service Owner Workspace based on the configured threshold limit defined on the portfolio record.

- Red: Indicates the score is lower than the set threshold limit.
- Amber: Indicates the score is within the set threshold.
- Green: Indicates the score is higher than the set threshold limit.

Performance score indicators

Metrics configuration

To view or configure Service Owner Workspace metric definitions, refer to Configure Service Owner Workspace metric definitions.

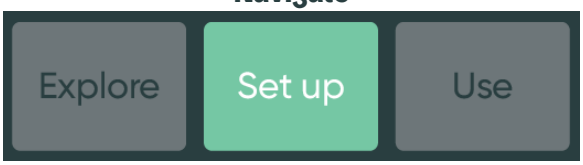
To view or configure Service Owner Workspace portfolio metrics, refer to Configure Service Owner Workspace portfolio metrics.

Setting up Service Owner Workspace

Prepare for your Service Owner Workspace experience by activating necessary applications, accessing quick start tests to ensure proper functionality, and configuring metrics to monitor.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate



Integrate with other applications

After activating the Service Owner Workspace plugin (com.spm_owner_workspace), align with other ServiceNow applications to expand your service portfolio monitoring experience.

Service Owner Workspace is meant to work seamlessly with Vendor Manager Workspace. Often service owners are also vendor managers. For this reason, activation of the Vendor Manager Workspace application is useful. Toggling between the two workspaces is easy because they share the same interface. Simply click the Vendor Manager Workspace icon in the workspace to view vendor-related data.

Workspace icons

Integrating with the Financial Management application provides estimated spend calculations based on fiscal periods and rolls spend data up from service offerings to associated services and taxonomy nodes within your portfolio. Estimated spend data is available to monitor and analyze in the workspace.

Refer to Service Owner Workspace integrations for complete details about applications that you can activate to add greater depth and value to your Service Owner Workspace monitoring experience.

Metrics definition and configuration

Monitoring your services involves metrics and scores that keep you apprised of how well your services are performing, how satisfied your customers are with the services you provide, and how many people are subscribing to your services. Defining metrics and applying the metrics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

to your portfolios, services, and offerings ensures an accurate and goal-oriented monitoring experience. You determine the upper and lower thresholds of service performance.

Portfolio setup automations

Choose from pre-built setup automations to apply to a portfolio to reduce your time creating services and offerings. Edit and update automations and scripts and define fields at the Service Portfolio record level which trigger when to run a script, or series of scripts.

- Automatically add five default metrics when you create a new service portfolio. You can choose not to add the metrics.
- Evenly weight all performance metrics for new offerings at the portfolio level.

  Each time an offering is created as part of a portfolio, the performance weight of each metric is evenly distributed. For example, each default metric is weighted at 20%.

  If re-parenting a service to a different portfolio, offerings will automatically assume the metrics of the new portfolio and the weights when the **Evenly weight performance metrics for new offerings** is active when creating a new portfolio. This same logic applies when an offering is created.

  Note:
  When you cannot evenly equal 100% across all metrics, use order to give the highest number the highest weight. For example, if you have seven metrics, you can weight the percentages as: 15, 15, 14, 14, 14, 14, 14. If you have three metrics, you can weight the percentages as: 34, 33, 33.

- Automatically create one-to-many offerings on a newly created service within a service portfolio or when adding a service to an existing service portfolio. The service must be associated with a service portfolio and it must not have any child offerings. When you activate this feature, a drop down field appears enabling you to choose how many offerings you want to create.

To activate these automations, refer to Create portfolios in Service Portfolio Management.

Activate Service Owner Workspace

The Service Owner Workspace plugin (com.spm_owner_workspace) is available as a separate subscription. It activates related plugins, including the Service Portfolio Management Premium plugin (com.snc.spm). Subscribing to Service Owner Workspace adds the service-owner user interface and premium functionality to your Service Portfolio Management environment.

Service Owner Workspace Migration Dashboard

Service Owner Workspace provides a migration dashboard to support your transition from the legacy Service Portfolio Management structure to the enhanced application structure.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

By viewing the **Migration Dashboard**, portfolio managers can quickly determine which existing services and offerings contain a deprecated structure or are considered orphaned in the enhanced Service Portfolio Management taxonomy structure.

Users with the following assigned roles can view the Service Portfolio Management dashboard:

- service_viewer
- portfolio_admin

Users with the portfolio_admin or service_editor role can modify services and service offerings to structurally comply with and migrate to the Service Portfolio Management Foundation application.

By default, the dashboard displays reports for all existing service portfolios. An interactive filter enables you to choose a single portfolio to view. The dashboard reports are visible even if there are no service portfolios defined.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Dashboard report categories display the number of related identified migration issues. If there are no migration issues identified for a report category, a 0 is shown.

Access the dashboard by navigating to **Service Portfolio Management** > **Migration Dashboard**. To view detailed information, hover over any report graphic. All report graphs can be refreshed for the latest data.

Migration issues are indicated when a number graphic greater than zero is indicated on the report. For these reports, hover over and click the number graphic. A list opens displaying the services or offerings that require modification to migrate to the Service Portfolio Management Enterprise structure.

The following reports are available on the **Migration Dashboard**. If migration issues are indicated, refer to the report description and how to remedy the issue for migration.

Migration Dashboard report	Description and migration task
Deprecated Operational Status Used for Offerings	Indicates the number of existing service offerings using the deprecated singular status of **Operational Status**. Modify these offerings by filling in both the **Phase** and **Status** fields on the **Service Offering** form. **Note:** Status can be one of several choices, such as **Design**, **Development**, **Build/ Test/Release**, **Operational**, and **Retiring**. Click **Update**.
Deprecated Operational Status Used for Service	Indicates the number of existing services using the deprecated singular status of **Operational Status**. Modify these services by filling in both the **Phase** and **Status** fields on the **Service** form. **Note:** Status can be one of several choices, such as **Requirements**, **Definition**, **Analysis**, **Approved**, and **Chartered**. Click **Update**.
Operational Services not in a Portfolio	Indicates the number of existing services not currently associated with a portfolio. Modify the **Service** form by selecting a portfolio in the **Service portfolio** field. Click **Update**.
Orphaned Services in Catalog Phase	Indicates the number of services in Catalog phase that do not have a parent taxonomy node.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migration Dashboard report	Description and migration task
	Modify the **Service** form by selecting a taxonomy node in the **Taxonomy node** field. Click **Update**.
Deprecated Usage of Service Catalog Entry	Indicates the number of services or offerings linked to a catalog item via the deprecated **Service Catalog Entry**(sc_cat_item_service) table.
Orphaned Service Offerings	Indicates the number of service offerings where the **Parent** field on the **Service Offering** form is not pointing to a parent service. Offerings must be children of a service. In the **Parent** field on the **Service Offering** form, search for and select the associated service. Click **Update**.
Cataloged Non-operational Offerings	Indicates the number of active catalog items connected to service offerings not in the catalog phase or with an operational status. Modify the **Service Offering** form **Phase** field to **Catalog** and the **Status** field to **Operational**. Click **Update**.
Services in Catalog Phase without Offering	Indicates the number of services in the **Catalog** phase without at least one associated service offering. An offering must be defined for a service to move into Catalog phase. To associate a service offering to a service, open a specific service offering associated with the cataloged service indicated in the **Migration Dashboard**. In the **Parent** field on the **Service Offering** form, search for and select the associated service. Click **Update**.

Service Owner Workspace integrations

Align with other product applications to add value to your Service Owner Workspace monitoring experience.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Service Owner Workspace and product alignment

Activate and integrate with these products to expand the functionality of Service Owner Workspace:

Vendor Manager Workspace

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate the Vendor Manager Workspace plugin (com.snc.vlm.vmw) to align this workspace data with Service Owner Workspace.

Manage your vendors from the same workspace interface to effectively gain knowledge of all vendor-related information.

Monitor and view vendor performance reports from the workspace view.

Decide what vendor metrics to monitor and manage in workspace view.

Calculate and view vendor CSAT weight and vendor service offering performance weight.

Financial Management

Activate the Service Portfolio Management Estimated Spend plugin (com.snc.spm.spend) to view service offering spend, enabling you to select between your local cost model and the cost model provided by the Financial Management application.

Activate the Financial Management for SPM plugin (com.snc.financial_management_for_spm) to provide preconfigured service offering cost models to view in Service Owner Workspace. Select between your local cost model and the Financial Management application model, when used.

Continual Improvement Management (CIM)

Display existing CIM records in Service Owner Workspace when a service relation is indicated on associated forms.

Service owners can initiate a CIM record when a performance issue with a service or offering is displayed.

Incident Management — Major Incident Management

Activate the Incident Management - Major Incident Management plugin (com.snc.incident.mim) to provide a consolidated workbench to view major incidents via the Service Owner Workspace activity stream.

Integration with Common Service Data Model

Improve your measurement and evaluation by using services and offering references on multiple IT Service Management task forms, including:

- Problem
- Change
- Continual Improvement Management
- Incident

Directly reference a service offering as the target of a problem, change, or incident for consistency with the Common Service Data Model (CSDM). The system filters available offerings based on the service selected.

View and define the service model **Model ID** reference field on the Service and Offering forms to integrate with the CSDM.

When the Service Portfolio Management Premium plugin (com.snc.spm) is activated with CSDM is applied, the navigational pane includes the modules **Manage Technical Services** and **Sell and Consume**. Service offerings with associated catalog items are available to view and manage via **Technology Request Catalog** and **Business Request Catalog** within these modules. For

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

complete information about CSDM and how it relates to Service Portfolio Management Premium, refer to Applying the CSDM guidelines to your product.

Configure Service Owner Workspace metric definitions

Configure unique metric definitions to measure the performance of your service offerings in Service Owner Workspace.

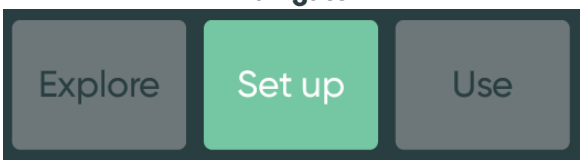
Before you begin

Role required: admin or portfolio_admin

About this task

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. Customers who opt in for the new standard portfolio structure use metrics calculated from key performance indicators (KPIs) in Digital Portfolio Management (DPM). For more information, see Digital Portfolio Management.

Navigate



Service Owner Workspace includes several metric definitions which you can view and edit, if necessary. You can also create new metric definitions unique to your desired performance monitoring needs.

Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Configuration** > **Metric Definitions**.
2. View the available base system metric definitions and associated indicators.
3. To create a unique metric definition, click **New**.
4. Provide a unique name for the metric definition in the **Name** field.
5. Select a Performance Analytics indicator in the **Indicator** field.
6. Click **Submit**.
   For more information about Service Owner Workspace metrics and weight configuration, see Service Owner Workspace performance metrics.

Configure Service Owner Workspace portfolio metrics

Decide which metrics to configure for your service portfolio to measure the performance of your service offerings in Service Owner Workspace.

Before you begin

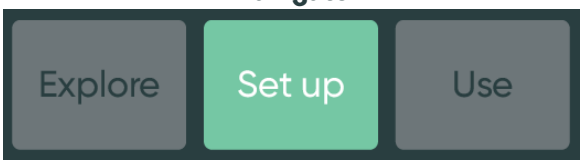
Role required: admin or portfolio_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. Customers who opt in for the new standard portfolio structure use metrics calculated from key performance indicators (KPIs) in Digital Portfolio Management (DPM). For more information, see Digital Portfolio Management.

Navigate



Procedure

1. Navigate to **All** > **Service Portfolio Management** > **Configuration** > **Portfolio Metrics**.
2. Click an existing service portfolio to learn what metrics are associated.
   The Portfolio Metrics list opens displaying all the metrics applied to the service portfolio.
3. To add an additional metric to the service portfolio, click **New**.
4. Fill in the form fields.

Portfolio Metric form

Field	Description
Service portfolio	Select the service portfolio for which you want to create a metric
Metric	Select the metric to apply. Choices include: **Activity**, **Availability**, **Breached SLA**, **Customer Satisfaction**, and **Critical Incidents**.
Order	Specify the display order of the trend chart on the **Trends** tab in Service Owner Workspace.
Trend chart	Check the box to display this metric on the **Trends** tab in Service Owner Workspace.
Performance calculation	Check the box to use this metric in the service offering performance calculation.

5. Click **Submit**.
   For more information about Service Owner Workspace metrics and weight configuration, see Service Owner Workspace performance metrics.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Generate a service offering availability

Generate on-demand availability reports displayed in Service Owner Workspace. When a service commitment contains an availability guarantee, the service offering displays an availability report.

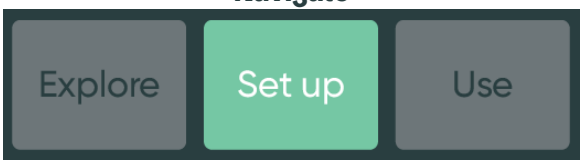
Before you begin

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For more information on availability, see View availability results in Service Portfolio Management. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Role required: service_editor

About this task

Navigate



Availability records are generated by a daily job when you select an Availability type service commitment for your service offering. By defining service offering availability, you generate reports that track the actual availability of the offering. For a 7-day chart, no reporting data is available until five days after the service offering is created. For 30-day charts, 23 days of data is required before a report is generated. For a 12-month chart, the database must contain at least 10 months of data.

Procedure

1. To generate a new service availability, navigate to **Service Portfolio Management** > **Availability** and click **New**.

   Note:
   When an Availability commitment type is added to a service offering, it will generate a year's worth of availability records for that offering and commitment. For this reason, existing Availability forms should not be edited. Availability is calculated based on the outages in the system for that offering. If an outage is updated, then the related availability records are updated too.

2. Fill in the form fields.

Service Availability form

Field	Description
Display name	Enter the name of the service availability as it appears in record lists. Automatically set at record creation based on service offering and commitment.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Service offering	Select the service offering for which you want to generate an availability record.
Service commitment	Select the service commitment to apply the availability record.
Start	Choose the start of this availability interval.
End	Choose the end of this availability interval.
Committed uptime	Enter the total expected service availability for this commitment.
Acceptable downtime	Enter the acceptable amount of downtime against this commitment schedule for this interval.
Total downtime	Enter the wall-clock downtime, independent of schedule.
Met commitment	Availability commitment was met for this interval. Check to indicate the commitment was met.

Note:
The following fields display SLA result data when available:

- **Total availability %** — Availability percentage for the entire interval, independent of schedule.
- **Total outages** — Total number of outages in this interval, independent of schedule.
- **Commitment availability %** — Availability percentage within this commitment schedule.
- **Commitment downtime** — Downtime that counts against this commitment schedule.
- **Commitment outages** — Number of outages against this commitment schedule in this interval.

3. Click **Submit**.
   View service offering **Availability** reports in Service Owner Workspace.

Change scope to Service Portfolio Management Premium

Grant access to a dedicated user to enable switching the scope from Global to Service Portfolio Management Premium to create a custom automated indicator.

Before you begin

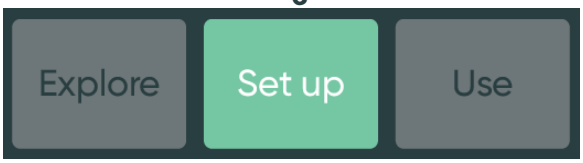
Role required: admin

About this task

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Navigate



Both the indicator and the job must be in the same scope. Provide a user with delegated developer access and the pa_admin role to change the scope from Global to Service Portfolio Management Premium when creating custom indicators for Service Portfolio Management Premium jobs.

Procedure

1. In the Navigator, type `sys_scope.list` and press Enter.
   The Applications list appears.
2. Search by name for Service Portfolio Management Premium and click the application name to open the associated Store Application form.
3. In Related Links, click **Manage Developers**.
4. Search for the user or group you want to grant delegated developer access to.
   The **Permissions** configuration screen appears.
5. Configure delegated developer access for the user or group.
   a. In the **File Type Access** section, toggle the **Reporting** category radio button to grant this type of access.
   b. Click **Save**.
   Grant access to any other section category by toggling the associated radio button.
6. Assign the pa_admin role to the user or group with delegated developer access.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create indicators in Service Portfolio Management Premium

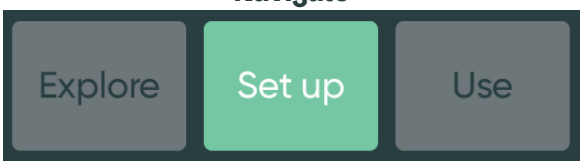
Create custom indicators for your Service Portfolio Management Premium jobs in the correct scope.

Before you begin

Role required: pa_admin

About this task

Navigate



You must have the Reporting file type delegated developer access to change the scope from Global to Service Portfolio Management Premium when creating custom indicators for the application. Administrators grant the Reporting file type delegated developer access. For information regarding obtaining delegated developer access, refer to Create indicators in Service Portfolio Management Premium.

When you create an indicator and associate it with a job in an application, both the indicator and the job must be in the same scope. Jobs and indicators available in the Service Portfolio Management Premium base system are in the correct Service Portfolio Management Premium scope. However, when you create a custom indicator, by default it is created in the Global scope. To associate a custom indicator with a Service Portfolio Management Premium job, you need to first change the scope from Global to Service Portfolio Management Premium.

Procedure

1. Click the Settings icon in the banner.
2. In **System Settings**, click **Developer**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

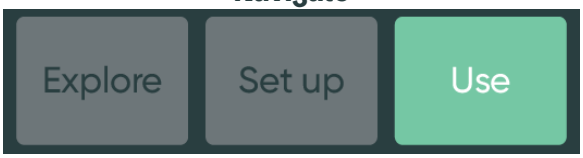
3. In **Application**, find and select Service Portfolio Management Premium.
4. Navigate to **Performance Analytics** > **Indicators** > **Automated Indicators** and click **New** to create an indicator in the Service Portfolio Management Premium scope.
   For details on how to create an automated indicator, refer to Create an automated indicator.

Using Service Owner Workspace

Use Service Owner Workspace to monitor the health of your services and your customer satisfaction. View outages, critical incidents, and change requests associated with services and offerings.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate



With Service Owner Workspace you can monitor metrics and analyze the health of your services from a single user interface. Get to know how metric models are created and configured for service offerings and how they are used in Service Owner Workspace.

Service Owner Workspace features

Service Owner Workspace features include:

- A view-only, multi-tab interface for monitoring and managing multiple portfolios and related services.
- Dashboards offer immediate access to portfolio and service health and performance metrics, as well as who owns and manages the service.

  Note:
  In most cases, data is collected up to the previous day. If there is a current outage or incident, then data does not appear in trend charts or displays.

- Comprehensive layout of all information related to a portfolio and its component services.

Service owners can access the workspace to perform their most common tasks, including:

- View and manage owned IT services, as well as view all IT services the business manages.
- Expand service lists to expose child services and service offerings.
- Select a service to access pertinent information, including service trends, related services and information, improvement initiatives, and associated service offerings.
- View and monitor service performance score reports, customers' scores, and total subscribers.
- Monitor recent and upcoming changes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Drill down into service offerings to view availability, SLA compliance, customer satisfaction, offering stability, performance scores, and more.
- View associated unique or critical information about the service offering in the impact stream panel on the right side of the workspace. For example, you can view outages records with a unique **Outage Number** identifier. You can also see the outage number on the list view for outages via the **Outage** tab in the report viewer.

> **Note:**
> The Outage Numbering plugin (com.snc.outage_numbering) must be activated to introduce number data. The plugin is automatically activated for all instances and upgrades except those that already have a number prefix column on the Outage table. Refer to the Activate Outage Numbering plugin [KB0823685] article in the HI Knowledge Base or contact Customer Service and Support if the plugin is not active and you want to move to the base system field.

System administrators can configure the workspace according to the specific needs within the organization:

- Disable particular metrics from displaying in the workspace.
- Configure the metric weights that contribute to performance scores within the workspace.
- Configure the metric thresholds for each metric that displays in the workspace.

Start here: Access Service Owner Workspace.

Access Service Owner Workspace

Open the Service Owner Workspace to access and display all your portfolios and services at a single location. Monitor and manage your services and offerings from the workspace.

Before you begin

Role required: service_viewer

About this task

> **Important:**
> As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate

To access and use Service Owner Workspace, the Service Owner Workspace plugin (com.spm_owner_workspace) must be activated and you must be assigned the Service Viewer [service_viewer] role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

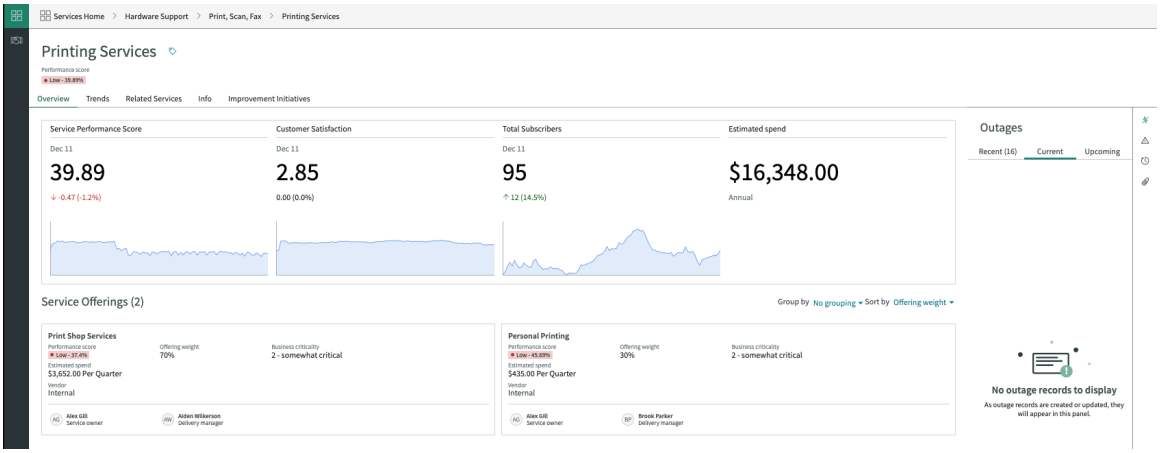
1. Navigate to **All** > **Service Portfolio Management** > **Service Owner Workspace**.
2. Click a portfolio name to expand the layers of services.
3. Click **My Services** to view portfolios that you own and manage.
   Or click **All Services** to view all the services your organization owns and manages.
   A list of services displays. You can expand each service to see child services within the service taxonomy.

4. Click a service name to view pertinent information about the service.
   The **Overview** dashboard provides a recent snapshot of the service offering performance. View performance over the last 7 days. The **Additional Node Info** sidebar displays who owns and manages the service, as well as the associated **Performance score**, **Taxonomy Nodes** (services), and **Estimated spend** if available.

   To contact a service owner, service offering owner, or associated manager, click the person's name in the workspace and then click the associated email. Phone numbers are also displayed for quick access to service stakeholders.

5. Choose how to group and sort dashboard data in the **Group by** and **Sort by** lists.
   You can group by **No grouping** or **Taxonomy node owner**. You can sort by **Ascending**, **Descending**, **Node weight**, **Performance score**, or **Name**.
6. Click a **Taxonomy Node** (service) to view pertinent information about the service.
   The associated service displays in the **Overview** tab.
7. Click in the **Service** card to drill deeper into the details and view health and performance metrics, as well as any associated service offerings.
   Service health and performance metrics, such as **Service Performance Score**, **Customer Satisfaction**, **Total Subscribers**, **Estimated spend**, and associated **Service Offerings** are displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. Click additional tabs besides the **Overview** tab to display data relevant to the offering, including:

   - **Trends** — View performance over a specified time frame, as well as SLA compliance. The **Trends** tab provides you with a more strategic view of service and offering performance over a longer period of time, so you can determine if performance is trending up or down. The base system includes performance metrics for **Activity**, **Availability**, **Breached SLA**, **Customer Satisfaction**, and **Critical Incidents**. The default time frame for **Trends** performance is 30 days, except for the **Critical Incidents** metric, which shows all open major and P1 incidents per day. Use the drop down menu to change the time frame if desired. Choices include as few as the last 7 days to the last year.

     Note:
     Prior to the Quebec release, the **Critical Incidents** metric was called **Stability** and was depicted as a single score widget. The data is now visualized in a time series chart. You need to set the lower and upper boundaries for the **Critical Incident** metric. For details, refer to Service Owner Workspace performance metrics.

   - **Relationships** — View service dependency details. This tab shows offering relationships, for example, which services a service depends on and which services depend on it.

     View the **I depend on** and **Depends on me** sections to see service offering dependencies at the parent service level via a card with a highlighted label reading **Inherited relationship**.

     Note:
     Dependencies that a service inherits from a child offering are visually distinct from dependencies defined directly between services.

     Service and offering types are distinguishable in the card by a unique icon and label specifying the type of service and offering. For example, **Business Service**, **Application Service**, and **Technical Service**. When you click on an offering card, the record view of the offering is displayed.

   - **Info** — View the service offering description, performance breakdown, general information, commitments, team, and more. You can also view your service offering to catalog item relationships via this tab. Click to open a catalog item to drill down into more details.

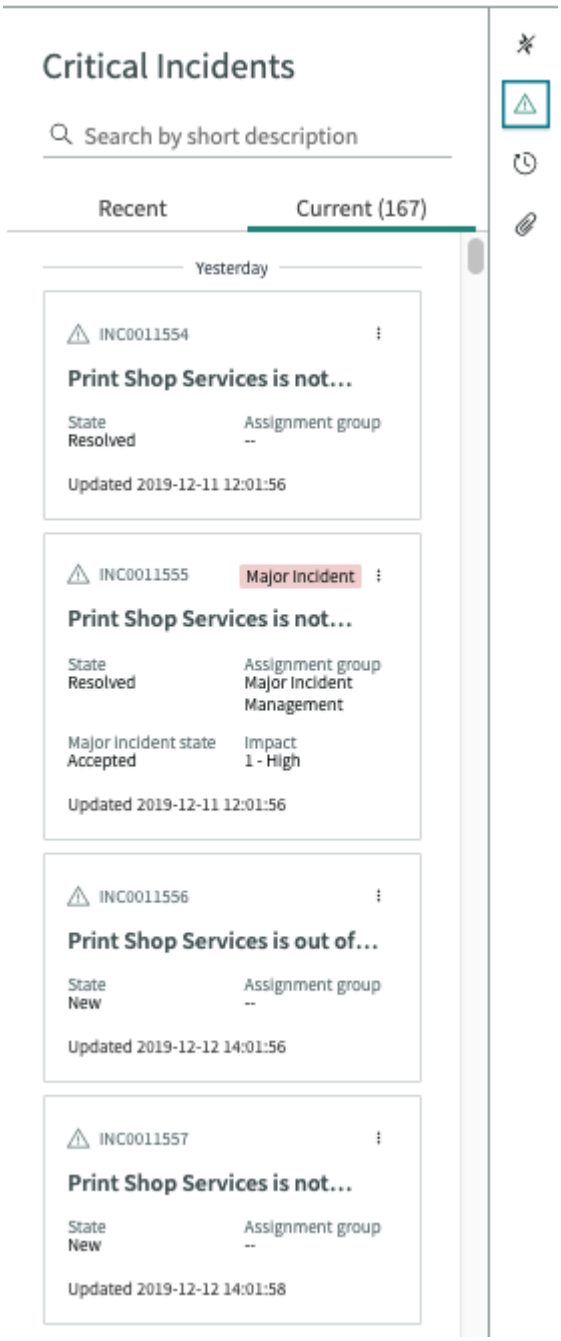
     Monitor fulfilled requests for all associated catalog items in the **Offering Activity** metric. For complete details about service offerings and associated catalog items, refer to Service offering to catalog item relationships.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The **Create Catalog Item** action is only available when there is no catalog item mapped to a service offering and there is no catalog item with the same name as the offering. This prevents the issue of having catalog items with the same name.

- **Improvement Initiatives** — View all CIM initiatives as links to the records. This tab displays with activation of the Continual Improvement Management (CIM) plugin (com.sn_cim).

9. Click icons in the impact stream panel, on the right side of the workspace, to display related information about **Outages**, **Critical Incidents**, **Change Requests**, or **Attachments**.
View the associated unique or critical information about the service offering in the impact stream.



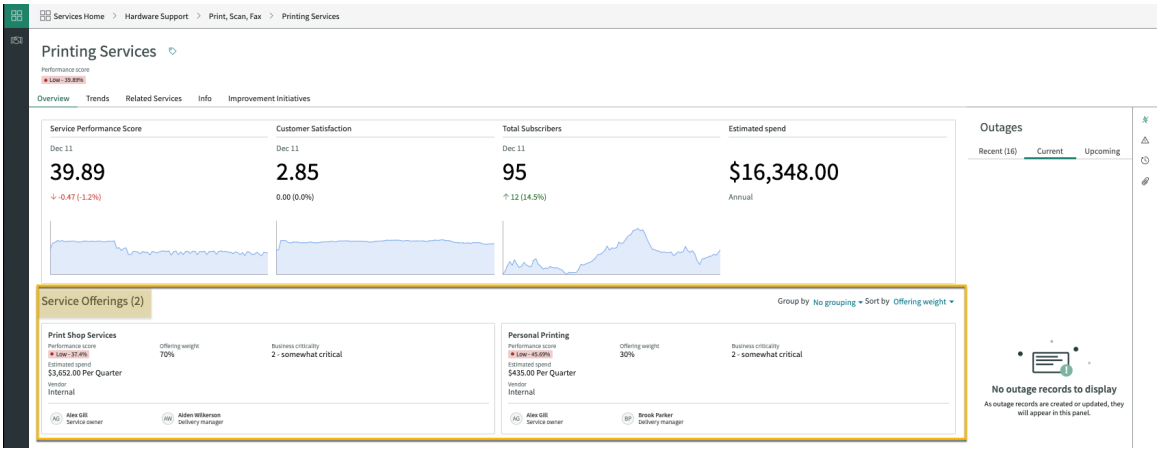
10. Click an outage, critical incident, or change request to drill deeper into the details.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Once you click an impact stream item, for example, a critical incident, you can view all details related to the item and even open the associated record by clicking **Open record**.

Recent, current, and upcoming outage data is available. Click a type of outage for the information you want. Refer to Outages for information about a unique **Outage Number** identifier and activating the Outage Numbering plugin (com.snc.outage_numbering).

11. If the service you are viewing has associated child offerings, click an offering to drill down and view details.



View the offering overview, as well as other pertinent data, such as service offering availability, breached SLAs, customer satisfaction, stability, and activity. Available service offering tabs include, **Overview**, **Trends**, **Relationships**,**Info**, **Catalog Items**, and **Improvement Initiatives**. These tabs similar data as is provided for services. The **Catalog Items** tab displays all catalog items related to the service offering, as well as a short description of the item.

Service offering to catalog item relationships

Manage the relationships between your service offerings and catalog items by associating your pre-existing catalog items to your service offerings and vice versa. View relationships in both ServiceNow AI Platform form related lists and Service Owner Workspace.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace. For information about this topic, see Subscribe users to a service offering in Service Portfolio Management.

Required roles and actions

Service owners and catalog administration managers can edit relevant forms to associate and manage pre-existing service offering to catalog item relationships. This feature is in addition to the **Create Catalog Item** feature that enables you to create a new catalog item.

With the service_editor role, you can add, change, and remove catalog items associated with an owned service offering via the Service Offering form Catalog Item related list. You can also create a catalog item from a service offering via Service Owner Workspace by clicking the **Create Catalog Item** link. A single service offering may have many related catalog items. Click the **Link** button in the Catalog Item related list to make a change.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If a catalog item is already associated with a service offering, you cannot associate the item to a new offering. You will have to contact a catalog_admin to remove the existing association so that you can make changes.

With the catalog_admin role, you can add, change, and remove service offerings associated with a catalog item via the Catalog Item form Service Offerings related list. A single catalog item can be related to one service offering.

Click the **Link** button in the related list to make a change. You can remove the association if needed with the related list **Delete** button.

Note:
If a service offering is already associated to a catalog item, the **Link** button does not appear in the related list. For details about viewing and editing Catalog Items, refer to Create or edit a catalog item.

Catalog items in Service Owner Workspace

View catalog items related to a service offering in Service Owner Workspace from the offering page **Catalog Items** tab. Click to open a catalog item to drill down into more details and even open up the form view.

Monitor fulfilled requests for all associated catalog items and order guides in the offering **Trend** tab **Activity** metric.

Hover over the **Trends** tab **Activity** metric to view both the catalog item name and the 30 day average running count.

When you click the trend line for an individual catalog item, only **Requested Items** for that catalog item and the offering are visible on the list view of the report viewer.

Things to keep in mind

- Avoid model phase conflicts between offerings and catalog items.
  - Catalog items can only be associated to service offerings in the **Catalog** phase.
  - The service offering must be operational for catalog items to be active.
  - Inactive catalog items can be associated to operational service offerings.
- Order guides are not referenced as associated items.

  In Service Owner Workspace, **Activity** metrics are driven by catalog items that compose an order guide.

Service Portfolio Management Premium notifications

Notifications are added with Service Portfolio Management Premium to manage your service offering to catalog item relationships.

Service Portfolio Management Premium includes several email notifications that alert catalog admins when a service offering associated with a catalog item is retired or when a new catalog item has been created from a service offering.

The following notifications are included:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Offering retired Table: Service Offering [service_offering]	Sends an email to a specified user group when a service offering that is associated with a catalog item is retired.
Catalog Item created from Offering Table: Available for Subscribers [sc_cat_item_subscribe_mtom]	Sends an email to a specified user group when a new catalog item has been created from a service offering. The email asks that the new catalog item be reviewed and prepared for activation in the catalog.

To configure catalog_admin recipients for these notifications, refer to Create a user group.

Service Owner Workspace Service Offering survey

Subscribers can rate their experience with service offerings via the Service Portfolio Management Premium Service Offering survey. This feedback provides portfolio managers and service owners with valuable information to improve service offering performance and subscriber satisfaction.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate

In the base system, a predefined SPM Service Offering Survey is available. Surveys are sent for operational and retiring service offerings only. Portfolio admins [portfolio_admin] can edit the survey and service editors [service_editor] can configure the associated trigger conditions.

You must have the admin or portfolio_admin role to modify the SPM Service Offering Survey. To view the survey, navigate to **Survey** > **View Surveys**.

The SPM Service Offering Survey is triggered randomly for 10% of service offering subscribers. Only subscribers who have not been polled within the previous three-month time period can receive a survey. Subscribers receive an email with the survey link. The service offering name is displayed and the survey inquires how satisfied the subscriber is with the service or service offering. Subscribers use radio buttons to rate satisfaction on a 1 through 5 scale, with 1 being not satisfied and 5 being very satisfied.

You are encouraged to modify the survey to better match your organizations needs.

Two system properties determine the percentage of subscribers to receive the survey and how often a subscriber is polled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *sn_spm.csat.survey_probability*: Default value is 10% of subscribers are randomly polled.
- *sn_spm.csat.survey_period*: Default value is 90 days. The system does not send a survey to a subscriber who has been polled within the previous 90 days.

Service owners can use the Service Offering form to define how often to send a CSAT survey. The**CSAT survey frequency** field offers the following frequency choices:

- **Never** (default)
- **Daily**
- **Weekly**
- **Monthly**

Service owners can view the last time a survey was sent for an offering in the **CSAT survey last sent** field on the Service Offering form.

Portfolio managers and service owners can review responses and view vendor CSAT weight in Service Owner Workspace.

For more detailed information about working with surveys, trigger conditions, and survey questions, see Surveys.

Financial Management for Service Owner Workspace

Integrate Service Owner Workspace with Financial Management to access preconfigured service offering cost models. You can use these cost models to evaluate expenses and generate cost lines based on the level of service offering for a defined cost.

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate

Activation and features

Activate the Financial Management for SPM plugin (com.snc.financial_management_for_spm) to access the preconfigured, base system models. Financial Management for SPM contains demo data and activates related plugins if they are not already active.

The Service Portfolio Management Estimated Spend plugin (com.snc.spm.spend) is available to enhance your Service Owner Workspace experience. With this feature, you can choose to use the default local service offering cost model or access the cost models offered via the Financial Management application.

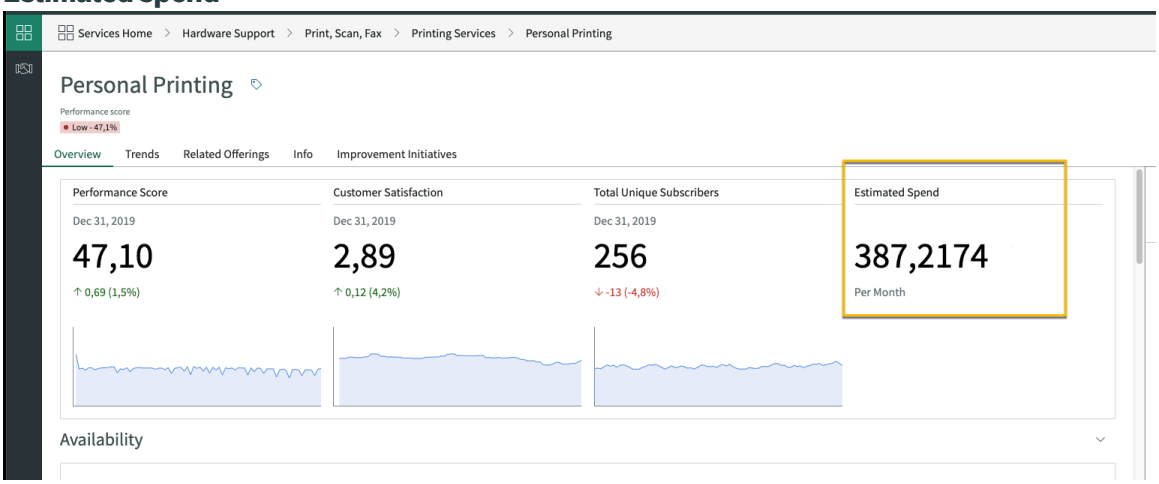
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When Service Owner Workspace (com.spm_owner_workspace) and Financial Management for SPM (com.snc.financial_management_for_spm) are activated and the *sn_spm_spend.offering_cost_source* system property is set to the value **Financial Management** the **Estimated Spend** form section displays the fields **Estimated annual spend**, **FM aggregated period**, and **FM aggregated cost**. These fields reveal read-only data stored on the service offering, service, and taxonomy records.

View calculated spend per offering in Service Owner Workspace

When you choose to use the cost models offered via the Financial Management application, calculated spend per service offering is displayed as a single score widget in Service Owner Workspace. View **Estimated Spend** as part of the **Overview** dashboard displaying associated service offering health and performance metrics.

Estimated spend



Service offering spend estimates are combined and summed up per period to the service and portfolio levels within your portfolio taxonomy. Estimated spend at the service and portfolio level enables you to better understand costs and how this aligns with performance throughout your service portfolio. With the estimated spend feature, you can:

- Balance your required service performance with the appropriate spend.
- Compare similar services by weighing spend to performance.
- Verify whether service spend is meeting your desired goals.
- View cost drivers within your service portfolio and the taxonomy structure.
- Compare an internal service spend to external service provider options.

Local model compared to Financial Management model for estimated spend

Estimated spend calculations run daily as a separate job.

When the system property *sn_spm_spend.offering_cost_source* = **Local Model**, the estimated annual spend for a service offering, service, and taxonomy is determined by adding the estimated annual spends for all child entities. Estimated annual spend data is stored on the service offering, service, and taxonomy records.

When the system property *sn_spm_spend.offering_cost_source* = **Financial Managment**, the estimated spend for a service offering, service, and taxonomy is determined by adding the Financial Management estimated spends for all child entities.

For each node, determine the Financial Management estimated spend for the currently selected Financial Management period by adding all the child entity estimated spends. This happens

© 2026 ServiceNow, Inc. All rights reserved.

recursively up the entire taxonomy structure, starting with the service offering, to the service, to the taxonomy.

For detailed information about integrating with Financial Management and configuring costing for a service offering, refer to Financial Management for licensed SPM users.

Configure the estimated spend offering cost source

Define the source used to calculate the estimated cost for service offerings. You can use the default local model or access the preconfigured Financial Management service offering cost models.

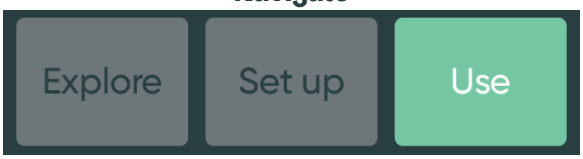
Before you begin

Role required: admin

About this task

Important:
As of the San Diego release, Service Owner Workspace is in a planned deprecation. New customers can't find or activate Service Owner Workspace. ServiceNow® continues to support existing customers with Service Owner Workspace. For information on the product replacement and the deprecation process, see Service Owner Workspace.

Navigate



The Service Portfolio Management Estimated Spend plugin (com.snc.spm.spend) is automatically activated with Service Owner Workspace.

Activate the Financial Management for SPM plugin (com.snc.financial_management_for_spm) to enable the associated cost model.

Service Portfolio Management Estimated Spend provides the *sn_spm_spend.offering_cost_source* system property. With this property, you can define the source used to calculate the estimated cost for service offerings. Values include:

- **Local Model**
- **Financial Management**
- **None**

The default value is **Local Model**.

Procedure

1. Enter `sys_properties.list` in the navigation filter to open the System Properties [sys_properties] table.
2. Find the *sn_spm_spend.offering_cost_source* system property and set it to the desired value.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Users can choose not to use the local cost model or the Financial Management model, by selecting **None** as the desired value.

Estimated spend offering cost source

Value	Description
Local Model	With this default source, the offering Estimated Spend cost is calculated based on the following fields on the Service Offering form: ○ **Cost model**: Choices include, **Fixed** and **Per unit**. ○ **Estimated spend**: The estimated cost of the offering for the associated time period. When the **Cost model** value is **Fixed**, additional fields appear on the Service Offering form, including: **Offering cost**, **Time period**, and **Cost Unit**. When the **Cost model**is **Per Unit**, additional fields appear on the Service Offering form, including: **Offering cost**, **Time period**, **Units per period**, and **Cost Unit**.
Financial Management	With this source, the offering **Estimated Spend** cost is calculated based on the following Service Offering form fields, as calculated by the Financial Management application: ○ **FM period**: Fiscal calendar period. ○ **FM cost**: The actual currency amount.
None	With this value, or any incorrect values, the system ignores both the local and Financial Management cost models and does not display associated Service Offering form fields.

3. Click **Update** to save any changes.

Service Level Management

The ServiceNow® Service Level Management (SLM) application helps to gather service requirements as well as monitor and report with regards to agreed service levels (SLAs).

Exploring Service Level Management

Configuring Service Level Management

Use

Using Service Level Management

Reference

Service Level Management reference

Exploring Service Level Management

Use Service Level Management across your organization to monitor and manage the quality of the services.

Service Level Management overview

Service Level Managers are responsible for negotiating a set of agreements between a service provider and customer that define the scope, quality and speed of the services being provided and ensuring that the agreed service levels are met.

Service Level Management concepts

The ServiceNow® Service Level Management (SLM) application facilitates you to oversee and control the services within the organization.

Service Level Managers are responsible for a set of agreements between a service provider and customer that define the scope, quality, and speed of the services being provided. The intention of SLM is to provide the customer with an expectation of service within a known timescale and the ability to monitor when service levels are not being met.

The SLM offers the following features:

- Service Level Agreement (SLA) definitions
- Task SLAs
- Integration with other ServiceNow plugins

Service Level Agreement (SLA) roles

Ensure that users can perform all necessary actions by assigning SLA roles.

Role	Definition
sla_admin	Provides full administrative rights to SLM. Users that possess the sla_admin role can configure SLM properties, run SLA repair, view

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role	Definition
	the SLA Overview dashboard, and manage SLA definitions. They may associate existing workflows or schedules to SLA definitions, but are unable to create workflows. The additional roles required to create workflows or schedules must be granted explicitly. See Base system roles for more information.
sla_manager	Lets users define SLA definitions, view SLA repair logs, and view the SLA Overview dashboard. Does not let users change SLM property values or define SLA condition types.

Service Level Agreement (SLA) definitions

Use the SLA Definition record to define a specific set of criteria that would result in an SLA being generated. Define some of the following parameters:

- Table: The task table that the SLA is defined for.
- Duration: The time duration in which the service must be provided to the customer.
- Schedule: The schedule, which indicates valid working and non-working days that the service provider follows to deliver the service. The selected schedule is used to determine when the SLA breaches.
- Conditions: The conditions under which the SLA starts, pauses, stops, or resets.

Task SLA definitions

When an SLA definition is triggered against a particular task, the task SLA record is generated and contains all the tracking data for the specific SLA on that record. For example, if an SLA definition exists for P1 incidents a task SLA record attaches to the P1 incident record and captures all the data associated with it. Often there are multiple task SLA records against a single task because many definitions apply.

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

On the Task SLA form, you can also select the target for the SLA: **Response**, **Resolution**, or **None**.

Integration with other ServiceNow plugins

The following plugins introduce extra functionality within SLM:

- SLA Contract Add-on
- Service Portfolio Management - SLA Commitments

SLM Template support in App Engine Studio

Application Templates support Service Level Management tables to be included when creating templates from applications in the App Engine Studio. The SLM tables that can be included in templates are:

- SLA Definition [contract_sla]
- Service Offering SLA [service_offering_sla]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- SLA Timer Configuration[sla_timer_config]
- SLA timer configuration mapping[sla_timer_config_mapping]

Define a service contract

A new table of SLA contracts is provided through the **Service Level Management** > **Service Contracts** module. These contracts group together SLAs that relate to a single vendor or customer, as well as the CIs, locations, groups, users, and child contracts that are related to the contract.

The table Service Contract [ast_service] extends the table Contract [ast_contract]. It stores information about service contracts for asset management purposes. To get the service contract functionality, activate the Service Level Management - Contract Management Integration [com.snc.sla.contract2] plugin. Installing the SLA Contract Add-on plugin adds relations to this table to make it useful for Service Management purposes. Once the plugin is installed, the Service Contract record possesses related lists for:

- SLAs
- Contract CIs
- Contract Locations
- Contract Groups
- Contract Users
- Child Contracts

Service contract table fields

Field	Description
Number	A unique number associated with the contract.
Starts	The date on which the contract takes effect.
Ends	The date on which the contract expires.
Approver	The person who approves the contract.
Location	The primary location of the contract, if applicable. If there are multiple, use the Contract locations related list.
Active	Whether the contract is currently in use.
Automatically renew/extend	Whether the contract has the possibility of being renewed or extended at the end of its term.
Vendor	The vendor responsible for the contract.
Vendor account	The account the vendor is responsible to.
Contract number	The number of the contract defining the Service Contract.
Total cost	The total cost of the contract.
Payment amount	The amount which has been paid so far.
Payment schedule	The duration at which payments are made.
Process non-contractual SLAs	If selected, you can have both contractual SLAs as well as non-contractual SLAs, such as OLA and Underpinning contracts, processed for the same task. You can track the

© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service contract table fields (continued)

Field	Description
	contractual SLAs as well as any SLA that is internal to the organization to enhance compliance. **Note:** The **Process non-contractual SLAs** check box is available for the zboot and upgrade customers. The system property *com.snc.sla.contract.tables* is not available for zboot customers so that contracts are processed for any table in the system instead of specific tables.
Short description	A short description of the Service Contract.
Description	A full description of the Service Contract.

Add contract field to task form

Depending on how the contract is used, the **Contract** field can be added to any task form by configuring the form. For information about how to configure a form, see Form configuration . As the **Caller**, **Assignment Group**, **Location**, and **Configuration item** fields are populated, the **Contract** field filters appropriately, helping the support desk to associate the ticket to the correct contract.

Note:
Do not add the same field to different sections of a form unless the field displays read-only data. Having two or more instances of an editable field can cause data loss and prevent the proper functioning of UI and data policies.

Service Level Agreement (SLA) breakdown definitions

Using SLA breakdown, the service owner or service desk manager can see detailed task ownership and SLA duration related data for any task SLA record associated with a task. This helps determine which teams and users are contributing to SLA compliance.

SLA breakdown is configurable and typically should be configured for the more significant SLAs such as P1 and P2 resolution. By default, the system deletes SLA breakdown data that is more than one year old. This is performed by a new table cleanup job *sla_breakdown_by_assignment*. Table cleanup jobs are defined in the [sys_auto_flush] table.

Configure Service Level Agreement (SLA)

Service Level Agreement (SLA) processing

The SLA engine performs two passes to evaluate SLA definitions and their conditions based on a task.

The SLA engine performs the following passes:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Checks the SLA definitions that do not have an active SLA record associated to the task. The SLA engine determines if the SLA definition applies to the task and if it needs to create a SLA record. The following condition checks are performed:
   a. If the Start condition is true and the Stop condition is true, do nothing. No SLA record is created, because the Stop condition overrides the Start condition.
   b. If the Start condition is true and the Stop condition is false, a new SLA record is created for this task using the SLA definition. The SLA record is then set to the In Progress stage.
2. Checks all active SLA records associated to the task. The engine determines if the SLA records are changing stage. The condition checks are performed in the following order:
   a. If the Stop condition is true, the SLA changes to **Completed** and becomes inactive.
   b. If both the Reset and Start conditions are true, the SLA changes to **Completed** and a new task SLA is created.
   c. If the Start condition is false, the SLA changes to **Cancelled** and becomes inactive.
   d. If the SLA is active, the Pause condition is true, and the SLA stage is **In Progress**, the SLA is paused.
   e. If the SLA is active, the Pause condition is false, and the SLA stage is **Paused**, the SLA changes back to **In Progress**.

Actual and business elapsed times

Task SLA records contain two sets of timing information: **Actual elapsed** and **Business elapsed**.

The difference between these two sets of timing is vital when you create and report on SLA definitions.

- **Actual elapsed** values are calculated on a 24x7 basis.
- **Business elapsed** values are calculated based on the schedule specified in the task SLA. The schedule is taken from the SLA definition by default.

> **Note:**
> If no schedule is specified, then the **Business elapsed time** is the same as the **Actual elapsed time**. This can be disabled by changing the *com.snc.sla.always_populate_business_fields* property to false in the SLA Engine. When this property is set to false, the **Business** fields will be 0 or empty.

By default, the related list for the task SLA record displays the actual elapsed time only. You can configure the list to also display the business elapsed time.

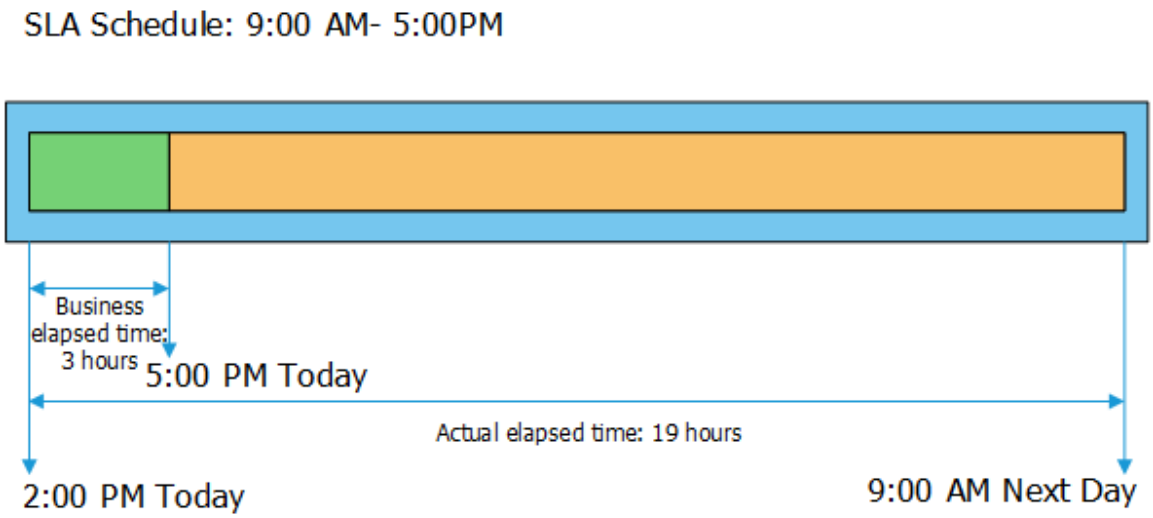
Elapsed times and schedules

Consider a scenario where an SLA has a defined schedule of 9 am to 5 pm on weekdays. With this schedule, the difference between actual and business elapsed times can be significant.

For example, if a task SLA starts at 2 pm on a weekday, its business elapsed time at 9 am on the next weekday is 3 hours while its actual elapsed time is 19 hours.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business elapsed time vs actual elapsed time



In addition, if a schedule defines an 8 hour working day, then 24 hours or one day in business elapsed time equates to 3 days in actual elapsed time.

Exampl of business and actual elapsed times - 24 X 7

Example

For example, an incident is opened on Friday, December 12 at 9 pm, outside of the SLA schedule of 8 am to 5 pm on weekdays.

If the current time is the following Monday at 9:30 am, then:

- **Business elapsed time** is 1 hour and 30 minutes because the SLA business timer stopped at 5 pm on Friday and restarted at 8 am on Monday.
- **Actual elapsed time** is 60 hours and 30 minutes, representing the real time between the incident being opened and the current time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Elapsed percentages are also similarly calculated. The actual elapsed percentage is over 750% while the business elapsed percentage is 19% on an 8 hour SLA.

SLA timer

Use the SLA timer component to track the amount of time that is required to complete the task as defined by the matching SLA definition.

The SLA timer component is designed to visually display the current status of the Task SLA. You can also view more information about the task in the tooltip, such as the SLA definition name, the remaining time to breach, and the percentage completed details. When your task is in-schedule, then the tooltip provides extra information, such as the out-of-schedule details.

The timer component can show any of the following stages depending on the current status of the task.

SLA timer stages

Stage	Color code	Description
In-progress		The stage of the timer when the task SLA is in progress. You can find more information about the schedule and time on tooltip. The color code changes for in-progress state: •  green to yellow: When the time to complete reaches 50% • yellow to orange: When the time to complete reaches 25%
Breached		The stage of the timer when the time allocated to complete the task SLA is over. The tooltip provides more information on the time that the task was breached.
Cancelled		The stage of the timer when the task SLA is cancelled. On the tooltip, you can see the time when it was cancelled.
Paused		The stage of the timer when the task SLA is paused or put on-hold. The color displayed in this stage will correspond to the percentage elapsed when the task SLA was paused. When the stage changes from **Paused** to in-progress the timer starts from time when it was paused. You can find

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA timer stages (continued)

Stage	Color code	Description
		more information about the schedule and time on tooltip.
Achieved (2010 SLA engine)		The stage of the timer when the task SLA is achieved. The information on when it was achieved is seen on the tooltip.
Completed		The stage of the timer when the task SLA is completed. You can see when the it was completed on the tooltip.
Out of Schedule		The stage of the timer when the task SLA goes out-of-schedule. You can find more information about the schedule and time on tooltip.

Configuring Service Level Management

You can configure various aspects of Service Level Management based on the specific requirements of your organization.

Service Level Management plugins

You can activate one or more of the Service Level Management plugins if they are not already active. Some plugins include demo data.

You can activate one or more of the following Service Level Management plugins.

Activate Service Level Management

You can activate the Service Level Management plugin (com.snc.sla) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin
Role required: admin

About this task
Activating this plugin, provides the core SLA functional.ities.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

List of plugins (Xanadu)

Installed with Service Level Management

Activating the Service Level Management plugin adds or modifies these components: tables, properties, UI actions, UI policies, script includes, client scripts, business rules, email notifications, scheduled jobs, and workflows.

Tables installed with Service Level Management

Tables are added with Service Level Management.

Display name [Table name]	Description
SLA Definition [contract_sla]	Provides the conditions, duration, and schedule for an SLA Definition.
SLA Conditions [sla_condition_class]	Defines how the conditions in the SLA Definition are used to determine the transitions between different stages of each task SLA.
SLA Repair Log[sla_repair_log]	Used to provide a log of when the SLA Repair function is set to action.
SLA Repair Log Entry [sla_repair_log_entry]	Extends syslog and stores the before or after values of a task SLA record that has been repaired.
Task SLA [task_sla]	Associates a task with the SLA Definition that applies to it.
SLA Timer Configuration [sla_timer_config]	Stores the timer configuration information.
SLA timer configuration mapping [sla_timer_config_mapping]	Stores the Task SLA mapping information.

Roles installed with Service Level Management

Roles are added with activation of Service Level Management plugin.

Roles installed

Role title [name]	Description	Contains roles
sla_admin	Users with this role have full administrative rights to the Service Level Management application	flow_operator

sla_manager	Users with this role can define SLA definitions and view SLA repair logs.	flow_operator

Scheduled jobs installed with Service Level Management

Scheduled jobs are added with Service Level Management.

Scheduled job	Description
SLA update (already breached)	Refreshes the timings in task SLA records that have already breached. This is limited to task SLAs where the breach time is within the last 365 days. This job runs once a day.
SLA update (breach after 30 days)	Refreshes the timings in task SLA records where the breach time is more than 30 days away. This is limited to task SLA records where the breach time is within the next 365 days. This job runs every 5 days.
SLA update (breach within 1 day)	Refreshes the timings in task SLA records where the breach time is more than 1 hour away and less than 24 hours away. This job runs every hour.
SLA update (breach within 1 hour)	Refreshes the timings in task SLA records where the breach time is more than 10 minutes away and less than 1 hours away. This job runs every 10 minutes.
SLA update (breach within 10 min)	Refreshes the timings in task SLA records where the breach time is in the next 10 minutes This job runs every minute.
SLA update (breach within 30 days)	Refreshes the timings in task SLA records where the breach time is more than 1 day away and less than 30 days away. This job runs once a day.

Activate SLA Breakdown definitions

You can activate the SLA Breakdowns plugin (com.snc.sla.breakdowns) if you have the admin role. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

SLA Breakdowns plugin (com.snc.sla.breakdowns) activates these related plugins if they are not already active.

Plugins for SLA Breakdowns

Plugin	Description
Service level management	Provides the core SLA functionality. SLA Definitions provide conditions to start, pause, stop, cancel and reset Task SLAs against any Task type.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins for SLA Breakdowns (continued)

Plugin	Description
[com.snc.sla]	In addition, you can specify a schedule on the definition to define the working hours and also a workflow to run against each Task SLA which is typically used to generate notifications.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics

List of plugins (Xanadu)

Installed with SLA breakdown definitions

Several types of components are installed with the SLA breakdown definitions.

Plugins installed with SLA breakdowns

Plugins are added with activation of SLA breakdowns.

SLA breakdowns adds the following plugin.

Plugin	ID	Description
SLA Breakdowns	com.snc.sla.breakdowns	Provides the ability to generate breakdown data for each Task SLA record. For example, the breakdown data for each Task SLA record can be generated by **Assignment group** or **Assigned to** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugin	ID	Description
		Note: You must have up-to-date versions of script includes *TaskSLAController* and *RepairTaskSLAController* before activating the plugin to ensure that breakdown data is generated correctly. If you have customized versions of either of these script includes, any customizations should be incorporated into the versions of these files from the most recent upgrade.

Table installed with SLA breakdowns

Tables are added with activation of SLA breakdowns.

SLA breakdowns adds the following tables.

Table	Description
SLA Breakdown Definition [sla_breakdown_definition]	A breakdown definition that is associated to a specific task type. For example, Incident.
SLA Breakdown Definition Field [sla_breakdown_definition_field]	A breakdown definition field (a child record of a breakdown definition). Each record defines a mapping between a field on the associated task table and the breakdown data table.
SLA Breakdown Definition to SLA Definition relation [sla_definition_sla_breakdown]	The relation between SLA Breakdown Definition and SLA Definitions.
SLA Breakdown Core [sla_breakdown_core]	The common columns for all SLA breakdown data tables. Each breakdown data table must extend this core table. **Note:** In the Madrid release, only the single breakdown data table SLA Breakdown By Assignment [sla_breakdown_by_assignment] is supported.
SLA Breakdown By Assignment [sla_breakdown_by_assignment]	Contains the breakdown records generated for each Task SLA record that has an associated breakdown definition.

Properties installed with SLA breakdowns

Properties are added with activation of SLA breakdowns.

SLA breakdowns adds the following properties.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Usage
com.snc.sla.breakdown_processor.log	Logging level for script include *SLABreakdownProcessor*. Type: Choice list Default value: Notice Location: SLA logging module

UI policy installed with SLA breakdowns

UI policies are added with activation of SLA breakdowns.

SLA breakdowns adds the following UI policies.

UI policy	Table	Description
Make definition fields read only	SLA Breakdown Definition Field [sla_breakdown_definition_field]	Make read only any fields on the form that are from the parent SLA Breakdown Definition
Hide "Fieldname data" field	SLA Breakdown Definition Field [sla_breakdown_definition_field]	The ui policy hides the field “Fieldname data” from the form. This field is only used by scripts that dynamically update other fields on the form and which should not be modified through the UI.

Script includes installed with SLA breakdowns

Script includes are added with activation of SLA breakdowns.

SLA breakdowns adds the following script includes.

Script include	Description
SLABreakdown	Base class that provides constants for SLA Breakdowns.
SLABreakdownDefinition	Extends SLABreakdownDefinitionSNC and in future releases can be used to override default functionality or provide additional methods. For the Madrid release, the script include is read only.
SLABreakdownDefinitionSNC	Provides methods for managing records in the sla_breakdown_definition table.
SLABreakdownDefinitionAJAX	Provides client callable methods used for managing records in the sla_breakdown_definition table.
SLABreakdownDefinitionBreakdownField	Extends SLABreakdownDefinitionBreakdownFieldSNC and in future releases can be used to override default functionality or provide additional methods. For the Madrid release, the script include is read only.

Script include	Description
SLABreakdownDefinitionBreakdownFieldSNC	Provides methods that determine the available values for breakdown_field on the sla_breakdown_definition_field table.
SLABreakdownDefinitionSourceFieldSNC	Extends SLABreakdownDefinitionSourceFieldSNC and in future releases can be used to override default functionality or provide additional methods. For the Madrid release, the script include is read only.
SLABreakdownDefinitionSourceFieldSNC	Provides methods that determine the available values for source_field on the sla_breakdown_definition_field table.
SLABreakdownDefinitionTaskTables	Extends SLABreakdownDefinitionTaskTablesSNC and in future releases can be used to override default functionality or provide additional methods. For the Madrid release, the script include is read only.
SLABreakdownDefinitionTaskTablesSNC	Provides the method that determines the available Task tables for breakdown definitions.
SLABreakdownProcessor	Extends SLABreakdownProcessorSNC and can be used to override default functionality or provide additional methods.
SLABreakdownProcessorSNC	Provides the methods for generating the breakdown data records for Task SLAs based on the available breakdown definition records.
SLABreakdownUtils	Extends SLABreakdownUtilsSNC and can be used to override default functionality or provide additional methods.
SLABreakdownUtilsSNC	Provides utility methods used by some of the other SLA breakdown script includes.
TaskSLABreakdownUtils	Extends TaskSLABreakdownUtilsSNC and can be used to override default functionality or provide additional methods.
TaskSLABreakdownUtilsSNC	Provides methods for the task_sla table.

Client scripts installed with SLA Breakdowns

Client scripts are added with activation of SLA breakdowns.

SLA breakdowns adds the following client scripts.

Script include	Table	Description
Hide assignment breakdown reports	Task SLA [task_sla]	Hides the embedded charts on the Task SLA form when no breakdown data is available.
Set available breakdown tables	SLA Breakdown Definition [sla_breakdown_definition]	Populates the options in the sla_breakdown_table field.
Set fieldname data	SLA Breakdown Definition Field [sla_breakdown_definition_field]	Sets data into a hidden field which is then used by the field choice scripts that populate breakdown_field_name and source_field_name.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Script include	Table	Description
Show 2010 engine message	SLA Breakdown Definition [sla_breakdown_definition]	Displays a message on the form for instances that are running the 2010 SLA engine.
Show breakdown data exists message	SLA Breakdown Definition Field [sla_breakdown_definition_field]	Displays a message on the form to explain that fields are read only due to breakdown data existing.
Show breakdown data exists message	SLA Breakdown Definition [sla_breakdown_definition]	Displays a message on the form to explain that fields are read only due to breakdown data existing.
Update already defined task tables	SLA Breakdown Definition [sla_breakdown_definition]	Disables options in the task_table field for task types that already have a breakdown definition.
Warning on setting inactive	SLA Breakdown Definition [sla_breakdown_definition]	Prompts for confirmation when a breakdown definition is updated to be inactive.

Business rules installed with SLA breakdowns

Business rules are added with the activation of SLA breakdowns.

SLA breakdowns adds the following business rules.

Business rule	Table	Description
Clear SLA Breakdown definitions cache	SLA Breakdown Definition to SLA Definition relation [sla_definition_sla_breakdown]	Clears the SLA breakdown definitions cache whenever a record is inserted, updated, or deleted.
Clear SLA Breakdown definitions cache	SLA Breakdown Definition Field [sla_breakdown_definition_field]	Clears the SLA breakdown definitions cache whenever a record is inserted, updated, or deleted.
Clear SLA Breakdown definitions cache	SLA Breakdown Definition [sla_breakdown_definition]	Clears the SLA breakdown definitions cache whenever a record is inserted, updated, or deleted.
Delete active breakdown data on inactive	SLA Breakdown Definition [sla_breakdown_definition]	Deletes any breakdown data records for active Task SLA records when the breakdown definition is updated to inactive.
Get breakdown table data	SLA Breakdown Definition [sla_breakdown_definition]	Populate data on the scratchpad that is required by client scripts.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Business rule	Table	Description
Get SLA breakdown data	Task SLA [task_sla]	Populate data on the scratchpad that is required by client scripts.
m2mSLABreakdownRestrictBreakdownDefs	Global [global]	Script to restrict the available values in the sla_breakdown_definition column in many-to-many table sla_definition_sla_breakdown.
m2mSLABreakdownRestrictSLAs	Global [global]	Script to restrict the available values in the sla_definition column in many-to-many table sla_definition_sla_breakdown.
Process changes to tables	SLA Breakdown Definition [sla_breakdown_definition]	Perform additional processing when either the sla_breakdown_table or task_table is changed.
Process SLA Breakdowns	Task SLA [task_sla]	Creates and updates breakdown data whenever a Task SLA record is created or updated.
Set field values into scratchpad	SLA Breakdown Definition Field [sla_breakdown_definition_field]	Populate data on the scratchpad that is used by other business rules or client scripts.

Activate SLA timeline

You can activate the SLA timeline plugin (com.snc.sla.timeline) if you have the admin role. This plugin activates related plugins if they are not already active.

Before you begin

Role required: sla_admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears:
   `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Script includes installed with SLA timeline

When SLA timeline is activated, script includes are installed.

SLA timeline adds the following script includes.

Script include	Description
SLATimeline	This script include generates the timeline data for a task SLA record by replaying the task's history and using the SLATimelineAPI to determine the appropriate stage transitions and timings for the task SLA.
SLATimelineAPI	This script include provides a number of functions that simulate how the SLA engine processes a particular task and SLA definition without actually creating any task SLA records.
SLATimeLineV2SNC	This script include is used by SLA Timeline internal REST API to inspect audit history of a Task and extract task SLA details to be presented on the UI.
ReadOnlyTaskSLAContoller	This script include is a helper script include and is for internal use. This script include is called by SLATimeLineV2SNC to process the task SLA stage details.

Activate Service Level Management - SLA Timer Config API

You can activate the Service Level Management - SLA Timer Config API plugin (com.sn_slm_timer) if you have the admin role.

Before you begin

Role required: admin

About this task

Activating this plugin provides the ability to set a preferred SLA for a given task through configuration which is dynamic, such as First SLA to breach, or declarative through a hierarchical mapping of first to match SLA definitions. This plugin includes demo data and activates related plugins if they are not already active.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

sn_slm_timer.sla_timer_admin	Users with this role has full administrative rights to the Service Level Management timer configuration.	sn_sla_definition_read

Script Includes installed with SLA Timer Config API

When SLA Timer Config API is activated, script includes are installed.

SLA Timer Config API adds the following script includes.

Script include	Description
SLATimerConfigAPI	This script includes provides various functions to process and identify the task SLA that is about to breach.

Configure Service Level Agreement (SLA)

Configure SLAs to define a set amount of time for a task to reach a certain condition, to ensure that incidents are closed or resolved according to the expectations set for customers.

Service Level Agreement (SLA) definition

An SLA definition is used to create and progress SLAs, enabling you to use an SLA system for your organization's tasks.

An SLA definition record defines the timings, conditions, workflows, and other information required to create and progress task SLAs.

For example, the default **Priority 1 resolution (8 hour)** SLA Definition defines the Task SLAs to attach to incidents with a P1 - Critical priority, specifies appropriate conditions for those Task SLAs, and uses the default SLA workflow to create events such as to send a notification, when an incident's Task SLA reaches 50% of its allotted time.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an SLA definition

You can create one or more Service Level Agreement (SLA) definitions and use them to create an SLA record. This SLA record enables you to use an SLA system for your organization's task.

Before you begin

When you create an SLA definition, avoid using dot-walked fields that change frequently in any of the SLA conditions (start, stop, pause, and reset). The SLA engine features, such as SLA Timeline and SLA Repair replays the audit history of the Task record that the task_sla is attached to. The SLA engine does not replay the audit history of any dot-walked fields from that Task, rather only considers the final state of the dot-walk fields.

For example, a pause condition is set to an incident dot-walk field `incident.company.cost_center`. The value of the Cost Center is first set to Finance and later changed to Engineering. When the SLA repair runs, only the final value of the Cost Center is considered. So, if the SLA pause condition is: `incident.company.cost_center is Engineering`, SLA Repair pauses immediately, because the SLA Repair does not consider the previous Cost Center value: Finance. This condition also applies to SLA Timeline (as well as when executing the SLA Engine asynchronously).

Now, if the requirement is to pause when incident.company.cost_center is Engineering and not Finance, then the audit history must be on the Task record using a custom field. Create a custom field (in this example on the incident table) such as: u_company_cost_center and a business rule to populate the field when either the company changes or the Cost Center of the company changes. In this approach, instead of setting the SLA pause condition to the dot-walked field, it is set against the custom field. The given approach ensures that the task_sla, SLA repair, and SLA Timeline always shows the same results.

Note:
The deeper the dot walk, the more business rules are required.

Role required: admin

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Click **New**.
   The **SLA Definition** form is displayed.
3. On the form, fill in the fields.

SLA Definition form

Field	Description
Name	Name that identifies the SLA definition.
Type	Select the type of agreement being defined: **SLA**, **OLA**, or **Underpinning contract**. **Note:** Type is used for reporting purposes only.
Target	Select the target of the agreement being defined: **None**, **Response**, or **Resolution**. Target is used for filtering, searching, and reporting purposes only.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This feature is available only in new instances starting with Jakarta or a later release.
Table	Table that determines the records tracked by the SLA. SLAs can be defined for any table that extends the task table, including incident, change request, and service catalog tasks. **Note:** Starting with the Helsinki release, you can and create an SLA definition for configuration items and business services for Event Management.
Flow	Select the flow to run when the SLA definition attaches to a Task record. Selecting a flow disables the **Workflow** field.
Workflow	Select the workflow to run when the SLA definition attaches to a Task record. Selecting a workflow disables the **Flow** field.
Vendor	Select the vendor associated with the SLA definition.
Service Commitment	A flag that helps to differentiate between a normal SLA definition and a service offering SLA definition.
Enable logging	Check box to activate debug logging just for the specific SLA definition. The debug logging information includes details of the conditions that have matched or not matched. The information also provides the before and the after values for the task SLA and task records.
Duration type	Specify the method for calculating the duration of the SLA. The duration can either be a **User specified duration**, or a **Relative Duration**, such as **Breach on Due Date** or **End of next business day**.
Duration	Specify the length of time the SLA runs before it is marked **Breached**. This field appears when the duration is **User specified duration**. **Note:** The number of days specified in this field is converted to 24-hour blocks. If the **Schedule** field identifies a schedule with eight-hour days, a duration of **1 Day** sets the SLA to breach three business days later.
Relative duration works on	Specify the record that the relative duration should be calculated for. Select either **Task record** or **SLA record**. This field appears only when the relative duration is specified.
Schedule source	Specify the schedule to be used when creating task SLAs. You can specify one of the following options: ○ **No schedule**: If the **No Schedule** option is selected, the SLA calculates the schedule duration based on a 24 x 7 schedule. ○ **SLA definition**: If the **SLA definition** option is selected, the **Schedule** choice list appears. **Schedule**: Specify the hours during which the SLA timer runs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Task field**: This option title is determined from the option selected in the Table field, for example, if the Incident option is selected in the Table field, this option becomes the Incident field. If the **Task table field** option is selected, the **Schedule source field** list appears. Schedule source field: Select the appropriate field from the task such as an incident or problem that provides the schedule. For example, **Configuration item** > **Schedule**.
Timezone Source	Specify the time zone source to be used when creating task SLAs. You can specify one of the following time zones: ○ **The caller's timezone**. ○ **The SLA definition's timezone**: If the **The SLA definition's timezone** option is selected, the **Timezone** choice list appears. **Timezone**: Specify a time zone for the SLA. The time zone can be the system time zone or active standard geographical time zones. ○ **The CI location's timezone**. ○ **The task's location's timezone**. ○ **The caller's location's timezone**.
Tabs	
Start condition	Define the conditions under which the SLA is attached. From the **When to cancel** list, you can choose the conditions under which the SLA is canceled. ○ **Start conditions are not met** option: If one or more of the specified start conditions change, the SLA is canceled. This option is selected by default. ○ **Cancel conditions are met** option: The start condition must be met only once, thereafter the SLA is canceled only when the cancel condition is met. ○ **Never** option: The SLA is never canceled. **Retroactive start**: to choose a date and time field from the task that provides the start time of the task SLA. If you select the **Retroactive start** check box, the **Set start to** field and the **Retroactive pause time** check box appear. ○ **Set start to** field: Offers the date and time fields available on the task type that this SLA definition applies to. For example, if you select **Retroactive start** on a Priority 1 SLA definition and choose **Created** in the **Set start to** field, then the SLA is attached with the start time that is the date and time from the **Created** field on the incident. ○ **Retroactive pause time** check box: Enables the calculation of retroactive pause time on the specific SLA definition. For example, if you select **Retroactive start** on a Priority 1 SLA definition and then

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	select the **Retroactive pause time** check box, the SLAs that have enabled retroactive start can recover prior to the pause time. **Note:** The **Retroactive pause time** check box is available only when the duration is a user-specified duration.
Pause condition	Define the conditions under which the SLA suspends increasing elapsed time. From the **When to resume** list, you can choose the conditions under which the SLA resumes increasing elapsed time. ○ **Pause conditions are not met** option: If one or more of the specified pause conditions no longer match, the elapsed time continues to increase. The **Pause conditions are not met** option is selected by default. ○ **Resume conditions are met** option: If one or more of the specified resume conditions match, the elapsed time continues to increase.
Stop condition	Define the conditions under which the SLA completes. If all these conditions match, then the task SLA completes regardless of whether it is breached.
Reset condition	Determines whether the existing task is canceled or completed on task SLA reset. Defines the conditions under which the running SLA is canceled or completed and a new SLA is attached. For a new SLA to be attached, the start condition must match. Reset condition also helps to configure SLAs when the value of any specific field on the task record changes, changes to, or changes from a specific value. For example, the value of the **Location** field in the task record is 101 Broadway East, Seattle,WA. If you set the SLA reset condition as **Location changes from** 101 Broadway East, Seattle,WA, any change in the value of the **Location** field resets the SLA of the task record.
Fields that can be added by configuring the form	
Condition type	Select the condition type to determine when an SLA attaches, pauses, completes, or resets.

Configure SLA retroactive start and pause

You can use retroactive start to retain timing information for an SLA when a task record changes. Retroactive pause prevents immediate breaches and notifications when retroactive start is enabled for SLA definitions.

Before you begin

Role required: admin

About this task

When a task record changes, typically a new SLA may be attached, with a new set of timing information. This is useful if you are re-assigning an incident to another group and want to attach a new SLA record with new timing information.

However, you may want to retain time information for the task in specific situations. For example, an incident is raised with a priority of **3 - Moderate** and the priority changes to **1 - Critical** after

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3 hours. A priority 1 SLA is attached to the incident at that time. You can use retroactive start to ensure this SLA timing is adjusted retroactively to count from when the incident was first created, rather than from when the incident's priority changed. This reflects the actual time the user contacted you.

You can use the retroactive pause property to apply pause times to the new SLA.

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Open the relevant SLA definition record.
3. In the **Start Condition** section, select the **Retroactive start** check box.
4. From the **Set start to**, select the event from which the SLA starts.

   This option determines the start time used for every task SLA record created from this SLA definition.

   For example, you can select **Opened** to start the SLA from when the task form was initially opened to create the record, which accurately reflects the time the end user contacts the service desk. Alternatively, you can select **Created** to start the SLA from when the task form was initially saved.

5. To enable the retroactive pause property, select the **Retroactive pause** check box.
   Enabling this property ensures that the new task SLA record gets any pause time that would have been accumulated during the period between the retroactive start time and now. This pause time increases the breach time with the appropriate amount.
6. Click **Update**.

What to do next

When retroactive start is enabled, it may result in task SLAs being breached as soon they attach, which will trigger multiple notifications. To prevent the workflow from being processed for these breached SLAs, set the *com.snc.sla.workflow.run_for_breached* property to false.

Configure the SLA timer

Configure the SLA timer to determine which task SLA must be displayed as part of the timer component.

Before you begin

Role required: sla_admin, sla_manager, itil, sn_slm_timer.sla_timer_admin, or admin

About this task

All Service Level Agreement (SLAs) attached to a task, such as an incident, problem, or change are of equal importance. However, on various scenarios and user interfaces, you might want to configure a hierarchy of preferred SLAs. After configuring the hierarchy, you can determine from the list the most important or preferred SLA that can be displayed.

The *slm-timer-config-api* application enables you to set a preferred SLA for a given task. You can use the configuration that is either dynamic, such as **First SLA to breach**, or declarative from a hierarchical mapping of first to matching SLA definitions.

The SLA timer configuration provides the following demo data which also serves as an example to customize.

Do not show SLA timer

Use this configuration if you don’t want to show the timer component.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Show SLA that will breach first

Use this configuration to determine the task SLA that has the earliest breach time.

Incident Response and Resolution Team

Use this configuration if you prefer to display Task SLA matching specific SLA Definition in the timer component. This configuration creates a hierarchy of SLA Definitions to be displayed.

The **SLA Timer Configuration** application comes only with demo data. However, you should create your own configuration records. You can use the demo data as a guide to help ensure that the preferred task SLA record is shown against a particular task.

Procedure

1. Navigate to **All** > **Service Level Management** > **Administration** > **SLA Timer Configuration**.
2. Select **New**.
3. On the forms, fill in the fields.

Name	Description
Name	Enter the name of the SLA timer configuration
SLA timer source	Choose any one of the following: **None** When you don't want to show the timer. **First to breach** When you want to display the task SLA with the earliest breach time. **Note:** When a task SLA with the earliest breach time pauses, goes out of schedule, or is completed, then the next task SLA is displayed. **Task to SLA mapping** When you want to create your own display hierarchy of task SLAs. If you choose this option, you must define the SLA Definition mappings to ensure that a preferred SLA definition is set.
Show completed	Select if you want to display the preferred task SLA that includes the breached stage. If this option is selected, on complete, it will not move to the next SLA priority.

4. Select **Update**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Open the SLA configuration that you created.
6. If the SLA timer **Source** is set to `Task to SLA Mapping`, then you must configure the mappings.
7. To configure the task to SLA mapping, select **New** in the **SLA timer configurations mappings** related list.
8. On the form, fill in the fields.

Name	Description
SLA timer config	Select the timer config from the look-up list. If created from related list, the timer config is auto-populated with the parent record.
Order	The hierarchical order of the task SLA. This value is pre-populated. However, you can edit it based on your requirements.
Table	Select the table that the task belongs to, for example, Incident, Problem, or Change. This selection is used as a reference qualifier on the SLA definition.
SLA definition	Select the SLA definition that is available for the table.

Note:
If there is an identical mapping for the **Order** or **SLA definition** in the selected table, the configuration is prevented using business rules. This check ensures that only one preferred SLA definition is set at each level in the hierarchy.

9. Select **Submit**.

Trouble?

If no configuration sys_id is provided to the sla-timer-configuration API, then the default behavior is:

- **SLA Timer source**: First to Breach
- **Show cancel**: true
- **Show complete**: true

However, you must not provide a configuration sys_id to the application. Set up your own configuration, even if it's identical to the default behavior.

Extend SLA condition rules

You can create custom SLA condition class and condition rule records.

Custom SLA condition class and condition rule records enable you to modify the logic around one or more of the transitions involved in task SLA processing. The custom records can then be applied globally to the processing of all task SLA records or on a per SLA definition basis.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create a custom SLA condition rule

You can create custom SLA condition rules to determine whether an SLA should attach, pause, complete, reattach, or cancel. SLA condition classes contain script to define processing for an SLA condition rule. Create an SLA condition rule after the SLA condition class is defined.

Before you begin

Role required: admin

Procedure

1. Define an SLA Condition Class.
   Navigate to **System Definition** > **Script Includes** and click **New**.

   Within the script in the SLA Condition Class, provide methods to modify one or more of the default SLA transitions (attach, pause, complete, reattach, cancel), defining the conditions for SLA processing. For example, the *attach* method defines when an SLA is created and attached to a task. The methods need to test a condition, referencing the condition fields on the SLA Definition form.

2. Create an SLA Condition Rule.
   a. Navigate to **Service Level Management** > **SLA Condition Rules** and click **New**.
   b. Name the SLA Condition Rule.
   c. Select the Script Include defined above in the **Class Name** reference field.

Example: Example of an SLA Condition Class

For example, including the following method in an SLA Condition Class attaches the SLA if its condition matches the SLA's `start_condition` field:

```
attach: function() {
      return (this._conditionMatches(this.sla.start_condition));
   },
```

The following is an example which shows the format of a script include that would extend the *SLAConditionBase* class and provide methods for each of the SLA transitions:

```
var SLAConditionLocal = Class.create();

SLAConditionLocal.prototype =
 Object.extendsObject(SLAConditionBase, {

   attach: function() {
     // insert script here
   },

   pause: function() {
     // insert script here
   },

   complete: function() {
     // insert script here
   },

   reattach: function() {
     // insert script here
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    },

    cancel: function() {
      // insert script here
    },
});
```

Invoke an SLA condition rule globally

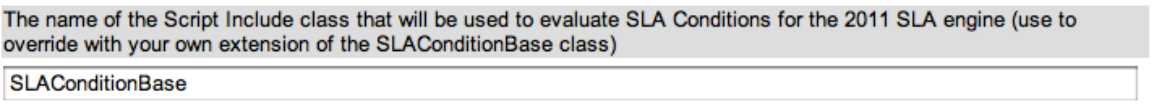
You can globally change the default set of SLA condition rules.

Before you begin
Role required: admin

About this task
By default, the *SLAConditionBase* is used for the SLA condition rules. This can be changed by doing the following:

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA Properties**.
2. Change the value of the *com.snc.sla.default_conditionclass* SLA property to the new condition rule name:



Note:
This is the default condition rule, if no condition rule is specified on an SLA definition.

Related topics

SLA condition rules

Invoke SLA condition rules on a specific SLA definition

You can change the SLA condition rules for a specific SLA definition.

Before you begin
Role required: admin

About this task
In cases where a particular SLA requires that specific SLA condition rules should be used, you can specify the condition rule to be used within the relevant SLA definition form.

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Open an SLA definition record.
3. Configure the form to add the **Condition type** field to the form.
4. Specify the appropriate SLA condition rule in the **Condition type** field

Note:
If no condition rule is defined, the global default condition rule is used.

SLA condition rules

Create SLA breakdown definitions

You can define an SLA breakdown to capture, store, and relay detailed task ownership information and duration for all task SLA records related to a specific task (incident). SLA breakdown is configurable and you can configure it on the basis of a specific SLA definition.

Before you begin

Role required: admin

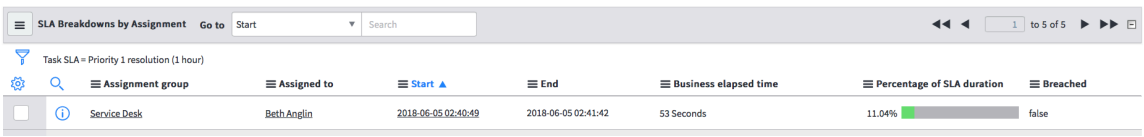
About this task

SLA breakdown data includes:

- Task SLA
- SLA Definition
- Assigned to
- Assignment Group
- Start time
- End time
- Business time during this period
- Total % of allocated SLA Duration
- Whether the Task SLA is breached during this period

Note:
SLA breakdown is on a per task-type basis. For example, once you define a breakdown definition for Incident that uses the breakdown table [SLA Breakdown by Assignment], you cannot define another breakdown definition for this task type.

SLA breakdown by assignment



Procedure

1. Navigate to **All** > **Service Level Management** > **Breakdowns** > **Breakdown definitions**, and click **New**.
2. On the form, fill in the fields.

SLA Breakdown Definitions

Field	Description
Name	Name of the SLA breakdown.
Task table	Task table on which the definition is applicable.
SLA breakdown table	Table where the SLA breakdown data is stored.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: For the Madrid release, only a single breakdown table is available: [SLA Breakdown by Assignment].
Active	Check box to select if the SLA breakdown definition is active.

3. Click **Submit**.
   The SLA Breakdown Definition Fields and the SLA Definitions related lists appear.
4. Under the **SLA Breakdown Definition Fields** tab, click **New** and fill in the fields.

Field	Description
Breakdown field name	Field in the breakdown table that is mapped with the field that you select in the source field.
Source field name	Field in the task record table which is mapped to the breakdown field.

5. Click **Submit**.
   The breakdown field and the associated source field appears under the **SLA Breakdown Definitions Field** tab.
6. Under the **SLA Definitions** tab, click **Edit** to relate one or more SLA definitions to the breakdown definition.
7. In the slush bucket, under Collection, select SLA Definitions to related to SLA Breakdown Definition.
   The breakdown is applied on this task record.
8. Click **Save**.
   The selected SLA Definitions appear.

Using Service Level Management

Use the Service Level Agreement (SLA) to define a set amount of time for a task to reach a certain condition, to ensure that incidents are closed or resolved according to the expectations set for customers.

SLA calculation

SLAs are calculated and assessed by a business rule and scheduled jobs that run in the background.

The mechanisms that control SLA Workflow and SLA Automation are independent of each other. You may have a requirement to send out email notifications from the SLA Workflow displaying the current elapsed percentage of the SLA. However, this does not work because using percentage in a notification only displays the most recently calculated value of the Task SLA. This results in inaccurate values sent out in email when using SLA calculated values in a Task SLA email notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

One solution is to specify elapsed percentage in SLA notifications by using notifications for each percentage level. For example, an email notification for "75 percent SLA Warning" is created and a special event is used to trigger that notification. The event can be called "sla.warning.75". Another solution is hard-coding these email notifications to trigger at a specified duration percentage, and configure the workflow linked to that SLA definition to send an email notification after waiting an elapsed percentage.

Run the 2011 SLA engine asynchronously

By default in the 2011 SLA engine, the SLA processing is performed by the *Run SLAs* business rule. This business rule runs synchronously and is the suggested configuration.

Before you begin

Role required: sla admin, admin

About this task

SLA processing runs asynchronously. For example, you can run this for performance reasons, such as to avoid delays when a user saves a new incident record. While the SLA engine is running asynchronously, there can be a short delay before the Task SLA records are available after updating a Task. Refresh the form to see the updated Task SLAs.
Use synchronous processing to get the best user experience. Asynchronous processing mode is used only when there a performance issues.

Note:
In the 2010 engine, the *Process SLAs* business rule runs the asynchronous processing.

Procedure

1. Navigate to **All** > **Service Level Management** > **Properties** > **SLA Engine**.
2. Select **Yes** for the **Execute the 2011 SLA Engine asynchronously** (*com.snc.sla.engine.async*) property.
3. Click **Save**.

Recalculate SLA times automatically

By default when a user opens a task, the SLA timing information for that task is not automatically recalculated.

Before you begin

Role required: admin

About this task

You can enable this information to be automatically recalculated each time the task is opened, to provide current information rather than information from the last scheduled job.

Procedure

1. Go to **Service Level Management** > **Properties** > **SLA Engine**.
2. For the **Recalculate Task SLA records when a task's form is displayed** property, select the **Yes** check box.

   Note:
   This property is disabled by default because there is a potential performance impact when several users concurrently open tasks.

3. Click **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use exact times in SLA calculations

When business percentages are used for SLA calculations, they are rounded up to two decimal places.

Before you begin
Role required: admin

About this task
As a result, breaches can occur when SLA calculations are rounded up to 100%. You can enable SLA calculations to instead use the business time or actual time left.
For example, a business percentage of 99.951% is rounded up to 100%, which causes a breach.

For more accurate SLA calculations, enable the SLA engine property for using the exact value of the business time left if a schedule is specified or the actual time left if the SLA has no schedule specified.

Procedure

1. Go to **Service Level Management** > **Properties** > **SLA Engine**.
2. For the **Use field "business_time_left" to calculate breach time instead of "business_percentage" field** property, select the **Yes** check box.
3. Click **Save**.

Repair Service Level Agreement (SLA)

SLA Administrators can repair SLA records to ensure SLA timing and duration information is accurate.

Repair of SLAs is useful to determine accurate timing information if your system has SLA records that contain incorrect values. For example, you may need to repair SLA records as a result of:

- Changing the SLA definition or SLA schedule for any task SLA that is still active.
- Changing the conditions of the SLA definition for any task SLA that is still active.
- Some other system anomaly.

The repair function removes the SLA record, then recreates and recalculates it from the start, including recreating the workflow. The repair uses the history from the Task and if appropriate will also create new Task SLAs that did not previously exist. For example, a new Task SLA may be needed if a new SLA Definition has been added since an associated Incident was created or updated.

SLA repair does not use the history of dot-walk fields but considers only the final state of the dot-walk fields. For example, if a pause condition is set to an incident dot-walk field as `incident.caller_id.location` and in real time the location is set to London, and later changed to San Diego. Then, when the SLA repair runs, only the final location is considered. So, if SLA is in pause state when the `incident.caller_id.location` is San Diego, repair pauses immediately as it does not consider the previous London location.

The workflow used when recreating the SLAs is controlled by system properties and can be found by navigating to **Service Level Management** > **Properties** > **SLA Repair**. Any workflow that is used in the repair process will attempt to follow a repair path when processing the SLA Percentage Timer activities. This can be used to avoid running activities that are not needed for the repair over and over again.

You can repair single SLAs from the relevant form or multiple SLAs from relevant lists.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
SLA repair is not available on SLA definitions, as running a repair operation for an SLA definition could affect large numbers of records on your system, with significant performance impact.

You can also configure and manage SLA repair functions.

Configure SLA repair

Administrators can set SLA repair properties and view repair logs.

Enable or disable SLA repair

The Repair SLA function is enabled for all new installed instances running the 2011 engine, but is disabled by default for upgraded instances. If disabled, no SLA repair functions are available, including all SLA repair modules, SLA repair logs, and UI actions.

Note:
Repair actions will not be available for instances that are not running the 2011 engine. To enable or disable SLA repair, use the *com.snc.sla.repair.enabled* repair property. You can also configure SLA workflow usage.

View repair logs

An SLA repair log record is created each time a repair action takes place with details such as who initiated the repair and start and end date and time. The log record contains a number of child **SLA Repair Log Entry** records related to it. Each repair log entry has a type of either **Before repair** or **After repair** that will contain the appropriate values from each Task SLA record that is repaired. If there is only a **Before repair** entry record for a task SLA, this indicates that it has been deleted. If there is only an **After record**, the repair function has created a task SLA that did not previously exist.

Navigate to **Service Level Management** > **Repair Logs** to view repair log information:

- **Active Repairs**: view repairs that are still in progress.
- **My Repairs**: view repairs you have run.
- **All Repairs**: view all repairs.
- **Repair Entries**: view SLA Repair Log entries for all repairs that have run.

Repair SLA from a form

You can repair task SLA records from the Task form, or from the task SLA form for an SLA associated to a Task.

Before you begin

Role required: admin

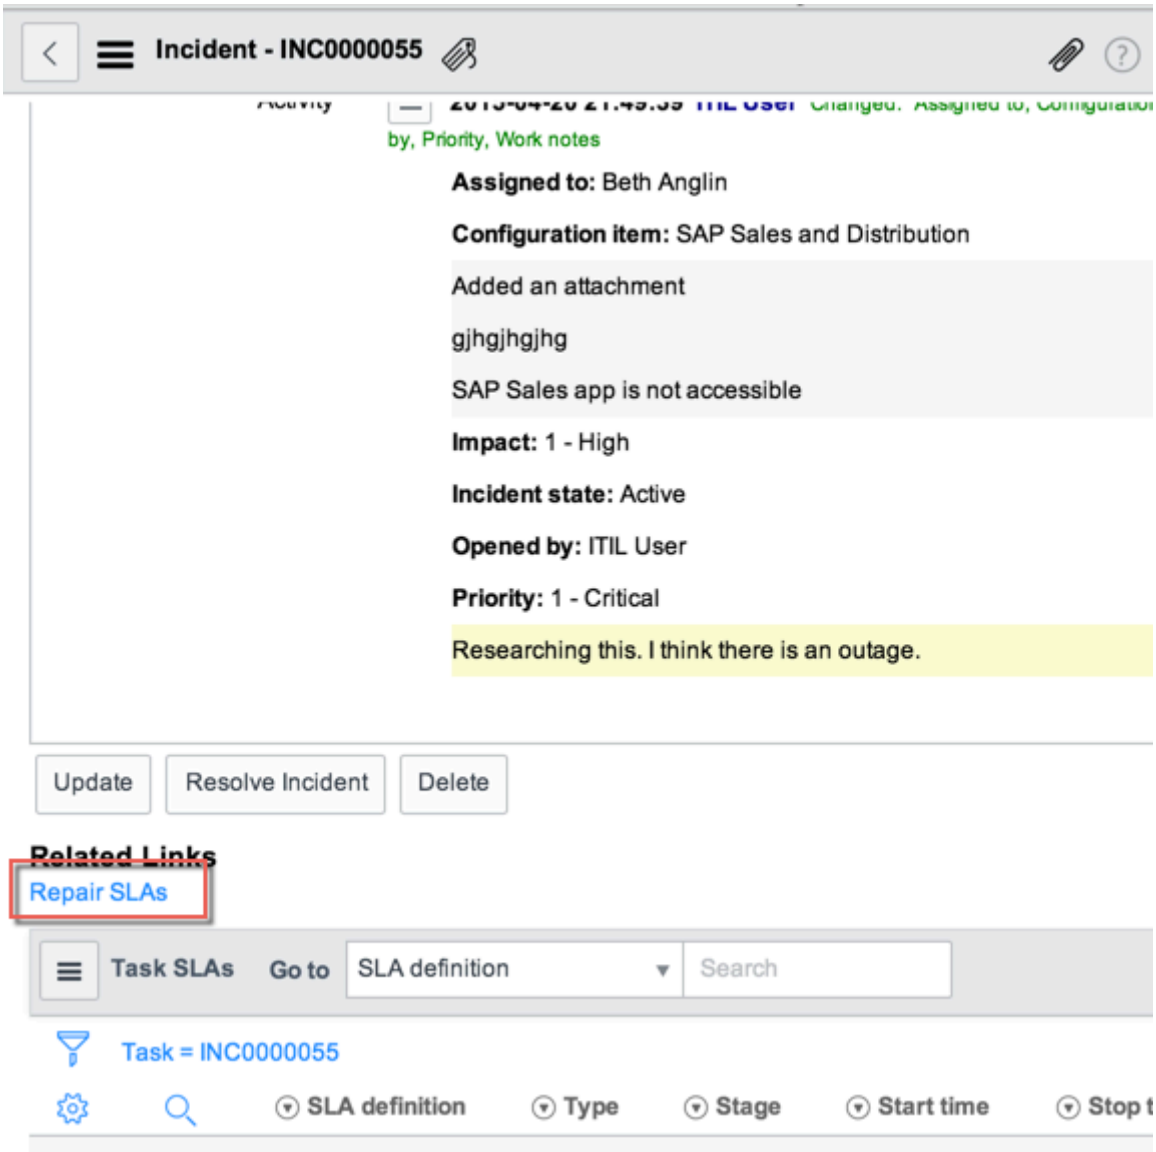
About this task

You can also repair multiple task SLA records from a list.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. To repair all SLAs associated to a specific task, open that form and select the **Repair SLAs** related link.



2. Alternatively, to repair a specific SLA on a specific Incident record, open the Incident record, open the SLA record associated with that incident, then select the **Repair** button on that SLA form.
   The SLAs selected are repaired. When the repair process is completed, the user selecting to repair receives a standard notification of the repair results.

> **Note:**
> Closing the progress dialog box does not stop the repair process. You can go to **Active repairs** or **My repairs** and click **Show progress** to view the progress dialog again.

Repair SLAs from a list

You can repair multiple SLA records from a list of task or SLA records.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
You can also repair SLA records from the relevant Task form, or from the SLA form for the SLA associated with the task.

Procedure
1. Navigate to a list of SLA records or task records.
2. Check the records to repair against.
3. Select the **Repair SLAs for selected** list action.
4. Alternatively, to repair SLAs for all records on that list, select the **Repair for all filtered definitions** related link.
   The SLAs selected are repaired. When the repair process is completed, the user selecting to repair receives a standard notification of the repair results.

Note:
Closing the progress dialog box does not stop the repair process. You can go to **Active repairs** or **My repairs** and click **Show progress** to view the progress dialog again.

Repair Service Level Agreement (SLA)

View SLA timeline
View an SLA timeline to review its details and its progress over time.

Before you begin
Role required: itil, sla_admin, sla_manager

Procedure
Open an SLA timeline from the SLA definition form, Task form, or Task SLA form.
The SLA timeline for the selected task or incident is displayed. It includes SLA report details and a visual representation of the SLA's progress over the lifetime of the task.

Add custom business rules to Service Level Agreement (SLA)
You can add custom business rules to your SLAs.

Before you begin
Role required: admin

Procedure
Select one of the following methods to add custom business rules.

Option	Description
Use setWorkflow(false)	Prior to updating your task, add a call to `setWorkflow(false)` on the GlideRecord object for the task within the business rule that is updating the task. This prevents the busi ness rules from being processed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description

	Note: The setWorkflow(false) disables processing of all engines and the update does not appear in the audit history of the task.
	
	For example, a script that copies the breach time to a custom field on the task.
	
	`(function(){ if (current.planned_end_time.changes()) { var taskGr = current.task.getRefRecord();`
	`taskGr.u_sla_breach_time = current.planned_end_time;`
	`taskGr.setWorkflow(false);`
	`taskGr.update(); } )();`

Create a sys_trigger (Schedule job) to update the task	In your custom business rule, use the **Script** field to generate a scheduled job to update the task. To ensure that the scheduled job is queued for processing immediately, it must be of type Run once, and have next action time of Now.
	
	Note: The `ScheduleOnce` script include includes functions to specify the target record and when to run the scheduled job. This enables you to specify the script to be executed and call another function to create the appropriate record in the `sys_trigger` table.
	
	For example, a script to create a scheduled job that copies the breach time from the task SLA to a custom field on the task.
	
	`(function(){ if (current.planned_end_time.changes()) { var scheduleJob = new ScheduleOnce();`
	`scheduleJob.setDocument(t.task.getRefRecord());`
	`scheduleJob.script =`

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	"current.u_sla_breach_time.setValue('" + current.getValue('planned_end_time') + "');current.update();"; scheduleJob.schedule(); })();

Add custom business rules to Service Level Agreement (SLA) considerations

Prior to adding custom business rules to the task SLA table, you must consider a few points regarding the processing and calculation of the task SLA based on your organization's needs.

Add custom fields to the task SLA table

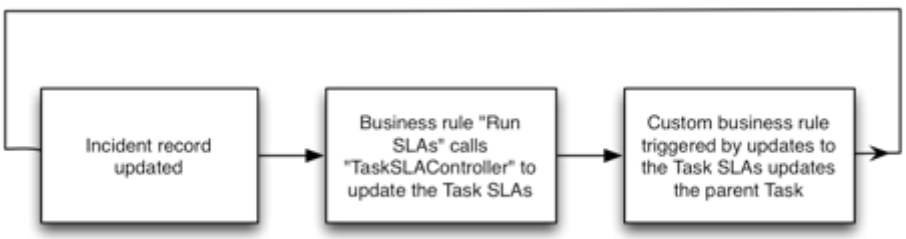
You can add custom fields to the task SLA table and write business rules to populate them. This does not impact the SLA engine. However, you must consider performance implications, if any, of these business rules since task SLAs are updated frequently during their lifecycle.

Points to consider

- Business rule that directly updates the parent task when an SLA is updated.

  Avoid writing a business rule on the task SLA table that updates the parent task directly. Doing so causes recursive processing of the business rules. This is represented in the diagram.

  Recursive business rule

- Business rule that updates the default fields on a task SLA.

  Avoid writing a business rule on the task SLA table that updates the default fields. These default fields are managed and updated by the SLA engine and any updates made to them might result in the following.

  - Fields being ignored, overwritten, or both the next time the SLA is calculated.
  - Incorrect calculations of other values on the task SLA.

Monitoring Service Level Agreement (SLA)

You can view the details for every task SLA record created for a task.

In the task SLA record, you can view the task SLA details such as the stage the task SLA is in and if it has breached.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can also view the target of the agreement being defined: **None**, **Response** or **Resolution**.

Target is used for filtering, searching, and reporting purposes only.

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

In addition, you can get an overview of the timings for the task SLA such as the actual and business elapsed time and percentage, and the actual and business time left in days and hours.

Verify SLA definition using SLA timeline

You can verify that a task is mapped appropriately with a defined SLA using the SLA timeline. If a task is mapped with the SLA definition, the SLA timeline displays a graphical representation of the progress of the task SLA.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **SLA** > **SLA Definitions**.
2. Click the SLA Definition that you want to verify.
3. Click the **Validate SLA Definition** related link.
   The SLA Timeline page appears.
4. From the SLA Definition Picker, select the SLA definition for which you want to confirm if an appropriate task is mapped.
5. From the Task Record Picker, select the task that must be mapped to the SLA definition.
   If the selected task is mapped to the SLA definition, then the SLA timeline displays a graphical progress of the task SLA.

Note:

When a selected task does not have any task SLA attached to it, the SLA timeline still displays the update to the task when the Show all Task updates check box is selected. This information can be used for debugging the task SLA.

Service Level Management reference

Reference sections provide additional information about components installed with Service Level Management.

Flows for SLA

Use the flow actions to send SLA notifications when the duration specified in the SLA definition is crossed.

You can create and edit flows using the Flow Designer. The default flow that is available with the Service level management plugin is **Default SLA flow**.

The **Default SLA flow** creates the events that send out notifications. For example, it creates an event to send a notification to the user assigned to a task, such as an incident, when the task SLA reaches 50% of its allotted time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **SLA Notification and Escalation flow** creates the events that send out notifications. When a task reaches 50% of its allotted SLA duration, a notification is sent to the assignee and the user listed in the **Supported by** field on the configuration item. At 75% and 100%, a notification is sent to the assignee and the assignee's manager.

Note:
This feature is available only in new instances starting with Orlando or a later release.

For more information on SLA notifications, refer SLA notifications.

Related topics

Flow Designer

SLA notifications

SLA sends notifications at certain events defined in the workflow.

By default, SLA notifications are sent on three occasions:

1. SLA is at 50% of the duration specified in the SLA Definition: Notification is sent to the user in the **Assigned to** field mentioned in the incident form and the **Supported by** field in the configuration item form.
2. SLA is at 75% of the duration specified in the SLA Definition: Notification is sent to the user in the **Assigned to** field mentioned in the incident form and the manager of the user.
3. SLA is breached: Notification is sent to the user in the **Assigned to** field mentioned in the incident form and the manager of the user.

For more information on SLA flows, refer Flows for SLA.

Related topics

Workflows for SLA

Workflows for SLA

SLA typically uses workflows to send notifications.

You can create and edit workflows with the Workflow Editor. The default workflow that is available with the Service level management plugin is **Default SLA Workflow**.

The **Default SLA Workflow** creates the events that send out notifications. For example, it creates an event to send a notification to the user assigned to a task, such as an incident, when the task SLA reaches 50% of its allotted time.

The **SLA Notification and Escalation Workflow** creates the events that send out notifications. When a task reaches 50% of its allotted SLA duration, a notification is sent to the assignee and the user listed in the **Supported by** field on the configuration item. At 75% and 100%, a notification is sent to the assignee and the assignee's manager.

Note:
This feature is available only in new instances starting with Jakarta or a later release. The Problem Management Best Practice – Jakarta plugin (com.snc.best_practice.problem.jakarta) plugin must be activate.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA duration types

You can select one of two SLA duration types to define the length of time within which a task must be completed before the SLA is breached.

If an SLA schedule is defined, the duration works along with the schedule. In a user-specific duration, you can choose to specify the length of time that an SLA must run before it is marked as breached. Relative durations specify durations that are relative to the start time of the task SLA and are defined using a script.

When you define an SLA, you can select either a **user specified duration** or a **relative duration**.

User specified duration

Specifies a static duration period, such as **8 hours**, along with a business schedule. The **Duration** field is displayed, enabling you to specify the length of time in days, hours, minutes, and seconds that the SLA must run before it is marked as **breached**. The number of days specified in the **Duration** field is converted to 24- hour blocks.

Each time that you set a duration, an example breach time information message is displayed at the top of the form. This information assists you in understanding how the breach date is calculated. For example, if the current date is January 1, 2015, the time is 10:30 am, and the duration is set to 10 hours and no schedule has been selected, the following information message is displayed: `An SLA starting now will end breach on 2015-01-01 20:30 (Actual elapsed time: 10 Hours).`

Relative duration

Specifies a duration relative to the start time of the task SLA and is defined using a script. For example, you can select a relative duration such as **Breach on Due Date**, **End of next business day** or **Next business day by 4pm**. The set of relative durations is defined in the core configuration using script-based duration calculations.

Note:
Pause conditions are not compatible with relative durations.

You can use a relative duration within the Service Level Management application in the following ways:

- Specify a relative duration.
- Relative duration usage scenarios.

Specify a relative duration

To specify a relative duration, select an option such as **Next business day by 4pm** or **End of next business day** from the list of available relative durations in the **Duration type** field.

When you select a relative duration such as **Next business day by 4pm**, the **Relative duration works on** field appears. You can specify the record that the relative duration should be calculated for. You can select to use **Task record** or **SLA record** and the record you select is available as **current** for the relative duration script.

Note:
If a relative duration is selected, the example breach date information message is not displayed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If your task record has a target date and time field, you can create an SLA with a relative duration based on that field.

Relative duration usage scenarios

If a schedule is selected in the SLA definition, the SLA duration works with the SLA schedule. For example, an SLA might have a user-specified duration of **16 hours** with the schedule as **8-5 weekdays**. If this SLA starts to run for a task at 8:00, it breaches at 16:00. The breach time is calculated from the schedule that defines working time as eight hours per day from Monday to Friday. So the 16-hours duration equates to two days later in the schedule.

The **Breach on Due Date** sets the breach time of the SLA to the date and time from the **Due Date** field of the task that the SLA is attached to.

If the **Due Date** field is empty or occurred in the past, the breach time of the task SLA is calculated to be one second ahead of the task SLA start time. If the date and time in the **Due Date** field is outside the schedule for the task SLA, the breach time is set to the next available scheduled time. For example, if the SLA definition specifies a task SLA schedule as 08:00-16:00 and the value in the **Due Date** field is **Wednesday 11th Jan 2017 20:30**, the breach time is set to **Thursday 12th 2017 Jan 08:00**.

If your task record has a target date and time field, you can create an SLA with a relative duration based on that field.

Schedules within SLA

Schedules within SLA enable you to define the time periods during which the SLAs accumulate business time.

Schedules are typically based on the working hours of the resource or departments to whom a task is allocated. When you define an SLA, you can select a schedule during which the SLA will accumulate business time. You can specify the schedule that each SLA must use in the SLA definition form.

Schedules in SLA definitions

You can specify the schedule to be used when creating new task SLAs in the **Schedule source** field. You can specify one of the following options:

- **No schedule**: If the **No Schedule** option is selected, the SLA will calculate based on a 24 x 7 schedule.
- **SLA definition**: If the **SLA definition** option is selected, the **Schedule** drop-down list appears.
- **Schedule**: Specify the hours during which the SLA timer runs. These set of schedules are defined in the core configuration. For example, you can select a schedule of **8-5 weekdays** or **8-5 weekdays excluding holidays**.
- **Task table field**: This option picks its title from the option selected in the **Table** field earlier on the **SLA Definition** form. For example, if **Incident** is selected in the **Table** field, then this option appears as **Incident field**. If the **Task table field** option is selected, the **Schedule source field** drop-down list appears.
- Schedule source field: Select the appropriate field from the task such as an incident or problem that will provide the schedule. For example, Configuration item > Schedule.

SLA duration and schedules

Schedules have an impact on the duration specified in an SLA definition.

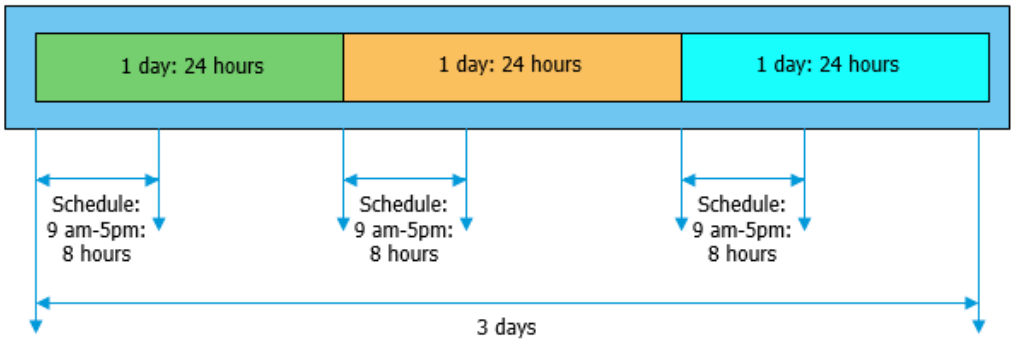
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This impact is reflected in the timings that are taken into consideration while calculating an SLA.

Note:
If a schedule is not selected for an SLA, the SLA will run 24X7.

Consider a scenario where you select a duration of one day, which is 24 hours, and a schedule of 9 am to 5 pm, which is 8 hours. The SLA calculation will distribute the 24 hours across three working days of 8 hours each. So a team working on a task associated with this SLA has 3 days to complete the task before the SLA is breached.

Time distribution



Time zones in SLAs

You can specify the geographical time zone that is used for schedule calculation.

Specify the time zone source to be used when creating task SLAs. You can select one of the following options:

- **The caller's timezone**: If this option is selected and the caller has not selected a time zone, then the system time zone is used.
- **The SLA definition's timezone**: If the **The SLA definition's timezone** option is selected, the **Timezone** list appears.

Timezone: Specify a time zone for the SLA. The time zone can be the system time zone or active standard geographical time zones.

- **The CI location's timezone**
- **The task location's timezone**
- **The callers' location's timezone**

Note:
If you select a time zone source other than the **The SLA definition's timezone** and the time zone derived from the time zone source is empty, the system time zone is used.

SLA conditions

SLA conditions determine when a task SLA record is attached, paused, resumed, reset, canceled, and completed.

On the SLA definition, you specify up to six conditions that are evaluated each time a task record is created or updated. For example, for an SLA to attach to a task, the start conditions must match and stop conditions must not match.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA conditions work in the following ways:

- SLA conditions
- SLA condition evaluation

SLA conditions

You can set up to six SLA conditions: start, cancel, pause, resume, stop, reset.

Start condition

Enables you to define the conditions under which the SLA will be attached.

You can choose the conditions from the **When to cancel** list under which the SLA will be canceled.

- **Start conditions are not met** option: If one or more of the specified start conditions change, then the SLA will be canceled. The **Start conditions are not met** option is selected by default.
- **Cancel conditions are met** option: The start condition has to be met only once, thereafter the SLA will only cancel when the cancel condition is met.
- **Never** option: The SLA will never be canceled.

Select **Retroactive start** to choose a date and time field from the task that will provide the start time of the task SLA. If you select the **Retroactive start** check box, the **Set start to** field appears offering the date and time fields available on the task type that this SLA definition applies to. For example if you select **Retroactive start** on a Priority 1 SLA definition and then choose **Created** in the **Set start to** field, then the SLA is attached with the start time being the date and time from the **Created** field on the Incident.

Cancel condition

Enables you to define the conditions under which the SLA will cancel. You can specify the cancel conditions at the same time when you specify the start conditions.

Pause condition

Enables you to define the conditions under which the SLA will suspend increasing elapsed time.

You can choose the conditions from the **When to resume** list under which the SLA will resume increasing elapsed time.

- **Pause conditions are not met** option: If one or more of the specified pause conditions no longer match, then the elapsed time will continue to increase.
- **Resume conditions are met** option: If one or more of the specified resume conditions match, then the elapsed time will continue to increase. The **Resume conditions are met** option is selected by default.

Resume condition

Enables you to define the conditions under which under which the SLA will resume increasing elapsed time. You can specify the resume conditions at the same time when you specify the pause conditions.

Stop condition

Enables you to define the conditions under which the SLA completes. If all of the specified stop conditions match, then the task SLA will complete regardless of whether it is breached.

Reset condition

Enables you to define the conditions under which the running SLA will be completed and a new SLA will be attached. For a new SLA to be attached, the start condition must match.

Reset condition also helps to configure SLAs when the value of any specific field on the task record changes, changes to or changes from a specific value in the record. For example, the value of the **Location** field in the task record is 101 Broadway East, Seattle,WA. If you set the SLA reset condition as **Location changes from** 101 Broadway East, Seattle,WA, any change in the value of the **Location** field resets the SLA of the task record.

SLA condition evaluation

Every task in the system is evaluated in the following order:

- Process new SLAs-- Determine if a new SLA record must be attached to a task
- Process existing SLA records attached to a task.

SLA conditions are evaluated in the following ways:

- Attach if start condition matches and both the stop and cancel conditions don't match.
- Complete if the stop condition matches.
- Pause if the pause condition matches.
- Resume if the pause condition doesn't match or resume condition matches.
- Reattach if both the reset and the start conditions match.
- Cancel if the start condition doesn't match or cancel conditions matches.

Consider this evaluation order when you create conditions. For example, if your Start condition is a subset of your Stop condition, the Stop condition will always match when the Start condition matches and the SLA will never attach. This includes processing any new SLAs that were just created.

Similarly, if your Pause condition is a subset of your Start condition, the SLA will attach but will permanently be in Paused state. As soon as the Pause condition does not match, the equivalent Start condition will also not match and that task SLA record will be canceled.

In addition, if you create a SLA definition with a Start condition and a Pause condition that are mutually exclusive, your SLA will never pause but will always be canceled first. For example, for an SLA definition where the Start condition is **State is one of "New, Active"** and the Pause condition is **State is "On Hold"**, when the Task is updated to state **On Hold**, the start condition will no longer match and the task SLA will be canceled.

SLA transitions

SLA records pass through a series of transitions during processing.

The following transitions exist for an SLA:

- Attach: when an SLA is created and bound to a task.
- Pause: when an SLA should temporarily stop tracking time.
- Resume: when an SLA should resume tracking elapsed time.
- Complete: when an SLA is marked complete.

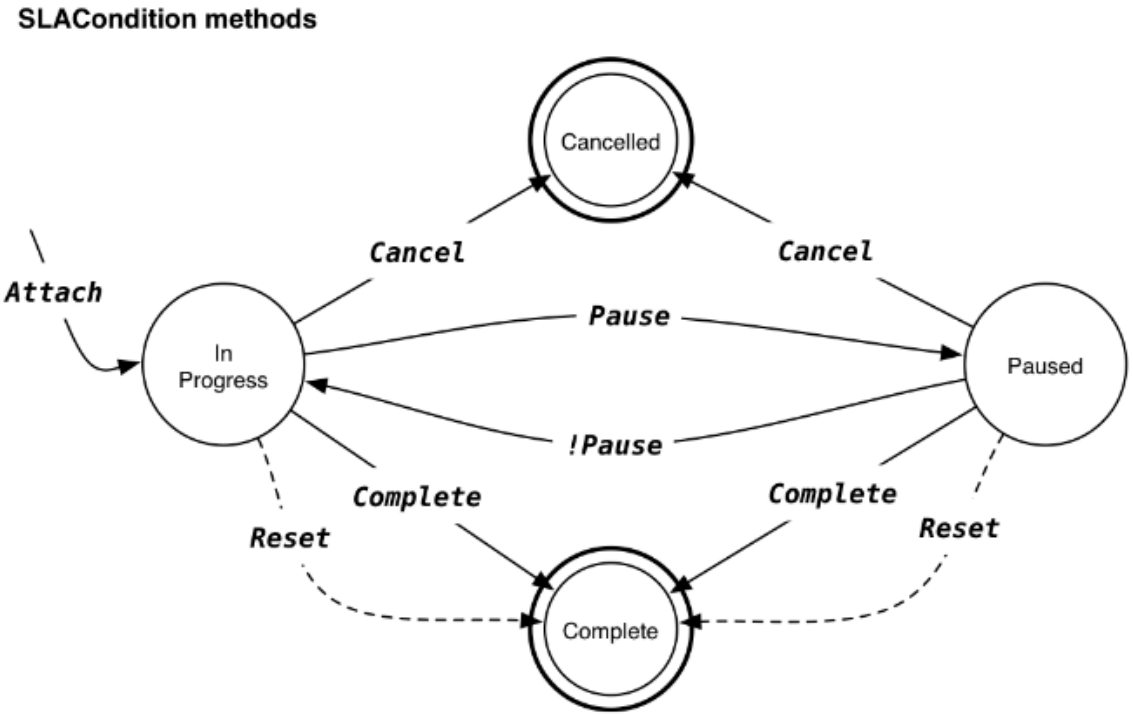
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Reattach: when an SLA is marked completed and a new copy is reapplied.
- Cancel: when an SLA is cancelled.

SLA conditions determine what action is performed on a task SLA record.

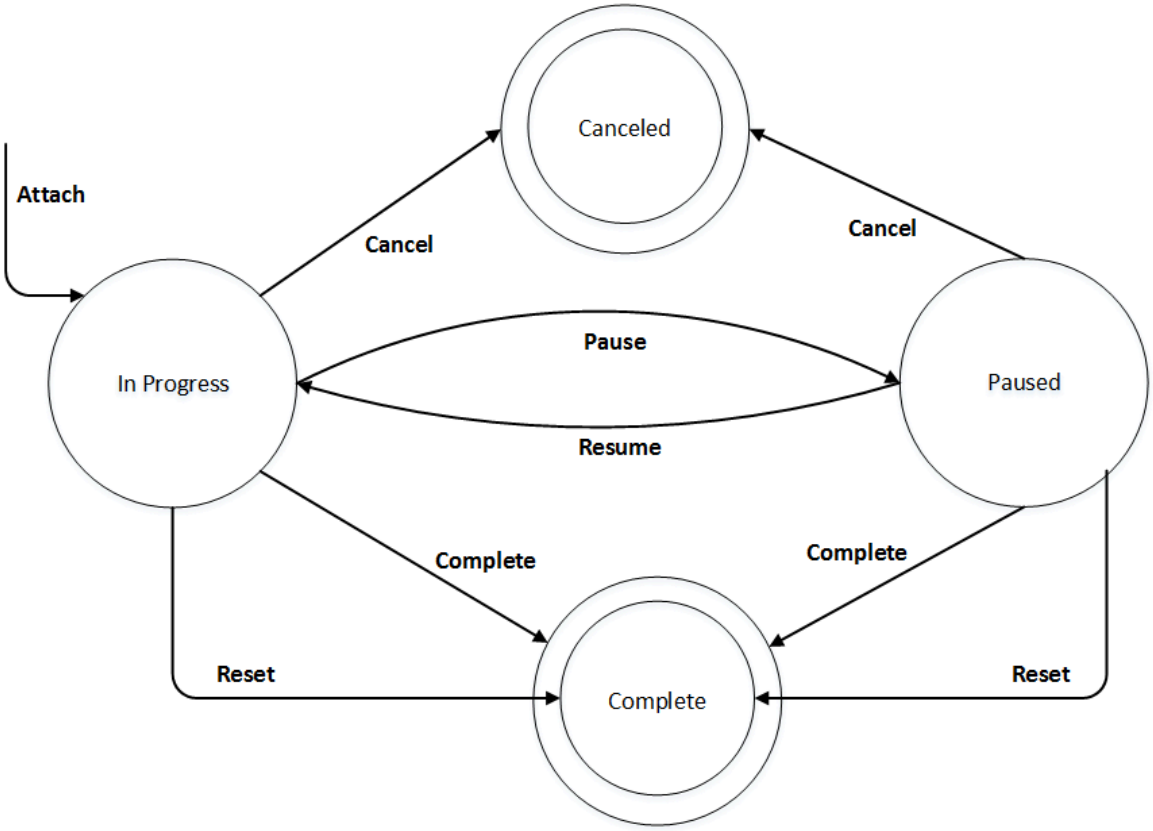
SLA condition	Resultant action on task SLA record
If Start condition matches and both Stop and Cancel conditions don't match	Attach
If Start condition matches, and **When to Cancel** is set to **Start conditions are not met**	Cancel if one or more of the specified start conditions no longer match.
If Start condition matches, and **When to Cancel** is set to **Cancel conditions are met**	Cancel when cancel conditions match.
Pause condition matches	Pause
If Pause condition matches, and **When to Resume** is set to **Pause conditions are not met**	Resume if one or more of the specified paused conditions no longer match.
If Pause condition matches, and **When to Resume** is set to **Resume conditions are met**	Resume if one or more of the specified resume conditions match.
Start and Reset	Reattach
Stop	Complete
Cancel	Cancel

SLA condition methods when the default cancel and resume conditions are selected



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Conditions Methods when the cancel and resume conditions are selected



Each of these conditions is defined as a method within a Script Include, referenced by an SLA Conditions Rule record.

SLA condition rules

SLA condition rules control how the different conditions you define in an SLA definition are combined to determine whether an SLA should attach, pause, complete, reattach, or cancel.

The way that the conditions in an SLA definition are interpreted, to control transitions in state, can be varied using SLA Condition Rules. SLA Condition Rules are defined globally, and can be overridden for specific SLA definitions.

SLAConditionBase is the default set of SLA condition rules.

Navigate to **Service Level Management** > **Administration** > **SLA Condition Rules** to see a list of SLA condition records.

SLAConditionBase script

The `SLAConditionBase` script include implements the default SLA transitions.

The `SLAConditionBase` script include implements the default SLA condition processing.

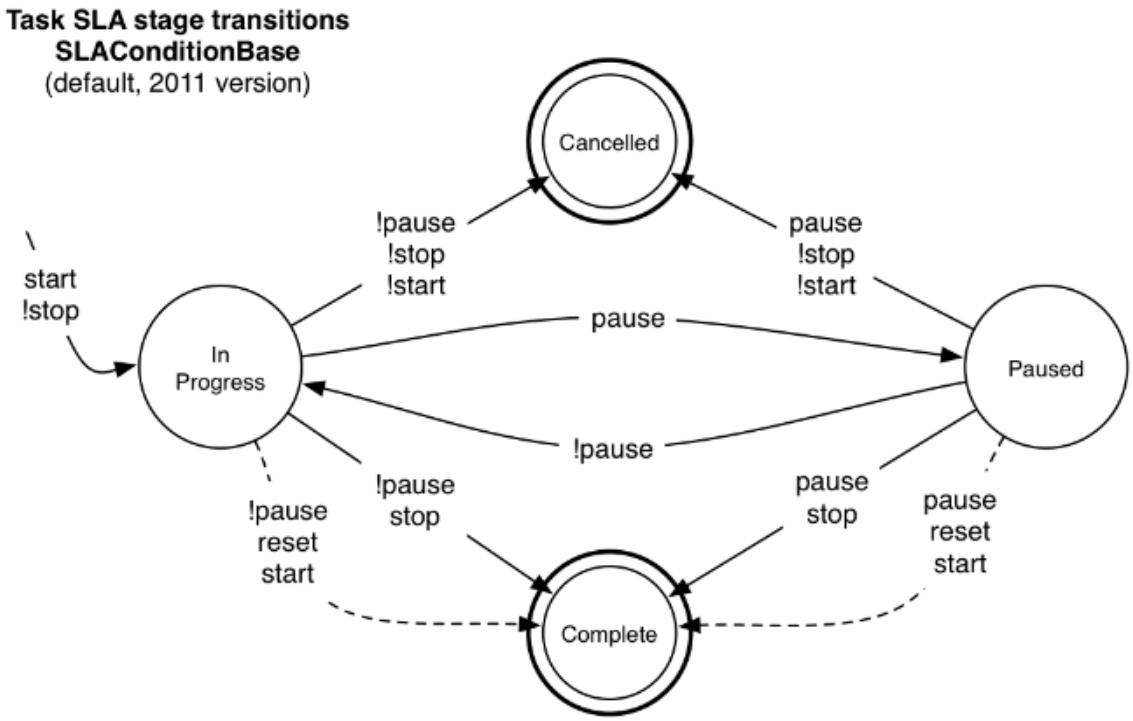
To view the script, navigate to **Service Level Management** > **Administration** > **SLA Condition Rules**, then click on the **SLAConditionBase** entry to view details. The record in the **Class name** field is the script include that defines the condition processing.

Note:
We recommend you do not modify this script , but use it as an example for creating your own script includes.

The following diagram shows how the transitions work:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLAConditionBase



SLAConditionSimple script

The `SLAConditionSimple` script include provides an example modification of default SLA condition processing.

The `SLAConditionSimple` script include is one of the default supplied SLA condition rules. This shows an example of how you can modify and extend condition processing, by overriding the SLAConditionBase methods, with a 'simple' variation that interprets each condition to match a particular transition. For example, for an SLA to attach only the start condition is checked. This affects attach, reattach, and cancel.

To edit this script, navigate to **Service Level Management** > **Administration** > **SLA Condition Rules**, then click on the **SLAConditionSimple** entry to view or modify details. Click **Class name** field to open the script include that defines the condition processing.

The following diagram shows how the transitions work:

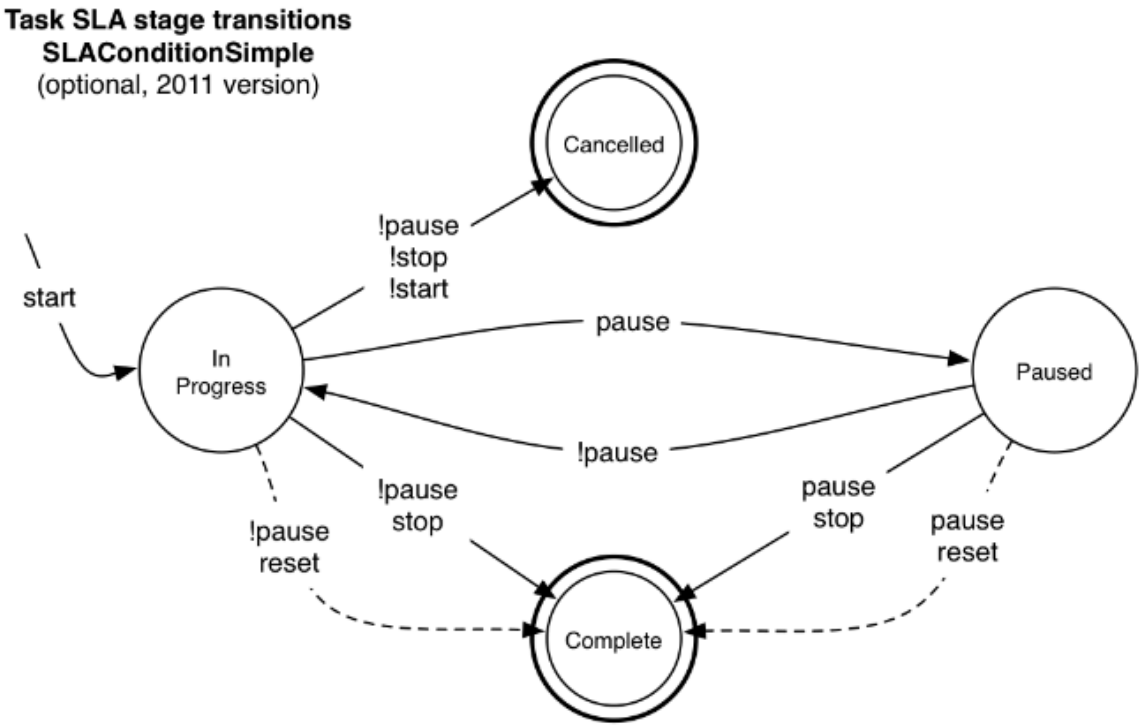
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLAConditionSimple



Service Level Agreement (SLA) process example

As work is done on the relevant task, the SLA may change stage appropriately, depending on the information defined for that SLA in the relevant SLA definition.

Before you begin

Role required: admin

About this task

For example, if an incident is resolved within the time specified, the SLA stage is typically set to **Complete**.

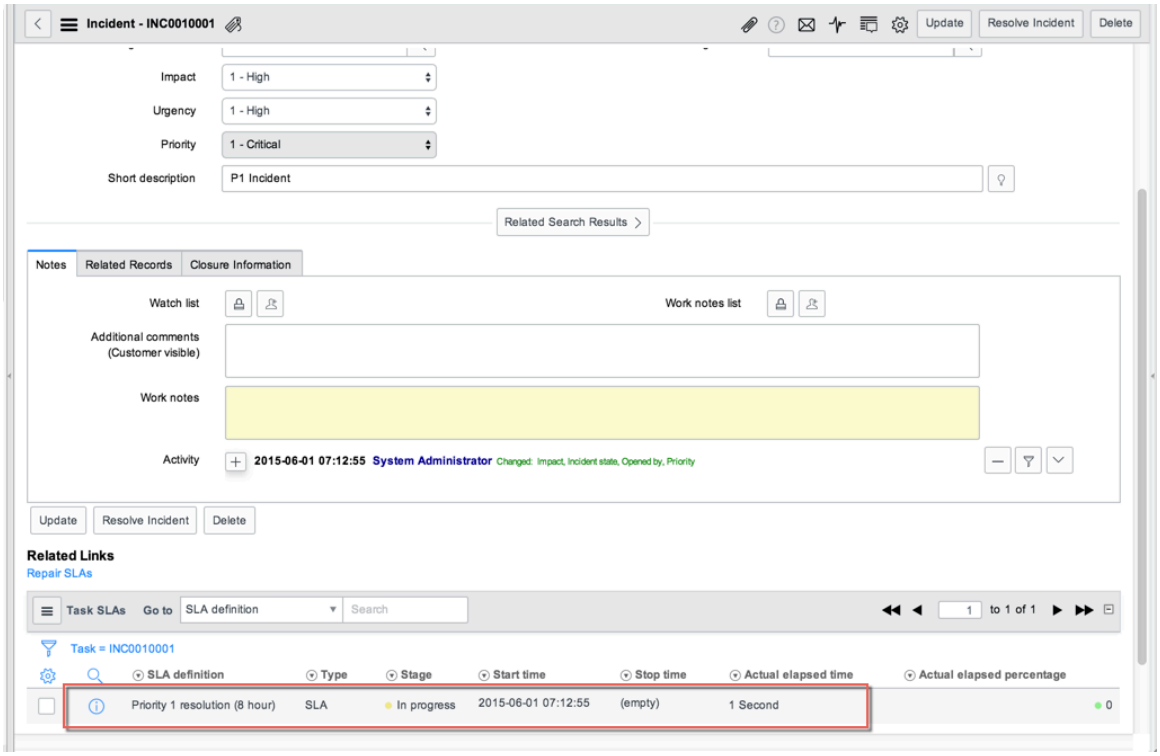
Similarly, if the incident does not reach the required condition within the set amount of time, the Task SLA record associated to that Incident marked as **Has Breached**. For example, by default, if a P1 incident is not resolved within 8 hours, the Task SLA for that incident will have **Has Breached** set to **true**.

This example demonstrates how an SLA can be attached to an incident, then progressed to completion.

Procedure

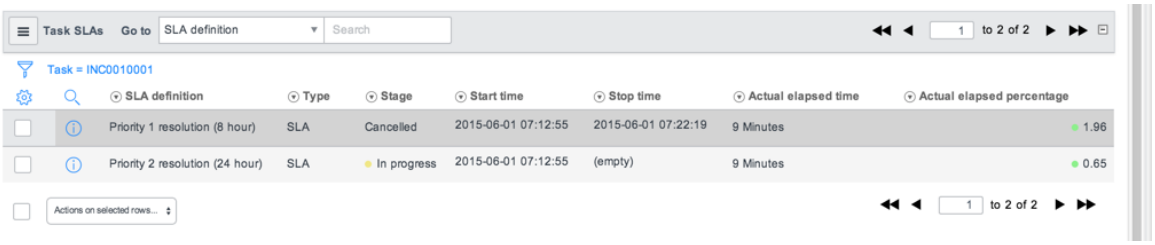
1. Navigate to **All** > **Incident** > **Create New**.
2. Set both **Impact** and **Urgency** to **1**.
   This setting changes the **Priority** to **1 - Critical**.
3. Save the form.
   The **Task SLA** Related List should now have a Priority 1 SLA attached to this incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



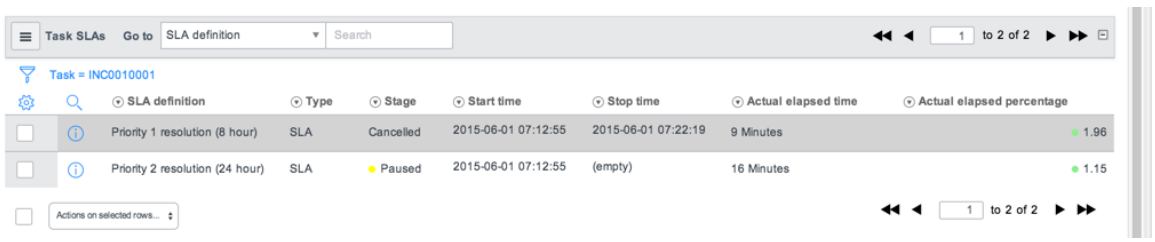
Note:
The default **Priority 1 resolution (8 hour)** SLA definition record is used to create and attach this Task SLA.

4. Change the **Impact** to **2**, which changes the **Priority** to **2 - High**, then save the form.
The Priority 1 SLA is now marked **Cancelled**, and a Priority 2 SLA has been attached, because of the conditions on the SLAs.



5. Change the **Incident State** to **Awaiting User Info**, then save the form.
Awaiting User Info is a **Pause** condition on the Priority 2 SLA, so the SLA is marked **Paused**.

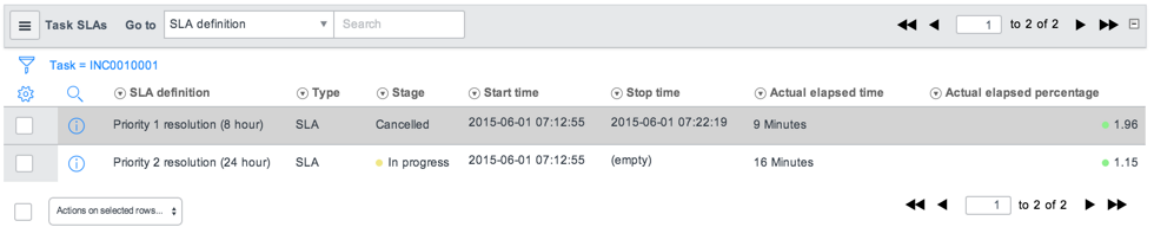
Note:
The pause duration on Task SLA gets updated only after the SLA moves out of pause.



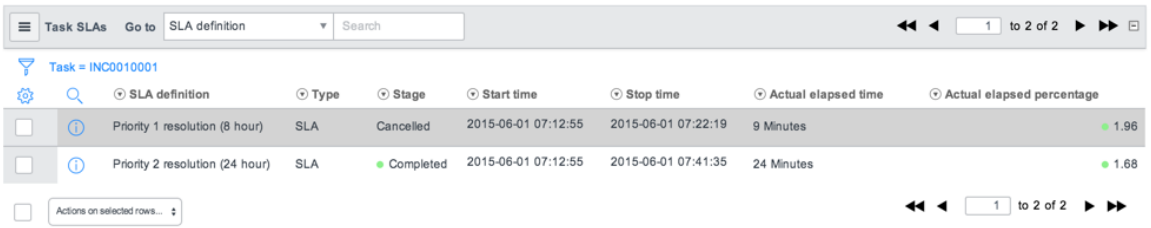
6. Change the **Incident State** to **Active**, then save the form.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Because the incident is no longer in a **Pause** condition, it resumes timing.



7. Enter any **Close code** and **Close notes** values in the **Closure Information** section of the incident.
8. Change the **Incident State** to **Resolved**, then save the form.
   The SLA is marked **Completed**.



Scheduled jobs for SLA

SLA has default scheduled jobs to regularly refresh the time calculations on each active task SLA.

- SLA update (breach after 30 days): repeats every 5 days
- SLA update (breach within 1 day): repeats every hour
- SLA update (breach within 1 hour): repeats every 10 minutes
- SLA update (breach within 10 min): repeats every 1 minute
- SLA update (breach within 30 days): repeats every day
- SLA update (already breached): repeats every day

> **Note:**
> By default, the *`SLA update (already breached)`* scheduled job will calculate either for up to one year after it was breached or if 1000% of its allocated time is breached. You can set this maximum actual elapsed percentage value property in the SLA Engine properties.

Scheduled job runs more frequently when the task SLA is closer to being breached.

SLA Repair workflow

You can configure workflow usage for SLA repair operations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Workflow usage

The SLA repair workflow is used if SLA repair functionality is enabled.

When the SLA repair function is in progress and new task SLA records are created, the workflow will follow a repair path through the workflow. The repair path is based on the result of the **SLA Percentage Timer** activities. While repair is in progress, the result of this activity will be **repair**, which enables the workflow to follow a different path in order to skip certain actions, such as generating events for notifications. This avoids duplicate notifications from being sent out during the repair process for each SLA that is repaired.

To specify that the SLA repair function should use the SLA's original workflow for repair operations, go to **Service Level Management** > **Properties** > **SLA Repair** and remove the selection from the *com.snc.sla.repair.use_repair_workflow* repair property.

Note:
If you choose to use a non-default repair workflow, or a workflow you have changed, you should modify this workflow to ensure it includes appropriate repair conditions on the **SLA Percentage Timer** activities. When a task SLA is repaired, the repair transitions are followed for any activities that occurred in the past. For example, the Default SLA Repair workflow configures the repair conditions to follow repair transitions.

Workflows for new or upgraded instances

For new instances, the SLA Repair function uses the Default SLA workflow, which incorporates repair activities. For upgrades, the SLA Repair function uses the Default SLA Repair workflow because the Default SLA workflow will not be updated in case it has been customized.

To change the default workflow the SLA repair function uses, go to **Service Level Management** > **Properties** > **SLA Repair** and set the *com.snc.sla.repair.workflow* repair property.

SLA timeline

The SLA timeline is a feature of the Service Level Management application. The SLA timeline detail helps you understand the progress of an SLA. The timeline provides detailed insight to the task updates which triggered stage changes during the life cycle of a task SLA.

The SLA timeline detail helps you to:

- View the progress of SLAs, OLAs, and underpinning contracts.
- View related task updates.
- Identify the reason a task update triggered a specific stage in the task SLA.
- Debug and verify a task SLA and the SLA definition.

Note:
This feature is available only on the SLA Engine 2011 version.

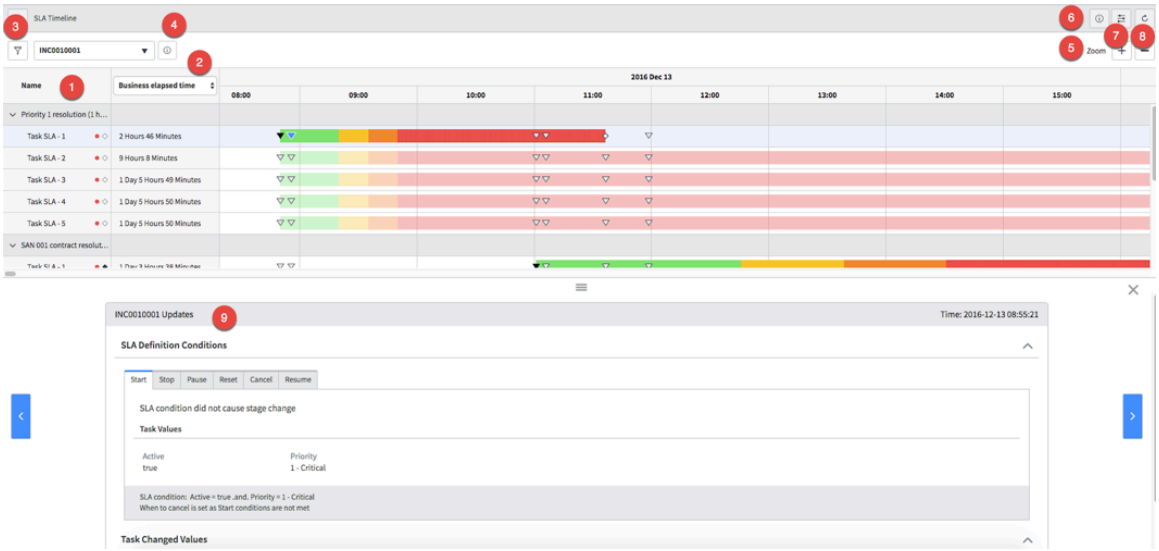
SLA Timeline



SLA Timeline field description

Levels	Field	Description
1	Name	Specifies the SLA definition name and lists the task SLAs that result from the SLA definition. This field also displays, in the form of symbols, the last known stage, and the completion or the cancellation status, if any, of the task SLA.
2	Preference to see **Business elapsed time** or **Business time left** on timeline row	**Business elapsed time:** Specifies the business time that has accumulated from the beginning of the SLA to its end. **Business time left:** Specifies the business time that is remaining by which the SLA task must be completed. **Note:** The selected option from the choice list is saved as a user preference and is selected by default when you navigate to the SLA timeline in the future. Whether you set the system property **Always populate business fields on a Task SLA** to true or false, the SLA timeline always populates the **Business fields for representation**.
3		Enables filtering of the data displayed by the SLA timeline . You can filter data by selecting the following options: • **Show only breached**: When selected, displays the task SLAs that are breached. This check box appears only when the SLA engine property **Enable compatibility with 2010 'breached' stage for SLAs** is set to false. • **SLA Stage**: Select to view the task SLA records that match the final stage of a specific task SLA.

SLA Timeline field description (continued)

Levels	Field	Description
		Note: If the SLA engine property **Enable compatibility with 2010 'breached' stage for SLAs** is set to true, the **Completed** stage appears as **Achieved** and the **Breached** check box appears under the SLA stage. • **SLA Definitions**: Select to view the task SLA records for a specific SLA definition.
4		Lets you view detailed information about the task when you click the information icon.
5		Provides several zoom in/out levels to control SLA timeline zoom resolution. **Note:** If the duration of any task SLA is more than 1 year, then the 5-minutes view is disabled because of performance issues and browser limitations. The condition is applicable for all the browsers. For IE and EDGE: • The 5-minutes view is not available for any task SLA that has a duration of more than 35 days. • The 8-hours view is not available for any task SLA that has a duration of more than 10 months, and the default view is set to 16 hours. • The 16-hours view is not available for any task SLA that has a duration of more than 21 months, and the default view is set to 24 hours.

SLA Timeline field description (continued)

Levels	Field	Description
7		Provides a toggle to show and hide task updates that did not cause an SLA stage. Task updates that are not responsible for an SLA stage change can help debug SLA definition conditions.
8		Refreshes the information on the SLA timeline.
9	Task SLA Details	Displays the details of a task SLA, depending on where you click the timeline. **Stage details**: When you click the update on the task SLA timeline, the stage details section appears with the following information: • Summary of the changes or useful information relevant to the selected stage. • Information on stage start and stage end such as the start and the end time, actual elapsed time and percentage, actual time left, pause duration. The stage information also displays any breach of the SLA. **Note:** If no schedule is attached to the SLA definition, then business values are hidden and actual values are displayed. If any schedule is attached to the SLA definition, both the business and the actual values are displayed. **Task update details**: When you click the task update, the **Task update details** section appears with the following information: • **SLA definition conditions**: Displays the respective conditions of the task SLA and the values for the related columns at that point for the task. A blue check mark appears for the conditions that affect the SLA stage change. • **Time**: Displays the date and the time when an update takes place in the task SLA. It also displays the delta changes that occurred in the task for that update. **Out of schedule details**: When you click the out of business schedule on the task SLA timeline, the outside business period details section appears with the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Timeline field description (continued)

Levels	Field	Description
		• **Start date**: Displays the start date of the selected task SLA. • **End date**: Displays the end date of the selected task SLA. • **Duration**: Displays the duration of the current out of schedule selection. • **Total out of schedule duration**: Displays the total out-ofschedule hours until the end of the current selection. **Note:** Click ‹ and › to navigate to the left and right task update in the details section.

Note:

The SLA timeline receives information about the task from the audit history and refers to the current SLA definition to pull data for the SLA timeline. The SLA timeline displays task SLA information as though the SLA repair is already executed, irrespective of whether it is executed or not.

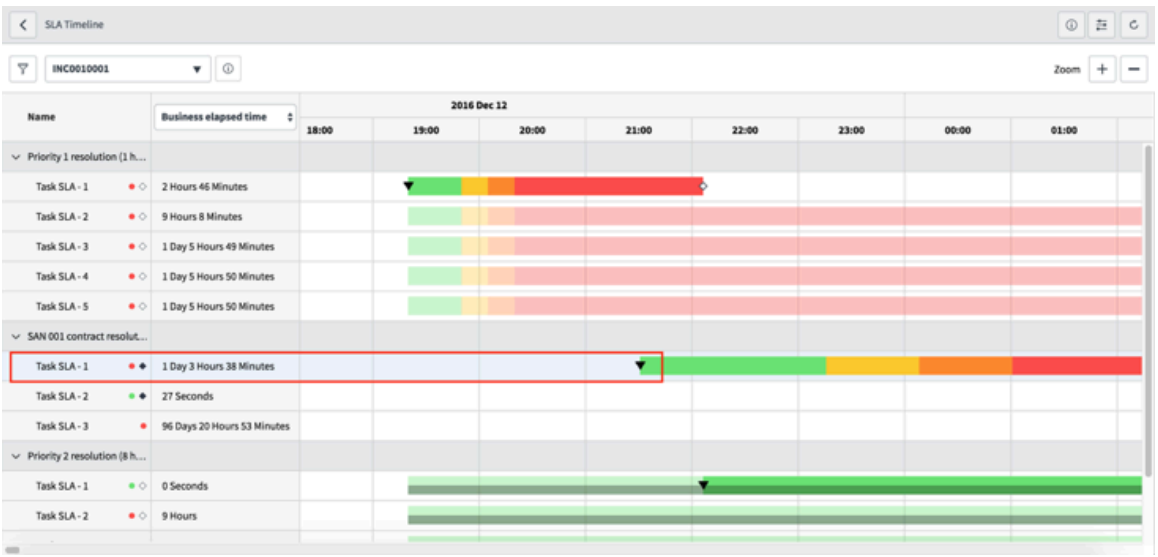
Related topics

- Use SLA timeline to determine business schedule
- Use SLA timeline to understand SLA stage change
- Use SLA Timeline to validate a new SLA definition
- Understand why an SLA did not trigger as expected

Understand why an SLA did not trigger as expected

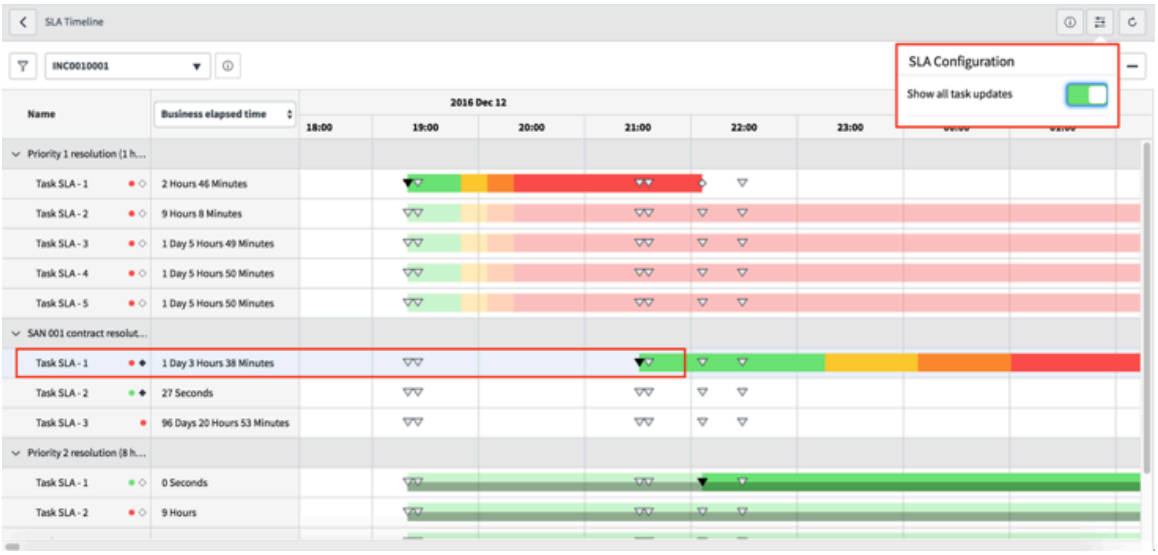
Describes the conditions when an SLA might not trigger as expected.

Using Task SLA -1 (highlighted in the screenshot) as an example, an SLA Manager may have expected this SLA to trigger earlier.

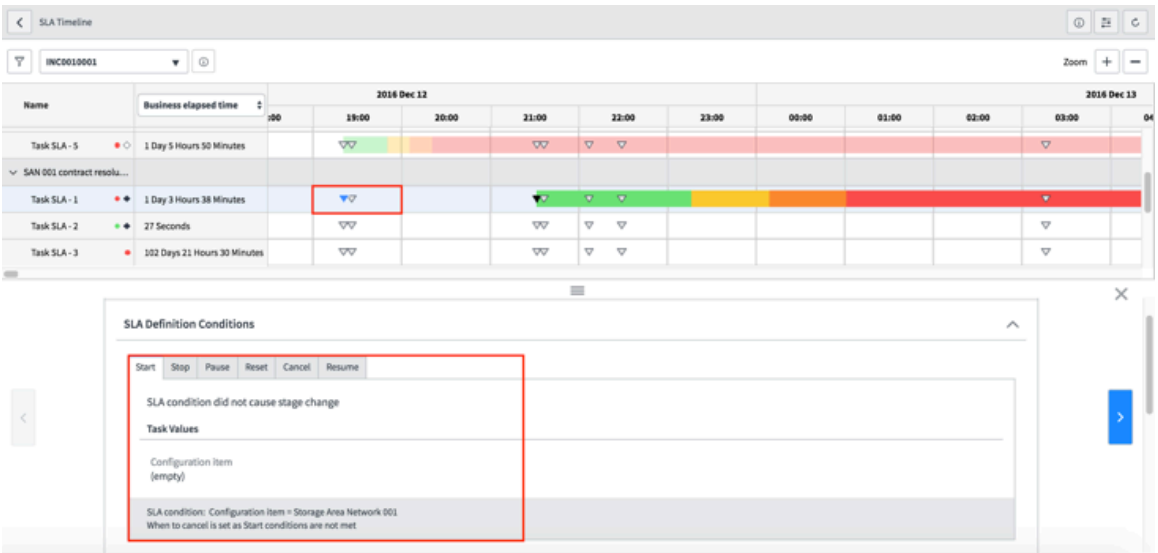


© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To troubleshoot this inconcistency, the SLA Manager can enable **Show all task updates** from the settings menu in the upper right of the SLA Timeline. The SLA timeline displays task updates that do not cause an SLA stage change as a white triangle.



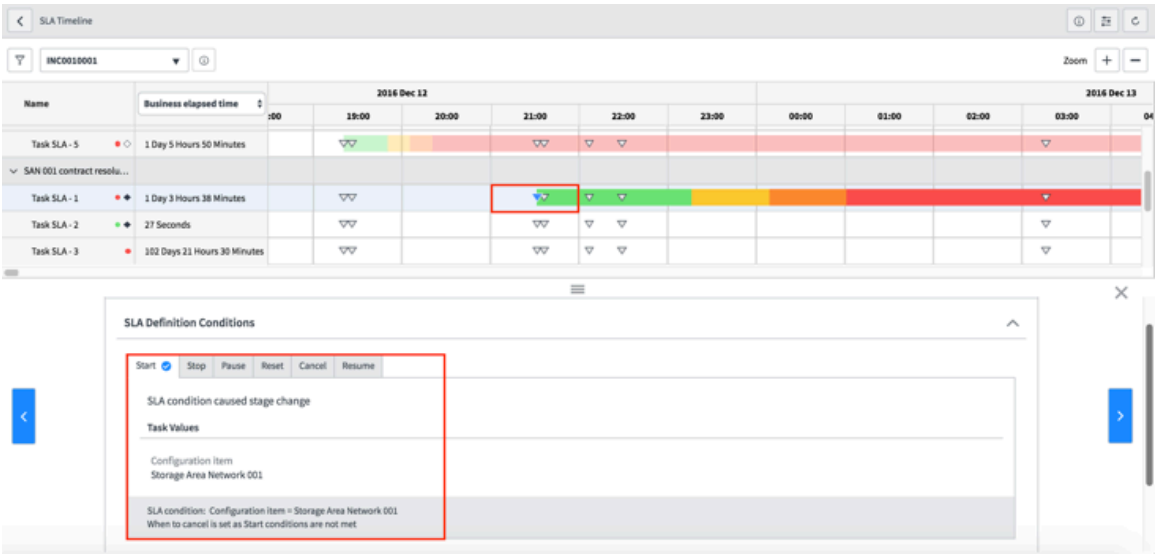
If you click the first or second task updates that did not cause a stage change, the details section displays the SLA start conditions and the task values that are key to trigger the start condition. In this case, the Configuration Item field is not populated and the SLA Definition conditions are defined to trigger when the Configuration Item is defined as the CI SAN 001.



On inspecting the details for the task update that triggered the SLA start condition, you can find that the configuration item is set to Storage Area Network 001 and this matches the SLA Definition start condition.

Show all task updates is a powerful tool to help SLA Managers understand why an SLA may not have behaved as expected.

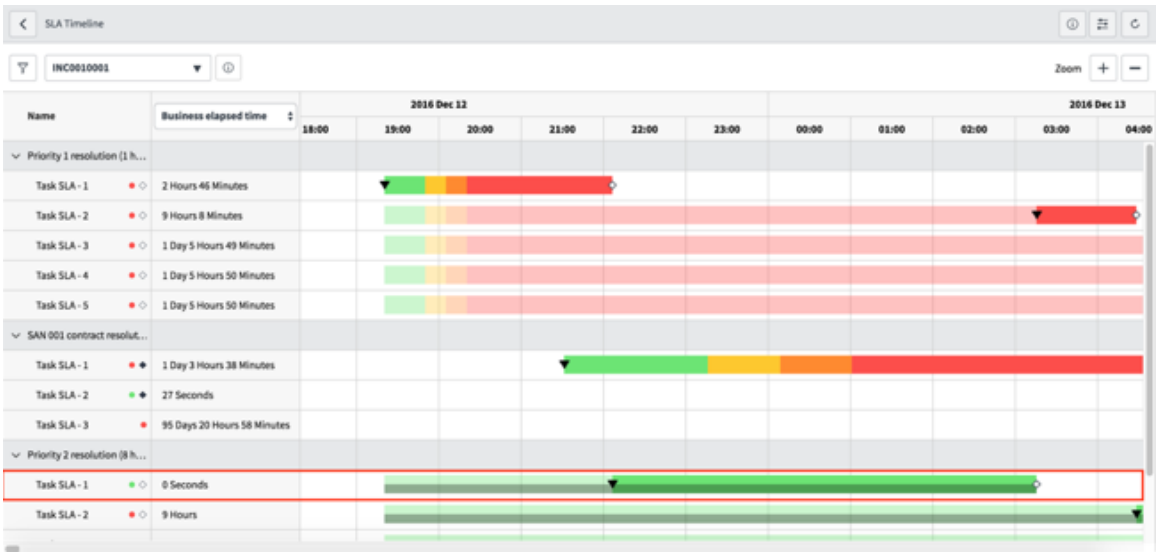
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use SLA timeline to determine business schedule

This example demonstrates how to use the SLA timeline to determine the business schedules and business percentage time related to a task SLA.

SLA timeline

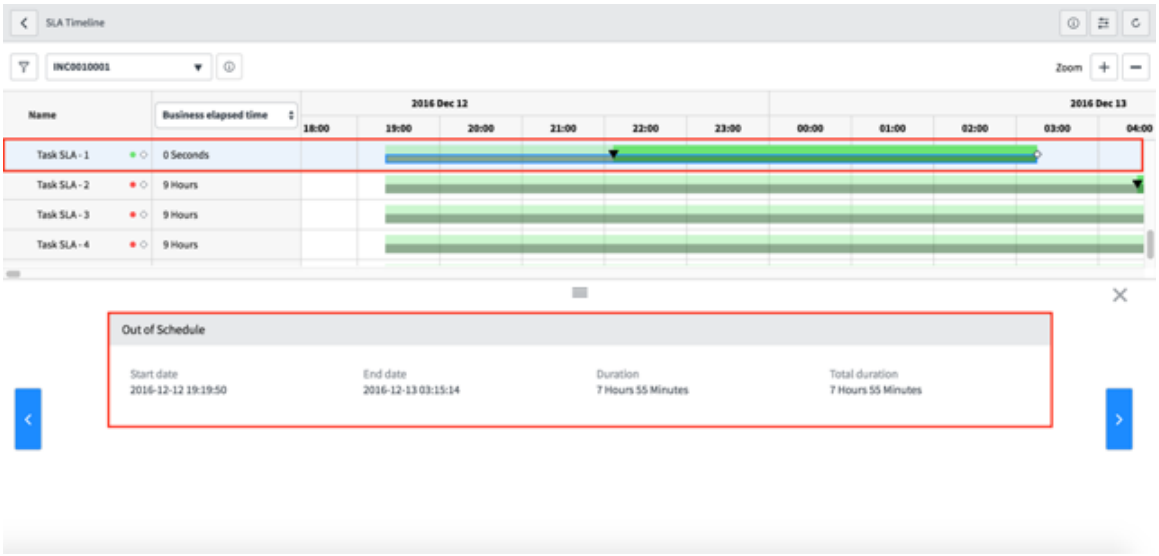


In the example above, the business percentage for the priority 2 incident is 0 seconds. The dark stripe in the SLA timeline determines the time when the SLA was out-of-schedule. The SLA time is not calculated during the out-of-schedule time. So, the business elapsed time is 0 since the total duration of this SLA is out of schedule.

If you want more detail of the out-of-schedule duration, you can hover over the dark stripe for summary detail or click it. The Out of Schedule detail section provides information on the details of the schedule such as when the out of schedule started, when it ended, the current duration of that out of schedule time and the total duration of all out of schedule time for the entire SLA. This provides detailed insight into when the SLA was accumulating time and the periods of time it did not accumulated time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

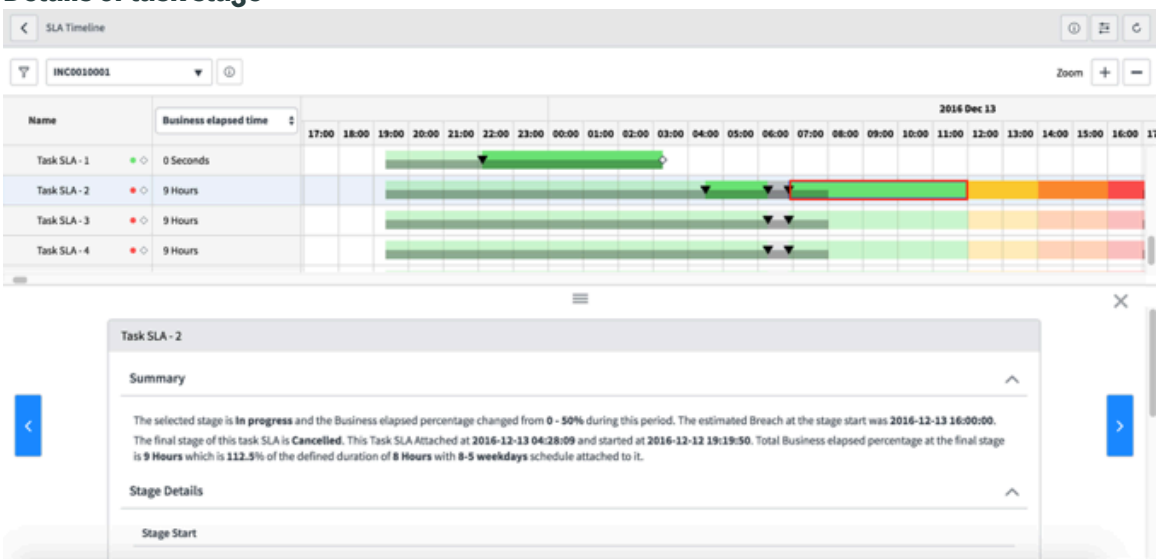
Out of schedule details



Using another example, you can understand in details how business time in an SLA is calculated. In the example below, the total SLA defined duration for Task SLA-2 is 8 hours. The highlighted area shows that the SLA is out of schedule from 07:00AM until 08:00AM and starts accumulating time at 8:00AM reaching 50% of it's total duration at 12:00PM. From 12:00PM to 14:00PM the SLA accumulates from 50 – 75% of it's total duration and from 14:00PM to 16:00PM it accumulates from 75 – 100% of it's total duration, ultimately breaching at 16:00PM.

At any time, you can hover over any stage to get a summary of it's detail or click a stage to get comprehensive detail of that SLA's stage, including a summary and detail of the stage start and stage end.

Details of task stage

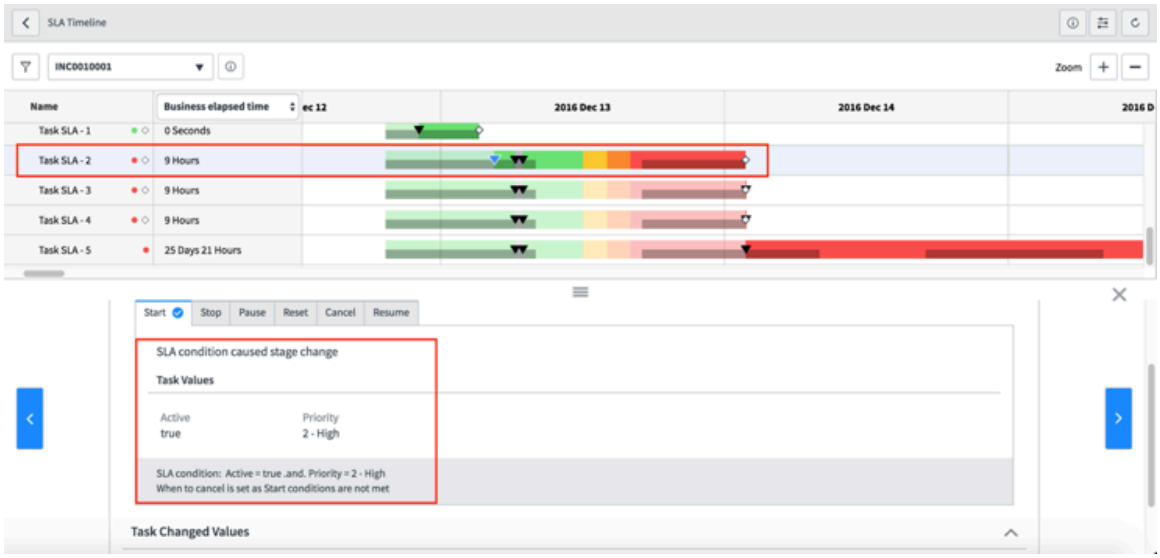


Use SLA timeline to understand SLA stage change

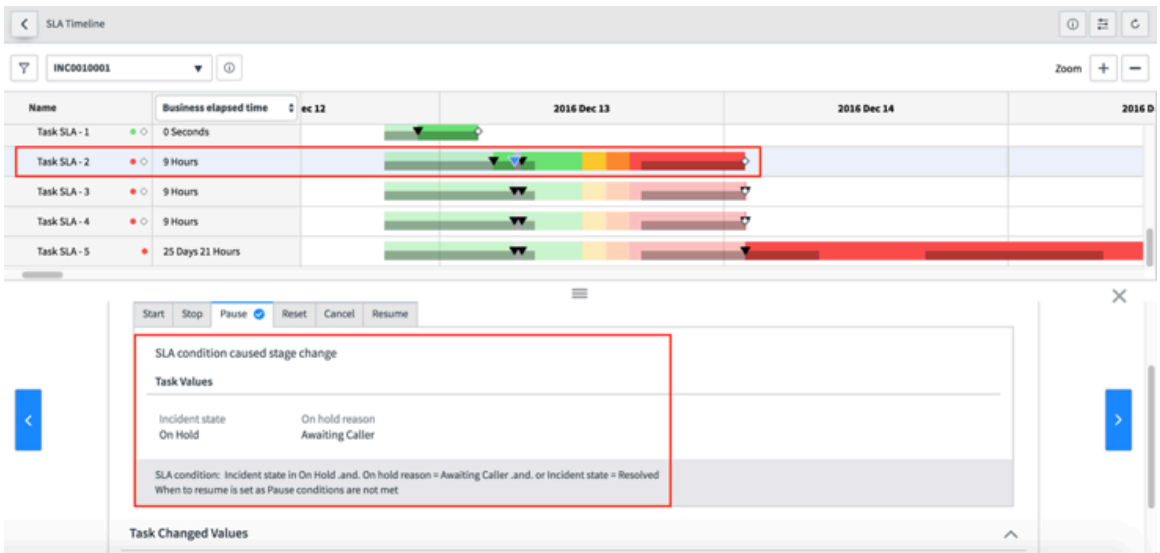
Describes how you can understand SLA stage changes using SLA timeline.

Using Task SLA-2 as an example, you can see a period of retroactive and out of schedule time preceding the task update that caused the SLA to attach to INC0010001. The task update is represented by the first triangle. When this event is selected, the detail pane displays and the Start tab has a blue check and is highlighted indicating this is the SLA Definition condition this event met and the task values which matched the SLA Definition start condition.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

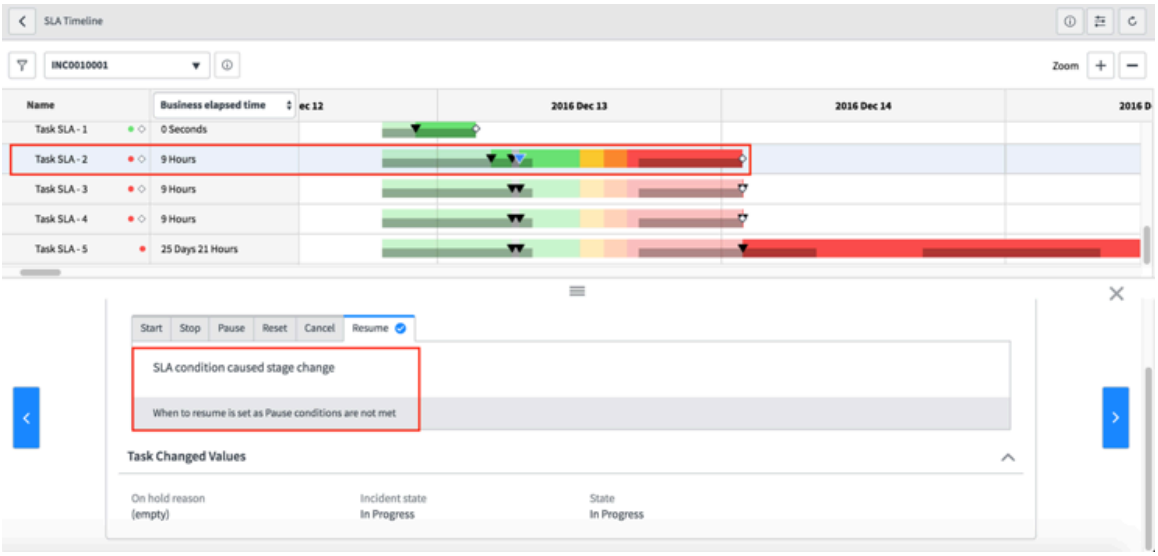


When the second task update represented by the second black triangle, which triggered an SLA stage change occurs, you can see that it triggers a pause condition. If you select this event in the timeline, the detail pane displays the highlighted Pause that contains a blue check indicating a match. Once again, the task values which match the SLA Definition condition are displayed so you easily know why the stage change occurred.

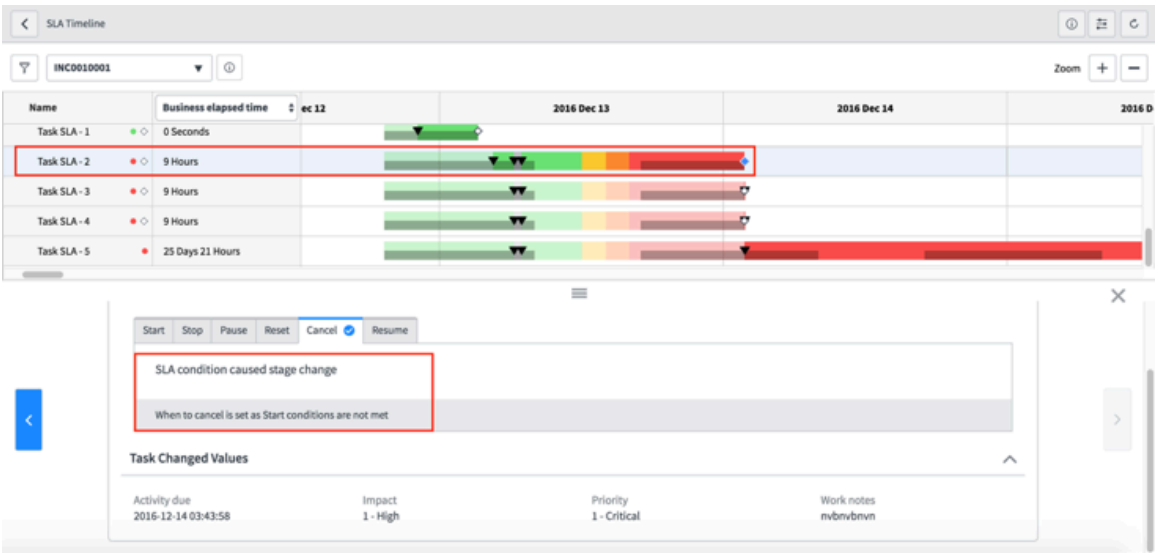


Similarly, when the third task update which triggers a stage change occurs, you can see this resumes the SLA. When that update is clicked, the Stage details section highlights the Resume tab which now contains a blue check and provides detailed information about the task update that occurred and the SLA conditions those updates matched.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



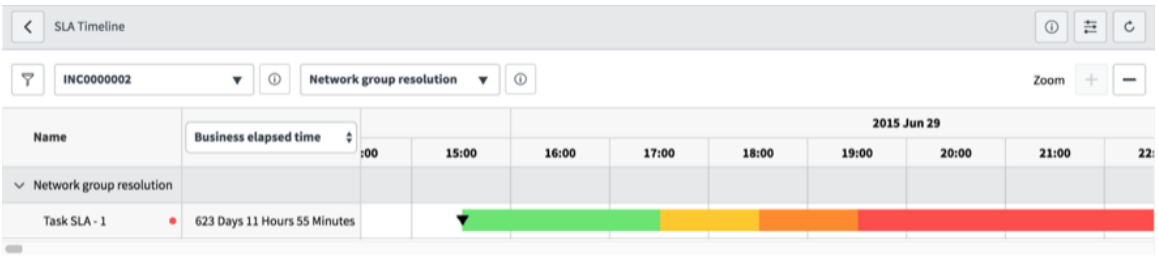
The SLA continues to accumulate time, until it is breached and this is visually represented by the yellow, orange, and the red colors. Eventually, another task update occurs which triggers the SLA's cancel conditions that is represented by the white diamond. The Stage details section highlights the conditions for the task SLA cancellation. In this case, the SLA Definition is defined to cancel when the 'Start conditions are not met'.



Use SLA Timeline to validate a new SLA definition

When a new SLA Definition is created the SLA Timeline can be used to see how the SLA will behave against existing task records.

From the SLA Definition form, open the SLA Timeline by clicking the Validate SLA Definition related link. Select a task by using the task picker in the upper left. The SLA Definition automatically populates for you. When a task is selected that matches your SLA Definition, the SLA Timeline allows you to inspect the different elements of the SLA.



© 2026 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Level Agreement (Legacy) engines

If you are on an earlier version of the SLA engine, you can upgrade to the 2011 engine to make use of the complete service level management functionality.

The SLA engine has three versions:

SLA engine version	Description
Escalation engine (pre-2010)	Tracks only one SLA per task.
The 2010 engine (the Service level management plugin)	Supports multiple SLAs per task. Business rules handle the processing of these SLAs while workflows handle notifications. The majority of logic is in a single large business rule called Process SLAs.
The 2011 engine (also part of the Service level management plugin)	The 2010 SLA engine functionality is concentrated into a number of script includes. Provides retroactive pause calculations and enables the customization of SLA condition processing through the use of condition rules.

Legacy SLA fields

Previously, only a single SLA could be attached to a task via the Escalation engine. The information for the SLA was stored in the task table using the **SLA Due**, **Made SLA**, and **Escalation** fields.

The Task SLA engine now enables multiple SLAs to be attached to a single task, making the earlier task fields redundant. Their equivalents are in the **task_sla** table for each SLA attached to the task.

- **Task SLA**, **Breach time**: This is equivalent to the SLA Due field
- **Task SLA**, **Has breached**: This will be true if the SLA has breached, the opposite of **Made SLA** field.
- There is no equivalent field for **Escalation** field. Notifications can be sent via the SLA workflow and an increase in priority can trigger additional SLAs to be attached to the task.

Note:
The **Business Duration** field is neither part of the Escalations Engine nor the Task SLA Engine.

The fields on the **Task** are considered legacy and are not updated by the Task SLA engine. In case these fields are being updated, the legacy Escalation engine may still be running. This can happen if you have upgraded from Express or a previous instances.

To prevent the Escalation engine from running, set the *com.snc.sla.run_old_sla_engine* property to false. If this property is set to false and the fields are still being updated, check the customizations made to your instance.

Upgrade SLA to 2011 engine

You can upgrade SLA processing to use the 2011 Engine.

Before you begin

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The service level management plugin was enhanced with the ability to script the condition rules for SLA transitions, giving control over how the conditions in an SLA Definition are used. Please review the documentation before enabling the enhancements to understand how the new engine will impact existing customizations

Note:
Activating the 2011 SLA engine will deactivate all business rules on the `task_sla` table (except for the rule *`Task SLA Empty Schedule Warning`*, which is part of the 2011 engine). If you have added any additional business rules or customized the default business rules, these will not be automatically deactivated. So you should review these customizations, and manually deactivate such business rules, before making this change.

The default Process SLAs rule on the `task` table will also be deactivated, so any customizations to this script must be incorporated into the new SLA engine.

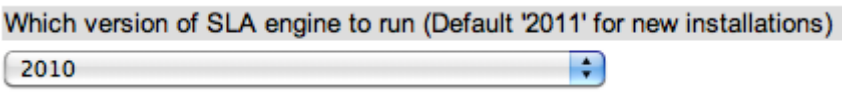
In addition, breach information is removed from the **Stage** field, and stored in the new **Has breached** field.

To enable the new functionality:

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA Properties**.
2. Change the following property from 2010 to 2011:

Example



By default, the 2011 Engine sets the **Stage** field to **In Progress**, shaded red to indicate the breached status, and sets the **Has Breached** field to true. The SLA continues to run until the stop conditions are met.

Organize the migration process

There are several ways to convert the old SLAs to the new Task SLAs.

Before you begin

Role required: admin

About this task

Perform the following steps to organize the conversion process:

Procedure

1. Convert the old SLAs to new SLA Definitions, but leave the Active flag unchecked on each one.
2. Back up the old SLAs by exporting the table to XML.
3. Deactivate the old SLAs, setting the **Run the old SLA engine (System Policy -> SLA Management)** system property (*`com.snc.sla.run_old_sla_engine`*) to **false**. This setting deactivates the legacy SLA engine preventing both engines from running and conflicting. This property is set to true by default, but will be set to false by the new SLA plugins, effectively deactivating the old SLAs.
4. Activate the new SLA Definitions by checking the Active flags on each one.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Navigate to **Incident** > **Open** and use the List Editor to "touch" each record.
   As each record is updated, the new Task SLA will attach to each incident. If there are too many open incidents to effectively touch using the List Editor, run a business rule that will update every open incident.

Convert an SLA to an SLA Definition

You must replicate the default SLA record as a new SLA definition.

Before you begin
Role required: admin

About this task
To convert old SLAs to SLA Definitions:

Procedure

1. Transfer the **Name** and **Table** fields.
2. If desired, check the **Retroactively Start** checkbox.
   If checked, this will cause the SLA to calculate from the moment the record is created (or from the date and time on the selected task), rather than the moment the SLA is attached. This is especially helpful for Task SLAs that will attach to active incidents that have old SLAs currently running.
3. Transfer the **Conditions** field to the **Start Conditions** field.
   Make sure to add **Active is True** as well, so that the new Task SLAs don't attach to closed incidents when they are updated.
4. Define a new set of **Pause Conditions** and **Close Conditions**.
5. Set the **Duration Type** and **Duration** fields.
   The old SLAs did not support relative duration, so to define the Task SLA to behave similarly to the old SLA, select **User Defined Duration** as the **Duration Type** and put the total length of time of all of the escalations here.

   Example
   For instance, an old SLA that has escalations of 4 hours to Moderate, 2 hours to High, and 2 hours to Overdue, the new Task SLA should have **Duration** set to **Days 0 Hours 08:00:00**.
6. Calendars have been replaced by Schedules, so if schedules haven't been defined yet, they will need to be.
7. Instead of escalations, attach an SLA Workflow.
   There is a default SLA workflow, however, you must create a new workflow to replicate the escalation levels on the old SLA. Escalation Levels are defined hour-by-hour, whereas the SLA Workflow uses a percentage timer.

   Example
   So for the above example of 4 hours to Moderate, 2 hours to High, and 2 hours to overdue, the workflow will need a 50% timer and then two 25% timers. The new task SLA records do not use the **Escalation** or **Made SLA** fields on the task record.

Example:
The following example is an old SLA for Priority 1 incidents to be resolved on a Monday-Friday (8-5) Calendar, with escalations to Moderate at 4 hours, to High at 2 hours, and to Overdue at 2 hours:

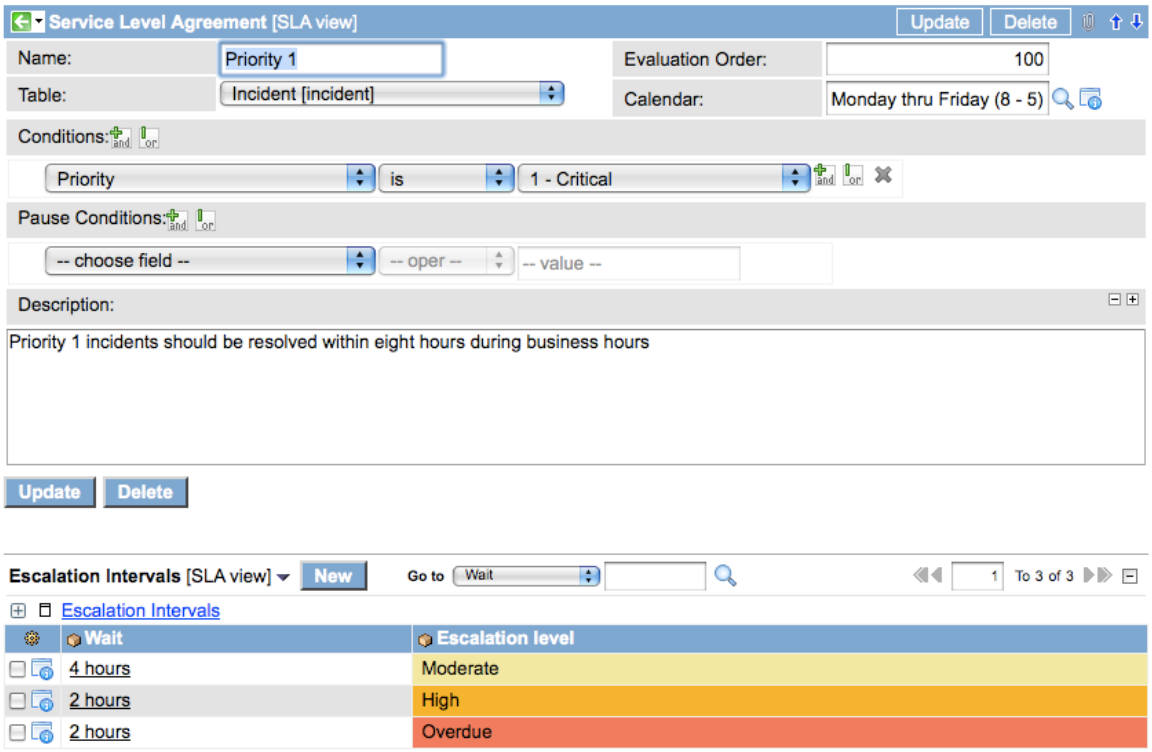
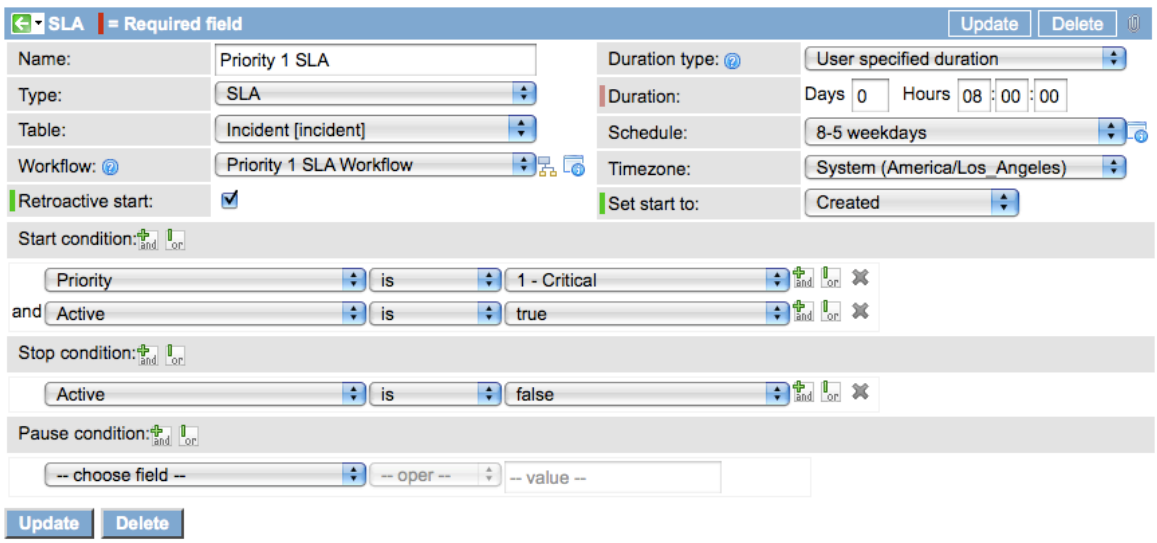
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Old SLA example



This is the new Task SLA created from the same information:

New SLA example



This is the workflow which powers the new Task SLA.

Note:
This example workflow responds to each escalation by firing off an event. A business rule can be configured to respond to escalation events, or the workflow can be adjusted to match the organization's process.

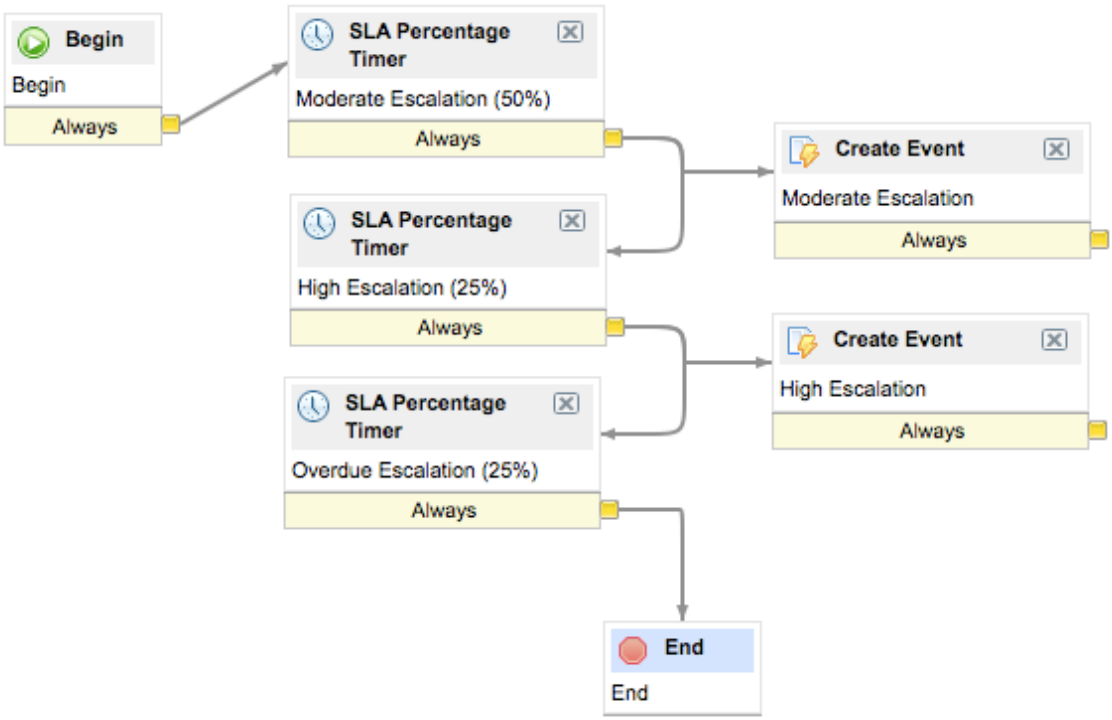
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New SLA workflow



Reactivate escalation engine

Escalation engine is replaced with 2011 SLA Engine.

Before you begin

Role required: admin

About this task

ServiceNow Express used the legacy Escalation Engine to process SLAs. If for any reason a customer who has upgraded from ServiceNow Express to ServiceNow Enterprise wants to reactivate the Escalation engine, they can follow the steps below.

Procedure

1. Navigate to sys_properties.list.
2. Update the property *com.snc.sla.run_old_sla_engine* to `true`.

Note:

ServiceNow recommends using the 2011 SLA Engine.

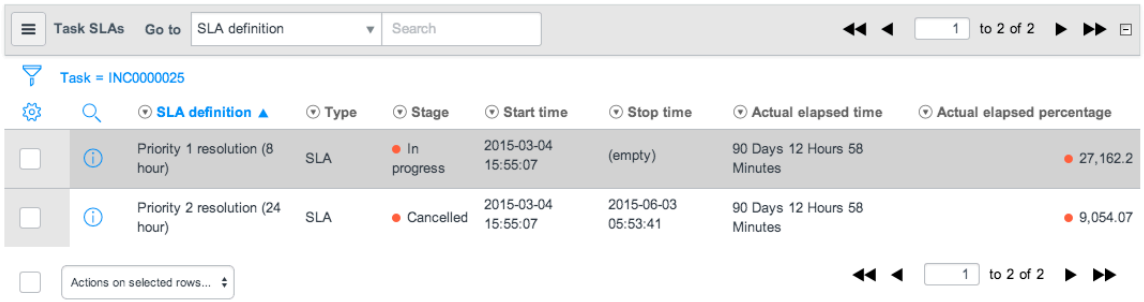
Task SLA table

The Task SLA [task_sla] table stores Task SLA records for the SLAs attached to particular tasks.

For each task, attached SLAs are accessible in a related list on the Task's form.

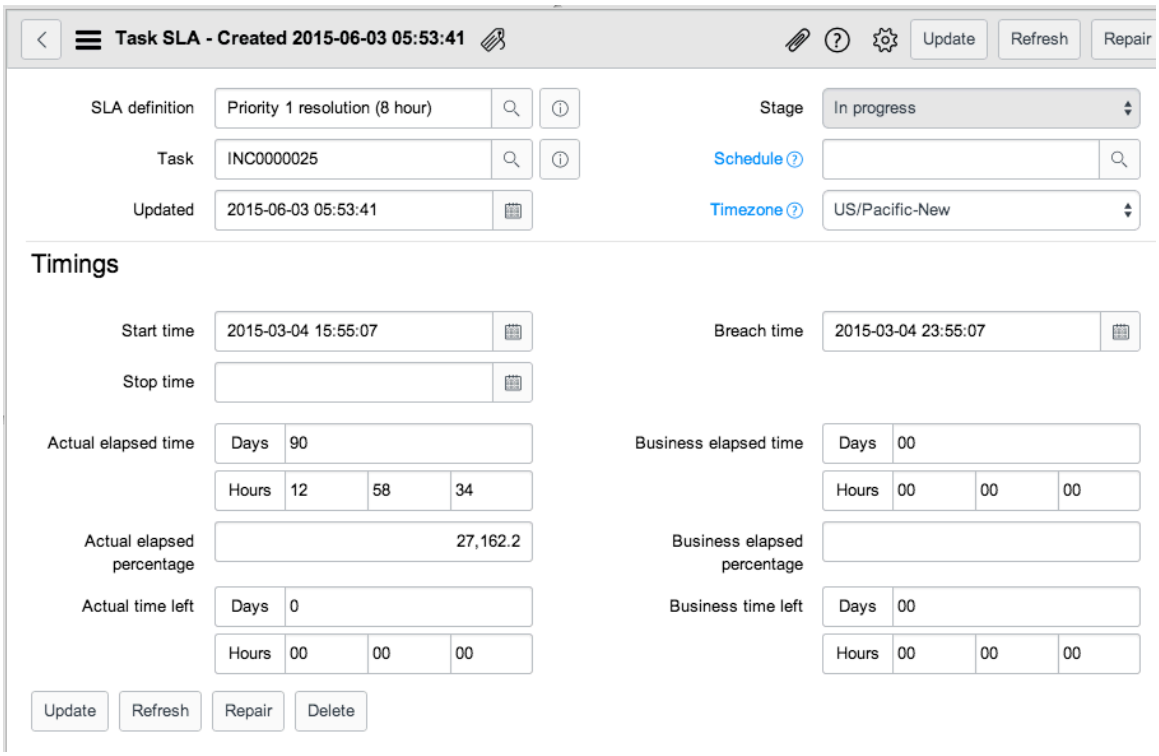
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task SLA table



The SLA form for a task shows further details:

Task SLA form



Stage values

The following **Stage** values are defined:

- **In progress**
- **Cancelled**
- **Paused**
- **Completed**

> **Note:**
> The **Breached** stage value is also available for systems either using the 2010 SLA engine, or running in compatibility mode.

Timing information

The **Timings** fields on the Task SLA contain the crucial information powered by the SLA Engine:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Task SLA Time-Based Fields

Field	Description
Start time	The time the SLA was started.
Stop time	The time the SLA ended.
Breach time	The time the SLA will breach, adjusted for business pause duration (for task SLAs with a schedule specified) or pause duration (for task SLAs with no schedule). **Note:** Breach time is the same as Planned end time.
Actual Elapsed Time	Time between start time and now (minus pause duration).
Actual Elapsed Percentage	Percentage of total SLA that has elapsed (minus pause duration).
Actual Time Left	Time remaining until SLA breach.
Business Elapsed Time	Time within the specified schedule between start time and now (minus pause duration).
Business Elapsed Percentage	Percentage of total SLA that has elapsed within the specified schedule (minus pause duration).
Business Time Left	Time within the schedule remaining until SLA breach.
Original breach time	The date/time the SLA would breach, as calculated when the SLA is first attached. **Note:** You may have to configure the form to see this field.

Service level management overview dashboard

The Service Level Management Overview Dashboard provides insight into Service Level Agreement (SLA) information relevant to the logged-in user. By default, the Overview dashboard is available to users who possess the itil role.

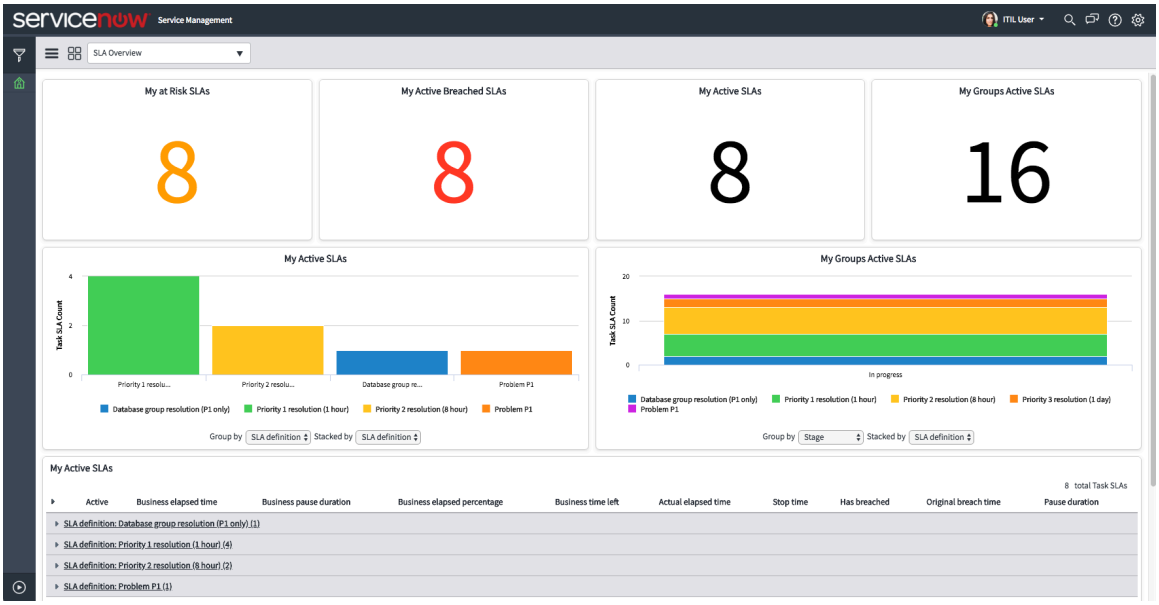
The Overview Dashboard is enabled by default for new customers. Customers upgrading from a prior release have to enable the Service Level Management Dashboard plugin (com.snc.sla.overview) to activate this feature.

You can navigate to the dashboard in the following ways:

- **Service Level Management** > **Overview**
- **Self – Service** > **Dashboard** > **SLA Overview**

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA overview dashboard



UI component	Description
My at Risk SLAs	Number of active task SLAs for tasks assigned to the logged in user that have not yet breached but have elapsed 75% of the duration of the SLA.
My Active Breached SLAs	Number of active task SLAs for tasks assigned to the logged in user that have breached.
My Active SLAs (count)	Number of active task SLAs for tasks assigned to the logged in user.
My Groups Active SLAs (count)	Number of active task SLAs for tasks assigned to groups that the logged in user is a member of.
My Active SLAs (bar chart)	Displays a bar chart of active task SLAs for tasks assigned to the logged in user. The data can be grouped and/or stacked on some of the fields available in the task SLA records.
My Groups Active SLAs (bar chart)	Displays a bar chart of active Task SLAs for Tasks assigned to groups that the logged in user is a member of. The data can be grouped and/or stacked on some of the fields available in the task SLA records.
My Active SLAs (list)	Displays a list of active task SLAs for tasks assigned to the logged in user. The data can be grouped on some of the fields available in the task SLA records.

Legacy: Platform Analytics Solutions for Service Level Management

This Platform Analytics Solution contains preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Enabling the Platform Analytics Solution

Use the Performance Analytics widgets on the dashboard to visualize data over time, analyze your business processes, and identify areas of improvement. With solutions, you can get value from Performance Analytics for your application with minimal setup.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Solutions include some dashboards that are inactive by default. You can activate these dashboards to make them visible to end users according to your business needs.

For unlimited access to all features of this Platform Analytics Solution, purchase a Performance Analytics subscription. For more information, see Activating your Performance Analytics subscription.

To enable the solution for Service Level Management, an admin navigates to **System Definitions** > **Plugins** and activates the Service Level Management PA Dashboard (com.snc.pa.sla.overview) plugin.

To use this Platform Analytics Solution, you must have an entitlement to use Performance Analytics with Service Level Management.

Domain separation and 'Run As' user

In some solutions, System Administrator is the **Run As** user for data collection jobs in the Platform Analytics Solutions. In other solutions, the **Run As** user for data collection jobs is left blank. Verify that the **Run As** user exists on the instance, and that this user has the appropriate level of access. An inappropriate **Run As** user can cause errors or limit the data that is collected. This setting only has an effect if domain separation is enabled.

Platform Analytics Solutions

Activate your Performance Analytics subscription

Legacy: Service level management PA dashboard

The Service Level Agreement (SLA) Overview module provides a Performance Analytics (PA) Dashboard to review SLA information at a glance.

Users with the itil role can access the dashboard.

You can navigate to the PA dashboard in the following ways:

- **Service Level Management** > **Overview**
- **Self – Service** > **Dashboard** > **SLA Overview (Premium)**

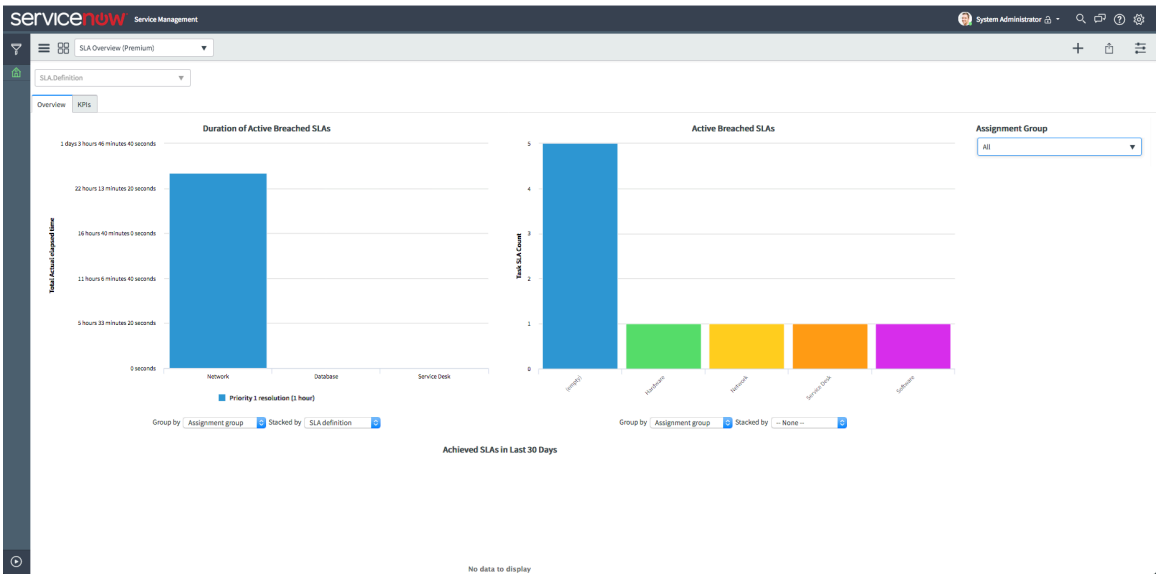
This dashboard has the following requirements:

- An entitlement to use Performance Analytics with Service Level Management.
- The Service Level Management PA Dashboard (com.snc.pa.sla.overview) plugin, which contains this dashboard.
- The SLA Breakdowns plugin (com.snc.sla.breakdowns) plugin, because some of the reports are generated from the breakdown data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Overview tab

SLA PA dashboard - Overview



UI component	Description
Duration of Active Breached SLAs	Uses available SLA breakdown data to generate a report showing time spent working on breached task SLAs that are still active and the SLA Definition Type is SLA. Use the Group by and Stacked By breakdown lists to show different representations of this data, for example: Group by Assignment group and Stacked By SLA Definition. The Assignment Group filter on the right can be used to limit the data shown in this report to a specific group.
Active Breached SLAs	This chart shows all breached task SLAs that are still active and the SLA Definition Type is SLA. Use the Group by and Stacked By breakdown lists to show different representations of this data, for example: Group by Assignment group and Stacked By SLA Definition. The Assignment Group filter on the right can be used to limit the data shown in this report to a specific group.
Achieved SLAs in Last 30 Days	This chart shows all task SLAs that completed in the last 30 days without breaching and where the SLA Definition Type is SLA. Use the Group by and Stacked By breakdown lists to show different representations of this data, for example: Group by Assignment group and Stacked By SLA Definition.

KPI tab

The KPI dashboard uses the following Performance Analytics indicators:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
These indicators are calculated on a daily basis to provide trend analysis.

Further operations are performed on the Performance Analytics indicators to generate the following KPIs on the dashboard:

KPIs based on Performance Analytics indicators

UI component	Description
% of Active Breached SLAs (Daily)	Shows the % of active task SLAs that breached yesterday.
Average Assignment Duration (Breached)	Shows the average duration of individual assignments for breached task SLAs completed yesterday. The KPI that provides the data captures this value on a daily basis to provide trend analysis. This report is based on SLA breakdown data and so shows data only for SLA definitions that are linked to an SLA Breakdown definition.
% of Achieved SLAs (Daily)	Shows the % of task SLAs that were completed yesterday without breaching. The KPI that provides the data captures this value on a daily basis to provide trend analysis.
Average Assignment Duration (Achieved)	Shows the average duration of individual assignments for achieved task SLAs completed yesterday. The KPI that provides the data captures this value on a daily basis to provide trend analysis. This report is based on SLA breakdown data and shows data only for SLA definitions that are linked to an SLA Breakdown definition.
Average Duration of Assignments for Breached SLAs	Shows the average duration of individual assignments for breached task SLAs completed yesterday broken down by either Assignment group or SLA Definition. Use the **Breakdown** field to change which breakdown data is displayed. The KPI that provides the data captures this value on a daily basis to provide trend analysis. This report is based on SLA breakdown data and shows data only for SLA definitions that are linked to an SLA Breakdown definition.
Average Duration of Assignments for Achieved SLAs	Shows the average duration of individual assignments for achieved task SLAs completed yesterday broken down by either Assignment group or SLA Definition. Use the **Breakdown** field to change which breakdown data is displayed. The KPI that provides the data captures this value on a daily basis to provide trend analysis. This report is based on SLA Breakdown data and shows data only for SLA definitions that are linked to an SLA Breakdown definition.

Domain separation and Service Level Management

Domain separation is supported in Service Level Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

Service Level Management overview

- Service Level Management helps customers monitor, measure, and report on agreed service level agreements (SLAs); SLA definitions encapsulate these agreements.
- Users can see only content in the domain to which they have access.

How domain separation works in Service Level Management

The intention of SLM is to provide customers with an expectation of service within a known timescale and the ability to monitor when service levels are not being met. To learn specific terms and definitions see Service Level Management concepts.

- SLA definitions and task SLAs have domain fields. However, task SLAs are created only in the domain of its attached task record.
- SLA definitions must be defined in a tenant domain (or global) in order for task SLAs to be created and attached to a given task (or extensions).
- Task SLAs attach to a task if an SLA definition exists in the task records domain or in an ancestor domain.
- Task SLAs always inherit the domain of its attached task record, which includes the workflow running on the task SLA record. If a task record ever flips, the task SLA also slips.
- If an SLA definition exists in an ancestor's domain, the definition can be overridden in a sub-domain (delegated administration).

Domain-separated tables

- SLA definition [contract_sla]
- Task SLA [task_sla]

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use cases

- An ESS user in the ACME domain logs in and creates an incident, at which point an SLA is attached. The SLA is created in the domain of the associated task record (incident), which is the ACME domain. The ESS user is not able to read SLA records. These are restricted to the following roles:
  - Administrator
  - ITIL
  - SLA Administrator
  - SLA Manager
- An ITIL user in the Acme domain logs in and creates an incident. The process above is the same except that the ITIL user can read the SLA record attached to the incident.
- If an SLA definition exists in the Acme domain and doesn't meet the needs of an Acme sub-domain (Acme child) an SLA Administrator can remediate. SLA Administrators can navigate to the ACME SLA definition when their session domain is ACME child, make the relevant changes, and save them. The SLA Administrator is alerted that an override has been created.
- An ITIL user sets the session domain to Acme child and creates an incident. The task SLA is created using the SLA definition from Acme child.

Configure Service Level Agreement (SLA) properties

You can configure the SLA engine, logging, and repair properties based on the requirements within your organization.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Service Level Management** > **Properties**.
2. Select one of the following:

   SLA Engine

   configure properties for the SLA engine.

   SLA Logging

   configure logging properties for SLA Script Includes and logging output destination.

   SLA Repair

   configure properties for the SLA Repair process.

SLA engine properties

Administrators can manage the SLA engine using SLA engine properties.

Navigate to **Service Level Management** > **Properties** > **SLA Engine** to view SLA engine properties.

SLA Engine Properties

Property name	Description
com.snc.sla.calculation.percentage	Maximum 'Actual elapsed percentage' value after which the 'SLA - update calculations' scheduled job will stop regularly calculating the SLA's time values. This is used to prevent 'long since breached' records from being unnecessarily updated. Setting to '0' will stop all calculations and leaving this blank will allow all SLAs to be calculated. By default, this is set to 1,000%, so that recalculation stops after the breach is

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Engine Properties (continued)

Property name	Description
	exceeded by a factor of 10. • Type: integer • Default value: 1000
com.snc.sla.maximum_duration	Maximum duration in days that is allowed in the SLA definition. • Type: integer • Default value: 1095
com.snc.sla.engine.version	Run the 2011 SLA engine (2010, 2011) • Type: choice list • Default value: 2011
com.snc.sla.engine.async	Run the 2011 SLA engine asynchronously after task insert or update operations. • Type: true | false • Default value: false
com.snc.sla.compatibility.breach	Enable compatibility with 2010 'breached' status of SLAs (default: false) Only enable if you require the old way of showing breached status (in the stage value), for reporting purposes. Using only the 'breached flag' is preferred • Type: true | false • Default value: false

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Engine Properties (continued)

Property name	Description
com.snc.sla.default_conditionclass	The name of the Script Include class that will be used to evaluate SLA Conditions for the 2011 SLA engine (use to override with your own extension of the SLAConditionBase class) • Type: String • Default value: SLAConditionBase
com.snc.sla.workflow.run_for_breached	An update to a Task can result in an SLA being attached that is already breached - for example when an Incident that has already been open for a while is upgraded to a high priority with a short resolution SLA. By default if there is a workflow specified in the SLA Definition it will not run if the Task SLA is attached and the Planned End Time has already passed. Enable this property if you would like the workflow to run for a Task SLA that is already breached when it is attached to the Task. • Type: true | false • Default value: false
com.snc.sla.calculate_planned_end_time_after_breach	Continue to re-calculate the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Engine Properties (continued)

Property name	Description
	"Planned End Time" of SLAs after they have breached • Type: true | false • Default value: false **Note:** zboot customers do not have this property available in the SLA Engine Properties page.
com.snc.sla.calculation.use_time_left	Use field business_time_left to calculate breach time instead of business_percentage field. Using business_time_left is more accurate because the business_percentage field is rounded to 2 decimal places. This means that once the business percentage reaches 99.995%, it is recorded as 100%, and the task SLA is marked as breached. • Type: true | false • Default value: false
glide.sla.calculate_on_display	Recalculate Task SLA records when a Task form is displayed. This ensures that the task SLAs calculations are up to date but this may increase form load time.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Engine Properties (continued)

Property name	Description
	• Type: true | false • Default value: false
com.snc.sla.always_populate_business_fields	When this property is set to true, the business fields such as Business elapsed time will be populated with the same values as those in the actual fields when there is no schedule specified on the Task SLA. If the property is false, the business fields will be empty when a Task SLA has no schedule. • Type: true | false • Default value: true for new instances, false for upgraded instances

SLA logging properties

Administrators can configure SLA logging using SLA properties.

Navigate to **Service Level Management** > **Properties** > **SLA Logging** to view SLA logging properties.

The **Logging level for...** properties set logging levels for relevant script includes. This allows you to activate extra logging targeted at whenever that script include is invoked via a task SLA. For example, if you know of an issue with the **TaskSLAworkflow** script include, you can use **the com.snc.sla.workflow.log** property to enable logging on that script include. These properties are all set to **Notice** level by default.

SLA Logging Properties

SLA Logging Property	Description
com.snc.sla.task_sla_controller.log	Logging level for TaskSLAController
com.snc.sla.task_sla.log	Logging level for TaskSLA
com.snc.sla.condition.log	Logging level for SLAConditionBase
com.snc.sla.workflow.log	Logging level for TaskSLAworkflow

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA Logging Properties (continued)

SLA Logging Property	Description
com.snc.sla.calculatorng.log	Logging level for SLACalculatorNG
com.snc.sla.repair.log	Logging level for SLARepair (SLA repair must be enabled to use this)
com.snc.sla.log.destination	Logging output destination. Select the log destination: either output to both the Database and node logs (the default), or output to node logs only. Database and node logs (**gs.log**) are visible as system logs from ServiceNow, node logs (**gs.print**) only appear in log files.

Logging levels

The following logging levels are available for the **Logging level for...** properties:

Logging Levels

Level	Name	Description
Emerg	Emergency	Total failure.
Alert	Alert	System corruption of a database, for example.
Crit	Critical	Typically used for hardware errors, for example.
Err	Errors	Errors
Warning	Warnings	Warnings
Notice	Notice	Possible action required but not essential.
Info	Informative	No action required.
Debug	Debugging	Generally not used except for capturing everything for fault-finding.

Note:
By default, logging levels are set to **Notice**

SLA repair properties

Administrators can manage the SLA repair function using system properties.

Navigate to **Service Level Management** > **Properties** > **SLA Repair** to view SLA repair properties.

SLA repair properties

Property name	Description
com.snc.sla.repair.enabled	Enable SLA repair. When enabled the Repair modules and UI Actions will be activated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SLA repair properties (continued)

Property name	Description
	• Type: true / false • Default value: true for new instances and false for upgraded instances
com.snc.sla.repair.use_repair_workflow	When repairing SLAs, use the Repair workflow instead of the one configured on the SLA Definition. • Type: true / false • Default value: false for new instances, true for upgraded instances • Learn more: Configure SLA repair
com.snc.sla.repair.workflow	The name of the Repair workflow. • Type: string • Default value: Default SLA Repair workflow

Migrate to service level management

Migrate SLA processing from the escalations engine to use the service level management functionality.

The two core differences between the old SLA engine and the new service level management plugin are that tasks can now run multiple SLAs simultaneously, and the escalation concept has been replaced with the more robust Workflow Editor. This allows administrators greater control on what actions, notifications, and events are triggered by tasks, to take into account more mature Service Level processes.

If an instance has been using the original SLA engine and has just activated the Service Level Agreements (SLA) Plugin, the old SLAs will not work. For the old SLAs to work, they must be converted to the new SLA Definition records, which will attach the appropriate Task SLA records to the matching Task records. This is done manually by creating new SLA Definition records that reflect the definition of the old SLA. Old SLAs will continue to function, but any time a task is updated, the appropriate new Task SLAs will attach.

Once new Task SLAs are implemented, they will attach themselves to any new or updated incident, including ones which already have old SLAs attached. If the new Task SLA is set to retroactively start, it will automatically calculate the duration from that point in the past, which means that the duration will still be accurate.

When enabled, the property **Compute prior SLA pause time for new, retroactive SLAs (2011 SLA engine only)** calculates the pause time when a retroactive SLA is attached.

For example: if a retroactive SLA attaches to an incident one hour after its creation, and meets the pause conditions for half an hour, then the elapsed time is half an hour rather than the full hour.

Note:
This property is only used with audited tables. Tables which are not audited ignore the pause time before the creation of the record.

ITSM Success Dashboard indicators

ITSM Success Dashboard indicators provide insights to the IT leadership team and process owners so that they can measure the performance of their ITSM implementation using the KPIs defined by ServiceNow.

Success Dashboard is available for IT Service Management and HR Service Delivery and is delivered via the following applications:

- ITSM Success Dashboard indicators

  The IT leaders can view the performance of the ITSM KPIs implemented.

- HR Service Delivery Success Dashboard indicators

  The HR leaders can view the performance of the HR KPIs implemented. For more information on HR Success Dashboard indicators, visit HR Success Dashboard indicators.

Exploring ITSM Success Dashboard indicators

Get an overview of the ITSM Success Dashboard indicators to understand the different components in the dashboard and how you can use the dashboard for your organization.

The IT leadership team can analyze and understand the key metrics such as call deflections and self-service to measure the success of the ITSM implementation. The leadership team can view the following insights:

- The number of times users are able to solve their problems on their own.
- The number of times users are able to submit their requests and issues without the help of tier 1 agents.
- The channels (knowledge articles, virtual agent conversations, catalog submissions) that are contributing to self-solve and call deflection.
- The number of times Predictive Intelligence successfully predicted an incident field, which in turn has a downstream impact on the resolution time.
- The formulae and definitions of the data being presented.
- The data trend for month-on-month, quarter-on-quarter, or year-on-year.
- The Key Performance Indicators (KPIs) metrics on the dashboard for a selected period. For more information to view metrics for a selected period, see View metrics for selected period in ITSM Success Dashboard indicators.

Also, process owners can view the records that contribute to these insights, do a deep dive analysis, and drive improvement plans.

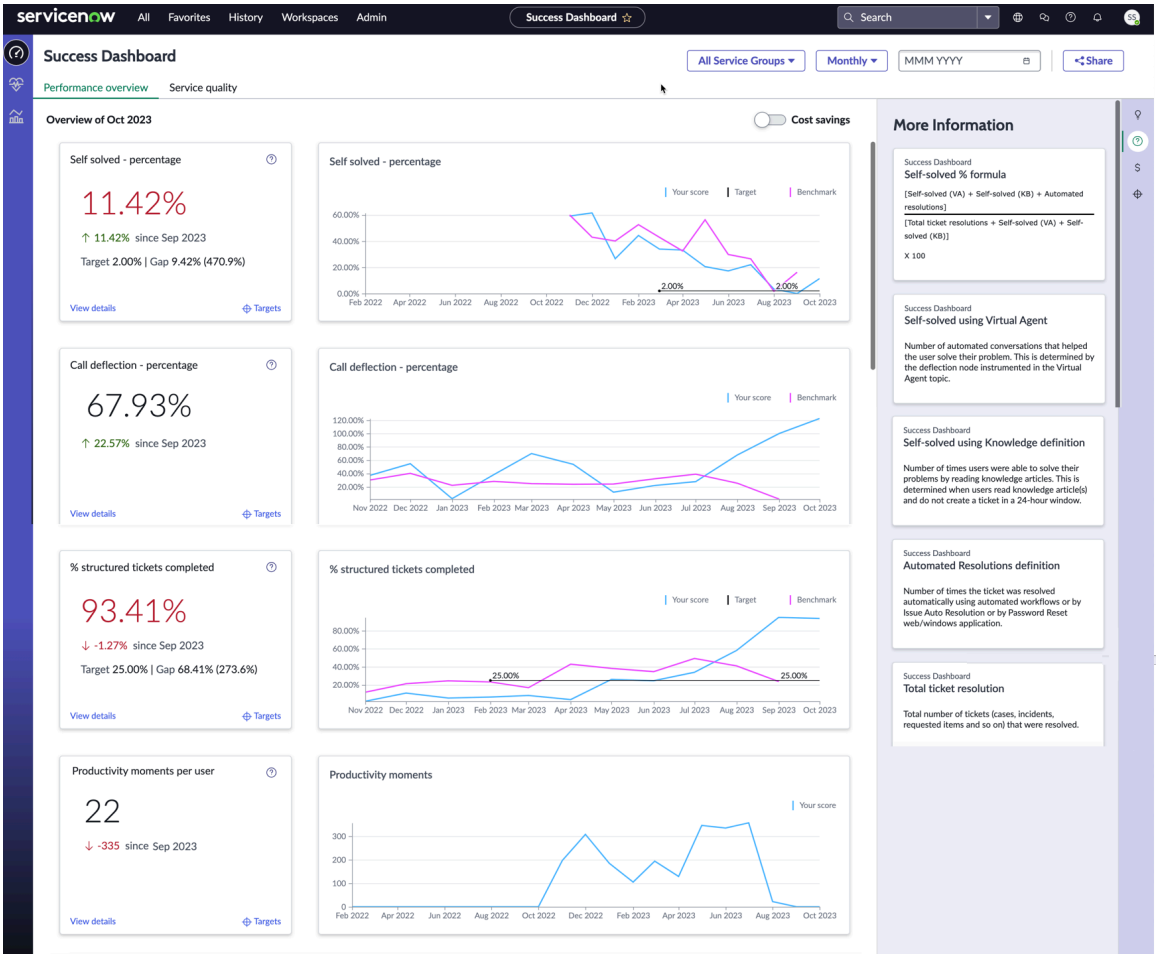
ITSM Success Dashboard indicators overview



ITSM Success Dashboard indicators components

Analyze the performance and self-solve data visually and drive business outcomes with the help of the dashboard components.

Getting started with the Admin Console

With the Admin Console, you can access the ITSM Success Dashboard, Operational Success, and Benchmarks dashboard. The Admin Console displays all the admin-related work at a glance and tasks that need attention, including installation of the related application and configuration settings.

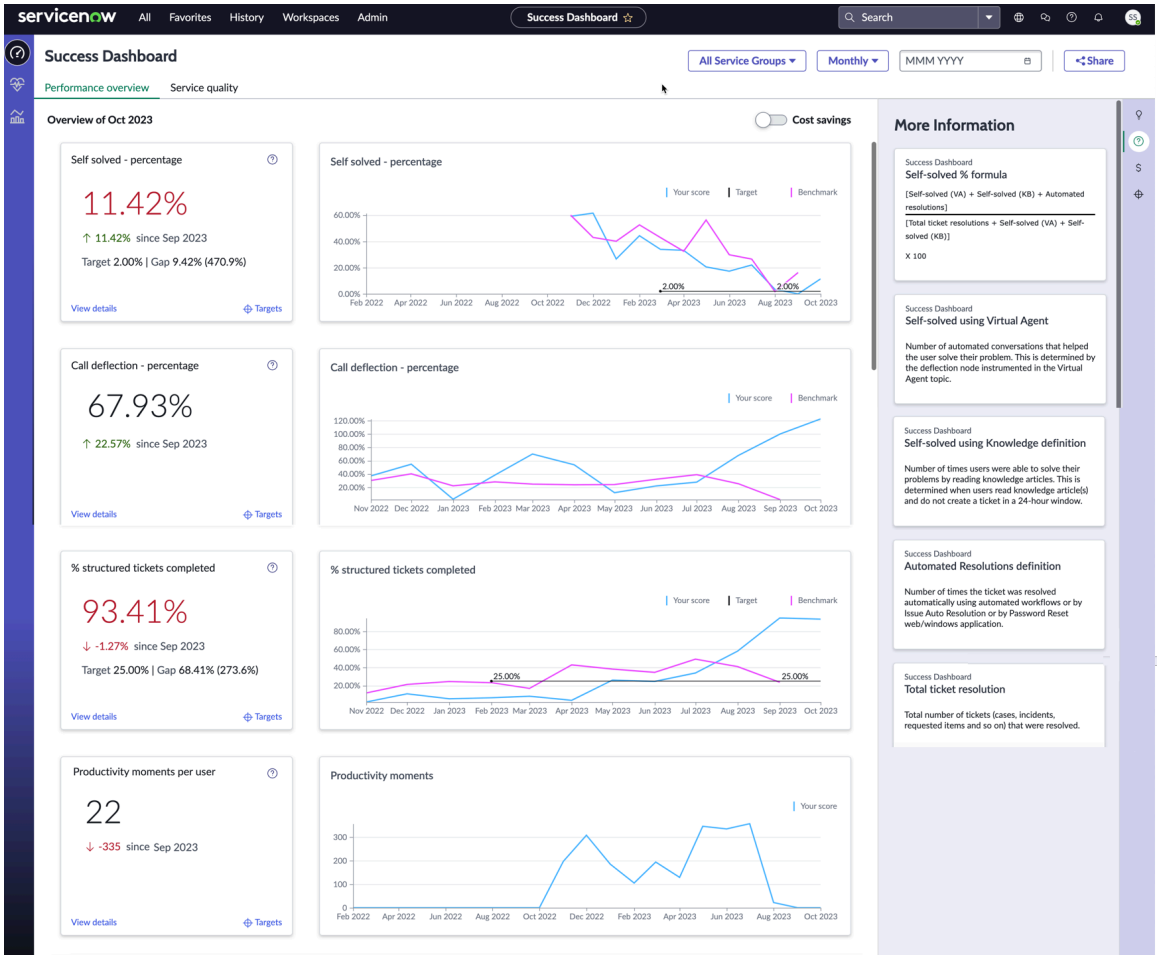
As an admin, you see the role-specific variant of the landing page. Admin landing pages include the following items:

- Related applications that have a latest update available.
- Related applications that aren't activated or installed.
- Configurations for all the installed applications.
- Common questions and more information related to the applications.

Performance overview in the ITSM Success Dashboard indicators

Measure the key performance indicators (KPIs) like Self-solved percentage, Call deflection percentage, Requests completed, and Successful predictions on the **Performance overview** tab. For more information, see ITSM Success Dashboard KPI definitions and formulas.

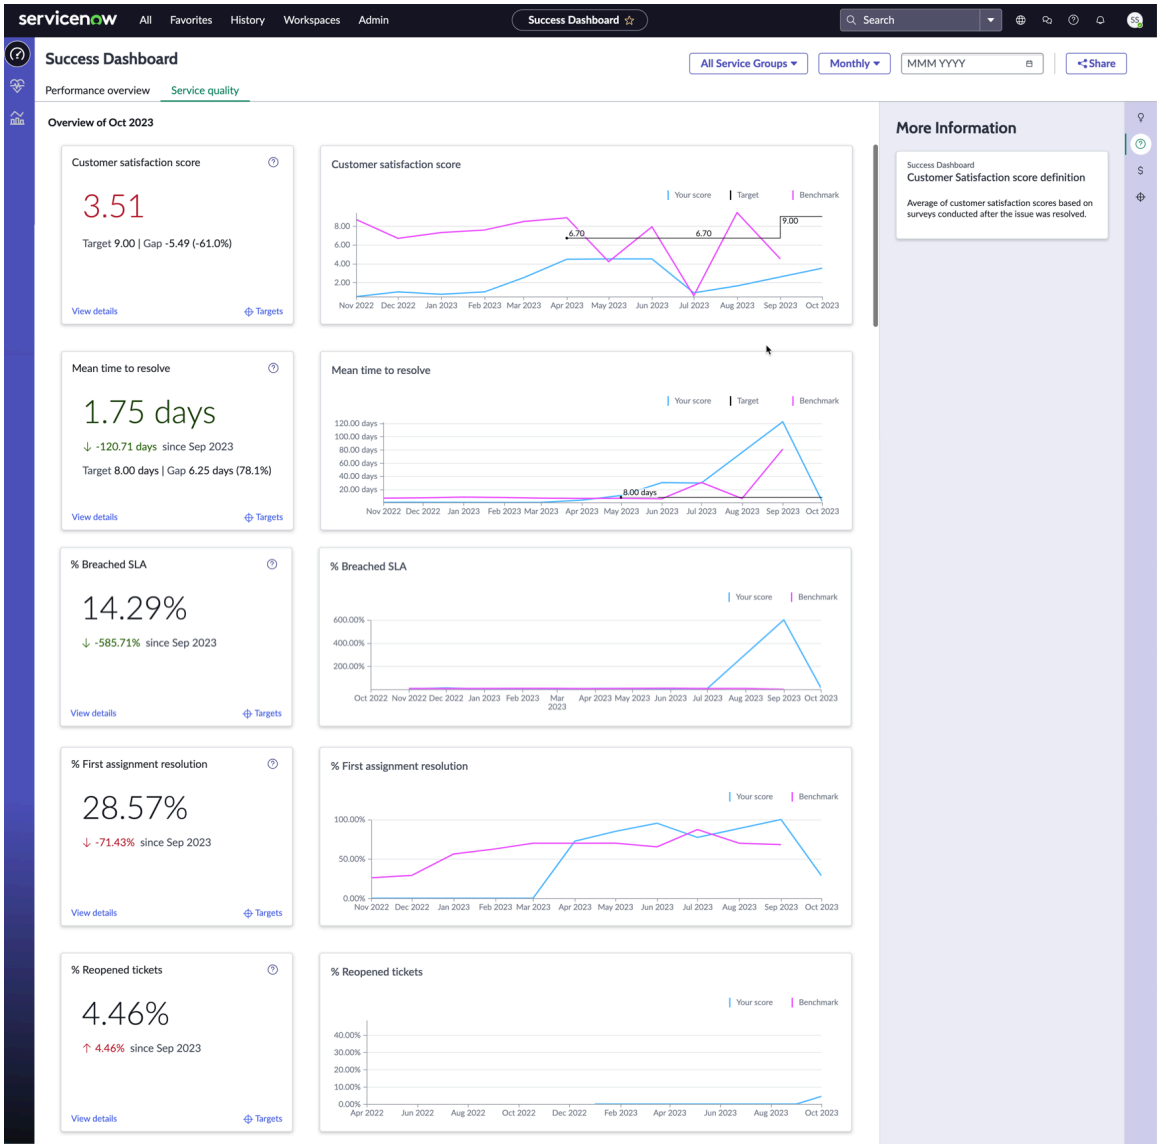
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Service quality in the ITSM Success Dashboard indicators

Measure the key performance indicators (KPIs) like Customer satisfaction score, Mean time to resolve, % Breached SLA, and % First assignment resolution on the **Service quality** tab. For more information, see ITSM Success Dashboard KPI definitions and formulas.

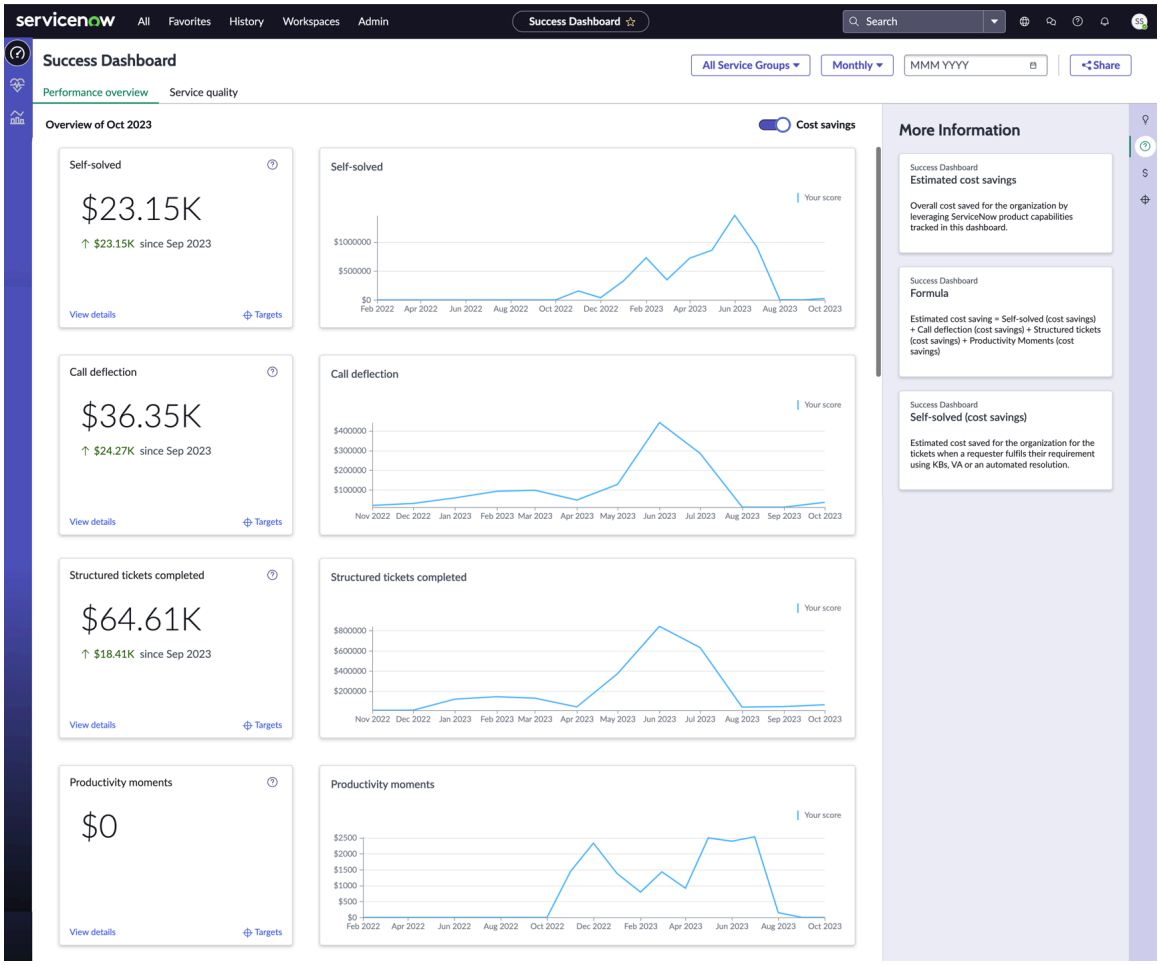
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Cost savings in the ITSM Success Dashboard indicators

View the overall estimated cost saved by using the ITSM Success Dashboard capabilities for Knowledge articles, Predictive Intelligence, Virtual Agent conversations, and Catalog submissions.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Scorecards in the ITSM Success Dashboard indicators

View the aggregation of the daily values for KPIs in the selected period in the scorecards with the following information.

Scorecard widget

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Current period score**: View the aggregated score for the current time period. Select one of the following options:
  - **Monthly:** View the data aggregated monthly. For counts, this data is the monthly sum of the daily values. For percentages, this data is the monthly average of the daily percentages.
  - **Quarterly:** View the data aggregated quarterly. For counts, this data is the quarterly sum of the daily values. For percentages, this data is the quarterly average of the daily percentages.
  - **Yearly:** View the data aggregated yearly. For counts, this data is the yearly sum of the daily values. For percentages, this data is the yearly average of the daily percentages.
- **Comparison with previous period**: View the percentage change compared to the previous period aggregation. Data is displayed in a month-over-month, quarter-over-quarter, and year-over-year comparison based on the availability of the data.

Info icons in the ITSM Success Dashboard indicators

Use the info icons to view the short description of the indicator and understand how the indicator value is calculated.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View process insights on the ITSM Success Dashboard

View the process insights on the ITSM Success Dashboard to analyze the process bottlenecks and take steps from the analyst workbench to improve the metrics.

On the **Service Quality** tab, select **Insights** on the contextual side panel, then select **View in Analyst Workbench**.

Only the top two insights that are the least efficient are displayed in the contextual side panel. The process insights are executed in the incident table only in the base system.

Operational Success dashboard in the ITSM Success Dashboard indicators

The Operational Success dashboard provides a consolidated view of the end-to-end performance of the IT processes that are implemented in your organization.

The dashboard showcases a snapshot of the performances for the Incident, Major Incident, Change, Request, Service Catalog, Interaction, Problem, and On-Call Scheduling applications. These indicators help teams and the leadership focus on areas that have an impact on business outcomes.

ITSM Success Dashboard indicators KPI definitions and formulas

Enable ITSM Success Dashboard and configure settings to understand and use the Key Performance Indicators (KPIs) and formulas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

All the Key Performance Indicators (KPIs) and formulas used in the ITSM Success Dashboard are detailed below.

- Performance overview
- Service Quality
- Operational Success

Performance overview

Performance overview details all the KPIs and metrics that help you analyse the benefits of your ITSM implementation.

- **Self-solved percentage:** Calculated from the daily average number of times your users achieved a resolution without intervention from Tier 1 Agents in the report range. Includes numbers from Self-solved using Virtual Agent, Self-solved using Knowledge and Automated resolutions (For example, Incident auto-resolution via Virtual Agent). See the formula:

```
[Self-solved (VA, KB, QnA, Proactive Engagement) + Automated
 resolutions] / [Total Tickets Resolution + Self-solved (VA,
 KB, QnA, Proactive Engagement) + Self service using Password
 Reset apps]*100
```

  - **Self-solved using Virtual Agent:** Number of automated conversations that helped the user solve their problem. This is determined when users complete a virtual agent conversation and does not engage (Interactions) with a human agent in the next 24-hour window.

    Considers both Virtual Agent powered by NLU and LLM (Now Assist VA)

    Note:
    To use a different method to determine this KPI, see Configure Success Dashboard indicators KPIs.

    To update the live agent script include see, Update the live agent script include.

  - **ITSM issues solved using NOW Assist VA (LLM):** Number of times the users were able to resolve their issues by interacting with Now Assist Virtual Agent (NAVA) conversation. This is determined when a user completes a Now Assist Virtual Agent conversation and doesn't create an incident or engages (Interactions) with a human agent in a 24-hour window.

    To update the live agent script include see, Update the live agent script include.

  - **Self-solved using Knowledge:** Number of times users were able to solve their problems by reading knowledge articles. This is determined when users read knowledge article(s) and do not create ticket or engages with a human agent in a 24-hour window.

    Note:
    To use a different method to determine this KPI, see Configure Success Dashboard indicators KPIs.

    To update the live agent script include see, Update the live agent script include.

  - **Self-solved using QnA:** Self-solved using the AI Search when a user interacts with a Virtual Agent or on Portal and gets a summarized answer from AI Search. This is determined when users are presented with a AI Search QnA result and do not go on to create ticket or engage with a human agent in a 24-hour window.

    To update the live agent script include see, Update the live agent script include.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Self-solved using Proactive Engagement for DEX** The number of digital experience issues **Self-solved using Proactive Engagement for DEX**. This is determined when DEX proactively detects issues and Proactive Engagement helps users self-solve them.

  To know more about the Proactive Engagement see, Proactive Engagement.

- **Automated Resolutions:** Number of times the ticket was resolved automatically. In the base system, the indicators contributing to this metric are Incident Auto Resolution and Request Fulfilled Automatically.
  - The Incident Auto Resolution value is determined by the deflection node configured in the Issue Auto Resolution Virtual Agent topic.
  - The Request Fulfilled Automatically value is the number of requested items that are fulfilled using automated workflows. When the catalog item uses an automated workflow, the **Fulfillment automation level** field of the catalog item must be set to **Fully-automated** for it to be included in this metric.
  - **Accounts unlocked using Password Reset apps**: Number of times users were able to unlock their accounts successfully using Password Reset apps.
  - **Passwords updated using Password Reset apps**: Number of times users were able to update their account passwords using the Password Reset apps.

  Note:
  To use a different method to determine this KPI or add more sources (for example, automated catalog workflows), see Configure Success Dashboard indicators KPIs.

- **Total ticket resolutions:** Number of incidents resolved + Number of requested items closed + Number of Agent interactions not resulting in tickets (closed).

- **Call deflection:** Calculated from the number of times per day requesters performed the actions, Ticket submissions using Service Catalog, Ticket submissions using Virtual Agent, Self-solved using Virtual Agent and Self-solved using Knowledge without Tier 1 agent intervention. See the formula:

```
[Catalog ticket submissions + VA ticket submissions +
 Self-solved (VA) + Self-solved (KB)]/ [Total tickets submitted
 + Self-solved (VA) + Self-solved (KB)] x 100
```

  - **Catalog ticket submissions:** Incidents and requested items submitted using Service Catalog in Service Portal or Now Mobile app.
  - **VA ticket submissions:** Number of times the ticket was submitted using Virtual Agent. In the base system, this is determined by the `ITSM - Triage & Created` deflection pattern instrumented in the Virtual Agent topic. The topics shipped with ITSM VA Conversations already have these nodes instrumented but must be instrumented in all other topics that create incidents.

    Note:
    If you use a different method to determine this KPI or add more sources (for example, automated catalog workflows), you can use the steps described in Configure Success Dashboard indicators KPIs.

  - **NOW Assist ticket submissions:** Number of times the ticket was submitted using NOW Assist. In the base system, this is determined by the `ITSM - Triage & Created` deflection pattern instrumented in the NOW Assist topic. The topics shipped with NOW

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Assist Conversations already have these nodes instrumented but must be instrumented in all other topics that create incidents.

- **Total tickets submitted:** Incidents created + RITMs created.

- **Structured tickets:** Total number of requested items completed successfully in the report range.
- **Productivity moments per user:** Productivity Moment is calculated when the ServiceNow products helped a user to be more productive while working in their day to day operations.
  - **Productivity in search per user**: The number of times the NLU prediction model accurately understood the intent of the user's conversation or auto-selected a topic.
  - **Productivity in routing per user**: Successful predictions of incident fields such as assignment group, or category by Predictive Intelligence solutions, counted when the prediction made by the solution is the same as final value when the incident was closed.
  - **Productivity in fulfilment per user**: Includes any productivity gains achieved where ServiceNow is helping the employees to save time to resolve a ticket

Note:
If you use a different method to determine this KPI, you can do so using the steps described in Configure Success Dashboard indicators KPIs.

Service Quality

Service quality lists all the KPIs that help you understand the quality of service offered when the employees raise a request to resolve their digital issues.

- **Customer Satisfaction Score:**Calculated from the daily average score of the surveys conducted after an issue was resolved through a ticket or through virtual agent.
- **Mean-time to resolve:** Calculated from the daily average of the time between the ticket creation and ticket closure.
- **% Breached SLAs:** Calculated from the daily average number of issues that were closed after having breached an SLA.
- **% First assignment resolution**: Calculated as the percentage of tickets that were resolved without having to reassign the ticket to a different group.
- **% Reopened tickets:** Calculated from the percentage of resolved tickets that were reopened during a specified period.

Operational Success

An operational KPI is a quantifiable measure that tracks the efficiency and effectiveness of day-to-day operations in your organization. The KPIs can be organized in a dashboard that highlights the areas that are running efficiently and the areas that need attention.

Enable Operational Success and configure the settings to understand and use the Key Performance Indicators (KPIs) and formulas.

By monitoring operational KPIs, you can identify areas for improvement, optimize processes, and ultimately achieve their strategic goals. Here are some techniques to use the operational KPIs:

- Ensure your KPIs match your organization’s business goals. Define your KPIs that contribute to achieving those objectives.
- Focus on the most critical KPIs that add value to the organization’s growth.
- Track and review KPIs regularly. Monitor your progress and modify the KPIs as required by the organization’s goals.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use data to drive decisions: Identify trends, uncover root causes, and use insights to improve processes and performance.
- Use the data to identify trends and use insights to improve processes and performance.

To create a new operational dashboard, refer Create an operational success dashboard.

This framework uses the PA Dashboard created as part of the Platform Analytics for ITSM. For more information see, Platform Analytics KPIs and dashboards.

Configuring ITSM Success Dashboard indicators

Set up the ITSM Success Dashboard indicators so that IT leadership teams and process owners can start using the dashboard.

Get started with ITSM Success Dashboard

1. Procure ITSM Pro license for ServiceNow IT Service Management applications.
2. Install the ITSM Success Dashboard application (sn_sd_itsm). For more information, see Install ITSM Success Dashboard.
3. Configure the knowledge base for IT Service Management. For more information, see Configure the knowledge base for ITSM Success Dashboard indicators.
4. Configure Virtual Agent topics with VA deflection nodes. For more information, see Configure Virtual Agent topics for ITSM Success Dashboard indicators.
5. Set fulfillment automation level of catalog item. For more information, see Set fulfillment automation level of catalog item for the Success Dashboard indicators.
6. Configure the Key Performance Indicators (KPI)s in the ITSM Success Dashboard. For more information, see Configure Success Dashboard indicators KPIs.
7. Run the `UpdateFormulasSD` script to recalculate formulas. For more information, see Run Update formula script for ITSM Success Dashboard indicators.
8. Activate Performance Analytics jobs. For more information, see Activate Performance Analytics jobs for ITSM Success Dashboard indicators.

Install ITSM Success Dashboard indicators

You can install the ITSM Success Dashboard indicators application (sn_sd_itsm) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they are not already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Install the following plugins before installing the ITSM Success Dashboard application from the store
  - Performance Analytics
  - Performance Analytics Premium
  - Self-service analytics

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITSM Success Dashboard indicators application (sn_sd_itsm) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

ITSM Success Dashboard Admin console

The ITSM Success Dashboard offers valuable insights to both the leadership team and process owners, enabling them to assess the performance of their product implementation.

The performance is assessed by utilizing the established key performance indicators (KPIs). This process categorizes configuration activities and provides information in each category such as planning guidance, pre-setup steps, and links to useful help content.

https://player.vimeo.com/video/1000871409?h=510f53d6b4&badge=0&autopause=0&player_id=0&app_id=58479

Prerequisites

- User Roles: You can assign different roles based on specific access requirements. For more information on the ITSM Success Dashboard roles, see Success Dashboard indicators user roles and responsibilities
- Review and configure self-service KPIs: You can review and configure the self-service KPIs for Knowledge deflection, Virtual Agent deflection, and Catalog Item fulfillment level.
- Performance Analytics jobs: Activate Performance Analytics jobs to collect daily and historical data for the ITSM Success Dashboard indicators.
- Process Mining projects: Review and Configure the process mining KPIs.

Advanced Options

Configure the ITSM Success Dashboard KPIs and its related attributes from the advanced options.

- System properties: Configure and manage the behavior of the features for the ITSM Success Dashboard.
- Attribute cost savings to contributing indicators: Review the time savings and the persona group association to contributing indicators based on your organization.
- Key performance indicators (KPIs): Enable the ITSM Success Dashboard and configure settings to understand and use the KPIs and formulas.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Contributing indicators: Modify the base system contributing indicators associated with the primary indicators, or add additional contributing indicators based on your implementation.
- Contextual Help content: Add or modify the contextual help content to be displayed for the primary or contributing indicators.

Set the refresh interval for Success Dashboard indicators

Set the refresh interval to calculate the number of incidents deflected within the defined time range when a user reads the KB article recommended by the Virtual Agent.

Before you begin

Role required: sn_sd.success_dashboard_admin

Procedure

1. Navigate to **All** > **Success Dashboard** > **Getting Started**.
2. Select **Review and Configure** in **Configure Knowledge deflection** card.
3. Select **Settings** tab.
4. Select a deflection pattern under Knowledge deflection.
5. Select **Edit**.
6. Update the value in **Window** field.

   This is the refresh interval for the report to be executed.
7. Right-click on the header and select **Save**.

Configure the knowledge base for ITSM Success Dashboard indicators

Include only the relevant knowledge bases related to IT while determining the **Self-solved using Knowledge** KPI in ITSM Success Dashboard indicators.

Before you begin

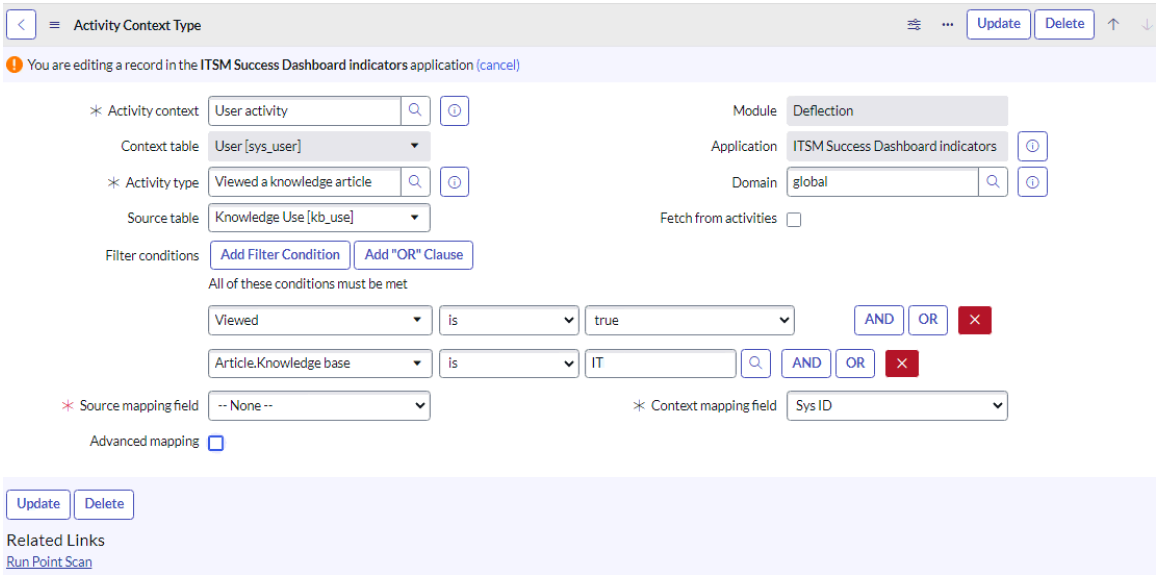
Role required: admin

Procedure

1. Navigate to **All** > **Self-Service Analytics** > **Activity Context**.
2. Select **User activity** from the list.
3. In the **Activity Context Types** tab, select the Preview icon corresponding to Viewed a knowledge article activity type.
4. Select **Open record**.
5. In the Activity Context Type form, change the filter condition to include the relevant knowledge bases.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activity context type



6. Select **Update**.

Configure Virtual Agent topics for ITSM Success Dashboard

Configure the Virtual Agent (VA) topics for ITSM Success Dashboard indicators so that data is displayed correctly if you have topics other than the base system topics.

There are two different ways the base system measures success for Virtual Agent usage:

- Using deflection nodes in Virtual Agent topics which provides highly accurate and requires medium effort in tracking. For more information on how to use the deflection nodes, see Configure Virtual Agent topics for ITSM Success Dashboard indicators.
- Using self-service activity analytics which provides mid-high accuracy and requires zero effort in tracking. For more information on how to configure using the self-service analytics, see Configure Virtual Agent topics for ITSM Success Dashboard using self-service analytics.
- To update the live agent script include see, Update the live agent script include.

Configure Virtual Agent topics for ITSM Success Dashboard indicators

Configure the Virtual Agent (VA) topics for ITSM Success Dashboard indicators so that data is displayed correctly if you have topics other than the base system topics.

Before you begin

Role required: admin

About this task

Map the topics with deflection patterns of the **ITSM VA Default** deflection tracker. Deflection trackers helps in analysing the performance of a conversation and how helpful Virtual Agent topics are for users.

Modify the URL for the **Link Output** in a topic to set the referrer to va so that when a catalog item is submitted, the item is calculated as a submission from Virtual Agent.

Procedure

1. Navigate to **All > Virtual Agent > Designer**.
2. Select the topic for which you want to add the deflection tracker.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Enable the flow chart view by disabling the **Table View** toggle switch.
4. Drag and drop the **Deflection** node from the **Utilities** section to the place in the flowchart where you want to add the deflection pattern.
5. Enter the following details in the Deflection Properties pane on the right.

Deflection input parameters

Field	Value
Deflection Configuration	ITSM VA Default
Deflection Pattern	○ **ITSM VA-Self-Resolving:** When the node in the topic indicates that Virtual Agent is able to resolve the user problem completely without creating an IT ticket (incident or request) and consequently contributing to the Self-solved KPIs. ○ **ITSM VA-Triage & Created:** When the node in the topic indicates that an IT ticket (incident or request) was submitted using Virtual Agent and consequently contributing to the call deflection KPIs.
Activity Table	Table where the deflection activity occurs. This table is associated with the primary activity table. For more information, see Create deflection configurations and patterns.
Activity Ids	List of comma-separated activity system IDs.

6. Select **Save**.
7. Select **Link Output** in the flow chart.
8. Select the url in the **Link** field in the Link response pane on the right.
9. Append the URL with `&referrer=va`.
10. Select **Save**.

Related topics

Tracking deflections using deflection topic blocks

Create deflection configurations and patterns

Configure Virtual Agent topics for ITSM Success Dashboard using self-service analytics

Configure the Virtual Agent (VA) topics for ITSM Success Dashboard indicators using the self-service analytics.

Before you begin

Role required: admin

To update the live agent script include see, Update the live agent script include.

Procedure

1. Navigate to **All** > **Success Dashboard** > **Getting Started** > **Success Dashboard** > **Virtual Agent deflection**.
2. Select **Review and Configure**.
3. Select **Review** tab.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select a deflection pattern under Virtual Agent deflection.
5. Update the value in **Refresh Window** field.

   This is the refresh interval for the report to be executed.
6. Select the fields under **Incidents considered**.
7. Select the **Virtual Agent topics considered**.
8. Select **Save**.

Update the live agent script include

Live agent configuration is used in the self-solved deflections (Deflection using KB articles, Deflection using QnA AIS, Deflection using QnA LLM, and Deflection using ITSM VA). While we configure these deflections, we need to update the live agent script include. Update the *SSADeflectionHelper* script to override the *checkInteraction* function.

Before you begin
Role required: admin

About this task
An agent interaction is where the interaction is not through a virtual agent interaction. The interaction could be through Walk up experience, phone, video or with a live agent. The base system instrumentation checks whether the employee created an incident or interacted with an agent after reading an article or interacting with a Virtual Agent.

The *SSADeflectionHelper* script overrides the check interaction function and helps in setting up the live agent interaction.

Procedure
1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Open the *SSADeflectionHelper* script include and modify the script as follows.
   a. Override the function *checkInteraction* from *SSADeflectionHelperSNC*

```
checkInteraction: function(openedFor, windowStart, windowEnd)
 {
       var interactionRecord = new
 GlideRecord('interaction');
       // Pulling Virtual Agent User sysId from
 com.glide.cs.va.sys_user property
       var vaUser =
 gs.getProperty('com.glide.cs.va.sys_user');
       var windowConditions = 'opened_for=' + openedFor +
 '^sys_created_on>=' + windowStart + '^sys_created_on<=' +
 windowEnd;
       var interactionConditions =
 'virtual_agent!=true^ORstateINon_hold,closed_abandoned^ORsys
_created_by=system^ORopened_for.web_service_access_only!=fals
e^opened_for.web_service_access_onlyISNOTEMPTY^ORopened_for.i
nternal_integration_user!=false^opened_for.internal_integrati
on_userISNOTEMPTY^assigned_to!=' + vaUser +
 '^ORassigned_to=NULL';
       var encodedQuery = windowConditions + '^' +
 interactionConditions;
       interactionRecord.addEncodedQuery(encodedQuery);
       interactionRecord.setLimit(1);
```

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        interactionRecord.query();
        if (interactionRecord.next()) {
            return true;
        }
        return false;
    },
```

b. Update the following line to update the live agent interaction conditions:

```
var interactionConditions =
 'virtual_agent!=true^ORstateINon_hold,closed_abandoned^ORsys
_created_by=system^ORopened_for.web_service_access_only!=fals
e^opened_for.web_service_access_onlyISNOTEMPTY^ORopened_for.i

Set fulfillment automation level of catalog item for the Success Dashboard indicators

Set the fulfillment automation level of catalog items from any Service group that are fulfilled without any manual intervention to Fully-automated tracking of the requested items with an end-to-end automated fulfilment.

Before you begin

Role required: admin or catalog_admin

Procedure

1. Navigate to **All** > **Service Catalog** > **Maintain Items**.
2. Select the catalog item for which you want to set the fulfillment automation level.
   Select Catalog items according to the Service group implementation, that is either ITSM or HR Catalog items.
3. In the Catalog Item form, set the **Fulfillment automation level** field to **Fully automated**.
4. Select **Save**.

Activate Performance Analytics jobs for ITSM Success Dashboard indicators

Activate the Performance Analytics (PA) jobs to collect daily and historical data for the ITSM Success Dashboard indicators.

Before you begin

Role required: admin

Procedure

1. Navigate to **All > Performance Analytics > Data Collector > Jobs**.
2. To run the daily jobs:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Filter the list of jobs to select the following:

- [SD ITSM] Daily Data Collection
- [PA SLA] Daily Data Collection
- [PA Requested Item] Daily Data Collection
- [PA Incident] Daily Data Collection
- [PA ITSM Dashboard] Daily Data Collection

b. Activate the scheduled jobs by selecting the **Active** check box corresponding to the job.

3. To run the scheduled jobs for historical data collection:

a. Filter the list of jobs to select the following:

- [SD ITSM] Historic Data Collection
- [PA Requested Item] Historic Data Collection
- [PA Incident] Historic Data Collection
- [PA ITSM Dashboard] Historic Data Collection

b. Select **Execute Now** to see the past 60 days data in the dashboard.

Configure Success Dashboard indicators KPIs

Success Dashboard indicators has a prescriptive methodology for measuring performance. But you can reconfigure the source of the Key Performance Indicators (KPIs) by replacing the available indicators in the base system or by adding more indicators.

For example, your organization may have a different method to determine **Self-solved using Knowledge**. You cannot change the definition of **Self-solved percentage** and **Call deflection** that use `Self-solved using Knowledge`, but you can replace or add the KPIs and its constituents.

There are two major types of indicators:

- Primary indicators: The indicators prescribed by ServiceNow.

  Warning:
  You must not modify any primary indicators as these are prescribed by ServiceNow®. Modifying these KPIs might impact your scores.

  - You can view the primary indicators in the Primary Indicator Registry table `(sn_sd_primary_indicator_registry)`.
  - You can view the corresponding Performance Analytics indicators in the Primary Indicator table `(sn_sd_primary_indicator)`.

    Primary indicators are of the following types:

    - Manual: The formulae for these indicators are made up of other primary indicators.
    - Automatic: The formulae for these indicators are automatically calculated based on the contributing indicators.

- Contributing Indicators: The indicators listed in the Contributing Indicator Registry `(sn_sd_contributing_indicator_registry)` table and that point to primary indicators.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When these indicators are registered with automatic primary indicators, the formula of the primary indicator is automatically updated to include these indicators in the sum.
- When these indicators are removed from the registry or marked inactive, the formula of the primary indicator is updated to remove this indicator from the sum. For example:

```
Self-solve (manual primary indicator) = Self-solved using
 Virtual Agent (automatic primary indicator) + Self-solved
 using Knowledge (automatic primary indicator) + Automated
 Resolutions (automatic primary indicator)
```

  Where:

  - Self-solved using Virtual Agent = Any Service group issues self-solved using VA (the only contributing indicator registered for this primary indicator)
  - Self-solved using Knowledge = Any Service group issues self-solved using Knowledge (the only contributing indicator registered for this primary indicator)
  - Automated Resolutions (automatic primary indicator) = Incident or HR ticket auto-resolution (the only contributing indicator registered for this primary indicator)

Add contributing indicators

Add new contributing indicators based on your organizational preferences.

Before you begin

Role required: sn_sd.success_dashboard_admin

About this task

Your organization can add the new contributing sources as the primary indicator. For example, determining the automated catalog request completions can be added to Automated Resolutions.

Procedure

1. Create a Performance Analytics (PA) indicator and its data collection job that measures the daily score (count) of the metric that you want to measure.
   The description set for this PA indicator is used to describe the indicator when the user selects the information icon on the score card. Alternatively, if you already have a PA indicator that measures daily scores of the metric you want to measure, you can directly proceed to register and use the PA indicator.

   For information on permissions required to create a PA indicator, see Performance Analytics roles for more details.

2. Register the PA indicator against the Primary Indicator that it must be reported in by creating a record in the Contributing Indicator Registry table (sn_sd_contributing_indicator_registry).

   a. Navigate to **All > sn_sd_contributing_indicator_registry.list**.

   b. Select **New**.

   c. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Contributing Indicator Registry form

Field	Description
Name	Unique identifier contributing indicator.
Contributing Indicator	Performance Analytics indicator of the metric.
Primary KPI	The primary indicator where the new indicator is being added to.
Service group	Service group of the performance indicator. **Note:** ITSM or HR must be selected as a service group, as required.

d. Right-click the header and select **Save**.

e. **Optional:** Add More information context cards for this indicator so that the user viewing the primary and contributing indicator details understands this KPI.
See Update more information cards for details.

f. In the **Persona Group Time Savings** related list, click **New**.

g. On the form, fill in the fields.

Persona Group Time Saving form

Field	Description
Persona Group	Option to select the persona group fr the contributing indicator.
Time saved	Option to enter the time that will be saved to complete the request.

h. Right-click the header and select **Save**.

Note:
You can also update the values for the indicators in **Persona Group Time Savings** section for the out of the box indicators that are **Automatic** type.

Add time savings

Add new time savings as a contributing indicator based on your organizational preferences.

Before you begin
Role required: sn_sd.success_dashboard_admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Success Dashboard** > **Getting Started** > **Success Dashboard** > **Key performance indicators (KPIs)**.
2. Select the row context menu for **Contributing KPI type** to add the time savings option as a contributing indicator.
3. Update the **Persona group** and **Time Saved**details.
4. Select **Add**.
5. Update the existing time savings for the requested items by selecting the record and select **Remove**.

Note:
You can update the record only in the application scope.

Update more information cards

Configure and update the **More Information cards** in the side panel.

Before you begin
Role required: sn_sd.success_dashboard_admin

Procedure

1. Navigate to **All > sn_sd_m2m_indicator_context_information.list**.
2. Find the context information record in the table based on the Primary Indicator or the Contributing Indicator Registry that the card is associated with.
3. Select the **Indicator context information** field to open the context information record.
4. Modify the content of the record based on your requirement.
5. Select **Save**.

What to do next
Associate the new context information card with an indicator. To associate a new context information card to a primary or contributing indicator, perform the following steps:

1. Navigate to **All >** > **sn_sd_indicator_context_information.list**.
2. Select **New**.
3. On the form, fill in the following fields:

Indicator Context Information

Field	Description
Icon	Name of the icon that appears beside the tagline. You can select from any of the icons available in the gallery.
Tagline	Short label of the card.
Heading	Short heading that provides context on what the card explains.
Content	HTML text that describes the card.
Footer	Footer of the card.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select **Submit**.
5. Navigate to **All > sn_sd_m2m_indicator_context_information.list**.
6. Select **New**
7. On the form, fill in the following fields:

M2m Indicator Context Information

Field	Description
Indicator Context information	The record that is being created.
Contributing Indicator Registry (if applicable)	The contributing indicator with which the card is associated with.
Primary Indicator (if applicable)	The primary indicator with which the card is associated with.
Order	The order in which the card should appear.

8. Select **Submit**.

Create a cost savings indicator for ITSM Success Dashboard

Create a cost savings indicator in ITSM Success Dashboard to determine and display the time saved for the contributing indicators when agents work on an incident.

Before you begin

Role required: sn_sd.success_dashboard_admin

Procedure

1. Navigate to **All** > **Success Dashboard** > **Getting Started**.
2. In the Customize Cost Savings card, select **For ITSM**.
3. On the form, fill in the fields.

Cost savings

Field	Description
Select the contributing indicator	Option to select a performance metric from the drop-down menu to add or modify time-saving measures. Select **Next**to go to **Time savings** section. Select **Cancel & Exit** to cancel the setup.
Time savings	Option to select the persona group. Select **Add**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Time savings action	○ Persona group – Select a persona group from the drop-down menu. ○ Contributing indicator registry – This field is populated based on the selected indicator. ○ Time saved – Define the time saved. Select **Mark Complete**.
Review updates	Verify that the values provided are accurate. Select **Mark Complete**.

Modify the currency code for ITSM Success Dashboard indicators

Modify the currency code for ITSM Success Dashboard indicators.

Before you begin

Role required: sn_sd.success_dashboard_admin

Procedure

1. Navigate to **All** > **Success Dashboard** > **Getting Started**.
2. On the **Configure System properties** card, select **Configure Properties For ITSM**.
3. Select *sn_sd.success_dashboard_currency*.
   If a message appears indicating that you need to change to the Success Dashboard Core application, select the word **here** in the message
4. Modify the **Value** field, enter your desired currency code.
5. Select **Update**.

Operational Success Admin Console

The Operational Success dashboard provides a consolidated view of the end-to-end performance of the IT processes that are implemented.

Prerequisites

User Roles: You can assign different roles based on specific access requirements.

Configure

Tabs and dashboards: Map a KPI category such as Incident, Problem, Change, Request, and so on as an Operational Success dashboard tab to view the ITSM processes performance in your organization. Use this option to map the Performance Analytics dashboard associated with these KPI categories.

Advanced options

Review and configure the data visualization available in the base system for Incident, Problem, Change, Request, Interaction, Service catalog, Major Incident, Password Reset, and Walk-up Experience.

Create an operational success dashboard

Create a KPI category and map with the operational dashboard to view the performance of the ITSM processes in your organization.

Before you begin

Role required: sn_sd.success_dashboard_admin

Procedure

1. In the navigation list, enter `sn_sd_kpi_category.list`.
2. Select **New**.
3. On the form, fill in the fields.

KPI Category

Field	Description
Name	Unique name of the KPI category.
Dashboard type	Dashboard type of the new KPI category that is to be associated.
Order	Order of the dashboard.

4. Select **Submit**.
5. In the navigation list, enter `sn_sd_tab_m2m_dashboard.list`.
6. Select **New**.
7. On the form, fill in the fields.

Dashboard mapping

Field	Description
Tab	Unique name of the dashboard.
PAR Dashboard	The PAR dashboard that must be associated with the Operational success tab.
Order	Order of the dashboard.

8. Select **Submit**.

Result

The new dashboard appears on the Operational success dashboard.

Benchmarks admin console

The ServiceNow® Benchmarks application gives you instant visibility into your key performance indicators (KPIs) and trends, as well as comparative insight relative to industry averages of your peers and to the industry top performers.

- User Roles: You can assign different roles based on specific access requirements.
- Opt in to Benchmarks: You can opt in to Benchmarks by accepting the opt-in agreement. Once you opt in, you have visibility into your service management key performance indicators and trends. It also provides a comparative insight relative to the industry averages of your peers.

For more information, see Getting started with the ITSM Success Dashboard admin console.

Run Update formula script for ITSM Success Dashboard indicators

Run the `UpdateFormulasSD` script to recalculate all the formulas in ITSM Success Dashboard indicators if you see outdated data in the dashboard.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
2. Open the `UpdateFormulasSD` list from the list.
3. Select **Execute Now**.

> **Note:**
> `UpdateFormulasSD` is a scheduled job that executes once in 24 hours.

Identify the automation opportunities on ITSM Success Dashboard

Identify the automation opportunities for ITSM Success Dashboard to implement or improve automation solutions for Virtual Agent (VA).

Before you begin
Role required: sn_sd.success_dashboard_details_read

Procedure

1. Navigate to **All** > **Success Dashboard** > **Success Dashboard**.
2. Select the **Performance overview** tab.
3. Select the **Self solved - percentage** indicator.
4. Select **Insights** ( ) on the contextual side panel.
5. Select **View in Automation Discovery**.

For more information on Automation Discovery, refer Automation Discovery.

Maximise the benefits of using the ITSM Success Dashboard indicators

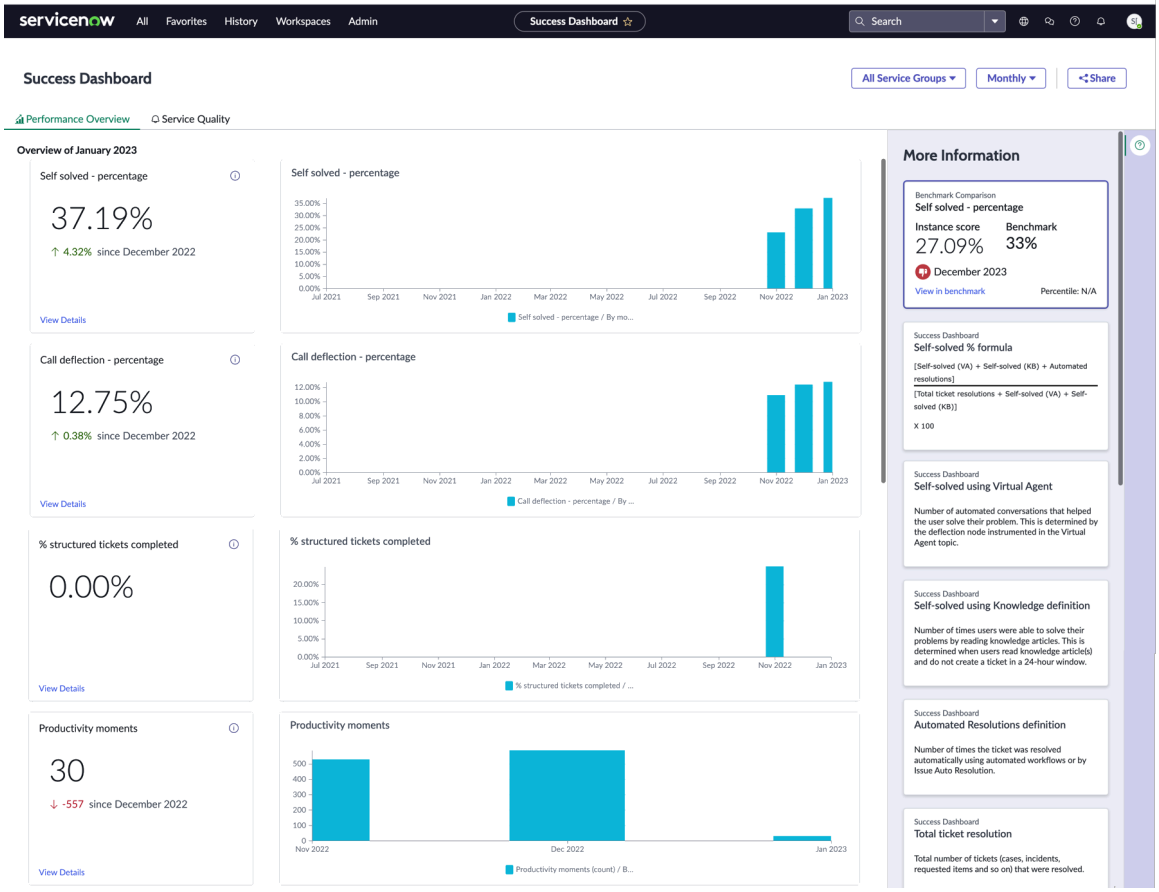
Use the ITSM Success Dashboard indicators to measure the performance of your ITSM implementation using the Key Performance Indicators (KPIs) defined by ServiceNow.

Monitoring the KPIs of your ITSM implementation

View and monitor the ITSM Success Dashboard indicators to measure the performance of your ITSM implementation using the Key Performance Indicators (KPIs) defined by ServiceNow.

You can access the aggregated KPI data in the ITSM Success Dashboard indicators by navigating to **All>** > **Success Dashboard** > **Success Dashboard** if you have the sn_sd.success_dashboard_admin, sn_sd.success_dashboard_read, or sn_sd.success_dashboard_details_read role.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can monitor data by any of the following time aggregations.

- **Monthly:** Shows the data aggregated monthly. For counts, this data is the monthly sum of the daily values. For percentages, this data is the monthly average of the daily percentages.
- **Quarterly:** Shows the data aggregated quarterly. For counts, this data is the quarterly sum of the daily values. For percentages, this data is the quarterly average of the daily percentages.
- **Yearly:** Shows the data aggregated yearly. For counts, this data is the yearly sum of the daily values. For percentages, this data is the yearly average of the daily percentages.

Once the time aggregation is set, all the score-cards show the data for that period.

For more information on the dashboard components, see HR Success Dashboard indicators components.

For more information on the KPI definitions and formulas, see HR Success Dashboard indicators KPI definitions and formulae.

Share the Success Dashboard indicators

Share the Success Dashboard indicators with your respective leadership teams, ITSM or HR to view the dashboard and measure the performance of their respective implementations.

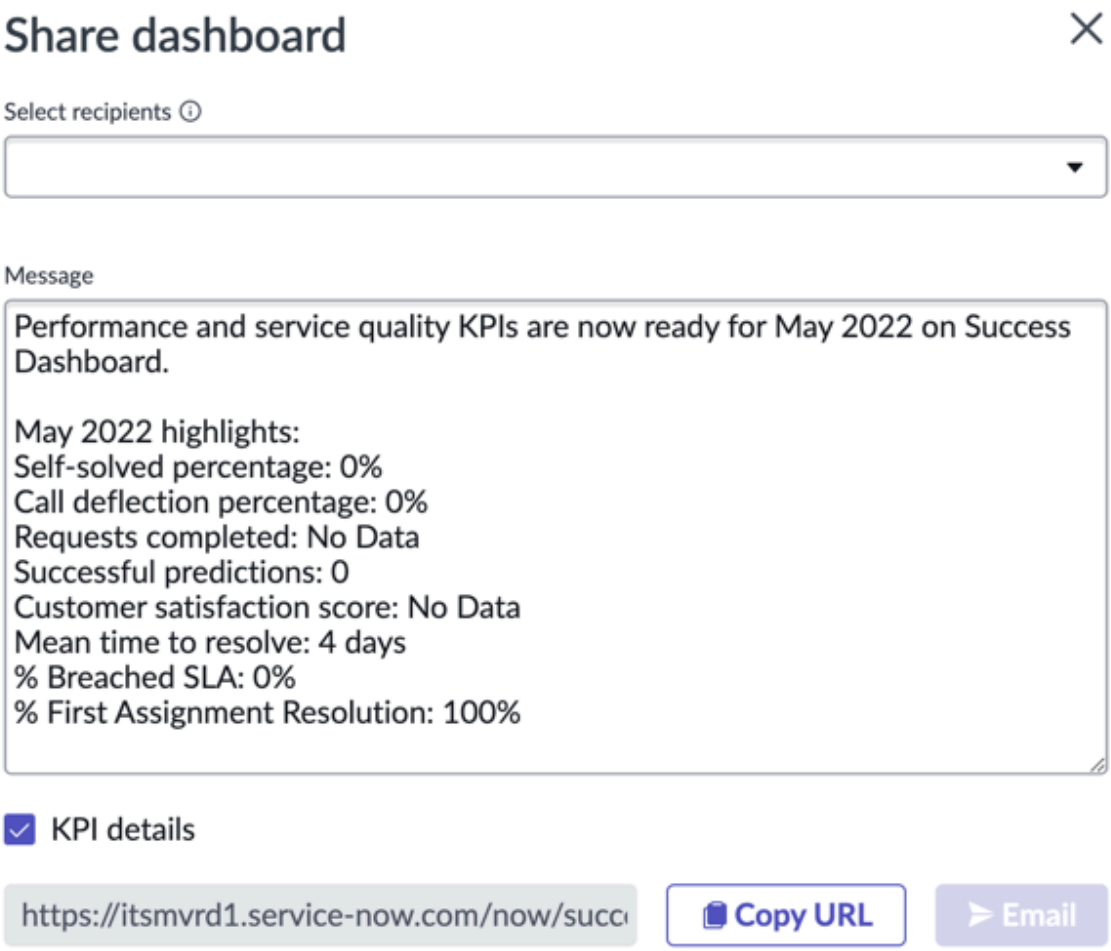
Before you begin

Role required: sn_sd.success_dashboard_admin, or sn_sd.success_dashboard_read, or sn_sd.success_dashboard_details_read

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All>** > **Success Dashboard** > **Success Dashboard**.
2. Select **Share dashboard**.
3. In the Share dashboard dialog box, select the recipients with whom you want to share the dashboard from the **Select recipients**



list.

4. **Optional:** Modify the default message that is sent to the recipients in the **Message** field.
5. **Optional:** Select the **KPI details** option to add the KPI information in the message.
6. Select **Email** to send the email to the selected recipients.
7. **Optional:** Select **Copy URL** to copy a link to the dashboard and send it through different means.

Benchmarks for Success Dashboard indicators

You can view the global benchmark score for the Success Dashboard KPIs and trends along with comparative insight relative to the customers using Success Dashboard.

You must enable the Benchmarks and allowed to share the organization's indicators data. For more information on Success Dashboards KPIs, refer Benchmark KPIs.

Estimated Cost Savings for Success Dashboard indicators

Estimated Cost Savings provides the data to measure the success of the product by calculating the total amount saved by the agents for Virtual Agent, Knowledge, and Service Catalog.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View the total estimated cost saved and its breakdowns to measure benefits from the product capabilities:

- Overall estimated cost saved by specific ServiceNow® product capabilities ITSM Success Dashboard
- Contribution by individual channels like Virtual Agent conversations, Knowledge articles, and Service Catalog submissions
- Formulas and definitions of the data presented on the dashboard
- Data trending monthly, quarterly, and yearly

Key features

This dashboard provides the following features:

- Centralized view with prescribed KPIs, computing cost savings for the overall cost saved that includes Self-solved, Call deflection, Structured tickets completed, and Successful predictions
- Monthly, quarterly and yearly aggregation of the KPIs
- Contextual help explaining a selected KPI and its formula
- Ability to configure persona groups, the hourly salary for each persona group, and the time saving for each persona group per indicator
- Ability to view the cost saved for individual components on the dashboard

Viewing the dashboard

To view the dashboard, you must have the sn_sd.success_dashboard_admin, sn_sd.success_dashboard_read, or sn_sd.success_dashboard_details_read role. Navigate to **All** > **Success Dashboard** > **Success Dashboard**.

View metrics for selected period in ITSM Success Dashboard indicators

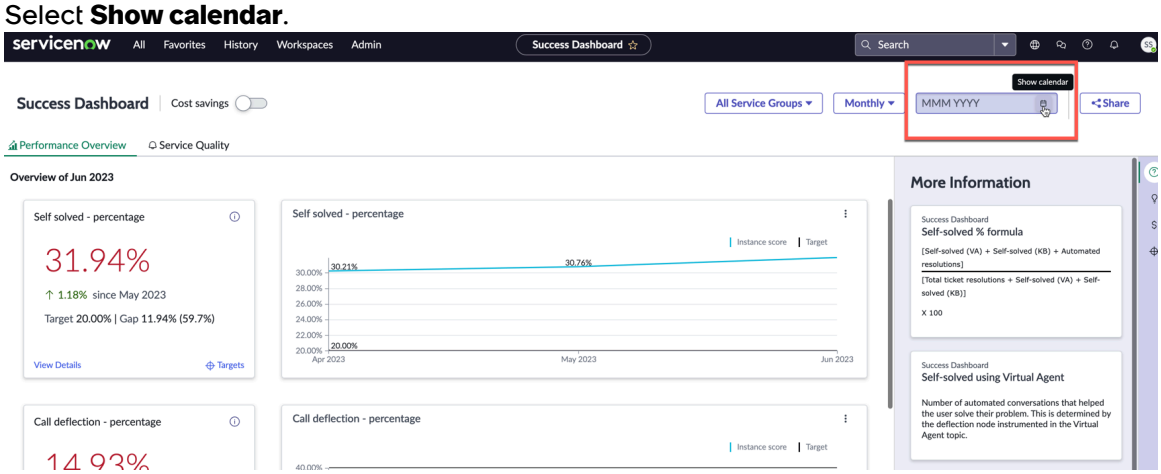
View the Key Performance Indicators (KPIs) metrics on the ITSM Success Dashboard for a selected period to analyze the performance.

Before you begin

Role required: user

Procedure

1. Navigate to **All** > **Success Dashboard** > **Success Dashboard**.
2. Select **Performance Overview** tab.
3. Select **Show calendar**.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Select the year, and the month.
5. Select **OK**.

Note:

The values of all the KPIs including the contributing KPIs for the selected criteria is displayed on the dashboard. The data is refreshed for each selected criteria.

Create target for the KPI in the Success Dashboard

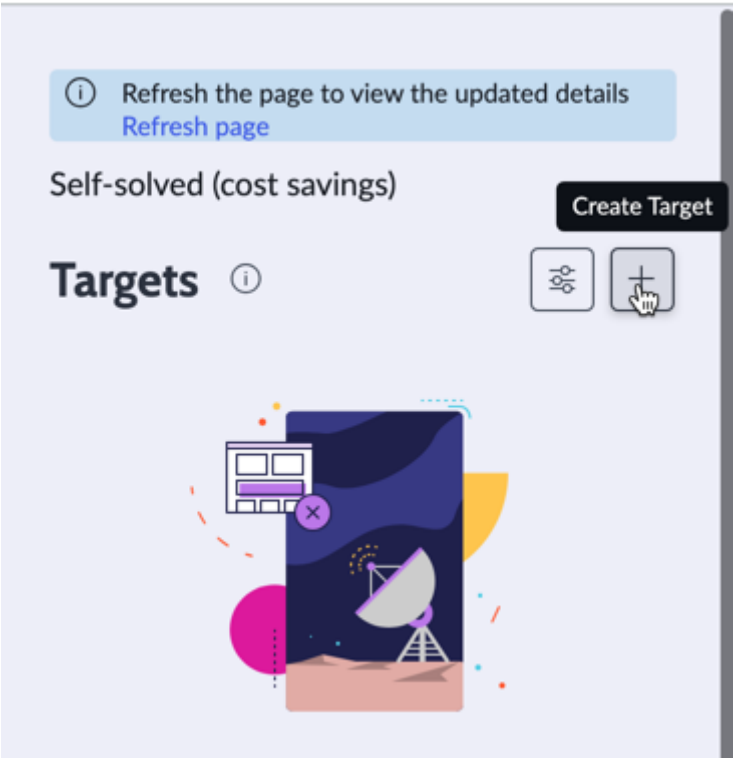
Create a target for a KPI to be on par with the benchmark score or the organizational targets.

Before you begin

Role required: user

Procedure

1. Navigate to **All** > **Success Dashboard** > **Success Dashboard**.
2. Select **Performance Quality** tab.
3. Select **Targets**.
4. Select **Create Target** (+) icon.



5. On the form, fill in the fields.

KPI targets

Field	Description
New value	Option to enter the target value for your KPI.
Target start date	Option to select the target start date.
Target review date	Option to select the date to review the target.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Save**.

Note:
Select **Refresh** to view the target set on the trendline.

ITSM Success Dashboard indicators reference

Reference topics provide additional information about components installed with ServiceNow ITSM Success Dashboard indicators.

Success Dashboard indicators user roles and responsibilities

Leaders and process owners of both ITSM and HR can configure and use the Success Dashboard indicators to measure the success of the implementation.

The Success Dashboard indicators roles and the tasks are uniform across Service groups; ITSM or HR. The following are the user roles and responsibilities:

User role and responsibilities	Required role
As a dashboard admin, you can: • Configure the dashboard settings • Manage KPIs by adding or removing a contributing indicator. • Share the dashboard	sn_sd.success_dashboard_admin
As an IT leader or process owner, you can • View the dashboard and KPIs • View the breakdowns at a high level • Share the dashboard	sn_sd.success_dashboard_read
As a process owner, you can • View the dashboard and KPIs • View the breakdowns at record-level • Share the dashboard	sn_sd.success_dashboard_details_read **Note:** You need to have the `sn_sd.success_dashboard_details_read` access to the records of the table to view the transactions in this level.

Task Outage

CI unavailability, or outage, is the actual down time of a CI. Whenever there is an outage for any of the CI items, the outage information is stored in the Outage [cmdb_ci_outage] table. The Task-Outage table [task_outage] maintains the mapping between the Task [task] table and the Outage [cmdb_ci_outage] table.

Activate Task-Outage Relationship

Activate the Task-Outage Relationship plugin (com.snc.task_outage) to track outage duration.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

About this task
The Task-Outage Relationship plugin creates a many-to-many relationship between the Task [task] table and the Outage [cmdb_ci_outage] table.

Procedure
1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

   Note:
   When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

   You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Related topics
List of plugins (Xanadu)

Components installed with Task-Outage Relationship
The Task Outage table is installed with activation of the Task-Outage Relationship plugin (com.snc.task_outage).

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Table installed

Table	Description
Task Outage [task_outage]	A many-to-many table that stores references to the Task [task] and Outage [cmdb_ci_outage] tables.

Add the Outage UI action to another task form
By default, the *Create Outage* UI action is available on the incident and problem forms, and can be added to other task forms. For new instances from Jakarta only, this feature is also available on the change request form.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Definition** > **UI Actions**.
2. Select the UI Action **Create Outage** on the Task [task] table.
   By default, the condition is:

```
current.getRecordClassName() == 'incident' ||
current.getRecordClassName() == 'problem'
```

3. Modify the **Conditions** field as described in the following examples.

Option	Description
To add this UI action to the Ticket [ticket] table	`current.getRecordClassName() == 'incident' || current.getRecordClassName() == 'problem' || current.getRecordClassName() == 'ticket'`
To use the UI action on only the Problem [problem] table	`current.getRecordClassName() == 'problem'`

4. Click **Update**.

Associate a task with an outage

You can associate multiple tasks with a defined outage.

Before you begin
Role required: itil

About this task
The administrator must configure the Outage form to include the Tasks related list.

Procedure

1. Navigate to the outage record.
2. Click **Edit** in the Tasks related list.
   All incident and problem tasks are listed. For new instances in Jakarta, change requests are also listed.
3. Use the filter or the search field above the **Collection** box to locate the task to associate to the outage.

   Example
   For example, filter for the same configuration item or business service, or look for tasks created on the same day as the outage.
4. Move the associated tasks to the **Task List** box on the right.
5. Click **Save**.

Create an outage from a task

Create an outage from a task record to understand the down time of a configuration item.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: itil or admin

About this task
The **Create Outage** UI action is added for the Task [task] table. When the Task-Outage Relationship plugin (com.snc.task_outage) is activated, the Outages related list is added to the related list of the task forms such as Incident, Problem, or Change. If you have the admin role, you can assign multiple tasks to an outage by configuring the Tasks related list to appear on the Outages form.

Procedure
1. Open the task record.
2. Right-click the header form and select **Create Outage**.
3. On the form, fill in the fields.

Field	Entry
Number	Unique number that identifies the outage.
Configuration Item	Look up icon to select configuration item from the list.
Type	Type of the outage.
Begin	The date and time when the outage starts. You can click the **Begin Outage Now** related link to populate the field with the current date and time.
End	The date and time when the outage ends. When the outage ends, open the record and enter the date and time manually. You can also click the **End Outage Now** related link to populate the field with the current date and time.
Duration	Duration of the outage in days and hours.
Task number	The parent task record number from which you have created the outage.
Short description	A brief description of the outage.

4. Click **Submit**.

Domain separation and task outage

Domain separation is supported in task outage. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

Task outage overview

Task-Outage Relationship [cmdb_ci_outage] is domain separated. Outages are now data separated, meaning they can be exposed to the appropriate personas without risk of data exposure. Fulfillers can view any Task-Outage Relationship records regardless of the domain that the records belong to. The Task-Outage Relationship table is installed when administrator activates the optional Task-Outage Relationship plugin.

Exploring Task Intelligence for ITSM

With Task Intelligence for ITSM, you can set up and deploy machine learning models to predict field-level recommendations and identify similar records for incidents, which will appear as actionable recommendations in the side panel.

Task Intelligence for ITSM overview

Task Intelligence for ITSM enables you to create, configure, and deploy solution models to predict incident fields information and similar records for incidents.

Task Intelligence for ITSM provides the following types of prediction models:

- Incident Categorization model - Predicts incident field information to categorize incidents and applications such as Service Operations Workspace. For more information, see Create an incident prediction model in Task Intelligence for ITSM.
- Similar Incidents model: Predicts similar incidents by recognizing similarities between two types of tables by comparing their fields.
- Similar open Change Requests for Incidents model: Predicts change requests by recognizing the similarities between the incident table and change request table, by comparing their fields.
- Similar open Problems for Incidents model: Predicts problems by recognizing the similarities between the incident table and problem table, by comparing their fields.

> **Note:**
> To know more about similarity based models, see Create a similar records prediction model in Task Intelligence for ITSM

The prediction models enable the agents to focus more on incident resolution reducing the time spent filling in field information or searching for similar records. These models can help lower the meantime to resolve (MTTR) of tasks. You can also track and monitor how the solution models are performing and modify the parameters of the model accordingly.

Task Intelligence for ITSM enables the agents to do the following:

- Solve issues faster for better service and experiences
- Focus#on#meaningful, high-value work
- Reduce#error#rates#and#drive down#costs
- Improve time to value with intuitive experiences

The Admin Console for Task Intelligence for ITSM provides the admin a no-code experience for deploying Task Intelligence solution models. Using machine-learning models, the application enables you to automate and optimize incident prediction and incident categorizations. The models use statistics to predict future data by training with your past data.

Task Intelligence for ITSM supports Utah patch 5 and later releases.

Task Intelligence for ITSM workflow

The workflow for Task Intelligence for ITSM includes the following:

1. Task Intelligence for ITSM: Use this application to set up and configure an incident prediction model to predict and recommend incident fields on the incident form. To configure and use a model, you must do the following:
   a. Set up an incident prediction model: Set up a model using the default template available with the base system.
   b. Train your model: Train the model with your data.
   c. Set your preferences: Set the prediction preferences and behavior for the model.
   d. Deploy the model: Deploy the model to predict incident field information.
   e. Monitor and analysis: Monitor how the model is performing and analyze the performance result data.
   f. Edit your model: Based on the analysis of the performance results, edit your model and deploy it again.
2. Go to the Advanced Recommended actions for ITSM application configuration to configure where, how, and when the model must be implemented in the Service Operations Workspace application. For more information, see Recommended Actions for ITSM in Service Operations Workspace.
3. Get incident predictions and recommendations in the incident form of Service Operations Workspace.

Task Intelligence for ITSM benefits

Task Intelligence for ITSM provides the following benefits:

Feature Benefits based on role

Benefit	Feature	User
Create and deploy solution-based incident prediction models to predict incidents fields for new IT service incidents. This helps in incident categorization	Create an incident prediction model in Task Intelligence for ITSM	Administrator
Create and deploy similarity-based model to predict similar records for IT service incidents which appear as actionable recommendations.	Create a similar records prediction model in Task Intelligence for ITSM	Administrator
Export an incident prediction model in Task Intelligence for ITSM to another instance so you can use the model in the other instance without recreating the model from scratch.	Export an incident prediction model	Administrator

Task Intelligence for ITSM Admin Console

Admin Console for Task Intelligence for ITSM provides you with an interface to create, train, access, set preferences, deploy, and monitor predictive models used for incident predictions and similar patterns recognition.

ServiceNow® Task Intelligence for ITSM admin console supports the following features:

- Train the required model with your data, and deploy it to predict incident fields or identify similar records for incidents, which will appear as actionable recommendations in the side panel.
- Use the incident field information to help categorize incidents or recognize similar records and reduce the incident handle time for agents.
- Track and monitor the performance of the deployed model.
- Edit the deployed model based on its performance results, then train and deploy the model again.

Configuring Task Intelligence for ITSM

Configure Task Intelligence for ITSM so agents can use the application to get the field level predictions and similar records on incidents as actionable recommendations in Service Operations Workspace.

Configuration overview

Configuring Task Intelligence for ITSM involves installing the application from ServiceNow® Store.

Install Task Intelligence for ITSM

You can install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) if you have the admin role. The application installs related ServiceNow® Store applications and plugins if they aren't already installed.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application .
- Review the Task Intelligence for ITSM application listing in the ServiceNow Store for information on dependencies, licensing and subscription requirements, and release compatibility.
- Installing Task Intelligence for ITSM requires the ITSM Pro Package subscription.

Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The following items are installed with Task Intelligence for ITSM:

- Store applications
- Roles
- Tables

For more information on what is installed, see Components installed with Task Intelligence for ITSM.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Task Intelligence for ITSM application (com.snc.itsm_ml_task) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you can't find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box, any dependencies installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
6. Select **Install**.

Managing Task Intelligence for ITSM models

Use the machine learning capabilities of Task Intelligence for ITSM to predict field level recommendations and similar records on the incidents which appear as actionable recommendations in the side panel.

Managing Task Intelligence for ITSM involves the following tasks.

Creating a prediction model

You can create and deploy solution-based prediction models to predict incidents fields and actionable real-time recommendations based on the similarities between two types of tables by comparing their fields for IT service incidents.

Task Intelligence for ITSM provides the following types of prediction models:

- **Incident Categorization model**: This model predicts incidents fields for new IT service incidents.
- **Similar Incidents model**: The model looks at the prediction fields of a prediction table and the training fields of a training table. It uses the similarities in these fields to predict similar records for incidents.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Similar open Change Requests for Incidents**: The model looks at the incident fields of an incident table and the change request fields of a change request table. It uses the similarities in these fields to predict similar change requests for incidents.
- **Similar open Problems for Incidents**: The model looks at the incident fields of an incident table and the problem fields of a problem table. It uses the similarities in these fields to predict similar problems for incidents.

Creating a model involves the following steps:

- Set up a model: Set up a prediction model using a template available in the base system.
- Define a model: Specify the purpose of the model by selecting the training table and prediction table which will be used for training the model further.
- Train a model: Train a model to make predictions using your data.
- Assess your model: Assess the results from the model training, view sample results for the predictions, and select the prediction preferences and behavior for your model.
- Deploy your model: Deploy your model to predict incident fields on incident forms.

Editing a prediction model

Edit a prediction model that has already been trained and deployed. Change the model configurations, view the updated training results, and redeploy the model.

Exporting a prediction model

Export a prediction model in Task Intelligence for ITSM to another instance so you can use the model in the other instance without recreating the model from scratch.

Create an incident prediction model in Task Intelligence for ITSM

Create and deploy solution-based incident categorization prediction models to predict incidents fields for new IT service incidents.

With an incident field prediction model, you can choose what the model uses to predict information. If you're an admin, you can decide when you want it to make predictions, what you want it to predict, and what data to use for those predictions. You can select the following information:

- Output fields, or the fields that the model predicts
- Input fields, or the fields used to predict the output fields
- Conditions that choose the set of records to train the model
- The prediction behavior: auto-fill, recommend, or Monitor only (run in the background) or turn off predictions.

After customizing your model, you can view the test results and deploy the model.

The model uses previous case records to train. You can see how the model would have predicted fields for past cases, providing you with an estimate of how the model performs when deployed.

Base system model

Task Intelligence for ITSM comes with a base system **Incident Categorization** model for predicting the Incident fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When you install the Task Intelligence for ITSM plugin in your production instance, the model is installed and is trained on your data automatically. This model is auto-deployed. The model starts predicting data in the background and doesn’t impact the Incident form.

The prediction data is then stored in the prediction tables. You can navigate to **All** > **Task Intelligence for ITSM** > **Monitoring** to view the performance results of this model. Based on these results, you can edit the model to show the predictions in Service Operations Workspace. You can configure the model to use the predictions to either auto-fill or give recommendations for the output fields on an incident form.

To edit and redeploy the base system model, you can navigate to the Setup page. From the model list, select **Incident Categorization** and edit the model. For more information on how to edit the model, see Edit an incident prediction model in Task Intelligence for ITSM.

This model is linked with a base system rule in the Recommended Actions for ITSM configuration. An admin isn't required to go to the Recommended Actions for ITSM application to configure any rules for this model.

To set up a new model using a template, see Set up your incident prediction model.

Set up your incident prediction model

Use Task Intelligence for ITSM to set up your incident prediction model and train it with your data to make predictions. Access your model's performance results, set the prediction preferences and behavior, and deploy your model.

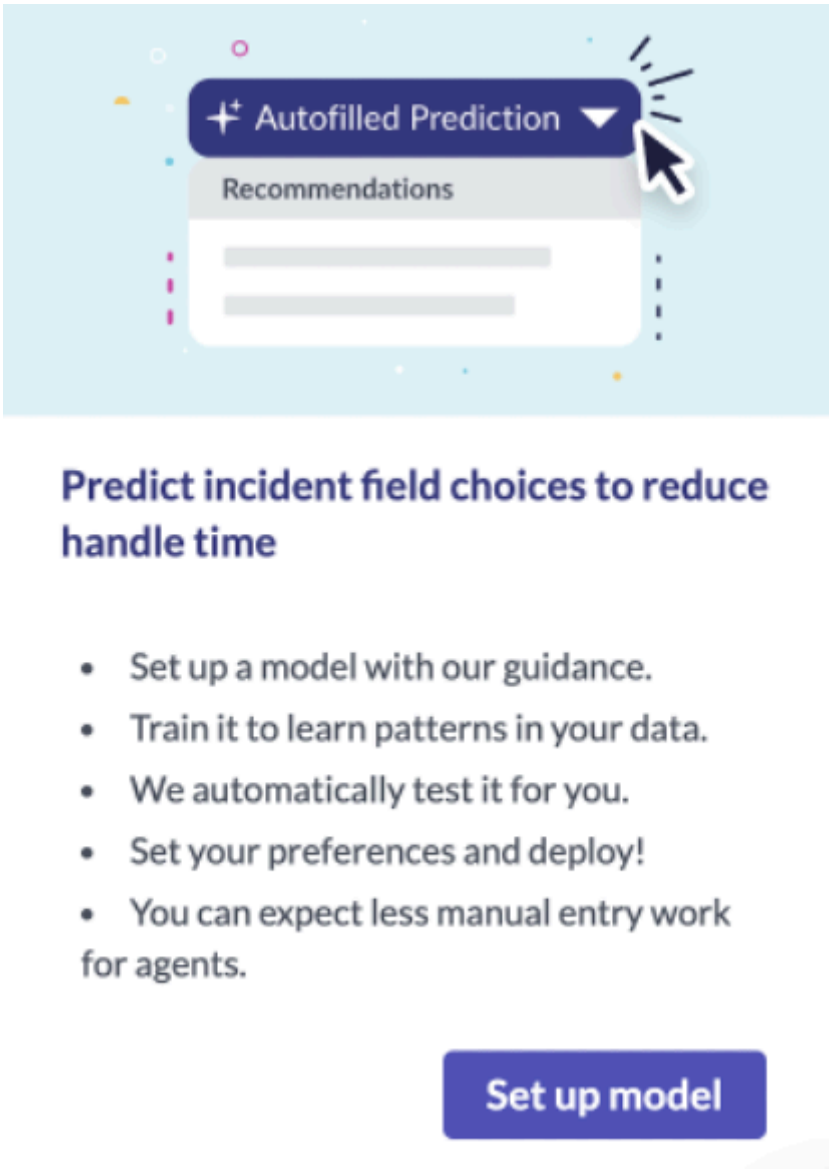
Before you begin

Role required: sn_ti_admin.tia_admin or admin

Procedure

1. Navigate to **All** > **Task Intelligence for ITSM** > **Setup** to access the Task Intelligence Admin Console.
2. On the **Predict incident field choices to reduce handle time** card, select **Set up model**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This action opens the model and displays the introductory pages. Each page in the model asks you questions and helps you select the information needed to build an effective model.

Train your model

Train your incident prediction model with data to predict the incident fields.

Before you begin

You can set up a task intelligence model or use the base system template that is shipped with Task Intelligence for ITSM. For more information on setting up a new model, see Set up your incident prediction model.

Role required: sn_ti_admin.tia_admin or admin

About this task

When you train a machine learning model, the model learns patterns from past data to make predictions about new data. Models are trained using large amounts of data so that they can learn patterns. A large data set makes the learned patterns statistically significant. As you answer questions about your information systems, business process, and service operations, the system actively learns from your responses.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

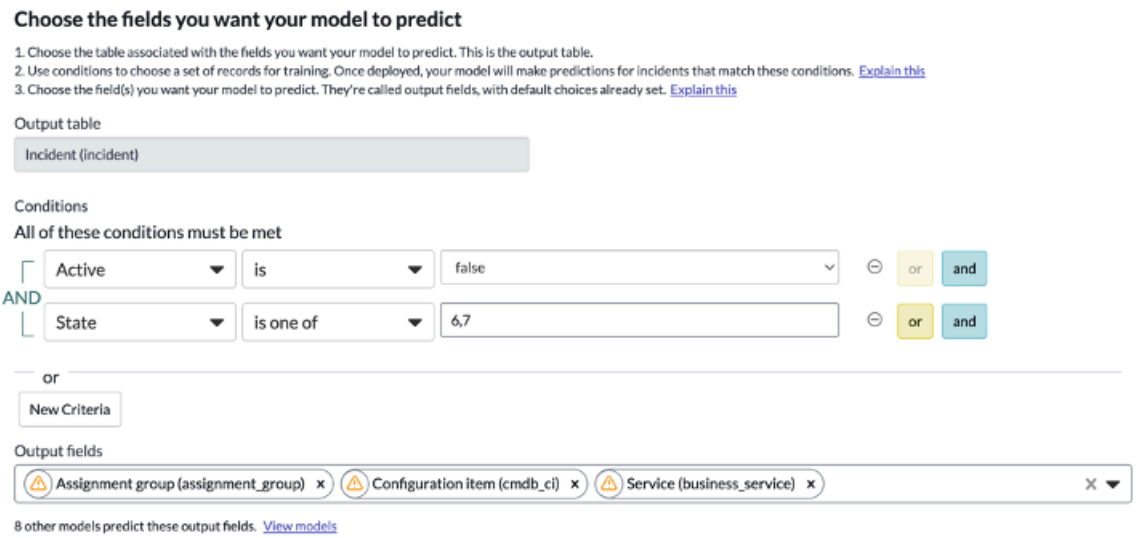
You can select the table and fields that you want to predict, such as the Output table and Output fields. Also, you can select the tables and fields that you want the model to use to predict the incident information, such as the Input table and Input fields.

Select this information to tell the model what to look for during training.

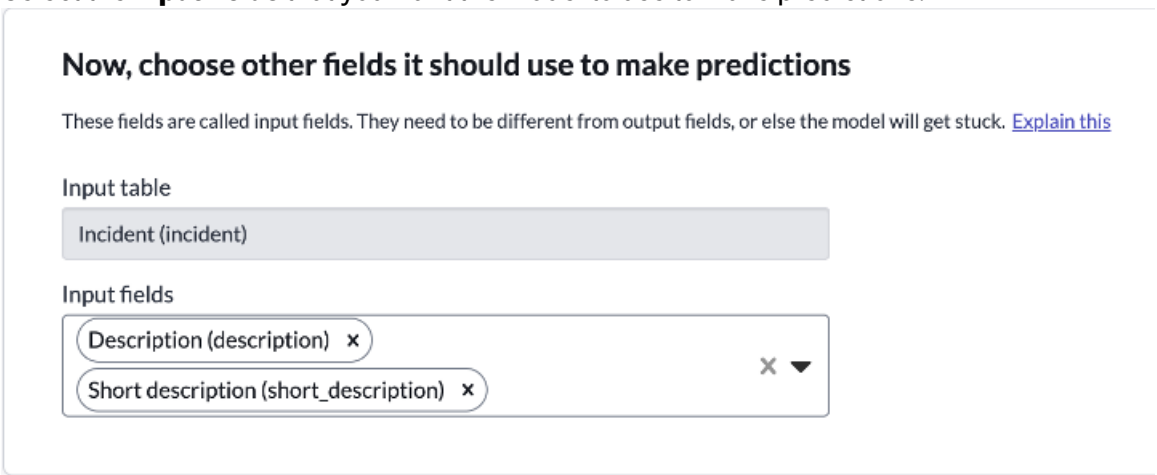
Note:
You can either use the recommended settings or customize the settings to fit your needs.

Procedure

1. Enter a name for the model.
2. Select the **Output table** you want the model to predict.
3. Select **Conditions** to choose a set of records to use for training.
   The selected conditions determine how the model is trained. These conditions provide the requirements that a record must meet to make the predictions.
4. Select the **Output fields** you want the model to predict.



5. Select the **Input table** in the training data that you want the model to use to make predictions.
6. Select the **Input fields** that you want the model to use to make predictions.

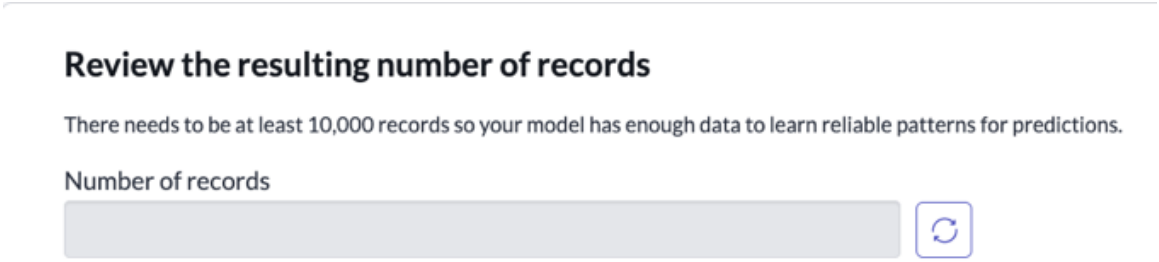


7. Review the resulting **Number of records** in the training data based on the selected conditions.

   The records that are counted include the number of fields, parameters, and data that the model uses to train. Based on the provided information and the set conditions, the number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

or records gets updated automatically. The model needs a minimum of 10,000 records for effective training. If this minimum number hasn't been reached, try selecting different conditions. You can also click the refresh icon ( ) to refresh the number.



8. Select **Launch training**.

Result

If you're training the model on a large amount of data, training can take some time. You can request that the system sends you an email when the training is done.

Assess your model

Assess the results from the model training and view sample results for the predicted fields. Reviewing the results gives you a preview of how your model will perform after being deployed. Based on the sample results, select the prediction preference and behavior for each field.

Before you begin

You must train your model with various data. For more information on how to train your model, see Train your model.

Role required: sn_ti_admin.tia_admin or admin

About this task

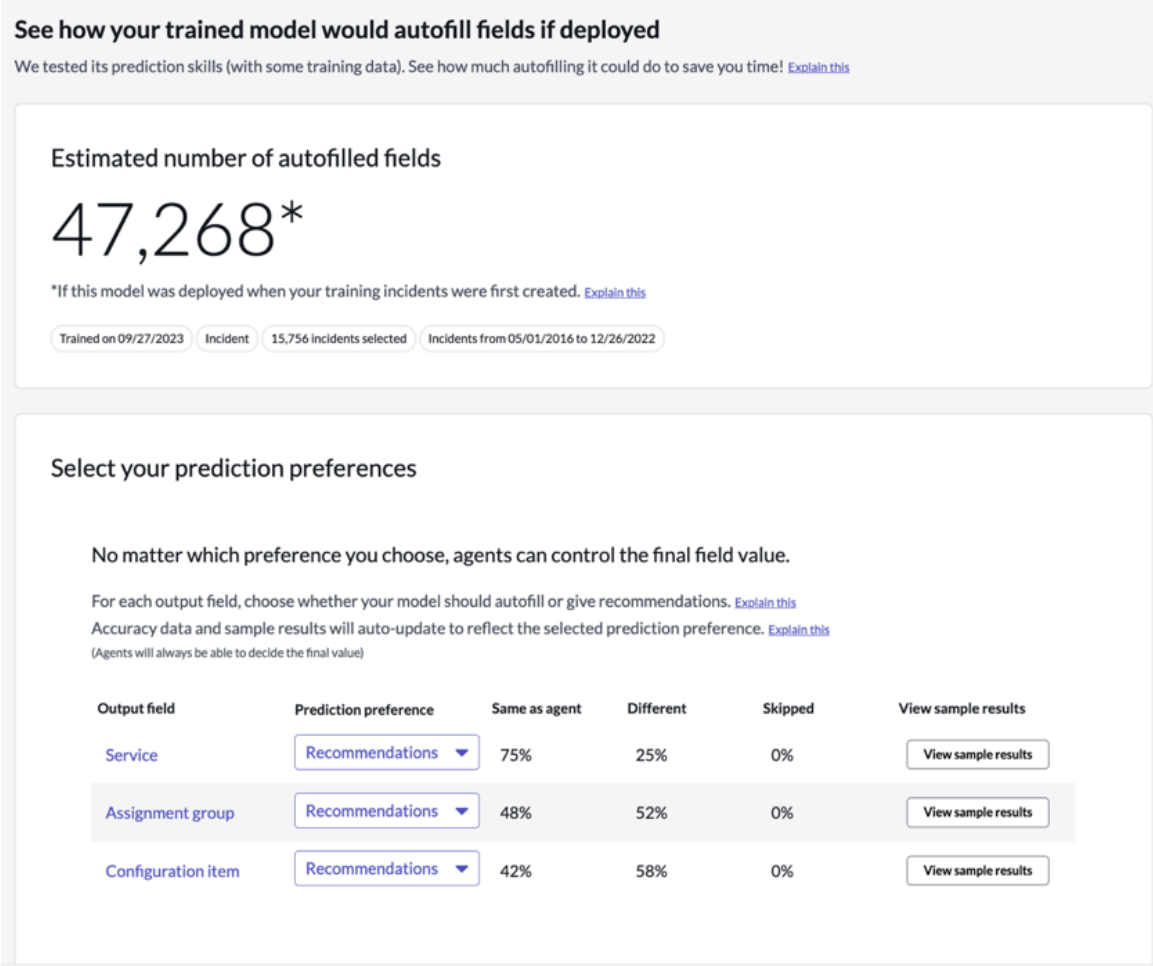
The model has flexible options. Based on the sensitivity and requirements of each incident field on the Incident form, you can do the following actions:

- Auto-fill the predicted value in the incident field.
- Recommend the predicted value in the incident field.
- Monitor and run the prediction model for the incident field in the background only.
- Turn off the predictions for the incident field.

Procedure

1. View the number value in the **Estimated number of autofilled fields** section.
   The number helps you predict how your model performs when deployed.
2. Select **View sample results** to see the sample results for each predicted field.
3. Select the **Comparison** button to see the details for a selected result.
4. Choose one of the following options from the **Prediction preference** drop-down list for each field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. Select **Save & continue**.

Deploy your model

Deploy the incident prediction model to predict the incident field information.

Before you begin

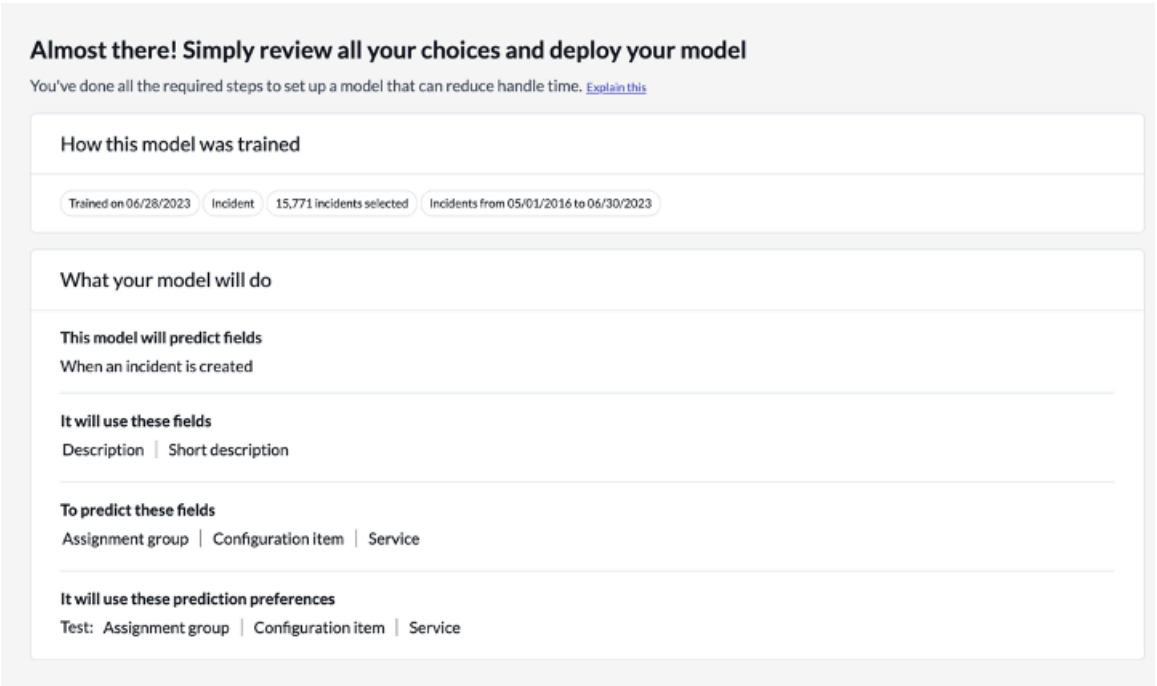
You must access the model and set the preferences for your model. For more information on setting model preferences, see Assess your model.

Role required: sn_ti_admin.tia_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Review your choices from the previous pages and information about how the model was trained.

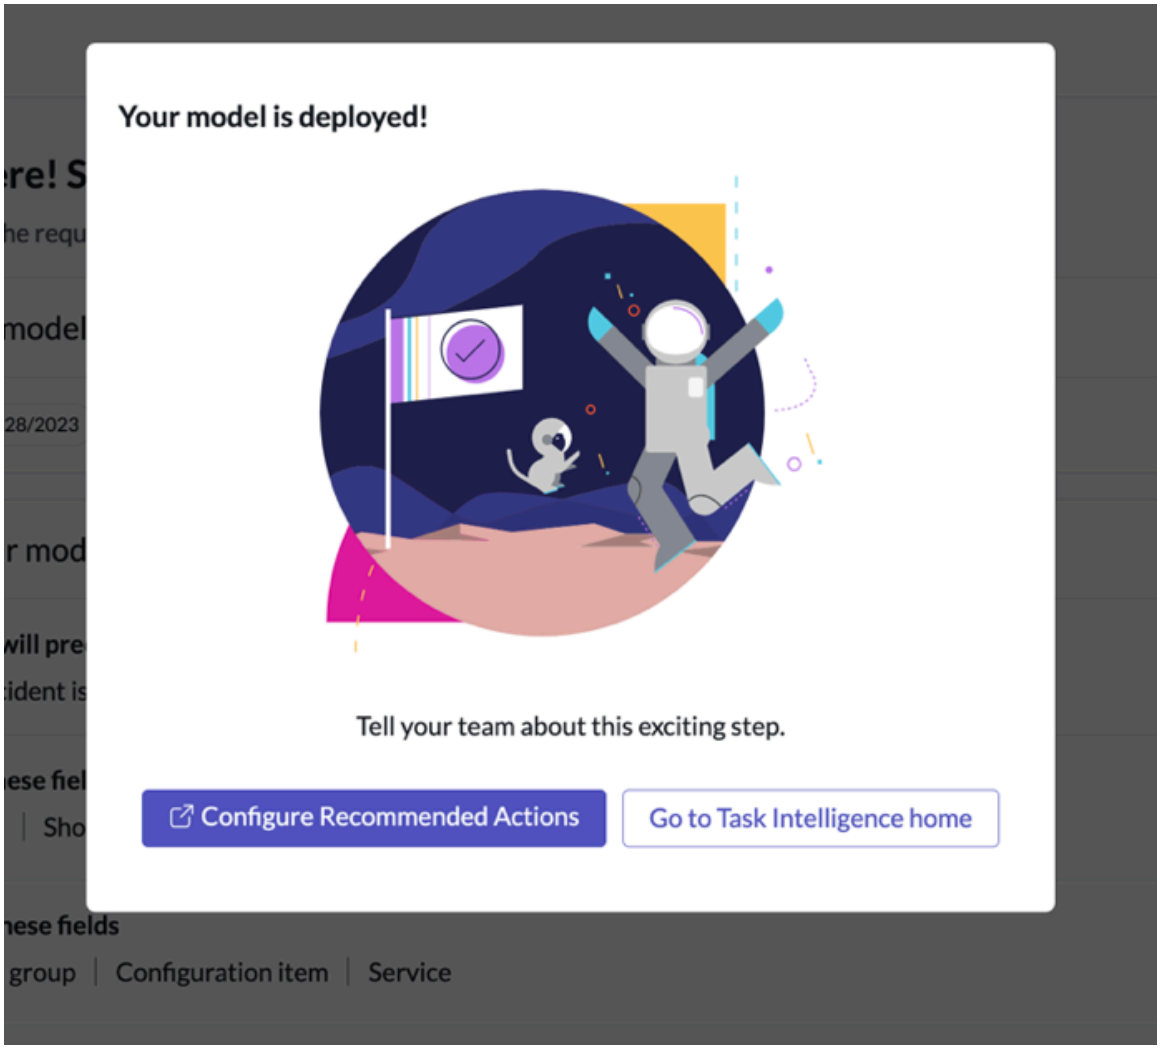


2. Select **Deploy** to deploy the model.

Result

A pop-up appears confirming that your model was deployed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



What to do next
Select **Configure Recommended Actions** to configure the implementation of the incident prediction model in the incident fields. For more information, see Recommended Actions for ITSM in Service Operations Workspace.

Create a similar records prediction model in Task Intelligence for ITSM

Set up a training model to help it recognize similarities between two types of tables by comparing their fields.

The model looks at the prediction fields of a prediction table and the training fields of a training table. It uses the similarities in these fields to predict similar records.

For example, the prediction fields might be the short description and description of an incident record, while the training fields could be the short description and title of a knowledge base (KB) article.

The model compares these fields to find KB articles that are similar to the current incident. This makes it easier for agents to find relevant information and resolve incidents quickly.

If you're an admin, you can decide when you want it to make predictions, what you want it to predict, and what data to use for those predictions.

You can select the following information:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Prediction fields using which similar records are predicted for the model.
- Training fields using which the similarities are compared to prediction fields to predict similar records.
- Conditions used to choose the set of records to train the model.
- The prediction behavior: **Recommendation**, **Monitor only** (run in the background) #or **turn off predictions**.

After customizing your model, you can view the test results and deploy the model.

The model uses previous case records to train. You can see how the model would have predicted similar records for past cases, providing you with an estimate of how the model performs when deployed.

Base system model

Task Intelligence for ITSM comes with a base system which has following models based on similarity:

- **Similar Incidents** model for predicting the similar incidents for incidents table.
- **Similar open Change Requests for Incidents** model for predicting the similar change requests for incident table.
- **Similar open Problems for Incidents** model for predicting the similar problems for incident table.

When you install the Task Intelligence for ITSM plugin in your production instance, the model is installed and is trained on your data automatically. This model is auto-deployed. The model starts predicting data in the background and doesn't impact the Incident form.

Note:
As an admin user, you should receive an email within four weeks with a link to your analytics dashboard.

The prediction data is then stored in the prediction tables. You can navigate to **All** > **Task Intelligence for ITSM** > **Monitoring** to view the performance results of this model. Based on these results, you can edit the model to show the predictions in Service Operations Workspace.

To edit and redeploy the base system model, you can navigate to the Setup page. From the model list, select the required similarity model(For example, Similar Incidents) and edit the model. For more information on how to edit the model, see Edit an incident prediction model in Task Intelligence for ITSM.

This model is linked with a base system rule in the Recommended Actions for ITSM configuration. An admin isn't required to go to the Recommended Actions for ITSM application to configure any rules for this model.

To set up a new model using a template, see Set up similar records prediction model.

Set up similar records prediction model

Use Task Intelligence for ITSM to set up similar records prediction model, define the purpose of the model and train it with your data to make predictions. Access your model's performance results, set the prediction preferences and behavior, and deploy your model.

Before you begin
Role required: sn_ti_admin.tia_admin or admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

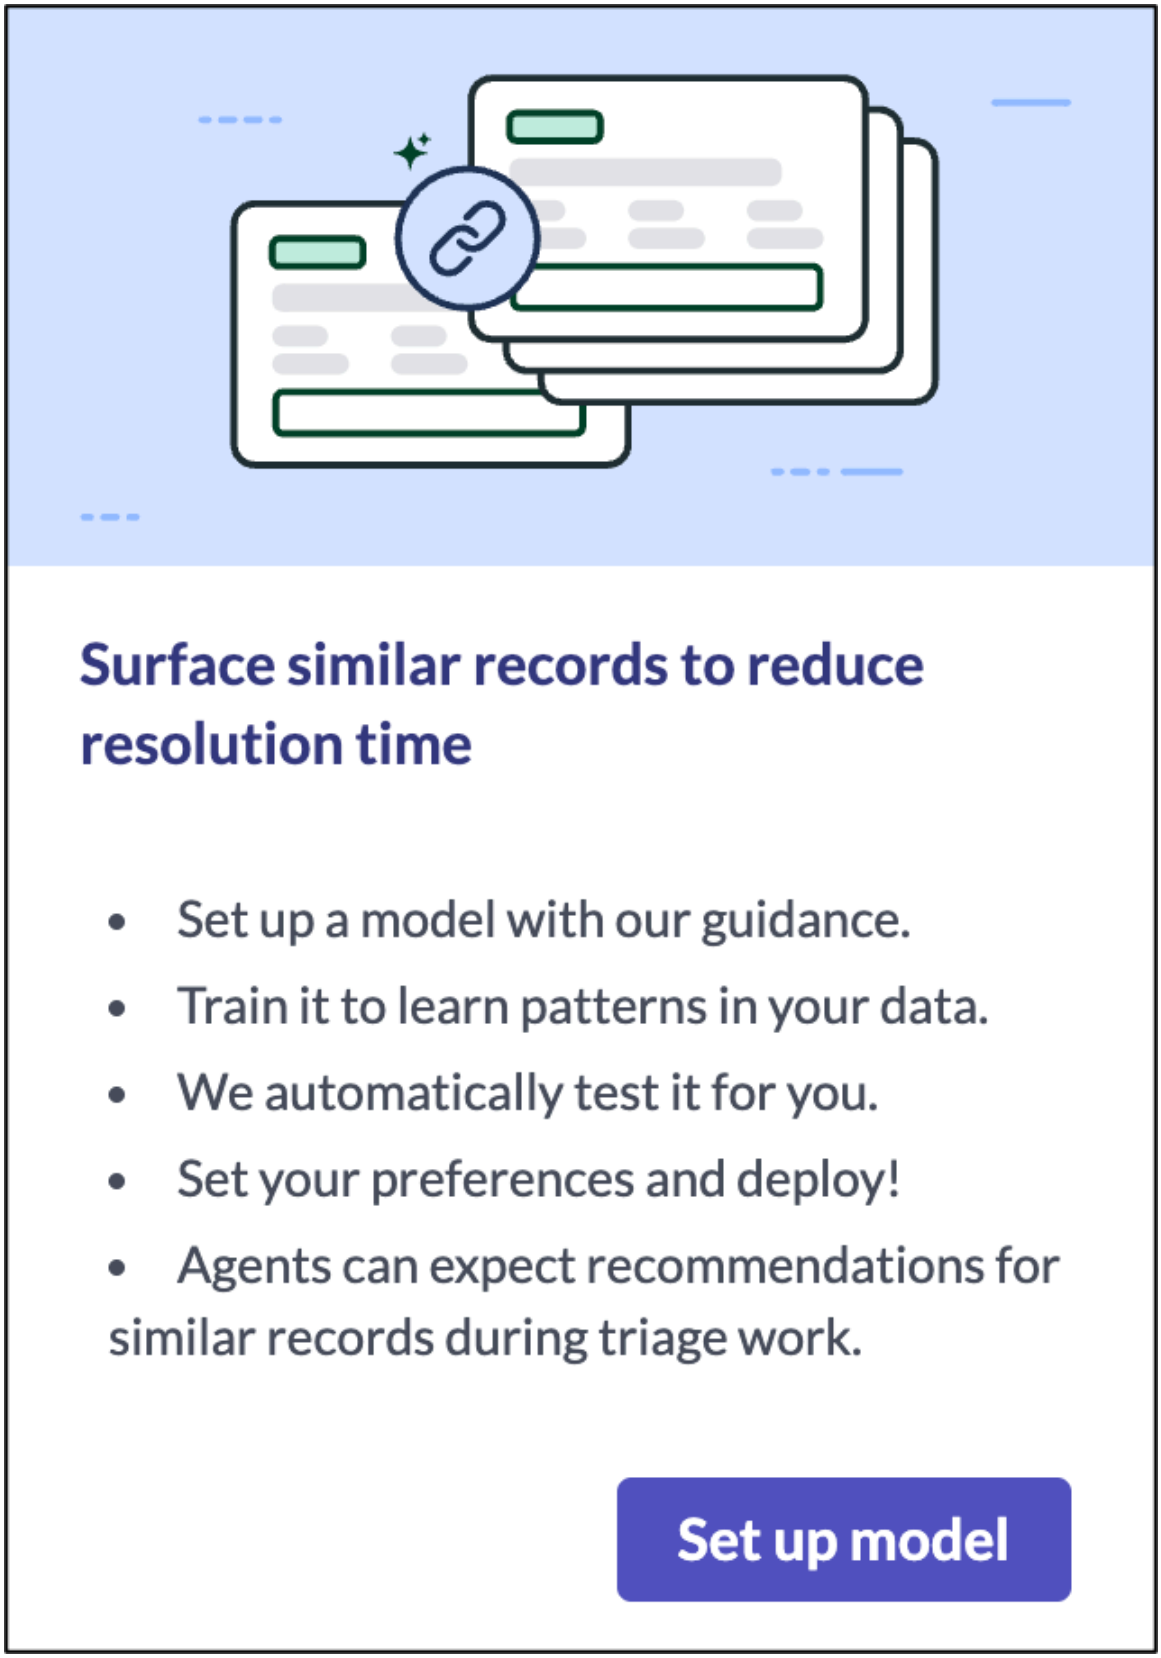
You can configure any of the following similarity-based models:

- **Similar Incidents** model for predicting the similar incidents for incidents table.
- **Similar open Change Requests for Incidents** model for predicting the similar change requests for incident table.
- **Similar open Problems for Incidents** model for predicting the similar problems for incident table.

Procedure

1. Navigate to **All** > **Task Intelligence for ITSM** > **Setup** to access the Task Intelligence Admin Console.
2. On the **Surface similar records to reduce resolution time** card, select **Set up model**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This action opens the model and displays the introductory pages. Each page in the model asks you questions and helps you select the information needed to build an effective model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Define the purpose

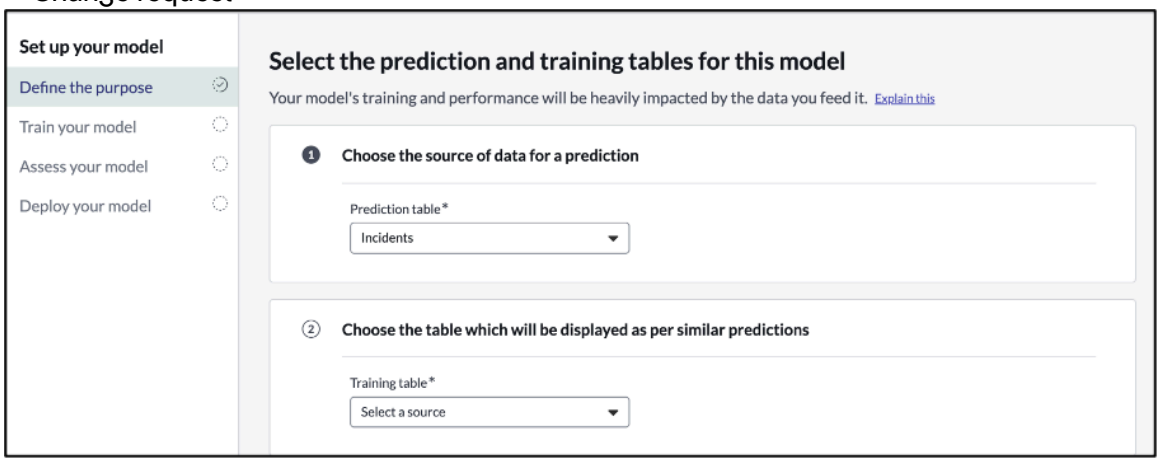
Specify the purpose of the similar records model. You can select the prediction table for which predictions will be generated. Then, select the training table (Incidents, Problems, or Change Requests) which will appear as predictions based on similarities between their selected fields.

Before you begin

Role required: sn_ti_admin.tia_admin or admin

Procedure

1. Select the prediction table.
2. Select any of the following training tables.
   - Incident
   - Problem
   - Change request



3. Select#**Save & continue**.

Result

Now that the purpose of the model is defined, you can start training it. For more information, see Train the similarity model.

Train the similarity model

Train your similar records models with training data to predict the similar records by recognizing similarities between fields of Incident table and training tables.

Before you begin

You can set up a task intelligence model or use the base system template that is shipped with Task Intelligence for ITSM. For more information on setting up a new model, see Set up similar records prediction model

Role required: sn_ti_admin.tia_admin or admin

About this task

When you train a machine learning model, the model looks at the prediction fields of a prediction table and the training fields of a training table. It uses the similarities in these fields to predict similar records.

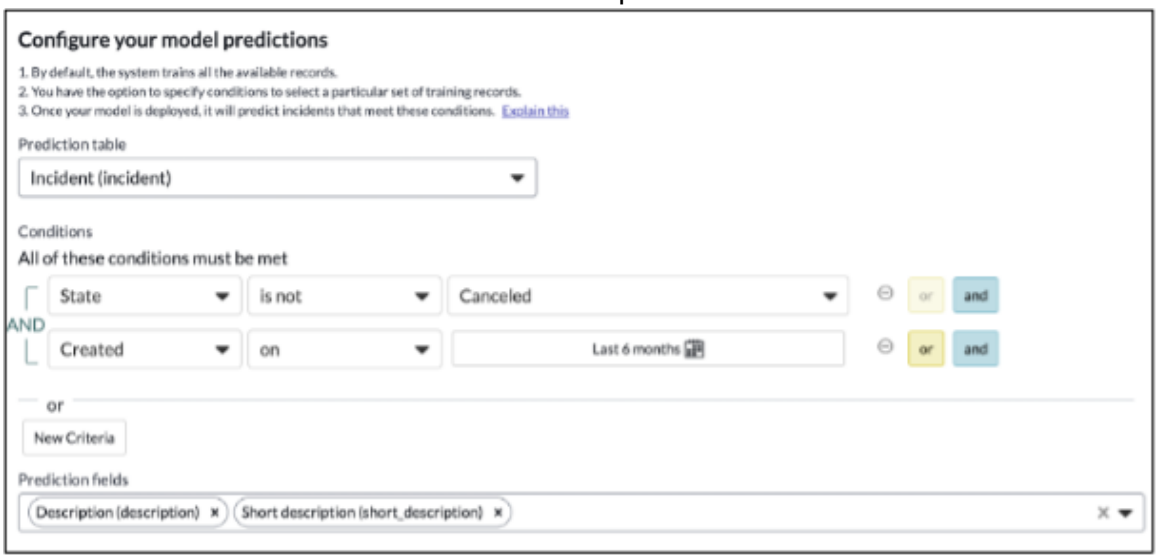
You can select the table and fields that you want to predict, such as the Prediction table and Predictions fields. Also, you can select the tables and fields that you want the model to use to predict the similar records, such as the Training table and Training fields.#Select this information to tell the model what to look for during training#.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
You can either use the recommended settings or customize the settings to fit your needs.

Procedure

1. Enter a name for the model.
2. Select the **Prediction table** you want the model to predict.
3. Select **Conditions** to choose a set of records to use for training.
   The selected conditions determine how the model is trained. These conditions provide the requirements that a record must meet to make the predictions.
4. Select the **Prediction fields** which will be used to predict similar records.

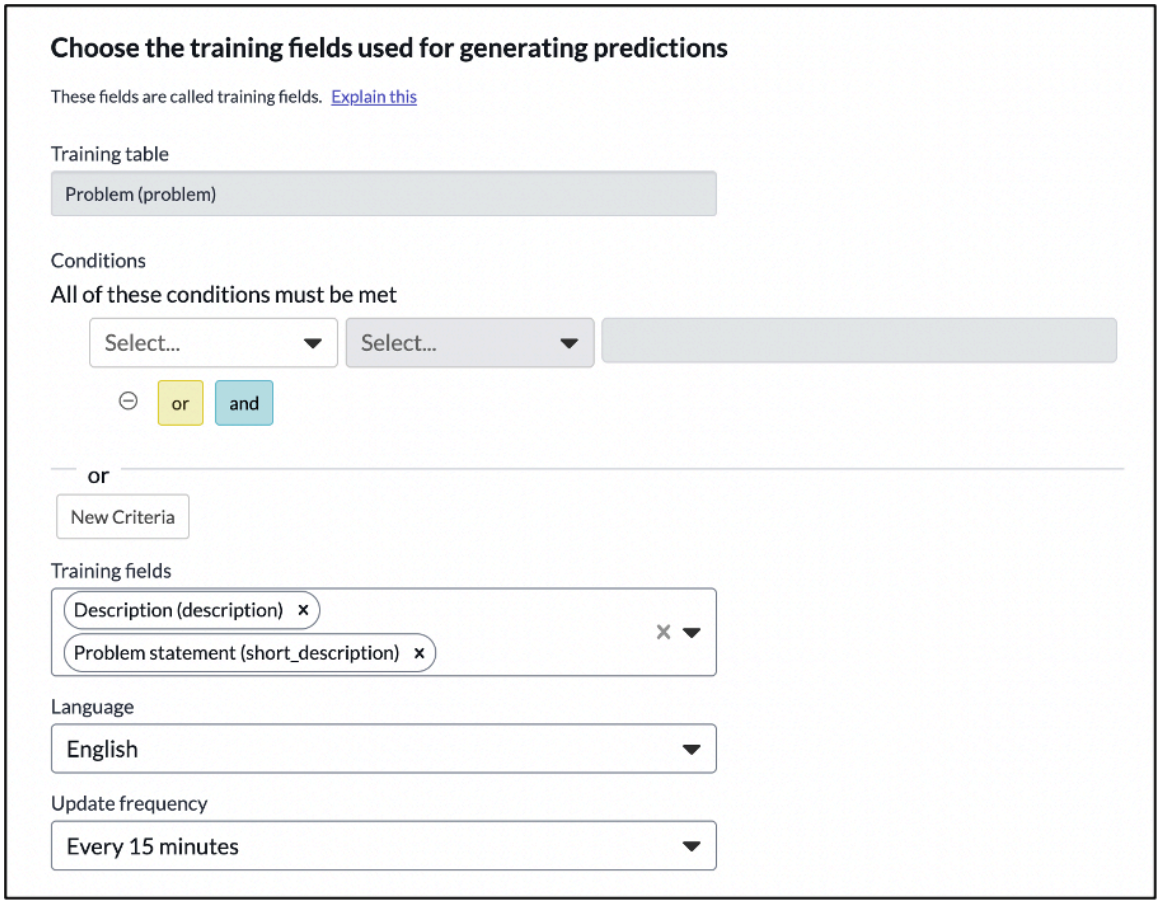


5. Choose the set of records used for training the similar records model by selecting the conditions on the training tables and training fields for training the similarity models.

   Note:
   This field appears only when you select **Problem** or **Change Requests** training table in the **Define your Purpose** page. If you select the prediction table and training table as Incident, the conditions selected in Step 3 is applied on both prediction and training tables (In this case both are incident tables) to generate training records that are used for prediction.

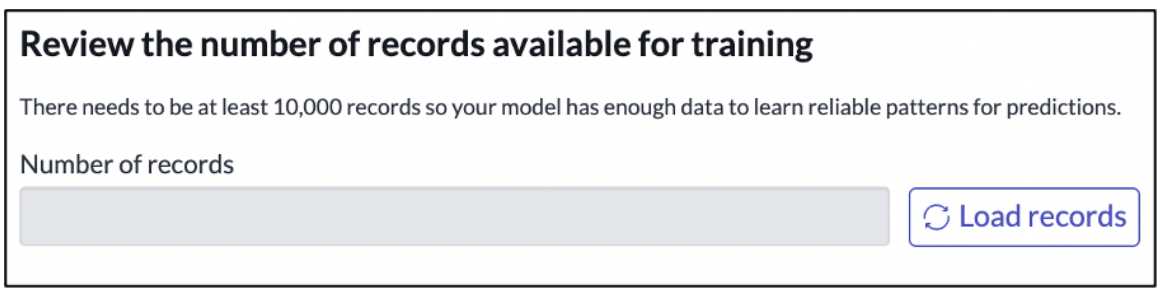
6. Select the **Training table** in the training data that you want the model to use to make predictions.
7. Select the **Training** fields that you want the model to use to make predictions.
8. Select the **Language** in which training takes place.
9. Select the **Update Frequency** to decide how frequently the training should occur.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



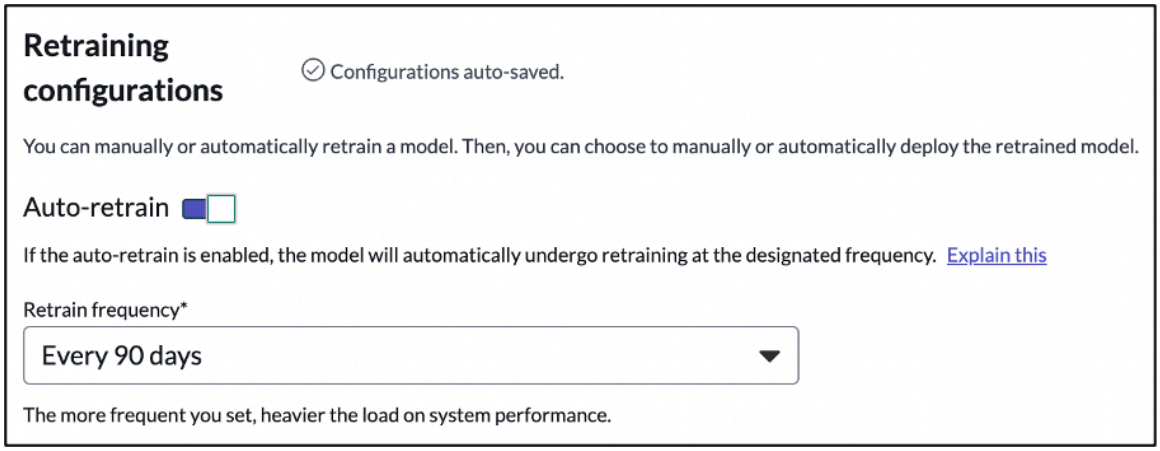
10. Review the resulting **Number of records** in the training data based on the selected conditions.

    The records that are counted include the number of fields, parameters, and data that the model uses to train. Based on the provided information and the set conditions, the number or records gets updated automatically. The model needs a minimum of 10,000 records for effective training. If this minimum number hasn't been#reached, try selecting different conditions. You can also click the refresh icon ( ) to refresh the number.



11. Set a#**Training Frequency**to define how often the model automatically retrains.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



12. Select **Launch training**.

Result

If you're training the model on a large amount of data, training can take some time. You can request that the system sends you an email when the training is done.

Assess the similarity model

Assess the results from the model training and view sample results to see the similar records predicted for incidents. Reviewing the results gives you a preview of how your model will perform after being deployed. Based on the sample results, select the prediction preference.

Before you begin

You must train your model with various data. For more information on how to train your model, see Train the similarity model

Role required: sn_ti_admin.tia_admin or admin

About this task

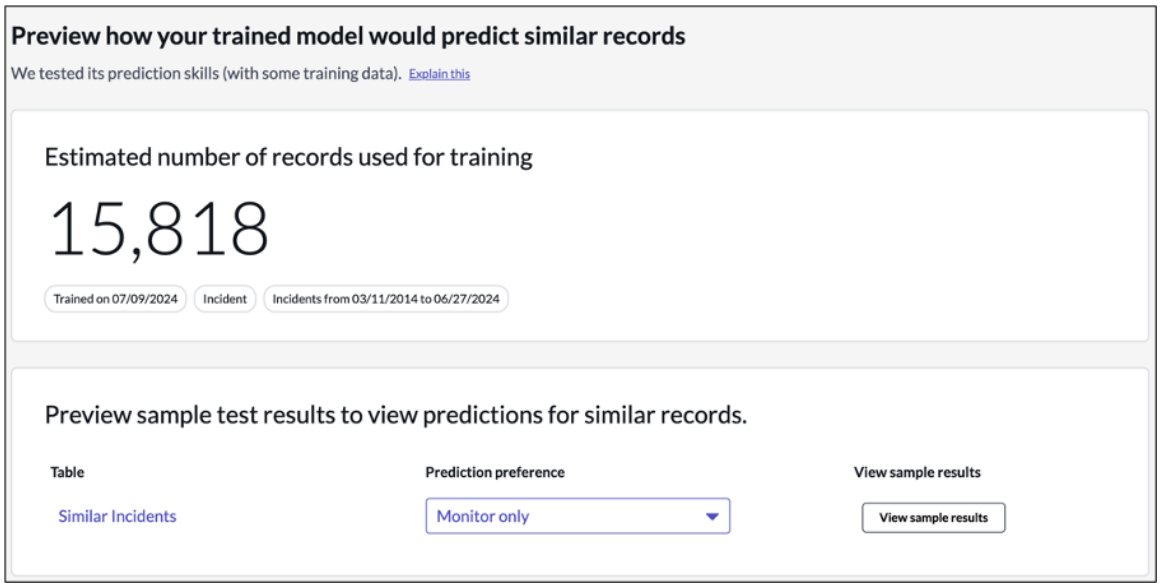
The model has flexible options. Based on the sensitivity and requirements of each incident record, you can do the following actions:

- Recommend the similar records for the incidents.
- Monitor and run the prediction model for the incidents in the background only.
- Turn off the predictions for the incidents.

Procedure

1. View the number value in the **Estimated number of records used for training** section. The number helps you predict how your model performs when deployed.
2. Select **View sample results** to see the similar records predicted for each incident.
3. Choose one of the following options from the **Prediction preference** drop-down list for each field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select **Save & continue**.

Deploy the similarity model

Deploy the Similar incidents model to predict the similar records for the incidents.

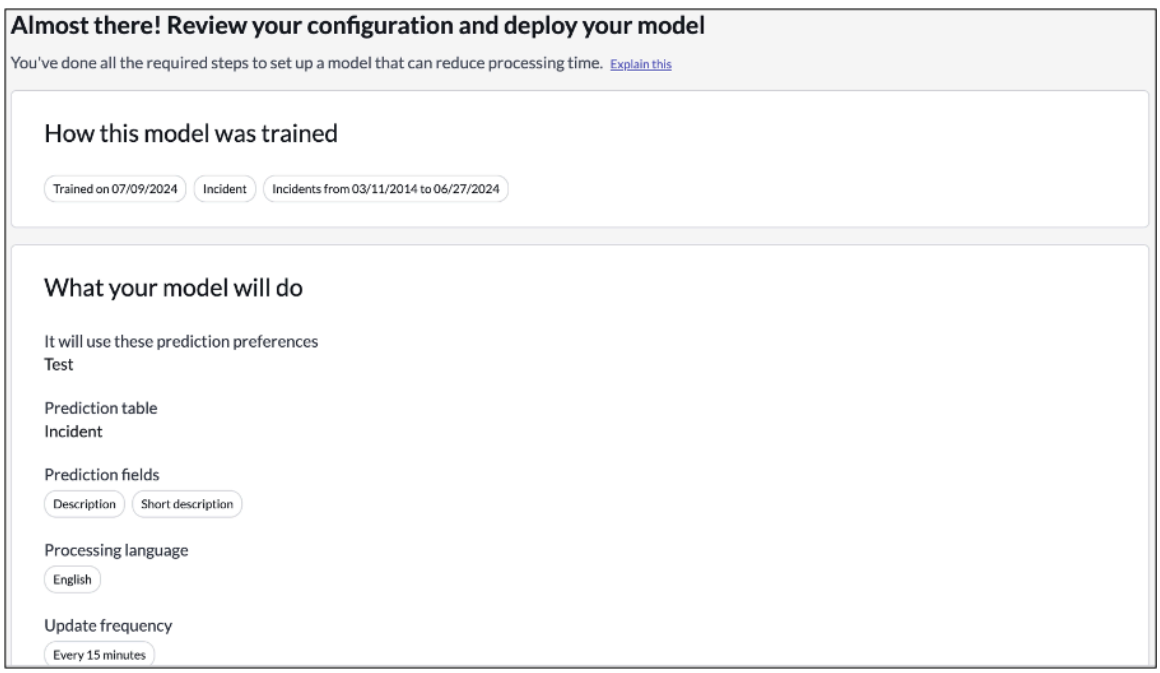
Before you begin

You must access the model and set the preferences for your model. For more information on setting model preferences, see Assess the similarity model.

Role required: sn_ti_admin.tia_admin or admin

Procedure

1. Review your choices from the previous pages and information about how the model was trained.

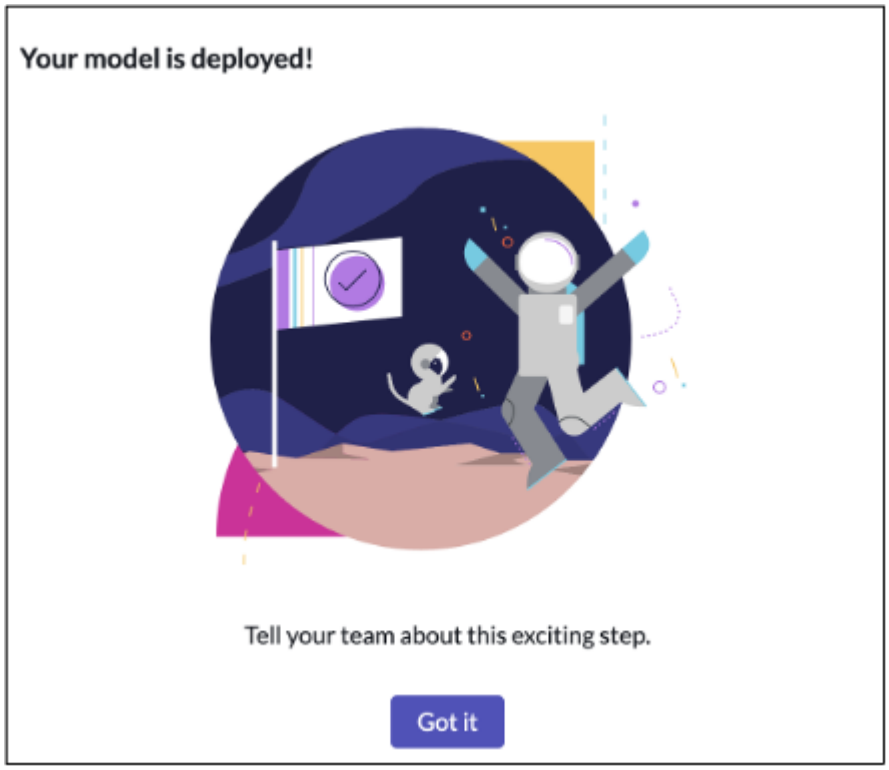


2. Select **Deploy** to deploy the model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

A pop-up appears confirming that your model was deployed.



Edit an incident prediction model in Task Intelligence for ITSM

Edit either the Similar Incidents or Incident Categorization model that has already been trained and deployed. Change the model configurations, view the updated training results, and redeploy the model.

Before you begin

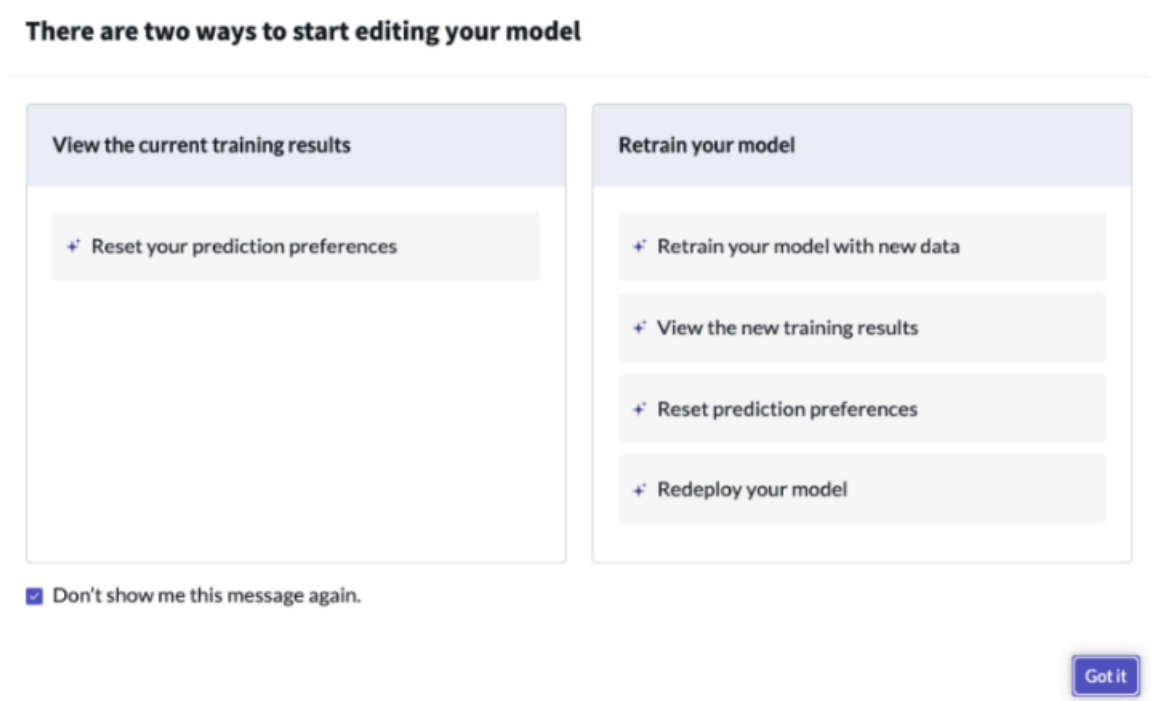
A prediction model must already be created, trained, and deployed. For more information on how to create a model, see Managing Task Intelligence for ITSM models.

Role required: sn_ti_admin.tia_admin or admin

About this task

You have two options for editing your model: view the current training results or retrain the model. The first time you edit a model, a pop-up appears to ask you which option you would like to take.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



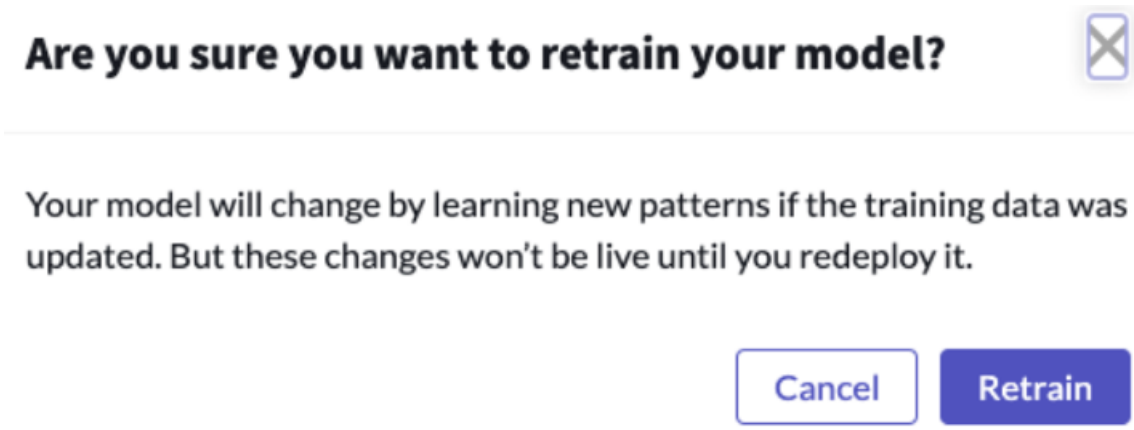
Resetting your prediction preferences enables you to change how visible the predictions are for agents. Retraining your model enables you to select new data for training, which changes the prediction capabilities of the model.

While you can retest your prediction model, it doesn't change the prediction skills. Edit your prediction model to reset your prediction preferences. Edit your prediction models to retrain the models with new data, predict different fields, or change the prediction preferences.

Changes aren't saved until you redeploy the model. The updated model replaces the previous model.

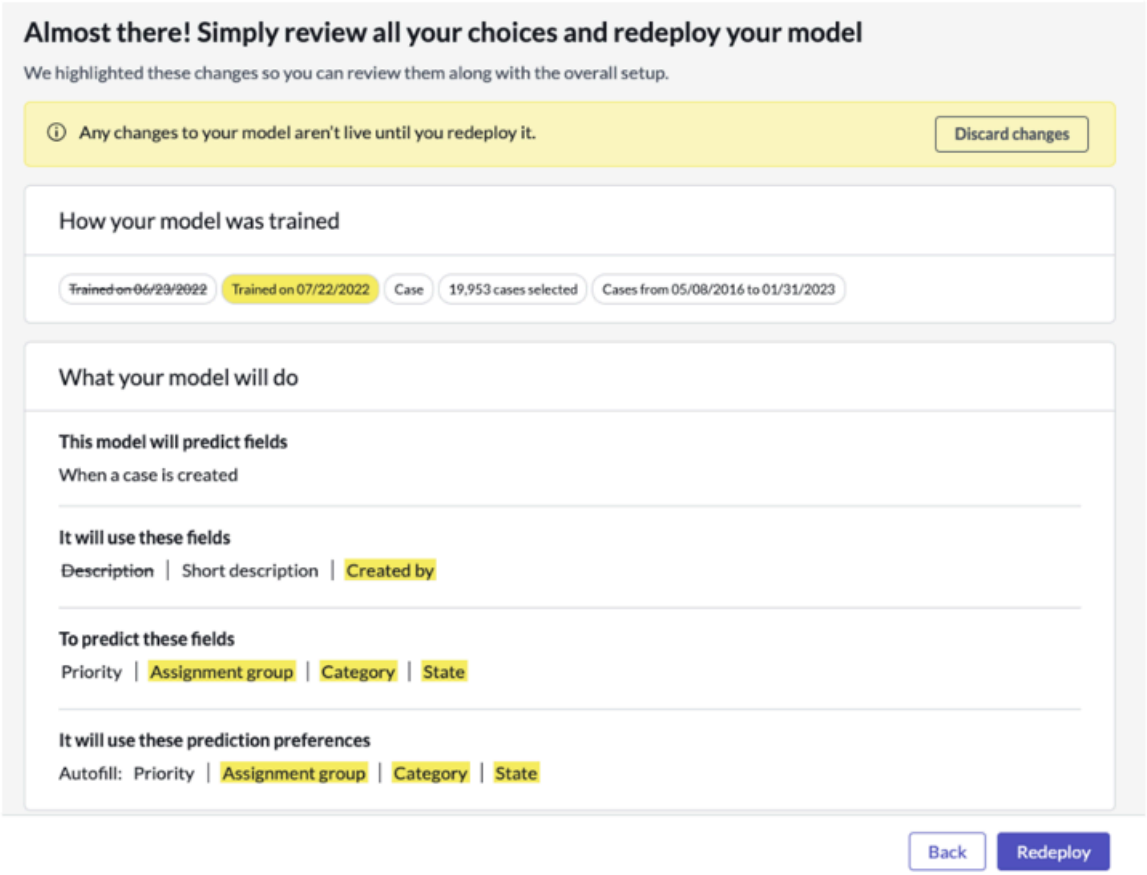
Procedure

1. Navigate to **All** > **Task Intelligence for ITSM** > **Setup**.
2. From the **Models** list, select the menu (⋮) icon of the model you want to edit, and then select **Edit Model**.
3. Modify the fields to get the required predictions.
4. Select **Launch training**.
   A warning message appears.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **Retrain**.
   The new training results page loads.
6. Select the **Compare models results** button to show both the previous results and the new results.
7. Select **Save & continue**.
8. Set your preferences for displaying the predictions or running them in the background.
9. Select **Save & continue**.
   The **Deploy your model** screen loads and shows the changes that you made indicated in yellow. If you don't want to deploy the changes, select **Discard changes**.



10. Review the model and select **Redeploy**.

Result
Your updated model is deployed.

Export an incident prediction model

Export either the Similar Incidents or Incident Categorization model model in Task Intelligence for ITSM to another instance so you can use the model in the other instance without recreating the model from scratch.

Before you begin
Role required: admin

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Task Intelligence for ITSM** > **Setup**.
2. In the Models list, select the menu (⋮) icon of the model you want to export, and then select **Export model**.
   A new tab opens with authentication steps.
3. Select **Allow**.

Result

The XML file of your model downloads to your browser.

What to do next

You can use the XML file to transfer the model to another instance using update sets. For more information update sets, see System update sets.

Monitoring and Analytics for Task Intelligence for ITSM

You can view the impacts of your trained incident prediction models. Monitor model performance overtime, track business value, and view what predictions your agents did and didn't use.

To access the Task Intelligence Analytics dashboard, navigate to **All** > **Task Intelligence for ITSM** > **Monitoring**.

Use the **Model** drop-down list to select a model. Select **Apply** to open the model's configuration.

The Analytics dashboard contains the following sections:

- Get an overview
- See how your trained model is doing

Get an overview

The Analytics dashboard uses visuals to represent the performance overview of the model.

Number of predictions

The line graph shows the number of fields that the Incident categorization and Similar Incidents models predicted over time. As the model continues to learn, it can increase the number of predictions.

Incident Mean time to resolve (MTTR)

The line graph shows the average amount of time that it takes to resolve incidents over time. As the model makes more predictions, the MTTR must decrease as the predictions help agents.

See how your trained model is doing

The Analytics dashboard uses visuals to track how the model used predictions over time.

Predictions agents accepted

The widget shows the correct predictions that your agents used during case management over time. If this number is trending downward, you can look to retrain your model. For more information on editing a trained model, see Edit an incident prediction model in Task Intelligence for ITSM.

Predictions agents replaced

The widget shows the incorrect predictions that your agents removed during case management over time. If this number is trending upward, you can look to retrain

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

your model. For more information on editing a trained model, see Edit an incident prediction model in Task Intelligence for ITSM.

Predictions the model skipped

The widget shows the number of predictions that were skipped by the model based on the model, output field, and date range selection. For more information on editing a trained model, see Edit an incident prediction model in Task Intelligence for ITSM.

Performance overview

The performance overview table shows the mean percentage values for correct, incorrect, and skipped data for each combination of model and output field.

Track usage of individual field predictions over time

The bar chart tracks the usage of the individual field predictions over time. Each bar in the chart shows three components, which are the predictions accepted, the predictions replaced, and the predictions that were skipped by the model. A red outline around each bar represents the total number of records for each day. To compare specific components, navigate to the legends and deselect the ones that you don't want to include so that you can have a more customized and focused comparison based on user preferences. By default, the view displays the number of predictions. However, you have the option to switch to the percentage view by toggling the Show Percentage option. In the percentage view, you can also access the information about the baseline that was replaced and accepted, which is derived from the training data. This option enables you to gain insights into the performance of the model with the baseline.

Task Intelligence for ITSM reference

Reference topics provide additional information about components installed with Task Intelligence for ITSM.

Components installed with Task Intelligence for ITSM

Several types of components are installed with the activation of the Task Intelligence for ITSM application plugin (com.snc.itsm_ml_task), including tables, user roles, and ServiceNow store applications.

Roles installed

Role description

Role title [name]	Description	Contains roles
Task Intelligence Admin [sn_itsm_ml_task.ti_admin]	Admin user with rights to all actions in the application. Creates, edits, and monitors all Task Intelligence models.	• sn_incident_read • sn_ti_admin.tia_admin
Task Intelligence Analyst [sn_itsm_ml_task.ti_analyst]	Views and monitors Task Intelligence models through the Analytics dashboard.	• sn_incident_read • sn_ti_admin.tia_analyst

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed

Table description

Table	Description
Task Intelligence Admin Template [sn_ti_admin_template]	Contains template records, which are inserted by other applications, that specify the defaults for model training settings, implementation plans, and UI display information.
Task Intelligence Admin Help [sn_ti_admin_help]	Contains help records that are displayed in a collapsible panel inside the application. Contents are filtered by the chosen template and setup page.
Task Intelligence Admin Feature [sn_ti_admin_feature]	High-level business unit feature for incident categorization and incident field detection.
Task Intelligence Admin Statistic [sn_ti_admin_statistic]	Groups statistic cards to a template and UI page.
Task Intelligence Admin Page [sn_ti_admin_page]	Records of URL page fragments that are referenced in the help table.
Task Intelligence Admin Statistic Card [sn_ti_admin_statistic_card]	Stores the statistic card's three-line scriptable content and its card description used in a card flip or tooltip.
Task Intelligence Admin Solution [sn_ti_admin_solution]	Stores how the state of each ML model set progresses for the solution types, such as incident categorization and classification.
Task Intelligence Admin Model Prediction [sn_ti_admin_model_prediction]	Stores the model test prediction for prebuilt models.
Task Intelligence Admin Tag [sn_ti_admin_tag]	Contains the tags provided by other business units and a created solution by an admin. Tags help business unit partners search the models.
Task Intelligence Admin Implementation Detail [sn_ti_admin_implementation_detail]	Contains implementation options specified by business units, which are listed as options for a chosen template. When an Admin Console user role chooses an implementation plan, the business unit decides how to display model results for end users.
Task Intelligence Admin Model [sn_ti_admin_model]	Stores the snapshot configuration view of the production and staging models for a solution.
Task Intelligence Admin Context [sn_ti_admin_context]	Contains context-specific data from monitoring graphs that show different model performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table description (continued)

Table	Description
Task Intelligence Admin Application Page **[sn_ti_admin_application_page]**	Contains data related to the application page, fields, and forms.
Task Intelligence Admin Landing Card **[sn_ti_admin_landing_card]**	Contains data related to the information cards displayed on the landing page of Task Intelligence for ITSM.
Task Intelligence Admin Landing Page **[sn_ti_admin_landing_page]**	Contains information related to the landing page of the admin console.

Store applications installed

Store application description

Store application	Description
Advanced Recommended actions for ITSM **[com.snc.uib.sow_itsm_ra_advanced]**	Enables you to configure and display relevant actions to agents based on record context. Agents can follow the actions to help customers and resolve issues.
Task Intelligence Admin Console **[com.sn_ti_admin]**	Enables you to setup, manage, and monitor incident prediction models that help categorize incidents.

Collaboration services

Collaboration services provides a way to communicate and collaborate in real-time. You can directly use a collaboration tool from task records and as a channel within communication plans.

Compatibility

Compatible with all the releases starting with the Madrid release.

Key features

- Slack
  - Create dynamic slack channels for tasks and import back.
  - Slash commands to get incident details directly from slack and perform basic operations on incident.
  - Initiate chat with slack users/channels directly from incidents.
  - Archive the slack channel when the task is closed.
- ServiceNow for Microsoft Teams

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Initiate a chat using Microsoft Teams directly from tasks.
- Import message history into a task record from Microsoft Teams, manually or automated.
- Send individual notification and collaboration on Major Incident and Incident Communication Plan using Slack or Microsoft Teams.
- For information about ServiceNow for Microsoft Teams integrations, see ServiceNow for Microsoft Teams.

- ServiceNow for Zoom
  - Initiate a chat using Zoom Team Chat directly from tasks.
  - Import message history into a task record from Zoom Team Chat.
  - For information about ServiceNow for Zoom integrations, see ServiceNow for Zoom.
  - Access ServiceNow Employee Center in the Zoom application. For information about ServiceNow Employee Center in Zoom, see Make Employee Center capabilities available in Zoom.

Install Collaboration services

You can install the Collaboration services application (sn_tcm_collab_hook) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Collaboration services requires the following ServiceNow Store applications. Ensure that these applications are installed before you install Collaboration services.

  Required ServiceNow Store applications

  Slack Spoke for ServiceNow IntegrationHub [com.sn.slack.ahv2]

  If you want Slack integration for tasks or task communication management, install the Slack Spoke for ServiceNow IntegrationHub application. The application provides actions that you can use when designing flows. These actions allow you to communicate with Slack APIs.

  ServiceNow for Microsoft Teams

  If you want to integrate ServiceNow for Microsoft Teams, install the IT Service Management integration with Microsoft Teams or HR Service Delivery integration with Microsoft Teams applications as required. For more information on the integration, see ServiceNow for Microsoft Teams.

  ServiceNow for Zoom

  If you want to integrate ServiceNow instance with Zoom, for complete information, see ServiceNow for Zoom.

Role required: admin

About this task

For the tables that are installed with Collaboration services, refer Components installed with Collaboration services

.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the application () using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install .

4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Components installed with Collaboration services

Several types of components are installed with activation of the Collaboration services application.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Tables installed

Note:
The tables are installed when you activate the Task Communications Management plugin (com.snc.task_communication_management).

Table	Description
Communication Channel Definition — Slack [comm_channel_def_slack]	Extends the Communication Channel Definition [comm_channel_definition] table.
Communication Channel — Slack [comm_channel_slack]	Extends the Communication Channel Definition [comm_channel] table.
Communication Plan — Collaboration Service Data [comm_plan_collab_data]	Stores Collaboration Service related data.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Setting up Slack for communication

The Slack spoke requires creating a custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke.

For more information, refer to Set up Slack spoke.

Configure Slack as a communication channel for a communication task

Configure Slack as a mode of communication for a communication task to send direct message to the users.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **Incident** > **Communication Plan Definitions**.
2. Open the communication plan where you want to add Slack as a communication channel for a communication task.
3. Open the communication task definition for which you want to add Slack as the mode of communication.
4. Click the **Add Channel – Slack** related links.
5. Click **Submit**.
   Slack gets added as a communication channel for the communication task.

Import messages from an incident

You can import messages from a slack channel for an incident and append them in the **Comments** to store all important messages in the ServiceNow® instance.

Before you begin

- Role required: sn_incident_write, itil, or admin
- You must be a member of the private slack channel to import messages from the private channel.
- Your ServiceNow® email ID must be associated with your slack account.
- This feature is compatible with:
  - Collaboration Services store app - minimum version 3.04
  - Slack store app - minimum version 1.4.x

About this task

Importing messages helps agents to view the history of the incident, allow the requester to see all discussions about their incident in one place. This helps to capture the information required for post-ticket review and continuous improvement processes.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Select the incident for which you want to import messages.
3. Click the **View Slack Channels** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The View Slack Channels form appears. The form shows all the available slack channel for that incident.

4. Click **Import messages** for the channel that you want to import the messages from.

   The Import messages from Slack form appears. The form shows all the messages on that channel sorted by date.

5. On the form, fill in the fields.

Import messages from Slack form

Field	Description
Search	Field to enter a keyword and search for a specific message.
Include reply threads in search	Option to include threads in search.
Filter by	○ **Shared by**: The messages will be filtered based on the selected users. ○ **Date**: The messages will be filtered based on the **Start** and **End**dates that you select.
Import messages as	○ **Additional comments**: The messages will be appended under Additional comments. ○ **Work notes**; The messages will be appended under Work notes.
Include attachments	Option to include attachments while importing messages.

6. Click **Import messages**.

Process flow for Slack communication

Collaborate with the stakeholders from major incident management workbench using slack for an open and transparent communication.

Define a communication plan to manage the communication process. The plan includes tasks to achieve the plan goal and the stakeholders whom you must contact in the process.

When you create communication tasks for a plan, select slack as a mode of communication. To know how to define a channel for any communication task, refer to Define a communication channel. Keeping in mind the fact that it not always possible to plan for a communication plan or task in advance, you have the option to create adhoc communication plan and its tasks from an incident. When any task record meets the conditions in the communication plan, the plan gets attached with the task record. If for a major incident, a communication plan gets attached to the incident which has communication channel as slack for any of its tasks, you can send slack notifications from the major incident workbench.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The slack communication is a one-way communication from ServiceNow application to slack. The contacts in the slack cannot reply to the person who initiated the slack communication. Also, the users in slack must be employees of the organization. For example, the email address that they share for participating in a slack collaboration must be their email address of that organization.

Slack communication uses the following subflows:

- TCM Slack – Add Users to Channel
- TCM Slack – Archive Channel
- TCM Slack – Create Channel
- TCM Slack – Send Message
- TCM Slack – Remove User From Channel

Slack communication through workbench

- In the major incident workbench, under the **Communicate** tab, you can find all the communication tasks for the plan.
- For the task where you have selected slack as a channel, you can click **Compose** to start a slack communication. For information on how to create a communication plan, refer to Add communication plan from the major incident workbench
- In the dialog box, the **To** field includes the contacts that you have added while creating the communication contact for the plan.
- The **Message** field includes the message you are intending to convey to the recipients.

Add a collaborative communication task

In major incident workbench, you can add a collaborative communication task to collaborate and understand the progress of communication plan and its related tasks.

Before you begin

- Role required: major_incident_manager
- This feature is compatible with:
  - Collaboration Services store app - minimum version 3.04
  - Slack store app - minimum version 1.4.x

Procedure

1. Navigate to **All** > **Incident Major incident** > **Open**.
2. Select the incident for which you want to add a collaborative communication task.
3. Click **View Workbench**.
4. Click the **Collaborate** tab, and then click **Add** that appears in the Collaborative Communication Tasks section.
5. On the form, fill in the fields.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Collaborative communication task plan form

Field	Description
Communication Plan	List to select a new communication plan or to select an existing plan and add communication tasks to the plan
Plan Short description	Brief description of what the communication plan is all about.
Task Short description	Brief description of what the communication task is all about.
Channel	Option to select **Slack chat** as a channel for collaboration.
Frequency	Frequency at which a specific task must be executed. A task can be executed only once or on specific durations
Due in(Minutes)	Time span when the task must be executed after the task initiates. For recurring tasks, it also indicates the time span after which the task must repeat.

6. Click **Next**.
7. In the **Manage Recipients** tab, add the users required to be involved in the major incident collaborative communication task, and click **Add**.

Create a Slack channel for a collaborative communication task

Create a Slack channel for a collaborative communication task to collaborate and discuss the communication task details.

Before you begin

Role required: major_incident_manager

Procedure

1. Navigate to **All** > **Incident** > **Major Incident Open**.
2. Select the relevant major incident.
3. Click **View Workbench**.
4. Click the **Collaborate** tab.
   The Collaborative Communication Tasks section appears.
5. Click **Initiate** for the task that you want to create a Slack channel.
6. On the form, fill in the fields.

Initiate form

Fields	Description
Add participants	Individual users or groups whom you want as participants to the channel.
Recommended and Selected	Columns to personalize your list. Select the items in the **Recommended** column and

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
	move them to the **Selected** column using the right-arrow icon ( ).
Channel name	Unique name for the channel that differentiates it from the rest of the channels in Slack.
Channel topic	Description about the purpose of the channel.
Include a brief message for participants	Brief message that you want to send to the participants.
Private channel	Option to indicate whether the slack channel is private or public.

7. Click **Start**.
   A slack channel is created, and you see the **View channel** and **Import messages** buttons next to the task.
8. To view the channel on slack, click **View channel**.
9. To import messages, click **Import messages**.
   For more information on how to import messages, see import-messages-from-incident.

Slack integration - Incident Management

With Slack integration, you can create a dedicated channel for incident responders to collaborate during an incident enabling bidirectional integration with slack. You can create and update an incident, view information such as who is on-call for a group or view the list of incidents assigned to you.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Compatibility

The Collaboration Services store app version 2.0.x is compatible with all the releases starting with the Paris Patch 3 release.

Key features

- Send a direct message to the caller
- Assign the incident to a user
- Create a collaboration channel for an incident
- View and join a channel from an incident
- Create and update incident using a Slash Command
- View who is on-call for a group

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System requirements

- Incident Management (com.snc.incident)
- Collaboration Services plugin (sn_tcm_collab_hook) version 2.0.x
- Slack Spoke for ServiceNow IntegrationHub plugin (com.sn.slack.ahv2) version 1.3.x and the necessary Integration Hub license to use Slack as a collaboration channel.

> **Note:**
> The Slack spoke requires creating a custom app on your Slack account to generate OAuth 2.0 tokens for the Slack spoke. For more information, refer Set up Slack spoke.

Create slack channel for an incident

Create a private or a public slack channel to collaborate with support teams or send a communication to keep stakeholders informed.

Before you begin

- Role required: sn_incident_write, itil, or admin
- Plugins required:
  - Collaboration Services plugin (sn_tcm_collab_hook) version 2.0.x
  - Slack Spoke for ServiceNow Integration Hub plugin (com.sn.slack.ahv2) version 1.3.x
- Ensure you have set up interactivity and shortcuts for slack. For more information, refer configure slack app.

About this task

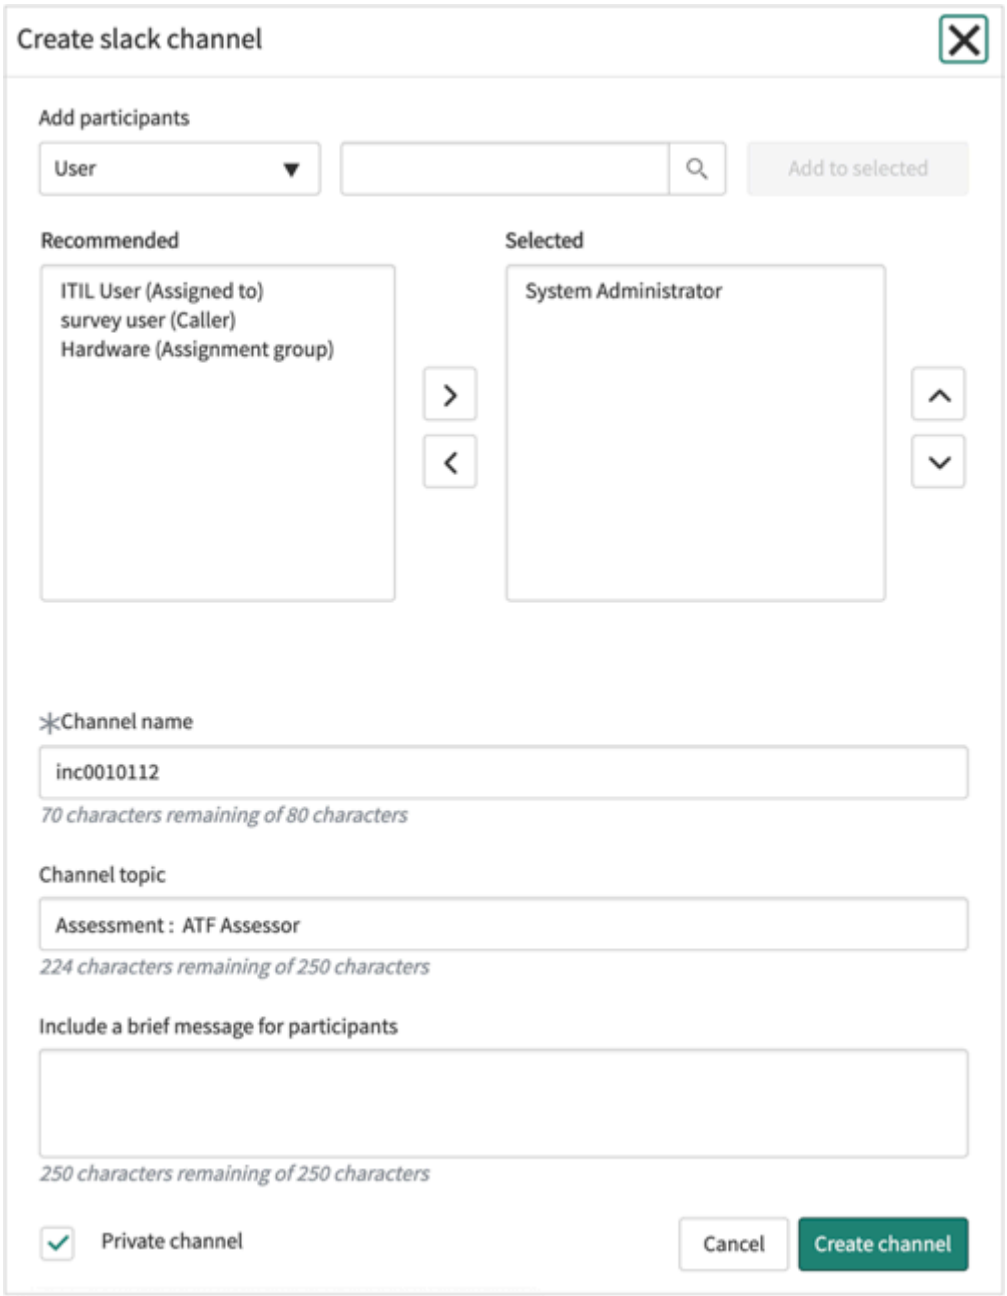
The system property *sn_tcm_collab_hook.slack_on_task* enables the slack feature on a task table. By default, the value is incident. If you want to enable the slack feature on other task tables such as problem or change_request, add the table names in the **Value** field.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open an active incident record.
3. Click the **Create Slack Channel** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create slack channel



4. On the form, fill in the fields.

Create slack channel form

Fields	Description
Add participants	Individual users or groups whom you want as participants to the channel.
Recommended and Selected	Columns to personalize your list. Select the items in the **Recommended** column and move them to the **Selected** column using the right-arrow icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fields	Description
Channel name	Unique name of the channel that differentiates it from the rest of the channels in Slack.
Channel topic	Description about the purpose of the channel.
Include a brief message for participants	Brief message that you want to send to the participants.
Private channel	Option to indicate whether the slack channel is private or public. If you select the check box, the channel is created as a private channel else it is created as a public channel.

5. Click **Create channel**.
   A slack channel is created and an invitation is sent to the participants. Any duplicate user is removed from the selected participant list before the notification is sent. The participants can click **Skip** or **Join Channel** to ignore or join a slack channel.

View or join slack channel from an incident

View all slack channels associated with an incident to know if a required slack channel already exists before you create a new one. You can also import messages from a slack channel.

Before you begin

- Role required: sn_incident_write, itil, or admin
- Plugins required:
  - Collaboration Services plugin (sn_tcm_collab_hook) version 2.0.x
  - Slack Spoke for ServiceNow Integration Hub plugin (com.sn.slack.ahv2) version 1.3.x

About this task

The system property *sn_tcm_collab_hook.slack_on_task* enables the slack feature on a task table. By default, the value is incident. If you want to enable the slack feature on other task tables, such as problem or change_request, add the table names in the **Value** field.

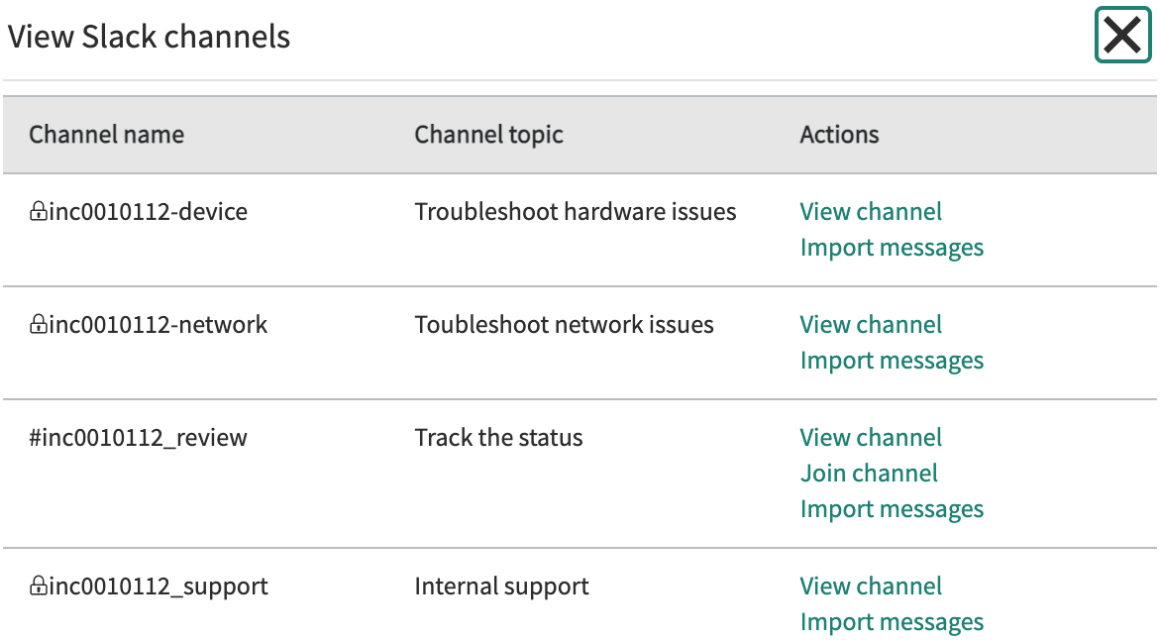
Note:
When an incident becomes inactive, the associated slack channels get archived.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open an active incident record.
3. Click the **View Slack Channels** related link.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View slack channels



All the dedicated slack channels for the incident are displayed.

Note:
The **Join channel** option appears only for public channels.

4. **Optional:** Click **View channel** to open the slack channel.
5. Click **Join channel** to join any slack channel.
6. To import messages from any slack channel, click **Import messages**.

Add form section to view slack channels

View unarchived slack channels associated with an incident in the form section. The form section saves you the effort of opening the available channel list manually from the related list.

Before you begin

Role required: personalize_form or admin

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open an incident record.
3. Click the Additional actions icon and select **Configure** > **Form Layout**.
   For more information, refer Configuring form layouts.
4. Under **Form view and section**, in the **Section** field, click **New**.
5. In the **Section caption** field, enter a name for the section such as Slack Channels and click **OK**.
6. From the **Available** column, select **View Slack Channels** and move it to the **Selected** column using the right-arrow icon ( ).
7. Click **Save**.

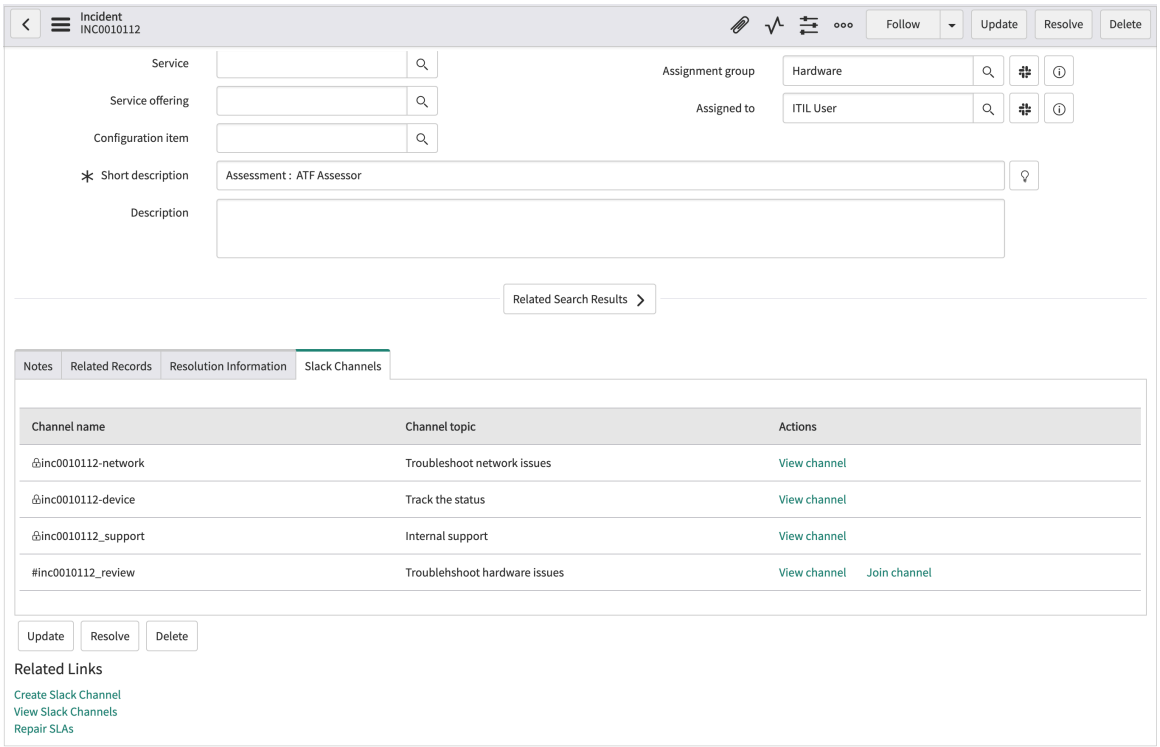
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The new section displays all the active slack channels.

Slack channels associated with the incident



Set up slack for a user or group

Set up slack from an incident to communicate and work together in channels with a user or a group.

Before you begin

Role required: admin

About this task

To enable slack for the **Assignment group** field, ensure you have set up a slack channel for that group. For more information, refer Associate existing slack channel with a group.

Procedure

1. Download the `Fix script to add Slack field decorators` update set to get the fix scripts from ServiceNow Store app.
2. Import the update set file.
   For more information, refer Import an update set.
3. Navigate to **System Definition** > **Fix Scripts**.
4. Open the *`Add Slack Field Decorator`* fix script.
5. **Optional:** In the **Scripts** field, edit the script to indicate the table and the field for which you want to enable the slack communication.
6. Click **Run Fix Script**.

   The slack icon ( ) appears next to the following fields mentioned in the script.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Caller**
- **Assignment group**
- **Assigned to**

Clicking the icon takes you to the direct message with the user on slack or slack channel for an assignment group.

Related topics

Open slack from an incident

Associate existing slack channel with a group

Associate an existing slack channel to reach out to an assignment group from an incident. Assignment groups are a great way to contact all your stakeholders at once.

Before you begin

Role required: sn_slack_ah_v2.slack_admin or admin

Procedure

1. Navigate to **All** > **Slack** > **Slack Channel Cache** and click **New**.
2. On the form, fill in the fields.

Field	Description
Channel Name	Name of the existing slack channel.
Channel ID	Unique ID given by slack for a channel.
Channel Topic	Description about the purpose of the channel.
Channel Link	URI scheme to deep link into native Slack client of user. Example: slack://channel?team={TEAM_ID}&id={CHANNEL_ID}, where <TEAM_ID> is slack workspace id and <CHANNEL_ID> is the unique Id for the slack channel. **Note:** For more information, refer Deep linking into Slack.
Document ID	Group record for which channel is intended to be used. ○ Table: Group [sys_user_group] ○ Document: <Reference to a group>
Is Archived	Option to indicate whether the slack channel is active or inactive.
Is Private	Option to indicate whether the slack channel is private or public.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: It is strongly recommended to associate a public slack channel. In case of private channel, and you are not a member of it, the navigation link may break.
Creator	User who creates the slack channel cache record.

3. Click **Submit**.

Open slack from an incident

Open slack from an incident and send message to a user or an assignment group to exchange incident information. You do not need to manually search for a user in slack to send a message.

Before you begin

Role required: sn_incident_read, sn_incident_write, itil, or admin

About this task

The slack icon ( ) appears for the fields that you include in the fix script. For example, if you have the **Caller**, **Assigned to**, and the **Assignment group** fields for incident in the fix script, then the icon appears for these fields.

Procedure

1. Navigate to **All** > **Incident** > **Open**.
2. Open an active incident record.
3. Click the slack icon ( ) that appears next to the **Caller**, **Assigned to**, or the **Assignment group** fields.
4. In the Open Slack dialog window, click **Open Slack**.
   A direct message with the user on slack or a slack channel opens for the group.

Slack slash commands

Slash commands provides a quick way to invoke your app to perform specific actions from Slack.

You need to configure slash commands to execute the commands. Only a user with the sn_incident_write, itil or admin role can execute the commands.

Slash commands

Commands	Description
/now help	Provides list of available ServiceNow commands with description.
/now create incident	Creates an incident with the inputs provided by the user.
/now list incidents	Lists all active incidents assigned to the user.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Slash commands (continued)

Commands	Description
/now oncall [group name]	Displays shifts and members who are currently on-call for a group. **Note:** Only a user with the itil or the admin role can execute this command.
Slash commands that can be run only from channels associated with ServiceNow	
/now comment [comment]	Posts a comment in the **Additional comments** field of the associated incident.
/now note [note]	Posts a note in the **Work notes** field of the associated incident.
/now assigntome	Assigns associated incident to the slack user.
/now assign [@slack_user]	Assigns associated incident to a specific user.

Vendor Management Workspace

Monitor the performance of your company's vendors and manage all vendor-related information using the ServiceNow® Vendor Management Workspace. Assess the performance of your vendors using key performance indicators (KPIs) that you can configure to create vendor metrics.

Get started

Track and analyze how your vendors are executing on their goals and which areas need attention from a unified, central location. Integrate data from Service Portfolio Management (SPM), Contract Management, Assets, SLA Contracts, Vendor Risk Management, and Continual Improvement Management (CIM) applications.

Explore	Configure
Monitor metrics and analyze your vendor's health using Vendor Management Workspace.	Plan and configure your implementation.

Exploring Vendor Management Workspace

Use Vendor Management Workspace to monitor metrics and analyze your vendor's health from a single user interface. Gain insights when you compare top-performing vendors and track compensation your vendors owe you when they breach the service agreement.

Vendor Management Workspace overview

The video provides an overview of Vendor Management Workspace.

https://player.vimeo.com/video/1014361687?h=6ef117ba57&badge=0&autopause=0&player_id=0&app_id=58479

As a vendor manager, you can:

- Organize your vendors into vendor KPI groups and analyze vendor performance.
- Gain insights into how your vendors are performing in comparison with other vendors in your organization.
- Track the compensation that you vendors owe for breaching service agreements.

Vendor Management Workspace users

Users

User	Description
Vendor admin	Vendor admins can add vendors and set up vendor metrics.
Vendor manager	Vendor managers use Vendor Management Workspace to evaluate vendor health.
UI builder admin	Using UI builder, UI builder admins can customize Vendor Management Workspace based on the users' needs.

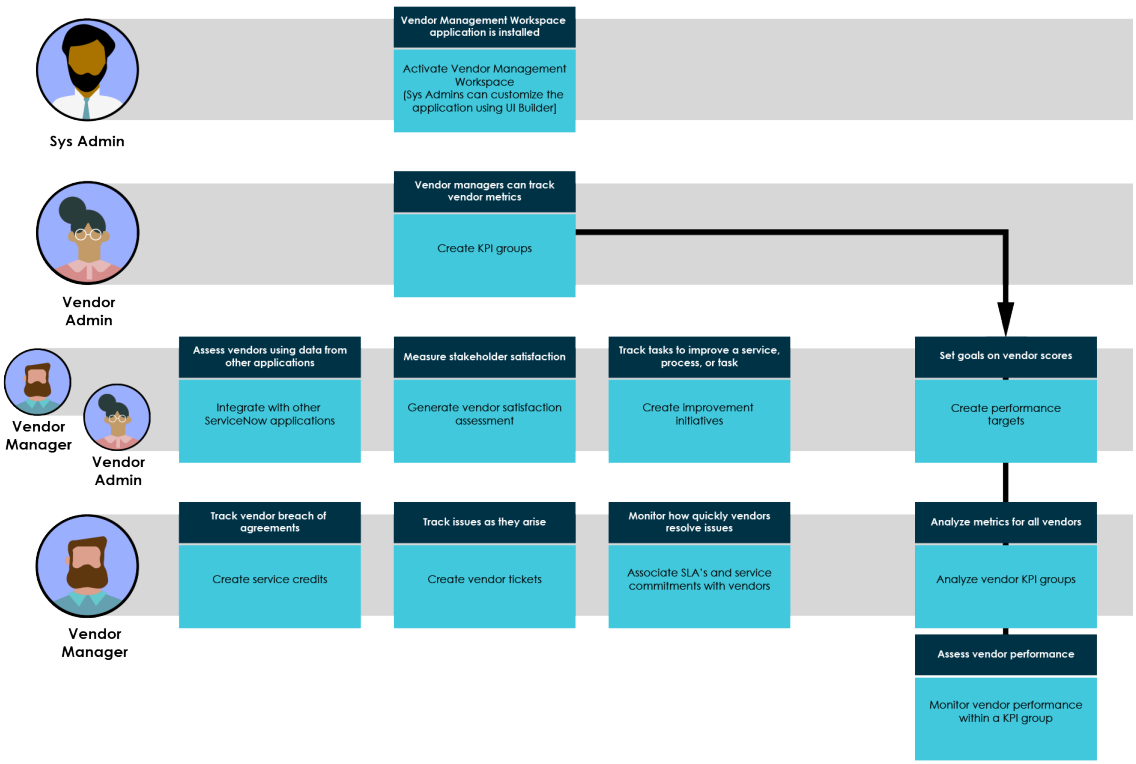
Vendor Management Workspace workflow



In this workflow:

1. Administrators activate Vendor Management Workspace. The application is installed after the Vendor Manager Workspace (sn_itsm_vendor) plugin is activated. Vendor administrators can then configure the application and vendor managers can use the application.

   Note:
   After the administrators activate Vendor Management Workspace, they can also customize Vendor Management Workspace using UI Builder.

2. Vendor admins can create KPI groups so that vendor managers can track vendor metrics.
3. Vendor admins and vendor managers can do any of the following:
   - Integrate with other ServiceNow applications to assess vendors who use data from other applications.
   - Generate vendor satisfaction assessment to measure stakeholder satisfaction.
   - Create improvement initiatives to track tasks to improve a service, process, or a task.
   - Create performance targets to set goals to achieve desired vendor scores.
4. Vendor managers can do any of the following:
   - Create service credits to track vendor breach of agreements.
   - Create vendor tickets to track issues as they arise.
   - Associate SLAs and service commitments with vendors to monitor how quickly vendors resolve issues.

© 2026 ServiceNow, Inc. All rights reserved.

Vendor KPI Groups in Vendor Management Workspace

Learn how you can organize your vendors into vendor KPI groups. You can then define Key Performance Indicators (KPI) to analyze the performance of all vendors within that vendor KPI group. Drill down into the metrics for a vendor, KPI or the KPI group—all from a central location.

As a vendor administrator, you can:

- Create a vendor KPI group for a common set of indicators (KPIs) you use to measure the performance of all vendors in that group.
- Add KPIs to the vendor KPI group.
- Add vendors that you want to measure using the KPIs.
- Define upper and lower thresholds to monitor the indicator status.

As a vendor manager, you can:

- Analyze the performance trends for your vendors as well as the performance for associated service offerings, contracts, improvement initiatives, and SLA definitions.
- Drill down into vendors, a KPI group, or a KPI to view trends and historical performance.

Understanding Vendor KPI Groups setup and use in Vendor Management Workspace

Learn how you can organize your vendors into Vendor KPI Groups. Understand how you can set up Vendor KPI Groups and how vendor scores get calculated and displayed in the Vendor Management Workspace.

Set up and use the Vendor Management Workspace configurable using User Interface Builder (UIB) with five simple steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Organize similar types of vendors into vendor KPI group categories.
2. Add a common set of KPIs that matter most to this type of vendors.
3. Set upper and lower thresholds for each vendor KPI group to monitor the status of the KPIs.
4. Add vendors to the KPI groups.

   For information on setting up KPI groups, see Create KPI groups to track metrics for your vendors.

5. Analyze vendor health using Vendor Management Workspace. For information on using Vendor Management Workspace, see Use Vendor Management Workspace in the UIB workspace.

Related topics

Example: Vendor Management Workspace setup

Example for Vendor Management Workspace setup

Learn how you can create KPI groups using Vendor Management Workspace with an example.

Before you begin

Role required: sn_vlm.vendor_admin

About this task

Let's assume that a vendor manager wants to create a vendor KPI group for all of their software vendors. They want to associate KPIs with the vendor KPI group to measure the performance of all vendors in the vendor KPI group.

Procedure

1. Create a KPI group.
   a. Navigate to **Vendor Management** > **Configuration** > **KPI Groups**
   b. Click **New**
   c. Create a vendor KPI group for software vendors.
      i. In the **Name** field, enter `Software`.
      ii. In the **Description** field, enter a description such as, "This KPI Group is for software vendors."
      iii. In the **Type** menu, select **Vendors**.
      iv. Right-click the form header and click **Save**.
2. Associate three KPIs with the vendor KPI group to evaluate the software vendors in that group.
   a. In the KPIs related list, click **New**.
   b. In the **KPI** field, click the search icon, select each of the indicators listed below and click **Submit** to add the KPIs to the group.
      - Vendor Satisfaction with the Display Aggregate set to Average.
      - Vendor Requested Items.
      - Total Incidents Created with the Display Aggregate set to Sum.
3. Add a weight value, which represents the relative order of importance, for each KPI that contributes towards the vendor score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For Vendor Satisfaction, set the weight value to 60.
- For Average Stability Requested Items set the weight value to 40.
- For Total Incidents Created, set the weight value to 0, which indicates that it does not contribute to the vendor score calculation.

The combined weight of all indicators added to the KPI group must be equal to 100. If the combined weight is above or below 100, then they are proportionately readjusted to 100.

4. Associate thresholds to the KPI group.
   Define a range for the threshold values and assign a state for each range. For example, you can assign the lower threshold as 0 and the upper threshold as 60 and define the status as critical. .

   Each range has a color associated with it by default. When the vendor score is calculated for the vendors in the vendor KPI group, the score displays the highlighted color associated with the threshold range in the Vendor Management Workspace

   For example:

   a. In the KPI Group Thresholds related list, click **New**.
      - In the **Lower Threshold** field, enter 0.
      - In the **Upper Threshold** field, enter 60.
      - In the **Status** menu, select **Critical**.
      - In the **Order** field, enter 200.
   b. Click **Submit**.

   Here is another example which shows that if the threshold values overlap between two different ranges, the one with a lower order number will be given preference.

   a. In the KPI Group Thresholds related list, click **New**.
      - In the **Lower Threshold** field, enter 50.
      - In the **Upper Threshold** field, enter 80.
      - In the **Status** menu, select **Moderate**.
      - In the **Order** field, enter 300.
   b. Click **Submit**.
   Because the KPI group threshold value of 60 overlaps between the two sets of thresholds set above, the preference is given to the KPI group threshold that has the Critical status because it has a lower order number. Therefore, if the KPI threshold has a value of 60, the highlighted color for that value in Vendor Management Workspace displays in the color set for the Critical status.

5. Add thresholds for the individual KPIs.

   After you set the thresholds, you can view the KPI values in highlighted colors that correspond to each threshold range for the KPI in Vendor Management Workspace.

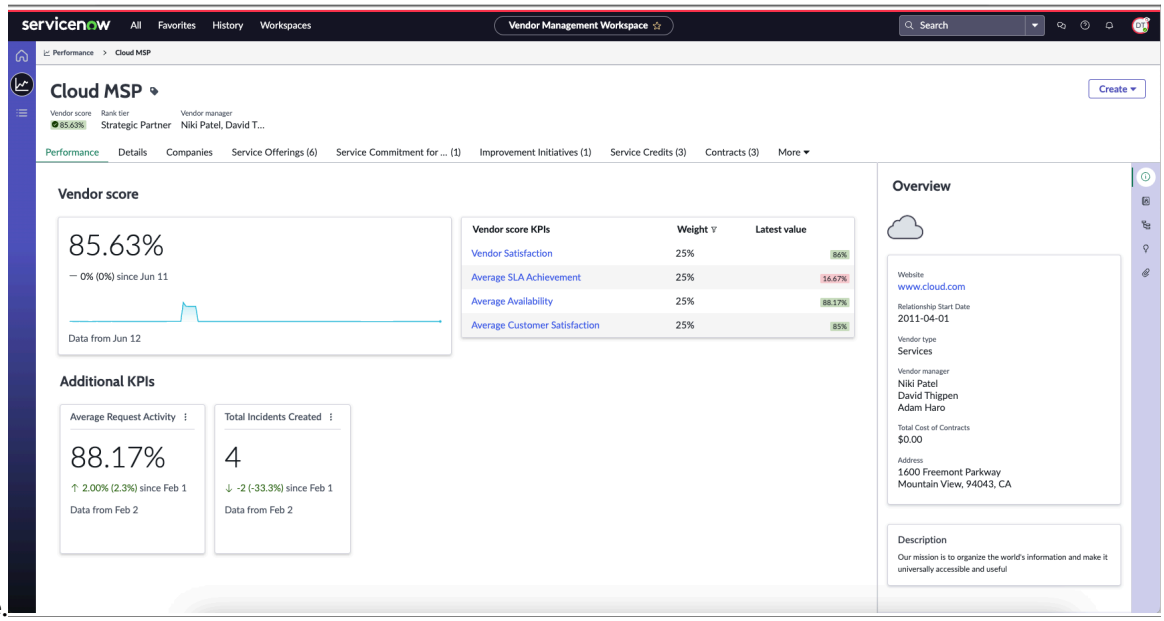
   a. In the KPIs related list, click the preview icon next to the KPI for which you want to set the threshold and click **Open Record**.
   b. In the KPI Thresholds related list, click **New**.
      - In the **Lower Threshold** field, enter 60.
      - In the **Upper Threshold** field, enter 80.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- In the **Status** menu, select **Moderate**.
- In the **Order** field, enter 300.

c. Click **Submit**.

The threshold values for the KPI are highlighted with the color based on the threshold range in Vendor Management Workspace.



6. Add vendors to the KPI group.
   a. In the Vendors related list, click **Edit**.
   b. Add the vendors you want to add to the KPI group and click **Save**.

Vendor Success Indicators in Vendor Management Workspace

Gain insights into how your vendors are performing in comparison with other vendors in your organization. Using the chi-square test, find out which attributes contribute to the success of your vendors.

> **Important:**
> You must install the Success Indicators (com.snc.vendor.insights) plugin separately from the ServiceNow Store. For more information, see Activate Vendor Management Workspace.

You can also see what common characteristics contribute to high performance. Identify gaps that could enhance the performance of your vendors and create improvement initiatives based on these insights. The Vendor Success Indicators application includes the following five modules:

Module Name	Description
Attributes	Identify and set up attributes that may correlate to the success of the vendor performance. Attributes are key data points such as geographical location, or contract costs. For the attributes available by default with your application, see Attributes installed with Vendor Success Indicators.
Executions	Displays the table and filter conditions based on the scheduled job that is run to collect the comparison data.
Inputs	Collects the data derived by the attributes specific to a vendor when the scheduled job is run.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Module Name	Description
Results	Displays high-performing attributes based on the inputs using Predictive Intelligence.
Properties	Properties to collect comparison data. For detailed information on properties for Vendor Success Indicators, see Properties installed with Vendor Success Indicators.

As a vendor admin, you can:

- Configure attributes for vendor success indicators to compare common characteristics against top-performing vendors.
- Run a scheduled job to collect attribute data and generate results that can be viewed on Vendor Management Workspace.

As a vendor manager, you can:

- Understand which attributes were used for comparing the vendors.
- Analyze how your vendors are ranked against the same attributes as compared with all other vendors in your organization.
- Get insights into the attributes that contribute to the success of high-performing vendors.

Service Credits in Vendor Management Workspace

Track and manage the compensation that your vendors owe your organization when they breach the service agreement you have with them.

Using Service Credits, you can:

- Track the compensation for every breach the vendor has made to the service agreement.
- Analyze the cumulative effect of multiple breaches by the same vendor from one location.
- Determine the credits your vendors owe you based on the breach count or the duration of each breach.
- Mark off credits that you've redeemed, which automatically calculates the amount that the vendor has paid off and the remaining amount, if any, they might still owe your organization.
- Associate service agreement breaches based on an outage, incident, service availability, or for the vendor.
- Create vendor tickets to monitor and resolve issues with your products and services. For more information, see Create a vendor ticket in Vendor Management Workspace.

Activate Vendor Management Workspace

The Vendor Manager Workspace (sn_itsm_vendor) plugin is available with the ITSM Pro subscription package. This plugin activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

Vendor Management Workspace plugins

Plugin	Description
Vendor Manager Workspace (sn_itsm_vendor) **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activates the Performance Analytics Premium for Service Management (com.snc.pa.premium.service_management) plugin that adds the following functionality to Vendor Management Workspace: • Create indicators, breakdowns, and other records. • Create text analytics widgets.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor Management Workspace plugins (continued)

Plugin	Description
	• Use Performance Analytics with external data. • Preserve performance scores beyond 180 days. Activates the Continual Improvement Management (com.sn_cim) plugin. This plugin enables you to monitor the continual improvement initiatives that your vendors are engaged with.
Vendor Success Indicators (com.snc.vendor.insights) **Important:** This plugin is being planned for deprecation after August 1, 2024. It will be hidden and no longer available for activation for new customers but will continue to work and be supported for existing customers. For details, see the Deprecation process [KB0867184].	Activates success indicators and adds the following functionality to gain insights into how your vendors are performing in comparison with other vendors in your organization.
Vendor Management Mobile (sn_vendor_mobile) **Note:** This is a ServiceNow Store plugin. You must install this plugin separately from the ServiceNow Store.	Activates the Vendor Mobile Agent app

You can also integrate Vendor Management Workspace with the Vendor Risk Management application when you enable the Vendor Risk Management (app-vendor-risk-management) plugin.

If you have downloaded the Vendor Risk Management application that is available from the ServiceNow Store, you can view the risk rating for your vendors. For more information on downloading the Vendor Risk Management application, refer to Download a GRC application from the ServiceNow Store for the first time.

When you enable the GRC: Vendor Risk Management Workspace (sn_vrm_ws) plugin from the ServiceNow Store you can view Vendor Risk Workspace within the Vendor Management Workspace application.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

   You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.
3. Select **Install** to start the installation process.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Customize a Vendor Management Workspace page using UI Builder

Clone an existing Vendor Management Workspace page variant and customize it based on your needs using the UI Builder.

Before you begin

Role required: admin, workspace_admin, or ui_builder_admin

About this task

All UI Builder pages and page variants are read-only. You can copy a page variant and then customize it. You can create a page variant from scratch or use a page template. For more information, see Create a variant of a page.

Note:
After you copy and customize a page variant, any automatic updates applied to the original read-only page variant will not be applied to the page variant that you have customized.

To open your configurable workspace experience in UI Builder, see Open a Configurable Workspace experience in UI Builder

For a list of all workspaces ServiceNow offers to target specific users, see List of workspaces.

Procedure

1. Navigate to **All** > **UI Builder**.
2. In the UI Builder screen, select **Vendor Management Workspace**.
3. In the **Page** menu, select the page you want to edit.
4. In the **Variants** section, select the menu icon (⋮) of the variant you would like to copy select **Duplicate**.
5. In the variant that you've duplicated, select the menu icon (⋮) and select **Edit page variant settings**.
6. In the Edit settings pop-up window, do the following:
   - In the **Variant name** field, enter a unique name for the variant.
   - If you would like to use a different page template, in the **Page template** field, select the page template.
   - Select **Save** to keep the changes.

     If you do not want to make any updates, select **Cancel** or select **Delete** to delete the variant.
7. Select the menu icon (⋮) and select **Edit conditions**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To add or edit conditions for the variant, in the **Variant Conditions** field, add your preferred conditions for the variant.
- To display the variant in Vendor Management Workspace, in the **Order** field, set the preferred order number.

8. Select **Done**.

Vendor Management Workspace integration applications (continued)

Application	Description
	with your vendor portfolio and completing the vendor assessment and remediation life cycle.
Process mining	Discover inefficiencies in your business processes and optimize them.
Service Credits	Track and manage the compensation that your vendors owe your organization when they breach the service agreement you have with them.
Service Portfolio Management	Document and manage vendor services using a standardized, structured format.
Assessments and Surveys	Assess how satisfied your stakeholders are with the vendors they collaborate with.
Performance Analytics	Manage key vendor metrics using a dashboard.
Incident Management	Restore normal vendor service operations while minimizing business impact.
Service Catalog	Request vendor catalog items using self-service.
Service Offerings	Refine vendor services to a specific business need. Understand the active service offerings and unique service offering subscribers associated with your vendors. Use this information to evaluate the business impact a vendor has on your company.
Digital Portfolio Management (DPM)	Manage solutions such as service and service offerings from one location.
Service Commitment	Specific vendor services that define the unique characteristics for a service offering.
Service Level Management	Manage vendor requirements on agreed SLAs. Find out how many active SLA definitions a vendor has to monitor their service level agreements with your company.
Service Level Agreement Definition	Manage vendor SLA definitions.

Browser support for workspaces

Important:
Due to significant performance issues, ServiceNow recommends that customers migrate away from Internet Explorer 11. For more information, refer to KB0683275.

Create a vendor in Vendor Management Workspace

Add vendors to your existing vendor list or modify the existing vendor-related information.

Before you begin

Role required: sn_vlm.vendor_admin or sn_vlm.vendor_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Define the information to include in a vendor record. For example, contact and contract information, the assigned vendor manager, and evaluation criteria.

Note:
Only users with the admin role can create a new vendor record. Users with the sn_vlm.vendor_manager role can edit existing vendor records.

For administrators, creating a vendor record entails simply adding general vendor information to a new record, for example, the vendor name and address, and updating the list. Vendor managers can then define the vendor record by adding more specific details about the vendor, such as, who manages the vendor, what state the vendor is in, internal and external contacts, and more.

Before defining the vendor record, vendor managers benefit from reviewing the Company form and planning and collecting all pertinent information about the vendor.

Procedure

1. To create a new vendor, administrators navigate to **Vendor Management** > **All Vendors** and click **New**.
   Alternatively, to edit an existing vendor record, vendor managers click the name of the vendor to open the Company form. Add to or change form field data as needed. To delete an existing vendor, click the **delete** button in the form header.
2. Fill in the form fields, as appropriate.

Company form

Field	Description
Name	The vendor providing this service. Typically this is the company name.
Vendor state	Status of the vendor.
Website	The URL for the vendor's website.
Rank tier	Ranking that represents the organization opinion of the products from this vendor.
Vendor manager	Person who manages the vendor. Add yourself as the manager or click the lock icon to add one or more users as vendor managers. **Note:** Select only users who have the sn_vlm.vendor_manager role.
Business owner	Person who owns the vendor company.
Parent	The vendor's parent company.
Notes	Additional information about the vendor.
General tab	
Vendor type	Type of business that applies to the vendor, for example, service, hardware, or software.
Vendor	Check box that's selected by default, to recognize this company as a vendor in the system.
Manufacturer	Check box to indicate if this company is a manufacturer.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Number of employees	The number of employees for the vendor.
Relationship start date	The date when you started engaging with the vendor.
Banner image	The image to appear in the vendor scorecard header. This is usually the vendor's company logo. **Note:** The image should be approximately 60–70 pixels high, and in one of these file formats: .jpg, .png, .bmp, .gif, .jpeg, and .ico.
Banner text	Text for the vendor scorecard, such as the company slogan.
Unique subscribers	The total number of subscribers to the product offered by the vendor.
Location tab	
Street	Name of the street where the vendor is located.
City	Name of the City where the vendor is located.
State / Province	Name of the state or province where the vendor is located.
Zip / Postal code	Zip code where the vendor is located.
Country	Country where the vendor is located.
Phone	Vendor's primary contact number.
Fax phone	Vendor's fax number.
Latitude	The geographical latitudinal coordinate for the vendor location.
Longitude	The geographical longitudinal coordinate for the vendor location.
Financial tab	
Publicly traded	Check box indicating if the vendor is a publicly traded company.
Stock symbol	The vendor's stock symbol.
Stock price	The vendor's stock price.
Total Cost of Contracts	Cost of all contracts.
Revenue per year	The annual revenue generated by the vendor.
Market cap	The market cap for the vendor.
Profit	The vendor's profit margin.
Fiscal year	The date on which the vendor fiscal year ends. Click the calendar icon to select the date.

3. Right click in the header to save the new vendor record.
   The following related links and related lists appear.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Related Links	
Create Service Credit	Credit that the vendor owes your organization because of a breached business service contract. Click to create a service credit if necessary.
See Vendor's Profile	General information, including performance metrics, about the vendor in the Vendor Management Workspace.
Companies	Name of companies you want to associate with the vendor.
Service Offerings	Business services offered by this vendor.
Service Commitment for Vendor	Service commitments negotiated with the vendor. For example, a cloud services vendor commits to 95% uptime.
Improvement Initiatives	Improvement initiatives associated with the vendor.
Service Credits	Service credits associated with the vendor.
Contracts	Contracts established with the vendor and the contract status.
SLA Definitions	SLA definitions associated with the vendor.
Vendor Catalog Items	Catalog items from the vendor that are available for users to order.
Vendor Stakeholders	Stakeholders associated with the vendor via the Assessments and Surveys application.
Product Models	Product models related to the vendor for vendors that are designated as manufacturers.
Assets	Assets purchased from the vendor that are available for assignment to in use.

4. Click any related list tab to view existing information or click **New** within a related list to create a new record.
5. Click **Submit** to save your vendor record or click **Update** after editing a vendor record.

Generate the Vendor Satisfaction Assessment in Vendor Management Workspace

Use Assessments and Surveys to assess how satisfied your stakeholders are with the vendors they collaborate with. Generate assessments using the Vendor Satisfaction Assessment metric type that comes with the Vendor Management Workspace application.

Before you begin

Role required: assessment_admin or sn_vlm.vendor_manager

About this task

The **Vendor Satisfaction Assessment** metric type is used to measure the satisfaction of stakeholders who collaborate with your vendors. This metric type uses the **Vendor Satisfaction** metric category to determine the vendor satisfaction score that displays in Vendor Management Workspace. Any new categories that are added to the metric type do not contribute towards the calculation of the vendor satisfaction score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Vendor Management** > **Assessment Administration** > **Types**.
2. Set the desired conditions for the Company [core_company] table.
   a. Select **Vendor Satisfaction Assessment**.
   For descriptions of the assessment metric type fields, refer to Configure an assessment.
   b. Select the **Conditions** tab.
   c. Add the desired filter conditions for the Company [core_company] table.
   d. Click **Update**.
3. Associate users to the metric categories for the assessment.
   a. In the **Metric Categories** tab, select **Vendor Satisfaction**.
   b. In the **Users** tab, select **Edit**.
   c. Add all users you want to associate with vendors to the Users List for Vendor Satisfaction.
   d. Select **Save**.
4. Associate users with vendors.
   a. Navigate to **Vendor Management** > **Assessment Administration** > **Stakeholders**.
   b. Select the Vendor Satisfaction Assessment metric type.
   c. Select a user from **Category Users**.
   d. Select the vendor you want to associate the user with from **Assessable Records**.
   e. Select **Associate**.
   f. **Optional:** Associate additional users to vendors.
5. **Optional:** Verify the association of users to vendors.
   a. Navigate to **All** > **Assessments** > **Advanced** > **Assessment Stakeholder**.
   b. Verify the association between the user and the vendor.

   Note:
   The **Category user** field lists all users and the **Assessable record** field display the associated vendors.
6. Generate the assessment.
   a. Navigate to **All** > **Vendor Management** > **Assessment Administration** > **Types**.
   b. In the **Assessment Metric Types** record, select **Vendor Satisfaction Assessment**.
   c. Select **Generate Assessments**.

Add a formula indicator to track vendor score

Create a custom formula indicator to add to your calculation for the vendor score. Add the indicator to your KPI group to analyze the score.

Before you begin

Role required: pa_contributor, pa_data_collector, pa_power_user, or pa_admin

Procedure

1. Navigate to **All** > **Performance Analytics** > **Indicators** > **Formula Indicators**.
2. Select **New**.
3. Fill in the fields on the form.
   a. In the **Name** field, enter a descriptive name for the formula indicator.
   b. Fill in the **Indicator properties** section.

Name	Description
Direction	▪ Select **Maximize** if an increase in score is desired. ▪ Select **Minimize** if a decrease in score is desired.
Unit	Select the percentage (%) value.
Precision	Rounding of the fractional results.

   c. In the **Formula** section, select **Browse for an indicator**.

      The **Add an indicator to a formula** appears.

   d. In the **Indicator** field, select the indicator you want to add to the formula.
   e. Click **Select**.
   f. Add any mathematical operators such as +, -, *, or %.
   g. If you need to add more indicators, select the **Browse for an indicator** link and add more indicators to the formula based on the score you want to calculate.
4. Select and hold (or right-click) the form header and select **Save**.
5. Add a vendor breakdown for the indicator.
   a. In the Breakdowns related list, select **Edit**.
   b. Select **Vendors** from the Collection list and add it to the Breakdowns list.
   c. Select **Save**.
6. Add the indicator to the vendor KPI group.
   a. Navigate to **All** > **Vendor Management** > **Configuration** > **KPI Groups**.
   b. Select the KPI group to which you want to add the formula indicator.
   c. In the KPIs related list, select **New**.

      The KPIs form appears.

   d. In the **KPI** field, select the formula indicator you've created.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In the **Order** field, set the order number.

f. Select **Submit**.

> **Note:**
> In the KPI Group form, make sure the combined weight of all KPIs in the KPIs related list adds to 100. If the combined weight is over 100, then the weight will be proportionately readjusted to 100.

Result

The formula indicator is added to the KPI group and is used for calculating the vendor score in Vendor Management Workspace.

For detailed information on creating a formula indicator, see Create a formula indicator.

Create KPI groups to track metrics for your vendors

Create key performance indicator (KPI) groups and include KPIs that matter most for your vendors. Associate the KPI groups with your vendors, set thresholds to monitor indicator status, and analyze vendor performance.

Before you begin

Configure Performance analytics indicators that you want to add to each vendor KPI group. For a list of indicators that are available by default refer to Installed with Vendor Management Workspace.

The indicators must have a vendor breakdown on the Company [core_company] table with associated vendors.

You can configure and track up to six KPIs with a percentage value that contribute towards the vendor score. Add 15 more KPIs with any unit value to analyze additional data.

For each indicator, configure:

- A weight value—A numeric value that indicates the percentage of contribution towards the vendor score. This value represents the importance of that indicator relative to other indicators within that KPI group. Each indicator is weighted against 100% of the combined weight of all indicators added to the KPI group. If the combined weight is over or under 100 %, then the weight of the indicators will be proportionately readjusted to 100.
- Order of priority—You can also establish the order of priority in which you want these indicators to appear on the vendor profile.
- Thresholds—Define upper and lower limit values to assess vendor performance for each indicator.

Role required: sn_vlm.vendor_admin

Procedure

1. Navigate to **All** > **Vendor Management** > **Configuration** > **KPI Groups**.
2. Create a KPI group.

> **Note:**
> You can also open an existing KPI group, create a copy of it, and modify it based on your needs.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Click **New**.

b. In the **Name** field, enter a name for the KPI group.

c. From the Type menu, select **Vendors**.

d. Right-click the form header and click **Save**.

3. Add KPIs to a KPI group.

a. In the KPIs related list, click **New**.

Field	Description
Indicator	Descriptive name for the indicator.
Indicator display name	Business-friendly name for the indicator. This name displays in the Vendor KPI Groups widget in Vendor Management Workspace.
Weight	The percentage of the total score you would like to attribute to this indicator. The combined weight of all indicators added to a KPI group must equal to 100.
Order	The order of priority in which you want this indicator to display in the Vendor Score Metrics widget in Vendor Management Workspace.
Lower Threshold	Lower limit defined for this indicator. You can view the highlighted value seen in Vendor Management Workspace vendor profile.
Upper Threshold	Upper limit defined for this indicator. You can view the highlighted value seen in Vendor Management Workspace.

b. In the **KPI** field, select the KPI to apply for this vendor.

Note:
The KPI could also have child KPIs that you could drill down into.

c. Click **Submit**.

4. Set KPI thresholds for a KPI group.

a. In the KPI Group Thresholds related list, click **New**.

b. In the **Lower Threshold** field, enter the lower threshold limit to be used for the status defined for the KPI group.

c. In the **Upper Threshold** field, enter the upper threshold limit to be used for the status defined for the KPI group.

d. In the **Order** field, enter a number for the defined threshold limits. This number must be unique for each set of limits.

e. In the **Status** field, select the status for the defined threshold as critical, positive, or warning.

Note:
The corresponding icon for each status displays in the manager workspace when the **Show Icon** check box is enabled for the status. This is enabled by default for the critical status.

5. Add vendors to the KPI groups.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the Vendors related list, click **Edit**.

b. Move the desired vendors from the Collection to the Vendors list.

c. Click **Save**.

What to do next

Associate the KPI group to vendors.

Create an improvement in Vendor Management Workspace

Create an improvement initiative for a vendor to track and manage tasks for improving a service, process, or tasks related to vendors.

Before you begin

The Continual Improvement Management (com.sn_cim) plugin must be activated. For more information on activating the plugin, see Request Continual Improvement Management.

You can view your vendor initiatives by navigating to **Vendor Management** > **Improvement Initiatives**.

Role required: sn_vlm.vendor_manager, sn_vlm.vendor_admin, or admin

Procedure

1. Navigate to **Vendor Management** > **Workspace**.
2. Click the Vendor Home icon.
3. From the list, go to **Vendors** > **All Vendors**.
4. Select a vendor to create the improvement initiative.
5. Create an improvement initiative.

6. In the **Vendor** field, select the vendor for which you want to create the initiative.
7. In the **Service offering** field, select the service offering for which you want to set improvement goals.
8. Fill in all required fields to complete the initiatives.
   For information on field descriptions, see Improvement field descriptions
9. **Optional:** If you want to add supporting documents, click **Browse** and select the file.
10. Click **Save**.

Create a service credit in Vendor Management Workspace

Create a service credit record each time the vendor breaches the agreement. The breaches are typically associated with an outage, incident, or SLA breaches.

Before you begin

From Vendor Management Workspace, you can create service credits from an incident, outage, or service availability record based on the conditions listed in the table below.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Record	Conditions for creating a service credit
Incident	• The incident state is **On Hold**. • The on hold reason is **Awaiting Vendor**.
Outage	The configuration item field in the outage record must be configured to a service offering.
Service availability	The service offering must be configured in the service availability record.

Role required: sn_vlm.vendor_manager

You must have the sn_incident_read role enabled to view service credit reports.

Procedure

1. Navigate to **All** > **Vendor Management** > **Workspace**.
2. Click the Vendor Home icon.
3. Create a service credit from a vendor, incident, outage, or a service offering.
4. Click **New**.
   Fill in the following fields as required:

Field	Description
Number	System generated reference number for this credit record.
Vendor	Name of the vendor.
Service offering	Service offering related to this vendor.
Service commitment	Specific service commitment that affects this vendor credit.
Service availability	Business service availability commitment that affects this vendor credit.
Related incident	Number of any incidents related to these vendor products.
Related outage	Actual outage that created the vendor credit. The value in this field is from the **Short description** in the outage record.
Vendor contract	Contract for this vendor, if any. Choose a contract for the specified vendor. These contracts can be in any state.
Reference number	Any reference that pertains to this credit, for example, a confirmation number from the vendor or the name of a contact.
Breach penalty time	Duration of the breach. This value is the elapsed time of the credit-generating event and is inherited from the **Service commitment** selected.
Breach penalty amount	Total amount of credit due from this event, inherited from the **Service commitment** selected.
Per	Unit for calculating the breach penalty amount, inherited from the **Service commitment** selected.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credit used	Check box indicating that credit from this vendor has been recovered.
Notes	Notes pertaining to this credit record, for example, to keep track of recovered credit.

5. Click **Save**.

Create a vendor ticket in Vendor Management Workspace

Create vendor tickets to monitor how quickly your vendors resolve issues for your products and services.

Before you begin

Role required: sn_vlm.vendor_manager

Procedure

1. Navigate to **All** > **Vendor Management** > **Workspace**.
2. Select the List icon.
3. Select the incident, outage, or a service availability list to create a vendor ticket.
4. Create a vendor ticket from an incident, outage, or a service availability.

Record	Conditions to set for creating a vendor ticket
Incident	○ The incident state is **On Hold**. ○ The on hold reason is **Awaiting Vendor**.
Outage	The configuration item field in the outage record must be configured to a service offering.
Service availability	The service offering must be configured in the service availability record.

5. In the **Vendor** field, select the vendor associated with the incident.
6. In the **Vendor Ticket** field, enter a ticket or incident number provided by the vendor.
   This ticket is the vendor identification number for the issue that's being resolved by the vendor.
7. Select **Save**.

Setting up Vendor Success Indicators in Vendor Management Workspace

Configure attributes that can give you meaningful insights when comparing top-performing vendors.

Important:
You must install the Success Indicators (com.snc.vendor.insights) plugin separately from the ServiceNow Store. For more information, see Activate Vendor Management Workspace.

You can configure either tables or indicators to define attributes. The base evaluating table for the vendor success indicator is the Company [core_company] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use properties to configure the Vendor Success Indicators. For more information, see Properties installed with Vendor Success Indicators.

Set up table attributes in Vendor Management Workspace

Configure attributes for a table to compare them with top-performing vendors.

Before you begin

Role required: sn_vlm.vendor_admin

About this task

The fields for a selected table display all supported string and numeric data types. The allowed data types are defined in the *sn_app_ml_insights.attr_datatype_inclusion_list* system property. For more information, see Properties installed with Vendor Success Indicators.

Procedure

1. Navigate to **All** > **Vendor Management** > **Success Indicators** > **Attributes**.
2. Click **New**.
3. In the **Name** field, enter a unique name for the evaluating attribute.
4. In the **Type** field, select **Table**.
5. Set up the field attributes.

Example:

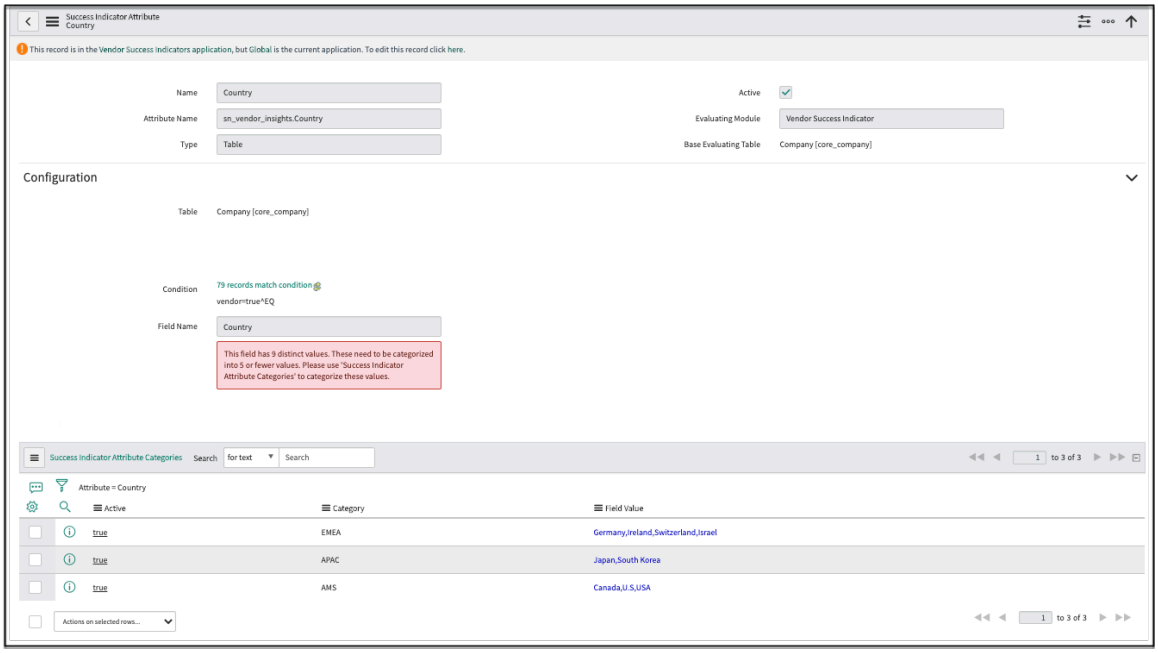
Example 1: In the example configuration shown in the following image:

- The table used for configuring the vendor success attributes is the same as the base table, Company [core_company].
- The field name selected, which is Country, is a string data type.

The pop-up message shows that the attribute Country has nine distinct values.

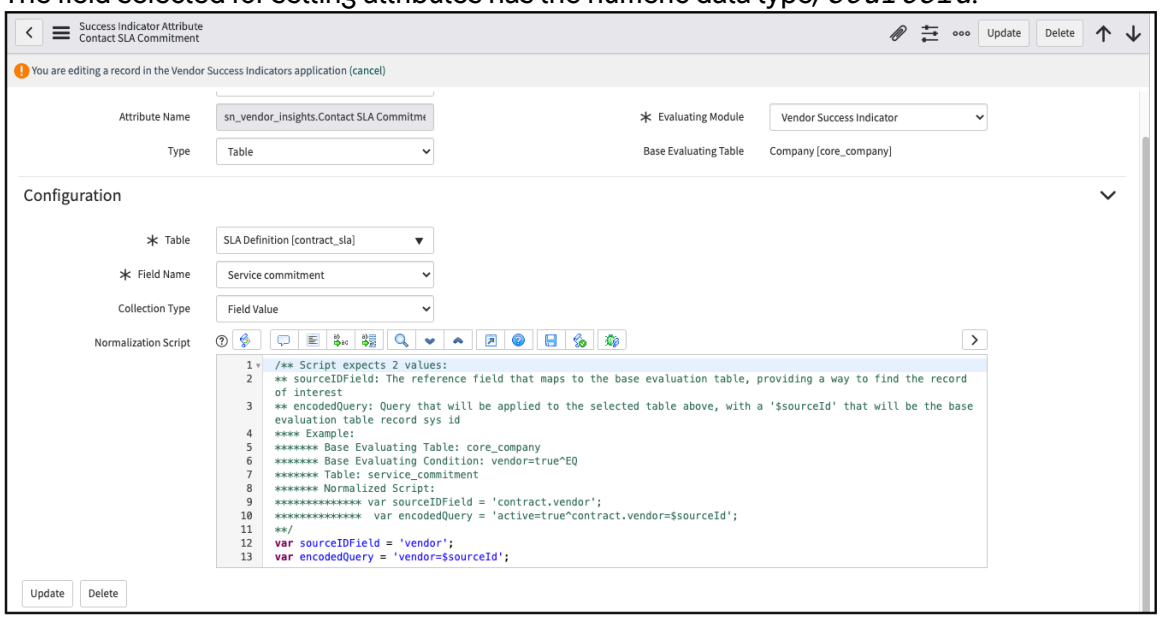
The nine values for Country are Germany, Ireland, Switzerland, Israel, Japan, South Korea, Canada, U.S., and USA. You have the option of configuring the attributes for Country by grouping them into categories such as EMEA, APAC, and AMS.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Example 2: In the example configuration shown in the following image:

- The table used for configuring the vendor success attributes is not the same as the base table, Company [core_company].
- The field selected for setting attributes has the numeric data type, *`sourceId`*.



Set up indicator attributes in Vendor Management Workspace

Configure indicator attributes to compare them with top-performing vendors.

Before you begin

Role required: sn_vlm.vendor_admin

Note:
For an overview on how to set up Vendor Success Indicators, see Setting up Vendor Success Indicators in Vendor Management Workspace.

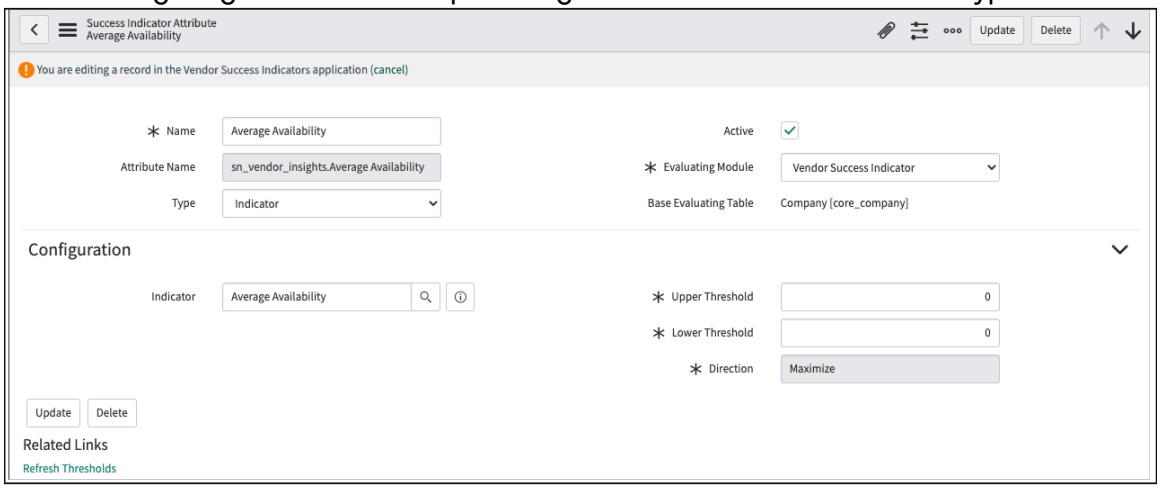
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

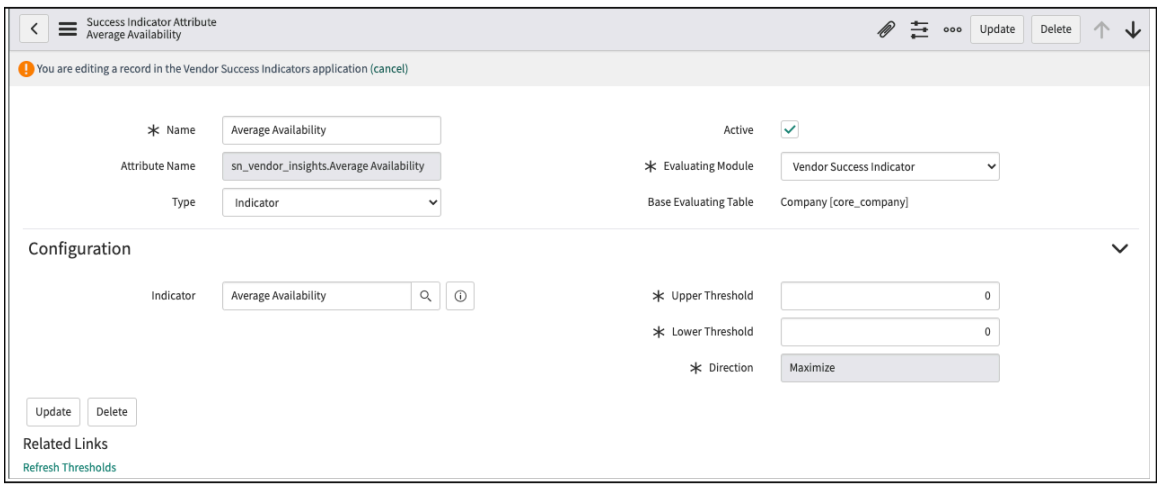
Procedure

1. Navigate to **All** > **Vendor Management Workspace** > **Success Indicators** > **Attributes**.
2. Click **New**.
3. In the **Name** field, enter a unique name for the evaluating attribute.
4. In the **Type** field, select **Indicator**.
5. In the Configuration section, from the **Indicator** field, select an indicator with the Company [core_company] breakdown from which you want to derive attributes.
   The **High** and **Low** fields are automatically populated based on the recommended values and the **Direction** field is set to **Maximize** by default.
6. Click **Submit**.

Example:

The following image shows an example configuration where the attribute is of type indicator.





Managing vendors using Vendor Management Workspace

Analyze vendor KPI groups and compare vendor characteristics with high-performing vendors using Vendor Management Workspace.

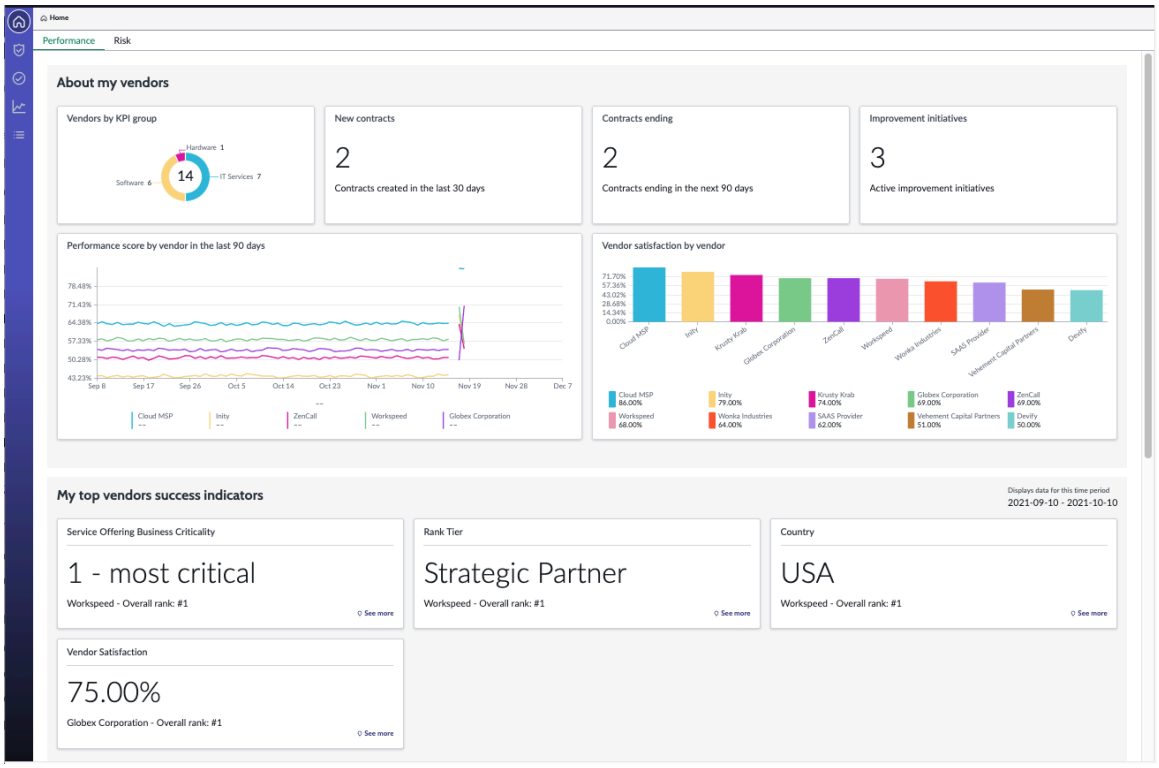
Vendor Management Workspace landing page

Monitor vendor metrics, the number of recently created contracts, the ones that are ending soon and the number of active improvement initiatives at any given time. See which characteristics

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

contribute to the success of your vendors. View how your vendors are ranked against those characteristics in comparison to other vendors.

You can clone an existing landing page and customize it using the Next Experience UI Builder. For more information, see Customize a Vendor Management Workpace page using the Next Experience UI Builder.



Required Vendor Manager Workspace roles

If you have the Vendor Manager [sn_vlm.vendor_manager] role, you can access the Vendor Management Workspace landing page.

Use cases

End user and goal	Required role
As a vendor manager, you can analyze real-time details such as: • Breakdown of vendors by KPI groups. • How many new contracts were created in the last 30 days. • How many contracts are ending in the next 90 days. • Number of continual improvement initiatives that are currently open. • The top five vendor success indicators.	Vendor Manager [sn_vlm.vendor_manager] To view reports on catalog items ordered, the sc_req_item access control list (ACL) must be enabled.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicators

Vendor score

Vendor performance of all vendors in your organization that's based on their vendor score for the last 90 days.

Vendor satisfaction

Satisfaction of stakeholders who collaborate with your vendors.

Breakdowns

The indicators breakdown is by vendors.

Data visualizations

Select a visualization to drill down and analyze further details.

Title	Type	Source table	Description
Vendors by KPI group	Donut	Company [core_company]	Breakdown of vendors KPI groups.
New contracts	Single score	Contract [ast_contract]	Number of contracts created in the last 30 days.
Contracts ending	Single score	Contract [ast_contract]	Number of contracts ending the next 90 days.
Improvement initiatives	Single score	Improvement Initiative [sn_cim_register]	Number of active improvement initiatives.

Analyze Vendor KPI Groups

After you set up vendor KPI Groups, you can analyze the metrics related to all of your vendors in one location. You can search all vendor-related information such as incidents, outages, improvement initiatives, and vendors and find associated records.

Before you begin

Role required: sn_vlm.vendor_manager

About this task

In workspace, you can sort the list by vendor types and analyze the performance of each vendor type in a single view. You can then drill down to each vendor and analyze additional data. You can also add attachments for the vendor profile in the **Vendor Details** section and download added attachments.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Vendor Management** > **Workspace**.
2. Analyze the vendor score.
   For information on how the vendor score is calculated, refer to Calculating the vendor score.

   The color indicator that highlights the vendor score in the header shows you how the vendor is performing based on the set threshold.

   Note:
   The **VMW:Update Vendor Score** scheduled job is set to run daily. If you want to view updated score, you can run this scheduled job at any time.

3. Click each indicator widget to view the breakdown for that metric.

   You can view:

   - A single-score widget that displays the indicator metric.
   - A time-series widget that shows the trend line for the selected KPI group and date range.
     - When you select the end date as the day before the current date, you can view the actual and the forecast trend for the selected KPI.
     - You can select a specific day in the time-series to analyze the vendor performance for the selected KPI on that day.
   - A breakdown of related service offerings for the selected KPI group and date range.
   - Threshold for each indicator highlighted to provide a visual indication for each service offering

     Note:
     You can analyze the key performance indicator (KPI) status such as Critical, Positive, or Warning for each vendor if your system administrator has enabled the display of the indicator status in Vendor Management Workspace. The indicator status to display KPI thresholds defined as critical is enabled by default.

   For the breakdown on the Vendor Satisfaction indicator, you can also view the Assessments Completed widget that displays the results of vendor satisfaction surveys.
4. Add supporting documents to a vendor profile.
   a. In the **Vendor Details** section, click the attachments icon .
   b. Click **Browse** and select the desired file to attach to the profile.
   c. Optionally, you can click the ellipses icon and download, replace, or remove the attachment.

Compare your vendor characteristics with high-performing vendors in Vendor Management Workspace

Monitor the attributes that define your vendor performance and compare them with top-performing vendors.

Before you begin

Important:
You must install the Success Indicators (com.snc.vendor.insights) plugin separately from the ServiceNow Store. For more information, see Activate Vendor Management Workspace.

Role required: sn_vlm.vendor_manager

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

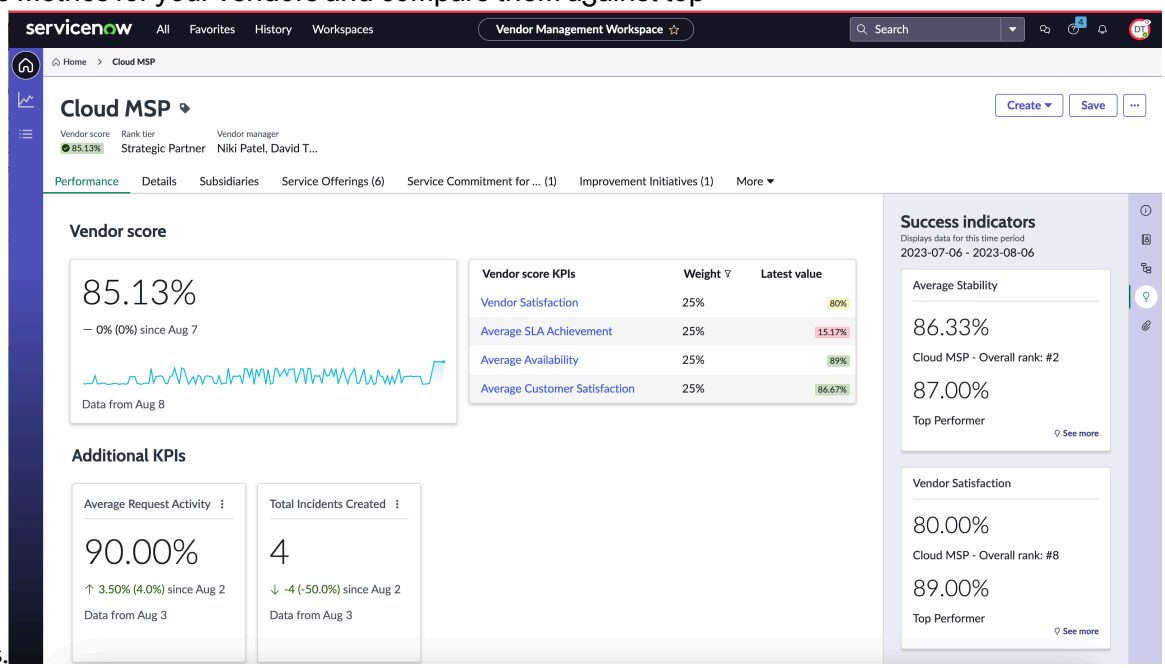
Vendor Success Indicators uses the chi-square test that compares two values to see if they're statistically different from what is expected.

Note:

- The comparisons depend on how well the density curve of the chi-square value is distributed between the vendor characteristics.
- When the degree of freedom is 1, then the p-value that measures probability between your comparisons must be less than 0.05 to have a statistical significance.
- Ideally, your comparison data must include at least 5 vendor records each that have values closer to the upper and lower thresholds.

Procedure

1. Navigate to **All** > **Vendor Management** > **Workspace**.
2. Select a vendor.
3. Select the Success Indicators icon ( ).
4. Analyze the metrics for your vendors and compare them against top performers.



Note:
Vendors must meet the following criteria for evaluating against top-performing vendors:

- Have a vendor KPI group assigned to them
- Have a valid vendor score

Only vendors who have a vendor KPI group assigned to them and also have a valid vendor score will be used for evaluating against top-performing vendors.

The preceding image shows an example of success indicators for the company Cloud MSP. The success indicators provide insight into the top five attributes across all vendors that contribute to high performance. These indicators are displayed in the order of their contribution to the performance ranking which is as follows:

a. Average Availability

b. Average SLA Achievement

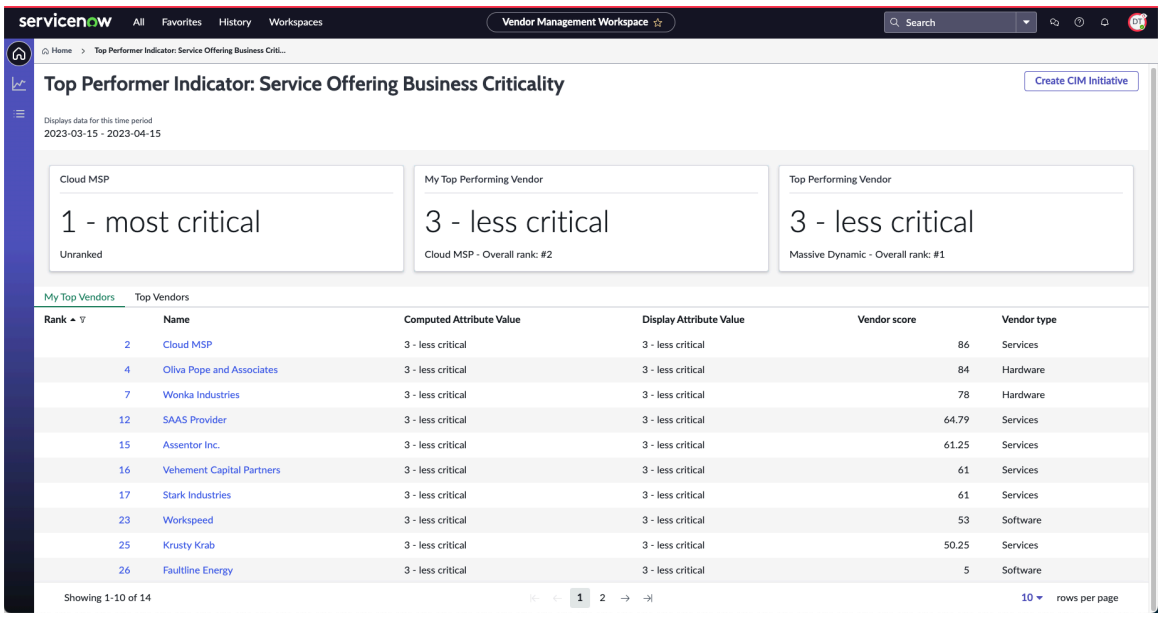
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Avg Perf Score of SO

d. Avg. Customer Satisfaction

For numeric attributes, the interpretation of the value depends on the direction set for the indicator.

5. Select **See more** to drill down into the data.
   The following image shows the drill down data for the Average Performance Score for Service Offerings.



Descriptions for the single-score widget drill-down data

Name	Description
Vendor display name [Example: Cloud MSP]	Displays the score for the selected attribute. The **Rank** field shows the overall vendor ranking for the attribute. **Note:** If the score falls outside the range of ranked vendors, the ranking displays as unranked.
My Top Performing Vendor	For the selected attribute, displays the score for the attribute. It also displays the ranking of the highest performing vendor among all the vendors that you manage.
Top Performing Vendor	For the selected attribute, displays the score for the attribute. It also displays the ranking of the highest performing vendor among all vendors in your organization.

Descriptions for the list view drill-down data

Name	Description
My Top Vendors	Displays the ranking and success indicator attribute details of all vendors that you manage.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Top Vendors	Displays the ranking and success indicator attribute details of all vendors in your organization.

You can select a rank or the name of a vendor to view the vendor profile.

Compare vendor performance within a vendor KPI group

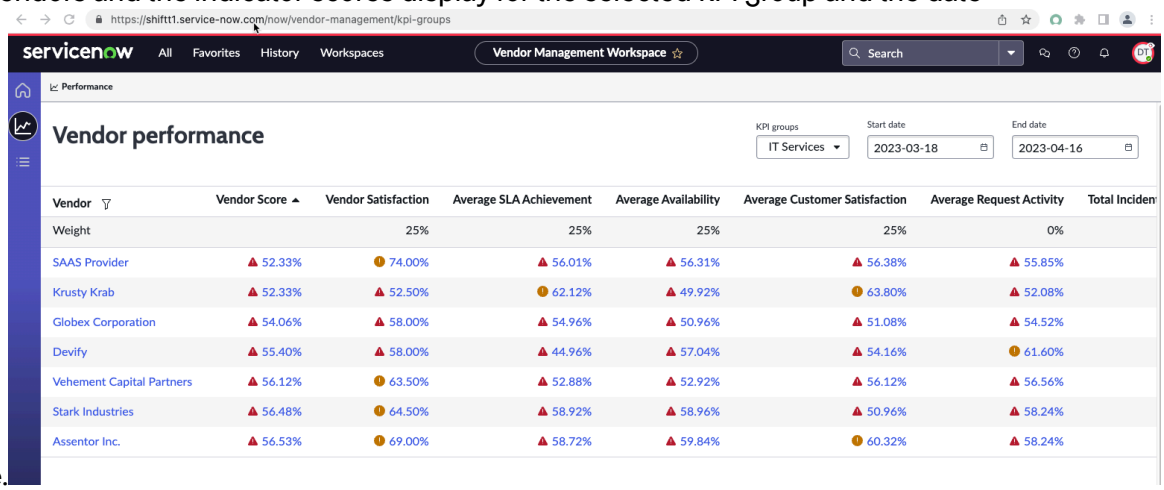
Monitor the performance of all vendors within a KPI group to assess their performance.

Before you begin

Role required: sn_vlm.vendor_manager

Procedure

1. Navigate to **All** > **Vendor Management** > **Workspace**.
2. Click the Performance icon ( ).
3. From the KPI groups list, select the group for which you want to compare vendor performance.
4. In the **Start date** field, click the calendar icon and select the date from which you want to start analyzing the data.
5. In the **End date** field, click the calendar icon and select the date up to which you want to analyze the data.
   The vendors and the indicator scores display for the selected KPI group and the date range.



Vendor	Vendor Score	Vendor Satisfaction	Average SLA Achievement	Average Availability	Average Customer Satisfaction	Average Request Activity	Total Inciden
Weight		25%	25%	25%	25%	0%	
SAAS Provider	52.33%	74.00%	56.01%	56.31%	56.38%	55.85%	
Krusty Krab	52.33%	52.50%	62.12%	49.92%	63.80%	52.08%	
Globex Corporation	54.06%	58.00%	54.96%	50.96%	51.08%	54.52%	
Devify	55.40%	58.00%	44.96%	57.04%	54.16%	61.60%	
Vehement Capital Partners	56.12%	63.50%	52.88%	52.92%	56.12%	56.56%	
Stark Industries	56.48%	64.50%	58.92%	58.96%	50.96%	58.24%	
Assentor Inc.	56.53%	69.00%	58.72%	59.84%	60.32%	58.24%	

Add targets for vendor score KPIs

Set key performance indicator goals for an indicator that contributes to the vendor score so that you can monitor and improve baseline measurements.

Before you begin

Role required:

To set a global target, you need the pa_target_admin and sn_vlm.vendor_manager roles.

To set a personal target, you need the sn_vlm.vendor_manager role.

Procedure

1. Navigate to **All** > **Vendor Management** > **Workspace**.
2. Click the Performance icon ( ).

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click on a performance score for an indicator for which you want to set a target.
4. Click the target icon ( ) to display the target pane.
5. Set the KPI target.

Associate contracts with vendors

Create a contract and associate it with the vendor who is responsible for the contract.

Before you begin
Role required: sn_vlm.vendor_manager

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the List icon.
3. Go to **Contracts** > **All Vendor Contracts**.
4. Select **New**.
5. Fill in the fields on the form.
   For information on the field descriptions, see Create a contract.

   Note:
   The start date must be the current day or a day before the current day.

6. Select **Save**.
   In the List menu, go to **Contracts** > **My Vendor Contracts** to view the contract you've created.

Associate SLAs and Service Commitments with Vendors

Create a vendor SLA and a service commitment and associate that with a vendor.

Before you begin
Role required: sn_vlm.vendor_manager and sla_manager

Procedure

1. Navigate to **Workspaces** > **Vendor Management Workspace**.
2. Select the List icon.
3. Create an SLA definition.

   a. Go to **Service Levels** > **All Vendor SLAs**.

   b. Select **New**.

   c. Fill in the fields on the form.
   For information on field descriptions, see Create an SLA definition.

   d. Select **Save**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Create an SLA breakdown definition.
   a. In the SLA definition that you've created, select the **SLA Breakdown definitions** tab.
   b. Select **New**.
   c. In the **SLA breakdown definition** field, select the definition.
   d. Select **Save**.
5. Create a service commitment.
   a. In the SLA definition that you've created, select the **Service commitments** tab.
   b. Select **New**.
   c. Fill in the fields on the form.
   d. Select **Save**.
   In the List menu, go to **Service Levels** > **My Vendor SLAs** to view the vendor SLA and service commitment you've created.

Identifying bottlenecks using Process Mining integration with Vendor Management Workspace

Get insights into your vendors' performance and analyze anomalies or bottlenecks within the process when you drill down into a Key Performance Indicator (KPI).

Important:
You must add the Process Optimization analyst (sn_process_optimization_analyst) role manually to perform tasks related to the Process Mining. For information on adding a role, see Create a role.

Create a Process Mining project for a KPI group

Create projects for each KPI group for which you want to mine the data.

Before you begin

Your administrator must have enabled the *sn_itsm_vendor.enable.po.vm* system property to enable the mining. For more information on this system property, see Installed with Vendor Management workspace.

Role required: sn_process_optimization_analyst

About this task

Important:
The process mining projects for Vendor Management Workspace are created only for the incident table. Only templates of type **Default** are supported for creating the projects.

Procedure

1. Navigate to **All** > **Vendor Management** > **Configuration** > **KPI Groups**.
2. Select a KPI group.
3. Select **Initiate Process Mining**.
   The process mining is run on vendors within the KPI group and on all automated and formula indicators in the KPI group. If you're using a formula indicator for process mining, you can select any indicator source that is used in the formula.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When you select **Initiate Process Mining** and mine the vendor data for the first time, it creates the project and then adds the vendors to the project. When you add a KPI that is not part of the same table as the other KPIs, or if you add or remove vendors from the KPI group within this project, the changes are synchronized when the *Process Mining - VM Remine Projects* scheduled job runs the next time. You can also select **Initiate Process Mining** and run it to synchronize the changes immediately.

A corresponding project is created in the **All** > **Vendor Management** > **Configuration** > **VM Projects** module. When the mining is complete, the **Mining state** field changes to **Available**.

When you navigate to **Vendor Management** > **Configuration** > **Process Mining Project Mapping**, you can see the relationship between the indicator, KPI group, project definition, and the table for the project you've mined.

Get insights into your vendors' performance

Get insights into process bottlenecks and find potential areas that you could optimize. You can also view variation analysis.

Before you begin

Role required: sn_process_optimization_analyst

- The *Process Mining - VM Remine Projects* job fetches projects that have not been mined based on the settings in the *sn_itsm_vendor.po_mining.run_frequency* system property. For more information, see Installed with Vendor Management Workspace.
- You must have mined the project for that KPI group for which you want to analyze process insights. For more information, see Create a Process Mining project for a KPI group.

About this task

The data is mined starting with the beginning of the previous month. For example, if the current date is June 26, 2023 then the data is mined starting at May 1, 2023.

Procedure

1. Navigate to **Workspaces** > **Vendor Manager Workspace**.
2. Select the List icon.
3. Go to **Vendors** > **All Vendors**.
4. Select the vendor for which you want to analyze process insights.
5. Drill down into a KPI, for example, Total incidents created.
6. Select the **Process analysis** tab and perform process insights and variation analysis.

Note:
- Select the **Vendor Breakdown** tab to view the details of the relationship of vendors to a table.
- Process mining can only be performed on KPIs based on the incident table.

You can analyze the process insights for the last 30 days, excluding the current day, for which you've mined the data. For more information on business insights, see View business insights.

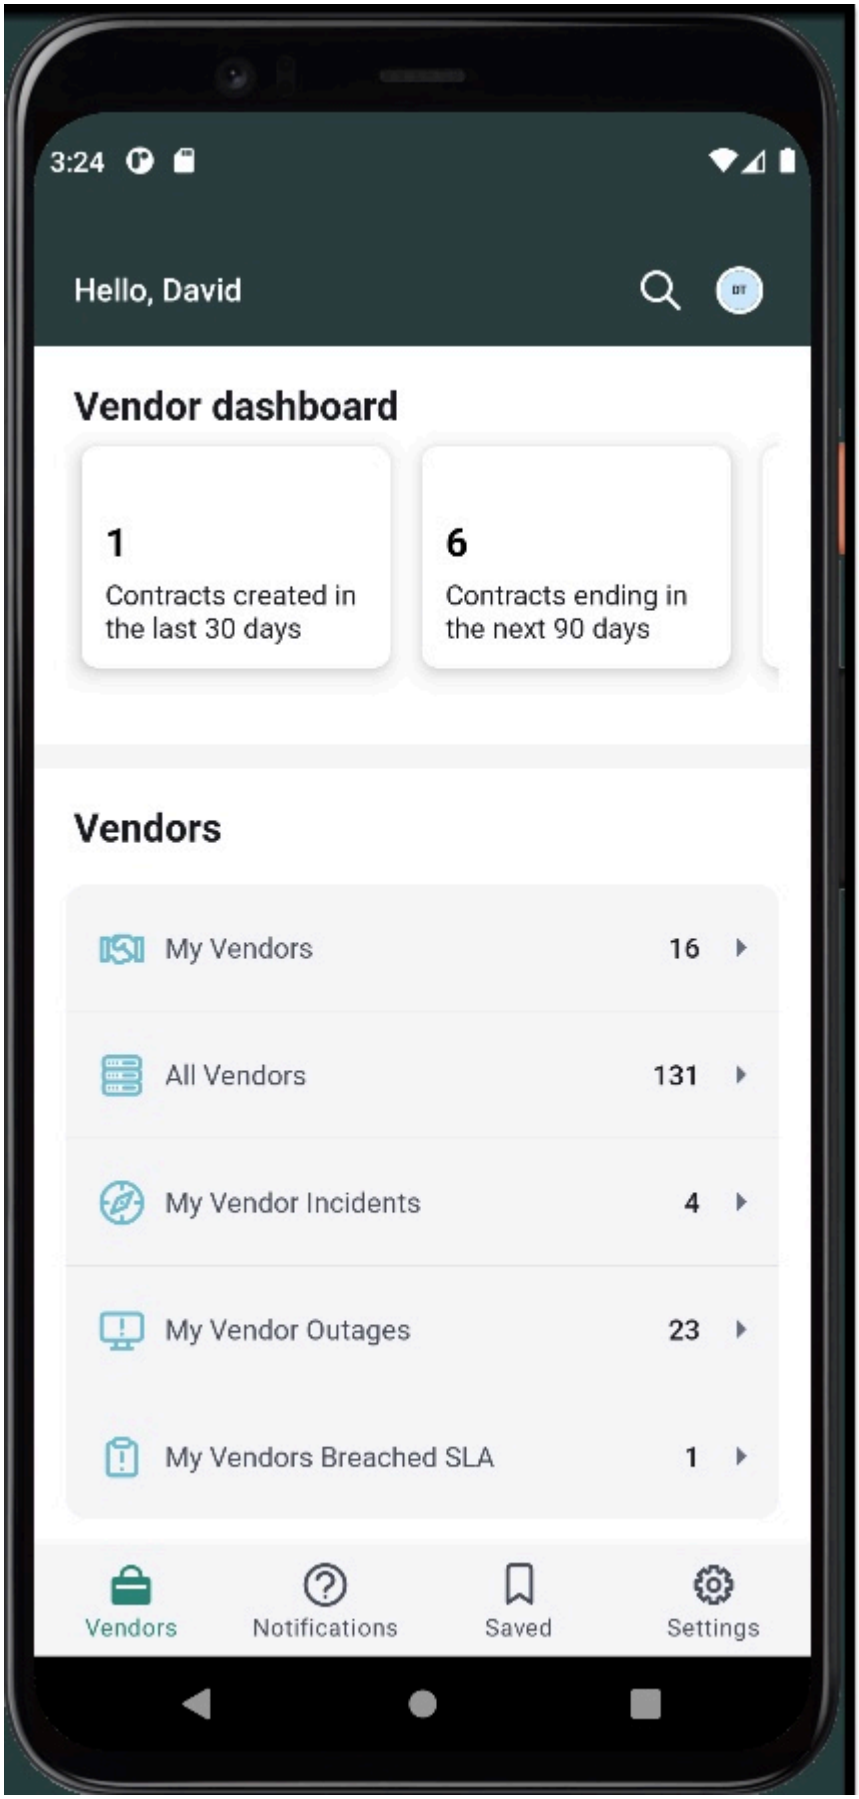
ITSM Vendor Management Mobile for Vendor Management Workspace

Using the ITSM Vendor Management Mobile app, vendor managers can access vendor details including vendor performance and monitor issues that are most important to them.

ITSM Vendor Management Mobile dashboard

Analyze vendors by KPI group. You can see which contracts were created in the last 30 days and which ones are ending in the next 90 days. Monitor improvement initiatives for your vendors.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required Vendor Management Mobile roles

If you have the Vendor Manager [sn_vlm.vendor_manager] role, you can access the Vendor Management Mobile landing page.

Use cases

End user and goal	Required role
As a vendor manager, you can analyze real-time details such as: • Breakdown of vendors by KPI groups. • How many new contracts were created in the last 30 days. • How many contracts are ending in the next 90 days. • Analyze improvement initiatives for your vendors.	Vendor Manager [sn_vlm.vendor_manager]

Data visualizations

Title	Type	Source table	Description
Vendors by KPI group	 Donut	Company [core_company]	Breakdown of vendors by metric model.
New contracts	Single score	Contract [ast_contract]	Number of contracts created in the last 30 days.
Contracts ending	Single score	Contract [ast_contract]	Number of contracts ending the next 90 days.
Improvement initiatives	Single score	Improvement Initiative [sn_cim_register]	Number of improvement initiatives created for your vendors.

Lists

Access the following vendor lists on the Vendor Management Mobile dashboard.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
My Vendors	List of all vendors managed by the vendor manager.
All Vendors	List of all vendors in your organization.
My Vendor Incidents	List of all incidents monitored by the vendor manager.
My Vendor Outages	List of all outages monitored by the vendor manager.
My Vendors Breached SLA	List of breached SLAs monitored by the vendor manager.

Access Vendor Management Mobile on your ServiceNow agent app

Install the ServiceNow agent app to enable the application on your mobile device. Scan the QR code or manually enter the address of your instance in the agent app to access your instance on the mobile device.

Before you begin

To enable you to manage and monitor vendor incidents, outages, and breached SLAs on your mobile app, your system administrator should have completed the following tasks:

- On your ServiceNow desktop application instance, install Vendor Manager Workspace (sn_itsm_vendor) plugin.
- On your ServiceNow desktop application instance, install the Vendor Management Mobile (sn_vendor_mobile) plugin.
- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: sn_vlm.vendor_manager

Procedure

1. On your mobile device, install the ServiceNow Agent app from the Apple App Store or Google Play Store.
2. Tap the Agent app icon on your mobile device.
3. Enter the address for the instance.
4. Tap **Login**.
5. Tap the Vendors icon (Vendors) to open the Vendor Management Mobile landing page.

Get notified about the vendors you manage using the Vendor Management Mobile application

Receive notifications when a P1 incident is created or resolved. You can also get notified if another incident gets upgraded to P1 or when a vendor outage occurs.

Before you begin

Role required: sn_vlm.vendor_manager

About this task

You must set your notification preferences in your desktop application to receive the notifications in your ITSM Mobile Agent application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enable notifications on your desktop application instance.
   a. Select your profile and the select **Preferences**.
   b. Select **Notifications**.
   c. Select **Core UI**.
   d. Enable **Allow Notifications**.
   e. In the **IT Service Management** section, enable the following notification:
      - Incident opened for vendor
      - Outage opened for vendor
2. Receive notifications on your mobile application when the following tasks are triggered:
   - A P1 incident is created or resolved
   - Another incident gets upgraded to a P1 incident
   - A vendor outage record is created

Access information related to your vendors using the Vendor Management Mobile application

Look up information related to your vendors such as incidents or outages created for your vendors or breached SLAs.

Before you begin

Role required: sn_vlm.vendor_manager

Procedure

1. Log into your Vendor Management Mobile application on your mobile device.
2. Do any of the following.

Vendor Management Workspace reference

When you activate the Vendor Management Workspace plugin (sn_itsm_vendor), the application installs components such as roles, tables, properties, and indicators.

Installed with Vendor Management Workspace

Vendor Management Workspace provides a single destination for you to view and manage your vendors.

Vendor Management Workspace

When you activate the Vendor Management Workspace (sn_itsm_vendor) plugin, the following components are installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles installed with Vendor Management Workspace

Role title [name]	Description	Contains roles
Vendor admin [sn_vlm.vendor_admin]	Can create, edit, or delete vendor types and KPI groups in Vendor Management Workspace	sn_vlm.vendor_manager
Vendor Manager [sn_vlm.vendor_manager]	Views and manages vendors using Vendor Management Workspace. Configures vendor performance metrics for use in Vendor Management Workspace.	• pa_viewer • service_viewer • service_credit_mgr

Table installed with Vendor KPI Groups

Name	Description
KPI Vendors [sn_itsm_vendor_kpi_group_m2m_vendor]	Store the relationship between KPIs and vendors.

Scheduled jobs

Name	Description
Process Mining - VM Remine Projects	• Automatically runs once a day. • Automatically updates the project when vendors are added or removed. • Fetches all projects that haven't been mined from the time-period specified in the **sn_itsm_vendor.po_mining.run_frequency** system property; for example, the last 7 days.

Navigate to **Vendor Management** > **Configuration** > **Vendor Properties** to set the properties for Vendor Management Workspace.

Properties installed with Vendor Management Workspace

Property	Description
sn_itsm_vendor.enable.po.vm	Enables the integration of Process Mining with Vendor Management Workspace. When enabled, you can initiate process mining and mine Process Mining projects and analyze process analysis in Vendor Management Workspace.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Vendor Management Workspace (continued)

Property	Description
	• **Type:** true | false • **Default value:** false
sn_itsm_vendor.po_mining.run_frequency	Fetches all projects that haven't been mined for the specified time-period. The *Process Mining - VM Remine Projects* job fetches the data based on the time specified in this property. • **Type:** Integer • **Default value:** 7

Installed with Vendor Success Indicators in Vendor Management Workspace

Using the Vendor Success Indicators application, you can compare the performance of your vendors against other top-performing vendors.

Important:
You must install the Success Indicators (com.snc.vendor.insights) plugin separately from the ServiceNow Store. For more information, see Activate Vendor Management Workspace.

Scheduled Job installed with Vendor Success Indicators

Name	Description
Vendor Success Indicator Weekly Scheduled Job	Runs weekly and gathers vendor attributes data for the past 30 days. The job then computes the correlation of the attributes with high-performing vendors using Predictive Intelligence.

Properties installed with Vendor Success Indicators

Name	Description
sn_app_ml_insights.top_n_results	Top N results to retrieve from the Insight Results table for further analysis. Default value is 5.
sn_app_ml_insights.max_records_to_process	Maximum number of records to be processed by the Success Indicator job. Default value is 50000.
sn_app_ml_insights.attr_category_string_value_lim	Maximum number of string values allowed before creating categories. Default value is 5.
sn_app_ml_insights.keep_last_n_runs	The number of the most recent executions to be retained after you run the table cleaner. Default value is 2.
sn_app_ml_insights.attr_datatype_inclusion_list	Comma separated list of valid data types to use for defining Vendor Insights attributes.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties installed with Vendor Success Indicators (continued)

Name	Description
	Default value is boolean,currency,date,datetime,due_date,field_name,glide_da
sn_app_ml_insights.chi_squared_critical_value	The critical value for a chi-square test that compares two values to see if there is a statistical significance. Default value is 3.84.
sn_app_ml_insights.chi_squared_threshold	The threshold for the critical value for the chi-square test. Default value is 5.

Attributes installed with Vendor Success Indicators

Attribute Name	Attribute Type	Default value
	Performance analytics indicators	
Average Availability	Average Availability	true
Average SLA Achievement	Average SLA Achievement	true
Average Stability	Average Stability	true
Avg Customer Satisfaction	Average Customer Satisfaction	true
Avg Perf Score of SO	Average Performance Score of Service Offering	true
Vendor Satisfaction	Vendor Satisfaction	true
	Table attributes	
Contract SLA Commitment	SLA Definition [contract_sla]	true
Contract SLA Type	SLA Definition [contract_sla]	true
Country	Company [core_company]	true
Rank Tier	Company [core_company]	true
Relationship Start	Company [core_company]	false
Service Commitment Type	Service commitment [service_commitment]	true
Service Offering Business Criticality	Service Offering [service_offering]	true
Total Contract Cost	Company [core_company]	false
Unique Subscribers	Company [core_company]	true
Vendor State	Company [core_company]	false
Vendor Type	Company [core_company]	false

Vendor KPI Groups in Vendor Management Workspace reference

Use Vendor KPI Groups that are provided by default to analyze vendor performance.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor KPI Groups

The following Vendor Key Performance Indicator (KPI) groups are available by default:

- IT Services—Includes KPIs to analyze vendor performance related to IT Services.
- Vendor Fulfillment—Includes KPIs to analyze vendor performance related to fulfillment.
- Software—Includes KPIs to analyze vendors related to software applications.
- Hardware—Includes KPIs to analyze vendors related to hardware applications.

Each KPI group provided by default has the following related lists:

- KPIs—Indicators with a vendor breakdown that measure the performance of your vendors.

  Each indicator that contributes toward the vendor score has a weight associated with it.
- KPI group thresholds—Defines threshold values to indicate the status of each KPI group.
- Vendors—List of vendors to analyze their performance.

IT Services KPI Group

This table shows the indicators provided by default in this KPI group. All indicators that have the unit as percentage are used to calculate the vendor score.

Indicators name	Description	Unit
VMW: Average Customer Satisfaction	Measures CSAT scores based on service offerings.	Number
Vendor Satisfaction	Provides monthly breakdown of vendor satisfaction scores.	Percentage
VMW: Average SLA Achievement	Calculates average value for SLAs that have been successfully completed.	Number
VMW: Average Availability	Calculates average value achieved for incident SLAs.	Percentage
VMW: Average Request Activity	Average value calculated from fulfilled request items derived from service portfolio catalog items. These items must be connected to service offerings.	Number
Total Incidents Created	The total number of incidents created for vendors.	Number

Vendor Fulfillment KPI Group

This table shows the indicators provided by default in this KPI group. All indicators that have the unit as percentage are used to calculate the vendor score.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicator	Description	Unit
VMW: Average Customer Satisfaction	Measures CSAT scores based on service offerings.	Number
Vendor Satisfaction	Provides monthly breakdown of vendor satisfaction scores.	Percentage
VMW: Average Incident SLA Achievement	Calculates average value achieved for incident SLAs that have been successfully completed.	Percentage
Average Request Fulfillment SLA Achievement	Calculates average value for SLAs that have been successfully completed.	Percentage
Total Incidents Created	The total number of incidents created for vendors.	Number
VMW: Average Request Activity	Average value calculated from fulfilled request items derived from service portfolio catalog items. These items must be connected to service offerings.	Number

Software KPI Group

This table shows the indicators provided by default in this KPI group. All indicators that have the unit as percentage are used to calculate the vendor score.

Indicator	Description	Unit
Vendor Satisfaction	Provides monthly breakdown of vendor satisfaction scores.	Percentage
Vendor Requested Items	Provides the count of the vendor-requested catalog items.	Number
Manual SLA from External Source	Calculates the manually added SLAs.	Percentage

Hardware KPI Group

This table shows the indicators provided by default in this KPI group. All indicators that have the unit as percentage are used to calculate the vendor score.

Indicator	Description	Unit
Vendor Satisfaction	Provides monthly breakdown of vendor satisfaction scores.	Percentage
Vendor Requested Items	Provides the count of the vendor-requested catalog items.	Number

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Indicator	Description	Unit
Manual SLA from External Source	Calculates the manually added SLAs.	Percentage

Vendor score indicator

The **Vendor Score** indicator is an automated indicator. It's used for calculating and displaying the vendor score. The calculation is done based on all indicators added to the KPI group for evaluating vendor performance.

By default, the following indicators are used to calculate the vendor score:

- Average Request Fulfillment SLA Achievement
- VMW: Average Availability
- Average Incident SLA Achievement
- Manual SLA from External Source

Schedule job

The *VMW Update Vendor Score* scheduled job runs daily and updates the score. You can run this job on-demand to get updated scores at any time.

The *VMW Update Vendor Profile* scheduled job runs monthly and updates all vendor profiles. You can run this job on-demand to get updated vendor profiles at any time.

Calculating the vendor score

The vendor score calculation is based on the weight of each indicator and the KPI score.

Important:
The Service Offering Metric Data [service_offering_metric_data] table along with the following four indicators have been deprecated in the Utah release:

- Average SLA Achievement [ServiceOffering.MetricData.SLA.Daily]
- Average Customer Satisfaction [ServiceOffering.MetricData.CSAT.Daily]
- Average Availability [ServiceOffering.MetricData.Availability.Daily]
- Average Request Activity [ServiceOffering.MetricData.Activity.Daily]

Therefore, if you have the Vendor Management Workspace application integrated with Service Portfolio Management, and if you are upgrading to the Service Portfolio Management standard portfolio, the metric data from the legacy indicators are no longer available. For information on Service Portfolio Management, see Service Portfolio Management portfolios.

You can calculate the vendor score using the indicators that have a percentage value. You can also create custom formula indicators and add them to your vendor score calculation. For more information, see Add a formula indicator to track vendor score.

This table provides an example of how a vendor score is calculated.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Vendor score calculation

Indicator	Indicator weight	KPI score	Indicator score that contributes toward vendor score
Vendor Satisfaction	10.00%	54.42%	5.442%
VMW: Average Customer Satisfaction	55.00%	83.00%	45.65%
VMW: Average Availability	25.00%	88.50%	22.125%
VMW: Average SLA Achievement	10.00%	100.00%	10.00%
Total			**83.217%**

The total vendor score has been rounded up to 83.22%. The score is also highlighted in the header with colors that are distinct for the defined threshold values for the KPI group.

Note:
The vendor score is impacted based on whether the direction for the indicator is set to maximize or minimize. This table shows an example of how the vendor score is impacted based on the indicator direction.

Vendor score impacted by indicator direction

Indicator	Direction	Indicator weight	Indicator metric score	Indicator score that contributes toward vendor score
VMW: Vendor Satisfaction	Maximize	10.00%	54.42%	5.442%
VMW: Average Customer Satisfaction	Maximize	55.00%	83.00%	45.65%
VMW: Average Availability	Minimize	25.00%	88.50%	2.875% [(100 - 88.5) x.25]
VMW: Average SLA Achievement	Minimize	10.00%	100.00%	0%
Total				**53.967%**

Domain separation and Vendor Management Workspace

Domain separation is supported in Vendor Management Workspace. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level: Standard

- Includes all aspects of **Basic** level support.
- Application properties are domain-aware as needed.
- Business logic: The service provider (SP) creates or modifies processes per customer. The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The instance owner must configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Sample use case: An admin must be able to make comments required when a record closes for one tenant, but not for another.

For more information on support levels, see Application support for domain separation.

The Vendor Management Workspace application uses performance analytics to collect data and provides domain separation support.

Request Vendor Management Workspace Domain Separation

The Domain Support - Domain Extensions Installer plugin (com.glide.domain.msp_extensions.installer) must be activated by ServiceNow personnel. After this plugin has been activated, as an administrator, you can activate the Performance Analytics - Domain Support plugin (com.snc.pa.domain_support) plugin.

The Performance Analytics - Domain Support plugin (com.snc.pa.domain_support) must be activated to enable the features for Vendor Manager Workspace

Related topics

Domain separation for service providers

Configure domain separation for Vendor Management Workspace

Configure domain separation for Vendor Management Workspace to collect vendor scores and analyze the data for a specific domain. Configure domains for vendor score metric models.

Before you begin

Role required: pa_data_collector or admin

Procedure

1. Configure a domain to collect vendor score performance analytics data for that domain.
   a. Navigate to **Performance Analytics** > **Data Collector** > **Domain Configurations**.
   b. Create a domain configuration for Vendor Management Workspace
      i. Click **New**.
      ii. In the **Name** field, enter a name for the configuration.
      iii. In the **Configuration type** menu, select **Conditions**.
      iv. In the Aggregate options section, select the **Collect children**check box to collect scores from all child domains.
   c. Right-click the form header and click **Save**.
   d. Add the following performance analytics jobs to the related list:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you do not have the Jobs related list, you must configure the form to display the related list.

- VMW Scheduled Data Collection
- VMW Weight Collection
- VMW Daily Data Collection
- VMW Vendor Score Collection

e. Click **Update**.
For more information on creating or scheduling a data collection job, refer to Create or schedule a data collection job

Note:
The Performance Analytics application:

- Runs the job and collects the score as the **Run as** user.
- Collects the scores only for the domain in which the logged-in user runs the job. The scores are not visible to vendor admins or vendor managers who are not part of that domain in Vendor Manager Workspace.
- Automatically adds database queries that limit results from the domain to the indicator source queries when the application runs a job for a domain configuration.

2. Configure a domain to assign a vendor score metric model to a domain.

a. Navigate to **Vendor Manager Workspace** > **Vendor Score Metric Models**

b. Do any of the following:

Quick start tests for Vendor Management Workspace in configurable workspace

Validate that Vendor Manager Workspace still works after you make any configuration change such as apply an upgrade or develop an application. Copy and customize these quick start tests to pass when using your instance-specific data.

Vendor Management Workspace quick start tests require activating the Vendor Manager Workspace plugin (com.snc.vlm.vmw) and loading demo data.

Vendor Management Workspace - Tests test suite

Test	Description	Release version
VLM: Create a Vendor	Track problems with the Vendor Manager Workspace plugin after upgrade. Create a new vendor.	New York

ITSM Predictive Intelligence Workbench

The ServiceNow® ITSM Predictive Intelligence Workbench application provides prebuilt use case templates and guides you through your machine learning implementation to create intelligent ITSM business processes.

Note:

Starting with the Xanadu release, the ITSM Predictive Intelligence Workbench application is being prepared for future deprecation. It will be completely deprecated and no longer deployed, enhanced, or supported from the Yokohama release. To get the latest experience for this functionality, you can install the Task Intelligence for ITSM plugin (com.snc.itsm_ml_task) or the Predictive Intelligence plugin (com.glide.platform_ml). For more information, see Task Intelligence for ITSM and Predictive Intelligence.

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Exploring ITSM Predictive Intelligence Workbench

The ITSM Predictive Intelligence Workbench application is built to help you get started using machine learning to quickly solve and expedite your IT incidents.

The workbench includes prebuilt use case templates that systematically guide you through the process of creating and training new predictive models, evaluating and testing them, and finally adding them to your business process to add value to your IT organization.

Guided machine learning provides next steps and helps you make informed decisions while you increase your knowledge of machine learning.

Once you train your use cases, they are usable immediately. Using Performance Analytics capabilities, you can monitor your successfully implemented use cases to ensure the best model efficacy. Define thresholds and monitor whether your models are performing as expected or if they are under-performing with the **Predictive Intelligence for Incidents** dashboard.

The ITSM Predictive Intelligence Workbench application depends on activation of the Predictive Intelligence application, which is available with the ITSM Pro SKU.

Who needs ITSM Predictive Intelligence Workbench

Business process architects use Predictive Intelligence Workbench functionality to get started with machine learning-based use cases. You can determine your business value, monitor your models, and view related statistics using the Predictive Intelligence Workbench dashboard.

If you are a process architect or owner, or someone who is championing machine learning for your IT organization, ITSM Predictive Intelligence Workbench can help you streamline your incident case load. Trained predictive models can resolve your incidents through past similar resolutions or by recommending relevant knowledge base articles to help expedite your incident investigation and resolution processes. This frees up valuable time for IT professionals who often need to spend time on more complex and challenging issues.

No prior knowledge or experience with artificial intelligence or machine learning is required when you use ITSM Predictive Intelligence Workbench. The application includes templates with prebuilt guidance to assist you in creating, training, evaluating, testing, and producing, your unique predictive models. You can also link to your knowledge base articles to support your IT incident case load, as well as access the many features of the Predictive Intelligence platform application.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Benefits from ITSM Predictive Intelligence Workbench

Cutting-edge artificial intelligence and machine learning technologies are widely adopted throughout many industries. The ITSM Predictive Intelligence Workbench application provides you with the machine learning tools you need to quickly and effectively resolve your IT incident tasks and improve your IT organization. The process of creating and implementing your predictive models can result in valuable business analysis and operations optimization.

ITSM Predictive Intelligence Workbench User Experience

Simple, streamlined model creation, evaluation, testing, and integration

Evaluate and test different model versions. When a retrained model version doesn't perform as well as the previous version, you can tune it, view the winning model version, and mark it as active.

View your trained models on the Use case guided steps page. When a model is integrated, the integration data is indicated parenthetically next to the model name. You can also see the **Created on** and **Trained on** dates and the **Active version** number for the model. Integrated models appear at the top of the list.

Identify the model with the highest net automation score as the green highlighted winning model. When two models have the same net automation score, the most recently created model is highlighted in green.

Use the faceted filters feature on the **Use cases - All Created Use Cases** page to filter by **Domain**, model **State**, and **Model training status**.

Use the faceted filters feature on the **Use cases - Create new from Template** page to filter by **Domain**, **Setup Help**, and **Business Value**.

Quickly find use case templates or use cases with a search filter added to the **Use cases - All Created Use Cases** and **Use cases - Create new from Template** pages.

Identify **Integrated** and **In progress** models by unique icons and easily recognize when a model training has failed or a model is underperforming with icons and flags on the Use cases - All page.

Edit model names and short descriptions as needed.

Deactivate a previous model version or select a previous model version to activate.

Know whether you have the necessary required data before starting the process of creating a use case. A message notifies you if data is insufficient.

Download a .CSV file of your model batch test or go to the test phase to view the results.

Dot-walking for input fields

Access fields on related tables from a form, list, or script.

Right to left language support

For users who read from right to left, this language support is added.

ITSM Predictive Intelligence Workbench administration

Administrators can activate the necessary plugins for ITSM Predictive Intelligence Workbench. Users with the piwb_admin role can configure the application to meet specific requirements.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Predictive Intelligence Workbench admins can perform the following tasks:

- Configure Predictive Intelligence Workbench property settings, such as the minimum number of predictions for evaluating use cases that underperform and the minimum percentage of net automation to show a pretrained model.
- Create a Predictive Intelligence Workbench user group and assign users necessary roles to move through the model implementation process.
- Configure notifications to alert Predictive Intelligence Workbench users via email for the following events:
  - When a new model is trained and ready for evaluation.
  - When batch testing is initiated and when test results are available.

Activate ITSM Predictive Intelligence Workbench

ITSM Predictive Intelligence Workbench is available with activation of the core Predictive Intelligence Workbench (com.sn_piwb_ml) plugin and the Predictive Intelligence Workbench ITSM content (com.sn_piwb_itsm_content) plugin.

Before you begin

Role required: admin

About this task

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The ITSM Predictive Intelligence Workbench -related plugins require activation of the Predictive Intelligence application. Predictive Intelligence is available with activation of the Predictive Intelligence (com.glide.platform_ml) plugin and the Predictive Intelligence Reports (com.glide.platform_ml_pa) plugin, which require an ITSM Pro package subscription. For more details, refer to Install Predictive Intelligence.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the plugin using the filter criteria and search bar.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the plugin by its name or ID. If you cannot find a plugin, you might have to request it from ServiceNow personnel.

3. Select **Install** to start the installation process.

Note:
When domain separation and delegated admin are enabled in an instance, the administrative user must be in the **global** domain. Otherwise, the following error appears: `Application installation is unavailable because another operation is running: Plugin Activation for <plugin name>.`

You will see a message after installation is completed. For information about the components installed with a plugin, see Find components installed with an application.

Components installed with ITSM Predictive Intelligence Workbench

Several roles are installed with activation of the Predictive Intelligence Workbench plugin.

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Two plugins are available to obtain feature ITSM Predictive Intelligence Workbench functionality.

- Predictive Intelligence Workbench (com.sn_piwb_ml): Provides a common framework for creating and managing use cases.

  Note:
  Requires activation of Predictive Intelligence and Predictive Intelligence Reports plugins, which are available with an ITSM Pro subscription.

- Predictive Intelligence Workbench ITSM content (com.sn_piwb_itsm_content): Enables access to ITSM -specific content that provides implementation guidance for use cases created through Predictive Intelligence Workbench Also, with this plugin you can access the **Predictive Intelligence for Incidents** dashboard to communicate value across multiple applications within IT Service Management.

  Note:
  Requires activation of Predictive Intelligence Workbench, Performance Analytics - Content Pack - ITSM Dashboards, and Incident plugins.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predictive Intelligence Workbench

Roles installed with Predictive Intelligence Workbench

Role title [name]	Description	Contains roles
Predictive Intelligence Workbench admin [piwb_admin]	Predictive Intelligence Workbench administrator. Configures the Predictive Intelligence Workbench property settings. Can create and manage use cases.	• piwb_manager • ml_admin
Predictive Intelligence Workbench manager [piwb_manager]	Typically a business process architect. Can create and manage use cases. Configures the Predictive Intelligence Workbench property settings. Monitors the **Predictive Intelligence for Incidents** dashboard.	• ml_admin • piwb_viewer • pa_admin
Predictive Intelligence Workbench viewer [piwb_viewer]	Can view the **Predictive Intelligence for Incidents** dashboard.	• pa_viewer • ml_report_user

Note:
All new records are created and updated through the Predictive Intelligence Workbench application. Only users with the maint role can update the base system tables.

Tables installed with ITSM Predictive Intelligence Workbench

Table	Description
Usecase Prediction Run [piwb_prediction_run]	Used to define the test prediction type for a use case, whether it is a single or batch test.
PIWB Use Case Template [piwb_usecase_template]	Used to create a use case template. Extends the Application File [sys_metadata] table.
Setup Assistant Tracker [piwb_usecase_sa_tracker]	Used to track the status of the guided path steps (Stage or Task).
PIWB Setup Assistant Stage Task [piwb_sa_stage_task]	Used to store the tasks for each stage of setup assistant plan . Extends the PIWB Setup Assistant Base Task [piwb_sa_task_base] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tables installed with ITSM Predictive Intelligence Workbench (continued)

Table	Description
PIWB Setup Assistant Plan [piwb_sa_plan]	Used to define the Setup Assistant Plan (Guided Path) for each type of use case.
PIWB Setup Assistant Base Task [piwb_sa_task_base]	Used to create a new Setup Assistant Base Task record and to make the task active.
PIWB Use Case [piwb_usecase]	Used to create a new use case per prebuilt template (piwb_admin and piwb_manager can create, update, and delete; piwb_viewer can only view).
PI Solution Model [piwb_model]	Used to create a **Predictive Intelligence** solution model and to make the model active (piwb_admin and piwb_manager can create, update, and delete; piwb_viewer can only view).
PIWB Setup Assistant Stage [piwb_sa_stage]	Extends the PIWB Setup Assistant Base Task [piwb_sa_task_base] table.
Usecase Prediction Result [piwb_prediction_result]	Used to define a use case prediction result based on the Prediction Run and Model (piwb_admin and piwb_manager can create, update, and delete; piwb_viewer can only view).
PI Solution Comment [piwb_model_comment]	Used to define a comment on a **Predictive Intelligence** solution for a given class (piwb_admin and piwb_manager can create, update, and delete; piwb_viewer can only view).

Domain separation and Predictive Intelligence Workbench

Domain separation is supported in the Predictive Intelligence Workbench application. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Standard Support level

- Includes **Basic** level support.
- Business logic: Processes can be created or modified per customer by the service provider (SP). The use cases reflect proper use of the application by multiple SP customers in a single instance.
- The owner of the instance needs to be able to configure the minimum viable product (MVP) business logic and data parameters per tenant as expected for the specific application.

Domain separation in Predictive Intelligence Workbench - overview

Predictive Intelligence Workbench enables the creation of machine learning models using historic datasets. A machine learning model can be configured in Predictive Intelligence Workbench per domain, which ensures that the data used by the solution is domain-specific data. After a model is trained for a domain, the model calls for a prediction to be made for resolution, depending on what that domain belongs to. For example, the model predicts an incident or case.

How domain separation works in Predictive Intelligence Workbench

An instance owner can train a machine learning model for each domain by creating a model definition for each domain and training those models. In this way each model uses data specific to the corresponding domain.

- Data can be domain separated
- Domain column is present for base system application tables
- Domain-specific configuration is managed by instance owner
- Tenant domains can manage their own application data

Related topics

Domain separation for service providers

Configure ITSM Predictive Intelligence Workbench settings

View the default Predictive Intelligence Workbench property settings and configure them to meet your business process needs.

Before you begin

Role required: piwb_admin or piwb_manager

About this task

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

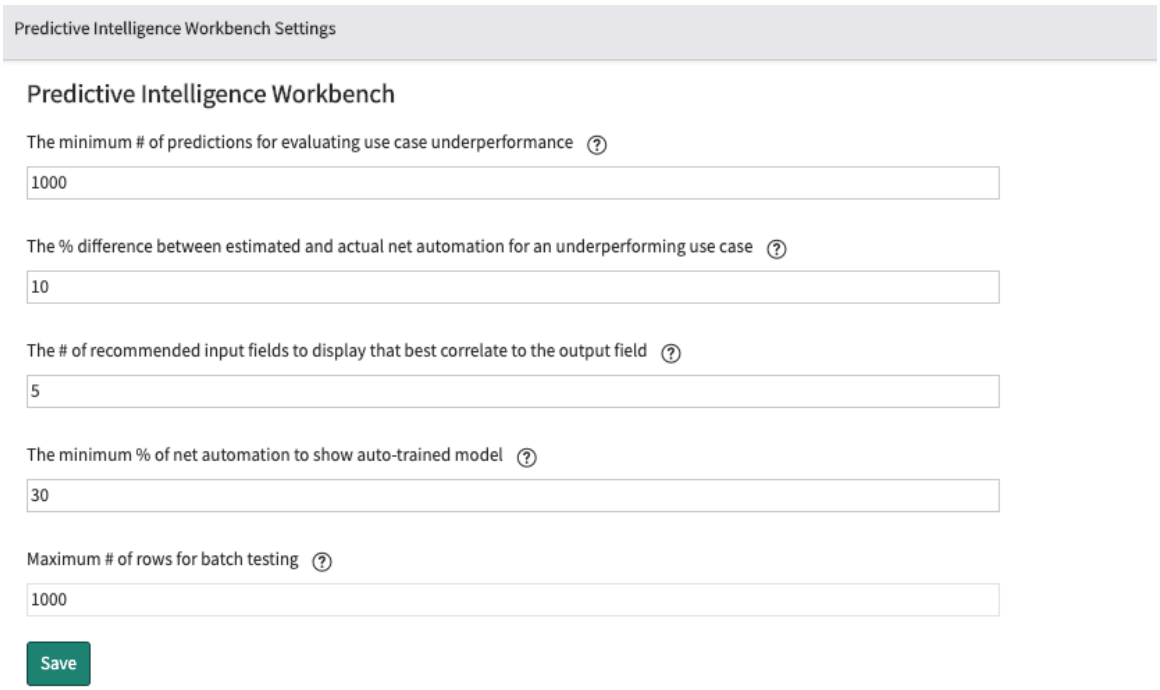
Predictive Intelligence Workbench includes several configurable property settings that enable you to define how you want to use and experience the application. For example, decide how

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

many rows you want for batch testing or the minimum percentage of net automation to show that a model is auto trained. Default settings are configured in the base-system application.

Procedure

1. Navigate to **All** > **Predictive Intelligence Workbench** > **Administration** > **Settings**.
   The Predictive Intelligence Workbench Settings page appears with default setting configurations.



2. Modify the property settings, if desired, or work within the default parameters.
3. Click **Save** if you make any changes.

ITSM Predictive Intelligence Workbench notifications

Email notifications are added with Predictive Intelligence Workbench.

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Predictive Intelligence Workbench includes several email notifications that alert users throughout the use case model implementation.

Predictive Intelligence process architects creating and training use case models receive an email notification when a use case model is successfully trained and when batch testing has finished successfully. If a use case fails training or if batch testing produces errors, users will receive notifications about these scenarios, as well.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Users can click a link in the email notification to view a newly trained use case or batch test results. They can also download the test results, if desired. Users can receive the following notifications:

Name	Description
Use case model training successful Table: PI Solution Model [piwb_model]	Sends an email to a specified user group when a use case model is successfully trained.
Batch test run complete	Sends an email to a specified user group when batch testing is complete.
Use case Model training failed Table: PI Solution Model [piwb_model]	Sends an email to a specified user group when a use case model training has failed.

Create an ITSM Predictive Intelligence Workbench user group and add users or roles to ensure Predictive Intelligence process architects are notified during the use case model implementation process. Refer to Create an ITSM Predictive Intelligence Workbench user group.

For more details about email notifications for Predictive Intelligence Workbench, refer to Preview email notification.

Create an ITSM Predictive Intelligence Workbench user group

Create an ITSM Predictive Intelligence Workbench user group and add users or roles to the group to receive email notifications when the use case model training and testing phase is complete.

Before you begin

Role required: admin

About this task

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Create an ITSM Predictive Intelligence Workbench user group and add either users or roles to the group so that email notifications are sent to alert users throughout the use case model training and testing phases.

Users can receive notifications for the following Predictive Intelligence Workbench events:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use case training is successful
- Batch testing is complete
- Use case training has failed

Procedure

To create an ITSM Predictive Intelligence Workbench user group and add users, refer to Create a user group.
For more information about the email notifications provided with this application, refer to ITSM Predictive Intelligence Workbench notifications.

Predictive Intelligence Workbench Migration Utility

Predictive Intelligence Workbench managers can easily migrate existing compatible Predictive Intelligence solution definitions into Predictive Intelligence Workbench. The Migration Utility enables a simplified configuration and expanded reporting functions.

Important:

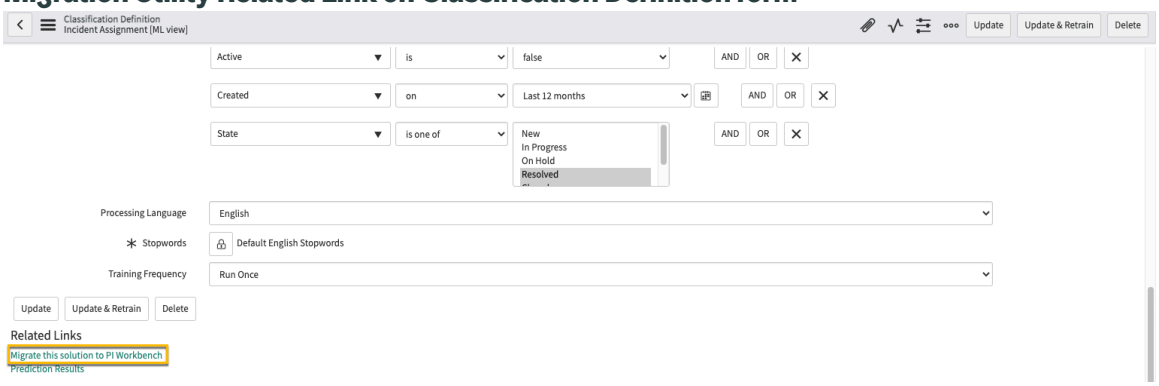
Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

The Predictive Intelligence Workbench Migration Utility enables existing Predictive Intelligence users with the piwb_manager role to convert a solution definition to a use case. The active solution is then converted into a model associated with the new use case.

A Related Link on the Predictive Intelligence Classification Definition form enables users to migrate a solution definition from Predictive Intelligence directly into Predictive Intelligence Workbench.

Migration Utility Related Link on Classification Definition form



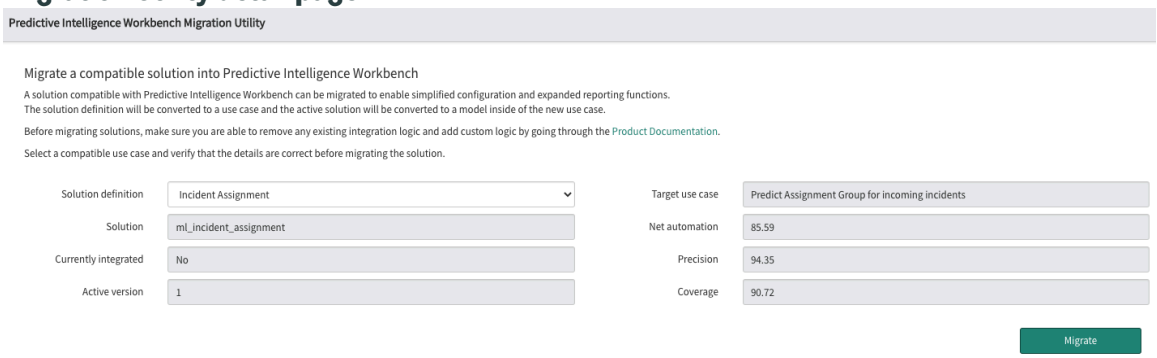
The Related Link only appears on the form when there is an active solution definition and that solution is not associated with a Predictive Intelligence Workbench use case.

Users can also access the Migration Utility as a module in the Predictive Intelligence Workbench application.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

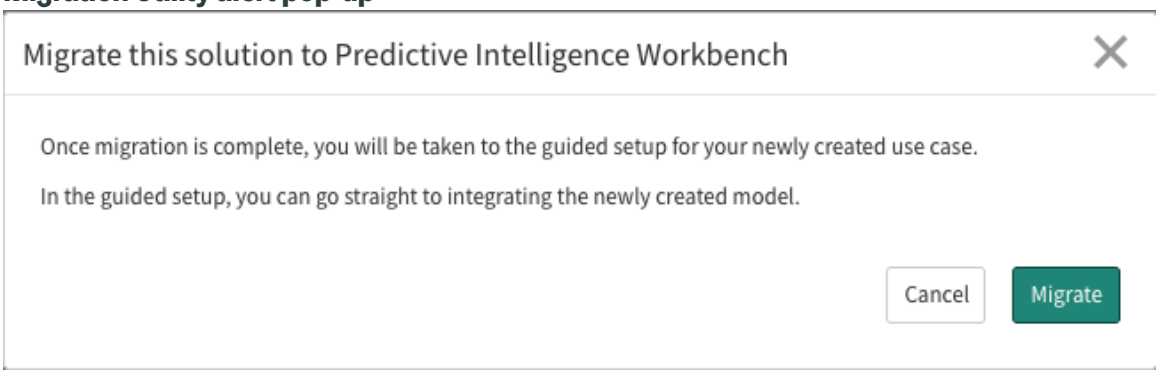
Clicking the **Migrate this solution to PI Workbench** Related Link or clicking the**Migration Utility** module, takes you to the Migration Utility detail page for the solution definition.

Migration Utility detail page

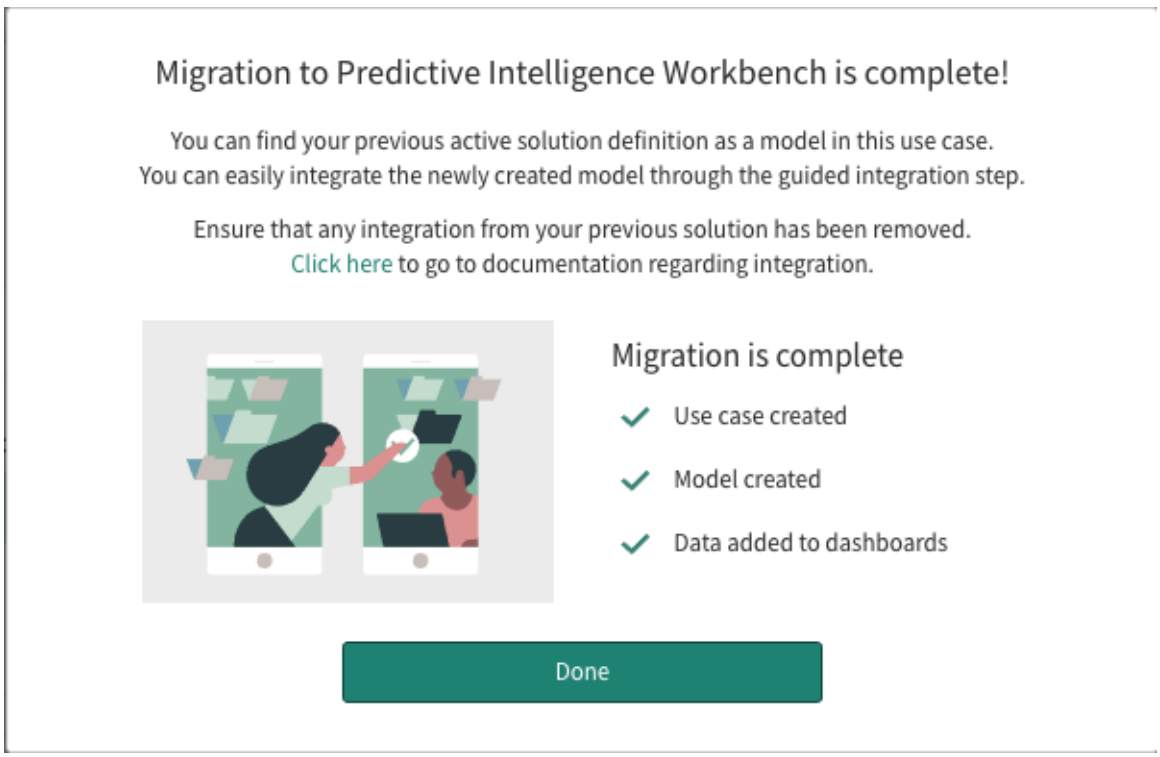


Clicking **Migrate** from the Migration Utility details page alerts you that a new use case will be created in Predictive Intelligence Workbench. You can then follow guided setup to integrate a new model.

Migration Utility alert pop-up



Clicking **Migrate** from this pop-up alert finalizes the migration.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predictive Intelligence Workbench pretrained use cases

The pretrain functionality mechanism for use cases enables and trains the machine learning solution definition when you activate the Predictive Intelligence Workbench application.

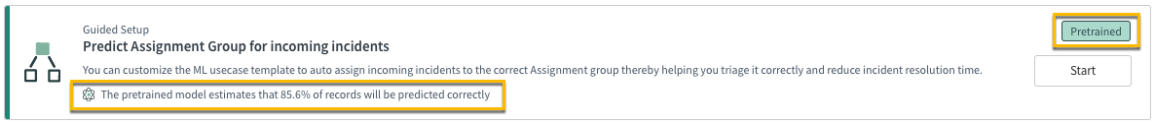
Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

When a pretrained machine learning solution exists in the system, Predictive Intelligence Workbench highlights the use case templates with the **Pretrained** flag.

ITSM Predictive Intelligence Workbench pretrained model use case template



The **Pretrained** flag for use case templates displays when the following criteria are met.

- The Predictive Intelligence Workbench *piwb.instance_eligible_auto_train* system property for pretraining is enabled (true) on the your instance. This property is disabled by default. Requires the piwb_admin role to enable.
- The instance has to be one of the following types:
  - ded-prod
  - shared-prod
  - ded-subprod
  - shared-subprod
- The associated machine learning solution is active and ready for deployment.
- The use case template does not contain an existing pretrained use case.
- The machine learning solution net automation is greater than the threshold value.

  Note:
  The default base-system threshold value is 30. You can configure this value via the Predictive Intelligence Workbench *piwb.auto_train_threshold* system property for. Requires the piwb_admin role to modify the default value.

- The machine learning solution is a pretrained base-system solution with an associated record for its definition in the ML Auto Train Solution [ml_autotrain_solution] table.

Predictive Intelligence Workbench integration and customization

Predictive Intelligence Workbench uses scripted extension points to integrate a trained use case model for prediction.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Scripted extension points for trained use case integration implementation

The scripted extension point is *PIWBPredictionProcessor* and *PIWBPredictionProcessor_incident* is the default implementation of *PIWBPredictionProcessor* for the Incident [incident] table. *PIWBPredictionProcessor_incident* runs all the predictions for integrated incident-related use case models.

Customizing default implementation

If you want to customize the default implementation, you can modify the *PIWBPredictionProcessor_incident* script. The business rule *PIWB Prediction - Incident* on the Incident table calls the *PIWBPredictionProcessor_incident* script for predictions. For details about scripted extension points, refer to Using extension points to extend application functionality.

ITSM Predictive Intelligence Workbench implementation

Use machine learning to optimize your business processes. You can train and implement ITSM Predictive Intelligence Workbench use case models to augment your existing application workflows.

Important:

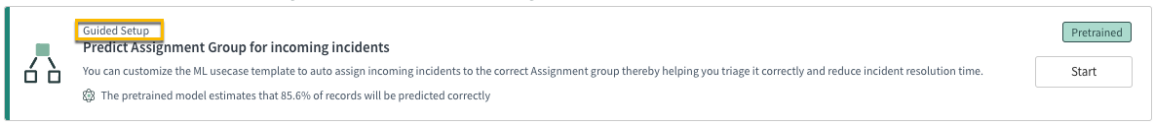
Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Explore use case templates

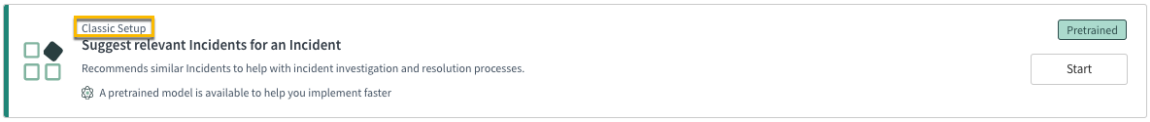
Users with the piwb_admin or piwb_manager role can explore the prebuilt use case templates and create predictive machine learning models. To create a machine learning model, you first select a prebuilt use case template. Some of the prebuilt templates are guided and display the **Guided Setup** flag. These templates include a comprehensive setup process to help ease you through implementation. Non-guided templates display the **Classic Setup** flag.

ITSM Predictive Intelligence Workbench guided use case template



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

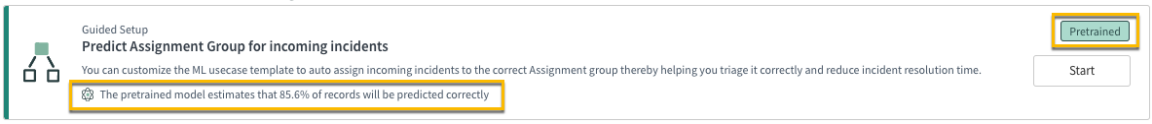
ITSM Predictive Intelligence Workbench classic setup use case template



Templates with available pretrained models accelerate your setup process, by providing a pre-generated model based on your data. When a template indicates **Pretrained**, this means you can go directly to the evaluation phase of the use case setup. If the pretrained model is acceptable, you can directly integrate it with your business processes. Otherwise, you can tune this model or create another model. You may change the name and description of the use case later. Pretrained models display the estimated percentage of your correctly predicted incidents.

Templates with available pretrained models also display the estimated percentage of the correctly predicted incidents. If the pretrained model is acceptable, you can directly integrate it with your business processes. Otherwise, you can tune this model or create another model. You may change the name and description of the use case later. Pretrained models display the estimated percentage of your correctly predicted incidents.

ITSM Predictive Intelligence Workbench pretrained model use case template



Non-guided, **Classic Setup** templates provide links to relevant Predictive Intelligence Workbench product documentation or link to the ServiceNow platform Predictive Intelligence application with the **Take me there**button.

ITSM Predictive Intelligence Workbench links to product documentation and Predictive Intelligence product documentation

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use case creation phases

Creating a predictive machine learning model involves several phases. After you create and train your model you need to evaluate and tune it, test its prediction results, and then integrate it with your business process. Use case model creation phases include:

- Create and train models: Define parameters to create a model that you will train based on your unique data. It is common to create multiple models in this phase. You will tune and refine your models by defining the right combination of coverage and precision to use.
- Test your models: Get prediction results from your models to decide which one is best to integrate with your business process. To see if a model returns a correct result, you can use either the single or batch testing process.
- Integrate the best model: Deploy the best model into your business process. After you determine which model returns the best, correct result, integrate it into production.

Note:
For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

Predict Assignment Group for incoming incidents

Use this guided template to auto-assign incoming incidents to the correct assignment group to reduce your incident resolution times.

Before you begin

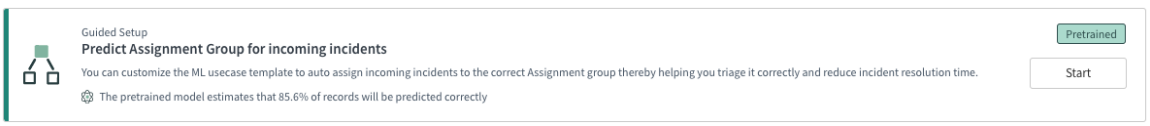
Role required: piwb_manager or piwb_viewer

About this task

This template walks you through customizing a use case model to predict the correct assignment group for your incoming incidents. When the use case template shows the label **Pretrained**, you can bypass several implementation steps and are automatically taken to evaluate and tune your models when you click **Start**. Otherwise, you will begin by creating a machine learning model.

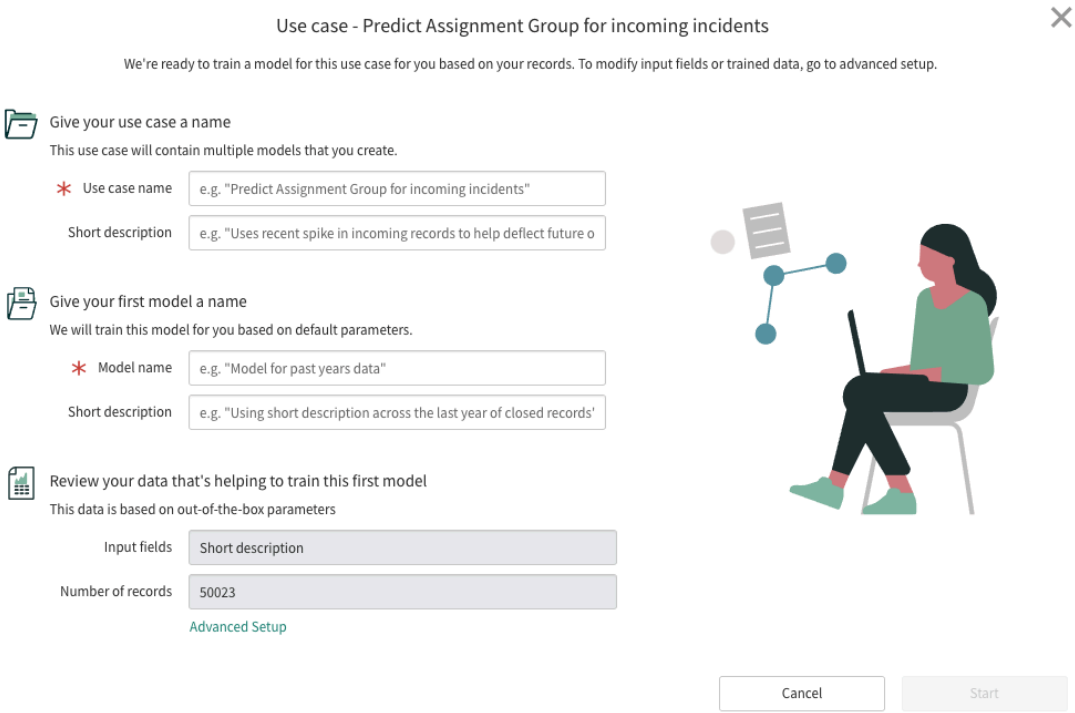
Procedure

1. Navigate to **All** > **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Predict Assignment Group for incoming incidents** guided template.



3. In the **Use case - Predict Assignment Group for incoming incidents** pop-up form, provide a unique name for your use case in the **Use case name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
The use case will contain multiple models that you create. You can use the same name as the template, if desired.

4. Although not mandatory, it's beneficial to provide unique details about the use case in the **Short description** field.

Note:
Typically the short description provides details about what the goal of the use case is or your purposes for creating the use case.

5. Provide a name for the model in the **Model name** field.

Note:
Models are trained based on default parameters. The name of the model should reflect its purpose, for example, "Model for past years data".

6. Review the base system parameters set to help train the model in the **Input fields** and **Number of records** fields.
7. Modify this data by clicking **Advanced Setup**.

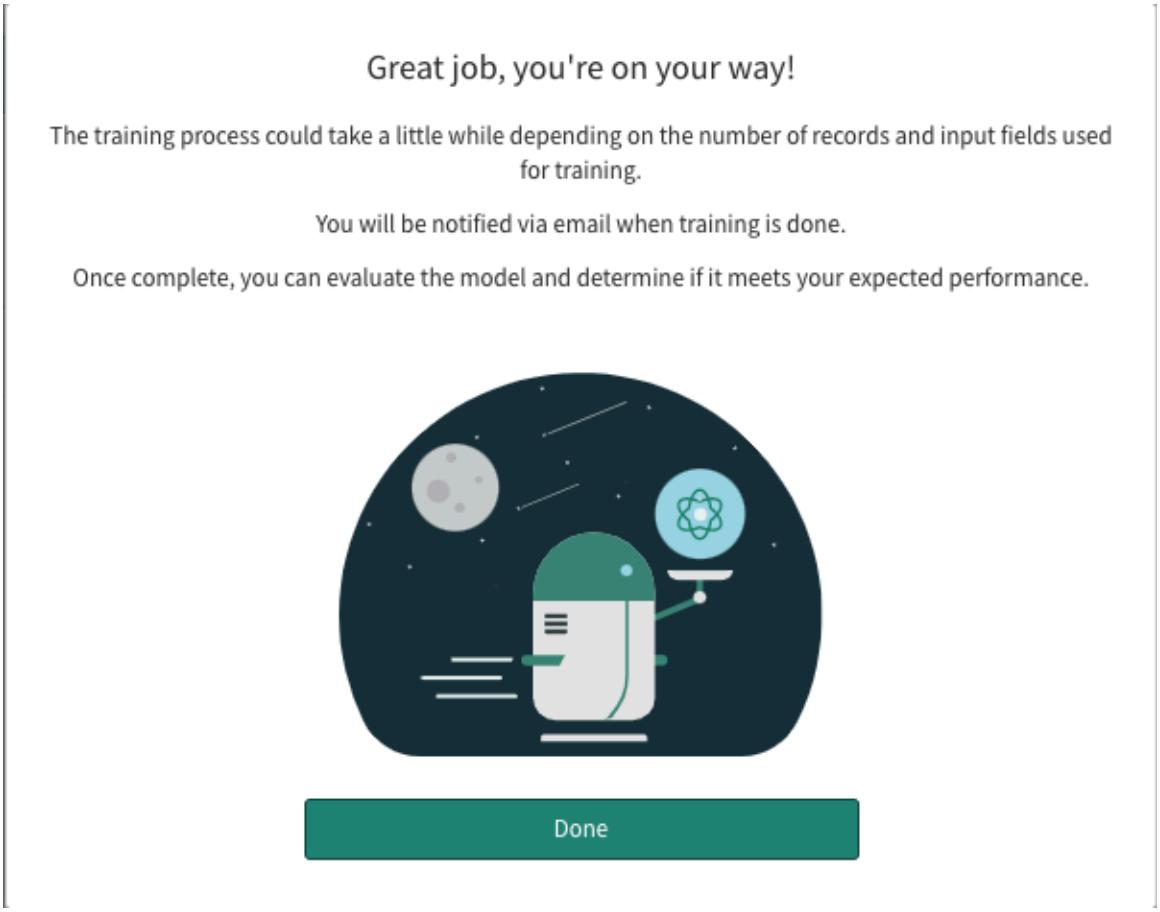
Note:
By clicking **Advanced Setup** you can change the processing language, review and modify filters used to train the model. You can customize the filters to best represent your business data or add new criteria by clicking **New Criteria**. Review and modify input fields used to generate predictions. Customize the fields to best represent your business data by moving fields between the **Available** and **Selected** lists. Save any changes you make.

8. Click **Start**.

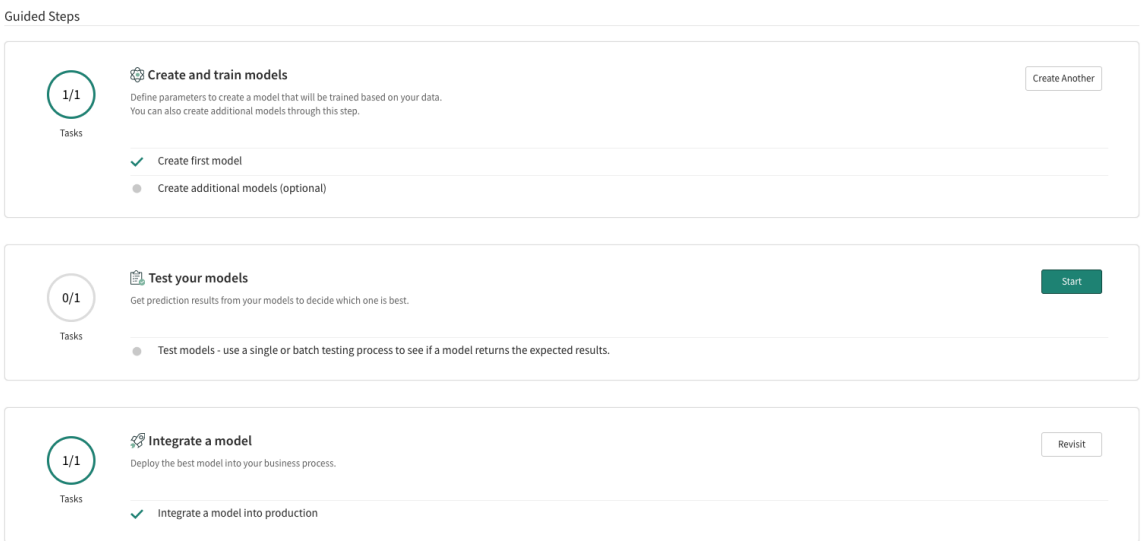
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A pop-up message lets you know your model is created and that training is underway.

Note:
To start implementation, you must provide at least a use case name and model name.

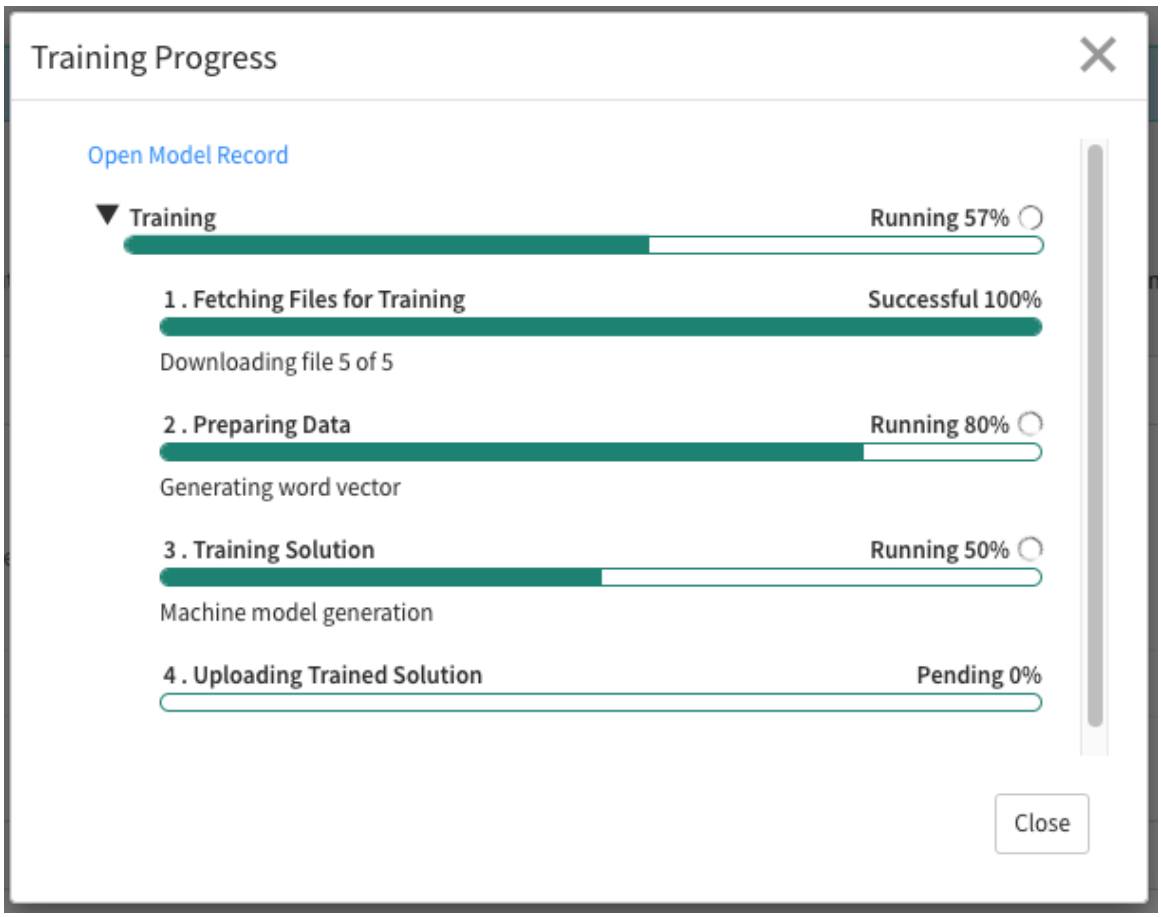


9. Click **Done**.
The use case page displays the name and description of the use case you created. On this page, you can see all the guided implementation phases you will work through to create and implement your use case model.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Click **View Progress** below the header on the use case setup page to monitor a current training process.



Note:
When training is complete, you will receive an email notification letting you know your use case model training was successful. For more information about use case model notifications, refer to ITSM Predictive Intelligence Workbench notifications.

11. Click the model name under **Trained Models** on the use case setup page to view associated data about the trained model.
The **Model details** page opens.
12. In the **Retraining Schedule** field of the **Models detail** page you can change the definition, if desired.
The default value is **Every 30 days**, but you can retrain as often as once to every 180 days
13. If you made schedule retraining changes to the use case model, click either **Update** or **Update and retrain**, to retrain again.
14. To tune a model, click **Tune Values** on the use case setup page under **Trained Models**.
The tuning page for the use case opens displaying the associated model name with the following data: **Distribution (%)**, **Net Automation**, **Precision (%)**, **Coverage (%)**, and any comments. View the evaluation data used for the use case and associated model.

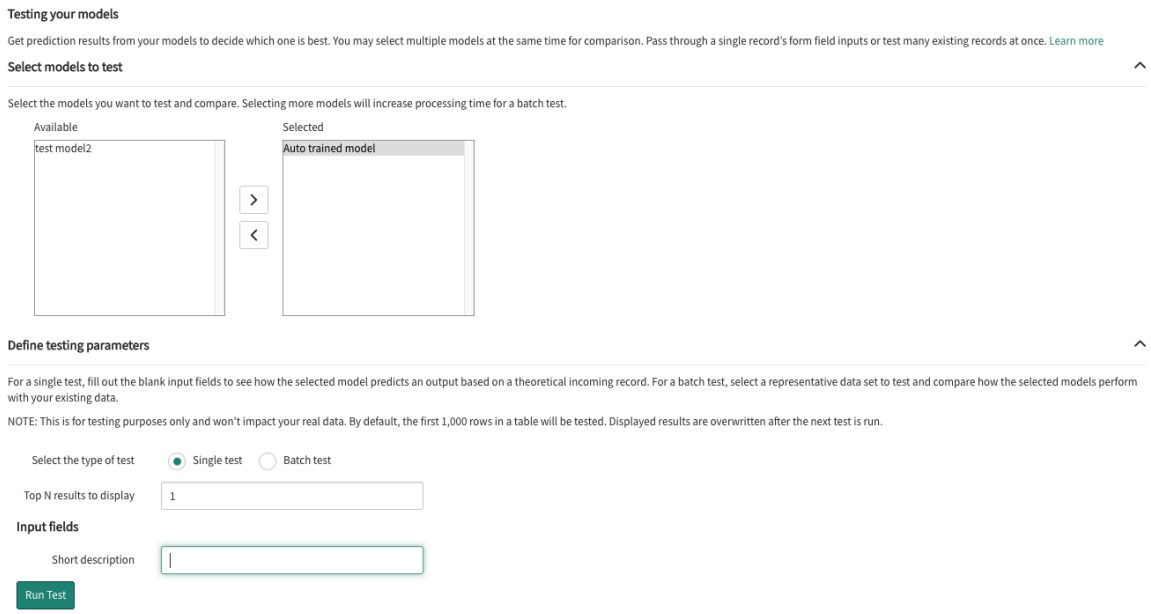
Note:
You can only tune values when the model is trained.

15. If desired, tune and refine the model by defining the right combination of coverage and precision to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Double-click in the **Precision (%)** and **Coverage (%)** fields to change values. Changes are automatically saved.

16. If desired, click **Create Another** to create another model associated with your use case in the **Create and train models** section of the setup page.
    Repeat the process to create and train the model.
17. In the **Test your models** section of the use case page, click **Start** to begin the testing process.
    The **Testing your models** page opens.



18. Under **Select models to test**, decide if there are other use case models available that you want to test.
    If so, move them to the **Selected** list.
19. Under **Define testing parameters**, decide if you want to test one use case model.

    If so, select the **Single test** test type. **Single test** is the default.

    Note:
    Select **Batch test** when you want to test more than one use case model.

20. Determine the number of top results you want to display.
21. Under **Input fields**, provide a short description of your use case model test.
22. Click **Run Test**.
23. View the test results data for the use case model under **View test results**.

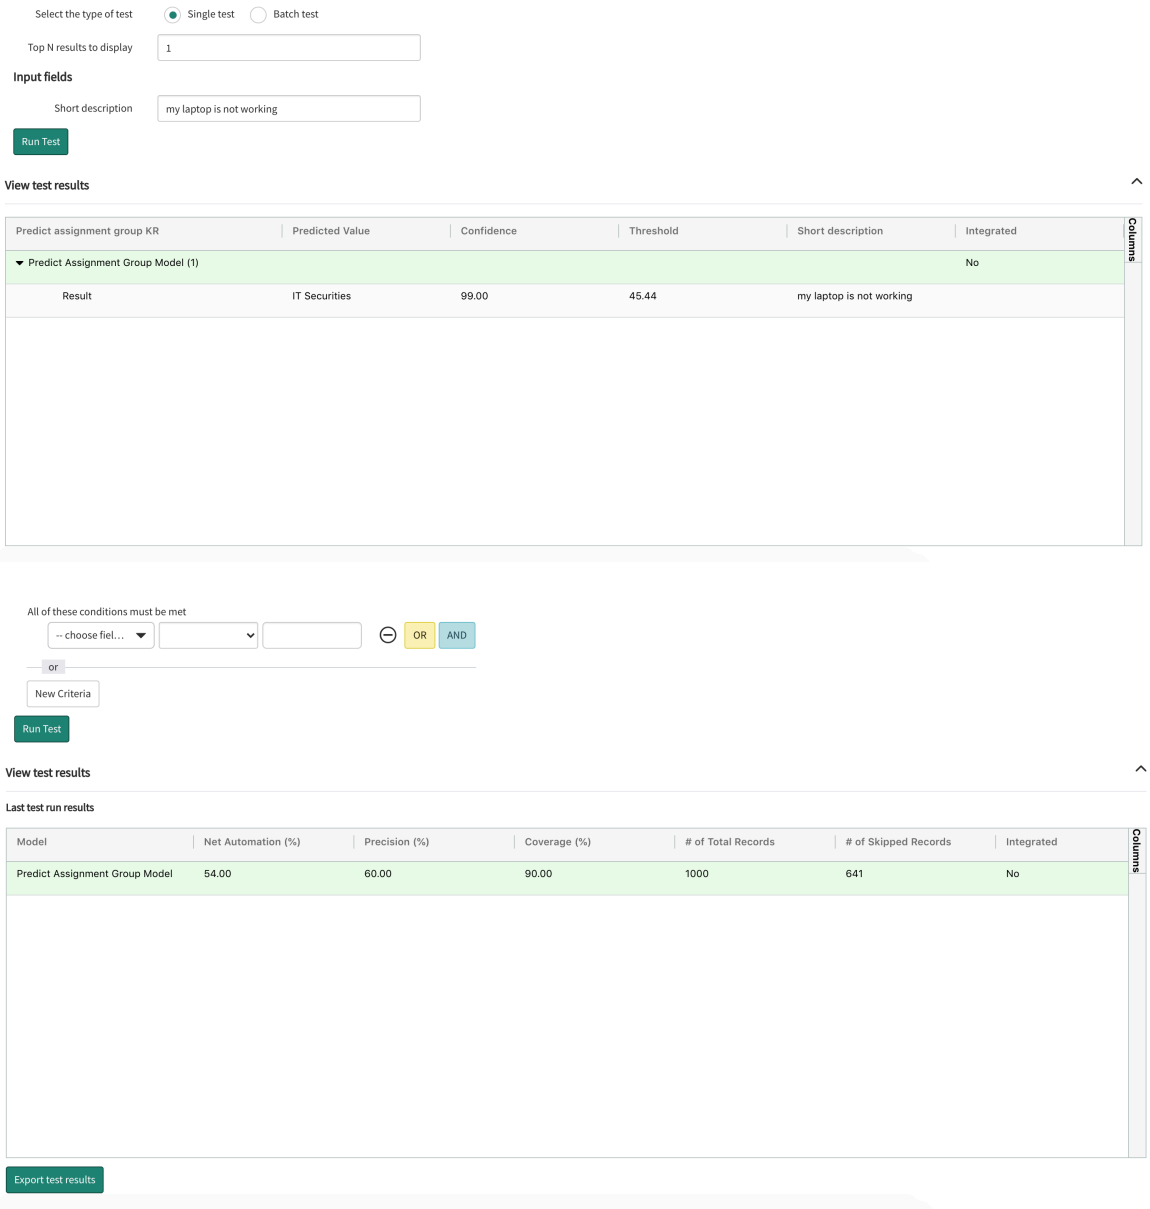
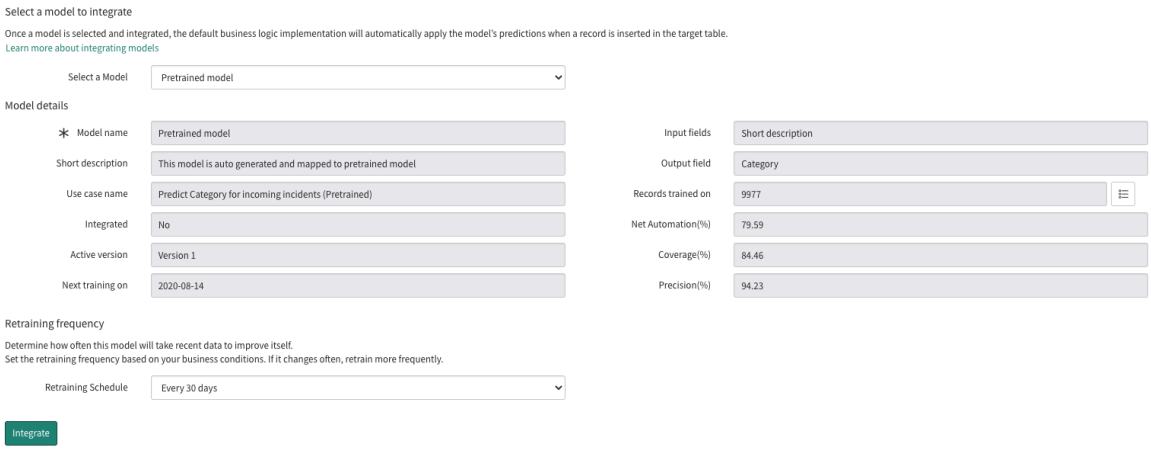
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



24. If you are ready to integrate your use case model into your business processes, return to the use case set up page and click **Start** in the **Integrate a model** section.
The **Select a model to integrate** page opens.

25. In the **Select a Model** drop-down menu, select the model you want to integrate.
The **Select a model to integrate** page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
You can change the retraining schedule via this page if you desire. Use the **Retraining Schedule** drop down selection field to change from the default 30 day value.

26. Click **Integrate**.
27. Click **Integrate** again when the pop-up asks you if you are sure you want to perform this action. You have integrated a use case model into your business process.

Note:
For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

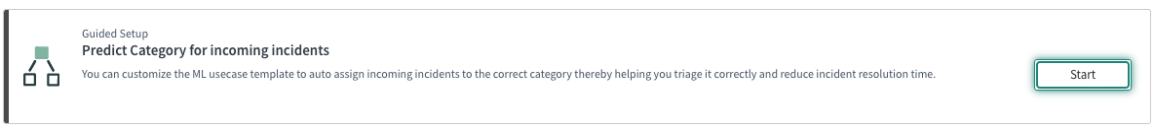
Predict Category for incoming incidents

Use this guided template to auto-assign incoming incidents to the correct category to reduce your incident resolution times.

Before you begin
Role required: piwb_manager or piwb_viewer

About this task
This template walks you through customizing a use case model to predict the category for your incoming incidents. When the use case template shows the label **Pretrained**, you can bypass several implementation steps and are automatically taken to evaluate and tune your models when you click **Start**. Otherwise, you will begin by creating a machine learning model.

Procedure
1. Navigate to **All** > **Predictive Intelligence Workbench** > **Use Cases** > **Templates**.
2. Select the **Predict Category for incoming incidents** guided template.



3. In the **Use case - Predict Category for incoming incidents** pop-up form, provide a unique name for your use case in the **Use case name** field.

Predict Service for incoming incidents

Use this guided template to auto-assign incoming incidents to the correct service to reduce your incident resolution times.

Before you begin

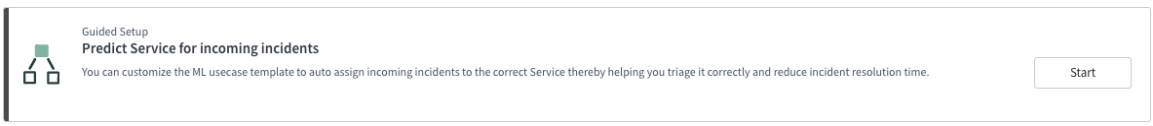
Role required: piwb_manager or piwb_viewer

About this task

This template walks you through customizing a use case model to predict the service for your incoming incidents. When the use case template shows the label **Pretrained**,you will bypass several implementation steps and are automatically taken to evaluate and tune your models when you click **Start**. Otherwise, you will begin by creating a machine learning model.

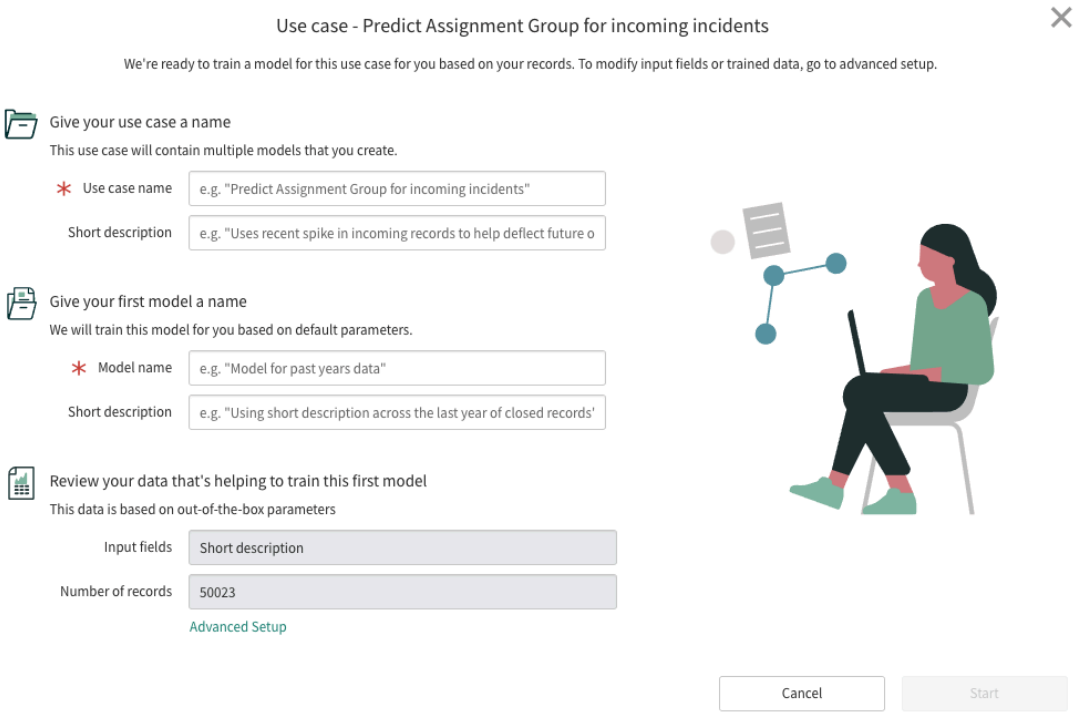
Procedure

1. Navigate to **All** > **Predictive Intelligence Workbench** > **Use Cases** > **Templates**.
2. Select the **Predict Service for incoming incidents** guided template.



3. In the **Use case - Predict Service for incoming incidents** pop-up form, provide a unique name for your use case in the **Use case name** field.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
The use case will contain multiple models that you create. You can use the same name as the template, if desired.

4. Although not mandatory, it's beneficial to provide unique details about the use case in the **Short description** field.

Note:
Typically the short description provides details about what the goal of the use case is or your purposes for creating the use case.

5. Provide a name for the model in the **Model name** field.

Note:
Models are trained based on default parameters. The name of the model should reflect its purpose, for example, "Model for past years data".

6. Review the base system parameters set to help train the model in the **Input fields** and **Number of records** fields.

   To modify this data, click **Advanced Setup**.

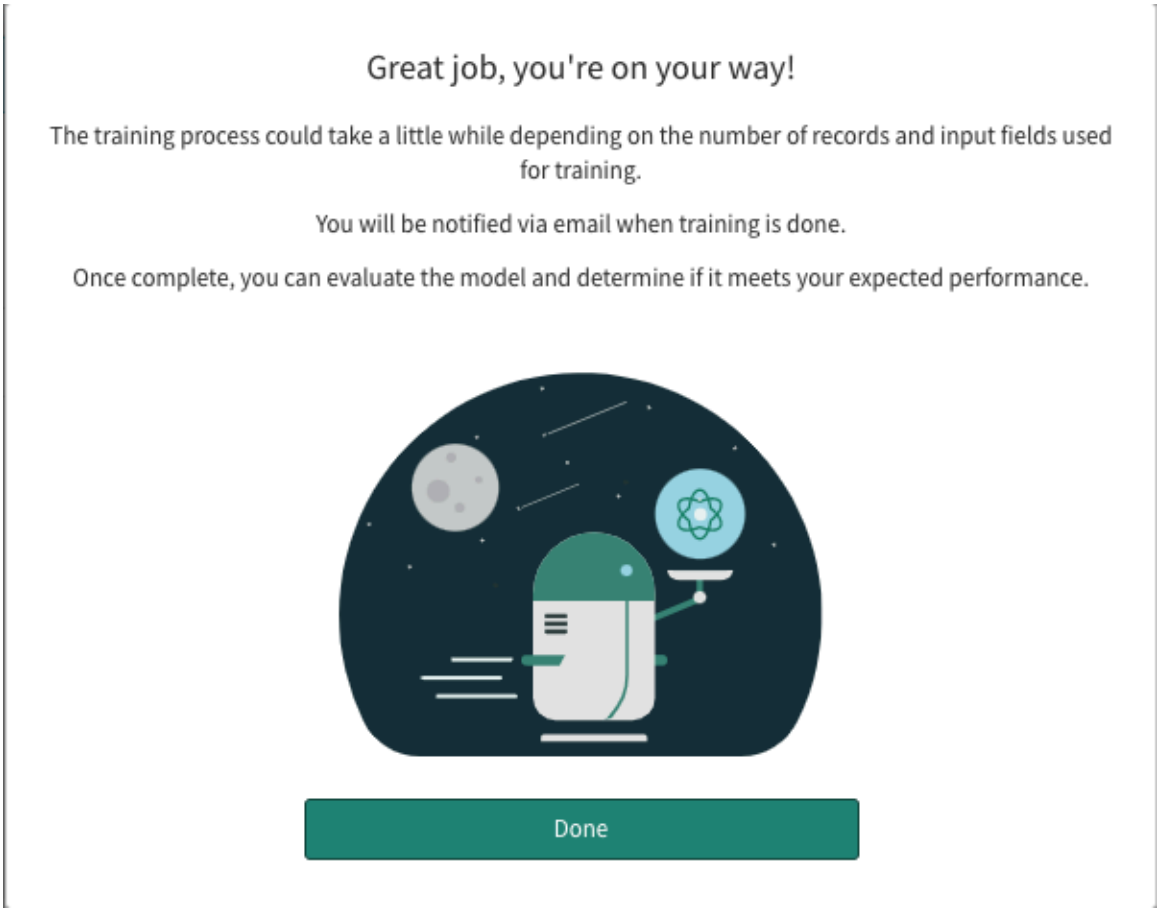
Note:
By clicking **Advanced Setup** you can change the processing language, review and modify filters used to train the model. You can customize the filters to best represent your business data or add new criteria by clicking **New Criteria**. Review and modify input fields used to generate predictions. Customize the fields to best represent your business data by moving fields between the **Available** and **Selected** lists. Save any changes that you make.

7. Click **Start**.

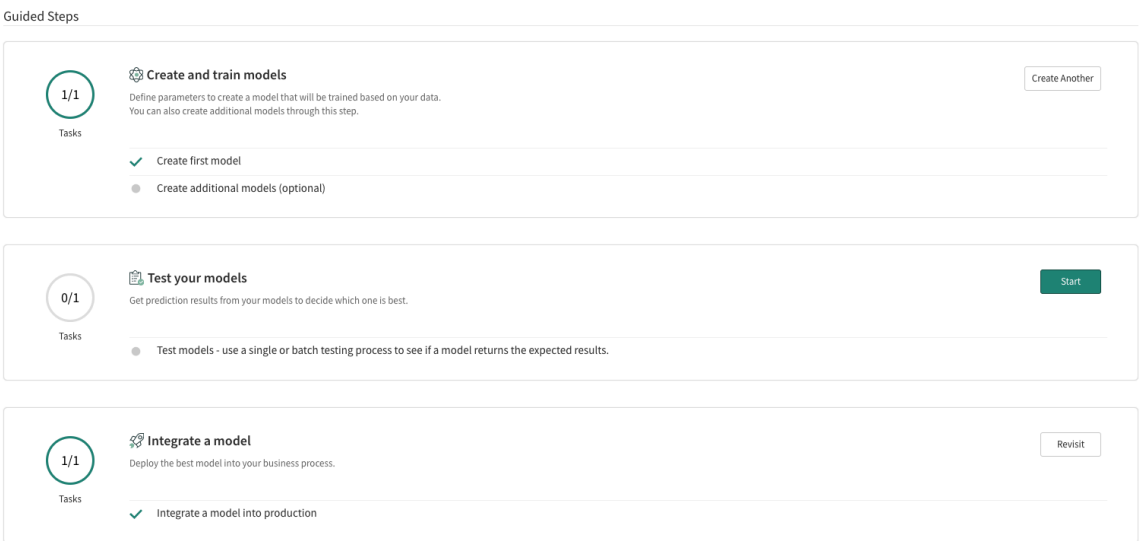
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A pop-up message lets you know your model is created and that training is underway.

Note:
To start implementation, you must provide at least a use case name and model name.

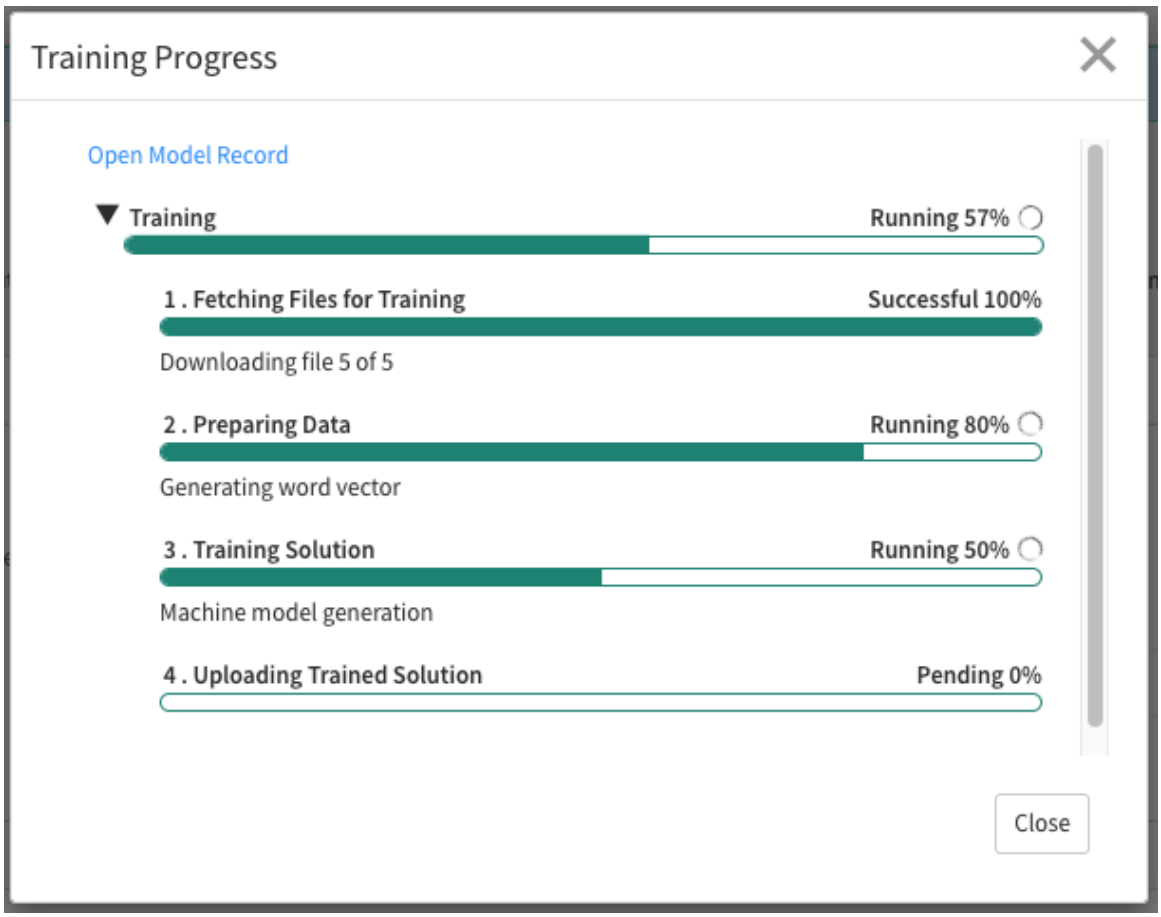


8. Click **Done**.
   The use case page displays the name and description of the use case you created. On this page, you can see all the guided implementation phases you will work through to create and implement your use case model.



© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Click **View Progress** below the header on the use case setup page to monitor a current training process.



Note:
When training is complete, you will receive an email notification letting you know your use case model training was successful. For more information about use case model notifications, refer to ITSM Predictive Intelligence Workbench notifications.

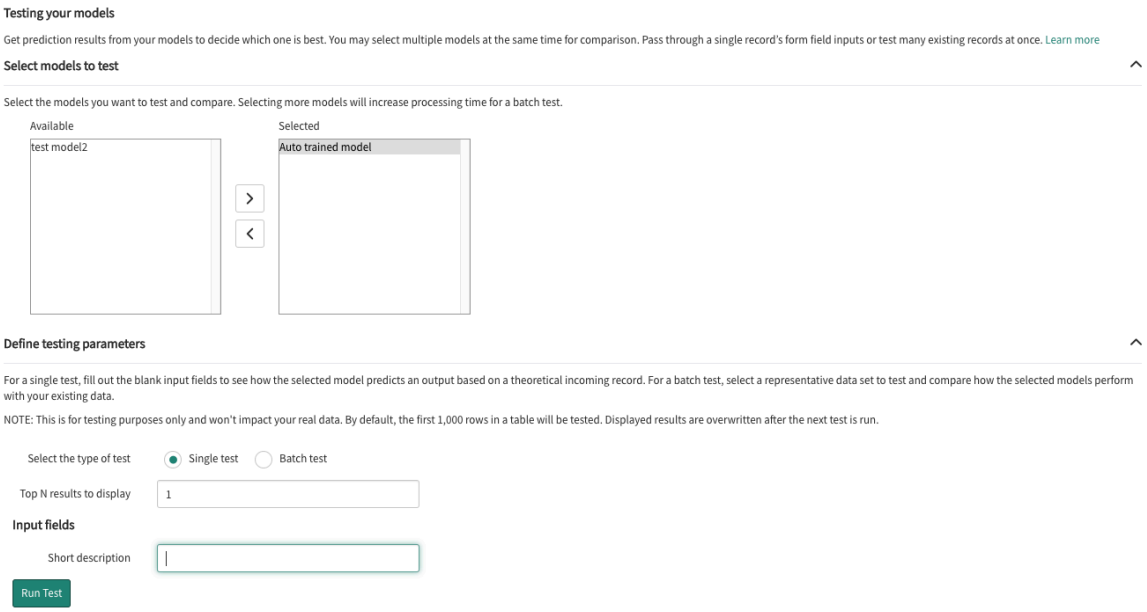
10. Click the model name under **Trained Models** on the use case setup page to view associated data about the trained model.
The **Model details** page opens.
11. In the **Retraining Schedule** field of the **Models detail** page you can change the definition, if desired.
The default value is **Every 30 days**, but you can retrain as often as once to every 180 days.
12. If you made schedule retraining changes to the use case model, click either **Update** or **Update and retrain**, to retrain again.
13. To tune a model, click **Tune Values** on the use case setup page under **Trained Models**.
The tuning page for the use case opens displaying the associated model name with the following data: **Distribution (%)**, **Net Automation**, **Precision (%)**, **Coverage (%)**, and any comments. View the evaluation data used for the use case and associated model

Note:
You can only tune values when the model is trained.

14. If desired, tune and refine the model by defining the right combination of coverage and precision to use.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

15. Double-click in the **Precision (%)** and **Coverage (%)** fields to change values.
    Changes are automatically saved.
16. If desired, click **Create Another** to create another model associated with your use case in the **Create and train models** section of the setup page.
    Repeat the process to create and train the model.
17. In the **Test your models** section of the use case page, click **Start** to begin the testing process.
    The **Testing your models** page opens.



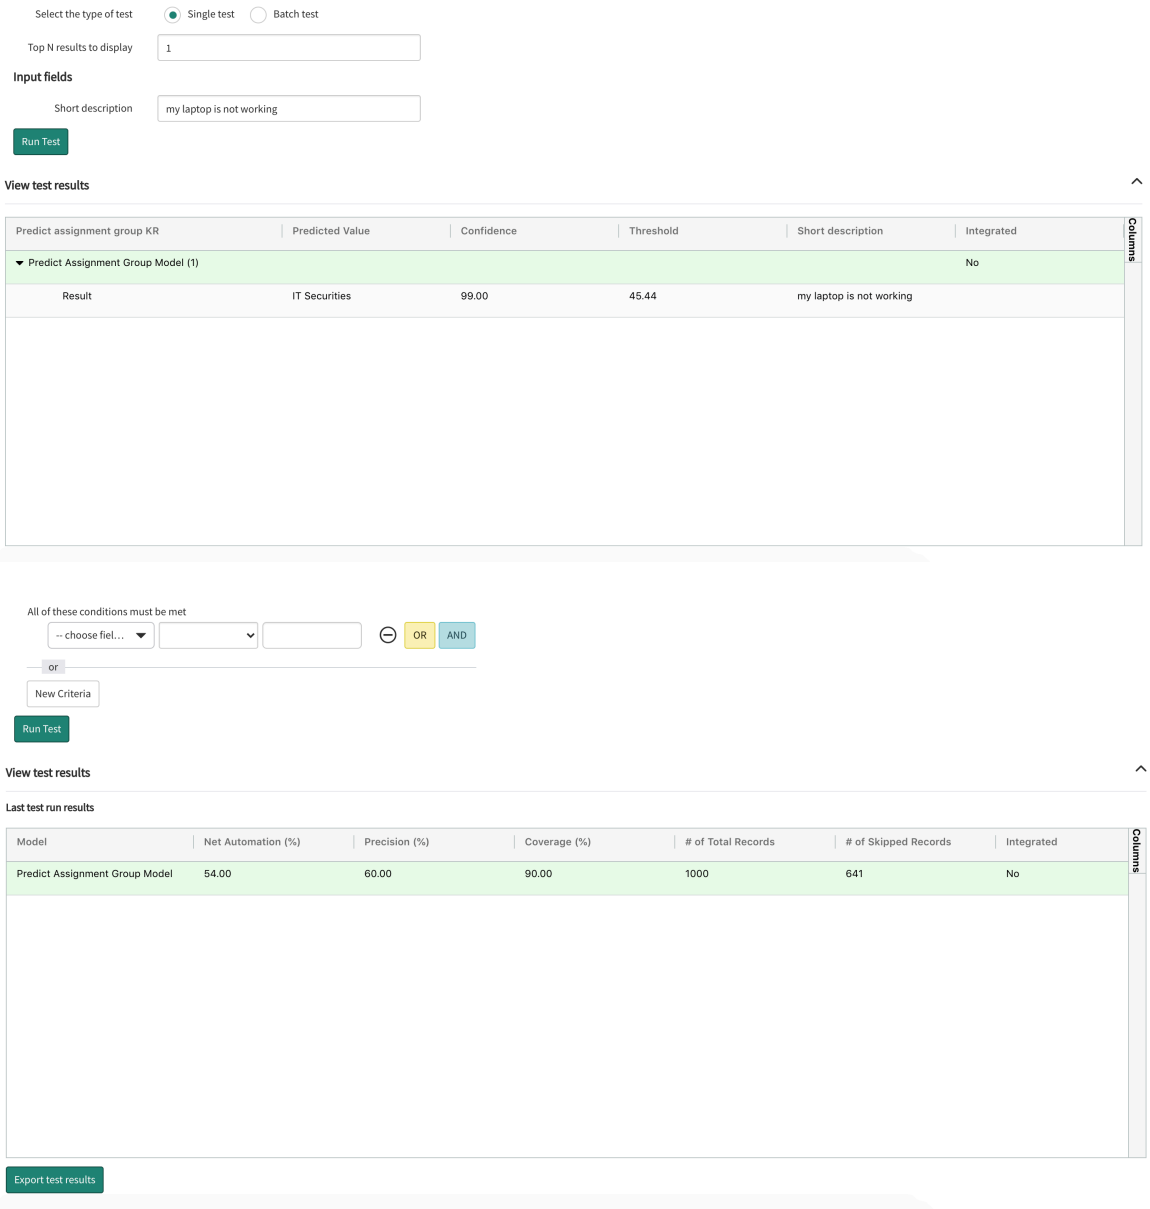
18. Under **Select models to test**, decide if there are other use case models available that you want to test.
    If so, move them to the **Selected** list.
19. Under **Define testing parameters**, decide if you want to test one use case model.

    If so, select the **Single test** test type. **Single test** is the default.

    Note:
    Select **Batch test** when you want to test more than one use case model.

20. Determine the number of top results you want to display.
21. Under **Input fields**, provide a short description of your use case model test.
22. Click **Run Test**.
23. View the test results data for the use case model under **View test results**.

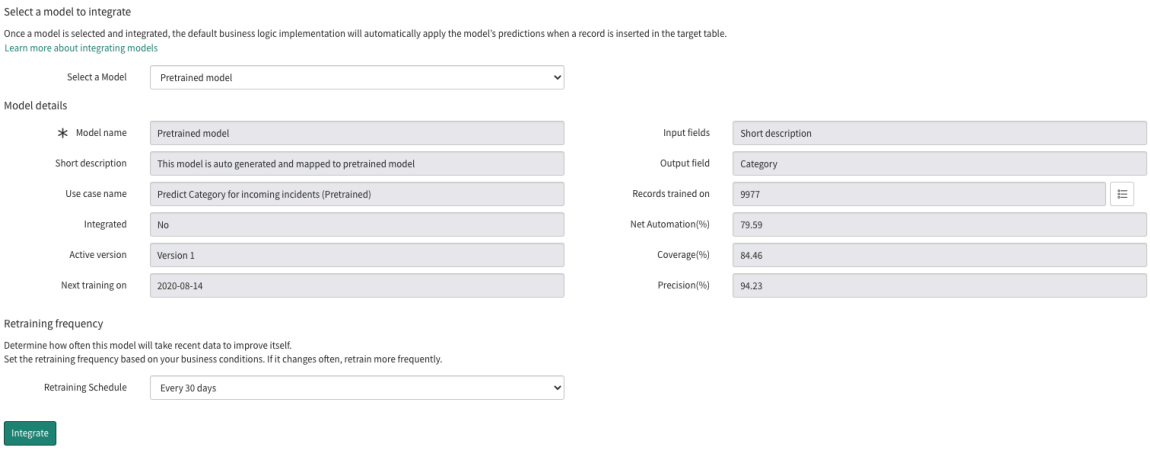
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



24. If you are ready to integrate your use case model into your business processes, return to the use case set up page and click **Start** in the **Integrate a model** section.
The **Select a model to integrate** page opens.

25. In the **Select a Model** drop-down menu, select the model you want to integrate.
The **Select a model to integrate** page opens.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
You can change the retraining schedule via this page if you desire. Use the **Retraining Schedule** drop down selection field to change from the default 30 day value.

26. Click **Integrate**.
27. Click **Integrate** again when the pop-up asks you if you are sure you want to perform this action. You have integrated a use case model into your business process.

Note:
For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

Similar Business Applications

Use this template to recommend the business application category based on name and description of existing business applications.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM business application category recommendations based on name and description of existing business applications. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an incoming incident with past resolved incidents for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Suggest relevant Incidents for an Incident** template.
   The **Suggest relevant Incidents for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select an incidents-related table, such as Incident [incidents] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find incidents based on the short description.

      Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

   b. Create and train a similarity solution.

   c. For this initial model creation, provide the similarity solution definition label `Similar Incidents` in the **Label** field.

   d. Set the **Training Frequency** field to **Run Once**.
      You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

   e. Set the **Update Frequency** field to **Every 15 minutes**.
      This setting defines the frequency at which past incidents refresh in the search window.

      When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for incoming incidents. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

      The **Filter** field conditions determine the search window for past resolved incidents. Configure the filter conditions to optimize for the best set of resolved incidents to search within. This includes many considerations, such as, time frame, location, category where incidents are relevant, and more.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

   If you have a similarity score above 60, but the two incidents do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

   If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

   If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
   You can manually provide inputs and select the top similar results outcome values.
6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.
   You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.
7. Integrate trained models by exporting them to production.

   Note:
   For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

8. Monitor similarity results and ensure IT agents are providing useful feedback.

   The base-system Predictive Intelligence experience includes a built-in feedback mechanism to discern if the similarity results are useful. Train your IT agents to provide feedback, both online and offline, to capture this data for future reporting. Since this is an unsupervised algorithm, you may need to acquire periodic feedback from the IT agents to check that the similarity model is still providing satisfactory results. This feedback is the only way to determine if the model has drifted and requires new training. Ensure that part of your implementation and integration strategy, as well as your change management process, includes training IT agents to provide similarity results feedback.

9. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

   Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

   For information regarding the Predictive Intelligence for Incidents dashboard, see ITSM Predictive Intelligence Workbench dashboard.

9. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

   Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

   For information regarding the Predictive Intelligence for Incidents dashboard, refer to ITSM Predictive Intelligence Workbench dashboard.

Suggest relevant Incidents for an Incident

Use this template to recommend similar relevant incidents to help expedite your incident investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for incoming incidents. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an incoming incident with past resolved incidents for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Suggest relevant Incidents for an Incident** template.
   The **Suggest relevant Incidents for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select an incidents-related table, such as Incident [incidents] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find incidents based on the short description.

Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

b. Create and train a similarity solution.

c. For this initial model creation, provide the similarity solution definition label `Similar Incidents` in the **Label** field.

d. Set the **Training Frequency** field to **Run Once**.
You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

e. Set the **Update Frequency** field to **Every 15 minutes**.
This setting defines the frequency at which past incidents refresh in the search window.

When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for incoming incidents. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

The **Filter** field conditions determine the search window for past resolved incidents. Configure the filter conditions to optimize for the best set of resolved incidents to search within. This includes many considerations, such as, time frame, location, category where incidents are relevant, and more.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

If you have a similarity score above 60, but the two incidents do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
You can manually provide inputs and select the top similar results outcome values.

6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.

7. Integrate trained models by exporting them to production.

   Note:
   For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

8. Monitor similarity results and ensure IT agents are providing useful feedback.

   The base-system Predictive Intelligence experience includes a built-in feedback mechanism to discern if the similarity results are useful. Train your IT agents to provide feedback, both online and offline, to capture this data for future reporting. Since this is an unsupervised algorithm, you may need to acquire periodic feedback from the IT agents to check that the similarity model is still providing satisfactory results. This feedback is the only way to determine if the model has drifted and requires new training. Ensure that part of your implementation and integration strategy, as well as your change management process, includes training IT agents to provide similarity results feedback.

9. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

   Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

   For information regarding the Predictive Intelligence for Incidents dashboard, refer to ITSM Predictive Intelligence Workbench dashboard.

Suggest relevant Incidents for a Major Incident

Use this template to recommend similar resolved incidents to help expedite your major incident investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for incoming incidents. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an incoming incident with past resolved incidents for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Suggest relevant Major Incident for an Incident

Use this template to recommend similar resolved major incidents to help expedite your incident investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for incoming incidents. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an incoming incident with past resolved incidents for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Suggest relevant Major Incident for an Incident** template.
   The **Suggest relevant Major Incident for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select an incidents-related table, such as Incident [incidents] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find incidents based on the short description.

      Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

   b. Create and train a similarity solution.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. For this initial model creation, provide the similarity solution definition label `Similar Incidents` in the **Label** field.

d. Set the **Training Frequency** field to **Run Once**.
You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

e. Set the **Update Frequency** field to **Every 15 minutes**.
This setting defines the frequency at which past incidents refresh in the search window.

When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for incoming incidents. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

The **Filter** field conditions determine the search window for past resolved incidents. Configure the filter conditions to optimize for the best set of resolved incidents to search within. This includes many considerations, such as, time frame, location, category where incidents are relevant, and more.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

If you have a similarity score above 60, but the two incidents do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
You can manually provide inputs and select the top similar results outcome values.

6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.
You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.

7. Integrate trained models by exporting them to production.

Note:
For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

Suggest relevant KB articles for an Incident

Use this template to recommend relevant knowledge base articles to help expedite your incident investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for incoming incidents. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an incoming incident with relevant knowledge base articles for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Suggest relevant KB article for an Incident** template.
   The **Suggest relevant KB article for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select an incidents-related table, such as Incident [incidents] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find incidents based on the short description.

      Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

   b. Create and train a similarity solution.

   c. For this initial model creation, provide the similarity solution definition label `Similar Knowledge Articles` in the **Label** field.

   d. For this initial model creation, set the **Training Frequency** field to **Run Once**.
      You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

   e. Set the **Update Frequency** field to **Every 15 minutes**.
      This setting defines the frequency at which past incidents refresh in the search window.

      When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for incoming incidents. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

      The **Filter** field conditions determine the search window for past resolved incidents. Configure the filter conditions to optimize for the best set of resolved incidents to search within. This includes many considerations, such as, time frame, location, category where incidents are relevant, and more.

   f. Click **Submit & Train** to create your similarity solution record and train it.
      Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

   If you have a similarity score above 60, but the two incidents do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
   You can manually provide inputs and select the top similar results outcome values.
6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.
   You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.
7. Integrate trained models by exporting them to production.

   Note:
   For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

8. Monitor similarity results and ensure IT agents are providing useful feedback.

   The base-system Predictive Intelligence experience includes a built-in feedback mechanism to discern if the similarity results are useful. Train your IT agents to provide feedback, both online and offline, to capture this data for future reporting. Since this is an unsupervised algorithm, you may need to acquire periodic feedback from the IT agents to check that the similarity model is still providing satisfactory results. This feedback is the only way to determine if the model has drifted and requires new training. Ensure that part of your implementation and integration strategy, as well as your change management process, includes training IT agents to provide similarity results feedback.

9. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

   Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

   For information regarding the Predictive Intelligence for Incidents dashboard, refer to ITSM Predictive Intelligence Workbench dashboard.

Suggest relevant Open incidents for an Incident

Use this template to recommend similar open incidents to help expedite your incident investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for incoming incidents. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The use case uses a similarity-based predictive model that compares an incoming incident with past resolved incidents for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Suggest relevant Open Incidents for an Incident** template.
   The **Suggest relevant Open Incidents for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select an incidents-related table, such as Incident [incidents] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find incidents based on the short description.

      Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

   b. Create and train a similarity solution.

   c. For this initial model creation, provide the similarity solution definition label `Similar Open Incidents` in the **Label** field.

   d. Set the **Training Frequency** field to **Run Once**.
      You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

   e. Set the **Update Frequency** field to **Every 15 minutes**.
      This setting defines the frequency at which past incidents refresh in the search window.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for incoming incidents. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

The **Filter** field conditions determine the search window for past resolved incidents. Configure the filter conditions to optimize for the best set of resolved incidents to search within. This includes many considerations, such as, time frame, location, category where incidents are relevant, and more.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

   If you have a similarity score above 60, but the two incidents do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

   If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

   If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
   You can manually provide inputs and select the top similar results outcome values.
6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.
   You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.
7. Integrate trained models by exporting them to production.

   Note:
   For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

8. Monitor similarity results and ensure IT agents are providing useful feedback.

   The base-system Predictive Intelligence experience includes a built-in feedback mechanism to discern if the similarity results are useful. Train your IT agents to provide feedback, both online and offline, to capture this data for future reporting. Since this is an unsupervised algorithm, you may need to acquire periodic feedback from the IT agents to check that the similarity model is still providing satisfactory results. This feedback is the only way to determine if the model has drifted and requires new training. Ensure that part of your implementation and integration strategy, as well as your change management process, includes training IT agents to provide similarity results feedback.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

9. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

   Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

   For information regarding the Predictive Intelligence for Incidents dashboard, see ITSM Predictive Intelligence Workbench dashboard.

Suggest relevant Resolved Incidents for an Incident

Use this template to recommend similar relevant resolved incidents to help expedite your incident investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for incoming incidents. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an incoming incident with past resolved incidents for smarter resolution. Similar past active incidents are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar past active incident search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**.
2. Select the **Suggest relevant Resolved Incidents for an Incident** template.
   The **Suggest relevant Resolved Incidents for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select an incidents-related table, such as Incident [incidents] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find incidents based on the short description.

Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

b. Create and train a similarity solution.

c. For this initial model creation, provide the similarity solution definition label `Similar Resolved Incidents` in the **Label** field.

d. Set the **Training Frequency** field to **Run Once**.
You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

e. Set the **Update Frequency** field to **Every 15 minutes**.

This setting defines the frequency at which past incidents refresh in the search window. When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for incoming incidents. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

The **Filter** field conditions determine the search window for past resolved incidents. Configure the filter conditions to optimize for the best set of resolved incidents to search within. This includes many considerations, such as, time frame, location, category where incidents are relevant, and more.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

If you have a similarity score above 60, but the two incidents do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
You can manually provide inputs and select the top similar results outcome values.

6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.

7. Integrate trained models by exporting them to production.

   Note:
   For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

8. Monitor similarity results and ensure IT agents are providing useful feedback.

   The base-system Predictive Intelligence experience includes a built-in feedback mechanism to discern if the similarity results are useful. Train your IT agents to provide feedback, both online and offline, to capture this data for future reporting. Since this is an unsupervised algorithm, you may need to acquire periodic feedback from the IT agents to check that the similarity model is still providing satisfactory results. This feedback is the only way to determine if the model has drifted and requires new training. Ensure that part of your implementation and integration strategy, as well as your change management process, includes training IT agents to provide similarity results feedback.

9. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

   Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

   For information regarding the Predictive Intelligence for Incidents dashboard, refer to ITSM Predictive Intelligence Workbench dashboard.

Suggest relevant Open Change requests for an Incident

Use this template to recommend similar open change requests to help expedite your change request investigation and resolution processes.

Before you begin

Activate the Predictive Intelligence for Incident plugin (com.snc.incident.ml).

Role required: piwb_manager or piwb_viewer

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for change requests. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an open change request with past resolved change requests for smarter resolution. Similar open changes are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar open changes search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Suggest relevant Open Problems for an Incident

Use this template to recommend similar open problem records to help expedite your problem investigation and resolution processes.

Before you begin

Activate the Predictive Intelligence for Incident plugin (com.snc.incident.ml).

Role required: piwb_manager or piwb_viewer

.

About this task

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for problem records. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an open problem record with past resolved problem records for smarter resolution. Similar open problem records are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar open problem search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

Procedure

1. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Template** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Template**
2. Select the **Suggest relevant Open Problems for an Incident** template.
   The **Suggest relevant Open Problems for an Incident** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
3. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select Incident [incidents] and Problem [problem] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find problems based on the short description.

      Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

   b. Create and train a similarity solution.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. For this initial model creation, provide the similarity solution definition label `Similar Open Problems` in the **Label** field.

d. Set the **Training Frequency** field to **Run Once**.
You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

e. Set the **Update Frequency** field to **Every 15 minutes**.

This defines the frequency at which past problem records refresh in the search window. When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for problem records. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

The **Filter** field conditions determine the search window for past resolved problem records. Configure the filter conditions to optimize for the best set of resolved problem records to search within. This includes many considerations, such as, time frame, location, category where problem records are relevant, and more.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

4. Evaluation and tune your model.

If you have a similarity score above 60, but the two problem records do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

If you want to adjust the score for your similarity solution, refer to Update your similarity score threshold.

5. Once you have a satisfactory model, test the similarity solution prediction.
You can manually provide inputs and select the top similar results outcome values.

6. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.
You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.

7. Integrate trained models by exporting them to production.

Note:
For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

Suggest skill assignment by comparing completed work with skills

Use this template to recommend who an assignment is routed to, based on skill set to help expedite your problem investigation and resolution processes.

Before you begin

Role required: piwb_manager or piwb_viewer

About this task

Note:
The Skill Recommendation plugin (sn.sre) must be activated to use predictive intelligence for recommending skills.#Configure skill recommendations in the **Skill Recommendation** module as part of this procedure.

This use case template helps you improve your ITSM first-call resolution and reduce the time required to investigate resolution steps for problem records. The template also provides a link to the Predictive Intelligence platform application and associated documentation.

The use case uses a similarity-based predictive model that compares an open problem record with past resolved problem records for smarter resolution. Similar open problem records are displayed in Agent assist and also in the Incident form via related search.

Note:
You will need business users to validate the similar open problem search results. Contact Customer Service and Support, if necessary, to configure sources for contextual search.

When the use case template shows the label **Pretrained**, you can go directly to the **Testing your models** implementation section. Otherwise, you will begin by creating a machine learning model.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Skill Recommendation** > **Configuration** to define the properties to recommend skills.

   Note:
   By default, the#**Enable skill recommendation**#property is configured to recommend skills for agents. Clear this check box to disable skill recommendation.

2. If you started this procedure directly from the Predictive Intelligence Workbench product **Create New from Templates** module, and clicked on the product documentation link to get here, skip this step.
   Otherwise, navigate to **Predictive Intelligence Workbench** > **Use Cases** > **Create New from Templates**.
3. Select the **Suggest skill assignment by comparing completed work with skills** template.
   The **Suggest skill assignment by comparing completed work with skills** pop-up opens featuring a link to this procedure and a link to the platform Predictive Intelligence product and associated documentation.
4. Create and train a machine learning predictive model.
   Creating a model involves the following: creating a word corpus, defining a similarity prediction rule, defining the initial training frequency, and defining the refresh frequency.

   a. Create a word corpus.

      When creating a word corpus on the Word Corpus Content form, select Incident [incidents] and Problem [problem] in the **Table** field and define the time frame that best describes the current usage of words in the **Filter** field. For example, if your IT system experienced a major infrastructure change six months back, use data from the last six months only. In the **Field List** field, define only the fields that best capture the words: **Description**, **Short description**, and **Resolution notes**. Defining these alone is typically enough, since the prediction rule is expected to find problems based on the short description.

      Creating the word corpus prepares you for the next step, creating the similarity prediction rule.

   b. Create and train a similarity solution.

   c. For this initial model creation, provide the similarity solution definition label `Similar Open Problems` in the **Label** field.

   d. Set the **Training Frequency** field to **Run Once**.
      You can reset this configuration after you implement this use case into your business processes and have monitored its performance in the Predictive Intelligence Workbench dashboard.

   e. Set the **Update Frequency** field to **Every 15 minutes**.

      This setting defines the frequency at which past problem records refresh in the search window. When possible, and if applicable, use an existing word corpus, created for another use case to reduce your overall word corpora and ease management of these records. In the **Table** field of the Similarity Definition form, select only those inputs for similarity that will be available at prediction time for problem records. You can select more inputs in the **Test Table** field, if required, for comparison. It is best to start with similar fields for both the **Table** and **Test Table** fields.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Filter** field conditions determine the search window for past resolved problem records. Configure the filter conditions to optimize for the best set of resolved problem records to search within. This includes many considerations, such as, time frame, location, category where problem records are relevant, and more.

f. Click **Submit & Train** to create your similarity solution record and train it.
Alternatively, you can click **Submit** to save your similarity solution record and return to train it later.

5. Evaluation and tune your model.

Make sure you run the **Start Skill Prediction** scheduled job every day#o start predicting skills for incidents or agents.

Note:
By default, this scheduled job is disabled. When enabled, it is set to run daily at 1:00 AM on all incidents resolved the previous day. The skills are then added to the User Predicted Skill [sn_sre_user_predicted_skill] table and Task Predicted Skill [sn_sre_user_predicted_skill] table.

If you have a similarity score above 60, but the two problem records do not look similar, you may want to create another model, word corpus, or both by changing inputs and filters. Keep in mind that modifying the solution definition will help you create a new solution, but it will invalidate the previous solution.

If you want to revert back to the previous solution definition, you will have to reset the parameters and retrain the solution. Therefore, first try creating a new similarity model before creating a new word corpus.

If you want to adjust the score for your similarity solution, see Update your similarity score threshold.

6. Once you have a satisfactory model, test the similarity solution prediction.
You can manually provide inputs and select the top similar results outcome values.
7. Once you have tested the behavior, configure the user experience layout to show attributed results and actions performed on the results.
You can configure these results and actions via Workspace UI for Agent assist or via the ServiceNow AI Platform for Contextual Search. Configure actions and search context though **Tables** configuration and user experience and card layout through **Contextual Search** > **Search Result Display Configuration**.
8. Integrate trained models by exporting them to production.

Note:
For details regarding trained use case integration implementation, refer to Predictive Intelligence Workbench integration and customization.

9. Monitor similarity results and ensure IT agents are providing useful feedback.

The base-system Predictive Intelligence experience includes a built-in feedback mechanism to discern if the similarity results are useful. Train your IT agents to provide feedback, both online and offline, to capture this data for future reporting. Since this is an unsupervised algorithm, you may need to acquire periodic feedback from the IT agents to check that the similarity model is still providing satisfactory results. This feedback is the only way to determine if the model has drifted and requires new training. Ensure that part of your implementation and

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

integration strategy, as well as your change management process, includes training IT agents to provide similarity results feedback.

10. Communicate the value of Predictive Intelligence to your stakeholders by linking business key performance indicators (KPIs) to machine learning metrics.

    Select one or more KPIs that you think is most beneficial to your IT agents. Create a Performance Analytics dashboard showing the trend of these KPIs. The “likes” you get from your IT agents via the feedback mechanism helps you communicate the value of Predictive Intelligence.

    For information regarding the Predictive Intelligence workbench dashboard, refer to ITSM Predictive Intelligence Workbench dashboard.

Manage ITSM Predictive Intelligence Workbench use cases

View your ITSM Predictive Intelligence Workbench use cases to monitor model performance and reevaluate the associated models, if necessary. You can also continue setup of models you started, but did not complete.

Before you begin

Role required: piwb_admin or piwb_manager

About this task

Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

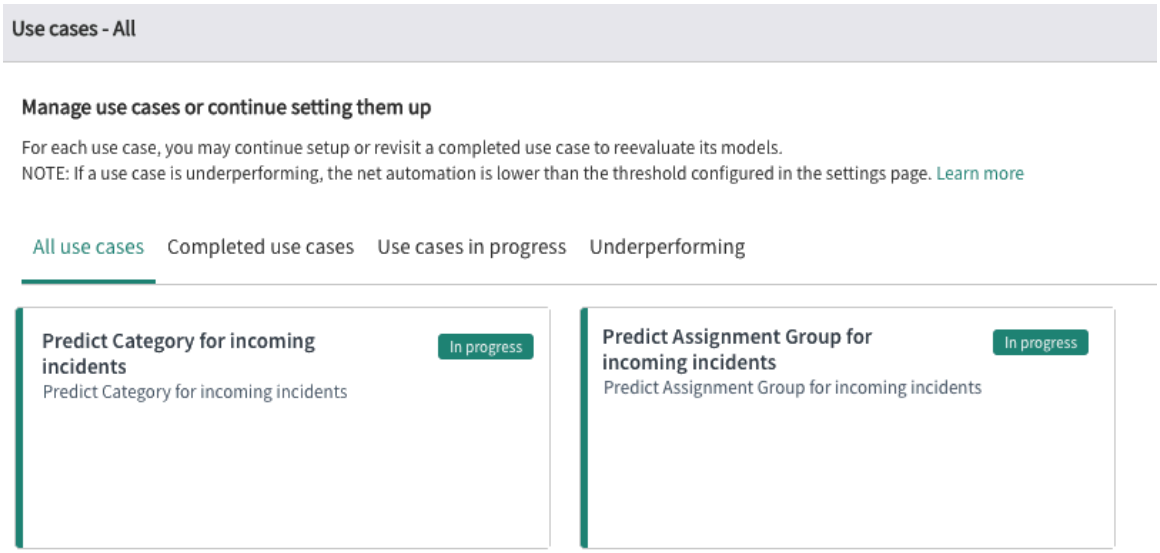
Via the Models detail page you can access the **Test** tab to perform the following actions:

- Perform single or batch tests on model versions.
- Export version test results as .csv files and mark versions as active.
- Filter the number of versions based on date range.
- Monitor testing progress with notifications via the guided process.

Procedure

1. Navigate to **Predictive Intelligence Workbench** > **Use Cases** > **All**.
   The **Use Cases - All** page opens displaying all use cases. The status of the use case is depicted on the card, for example, **In progress**. Other statuses include, **Completed** and **Monitoring**.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



2. Click a use case to continue with implementation.

   Or you can evaluate performance if the use case is in the **Monitoring** state.

   Note:
   If a use case is under performing, the net automation is lower than the threshold configured in the Settings page. See Configure ITSM Predictive Intelligence Workbench settings.

ITSM Predictive Intelligence Workbench dashboard

ITSM Predictive Intelligence Workbench provides the Predictive Intelligence for Incidents dashboard to enable you to measure the value of using machine learning to automate your IT business processes. Monitor use case models and view associated statistics. Effectively demonstrate business value to stakeholders with dashboard views.

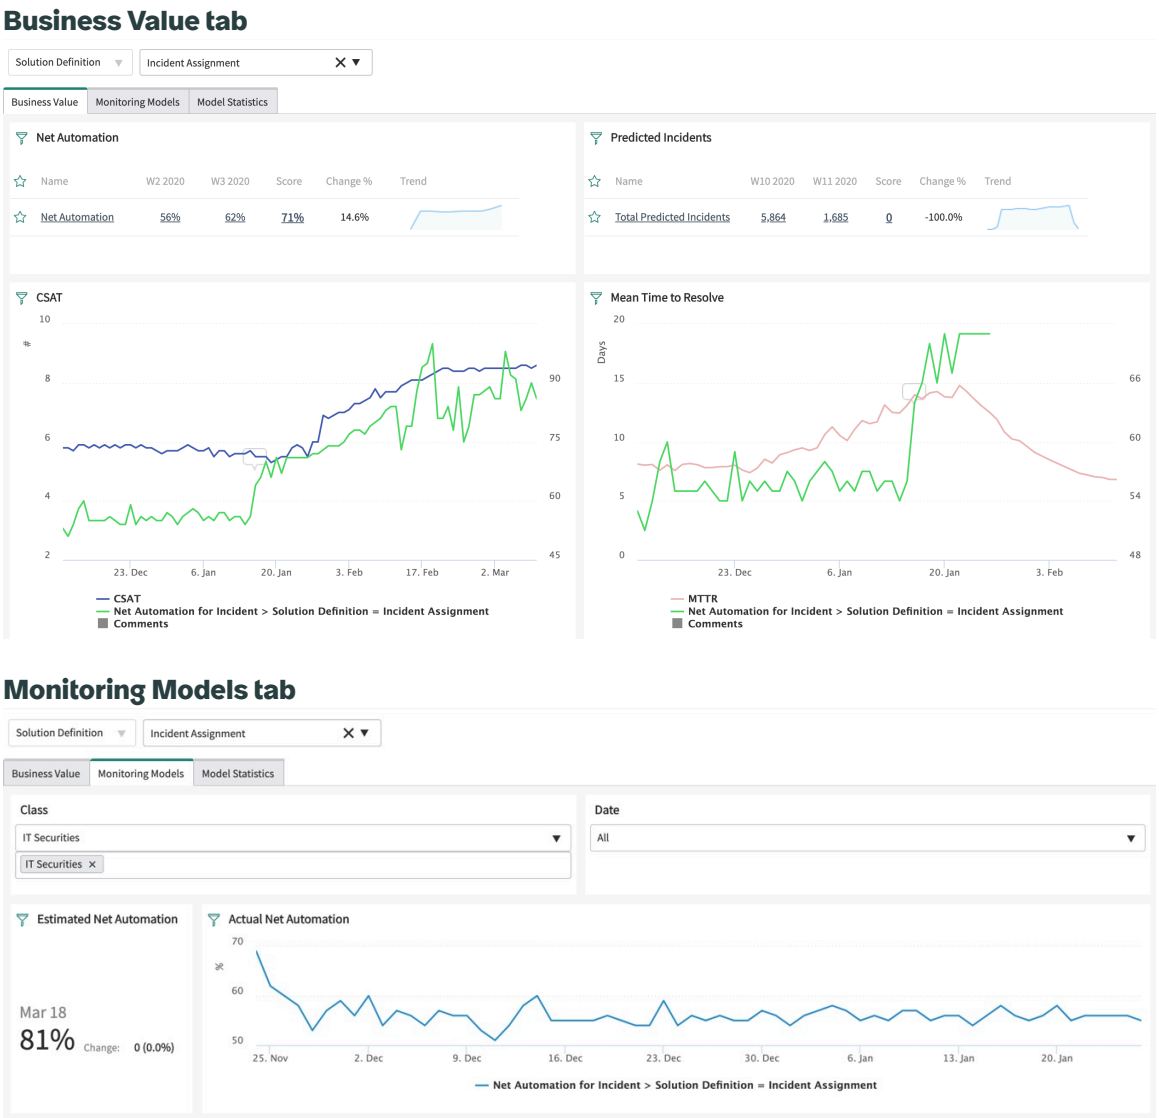
Important:

Starting with the Xanadu release, ITSM Predictive Intelligence Workbench is being prepared for future deprecation. It will be completed deprecated and will no longer be supported from the **Yokohama** release. To get the latest experience for this functionality, you must install the Task Intelligence for ITSM application (com.snc.itsm_ml_task) plugin. For more information, see Task Intelligence for ITSM

For details, see the Deprecation Process [KB0867184] article in the Now Support Knowledge Base.

Know exactly what stage your model workflows are in with automated comments on specific ServiceNow® Performance Analytics indicators. Comments appear on the **Actual Net Automation** indicators. Model stages comments include, when the model is integrated, when an integration is removed, when an existing model is changed to a new model, and when retraining is complete.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



You can view the Net Automation Threshold graph on the **Monitoring Models** tab. This threshold is a computation of the difference between estimated net automation and the underperformance property values. Thresholds are calculated daily and notifications are sent to stakeholders when thresholds are breached.

View automatic comments on the **Actual Net Automation** indicator at various stages of the model monitoring. A comment is generated when any of the following model criteria exists:

- Model is integrated
- Model integration is removed
- Existing model is changed to a new model
- Integrated model is retrained

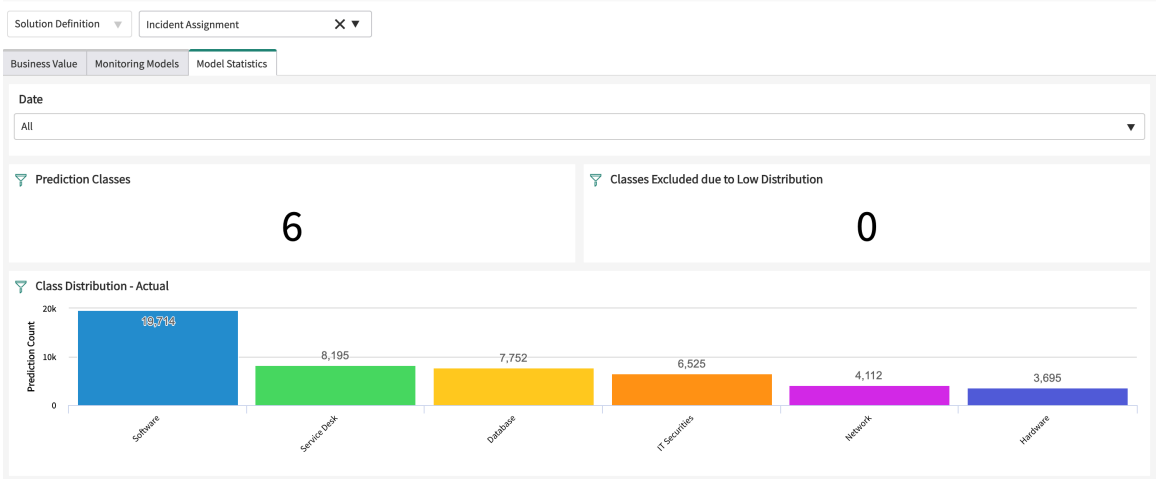
Model Statistics tab



End user and roles

End user and goal	Required role	Benefits
Process architect, process owner, or machine learning advocate: Visualize operational and automation metric performance. Communicate machine learning value to stakeholders to increase the automation capabilities of predictive intelligence.	Predictive Intelligence Workbench manager or viewer [piwb_manager] [piwb_viewer]	Ability to measure the value of using **Predictive Intelligence** to automate ITSM processes.

Indicators

Prediction Coverage for Incident

The score for this indicator is calculated according to the formula: `if ([[Number of attempted predictions based on Created Today for Incident]]==0){0}else{[[Number of applied predictions based on Created Today for Incident]]/[[Number of attempted predictions based on Created Today for Incident]]*100}`.

Number of predicted results based on final value date for incident

The number of predicted results is based on the final value date for an incident. The score is measured daily as unit #.

Net Automation for Incident

The score for this indicator is calculated according to the formula: `[[Prediction Precision for Incident]]*[[Prediction Coverage for Incident]]/100`.

Number of applied predictions based on Created Today for Incident

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number of applied predictions based on Created Today for Incident is measured daily as unit #.

Number of attempted predictions based on Created Today for Incident

Number of attempted predictions based on Created Today for Incident is measured daily as unit #.

The goal for this indicator is to maximize the quality of predictions.

Prediction Precision for Incident

The score for this indicator is calculated according to the formula: `if ([[Number of predicted results based on final value date for Incident]]==0){0}else{[[Number of successful predictions not skipped based on final value date for Incident]]/[[Number of predicted results based on final value date for Incident]]*100}`.

Estimated Net Automation

Estimated net automation measured daily as unit %.

Number of successful predictions not skipped based on final value date for Incident

Number of successful predictions not skipped based on final value date is measured daily as unit #. It is the count on data source MLPredictorResults.FinalValueDate.Incident, which is using the table: ml_predictor_results.

Number of Predicted for Incidents

Number of Predicted for Incidents is measured daily as unit #. It is the count on data source MLPredictorResults.CreatedToday.Incident, which is using the table: ml_predictor_results.

Breakdowns

Use Case.

Data visualizations

Note:
Regarding source tables, all indicators and reports are built off of newly added database views, combining ServiceNow platform Predictive Intelligence tables with Predictive Intelligence Workbench use case tables. With these new views, you can filter platform data by use case to better understand its impact on your metrics. All database views for this content application have a prefix of sn_piwb_itsm_conte_dbv.

Platform Analytics ITSM Dashboards

The ITSM Dashboards content pack provides several Platform Analytics Solutions that contain preconfigured dashboards. This content pack also includes several dashboards and indicators of its own. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Alternatively, executives and managers can use the metrics in the ITSM Success Dashboard to make informed decisions. For more information, see Exploring ITSM Success Dashboard indicators. Agents can use the IT Agent dashboard in Service Operations Workspace to obtain information about their work and their group's work. For more information, see IT Agent dashboard for Service Operations Workspace.

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

Important:
Set up and test Platform Analytics Solutions on a non-production instance before enabling them in production.

Note:
For more information on activating the Analytics subscription see, Activating your Performance Analytics subscription

Activate your Performance Analytics subscription

IT Agent dashboard for Service Operations Workspace

View the closed incidents that belong to you and your team's through personalized metric visualization.

Navigate to **Workspaces** > **Service Operations Workspace**.

Select the Dashboard icon to view the dashboard.

Procure the ITSM Pro package subscription to get additional performance analytics features.

For more information on performance analytics subscription, see Activating your Performance Analytics subscription.

You can monitor data by any of the following time aggregations.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Weekly**: View the data aggregated weekly. For counts, this data is the weekly sum of the daily values. For percentages, this data is the weekly average of the daily percentages.
- **Monthly**: View the data aggregated monthly. For counts, this data is the monthly sum of the daily values. For percentages, this data is the monthly average of the daily percentages.
- **Quarterly**: View the data aggregated quarterly. For counts, this data is the quarterly sum of the daily values. For percentages, this data is the quarterly average of the daily percentages.
- **Yearly**: View the data aggregated yearly. For counts, this data is the yearly sum of the daily values. For percentages, this data is the yearly average of the daily percentages.

Once the time aggregation is set, all the score-cards show the data for that period.

You can also view the summary for **Today**, **Yesterday**, **Last 6 months**, and **Custom range** time period.

End user and roles

End user and goal	Required role
itil	View only the incidents in the base system. The user with itil role can also view the metrics related to change, problem, and request if the administrator has configured in the Service Operations Workspace.

Data visualizations

Title	Description
Average resolution time	Average resolution time of resolved incidents
Closed incidents	Number of closed incidents is measured daily
Incidents that missed SLA	Number of incidents missed SLA is measured daily
Percent of incidents resolved without reassignment	Percentage of incidents resolved by first assigned group
Average age of open incidents	Average age of open incidents
Percent of incidents resolved on same day opened	Percentage of incidents resolved on the same day opened

Manage the dashboard in Service Operations Workspace

Add or edit the cards that are to be viewed on the IT Agent Dashboard in Service Operations Workspace.

Before you begin

Note:
This dashboard is applicable to all the itil users and user groups.

Role required: admin

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Workspaces** > **Service Operations Workspace**.
2. Select the Dashboard icon ( ) from the left pane.
3. Select **Edit**.
4. Select the **Add new element** drop-down, and then select the element to be added to the dashboard.
   For more information to edit a dashboard, see Edit Platform Analytics dashboards.

Platform Analytics KPIs and dashboards

Use the dashboards to monitor the operational KPIs and identify areas for improvement, optimize processes, to achieve their strategic goals.

An operational KPI is a quantifiable measure that tracks the efficiency and effectiveness of day-to-day operations in your organization. The KPIs can be organized in a dashboard that highlights the areas that are running efficiently and the areas that need attention.

Note:

- Ensure the `itsm_analytics` application is activated in the instance.
- These user-friendly and comprehensive Next experience dashboards are designed for easy navigation and quick access to all the required information.

By monitoring operational KPIs, you can identify areas for improvement, optimize processes, and ultimately achieve their strategic goals. Here are some techniques to use the operational KPIs:

- Ensure your KPIs match your organization's business goals. Define your KPIs that contribute to achieving those objectives.
- Focus on the most critical KPIs that add value to the organization's growth.
- Track and review KPIs regularly. Monitor your progress and modify the KPIs as required by the organization's goals.
- Use data to drive decisions: Identify trends, uncover root causes, and use insights to improve processes and performance.
- Use the data to identify trends and use insights to improve processes and performance.

Incident management dashboard

Dashboard providing a view into process metrics related to Open and Closed incidents.

Incident

Data Visualization	Description	KPI (Performance Analytics Indicator)
Overdue incidents	Number of open incidents that are pass the due date.	Number of open and overdue incidents
Incidents nearing SLA	Percentage of the incidents nearing the SLA threshold. This is based on the percentage of SLA elapsed where the elapsed percentage is between 50-75%,76- 85%, 86-95%, above 95%.	Incidents nearing SLA threshold
Open incidents not updated	Number of open incidents that aren't updated as per the age. This is categorized as per the age of an incident that are between 1-5, 6-10, 10-30, and greater than 30 days.	Number of open incidents
Incidents created (by priority)	Distribution of the Incidents created priority wise	Number of incidents created
Incidents by activity channel	Total number of closed incidents created from different sources.	Number of resolved incidents

Incident (continued)

Data Visualization	Description	KPI (Performance Analytics Indicator)
Mean time to resolve an incident (by priority)	Mean time to resolve the incidents priority wise	Incident MTTR
Average incident reassignment	Average number of times that incidents were reassigned.	Average incident reassignment
% high priority incidents	Percentage of P1 and P2 incidents that are successfully closed	% high priority incidents
Average number of incidents created per user	Average number of the incidents that are created by a specific user	Average number of incidents created per user
% Incidents associated with Problem	Percentage of the incidents that are associated with problem	% Incidents with associated Problem
Total outages due to incidents	Total outages in hours because of incidents.	Total outages due to incidents

Major incident dashboard

Dashboard providing a view into the process and communication related metrics for Open and Closed major incidents.

KPIs for Major Incident.

Major incident

Data Visualization	Description	KPI (Performance Analytics Indicator)
Overdue major incidents	Number of the major incidents that have breached the SLA.	Overdue major incidents
Open major incidents (by age and assignment)	Total number of open major incidents assigned/not assigned distributed over the age.	Open major incidents (by age and assignment)
Open major incidents (by services and state)	Distribution of major incidents between various services and state.	Open major incidents (by services)
Major incidents nearing resolution SLA	Percentage of the major incidents nearing the SLA. This is based on the percentage of SLA elapsed where the elapsed percentage is between 50-75%,76- 85%, 86-95%, above 95%.	Major incidents nearing resolution SLA

Major incident (continued)

Data Visualization	Description	KPI (Performance Analytics Indicator)
Closed major incidents (by services)	Distribution of closed major incidents between various services.	Closed major incidents (by services)
Mean time to take actions on a major incident	Average time taken for a major incident to be proposed, acknowledged and resolved.	Mean time to resolve a major incident
% Major incidents breached SLA	Percentage of major incidents that breached SLA.	% Major incidents breached SLA
% Major incidents closed without post incident report	Number of major incidents that are closed without having a post incident report (PIR).	% Major incidents closed without post incident report
% Major incidents associated with problems	Percentage of the major incidents associated with problems.	% Major incidents associated with problems
Outages due to major incidents	Total outages (in hours) caused due to major incidents.	Outages due to major incidents

Change dashboard

Dashboard providing a view into Change request workflow with metrics around successful and failed Change Request for different Change models and types.

KPIs for Change.

Change KPIs

Data Visualization	Description	KPI (Performance Analytics Indicator)
Open changes (by age and priority)	Priority wise distribution of the open change requests priority wise. This is categorized in days between 0-1, 2-5, 6-30, 31-90, and above 90 days.	Number of open changes
Open emergency changes (by age and priority)	Priority wise distribution of the emergency change requests that are still open. This is categorized in days between 0-1, 2-5, 6-30, 31-90, and above 90 days.	Number of new emergency changes
New change request (by risk)	Distribution of the new change requests by risk.	Number of new changes
Average age of open changes (by risk)	Average age of a change requests based on risk.	Average age of open changes

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Change KPIs (continued)

Data Visualization	Description	KPI (Performance Analytics Indicator)
Closed changes (by priority)	Priority wise distribution of the changes requests that are successfully closed.	Number of closed changes
Mean time to close a change (by priority)	Mean time to close the change request priority wise.	Mean time to close a change
Incidents caused by change requests	Total number of incidents that are created because of a change request.	Incidents caused by change
% Unauthorized changes	Percentage of the unauthorized change requests that are created.	% Unauthorized changes
Outages due to change	Total outages in hours because of change.	Outages due to Change

Change Success Score KPIs

Data Visualization	Description	KPI (Performance Analytics Indicator)
Change success score (by assignment group)	Distribution of the change requests by assignment group.	Change success scores
% Successful change with issues (by model and type)	Distribution of the change requests closed with issues distributed by change model and change type.	% Successful changes with issue
% Successful change without issues (by model and type)	Distribution of the change requests that are successfully closed with some issues by change model and change type.	% Successful changes
% Failed changes	Percentage of the change requests that are not successfully completed.	% unsuccessful changes

Note:
Access all the change success score related metrics categorized under the **Change Success Score** tab in the Change Management dashboard.

Request dashboard

Dashboard providing a view into process metrics related to Open and Closed Requested items.

KPIs for Request.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request

Data Visualization	Description	KPI (Performance Analytics Indicator)
Open requested items (by stages)	Distribution of the requested items that are open by stages.	Number of open requested items
Open requested items (by states)	Distribution of the requested items by state.	Number of open requested items
Active requested items due within 5 days	Total number of open requested items that are due in 5 days.	Active RITMs nearing due date
Open requested items (by age)	Distribution of the requested items in open state. This is categorized in days between 0-1, 2-5, 6-30, 31-90, and above 90 days.	Number of open requested items
Mean time to fulfill a requested item	Average time taken to fulfill a requested item.	Mean time to fulfil a requested item
Mean time to fulfill a requested item (by category and catalog items)	Mean time to fulfill a requested item for different catalog categories and catalog items.	Mean time to fulfil a requested item
Closed requested items (by states)	Distribution of the requested items by their closed state i.e. Skipped, Complete, Incomplete.	Number of closed requested items
Request items created from various channels	Distribution of the requested items created from different sources.	Requested Items: Channel analytics
Requested items from incidents (by category and catalog items)	Requested items created from incidents for different catalog categories and catalog items.	RITMs from Incidents

Service Catalog dashboard

Dashboard providing a view into metrics for catalog items.

KPIs for Service Catalog.

Service Catalog KPIs

Data Visualization	Description
Catalog Item best practice deviations	Number of deviations from the best practices for active catalog items.
Catalog item VA render type	Catalog items distributed by how they will be rendered on a Virtual Agent bot.
Catalog item fulfilment automation level distribution	Distribution of the catalog items that are fulfilled automatically.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Catalog KPIs (continued)

Data Visualization	Description
Catalog item translation coverage	Language wise distribution of the catalog items that are translated.

Interaction dashboard

Dashboard with distribution and process metrics for Interaction.

KPIs for Interaction.

Interaction KPIs

Data Visualization	Description
Interactions with task associated (by task type)	Number of interactions that are associated with a task and are distributed by task type.
% First call resolution	Percentage of the interactions that are closed in the first call and no tasks are created.
Closed interaction (by channel)	Distribution of the closed interactions created from different channel.

Problem dashboard

Dashboard providing a view into Problem Management related metrics for Open and Closed Problem records.

KPIs for Problem.

Problem KPIs

Data Visualization	Description	KPI (Performance Analytics Indicator)
Open problems (by age and priority)	Problems currently open distributed over age and priority.	Number of open problems
Open problems (by state and age)	Problems currently open distributed over age and state.	Number of open problems
% open critical problems (by state)	Percentage of critical problem that are categorized by state.	% of open critical problems
% open problems classified as known error	Percentage of problem with associated Known Error articles.	% of open problems classified as known error
Average reassignment of open problems (by category)	This is the average number of times problems have been reassigned.	Average re-assignment of open problems
Closed problems (by age and priority)	Closed problems by age and priority.	Number of closed problems

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Problem KPIs (continued)

Data Visualization	Description	KPI (Performance Analytics Indicator)
Mean time to close a problem	Average time taken to close a problem.	Average close time of problems

On-call dashboard

Dashboard providing view into the performance of On-call Escalations handled by the team.

KPIs for On-Call Scheduling.

On-Call Scheduling KPIs

Data Visualization	Description	KPI (Performance Analytics Indicator)
Active escalations (by priority and acknowledgement status)	Priority wise distribution of on-call escalations based on their escalation status.	Active Escalations
Acknowledged escalations (by level, shift and groups)	Distribution of acknowledged escalations based on level/ shift/groups.	Acknowledged Escalations
Acknowledged escalations (by channel)	Number of acknowledged escalations in a specified period of time.	Acknowledged Escalations
Acknowledged escalations level (by user)	Displays the average level at which the user acknowledges the escalation.	Acknowledged escalations level
Escalations not acknowledged (by level, shift and groups)	Distribution of escalations that are not acknowledged by level/shift/groups.	Unacknowledged Escalations
Contact attempts acknowledged	Total count of contact attempts acknowledged based on level and contact attempts.	Count of Contact Attempts Acknowledged
% Escalations acknowledged (by groups)	Percentage of the escalations that are acknowledged.	% of Acknowledged Escalations
% Escalations not acknowledged (by groups)	Percentage of the escalations that are not acknowledged.	% of Unacknowledged Escalations
Mean time to acknowledge an escalation (by group)	Mean time to acknowledge an escalation based on escalation level.	Average Escalation Acknowledgment
Mean time to acknowledge an escalation (by level)	Mean time to acknowledge an escalation based on escalation level.	Average Level Acknowledgment
Average time to acknowledge escalation notification	Average time taken to acknowledge the escalation notification.	Average time to acknowledge escalation notification

On-Call Scheduling KPIs (continued)

Data Visualization	Description	KPI (Performance Analytics Indicator)
Total On-call hours (by user)	Total number of hours the user was available for On-call.	Total On-call hours

Legacy: Performance Analytics ITSM Dashboards

The ITSM Dashboards content pack provides several Platform Analytics Solutions that contain preconfigured dashboards. This content pack also includes several dashboards and indicators of its own. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

ITSM Dashboard solutions

The ITSM Dashboards plugin (com.snc.pa.itsm_dashboards) activates the following solutions, along with a set of additional dashboards:

- Change Management (com.snc.pa.change)
- Problem Management (com.snc.pa.problem)
- Incident SLA (com.snc.pa.sla)
- Major Incident Management (com.snc.pa.incident.mim)
- Fixed Costs (com.snc.fixed_costs)

Inactive dashboards

Some dashboards in this content pack are inactive when installed. Complete configuration and run data collection jobs before you activate these dashboards. You can activate dashboards in Dashboard Properties, accessible from the context menu. You have to assign an owner to the dashboard to activate it. For more information about configuring Platform Analytics Solutions, see Configure Platform Analytics Solutions

Add Self-Service Analytic widgets to the ITSM dashboards

If you have Self-Service Analytics activated on an instance, you can add Self-Service analytics widgets to your Performance Analytics dashboards or a Service Portal. To obtain a ready-made set of indicators and breakdowns, activate the Self-Service Analytics PA (`com.snc.pa.self_service_analytics`) plugin. Find the Self-Service indicators through the Performance Analytics Admin Console, then create widgets and add them to your dashboard or portal. Also activate the [SSA] Self-Service Analytics data collection job.

End user and roles

End user and goal	Required role
IT Executive	None

Indicators

% of new critical incidents

The result of the formula `( [[Number of new incidents > Priority = 1 - Critical]] / [[Number of new incidents]] ) * 100`

% of new critical problems

The result of the formula `( [[Number of new problems > Priority = 1 - Critical]] / [[Number of new problems]] ) * 100`

% of open incidents not updated in last 5 days

Number of open incidents not updated in last 5 days as a percentage of number of open incidents, according to the formula `( [[Number of open incidents not updated in last 5 days]] / [[Number of open incidents]] ) * 100`.

% of open requested items before due date

The result of the formula `( [[Number of open requested items before due date]] / [[Number of open requested items]] ) * 100`

% of overdue requested items

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The result of the formula `100 - [[% of open requested items before due date]]`

Active Breached SLAs Today

The result in percentage of the formula `([[Number of breach task sla today]]/[[Number of active task sla]])*100`

Average age open incidents

The result, in days, of the formula `[[Summed age of open incidents]] / [[Number of open incidents]] / 24`

Average Cost per Resolved Incident - Weekly

The result of the formula `[[Cost of Incidents Resolved / By week SUM +]]/[[Number of resolved incidents / By week SUM +]]`. In other words, the weekly sum of the cost of resolved incidents, including partial weeks, divided by the weekly sum of resolved incidents, including partial weeks.

Average reassignment of open incidents

The result of the formula `[[Summed re-assignment of open incidents]] / [[Number of open incidents]]`

Average resolution time of resolved incidents

The result of the formula `[[Summed duration of resolved incidents]] / [[Number of resolved incidents]] / 24`

ITSM Average Overall Customer Satisfaction

Average of the normalized score for the Customer Satisfaction survey, as a result of the formula `[[ITSM normalized satisfaction score]] / [[ITSM survey instances]]`

Number of new incidents

The number of incidents opened today

Number of new problems

The number of incidents opened today

Number of open incidents

Number of incidents with no Resolved date

Number of open incidents not updated in last 5 days

Number of open incidents with an Updated date of more than five days ago

Number of open requested items

Number of requests with a registration date on or before today and no closed date, or a closed date after today

Number of open requested items before due date

Number of requested items open today (before midnight on collection date) and a due date after midnight on the collection date.

Number of resolved incidents

Number of incidents with a value in the Resolved date field

The following indicators do not appear on the dashboard but are used in formulas:

Cost of Incidents Resolved

The daily sum of the Value field of incident_metric records where the Definition field value is Incident Resolution Fixed Cost.

ITSM normalized satisfaction score

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Sum of the normalized score of metric results for the Customer Satisfaction survey

ITSM survey instances

Number of the survey instances of the Customer Satisfaction survey

Number of active task sla

The count of active SLA tasks on task_sla with a start time before today and a stop time after today.

Number of breach task sla today

The count of active SLA tasks on task_sla with a breach time before today

Summed age of open incidents

The sum of hours between the time an incident was opened and now

Summed duration of resolved incidents

The sum of hours between the time an incident was opened and the time it was resolved

Summed reassignments of open incidents

The summed reassignment count of all open incidents

Breakdowns

- Age (Requested Item, Incident)
- Assignment Group
- Backordered (Requested Item)
- Category (Incident)
- Contact Type (Incident)
- Item
- Opened by Department
- Priority (Requested Item, Incident, Problem)
- Requested by Department (Requested Item)
- SLA Definition
- Stage (Requested Item)
- State (Change, Request, Problem)

Legacy: IT Manager dashboard

Follow the daily and weekly progress of incidents, problems, and requests for your assignment groups.

Important:
Starting with the Xanadu release, the IT Manager dashboard is deprecated. Users can access the ITSM Success Dashboards to view the metrics for their assignment groups.

Number of open incidents not updated in last 5 days as a percentage of number of open incidents, according to the formula `( [[Number of open incidents not updated in last 5 days]] / [[Number of open incidents]] ) * 100`.

% of open incidents with problem

The result of the formula `[[Number of open incidents with problem]] / [[Number of open incidents]] * 100`

% of open problems not updated in last 30 days

The result of the formula `( [[Number of open problems not updated in last 30 days]] / [[Number of open problems]] ) * 100`

% of open problems with at least one incident

The result of the formula `[[Number of open problems with at least one open incident]] / [[Number of open problems]] * 100`

% open and overdue incidents

The result of the formula `( [[Number of open and overdue incidents]] / [[Number of open incidents that should be resolved in time]] ) * 100`

% Resolved Incidents with Breached SLA

The result of the formula `([[Number of Resolved Incidents with Breached SLAs]]/[[Number of resolved incidents]]) * 100`

Active Breached SLAs Today

The result in percentage of the formula `([[Number of breach task sla today]]/[[Number of active task sla]])*100`

Average age of open problems

The result, in days, of the formula `[[Summed age of open problems]] / [[Number of open problems]] / 24`

Average age of open requests

The result, in days, of the formula `[[Summed age of open requests]] / [[Number of open requests]] / 24`

Average age open incidents

The result, in days, of the formula `[[Summed age of open incidents]] / [[Number of open incidents]] / 24`

Average close time of requests

The result, in days, of the formula `[[Summed duration of closed requests]] / [[Number of closed requests]] / 24`

Average Cost per Incident

The result of the formula `[[Cost of Incidents Resolved]]/[[Number of resolved incidents]]`, when the number of resolved incidents is more than zero.

Average Cost per Request

The result of the formula `[[Cost of Requests Completed]]/[[Number of completed requests]]`, when the number of completed requests is more than zero.

Average Cost per Request - Weekly

The result of the formula `[[Cost of Requests Completed / By week SUM +]]/[[Number of completed requests / By week SUM +]]`.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In other words, the weekly sum of the cost of completed requests, including partial weeks, divided by the weekly sum of completed requests, including partial weeks.

Average Cost per Resolved Incident - Weekly

The result of the formula `[[Cost of Incidents Resolved / By week SUM +]]/[[Number of resolved incidents / By week SUM +]]`. In other words, the weekly sum of the cost of resolved incidents, including partial weeks, divided by the weekly sum of resolved incidents, including partial weeks.

Average reassignments of open and overdue incidents

The result of the formula `[[Summed reassignments of open and overdue incidents]] / [[Number of open and overdue incidents]]`

Average resolution time of resolved incidents

The result of the formula `[[Summed duration of resolved incidents]] / [[Number of resolved incidents]] / 24`

Closed workload

The result of the formula `[[Number of closed incidents]] + [[Number of closed problems]] + [[Number of closed requests]]`

ITSM Average Overall Customer Satisfaction

Average of the normalized score for the Customer Satisfaction survey, as a result of the formula `[[ITSM normalized satisfaction score]] / [[ITSM survey instances]]`

New workload

The result of the formula `[[Number of new incidents]] + [[Number of new problems]] + [[Number of new requests]]`

Number of closed complete requests

Number of requests closed today as complete (State = Complete)

Number of closed incidents

The number of incidents closed today

Number of closed problems

The number of probems closed today

Number of closed requests

The number of requests closed today

Number of Closed Requests with Breached SLAs

Count Distinct of SLA tasks [task_sla] with a task type of Request, Has breached = true, Stage != Cancelled, and closed today

Number of new incidents

The number of incidents opened today

Number of new problems

The number of incidents opened today

Number of new requests

The number of incidents opened today

Number of open changes planned in the next 7d

The number of Change Request [change_request] records opened today with a Planned Start date between today and the end of next week

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Number of open incident unassigned

The number of open incidents not assigned to anyone

Number of open incidents

Number of incidents with no Resolved date

Number of open incidents not updated in last 5 days

Number of open incidents with an Updated date of more than five days ago

Number of open and overdue incidents

The number of open incidents related to an SLA task that is not in the Cancelled stage (task_sla.stage) and has an actual elapsed percentage greater than 100% (task_sla.percentage).

Number of open incidents that should be resolved in time

The count distinct of open incidents associated with an SLA task [task_sla] that is not in the Cancelled stage.

Number of open incidents with problem

The number of open incidents with a value in the Problem field

Number of open problems

The number of problems opened on or before today and not yet closed.

Number of open problems not updated in last 30 days

Number of open problems with an Updated date of more than 30 days ago

Number of open problems with at least one open incident

The count distinct of open incidents where the Problem Active field value is true.

Number of open requests

Number of requests opened on or before today and not yet closed

Number of requests closed after due date

Number of requests that are closed after request due date (sc_request.closed_at > sc_request.due_date)

Number of resolved incidents

Number of incidents with a value in the Resolved date field

Number of resolved incidents by first assigned group

Number of incidents that were resolved by the first group assigned to them

Open workload

The result of the formula `[[Number of open incidents]] + [[Number of open problems]] + [[Number of open requests]]`

Predicted Average Cost of Open Incidents

The result of the formula `[[Cost of Incidents Resolved / By week SUM +]]/[[Number of resolved incidents / By week SUM +]] * [[Number of open incidents]]`

Predicted Average Cost of Open Requests

The result of the formula `[[Cost of Requests Completed / By week SUM +]]/[[Number of requests completed / By week SUM +]] * [[Number of open requests]]`

Workload backlog growth

The result of the formula `[[New workload]] - [[Closed workload]]`

The following indicators do not appear on the dashboard but are used in formulas:

Cost of Incidents Resolved

The daily sum of the Value field of incident_metric records where the Definition field value is Incident Resolution Fixed Cost.

Cost of Requests Completed

The daily sum of the Value field of sc_request_metric records where the Definition field value is Request Resolution Fixed Cost .

ITSM normalized satisfaction score

Sum of the normalized score of metric results for the Customer Satisfaction survey

ITSM survey instances

Number of the survey instances of the Customer Satisfaction survey

Number of active task sla

The count of active SLA tasks on task_sla with a start time before today and a stop time after today.

Number of breach task sla

The count of active SLA tasks on task_sla with a breach time before today

Number of incidents missed SLA

The number of records on the incident_sla table created on or before today, not yet closed, and that have breached SLA

Number of open incidents with problem

The count of open incidents with a Problem referenced in the Problem field.

Number of Resolved Incidents with Breached SLAs

Number of Incident-type SLA tasks that are not cancelled, that were resolved today, and where Has Breached is true

Summed age of open incidents

The sum of hours between the time an incident was opened and now

Summed age of open problems

The sum of hours between the time a problem was opened and now

Summed age of open requests

The sum of hours between the time a request was opened and now

Summed duration of closed requests

The sum of hours between the time a request was opened and the time it was closed

Summed duration of resolved incidents

The sum of hours between the time an incident was opened and the time it was resolved

Summed reassignments of open and overdue incidents

The summed reassignment count of all open Incident SLAs

Breakdowns

- Age (Request, Incident, Problem, and Change)
- Assignment Group

Define fixed costs for IT Manager dashboard

Define generic industry-based fixed costs to analyze impact by channel using the IT Manager dashboard in ITSM Performance Analytics Solutions.

Before you begin

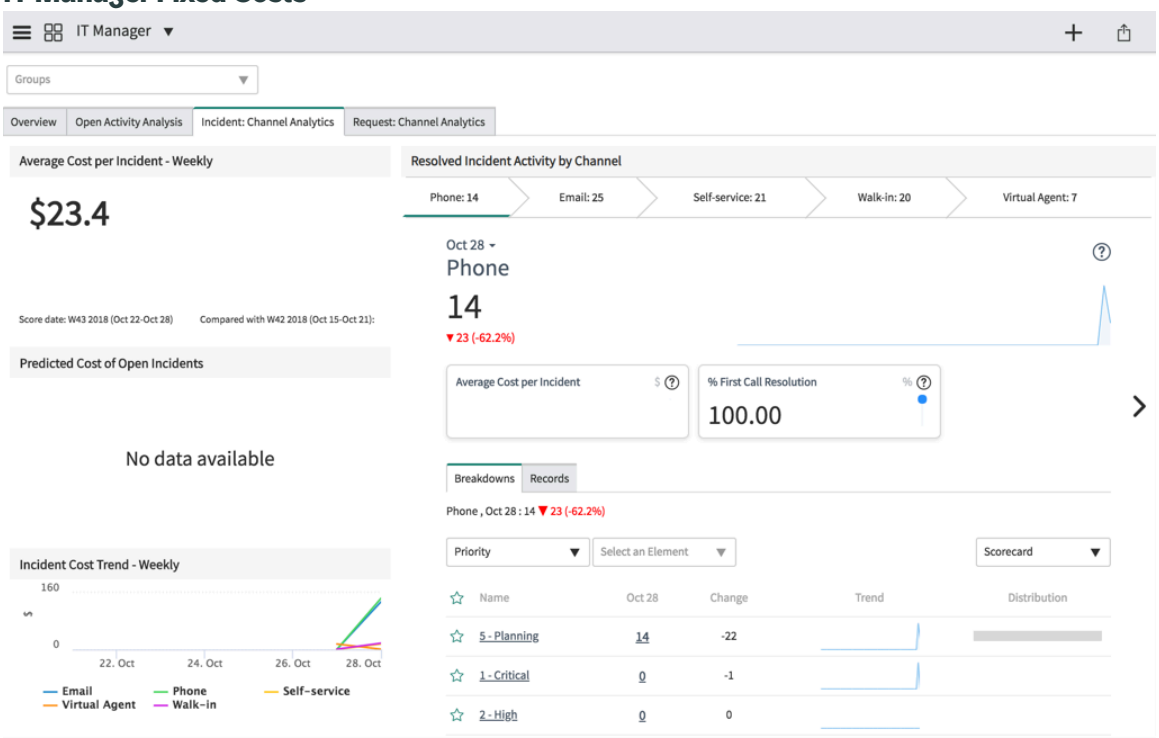
Role required: admin

About this task

Use the fixed cost model to analyze the cost for incidents and requests across channels (email, phone, self-service, walk-up, virtual agent) for cost management. For example, view current costs per channel and verify whether costs are reduced over time after implementing a solution.

Cost definitions are stored in the Fixed Cost Definitions [fixed_cost_definitions] table.

IT Manager Fixed Costs



Incident and request KPIs

Area	KPI
Volume	Total number of incidents

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Incident and request KPIs (continued)

Area	KPI
	Total number of requests
FCR	Number of incidents resolved on first assignment Number of requests resolved on first assignment
MTTR	Average time to resolve an incident Average time to resolve a request
SLA	% of incidents that breached SLAs % of requests that breached SLAs
CSAT	Average customer satisfaction score
Cost	Average cost to resolve an incident Average cost to resolve a service request

Breakdown:

- Assignment group
- Agent
- Skill

Procedure

Navigate to **All** > **Fixed Costs** > **Define Fixed Cost** (see table for field descriptions).

Fixed Cost Definitions form

Field	Description
Short Description	Description of the cost.
Table	Table that contains the field for the fixed cost condition.
Filter	Condition for the fixed cost definition, if applicable.
Cost Value	Currency type and fixed cost value.
Category	Category of the fixed cost.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• Total Fully Loaded Cost • Per Hour Cost
Source of the Cost	Source of the fixed cost. • HDI • ServiceNow • Manual
Active	Check box to activate the fixed cost definition. Clear the check box to disable.

Example: Cost per Network Incident

Fixed Cost Definitions form

Field	Value
Short Description	Incident in Network Category
Table	Incident [incident]
Filter	Category is Network
Cost Value	$15.56
Category	Total Fully Loaded Cost
Source of the Cost	HDI
Active	Selected

Legacy: IT Agent dashboard

View the open incidents, problems, and requests that belong to you and your assignment groups through personalized reports. You can also see which incidents that belong to your assignment groups exceed the Spotlight threshold.

Important:
Starting with the Xanadu release, the IT Manger dashboard is deprecated. Users can access the IT Agent dashboard for Service Operations Workspace to see their own and their team's assignments and set priorities.

ITSM Mobile Agent

The ServiceNow® ITSM Mobile Agent app delivers base system mobile-first experiences designed for IT agents to triage, act on, and resolve incidents on the go.

ITSM Mobile Agent overview

Watch this three-minute video to learn more about ITSM Mobile Agent. This video covers the ITSM Mobile Agent app overview, installation, and information on how to access the app.

Overview of the ITSM Mobile Agent application.

Get started

ITSM Mobile Agent assists IT agents with an intuitive interface to manage all their work, view schedules, check who is on call, respond to major incidents, and more. The agent can also view incident details and activity; edit an incident and add comments; resolve, assign, or reassign an incident; and view incident notifications.

Exploring ITSM Mobile Agent

ITSM Mobile Agent provides IT agents with the access needed to perform the various IT Service Management (ITSM) tasks on the go with this mobile application.

ITSM Mobile Agent overview

ITSM Mobile Agent is a mobile application designed for ServiceNow users who work in IT Service Management (ITSM) roles. It enables IT agents to perform various ITSM tasks and provide support from their mobile devices. The mobile agent app provides features such as ServiceNow® Incident Management, ServiceNow®, Problem Management, ServiceNow® Change Management, and ServiceNow® Service Catalog access. With ITSM Mobile Agent, IT agents can stay connected and collaborate on IT tasks while on the go.

ITSM Mobile Agent workflow

A general overview of the typical ITSM Mobile Agent workflow:

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Incident creation: When a user encounters an issue or incident, they can use ITSM Mobile Agent to create an incident ticket. The ticket can include details such as a description of the problem, priority level, and any relevant attachments.
2. Notification and assignment: After the incident ticket is created, the mobile agent app sends a notification to the assigned IT agent or the appropriate support group. This notification ensures that the incident is promptly handled.
3. Incident management: The assigned IT agent can view the incident details, communicate with the user through the chat functionality of the app, and perform any necessary troubleshooting steps. If necessary, the IT Agent can propose an incident to Major incident.
4. Resolution and closure: The IT agent can resolve the incident with the appropriate resolution code and description.
5. Reporting and analytics: The ITSM Mobile Agent also enables managers to access reports and analytics related to the incident management activities. They can review metrics, identify trends, and gain insights into the performance of the IT service management process.

User roles and personas in ITSM Mobile Agent

Learn about the various user roles and persona used to log in to ITSM Mobile Agent.

ITSM Mobile Agent supports the following user persona.

itil role

The IT agent is the primary user of the ITSM Mobile Agent application. IT agents or technicians responsible for handling and resolving IT incidents and service requests have the itil role

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

assigned. They have access to features such as incident management, asset management, knowledge base, ticket management, and On-call schedules. They can create, update, and resolve tickets, view their schedules and shift details, and create time off requests.

An itil user might also have more than one role assigned to them. For example:

- sn_incident_write
- sn_change_write
- sn_request_write

Apart from the itil role, users might have the following additional roles, based on the various features available in ITSM Mobile Agent.

Additional ITSM Mobile Agent roles

Feature	User role
Major incidents	major_incident_manager
Hardware asset management	approver_user:
On-call Scheduling	rota_manager
Shift Planning	sn_shift_planning.admin

ITSM Mobile Agent features and plugins

Learn about the plugins used in ITSM Mobile Agent.

The ITSM Mobile Agent application offers various plugins that can enhance functionality and provide additional features. Some of the common plugins used with ITSM Mobile Agent include the following:

- com.glideapp.itom.snac [Event management]
- com.sn_hamp [Hardware asset management]
- com.sn_shift_planning [Shift Planning]
- com.sn.slack.ahv2 [Slack spoke-store]
- com.snc.iam [Incident communications management]
- com.snc.incident.mim [Major incident management]
- com.snc.notify [Notify]
- com.snc.on_call_rotation [On-call Scheduling]
- com.snc.pa.incident.mim [Performance Analytics - Major Incident Management]
- com.snc.pa.itsm_dashboards [Performance Analytics - ITSM Dashboards]
- com.snc.tcm_collab_hook [Collaboration services - store]

AI Search in ITSM Mobile Agent

Intelligent query features enable agents to quickly find the required answers in ITSM Mobile Agent.

Using AI search, agents can easily search find the following records:

- Incidents (MIM, Breached Incidents, At Risk)
- Change tasks

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Catalog tasks
- Changes
- System users
- Knowledge base articles

You can also toggle between Zing search and AI search if needed.

AI Search in ITSM Mobile Agent offers the following features:

- Navigation tab filters: Filters help users narrow down results on a site.
- Auto-complete: As the user enters text, AI Search predicts the query and helps formulate the user's question.
- Auto-correct typos: Typos are auto-corrected based on indexed content.
- Synonym handling: The search engine also looks for words similar to the search term.
- Genius cards: Genius result cards display the most relevant answers.

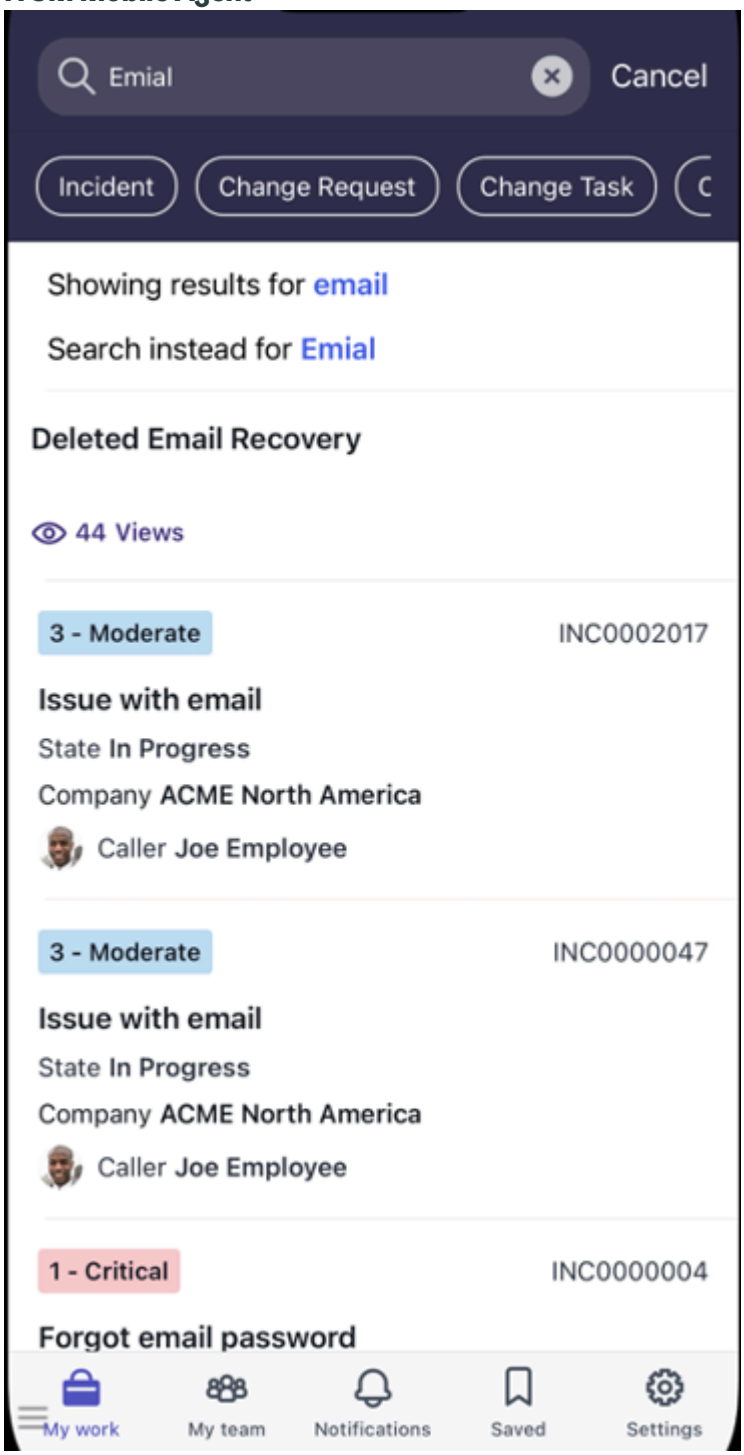
ITSM Mobile Agent



For information about AI search, see AI Search.

For information about AI search in mobile, see AI Search in mobile.

The following configurations are added for AI search experience in ITSM Mobile Agent:

- A search application configuration, [AIS] ITSM Mobile Agent Search Configuration. For information about search application configurations, see Search application configurations.
- A search profile, ITSM Mobile Agent Search Profile. For information about search profiles, see Search profiles.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Get started with AI search in new or zBoot instances

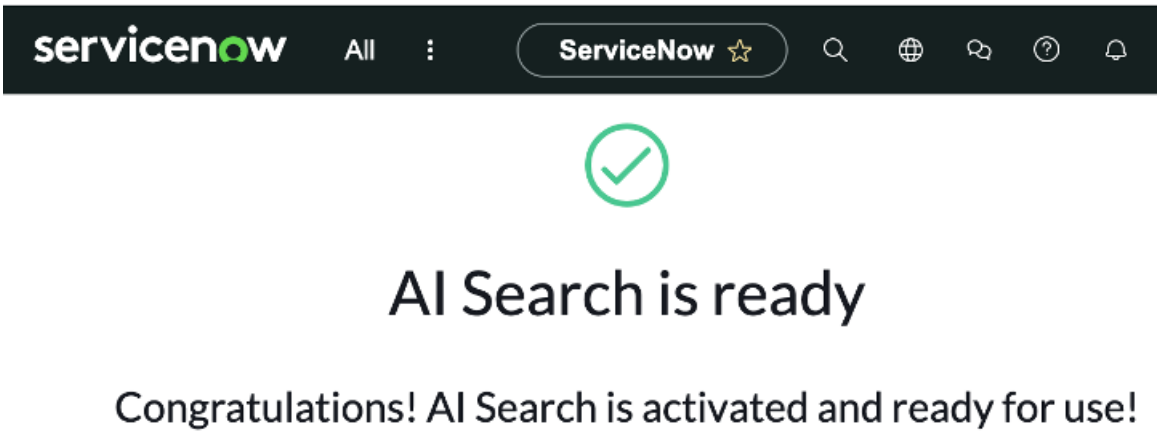
Enable intelligent query features that help agents to quickly find the required answers in ITSM Mobile Agent in new or restarted instances.

Before you begin
Role required: ais_admin or admin

About this task
AI search is enabled by default in the base system for new and restarted instances. You must publish the associated search profile.

Procedure
1. To ensure AI search is enabled, navigate to **All** > **AI Search** > **AI Search Status**.

AI Search



2. Publish the AI search-related search profile.
   a. Navigate to **All** > **AI Search** > **Search Experience** > **Search Profiles**.
   b. Click **ITSM Mobile Agent Search Profile**.
   c. Click **Publish**.

Get started with AI search in upgraded instances

Enable intelligent query features that help agents to quickly find the required answers in ITSM Mobile Agent in upgraded instances.

Before you begin
Role required: ais_admin or admin

About this task
You can get started with AI search in upgraded instances by using the AI search configuration in the base system.

Procedure
1. Enable AI search.
   a. Navigate to **All** > **AI Search** > **AI Search Status**.
   b. Click **Request AI Search**.
2. Activate the AI Search Index Sources (Id: com.glide.ais.index_sources) plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **All** > **System Definition** > **Plugins**.

b. Search for the AI Search Index Sources (Id: com.glide.ais.index_sources) plugin.

c. Click **Activate**.

3. Index all search sources.

a. Navigate to **All** > **AI Search** > **AI Search Index** > **Indexed Sources**.

b. Select all data sources.

c. From the **Actions on selected rows** drop down, select **Index All Tables**.

4. Publish the AI search-related search profile.

a. Navigate to **All** > **AI Search** > **Search Experience** > **Search Profiles**.

b. Click **ITSM Mobile Agent Search Profile**.

c. Click **Publish**.

5. Select the AI search-related search application configuration for the global search record.

a. Navigate to **sys_sg_global_search.list**.

b. From the list of search configurations, Click **ITSM Mobile Agent Search**.

c. For the **Search Application Configuration** field, select **[AIS] ITSM Mobile Agent Search Configuration**.

d. Click **Update**.

Note:
If you do not want to use the AI search configuration in the base system, migrate your search profiles and other configurations from zing search to AI search. Perform the steps mentioned in Configure AI Search for mobile devices.

Switch back to Zing search in ITSM Mobile Agent

If AI search is already enabled in ITSM Mobile Agent, enable Zing search configuration to use your own search profiles and configurations. It will enable Zing search in ITSM Mobile Agent and all workspaces.

Before you begin

Role required: admin

For information about Zing search in mobile, see Global search for mobile.

Procedure

1. Navigate to **sys_properties.list**.
2. Click **New**.
3. On the System property form, add the following information.
   - Name: glide.ais.global_search.use_zing
   - Value: true
4. Click **Submit**.

Enable dark theme in ITSM Mobile Agent

Enable a dark theme or mode in ITSM Mobile Agent. This option is commonly used to alleviate eye strain and improve readability.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: itil, rota_manager, sn_incident_write

Procedure

1. Open the ITSM Mobile Agent and tap **More**.
2. Tap **Settings** > **Preferences** > **Theme**.
3. Tap **Dark**.

Filter records

Set additional filters to limit the number of records that are displayed on a screen. Filtering records in the mobile app works like filtering with a condition builder on the ServiceNow AI Platform.

Before you begin
Role required: itil or group manager

Procedure

1. To further refine your search results, or to enter additional filter criteria on any list of records that is displayed, tap the filter icon ( ).
2. On the Filters screen that appears, tap the arrow on a field to expand it.
3. From the options available, tap the check box or tap an option for your filter.
   For many of the filters, you can select more than one option.
4. Tap the back icon ( ) or **DONE** to save your changes to a field.
   The criteria you chose displays on the Filters screen. The number of records that match your criteria also display on the top of the screen. Tap **Clear** or **RESET** to remove any filters and restore the default setting.
5. **Optional:** Repeat steps 1- 4 with the Filters screen displayed to continue setting your filter criteria.
6. Tap the and icon ( ) after you set all criteria to create AND conditions.
7. Alternatively, tap the OR icon ( ) to create OR conditions.
8. After you have added all the criteria you want, tap **DONE**.
   The incident records that match your filter criteria display on the screen.

Collaboration Services for ITSM Mobile Agent

Collaboration services provide a way to communicate and collaborate in real time. You can directly use a collaboration tool from an incident, incident task, and major incident records.

Install the Collaboration services (sn_tcm_collab_hook), Notify (com.snc.notify), Notify connector for Microsoft Teams (com.sn.ms_teams) applications in your instance to use collaboration services on ITSM Mobile Agent.

- Collaboration with incidents

  Initiate and manage the collaboration for incident records from the ITSM Mobile Agent app.

- Collaboration with incident tasks

  Initiate and manage the collaboration for incident task records from the ITSM Mobile Agent app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Collaboration with major incidents

  Initiate and manage the collaboration for major incident records from the ITSM Mobile Agent app.

Add deep linking support to ITSM Mobile Agent

Deep linking enables instances to support direct communication to a messaging application from a particular record in the system.

Before you begin
Role required: itil, itil_admin, or admin

About this task
You need to assign the deep linking support on the Mobile Studio.

Procedure

1. Log in to your instance.
2. In the Navigation filter, enter `sys_properties.list`.
   The entire list of properties in the System Properties [sys_properties] table appears.
3. Open the record for **glide.sg.allowed_external_deeplinks**.
4. In the form, match the following values:

System Properties table

Field	Value
Name	glide.sg.allowed_external_deeplinks
Type	String
Value	Slack,Teams

5. Click **Save**.

Configuring ITSM Mobile Agent

Plan and configure ITSM Mobile Agent.

Configuration overview
As an administrator, you can configure preferences and application behavior and create tools that improve the effectiveness of Agents and Managers. These are some of the tasks you can perform as an administrator:

- Migrate to latest and supported version of Mobile Agent.
- Create and configure actionable notifications for Mobile Agent.
- Enable push notification categories.

Install ITSM Mobile Agent

You can install the ITSM Mobile Agent application (sn_itsm_mobile_agt) if you have the admin role. The application installs related plugins if they are not already installed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.

Role required: admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITSM Mobile Agent application (sn_itsm_mobile_agt) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install ITSM Mobile Agent.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data comprises the sample records that describe application features for the common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Migration from ITSM Mobile to ITSM Mobile Agent

The ITSM Mobile plugin (com.sn_itsm_mobile) was deprecated in Quebec. The existing customers can migrate to ITSM Mobile Agent for enhanced mobile-first experiences in the base system, designed for agents to triage, act on, and resolve incidents on the go. ITSM Mobile Agent application improves productivity with an intuitive interface to manage all the work, view schedules, check who is on-call, respond to major incidents, and more.

For information about getting started with ITSM Mobile Agent, see Log in to ITSM Mobile Agent.

Deactivate the ITSM Mobile launcher screens and notifications

After you install the ServiceNow Agent app, avoid duplication of launcher screens and notifications from the deprecated ITSM Mobile app.

Before you begin

Role required: admin

About this task

After installing the ITSM Mobile Agent app on your instance, you can still view the launcher screens from the ITSM Mobile application when you log in to the ServiceNow Agent app (Android or iOS). Also, you might receive duplicate notifications since both ITSM Mobile and ITSM Mobile Agent apps are active on your instance.

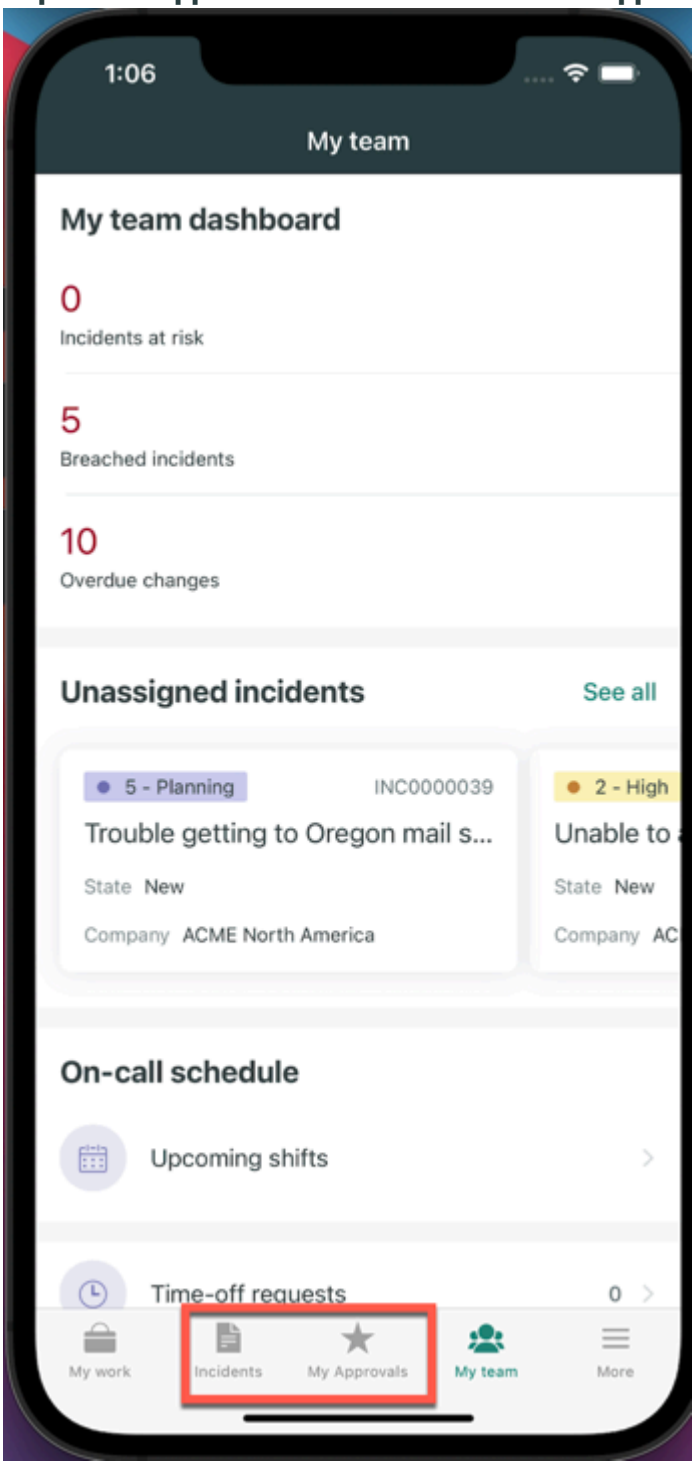
Deprecated applet launchers for incidents and approvals



Since no updates are supported on the ITSM Mobile plugin (com.sn_itsm_mobile), it's recommended that customers stop using the related deprecated features. It's also recommended that applets or applet launchers from both plugins (ITSM Mobile and ITSM Mobile Agent) aren't active at the same time.

Since the single-click uninstallation of plugins isn't supported, the deprecated plugin isn't deactivated in the base system. Hence, deactivate the applet launchers and notifications that exist in the deprecated ITSM Mobile plugin.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Applications** > **Studio**.
2. From the Select Application pop-up window, open the ITSM Mobile application in the studio.
3. To deactivate the ITSM Mobile launcher screens, perform the following steps:

   a. To deactivate the **Incidents** launcher screen, perform the following steps:

      i. Navigate to **Mobile Studio** > **Applet launchers** > **Incidents**.

      ii. From the header menu, make this launcher screen inactive by using the **Active** toggle switch.

      iii. Click **Save**.

   b. To deactivate the **My Approvals** launcher screen, perform the following steps:

      i. Navigate to **Mobile Studio** > **Applet launchers** > **My Approvals**.

      ii. From the header menu, make this launcher screen inactive by using the **Active** toggle switch.

      iii. Click **Save**.

   When you log into the ServiceNow Agent app, the deprecated launcher screens aren't displayed.

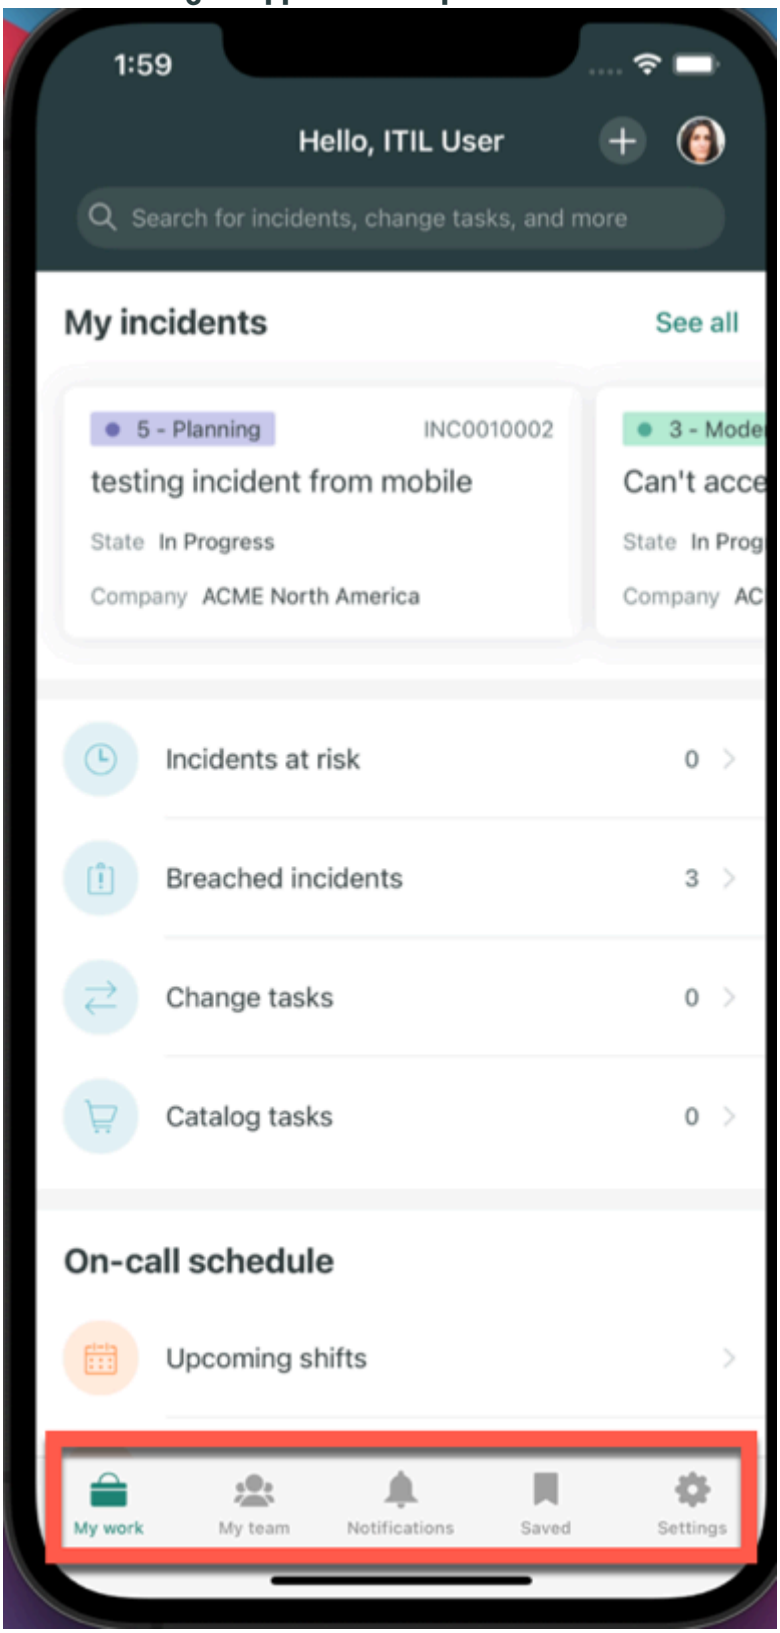
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ServiceNow Agent app without deprecated launcher screens



4. To deactivate the ITSM Mobile notifications, perform the following steps:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. To deactivate the notifications related to assigned approvals, perform the following steps:
   i. Navigate to **Notifications** > **Notifications** > **Approval assigned to me**.
   ii. Clear the **Active** check box.
   iii. Click **Update**.

b. To deactivate the notifications related to commented incidents, perform the following steps:
   i. Navigate to **Notifications** > **Notifications** > **Incident commented**.
   ii. Clear the **Active** check box.
   iii. Click **Update**.

Migrate customizations from the ITSM Mobile application scope to the ITSM Mobile Agent scope

When migrating from ITSM Mobile to ITSM Mobile Agent, an admin must verify if any customizations are defined in the deprecated ITSM Mobile application scope. Such customizations should be deactivated or moved to the ITSM Mobile Agent scope.

The admin must verify if any custom notifications are defined in the deprecated ITSM Mobile application scope. Such notifications should be deactivated or moved to the ITSM Mobile Agent scope.

Similarly, the admin must deactivate or move the custom launcher screens or custom applets to the ITSM Mobile Agent application scope.

Important:
To move customizations from the ITSM Mobile application scope to the ITSM Mobile Agent application scope, perform one of the following actions:

- Copy the custom code and paste it in the ITSM Mobile Agent application scope.
- Redefine the code in the ITSM Mobile Agent application scope.

Migration to ITSM Mobile Agent 5.0.3

Migration to ITSM Mobile Agent 5.0.3 enables the Next Experience theme and accessibility compliance in ITSM Mobile Agent.

This migration includes the following component changes:

- Migration of legacy icon sections to new icon sections. It includes better grouping of icon sections for on-call scheduling and incidents along with color variables for icons.
- Migration of legacy UI parameters to new input form screens. It simplifies the way parameters are defined, enables theming on the input form screen, and supports accessibility enhancements by Mobile Platform.
- Migration of legacy card views to mobile views. It allows using color variables as per theme.
- All styling changes can be done through UI rules instead of UI styles.
- For buttons that perform a positive action, button emphasis has changed from primary to positive.

When customers migrate from any older version to ITSM Mobile Agent 5.0.3, the following steps are automatically performed:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- When the *plugin.upgraded* event is triggered for the ITSM Mobile Agent (sn_itsm_mobile_agt) application, the *Run clean upgrade for ITSM Mobile Agent* script action is run.
- This script action invokes the following upgrade APIs:
  - For legacy icon sections to new navigation sections, the *cleanUpgradeIconSections()* method from the `sn_itsm_mobile_agt.MobileUtahUpgradeEngine` script include.
  - For old ui parameters to new input form screen, *cleanUpgradeButtonInstance()* method from the `sn_itsm_mobile_agt.MobileUtahUpgradeEngine` script include.
  - For legacy cards to new mobile views, *cleanUpgradeLegacyCards()* method from the `sn_itsm_mobile_agt.MobileUtahUpgradeEngine` script include.
  - A map with key value pairs, *sn_itsm_mobile_agt.MobileIconSectionMigrationConstant*, is introduced where the key is the sys_id of the legacy default configuration and the value is an object with a comma-separated list of metadata for the corresponding new default configuration that is introduced in the upgrade process.
- After the script action is run and performs all the required actions, it is deactivated so that it isn't run again on future upgrades.

Migration of legacy icon sections to navigation sections

In this case, the `sn_itsm_mobile_agt.MobileIconSectionMigrationConstants` script include contains the following key value pairs:

- Key: sys_id of the legacy default *sys_sg_icon_section* record.
- Value: Object with a comma-separated list of sys_ids of *sys_sg_navigation_section* and *sys_sg_applet_launcher_m2m_section* records.

The `Run clean upgrade for ITSM Mobile Agent` script action upgrade script runs to perform the following steps for each key in the map:

1. Check the following records for customizations.
   - Legacy default *sys_sg_icon_section* record.
   - Compare if the legacy default icon section has at least one new or one less *sys_sg_applet_launcher_m2m_section* record when compared to the new default icon section.
2. Based on customizations, one of the following steps is performed.
   - If any of the above records are customized, the script deactivates the new default *sys_sg_navigation_section* record.
   - If none of the above records are customized, the script deactivates the legacy default *sys_sg_icon_section* record.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- Custom icon sections that are not available by default continues to function but may not support Next Experience theme and accessibility compliance. Customers must migrate them to navigation sections for better experience.
- For customized icon sections that are available by default, customers must manually review the legacy default icon sections that are still active and move their customizations to the new default navigation sections.
- If customized icon sections are not migrated to the new navigation sections, then users will have a mixed experience that may not be fully compatible with the new Next Experience theme and can lead to accessibility issues.

Migration of UI parameters to input form screen

In this case, the `sn_itsm_mobile_agt.MobileInputFormScreenMigrationConstants` script include contains the following key value pairs:

- Key: sys_id of the legacy default *sys_sg_button_instance* record.
- Value: Object with comma-separated list of sys_ids of the new default *sys_sg_button_instance* record and other meta data.

The `Run clean upgrade for ITSM Mobile Agent` script action upgrade script then runs to perform the following steps for each key in the map:

1. Check the following records for customizations.
   - Legacy default *sys_sg_button_instance* record.
   - *sys_sg_button* record associated with the *sys_sg_button_instance* record.
   - *sys_sg_ui_parameter* and *sys_sg_action_param_map* records associated with the *sys_sg_button* record.
   - *sys_sg_write_back_action_item* record associated with the *sys_sg_button* record.
2. Based on customizations, one of the following steps is performed.
   - If any of the above records are customized, the script deactivates the new default *sys_sg_button_instance* record.
   - If none of the above records are customized, the script deactivates the legacy default *sys_sg_button_instance* record.

Note:

- Custom button instance flows (UI Params) that are not available by default continues to function but may not support Next Experience theme and accessibility compliance. Customers must migrate them to input form screens for better experience.
- For custom button instance flows (UI Params) that are available by default, customers must manually review the legacy default *sys_sg_button_instance* records that are still active and move their customizations to the new *sys_sg_button_instance* flow (refer to the map sn_itsm_mobile_agt.MobileInputFormScreenMigrationConstants). For configuring Input form screens on mobile, see Input form screen.
- If customized UI parameters are not migrated to the new input form screens, then users will have a mixed experience that may not be fully compatible with the new Next Experience theme and can lead to accessibility issues.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migration of item views to new mobile cards

In this case, the `sn_itsm_mobile_agt.MobileIconSectionMigrationConstants` script include contains the following key value pairs:

- Key: sys_id of the legacy default *sys_sg_item_view* record.
- Value: Object with a comma-separated list of sys_ids of *sys_sg_form_screen* and *sys_sg_master_item* records where legacy card (that is, item view) is referenced.

The `Run clean upgrade for ITSM Mobile Agent` script action upgrade script then runs to perform the following steps for each key in the map:

1. Check the following records for customizations.
   - Legacy default *sys_sg_item_view* record.
   - All *sys_sg_ui_style* records associated with the *sys_sg_item_view* record.
2. If any of the mentioned records are customized, the script reverts the *sys_sg_form_screen* and *sys_sg_master_item* records to previous state only if these records are not customized.

Note:

- Custom item views that are not available by default will continue to function but may not support Next Experience theme and accessibility compliance. Customers must migrate them to input form screens for better experience.
- For custom icon sections that are available by default, customers must manually review the old default flows which are still active and move their customizations to the new flow. For information about configuring cards on mobile, see Customize a screen using Mobile Card Builder.
- If customized item views are not migrated to new mobile cards, then users will have a mixed experience that may not be fully compatible with the new Next Experience theme and can lead to accessibility issues.

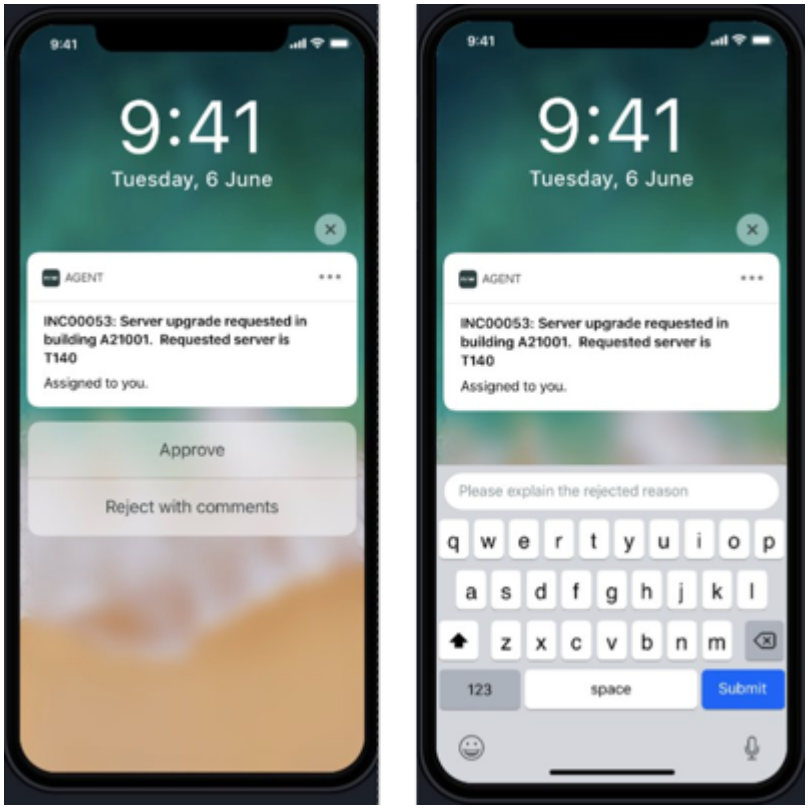
Configurable actionable notifications for ITSM Mobile Agent

With configurable actionable notifications for ITSM Mobile Agent, you can perform actions based on push notifications without having to open the ITSM Mobile Agent application.

You can associate up to three actions with a push notification. These actions must refer to an existing mobile function. The following function types of actions are supported:

- Action item
- Navigation
- URL
- Chat launcher

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Process for creating actionable push notifications

Create actionable push notifications using the following process:

1. Create an actionable push notification for ITSM Mobile Agent.
2. Create a push action category.
3. Create function for each push action.
4. Map functions with push actions on the actionable push notification.
5. Create push message content.
6. Create a standard notification.

Create an actionable push notification for ITSM Mobile Agent

Create a push notification for various actions performed on the ITSM Mobile Agent application.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Mobile** > **Mobile Push Notifications** > **Push Notifications**.
2. Click **New**.
3. In the push notification form, fill in the fields.

Push notification form

Field	Description
Name	The name of your push notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: This name does not appear to users viewing the notification.
Application	The scoped application for your notification. This field automatically uses the current application scope.
Actionable	Option for making a notification actionable.
Screen	Optional screen associated with your notification. Displays to a user when they tap on the notification.

4. Click **Save**.

Result
The notification record is created, and the **Push Action Instances** related list appears on the form.

Create a push action category

Create a push action category if any of the pre-defined push action categories do not meet the business requirements.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Mobile** > **Mobile Push Notifications** > **Push Action Categories**.

Push action categories

Action	Description
accept-reject-back	Displays **Accept** and **Reject** buttons. Users can select an option without opening the app.
Accept-Reject-fore	Displays **Accept** and **Reject** buttons. The app opens when the user selects an action.
accept-rejectwcomments-back	Displays **Accept** and **Reject** buttons. When users select the **Reject** option, a confirmation dialog box appears that requires the user to provide a message and click Send.
ack-escalate-ignore-back	Displays **Acknowledge**, **Escalate**, and **Ignore** buttons. Users can select an option without opening the app.
approve-reject-back	Displays **Approve** and **Reject** buttons. Users can select an option without opening the app.
approve-rejectwcomments-back	Displays **Approve** and **Reject** buttons. When users select the **Reject** option, a confirmation dialog box appears that requires the user to provide a message and click Send. Users can select an option without opening the app.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Action	Description
confirm-reschedule-cancel-back	Displays **Confirm**, **Reschedule**, and **Cancel** buttons. Users can select an option without opening the app.
joinbridge-fore	Displays a **Join Meeting** button. Tapping this button opens the app.
PromoteWComments-RejectWComments-fore	Displays **Promote** and **Reject** buttons. When users select either option, a confirmation dialog box appears that requires the user to provide a message and click Send.
queuerejoin-openincident-back	Displays **Online Check-in** and **Open Incident** buttons. Users can select an option without opening the app.
queuestay-queueleave-back	Displays **Stay in Queue** and **Leave Queue** buttons. Users can select an option without opening the app.
yes-no-back	Displays **Yes** and **No** buttons. Users can select an option without opening the app.

2. Click **New**.
3. In the push action category form, enter a name for the category in the **Name** field.
4. Click the lock icon ( ) next to the **Actions** field.
5. Click the reference icon ( ) to display the **Push Actions** list and select the actions for the push action category.
6. Select **Save**.

Create a push action

Create a push action if any of the pre-defined push actions do not meet the business requirements.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Mobile** > **Mobile Push Notifications** > **Push Actions**.
2. Click **New**.
3. In the push action form, fill in the fields.

Push action form

Field	Description
Label	Text your users will see in the notification for this action.
Application	Scoped application for this record. This field automatically populates.
Name	Name of the push action.
Foreground	When enabled, the app opens when your users select this action.
Response Type	Options are:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Simple** ○ **Text response**
Placeholder Text	Placeholder text to your users when they initiate the actionable push.

4. Click **Save**.

Create functions for notification push actions

Create a mobile function for each function in the action category. These actions perform tasks on your instance based on what the user selects in the notification.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Mobile** > **Functions**.
2. Click **New** to create a new function record.
3. Create a function for one of your push actions.
   When selecting a function type in the **Type** field, you must select one of the function types supported for actionable push notifications:
   - Action item
   - Navigation
   - URL
   - Chat launcher

   For information on function types, and detailed steps for creating functions, see Mobile functions.
4. Create additional functions for each push action.
   For example, if you have selected `ack-escalate-ignore-back` as your push notification category, your notification displays the **Acknowledge**, **Escalate**, and **Ignore** buttons. Create a function to determine the behavior of each of these buttons.

What to do next
Map functions with push actions for actionable push notifications

Map functions with push actions for actionable push notifications

Associate functions to the actions for an actionable push notification.

Before you begin
Role required: admin

Procedure

1. Navigate to **All** > **System Mobile** > **Mobile Push Notifications** > **Push Notifications**.
2. Open a notification.
3. In the **Push Action Instances** related list, click **New**.
4. On the form, fill in the fields.

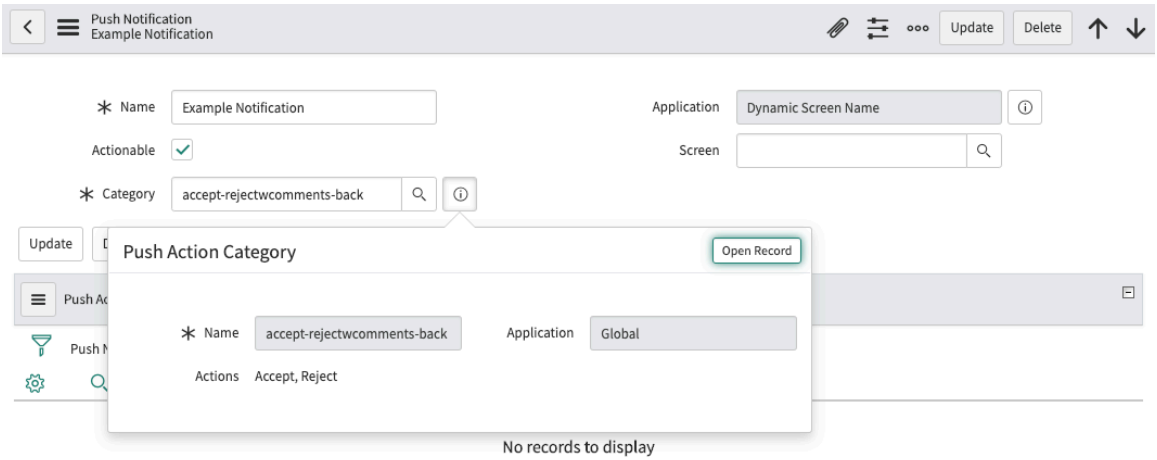
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Push action instance form

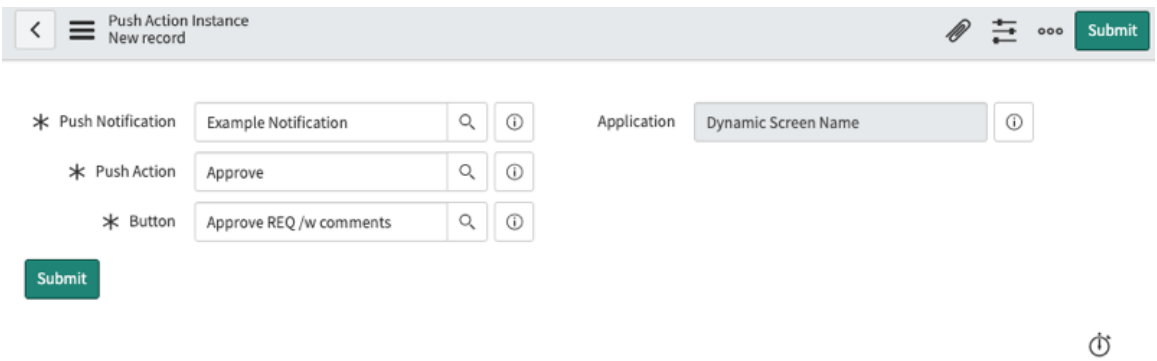
Field	Description
Push Notification	Push notification associated with this push action instance. This field is automatically filled in with your push notification.
Application	Scoped application associated with this record. This field is automatically filled in with the current application.
Push Action	Push action from your push notification record. Select one of the available actions.
Button	Function to associate with the push action. This action triggers when a user uses the action listed in the **Push Action** field.

5. Click **Submit**.

Example:
This example notification uses the *accept-rejectwcomments-back* in the **Category** field. Clicking the preview icon (ⓘ) shows the two actions used by this category: *Accept* and *Reject*.



In the example push action instance, the *Approve* push action is selected in the **Push Action** field, and the *Approve REQ /w comments* function is selected in the **Button** field. The instance executes this function when a user taps the **Approve** button in the notification.



Create push message content

Create the content of the message to be displayed as a notification.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Mobile** > **Mobile Push Notifications** > **Push Notifications**.
2. Open the notification.
3. Click **Create Push Message Content** in the Related Links section.
4. On the form, fill in the fields.

Push Notification Message Content form

Field	Description
Name	Name of your push message content record. This name is not visible to your users.
Application	Scoped application associated with this record. This field is automatically filled in with the current application.
Push app	Mobile Agent app on which the push notification is displayed.
Push Message Generation	The script that generates the push notification. When you create message content, this script is automatically generated.

5. Click **Submit**.

Create a standard notification

Create a record to determine the information to be displayed for a notification.

Before you begin
Role required: admin

Procedure
1. Navigate to **All** > **System Notification** > **Push** > **Create Push Notification**.
2. On the form, fill in the fields.

Push notification form

Field	Description
Name	Name of your notification. This name is not visible to your users.
Active	Option for determining whether the notification is active. The instance does not send inactive notifications to your users.
Table	Table containing the records relating to your notification. For example, notifications about new incidents use the Incident [incident] table.
Push Message Only	Indicates the notification is a push message only. This field cannot be changed.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Category	The category for your notification. This field value is **Uncategorized** by default.

3. Right-click the form header and select **Save**.
4. Configure the push message for your standard notification.
   a. Click to display the **What to Send** tab.
   b. Click the lock icon ( ) next to the **Push Messages** field.
   c. Click the reference icon ( ) to display the **Push Notification Messages** list.
   d. Click **New**.
   e. On the form, fill in the fields.

Push Notification Message form

Field	Description
Name	Name of your push notification message record. This name is not visible to your users.
Application	Scoped application associated with this record. This field defaults to the current application.
Push App	Mobile Agent app on which the push notification is displayed.
Table	Table containing the records relating to your notification. For example, a notification about new incidents would use the Incident [incident] table.
Push Message Content	The record for the push message content.
Message	Text the user sees in the push notification, for example, `An incident has been assigned to you.`

   f. Click **Submit**.
5. In the **Notification** form, click **Update**.

Enable Push notification categories for ITSM Mobile Agent

Enable push notification categories so your users can enable or disable notifications by category.

Before you begin

Role required: admin

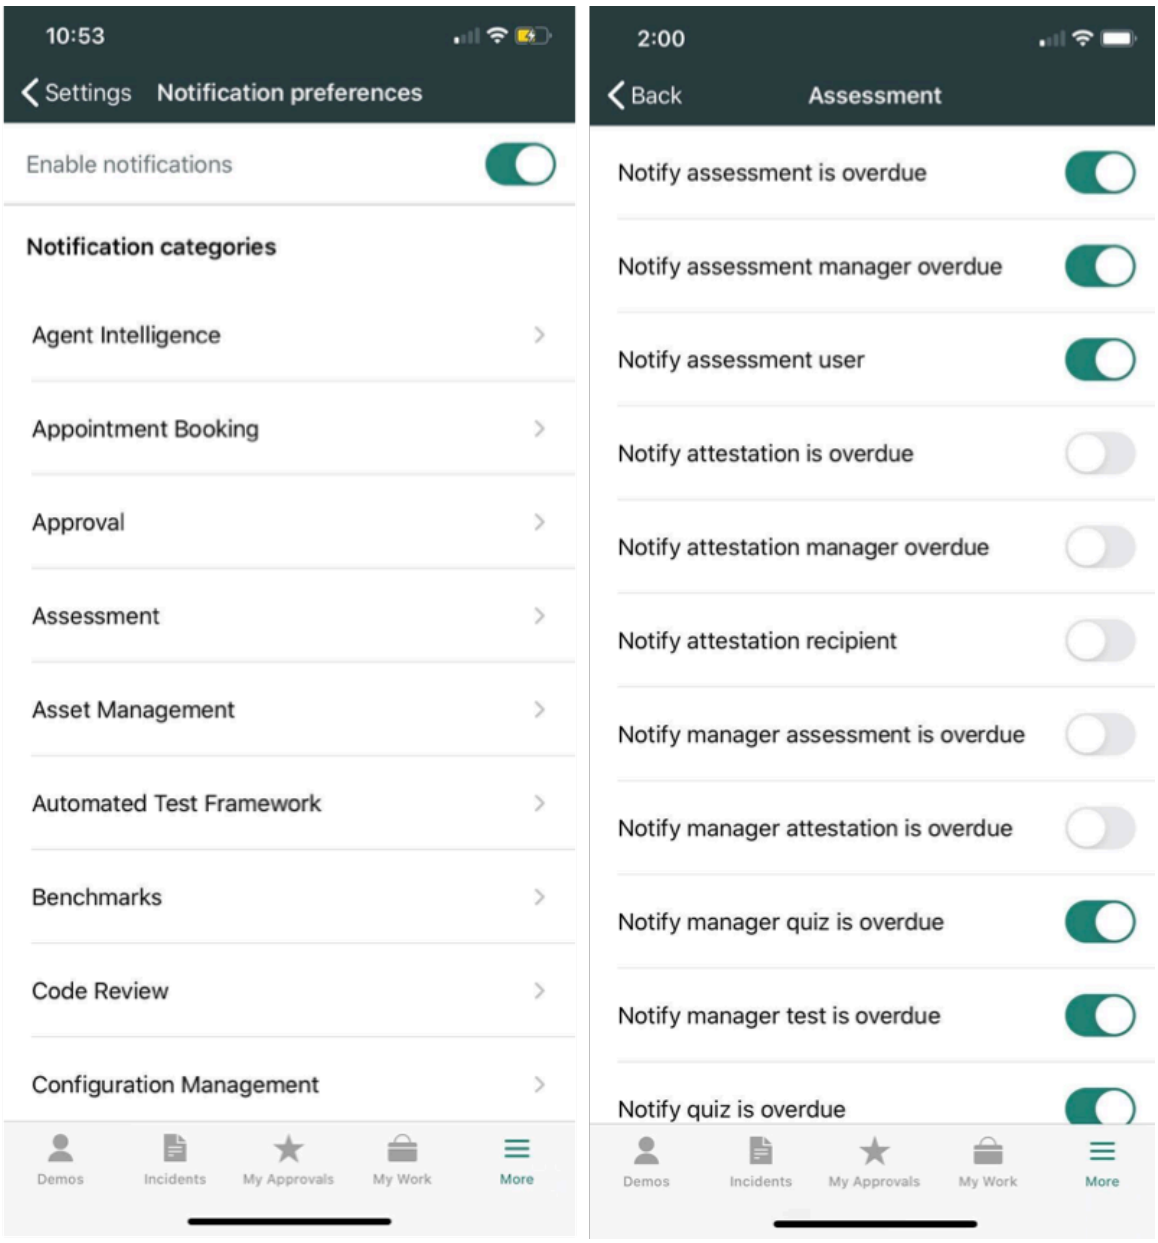
© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Type `sys_properties.list` in the application navigator.
2. In the system properties list, find and open the property with the name *`com.glide.sg.notifications.management`*.

> **Note:**
> If the property does not exist, click **New** and create a true|false property with the name mentioned in the previous step. After changing this property, users must log out and then log back in for the change to take effect.

3. In the **Value** field, enter `true`.
4. Select **Update**.



The user can enable or disable notifications by category. The categories shown in the notification preferences screen are defined in the **Notifications** [sysevent_email_action] table.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The screen to the left shows all the reference categories defined on this table. The screen to the right shows the record matching the selected category.

After you have updated your system property, your users will be able to enable or disable notifications by the defined categories.

Enable Override do not disturb to receive critical alerts

Enable the Override do not disturb to receive critical push notifications feature for ITSM Mobile Agent.

About this task

With the Override do not disturb to receive critical push notifications feature, ITSM managers can reach out to their on-call members even when their phones are set to Do Not Disturb mode.

To enable this feature, you must configure a prompt and reprompt property. The reprompt property resends the pop-up message if the agent didn't initially enable the configuration.

Before you begin

Role required: admin

Procedure

1. Navigate to **sys_sg_properties** > **Mobile properties**.
2. On the mobile properties page, switch to **Global scope**.
3. Select **New** and create a new property with the following details:
   - Name: *critical_alerts_request_prompt*
   - Type: **True/False**
   - Value: `true`
   - Mobile Application: **Agent**
4. Select the **Active** option.
5. Ensure that the value is **True** and select **Update** to create and apply the property.

   Note:
   After creating this property, users must log out and then log back in for the change to take effect.

6. Log in to the ITSM Mobile Agent application.
7. Select **Open Settings**, when prompted to `Enable Override Do Not Disturb To Receive Critical Alerts`.

   Note:
   If you log in to ITSM Mobile Agent using an iOS device, when prompted to `Enable Override Do Not Disturb To Receive Critical Alerts`, select **Allow**.

8. On the Do Not Disturb access settings page, select the ITSM Mobile Agent application from the list.
9. Select the **Allow Do Not Disturb** toggle button.
10. Confirm by selecting **Allow**.
    The user starts to receive the critical alerts in Do Not Disturb mode.
11. **Optional:** Configure the following reprompt property if you want to resend the **Override do not disturb to receive critical alerts** pop-up for the agents who didn't enable the property initially:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter `sys_sg_properties` in the navigation filter.

b. On the mobile properties page, select **New** and create a property with the name *`critical_alerts_request_reprompt`* and the same configuration as the *`critical_alerts_request_prompt`* property.

Configure critical notification

Configure the list of critical alerts that you want to receive when your mobile device is in Do Not Disturb mode.

Before you begin
Role required: admin

About this task
By default, the following notifications are set as critical:

- Major Incident Promotion Notification
- Major Incident- ICA SLA Breached
- Major Incident- ICT SLA Warning

Set any notification as critical and receive alerts when your mobile device is in Do Not Disturb mode.

Procedure

1. Navigate to **All** > **System notification** > **Push** > **Push Notification** and open the notification that you want to set as critical.
2. In the selected notification record, select the **What to send** tab.
3. Select the info icon (ⓘ) next to the **Push message** field.
4. Select **Open record** from the **Push Notification Message** pop-up message.
5. Set the *`isCritical`* attribute value to **true** to set the notification as critical.
   If the *`isCritical`* attribute value is set to **false**, the notification isn't treated as a critical alert.

Configure a customized notification for critical alert

Set your custom notifications as critical for ITSM Mobile Agent

Before you begin
Ensure that the custom notification is listed in the notification table.

Role required: admin

Procedure

1. Navigate to **All** > **System notification** > **Push** > **Push Notification** and open the notification that you want to set as critical.
2. In the selected notification record, select the **What to send** tab.
3. Select the info icon (ⓘ) next to the **Push message** field and select **Open record** from the **Push Notification Message** pop-up message.
4. Open the **Push Notification Message Content** table and paste the *`return new sn_itsm_mobile_agt.CriticalPushPayloadBuilder(current, json, attributes).buildJSON();`* attribute in the **Push Message Generation** field.
5. Create a new *`isCritical`* attribute with the attribute type as `string`.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Set the default value for the property as `False`.
7. In the Push Notification Message table, add the *`isCritical`* attribute, and set the value as `true`.

Configure a ringtone for critical alerts

Select a preferred ringtone for your critical notifications in ITSM Mobile Agent application.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Definition** > **Script Includes**.
2. Search and select *`CriticalPushPayloadBuilder`* from the list of scripts.
   Ensure that the selected script *`CriticalPushPayloadBuilder`* is in **ITSM Mobile Agent** application scope.
3. Open the **CriticalPushPayloadBuilder** record and edit the script with your preferred ringtone name:

```
var CriticalPushPayloadBuilder = Class.create();
CriticalPushPayloadBuilder.prototype = {
    initialize: function(currentGR, json, attributes) {
        this.currentGR = currentGR;
        this.json = json;
        this.attributes = attributes;
    },
    buildJSON: function() {
        if (this.attributes == null
 || this.attributes.isCritical == null
 || !(this.attributes.isCritical == "true"))
            return this.json;
        this.json["sncGoogleKeys"] = {
            "android": {
                "priority": "high"
            },
            "priority": "high"
        };
        this.json["aps"]["sound"] = {
            "critical": 1,
            "name": "NotificationAlert-9-Short.caf",
            "volume": 1
        };
        return this.json;
    },
    type: 'CriticalPushPayloadBuilder'
};
```

   You can select ringtones from below options:

   - NotificationAlert-1.caf
   - NotificationAlert-2.caf
   - NotificationAlert-3.caf
   - NotificationAlert-4.caf
   - NotificationAlert-5.caf

- NotificationAlert-6.caf
- NotificationAlert-7.caf
- NotificationAlert-8.caf
- NotificationAlert-9.caf
- NotificationAlert-10.caf
- NotificationAlert-11.caf
- NotificationAlert-12.caf
- NotificationAlert-13.caf
- NotificationAlert-14.caf

4. Select **Update**.

Log in to ITSM Mobile Agent

Access ITSM Mobile Agent on your mobile to manage incidents, view, and update on-call schedules.

Before you begin

Roles required: none

Ensure that ITSM Mobile Agent is installed from ServiceNow Store onto your instance. For more information, see Install ITSM Mobile Agent.

On your mobile, install the ServiceNow Agent app (from Apple App Store or Google Play Store). For more information about this app, see Mobile Agent.

Procedure

1. Tap the mobile app icon on your device, and then tap the plus button to login to an instance.
2. In the instance address field, enter the instance address in one of two ways:

Option	Description
Manual input	Type the instance address in the instance address field. **Note:** You do not need to include `service-now.com` at the end of the instance name.
Scan QR code	Tap the QR icon (Scan a QR code), and then scan the QR code given by your administrator.

3. **Optional:** Enter a nickname for this instance.
   If you have multiple instances added to the device, nicknames can help you quickly locate a ServiceNow AI Platform instance.
4. Tap **Save and Login**.
   The ITSM Mobile Agent landing screen opens. You can search for incidents, change tasks and more using the search bar on top of the landing screen.

Managing incidents and tasks using My Work applet

Use the My work applet in the ITSM mobile agent to perform various functions from the mobile.

As an agent, you can:

- Easily access incidents, change tasks, and catalog tasks.
- Take quick actions and provide timely updates.
- Add work notes or comments, update incident details, assign incidents to other agents.
- Easily access change requests and request approvals.

From the main screen of the agent mobile app, you can directly create an incident using a single click.

Create an incident from app landing page

Create an incident directly from your agent mobile app landing page with a single tap.

Before you begin

Role required: itil, sn_incident_write, or admin

Procedure

1. On your agent mobile app landing page, click on the to create an incident directly from the landing screen.
2. Fill in the fields.

Field	Description
Caller	Tap on the arrow to search and choose a caller to whom this incident should be assigned.
Short description	Provide a brief description of the incident.
Urgency	Populate the urgency of the incident. The available options are: ○ 1 - High ○ 2 - Medium ○ 3 - Low
Impact	Measure of the effect of the incident on business processes.
Priority	Identification of how quickly the service desk should address the task.
Description	Provide the detailed description of the incident.
Service	Tap the arrow to search and choose the service to which the incident belongs.
Configuration item	Tap the arrow to choose the configuration item for the incident.
Assignment group	Tap the arrow to search and choose an assignment group to which the incident should be assigned.
Assigned to	Tap the arrow to search and choose a person from the assignment group.

My incidents

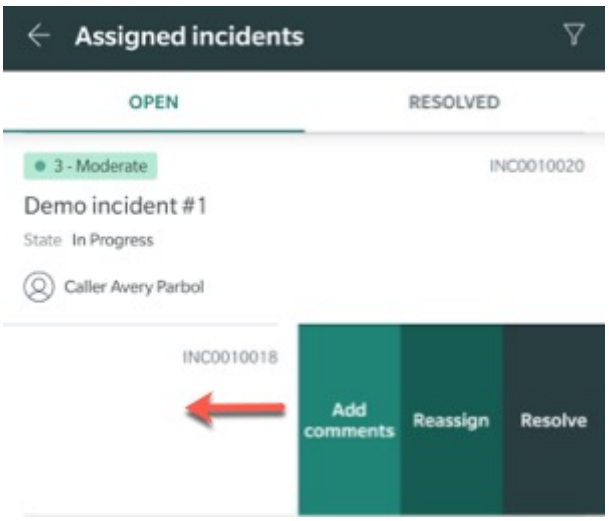
Use the My incidents applet to work on the incidents that are assigned to you.

Before you begin
Role required: none

About this task
Resolve, reassign the incident, or add comments to an incident assigned to you. Add work notes, view the details of an incident, or edit an incident, all from a single screen on your mobile.

Procedure

1. On the ITSM mobile agent landing screen, tap **See All** on the **My incidents** applet.
   The **Assigned Incidents** screen opens with a list of incidents.
2. If you want to reduce the number of records on the screen, see Filter records to search for records that match specific search criteria.
3. On the **Assigned incidents** screen with the list of incidents, swipe left on an incident to open the menu.



4. On the menu, choose one of the actions to process the incident.

Action	Description
Add comments	Add any additional comments or work notes about the incident in this field and tap .
Reassign	Use this action to reassign an incident to another agent. On the Reassign incident screen, tap the **Assignment group** field to change the assignment group, select the agent from the list in the **Assigned to** field and add any notes in the **Work notes**, and tap to submit.
Resolve	On the Resolve incident screen, tap the **Resolution code** field and choose a code for the resolution, add notes in the **Resolution notes** field, and tap .

5. On the **Assigned incidents** screen, tap a record on the list to open it and view more details.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. On the **My Incidents** screen, choose one of the actions in the table as appropriate.

Option	Description
DETAILS tab	Choose one to continue. ○ View the fields for details about the incident. The fields with an arrow have additional information. ○ At the top right of the screen, tap the menu icon to reassign, edit, or propose the incident as a major incident. ○ Add any additional comments using the **Add comments** button. ○ Resolve the incident after adding a resolution code and notes using the **Resolve** button.
ACTIVITY tab	View the activity on the incident like field changes or assignment changes. Tap the add icon to perform any of the following activities on the incident. **a.** *`Record Video`*: Record a video to be attached to the incident. **b.** *`Open Gallery`*: Open your photo gallery to attach an existing image or a video to the incident. **c.** *`Take Photo`*: Take a picture and attach it to the incident **d.** *`Attach File`*: Attach a file from another application to the incident. **e.** *`Add Additional Comments`*: Add any additional comments to the incident. **Note:** The comments can be made visible to the customer if you enable them using the toggle bar on the **Additional Comments** field. **f.** *`Add Work Notes`*: Add your work notes on the incident.
RELATED tab	View the related lists of the incident, such as, child incidents, incident tasks, alerts, task SLAs, impacted services, affected CIs, and attached published knowledge articles (translated versions if available). Tap on the arrow to view more details of these related items.
CALLS tab	View the list of all the calls related to an incident. Tap on any of the calls to **Add participants** or to **Join call**. Tap on the menu on top of the Conference Call page and tap **End call** to end the call.

Collaboration with incidents

Initiate and manage the collaboration for incident records from the ITSM Mobile Agent app.

Initiate a chat with the caller from an incident

Initiate a chat with the caller from an incident to discuss about the resolution of an incident.

8. Tap ••• .
9. Tap **End call**.

Incidents at risk

View a list of incidents at risk and work on them from your mobile.

Related topics

Process an incident at risk

Process an incident at risk

Work on an incident at risk from your mobile.

Before you begin
Role required: ITIL

About this task
Resolve, reassign the incident, or add comments to an incident assigned to you.

Procedure

1. On the ITSM mobile agent landing screen, tap the **Incidents at risk** applet.
   The **Incidents at risk** screen opens with a list of incidents.
2. If you want to reduce the number of records on the screen, see Filter records to search for records that match specific search criteria.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the **Incidents at risk** screen with the list of incidents, swipe left on an incident to open the menu.
4. On the menu, choose one of the actions to process the incident.

Action	Description
Add comments	Add any additional comments or work notes about the incident in this field and tap .
Reassign	Use this action to reassign an incident to another agent. On the Reassign incident screen, tap the **Assignment group** field to change the assignment group, select the agent from the list in the **Assigned to** field and add any notes in the **Work notes** and tap to submit.
Resolve	On the Resolve incident screen, tap the **Resolution code** field and choose a code for the resolution, add notes in the **Resolution notes field**, and tap .

5. On the **Incidents at risk** screen, tap a record on the list to open it and view more details.
6. On the **Incidents at risk** screen as shown in the following figure, choose one of the actions in the table as appropriate.

Option	Description
DETAILS tab	Choose one to continue. ○ View the fields for details about the incident. The fields with an arrow have additional information. ○ At the top right of the screen, tap the menu icon to reassign, edit, or propose the incident as a major incident. ○ Add any additional comments using the **Add comments** button. ○ Resolve the incident after adding a resolution code and notes using the **Resolve** button.
ACTIVITY tab	View the activity on the incident like field changes or assignment changes. Tap the add icon to perform any of the following activities on the incident. **a.** *`Record Video`*: Record a video to be attached to the incident. **b.** *`Open Gallery`*: Open your photo gallery to attach an existing image or a video to the incident. **c.** *`Take Photo`*: Take a picture and attach it to the incident **d.** *`Attach File`*: Attach a file from another application to the incident. **e.** *`Add Additional Comments`*: Add any additional comments to the incident.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
	Note: The comments can be made visible to the customer if you enable them using the toggle bar on the **Additional Comments** field. **f.** *Add Work Notes*: Add your work notes on the incident.
RELATED tab	View the related lists of the incident, such as, child incidents, task SLAs, impacted services, and affected CIs. Tap on the arrow to view more details of these related items.
CALLS tab	View the list of all the calls related to an incident. Tap on any of the calls to *Add participants* or to *Join call*. Tap on the menu on top of the Conference Call page and tap **End call** to end the call.

Breached Incidents

View a list of all the breached incidents of your group and take appropriate action on these incidents. Breached incidents are the incident for which the Service Level Agreement (SLA) has exceeded the due date.

Process a breached incident

View and manage the breached incident from the mobile.

Before you begin

Role required: admin

Procedure

1. On the ITSM mobile agent landing screen, tap the **Breached incident** applet.
   The **Breached incidents** screen opens with a list of incidents.
2. If you want to reduce the number of records on the screen, see Filter records to search for records that match specific search criteria.
3. On the **Breached incidents** screen with the list of incidents, swipe left on an incident to open the menu.
4. On the menu, choose one of the actions as described in the table.

Action	Description
Add comments	Add any additional comments or work notes about the incident in this field and tap .
Reassign	Use this action to reassign an incident to another agent. On the Reassign incident screen, tap the **Assignment group** field to change the assignment group, select the agent from the list in the **Assigned to** field, and add any notes in the **Work notes**, and tap to submit.
Resolve	On the Resolve incident screen, tap the **Resolution code** field and choose a code for the resolution, add notes in the **Resolution notes** field, and tap .

Change tasks

View and work on the change tasks assigned to you. You can view the details, activities, and other related change tasks by a single tap on the ITSM mobile agent app.

Tap on the card to access all the change tasks assigned to you.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. You can filter the list according to your set criteria.
2. Swipe left to add comments to the task or close the task.
3. On the **Change Tasks** screen, tap on any task to view the details, activity and related change tasks. You can add comments or close a task from this screen.

> **Note:**
> Each change task card shows you the risk value of the task. For example, very high, or moderate.

View catalog tasks

View a catalog task and add comments to it as part of the catalog item fulfillment.

A catalog task is a task that is associated with the service catalog item. Catalog tasks are used to source items and fulfill requests.

Tap on the card to access all the catalog tasks assigned to you.

1. You can filter the list according to your set criteria.
2. Swipe left to add comments or close the task.
3. On the **Catalog tasks** screen, tap on any task to view the details or activity of the catalog task. You can only add comments from this screen.

View upcoming shifts with On-Call Scheduling

Use the My work feature in the ITSM Mobile Agent app to view your upcoming shifts and request time off.

Before you begin

Role required: itil, sn_incident_write

About this task

Use the On-Call Scheduling applet to view your upcoming shifts and request time off. You can also view the members of your available on-call group.

Procedure

1. Open the ITSM Mobile Agent app.
2. On the **On-call Schedule** tab, tap **Upcoming shifts**.

   All upcoming shifts for the current month are displayed. The shifts are grouped based on the type of events. One-day events are displayed at the top, followed by multi-day events and short-duration events that are sorted based on the time that the event was created.

3. Tap a shift card to view the following shift details:
   - Name
   - Group
   - Roster
   - Start time
   - End time
   - Duration
   - Type
4. Swipe the shift card to the left and tap **Request time-off**.
5. On the Request time-off form, enter the following details and tap **Submit** to complete the time-off request:
   - Group
   - Start date
   - End date
   - Proposed coverage
   - Notes

Request time off with On-Call Scheduling

Use the **Time-off requests** tab to view a list of time-off requests that are divided into pending and completed requests.

Before you begin

Role required: itil, sn_incident_write

Procedure

1. Open the ITSM Mobile Agent app.
2. On the **On-call Schedule** tab, tap **Time-off requests**.
   A list of time-off requests is displayed. The list is divided into pending and completed requests.
3. Tap the filter icon ( ) to view specific time-off requests.
4. Tap the menu icon ( ) and select **Request time-off**.
5. Complete the following fields on the Request time-off form:
   - Group
   - Start date
   - End date
   - Proposed coverage
   - Notes
6. Tap **Submit**.

View on-call group members

View the members of your group that are available on call.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: Itil, sn_incident_write

Procedure

1. Open the ITSM Mobile Agent app.
2. In the **On-call Schedule** tab, tap **Who is on-call**.
   All the available groups are displayed.
3. Select a group and tap **Submit**.

Managing teams and incidents using My Team applet

Easily access and get insights into the work of the groups you are managing.

With the My Team applet, as a group manager you can:

- Easily access unassigned incidents from your group and quickly triage work
- Act upon time-off requests submitted by your team
- Review any On-call conflicts or gaps in a schedule and plan for appropriate coverage
- Access dashboards to gain insights like MTTR, CSAT, and so on for your groups.

My team dashboard

As a group manager, with the My team dashboard, gain insights into the data like incidents at risk, breached incidents or overdue changes.

Tap on the sections to process the incidents.

Manage upcoming shifts with On-Call Scheduling

As an On-Call Scheduling manager, view your team's schedule and perform activities like approving time-off requests and providing coverage.

Before you begin

Role required: rota_manager

Procedure

1. Open the ITSM Mobile Agent app and tap **My team**.
2. On the **On-call Schedule** tab, tap **Upcoming shifts**.
   All upcoming shifts for the current month are displayed. The shifts are grouped based on the type of events. One-day events are displayed at the top, followed by multi-day events and short-duration events that are sorted based on the time that the event was created.
3. Tap the shift card to view shift details.
4. Tap **Request time-off** and provide the following details:
   - Group
   - Member
   - Start date
   - End date
   - Proposed coverage
   - Notes
5. Tap **Submit**.
6. Tap **Provide Coverage** and provide the following details:
   - Start date
   - End date
   - Coverage
7. Tap **Submit**.
8. In **Upcoming shifts**, swipe the shift card to the left and tap **Request time-off** to go to the Request time-off form.
9. In **Upcoming shifts**, swipe the shift card to the left and tap **Provide Coverage** to go to the Provide Coverage form.

Manage time-off requests with On-Call Scheduling

Use the **Time-off requests** tab to approve or reject the time-off request that you've received.

Before you begin

Role required: rota_Manager

Procedure

1. Open the ITSM Mobile Agent app and tap **My team**.
2. On the **On-call Schedule** tab, tap **Time-off requests**.
   A list of time-off requests is displayed. The list is divided into pending and completed requests.
3. Tap **Approve** or **Reject** the time-off requests that you've received.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Add a reason for the time-off request rejection.

4. Tap the filter icon ( ) to view specific time-off requests.
5. Tap the menu icon ( ) and select **Request time-off** to go to the Request time-off form.
6. Complete the required fields on the form and tap **Submit**.

Manage gaps and conflicts with On-Call Scheduling

Resolve all gaps and conflicts for the shifts in your group.

Before you begin

Role required: rota_manager

Procedure

1. Open the ITSM Mobile Agent app and tap **My team**.
2. On the **On-call Schedule** tab, tap **Gaps and conflicts**.
   A list of all the gaps and conflicts for the shifts in your group is displayed.
3. Tap any day of the month to view all gaps and conflicts for the shifts on that day.
4. Tap a shift card to view gaps and conflicts for the shift.
5. Swipe a shift card to the left and tap **Provide coverage** to provide or replace coverage, delete coverage, and manage a shift.
6. On the Gaps and conflicts form, tap **Provide coverage** to manage the coverage for a gap in the shift.

Performance metrics

Access the performance data of your team directly from your mobile with the ITSM Mobile Agent app.

As a group manager, with the My team dashboard, gain insights into the work of the groups you are managing by accessing metrics like MTTR (Mean Time To Resolution), CSAT, breached SLAs and so on.

Also view the graphical representation of the incidents raised in a week.

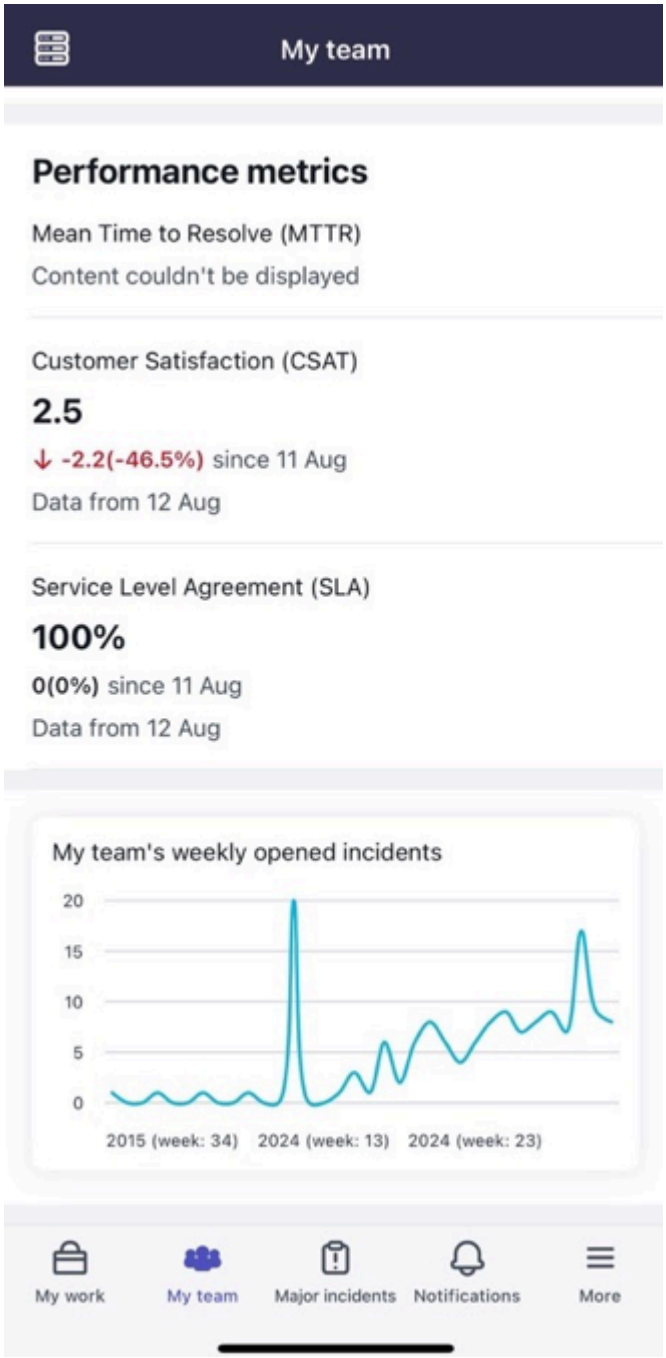
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:

- The data visualization changes for Performance metrics are available in the base system for both the new or upgrade customers. You can also view mobile analytics in Platform analytics workspace to configure or create new data visualization. For more information, see Create a mobile analytics preview.
- For the upgrade customers who have already customized the analytics sections, the data visualizations changes are not available by default. You can enable the new analytics section records from the Mobile Agent section of the Mobile App Builder to view the visualized changes.

Managing major incidents using Major Incident applet

As a major incident manager you can quickly review active major incidents or proposed major incidents and act upon them.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

As a major incident manager, you can also view and access the ongoing conference calls for current major incidents with the ability to start, join or end conference calls.

The major incident application contains the applets and folders as in the below table.

Major incident management applets

Applet/Folder	Description
Active major incidents	View, filter and act upon active major incidents.
Major incident candidates	Review the incidents that are proposed as major incidents and add comments.
Resolved major incidents	View resolved major incidents and add comments.
Major incident dashboard	Gain insights on the major incidents worked on by your group, like number of major incidents, Mean time to identify, and mean time to resolve.
Performance metrics	View a non-interactive graph of major incidents opened per week.

Active major incidents

View a list of related incidents, details of a major incident and activities on an incident.

Before you begin

Role required: major incident manager

Procedure

1. On the Agent landing screen, tap **See All** on the **Active major incidents** applet.
   The **Active major incidents** screen opens with a list of major incidents.
2. If you want to reduce the number of records on the screen, see Filter records to search for records that match specific search criteria.
3. On the **Active major incidents** screen with the list of incidents, swipe left on an incident to open the menu.
4. Tap **Add comments** to add any additional comments or work notes about the incident in this field and tap the send icon ( ).
5. Tap **Resolve** to resolve the major incident by adding the **Resolution code** and **Resolution notes**.
6. On the **Active major incidents** screen, tap a record on the list to open it and view more details.
7. Use the menu at the top of the screen for quick actions.

   The quick actions available for an active major incident are as follows:

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Assign to someone: Assign the major incident to someone in an appropriate assignment group.
- Resolve: Add a resolution code and resolution notes and tap the send icon ( ) to resolve the incident.
- Add comments: Add any additional comments or work notes for the major incident and tap the send icon ( ) to add these comments to the record.

8. On the **Active major incident** screen, choose one of the actions in the table as appropriate.

Option	Description
DETAILS tab	View the fields for details about the incident. The fields with an arrow have additional information.
ACTIVITY tab	View the activity on the incident like field changes or assignment changes. Tap the add icon ( ) to perform any of the following activities on the incident. **a.** *`Record Video`*: Record a video to be attached to the incident. **b.** *`Open Gallery`*: Open your photo gallery to attach an existing image or a video to the incident. **c.** *`Take Photo`*: Take a picture and attach it to the incident **d.** *`Attach File`*: Attach a file from another application to the incident. **e.** *`Add Additional Comments`*: Add any additional comments to the incident. **Note:** The comments can be made visible to the customer if you enable them using the toggle bar on the **Additional Comments** field. **f.** *`Add Work Notes`*: Add your work notes on the incident.
TASKS tab	View the list of all the tasks associated with the incident. Swipe left on an associated task to **Close task** or **Snooze** for a later time.
RELATED tab	View the related lists of the major incident, such as, child incidents, impacted services, outages, and affected CIs. Tap on the arrow to view more details of these related items.

Major incident candidates

View a list of major incident candidates and add comments to the incidents proposed as major incidents.

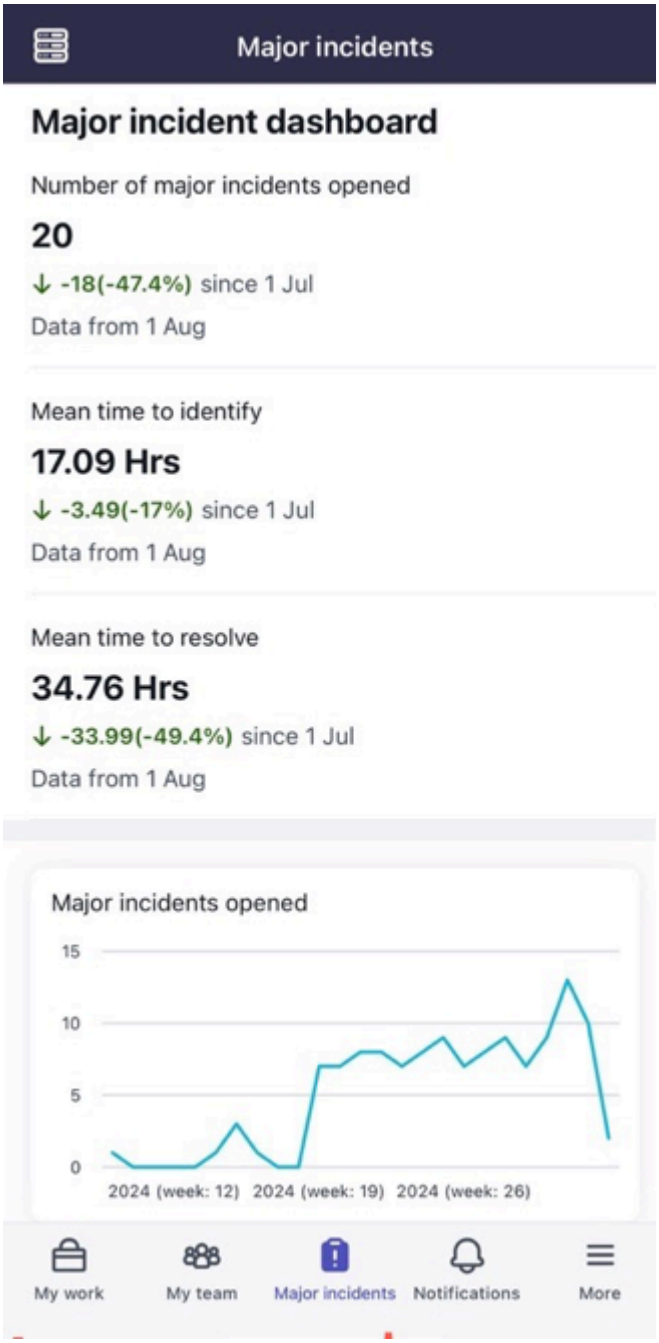
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Tap on any of the areas to open a detailed graphical representation of the associated information. You can also scroll left or right on the screen to view information pertaining to a different day or a week.

Note:

- The data visualization changes for Major incident dashboard are available in the base system for both the new or upgrade customers. You can also view mobile analytics in Platform analytics workspace to configure or create new data visualization. For more information, see Create a mobile analytics preview.
- For the upgrade customers who have already customized the analytics sections, the data visualizations changes are not available by default. You can enable the new analytics section records from the Mobile Agent section of the Mobile App Builder to view the visualized changes.

Domain Separation for ITSM Mobile Agent

This is an overview of domain separation and ITSM Mobile Agent. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can then control several aspects of this separation, including which users can see and access data.

© 2026 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Support level - Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. This includes domain separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the client must be able to see the SP's response.

ITSM Mobile Agent overview

The mobile platform supports domain separation for all native clients. The mobile UI design clearly indicates the domain that a record is associated with.

Before extending the domain separation functionality to mobile, the feature must be enabled on the platform web-based interface. For further information on configuration, see Domain separation setup and administration.

How domain separation works in mobile

You can use the company or account fields to display appropriate records by domain. These fields are available in tables when the domain separation plugin is enabled. Because each company or account is linked to a single domain, when you create a record, you can use these fields to specify the domain in which you want to create the record.

After the feature has been set up through the platform web-based interface, a two-part process is required to further extend the domain separation functionality on mobile. For additional information about configuring domain separation on mobile devices, contact Customer Service and Support.

Domain separated tables

- Incident [incident]
- Incident Task [incident_task]

Use cases

- An ESS user belonging to "Initech" domain, creates an incident. Only those ITIL users belonging to "Initech" domain or global domain can see this incident.
- An ITIL user belonging to a parent domain can see incidents of all its child domains as well.
- An ITIL user belonging to a specific domain can create incidents only on behalf of the domains that they have access to.
- An ITIL user can associate child incidents only of those domains that they have access to.
- If a user has access to multiple domains, the domain specified on the current record drives the functionality of that record and reference fields.
