Logical UUID [uuid_logical]	The logical unique identifier of the HPE server blade (HPE's proprietary identifier).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

HPE BladeSystem Blade [cmdb_ci_hpe_bladesystem_blade] (continued)

Field	Description
Model ID [model_id]	The blade server's product name (model).
Manufacturer [manufacturer]	The blade server's manufacturer name ("HP" or "HPE" depending on the model).
Serial number [serial_number]	A generated serial number according to this convention: **<blade's original serial> :: <blade's UUID>**.
Logical serial number [serial_number_logical]	The logical serial number of the HPE server blade (HPE's proprietary identifier).
Asset tag [asset_tag]	The asset tag as extracted from the blade's data.
Model number [model_number]	The blade's part number (HPE proprietary).
RAM (MB) [ram]	The blade's RAM size.
ROM Version [rom_version]	The version of the blade's ROM.
System Board Spare Part Number [system_board_spare_part_number]	The blade's system board spare part number (HPE proprietary).
Boot Mode [boot_mode]	The blade's boot mode.
Secure Boot Status [secure_boot_status]	The blade's secure board status.
Management Processor Type [management_processor_type]	The blade's management processor type (iLOversion).
Management Processor Name [management_processor_name]	The blade's management processor hostname.
Management Processor Firmware Version [management_processor_firmware_version]	The blade's management processor firmware version.
Management Processor IP Address [amanagement_processor_ip_address]	The blade's management processor IP address.
Management Processor MAC Address [management_processor_mac_address]	The blade's management processor MAC address.
Power Management Controller Version [power_management_controller_version]	The blade's power management controller's version.
iLO Federation Capable [ilo_federation_capable]	The iLofederation capability enabled/disabled.
Bay Number [bay_number]	The enclosure's bay number in which the blade is installed.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
MAC Address [mac_address]	The blade's management processor's ethernet address (= iLOnetwork interface MAC address).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Network Adapter [cmdb_ci_network_adapter] (continued)

Field	Description
Name [name]	The blade's management processor's hostname.
IP Address [ip_address]	The blade's management processor's IP address.
Configuration Item [cmdb_ci]	References the HPE BladeSystem Blade [cmdb_ci_hpe_bladesystem_blade] table.

IP Address [cmdb_ci_ip_address]

Field	Description
Name [name]	The blade's management processor (iLO) IPv4 IP address.
IP Address [ip_address]	The blade's management processor's IP address.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.

The implementation of HPE BladeSystem Enclosure CMDB model includes three new CI Classes:

CMDB Model: (New CI Classes)

Field	Description
Enclosure [cmdb_ci_enclosure]	A general class to represent any enclosure entity. Extends Hardware CI class.
HPE BladeSystem Enclosure [cmdb_ci_hpe_bladesystem_enclosure]	A CI class for representing the enclosure entity.
HPE BladeSystem Blade [cmdb_ci_hpe_bladesystem_blade]	A CI class for representing the blade server entity.

CI relationships

Discovery creates these relationships to support HPE BladeSystem Enclosure discovery.

CI	Relationship	CI
HPE BladeSystem Enclosure [cmdb_ci_hpe_bladesystem_enclosure]	Contains::Contained by	HPE BladeSystem Blade [cmdb_ci_hpe_bladesystem_blade]
HPE BladeSystem Blade [cmdb_ci_hpe_bladesystem_blade]	Owns::Owned by	Network Adapter [cmdb_ci_network_adapter]

SNMP-based queries

IBM Cloud Platform discovery

The ServiceNow Discovery application finds IBM Cloud Platform components (Softlayer API v3 and v3.1 and Bluemix API v2) using the IBM Cloud Platform patterns. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

You can use the patterns on the ServiceNow AI Platform using London Patch 7, Madrid Patch 2, or later releases.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

MID Server

Use a dedicated MID Server for cloud discovery. The MID Server must have 16 Cores, 8 GB with 4 GB Java Memory Model (JVM) memory allocation.

Deploy and connect the dedicated MID Server with internet access.

Credentials

The cloud resources are in an IBM cloud. Create the IBM Credentials for accessing your IBM account.

1. Navigate to **Discovery** > **Credentials**.
2. Click **New**.
3. Click **IBM Credentials** and then fill in the form:

Credentials form

Field	Description
Name	Credential name. An example is `ibm-cred`.
Order	Order in which the platform tries this credential as it attempts to log on to devices. A smaller number indicates that the credential appears higher in the list. Establish the credential

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number, or none, the instance tries the credentials in a random order. The default value is 100.
Softlayer API User	Username for the Softlayer API. Use the Softlayer API Username defined in the Softlayer console.
Softlayer API Key	Key for the Softlayer API. Use the Softlayer API Key that is defined in the Softlayer console.
Bluemix API Key	Key for the Bluemix API. Use the Bluemix API Key defined in the IBM Cloud console.

4. Click **Submit**.

Create an IBM cloud service account

Use the credentials defined in the preceding procedure to create the IBM cloud service account.

1. Navigate to **Cloud Provisioning and Governance** > **Service Accounts**.
2. Click **New**.
3. On the form, fill in the fields:

Cloud Service Account form

Field	Description
Name	Credential name. An example is `ibm-snow`
Account Id	IBM account ID name. Enter the IBM Account ID.
Discovery credentials	Discovery credentials that you defined earlier.
Datacenter Type	Datacenter type. As an example, `IBM Datacenter [cmdb_ci_ibm_datacenter]`

4. Click **Submit**.

Create a serverless Discovery schedule

Configure a serverless Discovery.

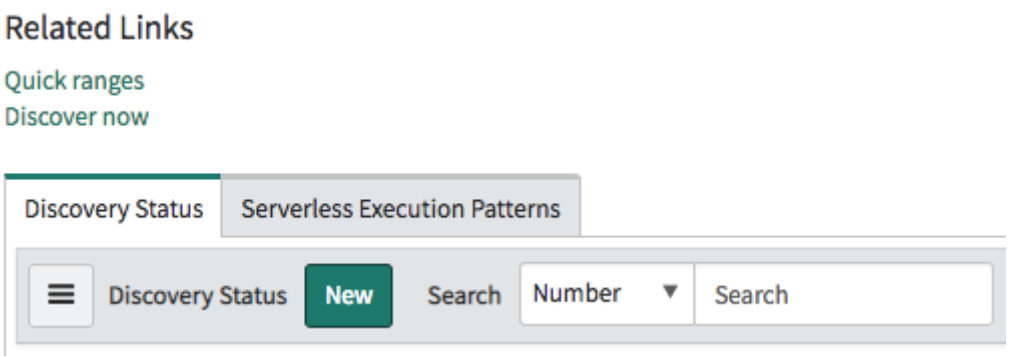
1. On the ServiceNow AI Platform, navigate to **Discovery** > **Discovery Schedules**.
2. Click **New**.
3. On the form, fill in the fields:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery Schedule form

Field	Description
Name	Name for this Discovery schedule. As an example, `Serverless Pattern`
Discover	Discover type. Select **Serverless**
MID Server	Name of the MID Server. As an example, `Discovery_Server`
Active	Option for enabling this schedule for Discovery. Select this check box to enable Discovery.
Run	Specifies how frequently to run the Discovery schedule.

4. Right-click the header of the Discovery Schedule form and select **Save**.



5. Click the **Serverless Execution Patterns** tab.
6. Click **New**.
7. On the form, fill in the fields:

Serverless Execution Pattern form

Field	Description
Name	Name for this Serverless Execution Pattern. As an example, `IBM1`
Pattern	Name of the pattern that you want to run.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	 If you want to run multiple patterns, create multiple records.
Proxy Host	Fully qualified domain name of the machine on which you are installing the proxy server. Specify **Global**.
Active	Option for enabling this schedule for Discovery. Select this check box to enable Discovery.

8. Configure the parameters required by the IBM Cloud Platform pattern as follows:

Discovery Pattern Launcher parameters

Parameter	Description
cloud_cred_id	The sys_id of the IBM credentials specified into the configuration.
cloud_account_id	The IBM account ID.
cloud_datacenter_type	cmdb_ci_ibm_datacenter

9. **Update**.
10. To start Discovery, navigate to the Serverless Discovery definition and click **Discover Now**.

IBM flow - horizontal discovery

- To perform a discovery using a serverless schedule, the IBM Cloud Platform patterns that were selected run and discover IBM Cloud Platform resources.
- To perform a discovery using a service account, a full IBM Cloud Platform discovery schedule runs, discovering all supported IBM Cloud Platform resources.

Cloud custom operation

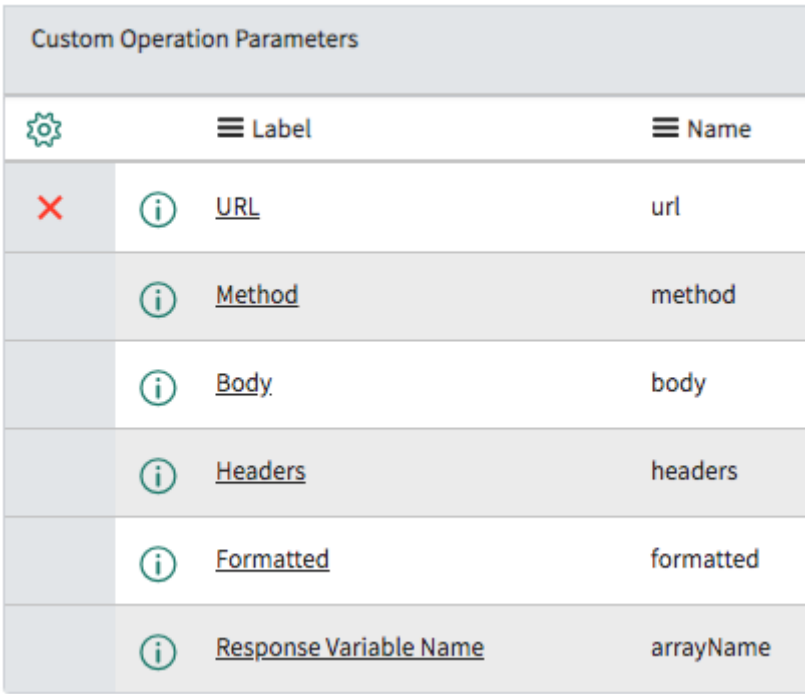
Cloud REST – Add Response to Context

Operation for Cloud REST queries that supports large-scale responses and better memory usage.

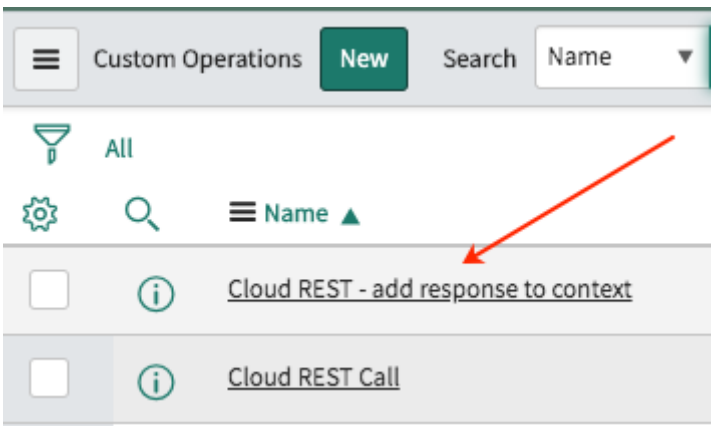
- Specify all the fields with the same values as in the Cloud REST Query custom operation, except to specify the table for the response, which is set in the **Response Variable Name** field.



- Set **Define parsing** to None.

Methods to retrieve data for the IBM account

1. Navigate to **Pattern Designer** > **Custom Operations**.



2. Click **Cloud REST – add response to context**.

Method: Get Call

API URLs used to retrieve the data:

EVAL functions

Use the following EVAL function to transform the Load Balancer API response into a full JSON format. The default response is formatted as "[<resource objects>]".

```
var cloud_lb_response = ${cloud_lb_response};
for (var i = 0; i < cloud_lb_response.size(); i++){
      cloud_lb_response.set(i, '{"result":[' +
 cloud_lb_response.get(i) + ']}');
}
CTX.setAttribute("cloud_lb_response",
 cloud_lb_response;
```

Use the following EVAL function to transform the Network API response into a full JSON format. The default response is formatted as "[<resource objects>]".

```
var network_response = ${network_response};
for (var i = 0; i < network_response.size(); i++){
      network_response.set(i, '{"result":[' +
 network_response.get(i) + ']}');
}
CTX.setAttribute("network_response", network_response);
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the following EVAL function to get the IBM region from the LB availability zone (datacenter). The same function is used for other resources inside the pattern.

```
var res = "";
res =
 IbmCloudDcToRegion.convertDctoRegion(${cloud_lb[].clou
d_lb_az_short_name});
```

Use the following EVAL function to select the required algorithm in the pattern.

```
var rtrn
var lb_algorithm =
 ${cloud_lb_pools[].lb_algorithm}.toString();
switch (lb_algorithm){
   case "ROUNDROBIN":
      lb_algorithm = "round-robin";
      break;
   case "WEIGHTED_RR":
      lb_algorithm = "round-robin";
      break;
   case "LEASTCONNECTION":
      lb_algorithm = "least-connections";
      break;
   default: break;
```

Use the following EVAL function to parse the unique region to the account that hosts the Organizations and the corresponding spaces.

```
var tableWithoutDuplicates = '';
tableWithoutDuplicates =
 DuplicateRemover.removeDuplicates(${account_region},["
region_name"]);
CTX.setAttribute("account_region_unique",
 tableWithoutDuplicates);
```

Use the following EVAL function to get information for all the organizations that are assigned to the IBM cloud account, where iteration for getting the unique region is performed.

```
var cloudcall = new CloudRestAPIClient();
var resourceTable =
 ${account_region_unique[*].region_name};
var tableSize = resourceTable.size();
var tmp_response = new Packages.java.util.ArrayList();
var all_organizations_response = new
 Packages.java.util.ArrayList();
for (var i = 0; i < tableSize ; i++){
   if  (!resourceTable.get(i)) continue;
   var url =
 "https://api."+resourceTable.get(i)+".bluemix.net/v2/o
rganizations";
   tmp_response =
 cloudcall.arrayListExecute(${service_account}, null,
 url, null, 'GET', null, 'true', CTX);

   for (var j = 0; j < tmp_response.size(); j++){
```

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      all_organizations_response.add('{"result":[' +
 tmp_response.get(j) + ']}');
   }
}
CTX.setAttribute("all_organizations_response",
 all_organizations_response);
```

Use the following EVAL function to get information for all the IBM cloud account assigned spaces, where the iteration for getting the unique region is performed.

```
var rtrn = '';
var cloudcall = new CloudRestAPIClient();
var resultList = new Packages.java.util.ArrayList();
var rest = '';
var resourceTable =
 ${account_region_unique[*].region_name};
var result = new Packages.java.util.ArrayList();
var all_organizations_response =
 ${all_organizations_response}
for (var i = 0; i < resourceTable.size() ; i++){
   var url =
 "https://api."+resourceTable.get(i)+".bluemix.net/v2/s
paces";
   result =
 cloudcall.arrayListExecute(${service_account}, null,
 url, null, 'GET', null, 'true', CTX);
   for (var z = 0; z <
 all_organizations_response.size(); z++){
      var jsonObj = JSON.parse(result.get(z));
      ms.log("length "+jsonObj.resources.length);
for(var j=0;j<jsonObj.resources.length;j++){
         var guid = jsonObj.resources[j].metadata.guid;
         var url = jsonObj.resources[j].metadata.url;
         var name = jsonObj.resources[j].entity.name;
         var organization_guid =
 jsonObj.resources[j].entity.organization_guid;
         var allow_ssh =
 jsonObj.resources[j].entity.allow_ssh ? "true" :
 "false";
         var row = new Packages.java.util.HashMap();
 Packages.com.snc.sw.log.DiscoLog.getLogger("IBM Cloud
 Space and Org").debug(">>>>>>>>>>>>>>|||||||||||>>>>>>
 region alias=" + resourceTable.get(i));

 Packages.com.snc.sw.log.DiscoLog.getLogger("IBM Cloud
 Space and Org").debug(">>>>>>>>>>>>>>|||||||||||>>>>>>
 region full name=" +
 IbmCloudDcToRegion.regionNamebyAlias(resourceTable.get
(i)));
         row.put("region",
 IbmCloudDcToRegion.regionNamebyAlias(resourceTable.get
(i)));
         row.put("space_guid",guid);
         row.put("space_url",url);
         row.put("space_name",name);

 row.put("space_organization_guid",organization_guid);
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
        row.put("space_allow_ssh",allow_ssh);
        row.put("rest", rest);
        resultList.add(row);
     }
   }
   CTX.setAttribute('spaces_table', resultList);
}
```

Use the following EVAL function to filter all the spaces by unique region.

```
var space_region = ${spaces_table[].region};

Packages.com.snc.sw.log.DiscoLog.getLogger("IBM Cloud
 Space and Org").debug("filtering space according to
 LDC. space_region=" + space_region);
var regions = ${cmdb_ci_ibm_datacenter[*].region};
Packages.com.snc.sw.log.DiscoLog.getLogger("IBM
 Cloud Space and Org").debug("input regions list=" +
 regions.toString());

var rtrn = "false";
if(regions.contains(space_region)) {
    rtrn = "true";
}
rtrn;
```

Use the following EVAL function to filter all the spaces by storage discovery.

```
var storage_response = ${storage_response};
for (var i = 0; i < storage_response.size(); i++){
      storage_response.set(i, '{"result":[' +
 storage_response.get(i) + ']}');
}
CTX.setAttribute("storage_response", storage_response);
```

Use the following EVAL function to transform the API response into full JSON format, as the untouched response is formatted as "[<resource objects>]".

```
var ssh_key = ${ssh_key_json};
for(var i = 0; i < ssh_key.size(); i++){
   ssh_key.set(i,'{"result\" : ' + ssh_key.get(i) +
 "}");
}
CTX.setAttribute("ssh_key_json", ssh_key);
```

Use the following EVAL function to populate the availability zone into the storage volume table.

```
var rtrn;
var resource_group =
 ${network_storage[].resource_name};
var regex = /.*-(\w{3}\d{2}).*/;
var az_name = regex.exec(resource_group);
if (az_name) {
   rtrn = az_name[1];
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
} else {
   rtrn;
}
```

Use the following EVAL function to populate the region into the storage volume table.

```
var res = "";
res =
 IbmCloudDcToRegion.convertDctoRegion(${network_storage
[].availability_zone});
```

Use the following EVAL function to transform the size of the storages to bytes from gigabytes.

```
var rtrn = '';

var size = ${network_storage[].size};

rtrn = (parseInt(size) * 1073741824) + '';
```

Use the following EVAL function to transform the size of the storages to bytes from gigabytes.

```
var cloudcall = new CloudRestAPIClient();
var resourceTable =
 ${network_storage[*].storage_object_id};
var tableSize = resourceTable.size();
var allResources = new Packages.java.util.ArrayList();
var response = new Packages.java.util.ArrayList();
for (var i = 0; i < tableSize ; i++){
   if  (!resourceTable.get(i)) continue;
   var url =
 "https://api.softlayer.com/rest/"+${api_version}+"/Sof
tLayer_Network_Storage/"+resourceTable.get(i)+"/getObje
ct?objectMask=mask[snapshots]";
   // the commented out code is to call the "Cloud Rest
 Call" API

   allResources =
 cloudcall.arrayListExecute(${service_account}, null,
 url, null, 'GET', null, 'true', CTX);
   for (var j = 0; j < allResources.size(); j++){
      response.add('{"result":[' + allResources.get(j)
 + ']}');
   }
}
CTX.setAttribute("all_snapshots_response", response);
```

Use the following EVAL closure that transforms the JSON that is received from the API to a format that the JSON parser can work with. The default JSON is saved in `$vm_json_array`, the new JSON is in `$vm_json`.

```
var vm_json = new Packages.java.util.ArrayList();
vm_json.addAll(${vm_json_array});
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
for (var i = 0 ; i < vm_json.size(); i++){
      vm_json.set(i, '{\"result\":[' + vm_json.get(i) +
 ']}');
}

CTX.setAttribute("vm_json", vm_json);
```

Use the following EVAL closure that returns 'on' if the power status is running. The value 'off' is returned if the power status is off.

```
var power = ${cmdb_ci_vm_instance[].state};
var rtrn = '';

if (power == 'Running'){
   rtrn = "on";
}
else {
   rtrn = "off"
}
```

Use the following EVAL closure that returns the region of the CI, based on provided availability zone name.

```
var az = ${cmdb_ci_vm_instance[].avail_zone};
var rtrn = '';
rtrn = IbmCloudDcToRegion.convertDctoRegion(az);
```

Use the following EVAL closure that builds a HashMap of HashSets, Connecting VMs with their network storages. The following key is used:

- P = page
- V = VM
- N = network storage

```
var rtrn = '';
var vmJson = ${vm_json_array};
var VMtoStorageHashMap = new
 Packages.java.util.HashMap();

for (var p = 0 ; p < vmJson.size(); p++){
   var page = JSON.parse(vmJson.get(p));
   for (var now_V in page){
      if (page[v].allowedNetworkStorage.length > 0){
         var vm_id = page[v].id + '';
         var storageSet = new
 Packages.java.util.HashSet();
         for (var n in page[v].allowedNetworkStorage){

 storageSet.add(page[v].allowedNetworkStorage[n].id +
 '');
         }
         VMtoStorageHashMap.put(vm_id,storageSet);
      }
   }
}
CTX.setAttribute("VMStorageCache", VMtoStorageHashMap);
```

Use the following EVAL closure to remove duplicate entries from tables.

```
var tableWithoutDuplicates = '';
tableWithoutDuplicates =
 DuplicateRemover.removeDuplicates(${cmdb_ci_os_templat
e},["object_id"]);
CTX.setAttribute("cmdb_ci_os_template",
 tableWithoutDuplicates);
```

Use the following EVAL closure that builds a list of VM IDs that are related to the current security group ID.

```
var rtrn = '';
//get the Security Group ID of the current record in
 the table for comparison
var current_table_id =
 ${security_groups[].sec_group_id};
var current_table_id_string = current_table_id + '';

// get the list of instance's ID that will be then
 added to Security Group table
var needed_value_id_list =
 ${sec_group_network_components[*].vm_instance_id};
//get the list of Security Group IDs in the Network
 Component table, which will then be compared one by
 one to the current record of the security_groups table
var compare_id_list =
 ${sec_group_network_components[*].sec_group_id};

var beforeReturn = '';
var separator = '';
for (var i = 0; i <  compare_id_list.size(); i++)   {

   if   (current_table_id_string ==
 compare_id_list.get(i)){

      beforeReturn += separator +
 needed_value_id_list.get(i);
      separator = ',';
   }
}
rtrn = beforeReturn;
```

Use the following EVAL closure that builds a HashMap of HashSet between security groups and the VMs that are configured to use them.

```
rtrn = '';
var secGroupTable = ${cmdb_ci_endpoint_comp_security};
var secToVMHashSet = new Packages.java.util.HashMap();

// this loop worst case O(N*M) M = security groups, N =
 VMs
for(var i=0; i<secGroupTable.size(); i++){
   var securityTableId =
 secGroupTable.get(i).get('object_id');
   var vmListStr =
 secGroupTable.get(i).get('instance_list');
```

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
   var vmList = vmListStr.split(",");

   var vmSet = new Packages.java.util.HashSet();
   for (var j in vmList){
      vmSet.add(vmList[j]);
   }

   secToVMHashSet.put(securityTableId,vmSet);
}
CTX.setAttribute("securityVMCache",  secToVMHashSet);
```

Use the following EVAL closure that returns 'true' if the current VM is using the current security group ID.

```
var rtrn = '';
var vm_id = ${cmdb_ci_vm_instance[].object_id};
var vmHashSet =
 ${securityVMCache}.get(${cmdb_ci_endpoint_comp_securit
y[].object_id});
rtrn = vmHashSet.contains(vm_id);
```

Use the following EVAL closure that returns 'true' if the current VM is using the current storage volume.

```
var rtrn = '';
var vm_id = ${cmdb_ci_vm_instance[].object_id};
var vol_id = ${cmdb_ci_endpoint_iscsi[].object_id};
var vmHashSet = ${VMStorageCache}.get(vm_id);
if (vmHashSet){
   rtrn = vmHashSet.contains(vol_id);
}
else {
   rtrn = 'false'
}
```

Use the following EVAL function to transform the API response into full JSON format, as the untouched response is formatted as "[<resource objects>]".

```
var cloud_response = ${location_groups_response}
for (var i = 0; i < cloud_response.size(); i++){
    cloud_response.set(I, '{"result":[' +
 cloud_response.get(i) + ']}');
}
CTX.setAttribute("location_groups_response",
 cloud_response);
```

Parses the unique Location Groups in the "location_groups_az" table basdon the column "lg_id" and creates a new table "location_groups_az_unique" that contains the result.

```
var tableWithoutDuplicates= '';
tableWithoutDuplicates =
 DuplicateRemover.removeDuplicates(${location_groups_a
z},["lg_id"]);
CTX.setAttribute("location_groups_az_unique",
 tableWithoutDuplicates);
```

Creates a list of Availability Zones per Location Group, that is stored in a column new column in the location_groups_az_uniquetable. The list records are divided by commas purposely, so that unique relations could be made in consecutive step.

```
var current_table_id=
 ${location_groups_az_unique[].lg_id};
var current_table_id_string = current_table_id+ '';
var needed_v alue_id_list =
 ${location_groups_az[*].lg_az_id};
var compare_id_list= ${location_groups_az[*].lg_id};
var beforeReturn= '';
var separator = ',';
for (var i= 0; i< compare_id_list.size(); i++)  {
    if (current_table_id_string ==
 compare_id_list.get(i)){
    beforeReturn += separator + needed_v
 alue_id_list.get(i) + separator;
  }
}
rtrn = beforeReturn;
```

Activate the cloud-related CI relationships

To include discovered components into service instances, enable CI relationships used in tag-based discovery by Service Mapping. These CI relationships are available from the 1.0.68 release on the ServiceNow Store. For operational steps, see Tag-based discovery configuration.

Data collected by Discovery during horizontal discovery

Data is collected using these patterns:

- IBM Cloud Load Balancer
- IBM Cloud Location Groups
- IBM Cloud Network
- IBM Cloud Organizations and Spaces
- IBM Cloud Resource Groups
- IBM Cloud SSH Key
- IBM Cloud Storage
- IBM Cloud Virtual Server

Data collected for IBM components:

IBM Cloud Load Balancer discovered resources

Field	Description
Main CI: cmdb_ci_cloud_load_balancer	
name	Load balancer name.
object_id	Load balancer unique identifier.
fqdn	Load balancer address (host name).
dns_name	Load balancer domain server name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
short_description	Load balancer description that you provide for easy identification.
operational_status	Load balancer status, one of either: • ONLINE • OFFLINE
location	Datacenter location.
state	Load balancer provisioning status.
Related CI: cmdb_ci_lb_service	
name	Pattern created name, composed of: • load balancer name • type of protocol • resource type listener
object_id	Load balancer unique identifier.
port	Port number of the listener.
front_end_port	Protocol port number of the listener.
listener_protocol	Protocol of the listener. One of the following protocols: • TCP • HTTP • HTTPS
operational_status	Provisioning status of the listener.
Related CI: cmdb_ci_lb_pool	
name	Pattern created name, composed of: • load balancer name • type of protocol • port • resource type “pool”
object_id	Load balancer pool unique identifier.
port	Protocol port of the backend.
pool_status	Load balancer pool provisioning status.
load_balancing_method	Load balancing method. One of the following algorithms:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	• "ROUNDROBIN" • "WEIGHTED_RR" • "LEASTCONNECTION"
Related CI: cmdb_ci_lb_pool_member	
name	Pattern created name, composed of: • load balancer name • type of protocol • IP address of the Pool Member
object_id	Load balancer pool member unique identifier, composed of: • Member ID • Listener ID
ip_address	IP address of a load balancer member.
server_id	ID of the member in IBM cloud.
load_balancer	Name of the related Load Balancer.
Related CI: cmdb_ci_lb_health_service	
name	Pattern created name, composed of: • load balancer name • type of protocol • resource type: **Health Check** • resource ID
object_id	Unique identifier of the Health Service Check.
monitor_type	Health check type. One of the following: • TCP • HTTP • HTTPS
timeout_sec	Timeout, in seconds, to wait for health check responses.
check_interval_sec	Interval, in seconds, to perform health check.

IBM Cloud Location Groups discovered resources

Field	Description
Main CI: cmdb_ci_cloud_location_group	
name	A descriptive name used to identify a Location Group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
object_id	The ID of the Location Group record.
locationGroupType Name	The name of the Location Group Type.
short_description	A small note about a Location Group to use at your discretion.
locationGroup Type ID	The ID of the Location Group Type.

IBM Cloud Network discovered resources

Field	Description
Main CI: cmdb_ci_network	
name	VLAN number.
object_id	Network unique identifier.
access_port_vlan	VLAN number.
is_external	Network space value. The value is either: • true if the network_space is “PUBLIC” • false if the network_space is “PRIVATE”.
state	State has the value "available".
Related CI: cmdb_ci_cloud_subnet	
name	Name, composed of: “network_identifier/cidr”
object_id	Subnet unique identifier.
subnet_mask	Netmask of the subnet.
gateway	Gateway IP address.
cidr	Method for allocating IP addresses and IP routing: “network_identifier/cidr”.
category	Subnet type.
broadcast_address	Subnet broadcast address.
available_ip_count	Number of available IP addresses in the subnet.
Related CI: cmdb_ci_compute_security_group	
name	Security Group name.
object_id	Security Group unique identifier.
short_description	Security Group description that you provide for easy identification.
Related CI: cmdb_ci_compute_security_group_rule	
name	Field with the same value as the Security Group Rule object_id field.
object_id	Security Group Rule unique identifier.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
created	Date the CI was created.
direction	Direction of the information. One of the following: • inbound • outbound
Ethertype	Ethertype. One of the following: • IPv4 • IPv6
port_range_min	The first port of the range that the rule applies to.
port_range_max	The last port of the range that the rule applies to.
protocol	Protocol that the rule is applied to.
remote_group_id	Security Group ID for the Source/Destination security group. It means that this rule applies on all IP addresses that were configured in this security group.

IBM Cloud Organizations and Space discovered resources

Field	Description
Main CI: cmdb_ci_cloud_org	
name	Name of the cloud organization.
guid	Unique identifier of the organization.
url	Unique URL of the organization.
billing_enabled	Billing method in use by the organization. One of either: • Enabled / (TRUE) • Disabled / (FALSE)
quota_definition_url	Resources that are available to an organization.
spaces_url	Unique URL of the space assigned to the organization.
operational_status	Operational status of the organization.
Related CI: cmdb_ci_cloud_space	
name	Unique name of the space.
object_id	Space unique identifier (guid).
alllow_ssh	Access to the application over SSH is either allowed or not allowed. Boolean, one of either: • TRUE • FALSE
URL	URL of the space from the metadata description.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM Cloud Resource Groups discovered resources

Field	Description
Main CI: cmdb_ci_resource_group	
name	Name of the resource group.
object_id	Unique identifier of the resource group.
quota_id	Value identifying the quota ID associated with the resource group.

IBM Cloud SSH Key discovered resources

Field	Description
Main CI: cmdb_ci_cloud_key_pair	
name	Name to identify an SSH key.
object_id	ID of the SSH key record.
key	SSH Key record.
finger_print	Short sequence of bytes used to authenticate or lookup a longer SSH Key. This value is automatically generated when adding or modifying the SSH Key. Read only. Changes made are ignored.
created _date	Date when the SSH Key was added. Read only. Changes made are ignored.
modify_date	Date when the SSH Key was modified. Read only. Changes made are ignored.
short_description	SSH description that you provide for easy identification.
Related CI: cmdb_ci_ibm_datacenter	
name	Name of the datacenter.
region	Region that the datacenter is in.
discovery_status	Status information about the IBM datacenter.
sys_class_name	Class of the datacenter
Related CI: cmdb_ci_cloud_service_account	
name	Name of the cloud service account.
account_id	Account ID for this cloud service account.
discovery_credentials	Credentials for this cloud service account.
datacenter_url	URL used to populate Logical Data Centers (LDCs).
datacenter_type	Type of datacenter. As an example, IBM Datacenter [cmdb_ci_ibm_datacenter]
datacenter_discovery_status	Status of last execution of Discover Datacenters.

IBM Cloud Storage discovered resources

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Main CI: cmdb_ci_storage_volume	
name	Username used to: • access a non-EVault Storage volume • register the EVault server agent with the vault backup system
object_id	Storage account unique identifier.
size	Capacity of the storage account, measured in gigabytes.
size_bytes	Capacity of the storage account, measured in bytes.
label	Name of the storage network resource.
storage_type	Description of the storage type. As an example, NAS.
fqdn	IP address of a storage resource or fully qualified domain name.
device	Unique identification number of the device associated with a Storage volume.
Related CI: cmdb_ci_storage_vol_snapshot	
name	Name of a storage network resource.
object_id	Storage unique identifier.
capacity	Capacity of the snapshot volume in gigabytes.
fqdn	IP address of a storage resource or fully qualified domain name.
location	Unique availability zone where the storage volume is located.
Related CI: cmdb_ci_ibm_datacenter	
name	Name of the datacenter.
region	Region that the datacenter is in.
discovery_status	Status information about the IBM datacenter.
sys_class_name	Class of the datacenter
Related CI: cmdb_ci_cloud_service_account	
name	Name of the cloud service account.
account_id	Account ID for this cloud service account.
discovery_credentials	Credentials for this cloud service account.
datacenter_url	URL used to populate LDCs.
datacenter_type	Type of datacenter. As an example, IBM Datacenter [cmdb_ci_ibm_datacenter]
datacenter_discovery_status	Status of last execution of Discover Datacenters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Related CI: cmdb_ci_availability_zone	
name	Name of the availability zone (AZ).
object_id	Unique identifier for this resource.
short_description	Availability zone description that you provide.

IBM Cloud Virtual Server discovered resources

Field	Description
Main CI: cmdb_ci_vm_instance	
name	Name of the VM.
object_id	Unique identifier of the VM.
dns_domain	VM domain server name.
fqdn	VM IP address.
short_description	Description in a note that is attached to the VM on the IBM console.
cpus	Number of CPU cores assigned to this VM.
memory	Memory size assigned to this VM.
disks	Number of disks assigned to this VM.
state	The running state of the VM. • On – returned as 'Running' from the API. • Off – returned as 'Halted' from the API.
placement_group_id	Placement group ID.
nics	Number of NICs.
Related CI: cmdb_ci_nic	
name	Name, composed of: • load balancer name • Port
object_id	Unique identifier of the NIC.
ip_address	IP that is configured on the NIC.
mac_address	NIC MAC details.
netmask	Mask used to divide the IP address into subnets and to specify the available hosts in the network.
status	State of the NIC.
Related CI: cmdb_ci_endpoint_vnic	
name	Name for the VNIC endpoint.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
object_id	Unique identifier of the VNIC endpoint.
host	Host identifier.
Related CI: cmdb_ci_storage_volume	
name	Username used to: • access a non-EVault Storage volume • register the EVault server agent with the vault backup system
object_id	Storage account unique identifier.
size	Capacity of the storage account, measured in gigabytes.
size_bytes	Capacity of the storage account, measured in bytes.
label	Name of the storage network resource.
storage_type	Description of the storage type. As an example, NAS.
fqdn	IP address of a storage resource or fully qualified domain name.
device	Unique identification number of the guest associated with a Storage volume.
Related CI: cmdb_ci_endpoint_nfs	
name	Name for the NFS endpoint.
host	Host identifier.
protocol	Protocol that was applied.
type	NFS endpoint type.
created	Date that the NFS endpoint was created.
updated	Date that the NFS endpoint was updated.
discovery_source	Source of the discovery. As an example, ServiceWatch
host_name	Host name of the NFS endpoint
Related CI: cmdb_ci_endpoint_iscsi	
host	Host identifier for the ISCSI endpoint.
port	Port to determine how GCP iscsi contact to the VMs.
protocol	Protocol that was applied.
type	ISCSI endpoint type
created	Date that the ISCSI endpoint was created.
updated	Date that the ISCSI endpoint was updated.
discovery_source	Source of the discovery. As an example, ImportSet

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
host_name	Host name of the ISCSI endpoint
Related CI: cmdb_ci_endpoint_block	
name	Name for the block endpoint.
object_id	Unique identifier of the block endpoint.
host	Host identifier.
Related CI: cmdb_ci_os_template	
name	Name of the image. For example, 'CentOS 7.0-64 Minimal for VSI'.
object_id	Unique identifier of the image.
guest_os	OS used by the image. As an example, Linux.
root_device_type	Type of device used by root.
image_source	Source of the image.
image_type	Image type.
infuse_key	Key used to infuse the image.
update_host_name	Update host name for the image.
credentials	Credentials for the image.
version	OS version. For example, '7.0-64 Minimal for VSI'.
Related CI: cmdb_ci_cloud_key_pair	
name	Name to identify a key (key label).
object_id	ID of the key record.
key	Key record.
finger_print	Short sequence of bytes used to authenticate or look up a Key. This value is automatically generated when adding or modifying the Key. Read only. Changes made are ignored.
created _date	Date when the Key was added. Read only. Changes made are ignored.
modify_date	Date when the Key was modified. Read only. Changes made are ignored.
short_description	Description that you provide for easy identification.
Related CI: cmdb_ci_compute_security_group	
name	Security Group name.
object_id	Security Group unique identifier.
short_description	Security Group description that you provide for easy identification.
Related CI: cmdb_ci_endpoint_comp_security	
host	Host identifier of the compute security endpoint.
port	Unique identifier of the compute security endpoint.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
protocol	Protocol that was applied.
type	Type of compute security endpoint.
created	Date when the compute security endpoint was added. Read only. Changes made are ignored.
updated	Date when the compute security endpoint was modified. Read only. Changes made are ignored.
discovery_source	Source of the discovery. As an example, Manual Entry.
host_name	Host name of the compute security endpoint.
Related CI: cmdb_ci_ibm_datacenter	
name	Name of the datacenter.
region	Region that the datacenter is in.
discovery_status	Status information about the IBM datacenter.
sys_class_name	Class of the datacenter
Related CI: cmdb_ci_availability_zone	
name	Name of the availability zone (AZ).
object_id	Unique identifier for this resource.
short_description	Availability zone description that you provide.
Related CI: cmdb_ci_cloud_service_account	
name	Name of the cloud service account.
account_id	Account ID for this cloud service account.
discovery_credentials	Credentials for this cloud service account.
datacenter_url	URL used to populate LDCs.
datacenter_type	Type of datacenter. As an example, IBM Datacenter [cmdb_ci_ibm_datacenter]
datacenter_discovery_status	Status of last execution of Discover Datacenters.

Relationships discovered for the virtual machine (VM) instance

CI	Relationship	CI
Servers [cmdb_ci_server]	Virtualized by:: Virtualizes	Virtual Machine Instance [cmdb_ci_instance]

Data collected by Service Mapping during tag-based discovery

Service Mapping uses tag-based discovery to create service instance maps including the Cloud components. The Service Mapping application comes with the following preconfigured CI relationships used for tag-based discovery. These CI relationships are available from the 1.0.68 release on the ServiceNow Store.

CI	Relationship	CI
Configuration Item [cmdb_ci]	Hosted on::Hosts	Logical Datacenter [cmdb_ci_logical_datacenter]
Logical Datacenter [cmdb_ci_logical_datacenter]	Hosted on::Hosts	Cloud Service Account [cmdb_ci_cloud_service_account]

Troubleshooting

If the mapping process does not proceed as you expected, follow the following suggestions.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Symptom	Cause	Solution
Discovery fails. The discovery message contains the information about an error caused by the REST timeout.	There are many CIs sending the REST call response in the deployment. The MID Server cannot process the REST call response without exceeding the time limit controlled by the *mid.sa.cloud.request_timeout* parameter.	By default, the *mid.sa.cloud.request_timeout* parameter is set to 30000 milliseconds. Increase the value of this parameter on the relevant MID Server and run discovery again. **Note:** If the **Configuration Parameters** related list for the relevant MID Server does not show this parameter, you may need to add it.
Pattern Designer fails during a debug session. The Pattern Designer message contains information about an error caused by a timeout.	The Pattern Designer fails because of a timeout during pattern debugging (and not during discovery).	By default, the *sa.debugger.max_timeout* parameter is set to 240 seconds. Increase the value of this parameter on the relevant MID Server.

IBM Db2 on Linux database discovery

ServiceNow Discovery uses the Db2 on Linux discovery pattern to find IBM Db2 instances on Linux servers.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Discovery uses this pattern to run horizontal discovery. The pattern is triggered automatically by classification using these Db2 identifiers: tcp_port, name, installed_dir.

Prerequisites

Configure SSH credentials for the Linux server.

In addition, ensure that the user has the permissions to run the following commands:

Identification for Db2 UDB entry point types

```
". /" + $process.environmentVariables.HOME.value +
"/sqllib/db2profile; " +
$process.environmentVariables.HOME.value + "/sqllib/bin/
db2level"

"source " + $installed_dir + "db2profile"

"db2 list database directory | grep \"Database name\" |
grep -i \"" + $entry_point.instance + "\" | head -1"

"db2level | grep \"DB2 v\""
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Identification for Db2 UDB entry point types - NONE

```
"cat " + $installed_dir + "/db2dump/db2diag.log | grep
\"INSTANCE:\" | grep " + $entry_point.instance + " | head
-1"

"db2level | grep \"DB2 v\""
```

Identification for Db2 on z/OS

```
"netstat -a | grep " + $entry_point.port

"ls -d /*/* |grep " + $id
```

Data collected by Discovery during horizontal discovery

The **Identification for Db2 UDB entry point types** and **Identification for Db2 UDB entry point types – NONE** sections collect the following tables and fields:

DB2 Subsystem [cmdb_ci_db_db2_instance]

Field	Description
Name [name]	The Db2 instance name.
TCP port(s) [tcp_port]	TCP port.
Install Directory [installed_dir]	Installation directory.
Version [version]	Db2 version.

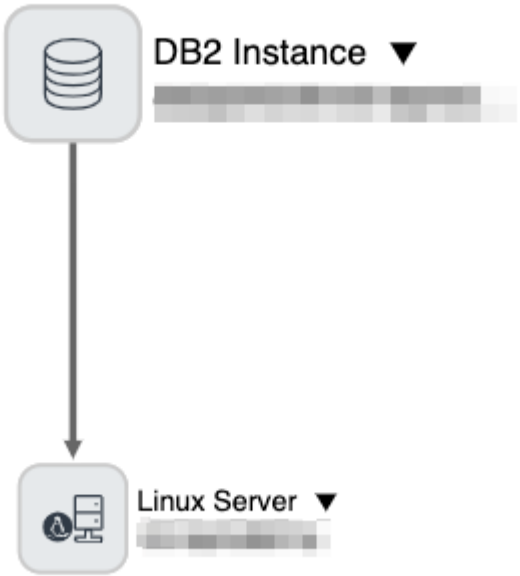
The Identification for Db2 on Z/OS section collects the following tables and fields:

DB2 Subsystem [cmdb_ci_db_db2_instance]

Table and field	Description
Name [name]	The Db2 instance name.
TCP port(s) [tcp_port]	TCP port.
Install Directory [installed_dir]	Installation directory.

The Dependency Views map shows all discovered IBM Db2 instances in your organization and the relationships between them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



CI relationships

The IBM Db2 on Linux pattern does not create any CI relationships.

IBM Db2 on Windows database discovery

ServiceNow Discovery uses the Db2 on Windows discovery pattern to find IBM Db2 instances on Windows servers.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Discovery uses this pattern to run horizontal discovery. The pattern is triggered automatically by classification using these Db2 identifiers: tcp_port, name, installed_dir

Prerequisites

Ensure that the user has the permissions to run the following commands:

- `"|"" + $installed_dir + "|bin|db2cmd|" /c /w /i db2 list database directory"`
- `"|"" + $installed_dir + "|bin|db2cmd|" /c /w /i db2 list database directory | findstr |"Database name|" | findstr /i " + $entry_point.instance`
- `"|"" + $installed_dir + "|bin|db2level|""`

Data collected by Discovery during horizontal discovery

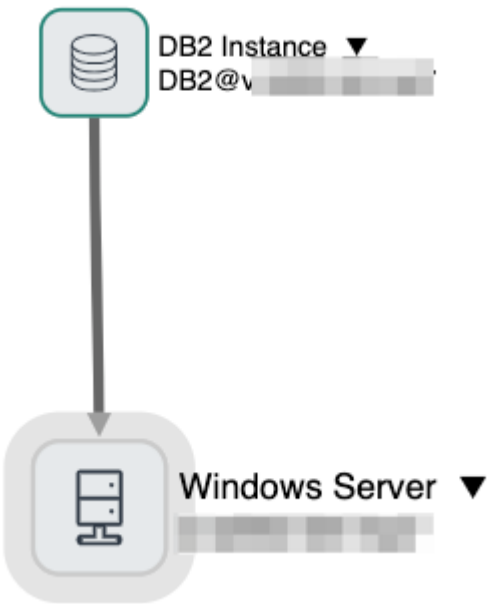
The discovered data includes the following tables and fields.

Table and field	Description
name	Name of the Db2 instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
tcp_port	TCP port.
installed_dir	The installation directory.
version	Db2 version.
db_name	Name of the database.
pid	Process ID of the Db2 instance.

The Dependency Views map shows all discovered IBM Db2 instances in your organization and the relationships between them.



CI relationships

The IBM Db2 on Windows pattern does not create any CI relationships.

IBM Informix Dynamic Server discovery

The ServiceNow Discovery and Service Mapping applications can find and map the Informix Dynamic Server. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

User

Provide a user with permissions to run the following commands without elevated rights:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `$install_directory/bin/onstat -g dis`

  This command gets the status and configuration of Informix Dynamic server.

- `$install_directory/bin/dbaccess sysmaster`

  This command runs an sql query against the master schema.

The same user must have read permission for the following directories:

- install_directory + "/etc/sqlhosts

  Access to this directory is necessary to get information about the port, host, and service definition of the Informix Dynamic server.

- /etc/services

  Access to this directory is required to get information about the host service definition.

Credentials

Configure SSH credentials in the Credentials module of the ServiceNow platform for accessing the server hosting the Informix Dynamic server.

Data collected by Discovery during horizontal discovery

Table and Field	Description
Informix Instance [cmdb_ci_db_informix_instance]	The Informix instance attributes.
tcp_port	
running_process	
version	
install_directory	
config_file	
name	
Informix Catalog [cmdb_ci_db_informix_catalog]	The database included in the Informix Instance.
database	

CI Relationships

CI	Relationship/Reference	CI
Informix Instance [cmdb_ci_db_informix_instance]	Contains::Contained by	Informix Catalog [cmdb_ci_db_informix_catalog]

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Top-down

During top-down discovery, Service Mapping discovers connections between the Informix Instance and the Informix Catalogs that the instance contains and displays them as an inclusion on the application service map.

IBM PowerHA SystemMirror for AIX discovery

The ServiceNow Discovery application uses the IBM PowerHA Cluster (HACMP) pattern to find IBM PowerHA SystemMirror for AIX (formerly HACMP) high-availability clusters on AIX UNIX and Linux systems running on IBM platforms. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses this pattern to run horizontal discovery.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the following application is up to date

Discovery and Service Mapping Patterns

Verify the IBM PowerHA Cluster (HACMP) pattern is in Triggers probes tab

1. Navigate to **CI Classification** > **UNIX**.
2. Select **AIX**.
3. In The **Triggers probes** tab, verify that the IBM PowerHA Cluster (HACMP) pattern is listed as an exploration that runs after the AIX Server pattern.

For more information on AIX Server discovery, see AIX server discovery.

Verify server IP address or hostname

Verify that the server IP address or hostname are used during discovery. For more information, see Schedule a horizontal discovery.

Verify MID Server access

Verify that the MID Server has access to the target host and can execute all the commands that are implemented in the pattern.

Configure a UNIX user with the following permissions

Configure a UNIX user with permissions to run all commands defined in the official IBM documentation, and the following commands on AIX.

Command	Description
`lssrc -s clstrmgrES`	Verify that the clstrmgrES process is running
`lslpp -l cluster.license`	Get the license and version data of the cluster
`lslpp -l cluster.license | awk '{$1=$2=$3=\"\";`	Get the software label version data of the cluster

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Command	Description
`print $0}' |sed -e 's/^[[:space:]]*//'`	
`/usr/es/sbin/cluster/utilities/clRGinfo -a | awk '{print $1,$2}' | grep -E -v 'denied|error'`	Get resource groups name and type
`/usr/es/sbin/cluster/utilities/clRGinfo -s | grep -E -v 'denied|error'`	Get more information about resource groups
`/usr/es/sbin/cluster/utilities/clfindres -s | grep -E -v 'denied|error'`	Alternative command to get more information about resource groups
`/usr/es/sbin/cluster/utilities/clshowres | grep -E 'Resource Group Name|Volume' | grep -E -v 'Concurrent| Automatically|error|denied' | sed 's/Volume Groups/Volume Groups Names/' | awk '{print substr($0, index($0,$4))}' | sed 'N;s/\n/ /'`	Get volume groups associated to resource groups
`/usr/es/sbin/cluster/clstat -o | grep 'Resource Group' | grep -E -v 'error|denied' | awk '{print $3, $5, $6}'`	Get the state of the resource group(s)
`/usr/es/sbin/cluster/utilities/cltopinfo -c`	Get the cluster name
`/usr/es/sbin/cluster/utilities/cllscf`	Alternative command to get the cluster name
`lssrc -ls clstrmgrES`	Get cluster current state
`/usr/es/sbin/cluster/clstat -o |awk '{$1=$2=\"\"; print $0}' |sed -e 's/^[[:space:]]*//'`	Get the cluster ID
`/usr/es/sbin/cluster/utilities/cllsclstr | grep -E -v 'error|denied' | awk '{print $1}'`	Alternative command to get the cluster ID
`/usr/bin/odmget HACMPcluster| grep -w id | grep -E -v 'error|denied'`	Alternative command to get the cluster ID
`/usr/es/sbin/cluster/utilities/cltopinfo -n | grep -E -v 'error|denied'`	Get the cluster node(s) name(s)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Command	Description
`/usr/es/sbin/cluster/utilities/cllsnode | grep -E -v 'error|denied'`	Alternative command to get cluster node(s) name(s)
`/usr/es/sbin/cluster/clstat -o | grep -i 'Node:' | awk '{print $2, $4}'`	Get cluster node(s) state(s)
`lscluster -m | grep -E 'Node name|State of node' | grep -E -v 'ERROR| lscluster' | awk '{print $2, $3, $4}' | sed 'N;s/\n/ /'`	Alternative command get cluster node(s) state(s)
`/usr/es/sbin/cluster/utilities/cllsif | grep -E -v 'error|denied' | awk '{print $1, $2, $6, $7}'`	Get network interface information
`lspv | grep -E -v 'error|denied'`	Get physical volumes information
`lsvg | grep -E -v 'error|denied'`	Get volume groups information
`lsvg -o | grep -E -v 'error|denied'`	Get information about the active volume groups
`/usr/es/sbin/cluster/utilities/clshowres | grep 'Concurrent Volume Group' | awk '{$1=$2=$3=\"\"; print $0}' |sed -e 's/^[[:space:]]*//'`	Get information about the concurrent volume groups
`hostname`	Get current node host name
`nslookup hostname`	Convert hostname to FQDN

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the IBM PowerHA Cluster (HACMP) pattern.

Cluster Resource Group [cmdb_ci_cluster_resource_group]

Field	Description
Name [name]	The name of the resource group configured into the cluster context.
Server [server]	The name of the PowerHA/HACMP cluster.
Resource Group Status [resource_group_status]	The status of the resource group into the cluster context. Example: Online.
Resource Group Type [resource_group_type]	The type of the resource group. Examples: Concurrent, non-concurrent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cluster Resource Group [cmdb_ci_cluster_resource_group] (continued)

Field	Description
Cluster [cluster]	The name of the PowerHA/HACMP cluster to which the resource group belongs.

UNIX Cluster Resource [cmdb_ci_unix_cluster_resource]

Field	Description
Name [name]	The name of the volume group into the cluster context.
Resource Type [resource_type]	The resource type (volume group).
Resource Status [resource_status]	The status of the volume group. Examples: Online, Offline.
Cluster [cluster]	The name of the PowerHA/HACMP cluster to which the volume group belongs.

UNIX Cluster Node [cmdb_ci_unix_cluster_node]

Field	Description
Name [name]	The name of the node that participates in the cluster.
Node State [node_state]	The state of the cluster node in the context of the CI state. For example: UP, DOWN, UNKNOWN.
Node Status [node_status]	The status of the node in the context of the resource group to which it belongs.
IP Address [ip_address]	The IP addresses assigned to the node.
Cluster [cluster]	The name of the cluster to which the cluster node belongs.

AIX Server [cmdb_ci_aix_server]

Field	Description
Name [name]	Name of the AIX server, representing the cluster node into the context of the PowerHA/HACMP cluster.

UNIX Cluster [cmdb_ci_unix_cluster]

Field	Description
Name [name]	The name of the PowerHA/HACMP cluster.
Cluster ID [cluster_id]	The ID of the PowerHA/HACMP cluster. Example: 0123456789.
Cluster Status [cluster_status]	The current state of the PowerHA/HACMP cluster. Examples: ST_STABLE, NOT_CONFIGURED.
Cluster Version [cluster_version]	The version of the PowerHA/HACMP cluster. Examples: 5.5; 6.1; 7.2.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

UNIX Cluster [cmdb_ci_unix_cluster] (continued)

Field	Description
Cluster Type [cluster_type]	The type of the PowerHA/HACMP cluster. Relevant only for versions 7.2 and above. Example: Stretched.
Description [short_description]	Description of the PowerHA/HACMP cluster (version, ID).

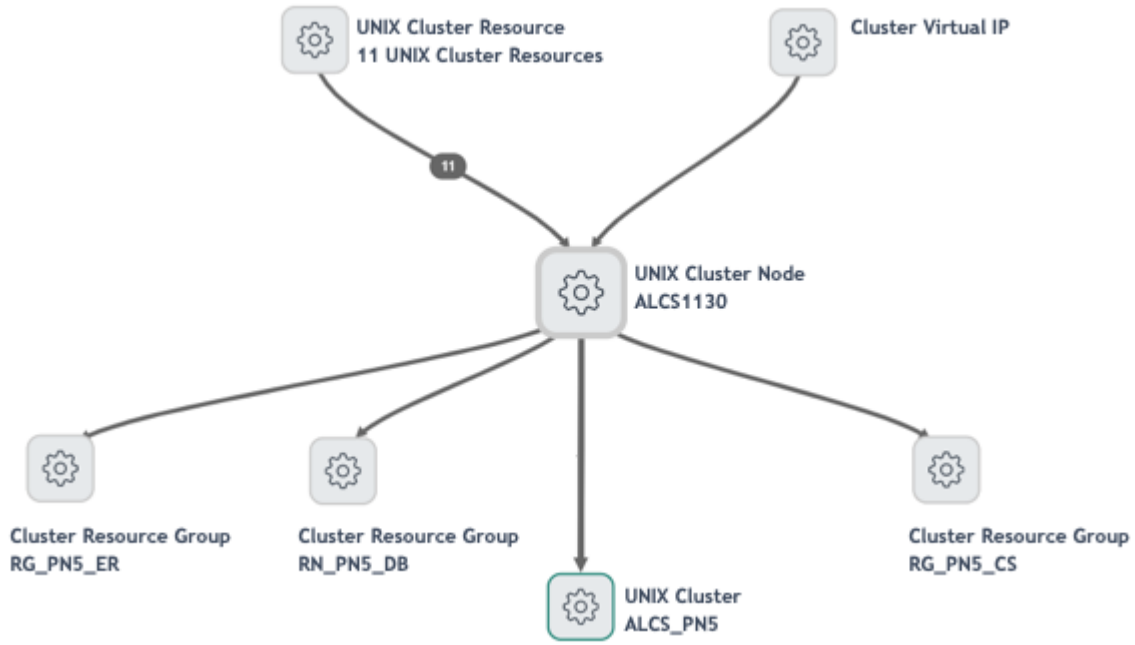
Cluster Virtual IP [cmdb_ci_cluster_vip]

Field	Description
Name [name]	The cluster node interface name.
IP Address [ip_address]	Hostname or IP address where the Hostname represents the cluster node network interface name and the IP address the IPv4 address associated to the network interface name. (As the IBM PowerHA/HACMP cluster does not have dedicated VIP address).
Cluster [cluster]	The name of the PowerHA/HACMP cluster.

On the Dependency Views map you can see all discovered cluster CIs in your organization and the relationships between them.

In this example, UNIX Cluster Node represents a cluster of UNIX Clusters. UNIX Cluster Node gets resources from UNIX Cluster Resource and uses Cluster Virtual IP. UNIX Cluster Node contains three Cluster Resource Groups.

Dependency Views sample map



CI relationships

These relationships are created to support IBM HACMP/PowerHA cluster discovery:

IBM Virtualization and Hardware Management Console discovery

The Discovery and Service Mapping Patterns application uses the IBM HMC Server pattern to find information about Hardware Management Console (HMC), frame, and logical partition (LPAR) servers. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery supports the following configuration items (CIs):

- HMC server
- IBM frame
- LPAR instance

  An LPAR is the virtual machine equivalent of IBM.

- LPAR resource

Discovery is used on the HMC server and the individual AIX machines (LPARs).

The IBM HMC Server pattern runs using SSH. It's supported to run on IBM AIX OS for LPAR and on Linux for HMC servers only.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Discovery and Service Mapping Patterns
- CMDB CI Class Models

Verify permissions for HMC and AIX servers

- Verify you have permissions for the following HMC commands:
  - `lssyscfg`
  - `lshmc`
  - `lshwres`
  - `lssysconn -r all -F type_model_serial_num:ipaddr`
- Verify you have permissions for the following AIX (LPAR) command: `lparstat -i`.

> **Note:**
> The `lparstat -i` command is in addition to the commands required for AIX server discovery. For more information on AIX server discovery, see AIX server discovery. For a list of the AIX commands, see Service Mapping commands requiring a privileged user.

Configure SSH credentials

Configure SSH credentials on the ServiceNow AI Platform. For more information, see SSH credentials.

Run a horizontal discovery for HMC Server and LPARs

1. Run a discovery on the HMC IP address.
2. Only when the HMC Server discovery has successfully completed, run a discovery on the LPARs using the AIX machine IP address.

For more information on running a discovery, see Schedule a horizontal discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the IBM HMC Server pattern.

IBM HMC Server [cmdb_ci_hmc_server]

Field	Description
Name [name]	Name of the HMC.
Frame count [frame_count]	Number of frames managed for the HMC. A frame is the physical machine on which the LPARs reside. A frame is the equivalent of an ESX machine.
Serial number [serial number]	Serial number of the HMC server.
IP Address [ip_address]	IP address of the HMC.
OS Version [os_version]	Operating system version.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM HMC Server [cmdb_ci_hmc_server] (continued)

Field	Description
CPU type [cpu_type]	CPU type.
CPU speed (MHz) [cpu_speed]	CPU speed.
CPU count [cpu_count]	CPU count.
CPU core count [cpu_core_count]	CPU core count.
RAM (MB) [ram]	Memory RAM.

IBM Frame [cmdb_ci_ibm_frame]

Field	Description
Name [name]	Name of the frame.
Serial number [serial number]	Serial number of the Frame server.
Current available processor units [curr_avail_sys_proc_units]	Current available processor units.
Configurable processor units [configurable_sys_proc_units]	Configurable processor units.
Installed processor units [installed_sys_proc_units]	Installed processor units.
Current available memory units [curr_avail_sys_mem]	Current available memory units.
Configurable memory units [configurable_sys_mem]	Configurable memory units.
Installed memory units [installed_sys_mem]	Installed memory units.
IP Address [ip_address]	Management IP address of the IBM frame.

IBM LPAR Instance [cmdb_ci_lpar_instance]

Field	Description
Name [name]	Name of the LPAR instance.
State [state]	Operational state. Possible values are On or Off. • On: running • Off: not activated or not available
Serial number [serial_number]	Serial number of the LPAR.
Object ID [object_id]	Unique object identifier. This identifier is concatenated from the frame serial number and the LPAR identifier.
Is VIO [is_vio]	Identifies the LPAR as a VIO server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IBM LPAR Instance [cmdb_ci_lpar_instance] (continued)

Field	Description
	A VIO server is the LPAR that manages the physical components for other LPARs, such as network interface cards (NICs) and optical drives.
VIO Servers [vio_servers]	• Client LPARs: Identifies the VIO servers that manage the client LPARs. • VIO servers: Identifies the Client LPARs the VIO servers manage.
Current Min Proc Units [curr_min_proc_units]	Minimum number of processing units that can be assigned to the partition dynamically.
Running Proc Units [run_proc_units]	Number of processing units that are varied on for the partition.
Current Memory [curr_mem]	The amount of memory in megabyte (MB) assigned to the partition.
Running Memory [run_mem]	Current amount of memory in MB that the partition has varied on.
IP Address [ip_address]	IP address assigned to the VIOS LPAR instance.
Model number [model_number]	OS version of the VIOS LPAR instance.
Frame Name [frame_parent]	References the IBM Frame [cmdb_ci_ibm_frame] table.

LPAR Resource [cmdb_ci_lpar_resource]

Field	Description
High Watermark VCPU [high_watermark_vcpu]	Highest recorded value of the **Online Virtual CPUs** field, as collected by the `lparstat -i` command. Because the value is dynamic, the results of a discovery could affect the value: • If the value of the **Online Virtual CPUs** field is lower than the value collected by the `lparstat -i` command, the value doesn't change. • If the value of the **Online Virtual CPUs** field is higher than the value collected by the `lparstat -i` command, the higher value is used.
Node name [node_name]	Name of the instance, along with the field that refers to the LPAR instance CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Serial Number [cmdb_serial_number]

Field	Description
Serial number [serial_number]	Serial number of the CI.

CI Relationships

Discovery creates these relationships to support the IBM Virtualization and HMC discovery.

CI	Relationship	CI
IBM HMC Server [cmdb_ci_hmc_server]	Defines resources for::Gets resources from	IBM HMC Processor Pool [cmdb_ci_processor_pool]

IBM WebSEAL discovery

The ® Discovery application uses the IBM WebSEAL patterns to find WebSEAL applications, web application servers, and junctions on your infrastructure. Discovering some of these resources requires installing the Discovery and Service Mapping Patterns application from the ® Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Detailed information on IBM WebSEAL

For information, see Detailed information on products discovered by ITOM Visibility

Authentication

The WebSEAL authentication process includes HTTP header authentication with basic credentials Basic authentication credentials.

If you're running discovery for the first time, configure Credential affinity for Discovery and Orchestration Credential affinity for Discovery and Orchestration.

Note:
Credential affinity isn't available In debug mode.

Configured MID Server

Ensure the MID Server has access and permissions to send HTTPS requests to the WebSEAL application.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configured user permissions to execute API calls

Ensure that the user has the permission to run the following API:

- `/net/general`
- `/net/dns`
- `/wga/reverseproxy`
- `/wga/reverseproxy/<reverse_proxy_id>/configuration/stanza/junction/entry_name/match-vhj-first`
- `/wga/reverseproxy/<reverse_proxy_id>/junctions`
- `/wga/reverseproxy/"<reverse_proxy_id>/junctions?junctions_id=<junction_id>`
- `/wga/widgets/health.json`

HTTP Classification enabled

The IBM WebSEAL Pattern is triggered when you run the discovery on the server that the WebSEAL is on. Ensure that the HTTP Classification is present in the instance. For more information, see Create an HTTP classification and Run discovery through an HTTP or HTTPS REST call

Data collected during horizontal discovery

Field	Description
ISAM Server [cmdb_ci_isam_server]	
name	The name of the server as returned by the `/net/general` API call. If the field is empty, `nslookup` on the IP address would be attempted to populate this field.
IP Address [ip_address]	The IP address according to the discovery schedule/configuration.
fqdn	The `search_domain` returned by the`/net/dns` API call.
WebSEAL [cmdb_ci_app_server_webseal]	
name	The name of the WebSEAL server as returned by the API.
IP Address [ip_address]	The IP address according to the discovery schedule/configuration.
fqdn	The `search_domain` returned by the `/net/dns` API call.
install_status	The status is set to **installed** by default.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
operation_status	The status is set to **operational** by default.
install_directory	According to the identification requirement, this field is populated with the FQDN of the server.
WebSEAL Reverse Proxies [cmdb_ci_webseal_reverse_proxy]	
name	The name of the resource according to the API response.
object_id	The ID of the resource, of the API response.
install_status	Indicates if the installation is enabled.
operational_status	Indicates if the operation has started.
service_type – hard-coded	The status is set to `Webseal Reverse Proxy`by default.
webseal_health_status	The WebSEAL reported health status regarding the `/wga/widgets/health.json` API call
WebSEAL Junctions [cmdb_ci_webseal_junction]	
name	The name of the resource according to the API response.
object_id	The id of the resource, created as a unique hash number corresponding to the case-sensitive name of the resource. **Note:** The case insensitivity of the queries may create duplicate fields when the **name** value is identical to the **Object ID** value. One of the identification attributes must be changed to have a unique value.
install_status	Hard-coded to installed status
operational_status	Hard-coded to operational status
stateful_junction	Boolean value indicating whether it's a stateful Junction
transparent_path_junction	Boolean value indicating whether it's a transparent path Junction
junction_type	List for the type of the Junction
WebSEAL Backend Servers [cmdb_ci_webseal_backend_server]	
name	the name of the resource, as per API response
object_id	the id of the resource, as per API response
install_status	the status of the resource as per the "enabled" value in the API response
operational_status	the status of the resource as per the "operation state" value

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
server_id	The UUID used to identify the junction web server
http_port	HTTP port of the back-end third-party server. Applicable when the junction type is tcp.
service_port	TCP port of the back-end third-party server. Default is 80 for TCP junctions and 443 for SSL junctions
Priority	The priority of the server (1-9). Default is 9.

Pattern Relations

CI	Relationship Type	CI
Webseal [cmdb_ci_app_server_webseal]	Runs on::Runs	ISAM Server [cmdb_ci_isam_server]
Webseal Reverse Proxy [cmdb_ci_webseal_reverse_proxy]	Hosted on::Hosts Reference[load_balancer]	Webseal [cmdb_ci_app_server_webseal]
Webseal Reverse Proxy [cmdb_ci_webseal_reverse_proxy]	Runs on::Runs Reference[isam_server]	ISAM Server [cmdb_ci_isam_server]
Webseal Junction [cmdb_ci_webseal_junction]	Allocated to::Allocates Reference [service]	Webseal Reverse Proxy [cmdb_ci_webseal_reverse_proxy]
Webseal Junction [cmdb_ci_webseal_junction]	Owns::Owned by Reference [pool]	Load Balancer Pool Member [cmdb_ci_webseal_backend_server]
Webseal Junction [cmdb_ci_webseal_junction]	Reference only [load_balancer]	Webseal [cmdb_ci_app_server_webseal]

Note:
Currently, the relation between the back-end servers and actual server CIs in the CMDB isn't possible for HD.

IBM WebSphere Application Server discovery using patterns

The Discovery and Service Mapping Patterns application uses the Websphere On Windows and Websphere On Unix patterns to find IBM WebSphere Application Servers. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The IBM WebSphere Application Server is a software framework with middleware that hosts Java-based web applications. Discovery identifies and classifies information about the IBM WebSphere Application Server on both Windows and Linux computers.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Starting with Visibility Content version 6.1.0, pattern-based discovery is the default method for discovering IBM WebSphere Application Servers. The WebSphere probes are disabled by default. For more information, see IBM WebSphere server discovery using probes.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites for Windows discovery

Verify that the following applications are up to date:

- Discovery and Service Mapping Patterns
- Visibility Content

Enable PowerShell on the MID Server

For more information, see Set up MID Servers to use PowerShell.

Verify access to files and directories

Verify access to the following files and directories:

- Installation directory of the product
- Configuration directory of the product
- `versionInfo.bat`
- `WAS.product`
- `BASE.product`
- `profile.version`
- `Express.product`
- `application.xml`
- `server.xml`
- `cell.xml`

Create Windows credentials

For more information, see Windows credentials.

Schedule a horizontal discovery

For more information, see Schedule a horizontal discovery.

Prerequisites for Linux discovery

Verify that the following applications are up to date:

- Discovery and Service Mapping Patterns
- Visibility Content

Enable SSH on WebSphere Application Server

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see the "Setting up SSH on Linux or UNIX servers" article in the "WebSphere Automation" section of the IBM documentation (https://www.ibm.com/docs/en/products).

Verify access to files and directories

Verify access to the following files and directories:

- Installation directory of the product
- Configuration directory of the product
- `oeconsol`
- `WAS_HOME`
- `CONFIG_ROOT`
- `versionInfo.sh`
- `WAS.product`
- `BASE.product`
- `profile.version`
- `Express.product`
- `application.xml`
- `server.xml`
- `cell.xml`

Create SSH credentials

For more information, see SSH credentials .

Verify elevated rights for IBM WebSphere Application Server commands

For more information, see IBM WebSphere Application Server (on UNIX) table in Service Mapping commands requiring a privileged user.

Schedule a horizontal discovery

For more information, see Schedule a horizontal discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Websphere On Windows and Websphere On Unix patterns.

IBM Websphere [cmdb_ci_app_server_websphere]

Field	Description
Name [name]	Name of the WebSphere Application Server.
Version [version]	Current version of the WebSphere Application Server.
Node [node]	Name of the Node grouping the WebSphere Application Server or servers.
Cell [cell]	Name of the cell grouping one or more nodes of the WebSphere Application Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Websphere EAR [cmdb_ci_app_server_ws_ear]

Field	Description
Name [name]	Name of the enterprise application archive (EAR) file.
Installation directory [install_directory]	Installation directory of the EAR file.

Web Service [cmdb_ci_web_service]

Field	Description
Name [name]	Name of the web service.
Service ID [service_id]	ID of the web service.
Attributes [attributes]	Additional attributes of the web service.

Websphere Cell [cmdb_ci_websphere_cell]

Field	Description
Name [name]	Name of the WebSphere cell.
Cell ID [cell_id]	ID of the WebSphere cell.
Cell type [cell_type]	Type of the WebSphere cell.
Cell discovery protocol [cell_discovery_protocol]	Cell discovery protocol.
Description [short_description]	Description of the cell, if one has been provided. This field is populated in Linux discovery only.

CI relationships

Discovery creates these relationships to support the WebSphere Application Server discovery for both Windows and Linux systems.

CI	Relationship	CI
IBM Websphere [cmdb_ci_app_server_websphere]	Contains::Contained by	Websphere Cell [cmdb_ci_websphere_cell]
IBM Websphere [cmdb_ci_app_server_websphere]	Contains::Contained by	Websphere EAR [cmdb_ci_app_server_ws_ear]
Web Service [cmdb_ci_web_service]	Runs on::Runs	IBM Websphere [cmdb_ci_app_server_websphere]

InfiniBox Discovery

ServiceNow Discovery uses the InfiniBox pattern to find and map instances. Discovering these resources requires installing the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses multiple patterns to find InfiniBox storage system data. Discovering these resources requires installing the Discovery and Service Mapping Patterns and the CMDB CI Class Models applications from the ServiceNow Store, as each application is dependent on the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

other. You can use the patterns for discovering the InfiniBox components on the ServiceNow AI Platform using the Paris release or later.

The InfiniBox enterprise storage array delivers faster-than-all-flash performance, high availability, and multi-petabyte scale for mixed application workloads. The InfiniBox hardware redundancy design enables rapid recovery from any component failures.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Note:
Discovery of 'Hosts' and 'Clusters' associated to the InfiniBox system are not supported from version 1.0.83 of the Discovery and Service Mapping Patterns (sn_itom_pattern) plugin.

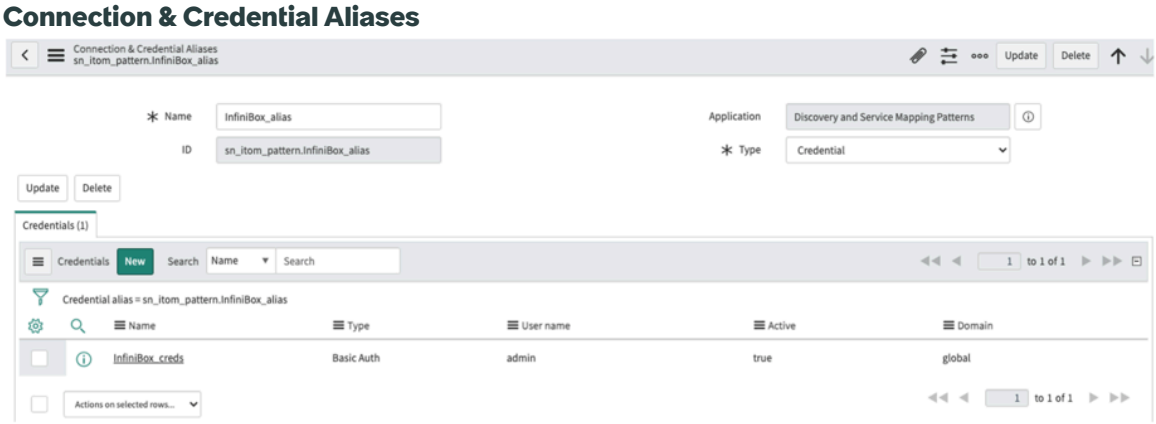
- Install the following plugins:
  - CMDB CI Class Models plugin (Version 1.28.0 or later)
  - Discovery and Service Mapping Patterns plugin (Version 1.0.81 or later)
- Set Basic Auth credentials for the InfiniBox storage system
- Set a credential alias and associate it with the InfiniBox system credential record.
- Set discovery schedule type to Serverless.
- Make sure that the MID server has access to the target device.

Authentication

Configure the credentials of the Basic Auth type for authenticating the REST API calls. They are used for discovery of the CI types associated with the InfiniBox Storage system.

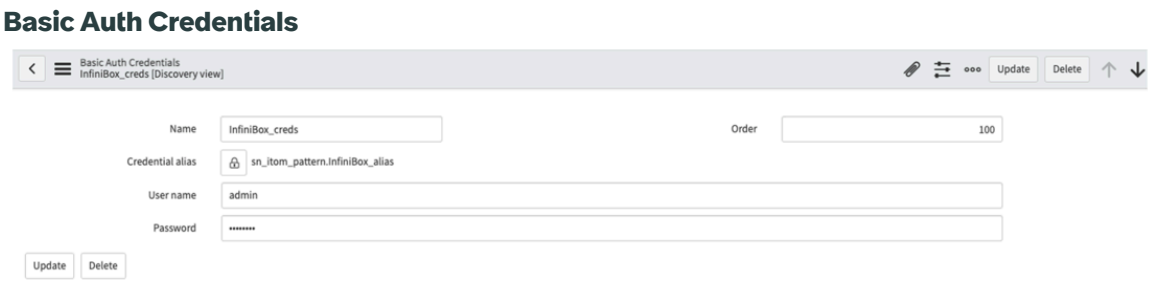
1. Navigate to **Connections & Credential Aliases**.
2. Create a new **Credential** record.
3. Create a new **Basic Auth** credential record from the Credentials related list form. Configure the **Basic Auth** parameters:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



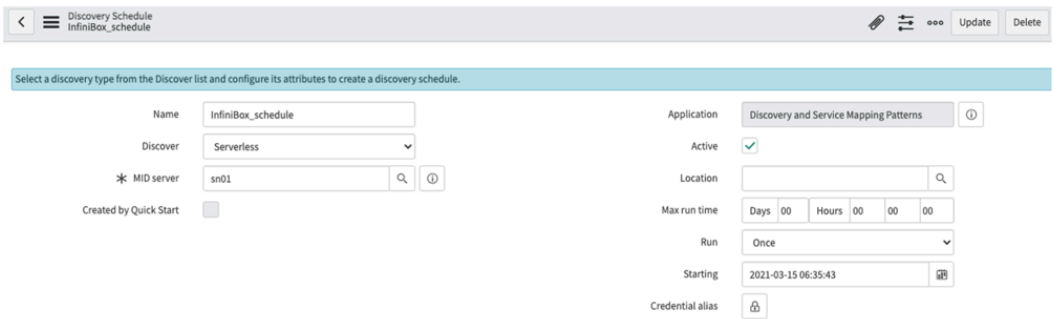
Configure the credentials of the **Basic Auth** type and the credential Alias associated with the credential record.

You can make the same configuration from the credential record form where you previously created the Credential alias. Associate the Connections and Credential Alias records respectively.



Discovery schedule

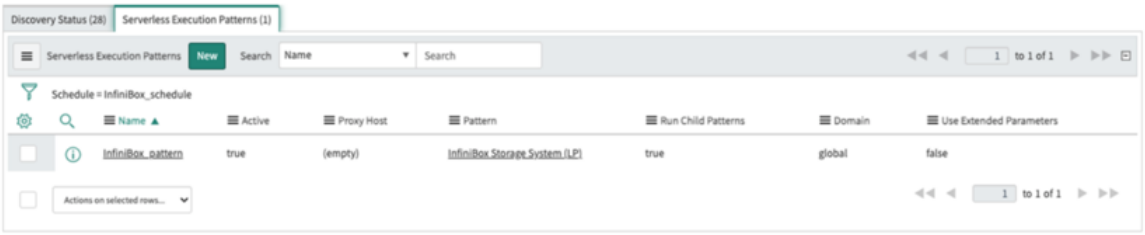
1. Create the Discovery schedule with the Serverless Discovery type.



2. For the Discovery schedule with the Discover type of Serverless, configure the InfiniBox Storage System LP pattern within the Serverless Execution Patterns tab.
3. Set the Run Child Patterns to True.

   This enables the system to trigger all the patterns associated Child Patterns with the InfiniBox Storage System (LP). This is necessary due to the Large Payload (LP) mechanism. This is used for the discovery of the InfiniBox storage system and all the corresponding CI types.

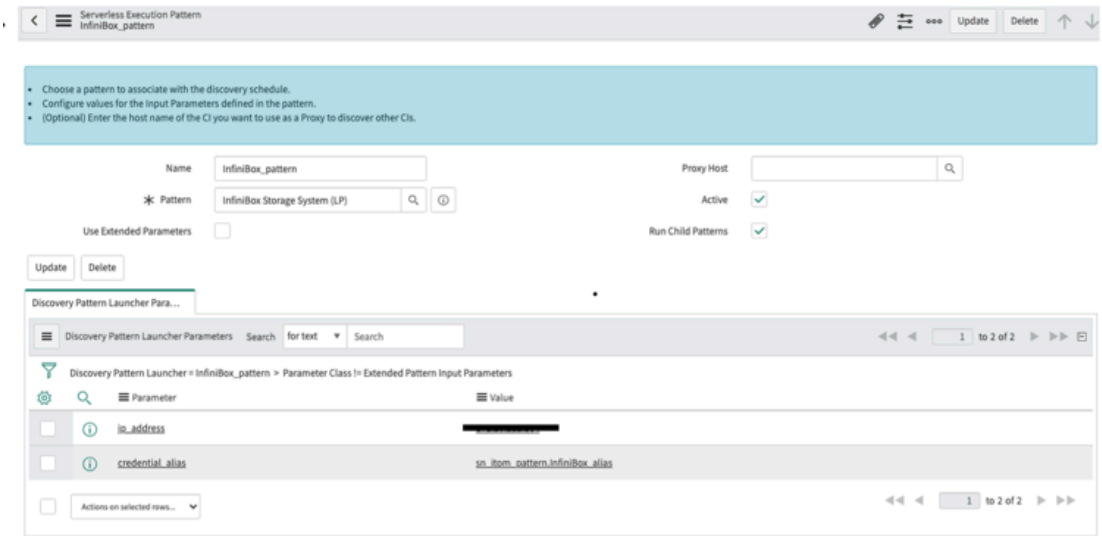
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Apply the values for **ip_address** and **credential_alias** from the Serverless Execution Pattern related section. These serve as input parameters for triggering the discovery schedule and the associated InfiniBox discovery pattern.

Apply the IP Address of the InfiniBox system and the ID of the previously created Connections & Credential Aliases record. These are related to the InfiniBox credential **Basic Auth** type record.

Serverless Execution Pattern



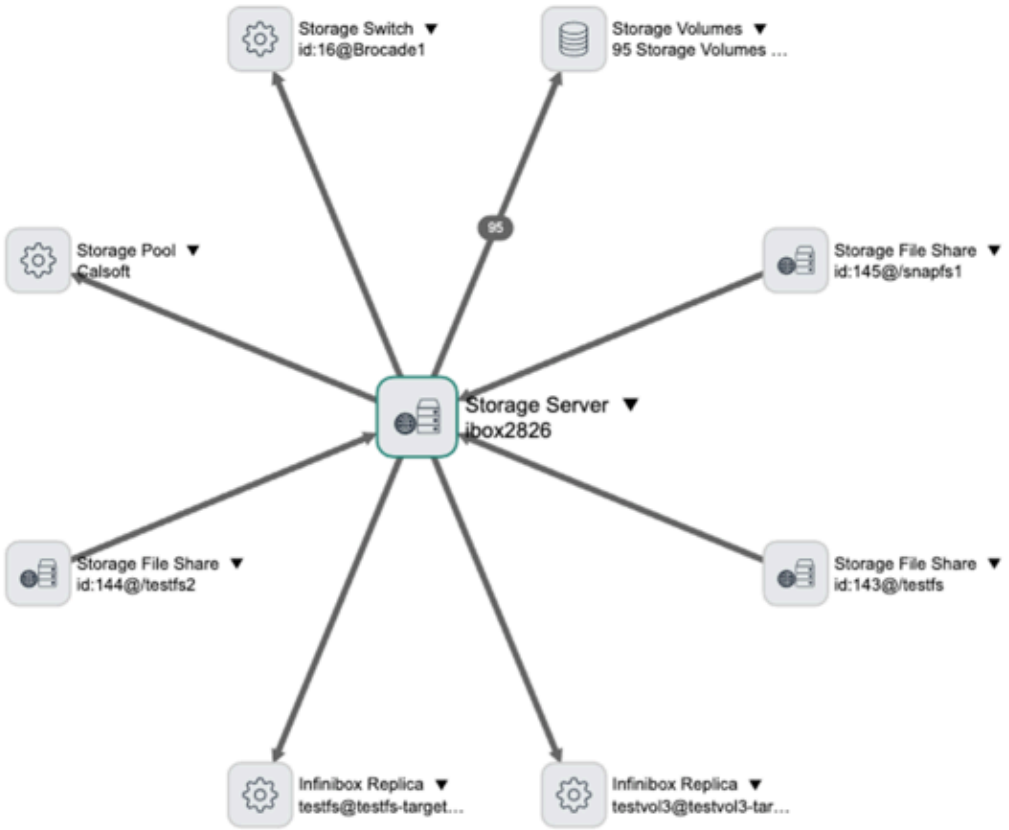
Data collected by Discovery during horizontal discovery

Storage Server [cmdb_ci_storage_server]

Field	Description
ip_address	The IP address of the InfiniBox system.
name	The name of the InfiniBox system.
os_version	The current version of the InfiniBox system.
model_id	The model ID of the InfiniBox system.
manufacturer	The product name of the InfiniBox system.
serial_number	The serial number of the InfiniBox system.
operational_status	The operational state of the InfiniBox system.
physical_capacity	The total physical capacity of the InfiniBox system in gigabytes.
virtual_capacity	The total virtual capacity of the InfiniBox system in gigabytes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Server View Map



Disk [cmdb_ci_disk]

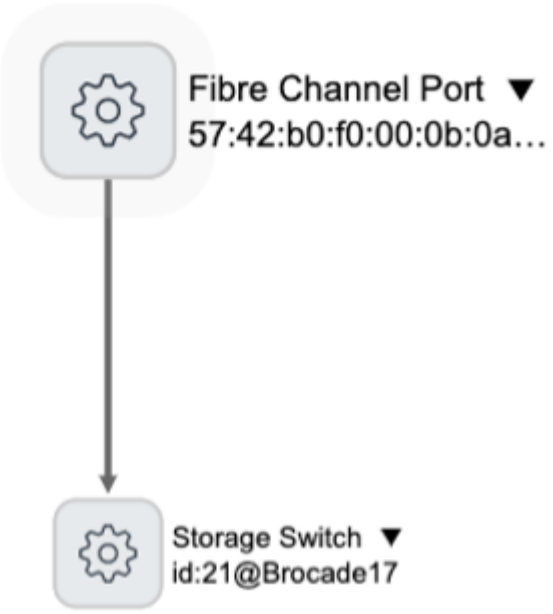
Field	Description
device id	The ID of the physical disk device, combination of NODE_ID@DISK_ID.
name	The name of physical disk device, combination of INFINIBOX_NAME:NODE_ID@DISK_ID
drive_type	The drive type of the physical disk device.
model_id	The model ID of the physical disk device.
manufacturer	The vendor of the physical disk device.
operational_status	The operational state of the physical disk device.
serial_number	The serial number of the physical disk device.
computer	Reference to any of the physical nodes part of the InfiniBox system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Fibre Channel Port [cmdb_ci_fc_port]

Field	Description
wwpn	The world wide port name of fibre channel port.
name	The name of fibre channel port (wwpn).
speed	The speed value of the fibre channel port in gigabits per second, if applied.
wwnn	The world wide node name of fibre channel port.
port_role	The role of fibre channel port.
state	The state of fibre channel port.
link_state	The state of the connectivity of fibre channel port.
manufacturer	The vendor of the fibre channel port.
model_id	The model ID of the of fibre channel port.
computer	The reference to any of the physical nodes part of the InfiniBox system.

Fibre channel view map



Storage Switch [cmdb_ci_storage_switch]

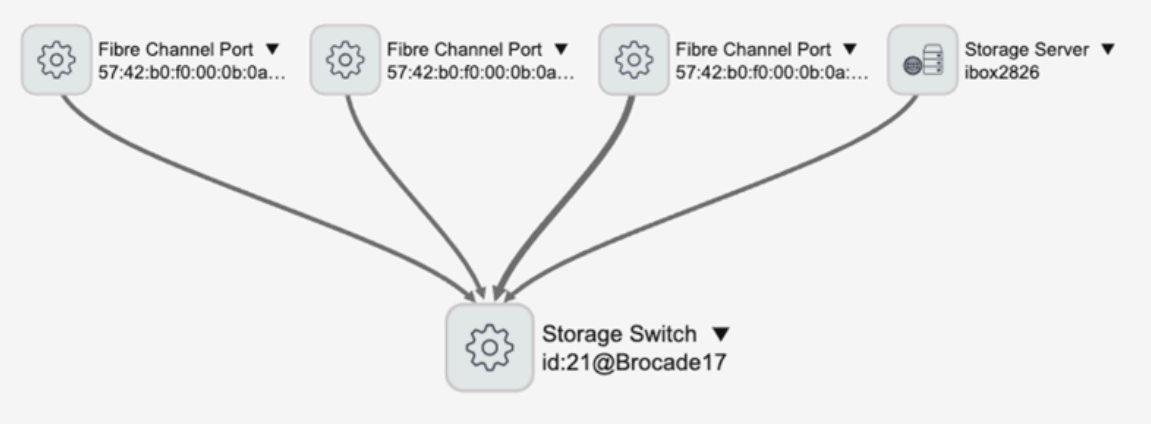
Field	Description
object_id	The ID of the storage switch.
name	The name of storage switch, combination of id:SWITCH_ID@SWITCH_NAME.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Switch [cmdb_ci_storage_switch] (continued)

Field	Description
wwnn	The world wide node name of the storage switch.
manufacturer	The vendor of the storage switch.

Storage Switch View Map

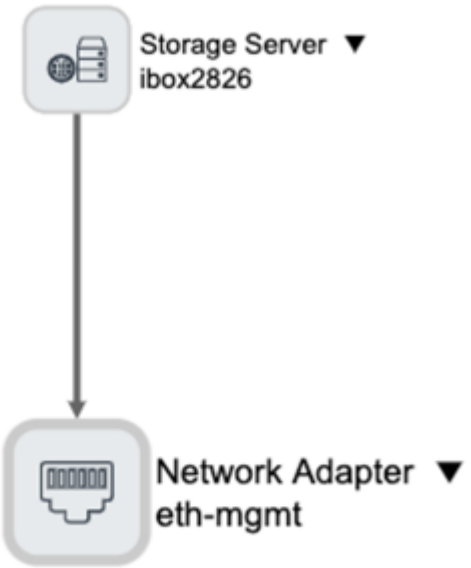


Network Adapter [cmdb_ci_network_adapter]

Field	Description
mac_address	The ethernet address of the network adapter.
name	The ethernet name of the network adapter.
operational_status	The ethernet link state of the network adapter.
manufacturer	The ethernet vendor of the network adapter.
model_id	The ethernet model ID of the network adapter.
ip_address	The IPv4 IP address associated with the ethernet network adapter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Network Adapter View Map



IP Address [cmdb_ci_ip_address]

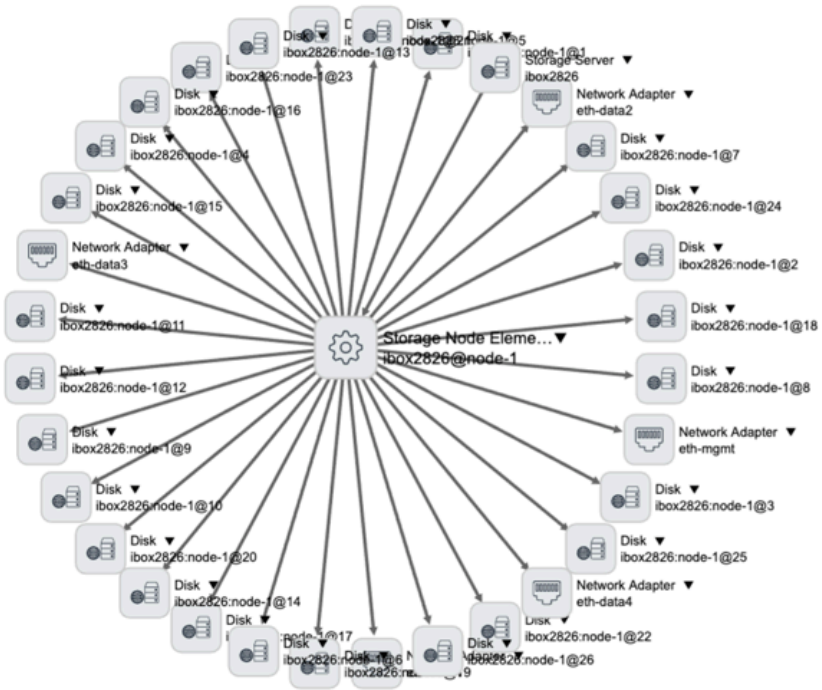
Field	Description
netmask	The netmask associated with the InfiniBox storage system.
name	The IPv4 IP address of any of the InfiniBox nodes or the InfiniBox storage system.
ip_address	The IPv4 IP address of any of the InfiniBox nodes.

Storage Node Element [cmdb_ci_storage_node_element]

Field	Description
object_id	The name of the InfiniBox Storage Node, combination of id:NODE_ID@NODE_NAME.
name	The name of the InfiniBox Storage Node, combination of INFINIBOX_NAME@NODE_NAME.
node_state	The operational state of the InfiniBox Storage Node.
manufacturer	The vendor of the InfiniBox Storage Node.
model_id	The model of the InfiniBox Storage Node.
ip_address	The IPv4 IP address assigned to the InfiniBox Storage Node.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Node Element View Map



Serial Number [cmdb_serial_number]

Field	Description
serial_number	The serial number associated to the InfiniBox storage system.
serial_number_type	The serial number type of the InfiniBox storage system.
valid	The serial number valid type of the InfiniBox storage system.

Storage Volume [cmdb_ci_storage_volume]

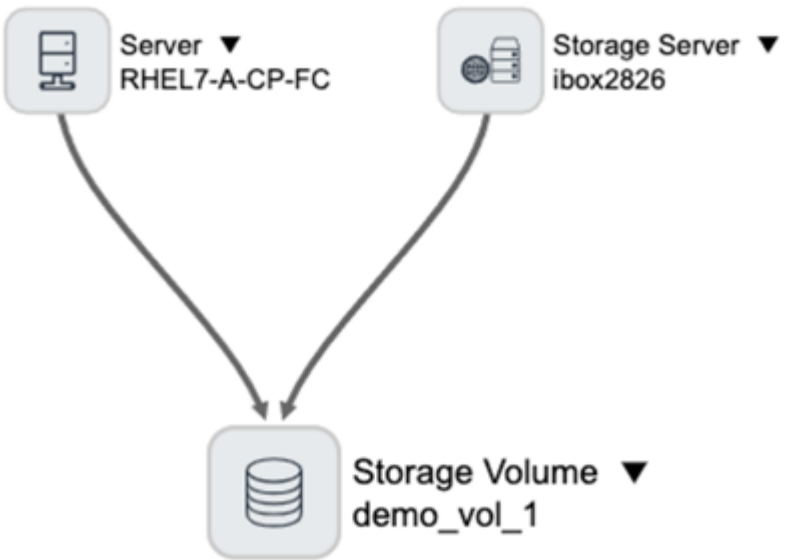
Field	Description
object_id	The ID of the storage volume, combination of id:VOLUME_ID@VOLUME_NAME.
volume_id	The ID of the storage volume, combination of id:VOLUME_ID@VOLUME_NAME.
name	The name of the storage volume.
storage_type	The role of the storage volume.
size_bytes	The total size of the storage volume in bytes.
serial_number	The serial number of the storage volume.
pool_id	The ID of the pool to which the storage volume is associated.
state	The lock state of the storage volume.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume [cmdb_ci_storage_volume] (continued)

Field	Description
provisioning_type	The type of provisioning of the storage volume.
size	The total size of the storage volume in gigabytes
provided_by	The reference to the storage pool, to which the storage volume is associated.

Storage Volume View Map



Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]

Field	Description
object_id	The ID of the storage volume snapshot, combination of id:VOLUME_ID@VOLUME_NAME.
storage_server	The name of InfiniBox system, to which the volume snapshot is associated.
name	The name of the storage volume snapshot.
size_bytes	The total size of the storage volume snapshot in bytes.
size	The total size of the storage volume snapshot in gigabytes.
serial_number	The serial number of the storage volume snapshot.
pool_id	The ID of the pool, to which the storage volume snapshot is associated.
parent_id	The ID of the storage volume, parent of the storage volume snapshot.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

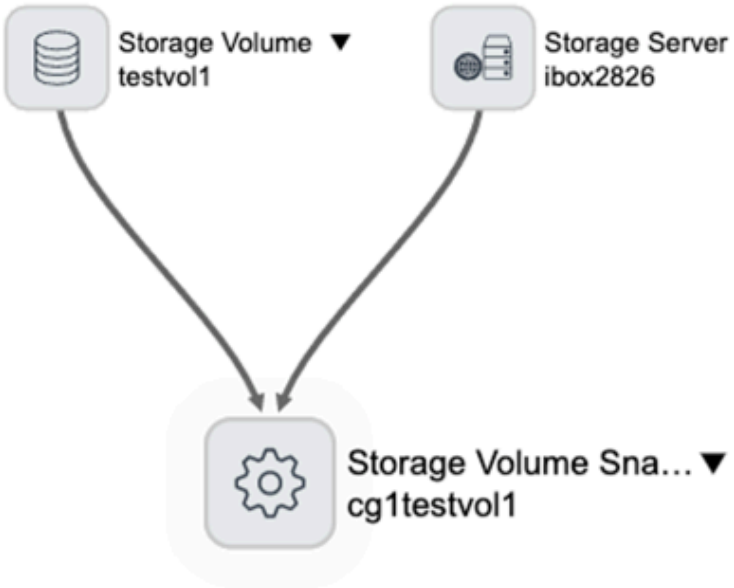
Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot] (continued)

Field	Description
state	The lock state of the storage volume snapshot.
provisioning_type	The type of provisioning of the storage volume snapshot.
provided_by	The reference to the storage pool, to which the storage volume is associated.

Storage Volume Snapshot



Storage Pool [cmdb_ci_storage_pool]

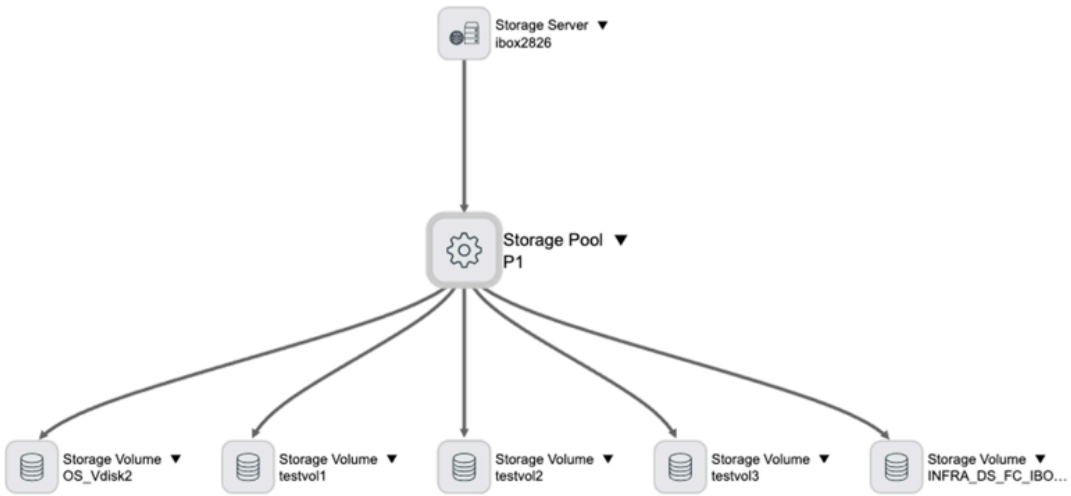
Field	Description
object_id	The ID of the storage volume, combination of id:POOL_ID@POOL_NAME.
name	The name of the storage pool.
physical_capacity	The total physical capacity of the storage pool in gigabytes.
virtual_capacity	The total virtual capacity of the storage pool in gigabytes.
free_phys_capacity	The available physical capacity of the storage pool in gigabytes.
free_virt_capacity	The available virtual capacity of the storage pool in gigabytes.
num_vols	The number of the volumes participating into the storage pool.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Pool [cmdb_ci_storage_pool] (continued)

Field	Description
num_file_sys	The number of the file systems participating into the storage pool.
num_file_sys_snap	The number of the file system snapshots participating into the storage pool.
num_vol_snap	The number of the volume snapshots participating into the storage pool.
pool_id	The ID of the storage pool.
pool_state	The state of the storage pool.

Storage Pool View Map



File System [cmdb_ci_file_system]

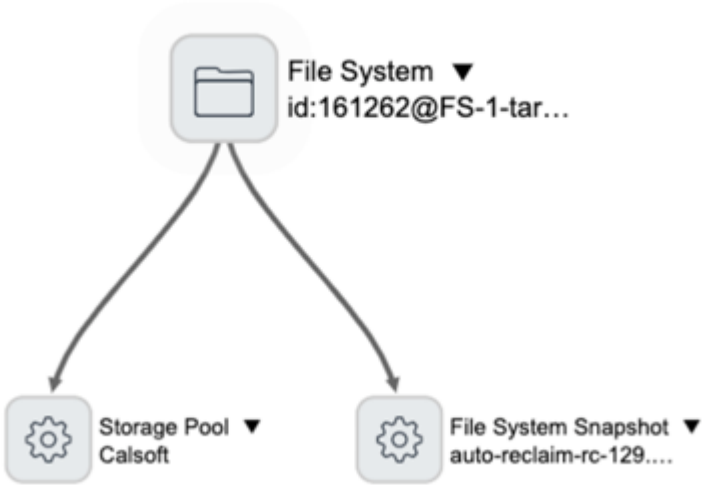
Field	Description
object_id	The ID of the primary file system, combination of id:FILE_SYSTEM_ID.
server_name	The name of InfiniBox system, to which the primary file system is associated.
name	The name of the primary file system, combination of id:FILE_SYSTEM_ID@FILE_SYSTEM_NAME.
size_bytes	The total size of the primary file system in bytes.
size	The total size of the primary file system in gigabytes.
free_space_bytes	The free space of the primary file system in bytes.
serial_number	The serial number of the primary file system.
storage_type	The type of the primary file system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

File System [cmdb_ci_file_system] (continued)

Field	Description
pool_id	The ID of the pool, to which the primary file system is associated.
provisioning_type	The type of provisioning of the primary file system.
provided_by	The reference to the storage pool, to which the primary file system is associated.

File System View Map



File System Snapshot [cmdb_ci_file_system_snapshot]

Field	Description
object_id	The ID of the snapshot file system, combination of id:FILE_SYSTEM_ID@FILE_SYSTEM_NAME.
volume_id	The ID of the snapshot file system, combination of id:FILE_SYSTEM_ID@FILE_SYSTEM_NAME.
server_name	The name of InfiniBox system, to which the snapshot file system is associated.
name	The name of the snapshot file system.
size_bytes	The total size of the snapshot file system in bytes.
free_space_bytes	The free space of the snapshot file system in bytes.
serial_number	The serial number of the snapshot file system.
storage_type	The type of the snapshot file system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

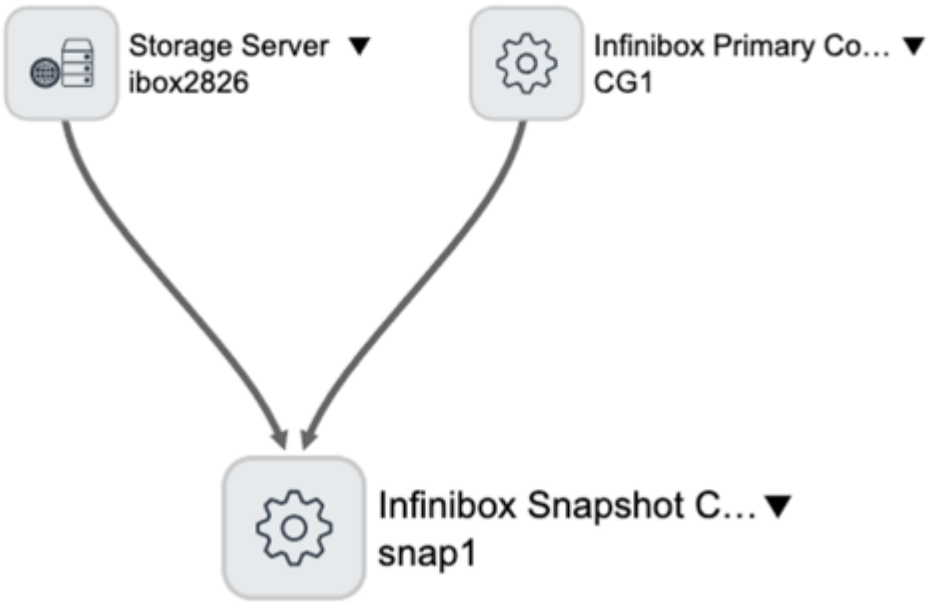
InfiniBox Snapshot Consistency Group[cmdb_ci_infinibox_snapshot_cg] (continued)

Field	Description
pool_id	The ID of the pool, to which the snapshot InfiniBox consistency group is associated.
lock_state	The lock state of the snapshot InfiniBox consistency group.

Snapshot Consistency Group View Map



InfiniBox Link [cmdb_ci_infinibox_link]

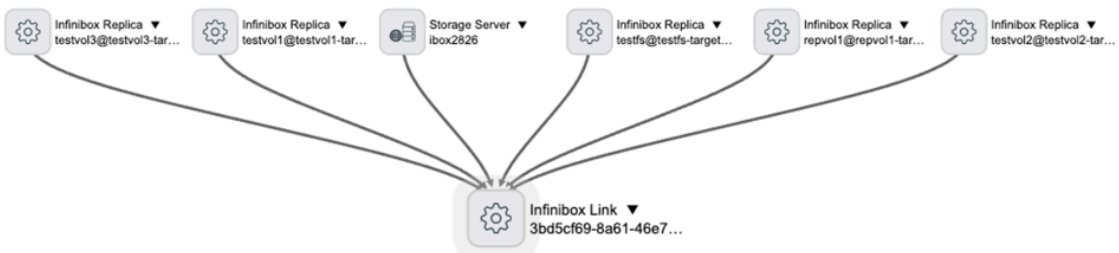
Field	Description
object_id	The ID of the InfiniBox link.
name	The name of the InfiniBox link.
remote_version	The version of the remote InfiniBox storage system.
remote_host	The host name or IP address of the remote InfiniBox storage system.
remote_ip	The IP address of the remote InfiniBox storage system.
remote_link_id	The link ID of the remote InfiniBox storage system.
remote_serial_number	The serial number of the remote InfiniBox storage system.
remote_sys_name	The system name of the remote InfiniBox storage system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

InfiniBox Link [cmdb_ci_infinibox_link] (continued)

Field	Description
link_state	The state of the link between the InfiniBox storage systems.
link_config_id	The link configuration ID of the remote InfiniBox storage system in GUID format.
link_mode	The mode of the link between the InfiniBox storage systems.
resiliency_mode	The resiliency mode between the InfiniBox storage systems.
local_witness_state	The local witness state of the InfiniBox storage system.
witness_address	The local witness address of the InfiniBox storage system, if assigned.
last_connection_time	The time stamp of the established connection between the Infinibox storage systems in format YY-MM-DD HH:MM::SS.
local_replica_net_space_id	The local replica network space ID of the Infinibox storage system.
link_replication_type	The replication type of the link between the Infinibox storage systems.

Link View Map



InfiniBox Replica [cmdb_ci_infinibox_replica]

Field	Description
object_id	The ID of the InfiniBox replica, combination of LOCAL_ENTITY_NAME@REMOTE_ENTITY_NAME@replica:REPLICA_ID.
name	The ID of the InfiniBox replica, combination of LOCAL_ENTITY_NAME@REMOTE_ENTITY_NAME@replica:REPLICA_ID.
replica_role	The role of the InfiniBox storage system replica.
entity_type	The type of the entity replicated in the context of the InfiniBox storage system.
replica_state	The state of the replica in the context of the InfiniBox storage system

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

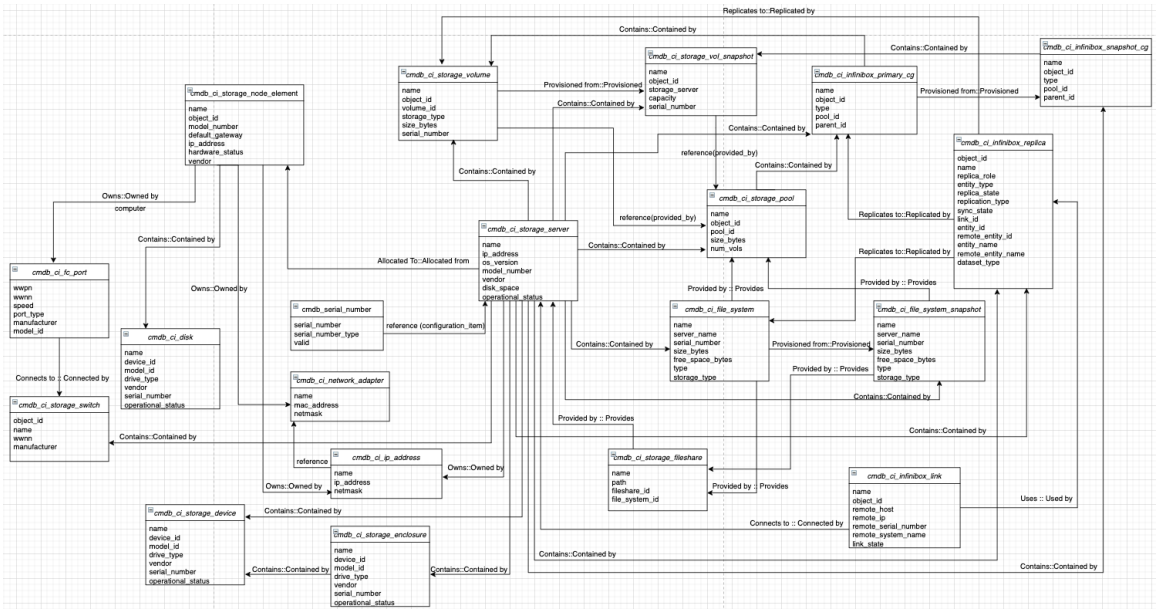
Infinibox Class Model



Next-Generation Juniper Network Firewall discovery

The ServiceNow Discovery application uses the Next-Generation Juniper Network Firewall discovery pattern to find Juniper network firewalls. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The discovery pattern uses a set of SNMP calls to find the Juniper network firewalls. Discovery uses the pattern to run horizontal discovery.

You can use this pattern on the ServiceNow AI Platform® using the Madrid release or later.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

- Ensure that your network firewall device has SNMP access.
- On the ServiceNow instance, configure SNMP credentials.
- Add the SNMP system OID record for the Juniper device to the ServiceNow instance. Update the following:
  - Classifier: Juniper Firewall
  - Class: Juniper Firewall Device

Deploy the pattern as follows:

1. Download and install the CMDB CI Class Models: Release 1.10.0 from the ServiceNow Store. The app adds the new CMDB classes required for network firewall discovery. For more information, see Firewall extension classes.
2. Download and install the discovery pattern from the ServiceNow Store.
3. Sync the pattern with the appropriate MID Server.

Data collected by Discovery during horizontal discovery

The discovered data includes the following tables and fields.

Table and field	Description
IP Firewall [cmdb_ci_ip_firewall] - Contains all network firewalls.	
Name [name]	Hostname.
Serial Number [serial_number]	Device serial number.
Operational Status [operational_status]	Indicates if the device is in active state.
IP address [ip_address]	IP address.
Manufacturer [manufacturer]	Device manufacturer.
Description [short_description]	Short description.
Model Number [model_number]	Device model number.
Firmware [firmware_version]	Firmware version.
Hardware Operating System [hardware_os]	OS running on the hardware.
Hardware OS Version [hardware_os_version]	OS version running on the hardware.
Firewall Device [cmdb_ci_firewall_device] - Abstract class for vendor-specific firewalls.	
Name [name]	Hostname.
Serial Number [serial_number]	Serial number of the device.
Fully qualified domain name [fqdn]	Fully qualified domain name.
Operational Status [operational_status]	Indicates if the device is in active state.
IP address [ip_address]	IP address.
Manufacturer [manufacturer]	Device manufacturer.
Description [short_description]	Short description.
Model Number [model_number]	Device model number.
Firmware [firmware_version]	Firmware version.
Hardware Operating System [hardware_os]	OS running on the hardware.
Hardware OS Version [hardware_os_version]	OS version running on the hardware.
Juniper Firewall Device [cmdb_ci_firewall_device_juniper] - Contains physical Juniper firewalls.	
Name [name]	Hostname.
Serial Number [serial_number]	Serial number of the device.
Fully qualified domain name [fqdn]	Fully qualified domain name.
Operational Status [operational_status]	Indicates if the device is in active state.
IP address [ip_address]	IP address.
Manufacturer [manufacturer]	Device manufacturer.
Description [short_description]	Short description.
Model Number [model_number]	Device model number.

Linux Pacemaker Cluster discovery

The ServiceNow Discovery application uses the Linux Pacemaker Cluster discovery pattern to find high-availability cluster data and populate the CMDB with the discovered information. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

This pattern is an extension section of the Linux Server pattern. Discovery uses the pattern to run horizontal discovery.

You can use this pattern on the ServiceNow AI Platform® using the Madrid release or later.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

- Configure SSH credentials for the Linux server.
- Provide a user with permissions to read the following files:
  - `/etc/hosts`
  - `/etc/corosync/corosync.conf`
  - `/var/lib/heartbeat/crm/cib.xml`, or `/var/lib/pacemaker/cib/cib.xml` from Linux SP3
- Provide a user with permissions to run the following commands:

```
ps -ef | grep corosync | grep -v grep
```

```
ps -ef | grep pacemaker | grep -v grep
```

```
ifconfig | grep 'inet addr:' |awk '{print $1, $2 }'
```

```
hostname -s
```

```
hostname -f
```

Data collected by Discovery during horizontal discovery

The discovered data includes the following tables and fields.

Table and field	Description
Main CI - UNIX Cluster [cmdb_ci_unix_cluster]	
name	Cluster name.
cluster_id	Cluster ID. Contains the nodes ID.
cluster_type	Cluster type.
cluster_status	Cluster status: Online/offline.
cluster_version	Cluster version.
UNIX Cluster Resource [cmdb_ci_unix_cluster_resource]	
name	Resource name.
resource_type	Resource type.
resource_status	Resource status. For example, Started.
ip_address	IP address of the machine where the resource is running.
fqdn	FQDN of the machine where the resource is running.
Cluster Virtual IP [cmdb_ci_cluster_vip]	
name	Cluster VIP name.
ip_address	IP address of the VIP.
Cluster Resource Group [cmdb_ci_cluster_resource_group]	
name	Resource group name.

	Contains::Contained by	cmdb_ci_unix_cluster_node
	Contains::Contained by	cmdb_ci_unix_cluster_resource

Microsoft Azure Cloud components discovery using patterns

Discovery uses multiple patterns to discover components of the Microsoft Azure Cloud deployment during horizontal discovery. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date.

- Discovery and Service Mapping Patterns
- CMDB CI Class Models
- Visibility Content

Verify the configuration of Cloud Discovery for Microsoft Azure

- Use the Cloud Discovery Workspace to set up Cloud Discovery. For more information, see Cloud Discovery setup using Cloud Discovery Workspace
- Enable Cloud Discovery to access your Azure environment. For more information, see Set up Azure service accounts.

Activate the cloud-related CI relationships

To include discovered components into service instances, enable CI relationships used in tag-based discovery by Service Mapping. These CI relationships are available from the 1.0.68 release on the ServiceNow Store. For operational steps, see Tag-based discovery configuration.

Azure Availability Set

Wait for the **Clean-Up job for Availability zone to clear availability set record** schedule job to delete all the pre-populated availability set's Configuration Items (CI) in the **cmdb_ci_azure_availability_set** table.

Azure Availability Zone

To run a discovery with Azure Availability Zone, register the subscription ID to the **AvailabilityZonePeering** feature with AZ CLI using `az feature register -n AvailabilityZonePeering --namespace Microsoft.Resources` to

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

use the Check Zone Peering API. Check the status with `az feature show -n AvailabilityZonePeering --namespace Microsoft.Resources` before running discovery.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Azure resources discovery by datacenters

Azure has multiple datacenters around the world, but resources like load balancers and virtual machines are typically deployed in only some of them. The **Azure Datacenter Discovery** pattern executes before all other Azure patterns to identify the datacenters that have resources related to your service account ("active") and the datacenters that don't have your resources ("passive"). This model improves the performance of the Azure discovery. This execution model is more efficient than the previous one, in which all datacenters were discovered regardless of having relevant resources in them.

After identifying the "active" and "passive" datacenters, the Discovery schedule continues to execute all Azure patterns only for the "active" datacenters, to discover your Azure cloud resources. The "passive" datacenters are ignored while running the schedule.

You might notice differences in Azure discovery log, in discovery time and in the CMDB, depending on the service account and MID Server property settings.

Datacenters that have already been discovered before the upgrade to Discovery and Service Mapping Patterns version 1.15.0, remain in the **Azure Datacenters** table. However, the discovery runtime behavior is now determined by the value of the MID Server property *mid.cloud.discovery.sonar.discover_all_azure_datacenters*. The property is set to **false** by default, to limit the discovery execution to the "active" datacenters, rather than all datacenters. You can discover all datacenters for a service account, including "passive" ones, by setting the property to **true**. For more information, see: Create a MID Server property.

If the MID Server property is set to **false**, the Azure Datacenters table shows only active datacenters. All other behaviors remain unchanged from previous Discovery and Service Mapping Patterns versions.

Differences in datacenter discovery by Discovery and Service Mapping Patterns version

Discovery and Service Mapping Patterns version	MID Server property setting	Discovered datacenters	Datacenters contained in Azure Datacenters table	Datacenters displayed in discovery log
Discovery and Service Mapping Patterns starting with version 1.15.0	False (default)	Active only	Active only	Active only
Discovery and Service Mapping Patterns starting with version 1.15.0	True	All datacenters	All datacenters	All datacenters

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Differences in datacenter discovery by Discovery and Service Mapping Patterns version (continued)

Discovery and Service Mapping Patterns version	MID Server property setting	Discovered datacenters	Datacenters contained in Azure Datacenters table	Datacenters displayed in discovery log
Discovery and Service Mapping Patterns before version 1.15.0	False (default)	Active only	All datacenters	Active only
Discovery and Service Mapping Patterns before version 1.15.0	True	All datacenters	All datacenters	All datacenters

For management groups, Azure Cloud Discovery discovers all Azure datacenters.

Starting with Discovery and Service Mapping Patterns version 1.29.0, the **Refresh Datacenters** flow displays all regions, not just active ones. You don't need to create another schedule when a resource is added or a datacenter switches from passive to active.

Azure Hardware Type discovery

Hardware Type discovery has undergone three model changes in recent years. The 1.15.0 model triggers the **Hardware Type** pattern and the **Virtual Machine** pattern after the **Azure Datacenter Discovery** pattern. Starting Discovery and Service Mapping Patterns plugin version 1.15.0, Cloud Discovery identifies which Hardware Type model is used, and launches only one of the two patterns: **Hardware Type (LP)** or **Cloud Hardware Type (LP)**.

Migration to the new Azure Hardware Type discovery model- Use cases

Discovery and Service Mapping Patterns version	Hardware Type Migration status	Which pattern executes	Discovery result
Prior to 1.0.75	Haven't migrated to the new model	**Hardware Type (LP)** pattern	The CI type created: [cmdb_ci_compute_template]
Discovery and Service Mapping Patterns version 1.0.75	The migration to the new model is done by migration script. See KB0955939	**Hardware Type (LP)** pattern	The CI type created: [cmdb_ci_cloud_hardware_type]
Discovery and Service Mapping Patterns version 1.6.0	The Hardware Type new model is provided OOB, enabled with the system property: *sn_itom_pattern.use a single hardware type for cloud datacenters*. For more information, seeKB1285337.	According to KB1285337 Flow Diagram	The CI type created: According to KB1285337

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Migration to the new Azure Hardware Type discovery model- Use cases (continued)

Discovery and Service Mapping Patterns version	Hardware Type Migration status	Which pattern executes	Discovery result
Discovery and Service Mapping Patterns 1.15.0	The Hardware Type new model is provided OOB enabled with the system property: *sn_itom_pattern.use a single hardware type for cloud datacenters*. For more information, seeKB1285337.	The flow is as described in KB1285337. However, only one pattern executes. The pattern that used to gracefully terminate doesn't execute.	Either **Hardware Type (LP)** pattern or **Cloud Hardware Type (LP)** pattern executes.

Azure SQL Managed Instance license discovery

The Azure DataBase (LP) pattern extension **Azure SQL Managed Instance license** discovers Azure SQL Managed Instance license information and populates the license type in the Key Value [cmdb_key_value] table of Cloud Database CI [cmdb_ci_cloud_database].

Required plugins and applications

- Software Asset Management Professional for Microsoft
- Visibility Content

Discovered resources and relationships

Resources discovered using the Azure DataBase (LP) pattern extension: Azure SQL Managed Instance license

Relationships discovered using the Azure DataBase (LP) pattern extension: Azure SQL Managed Instance license

Azure Marketplace discovery

The Azure - Marketplace LB (LP) pattern discovers the following Azure Marketplace products:

- SaaS
- Azure Application
- Virtual Machine

Note:
The pattern discovers only virtual machines (VMs) created from third-party or commercial marketplace images.

Discovered resources and relationships

Resources discovered by the Azure - Marketplace LB (LP) pattern

Relationships discovered using the Azure - Marketplace LB (LP) pattern

Data collected by Discovery during horizontal discovery

Resources discovered by the Microsoft Azure - Application LB (LP) pattern

Field	Description
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the load balancer.
location	The path of the load balancer.
state	The current state of the load balancer.
install_status	Resource provisioning status.
ip_address	IP Address of the load balancer.
fqdn	The fully qualified domain name of the load balancer.
dns_name	The DNS name of the load balancer.
comments	Identifier for internal usage (deletion strategy).
Cloud LB IP Address [cmdb_ci_cloud_lb_ipaddress]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
lb_id	A unique identifier for the load balancer.
ip_address	IP address of the load balancer.
ip_address_type	The type of the IP Address, which can be private or public.
fqdn	The fully qualified domain name of the load balancer.
comments	Identifier for internal usage (deletion strategy).
install_status	Resource provisioning status.
Load Balancer Pool [cmdb_ci_lb_pool]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the load balancer pool.
location	Path of the load balancer pool.
install_status	Resource provisioning status.
comments	Identifier for internal usage (deletion strategy).
Load Balancer Service [cmdb_ci_lb_service]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the load balancer service.
location	Path of the load balancer service.
port	The TCP port that the load balancer service listens to.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
install_status	Resource provisioning status.
comments	Identifier for internal usage (deletion strategy).

Resources discovered by the Microsoft Azure - Classic LB (LP) pattern

Field	Description
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the load balancer.
location	Path of the load balancer.
state	The current state of the load balancer.
install_status	Resource provisioning status.
comments	Identifier for internal usage (deletion strategy).
Cloud LB IP Address [cmdb_ci_cloud_lb_ipaddress]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
lb_id	A unique identifier for the load balancer.
ip_address	IP address of the load balancer.
ip_address_type	The type of the IP address, which can be private or public.
fqdn	The fully qualified domain name of the load balancer.
comments	Identifier for internal usage (deletion strategy).
install_status	Resource provisioning status.
Load Balancer Service [cmdb_ci_lb_service]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the load balancer service.
location	Path of the load balancer service.
port	The TCP port that the load balancer service listens to.
install_status	Resource provisioning status.
comments	Identifier for internal usage (deletion strategy).
Load Balancer Pool [cmdb_ci_lb_pool]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the load balancer pool.
location	Path of the load balancer pool.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
install_status	Resource provisioning status.
comments	Identifier for internal usage (deletion strategy).

Resources discovered by the Microsoft Azure - Hardware Type (LP) pattern

Field	Description
Hardware Type [cmdb_ci_hardware_type]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the hardware type.
local_storage_gb	Storage assigned to this template.
cores	The default number of cores for the instance type.
memory_mb	Memory size assigned to this template.
vcpus	Number of CPU cores assigned to this template.

Resources discovered by the Microsoft Azure - Host (LP) pattern

Field	Description
Host [cmdb_ci_cloud_host]	
name	The Name or ID if no Name is specified for the host.
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
host_type	The host type.
cloud_vendor	The cloud vendor: Microsoft Azure.
virtual	Virtual host: False.

Resources discovered by the Microsoft Azure - Image (LP) pattern

Field	Description
Image table [cmdb_ci_os_template]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the image.
location	Path of the image.
guest_os	Operating system that is secondary to the OS.
comments	Identifier for internal usage (deletion strategy).
image_source	Source of the OS image.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
When using the Image [cmdb_ci_os_template] table to store Cloud OS Images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

Resources discovered by the Microsoft Azure - Network and Subnet (LP) pattern

Field	Description
Cloud Network [cmdb_ci_network]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the cloud network.
location	Path of the network.
state	The current state of the network.
install_status	Resource provisioning status.
cidr	CIDR representation of the network. For example, 10.0.0.0/24.
Cloud Subnet [cmdb_ci_cloud_subnet]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the cloud subnet.
location	Identifier for internal usage (deletion strategy).
state	The current state of the subnet.
install_status	Resource provisioning status.
cidr	CIDR representation of the subnet. For example, 10.0.0.0/24.

Resources discovered by the Microsoft Azure - NIC (LP) pattern

Field	Description
Cloud Mgmt Network Interface [cmdb_ci_nic]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the network interface.
location	Path of the network interface.
install_status	Resource provisioning status.
state	The current state of the network interface.
public_ip	The address of the Elastic IP address bound to the network interface.
private_ip	The IPv4 address of the network interface within the subnet.
primary	True/False. Defines if the network interface is the primary network interface or not.
mac_address	The MAC address of the network interface.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
public_dns	The public DNS name of the network interface.

Resources discovered by the Microsoft Azure - Private Gateway (LP) pattern

Field	Description
Virtual Private Gateway [cmdb_ci_virtual_pvt_gateway]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the private gateway.
location	Path of the private gateway.
connection_type	Type of VPN connection the gateway supports.
operational_status	The state of the resource.
install_status	Resource provisioning status.
Virtual Private Gateway Endpoint [cmdb_ci_endpoint_vpg]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the endpoint.
location	Path of the endpoint.
connection_type	Type of VPN connection the gateway supports.

Resources discovered by the Microsoft Azure - Public IP (LP) pattern

Field	Description
Cloud Public IP Address [cmdb_ci_cloud_public_ipaddress]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the IP address.
location	Path of the IP address.
state	The current state of the IP address.
public_ip_address	The address of the Elastic IP address.
public_dns	The public DNS name.
install_status	Resource provisioning status.

Resources discovered by the Microsoft Azure - Resource Group (LP) pattern

Field	Description
Resource Group [cmdb_ci_resource_group]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
name	The Name or ID if no Name is specified for the resource group.
location	Path of the resource group.
state	The current state of the resource group.
install_status	Resource provisioning status.

Resources discovered by the Microsoft Azure - Route Table (LP) pattern

Field	Description
Route Table [cmdb_ci_route_table]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the route table.
location	Path of the route table.
install_status	Resource provisioning status.
state	The current state of the route table.

Resources discovered by the Microsoft Azure - Security Group (LP) pattern

Field	Description
Compute Security Group [cmdb_ci_compute_security_group]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the security group.
location	Path of the security group.
state	The current state of the security group.
install_status	Resource provisioning status.

Resources discovered by the Microsoft Azure - SQL Server (LP) pattern

Field	Description
Virtual Machine Instance [cmdb_ci_vm_instance]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
location	Path of the VM instance.

Resources discovered by the Microsoft Azure - Storage Account (LP) pattern

Field	Description
Cloud Storage Account [cmdb_ci_cloud_storage_account]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
name	The Name or ID if no Name is specified for the storage account.
location	Path of the storage account.
sku_name	The name of the SKU (for backup frequency).
install_status	Resource provisioning status.
state	The current state of the storage account.

Resources discovered by the Microsoft Azure - Storage Containers (LP) pattern

Field	Description
Storage Volume [cmdb_ci_storage_volume]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the storage volume.
location	Path of the storage volume.
volume_id	Identifier that holds the volume ID as the value.
volume_container	The container name.
comments	Identifier for internal usage (deletion strategy).
status	The status of the resource.
Block Endpoint [cmdb_ci_endpoint_block]	
name	The Name or ID if no Name is specified for the block endpoint.
object_id	A unique identifier, allocated by Microsoft Azure for this resource.

Resources discovered by the Microsoft Azure - Storage Volume (LP) pattern

Field	Description
Storage Volume [cmdb_ci_storage_volume]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the storage volume.
volume_id	The volume type. For example: • `gp2` for General Purpose SSD • `io1` for Provisioned IOPS SSD • `st1` for Throughput Optimized HDD • `sc1` for Cold HDD • `standard` for Magnetic volumes
location	Path of the storage volume.
state	The current state of the storage volume.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
install_status	Resource provisioning status.
size	The size of the volume.
size_bytes	The size of the volume (bytes).
storage_type	For example, hard-coded value “block.”
comments	Identifier for internal usage (deletion strategy).

Resources discovered by the Microsoft Azure - Sub Account (LP) pattern

Field	Description
Cloud Service Account [cmdb_ci_cloud_service_account]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
account_id	The unique identifier (ID) of the account.
name	The Name or ID if no Name is specified for the service account.
datacenter_type	cmdb_ci_azure_datacenter
discovery_credentials	Reference field to the related Microsoft Azure credentials.
datacenter_url	The URL of the datacenter.
parent_account	Reference to the primary account, if it exists.
is_master_account	The Boolean attribute indicating if this is the primary account or not.

Resources discovered by the Microsoft Azure - Virtual Machine (LP) pattern

Field	Description
Virtual Machine Instance [cmdb_ci_vm_instance]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the instance.
location	The path of the instance.
install_status	Resource provisioning status.
state	The current state of the instance.
vm_inst_id	The ID of the instance.
nics	The number of NICs available to the instance.
disks	The number of disks attached to the instance.
disks_size	The total size of the attached disks.
memory	The amount of memory available to the instance. (MBs)
cpus	The number of CPUs available to the instance.
Block Endpoint [cmdb_ci_endpoint_block]	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the endpoint.
location	The path of the endpoint.
host	The public IPv4 address assigned to the instance, if applicable.
Storage Volume [cmdb_ci_storage_volume]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the storage volume.
location	The path of the storage volume.
comments	Identifier for internal usage (deletion strategy).
Cloud Mgmt Network Interface [cmdb_ci_nic]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
location	The path of the network interface.
VNIC Endpoint [cmdb_ci_endpoint_vnic]	
object_id	A unique identifier, allocated by Microsoft Azure for this resource.
name	The Name or ID if no Name is specified for the endpoint.
location	The path of the endpoint.

The pattern extension section discovers Bring Your Own License (BYOL) or the included licenses for Windows VMs and Red Hat Enterprise Linux (RHEL) VMs.

- For Windows VM using a custom image, Discovery populate key values only when the primary OS disk details are available.
- For RHEL VMs, information is populated only for VMs that use Marketplace images.

Field	Description
Key value [cmdb_key_value]	
Key [key]	The key is one of the options: • Windows_OS_License_Type_automatic • RHEL_OS_License_Type_automatic • SQL_Server_License_Type_automatic
Value [value]	The value is one of the options: • BYOL • License Included
CI [ci]	Reference to the Virtual Machine Instance record.
Class	The Class is *Virtual Machine Instance*.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resources discovered by the Microsoft Azure WebSite (LP) pattern and Microsoft Azure WebSite pattern

Field	Description
Cloud Resource [cmdb_ci_cloud_webserver]	
Name [name]	The name of the Azure web server.
Object ID [object_id]	The ID of Azure web server.
IP Address [ip_address]	The IP address of the web server.
FQDN [fqdn]	The fully qualified domain name (FQDN) of the web server.
Vendor [vendor]	The vendor is Microsoft.
Install Status [install_status]	The install status of the web server.
State [state]	The operational state of the web server.
Operational Status [operational_status]	The operational status of the web server.
IP Address [cmdb_ci_ip_address]	
Name [name]	The IP address of the web server.
IP Address [ip_address]	The IP address of the web server.
FQDN [fqdn]	The fully qualified domain name (FQDN).
Vendor [vendor]	The vendor is Microsoft.
Install Status [install_status]	The install status.
Operational Status [operational_status]	The operational status.
Key Value [cmdb_key_value]	
Key [key]	The Azure Key Value name.
Value [value]	The Azure Key Value value.

Resources discovered using the Azure DataBase (LP) pattern

Cloud DataBase [cmdb_ci_cloud_database]

Field	Description
Fully qualified domain name [fqdn]	The FQDN that Microsoft Azure assigned to your database.
Name [name]	The name of the database that you created in Microsoft Azure.
Object ID [object_id]	The identification name of the database.
Operational Status [operational_status]	The operational status of the database.
Type [type]	The type of database you created.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud DataBase [cmdb_ci_cloud_database] (continued)

Field	Description
State [state]	The state of the database: Whether it's Available or Terminated.
Vendor [vendor]	The vendor name is Azure.
Version [version]	The version of the database.
Category [category]	The stock keeping unit (SKU) family.

Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Object ID [object_id]	A unique identifier for the hardware type.
Name [name]	Name for the hardware type.
vCPUs [vcpus]	Number of virtual CPU cores.
Provider [provider]	Provider for the hardware type: Azure.

IP Address [cmdb_ci_ip_address]

Field	Description
Netmask [netmask]	Netmask of the Azure database.

Resources discovered using the Azure DataBase (LP) pattern extension: Azure SQL Managed Instance license

Key value [cmdb_key_value]

Field	Description
Key [key]	SQL_Server_PaaS_Managed_Instance_License_Type_automatic
Value [value]	License type. The following maps the Azure portal license to ServiceNow values: • **Azure Hybrid Benefit**: BYOL • **Pay as you go**: License Included • **Hybrid Failover rights**: Hybrid Failover
Configuration item [configuration_item]	cmdb_ci_cloud_database

Serverless Hardware [cmdb_ci_serverless_hardware]

Field	Description
Object ID [object_id]	Object ID of the Azure cloud database.
Name [name]	SKU name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Serverless Hardware [cmdb_ci_serverless_hardware] (continued)

Field	Description
Cloud Vendor [cloud_vendor]	Cloud vendor of the serverless hardware: MS Azure.
CPU core count [cpu_core_count]	Number of virtual cores (vCores).
CPU core thread [cpu_core_thread]	Number of vCores.
CPU count [cpu_count]	Number of vCores.
Category [category]	vCore purchasing model.
Subcategory [subcategory]	SKU tier.
Host Type [host_type]	Host type: PaaS.

Resources discovered by the Azure - Marketplace LB (LP) pattern

Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product]

Field	Description
Name [name]	Name of the Cloud resource, usually the marketplace offering or SKU name.
Object ID [object_id]	A unique resource ID of the Cloud resource.
Resource Type [resource_type]	Service in Cloud Marketplace. For example: microsoft.compute/virtualmachines.
Plan Name [plan_name]	Billing or SKU plan for a resource from the Cloud Marketplace. For example: Pay as You Go.
Market [market]	International Organization for Standardization (ISO) code of the geographical market where the resource is sold in the specified market. For example: US or EU.
Organization Id [organization_id]	A unique identifier for the organization or publisher that owns the marketplace resource.

Marketplace Product Details [marketplace_product_details]

Field	Description
Product Code [product_code]	A unique product code of the resource within the Cloud Marketplace.
Publisher Name [publisher_name]	Organization or individual responsible for creating and offering the product or service.
Version [version]	Release number or iteration of the product.
Deployed On [deployed_on]	References the Deployed Marketplace Product [cmdb_ci_deployed_marketplace_product] table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Azure Key Value name.
Value [value]	Azure Key Value value.

Resources discovered by the Azure - Sub Account (LP) pattern extension: Azure Management Groups

Cloud Organizations [cmdb_ci_cloud_org]

Field	Description
Name [name]	Tenant ID or name. • Tenant ID: When using management-level credentials • Tenant name: When using tenant-level credentials
Object ID [object_id]	Tenant ID.
DNS Domain [dns_domain]	Domain name entered during registration. For example: `servicenow.com`. This field is only populated when using tenant-level credentials.

Azure Management Group [cmdb_ci_azure_management_group]

Field	Description
Name [name]	Management group name.
Object ID [object_id]	Management group name and tenant ID in the following format: `name+@+tenantId`. For example: `itomMgmtGroup@8bcff-vdc-btrv`.
Parent [parent]	References the direct parent Azure Management Group [cmdb_ci_azure_management_group] table.

CI relationships

Relationships discovered using the Microsoft Azure - Application LB (LP) pattern

CI	Relationship	CI
cmdb_ci_cloud_load_balancer	Owns::Owned by	cmdb_ci_cloud_lb_ipaddress

*Only references the direct parent-child management group relationship.

Events discovered by Discovery during horizontal discovery

Discovery uses patterns to find events created for Microsoft Azure components. If there are events that indicate the change of state in one of the Microsoft Azure components, it triggers the discovery of Microsoft Azure components using the patterns.

Patterns used for event discovery

Pattern	CI Class
Azure Application LB Event	Cloud Load Balancer [cmdb_ci_cloud_load_balancer]
Azure Availability Set Event	Availability Set [cmdb_ci_availability_set]

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Patterns used for event discovery (continued)

Pattern	CI Class
Azure Classic LB Event	Cloud Load Balancer [cmdb_ci_cloud_load_balancer]
Azure DataBase Event	Cloud DataBase [cmdb_ci_cloud_database]
Azure Express Route Circuit Event	Cloud Direct Connect [cmdb_ci_cloud_direct_connect]

Tag information collected by Discovery during horizontal discovery

When running the patterns, tag information is collected to populate the cmdb_key_value table. Each tag is related to a CI that was discovered during the discovery. Tag discovery is done in the extension section of each pattern.

Data collected by Service Mapping during tag-based discovery

Service Mapping uses tag-based discovery to create service instance maps including the Cloud components. The Service Mapping application comes with the following preconfigured CI relationships used for tag-based discovery. These CI relationships are available from the 1.0.68 release on the ServiceNow Store.

CI	Relationship	CI
Configuration Item [cmdb_ci]	Hosted on::Hosts	Logical Datacenter [cmdb_ci_logical_datacenter]
Logical Datacenter [cmdb_ci_logical_datacenter]	Hosted on::Hosts	Cloud Service Account [cmdb_ci_cloud_service_account]

Azure App Configuration store pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

The Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - App Configuration Configuration Store - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure App Configuration - Configuration Store [cmdb_azure_app_configuration_configuration_store]

Field	Description
Authentication Mode [authentication_mode]	The method or strategy used for authenticating access.
Disable Local Auth [disable_local_auth]	Indicates whether local authentication methods are disabled.
Enable Purge Protection [enable_purge_protection]	Indicates if purge protection is enabled for the resource.
Endpoint [endpoint]	The URL endpoint through which the service is accessed.
Key Vault Properties [key_vault_properties]	Properties related to the configuration of Key Vault services.
Location [location]	The Azure region where the resource is deployed.

Azure App Configuration - Configuration Store [cmdb_azure_app_configuration_configuration_store] (continued)

Field	Description
Object Id [object_id]	The unique identifier of the resource.
Private Link Delegation [private_link_delegation]	Configurations related to the delegation of private links.
Provisioning State [provisioning_state]	The current state of the resource provisioning process.
Resource Group [resource_group]	Name of the resource group.
SKU Name [sku_name]	The stock keeping unit (SKU) representing the pricing tier of the resource.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The unique identifier of the Azure Active Directory tenant.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

The Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - App Configuration Configuration Store - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The Azure region where the resource is deployed.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.appconfiguration/configurationstores**.

CI relationships

The pattern creates these relationships to support discovery.

Azure App Service - App Service Plan [cmdb_azure_app_service_app_service_plan]

Field	Description
Kind [kind]	The category or specialization of the resource, often specific to certain Azure services.
Location [location]	The Azure region where the resource is hosted.
Object Id [object_id]	The unique identifier for the resource.
Provisioning State [provisioning_state]	The current provision status of the resource.
Resource Group [resource_group]	Name of the resource group.
Status [status]	The operational status or health of the resource.
Subscription Id [subscription_id]	The subscription ID.
Tenant Id [tenant_id]	The identifier of the Azure Active Directory tenant associated with the resource.
Tier [tier]	The performance level or pricing tier assigned to the resource.
Configuration Item [configuration_item]	References the Cloud App Server [cmdb_ci_cloud_appserver] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - App Service App Service Plan - Extended Inventory(LP) pattern.

Cloud App Server [cmdb_ci_cloud_appserver]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The Azure region where the resource is hosted.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier for the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Type [type]	Type of resource. The value is set to **microsoft.web/serverfarms**.

CI relationships

The pattern creates these relationships to support discovery.

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Microsoft Azure Application Gateway discovery with Patterns

The ServiceNow Discovery application uses the Azure Application Gateway HD pattern for discovering this product, while the Service Mapping application discovers Application Gateway using the Azure Application Gateway TD (LBS) pattern. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Azure Principal credentials

On the ServiceNow platform, create a service account for cloud discovery. Set the account Id to the Azure Service Principal as it appears at the Microsoft Azure Console.

Privileges

On the Microsoft Azure Console, provide a user a user with the reader role.

Data collected by Discovery during horizontal discovery

Table and field	Additional information
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	
name	The name of the Azure Application Gateway.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Additional information
Fqdn	The fully qualified domain name of the Azure Application Gateway.
Object_id	The ID of the gateway.
Install_status	The install status of the of the Azure Application Gateway.
state	The state of the Azure Application Gateway.
Cloud LB IPAddress [cmdb_ci_cloud_lb_ipaddress]	
name	The IP address of the Azure Application Gateway.
Object_id	The ID of the Azure Application Gateway.
ipaddress _type	The type of the IP address, which can be private or public.
ip_address	The IP address of the Azure Application Gateway.
state	The state of the IP address of the Azure Application Gateway.
operational_state	The operational state of the IP address of the Azure Application Gateway.
install_status	The install status of the IP address of the Azure Application Gateway.
Load Balancer Service [cmdb_ci_lb_service]	
serial number	The ID of the Azure Application Gateway service.
port	The TCP port that the Azure Application Gateway service listens to.
name	The FQDN with the port number of the Azure Application Gateway service, following this syntax: <fqdn>:<port>.
ip_address	The IP address of the Azure Application Gateway on which the service runs.
object_id	The ID of the Azure Application Gateway service.
operational_state	The operational state of the Azure Application Gateway service.

Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Load Balancer [cmdb_ci_cloud_load_balancer]

Connections discovered by Service Mapping during the top-down discovery

Service Mapping performs the top-down discovery of the Azure Application Gateway in the context of application services. Service Mapping discovers the outgoing http connections from Azure Application Gateway service to pool members, such as virtual machines.

Azure Application Insight - Component [cmdb_azure_application_insight_component]

Field	Description
App ID [app_id]	The identifier for the application linked to this resource.
Application Type [application_type]	The type of application to which the resource is related.
Connection String [connection_string]	The string used to connect to the resource endpoint.
Instrumentation Key [instrumentation_key]	The key used for application insights to log telemetry data.
Kind [kind]	The specific subtype or variation of the resource.
Location [location]	The geographic region where the resource is deployed.
Object Id [object_id]	The unique identifier for the resource.
Provisioning State [provisioning_state]	The current provision status of the resource.
Resource Group [resource_group]	Name of the resource group.
Retention In Days [retention_in_days]	The number of days that logs or data are retained.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The directory tenant to which the resource belongs.
Version [version]	The version number of the resource or service.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Application Insight Component - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic region where the resource is deployed.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier for the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

Azure Automation Account [cmdb_azure_automation_automation_account]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure availability sets discovery using patterns

Discovery and Service Mapping Patterns uses the Azure - Availability Set (LP) pattern to discover Azure availability sets during horizontal discovery. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Availability Set (LP) pattern.

Availability Set [cmdb_ci_availability_set]

Field	Description
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Name [name]	The Name or ID if no Name is specified for the availability zone.
Install Status [install_status]	Resource provisioning status.

CI relationships

Discovery creates these relationships to support the Azure availability sets discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Availability Set [cmdb_ci_availability_set]
Azure Datacenter [cmdb_ci_azure_datacenter]	Contains::Contained by	Availability Set [cmdb_ci_availability_set]

Azure availability zones discovery using patterns

Discovery and Service Mapping Patterns uses the Azure - Availability Zones (LP) pattern to discover Azure availability zones during horizontal discovery. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - Availability Zones (LP) pattern.

Availability Zone [cmdb_ci_availability_zone]

Field	Description
Object ID [object_id]	Name of the availability zone in the following format: **{Location} + "-" + {ZoneNum}**.
Name [name]	Name of the availability zone in the following format: **{Location} + "-" + {ZoneNum}**.
Install Status [install_status]	Install status of the availability zone. Default value is Installed.

CI relationships

Discovery creates these relationships to support the Azure availability zone discovery.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Azure Datacenter [cmdb_ci_azure_datacenter]	Contains::Contained by	Availability Zone [cmdb_ci_availability_zone]

Azure Compute Gallery Image Definition pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Compute Gallery Image Definition - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Compute Gallery - Image Definition [cmdb_azure_compute_gallery_image_definition]

Field	Description
Architecture [architecture]	Central processing unit (CPU) architecture of the resource, such as x86 or ARM.
Hyper-V Generation [hyper_v_generation]	The Hyper-V generation version of the virtual machine.
Kind [kind]	The specific subcategory or variation type of the resource.
Location [location]	The geographical region where the resource is deployed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Compute Gallery - Image Definition [cmdb_azure_compute_gallery_image_definition] (continued)

Field	Description
Object Id [object_id]	The unique identifier of the resource.
OS Type [os_type]	The operating system type associated with the resource.
Provisioning State [provisioning_state]	Current provisioning status of the resource.
Resource Group [resource_group]	Name of the resource group.
SKU [sku]	The stock keeping unit (SKU) that defines the pricing tier of the resource.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The unique identifier for the Azure Active Directory tenant.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Compute Gallery Image Definition - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the resource is deployed.
Name [name]	The name given to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.compute/galleries/images**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Azure Compute Gallery - Image Definition [cmdb_azure_compute_gallery_image_definition]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Compute Snapshot pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Compute Snapshot - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Compute - Snapshot [cmdb_azure_compute_snapshot]

Field	Description
Disk State [disk_state]	The current state of the disk. For example: Attached or Unattached.
Encryption Type [encryption_type]	The encryption mechanism applied to the resource data. For example: EncryptionAtRestWithCustomerKey or EncryptionAtRestWithPlatformKey.
DC Location [location]	The geographic location where the resource is deployed.
Network Access Policy [network_access_policy]	The policy that governs network access to the resource.
Object Id [object_id]	A unique identifier for the queried resource.
OS Type [os_type]	The type of operating system associated with the resource.
Provisioning State [provisioning_state]	Current provisioning state of the resource. For example: Succeeded or Failed.
Public Network Access [public_network_access]	Indicates whether the resource can be accessed via the public network.
Resource Group [resource_group]	Name of the resource group.
SKU Tier [sku_tier]	The tier of the stock keeping unit (SKU) that determines resource performance and costs.
Subscription Id [subscription_id]	The subscription ID.
Tenant Id [tenant_id]	The unique identifier of the tenant owning the resource.
Type [type]	The type or category of the resource.
Configuration Item [configuration_item]	References the Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Compute Snapshot - Extended Inventory(LP) pattern.

Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]

Field	Description
Capacity [capacity]	The size of the disk in terms of storage capacity.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic location where the resource is deployed.
Name [name]	The name of the resource.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot] (continued)

Field	Description
Object ID [object_id]	A unique identifier for the queried resource in the following format: **/subscriptions/{subscriptionId}/resourceGroups/{resouceGroupName}/providers/Microsoft.Compute/snapshots/{snapshotName}**.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
State [state]	The current state of the disk. For example: Attached or Unattached.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]
Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Compute - Snapshot [cmdb_azure_compute_snapshot]	References	Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Container Registry pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Container Registry - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Container Registry [cmdb_azure_container_registry_registry]

Field	Description
Admin User Enabled [admin_user_enabled]	Indicates whether the administrator user account is enabled for the resource.
Encryption Status [encryption_status]	The current encryption status of the resource, specifying if data is encrypted.
Identity [identity]	The identity information for the resource, used for authentication and authorization.
Kind [kind]	The specific kind or subtype of the resource, if applicable.
Location [location]	The geographical region where the resource is deployed.
Object Id [object_id]	The unique identifier for the resource.
Provisioning State [provisioning_state]	The current provisioning state of the resource.
Public Network Access [public_network_access]	Indicates whether public network access is allowed for the resource.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The Azure Active Directory tenant ID associated with the resource.
Tier [tier]	The service or resource tier, indicating the level of performance or cost.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Container Registry - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the resource is deployed.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier for the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.containerregistry/registries**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Container Registry [cmdb_azure_container_registry]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Cosmos DB for PostgreSQL Cluster pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Cosmos DB for PostgreSQL Cluster - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Cosmos DB for PostgreSQL Cluster [cmdb_azure_cosmos_db_for_postgresql_cluster_cluster]

Field	Description
Object Id [object_id]	The unique identifier of the resource.
Kind [kind]	The specific kind or stock-keeping unit (SKU) of the resource.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the Azure resource group containing the resource.
Subscription Id [subscription_id]	The unique identifier for the Azure subscription.
Tenant Id [tenant_id]	The universally unique identifier (UUID) of the Azure Active Directory tenant associated with the resource.
Provisioning State [provisioning_state]	The current state of the provisioning process for the resource.
Configuration Item [configuration_item]	References the Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster] table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Cosmos DB for PostgreSQL Cluster - Extended Inventory(LP) pattern.

Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]

Field	Description
Name [name]	The name assigned to the resource.
Location [location]	The Azure region where the resource is deployed.
Cluster ID [cluster_id]	The unique identifier of the resource.
Cluster Status [cluster_status]	The current operational status of the cluster.
Cluster Version [cluster_version]	The version number of the cluster software.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Description [short_description]	Type of resource. The value is set to **microsoft.dbforpostgresql/servergroupsv2**.
Vendor [vendor]	Name of vendor: Microsoft.

CI relationships

The Azure - Cosmos DB for PostgreSQL Cluster - Extended Inventory(LP) pattern creates these relationships to support Azure Cosmos DB for PostgreSQL Cluster discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]
Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

Azure Data Explorer Cluster pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Data Explorer Cluster - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Data Explorer Cluster [cmdb_azure_data_explorer_clusters_data_explorer_clusters]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or stock-keeping unit (SKU) of the resource.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group that contains the resource.
Subscription Id [subscription_id]	The unique identifier of the Azure subscription.
Tenant Id [tenant_id]	The unique identifier of the Azure Active Directory tenant.
Provisioning State [provisioning_state]	The current provisioning state of the resource.
Configuration Item [configuration_item]	References the Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster] table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Data Explorer Cluster [cmdb_azure_data_explorer_clusters_data_explorer_clusters] (continued)

Field	Description
Enable Disk Encryption [enable_disk_encryption]	Specifies whether disk encryption is enabled on the resource.
Public Network Access [public_network_access]	Indicates if the resource is accessible over a public network.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Data Explorer Cluster - Extended Inventory(LP) pattern.

Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]

Field	Description
Name [name]	The name assigned to the Azure resource.
Location [location]	The Azure region where the resource is deployed.
Cluster ID [cluster_id]	The unique identifier of the Azure resource.
Cluster Status [cluster_status]	The current operational status of the Kusto cluster.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Description [short_description]	Type of resource. The value is set to **microsoft.kusto/clusters**.
Vendor [vendor]	Name of vendor: Microsoft.

CI relationships

The Azure - Data Explorer Cluster - Extended Inventory(LP) pattern creates these relationships to support Azure Data Explorer Cluster discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud DataBase Cluster [cmdb_ci_cloud_db_cluster]

Azure Data Factory [cmdb_azure_data_factory_data_factory] (continued)

Field	Description
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Public Network Access [public_network_access]	The status of public network accessibility for the resource.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The unique identifier of the tenant containing the resource.
Version [version]	The version of the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Data Factory - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical location where the resource is deployed.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.datafactory/factories**.
Description [short_description]	Description of the resource or service.
Version [version]	The version of the resource.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]

Azure Data Protection - Backup Vault [cmdb_azure_data_protection_backup_vault]

Field	Description
Kind [kind]	The type or category of the resource.
Location [location]	The geographic location where the resource is deployed.
Object Id [object_id]	The unique identifier for the resource.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The identifier of the Azure Active Directory tenant.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Data Protection Backup Vault - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic location where the resource is deployed.
Name [name]	The name given to the resource.
Object ID [object_id]	The unique identifier for the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.dataprotection/backupvaults**.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Databricks Workspace pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Databricks Workspace - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Databricks - Workspace [cmdb_azure_databricks_workspace]

Field	Description
Kind [kind]	The model or configuration type of the resource.
Location [location]	Geographical region where the resource is deployed.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current provisioning state of the resource.
Public Network Access [public_network_access]	Indicates whether public network access is enabled for the resource.
Resource Group [resource_group]	Name of the resource group.
SKU name [sku_name]	The stock keeping unit (SKU) that defines the resource's pricing tier.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The identifier for the Azure Active Directory tenant.
Workspace ID [workspace_id]	The unique identifier for the workspace associated with the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Databricks Workspace - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	Geographical region where the resource is deployed.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.databricks/workspaces**.

CI relationships

The pattern creates these relationships to support discovery.

Azure Dev Center [cmdb_azure_dev_centers_dev_center]

Field	Description
Object Id [object_id]	The unique resource identifier in Azure Resource Manager format.
Kind [kind]	The specific type or classification of the resource.
DC Location [location]	The Azure datacenter region where the resource is located.
Resource Group [resource_group]	The name of the Azure Resource Group containing the resource.
Subscription Id [subscription_id]	The unique identifier of the Azure subscription.
Tenant Id [tenant_id]	The unique identifier of the Azure Active Directory tenant.
Provisioning State [provisioning_state]	The current state of resource provisioning. For example: Succeeded or Failed.
Configuration Item [configuration_item]	References the Cloud App Server [cmdb_ci_cloud_appserver] table.
Dev Center URI [dev_center_uri]	The Uniform Resource Identifier (URI) endpoint for connecting to the Dev Center resource.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Dev Center - Extended Inventory(LP) pattern.

Cloud App Server [cmdb_ci_cloud_appserver]

Field	Description
Object ID [object_id]	The unique resource identifier in Azure Resource Manager format.
Name [name]	The name of the resource.
Type [type]	Type of resource. The value is set to **microsoft.devcenter/devcenters**.
Location [location]	The Azure datacenter region where the resource is located.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

CI relationships

The Azure - Dev Center - Extended Inventory(LP) pattern creates these relationships to support Azure Dev Center discovery.

Azure Disk Encryption Set [cmdb_azure_disk_encryption_set_disk_encryption_set]

Field	Description
Encryption Type [encryption_type]	The method used to encrypt the resource data.
Identity type [identity_type]	The classification of the identity assigned to the resource. For example: SystemAssigned or UserAssigned.
Key Url [key_url]	The URL where the encryption key is stored or accessible.
Location [location]	The geographic region where the resource is deployed.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current status of the resource provisioning process.
Resource Group [resource_group]	Name of the resource group.
Tenant Id [tenant_id]	The identifier for the tenant that owns the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Disk Encryption Set - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic region where the resource is deployed.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.compute/diskencryptionsets**.

CI relationships

The pattern creates these relationships to support discovery.

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure DNS zones and record sets discovery using Patterns

The Discovery and Service Mapping Patterns application uses the Azure - DNS Zones (LP) and Azure - DNS Zone Recordsets (LP) Patterns to discover Azure Domain Name System (DNS) definitions (zones and their respective record sets). Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about Azure DNS zones and record sets and their version that you can discovery, refer to Detailed information on products discovered by ITOM Visibility.

For more information on Azure cloud discovery, see Discovery for Microsoft Azure Cloud.

Prerequisites

Verify privileges

On the Microsoft Azure Console, provide a user with the API Management Service Reader role.

Create Azure Service Principal credentials

For more information see: Create Azure cloud credentials.

Configure Azure service account

For more information, see Set up a cloud account for Azure.

Create discovery schedule

Create a schedule for the relevant Azure service accounts. For more information, see Create a discovery schedule in Cloud Discovery Workspace.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Verify the REST API Permissions

Download the Cloud Discovery patterns spreadsheet so you can grant user permissions required for running the Discovery patterns. In addition to permissions, the spreadsheet also includes useful information such as pattern names, types, CI Classes, and links to vendor documentation. New patterns are available quarterly, so check periodically to be sure you have the latest version of the spreadsheet.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - DNS Zones (LP) and Azure - DNS Zone Recordsets (LP) Patterns.

Resources discovered by the Azure - DNS Zones (LP) pattern

DNS Zone [cmdb_ci_dns_zone]

Field	Description
Name [name]	The name of the DNS Zone.
Number Of RecordSets [number_of_recordsets]	The number of the recordsets defined within the DNS Zone.
Operational status [operational_status]	The operational status of the DNS Zone.
State [state]	The state of the DNS Zone.
Install Status [install_status]	The install status of the DNS Zone.
Comments [comments]	The field for general comments.

Resources discovered by the Azure - DNS Zone Recordsets (LP) pattern

DNS Alias [cmdb_ci_dns_alias]

Field	Description
Name [name]	The name of the DNS alias record.
IP Address [ip_address]	IP address of the DNS alias record.
Comments [comments]	Unique identifier for an Azure DNS zone combining service account ID, DNS zone name, and a fixed hash suffix.
Operational status [operational_status]	The operational status of the DNS alias record.

DNS Name [cmdb_ci_dns_name]

Field	Description
Name [name]	The name of the DNS Name record.
Operational status [operational_status]	The operational status of the DNS record.
Comments [comments]	Unique identifier for an Azure DNS zone combining service account ID, DNS zone name, and a fixed hash suffix.

Azure Event Grid - System Topic [cmdb_azure_event_grid_system_topic]

Field	Description
Kind [kind]	The specific kind or stock keeping unit (SKU) of the resource, detailing its capabilities or configuration.
Metric Resource Id [metric_resource_id]	The identifier used for accessing metrics related to the resource.
Object Id [object_id]	The unique identifier of the resource within Azure.
Provisioning State [provisioning_state]	The current status of the resource's provisioning process.
Resource Group [resource_group]	Name of the resource group.
Subscription Id [subscription_id]	The subscription ID.
Tenant Id [tenant_id]	The unique identifier for the Azure Active Directory tenant.
Topic Type [topic_type]	The category or type of the event topic.
Configuration Item [configuration_item]	References the Cloud Messaging Service [cmdb_ci_cloud_messaging_service] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Event Grid System Topic - Extended Inventory(LP) pattern.

Cloud Messaging Service [cmdb_ci_cloud_messaging_service]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the resource is hosted.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier of the resource within Azure.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Type [type]	Type of resource. The value is set to **microsoft.eventgrid/systemtopics**.

CI relationships

The pattern creates these relationships to support discovery.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Event Hub - Namespace [cmdb_azure_event_hub_namespace]

Field	Description
Kind [kind]	The nature or subtype of the resource, often describing its specific role or variation.
Location [location]	The geographical location where the resource is hosted.
Minimum TLS Version [minimum_tls_version]	The minimum Transport Layer Security (TLS) version required by the resource for secure connections.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current status of the resource provisioning process.
Public Network #ccess [public_network_access]	Indicates whether the resource can be accessed via the public network.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The identifier of the Azure Active Directory tenant.
Configuration Item [configuration_item]	References the Cloud Messaging Service [cmdb_ci_cloud_messaging_service] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Event Hub Namespace - Extended Inventory(LP) pattern.

Cloud Messaging Service [cmdb_ci_cloud_messaging_service]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical location where the resource is hosted.
Name [name]	The name given to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Type [type]	Type of resource. The value is set to **microsoft.eventhub/namespaces**.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Network Security Azure Firewall - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Network Security - Azure Firewall [cmdb_azure_network_security_azure_firewall]

Field	Description
Object Id [object_id]	The unique identifier of the resource.
Kind [kind]	The specific resource kind or sub-type (if applicable).
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the Azure Resource Group containing the resource.
Subscription Id [subscription_id]	The identifier of the Azure subscription hosting the resource.
Tenant Id [tenant_id]	The identifier for the Azure Active Directory tenant.
Provisioning State [provisioning_state]	The current lifecycle state of the resource. For example: Succeeded or Updating.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Firewall Policy [firewall_policy]	The identifier or reference to the firewall policy applied to the Azure Firewall resource.
Tier [tier]	The service or performance tier assigned to the resource.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Network Security Azure Firewall - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the resource.
Name [name]	The name assigned to the resource.
Location [location]	The Azure region where the resource is deployed.
Install Status [install_status]	Install status of the resource. Default value is Installed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Cloud Resource [cmdb_ci_cmp_resource] (continued)

Field	Description
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.network/azurefirewalls**.

CI relationships

The Azure - Network Security Azure Firewall - Extended Inventory(LP) pattern creates these relationships to support Azure Firewall Network Security discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Network Security - Azure Firewall [cmdb_azure_network_security_azure_firewall]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Microsoft Azure Functions discovery with Patterns

The Discovery and Service Mapping Patterns application uses the Azure - Functions (LP) and Azure - Functions TD Patterns to discover Azure Functions apps and map them in the context of application services. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Azure Functions detailed information

Detailed information on products discovered by ITOM Visibility

Azure service account

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Azure service account. For more information, see Set up a cloud account for Azure

Azure Principal credentials

On the ServiceNow AI Platform, create a service account for cloud discovery. Set the account Id to the Azure Service Principal as it appears at the Microsoft Azure Console. For more information see: Create Azure cloud credentials

Privileges

On the Microsoft Azure Console, provide a user with the API Management Service Reader role.

Run Azure Cloud discovery

For detailed information, see: Discovery for Microsoft Azure Cloud

Create discovery schedule

Create a discovery schedule in Cloud Discovery Workspace

Data collected by Discovery during horizontal discovery

Table and field	Description
Azure Function [cmdb_ci_cloud_function]	
name	The name of the Function app.
Object_id	The ID of the Function app.
ip_address	The IP Address of the Function app.
fqdn	The Fully Qualified Domain Name (FQDN) of the Function app.
code_location_url	The URL of the Function app source code.
app_function_state	The state of the Function app.
operational_status	The operational status of the Function app.
install_status	The installation status of the Function app.

CI relationships

These relationships are created to support Azure Functions discovery:

CI	Relationship	CI
Azure Functions [cmdb_ci_cloud_function]	Hosted on::Hosts	Azure datacenter [cmdb_ci_azure_datacenter]

Connections found by Service Mapping during top-down discovery

Service Mapping can discover the following connections:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Connections to the following databases: MSSql, MySql, MongoDB, and Documentum.
- HTTP connections belonging to Azure Functions environment, for example, https://scenario4-hop1-azure-function.azurewebsites.net.

Note:
Service Mapping does not scan java classes/jars and binary files for possible information about outgoing HTTP connections of Azure Functions. If java classes/jars and binary files are the only source of information about some outgoing HTTP connections, Service Mapping does not find such HTTP connections.

Azure Key Vault pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Key Vault - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Key Vault [cmdb_azure_key_vault_key_vault]

Field	Description
Kind [kind]	The specific form or variant of the resource type.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Key Vault [cmdb_azure_key_vault_key_vault] (continued)

Field	Description
Location [location]	The geographical location where the resource is hosted.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Public Network Access [public_network_access]	Indicates whether the resource is accessible over a public network.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Tenant ID [tenant_id]	The unique identifier of the Azure Active Directory tenant to which the resource belongs.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Key Vault - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical location where the resource is hosted.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.keyvault/vaults**.
Description [short_description]	Description of the resource or service.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Key Vault [cmdb_azure_key_vault_key_vault]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Log Analytics Workspace pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Log Analytics Workspace - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Log Analytics - Workspace [cmdb_azure_log_analytics_workspace]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or variant of the resource.
DC Location [location]	The geographical region where the resource is deployed.
Resource Group [resource_group]	The Azure resource group to which the resource belongs.
Subscription Id [subscription_id]	The unique identifier of the Azure subscription containing the resource.
Tenant Id [tenant_id]	The identifier of the Azure Active Directory tenant associated with the resource.
Provisioning State [provisioning_state]	The current lifecycle state of the resource. For example: Succeeded, Creating, or Failed.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Customer Id [customer_id]	The unique identifier of the Log Analytics workspace or customer instance.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Log Analytics Workspace - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the Azure resource.
Name [name]	The name of the resource.
Location [location]	The geographical region where the resource is deployed.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.operationalinsights/workspaces**.

CI relationships

The Azure - Log Analytics Workspace - Extended Inventory(LP) pattern creates these relationships to support Azure Log Analytics Workspace discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Logic App [cmdb_azure_logic_app_logic_app]

Field	Description
Access Endpoint [access_endpoint]	The endpoint URL used for accessing the resource.
Identity [identity]	The identity associated with the resource for access and security purposes.
Kind [kind]	The specific subcategory or variant of the resource.
Location [location]	The geographical region where the resource is deployed.
Object Id [object_id]	The unique identifier of the resource.
Provisioning State [provisioning_state]	The current provisioning state of the resource.
Resource Group [resource_group]	Name of the resource group.
State [state]	The overall current operational state of the resource.
Subscription Id [subscription_id]	The subscription ID.
Tenant Id [tenant_id]	The identifier of the tenant that owns the resource.
Type [type]	The type or category of the resource.
Configuration Item [configuration_item]	References the Cloud Function [cmdb_ci_cloud_function] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Logic App - Extended Inventory(LP) pattern.

Cloud Function [cmdb_ci_cloud_function]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the resource is deployed.
Name [name]	The name assigned to the resource.
Object ID [object_id]	The unique identifier of the resource in the following format: **/subscriptions/{subscriptionId}/resourceGroups/{resouceGroupName}/providers/Microsoft.logic/workflows/{workflowName}**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Function [cmdb_ci_cloud_function] (continued)

Field	Description
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

CI relationships

The pattern creates these relationships to support discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Function [cmdb_ci_cloud_function]
Cloud Function [cmdb_ci_cloud_function]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Logic App [cmdb_azure_logic_app_logic_app]	References	Cloud Function [cmdb_ci_cloud_function]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Managed Identity User Assigned Identity pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Managed Identity User Assigned Identity - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Managed Identity - User Assigned Identity [cmdb_azure_managed_identity_user_assigned_identity]

Field	Description
Client ID [client_id]	The unique identifier for an Azure Active Directory (Azure AD) application, also known as a client.
Location [location]	The geographical region where the resource is deployed.
Object Id [object_id]	The unique identifier of the resource.
Principal ID [principal_id]	The unique identifier of the principal service or user associated with the resource.
Resource Group [resource_group]	Name of the resource group.
Tenant ID [tenant_id]	The unique identifier of the Azure AD tenant.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Managed Identity User Assigned Identity - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical region where the resource is deployed.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.

Azure Recovery Services - Vault [cmdb_azure_recovery_services_vault]

Field	Description
Object Id [object_id]	The unique resource identifier for the Azure resource.
Kind [kind]	The resource kind, indicating its specific variant or implementation.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The Azure subscription ID under which the resource exists.
Tenant Id [tenant_id]	The Azure Active Directory tenant ID associated with the resource.
Provisioning State [provisioning_state]	The current provisioning state of the resource. For example: Succeeded, Failed, or Updating.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Recovery Services Vault - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique resource identifier for the Azure resource.
Name [name]	The name assigned to the resource.
Location [location]	The Azure region where the resource is deployed.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.recoveryservices/vaults**.

CI relationships

The Azure - Recovery Services Vault - Extended Inventory(LP) pattern creates these relationships to support Azure Recovery Services Vault discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Recovery Services - Vault [cmdb_azure_recovery_services_vault]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Recovery Services Vault Backup Item pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Recovery Services Vault Backup Item - Extended Inventory(LP) pattern.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Recovery Services - Vault Backup Item [cmdb_azure_recovery_services_vault_backup_item]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or sub-type of the resource.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The unique identifier of the Azure subscription.
Tenant Id [tenant_id]	The unique identifier of the Azure Active Directory tenant.
Backup Management Type [backup_management_type]	The method or platform by which backups are managed.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Last Backup Status [last_backup_status]	The result or outcome of the most recent backup operation.
Policy Name [policy_name]	The name of the backup policy associated with the resource.
Protection State [protection_state]	The operational state of backup protection on the resource.
Protection Status [protection_status]	The current protection status assigned to the resource.
Virtual Machine Id [virtual_machine_id]	The unique identifier of the associated virtual machine.
Workload Type [workload_type]	The type of workload or application being protected by the backup.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Recovery Services Vault Backup Item - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the Azure resource.
Name [name]	The name of the Azure resource.
Location [location]	The Azure region where the resource is deployed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Resource [cmdb_ci_cmp_resource] (continued)

Field	Description
Comments [comments]	The unique identifier of the backup vault associated with the resource.
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.recoveryservices/vaults/backupfabrics/protectioncontainers/protectedItems**.

CI relationships

The Azure - Recovery Services Vault Backup Item - Extended Inventory(LP) pattern creates these relationships to support Azure Recovery Services Vault Backup Item discovery.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Recovery Services - Vault Backup Item [cmdb_azure_recovery_services_vault_backup_item]	References	Cloud Resource [cmdb_ci_cmp_resource]

Microsoft Azure resource inventory discovery

The ServiceNow Discovery application uses the Azure Resource Inventory (LP) pattern to find resources available through Azure that don't have a dedicated pattern. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

You can discover up to 10 thousand resources using the Azure Resource Inventory (LP) pattern.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Azure service principal

Verify the Azure service principal is configured. For more information, see Discovery for Microsoft Azure Cloud

Privileges

For versions 1.3.0 and later:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the Microsoft Azure Console, provide a user with the API Management Service Reader role with permissions to run the following REST POST request:

`"https://management.<resource url>/providers/microsoft.resourcegraph/resources?api-version=2022-10-01"`

<resource url> – The URL varies based on the Azure account type, like "azure.com" or government site address.

For versions 1.0.99 and earlier:

On the Microsoft Azure Console, provide a user with the API Management Service Reader role with permissions to run the following REST GET request:

`"https://management.azure.com/subscriptions/<subscription id>/resources"`

Create a Cloud Discovery schedule

Create a schedule for the relevant Azure service account as described in Create schedules for discovering cloud resources in Cloud Discovery

Fine-tune Azure inventory discovery using the Resource Inclusion List

If your deployment has custom patterns for Azure discovery, ensure that you don't discover Azure resources twice.

Note:
Leaving the [pre_resource_whitelist] table empty causes the Pattern to populate all resources and it might cause performance issues.

1. Ensure that the application scope is Discovery and Service Mapping Patterns:
   a. Navigate to **Settings** > **Developer**.
   b. Select `Discovery and Service Mapping Patterns` from the **Application** list.
2. Navigate to **System Definitions** > **Tables**.
3. Open the Cloud Inventory Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table.
4. Under **Related Links**, click **Show List**.
5. Select resource types for which you have custom patterns, and select `Delete` from the **Actions on selected rows** list.

The Cloud Inventory Resource Inclusion List is predefined with common services. You can expand the inclusion list with additional resource types that you want the pattern to discover. The names of these resource types must conform to the appropriate vendor naming conventions.

Note:
When you modify the out-of-the-box inclusion list, it is no longer updated automatically in application updates. You must maintain the customized list on your own.

1. Open the Cloud Inventory Resource Inclusion List [sa_cloud_inventory_resource_whitelist] table.
2. Click **New**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the form, and then click **Submit**.

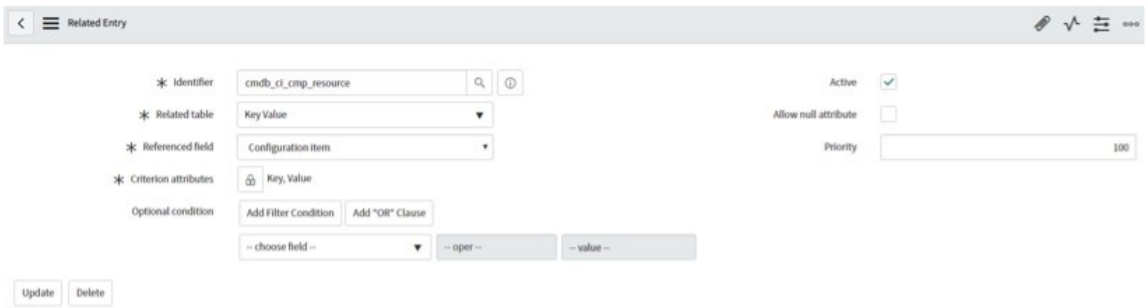
Field	Description
Cloud Vendor	The vendor of the resource type: Azure.
Resource Type	The Azure resource type value.
Application	The application scope: Discovery and Service Mapping Patterns.

The changes are applied the next time you run the pattern.

Modify the ServiceNow related entries

1. Navigate to **Related Entries**.
2. Click **New**.
3. For the identifier, enter **cmdb_ci_cmp_resource**.
4. For the related table, select **Key Value [cmdb_key_value]**.
5. For the referenced field, select **Configuration Item**.
6. For the criterion attributes, add **Key** and **Value**.

   You may need to click the lock icon to view and change the criterion attributes.



Data collected by Discovery during horizontal discovery

Table and field	Additional information
Cloud Resource [cmdb_ci_cmp_resource]	
Name	A descriptive name used to identify the Azure resource.
Resource type	The type of the resource, for example network, load balancer.
Object ID	The ID of the Azure resource.
Description	The text populated during discovery that specifies that this resource is available from Azure.
Key Value [cmdb_key_value]	
Key	The Azure tag key name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Additional information
Value	The Azure tag value name.

CI relationships

These relationships are created to support Azure resource inventory discovery:

CI	Relationship	CI
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on:Hosts	Azure datacenter [cmdb_ci_azure_datacenter]

Azure Service Bus - Namespace [cmdb_azure_service_bus_namespace]

Field	Description
Identity [identity]	The identity information associated with the resource, often used for authentication or access control.
Location [location]	The geographical location where the resource is hosted.
Object Id [object_id]	The unique identifier of the resource.
Resource Group [resource_group]	Name of the resource group.
Status [status]	The current status or state of the resource.
Subscription ID [subscription_id]	The subscription ID.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Service Bus Namespace - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographical location where the resource is hosted.
Name [name]	The name of the resource.
Object ID [object_id]	The unique identifier of the resource.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Resource type [resource_type]	Type of resource. The value is set to **microsoft.servicebus/namespaces**.
Description [short_description]	Description of the resource or service.

Azure Service Bus - Queue [cmdb_azure_service_bus_queue]

Field	Description
Enable Batched Operations [enable_batched_operations]	Indicates whether batched operations are enabled for the queue.
Enable Partitioning [enable_partitioning]	Indicates whether message partitioning is enabled for load distribution across multiple message brokers.
DC Location [location]	The geographic region where the Service Bus queue is deployed.
Max Message Size In KB [max_message_size_in_kb]	The maximum allowed size of a single message in kilobytes (KB).
Max Size In MB [max_size_in_mb]	The maximum storage size of the queue in megabytes (MB).
Object Id [object_id]	The unique identifier for the Service Bus queue.
Resource Group [resource_group]	Name of the resource group.
Subscription ID [subscription_id]	The subscription ID.
Status [status]	The current status of the Service Bus queue.
Configuration Item [configuration_item]	References the Cloud Messaging Service [cmdb_ci_cloud_messaging_service] table.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Service Bus Queue - Extended Inventory(LP) pattern.

Cloud Messaging Service [cmdb_ci_cloud_messaging_service]

Field	Description
Install Status [install_status]	Install status of the resource. Default value is Installed.
Location [location]	The geographic region where the Service Bus queue is deployed.
Name [name]	The name of the Service Bus queue.
Object ID [object_id]	The unique identifier for the Service Bus queue.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Type [type]	Type of resource. The value is set to **Microsoft.ServiceBus/namespaces/queues**.

Azure Service Endpoint Policy [cmdb_azure_service_endpoint_policy_service_endpoint_policy]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Kind [kind]	The specific kind or stock-keeping unit (SKU) of the resource.
DC Location [location]	The geographic region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The Globally Unique Identifier (GUID) of the subscription that owns the resource.
Tenant Id [tenant_id]	The GUID of the Azure AD tenant the resource belongs to.
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.

Azure Service Endpoint Policy Definition [cmdb_azure_service_endpoint_policy_definition]

Field	Description
Object Id [object_id]	The unique identifier of the Azure resource.
Name [name]	The name assigned to the resource.
Type [type]	Type of resource. The value is set to **microsoft.network/serviceendpointpolicies**.
Provisioning State [provisioning_state]	The current provisioning status of the resource.
Configuration Item [configuration_item]	References the Cloud Resource [cmdb_ci_cmp_resource] table.
Service [service]	The specific Azure service related to the resource.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Service Endpoint Policy - Extended Inventory(LP) pattern.

Cloud Resource [cmdb_ci_cmp_resource]

Field	Description
Object ID [object_id]	The unique identifier of the Azure resource.
Name [name]	The name assigned to the resource.

© 2025 ServiceNow, Inc. All rights reserved.

Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Cloud Resource [cmdb_ci_cmp_resource]
Cloud Resource [cmdb_ci_cmp_resource]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Service Endpoint Policy [cmdb_azure_service_endpoint_policy_service_endpoint_policy]	References	Cloud Resource [cmdb_ci_cmp_resource]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Virtual Machine Scale Sets (VMSS) Instance discovery

The Discovery and Service Mapping Patterns application uses the Azure - VM Scale Set (LP) and the Azure VM Instance - Uniform Scale Set patterns to find Azure Virtual Machine Scale Sets (VMSS). Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

VMSS let you create and manage a group of load balanced virtual machines (VMs). The number of VM instances can automatically increase or decrease in response to demand or a defined schedule. There Uniform Orchestration modes Flexible and achieve.

- VMSS with Flexible Orchestration achieves high availability at scale with identical or multiple virtual machine types. With Flexible orchestration, Azure provides a unified experience across the Azure VM ecosystem.
- VMSS with Uniform Orchestration optimized for large-scale stateless workloads with identical instances. VMSS with Uniform orchestration use a virtual machine profile or template to scale up to desired capacity. While there is some ability to manage or customize individual virtual machine instances, Uniform uses identical VM instances.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about VMSS and their versions that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

Prerequisites

Verify the Azure discovery prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Azure - VM Scale Set (LP) Pattern.

Instance Scale Set [cmdb_ci_instance_scale_set]

Field	Description
Install Status [install_status]	Install status of the instance scale set. Default value is Installed.
State [state]	Provisioning state of the instance scale set. Possible values are Available or Terminated.
Object ID [object_id]	A unique identifier for the instance scale set.
Name [name]	Name of the instance scale set.

Discovery populates the data in the CMDB when running the Azure VM Instance - Uniform Scale Set pattern.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Network adapters [nics]	Number of Network Interface Cards (NICs) attached to the virtual machine (VM) instance.
State [state]	Current state of the instance. For example: On, Off, or Terminated.
Install Status [install_status]	Install status of the instance. Default value is Installed.

Virtual Machine Instance [cmdb_ci_vm_instance] (continued)

Field	Description
Operational status [operational_status]	Operational status of the instance. Default value is Operational.
Disks [disks]	Number of disks attached to the instance.
Disks size (GB) [disk_size]	Total storage capacity of all disks attached to the VM, in gigabytes (GB).

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	Name or ID for the storage volume.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Install Status [install_status]	Install status of the storage volume. Default value is Installed.
Operational status [operational_status]	Operational status of the storage volume. Default value is Operational.

Cloud Mgmt Network Interface [cmdb_ci_nic]

Field	Description
Name [name]	Name or ID for the network interface.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Install Status [install_status]	Install status of the network interface. Default status is Installed.
Operational status [operational_status]	Operational status of the network interface. Default status is Operational.

VNIC Endpoint [cmdb_ci_endpoint_vnic]

Field	Description
Name [name]	Name or ID for the endpoint.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.

Image [cmdb_ci_os_template]

Field	Description
Name [name]	Name or ID for the image.
Object ID [object_id]	A unique identifier, allocated by Microsoft Azure for this resource.
Install Status [install_status]	Install status of the image. Default value is Installed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Image [cmdb_ci_os_template] (continued)

Field	Description
Operational status [operational_status]	Operational status of the image. Default value is operational.

Note:
When using the Image [cmdb_ci_os_template] table to store Cloud OS Images, you may notice an unusually large number of records. To avoid this issue, you can store the discovered OS images in the Cloud Image [cmdb_ci_cloud_os_image] table. For more information, see Enable Cloud OS Image discovery.

Hardware Type [cmdb_ci_compute_template]

Field	Description
Name [name]	Name of the hardware type.

Note:
Under certain circumstances, you may notice an unusually large number of records in the Hardware Type [cmdb_ci_compute_template] table. In such cases, you can store the discovered hardware types in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table. For more information, see Enable the Cloud Hardware Type class extension.

CI relationships

Discovery creates these relationships to support the VMSS discovery, when running the Azure - VM Scale Set (LP) pattern.

CI	Relationship	CI
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Instance Scale Set [cmdb_ci_instance_scale_set]

Tags discovery

Both the Azure - VM Scale Set (LP) and the Azure VM Instance - Uniform Scale Set patterns collect tags and populate them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

Azure Web Application Firewall Policy pattern-based discovery

Discovery and Service Mapping Patterns finds Azure services on your cloud environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Pattern-based discovery and mapping requirements

Verify the Microsoft Azure discovery prerequisites

For more information, see the prerequisites section in Microsoft Azure Cloud components discovery using patterns.

Enable the relevant pattern

The pattern for this service is disabled by default. Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value. For more information on enabling patterns, see Activate a disabled pattern.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure the Discovery schedule to support GovCloud

Discovering Azure GovCloud (US) accounts requires using a datacenter URL when setting up an Azure service account. For more information, see Set up Azure service accounts.

Discovery and Service Mapping Patterns application populates data in both CMDB and non-CMDB tables.

Data stored in non-CMDB tables

Discovery and Service Mapping Patterns application populates data in the non-CMDB table when running the Azure - Web Application Firewall Policy - Extended Inventory(LP) pattern.

You can review the non-CMDB Azure tables by navigating to **All** > **Configuration** > **Azure**. You can also search the navigation filter for the specific pattern name.

Azure Web Application Firewall - Policy [cmdb_azure_web_application_firewall_policy]

Field	Description
Object Id [object_id]	The unique identifier of the resource.
Kind [kind]	The specific kind or variant of the resource.
DC Location [location]	The Azure region where the resource is deployed.
Resource Group [resource_group]	The name of the resource group containing the resource.
Subscription Id [subscription_id]	The subscription ID associated with the resource.
Tenant Id [tenant_id]	The Azure Active Directory tenant ID associated with the resource.
Provisioning State [provisioning_state]	The latest provisioning status of the resource.
Configuration Item [configuration_item]	References the Web ACL [cmdb_ci_web_acl] table.
Policy State [policy_state]	The current state of the policy applied to the resource.

Data stored in CMDB tables

Discovery and Service Mapping Patterns application populates data in the CMDB when running the Azure - Web Application Firewall Policy - Extended Inventory(LP) pattern.

Web ACL [cmdb_ci_web_acl]

Field	Description
Object ID [object_id]	The unique identifier of the resource.
Name [name]	The name of the resource.
Location [location]	The Azure region where the resource is deployed.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Web ACL [cmdb_ci_web_acl] (continued)

Field	Description
Default Action [default_action]	Indicates the effective operation mode of the web application firewall (WAF) policy. Possible values are allow and detect. • allow: policy is running in **Prevention** mode and is blocking traffic • detect: policy is running in **Detection** mode and is logging only
Install Status [install_status]	Install status of the resource. Default value is Installed.
Operational status [operational_status]	Operational status of the resource. Default value is Operational.
Description [short_description]	Type of resource. The value is set to **microsoft.network/applicationgatewaywebapplicationfirewallpolicies**.

CI relationships

The Azure - Web Application Firewall Policy - Extended Inventory(LP) pattern creates these relationships to support Azure Web Application Firewall Policy discovery.

CI	Relationship	CI
Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	Protected by::Protects	Web ACL [cmdb_ci_web_acl]
Resource Group [cmdb_ci_resource_group]	Contains::Contained by	Web ACL [cmdb_ci_web_acl]
Web ACL [cmdb_ci_web_acl]	Hosted on::Hosts	Azure Datacenter [cmdb_ci_azure_datacenter]
Azure Web Application Firewall - Policy [cmdb_azure_web_application_firewall_policy]	References	Web ACL [cmdb_ci_web_acl]

Azure tag discovery

The pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	Tag name.
Value [value]	Tag value.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Microsoft Certificate Authority (CA) certificates discovery

The ServiceNow Discovery application can discover Microsoft Certificate Authority (CA) certificates using the Microsoft CA - Certificate Management pattern. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Starting with version 1.27.0, Discovery and Service Mapping Patterns supports discovering the subject alternative name (SAN) for both the all request IDs and the template ID discovery methods.

Prerequisites

Verify the following applications are up to date

- Discovery and Service Mapping Patterns
- CMDB CI Class Models

Verify the certificate Authority process

Ensure that the CA process is up and running on the host machine.

Verify previous Windows discovery

Verify a Windows host was discovered during a previous horizontal discovery. For more information, see Windows discovery.

Create a serverless discovery schedule

Create a discovery schedule to perform targeted discovery of Microsoft CA certificates using the host on which the CA process is running. For more information, see Create a serverless schedule for Microsoft Certificate Authority (CA) discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Microsoft CA - Certificate Management pattern.

Unique Certificate [cmdb_ci_certificate]

Field	Description
Fingerprint [fingerprint]	Hash value of the certificate.
Fingerprint algorithm [fingerprint_algorithm]	Algorithm used to hash the certificate.
Subject common name [subject_common_name]	Identifies the host name/domain associated with the certificate, listed in the certificate's **Subject** field.
Subject distinguished name [subject_distinguished_name]	Identifying information of the subject listed in the certificate's **Subject** field.
Issuer distinguished name [issuer_distinguished_name]	Distinguished name of the issuer.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unique Certificate [cmdb_ci_certificate] (continued)

Field	Description
Comments [comments]	Includes a readable description for users.
Renewal tracking [renewal_tracking]	Indicates whether to create any priority 1 or priority 3 tasks for the expiring certificates.
Certificate Template [cert_template]	Certificate template that defines the policies and rules that a CA uses when a request for a certificate is received.
Certificate ThumbPrint [thumb_print]	Unique identifier for certificates in applications when making trust decisions, in configuration files, and when displayed in interfaces.
Issuer common name [issuer_common_name]	Common name of the issuer.
Valid from [valid_from]	Validity start period of the certificate.
Serial Number [serial_number]	Serial number of the certificate.
Subject country [subject_country]	Two-letter country code in the certificate's **Subject** field.
Subject organization [subject_organization]	Organization listed in the certificate's **Subject** field.
Issuer [issuer]	Entity that signed and issued the certificate.
Subject organizational unit [subject_organizational_unit]	Organizational unit listed in the certificate's **Subject** field..
Subject alternative name [subject_alternative_name]	List of fully qualified domain names secured by the certificate, listed in the certificate's **Subject** field.
Valid to [valid_to]	Validity end period of the certificate.
Name [name]	Name of the CI.
State [state]	Life-cycle state of the certificate. For example: Installed, Issued, or Revoked.
Root issuer [root_issuer]	Root entity that signed and issued the immediate certificate.
Subject locality [subject_locality]	Locality listed in the certificate's **Subject** field.
Subject state [subject_state]	State listed in the certificate's **Subject** field.
Operational status [operational_status]	Indicates whether the certificate is valid or was revoked. Possible values are: • **Operational**: Valid certificate • **Non-Operational**: Revoked certificate
Signature algorithm [signature_algorithm]	Signature algorithm of the certificate. For example: SHA-256, sha256RSA, or SHA1withRSA.
Request Type [request_type]	Format used for requesting the certificate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Unique Certificate [cmdb_ci_certificate] (continued)

Field	Description
Request Submission Date [request_submission_date]	Date that the certificate request was submitted.
Request Resolution Date [request_resolution_date]	Date that the certificate request was resolved by the CA.
Request Revocation Date [request_revocation_date]	Date that the certificate was revoked. This field is populated only for revoked certificates.
Effective Revocation Date [effective_revocation_date]	Date that the certificate was effectively revoked by being added to the Certificate Revocation List (CRL). This field is populated only for revoked certificates.
Revocation Reason [revocation_reason]	Reason for the certificate's revocation. This field is populated only for revoked certificates.
Requester Name [requester_name]	Name of the person who requested the certificate.
Template Enrollment Flags [template_enrollment_flags]	Information about the certificate that needs to be acted on by the CA or the certificate's owner. For more information, search for the error code in the official Microsoft documentation site.

CI relationships

The Microsoft CA - Certificate Management pattern doesn't create any CI relationships.

Create a serverless schedule for Microsoft Certificate Authority (CA) discovery

Create a serverless discovery schedule to discover Microsoft Certificate Authority (CA) certificates.

Before you begin

- Verify that the CA process is up and running on the host machine.
- Verify that a Windows host was discovered during a previous horizontal discovery. For more information, see Windows discovery.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Discovery Schedules**.
2. Create the discovery schedule record.
   a. Select **New**.
   b. On the form, fill in the fields.

Discovery Schedule New record form

Field	Description
Name	Unique name for this discovery schedule.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	For example: Discover MS CA.
Discover	Scan type, which should be Certificates.
Certificate Discovery Type	Certificate type, which should be CA Trust Discovery.
MID server	Name of the MID Server to use for this schedule.
Active	Enables this schedule for discovery.

c. Select **Submit**.

3. Create the execution pattern.

a. In the Discovery Schedules page, select the record you created.

b. In the **Serverless Execution Patterns** tab, select **New**.

Discovery uses each execution pattern to discover up to 20,000 certificates. For deployments using more than 20,000 certificates, create several execution patterns.

c. On the form, fill in the fields.

Serverless Execution Pattern New record form

Field	Description
Name	Descriptive name for this record. For example: Discover MS CA.
Pattern	Pattern to be used for this schedule, which should be the Microsoft CA - Certificate Management pattern.
Proxy Host	CI name of the Windows host running the Microsoft CA Service, discovered in a previous discovery and populated in the CMDB.
Active	Option to enable this schedule for discovery.

d. Select **Submit**.

4. Set the pattern launcher parameters.

a. In the **Discovery Pattern Launcher Parameters** tab, select the record you created.

b. On the form, fill in the fields.

Parameter	Description
template_list	Determines whether to search on all the request IDs or a template ID to discover certificates.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Parameter	Description
	▪ all: Restricts discovery to all certificate request IDs in ascending order either based on the default execution pattern limitation of 20,000 or values set in *start_offset* or *limit*. ▪ Template ID: Searches for certificates only in the specific template ID.
start_offset	This optional parameter specifies the number of the certificate from which to start discovery and is relevant only when *template_list* is set to all and for deployments with over 20,000 certificates. If you create multiple serverless execution patterns for deployments with over 20,000 certificates, use 1 for the first execution, 20001 for the second, and so on. If this parameter remains empty, *start_offset* defaults to 1.
limit	This optional parameter limits the certificate discovery to the specified value and is relevant only when *template_list* is set to all. If the parameter remains empty, the limit defaults to 20,000 certificates.
ip	IP of the server on which the CA process (certsrv) is running.
discover_SAN_for_template	When set to true, this optional parameter enables the discovery of the subject alternative name (SAN) of the certificates when a template ID is provided in the *template_list* parameter. This parameter executes separate commands for each certificate within the template ID, which could impact performance. When searching on all request IDs, SAN is automatically discovered, so this parameter should remain empty.

c. Select **Submit**.

What to do next

Either execute discovery immediately by selecting **Discover now** or wait until the predefined schedule triggers the discovery.

Microsoft Certificate Authority (CA) certificates discovery

NetApp SolidFire storage system discovery

ServiceNow Discovery uses the NetApp SolidFire storage system discovery pattern to find clusters and nodes on the SolidFire storage system. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Discovery and Service Mapping Patterns store app

Verify the Discovery and Service Mapping Patterns store app (version 1.0.74) is installed.

Basic Auth permissions

Ensure Basic Auth credentials are configured for authenticating the Element API calls. Save the following SolidFire Cluster Admin credentials as Basic Auth credentials to ensure proper access:

- read
- clusterAdmins
- reporting
- drives

MID server

Ensure the MID server can access the target device.

Discovery credentials

Ensure you have the credentials for running Discovery on the host machine running the SolidFire storage system.

Create a serverless discovery schedule

Create a discovery schedule to perform targeted discovery of SolidFire clusters and nodes.

1. Navigate to **Discovery** > **Discovery Schedules**.
2. Click **New** and then fill in the form.

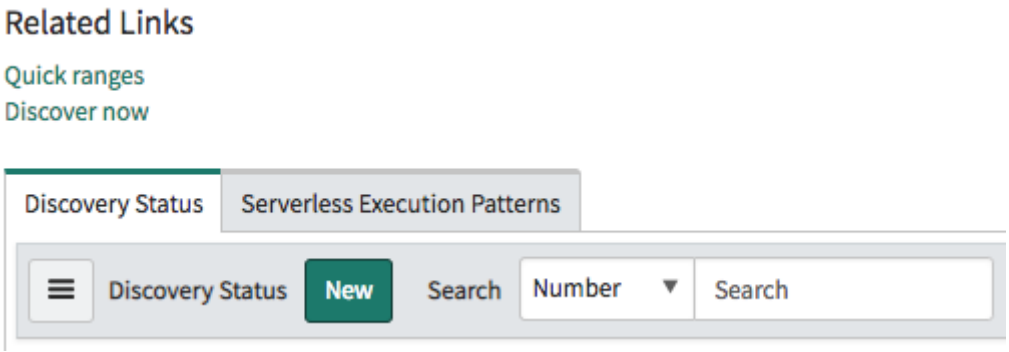
Discovery Schedule form

Field	Description
Name	Name for the Discovery schedule. For example, `Discover SolidFire`.
Discover	Discover type. Select **Serverless**.
MID Server	Name of the MID Server.
Active	Option for enabling this schedule for discovery. Select this check box to enable discovery.

3. Right-click the header of the Discovery Schedule form and select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Click the **Serverless Execution Patterns** tab, click **New**, and then fill in the form.



Serverless Execution Pattern form

Field	Description
Name	Name for this Serverless Execution Pattern. For example, `SolidFire Storage Pattern`.
Pattern	Name of the pattern to run: NetApp SolidFire Storage System.
Proxy Host	Fully qualified domain name of the machine on which you are installing the proxy server. Specify **Global**.
Active	Option for enabling this schedule for discovery. Select this check box to enable discovery.

5. Under **Discovery Pattern Launcher Parameters**, configure the launch parameters with the relevant values. Ensure the Management IP of the cluster and Credentials Alias are defined.

Data collected by Discovery during horizontal discovery

The discovered SolidFire configuration data includes the following tables and fields.

Table and field	Description
Main Configuration Item [cmdb_ci_storage_server]	
name	The name of the CI.
serial_number	The serial number associated with the CI.
firmware_version	The firmware version of the CI.
ip_address	The IP address of the CI.
short_description	A short textual description of the CI.
manufacturer	The device manufacturer.
model_id	The device model ID.
os_version	The version of the OS running on the CI.
os	The OS running on the CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Storage cluster [cmdb_ci_storage_cluster]	
ip_address	The IP address of the storage cluster.
manufacturer	The device manufacturer.
short_description	A short textual description of the CI.
cluster_version	Element OS API version running on the cluster.
name	The name of the CI.
Storage cluster node [cmdb_ci_storage_cluster_node]	
name	The name of the CI.
operational_status	Indicates if the device is in active state.
cluster	Reference for the cluster CI.
Storage node element [cmdb_ci_storage_node_element]	
short_description	A short textual description of the CI.
manufacturer	The device manufacturer.
serial_number	The serial number associated with the CI.
model_id	The device model ID.
chassis_type	The type of chassis that contains the server.
ram	The memory size of the CI.
cpu_type	The CPU type.
cpu_manufacturer	The CPU manufacturer.
Storage disk [cmdb_ci_disk]	
name	The name of the CI.
device_id	The ID of the device.
serial_number	The serial number associated with the CI.
storage_type	The storage type.
size_bytes	The available storage size in bytes.
manufacturer	The device manufacturer.
model_id	The device model ID.
computer	Reference for the storage server.
Network adapter [cmdb_ci_network_adapter]	
name	The name of the CI.
ip_address	The IP address of the CI.
netmask	The netmask of the server hosting the network adapter.
mac_address	The MAC address of the network adapter.
IP address [cmdb_ci_ip_address]	
ip_address	The IP address of the CI.

Network router discovery using patterns

The Discovery and Service Mapping Patterns application uses the Network Router pattern to find network routers in your environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about network routers and their versions that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

For information on probe-based network switch and router discovery, see Network switch and router discovery.

Prerequisites

Verify that the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Verify IP address information

The router must contain IP address information for successful discovery.

Verify that exit interface routing rules are configured and reachable

The router that provides the IP address must have exit interface routing rules configured and be reachable for successful discovery.

Create SNMP credentials

Create SNMP Community Credentials or SNMPv3 credentials. For more information, see SNMP credentials.

Configure properties for router discovery

Navigate to `sys_properties.list` and verify that the *`glide.discovery.L3_mapping`* system property is set to **true**.

You can configure these additional properties for network router discovery.

Property	Description
glide.discovery.max_concurrent_invocations_per_schedule	Sets a maximum number of scheduled invocations for the same Discovery schedule. It prevents a backlog of scheduled runs if Discovery does not finish before the next one starts. The value is an integer that represents the max number of automated invocations that can run concurrently for the same schedule. If the limit is reached, subsequent

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	scheduled invocations are canceled. A value of 0 or any negative number disables this property. • **Type:** integer • **Default value:** 3 • **Location: Discovery Definition** > **Properties** **Note:** This property does not apply to schedules that have a 'Run after' configuration set to 'Even if canceled'.
glide.discovery.bgp_router_disable	Disables running the SNMP – Routing pattern when discovering a router running the BGP protocol. If you must populate the Device Neighbors [discovery_device_neighbors] table during horizontal layer 2 discovery of the BGP-enabled devices, set the **BGP router exploration disable** property to **No**. Notice that enabling this property can cause performance issues including out-of-memory issues on the MID Server. • **Type:** true | false • **Default value:** true • **Location: Discovery Definition** > **Properties**

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Network Router pattern.

IP Router [cmdb_ci_ip_router]

Field	Description
Name [name]	Name of the router.
Model ID [model_id]	Hardware model ID of the router.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

IP Router [cmdb_ci_ip_router] (continued)

Field	Description
Manufacturer [manufacturer]	Router manufacturer.
Serial number [serial_number]	Unique hardware serial number of the router.
IP Address [ip_address]	IP addresses assigned to interfaces.
Description [short_description]	Device description.
Can route IP [can_route]	Indicates whether the IP pockets can be routed between networks. Possible values are true or false.
Can partition VLANs [can_partitionvlans]	Indicates whether the local area network (LAN) can be partitioned. Possible values are true or false.
Can switch IP [can_switch]	Indicates whether a network device has Layer 2 switching capabilities. Possible values are true or false.
Physical interface count [physical_interface_count]	Number of physical interfaces.
Ports [ports]	Individual network interface (physical or logical) used to connect devices such as computers, servers, access points, or uplinks to switches or routers.
Discovery Protocol ID [discovery_proto_id]	Unique identifier of the device participating in the Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) protocol.
Discovery Protocol Type [discovery_proto_type]	Protocol type. Possible values are CDP or LLDP.

IP Address [cmdb_ci_ip_address]

Field	Description
IP Address [ip_address]	IP address of the router.
Netmask [netmask]	Netmask of the router.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Name of the network adapter.
IP Address [ip_address]	IP address of the network adapter.
Netmask [netmask]	Netmask of the network adapter.
MAC Address [mac_address]	MAC address of the network adapter.
Alias [alias]	User-assigned name for the network adapter.
Configuration Item [cmdb_ci]	References the IP Router [cmdb_ci_ip_router] table.

Network switch discovery using patterns

The Discovery and Service Mapping Patterns application uses the Network Switch pattern to find network switches in your environment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about network switches and their versions that you can discover, refer to Detailed information on products discovered by ITOM Visibility.

For information on probe-based network switch and router discovery, see Network switch and router discovery.

Prerequisites

Verify that the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Verify IP address information

The switch must contain IP address information for successful discovery.

Verify that exit interface routing rules are configured and reachable

The switch that provides the IP address must have exit interface routing rules configured and be reachable for successful discovery.

Create SNMP credentials

Create SNMP Community Credentials or SNMPv3 credentials. For more information, see SNMP credentials.

Configure properties for switch discovery

Navigate to `sys_properties.list` and verify that the *`glide.discovery.L3_mapping`* system property is set to **true**.

You can configure these additional properties for network switch discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
glide.discovery.max_concurrent_invocations_per_schedule	Sets a maximum number of scheduled invocations for the same Discovery schedule. It prevents a backlog of scheduled runs if Discovery does not finish before the next one starts. The value is an integer that represents the max number of automated invocations that can run concurrently for the same schedule. If the limit is reached, subsequent scheduled invocations are canceled. A value of 0 or any negative number disables this property. • **Type:** integer • **Default value:** 3 • **Location: Discovery Definition** > **Properties** **Note:** This property does not apply to schedules that have a 'Run after' configuration set to 'Even if canceled'.
glide.discovery.bgp_router_disable	Disables running the SNMP – Routing pattern when discovering a router running the BGP protocol. If you must populate the Device Neighbors [discovery_device_neighbors] table during horizontal layer 2 discovery of the BGP-enabled devices, set the **BGP router exploration disable** property to **No**. Notice that enabling this property can cause performance issues including out-of-memory issues on the MID Server.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type:** true | false • **Default value:** true • **Location: Discovery Definition** > **Properties**

Discovering stacked switches

Network switch discovery supports Cisco stacked switches. Multiple switches in the stack are identified by the primary IP address. Discovery identifies each member of the stack by elements such as the primary IP address, a name associated with the switch, and the stack mode. The relationship is created between a primary switch and the secondary switches.

The primary switch has all the fields listed in the IP Switch [cmdb_ci_ip_switch] table. The secondary switch has name, serial_number, model_id, manufacturer, stack, and stack_mode.

Note:
If all ports on a switch are open for port 161, the switch has an IP per port, but the same serial number is used across all ports. The configuration item (CI) identification is based on the serial number, therefore, discovery updates the existing record every time instead of creating a new one.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Network Switch pattern.

IP Switch [cmdb_ci_ip_switch]

Field	Description
Name [name]	Name of the switch.
Model ID [model_id]	Hardware model ID of the switch.
Manufacturer [manufacturer]	Switch manufacturer.
Install Status [install_status]	Install status of the device. Default value is Installed.
Serial number [serial_number]	Unique hardware serial number of the router.
IP Address [ip_address]	IP addresses assigned to interfaces.
Description [short_description]	Device description.
Can route IP [can_route]	Indicates whether the IP pockets can be routed between networks. Possible values are true or false.
Can partition VLANs [can_partitionvlans]	Indicates whether the local area network (LAN) can be partitioned. Possible values are true or false.
Can switch IP [can_switch]	Indicates whether a network device has Layer 2 switching capabilities. Possible values are true or false.

IP Switch [cmdb_ci_ip_switch] (continued)

Field	Description
Physical interface count [physical_interface_count]	Number of physical interfaces.
Ports [ports]	Individual network interface (physical or logical) used to connect devices such as computers, servers, access points, or uplinks to switches or routers.
Discovery Protocol ID [discovery_proto_id]	Unique identifier of the device participating in the Cisco Discovery Protocol (CDP) or Link Layer Discovery Protocol (LLDP) protocol.
Discovery Protocol Type [discovery_proto_type]	Protocol type. Possible values are CDP or LLDP.
Stack [stack]	Indicates whether a network device is part of a stacked group of switches operating as one unit. Possible values are true or false.
Stack Mode [stack_mode]	Stacking architecture or role of a network device within a stack. For example: standalone, stack_master, or stack_member.
Location [location]	Location where the switch is installed.

IP Address [cmdb_ci_ip_address]

Field	Description
IP Address [ip_address]	IP address of the network switch.
Netmask [netmask]	Netmask of the network switch.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Name of the network adapter.
IP Address [ip_address]	IP address of the network adapter.
Netmask [netmask]	Netmask of the network adapter.
MAC Address [mac_address]	MAC address of the network adapter.
Alias [alias]	User-assigned name for the network adapter.
Configuration Item [cmdb_ci]	References the IP Switch [cmdb_ci_ip_switch] table.

DNS Name [cmdb_ci_dns_name]

Field	Description
Name [name]	Name of the Domain Name System (DNS).
IP Address [ip_address]	IP address of the DNS.

CI relationships

Discovery creates these relationships to support the network switch discovery.

Nutanix Acropolis discovery

The ServiceNow Discovery application uses the Nutanix Components pattern to find components of the Nutanix Acropolis solution containing Nutanix Prism Central version 2024.3.1.8 or Nutanix Prism Element 7.0.1.6. The Nutanix VM Event pattern finds events created for virtual machines (VMs) in the Nutanix deployment. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The Nutanix Components pattern uses REST APIs to collect information about the Acropolis deployment components.

The Nutanix VM Event pattern runs every five minutes. If there are events that indicate the change of state in one of the Nutanix components, it triggers rediscovery of Nutanix components using the Nutanix Components Pattern.

Starting with version 1.29.0, Discovery and Service Mapping Patterns supports Nutanix v4 discovery. When you switch to v4, Discovery creates new pool and container records, while existing records stop being updated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the following applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content
- CMDB CI Class Models

Verify MID Server requirements

Deploy and connect a dedicated MID Server with network access to Prism Element and Prism Central.

To discover events related to VMs in the Nutanix deployment, set the MID Server capability to **All** or to **Nutanix**.

Install Nutanix end-point SSL certificates for the MID Server JRE

1. Collect the certificates by browsing the Nutanix Prism console on internet Explorer.
2. Add SSL certificates for the MID Server, as described in Add SSL certificates for the MID Server.
3. Use the following JRE keytool command to import the SSL certificates in the MID Server's keystore: `<MID Installation>/jre/bin/keytool -import -v -keystore <MID Installation>jre/lib/security/cacerts`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If you must enter a password, enter the custom password or the default password- "changeit".

4. Install Nutanix end-point SSL certificates for the MID Server JRE.

Verify API permissions for v1-3

Verify that the user has read-only access to the following API requests:

- `/PrismGateway/services/rest/v1/vms`
- `/PrismGateway/services/rest/v1/storage_pools`
- `/PrismGateway/services/rest/v2.0/tasks/list`
- `/PrismGateway/services/rest/v2.0/hosts`
- `/PrismGateway/services/rest/v2.0/clusters`
- `/PrismGateway/services/rest/v2.0/vms`
- `/PrismGateway/services/rest/v2.0/storage_containers`
- `/api/nutanix/v3/clusters/list`
- `/api/nutanix/v3/categories/list`
- `/api/nutanix/v3/categories/{category_keys}/list`
- `/api/nutanix/v3/category/query`

Verify API permissions for v4

Verify that the user has read-only access to the following GET APIs. Note that the API call referencing `/PrismGateway/services/rest/v1/vms` uses a legacy endpoint because it's not available yet in the newer API.

- `/api/clustermgmt/v4/config/clusters`
- `/api/clustermgmt/v4/config/clusters/{clusters_ID}/hosts`
- `/api/clustermgmt/v4/config/storage-containers`
- `/api/vmm/v4/ahv/config/vms`
- `/PrismGateway/services/rest/v1/vms`
- `/api/prism/v4/config/categories?$expand=associations`
- `/api/prism/v4/config/categories/{categories_ID}?$limit=extId&$expand=detailedAssociations`

Verify Prism Central version for v4 API

Ensure that Prism Central is at least version 7.3 to use the v4 API.

Set MID Server property to discover v4

Enable Nutanix v4 discovery by setting MID Server property value to the exact v4 version. For more information, see Enable Nutanix v4 discovery.

Configure basic authentication credentials

For more information, see Basic authentication credentials.

Create a serverless discovery schedule

Create a discovery schedule to perform targeted discovery of Nutanix components. For more information, see Create a serverless schedule for Nutanix Acropolis discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Link Nutanix components to ESX clusters

The Nutanix Components pattern can discover Nutanix components hosted on ESX clusters, like storage pools, storage containers, and Controller Virtual Machine (CVM), but not ESX clusters themselves. Run VMware probe discovery before the Nutanix pattern discovery to link the Nutanix components to their ESX clusters. If you don't, the Nutanix components are linked to Nutanix Prism instead. For more information on VMware probe discovery, see Discovery for VMware virtualization.

(Optional) Disable CI tag discovery

The Nutanix Components pattern discovers tags for Nutanix hosts and virtual machines. If you have dozens of tags in your deployment, it might slow down the discovery causing performance issues. You can disable the CI tag discovery by performing the following steps:

1. Navigate to **Pattern Designer** > **Discovery Patterns**.
2. Select the **Nutanix Components** pattern.
3. Under **Extension Section**, select the check box for **Categories (Tags)** and select **Remove**.
4. Select **Save**.

Adjust the batch size for removing redundant relationship data

The *sn_itom_pattern.nutanix_relations_deletion_batch_size* property sets the batch size for deleting relations between Nutanix Virtual Machine Instance and Nutanix Host. The default value is 1000; you can adjust this batch size as needed.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Nutanix Components pattern.

Note:
API v4 calls might retrieve or populate different values compared to v1-3. For more information, search the Nutanix documentation for the "API Reference v4 Introduction" article.

Nutanix Controller VM [cmdb_ci_nutanix_controller_vm]

Field	Description
Name [name]	The name of the Nutanix Controller VM.
VM ID [vm_id]	The universally unique identifier (UUID) of the Nutanix Controller VM.
Object ID [object_id]	The ID of the Nutanix Controller VM.
Memory (MB) [memory]	The memory size of the Nutanix Controller VM in Megabytes (MB).
State [state]	The power state of the Nutanix Controller VM (on/off).
Hypervisor Type [hypervisor_type]	The type of the hypervisor used for the Nutanix Controller VM.
Description [short_description]	The description defined for the virtual machine in the Nutanix console: Prism Central or Prism Element.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Cluster [cmdb_ci_nutanix_cluster]

Field	Description
Name [name]	The name of the Nutanix Cluster.
IP Address [ip_address]	The IP address of the Nutanix Cluster.
Cluster ID [cluster_id]	The ID of the Nutanix Cluster.
Object ID [object_id]	The object ID of the Nutanix Cluster.
Version [version]	The Nutanix Cluster version.
Full Version [full_version]	The full version of the Nutanix Cluster.
Internal Subnet [internal_subnet]	The subnet of the internal IP address of the Nutanix Cluster.
External Subnet [external_subnet]	The subnet of the external IP address of the Nutanix Cluster.
Timezone [timezone]	The time zone of the Nutanix Cluster.
Hypervisor Types [hypervisor_types]	The type of the hypervisor used for the Nutanix Cluster.
NTP Servers [ntp_servers]	The Network Time Protocol (NTP) servers that are related to the Nutanix Cluster.
Number of Nodes [num_nodes]	The number of nodes connected to the Nutanix Cluster.
NCC Version [ncc_version]	The Nutanix Cluster Check (NCC) version.
Block Serial Numbers [block_serial_numbers]	The serial numbers of blocks of data connected to the Nutanix Cluster.

Nutanix Host [cmdb_ci_nutanix_host]

Field	Description
Name [name]	The name of the Nutanix host.
Object ID [object_id]	The ID of the Nutanix host.
CPU core count [cpu_core_count]	The number of Nutanix host cores.
CPU core thread [cpu_core_thread]	The number of threads of the Nutanix host.
CPU speed (MHz) [cpu_speed]	The CPU speed of the Nutanix host in MHz.
CPU count [cpu_count]	The number of CPU sockets of the Nutanix host.
RAM (MB) [ram]	The memory of the host in Megabites (MB).
Serial number [serial_number]	Serial number of the Nutanix host. This field is not applicable for v4.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]

Field	Description
Name [name]	• v1-3: The name of the Nutanix storage pool. • v4: Cluster name.
Pool ID [pool_id]	• v1-3: The UUID of the Nutanix storage pool. • v4: The external ID (extId) of the pool retrieved from the Nutanix Storage Container.
Object ID [object_id]	• v1-3: The ID of the Nutanix storage pool. • v4: The external ID (extId) of the pool retrieved from the Nutanix Storage Container.
Size [size]	The size of the Nutanix storage pool. This field is not applicable for v4.

Nutanix Storage Container [cmdb_ci_nutanix_storage_container]

Field	Description
Object ID [object_id]	The ID of the Nutanix container.
Container ID [container_id]	The UUID of the Nutanix container.
Name [name]	The name of the Nutanix container.
Replication Factor [replication_factor]	The number of copies created for the data stored on this Nutanix storage container.
Deduplication [deduplication]	The deduplication is enabled or disabled for the Nutanix container.
Compression [compression]	The compression is enabled or disabled for the Nutanix container.
Erasure Code [erasure_code]	The erasure of code is enabled or disabled for the Nutanix container.
Size [size]	The Nutanix container size calculated dynamically during discovery.

Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance]

Field	Description
Name [name]	The name of the Nutanix Controller VM.
VM Instance ID [vm_inst_id]	The universally unique identifier (UUID) of the Nutanix Controller VM.
Object ID [object_id]	The ID of the Nutanix Controller VM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Nutanix Virtual Machine Instance [cmdb_ci_nutanix_vm_instance] (continued)

Field	Description
CPUs [cpus]	The number of CPUs that the VM has.
Memory (MB) [memory]	The memory size of the Nutanix Controller VM in Megabytes (MB).
State [state]	The power state of the Nutanix Controller VM (on/off).
Description [short_description]	The description defined for the virtual machine in the Nutanix console: Prism Central or Prism Element.

Nutanix Prism Central [cmdb_ci_nutanix_prism_central]

Field	Description

Name [name]	The name of the Nutanix Prism Central multi-cluster manager.
	• **PrismCentral@<IP_ADDRESS>**: When the IP address is associated with the Prism Central instance, in the following scenarios:
	  ○ During quick discovery using HTTP classification.
	  ○ During serverless discovery if IP address was entered in **PRISM_Address** parameter value.
	• **PrismCentral@<DNS_NAME>**: When the DNS name is associated with the Prism Central instance and was entered in **PRISM_Address** parameter value during serverless discovery.

Object ID [object_id]	The ID of the Nutanix Prism Central. This field has the same value as the **Name** field.
	• **PrismCentral@<IP_ADDRESS>**: When the IP address is associated with the Prism Central instance, in the following scenarios:
	  ○ During quick discovery using HTTP classification.
	  ○ During serverless discovery if IP address was entered in **PRISM_Address** parameter value.
	• **PrismCentral@<DNS_NAME>**: When the DNS name is associated with the Prism Central instance and was entered in **PRISM_Address** parameter value during serverless discovery.

CI	Relationship	CI
Nutanix Controller VM [cmdb_ci_nutanix_controller_vm]	Hosted on::Hosts	Nutanix Prism Central [cmdb_ci_nutanix_prism_central]
Nutanix Storage Pool [cmdb_ci_nutanix_storage_pool]	Hosted on::Hosts	Nutanix Prism Central [cmdb_ci_nutanix_prism_central]

Tag discovery

The Nutanix Components pattern collects tags and populates them in the Key Value [cmdb_key_value] table.

Key Value [cmdb_key_value]

Field	Description
Key [key]	The category key.
Value [value]	The category value.
Configuration item [configuration_item]	References the Nutanix Host [cmdb_ci_nutanix_host] table.

Dashboard

The dashboard contains reports that query the Configuration Management Database (CMDB) and display the results. The information is displayed only after the pattern has discovered the infrastructure.

To display the dashboard, navigate to **Self-Service** > **Dashboards** > **All** > **Nutanix**.

After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** and use the enhanced dashboard.

Create a serverless schedule for Nutanix Acropolis discovery

Create a serverless schedule to discover Nutanix Acropolis using REST API.

Before you begin

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery** > **Discovery Schedules**.
2. Create the discovery schedule record.
   a. Select **New**.
   b. On the form, fill in the fields.

Discovery Schedule New record form

Field	Description
Name	Unique name for this discovery schedule.
Discover	Scan type, which should be Serverless.
MID server	Name of the MID Server with access to the Nutanix environment.
Active	Enables this schedule for discovery.
Run	Determines the run schedule of the discovery.

   c. Select **Submit**.
3. Create the execution pattern.
   a. In the Discovery Schedules page, select the record you created.
   b. In the **Serverless Execution Patterns** tab, select **New**.
   c. On the form, fill in the fields.

Serverless Execution Pattern New record form

Field	Description
Name	Descriptive name for this record.
Pattern	Pattern to be used for this schedule, which should be Nutanix Components.
Proxy Host	Fully qualified domain name (FQDN) of the machine where the proxy server is installed, which should be Global. This field is optional.
Active	Enables this schedule for discovery.

   d. Select **Submit**.
4. Set the pattern launcher parameters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. In the **Discovery Pattern Launcher Parameters** tab, select the record you created.

b. On the form, fill in the fields.

Parameter	Value
PRISM_Address	IP Address or the FQDN associated with the Prism Central instance.

c. Select **Submit**.

What to do next

Either execute discovery immediately by selecting **Discover now** or wait until the predefined schedule triggers the discovery.

Related topics

Nutanix Acropolis discovery

Enable Nutanix v4 discovery

Enable Nutanix v4 discovery by setting the MID Server property value to the exact v4 version.

Before you begin

Verify that you have Discovery and Service Mapping Patterns installed (starting with version 1.29.0).

Role required: discovery_admin

Procedure

1. Navigate to **All** > **MID Server** > **Properties**.
2. In the **Name** column, search for the `sn_itom_pattern.nutanix_prism_version` property.
3. Select the **sn_itom_pattern.nutanix_prism_version** property.
4. In the **Value** field, enter the exact v4 version to discover.
   For example: `v4.0.b1`.
5. Select **Update**.

NVIDIA GPU discovery using patterns

The Discovery and Service Mapping Patterns application uses the Linux Server pattern extension **Discover Nvidia GPU** to find NVIDIA graphics processing units (GPUs). Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The Discover Nvidia GPU pattern is an extension of the Linux Server pattern. For more information, see Linux discovery.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the following applications are up to date

- Discovery and Service Mapping Patterns
- CMDB CI Class Models

Verify permissions for the following SSH command

Verify that you have **read access** permission for the SSH command: `nvidia-smi -q`.

Create SSH credentials

For more information, see SSH credentials.

Schedule a horizontal discovery

For more information, see Schedule a horizontal discovery.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Discover Nvidia GPU Pattern.

Graphics Processing Unit [cmdb_ci_gpu]

Field	Description
Name [name]	Model name of the GPU.
Manufacturer [manufacturer]	Vendor of the GPU.
Model ID [model_id]	Product name of the GPU.
Serial number [serial_number]	Serial number of the GPU.

Additionally, Discovery populates the data in a non-CMDB table when running the Discover Nvidia GPU Pattern.

GPU Details [gpu_details]

Field	Description
Board ID [board_id]	Identifier for the GPU board, which can be used for diagnostic purposes.
Board Part Number [board_part_number]	The part number of the GPU board.
Bus ID [bus_id]	Identifier for the peripheral component interconnect (PCI) bus on which the GPU is located.
CUDA Version [cuda_version]	Version of the CUDA Toolkit supported by the installed NVIDIA driver.
Driver version [driver_version]	Version of the NVIDIA driver installed on the system.
GSP Firmware Version [gsp_firmware_version]	Version of the GPU System Processor (GSP) firmware.
Index [index]	Index number of the GPU as reported by the system.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

GPU Details [gpu_details] (continued)

Field	Description
Inforom ECC [inforom_ecc]	Version of the error-correcting code (ECC) used to record data in the InfoROM.
Inforom IMG [inforom_img]	Global version of the infoROM image.
Inforom OEM [inforom_oem]	Version of the original equipment manufacturer (OEM) configuration data in the InfoROM.
Inforom PWR [inforom_pwr]	Version of the power management data in the InfoROM.
Memory Free Usage [memory_free_usage]	Amount of GPU memory currently free.
Memory Total Usage [memory_total_usage]	Total amount of GPU memory installed.
Memory Used Usage [memory_used_usage]	Amount of GPU memory currently in use.
Name [name]	Official product name of the GPU.
PCIE Current Link [pcie_current_link]	Current peripheral component interconnect express (PCIe) link generation.
Performance State [performance_state]	Power and performance levels of the GPU. Possible values run from P0 to P15, with lower numbers indicating higher performance.
Persistence Mode Status [persistence_mode_status]	Indicates whether persistence mode is enabled for the GPU. Possible values are Enabled or Disabled.
Serial Number [serial_number]	Serial number of the GPU.
UUID [uuid]	Universally unique identifier (UUID) of the GPU.
Vbios Version [vbios_version]	Basic Input/Output System (BIOS) of the GPU board.

CI relationships

Discovery creates these relationships to support the NVIDIA GPU discovery.

CI	Relationship	CI
Graphics Processing Unit [cmdb_ci_gpu]	Used by::Uses	Linux Server [cmdb_ci_linux_server]

OpenStack resource discovery

The ServiceNow Discovery application uses OpenStack resource discovery patterns to find OpenStack resources through REST API calls. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses OpenStack resource discovery patterns to run horizontal discovery.

Starting with the Discovery and Service Mapping Patterns August 2024 store release, OpenStack resource discovery patterns support both private and public cloud discovery.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

OpenStack requirements

- In the OpenStack Identity service catalog, find the access URL that is used as the OpenStack identity service endpoint. For example: https://<openstack dns>:<port>.
- Configure an OpenStack user with permissions to generate a project scope token. Setting Domain ID, User Name, Project Name, and Password values is required for generating a token.

MID Server requirements

Deploy and connect a dedicated MID Server for cloud discovery.

The dedicated MID Server must have access to OpenStack and an open port for each OpenStack service to be discovered.

Credentials

On the ServiceNow AI Platform, create OpenStack credentials for the ServiceNow cloud service account. Enter the Domain ID, User Name, Project Name, and Password values you've configured in OpenStack requirements. For more information, see Create and test your credentials.

Service account

On the ServiceNow AI Platform, configure a ServiceNow cloud service account using the created OpenStack credentials and the OpenStack datacenter details. In the **Account Id** field, provide the Project ID of the OpenStack Project to be discovered.

Create a discovery schedule

For more information, see Create a discovery schedule in Cloud Discovery Workspace.

Create an automatic discovery schedule for OpenStack service accounts—for private cloud only

Create an automatic serverless discovery schedule for OpenStack service accounts using the OpenStack - Discover Service Accounts pattern. For more information, see the Auto Cloud discovery schedule for Open stack [KB1638685] article in the Now Support Knowledge Base.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the OpenStack resource discovery patterns.

Virtual Machine Instance [cmdb_ci_vm_instance]

Field	Description
Object ID [object_id]	Server UUID.
Name [name]	Server name.
Status [status]	Server status.
Description [short_description]	(Optional) Server description.
CPUs [cpus]	Number of virtual CPUs (vCPUs) from the Flavor that the VM instance is provisioned with.
Disks [disks]	Number of all managed volumes by Cinder that are returned from the VM instance.
Disks size (GB) [disk_size]	Total amount of all managed volumes by Cinder that are used by the VM instance measured in gigabytes (GB).
Memory (MB) [memory]	The **ram** value from the Flavor that the VM instance is provisioned with, measured in megabytes (MB).
Network adapters [nics]	Number of unique interfaces configured in the VM instance.
State [state]	Mapped status value returned for the VM instance. The OpenStack Server statuses and their related ServiceNow **State** values are: • ACTIVE: on • RESCUED: on • PAUSED: paused • SUSPENDED: off • STOPPED: off • SOFT_DELETED: terminated • HARD_DELETED: terminated • RESIZED: off • ERROR: error • INITIALIZED: starting For any **status** value not listed, the default value is off.

Cloud Key Pairs [cmdb_ci_cloud_key_pair]

Field	Description
Object ID [object_id]	Keypair UUID.
Name [name]	Keypair name that is used to reference it.
Finger print [finger_print]	Keypair fingerprint.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Load Balancer [cmdb_ci_cloud_load_balancer]

Field	Description
Object ID [object_id]	Load balancer ID.
Name [name]	Human-readable resource name.
Description [short_description]	(Optional) Human-readable resource description.
Install Status [install_status]	Resource provisioning status.
Operational Status [operational_status]	Resource operational status.

Load Balancer Listener [cmdb_ci_lb_listener]

Field	Description
Object ID [object_id]	Listener ID.
Name [name]	Human-readable name of the resource.
Install Status [install_status]	Provisioning status of the resource.
Listener Protocol [listener_protocol]	Protocol for the resource. One of HTTP, HTTPS, TCP, TERMINATED_HTTPS, or UDP.
Listener Port [listener_port]	Protocol port number for the resource.
Operational status [operational_status]	Resource operational status.
Description [short_description]	(Optional) Human-readable resource description.

Load Balancer Pool [cmdb_ci_lb_pool]

Field	Description
Object ID [object_id]	Pool ID.
Name [name]	Human-readable resource name.
Install Status [install_status]	Resource provisioning status.
Operational Status [operational_status]	Resource operational status.
Description [short_description]	(Optional) Human-readable resource description.
Load Balancing Method [load_balancing_method]	Load balancing algorithm for the pool. One of these values: LEAST_CONNECTIONS, ROUND_ROBIN, SOURCE_IP, or SOURCE_IP_PORT.

Load Balancer Pool Member [cmdb_ci_lb_pool_member]

Field	Description
Object ID [object_id]	Pool member ID.
Name [name]	Human-readable resource name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Load Balancer Pool Member [cmdb_ci_lb_pool_member] (continued)

Field	Description
Install Status [install_status]	Resource provisioning status.
IP address [ip_address]	Back-end member server IP address.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Object ID [object_id]	Volume UUID.
Name [name]	Volume name.
Status [status]	Volume status.
Description [short_description]	(Optional) Human-readable description.
Storage type [storage_type]	Associated volume type.

Storage Volume Snapshot [cmdb_ci_storage_vol_snapshot]

Field	Description
Object ID [object_id]	Volume UUID.
Name [name]	Volume name.
Status [status]	Volume status.
Description [short_description]	(Optional) Human-readable description.

Image [cmdb_ci_os_template]

Field	Description
Object ID [object_id]	User-defined image UUID.
Name [name]	Image name. The value can be null (the JSON Null data type).
Status [status]	Image status.

Cloud Network [cmdb_ci_network]

Field	Description
Object ID [object_id]	Network ID.
Name [name]	Human-readable network name.
Operational Status [operational_status]	Network status. Possible values: ACTIVE, DOWN, BUILD, or ERROR.
Description [short_description]	(Optional) Human-readable description.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Subnet [cmdb_ci_cloud_subnet]

Field	Description
Object ID [object_id]	Subnet ID.
Name [name]	Human-readable resource name.
DHCP enabled [is_dhcp_enabled]	Whether DHCP is enabled or disabled for the subnet.
Description [short_description]	(Optional) Human-readable description.

Compute Security Group [cmdb_ci_compute_security_group]

Field	Description
Object ID [object_id]	Security group ID.
Name [name]	Human-readable resource name.
Description [short_description]	(Optional) Human-readable description.

Security Group Rule [cmdb_ci_compute_security_group_rule]

Field	Description
Name [name]	This field has the same value as the object_id field.
Object ID [object_id]	Security group rule ID.
Description [short_description]	(Optional) Human-readable description.
Ethertype [ethertype]	Ethertype. Must be IPv4 or IPv6. Addresses represented in CIDR must match the ingress or egress rules.
Port range max [port_range_max]	The last port of the range to which the rule applies. This value is the maximum port number in the range that is matched by the security group rule. • If the protocol is TCP, UDP, DCCP, SCTP or UDP-Lite, this value must be greater than or equal to the port_range_min attribute value. • If the protocol is ICMP, this value must be an ICMP code.
Port range min [port_range_min]	The first port of the range to which the rule applies. This value is the minimum port number in the range that is matched by the security group rule. • If the protocol is TCP, UDP, DCCP, SCTP or UDP-Lite, this value must be less than or equal to the port_range_max attribute value. • If the protocol is ICMP, this value must be an ICMP type.

OpenStack Domain [cmdb_ci_cloud_openstack_domain]

Field	Description
Object ID [object_id]	Domain ID.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OpenStack Domain [cmdb_ci_cloud_openstack_domain] (continued)

Field	Description
Name [name]	Domain name.
Description [short_description]	(Optional) Human-readable description.
Enabled [enabled]	Defines whether the domain is enabled or disabled. • True - The domain is enabled. • False - The domain is disabled.

OpenStack Service [cmdb_ci_cloud_openstack_service]

Field	Description
Object ID [object_id]	Service ID.
Name [name]	Service name.
Description [short_description]	(Optional) Human-readable description.
Type [type]	Service type. Describes the API implemented by the service. Possible values: Compute, ec2, identity, image, network, or volume.
Catalog enabled [enabled]	Defines whether the service and its endpoints appear in the service catalog. • True - The service and its endpoints appear in the service catalog. • False - The service and its endpoints do not appear in the service catalog.

OpenStack Endpoint [cmdb_ci_cloud_openstack_endpoint]

Field	Description
Object ID [object_id]	Endpoint ID.
Name [name]	Service name.
Interface [interface]	Interface type that describes the visibility of the endpoint. Possible values: • Public - Visible by end users on a publicly available network interface. • Internal - Visible by end users on an unmetered internal network interface. • Admin - Visible by administrative users on a secure network interface.
Catalog enabled [enabled]	Defines whether the service and its endpoints appear in the service catalog.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

OpenStack Endpoint [cmdb_ci_cloud_openstack_endpoint] (continued)

Field	Description
	• True - The service and its endpoints appear in the service catalog. • False - The service and its endpoints do not appear in the service catalog.

Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Name [name]	The **name** field of OpenStack Flavor.
Object ID [object_id]	The **id** field of OpenStack Flavor.
vCPUs [vcpus]	The **vcpus** field of OpenStack Flavor.
Memory MB [memory_mb]	The **ram** field of OpenStack Flavor.
Local Storage GB [local_storage_gb]	The **disk** field of OpenStack Flavor.

The discovered data includes the OpenStack Hypervisor View [cmdb_ci_openstack_hypervisor_view] table and its fields for private cloud only.

OpenStack Hypervisor View [cmdb_ci_openstack_hypervisor_view] table fields

Field	Description
Name [name]	Concatenated value of **hypervisor_type** and **hypervisor_hostname** fields. For example: QEMU@host.acmecorp.com.
IP Address [ip_address]	The value of **host_ip** field.
Hypervisor technology [hypervisor_technology]	The value of **hypervisor_type** field.
Object ID [object_id]	The value of **id** field.
State [state]	The value of **state** field.
Version [version]	The value of **hypervisor_version** field.

The Dependency Views map shows all discovered OpenStack resources in your organization that are available through REST API calls and the relationships between them.

Oracle Catalog discovery

The Discovery and Service Mapping Patterns application uses the **Get Catalog info** pattern extension of the Oracle DB on Unix and Oracle DB on Windows patterns to find Oracle Catalog objects. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses the Oracle DB on Unix and Oracle DB on Windows patterns and the Get Catalog info pattern extension to run horizontal discovery.

You can use this pattern on the ServiceNow AI Platform® using the Madrid release or later.

For information on Oracle database discovery, see Oracle database discovery.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

Provide a user with permissions to run queries on ALL_TABLES

Provide a user with permissions to run queries on ALL_TABLES.

To view other users' tables in ALL_TABLES, a user must have any of the following permissions:

- Object-level privileges, for example: SELECT.
- Higher-level role, for example: SELECT ANY TABLE.

Configure applicative credentials

Configure applicative credentials for the Oracle instance [cmdb_ci_db_ora_instance] CI type. For more information, see Applicative credentials.

Configure Windows credentials for Windows operating system (OS)

For more information, see Windows credentials.

Configure UNIX credentials for UNIX OS

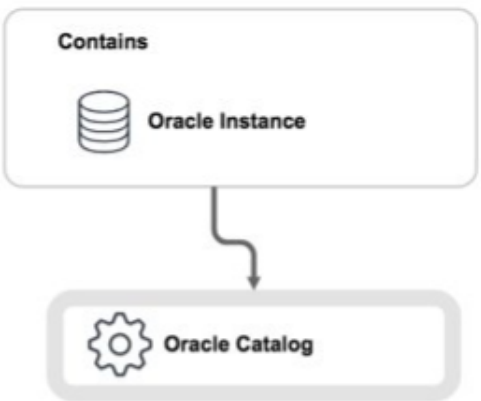
For more information, see SSH credentials.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Get Catalog info Pattern extension.

Table and field	Description
Oracle Catalog [cmdb_ci_db_ora_catalog]	
database_instance	The name of the database instance (SID).
name	The name of the CI in the CMDB; schema and SID.
schema	The name of the catalog object.

The following is a dependency view of the relationship between an Oracle Catalog and an Oracle instance.



CI relationships

This relationship is created to support Oracle Catalog discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Oracle Catalog [cmdb_ci_db_ora_catalog]	Contains::Contained by	Oracle Instance [cmdb_ci_db_ora_instance]

Oracle Database 12c discovery

The ServiceNow Discovery application can discover pluggable databases (PDBs) and container databases (CDBs), which are features of Oracle Database 12c. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

A PDB is a portable collection of schemas, schema objects, and non-schema objects that appear to an Oracle Net client as a separate database. A collection of PDBs is called a container database (CDB).

For more information about PDBs and CDBs, see What are CDBs, PDBs and Containers?

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Set the user credentials and grant permissions:

- Configure Applicative credentials.
- For Windows, configure Windows credentials
- For Unix, configure SSH credentials
- For the Oracle database, configure Oracle database discovery
- Provide a user with permissions to run queries on the following tables:
  - V$DATAFILE
  - V$TEMPFILE
  - V$LOG
  - DBA_FREE_SPACE
  - V$DATABASE
  - V$PDBS
  - V$PARAMETER

Note:
Set applicative credentials at the CDB level to discover relationships for PDBs and the CDB size only. Alternatively, set applicative credentials at the CDB/PDB level to discover relationships for PDBs and the CDB/PDB size. If you do not set applicative credentials at the CDB level, no PDB attributes are discovered.

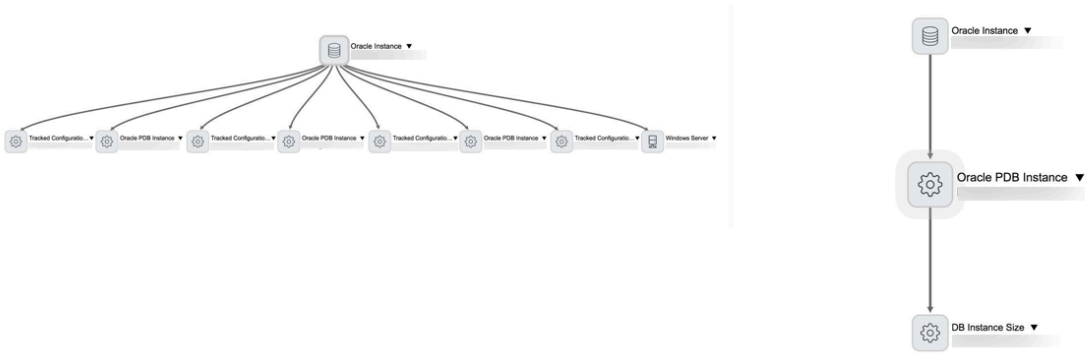
Data collected during Discovery

Discovery collects the following data:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
cmdb_ci_db_ora_pdb_instance: Relation Type : Managed By	
sid	Name of the PDB instance
name	Name of the CI in CMDB. This is a combination of sid and the hostname.
version	Version of the PDB as taken from the CDB instance
edition	Edition of the PDB as taken from the CDB instance
install_directory	Install directory of the PDB as taken from the CDB instance
oracle_home	Oracle home of the PDB as taken from the CDB instance
cdb_name	Name of the cdb sid that contains the PDB. This refers to the Oracle database instance configuration item (CI)
cmdb_ci_db_instance_size: Relation Type : Contained By	
sid	Name of the Oracle database CDB/PDB instance
name	Name of the CI in CMDB. This is a combination of the sid and the hostname.
db_size	Total size allocated to the database instance
used_size	Size used by the database instance
free_size	Size of the free space on the database instance

The following is a dependency view of the relationship between PDBs, CDBs, and containers.



Oracle Global License Advisory Services (GLAS) data collection using patterns

The ServiceNow Discovery application uses the Oracle verified GLAS Data Collection pattern to discover Oracle GLAS data. This data includes discovered Oracle Database, Middleware, and Java configuration items.

The Oracle GLAS Data Collection pattern is an extension of the following patterns:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Oracle Database on UNIX and Windows patterns
- Oracle Middleware on Linux for the following patterns:
  - Oracle Tuxedo
  - WebLogic
  - Linux
- Oracle Java on Java installation pattern

The Oracle Database and Middleware patterns execute the pattern extensions, and the data collected is stored in the ServiceNow tables for GLAS data. The Oracle GLAS Data Collection Database pattern can be used on the ServiceNow AI Platform beginning with the Paris release. The Oracle GLAS Data Collection Middleware pattern can be used on the ServiceNow AI Platform beginning with the Rome release. The Oracle Java pattern can be used on the ServiceNow AI Platform beginning with the Washington DC release.

For details on how to view and download the collected Oracle GLAS data, see Download Oracle Global License Advisory Services (GLAS) data.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

To learn about the supported versions of Oracle, refer to Detailed information on products discovered by ITOM Visibility.

Prerequisites

Install the Data Collection for Oracle Global Licensing and Advisory Services store app

Navigate to **System Definition** > **Plugins** and install the Data Collection for Oracle Global Licensing and Advisory Services app.

- The minimum version for Database collection is 1.4.0
- The minimum version for Middleware collection is 1.7.1
- The minimum version for Java collection is 1.8.4

Note:
The Data Collection for Oracle Global Licensing and Advisory Services app requires the Discovery (com.snc.discovery) plugin to work correctly.

Verify the following applications are installed

- Discovery and Service Mapping Patterns
- CMDB CI Class Models

Verify operating system privileges

Verify that your Windows or UNIX user can write temporary files under `/tmp`.

Verify that you can run the following operating system commands:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- ls
- cat
- ps

Create operating system credentials

Verify that you have the following credentials for your operating system, and then create credentials for them on the ServiceNow AI Platform:

- UNIX credentials using SSH. For more information, see SSH credentials.
- Windows credentials using PowerShell/WMI. For more information, see Windows credentials.

Note:
PowerShell and WMI credentials are required only for Database collection.

Verify the following Oracle privileges

Verify that you have applicative credentials for the Oracle instance (cmdb_ci_db_ora_instance) that have the following privileges:

- Read permissions on the `tnsnames.ora` file.
- Permissions to execute the *`sqlplus`* command.
- (For middleware collection) Sudo permissions to run the following command: `sudo su - oracle -c "$ORACLE_INSTANCE/bin/opmnctl status"`

Verify you have the user name and password for the relevant Oracle Database, with read permissions on the following tables:

DBA_ADVISOR_TASKS	DBA_USERS	SYS.MODEL$
DBA_CPU_USAGE_STATISTICS	DMSYS.DM$MODEL	SYS.REGISTRY$HISTORY
DBA_ENCRYPTED_COLUMNS	DMSYS.DM$OBJECT	SYSMAN.MGMT_INV_CONTAINER
DBA_FEATURE_USAGE_STATISTICS	DMSYS.DM$P_MODEL	SYSMAN.MGMT_LICENSES
DBA_FLASHBACK_ARCHIVE_TABLES	DVSYS.DBA_DV_REALM	SYSMAN.MGMT_LICENSE_DEFINITIONS
DBA_INDEXES	GV$IM_SEGMENTS	SYSMAN.MGMT_TARGETS
DBA_LOBS	GV$INSTANCE	SYSMAN.MGMT_VERSIONS
DBA_LOB_PARTITIONS	GV$PARAMETER	V $ARCHIVE_DEST_STATUS
DBA_LOB_SUBPARTITIONS	MDSYS.SDO_FEATURE_USAGE	V $BLOCK_CHANGE_TRACKING
DBA_OBJECTS	MDSYS.SDO_GEOM_METADATA_TABLE	V$CONTAINERS
DBA_RECYCLEBIN	MGMT$TARGET	V$DATABASE
DBA_REGISTRY	ODM.ODM_MINING_MODEL	V$DATAGUARD_CONFIG
DBA_SQLSET	ODM_DOCUMENT	V$LICENSE
DBA_SQLSET_REFERENCES	ODM_RECORD	V$OPTION
DBA_SQL_PROFILES	REDACTION_POLICIES	V$PARAMETER

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DBA_TABLES	SCHEMA_VERSION_REGISTRY$	V$VERSION
DBA_TABLESPACES	SYS.CDC_CHANGE_SETS$	dba_aws
DBA_TAB_PARTITIONS	SYS.CDC_CHANGE_TABLES$	
DBA_TAB_SUBPARTITIONS	SYS.DBA_MINING_MODELS	

Create applicative credentials for Oracle Instance

Create applicative credentials on the ServiceNow AI Platform. For more information, see Applicative credentials.

For virtual machines: Verify virtual machine credentials

For virtual machines, verify you have the relevant credentials to collect hardware data for machines hosted on the following virtual providers:

- VMware
- Nutanix
- IBM
- Hyper-V

Database CI relationships

CI	Relationship/Reference	CI
cmdb_ci_orcl_vsession	Contains::Contained By	cmdb_ci_db_ora_instance
cmdb_ci_ora_lms_detail	Contains::Contained By	cmdb_ci_db_ora_instance

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The asterisk represents one or more characters in the file name.

Processes collected:

- BBL
- DBBL
- GWWS
- JSH
- JSL
- TMJAVASVR
- TMMETADATA

WebLogic middleware extension

Files collected:

- beahomelist
- biee-domain.xml
- cluster.properties
- comps.xml
- config.xml
- domain-registry.xml
- opmn.xml
- portalconfig.xml
- pthome.xml
- registry.xml
- server.xml
- sessions.xml
- setupinfo.txt

WebLogic processes and files collected for the following middleware products:

- WebLogic
- OAS
- SOA
- OBI
- WebCenter
- FormsReports

Processes

WebLogic			OAS			OBI

Middleware CI relationships

CI	Relationship/Reference	CI
cmdb_ci_ora_lms_overview	Contains::Contained by	cmdb_ci_linux_server
cmdb_ci_config_file_tracked	Contains::Contained by	cmdb_ci_linux_server

These relationships are created by a containment rule that describes the valid objects that the Linux CIs can contain.

Properties installed with the Middleware data collection application

To access the installed application properties, navigate to **All** > **System Properties** > **All Properties**. You must have the admin role to modify these properties.

System property	Default value	Description
sn_itom_oracleglas.isMaskingIp	*true*	Determines whether to mask the IP Address in Oracle middleware tracked files by replacing the value with "text_removed."
sn_itom_oracleglas.isMaskingUserName	*true*	Determines whether to mask the user name in Oracle middleware tracked files by replacing the value with "text_removed."
sn_itom_oracleglas.isMaskingPort	*true*	Determines whether to mask the port in Oracle middleware

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

System property	Default value	Description
		tracked files by replacing the value with "text_removed."

Control GLAS data collection

The following MID Server property controls the GLAS data collection:
sn_itom_oracleglas.disable_glas_data_collection

The property is set to **False** by default.

Note:
In Data Collection for Oracle Global Licensing and Advisory Services versions earlier than 1.10.2, the property name is *sn_itom_pattern.disable_glas_data_collection*.

Oracle Java process discovery

ITOM Visibility can discover Java-running processes in your infrastructure, allowing you to comply with Oracle licensing agreements and prepare for GLAS Audits. You can perform the discovery using the Java Installation pattern (IP-based), Agent Client Collector with application patterns, or Agent Client Collector with file-based discovery.

In the pattern flow, the Java processes are discovered by Application Dependency Mapping (ADM). When the processes are discovered, the Java Installation pattern triggers and collects the data.

For information about privileged user access, see KB1705845.

For more information about Agent Client Collector with patterns, see Application patterns for the Agent Client Collector.

For more information about Agent Client Collector with file-based discovery, see Discover java installation data using Agent Client Collector for Visibility - Content file-based discovery.

Data collected

Java Audit [ora_java_audit]

Field	Description
Name	Name of the record. For example: Java@hostname
Physical Machine Name	Name of the host CI
Machine Type	Either Server(S) or Desktop(D)
Java Publisher/Runtime Vendor	Java Vendor name
Operating System	Operating system in which the java is run
Environment Type	Production or Development or QA environment
Java Release/Version/Build	Java Version
Installation Path	Absolute installation path of the java binary

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Java Audit [ora_java_audit] (continued)

Field	Description
Installation Date (DateTime)	The date and time of the java binary file created on the filesystem
Release File (Y / N)	Indicates if a *release.md* file exists in the installation
Processor Make/Model	Processor model name
Sockets (Integer)	Number of CPU sockets
Cores (Integer)	Number of CPU cores
V6 and earlier	Indicates if you have a 6 or earlier java version
Open Source	Indicates if you have an open-source java installation
Unlock Commercial features	Indicates if you have the commercial features (like JFR) enabled
Mission Control	Indicates if the mission control plugin is enabled
AMC Agent	Indicates if the AMC agent plugin is enabled
Usage Tracker	Indicates if the Usage Tracker feature is enabled
Virtual Machine Object ID	Object ID of the Virtual machine instance
PID	Running process PID
IP Address	IP address of the host/VM
First Discovered	The date of the first discovery
Most recent discovery	The date of the most recent discovery
Discovery Source	The discovery method.
Application	Reference to the [cmdb_ci_appl] table
Software installation	Reference to the [cmdb_sam_sw_install] table
Java evidence	Reference to the [cmdb_ora_java_evidence] table
Host	Reference to the [cmdb_ci] table

Java Evidence [ora_java_evidence]

Field	Description
Running process	Reference to the [cmdb_running_process] table

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Host CI	Reference to the [cmdb_ci_computer] table
File information	Provides a reference to the [cmdb_file_information] table. Relevant only for file-based discovery (FBD); in pattern-based discovery, this field remains empty.

Download the Oracle GLAS report in the Discovery Admin Workspace. For more information, see Download Oracle Global License Advisory Services (GLAS) data.

Oracle GLAS Data Collection

After Discovery finishes discovering the components of your database or middleware deployment, you can view the relevant statistics in the Oracle GLAS Data Collection.

After upgrading to Discovery Admin Workspace version 1.3.1 (August 2024 Store), you can navigate to **Workspaces** > **Discovery Admin Workspace** > **Insights** to view and access the Oracle GLAS Data Collection.

Download Oracle Global License Advisory Services (GLAS) data

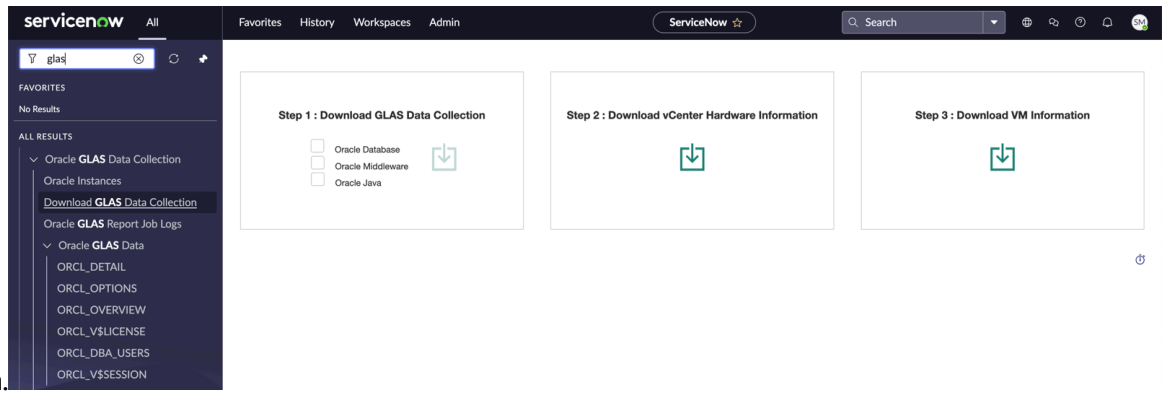
Download Oracle GLAS data in CSV format to get detailed information on patterns and configuration items. You can also download reports for Oracle Database, Middleware, Oracle Java, VM, and vCenter hardware information.

Before you begin

Role required: admin or glas_admin

Procedure

1. Navigate to **All** > **Oracle GLAS Data Collection** > **Download GLAS Data Collection**.



2. Download the following reports for Oracle GLAS data:
   - For downloading Oracle Database, Middleware, and Java reports, navigate to **Step 1: Download GLAS Data Collection** and select your data collection options.
   - For downloading vCenter hardware information based on your environment setup, navigate to **Step 2: Download vCenter Hardware Information**.
   - For downloading VM information, navigate to **Step 3: Download VM Information**.
3. Select the download icon ( ).
4. In the Enter email address dialog box, enter the email address where you want to receive a notification when the report is ready.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select **OK**.
   After the report creation status message appears, you can check the status of the download job by selecting the link provided in the message.

   The Oracle GLAS Report Job Log [sn_itom_oracleglas_job_log] table opens in a new window. After your report is successfully created, the status of the report changes to Complete in the Oracle GLAS Report Job Logs table.

6. Select a job log record to view its details including the unique number, name, status, description, and the date and time when the job log is created and updated.
7. On the Oracle GLAS Report Job Log form that opens, download your report by navigating to **Manage Attachments** and selecting **download**.

   - If you select Oracle Database, the following CSV files are downloaded:
     - `ORCL_V$SESSION.csv`
     - `ORCL_OPTIONS.csv`
     - `ORCL_DBA_USERS.csv`
     - `ORCL_DETAIL.csv`
     - `ORCL_V$LICENSE.csv`
     - `ORCL_OVERVIEW.csv`
   - If you select Oracle Middleware, the following files are exported in the format as shown for the server name and the Oracle product installed:
     - ORCL_OVERVIEW.csv
     - `Collection-<Server Name>_<Oracle Product>.tar.bz` with the files and directories of the format FMW/u01/app/oracle/config/domains/soa_domain/config/config.xml in it.
   - If you select Oracle Java, the following folders are downloaded:
     - Java folder – contains Java installation information
     - CPUQ folder – contains CPUQ files, vCenter Hardware, and VM information

   Note:
   You can also download the CSV files for Oracle Database by navigating to **Oracle GLAS Data Collection** > **Oracle GLAS Data**. From the list that opens, select the table that you want to download and then select **Download GLAS Report**.

Result
The downloaded files appear in the location that you select.

Trouble?

If the files are empty or contain an error message, check their sizes to verify that they haven't exceeded the limits set in the following properties. Navigate to **All** > **System Properties** > **All Properties** to find the following properties.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Important:
Consult with ServiceNow support before changing these properties.

Property	Description
glide.discovery.file_tracking.max_file_size	The maximum file size for tracked configuration file content. Type: integer Default value: 500000
glide.discovery.file_tracking.max_files_per_ci	The maximum number of tracked configuration files per CI. Type: integer Default value: 50
glide.discovery.file_tracking.change_limit_count	Number of changes permitted on a tracked configuration file in the defined time window. Type: integer Default value: 4
glide.discovery.file_tracking.change_limit_days	Time window (in days) that limits the number of changes on a tracked configuration file. Type: integer Default value: 7

If you receive an error `Error: Skipped sensor for Horizontal Pattern because of error in payload: Payload length 5056040 exceeded the limit of 300000`, verify that the payload hasn't exceeded the system limit. Navigate to **All** > **MID Server** > **Properties** to find the following properties.

Property	Description
mid.discovery.max_payload_size	Defines the maximum overall payload size for the payload of results that come from patterns. Type: integer (bytes) Default value: 300000

If you receive an SSH timeout error, you must create and set the following properties. See "Create a MID Server property" in MID Server Properties for details.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
mid.ssh.command_timeout_ms	Number of milliseconds an SSH command is permitted to run before timing out (default is configurable per MID Server). Type: integer
mid.sa.ssh.timeout	The SSH timeout in milliseconds. Type: integer
channel_timeout_ms	The amount of time, in milliseconds, that a MID Server waits for activity when processing an SSH command. If the MID Server doesn't detect activity within the specified window, the system terminates the command. Type: integer

Oracle GoldenGate discovery

The ServiceNow Discovery and Service Mapping applications find Oracle GoldenGate version 12c components using the Oracle Golden Gate pattern. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses the Oracle Golden Gate pattern to perform horizontal discovery to collect data into the `$report_file` file. Service Mapping performs top-down discovery on the `$report_file` file to find outgoing Oracle Golden Gate connections.

The Oracle Golden Gate pattern supports the following platforms: AIX, Linux Hewlett Packard, and Solaris.

You can use this pattern on the ServiceNow AI Platform using Kingston, London, or Madrid.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Credentials

Configure the SSH credentials, for the operating system of the server that hosts the Oracle Golden Gate Server.

User access

Give the UNIX OS user permissions to read the `$report_file`. The `$report_file` is the report file that is extracted from the Oracle Golden Gate `manager/replicat/extract` process, with the extension `.rpt`. For example:

Configuration file:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
/base/ggs_beta/oracle/bt01pims/ggs/dirprm/mgr.prm
 REPORTFILE
```

Report file:

```
/base/ggs_beta/oracle/bt01pims/ggs/dirrpt/MGR.rpt
 PROCESSID MGR
```

Permissions to run commands

The OS user must have permissions to run the relevant OS commands for each supported platform.

Give the UNIX OS user permissions to run the following commands against the Oracle Golden Gate Server:

Command	Mandatory/Optional	Description
`$sudo + " ls -d " + $rpt_base_dir + "*.rpt | sort "`	Mandatory	List all report files under the Oracle Golden Gate report base directory.
`$sudo + " ls -d " + $prm_base_dir + "*.prm| sort "`	Mandatory	List all parameter files under the Oracle Golden Gate parameter base directory.

Retrieve data

Retrieve data by parsing:

- The Oracle Golden Gate manager report file (report_file) to retrieve related configuration item (CI) names and counter information.
- Variables in the process command line to retrieve the install folder, manager process name, configuration file, and parameters file.
- Variables in the Oracle Golden Gate installation folder to retrieve a list of parameter and configuration files.

EVAL closure functions

Use the following EVAL closure functions to remove duplicate entries from the extract process and the replicat process.

- var tableWithoutDuplicates = '';tableWithoutDuplicates = DuplicateRemover.removeDuplicates(${extracts}, ["name"]);CTX.setAttribute("extracts", tableWithoutDuplicates);
- var tableWithoutDuplicates = '';tableWithoutDuplicates = DuplicateRemover.removeDuplicates(${replicats}, ["name"]);CTX.setAttribute("replicats", tableWithoutDuplicates);

Use the following EVAL closure functions to count the number of extract processes and replicat processes.

```
return
 ${cmdb_ci_appl_ora_gg_replicat[*].config_file}.size()
return
 ${cmdb_ci_appl_ora_gg_extract[*].config_file}.size()
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the following EVAL closure function to return the privileged command.

```
return
 ${ctx}.getDiscoveryProvider(com.snc.sw.dto.ProviderTyp
e.SSH).getPrivilegedCommand();
```

Use the following EVAL closure function to return the discovery type.

```
ctx.getWork().getDiscoveryType();
```

Use the following EVAL closure function to extract the version from the installation directory path if it is empty.

```
inst_dir =
 ${install_directory}if(inst_dir.isEmpty()){return
 ${version}}if(inst_dir.startsWith('/')){return
 inst_dir.replaceAll('/.*/','')}if(!inst_dir.startsWith
('/') && !inst_dir.isEmpty()){return
 inst_dir.replaceAll('.*\\\\',’’)}
```

Applicative credentials

1. Navigate to **Discovery** > **Credentials**.
2. Click **New**.
3. Click **Applicative Credentials**.
4. On the form, fill in the fields.

Applicative Credentials form

Field	Description
Name	Credential name. An example is oracle_db_user.
Active	Option for enabling this credential for discovery. Select this check box to enable discovery.
Applies to	Credentials that you may or may not want to apply to **All MID servers** in your network, or to one or more **Specific MID servers**. Select **Specific MID servers**.
MID Servers	MID Servers that the credentials apply to. Select the required MID Server. This field appears when **Specific MID servers** is selected from the **Applies to** field.
Order	Order in which the platform tries this credential as it attempts to log on to devices. A smaller number indicates that the credential appears higher in the list. Establish the credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number, or none, the instance tries the credentials in a random order. The default value is **100**.
User name	Name of the user of this applicative credential. An example is oracle_db_user. You can use any user for the credential for this pattern, because the information is extracted from a local cache.
Password	Not required. You can leave this field blank or enter any value.
CI type	CI type for which this credential is used: Storage Server [cmdb_ci_storage_server].

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: ServiceNow applications refer to devices and applications that comprise a service instance as configuration items (CIs).

5. Click **Submit**.

Entry point

For top-down discovery, use the Oracle Golden Gate IP address and specify the MID Server.

Data collected by Discovery during horizontal discovery

Discovery uses the Oracle Golden Gate pattern to collect the data described in the following table.

Table and field	Description
Main CI cmdb_ci_appl_oracle_golden_gate	
Name [name]	Name of the CI in the CMDB (<process name>@<source db>).
Version [version]	Version of the Oracle Golden Gate installation.
Source DB [source_db]	Manager process source database system identifier (SID).
Replicats count [count_replicat]	Counter of replicat processes that are managed by the Oracle Golden Gate manager instance.
Extracts count [count_extract]	Counter of extract processes that are managed by the Oracle Golden Gate manager instance.
Configuration file [config_file]	Parameter file of the Oracle Golden Gate process. Specify the path to the configuration file and the file name, <name>.prm
Report File [report_file]	Report file of the Oracle Golden Gate process. Specify the path to the report file and the file name, <name>.rpt
Type [type]	Type of the Oracle Golden Gate installation. Specify the Oracle Golden Gate for Oracle technologies.
Installation directory	Folder that contains all the Oracle Golden Gate setup, configuration, libraries, and executable files.

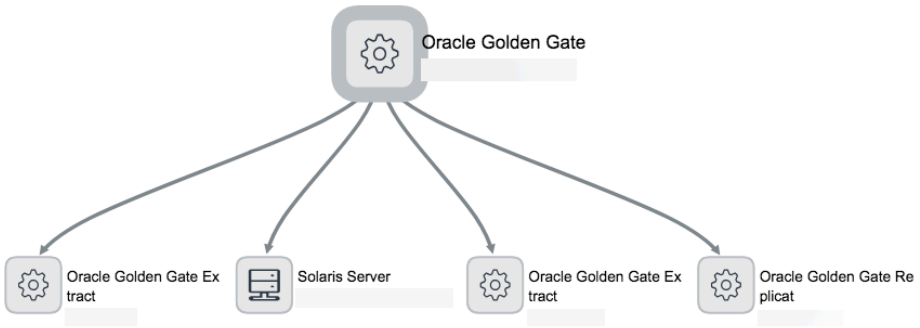
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
[install_directory]	
Related CI cmdb_ci_appl_ora_gg_replicat	
Name [name]	Name of the CI in the CMDB (<process name>@<source db>).
Report file [report_file]	Replicat process report file. Specify the path to the report file and the file name <name>.rpt
Configuration file [config_file]	Parameter file of the replicat process. Specify the path to the configuration file and the file name <name>.prm
Installation directory [install_directory]	Folder that contains all the Oracle Golden Gate setup, configuration, libraries, and executable files.
Version [version]	Version of the Oracle Golden Gate installation.
Source DB [source_db]	Manager process source database SID.
Operational status [operational_status]	Operational status of the CI. Select **Operational**.
Related CI cmdb_ci_appl_ora_gg_extract	
Name [name]	Name of the CI in the CMDB (<process name>@<source db>).
Report File [report_file]	Report file of the replicat process.
Configuration file [config_file]	Parameter file of the extract process.
Version [version]	Version of the Oracle Golden Gate installation.
Installation directory [install_directory]	Folder that contains all the Oracle Golden Gate setup, configuration, libraries, and executable files.
Source DB [source_db]	Manager process source database SID.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Operation status [operational_status]	Operational status of the CI. Select **Operational**.

The Dependency Views map shows discovered load balancer CIs and the relationships between them.



CI relationships

These relationships are created to support Oracle Golden Gate discovery.

CI	Relationship	CI
Main cmdb_ci_appl_oracle_golden_gate		
cmdb_ci_appl_oracle_golden_gate	Manages::Managed by	cmdb_ci_appl_ora_gg_replicat cmdb_ci_appl_ora_gg_extract
cmdb_ci_appl_oracle_golden_gate	Runs on::Runs	cmdb_ci_hardware
cmdb_ci_appl_oracle_golden_gate	Extends from	cmdb_ci_appl

Data collected by Service Mapping during top-down discovery

To discover the Oracle Golden Gate process, use the TCP entry point with the proper host and port of the Oracle Golden Gate process.

Table and field	Description
Main CI cmdb_ci_appl_oracle_golden_gate	
Name [name]	Name of the CI in the CMDB (<process name>@<source db>).
Version [version]	Version of the Oracle Golden Gate installation.
Installation directory [install_directory]	Folder that contains all the Oracle Golden Gate setup, configuration, libraries, and executable files.
Configuration file [config_file]	Parameter file of the Oracle Golden Gate process.
Report file [report_file]	Report file of the Oracle Golden Gate replicat process.
Source database [source_db]	Manager process source database SID.
Extract process count [count_extract]	Counter of extract processes that are managed by the Oracle Golden Gate manager instance.
Replicat process count [count_replicat]	Counter of replicat processes that are managed by the Oracle Golden Gate manager instance.

Oracle Linux Virtualization Manager and Red Hat Virtualization discovery

The ServiceNow Discovery application uses patterns to find Oracle Linux Virtualization Manager (OLVM) and Red Hat Virtualization (RHV) components. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Starting with version 1.28.0, Discovery and Service Mapping Patterns supports both OLVM and RHV discovery. Note that the RHV patterns, tables, and related items have been renamed to oVirt. For a full list of name changes, see the Zurich release ITOM Visibility release notes.

Discovery uses the following patterns for OLVM and RHV discovery:

- oVirt Clusters and Hosts
- oVirt Discover Logical Datacenters
- oVirt Discover Manager Instance

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- oVirt Virtual Machines
- oVirt Templates (starting with Discovery and Service Mapping Patterns version 1.29.0)

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Deploy the MID Server

Deploy and connect the dedicated MID Server to access either the OLVM or Red Hat Virtualization Manager (RHV-M) instances.

Create oVirt credentials

Configure the following credentials:

1. Navigate to **Discovery** > **Credentials**.
2. Select **New**.
3. Select **oVirt Credentials**, fill in the form, and then select **Submit**.

Field	Description
Name	Credential name.
User name	Name of the user for performing this discovery.
Password	Password for this user.
Active	Option to select to enable this credential for discovery.
Bearer Token	Option to select to enable use of a bearer token.

Verify API permissions

Verify that the user has read-only permissions to send the following queries.

- /ovirt-engine/api/
- /ovirt-engine/api/datacenters
- /ovirt-engine/api/clusters
- /ovirt-engine/api/hosts
- /ovirt-engine/api/vms

Add CMDB CI Class Models

Add class models that extend the CMDB class hierarchy, using the CMDB CI Class Models application. The app is available from the ServiceNow Store. Discovery patterns use these class extensions to populate CIs. For more information, see Red Hat Virtualization (RHV) extension classes.

Create a cloud service account

Create an OLVM or RHV cloud service account on the ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Confirm that Discovery Admin Workspace is using at least version 1.10.0. The **Discovery** > **Cloud Service Accounts** navigation module isn't available with earlier versions. To access **Cloud Service Accounts** with an earlier version, enter in the navigation filter: `cmdb_ci_cloud_service_account.list`.

1. Navigate to **All** > **Discovery** > **Cloud Service Accounts**
2. Select **New**.
3. On the form, fill in the fields.

Field	Description
Name	A unique name for the service account.
Account Id	The account ID to which this credential belongs. The API url of the instance should be specified, including the port. For example: `https://my-manager-instance.com:443`.
Discovery credentials	The discovery credentials that were created previously.
Datacenter Type	The datacenter type, which should be oVirt LDC [cmdb_ci_rhv_ldc].

Create a discovery schedule

Create a discovery schedule to perform full discovery of OLVM or RHV components.

1. Open the cloud service account created previously.
2. Under **Related Links**, select **Create Discovery Schedule**.

   A new schedule is created under the **Discovery Schedule** menu item.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the patterns.

oVirt LDC [cmdb_ci_rhv_ldc]

Field	Description
Name [name]	Name of the datacenter.
Object ID [object_id]	Unique object identifier.
Description [short_description]	Description of the datacenter that you provide for easy identification.
Quota Mode [quota_mode]	Quota mode policy.
URL [url]	API URL to access the datacenter.
Href ID [href_id]	Href ID.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

oVirt Cluster [cmdb_ci_rhv_cluster]

Field	Description
Name [name]	Name of the cluster.
Object ID [object_id]	Unique object identifier.
Description [short_description]	Description of the cluster that you provide for easy identification.
CPU Type [cpu_type]	CPU type. For example, x86_64.
CPU Architecture [cpu_architecture]	CPU architecture. For example, Intel Broadwell IBRS SSBD MDS Family.
KSM [ksm]	Enabled state of kernel same-page merging (KSM) memory policy.
Fencing Policy [fencing_policy]	Fencing policy.
Memory Overcommit [memory_overcommit]	Amount of over-commitment memory allowed on the cluster.
Transparent Huge Pages [thp]	Transparent huge memory pages policy.
Ballooning [ballooning]	Memory ballooning for guests.
Compatability Version [compatibility_version]	Compatibility version.
URL [url]	API URL to access the cluster.
Href ID [href_id]	Href ID.

oVirt Server [cmdb_ci_rhv_server]

Field	Description
Name [name]	Name of the server.
Serial number [serial_number]	Serial number.
Object ID [object_id]	Unique object identifier.
CPU core count [cpu_core_count]	Total number of cores.
CPU count [cpu_count]	Total number of CPUs.
CPU type [cpu_type]	CPU type.
CPU speed (MHz) [cpu_speed]	CPU speed (MHz).
Host name [host_name]	Hostname.
IP Address [ip_address]	IP address of the server.
Model ID [model_id]	Model ID.
Operating System [os]	OS family.
OS Version [os_version]	OS version.
RAM (MB) [ram]	Amount of RAM (MB).
URL [url]	API URL used access the server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

oVirt Virtual Machine Instance [cmdb_ci_rhv_vm_instance]

Field	Description
Name [name]	Name of the instance.
State [state]	State of the instance.
Object ID [object_id]	Unique object identifier.
IP Address [ip_address]	IP address of the instance.
Disks [disks]	Number of disks.
MAC Address [mac_address]	MAC address of the instance.
Management URL [mgmt_url]	Management API URL.
Description [short_description]	Description of the instance that you provide for easy identification.
Fully qualified domain name [fqdn]	Fully Qualified Domain Name (FQDN) of the instance.
CPU Architecture [cpu_architecture]	CPU architecture. For example: Intel Broadwell IBRS SSBD MDS Family.
Delete Protected [delete_protected]	Delete protected, possible values: true or false.
CPUs [cpus]	Number of CPUs.
HA Priority [ha_priority]	High availability (HA) priority.
High Availability [high_availability]	High availability, possible values: true or false.
Memory MAX [memory_policy_max]	Maximum memory in the dynamic memory allocation policy for the virtual machine (VM).
Memory Guarantee (MB) [memory_policy_guaranteed]	Amount of memory guaranteed for the VM (MB).
Multi Queues [multi_queues]	Multi queues.
Placement Policy [placement_policy]	Placement policy.
Stateless [stateless]	Stateless, possible values: true or false.
On Storage Error [storage_error_resume_behaviour]	Behavior of a VM that is paused due to storage I/O error. For example: AUTO_RESUME, LEAVE_PAUSED, and KILL.
Start Time [start_time]	Start time of the VM.
Stop Time [stop_time]	Stop time of the VM.
Threads [threads]	Number of threads.
Time Zone [time_zone]	Time zone of the VM.
USB [usb]	USB enabled state.
Run Once [run_once]	Run once.
RHV Type [rhv_type]	OLVM or RHV type.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Service Account [cmdb_ci_cloud_service_account]

Field	Description
Account Id [account_id]	Account ID for this cloud service account.
Object ID [object_id]	Account ID for this cloud service account.
Datacenter Type [datacenter_type]	Type of datacenter: oVirt LDC [cmdb_ci_rhv_ldc].
Discovery credentials [discovery_credentials]	Credentials for this cloud service account.

IP Address [cmdb_ci_ip_address]

Field	Description
Name [name]	The IP address of the network interface card (NIC) assigned to the VM.
IP Address [ip_address]	The IP address of the NIC assigned to the VM.
IP version [ip_version]	IP version: IPv4 or IPv6.

VNIC Endpoint [cmdb_ci_endpoint_vnic]

Field	Description
Object ID [object_id]	Unique identifier for this resource.
Name [name]	Name for the virtual network interface card (vNIC) endpoint.
IP Address [ip_address]	IP address bound to the network interface.

Cloud Mgmt Network Interface [cmdb_ci_nic]

Field	Description
Object ID [object_id]	ID of the network interface.
Name [name]	Name of the network interface.
IP Address [ip_address]	IP address bound to the network interface.
Public IP [public_ip]	Public IP address bound to the network interface.
Private IP [private_ip]	Private IP address bound to the network interface.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	Name of the disk.
Object ID [object_id]	Unique ID of the disk.
Size [size]	Storage capacity of the disk.
Storage type [storage_type]	Type of storage backend the disk is using.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Network [cmdb_ci_network]

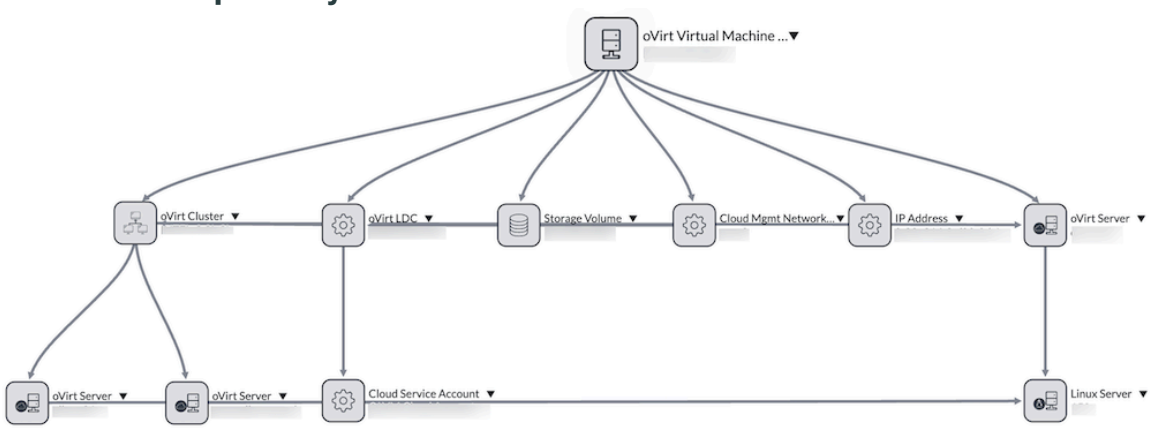
Field	Description
Name [name]	Name of the network.
Object ID [object_id]	Unique ID of the network.

Cloud Hardware Type [cmdb_ci_cloud_hardware_type]

Field	Description
Name [name]	Name of the template.
Object ID [object_id]	Unique ID of the template.
Cores [cores]	Number of CPU cores.
Install Status [install_status]	Install status of the template. Default value is Installed.
Memory MB [memory_mb]	Memory in megabytes (MB).

On the Dependency Views map, you can view all discovered OLVM or RHV resources in your organization and the relationships between them.

OLVM or RHV dependency view



CI relationships

The following relationships are created to support OLVM or RHV discovery.

CI	Relationship	CI

Oracle Listener HD discovery

ServiceNow Discovery uses the Oracle Listener HD pattern to find and map Oracle real application cluster components. To discover these resources, install the CMDB CI Class Models and the Discovery and Service Mapping Patterns from the ServiceNow Store.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Oracle RAC enables you to cluster an Oracle database. Oracle RAC uses Oracle Clusterware for the infrastructure to bind multiple servers so they operate as a single system. Oracle Clusterware enables you to create a clustered pool of storage that can be used by any combination of non-cluster and Oracle RAC databases. Discovery uses Oracle Listener HD patterns to discover information about the Oracle Database Listener and the components in the Oracle RAC infrastructure, when such a setup is configured.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

- Ensure that the following plugins are installed:
  - CMDB CI Class Models plugin (Version 1.29.0 or later).
  - Discovery and Service Mapping Patterns plugin (Version 1.0.82 or later).
- Ensure that the Discovery User is in the Oracle DBA group or has the correct Permissions.
- Ensure that the MID Server has access to the target device.
- Ensure that the Oracle Clusterware/Grid infrastructure is installed and the Oracle RAC Database is configured. If there is an Oracle Clusterware setup.
- Ensure that the Oracle Listener process is running on a UNIX OS host.
- Use Oracle Clusterware minimum version 12.2.X.X (Oracle Database 12c Release 2) or higher, If there is an Oracle Clusterware setup.

Note:
This pattern is supported from the Paris release on. More UNIX OS types (AIX, Solaris, HP-UX) are supported from version 1.0.87 of the Discovery and Service Mapping Patterns plugins.

The following commands are executed during the pattern execution. Executing the commands enables the pattern to populate allthe relevant CMDB classes with the necessary information:

- **export TNS_ADMIN=<oracle_home_directory>/network/admin**: Sets the ORACLE_HOME to the TNS_ADMIN environment variable.
- **export ORACLE_BASE==<oracle_home_directory>**: Sets the ORACLE_HOME to the ORACLE_BASE environment variable.
- **lsnrctl status LISTENER_NAME**: Checks the Database Listener status.
- **ps -ef | grep 'd.bin'**: Searches for the GRID_HOME path.
- **crsctl query cluster site -all**: Lists the nodes and disks that the sites contain.
- **lsnrctl services LISTENER_NAME**: Lists the services that the listener identifies.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

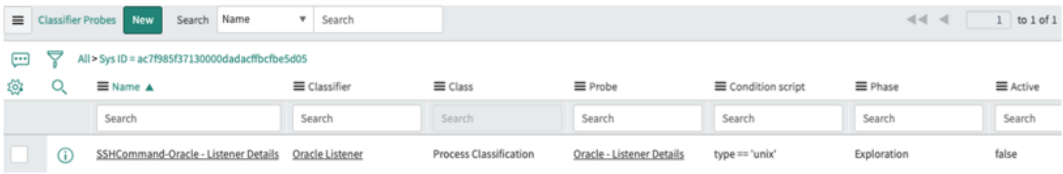
- **crsctl stat res -f -w '((TYPE = ora.database.type))'**: Lists the database name, associated node, type, and active status.

> **Note:**
> If no output is obtained from the **lsnrctl status LISTENER_NAME**, then the **Oracle Listener HD** pattern is terminated.

Limitations

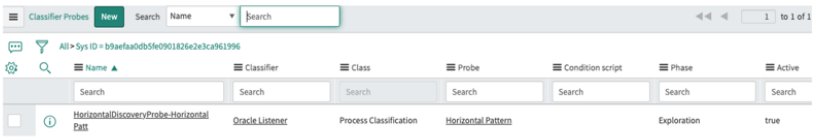
The Oracle Clusterware setup is only supported for the UNIX Operating Systems. The base system **SSH Command-Oracle - Listener Details classifier probe** is inactive (Active is set to False), when installing the CMDB CI Class Models version 1.29.0 or higher.

Classifier Probes- Oracle Listener Details



The **Oracle Listener process classification** triggers the Oracle Listener HD pattern.

Classifier Probes- Horizontal Pattern



Data collected by Discovery during horizontal discovery

The Oracle Listener HD pattern populates the following CIs:

Main CI (Oracle Database Listener) [cmdb_ci_db_ora_listener]

Field	Description
name	The name of the Oracle Database Listener.
oracle_home	The Oracle home directory where software is installed.
configuration	The listener.ora network configuration file.
scan_listener_name	The name of the SCAN LISTENER.
version	The version of the Oracle product.
tcp_port	The listening port for Oracle client connections.

Oracle Solaris LDOM discovery

Discovery uses the Solaris Logical Domain (LDOM) infrastructure pattern and Solaris LDOM shared library pattern to find all LDOM data. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery uses these patterns to run horizontal discovery. You can use the patterns on the ServiceNow AI Platform using the Yokohama release or later.

The Solaris LDOM infrastructure pattern is triggered automatically on Solaris Server discovery. The pattern verifies if there is an LDOM controller, and stops running if it doesn't find a controller.

The Solaris LDOM shared library pattern is run as an Extension Section to the Solaris Server pattern. The pattern modifies the Serial Number (SN) on LDOM machines so that it matches the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SN populated by the Solaris LDOM infrastructure pattern. For further information about Solaris Server, see Solaris discovery.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

LDOM commands when running the Solaris LDOM infrastructure pattern

Ensure the relevant users have permissions to execute the following used commands for the Solaris LDOM infrastructure pattern:

- *"sudo /usr/sbin/virtinfo -a"*
- *"sudo /usr/sbin/ldm -V"*
- *"hostname"*
- *"svcs ldmd"*
- *"sudo /usr/sbin/ldm list-rsrc-group -a"*
- *"sudo /usr/sbin/sneep -T | grep ChassisSerialNumber 2> /dev/null"*
- *"/usr/sbin/prtdiag -v | awk '/Chassis Serial/{getline; getline; print}'"*
- *"sudo /usr/sbin/ldm list"*

Note:
Some of these commands are used with conditions, and will not be executed on each discovery. For example, the main way to get the SN for servers is by using the *'sneep'* command. However, this is not available by default on Solaris servers, so *'prtdiag'* is used as an alternative method to get the SN.

Important LDOM commands when running the Solaris LDOM shared library pattern

Ensure the relevant users have permissions to execute the following used commands for the Solaris LDOM shared library pattern:

- *"sudo /usr/sbin/virtinfo -a"*
- *"sudo /usr/sbin/sneep -T | grep ChassisSerialNumber 2> /dev/null"*
- *"hostname"*

Ensure the relevant users have the permissions to execute the LDOM *virtinfo* command. This command ensures the proper LDOM role can be established.

Ensure the relevant users have the permissions to execute the LDOM *"sudo /usr/sbin/ldm list"* command for listing Guest VMs on the LDOM controller. This is required in order to set relations between the LDOM controller and the LDOM Guest VMs.

One of the *'sneep'* or *'prtdiag'* Serial Number commands has to return a correct response in order to correctly set the SN.

Data collected by Discovery during horizontal discovery

The data discovered by both patterns includes the following tables and fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Solaris Server [cmdb_ci_solaris_server]	
ldom_version	The LDOM version installed on the LDOM controller.
ldom_role	The LDOM role; "controller" or "guest".
ldom_state	The state of the LDOM implementation on the LDOM controller.
serial_number	The serial number of the machines.
virtual	Whether or not a virtual machine (for Guest VMs) is used for the LDOM controller.
ram	The memory available on the LDOM controller.
cpu_core_count	The number of CPU cores on the LDOM controller.

CI relationships

CI	Relationship	CI
LDOM controller	Hosted on::Hosts	LDOM Guest VM

Palo Alto Networks firewall discovery

The ServiceNow Discovery application uses the Next-Generation Palo Alto Firewall pattern to find Palo Alto Networks firewalls. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The discovery pattern uses a set of SNMP calls to find the Palo Alto Networks firewalls. Discovery uses the pattern to run horizontal discovery.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

- Ensure that your network firewall device has SNMP access.
- On the ServiceNow instance, configure SNMP credentials. For more information, see SNMP credentials.
- Add the SNMP system OID record for the Palo Alto Networks device to the ServiceNow instance. Update the following:
  - Classifier: Palo Alto Firewall
  - Class: Palo Alto Firewall Device
- Deploy the pattern as follows:
  1. Download and install Firewall extension classes from the ServiceNow Store. The app adds the new CMDB classes required for network firewall discovery.
  2. Download and install the discovery pattern from the ServiceNow Store.
  3. Sync the pattern with the appropriate MID Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Next-Generation Palo Alto Firewall Pattern.

Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]

Field	Description
IP Address [ip_address]	IP address of the Palo Alto device.
Serial number [serial_number]	Serial number of the Palo Alto device.
Fully qualified domain name [fqdn]	Fully qualified domain name (FQDN) of the Palo Alto device.
Manufacturer [manufacturer]	Palo Alto device manufacturer.
Model ID [model_id]	Model ID of the Palo Alto device.
Operational status [operational_status]	Indicates whether the Palo Alto device is in active state.
Hardware OS [hardware_os]	OS running on the hardware.
Hardware OS Version [hardware_os_version]	OS version running on the hardware.
Description [short_description]	Short description of the Palo Alto device.
Firmware version [firmware_version]	Palo Alto device firmware version.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
IP Address [ip_address]	IP address of the network adapter.
Alias [alias]	The user-assigned name for the network adapter.
Netmask [netmask]	Netmask of the network adapter.
MAC address [mac_address]	MAC address of the network adapter.
Name [name]	Name of the network adapter.
Configuration Item [cmdb_ci]	References the Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto] table.

IP Address [cmdb_ci_ip_address]

Field	Description
IP Address [ip_address]	IP address of the Palo Alto firewall.
Netmask [netmask]	Netmask of the Palo Alto firewall.
Nic [nic]	References the Network Adapter [cmdb_ci_network_adapter] table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

DNS Name [cmdb_ci_dns_name]

Field	Description
Name [name]	Domain Name System (DNS) name of the Palo Alto firewall device.
IP Address [ip_address]	Host IP address.

CI relationships

These relationships are created to support Palo Alto Networks firewall discovery:

CI	Relationship	CI
IP Address [cmdb_ci_ip_address]	References	Netwrk Adapter [cmdb_ci_network_adapter]
Network Adapter [cmdb_ci_network_adapter]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
Netwrk Adapter [cmdb_ci_network_adapter]	References	Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]
Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]	Extends from	Firewall Device [cmdb_ci_firewall_device]
Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]	Owns::Owned by	Netwrk Adapter [cmdb_ci_network_adapter]
Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]	Owns::Owned by	IP Address [cmdb_ci_ip_address]
Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]	Uses::Used by	Router Interface [dscy_router_interface]
Router Interface [dscy_router_interface]	References	Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]
Serial Number [cmdb_serial_number]	References	Palo Alto Firewall Device [cmdb_ci_firewall_device_palo_alto]

Pivotal Cloud Foundry discovery

The ServiceNow Discovery application finds Pivotal Cloud Foundry (PCF) version 3 components using the Pivotal Cloud Foundry pattern. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

You can use this pattern on the ServiceNow AI Platform starting Kingston version.

The discovery of PCF V3 components is supported when the Discovery and Service Mapping Patterns plugin Version 1.0.99, March 2023 is installed. The Pattern continues to support the discovery of PCF V2 components.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Prerequisites

Pivotal Cloud Foundry credentials

Create the Pivotal Cloud Foundry credentials.

1. Navigate to **Discovery** > **Credentials**.
2. Select **New**.
3. Select **CloudFoundry Credentials**.
4. On the form, fill in the fields:

Field	Description
Name	Credential name. As an example, `pcf_user credentials`
Active	Option for enabling this credential for discovery. Select this check box to enable discovery.
Applies to	Credentials that you may or may not want to apply to **All MID servers** in your network, or to one or more **Specific MID servers**. Select **Specific MID servers**.
Order	Order in which the platform tries this credential as it tries to log in to devices. A smaller number indicates that the credential seems higher in the list. Establish the credential order when using large numbers of credentials or when security locks out users after three failed logins tries. If all the credentials have the same order number, or none, the instance tries the credentials in a random order. The default value is 100.
User name	Name of the user of these credentials. Avoid leading or trailing spaces in user names. A warning seems if the platform detects leading or trailing spaces in the user name. An example is `pcf_user`. Use the `client_id` that is used to generate the JWT token.
Password	Password for the user of these credentials. Use the `client_secret` that is used to generate the JWT token.
Credential alias	Alternate name for these credentials. As an example, `cf`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	If this field is closed, select the unlock icon to unlock the field.

5. Select **Update**.

JSON web token credentials

To verify the JSON web token (JWT), perform the following token validation steps.

The format of the JWT token is: https://docs.cloudfoundry.org/api/uaa/version/4.27.0/index.html#jwt-bearer-token-grant

1. Run the following cURL script against the User Account and Authentication (UAA) server API and verify the results:

```
curl -s -k https://ip_address:port/oauth/token
-X; POST -H "Content-Type: application/x-www-
form-urlencoded" -H "Accept: application/json" -d
"client_id=<INSERT_USER_HERE>&client_secret=<INSERT_PASS_HERE>&grant_ty
```

   If this command doesn't generate a token, verify that the credentials in the ServiceNow repository are correct, otherwise go to step 2.

2. Run the following cURL script against Pivotal Cloud Foundry API:

```
curl https://ip_address:port/v3/spaces -k -v -H
"Accept: application/json" -H "Authorization:
bearer<INSERT TOKEN HERE>"
```

   If this command doesn't retrieve the PCF spaces information, verify the credentials on the ServiceNow credentials repository.

Credentials for V3 API elements

Provide a read-only user with permission to use the following API elements:

- –/v3/organizations
- –/v3/spaces
- –/v3/domains
- –/v3/routes
- –/v3/organization_quotas
- –/v3/space_quotas
- –/v3/apps
- -/v3/service_offerings
- -/v3/service_plans
- -/v3/service_instances
- -/v3/droplets

Note:
The Pivotal Cloud Foundry Pattern also supports the PCF V2 APIs.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

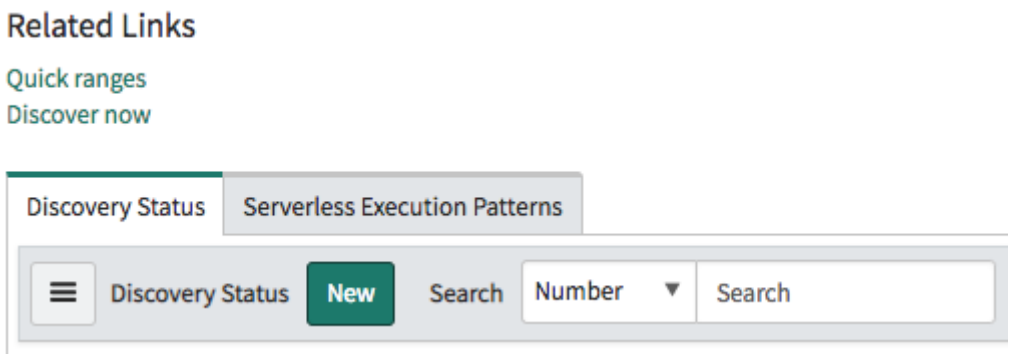
Create a serverless Discovery schedule

1. Navigate to **Discovery** > **Discovery Schedules**.
2. Select **New**.
3. On the form, fill in the fields:

Discovery Schedule form

Field	Description
Name	Enter a unique and descriptive name for this Discovery schedule, for example, `pcf`
Discover	For the Discover type, select **Serverlesss**
MID Server	MID Servers that the credentials apply to. Specify the required MID Server, for example, `Discovery_Server`
Active	Option for enabling this credential for discovery. Select this check box to enable discovery.
Credential alias	Alternate name for these credentials. Use the alias related with the Pivotal Cloud Foundry credentials that you created earlier.

4. Right-click the header of the Discovery Schedule form and select **Save**.



5. Select the Serverless Execution Patterns tab.
6. Select **New**.
7. On the form, fill in the fields:

Serverless Execution Pattern form

Field	Description
Name	Enter a unique and descriptive name for this Serverless Execution Pattern, for example, `pcf1`
Pattern	Select **CloudFoundry**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Proxy Host	Fully qualified domain name of the machine on which you're installing the proxy server. Specify **Global**.
Active	Check box to enable this schedule for discovery. Select this check box.

8. Right-click the header of the Serverless Execution Patterns form and select **Save**.
9. Select the Serverless Execution Patterns tab
10. Create and define the serverless execution pattern as described in the product documentation.

    Configure the parameters required by the Pivotal Cloud Foundry Pattern as follows:

    Discovery Pattern Launcher parameters

Parameter	Description
Organization	Name of the organization that is required to be discovered, or all where the input is "*".
CredentialAlias	Alternate name for these credentials. Use the alias related with the Pivotal Cloud Foundry credentials that you created earlier.
URL_CF	API URL of the Cloud Controller that is used to retrieve the information from Pivotal Cloud Foundry.
URL_CF_AUTH	UAA server APIthat is used to generate the token. Enter the value in the format: https://uaa.sys.dev.phx.pcf.example.com/oauth/token

11. **Update**.
12. To start discovery, navigate to the Serverless Discovery definition and select **Discover Now**.

EVAL closure functions

Use the following EVAL closure functions to concatenate all organizations with "," as a separator.

```
var rtrn = '';
var organizations = ${organizations[*].name};
var beforeReturn = '';
var separator = '';
for (var i = 0; i < organizations.size(); i++)
 {
 beforeReturn += separator + organizations.get(i);
 separator = ',';
 }
rtrn = beforeReturn;
```

Use the following EVAL closure functions to return 1 if the operational status is active and 2 if it isn't active.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var rtrn = '';
var currentOrgStatus =
 ${organizations[].operational_status};
var status = currentOrgStatus.toLowerCase();
if(status == "active"){
   rtrn = "1";
}
else {
   rtrn = "2";
}
```

Use the following EVAL closure function to return 1 if the operational status is started and 2 if it isn't started.

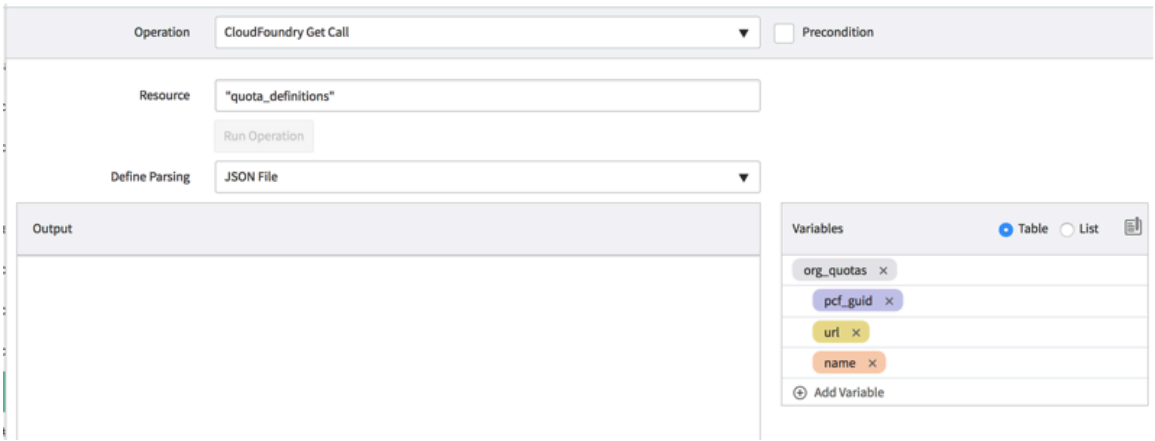
```
var rtrn = '';
var currentAppStatus = ${apps[].state};
var status = currentAppStatus.toLowerCase();
if(status == "started"){
   rtrn = "1";
}
else {
   rtrn = "2";
}
```

CloudFoundry Get Call

The CloudFoundry Get Call custom operation handles the generation of tokens. It uses the credentials and URL_CF_AUTH context variable to generate a token that is used to create API calls.

When a token is generated, the URL_CF is used to create the API calls defined in the **Resource** field. The custom operation also handles pagination where the response has more than one page.

CloudFoundry Get Call parses the input JSON to populate the tables and variables.



Pivotal Cloud Foundry BOSH extension section

The Pivotal Cloud Foundry BOSH is an extension section of the Pivotal Cloud Foundry Pattern.

The extension is available on the ServiceNow® Store for the June 2023 release of Discovery and Service Mapping Patterns 1.6.0.

Requirements for Pivotal Cloud Foundry BOSH

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The following requirements are relevant only to the BOSH extension section.

The Opsman authentication URL has to be provided as a pattern parameter with the name *URL_OPSMAN_AUTH*. For example: `https://<opsman entry point>/uaa/oauth/token`

The added credentials must have permission to execute the following APIs:

- `/uaa/oauth/token`
- `/api/v0/deployed/products`

Note:
Custom APIs are added as *Tanzu Opsman Get API* step to the Pattern.

Data collected by Discovery during horizontal discovery

Collected information

Field	Description
Main CI: PCF Foundation [cmdb_ci_pcf_foundation]	
Name	Pivotal Cloud Foundry cluster entry name `<name>-<hostCf:<portCf>`
ip_address	Pivotal Cloud Foundry host IP.
port	Pivotal Cloud Foundry service port.
short_description	Pivotal Cloud Foundry service build number.
Organization	Organization list, managed by PCF cluster. The entries are separated using a "," comma separator.
PCF Organization [cmdb_ci_pcf_organization]	
Name	Organization name
URL	Organization unique URL
pcf_guid	Organization UID in CF
operational_status	Organization status
PCF Space [cmdb_ci_pcf_space]	
Name	Space name
URL	Space unique URL
pcf_guid	Space UID in CF
PCF Application [cmdb_ci_pcf_appl]	
Name	Application name
URL	Application unique URL
pcf_guid	Application UID in CF
PCF Route [cmdb_ci_pcf_route]	
Name	Route name

Pure Storage FlashArray discovery

The Discovery and Service Mapping Patterns application uses the Pure Storage Flash Array pattern to find Pure Storage FlashArray on your infrastructure. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Note:
Starting March 2024, the pattern execution is disabled by default. To create a CI for Pure Storage FlashArray, synchronize the pattern to the MID Server.

Request new or enhanced Patterns on the ServiceNow® Store

Visit the ServiceNow Store to view all the available updates and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Verify that the applications are up to date

- Discovery and Service Mapping Patterns
- Visibility Content

Verify the configuration of the credentials

Configure basic authentication credentials to classify FlashArray. For more information, see basic authentication.

Verify the permissions to run REST API calls

The Pure Storage Flash Array pattern supports the API 2.17 version.

- `/api/1.17/auth/apitoken`
- `/api/2.17/auth/session`
- `/api/2.17/arrays`
- `/api/2.17/volumes`
- `/api/2.17/volume-groups`
- `/api/2.17/host-groups`
- `/api/2.17/hardware`
- `/api/2.17/dns`
- `/api/2.17/ports`

Note:
The February 2024 Pure Storage pattern version supports only iSCSI protocol discovery.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Running Discovery

To run discovery using Patterns, create a discovery schedule that targets the management IP address of the FlashArray storage. For more information, see Running discoveries in your network.

Data collected by Discovery during horizontal discovery

Discovery populates the data in the CMDB when running the Pure Storage Flash Array Pattern.

Storage Server [cmdb_ci_storage_server]

Field	Description
Name [name]	The user-assigned identifier or label for the FlashArray storage.
Serial number [serial_number]	Serial number that uniquely identifies each individual FlashArray storage.
Operating System [os]	Operating system running on the FlashArray storage.
OS Version [os_version]	Software version that is installed on the FlashArray storage.
IP Address [ip_address]	IP Address of the FlashArray storage.
Manufacturer [manufacturer]	Manufacturer name: Pure Storage.
Object ID [object_id]	Credential affinity assigned during discovery to the FlashArray storage. For more information about credential affinity, see Credential affinity for Discovery and Orchestration.
Model ID [model_id]	Model ID of the FlashArray storage.
Encryption at rest [encryption_at_rest]	Encrypted data stored on a physical device or in a database. Possible values are: • active • disable
Encryption algorithm [encryption_algorithm]	Type of algorithm the storage server employs. Possible values are: • AES-256: Advanced Encryption Standard (AES) 256 Encryption • multiple methods: Pure Storage doesn't currently support multiple methods • Unknown: If during a previous discovery an algorithm type was discovered but during the next discovery it isn't discovered, the value is unknown
Total Free Capacity (GB) [total_free_capacity]	Total amount of storage space that is currently available for use on the FlashArray storage system, which is measured in gigabytes (GB).
Physical Capacity (GB) [physical_capacity]	Total amount of physical storage space available within the FlashArray system, measured in GB. This capacity includes both allocated and unallocated storage resources.
Free Physical Capacity (GB) [free_physical_capacity]	Available physical storage space within the FlashArray system, measured in GB.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Server [cmdb_ci_storage_server] (continued)

Field	Description
Used Physical Capacity (GB) [used_physical_capacity]	Used physical storage space within the FlashArray system, measured in GB.
Virtual Capacity (GB) [virtual_capacity]	Total virtual storage capacity provisioned within the FlashArray system, measured in GB.
Free Virtual Capacity (GB) [free_virtual_capacity]	Available virtual storage capacity within the FlashArray system, measured in GB.
Used Virtual Capacity (GB) [used_virtual_capcity]	Used virtual storage capacity within the FlashArray system, measured in GB.

Storage Cluster Node [cmdb_ci_storage_cluster_node]

Field	Description
Name [name]	Cluster node name.
Cluster [cluster]	Host group associated with this cluster node in the FlashArray environment.
Change Group [assignment_group]	iSCSI or Fibre Channel initiator connections between the storage and the host.
Manufacturer [manufacturer]	Manufacturer name: Pure Storage.
Comments [comments]	All the logical unit numbers (LUN) connected to the cluster node.

Storage Cluster [cmdb_ci_storage_cluster]

Field	Description
Name [name]	Storage cluster name.
Correlation ID [correlation_id]	Combines the cluster name and the storage's serial number to create a unique identifier (UID).
Manufacturer [manufacturer]	Manufacturer name: Pure Storage.

Storage Volume [cmdb_ci_storage_volume]

Field	Description
Name [name]	Volume name.
Serial number [serial_number]	Serial number of the volume.
Volume ID [volume_id]	Volume ID.
Installed [install_date]	Date the volume was installed.
Size bytes [size_bytes]	Volume size in bytes.
Pool ID [pool_id]	ID of the pool containing the volumes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Storage Volume [cmdb_ci_storage_volume] (continued)

Field	Description
Attributes [attributes]	Names of the hosts connected to the volumes.
Manufacturer [manufacturer]	Manufacturer name: Pure Storage.

Storage Pool [cmdb_ci_storage_pool]

Field	Description
Name [name]	Name of the storage pool.
Object ID [object_id]	ID of the storage pool.
Manufacturer [manufacturer]	Manufacturer name: Pure Storage.

Storage Controller [cmdb_ci_storage_controller]

Field	Description
Name [name]	Combination of asset and asset tag.
Model ID [model_id]	Model ID of the controller.
Assigned [assigned]	Availability status.
Device ID [device_id]	A unique label for the controller.
Manufacturer [manufacturer]	Manufacturer name: Pure Storage.

Disk [cmdb_ci_disk]

Field	Description
Name [name]	Spindle ID.
Size bytes [size_bytes]	Disk size in bytes.
Drive type [drive_type]	Type of drive installed on the disk.
Device ID [device_id]	Combination of the storage system serial number with the disk name that uniquely identifies each disk within the FlashArray environment.
Manufacturer [manufacturer]	Disk manufacturer.

Network Adapter [cmdb_ci_network_adapter]

Field	Description
Name [name]	Name of the network adapter.
IP Address [ip_address]	IP address of the network adapter.
MAC Address [mac_address]	MAC address of the network adapter.
IP default gateway [ip_default_gateway]	IP address of the default gateway.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Network Adapter [cmdb_ci_network_adapter] (continued)

Field	Description
Alias [alias]	The user-assigned name for the network adapter.
Netmask [netmask]	Netmask of the network adapter.

Fibre Channel Export [cmdb_ci_fc_export]

Field	Description
Initiator WWPN [initiator_wwpn]	UID combining the Director ID, port number, and Initiator ID.

iSCSI Export [cmdb_ci_iscsi_export]

Field	Description
Name [name]	Initiator ID in FlashArray systems, which serves as a UID for the initiator in the context of iSCSI exports.
Export ID [export_id]	UID for an iSCSI export within FlashArray systems, facilitating the management and tracking of iSCSI connections.
Initiator IQN [initiator_iqn]	iSCSI Qualified Name (IQN) assigned to an initiator in the iSCSI network.

CI relationships

CI	Relationship type	CI

Pure Storage FlashBlade discovery

The ServiceNow Discovery application uses the FlashBlade Pure Storage pattern to find FlashBlade components. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Discovery can find Pure Storage FlashBlade version 4.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

Only Linux MID Servers are supported for Pure Storage FlashBlade discovery. Windows MID Servers are not supported.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Configure user permissions for UNIX OS

Configure a user for accessing the UNIX OS.

- Define the OS user with permissions to run the following commands.

Command	Parameter	Mandatory/ Optional	Description
Pureman	-	Mandatory	Accesses the list of pure storage commands and uses them for classification.
Echo	$$username$$	Mandatory	Fills in the username for the temporary variable.
"pureadmin list "	+ $usr + " --api-token --expose --csv"	Mandatory	Gets the user API token to generate the x-auth for the REST call commands.

- Define the OS user with the required permissions to run the following REST API calls.
  - `/api/login` – Gets the x-auth token reader from the response in Groovy.
  - `/api/1.2/file -systems` – Retrieves information about the file systems.
  - `/api/1.2/blades` – Retrieves information about blades.
  - `/api/1.2/dns` – Retrieves information about DNS.
  - `/api/1.2/hardware` – Retrieves information about the storage hardware.
  - `/api/1.4/network-interfaces` – Retrieves information about network interfaces.

Configure SSH credentials

On the ServiceNow AI Platform, configure SSH credentials for the OS user. For more information, see SSH credentials.

Configure applicative credentials

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

On the ServiceNow AI Platform, configure applicative credentials for the OS user. The password field is not relevant; you can enter any value for the password or leave it empty. For more information, see Applicative credentials.

Access to the port used for REST calls

On relevant Linux MID Servers, provide a user with access to the port used for REST calls.

Data collected by Discovery for Pure Storage FlashBlade

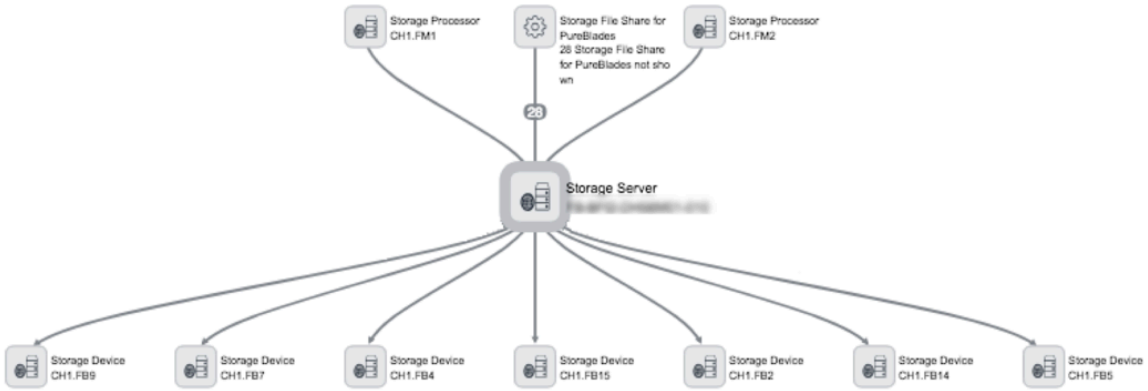
Discovery populates the data in the CMDB when running the FlashBlade Pure Storage pattern.

Table and field	Description
Storage Server [cmdb_ci_storage_server]	The attributes of the storage server provided by FileShare for PureBlade.
IP address [ip_address]	
Serial number [serial_number]	
Name [name]	
Pure Storage Processor [cmdb_ci_storage_processor_pure]	The attributes of the PureBlade storage processor.
Name [name]	
Serial number [serial_number]	
Device ID [device_id]	
Model number [model_number]	
Serial [serial]	
Slot [slot]	
Type [type]	
Status [status]	
Pure Storage File Share [cmdb_ci_storage_fileshare_pure]	The attributes of the storage FileShare.
Name [name]	
Path [path]	
Protocols [protocols]	
Provisioned Space [provisioned_space]	
Unique Space [unique_space]	
Snapshots Space [snapshots_space]	
Total Physical Space [total_physical_space]	
Shared space [shared_space]	
Data Reduction [data_reduction]	
System Space [system_space]	
Storage Device [cmdb_ci_storage_device]	The attributes of the storage device contained by the storage server.
Device ID [device_id]	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table and field	Description
Name [name]	
Serial number [serial_number]	
Model number [model_number]	
Storage type [storage_type]	

The graphic illustrates CIs that are part of FlashBlade discovery.



CI relationships

Discovery creates these relationships to support the Pure Storage FlashBlade discovery.

CI	Relationship	CI
Pure Storage File Share [cmdb_ci_storage_fileshare_pure]	Provided By::Provides	Storage Server [cmdb_ci_storage_server]
Storage Device [cmdb_ci_storage_device]	Contains::Contained by	Storage Server [cmdb_ci_storage_server]
Storage Server [cmdb_ci_storage_server]	Contains::Contained by	Pure Storage Processor [cmdb_ci_storage_processor_pure]

Red Hat JBoss Fuse discovery

The ServiceNow Discovery and Service Mapping applications can find and map the Fuse application server using the JBoss Fuse pattern. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Credentials

Configure SSH credentials in the Credentials module of the ServiceNow platform for accessing the server hosting the Fuse server.

User

Provide a user with the read rights for accessing the following directories:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- `$install_directory + "/readme.txt"`

  Access to this directory allows getting version information.

- /etc/services

  Access to this directory allows reading the hosts service definition.

Data collected by Discovery during horizontal discovery

Table and Field	Description
Jboss Fuse [cmdb_ci_appl_jboss_fuse]	
config_directory	The configuration directory of the Fuse server.
config_file	The configuration file of the Fuse server.
install_folder	The installation folder of the Fuse server.
version	The version of the Fuse server.
name	The name configured for the Fuse server during installation.

Data collected by Service Mapping during top-down discovery

Service Mapping discovers the connection between the JBoss Fuse server and the IBM Informix Dynamic server.

Rubrik Cluster discovery

Discovery uses multiple patterns to find all Rubrik cluster data. Discovering these resources requires installing the Discovery and Service Mapping Patterns and the CMDB CI Class Models applications from the ServiceNow Store, as each application is dependent on the other.

You can use the patterns for discovering the Rubrik components on the ServiceNow AI Platform using the Paris release or later.

Note:
The update applied in version 1.0.78 of the Discovery and Service Mapping Patterns application resolves an issue of duplicate CI types in the CMDB. If you are using Rubrik discovery patterns and already installed versions 1.21.0, 1.23.0, 1.24.0 or 1.25.0 of the CMDB CI Class Models store app (sn_cmdb_ci_class), or versions 1.0.73, 1.0.74, 1.0.75 or 1.0.76 of the Discovery and Service Mapping Patterns application (sn_itom_pattern), you should follow the instructions in KB0957523.

All of the information for the main CI (Rubrik Cluster) and its corresponding CI types is returned by REST API calls.

Take note of the following limitations:

- Reference fields are not supported due to the Large Payload mechanism limitations in the Paris and Quebec releases.
- All the entities returned from the Rubrik REST API for Hosts (Servers) with IP addresses not resolved to hostnames are filtered out (excluded) from the Rubrik discovery. This is done to prevent the creation of duplicates across the CMDB.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Discovery and Service Mapping Patterns store app

Deploy the 1.0.73 release or later from the ServiceNow Store.

CMDB CI Class Models store app

Deploy the 1.21.0 release or later from the ServiceNow Store.

Basic Auth permissions

Ensure Basic Auth credentials are configured for authenticating the REST API calls.

Credential aliases associated with the Rubrik credentials of type Basic Auth must also be created. These aliases serve as input parameters, along with the IP address.

These are used for discovery of all the CI types associated with the Rubrik cluster.

- Security Scheme Type: HTTP
- HTTP Authorization Scheme: basic

MID server

Ensure that the MID server can access the target appliance device.

Create a serverless discovery schedule

Create a serverless discovery schedule to perform targeted discovery of Rubrik cluster resources.

> **Note:**
> The Discovery schedule that triggers all the Rubrik related patterns supports only the serverless discovery type. In addition, for each different Rubrik cluster (Brik), a different serverless discovery schedule should be created. The schedule should include the IP address of any of the Rubrik nodes associated with the Rubrik cluster, and the credential alias associated with the Rubrik Basic Authentication credential record.

1. Navigate to **Discovery** > **Discovery Schedules**.
2. Click **New** and then fill in the form.

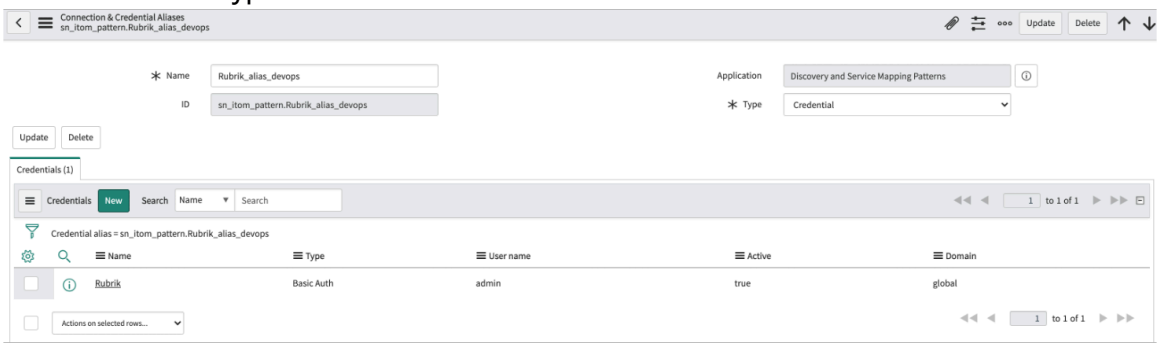
Discovery Schedule form

Field	Description
Name	Name for the Discovery schedule. For example, `Discover Rubrik`.
Discover	Discover type. Select **Serverless**.
MID Server	Name of the MID Server.

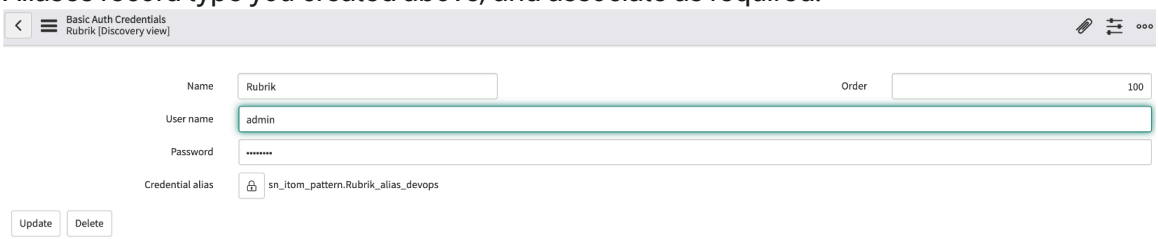
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Active	Option for enabling this schedule for discovery. Select this check box to enable discovery.

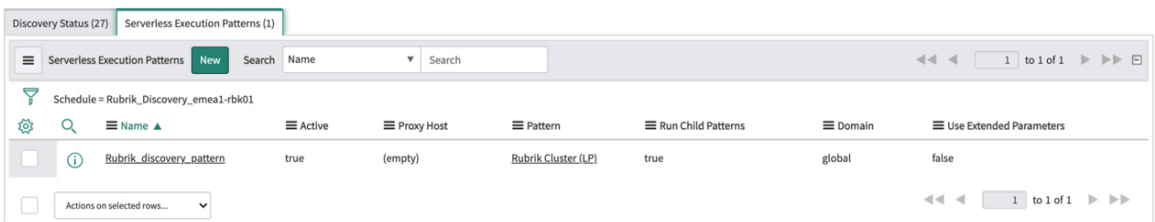
3. Right-click the header of the Discovery Schedule form and select **Save**.
4. Navigate to **Connections & Credential Aliases** and create a new Credential record type. In the Credentials related list form, create a new Basic Auth credential record type.



Note:
The credential alias can be associated with existing credentials. When creating a credential record you can also associate to it the credential alias. Click the **Credential alias** padlock icon in the Connections & Credential Aliases record type you created above, and associate as required.



5. Click the **Serverless Execution Patterns** tab.

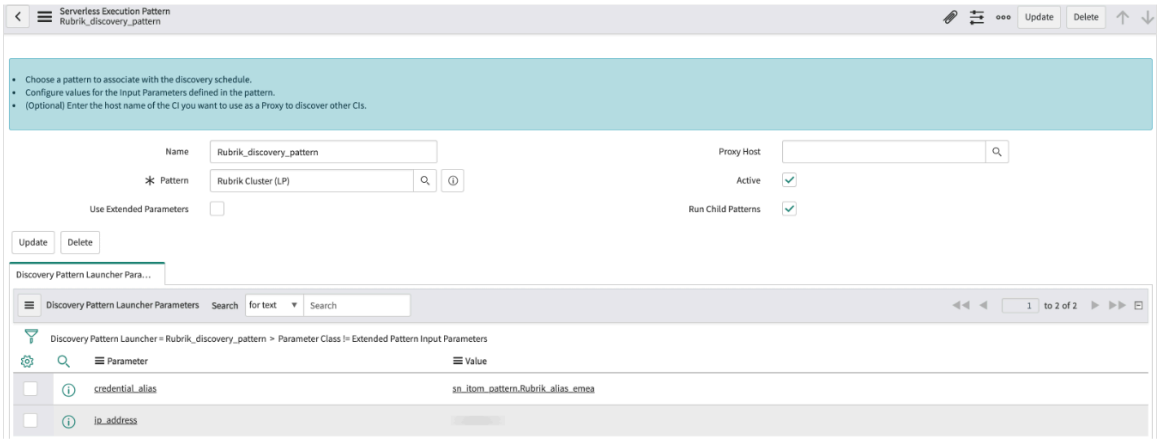


6. Ensure the Run Child Patterns column for the Rubrik discovery pattern is set to **true**. This triggers all the child patterns associated with the Rubrik discovery pattern. This is needed due to the Large Payload (LP) mechanism, used for discovery of the Rubrik cluster and all corresponding CI types.
7. Under **Discovery Pattern Launcher Parameters**, set the **credential_alias** and **ip_address** parameters, which serve as input parameters for triggering the Discovery schedule and the associated Rubrik discovery pattern.

   Set the **ip_address** with one of the IP addresses of any of the Rubrik nodes associated with the Rubrik cluster. Set the **credential_alias** with the ID of the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Credential record type created in **Connections & Credential Aliases**, which is related with the Rubrik credential Basic Auth record type.



Data collected by Discovery during horizontal discovery

Resources discovered by the Rubrik AIX Host (LP) pattern

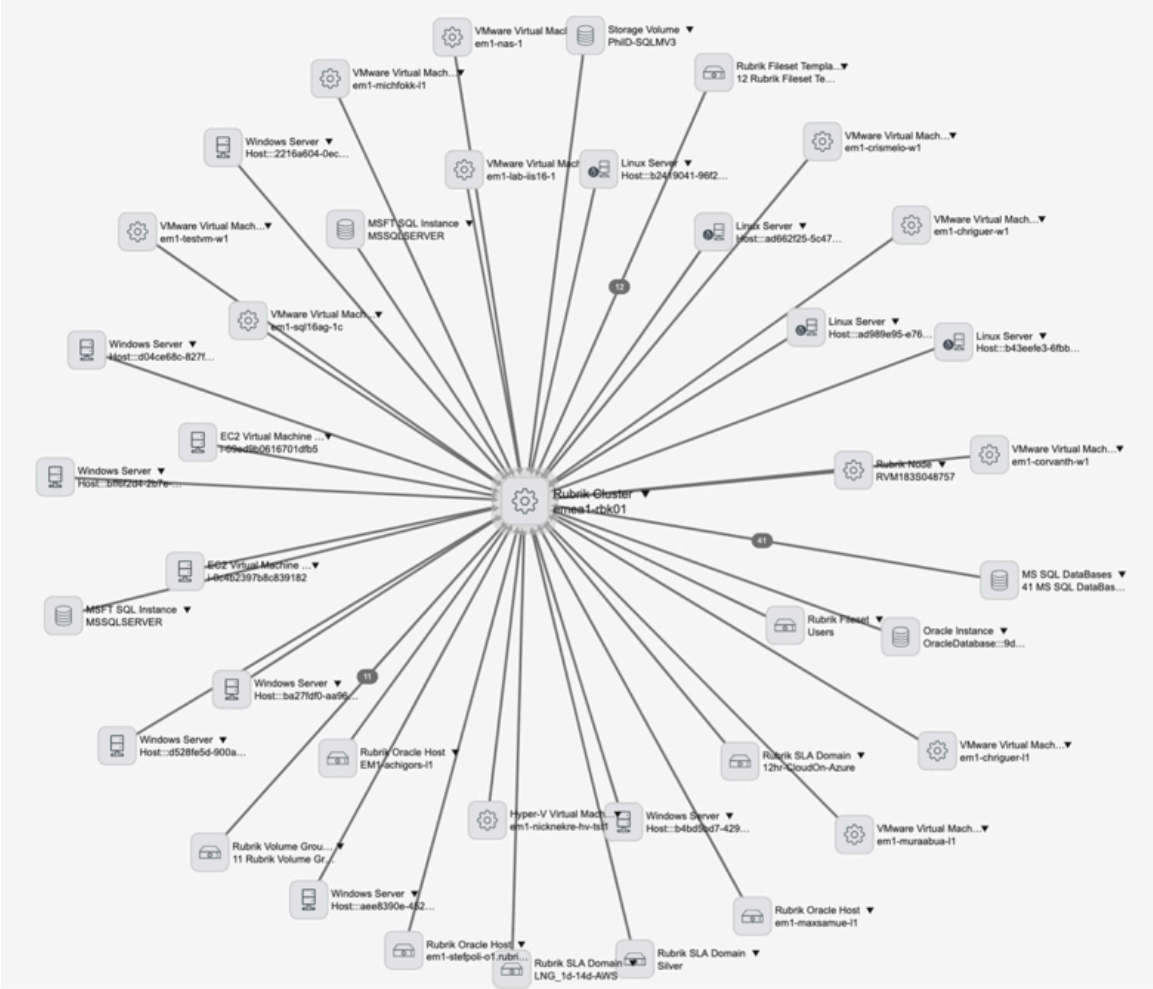
Field	Description
Rubrik AIX Host [cmdb_ci_aix_server]	
name	The name of the host.
host_name	The host name of the host.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
os	The operating system type configured on the host.
os_version	The operating system version, edition or distribution configured on the host.
operational_status	The current operational status of the host.

Resources discovered by the Rubrik Cluster (LP) pattern

Field	Description
Rubrik Cluster [cmdb_ci_rubrik_cluster]	
cluster_id	Unique ID of the Rubrik cluster.
name	The name of the Rubrik cluster.
cluster_version	The current version of the Rubrik cluster.
api_version	The API version of the Rubrik cluster.
timezone	The timezone used by the Rubrik cluster.

The Dependency Views map shows discovered cluster resources and the relationships between them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



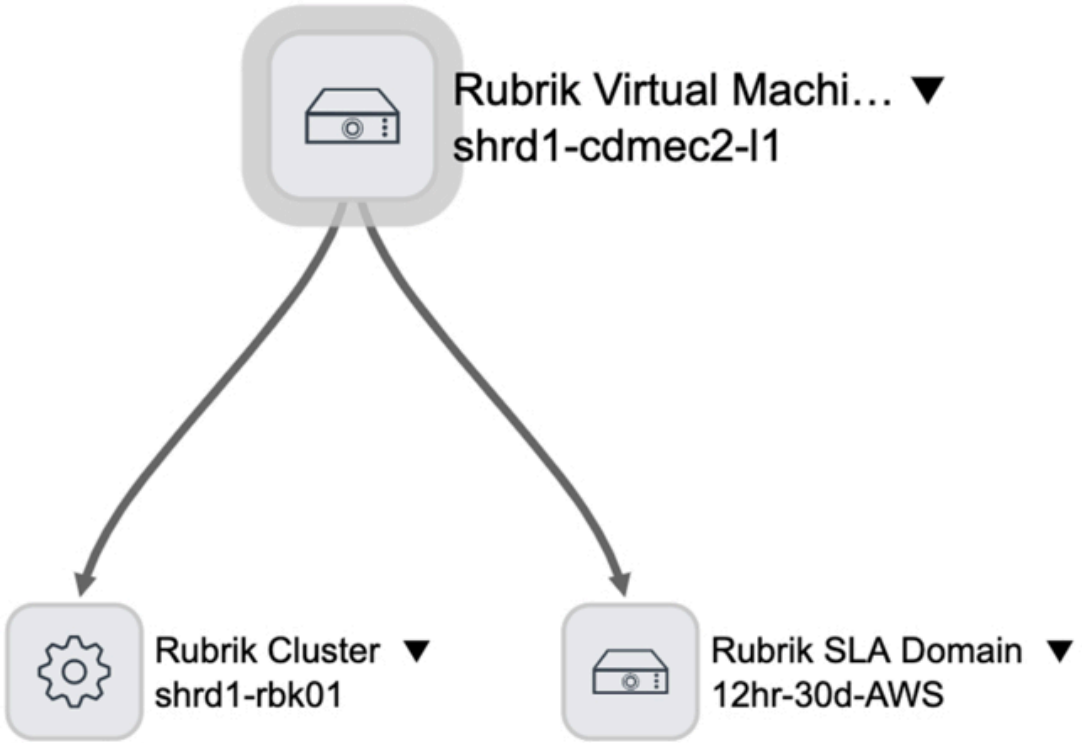
Resources discovered by the Rubrik EC2 Instance (LP) pattern

Field	Description
Rubrik EC2 Instance [cmdb_ci_rubrik_vm_instance]	
object_id	The ID of the EC2 instance in the Rubrik context.
name	The name of the EC2 instance in the AWS context.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
account_id	The ID of the AWS account associated with the EC2 instance.
account_name	The name of the AWS account associated with the EC2 instance.
instance_id	The ID of the EC2 instance in the AWS context.
instance_name	The name of the EC2 instance in the Rubrik context.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
instance_type	The template type of the EC2 instance.
region	The geographical region where the EC2 instance is located, in the AWS context.

The Dependency Views map shows discovered EC2 instances and the relationships between them.



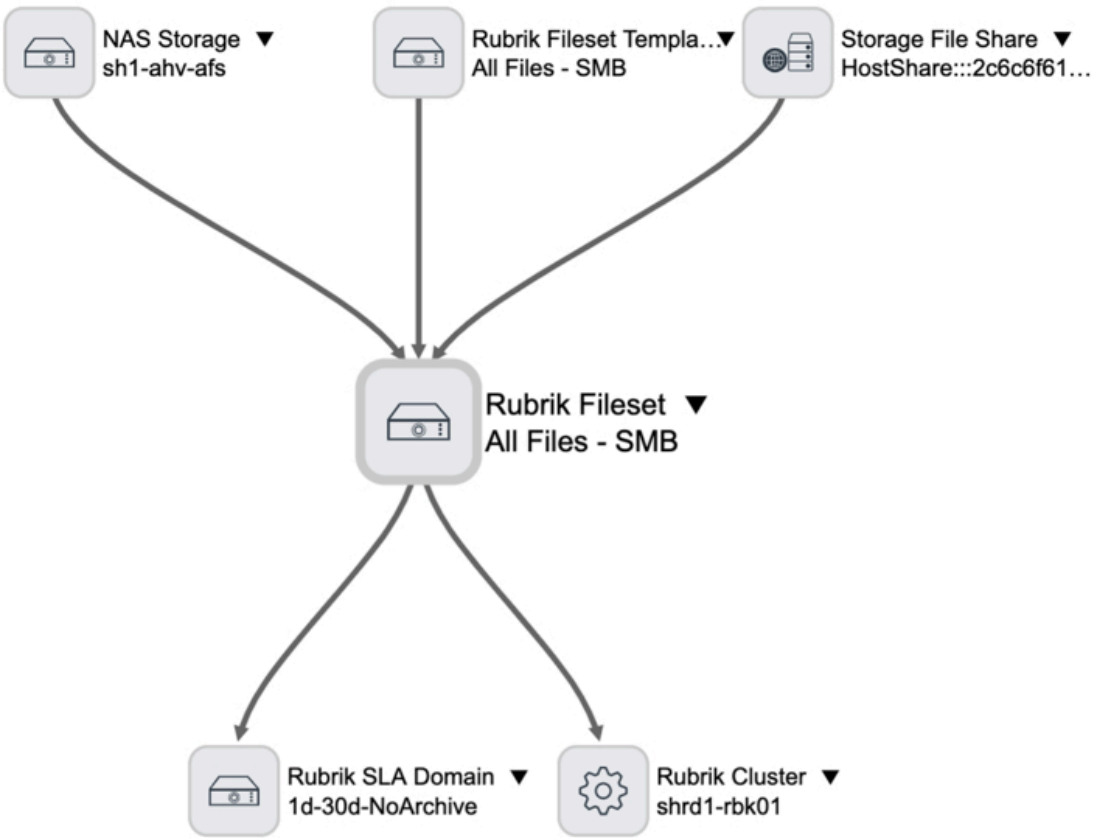
Resources discovered by the Rubrik Fileset (LP) pattern

Field	Description
Rubrik Fileset [cmdb_ci_rubrik_fileset]	
object_id	The ID of the Rubrik Fileset.
name	The name of the Rubrik Fileset.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
host_id	The ID of the host with which the Rubrik Fileset is associated.
template_id	The ID of the Rubrik Fileset Template, where the Rubrik Fileset defines resources from.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
share_id	The ID of the Rubrik Share owning the Rubrik Fileset.

The Dependency Views map shows discovered filesets and the relationships between them.

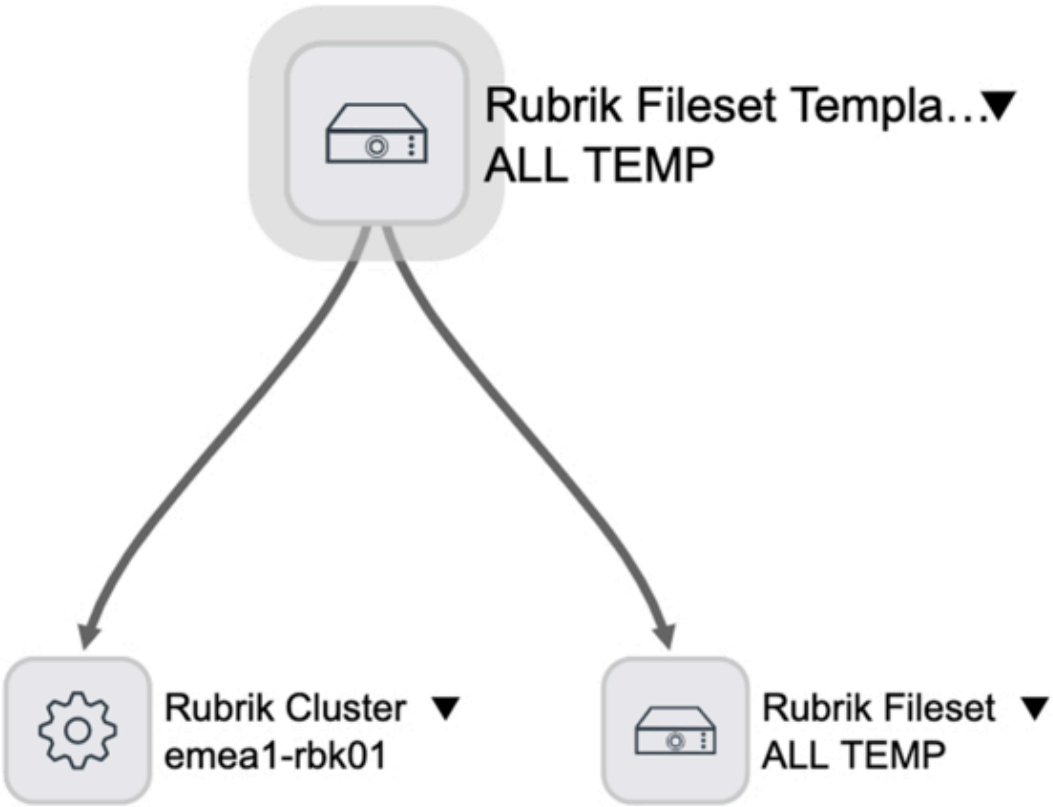


Resources discovered by the Rubrik Fileset Template (LP) pattern

Field	Description
Rubrik Fileset Template [cmdb_ci_rubrik_fileset_template]	
object_id	The ID of the Rubrik Fileset Template.
name	The name of the Rubrik Fileset Template.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
share_count	The count of shares associated with the Rubrik Fileset Template.
share_type	The type of shares associated with the Rubrik Fileset Template.
host_count	The host count associated with the Rubrik Fileset Template.
os_type	The operating system type associated with the Rubrik Fileset Template.

The Dependency Views map shows discovered fileset templates and the relationships between them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



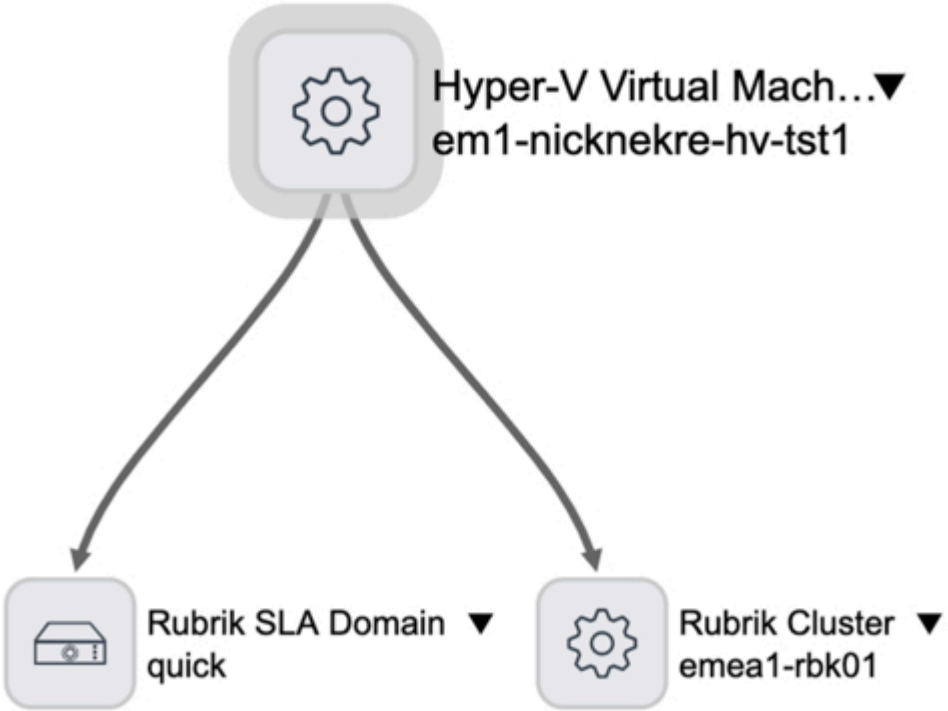
Resources discovered by the Rubrik Hyper-V Instance (LP) pattern

Note:
Discovery of Hyper-V instances only updates existing CIs. This is due to a limitation in the Rubrik REST API not returning the GUID (object_id) of the Hyper-V instance. If there is no match between the data from the REST API and the CMDB, no CIs are updated. In addition, when there is no match, the Rubrik Hyper-V Instance (LP) pattern completes in an 'Error' state, which is expected behavior.

Field	Description
Rubrik Hyper-V Instance [cmdb_ci_hyper_v_instance]	
name	The name of the Hyper-V instance.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
host_id	The ID of the host to which the Hyper-V instance is associated.

The Dependency Views map shows discovered Hyper-V instances and the relationships between them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

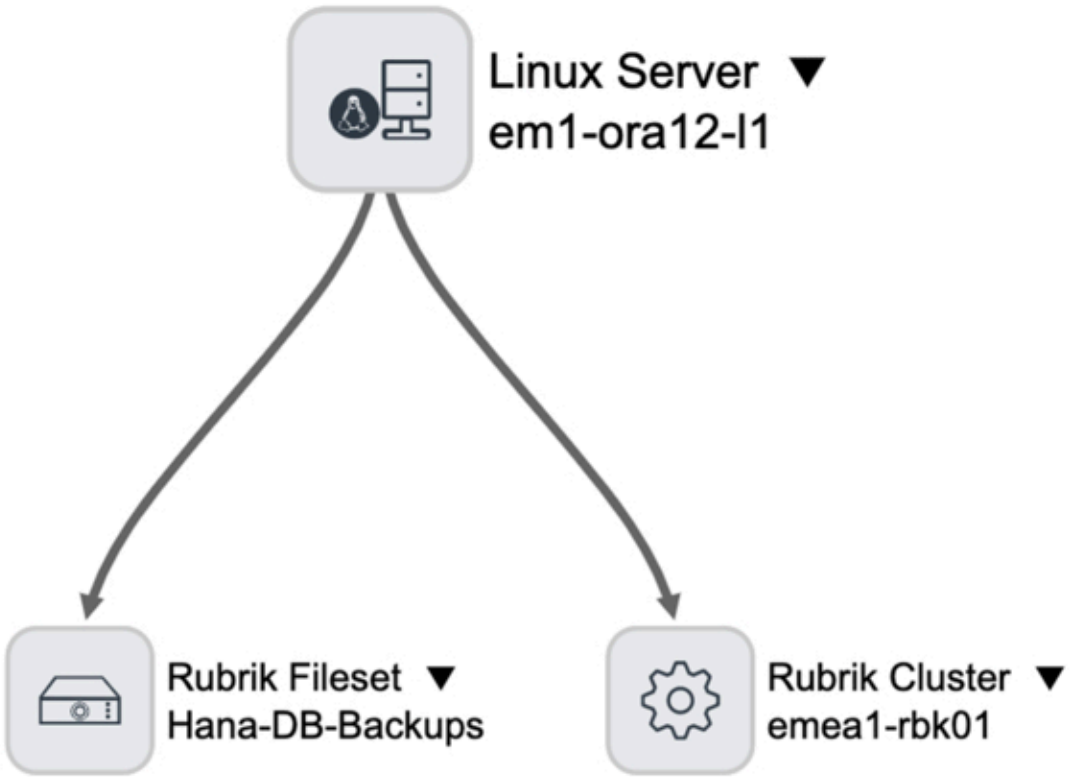


Resources discovered by the Rubrik Linux Host (LP) pattern

Field	Description
Rubrik Linux Host [cmdb_ci_linux_server]	
name	The name of the host.
host_name	The host name of the host.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
os	The operating system type configured on the host.
os_version	The operating system version, edition or distribution configured on the host.
operational_status	The current operational status of the host.

The Dependency Views map shows discovered hosts and the relationships between them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

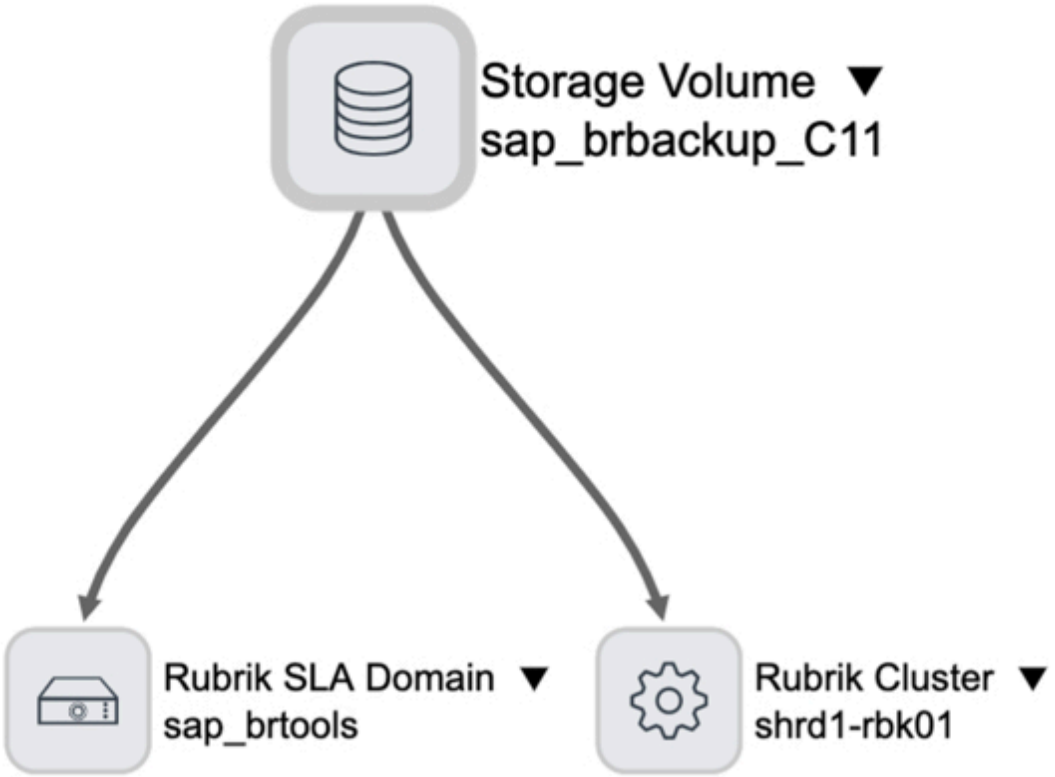


Resources discovered by the Rubrik Managed Volume (LP) pattern

Field	Description
Rubrik Managed Volume [cmdb_ci_storage_volume]	
object_id	The ID of the managed storage volume.
volume_id	The volume ID of the managed storage volume.
name	The name of the managed storage volume.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
size_bytes	The total capacity size in bytes of the storage volume.
used_size_bytes	The total used capacity size in bytes.
snapshot_count	The snapshot count of the managed storage volume.
share_type	The shared type of the managed storage volume.
state	The state of the managed storage volume.

The Dependency Views map shows discovered managed storage instances and the relationships between them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik MS SQL DB (LP) pattern

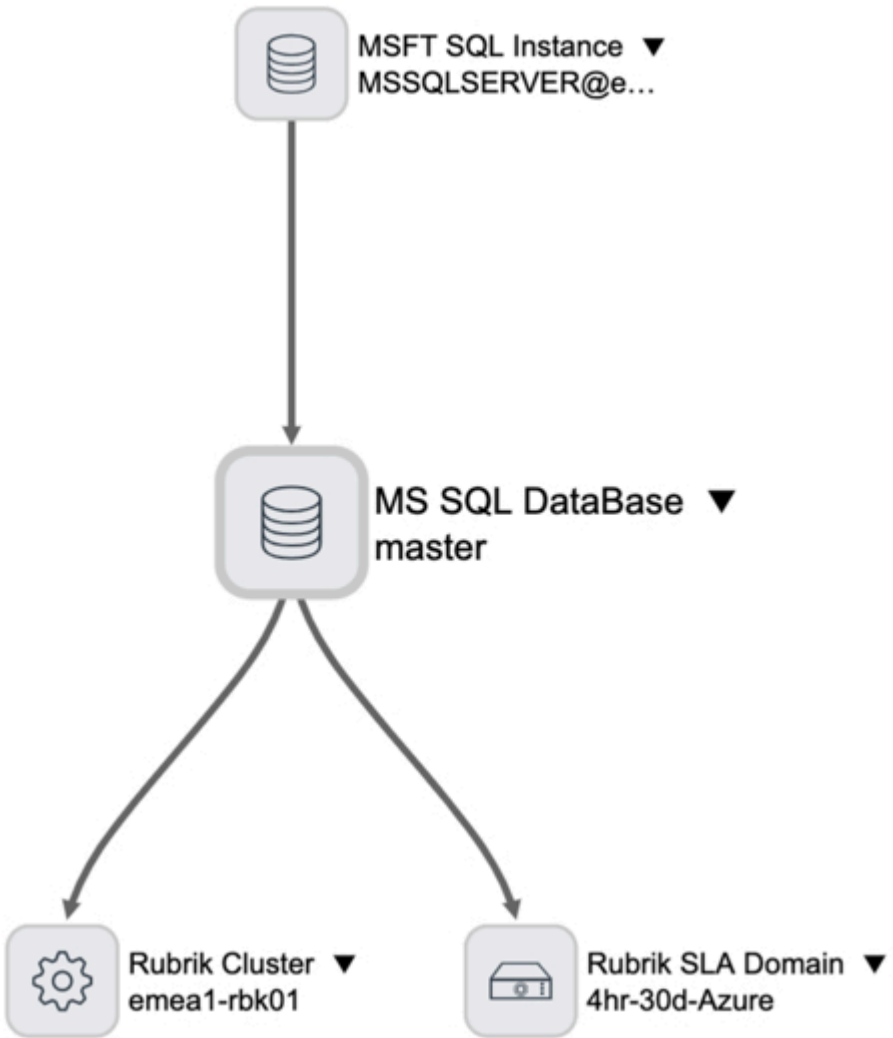
Note:
Relationships between MS SQL instances hosted on Windows clusters and the associated MS SQL databases are not supported from the 1.0.79 release onwards of the Discovery and Service Mapping Patterns application. This is due to insufficient information returned from the Rubrik REST API for Windows clusters. The MS SQL Instances and MS SQL databases associated to Windows clusters are filtered out from the Rubrik discovery associated patterns.

Field	Description
Rubrik MS SQL DB [cmdb_ci_db_mssql_database]	
database	The ID of the MS SQL database.
name	The name of the MS SQL database.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
host_id	The ID of the host where the MS SQL database is running.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
instance_id	The ID of the database instance, to which the MS SQL database is associated.
state	The state of the MS SQL database.
recovery_model	The recovery model type of the MS SQL database.
last_snapshot	The last snapshot of the MS SQL database, in the format YY-MM-DD HH-MM-SS.
missed_snapshot_count	The missed snapshot count of the MS SQL database.

The Dependency Views map shows discovered MS SQL DBs and the relationships between them.



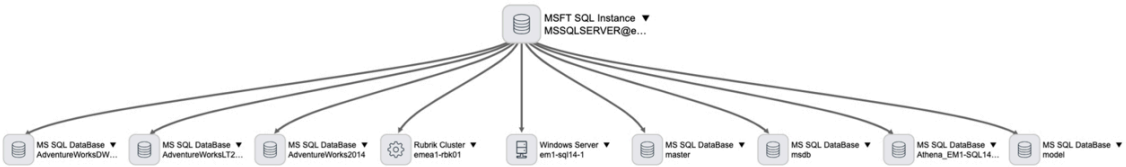
Resources discovered by the Rubrik MS SQL Instance (LP) pattern

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Relationships between MS SQL instances hosted on Windows clusters and the associated MS SQL databases are not supported from the 1.0.79 release onwards of the Discovery and Service Mapping Patterns application. This is due to insufficient information returned from the Rubrik REST API for Windows clusters. The MS SQL Instances and MS SQL databases associated to Windows clusters are filtered out from the Rubrik discovery associated patterns.

Field	Description
Rubrik MS SQL Instance [cmdb_ci_db_mssql_instance]	
instance_name	The ID of the MS SQL instance.
name	The name of the MS SQL instance.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
host_id	The ID of the host with which the MS SQL instance is associated.
version	The version of the MS SQL instance.

The Dependency Views map shows discovered MS SQL instances and the relationships between them.



Resources discovered by the Rubrik NAS Host (LP) pattern

Field	Description
Rubrik NAS Host [cmdb_ci_nas_storage]	
name	The name of the host.
host_name	The host name of the host.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
short_description	The vendor type of the NAS storage.
operational_status	The current operational status of the host.

The Dependency Views map shows discovered hosts and the relationships between them.

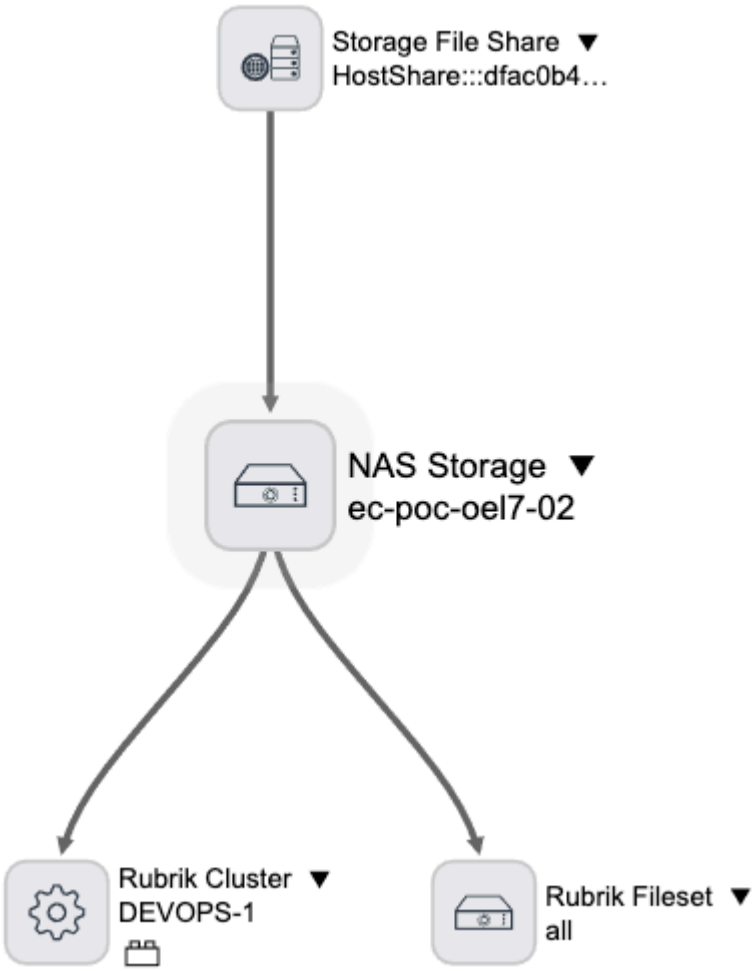
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik Node (LP) pattern

Field	Description
Rubrik Node [cmdb_ci_rubrik_node]	
brik_id	The Chassis ID of the Rubrik node.
name	The unique name of the Rubrik node, serving as the ID of the Rubrik node.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
unavailable_disks	True / False. Indicates any unavailable disks on the Rubrik node,
ip_address	The IP address of the Rubrik node associated with the Rubrik cluster.
tunnel_enabled	True / False. Indicates if tunneling is enabled for the Rubrik node.
cpu_core_count	The CPU cores count of the Rubrik node.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
ram	The amount of RAM memory (in MB) allocated for the Rubrik node.
[cmdb_ci_rubrik_node_disk]	
node_name	The name of the Rubrik node to which the disk is associated.
device_id	The ID of the Rubrik node disk, concatenated with the Rubrik node name in the format `ID@NODE_NAME`.
name	The name of the disk associated with the Rubrik node. The name includes the concatenation of the Rubrik node name, the ID of the disk and the type of the disk, in the format `NODE_NAME@DISK_ID@DISK_TYPE`.
size_bytes	The total capacity size in bytes.
unallocated_size_bytes	The total unallocated capacity size in bytes.
usable_size_bytes	The total available capacity size in bytes.
storage_type	The type of the storage disk: SSD or HDD.
storage_path	The location path of the storage disk.
operational_status	The operational status of the storage disk.

The Dependency Views map shows discovered nodes and node disks, and the relationships between them.

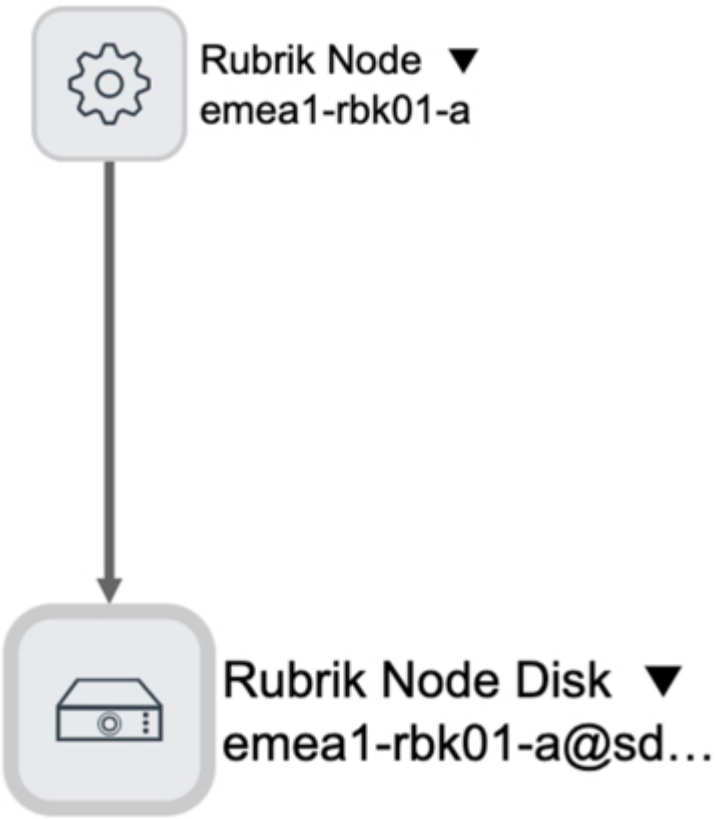
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik Nutanix Instance (LP) pattern

Field	Description
Rubrik Nutanix Instance [cmdb_ci_nutanix_vm_instance]	
object_id	The ID of the Nutanix VM instance.
vm_inst_id	The ID of the Nutanix VM instance.
name	The name of the Nutanix VM instance.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
vm_cluster_id	The cluster ID to which the Nutanix VM instance belongs.
vm_cluster_name	The cluster name to which the Nutanix VM instance belongs.
os_type	The operating system type configured on the Nutanix VM instance.

The Dependency Views map shows discovered Nutanix instances and the relationships between them.

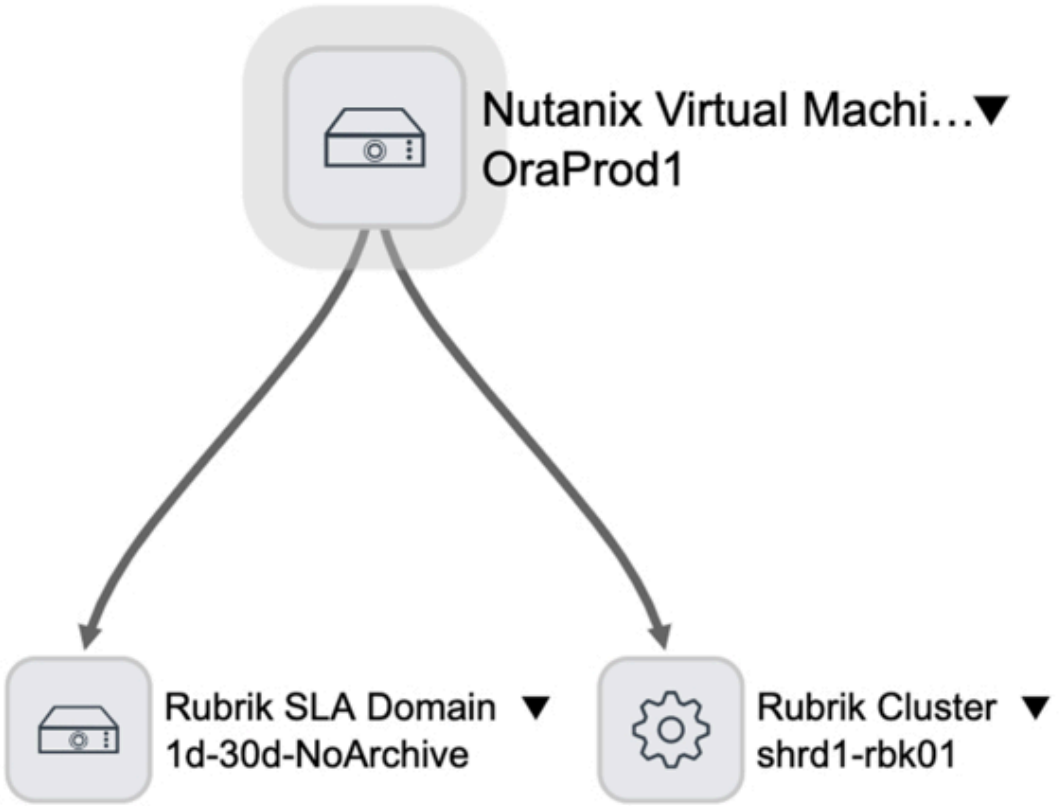
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik Oracle DB (LP) pattern

Field	Description
Rubrik Oracle DB [cmdb_ci_db_ora_instance]	
sid	The Oracle system ID of the database.
name	The ID of the Oracle database in the Rubrik context.
database_name	The name of the Oracle database.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
rac_id	The ID of the Oracle RAC (Real Application Cluster), to which the database is part of.
host_id	The ID of the host, where the Oracle database is running.
instance	The Oracle instance ID managing the database associated data.
Instance_count	The Oracle instances count managing the database associated data.

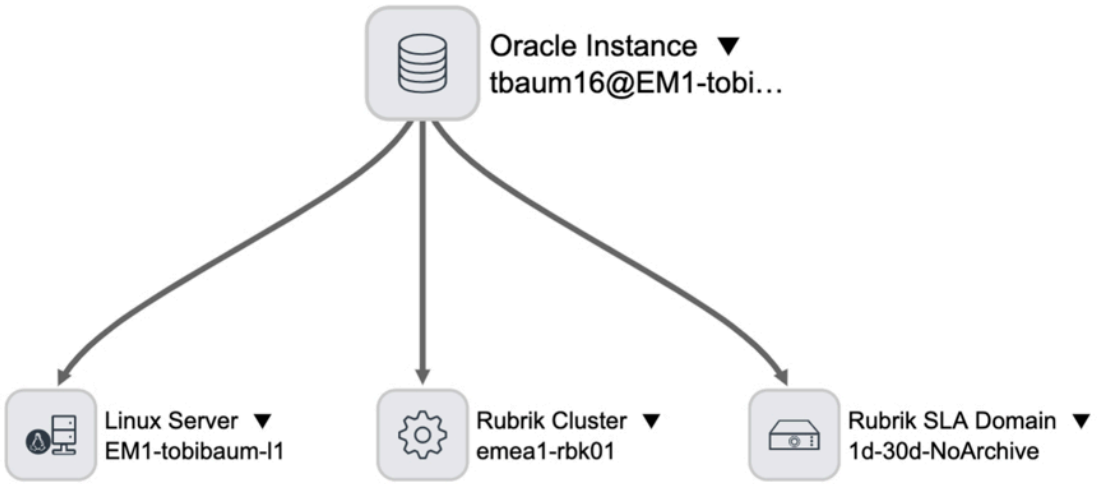
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
last_snapshot	The last snapshot of the Oracle database, in the format YY-MM-DD HH-MM-SS.
missed_snapshot_count	The missed snapshot count of the Oracle database.
tablespaces_count	The count of the logical storage units associated with the Oracle database.

The Dependency Views map shows discovered Oracle DBs and the relationships between them.



Resources discovered by the Rubrik Oracle RAC (Real Application Cluster) (LP) pattern

Field	Description
Rubrik Oracle RAC [cmdb_ci_rubrik_db_ora_rac]	
object_id	The ID of the Rubrik Oracle RAC.
name	The name of the Rubrik Oracle RAC.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
db_count	The count of databases associated with the Rubrik Oracle RAC.
node_count	The count of the nodes participating in the Rubrik Oracle RAC.
state	The state of the Rubrik Oracle RAC.

The Dependency Views map shows discovered Oracle RACs and the relationships between them.

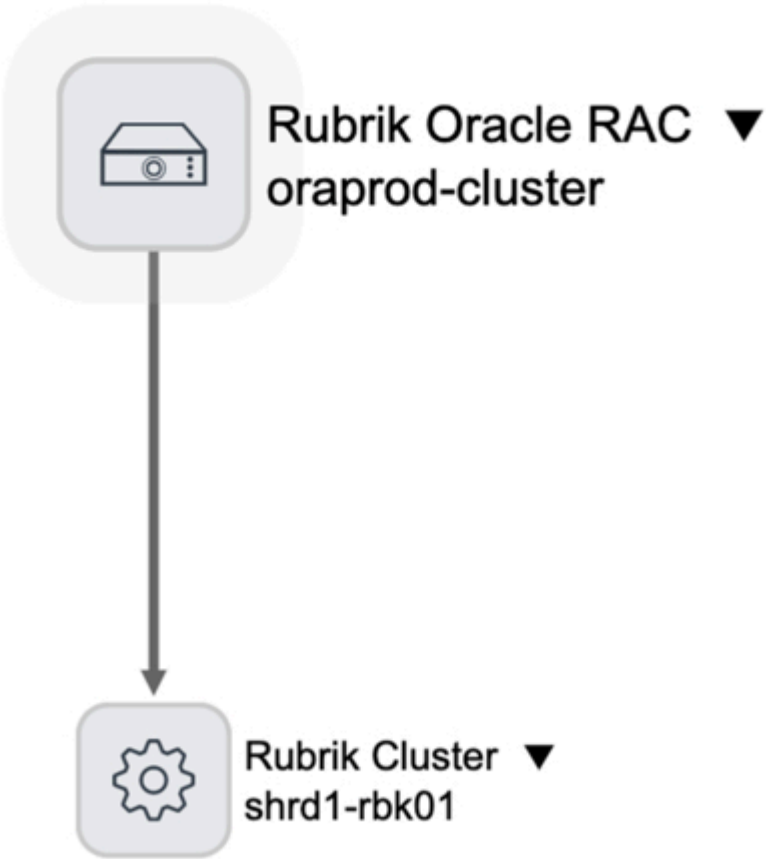
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik Share (LP) pattern

Field	Description
Rubrik Share [cmdb_ci_storage_fileshare]	
name	The ID of the host share.
path	The export point of the host share.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
host_id	The ID of the host with which the host share is associated.
share_type	The share type of the host share.
vendor_type	The vendor type of the host share.
status	The current state of the host share.

The Dependency Views map shows discovered host shares and the relationships between them.

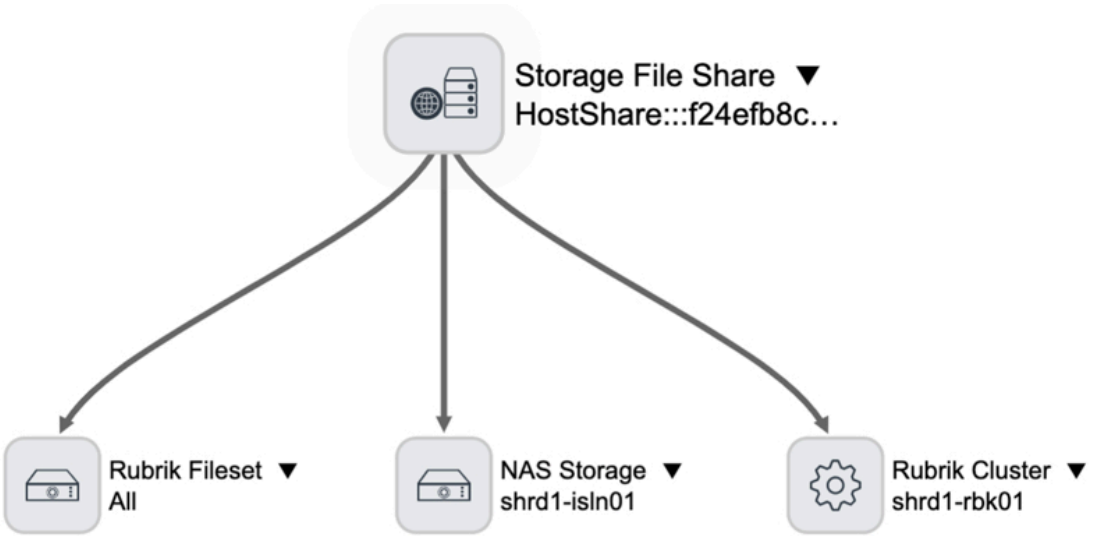
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik SLA Domain (LP) pattern

Field	Description
Rubrik SLA Domain [cmdb_ci_rubrik_sla_domain]	
object_id	The ID of the Rubrik SLA domain policy.
name	The name of the Rubrik SLA domain policy.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
max_local_retention_limit	The maximum local retention limit of the SLA domain policy.

The Dependency Views map shows discovered SLA domains and the relationships between them.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Resources discovered by the Rubrik Solaris Host (LP) pattern

Field	Description
Rubrik Solaris Host [cmdb_ci_solaris_server]	
name	The name of the host.
host_name	The host name of the host.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
os	The operating system type configured on the host.
os_version	The operating system version, edition or distribution configured on the host.
operational_status	The current operational status of the host.

Resources discovered by the Rubrik VMware Instance (LP) pattern

Note:
Discovery of VMware instances only updates existing CIs. This is because the regular vCenter discovery does not use the IRE (Identification and Reconciliation Engine) and the Rubrik VMware pattern will create duplicates. If there is no match between the data from the REST API and the CMDB, no CIs are updated. In addition, when there is no match, the Rubrik VMware Instance (LP) pattern completes in an 'Error' state, which is expected behavior.

Field	Description
Rubrik VMware Instance [cmdb_ci_vmware_instance]	
object_id	The ID of the VMware instance.
name	The name of the VMware instance.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
host_id	The ID of the VMware host.
host_name	The name of the VMware host.
vm_cluster_name	The cluster name to which the virtual machine instance belongs.
ip_address	The IP address of the VMware instance, if assigned.
guest_os_fullname	The guest operating system type.
state	The state of the VMware instance.

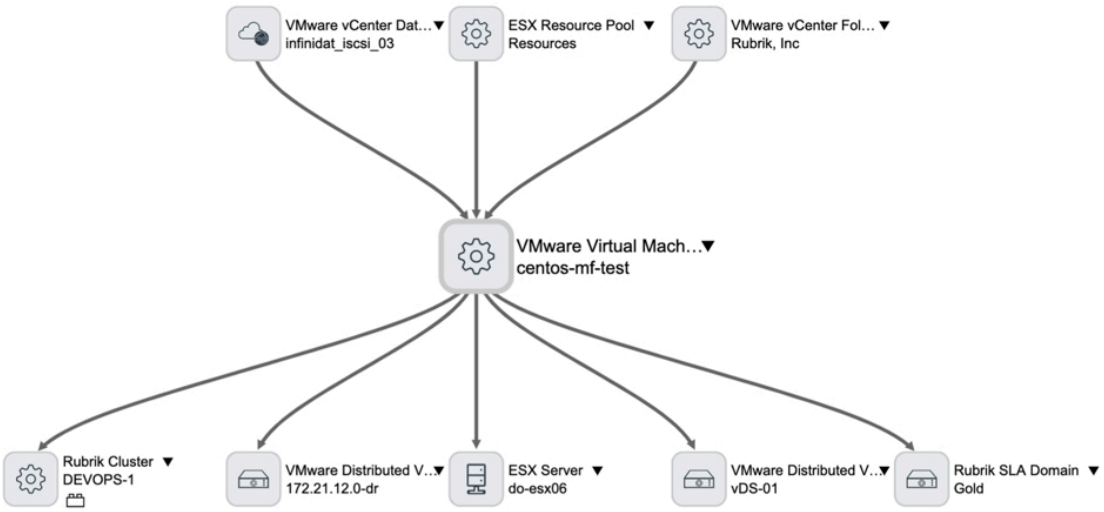
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Dependency Views map shows discovered VMware instances and the relationships between them.



Resources discovered by the Rubrik Volume Group (LP) pattern

Field	Description
Rubrik Volume Group [cmdb_ci_rubrik_volume_group]	
object_id	The ID of the volume group.
volume_id	The volume ID of the volume group.
name	The name of the volume group.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
effective_sla_domain	The ID of the Rubrik SLA Domain.
effective_sla_domain_name	The name of the Rubrik SLA Domain. See also: [cmdb_ci_rubrik_sla_domain]
host_id	The ID of the host with which the volume group is associated.

The Dependency Views map shows discovered volume groups and the relationships between them.

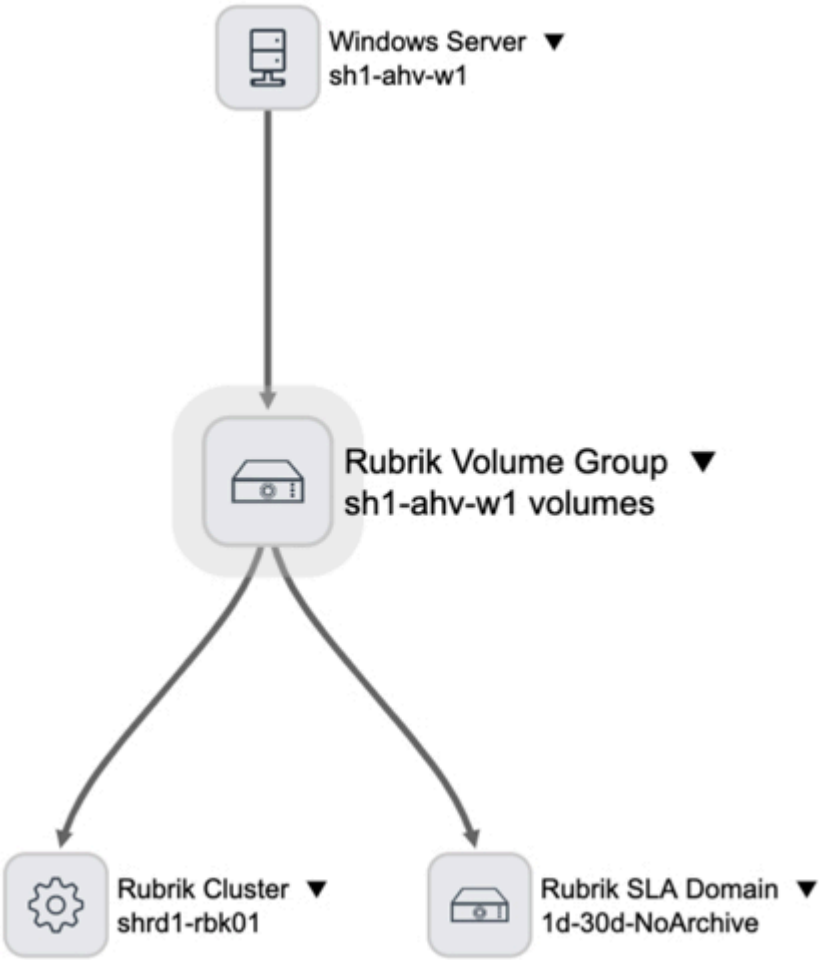
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Resources discovered by the Rubrik Windows Host (LP) pattern

Field	Description
Rubrik Windows Host [cmdb_ci_win_server]	
name	The name of the host.
host_name	The host name of the host.
cluster_id	The ID of the Rubrik cluster.
cluster_name	The name of the Rubrik cluster. See also: [cmdb_ci_rubrik_cluster]
os	The operating system type configured on the host.
os_version	The operating system version, edition or distribution configured on the host.
operational_status	The current operational status of the host.

The Dependency Views map shows discovered hosts and the relationships between them.

Veritas Cluster Server discovery

The ServiceNow Discovery application uses the Unix Cluster – VERITAS Cluster pattern to find Veritas Cluster Server components. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

You can use this pattern on the ServiceNow AI Platform using Kingston Patch 8, London, or Madrid.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

SSH credentials

On the ServiceNow AI Platform®, configure the SSH credentials for a user with elevated rights for running the *cat* command. For more information about commands, see Service Mapping commands requiring a privileged user under Service Mapping documentation.

Permissions to read the Veritas Cluster Server configuration file

Give the Unix OS user permissions to read the following configuration file: `/etc/VRTSvcs/conf/config/main.cf`.

Permissions to run Veritas Cluster commands

Give the Unix OS user permissions to run the following commands against the Veritas Cluster Server:

Command	Parameter	Mandatory/Optional	Description
“privilege user” + cat /etc/VRTSvcs/conf/config/main.cf	-	Mandatory	Read the Veritas Cluster Server configuration file.
“privilege user” + /opt/VRTSvcs/bin/haclus -value ClusterUUID 2>/dev/null	-	Mandatory	Get the Veritas Cluster Server cluster UUID.
“privilege user” + /opt/VRTSvcs/bin/haclus -value ClusterName 2>/dev/null	-	Mandatory	Get the Veritas Cluster Server cluster name.
“privilege user” + /opt/VRTSvcs/bin/haclus -value EngineVersion	-	Mandatory	Get the Veritas Cluster Server cluster version.
“privilege user” + /opt/VRTSvcs/bin/haclus -value ClusterAddress	-	Mandatory	Get the Veritas Cluster Server cluster address.
“privilege user” + /opt/VRTSvcs/bin/haclus -value ClusState	-	Mandatory	Get the Veritas Cluster Server cluster status.
“privilege user” + /opt/VRTSvcs/bin/hasys -state	-	Mandatory	Get the Veritas Cluster Server cluster nodes.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

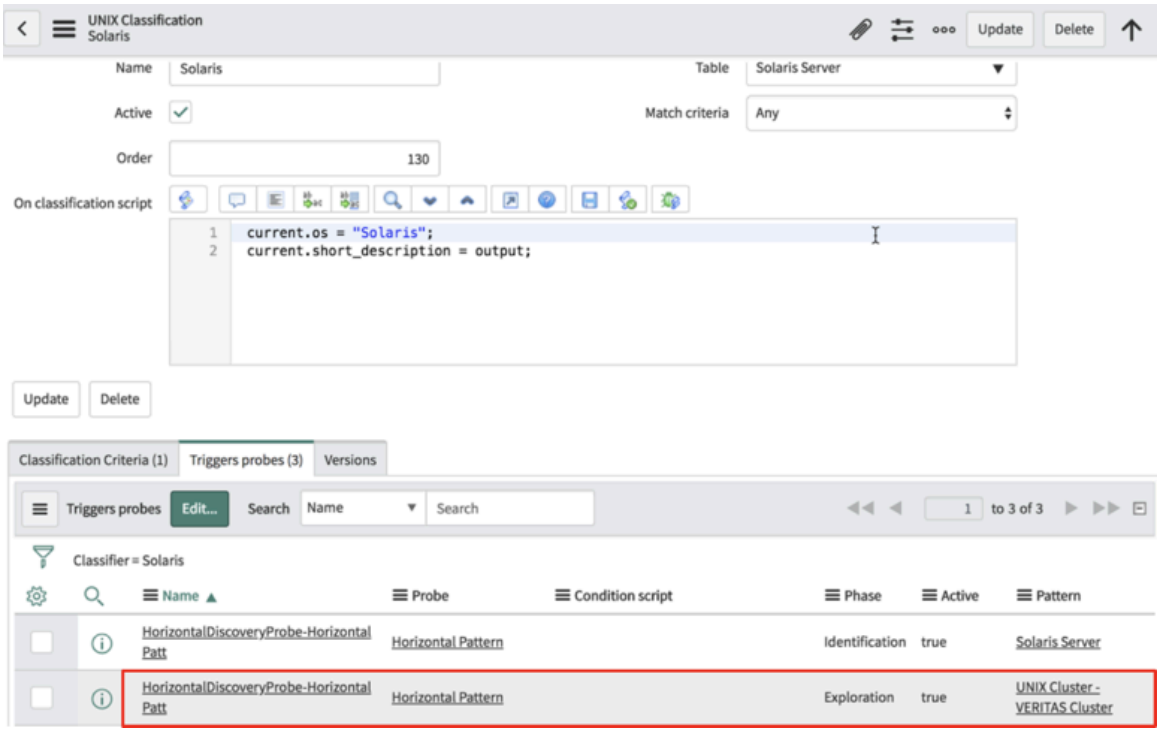
Command	Parameter	Mandatory/Optional	Description
“privilege user” + /opt/VRTSvcs/bin/hares -state	-	Mandatory	Get the cluster resources of the Veritas Cluster Server.
“privilege user” + /opt/VRTSvcs/bin/hares -display | grep -w 'Type' |grep 'global' 2>/dev/null	-	Mandatory	Get the cluster resource type of the Veritas Cluster Server.
“privilege user” + /opt/VRTSvcs/bin/hares -display | grep Group 2>/dev/null	-	Mandatory	Get the cluster resource group of the Veritas Cluster Server.
“privilege user” + /opt/VRTSvcs/bin/hagrp -state 2>/dev/null	-	Mandatory	Get the resource group name and status of the Veritas Cluster Server.

Classification probe for triggering the UNIX Cluster – VERITAS Cluster pattern

Verify that the classification probe is set to trigger the UNIX Cluster – VERITAS Cluster pattern:

1. Navigate to **Discovery Definition** > **CI Classification** > **CI Classification** > **UNIX**.
2. In the **UNIX Classification** list, click **Solaris** or **Linux**.
3. On the **Triggers probes** tab, check that the *HorizontalDiscoveryProbe-HorizontalPatt* probe is assigned to the *UNIX Cluster – VERITAS Cluster* pattern.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Note:
The discovery log shows the error for OS discovery step even if the discovery finished successfully.

System property for the new host class

Add a system property [sys_property] *sa.host_classes* and set the value to cmdb_ci_unix_cluster. Creating a new host class for Veritas Cluster servers helps to identify this type of hosts correctly.

Limitations

You cannot customize the Unix Cluster – VERITAS Cluster pattern in the Debug mode in the Pattern Designer.

Data collected by Discovery during horizontal discovery

Table and field	Description
Unix Cluster [cmdb_ci_unix_cluster]	The attributes of the Unix Cluster.
IP address [ip_address]	
Cluster type [cluster_type]	
Name [name]	
Cluster version [cluster_version]	
Cluster status [cluster_status]	
Unix Cluster Node [cmdb_ci_unix_cluster_node]	The attributes of the Unix Cluster Node.
Name [name]	
Cluster [cluster]

Unix Cluster resource group [cmdb_ci_unix_cluster_resource_group]	Contains: Contained by	Unix Cluster resource [cmdb_ci_unix_cluster_resource]

VMware NSX Advanced load balancer discovery

The ServiceNow Discovery application uses the VMware NSX Advanced load balancer discovery pattern to find VMware NSX load balancers. Discovering some of these resources requires updating the Discovery and Service Mapping Patterns application from the ServiceNow Store.

The pattern uses a set of REST APIs to find the load balancers. It is triggered by the NSX HTTP classifier that responds to the **HTTP - Classify** probe. For more information, see HTTP device discovery.

Note:
There are two patterns available. The legacy VMware NSX Load Balancer pattern is for the S series. The new VMware NSX-T Load Balancer pattern is for the T series. The functionality and collected information remain the same.

Request apps on the Store

Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.

Prerequisites

Enable NSX Basic Authentication

In VMware NSX, enable NSX Basic Authentication.

Verify that the applications are up to date

- CMDB CI Class Models
- Visibility Content
- Discovery and Service Mapping Patterns

Configure basic authentication credentials

On the ServiceNow AI Platform, configure basic authentication credentials. The credentials must have the following API permissions:

- NSX:
  - /api/4.0/edges
  - /api/4.0/edges/<edge_id>loadbalancer/config
- NSX-T: /api/v1/edge-clusters

For more information about basic authentication credentials, see Basic authentication credentials.

Verify HTTP discovery is triggered against the NSX Main Controller IP

The HTTP discovery is triggered only if SSH or SNMP discovery is unsuccessful.

Create a discovery schedule

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create the discovery schedule for VMware NSX load balancer discovery or run a quick discovery on the IP address of the NSX Main Controller. For more information about running a quick discovery, see Run a Quick Discovery.

Data collected by Discovery for VMware NSX Advanced load balancer

Discovery populates the data in the CMDB when running the VMware NSX Advanced load balancer patterns.

NSX Load Balancer [cmdb_ci_nsx_lb]

Field	Description
Name [name]	Edge name.
Object ID [object_id]	Edge ID.
IP Address [ip_address]	IP address of the NSX Main Controller.
Operational status [operational_status]	Load balancer status: Active or inactive.

Load Balancer Service [cmdb_ci_lb_service]

Field	Description
Name [name]	Virtual server name.
IP Address [ip_address]	Virtual server IP address.
Object ID [object_id]	Virtual server object ID.
Port [port]	Virtual server port with which to communicate.
Listener Protocol [listener_protocol]	Listener protocol. For example: HTTP, HTTPS.

Load Balancer Pool [cmdb_ci_lb_pool]

Field	Description
Name [name]	Pool name.
Object ID [object_id]	Pool object ID.

Load Balancer Pool Member [cmdb_ci_lb_pool_member]

Field	Description
Name [name]	Pool member name.
IP Address [ip_address]	Pool member IP address.
Object ID [object_id]	Pool member object ID.
Service port [service_port]	Pool member port with which to communicate.

Cloud Load Balancer Health Service [cmdb_ci_lb_health_service]

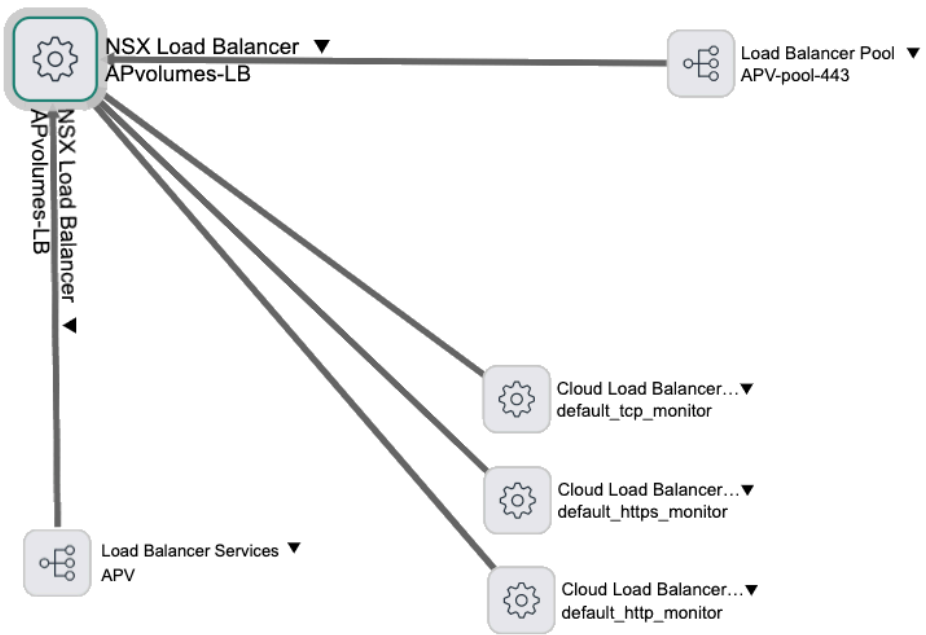
Field	Description
Name [name]	Monitor name.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Load Balancer Health Service [cmdb_ci_lb_health_service] (continued)

Field	Description
Object ID [object_id]	Monitor object ID.
Timeout in seconds [timeout_sec]	Time in seconds to wait for a response.
Interval in seconds [check_interval_sec]	Interval in seconds after which the monitor sends the request again.
Monitor type protocol [monitor_type]	Monitor type. For example: HTTP, HTTPS, TCP.
Request path [request_path]	Path where the monitor sends the request.
Max retries [max_retries]	The maximum number of times the resource is tested before it is declared "Down".

The Dependency Views map shows all discovered load balancer CIs and the relationships between them.



CI relationships

Discovery creates these relationships to support the VMware NSX load balancer discovery.

CI	Relationship	CI
Load Balancer Service [cmdb_ci_lb_service]	Runs on::Runs	NSX Load Balancer [cmdb_ci_nsx_lb]
Load Balancer Service [cmdb_ci_lb_service]	Uses::Used by	Load Balancer Pool [cmdb_ci_lb_pool]
Load Balancer Pool [cmdb_ci_lb_pool]	Hosted on::Hosts	NSX Load Balancer [cmdb_ci_nsx_lb]

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

CI	Relationship	CI
Load Balancer Pool [cmdb_ci_lb_pool]	Owns::Owned by	Load Balancer Pool Member [cmdb_ci_lb_pool_member]
Cloud Load Balancer Health Service [cmdb_ci_lb_health_service]	Hosted on::Hosts	NSX Load Balancer [cmdb_ci_nsx_lb]
Cloud Load Balancer Health Service [cmdb_ci_lb_health_service]	Used by::Uses	Load Balancer Pool [cmdb_ci_lb_pool]

Troubleshooting

If the mapping process does not proceed as you expected, follow the following suggestions.

Symptom	Cause	Solution
Discovery fails. The discovery message contains the information about an error caused by the REST timeout.	There are many CIs sending the REST call response in the deployment. The MID Server cannot process the REST call response without exceeding the time limit controlled by the *mid.sa.cloud.request_timeout* parameter.	By default, the *mid.sa.cloud.request_timeout* parameter is set to 30000 milliseconds. Increase the value of this parameter on the relevant MID Server and run discovery again. **Note:** If the **Configuration Parameters** related list for the relevant MID Server does not show this parameter, you may need to add it.
Pattern Designer fails during a debug session. The Pattern Designer message contains information about an error caused by a timeout.	The Pattern Designer fails because of a timeout during pattern debugging (and not during discovery).	By default, the *sa.debugger.max_timeout* parameter is set to 240 seconds. Increase the value of this parameter on the relevant MID Server.

Configuring Pattern Designer and related applications

Install the latest available versions of the ServiceNow applications to use the latest discovery patterns.

The Pattern Designer (com.snc.pattern.designer) application provides the UI for creating or customizing discovery patterns. Pattern Designer is automatically installed with Discovery or Service Mapping. The patterns themselves are released using dedicated pattern applications.

The following user roles have access to Pattern Designer and can perform various actions. Note that customizing patterns requires basic knowledge of programming.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pattern Designer users and access

User	Description
PD user	Has read-only access to **Discovery Pattern Log**.
PD admin	Can view, create, edit, and publish patterns.
PDE viewer	Starting with Pattern Designer Enhancements version 3.9.0, users can view **Command Validation Tasks**, **Command Validation Tasks Results**, and **Command List**. The pde_viewer can view the **Command Validation Tool** modules and related tables, but doesn't have permissions to modify or edit them. The pde_viewer role can view the following tables only: • Command List [pd_command_list] • Command Validation Task [pd_command_validation] • Command Validation Task Results [pd_command_validation_results] • Pattern Shared Library Mapping [pd_pattern_to_shared_library_mapping] • Temporary Variable Mappings [pd_temp_variable_value_mapping] For more information, see Discovery commands for probes and patterns.
PD MID	Not assigned to a user directly but to the MID Server record or the user under which the MID Server runs. The role enables the MID Server to interpret and run pattern-based probes.

ServiceNow releases all discovery patterns using the following applications:

Discovery and Service Mapping Patterns (sn_itom_pattern)

This application provides the latest versions of discovery patterns the original version of which ServiceNow released on ServiceNow Store.

Visibility Content (sn_pattern_design)

This application supplies the updated version of the patterns that were part of the family releases up until Tokyo.

You can install the latest available versions of the pattern applications from the ServiceNow Store. Alternatively, you can install these applications as plugins on your ServiceNow instance.

Check which plugin contains a required pattern

Since ServiceNow releases discovery patterns using two different plugins, you may need to check which plugin to install or upgrade.

Before you begin

Role required: service_mapping_admin

About this task

ServiceNow releases all discovery patterns using the following applications:

Discovery and Service Mapping Patterns (sn_itom_pattern)

This application provides the latest versions of discovery patterns the original version of which ServiceNow released on ServiceNow Store.

Visibility Content (sn_pattern_design)

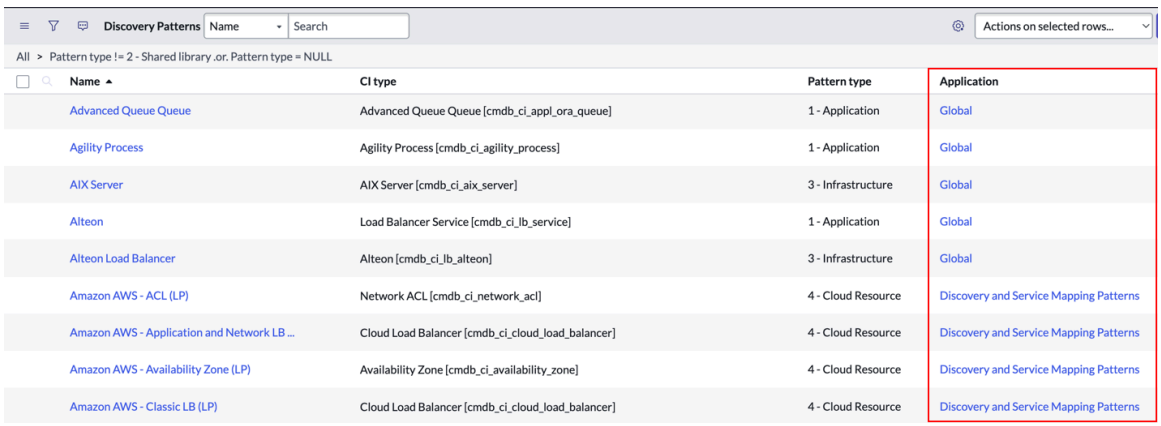
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This application supplies the updated version of the patterns that were part of the family releases up until Tokyo.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Display the **Application** column.
   a. Click **Personalize List**.
   b. In the Personalize List Columns dialog box, select **Application** under **Available**, and click the right arrow.
3. **Optional:** You can filter out shared libraries to see only patterns in the list.
4. Search for the relevant pattern in the list.
5. Check to which application it belongs.

   Global stands for Visibility Content.



Name	CI type	Pattern type	Application
Advanced Queue Queue	Advanced Queue Queue [cmdb_ci_appl_ora_queue]	1 - Application	Global
Agility Process	Agility Process [cmdb_ci_agility_process]	1 - Application	Global
AIX Server	AIX Server [cmdb_ci_aix_server]	3 - Infrastructure	Global
Alteon	Load Balancer Service [cmdb_ci_lb_service]	1 - Application	Global
Alteon Load Balancer	Alteon [cmdb_ci_lb_alteon]	3 - Infrastructure	Global
Amazon AWS - ACL (LP)	Network ACL [cmdb_ci_network_acl]	4 - Cloud Resource	Discovery and Service Mapping Patterns
Amazon AWS - Application and Network LB ...	Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	4 - Cloud Resource	Discovery and Service Mapping Patterns
Amazon AWS - Availability Zone (LP)	Availability Zone [cmdb_ci_availability_zone]	4 - Cloud Resource	Discovery and Service Mapping Patterns
Amazon AWS - Classic LB (LP)	Cloud Load Balancer [cmdb_ci_cloud_load_balancer]	4 - Cloud Resource	Discovery and Service Mapping Patterns

Install Discovery and Service Mapping Patterns

You can install the Discovery and Service Mapping Patterns application (sn_itom_pattern) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Discovery and Service Mapping Patterns application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

Multiple tables are installed with Discovery and Service Mapping Patterns.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Discovery and Service Mapping Patterns application (sn_itom_pattern) using the filter criteria and search bar.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box that is displayed, any dependencies that are installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Install Visibility Content

You can install the Visibility Content application (sn_pattern_design) if you have the admin role.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the Visibility Content application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

Role required: admin

About this task

Multiple tables are installed with Visibility Content.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Visibility Content application (sn_pattern_design) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   In the list next to the **Install** button, the versions that are available to you are displayed.

3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box that is displayed, any dependencies that are installed with your application are listed.

4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

Password2 encryption for patterns

The Password (two-way encrypted) field type is used to encrypt and decrypt data. The field type works in accordance with NIST 800-57 guidelines and provides FIPS 140-2-L3 protection.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Password2 is a text field that stores sensitive data with two-way encryption. The two-way encryption stores the data as a secure encrypted value that can be decrypted within the ServiceNow AI Platform instance.

From Quebec, Key Management Framework enables you to manage keys used for Password2 fields. However, the implementation of Password2 is required on a ServiceNow AI Platform using the Rome release or later.

Note:
Only newly created records containing Password2 fields are two-way encrypted. Existing data is not automatically converted to use Password2 encryption.

Verify Password2 implementation

Discovery and Service Mapping Patterns store app

Verify that the Discovery and Service Mapping Patterns store app (version 1.0.76) is installed.

Verify Password2 is included in XML records

View the XML records in the ServiceNow AI Platform instance, and verify that the encryption looks similar to this example:

Create CI types for Service Mapping and Discovery

Create CI types (or CI classes) for applications and devices, which Service Mapping and Discovery do not support by default.

Before you begin

Role required: service_mapping_admin, personalize_dictionary, or admin
Verify that there is no existing CI type for this application or device.

About this task

All applications and hosts in your organization must have a corresponding configuration item (CI) type, which is necessary for discovering and processing applications and hosts correctly.

Note:
The Discovery and the CMDB interface refers to CI types as CI classes.

A wide range of preconfigured CI types that cover most commonly used applications are available to you. If your organization uses a less known or proprietary application that does not have a corresponding CI type, you must create it.

A CI type is a generic notion that is used by several ServiceNow applications, but there are some attributes that are specific to Service Mapping and Discovery.

A CI type (or class) contains several important definitions that apply to all CIs belonging to it, such as:

- CI attributes are added as fields to the CMDB tables.
- Identifiers help Service Mapping and Discovery to differentiate between new and existing CIs. For example, if there is an Apache Web Server CI type defined in the CMDB, and Service Mapping and Discovery both discover an Apache Web Server CI, it processes it using identifiers. It then recognizes it as an updated version of the Apache Web Server CI that already exists in the system, not a new Apache Web Server CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- There are reconciliation rules that help the ServiceNow platform to consolidate CI attributes received from different applications correctly. These rules are necessary for organizations where more than one application participates in the discovery process. Reconciliation rules define how attributes of the same CI discovered by different discovery sources are merged. For example, Service Mapping discovers the version and home directory attributes of an Apache Web Server CI, while Discovery discovers the version and patch level attributes for the same Apache Web Server CI. The ServiceNow AI Platform applies the reconciliation rule and as a result Service Mapping does not overwrite the attributes found by Discovery.
- Related items, both CIs and non-CIs, serve as a reference and provide additional information about the CI. For example, you can define a serial number, a port and an network APR table as related items for a hardware server. The system does not use these items for identification. After you configure related items for the CI type, you can use horizontal discovery for CIs of this type together with their related items. For information, see Discover related items together with the main CI.

  Note:
  Non-CIs are items that do not extend the Configuration Item [cmdb_ci] table. Examples of non-CIs are ports, serial numbers, or Network ARP tables.

- CMDB stores CI class in the form of a hierarchy where some CI classes are parents to other CI classes, who automatically derive their parent's attributes in addition to attributes you configure specifically for child CI classes. CI class hierarchy is used widely for configuring CI behavior, relationships, and display. In this example, the Apache Web Server CI is a child of the Web Server CI and derives many attributes from its parent, such as name, version, model ID. By default, child CI classes inherit identifiers from their parent CI classes.

In addition to these CI type definitions, the horizontal discovery process uses a CI classification to define to which CI type a CI belongs. Create a device CI classification if you create a CI type for devices using SNMP and a process CI classification for an application CI type.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. To use an existing CI type as a parent for the new CI type, click **Hierarchy** to display the CI Classes list.
3. Click the context menu for the required CI type and select **Add Child Class**.
4. Create a table to store the CI type attributes:

New table form

Field	Description
Label	CI type name. For example, Apache Web Server.
Name	The table name. For example, cmdb_ci_apache_web_server. Use a name similar to the other CMDB classes (for example, `u_cmdb_ci_laptop`).
Extends table	The table name of the parent CI type. All CI types are extensions of the Configuration Item [cmdb_ci] table or its child tables. For example, if the new class is Laptops, which is a subclass of Computers, select the cmdb_ci_computer table. If the new class is a top-level class, select the cmdb_ci table.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	The most commonly used parent CI types are: ○ cmdb_ci - basic ○ cmdb_ci_database - for databases ○ cmdb_ci_app_server - for application servers ○ cmdb_ci_infra_service - for infrastructure services ○ cmdb_ci_endpoint_inclusion - for entry points of the inclusion type ○ cmdb_ci_appl - for applications ○ cmdb_ci_web_server - for web servers ○ cmdb_ci_lb - for load balancers ○ cmdb_ci_endpoint - for entry points

5. Configure how the instance determines if a discovered CI is an upgraded CI existing in the instance or a brand new CI.
   See Create or edit a CI identification rule for detailed procedure.

> **Warning:**
> If there is no CI identification rule for a CI type, Service Mapping discovers CIs belonging to this type, but cannot interpret the results of the discovery process. In this case, the ServiceNow AI Platform rejects the discovery results for these CIs and their information is not updated.

   a. On the **Identifiers** page, configure the parameters as follows:

Identifier form

Field	Description
Name	Use a meaningful name.
Applies to	Enter the CI type.
Active	Select the check box.
Independent	Clear the check box.

   b. Configure the identifier entry parameters as follows:

Identifier entry form

Field	Description
Criterion attributes	Select the attribute that you want to use for identifying the CI. For example, **Class**, **Installation directory**, or **Serial number**.
Allow null attribute	Select the check box.
Priority	If there is more than one identifier entry, add priority to determine the order in which Service Mapping applies these entries. If none of the identification criteria matches the discovered CI, this CI is new.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** Configure references to other CIs or non-CIs as related items for the CI type.

Related Entry form

Field	Description
Active	Check box that specifies that the related entry is active.
Related table	A related table that references the CI that is being matched.
Referenced field	A referenced field in **Related table** that should store the referenced CI. This field always references the cmdb_ci table, or a descendent of the cmdb_ci table.
Priority	Priority of the related entry for the specified **Related table**. Rules with lower priority numbers are given higher priority while matching a related item for specific related table. Related entries for the specified related table with identical priorities are applied randomly. You can keep gaps between the priority numbers, so you can assign the unused priority numbers to new entries without modifying the existing priority order.
Criterion attributes	The set of attributes to uniquely identify the related item. Attributes can belong to the current class, or to a parent class. **Note:** It is possible to add reference fields as a criterion attribute. However, such fields might not always be effective: ○ Reference fields store *sys_id*s that point to a record in another table, and thus is considered a weak criterion attribute (in terms of uniqueness) for the current table. ○ The system detects and then replaces invalid values in a reference field with 'Unknown'. For example, an invalid *Model ID* value is replaced with the value 'Unknown'. Also, if several CIs end up having that same reference field set to 'Unknown', then these CIs become duplicate CIs. Select the lock icon to view, add, or remove attributes from the identification rule.
Allow null attribute	If at least one criterion attribute in the related table is not null, allow to attempt matching with an identifier entry even if there are criterion attributes which are null.
Filter conditions	Add conditions to construct a filter to narrow the set of records that will be searched for a matching related item.

7. **Optional:** Configure the instance to consolidate CI attributes received from different data sources correctly.
See Create or edit a CI reconciliation rule.

Configure the following Service Mapping related parameters correctly:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Reconciliation Definition form

Field	Description
Data source	Select `ServiceWatch`.
Applies to	Select the relevant CI type.
Optional condition	Set a condition if necessary.

Note:
If you do not create a CI reconciliation rule, data discovered by patterns is used to update CI attributes.

8. Configure the CI classification for your CI type:
   - For CI types representing applications, perform configuration as described in Create a Discovery process classification.
   - For CI types representing SNMP devices, perform configuration as described in Create a Discovery CI classification.

   Note:
   There is no need to create CI classifications for hosts because these classifications are included in the base system.

9. For CI types that represent inclusions, define the hierarchy for the new CI type.

   Clear the **Reverse Relationship Direction** check box while performing this configuration.

   See Create dependent relationships.

10. If necessary, customize icons that represent CIs in maps.
    See Create or modify map icons.

Create entry point types for Service Mapping

An entry point is a point where clients access a service instance. Service Mapping starts the mapping process for every application service from the entry point you define for it. Service Mapping includes a wide range of preconfigured entry point types that cover most commonly used applications. If your organization uses a less known or proprietary application that does not have a corresponding entry point type in Service Mapping, you must create it.

Before you begin

If your ServiceNow instance uses domain separation and you have access to the global domain, log in to the relevant domain. The selected domain must be a domain without any child domains.

Role required: service_mapping_admin or admin

About this task

In addition to starting the mapping process from entry points, Service Mapping patterns use entry points to discover CI outbound connections.

Entry points are modeled in the ServiceNow CMDB as CIs of endpoint type. Entry points are stored as records in the Endpoint [cmdb_ci_endpoint] tables.

Like any other CI type, an entry point contains several important definitions that apply to all CIs belonging to it:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- CI attributes are added as fields to the CMDB tables.
- Identifiers help Service Mapping and Discovery to differentiate between new and existing CIs. For example, if there is an endpoint CI type for Active Directory Forest in the CMDB 360, and Service Mapping discovers an Active Directory Forest CI. Service Mapping processes this CI using identifiers and recognizes it as an updated version of the Active Directory Forest CI that exists in the system, not a new Active Directory Forest CI.
- CI type hierarchy. CMDB stores CI class in the form of a hierarchy where some CI classes are parents to other CI classes, who automatically derive their parent's attributes in addition to attributes you configure specifically for child CI classes. CI class hierarchy is used widely for configuring CI behavior, relationships, and display. Create standard entry points as child CIs for the endpoint CI type, which creates an extension for the cmdb_ci_endpoint table. For entry points of inclusion type create child CIs for the inclusion endpoint CI type extending the cmdb_ci_endpoint_inclusion table. In an inclusion, a server hosts applications that are treated as independent objects.

Procedure

1. Navigate to **All** > **Configuration** > **CI Class Manager**.
2. Select **Open Hierarchy**.
3. To create a standard entry point, right-click **Endpoint** from the **Class Hierarchy** pane and select **Add Child Class**.
4. To create an entry point of the inclusion type, right-click **Inclusion Endpoint** from the **Class Hierarchy** pane and select **Add Child Class**.
5. Define the parameters for the new entry point type as described in Create a CI class.

Related topics

Map a single application service using classic Service Mapping

Create CI types for Service Mapping and Discovery

Create or customize patterns

Create or modify a discovery pattern and define its basic attributes.

Before you begin

Make sure that the application for which you want to create a pattern, has a corresponding configuration item (CI) type and a CI classification. If the CI type you require is not in the list, create it as described in Create CI types for Service Mapping and Discovery.

If your ServiceNow instance uses domain separation and you have access to the global domain, log in to the relevant domain. The selected domain must be a domain without any child domains.

Role required: pd_admin

Basic knowledge of programming is desirable.

About this task

Patterns can be of the infrastructure or application type. Infrastructure patterns are used only by Discovery for creating lists of devices. Application patterns serve both Service Mapping and Discovery, which use the same application patterns for their purposes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Click **New** or select the relevant pattern from the list.
3. Define the basic pattern attributes on the **Basic** tab.

Field	Description
Pattern type	○ Select **Application** for an application pattern. It can be used both for top-down discovery performed by Service Mapping and horizontal discovery performed by Discovery. ○ Select **Infrastructure** for an infrastructure pattern used for the horizontal host discovery performed by Discovery.
Name	Enter the pattern name. This name must be unique to this pattern. Use self-explanatory names such as `Apache on Unix pattern`.
CI type	Select the CI type which you want this pattern to discover. **Note:** Discovery can find multiple CIs that belong to the same CI type.
Operating system [Application patterns only]	Select the operating system that the selected CI runs: ○ Click **All** if the CI runs on more than one operating system. Or ○ Select the relevant operating systems from the list.
Run Order [Application patterns only]	For an application pattern used by Service Mapping, define when the pattern runs **a.** Select the order in which this pattern always runs: ▪ **Before** ▪ **After** **b.** Then select the other applicable pattern. This field is only relevant if a particular pattern can be confused with another pattern. For example, both IIS and MS Exchange applications have an HTTP entry point. However MS Exchange uses some of the components of IIS. Therefore, if the IIS pattern ran first, discovery might incorrectly identify MS Exchange as IIS. To prevent this error, in the **Run Order** field in the MS Exchange pattern definition, select **Before** and **IIS**.
Description	Provide a description for this pattern.

4. **Optional:** When creating an application pattern, make the MID Server run this pattern only if the process identified on a CI matches the classification criteria for this pattern, select **Enforce Process Classification**.
   All simplified patterns created from generic applications, have this attribute enabled. For more information about creating process classification, see Discovery classifiers.
5. Define a set of identification steps for every incoming connection of a configuration item (CI) as described in KB1698521: Create or customize patterns.
6. If necessary, create more identification sections.
7. Save the pattern.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. **Optional:** To test the pattern, select **Debug Mode** and enter the IP address of the host.
9. Upload the updated set of patterns onto the MID Server:
   a. Navigate to **Discovery** > **MID Servers**.
   b. Alternatively, navigate to **Service Mapping** > **MID Servers**.
   c. Click **Pattern Sync to Mid**.

What to do next

For application type patterns, continue with creating a connection section as described in the KB article KB1698521: Create or customize patterns.

Related topics

Discovery for cloud environment

KB0747679: Pre/Post Processing Scripts for patterns

KB0854603: Pattern Debugger Session Timed Out

Discover related items together with the main CI

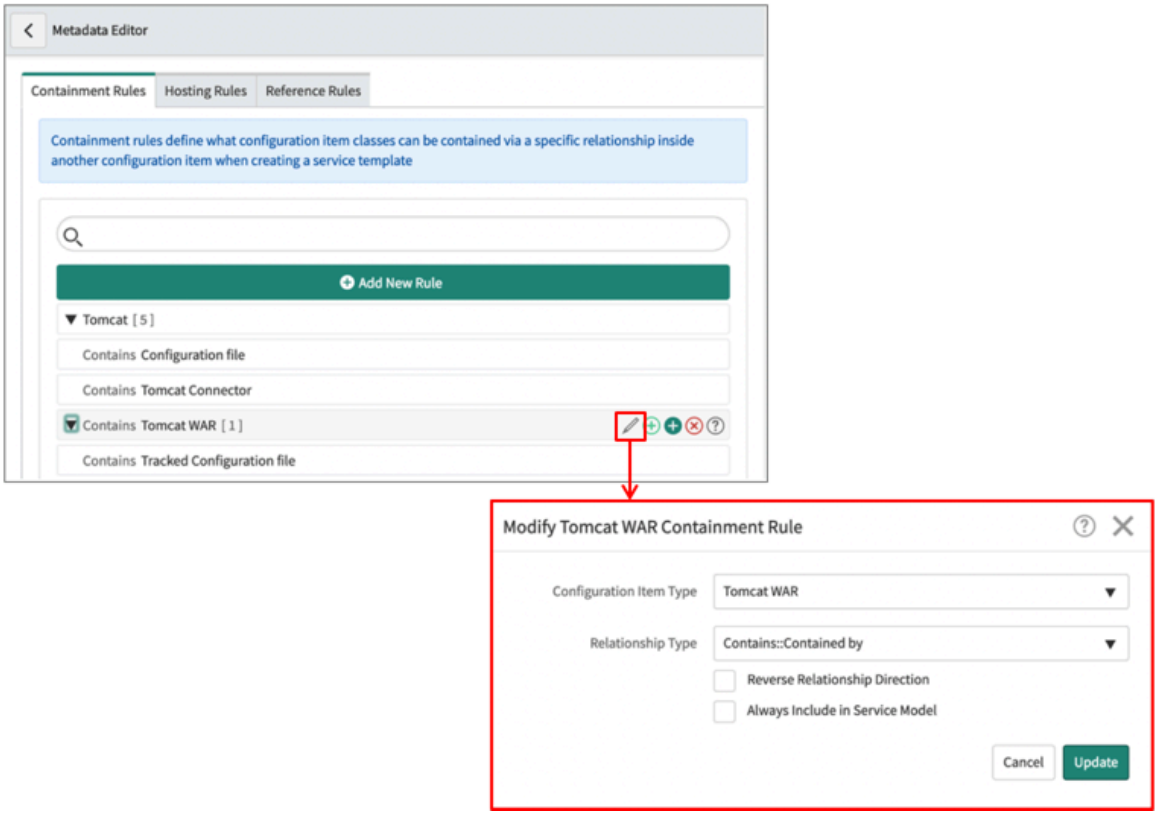
Add related items to the patterns to perform horizontal discovery of configuration items with all their related items: CIs or non-CIs, like ports or serial numbers.

Before you begin

1. (Optional) Check if the CI is dependent: The system uses the identification rules to identify the CI independently of other CIs. Refer to Create or edit a CI identification rule.
2. (Optional) To understand the model better, check dependent relationship rules which define the dependency structure of the CI types and the relationship types in these service definitions. For example, you can discover a Tomcat server with Tomcat WARs belonging to it. For more information, refer to Dependent relationship rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example of the Containment rule for Tomcat WAR



3. To add a non-CI to the pattern, add it as a related item for the CI type to which the main CI belongs. For more information on adding related items for the CI type, see Configure references to other CIs or non-CIs as related items for the CI type.

Role required: pd_admin

About this task

Related items, both CIs and non-CIs, serve as a reference and provide additional information about the CI. For example, you can define a serial number, a port and an network APR table as related items for a hardware server. The system does not use these items for identification. After you configure related items for the CI type, you can use horizontal discovery for CIs of this type together with their related items.

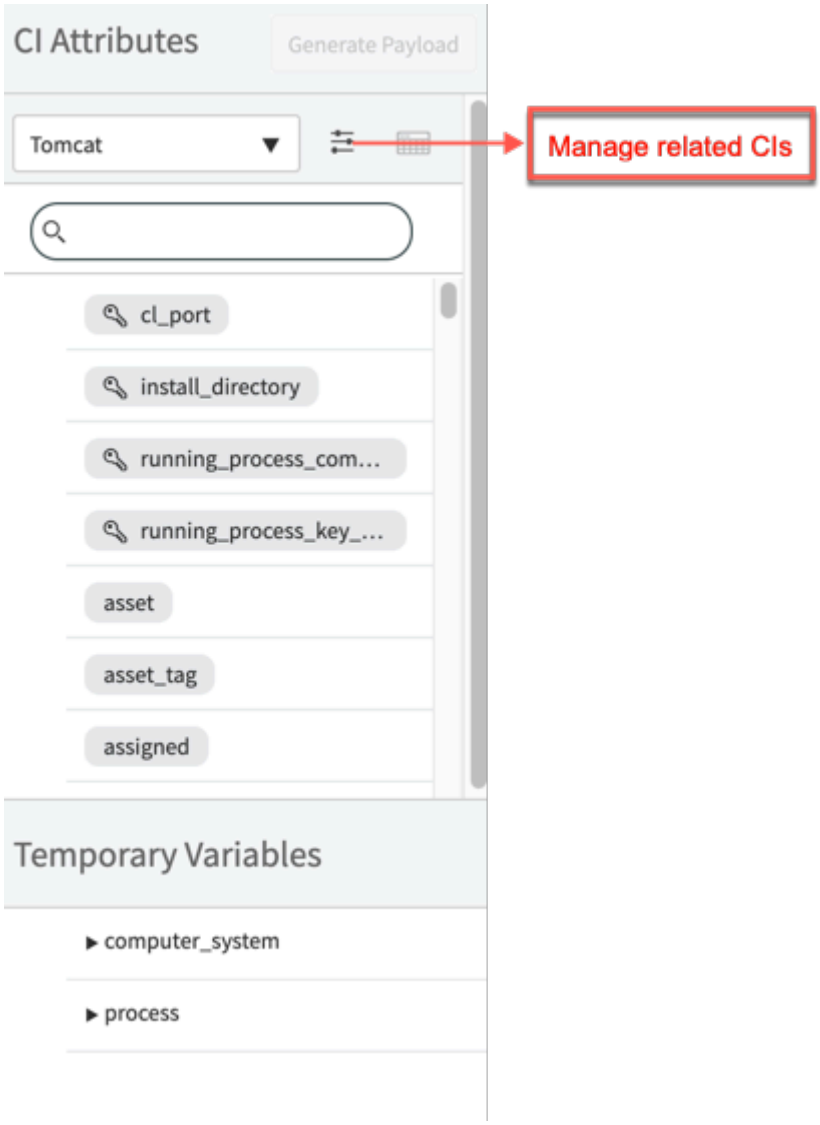
Note:
Non-CIs are items that do not extend the Configuration Item [cmdb_ci] table. Examples of non-CIs are ports, serial numbers, or Network ARP tables.

Pattern Designer displays attributes of related CI types, which you added to the pattern in the CI attributes pane. You can view and use these attributes while creating or modifying the main CI pattern.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Select the relevant pattern.
3. On the pattern form, select the relevant identification section.
4. Make sure that you are not in Debug mode.
5. On the **CI Attributes** pane, click the **Manage related CIs** icon.

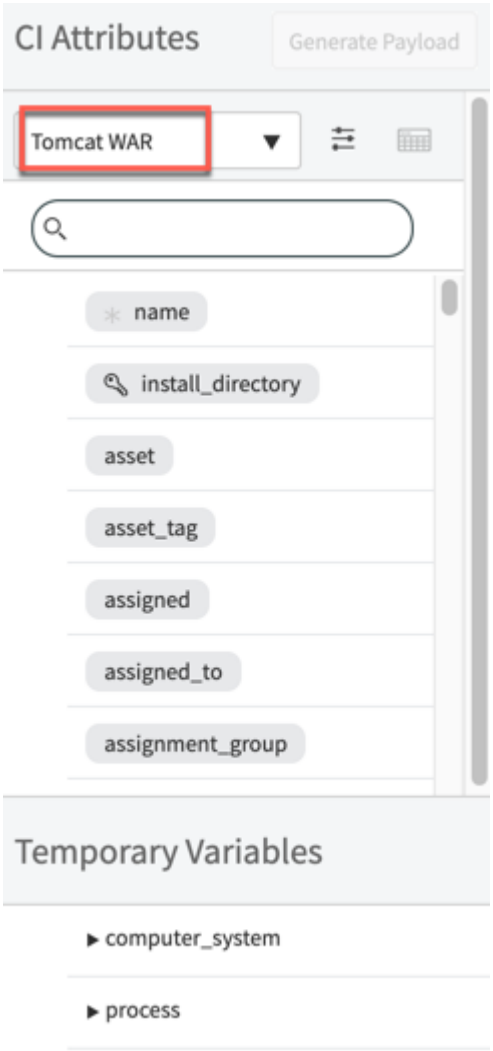
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



6. Select the relevant related CI type.
   You can use the search box to locate a specific CI type.
7. Click the Plus icon.
   The new related CI type is added to the list.
8. **Optional:** Add other related CI types.
9. Click **OK**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

New tabs for related CI types you added appear under the tab for the main CI:



What to do next

Continue editing the pattern by adding more steps as necessary. To view or use attributes of a related CI type, click the relevant tab in the **CI Attributes** pane.

Enhance patterns without changing their identification sections

Enable patterns to search for additional attributes and modify pattern discovery logic defined in identification sections by using extension sections. Each extension section contains a preconfigured set of discovery steps referred to as a shared library.

Before you begin

If your ServiceNow instance uses domain separation and you have access to the global domain, log in to the relevant domain. The selected domain must be a domain without any child domains.

Basic knowledge of programming is desirable.

Role required: pd_admin

About this task

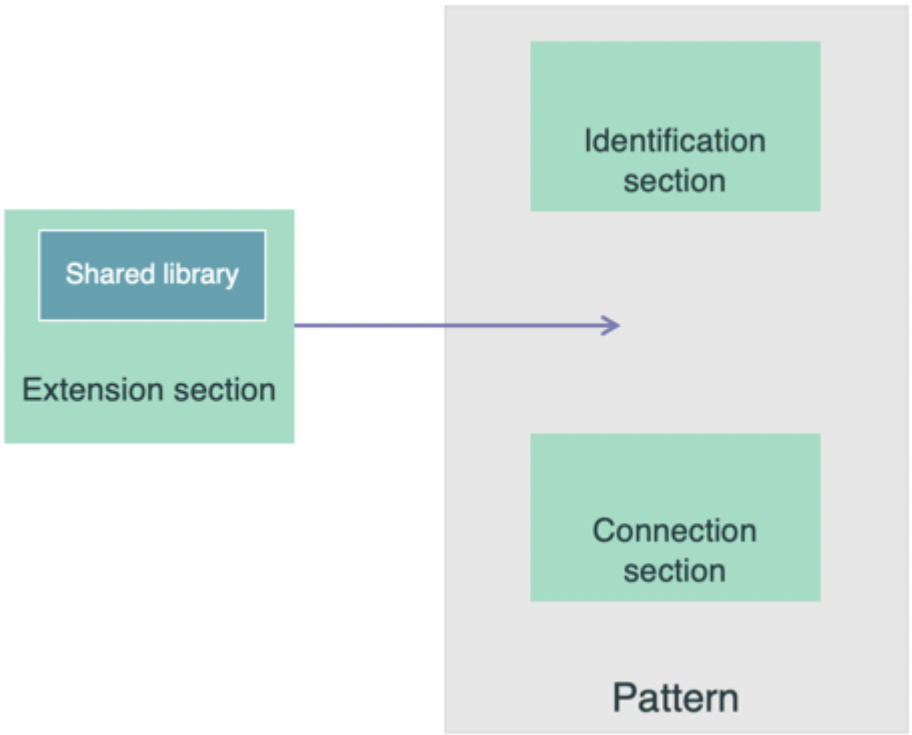
Patterns can be of the infrastructure or application type. Infrastructure patterns are used only by Discovery for creating lists of devices. Application patterns serve both Service Mapping and Discovery, which use the same application patterns for their purposes. Each pattern including

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

its identification and connection sections is an individual file. There are also reusable sequences of discovery steps referred to as shared libraries. Each shared library is an individual file, but it is always part of the infrastructure or application pattern and is not used as a standalone pattern. Records for both patterns and shared libraries reside in the Discovery Patterns [sa_pattern] table.

To modify the discovery logic in identification sections without changing the identification sections themselves, you can add extension sections to the pattern. Every extension section consists of a shared library, either new or existing.

Adding an extension section to a pattern



When you create or modify a shared library in the extension section, you save changes only to the shared library, not to the pattern containing this extension section.

Warning:
The changes to the shared library affect all patterns using this shared library.

The MID Server runs extension sections after identification sections and only if at least one identification section completes successfully.

If there are more than one extension sections associated with this pattern, define the order in which the MID Server runs these extension sections.

You can deactivate shared libraries, so that patterns using them, skip steps in deactivated shared libraries. For more information, see Discovery Configuration Console. If a precondition defined for a shared library step is not fulfilled, the pattern skips all steps belonging to this shared library. For example, if the file, to which the variable points, does not contain "test", the pattern does not run the shared library steps 1-1 to 1-5. The precondition exists only for the pattern within which you created it. The precondition does not affect other patterns using this shared library.

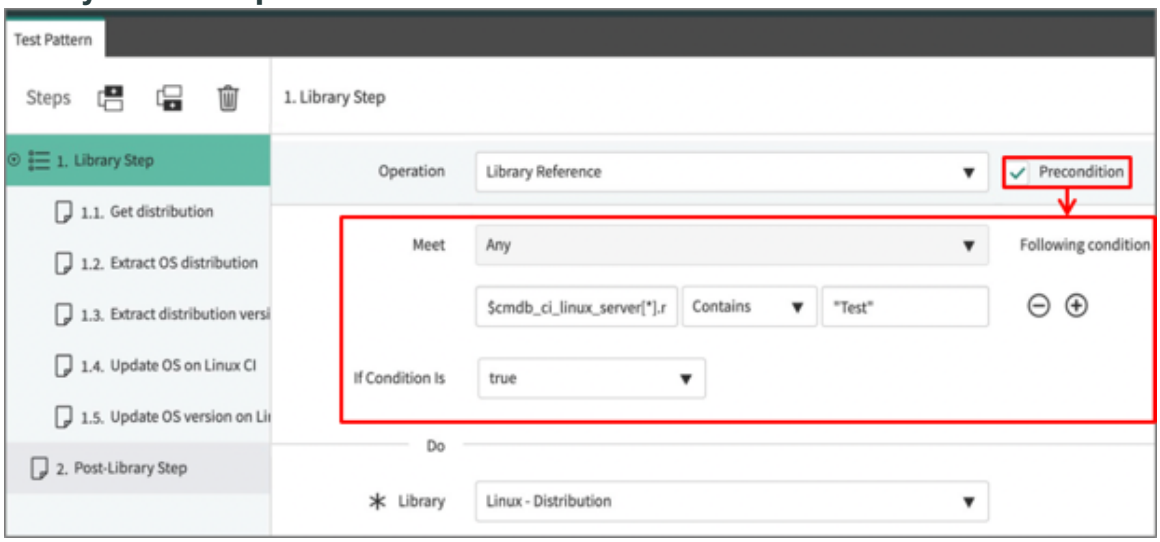
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Library Reference operation form



Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns** and open the required pattern from the pattern list.

   The pattern can be of the Infrastructure or Application type.

2. To create an extension section and define discovery steps for its shared library.

   a. Click **New** under **Extension section**.

   b. Enter the name of this extension section.

   c. Click **Done**.
   The pattern form displays the new section under **Extension section**.

   d. Click the name of the new extension section.

   The Pattern Designer opens showing the Steps tree on the left.

   If no discovery steps have been identified for this pattern, the **Untitled Step** appears in the Steps tree in the left pane of the window.

   e. Define discovery steps.

   f. Click **Save** to save the extension section and make Service Mapping and Discovery use it. You do not publish extension sections.

3. To use an existing shared library for the new extension section:

   a. Click **Add** under **Extension section**.

   b. Select the shared library from the name list.

4. If there are more than one extension sections, define the order in which the MID Server runs the extension section.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the check box next to the extension section.

b. Click **Edit** under **Extension section**.

c. Enter a number that determines the order in the **Order** field.
If there is only one extension section, its order is **1** by default.

The section with the lowest order number is used first.

d. Click **Done**.

What to do next
Click **Debug** to run the newly created extension section. Pattern Designer runs extension sections after running identification sections.

Fine-tune patterns using traffic-based discovery

As an alternative to customizing the pattern from the Pattern Designer side, improve existing patterns so that Service Mapping can use them to find configuration item (CI) connections previously found using traffic-based discovery.

Before you begin
Role required: pd_admin

Basic knowledge of programming is desirable.

About this task
Service Mapping can discover and map configuration items (CIs) following their traffic-based connections. This method is referred to as traffic-based mapping and complements pattern-based mapping.

Using traffic-based discovery, Service Mapping may discover an important CI connection. In this case, you can make sure that this connection is always found for all CIs belonging to the same CI type. You do that by modifying the pattern used to discover CIs of that CI type. A pattern is a sequence of commands whose purpose it is to detect attributes of a CI and its outbound connections.

You can search CI configuration files to locate data discovered using traffic-based discovery, for example IP address and port. If there are configuration files containing this data, you create a pattern step to parse this file. Next time Service Mapping discovers this CI using the modified pattern, it extracts the information about this connection directly from the configuration file.

Procedure

1. Navigate to **Service Mapping** > **Services** > **Application Services**.
2. Click **View Map** next to the relevant service instance.
3. Right-click the relevant CI.
4. Select **Show traffic based connections**.
The Traffic Based Connections List displays the following information:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

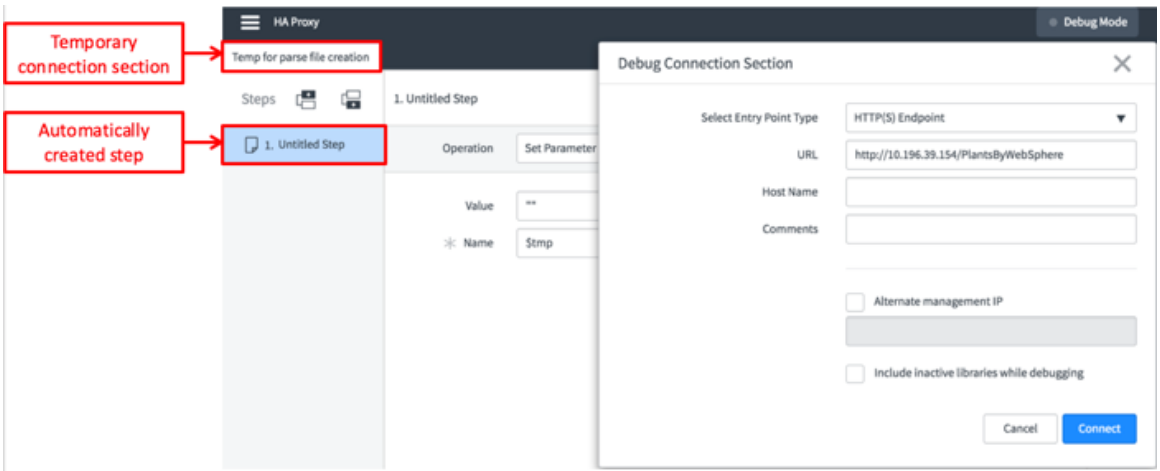
Traffic Based Connections List (when discovery based on Predictive Intelligence is disabled)

Field	Description
IP	The IP address of the application connected to the selected CI.
Port	The port on the selected CI that is used to communicate to the other application.
Process	The ID of the process in the selected CI.
Already on map	○ **Yes** — if this connection shows on the map. ○ **No** — if this connection is not part of the service instance and not on the map.
System decision	The setting defines if Service Mapping keeps the discovered traffic-based connection or removes it. The value comes from the algorithm that Service Mapping uses.
User decision	(Optional) The setting overrides the System decision setting, which defines if Service Mapping keeps the discovered traffic-based connection or removes it. For example, if the System decision setting for a connection is Keep, and you want to remove this connection, select `Remove`.

Note:
There may be a case when you can see traffic-based connections on the map, but the Traffic Based Connections list does not display them. It happens for the connections that have been removed from the TCP Connection [cmdb_tcp] table less than three days.

5. Double-click the connection you want to use to create a pattern step.
6. If there are multiple patterns used to discover this CI, select the pattern for which you want to create the step, and click **OK**.

   Pattern Designer creates a temporary connection section for this pattern with a new step.



The Debug Connection Section window is displayed with some fields automatically populated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

7. Click **Connect**.

   The Debug mode is activated.

   The Search Assistant window opens.

8. Search CI configuration files for data received using traffic-based discovery:

   a. Under **Free Text**, review data automatically filled in from the Traffic Based Connections List.

   The File Patterns field displays file types in which Pattern Designer performs the search.

   b. Click the **Search Files** tab and review files.
   If necessary, you can remove irrelevant files from the search by clicking the Minus icon.

   c. Click **Search**.

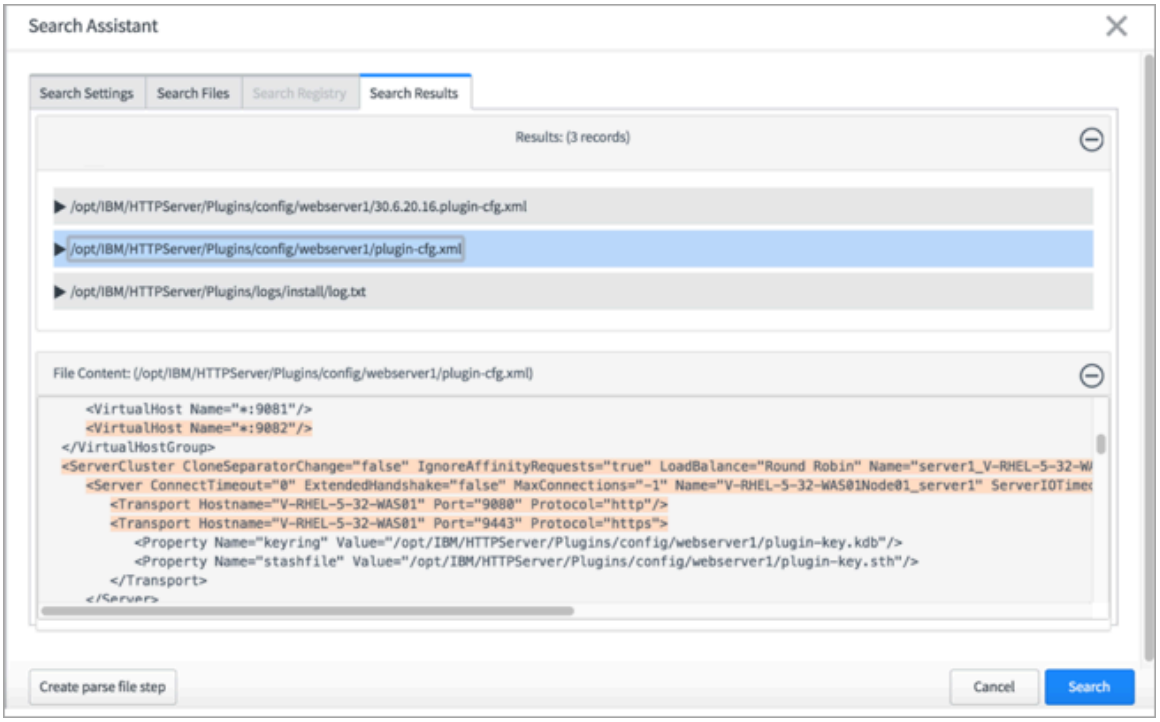
   After search completes, the **Search Result** tab opens with the list of files in which any of the search criteria was found.

9. Create a pattern step for parsing the configuration file containing information about the connection:

   a. On the Search Result tab, click one of the files and review connection data found in this file.

   b. Wait for the file content to load and select the relevant entry under the file name:

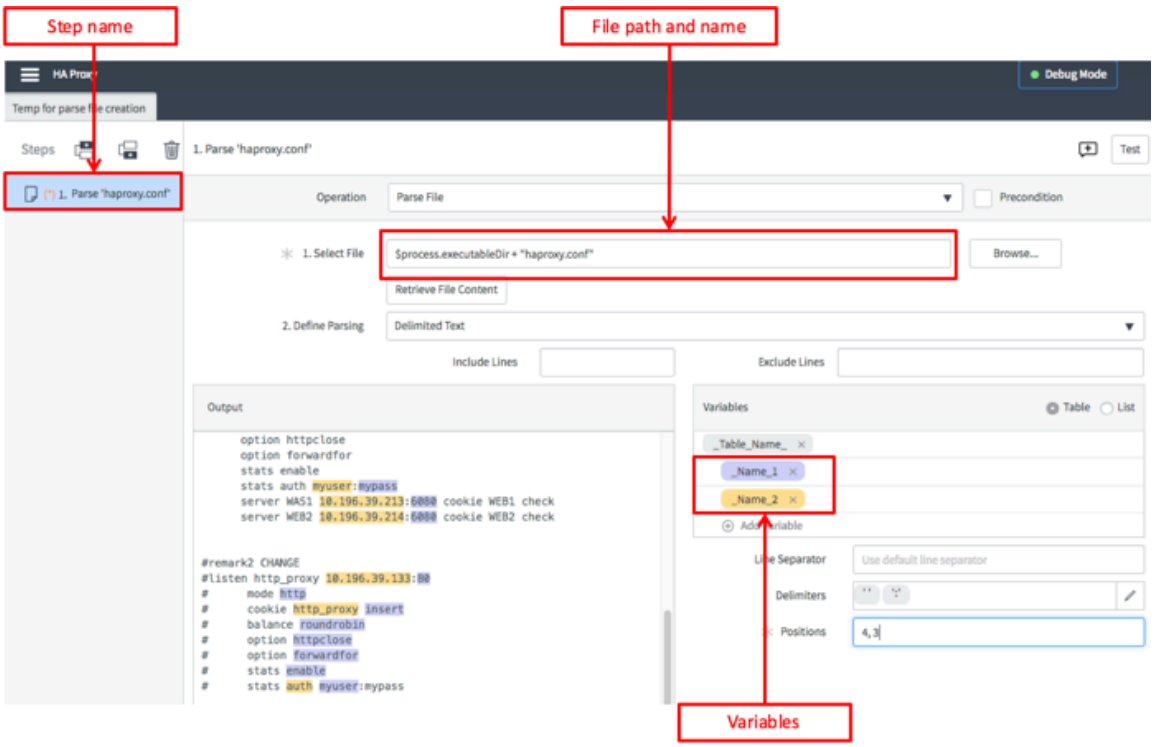
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



c. To use this data to create the pattern step, click **Create parse file step**.

Pattern Designer shows the new step with the Parse File operation. It automatically assigns this step the name in the following format: Parsing <file name>.

Pattern Designer automatically sets the file name, file path, and parsing strategy for the step. It also creates variables that contain data you searched for. If there is a variable, which contains the file path, Pattern Designer enters this variable for the path.



d. Optional: If necessary, you can modify parsing strategy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Rename the section to provide a meaningful name, for example Discover HA Proxy client connection.
Or

Copy and past the step into the relevant connection section.

10. Complete modifying the pattern as described in Finalize a pattern.

Traffic-based discovery in Service Mapping

Enable traffic-based discovery for CI types or specific CIs

Discovery patterns used by ITOM Visibility

Finalize a pattern

After you finish defining your pattern, make it ready for use by Service Mapping and Discovery.

Before you begin

Role required: pd_admin

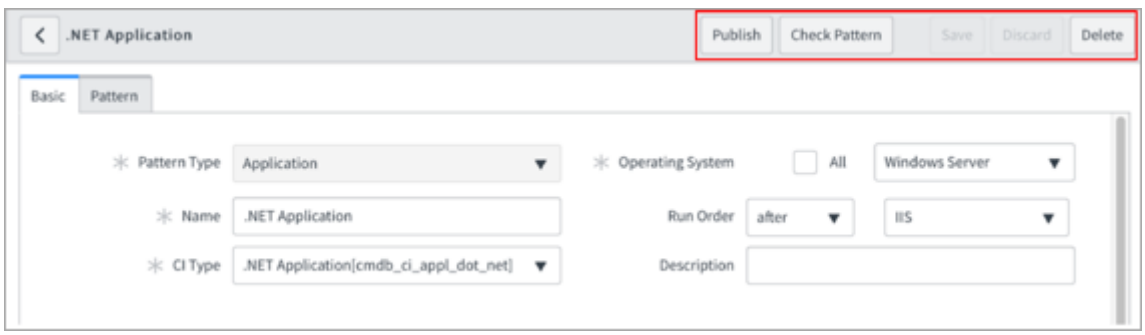
About this task

There are several ways to finalize a pattern after creating or modifying it:

- Saving — Save all the information you defined for the pattern creating a draft. You can continue working on the pattern draft at any time. Service Mapping and Discovery do not use the pattern draft for discovery and mapping.
- Discarding changes — If you realized that the changes you made to a pattern are incorrect, you can discard them.
- Checking — Actually run the pattern on the relevant configuration item (CI) to check that the operations that you defined for it are correct. Check your pattern before activating it. This option is available only for application patterns used by Service Mapping.
- Publishing — Make Service Mapping and Discovery use this pattern for discovery and mapping. A new version of this pattern is created. The state of the pattern version used previously changes to History.

Procedure

1. On the pattern definition form, complete your pattern definition by performing one or more of the following actions.



2. Close the Pattern Designer tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Copy patterns from one instance to another

To copy patterns from one instance to another, create an update set containing new or modified patterns with their related items in your development instance. Then, import the update set into your production instance.

Before you begin

Role required: pd_admin

About this task

Typically, you maintain two ServiceNow instances in your organization: for production and for development. Create or modify patterns, test them, and verify results in the development instance. When you are satisfied with the discovery results, export relevant patterns from the development instance to create an update set.

Update sets is a ServiceNow feature for transferring customizations from one instance to another. Each update set is stored in the Update Set [sys_update_set] table. Specific customizations associated with the update set are the entries in the Customer Update [sys_update_xml] table, and they appear as a related list on the update set record. The method of creating update sets for patterns is different from creating update sets for other types of customizations.

Warning:
Always follow this procedure to create update sets for patterns. Do not use the standard platform procedure for creating update sets.

Depending on the extent of the changes, you can use the following pattern export methods:

Export patterns

This option creates a new, customized version of the pattern and its related items necessary for the patterns to function properly. It then links them to the update set. The related items include:

- Extension sections
- Tracked files
- Related CI types
- Classification records
- Associated scripts

Note:
Update sets do not include changes in script includes used in patterns.

Export patterns with CMDB items

This option creates a new, customized version of the pattern and its related items from the previous option, including any associated CMDB items. It then links all of these to the update set. The CMDB items include:

- Main CI type
- Entry point types
- Lookup tables
- Identifiers
- Hosting and reconciliation rules

The update set is an XML file with the following name convention: sys_remote_update_set<random alphanumeric string>.xml.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the development instance, perform these steps to export patterns:
   a. Navigate to **Pattern Designer** > **Discovery Patterns**.
   b. Select application or infrastructure patterns that you want to export.

      Note:
      You cannot export shared libraries.

   c. At the bottom of the window, click the **Actions on selected rows** button.

      Note:
      You cannot use more than 20 patterns at a time for the **Export patterns with CMDB items** method.

   d. Click **Export patterns** or **Export patterns with CMDB items**.
   e. When the system finishes exporting patterns, it creates the update set.
   f. To view the list of items included in the update set, click **View Logs** in the success message.
   g. Click **Close**.
      The update set file in XML format is automatically downloaded on the computer.
   h. Save the update set file locally for future use.
2. In the production instance, perform these steps to import the customized patterns:
   a. Elevate privileges to the security_admin role.
   b. Navigate to **System Update Sets** > **Retrieved Update Sets**.
   c. Select the link **Import Update Set from XML**.
   d. Select **Choose File** and select an XML file.
   e. Select **Upload**.
      The customization is now available as a retrieved update set with state *Loaded*.
3. Preview the imported update set.
   The system scans and validates the update set and displays its contents on the **Customer Updates** tab.
4. Commit the update set.
5. Click **Close** in the success message.
   The production instance contains all new or modified patterns with related items from the update set.
6. Upload the updated set of patterns and related items onto the MID Server:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Discovery** > **MID Servers**.

b. Alternatively, navigate to **Service Mapping** > **MID Servers**.

c. Click **Pattern Sync to Mid**.

7. If the discovery fails or the result is not as expected, restart the MID Server to make sure that the MID Server runs the latest set of patterns.

System update sets

Choose the pattern version

Every time you modify and save a pattern, you create a version of this pattern. Choose which pattern version Service Mapping and Discovery use for discovery.

Before you begin

Role required: admin

About this task

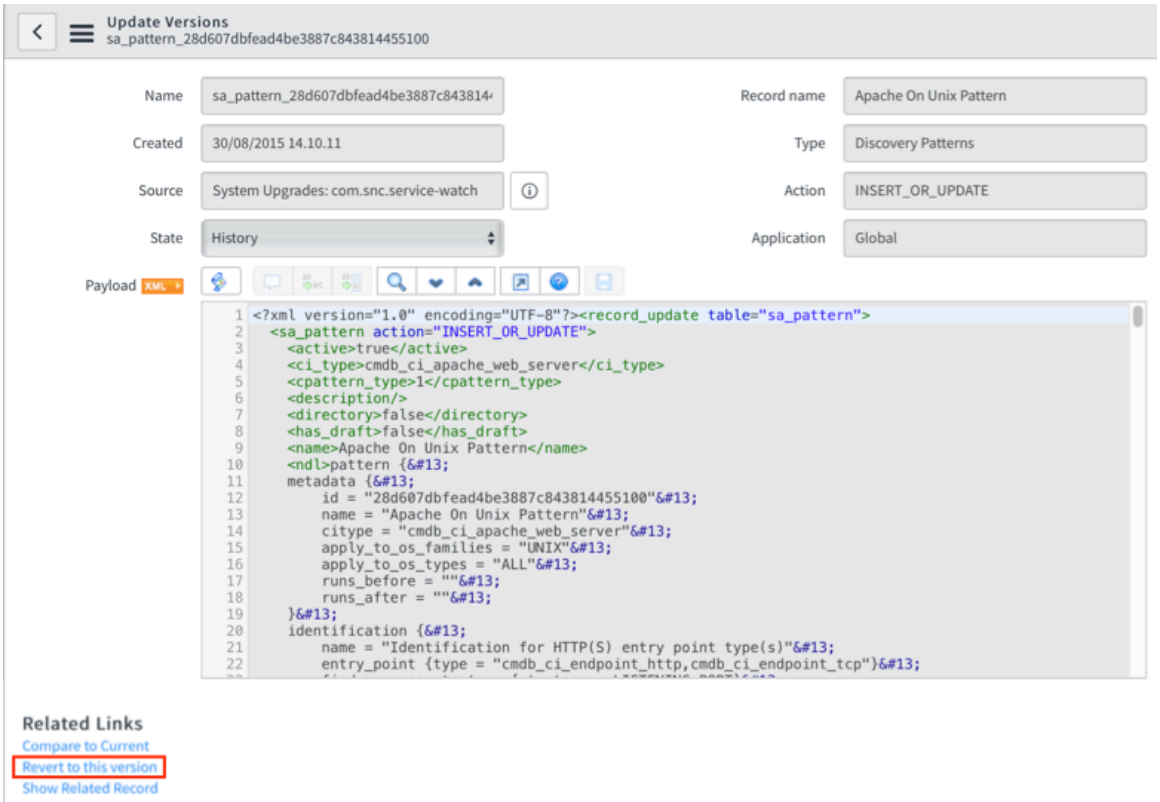
By default, the latest version is used for discovery, but you can choose any other version to use.

If necessary, you can compare pattern versions.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Click the required pattern.
   The form for this pattern opens.
3. Click the **Pattern** tab.
4. Scroll down to the **Versions** section.
   The state of the active pattern version that Service Mapping and Discovery use is **Current**.
5. Click the version you want to use.
6. Click **Revert to this version** under **Related Links**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



This pattern version becomes the active version that Service Mapping and Discovery use. Its state changes to Current.

Compare pattern versions

If you have multiple versions of the same pattern, you can compare them to decide which pattern version to use for discovery.

Before you begin

Role required: pd_admin

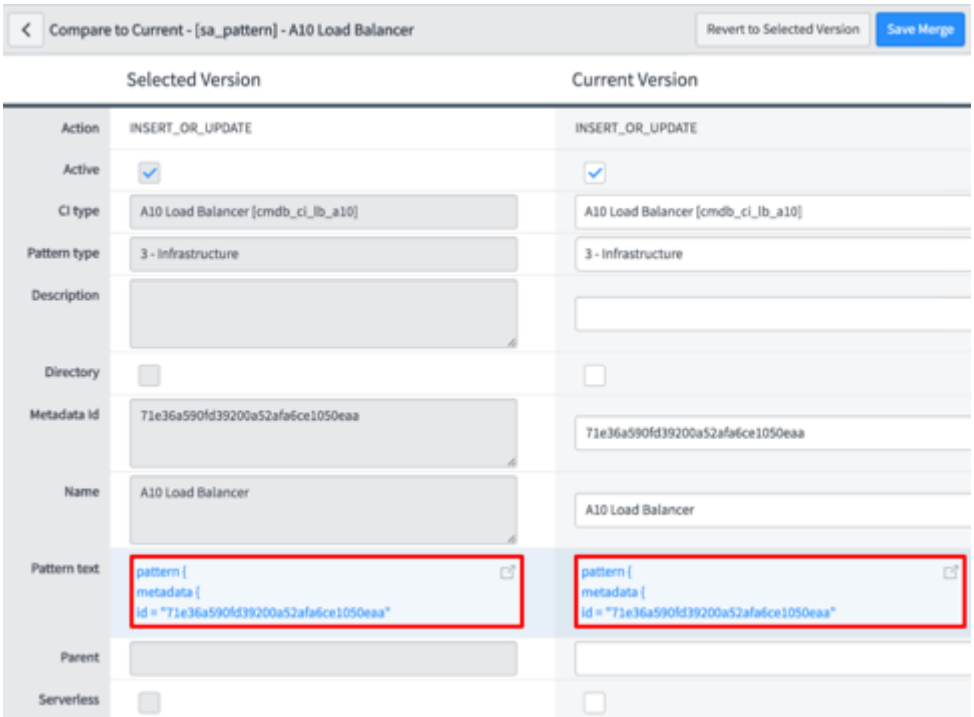
About this task

Service Mapping and Discovery use patterns in their discovery process. Every time you modify and save a pattern, you create a version of this pattern.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. Click the required pattern.
   The form for this pattern opens.
3. Click the **Pattern** tab.
4. Scroll down to the **Versions** section.
   The state of the active pattern version that Service Mapping and Discovery use is **Current**.
5. Click the previous pattern version, which you want to compare to the current version.
6. Click **Compare to Current** under **Related Links**.
7. In the Compare to Current window, click the **Pattern text** pane either under **Selected Version** or **Current Version**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

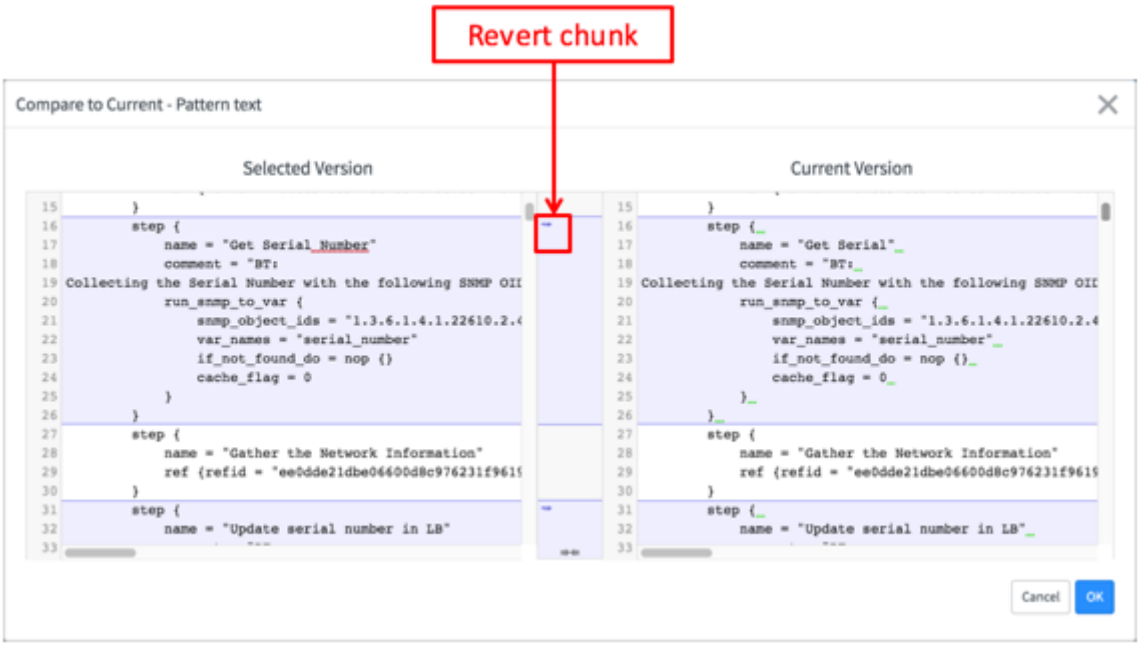


The text comparison view opens showing the text of the selected pattern version and the current pattern version side by side. The step containing a difference appears highlighted.

Highlight colors indicate the type of change:

- Updated step — purple
- New line or characters — green
- Deleted line or characters — red

8. Review the differences in the pattern versions.
9. If necessary, click **Revert chunk** to replace the step in the current version with the step from the previous version.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

10. Click **OK** when done.
11. If you copied any steps from the previous version and want to save the change, click **Save Merge**.

Activate a disabled pattern

If you want to use a pattern for discovery that's disabled by default, activate it manually.

Before you begin

Role required: discovery_admin

About this task

Starting with Visibility Content version 6.28.0, activating or deactivating a pattern won't be considered a customization, and it will continue to receive updates. Patterns that were previously activated or deactivated will reset to the latest predefined version after upgrading while retaining the last active field value.

Procedure

1. Navigate to **All** > **Pattern Designer** > **Discovery Patterns**.
2. In the **Name** field, search for the relevant pattern.
3. Select the pattern.
4. Select the **Active** check box.
5. Select **Update**.

Enable the Cloud Hardware Type class extension

Enable the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table to store the predefined virtual machine (VM) hardware type records for Amazon AWS Cloud Microsoft Azure Cloud and Google Cloud Platform (GCP). This class extension helps prevent duplication of the VM hardware type records in the Hardware Type [cmdb_ci_compute_template] table, which improves performance for Discovery and related flows.

Before you begin

- Veirfy that the latest versions of the following applications are installed:
  - CMDB CI Class Models
  - Discovery and Service Mapping Patterns

    If the version of Discovery and Service Mapping Patterns is earlier than 1.6.0, see the Knowledge Base article KB0955939.
- Ensure that the application scope is the Discovery and Service Mapping Patterns application.

Role required: admin

About this task

Each cloud service provider offers several predefined VM hardware types, such as t1.micro (AWS), and so on. You can also create your own. By default, Discovery stores the discovered VM hardware types in the Hardware Type [cmdb_ci_compute_template] table. This table is a "child" of the cmdb_ci_logical_datacenter class, so the attributes in the Hardware Type table includes the attributes in the cmdb_ci_logical_datacenter class.

This model might create duplicate records for each discovered VM hardware type:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The count of records for each discovered VM hardware type is determined by the number of service accounts multipled by the Number of logical datacenters.

For example, let's assume an organization has an AWS account of t1.micro VM. The organization has 3000 service accounts and 10 Logical Data Centers (LDCs), such as West US. Your next discovery can detect the VM hardware type and create 30,000 records in the Hardware Type [cmdb_ci_compute_template] table.

This approach could slow down your discovery and related flows.

Avoid these issues by storing the predefined AWS and GCP VM hardware types in the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table.

This table extends the Hardware Type [cmdb_ci_compute_template] table. Because it's not tied to any LDC or service account, Discovery avoids adding many VM hardware type records to the Hardware Type [cmdb_ci_compute_template] table.

The Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table uses the object_id and the provider fields in the identification rule.

Note:
In AWS environments, the discovery pattern discovers hardware types only to the master account's datacenter. It then creates relationships of the discovered hardware types to the corresponding regions in member accounts.

- If a discovery schedule is run for both a master account and member accounts, the pattern discovers only the master account's datacenter hardware type.
- If a discovery schedule is run for a standalone member account, the pattern discovers that member account's datacenter and its hardware type.
- If a discovery schedule is run for a master account after a standalone member account has already been discovered, the pattern doesn't rediscover the hardware type for the member account. Instead, it discovers the hardware type for the master account and maps the relationships between the master and member accounts.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `sn_itom_pattern.use a single hardware type for cloud data centers`.
3. Select the *`sn_itom_pattern.use a single hardware type for cloud data centers`* property.
4. In the **Value** field, enter `true`.
5. Select **Update**.

What to do next

1. Clean up the Hardware Type records. For more information, see the Knowledge Base article KB1285337.

   Important:
   The cleanup removes all the existing compute profiles from the CMDB.
   Therefore, if you have manually added a hardware template to the Hardware Type [cmdb_ci_compute_template] table, you must manually add it to the Cloud Hardware Type [cmdb_ci_cloud_hardware_type] table.

2. Rerun the Cloud Discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Google Cloud Platform (GCP) Cloud components discovery using Patterns

Microsoft Azure Cloud components discovery using patterns

Enable Cloud OS Image discovery

Enable the Cloud OS Image [cmdb_ci_cloud_os_image] table to store the cloud OS image records for Amazon AWS Cloud, Microsoft Azure Cloud, Google Cloud Platform (GCP), Oracle Cloud Infrastructure (OCI), and IBM Cloud.

Before you begin

- Ensure that the latest versions of the following applications are installed:
  - Discovery and Service Mapping Patterns
  - CMDB CI Class Models
- Ensure that the application scope is the CMDB CI Class Models application.

Note:
Cloud Provisioning and Governance (CPG) doesn't support the New Cloud Image (cmdb_ci_cloud_os_image) table. If you're currently utilizing CPG Provisioning flows or have intentions to do so, don't migrate to the new Image Model.

Role required: admin

About this task

Each cloud service provider offers OS images to launch a Compute/VM instance. Cloud Discovery stores the discovered Image [cmdb_ci_os_template] table. This table is a dependent class on [cmdb_ci_logical_datacenter] or [cmdb_ci_cloud_service_account]. The new Image model creates one record for each public Image (object id) irrespective of the service account and populates them in the Cloud Image [cmdb_ci_cloud_os_image] table. There for, the new model reduces the number of records in the CMDB

Note:
If you have Discovery and Service Mapping Patterns version 1.10.0- November 2023, proceed to the following procedure. If you have an earlier version, see the Knowledge Base article KB1000183.

Procedure

1. In the navigation filter, enter `sys_properties.list`.
2. In the **Name** field, search for `sn_cmdb_ci_class.use_single_cloud_os_image`.
3. Select the *`sn_cmdb_ci_class.use_single_cloud_os_image`* property.
4. In the **Value** field, enter `true`.
5. Select **Update**.

What to do next

1. Clean up the Image records. For more information, see the Knowledge Base article KB1537376.
2. Rerun the Cloud Discovery.

© 2025 ServiceNow, Inc. All rights reserved.

ITOM Content Service

ServiceNow® ITOM Content Service offers extensive visibility of products in your infrastructure. The classification of processes identified by Predictive Intelligence enables wider discovery and weekly updates of new configuration items in the CMDB. Use the Discovery Admin Workspace to review and manage ITOM Content Service suggestions.

ITOM Content Service Model

About ITOM Content Service

ITOM Visibility offers multiple methods of discovering products in your infrastructure. When running discovery with Discovery and Service Mapping Patterns for example, each pattern searches for one version of a product and can offer in-depth visibility of the product's information.

While your infrastructure is growing at scale, and new IT products are rapidly released to the market, you must have wider, rapidly updating visibility. Every week, ITOM Content Service identifies products that you're currently using and delivers new Configuration Items (CI) for your usage. The latest version of Discovery Admin Workspace enables you to refresh the content service suggestions manually before reviewing them.

ITOM Content Service provides the following benefits:

- Reviews the products that you're currently using every week and delivers new configuration items (CIs).
- Based on AI, it helps you identify running processes fingerprints and SNMP System OIDs and create the CIs you need for monitoring your infrastructure.
- Identifies irrelevant processes that aren't suitable candidates for CIs.
- Discovers a higher number of products by using AI capabilities that cluster and classify running application processes.

Benefits of Software Asset Management integration with ITOM Content Service

ITAM Software Asset Management (SAM) users benefit from the integration with ITOM Content Service in multiple ways.

- Gain visibility on the processes currently running on the installed software. This also enables you to find out which installed software doesn't have running processes and might be redundant.
- ITOM Content Service compliments Software Asset Management in cases of services that don't require installation, for example, an Oracle database that runs as a service and isn't

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

installed. In cases like this, ITOM Content Service creates the installed software record based on combining the process fingerprint data with the data discovered by SAM. Without ITOM Content Service, you can't gain this kind of visibility.

- Using file-based discovery capabilities, ITOM Content Service can discover a running system file that is identified with an app. For example, ITOM Content Service can match an installed software record to an Apache Kafka running an `exe` file. For more information, see File-based Discovery.

For more information on Software Asset Management, see Software Asset Management Content Service.

Benefits of using Service Mapping with ITOM Content Service

With the latest version of ITOM Content Service, Service Mapping users can leverage Service Fingerprints suggestions to identify and select application services based on classified components. By viewing component details such as product, product category, publisher, and description, you can make informed decisions about which candidates to convert into application services. You can also see which additional processes can be integrated into the service, as certain processes collectively build a comprehensive service when combined.

Both ITOM Content Service suggestions and Service Fingerprints offer automated, weekly suggestions for candidates, but they differ in a few ways.

Comparison between ITOM Content Service suggestions and Service Fingerprints

Name	Type	Identifies	Focus	Details on publisher	Location
ITOM Content Service suggestions	Process fingerprints	Individual processes, which could be components of a service or standalone.	Specific actions of a process, offering higher granularity.	Process's publisher. If a process is part of a service but has a different publisher, the process provides details only about its own publisher.	**Content service suggestions** tab in Discovery Admin Workspace Content 360
Service Fingerprints	Service fingerprints	Services based on classified components.	The service as a whole, providing a broader perspective.	Service's publisher. If a process is part of a service but has a different publisher, the service fingerprint provides details only about the service's publisher.	**Service Fingerprints** tab in Service Mapping workspace

For more information about using Service Fingerprints in Service Mapping, see Map application services based on Automated Service Suggestions.

For more information about Service Fingerprints candidates, see KB1706310.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Managing ITOM Content Service with the Discovery Admin Workspace

Review recommended actions and application suggestions and configure discovery through Discovery Admin Workspace.

Note that the Discovery Admin Workspace is supported starting with the Vancouver release.

For more information, see Discovery Admin Workspace Content 360.

Sharing data on the CDS

The Continuance Delivery System (CDS) is a ServiceNow® technology that synchronizes data between the Data Services instance that stores and distributes data and the customer instances.

Opting in to sharing application fingerprint process data with ITOM Content Service through the CDS enables them to be tagged and classified by AI librarians. ITOM Content Service then delivers new CIs every week. Your data is shared with your ServiceNow® instance in a safe environment. You can control access to your data by setting permissions in the Discovery Admin Workspace.

The three options for sharing your data are:

- Sharing the running processes fingerprint data, which enables access to the Process Groups [cmdb_process_groups] table.
- Sharing the SNMP System OIDs data, which enables access to the SNMP OID [discovery_snmp_oid] table.
- Sharing the Service Info data of mapped candidates, which enables access to the Application Service Candidate [application_service_candidate] table (starting with ITOM Content Service version 1.6.2 and Discovery Admin Workspace version 1.11.0).

For more information on setting the permissions, see Share data on ITOM Content Service

ITOM Content Service use case

This ITOM Content Service use case demonstrates how organizations can achieve enhanced visibility into their environment.

Use case overview

The Application Configuration Items (CIs) class is a key component of an organization's data platform within the Common Service Data Model (CSDM). Application CIs help log software activities and support critical IT operations.

Many products and applications rely on application CIs for essential tasks. A few key examples are:

- Service Mapping: Uses application CIs to create service maps
- ITOM Health: Monitors application health and resolves incidents using application CIs
- IT Asset Management (ITAM): Tracks and manages software applications and their associated licenses with application CIs
- IT Service Management (ITSM): Analyzes service impact and calculates blast radius with application CIs
- Enterprise Architecture (EA): Leverages application CIs to generate business outcomes

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Challenge

A large organization with numerous applications requires accurate discovery. Managing application CIs is essential, yet the IT team finds it challenging to maintain visibility over its growing infrastructure.

ITOM Visibility offers several methods for discovering products within an organization's infrastructure, such as Discovery and Service Mapping Patterns. This method provides detailed visibility into a product's information. When a wide range of applications is in use, not all can have a dedicated pattern. If an application does not have a dedicated pattern, discovery populates only the Running Process [cmdb_running_process] table without identifying the product or creating a CI for it.

Without an application CI, the organization lacks accurate visibility into its infrastructure and might struggle to optimize the following essential actions:

- Bind CIs with monitoring alerts and open incidents regarding the CIs
- Schedule automated software upgrades
- Automate scripts to optimize or troubleshoot the product
- Perform impact assessments and change impact analysis
- Create security workflows

Solution

ITOM Content Service enhances the discovery process by tagging and classifying process fingerprints. This service provides details about the publisher, product, and the essential component of the CI. Unlike pattern-based discovery, ITOM Content Service identifies applications directly within the organization's environment without requiring published pattern classifiers. This approach enables the continuous delivery of content without being constrained by a scheduled release cycle.

For example: Discovery identifies the Elipse Software E3 Database Engine process (E3DBEngine.exe) and lists it in the Running Process [cmdb_running_process] table. If the E3DBEngine.exe process classification condition isn't set to trigger a pattern, it doesn't launch a pattern and a CI isn't created. However, with ITOM Content Service, the E3DBEngine.exe process is tagged and classified, enabling Discovery to turn the process into a CI during the next scan.

Result

Discovery using ITOM Content Service creates a CI record by tagging and classifying the publisher, product, and essential component for all applications in the organization's environment. This method provides enhanced and continuous visibility into the application landscape, enabling effective monitoring, proactive actions, and ongoing optimization.

Install ITOM Content Service

Install the ITOM Content Service application (sn_smart_content) to manage and monitor the creation of configuration items based on application fingerprints.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Review the ITOM Content Service application listing in the ServiceNow Store for information on dependencies, licensing or subscription requirements, and release compatibility.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: admin

About this task

The following plugins are activated with ITOM Content Service:

- Discovery (com.snc.discovery)
- Normalization Data Services Client (com.glide.data_services_canonicalization.client)
- File Based Discovery (com.snc.discovery.file_based_discovery)—starting with ITOM Content Service version 1.5.1

Note:
The ITOM Smart Content plugin (com.snc.itom.smart.content) is available starting with XP5. This plugin is optional and can be requested through ServiceNow personnel. For more information, see Request a plugin.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITOM Content Service application (sn_smart_content) using the filter criteria and search bar.

   You can search for the app by its name or ID.

   In the list next to the **Install** button, the versions that are available to you are displayed.
3. Select a version from the list and select **Install**.

   In the Review Installation Details dialog box that is displayed, any dependencies that are installed with your application are listed.
4. If you're prompted, follow the links to the ServiceNow Store to get any additional entitlements for dependencies.
5. Select **Install**.

What to do next

- ITOM Content Service (at least version 1.6.2)
- Discovery Admin Workspace (at least version 1.11.0)

Role required: discovery_admin

Procedure

1. Navigate to **Workspaces** > **Discovery Admin Workspace**.
2. Indicate whether and what data you want to share with AI librarians.

Related topics

ITOM Content Service

Enable discovery with ITOM Content Service

Review the ITOM Content Service suggestions for application discovery and activate the discovery classifiers to enable the creation of configuration items.

Before you begin

Ensure that the following application and plugin are installed:

- ITOM Content Service (sn_smart_content)
- Discovery Admin Workspace (com.snc.itom.daw)

Ensure that ITOM Content Service is active. For more information, see Share data on ITOM Content Service.

Role required: discovery_admin

Procedure

1. Navigate to **Workspaces** > **Discovery Admin Workspace** > **Content 360**.
2. Select the **Content service suggestions** tile.
3. Manually sync with suggestions from your system by selecting **Sync candidates**.

   Note:
   If a message appears about the application scope, select **OK** to exit the message. Then, change the scope by selecting the application scope icon ( ) and selecting **Global**.

4. In the Sync candidates confirmation window, select **Yes**.
5. Review the Content Service suggestions for discovery by product.
   - To filter the list, select the products from the **Content service suggestions** tab.
   - To review a product's description and details, select the link from the **Name** column.
6. Select the product you want to enable discovery for.
7. Activate discovery classifiers by product categories.

   Note:
   The number of classifiers that will be activated is indicated in the **Activate** button.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- To enable the discovery by product categories, select the product categories check boxes, select the check box next to the **Name** column, and select **Activate**.
- To enable the discovery by individual products, select the product from the **Name** column and select **Activate**.

Result

The new configuration items are added to the CMDB the next time Discovery runs a schedule. The Discovery Admin Workspace then lists the added CIs and removes them from the suggested applications list.

Discover installed software data with ITOM Content Service

Use ITOM Content Service and ITSM Software Asset Management to discover version-less installed software that isn't discovered automatically with Software Asset Management Core or Software Asset Management Professional or file-based Discovery.

Before you begin

Ensure that the following application and plugins are installed:

- ITOM Content Service (sn_smart_content)
- Software Asset Management Core (com.snc.sam.core) or Software Asset Management Professional (com.snc.samp)
- File Based Discovery (com.snc.discovery.file_based_discovery)

Ensure that ITOM Content Service is active. For more information, see Share data on ITOM Content Service.

Ensure that the content service suggestions in the relevant category are activated. For more information, see Enable discovery with ITOM Content Service.

Role required: discovery_admin

Procedure

1. Navigate to **All** > **Discovery Smart Content** > **Smart Content Categories**.
2. Activate the relevant category.
   a. In the **Name** column, search for the relevant category.
   b. Double-click (or use the keyboard shortcut) the **Create Installed Software** column.
   c. In the list, select **true**.
   d. Verify the value by selecting the green check mark.

Result

The new installed software record is created and added to the CI Software Installations list the next time Discovery runs a schedule.

Tag Governance benefits

Tag Governance benefits

Benefit	Feature	Users
Implement cloud event processing and configure a tag policy to automatically update cloud resource tags in real time.	Performing real-time updates to tags for cloud resources	Cloud admins
Tag Governance supports domain separation, allowing you to logically group and segregate data, processes, and administrative tasks into distinct domains. This enables precise control over aspects like user access and data visibility.	Domain separation and Tag Governance	Cloud admins
Review non-compliant CIs flagged by tag audits and resolve them by adding the required tags.	Preview and remediate tag audit failures	Tag admins

Exploring

Discovery's contribution to Tag Governance

The Discovery and Cloud Discovery features discover all resources in the CMDB as well as cloud resources from cloud providers such as Amazon AWS Cloud, Microsoft Azure Cloud, and Google Cloud Platform (GCP).

Tag Governance dashboard – Overview tab

The **Overview** tab tracks the health and compliance of CIs based on tag audits. Interactive widgets provide information that enables you to view and analyze tag compliance status and the most-used and least-used tags.

Tag Governance dashboard – Policy View tab

Use the Policy View tab to view and analyze tag compliance filtered by cloud service account, by tag policy, and by datacenter. Filters enable you to focus your efforts to improve tag compliance.

Tag Governance dashboard – Efficacy tab

The Efficacy tab displays the results of tag audits as tag health ratings and compliance coverage of CIs. Interactive widgets show tag coverage status and tagging trends over time.

What to explore next

To learn more about configuring and using Tag Governance, see:

- Configuring Tag Governance
- Using Tag Governance
- Tag Governance reference

Discovery's contribution to Tag Governance

The Discovery and Cloud Discovery features discover all resources in the CMDB as well as cloud resources from cloud providers such as Amazon AWS Cloud, Microsoft Azure Cloud, and Google Cloud Platform (GCP).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The role of discovery

Discovery and Cloud Provisioning and Governance can discover tags that are used by all major cloud providers and container ecosystems through Service Mapping patterns. Once the tags are discovered, Service Mapping can create application services that are based on the tags. Typically, organizations use tagging in virtualized, hyper-converged, or multi-cloud infrastructures. For examples of the infrastructure types and tags used for them, see Tag-based discovery in Service Mapping.

Discovery also collects cloud tags that are specific to each virtual machine (VM) and saves them to the Key Value [cmdb_key_value] table.

The discovery process also detects tags that are associated with CIs. If your organization does not use consistent tagging standards or terms (key-value pairs), however, managing CIs with tags becomes difficult.

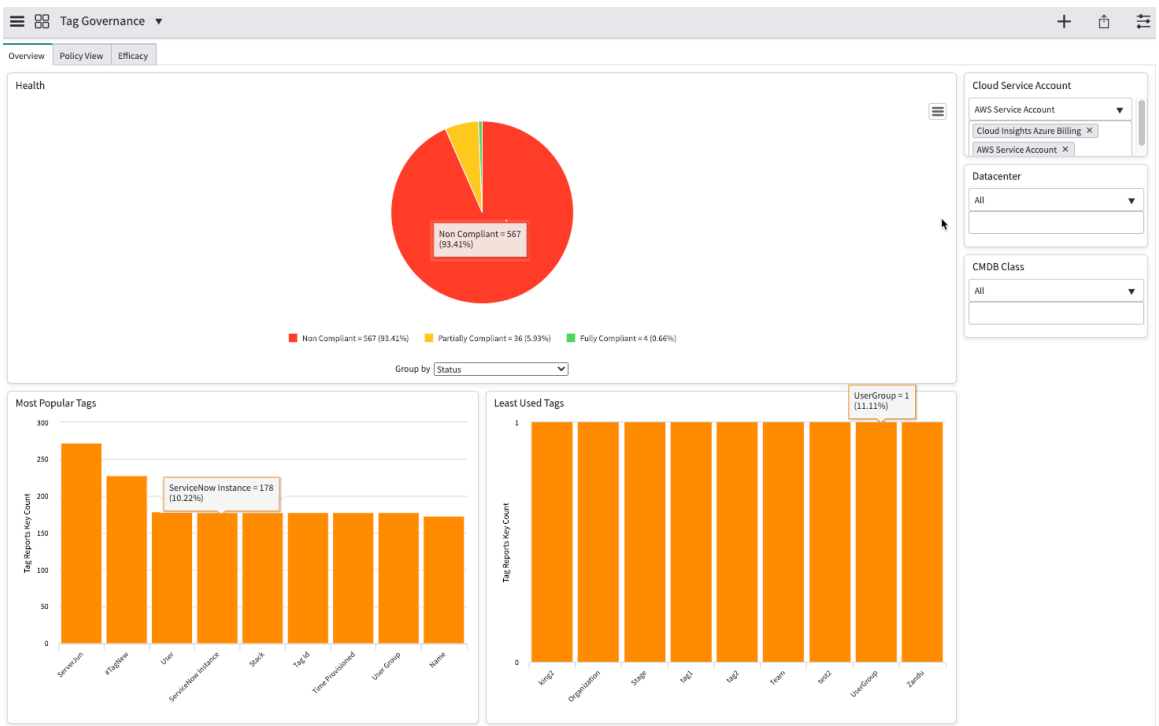
Tag Governance dashboard – Overview tab

The **Overview** tab tracks the health and compliance of CIs based on tag audits. Interactive widgets provide information that enables you to view and analyze tag compliance status and the most-used and least-used tags.

Accessing the dashboard

Log in as a Tag Governance administrator (sn_itom_tag.tag_governance_admin) to configure reports and Tag Governance Viewer (sn_itom_tag.tag_reports_viewer) view the reports. To access the dashboard, navigate to **Tag Governance** > **Dashboard**.

Overview tab



Applying filters

The Health tab displays the cumulative status of the tag health of all CIs that the tag audits ran on. Each category indicates the percentage and the count of CIs with a matching status.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, data is grouped by status. You can also group the results by using the filters in the **Group By** list.

Use the following interactive filters to refine reports:

- **Cloud Service Account**
- **Logical Datacenter**
- **CMDB Class**

> **Note:**
> The **CMDB Class** filter only applies to the **Tag Health** report. Using this filter does not impact or refine the results of the **Most Popular Tags** and the **Least Used Tags** reports.

For example, you can use a combination of the **Cloud Service Accounts**, **CMDB Class**, and **Logical Datacenter** filters. You can then view the tag audit results for the virtual machine instances that are mapped to a specific cloud service account and are located in a specific logical datacenter.

Reports

Tag audits run on all discovered resources in the CMDB CI [*cmdb_ci*] table. The tab displays health and compliance results for discovered CIs.

Widget	Description	Description
Health	Pie chart	Percentage and count of all CIs in the following categories: • Non Compliant: CIs that meet none of the tag policy requirements. • Partial Compliant: CIs that meet some tag policy requirements. • Fully Compliant: CIs that meet all tag policy requirements. Select any related slice or category to view a more detailed report.
Most Popular Tags	Bar chart	The ten most commonly used tags across all discovered CIs that tag audits evaluate. • Point to a bar to view the corresponding percentage of the total and count of the tag's occurrence. • Select a bar to view the list of CIs with that tag.
Least Used Tags	Bar chart	The ten least used tags across all discovered CIs that tag audits evaluate.

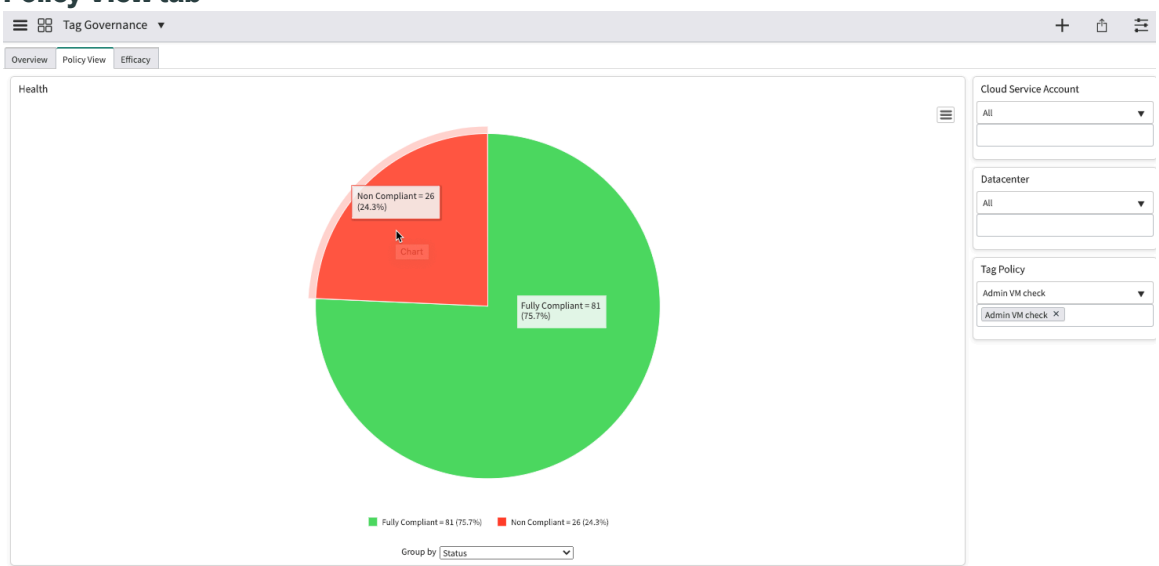
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Widget	Description	Description
		• Point to a bar to view the corresponding percentage of the total and count of the tag's occurrence. • Select a bar to view the list of CIs with that tag.

Tag Governance dashboard – Policy View tab

Use the Policy View tab to view and analyze tag compliance filtered by cloud service account, by tag policy, and by datacenter. Filters enable you to focus your efforts to improve tag compliance.

Policy View tab



The Policy View tab displays the cumulative tag health of all audited CIs. The Policy dashboard renders tag policy compliance on discovered CIs into an interactive pie-chart. The results are listed in the following categories.

- Fully Compliant: CIs that meet all tag policy requirements.
- Non Compliant: CIs that do not meet tag policy requirements.

Use the following interactive filters to refine reports:

- **Cloud Service Account**
- **Datacenter**
- **Tag Policy**

For example, you can use a combination of the **Cloud Service Accounts**, **Tag Policy**, and **Datacenter** filters to view tag audit results for CIs that match the filters you configure.

For more information about tag audit results and non compliant CIs, see Preview and remediate tag audit failures.

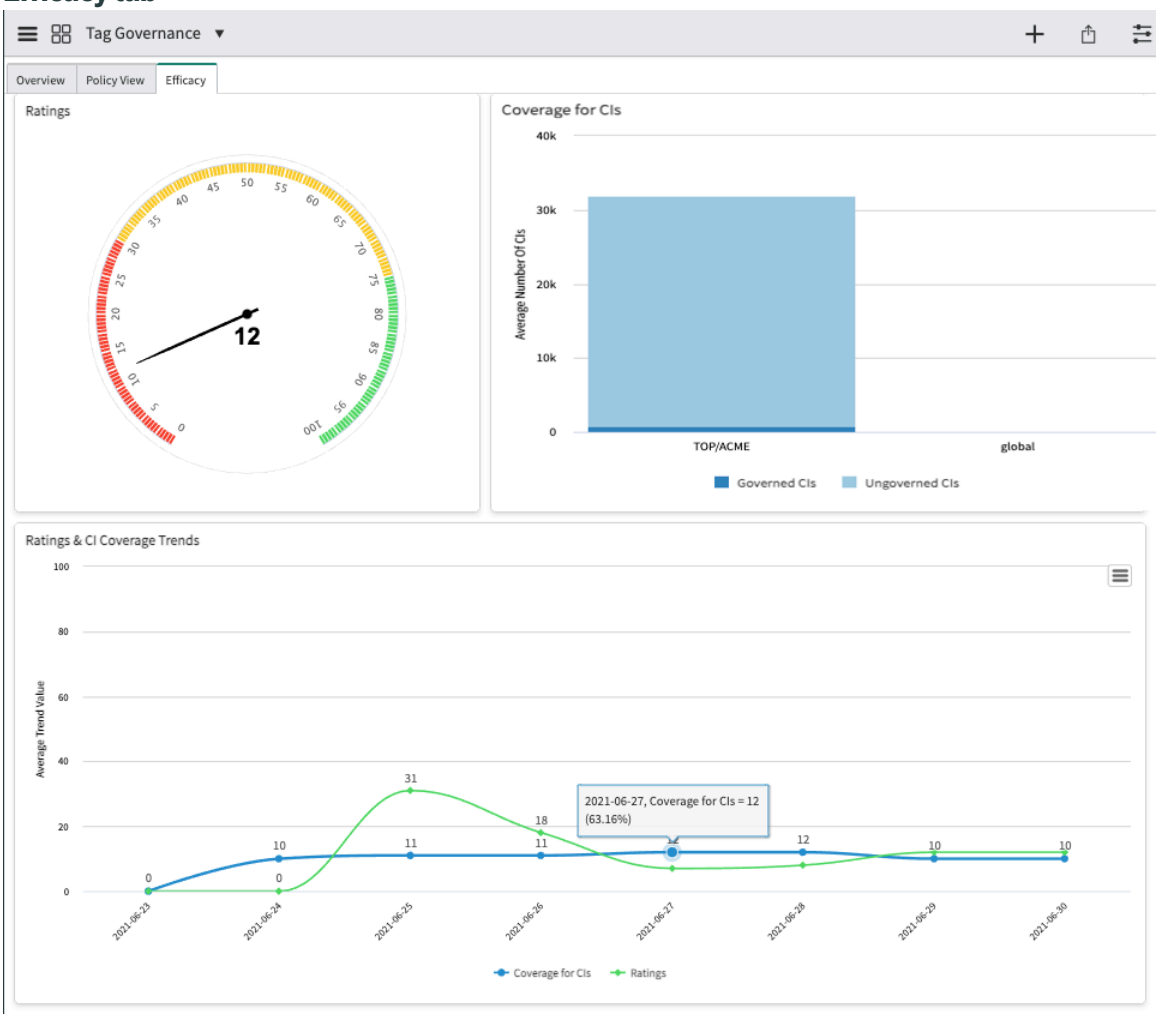
Tag Governance dashboard – Efficacy tab

The Efficacy tab displays the results of tag audits as tag health ratings and compliance coverage of CIs. Interactive widgets show tag coverage status and tagging trends over time.

Efficacy tab



Ratings

See the Ratings report to check the quality of CI tag health. The score is based on an algorithm that considers the following information and the data gathered from tag audit runs:

- Tag policy compliance
- Overall CI tagging compliance

Coverage for CIs

The Coverage for CIs report displays the count of CIs in the CMDB that tag policies govern and the percentage of all CIs that are governed. You can use this information to improve coverage of tag policies.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Ratings and CI Coverage Trends

The **Trends** report displays the average trend value over time of tag governance rating and coverage of CIs. The report provides insights as to how tag quality and tag coverage have fared over time.

Reports

Title	Type	Description
Ratings	Gauge report	Score that indicates the tagging quality rating across CIs. This value is based on an algorithm that uses the number of CIs that the tag policy covers and the total number of CIs that the tag policy certifies.
Coverage for CIs	Stacked Bar report	Percentage and count of all CIs that are governed by tag policies versus all CIs in the CMDB. The value is based on the total number of CIs that tag policies govern, divided by the total number of CIs in the CMDB. An individual bar represents each domain's CI coverage data.
Trends	Line trend report	Performance trends of tag quality and tag coverage over time.

Tag Categorization in Tag Governance

By automatically grouping similar tag keys into predefined categories, Tag Categorization streamlines the management of configuration items (CIs) and cloud resources while promoting clear and consistent tagging practices.

Tag categorization requirements

Note:

The Tag Categorization feature in Tag Governance leverages the CI tag category [svc_tag_categories] and the CI tag key [svc_tag_names] tables in Service Mapping. Full access to these tables requires installation of the version 1.16.3 or later of Service Mapping Plus. Without it, access to these tables might be limited, affecting your ability to recategorize tags, modify tag definitions, or fully use the feature. For more information, see Install Service Mapping Plus.

Tag Categorization overview

Tag Categorization helps streamline and improve the accuracy of tag management by providing preconfigured categories to help you group tags for your CIs. A daily scheduled job categorizes newly added tags and maps any unrecognized tag keys to the appropriate category. For

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

more information about the predefined tag categories, see Components installed with Tag Governance.

You can modify the tag category definitions, create your own categories, or add additional tag keys as needed. For more information, see Modify tag category information for Tag Categorization.

The Tag category policy confirms that all categories are properly mapped and up-to-date. It retrieves records and checks for category mappings to identify any missing categories. CIs that are missing a category are marked as non-compliant, which helps you address and remediate any tag category issues.

The system uses the *sn_itom_tag.recategorization_required* property to determine whether recategorization is needed. By default, this property is set to false, but when a change to a category occurs, a business rule sets the property to true, indicating that recategorization is needed. A daily scheduled job then checks this property and if it is set to true, begins the recategorization process. This process automatically updates the tag mappings within 24 hours of the change, but you can also initiate recategorization to apply the changes immediately. All changes and updates are stored in the CI tag category table.

Tag Categorization and domain separation

Tag Categorization supports domain-specific management. If an instance isn't domain-separated, the categories are added to the global domain. For domain-separated instances, the categories are added to each leaf domain. When you access or manage tags, the system gets domain information from the CI and adds tag mappings to the matching category in the appropriate domain. For general information about domain separation with Tag Governance, see Domain separation and Tag Governance.

Configuring Tag Governance

Install the Tag Governance app to execute tag audits, view the Tag Data Governance dashboard, and perform tag remediation.

Configuration overview

- Domain separation and Tag Governance

  Domain separation is supported in Tag Governance. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

- Install Tag Governance

  Install the Tag Governance app to execute tag audits, view the Tag Data Governance dashboard, and perform tag remediation.

  To view the list of plugins and applications installed with Tag Governance, including any dependencies, see Plugins or applications installed with ITOM Visibility.

Install Tag Governance

Install the Tag Governance app to execute tag audits, view the Tag Data Governance dashboard, and perform tag remediation.

Before you begin

- Ensure that you use the Discovery and Service Mapping Patterns for tag-based discovery.
- Install the ServiceNow Cloud Access Interface app for cloud remediation.

Establishing Tag Governance policies

Configure tag policies that define the criteria for tag audits on discovered cloud resources or CIs. View audit results on tag quality and compliance on the Tag Health dashboard. You establish tag policies that support the scale and needs of the various groups in your organization so all users can benefit.

Considerations

Follow a methodical approach when defining tagging standards to keep the count of tags low. Standardized tag policies improve the power of the Tag Governance app to monitor and manage tags across CIs in your organization.

You might need extensive discussions and research to understand the needs of all the varied teams in your organization. For example, finance teams might want CIs to be tagged based on cost-center allocations, applications assignments, and business purpose. In contrast, IT security teams might want CIs categorized by OS and security patch level as part of their vulnerability management plan.

Before you finalize your tagging approach, ensure that you have considered the following issues:

- Tag filters that various teams will use.
- The level of access that different users need.
- Whether you need real-time checks.
- Whether you need to synchronize tags with cloud resources.

Related topics

Configure a tag policy for Tag Governance

Configure remediation policies on tag audit findings

Configure a tag policy for Tag Governance

Configure tag policies that define the criteria for tag audits on discovered cloud resources or CIs. View audit results on tag quality and compliance on the Tag Health dashboard.

Before you begin

Role required: sn_itom_tag.tag_governance_admin, admin.

About this task

You can specify filters that narrow the scope of an audit, for example, to audit only service accounts and datacenters.

Procedure

1. Navigate to **All** > **Tag Governance** > **Policies**.
2. Select **New** and then fill in the Tag Policies form.
   The form fields are described in Tag Policies form.
3. Select **Submit**.
   - The Tag Policy Runs related list displays the list of tag audit runs with their corresponding state, created, and updated timestamps.
   - The Latest Policy Run Findings related list displays the results of the tag audit run.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Select the **Show Audit Results** related link to view all audit results.
- Select the **Run Point Scan** related link to execute all applicable checks against the record.
- For more information see, Flows and Subflows.

Configure remediation policies on tag audit findings

Configure and preview remediation options, generate keys, and perform actions to remediate non-compliance or failures that are based on tag audit reports.

Before you begin

Ensure that tag policies are configured and in Active state.

Role required: sn_itom_tag.tag_governance_admin, admin

About this task

You can run remediation automatically if you map a remediation policy to a tag policy. You can also update the tags of non-compliant CIs at the cloud provider's end in real time.

Configure remediation policies and logic and also enable updating tags on cloud resources associated with the following CMDB classes:

- Virtual Machines
- Compute Security Groups
- Storage Volumes
- Cloud Networks
- Cloud Subnet
- Network Interfaces
- Load Balancers
- Availability Zones
- Public IP addresses
- Storage Accounts
- Resource Groups

The list of CMDB classes for which you can update tags on CIs in the CMDB as well as cloud resources also displays on the Tag Remediation form. If you select the **Update Tags in Cloud** check box in the Remediation form, remediation will only preview CI failures belonging to the CMDB classes listed.

Procedure

1. Navigate to **All** > **Tag Governance** > **Remediation**.
2. Select **New** to create a new record.
3. In the **Name** field, provide a unique descriptive name.
4. In the **Policy** field, select the lookup icon.

   Note:
   The **Policy Type** field is automatically populated after you select a policy from the lookup list.

5. In the Tag Policies list, configure a remediation policy in one of the following ways:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select an existing tag policy from the lookup list.
- Select **New**. Fill in fields on the Tag Policies form (the fields are described in Tag Policies form.

Note:
If you are creating a new tag policy, you must run an audit before you can run remediation flows.

You have created or selected a policy for the remediation record.

6. **Optional:** Select the **AutoRemediation** check box to automatically run remediation on non-compliant CIs.
When an audit run finishes, remediation runs on all CIs with policy failures.
7. **Optional:** Select the **Update Tags in Cloud** check box to apply remediation and update the tags in the relevant cloud provider environment for supported CMDB CI classes.

Important:
The **Update Tags in Cloud** feature works only for AWS and Microsoft Azure Cloud resources for CMDB classes listed in the Tag Remediation form. See Performing real-time updates to tags for cloud resources.

8. On the Tag Remediation form, select **Submit**.
The remediation policy is configured. The Tag Remediations list opens.

Preview and remediate tag audit failures

Preview audit reports for resources that tag policies identify as non-compliant. Remediate failures by adding or updating tags.

Before you begin

Configure tag policies and remediation policies. See Configure a tag policy for Tag Governance and Configure remediation policies on tag audit findings.

Note:
The update to cloud works only for AWS and Microsoft Azure Cloud resources for CMDB classes listed in the Tag Remediation form.

Role required: sn_itom_tag.tag_admin, admin

About this task

Based on the tag policies that you create, you can preview remediation flows and auto-generate missing tags for non-compliant CIs. The Tag Remediation Preview related list displays this information. See Flows and Subflows.

Note:

- If you select the **Update Tags in Cloud** check box while configuring remediation, the Preview audit filters failures belonging to the listed CI classes.
- If you selected both the **Auto-Remediate** and **Update Tags in Cloud** settings while configuring remediation, then tags are updated both in the CMDB and in cloud resources (only for supported CMDB CI classes).
- If you select only **Auto-Remediate**, the remediation runs and updates tags in the CMDB alone.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Tag Governance** > **Remediation**.
2. From the Tag Remediations list, select the record that you want to view.
3. Select the **Preview Remediation** related link.
   The Tag Remediation Previews related list displays the non-compliant CIs.
4. Select the Tag Remediation Previews related list to identify the missing tags and their values.
5. On the Tag Remediation Keys related list, select **New** to create a tag remediation key.
   The fields on the Tag Remediation Key form are described in Tag Remediation Key form.
6. Select **Submit**.
   You have created the Tag Remediation keys associated with the policy.
7. **Optional:** Select the **Generate Keys** related link, if you have run the **Tag Key Policy**.
   The **Generate Keys** related link appears only for the *Tag Key Policy* policy type. Because the policy specifies the expected tags, you can select the **Generate Keys** related link to generate the keys that you need for remediation instead of manually adding them in the Tag Remediation Keys related list.
8. **Optional:** Select the **Generate Key Values** related link, if you have run the **Tag Key & Value Policy**.
   The **Generate Key Values** related link appears only for the *Tag Key and Value Policy* policy type. Because you have already specified the values you are looking for in the tag policy, you can select the **Generate Key Values** related link to add the expected key values.
9. Select the **Remediate Tags** related link.
   The remediation flow to add missing tags initiates. A relevant information message displays on the form when the Remediation is active. Select the **More Info** link on the message to navigate to the default flow context.

Result

Based on the tag audit result findings and the Tag Remediations Keys that you create, the remediation flow adds missing tags to the non-compliant CIs to achieve policy compliance.

Performing real-time updates to tags for cloud resources

You can set up cloud events processing and map a tag policy to update tags for cloud resources in real time.

Prerequisites

- Cloud events table [sn_cmp_cloud_events] table does not have any records in the *processed* state.
- CIs impacted by tag change events are identified by either CAPI or Discovery and Service Mapping patterns.
- Configured at least one tag policy.
- Select the **Run on cloud events** check box in the tag policy you create.

Instructions depend on the cloud provider

See the following setup instructions for cloud event processing:

- Configure the Amazon AWS Config service to auto-update the CMDB
- Configure the Microsoft Azure Alert service to auto-update the CMDB
- Configure the Google Cloud's Operations Suite Logging service to auto-update the CMDB

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process cloud events related to changes in tags and execute tag audits on the events in real time.

Unlike regular tag audits, where the audit is performed on all CIs in the CMDB that the tag policy applies to, tag events are processed per CI. Based on the prerequisites, tag event processing occurs on events that are identified with a tag change. The impacted CI is identified and, if the associated policy is applicable to the CI, the tag policy is run on the identified CI.

If the **Run on cloud events** check box is selected during policy creation, the policy is selected to run an audit on tag change events. If the check box is cleared, the audit is not run on the CI even if there are tag change cloud events.

View the change type that applies to the tag (the change that triggered the audit) in the Tag Change Log [sn_itom_tag_change_log] table. The records in the table are stored for 90 days by default. The change log records appear whether a remediation run or an event triggered the change on the CI. You can also view tags that were added or updated as part of the change.

Optimizing performance

High event inflow or a large number of tag policies can decrease performance. You can modify the following system properties to ensure acceptable performance:

- [sn_itom_tag.azure_window_size] - This system property is configurable (in minutes).
- [sn_itom_tag.max_audit_lag_ratio] - Specify the lag between tag audits that are already running, before the audit triggers on the records ready for audit.
- [sn_itom_tag.policy_batch_size] - Batch size on which the tag audit is run.
- [sn_itom_tag.event_batch_size] - Event batch size to be processed.

Modify tag category information for Tag Categorization

Modify tag category definitions to support Tag Categorization and ensure that tag categories align with your requirements for data management and classification.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: tag_governance_admin

Procedure

1. Navigate to **All** > *Tag Governance* > **Tag Categories**.
2. Verify that you are in the leaf domain.
   a. In the page header, select the globe icon .
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Select the category definition for the tag category you want to modify.
4. In the **Regex** field, modify the definition.
   You can delete an existing value (regex) or add a new value (regex) in this field.
5. **Optional:** Enter a value in the **Priority** field to set a priority for this tag category.
   Because a tag key can belong to multiple categories. setting the priority ensures that Tag Categorization maps CIs to the correct category.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. Select **Update** to save the changes.
7. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Add or delete a tag category for Tag Categorization

Add or delete a tag category for improved tagging of your organization's configuration items (CIs) and cloud assets.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: tag_governance_admin

Procedure

1. Navigate to **All** > **Tag Governance** > **Tag Categories**.
2. Verify that you are in the leaf domain.
   a. In the page header, select the globe icon .
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Add or delete a tag category.

4. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Set the priority for tag category definitions for Tag Categorization

Set the priority for tag category definitions to ensure that tag keys belonging to multiple categories are properly categorized.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: admin

About this task

A tag key can belong to multiple categories. Setting the priority ensures that Tag Categorization maps Configuration Items (CIs) and cloud resources to the correct category.

For example, the tag key Application might belong to both the Application and Cost Center tag categories. Set the priorities for the Cost Center and Application tag categories to 100 and 101, respectively, to prioritize mapping to the Application category. If a conflict occurs, this setting ensures that the Application category has higher priority and automatically maps the tag key to it.

Procedure

1. Navigate to **All** > **Tag Governance** > **Tag Categories**.
2. Verify that you are in the leaf domain.
   a. In the page header, select the globe icon .
   b. Select **Domain scope**, and choose the appropriate leaf domain.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select the category definition for the tag category whose priority you want to set.
4. In the Priority field, set the value.
5. Select **Update** to save the change.
6. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Add or delete tag keys for Tag Categorization

Add or delete tag keys to ensure that they align with your requirements for data management and classification.

Before you begin

Verify that you have installed version 1.16.3 of Service Mapping Plus to access to the CI tag category and CI tag key tables. For more information, see Install Service Mapping Plus.

Role required: tag_governance_admin

Procedure

1. Navigate to **All** > *Tag Governance* > **Tag Categories**.
2. Verify that you are in the leaf domain.
   a. In the page header, select the globe icon .
   b. Select **Domain scope**, and choose the appropriate leaf domain.
3. Select the tag category to which you want to add or delete tag keys.
4. Under **CI tag keys**, either add a new tag key or delete an existing tag key.

5. If you want to apply your changes immediately rather than waiting for the automatic update within 24 hours, select the **Re-Categorize Tags** button.

Tag Governance reference

Reference topics provide additional information on Tag Governance forms and other resources.

Domain separation and Tag Governance

Domain separation is supported in Tag Governance. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information on support levels, see Application support for domain separation.

Domain separation

You can identify CIs or cloud resources that are inconsistent and do not comply with the policies that you configure to govern tag data. In Tag Governance, domain separation targets tenant domain requester use cases in an application. The application has been designed to support requester activities within tenant domains. Logic is in place to route data to tenant domains, based on applicable use cases. The owner of the instance must be able to set up the application to function normally across multiple tenants. The application handles data routing to domains.

All tables in Tag Governance support data separation only; delegated domain separation is not supported.

To ensure that domain-sensitive information is not available at a global domain, ensure that you create policies at a domain level and not at a global level. While managing service providers, create policies at the service provider level. If you create policies at a global level instead, when you run the audit, the "run" findings are created in the Global domain instead of respective domains.

Domain separation for service providers

Tag policies and remediation for AWS

Tag audits apply policies to discovered CIs to determine tag compliance; existence of tags, appropriate count of tags, and the presence of specified key-value pairs.

Tag policies

Run a tag audit to audit discovered CIs for the following tag policy types:

- Tag Count: Checks CIs for the tag key count that you specify
- Tag Presence: Checks CIs for the presence of the tag key values that you specify
- Tag Key & Value: Checks CIs for the presence of key-value pairs that you specify.

Specify string value or tag keys that you are looking for in a comma-separated format in the Tag Presence policy type. You can also specify a number in the Tag Count check policy type to identify CIs with one or more tags. After you run the tag audits, you can view audit results and configure remediation measures that are based on the compliance index quality. Optionally, you can also assign remediation tasks for non-compliant CIs to user groups and users for follow-on tasks.

Auto-remediation works with the Assume Role on AWS to automate the tagging of cloud resources, by following the steps in Configure access using temporary credentials based on trusted AWS accounts with AWS credentials.

The Assume Role must have the following permissions (policy) for remediation to work:

```
{
    "Version": "2012-10-17",
    "Statement": [
        {
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
            "Effect": "Allow",
            "Action": "tag:TagResources",
            "Resource": [
                "arn:aws:ec2:*:*:instance/*",
                "arn:aws:ec2:*:*:security-group/*",
                "arn:aws:ec2:*:*:volume/*",
                "arn:aws:ec2:*:*:vpc/*",
                "arn:aws:ec2:*:*:subnet/*",
                "arn:aws:ec2:*:*:network-interface/*",
 "arn:aws:elasticloadbalancing:*:*:loadbalancer/*",
                "arn:aws:ec2:*:*:availability-zone/*",
                "arn:aws:ec2:*:*:public-ip/*",
                "arn:aws:storagegateway:*:*:gateway/*",
                "arn:aws:resource-groups:*:*:group/*"
            ]
        }
    ]
}
```

Note:

While performing tag remediation, if it is found that Discovery is credential-less, MID Server with Tag Management capability is picked. Hence, add Tag Management capability to the correct MID Server with service account IAM role attached. This action is essential because there might be several accounts that IAM role MID Servers must choose from.

For more information, see contact Customer Service and Support.

Tag Policies form

You use the Tag Policy form to configure tag compliance and health policies that are used in tag audits runs on discovered cloud resources or CIs.

Tag Policies form

Field	Description
Name	Unique and descriptive name for the policy.
Short Description	A short summary that describes the policy.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description
Policy Type	Policy type selection for the tag compliance and health audit. • Tag Count Policy: Check for a specific count of tags for CIs. • Tag Key Policy: Check for tags with specific values (string expressions). • Tag Key & Value Policy: Check for key-value pair and value strings. Based on your selection, you will specify additional values.
Expected Tag Count	This field appears only when the **Tag Count Policy** policy type is selected. CIs with fewer tags than the specified number are considered as failed or non-compliant. CIs that meet the value are considered certified against this policy. For example, if you specify `4`, the policy checks whether the CIs have at least four tags specified.
Expected Tag Keys	This field appears only when the **Tag Key Policy** policy type is selected. Policy that checks discovered CIs for the tags specified in the **Expected Tag Keys** field. Specify multiple tags or string expressions in a comma-separated list. For example, if you specify `prod,finance,cost center` the policy checks whether the CIs have all the specified tags. CIs that have all the specified tags as certified or fully compliant. If CIs are missing any of the listed tags, they're considered failed or non-compliant.
Tag Key & Value Checks	Execute this policy to check discovered CIs for the tag key and values specified in the **Tag Keys & Value Checks** field. You can specify multiple tag key & value pairs or specify a script to check for a collection of values. For example, you can specify `user` in the **Key** field, and `admin` in the **Value** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description

	Note:
	The **Script** field appears only when **Tag Key & Value Policy** is selected in the **Policy Type** field. Use the **Script** field to specify multiple values to return a string set.
	Example code
	`// The script should return a string set to tagValues variable.`
	`// the code sets the tagValues array with name of the CI`
	`// by this the check will be done for the tag to match the CI's name`
	`tagValues = [ci.name.toString()];`

Active	Option to activate or deactivate the run schedule.
Run on cloud events	Option to enable real-time audit runs when cloud events occur. **Note:** Ensure that you have configured auto-updating the CMDB with cloud events for the relevant cloud provider.
Save cert audit result	Option to save the certification audit findings and incorporate tag audit outcomes in a CI's health calculations. **Note:** This option can be activated if there is a business need to incorporate tag audit outcomes in CI health calculations.
Run	Frequency at which the tag audit runs. • **Daily** • **Monthly**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description
	• **Weekly** • **Periodically** • **Once** • **On Demand** **Note:** To run an audit immediately after configuring the policy, select the **On Demand** option. • **Business Calendar: Entry Start** • **Business Calendar: Entry End**
Next scheduled run date	Date and time on which the tag audit is next scheduled to run. This field appears only for scheduled runs and not for on-demand runs.
Filters	Condition statements with a series of contextually generated fields. Use lookup lists to build conditions and filter the CIs eligible for audit. Dynamic conditions and filters you specify to fetch the desired tags based on service accounts and associated datacenters.
Table	Displays the *Configuration Item [cmdb_ci]* table to which filters are applied.
Policy Criteria	Other policy criteria that you can configure using dynamically populated reference lookup lists. The Configuration Item [cmdb_ci] table populates the data for this lookup list. For more information, see the Reference lookup.
Tag Filter	Filter CIs further based on **Key**, **Keywords**, and **Value** that you specify. Use the condition builder to customize a filter.
Task Assignment	Option to assign follow-on tasks to users or user groups.
Create Tasks	Option to create follow-on tasks.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Policies form (continued)

Field	Description
	Note: If there is an existing task mapped to a CI and tag policy, the *sn_itom_tag.allow_new_cert_follow_on_tas* system property determines whether to create a new task or update an existing one when there is a compliance failure: • To update the existing task with the compliance failure details but not create a new task, set the property to false (default) • To create a new task, set the property to true.
Group	This field appears only when you select the **Create Tasks** check box. Assignment group to which to assign the task. Use lookup lists to select a group.
User	Specific user from the assignment group to whom you want to assign the task. Use lookup lists to select a user. This field appears only when you select the **Create Tasks** check box.

Tag Remediation Key form

You use the Tag Remediation Key form to create a tag remediation key.

Tag Remediation Key form

Field	Description
Key	Tag key value that is used to remediate non-compliant CIs. For example, if the remediation preview shows the value as `cost center`, you can specify `cost center` as a new remediation key if it doesn't exist.
Order	Order of execution that the system considers when you initiate remediation. For example, you can run a tag count policy for four tags and identify CIs that are missing two tag keys. If you've configured multiple remediation keys, the system considers the

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag Remediation Key form (continued)

Field	Description
	two keys with the lowest values in the order field.
Remediation	Remediation name and record preview.
Value Type	Type of the value that you specify in the **Value** field — **Static** or **String**. Based on your selection, you must specify a script or a value for the tag key.
Value	String value for the key that you're creating. This field appears only when **String** is selected in the **Value Type** field.
Script	Script code to generate values for the key. This field appears only when **Script** is selected in the **Value Type** field.

Components installed with Tag Governance

Several key components are installed with, or linked to, the Tag Governance plugin to help standardize and manage your organization's tags.

Roles installed

Role title	Description	Contains roles
[tag_governance_admin]	Sets up and manages the tag governance application. Defines and enforces tag policies, manages tag categories and values, and promotes compliance with organizational standards. Performs advanced configuration and customization of tag governance features. Assign this role to application administrators.	• [itil] • [certification_admin] • [discovery_admin] • [flow_operator]
[tag_reports_viewer]	Views and analyzes tag reports related to tag usage and compliance. Assign this role to users who monitor and analyze tag data.	[cmdb_read]

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag categories installed

Starting with version 1.7.0, the predefined categories listed in the table are installed with Tag Governance and require the installation of at least Service Mapping Plus version 1.16.3. For more information see Install Service Mapping Plus.

Tag category	Definition (Regex)
Application ID	applicationid|application-id|app-id|appid|application id|app id
Assignment Group	assignment-group|assignment_group|assignment group|assignmentgroup|assign group
Cost Center	costcenter|cost-center|cost_centre|costcentre|cost-centre|cost centre
Environment	env|envt|environ|environment
Owner	own|owner|owners|ownership|owned

Properties installed

Property	Description
sn_itom_tag.glide.script.block.client.globals	Controls the access client-side scripts have to global variables for enhanced security. If set to true, these scripts can't access global variables. • **Type:** boolean • **Value:** true/false • **Default value:** False
sn_itom_tag.allow_new_cert_follow_on_task	Enables the creation of new certification follow-up tasks for each audit in Tag Governance. • **Type:** boolean • **Value:** true/false • **Default value:** False
sn_itom_tag.azure_window_size_in_mins	Time window size, in minutes, to check for changes in Azure Resources. This value helps determine the start and end times for the check: **Start time:** The time the event occurred minus the time window size. **End time:** The time when the event occurred plus the time window size.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	• **Type:** integer • **Default value:** 10
sn_itom_tag.performance.config.bulksize	Sets the number of app data items to process at one time. • **Type:** integer • **Default value:** 5000
sn_itom_tag.last_event_processed	Indicates the last tag event successfully processed to verify that the system is up to date with the latest changes. • **Type:**string • **Default value:**
sn_itom_tag.max_audit_lag_ratio	Sets the maximum acceptable ratio of delay for tag audits to confirm that tag policy audits are performed within a specified time frame. • **Type:** integer • **Default value:** 2
sn_itom_tag.tag_event_batch_size	Sets the number of tag events, such as the creation, update, or deletion of tags, processed together in a single batch. • **Type:** integer • **Default value:** 500
sn_itom_tag.policy_batch_size	Sets the number of items processed together in a single batch when a tag policy audit is run. • **Type:** integer • **Default value:** 1000

Cloud Discovery Workspace

Cloud Discovery Workspace offers a comprehensive solution to manage the cloud operations of your organization.

Install Cloud Discovery Workspace	Use Cloud Discovery Workspace

Troubleshoot and get help

- Ask or answer questions in the Cloud Discovery Workspace forum on the ServiceNow Community
- Search the Known Error Portal for known error articles
- Contact Customer Service and Support

Install Cloud Discovery Workspace

You can install the Cloud Discovery Workspace application (com.cloud_operations_workspace) if you have the admin role.

Before you begin

Note:
When Cloud Discovery Workspace is installed, several plugins and applications are also installed. For more information, see Plugins or applications installed with ITOM Visibility.

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Cloud Discovery Workspace requires the following plugin. Ensure that the following plugin is activated before you install Cloud Discovery Workspace.

  Required ServiceNow plugins

  Discovery (com.snc.discovery)

  ServiceNow Cloud Discovery finds applications and devices on your network, and then updates the CMDB 360 with the information it finds. For more information on activating Discovery, see Request Discovery.

Role required: admin

About this task

When you install the Cloud Discovery Workspace application, it automatically installs the following role:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Discovery Workspace role

Role name	Description and tasks	Nested roles
sn_cloud_ops_ws.cloud_ops_admin	The Cloud Discovery Workspace admin can perform the following actions: • View the Cloud Discovery Workspace dashboard • Create Cloud Discovery schedules • Monitor Cloud Discovery operations • View Cloud Discovery reports	• sn_itom_ui_comp.itom_component_user • discovery_admin • cloud_admin

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the Cloud Discovery Workspace application (com.cloud_operations_workspace) using the filter criteria and search bar.

   You can search for the application by its name or ID. If you cannot find the application, you might have to request it from the ServiceNow Store.

   Visit the ServiceNow Store website to view all the available apps and for information about submitting requests to the store. For cumulative release notes information for all released apps, see the ServiceNow Store version history release notes.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Cloud Discovery Workspace.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.
   Demo data are sample records that describe application features for common use cases. Load the demo data when you first install the application on a development or test instance.
5. Select **Install**.

Cloud Discovery Workspace dashboard

The ServiceNow® Cloud Discovery Workspace dashboard provides a summary of the cloud operations of your organization and shows the ServiceNow applications that you can use to manage them.

Note:
To access the in-product help, Enable Next Experience. You can improve the visual experience by using the dark theme. For more information, see Exploring themes in Next Experience.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Required ServiceNow AI Platform roles

sn_cloud_ops_ws.cloud_ops_admin.

Access the Cloud Discovery Workspace dashboard

To open the dashboard, navigate to **All** > **Cloud Discovery Workspace**.

Use cases

User	Dashboard use
sn_cloud_ops_ws.cloud_ops_admin	• Gain insight into the trend of CI discovery, trend of Cloud Discovery events, and Cloud Discovery errors • Select the cloud provider of your organization. • Access the applications that you can use to manage the cloud operations of your organization.

Indicators

Discovery errors today: Count of all Cloud Discovery errors that occurred during the scheduled discoveries over the last 24 hours.

Reports

The following reports are available in the Cloud Discovery Workspace dashboard:

Title	Type	Source table	Description
Total configuration items	Line and area chart 	cmdb_ci	This report displays the number of CIs discovered over time. Select the report to view the list of all the configuration items discovered so far. You can select any CI record to view more information about the CI and its multi-source data if available.
Events by provider - last 24 hours	Line chart	sn_cmp_cloud_event_list	This report displays the trend of the cloud events received over the last 24 hours. The report contains a separate trend line for each cloud provider.

In addition, the dashboard cards display the applications that you can use to manage the cloud operations of your organization. Use the Cloud provider selection page to select the cloud providers of your organization. The selection helps to customize the menus of the Cloud Discovery Workspace applications and display only the cloud providers that are relevant for your organization.

Open your configurable workspace experience in UI Builder for Cloud Discovery Workspace

Access your Configurable Workspace experience in UI Builder for editing.

Before you begin

Role required: admin, ui_builder_admin

Procedure

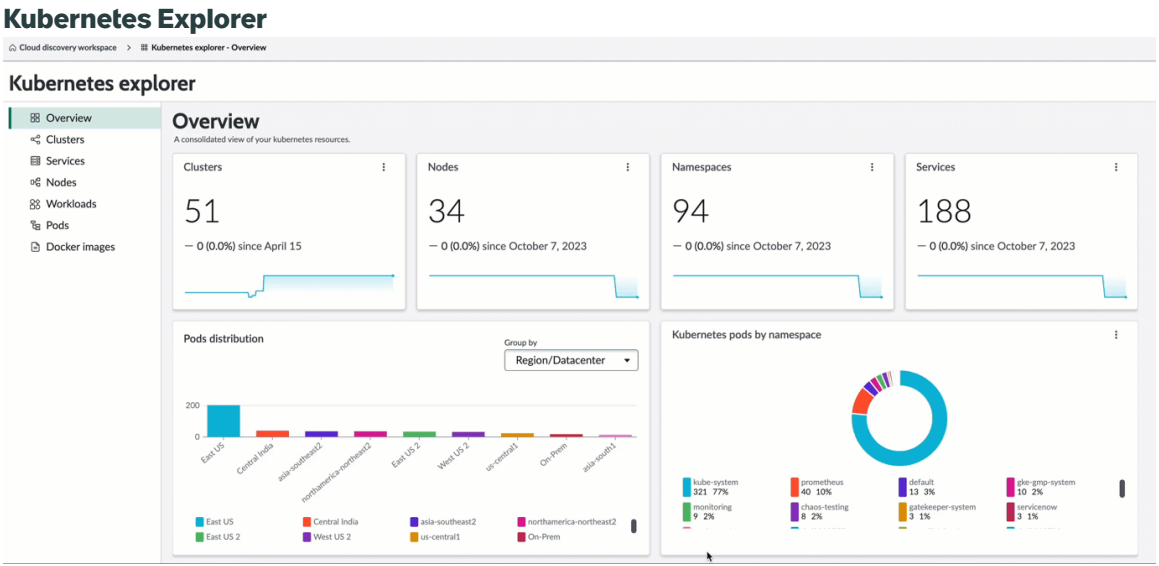
1. In the navigation filter, navigate to **All** > **Now Experience Framework** > **UI Builder**.
2. Select **Experiences**.
3. Select your experience.

Result

Your configurable experience opens in UI Builder.

Kubernetes Explorer

Use the ServiceNow® Kubernetes Explorer to drill-down and view the Kubernetes environments and resources of your organization.



The Kubernetes Explorer supports the following cloud providers:

- Amazon Web Services (AWS): Amazon Elastic Kubernetes Service (EKS)
- Microsoft Azure Cloud: Azure Kubernetes Service
- Google Cloud Platform (GCP): Google Kubernetes Engine (GKE)
- OpenShift

Important:
In the Kubernetes Explorer, any Kubernetes resource hosted on OpenShift is considered on-prem. Whereas, any Kubernetes resource hosted on Amazon Web Services (AWS), Microsoft Azure, and Google Cloud Platform (GCP) is considered cloud hosted.

Required ServiceNow AI Platform roles

The sn_cloud_ops_ws.cloud_ops_admin role is required to view the Kubernetes Explorer.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Access the Kubernetes Explorer

To open the dashboard, navigate to **All** > **Cloud Discovery Workspace** > **Kubernetes Explorer**.

Use cases

For examples of how different people in your organization would use this dashboard, see these use cases.

User	Dashboard use
Application owner	Review the statistics of the applications and workloads running on the Kubernetes clusters.
IT admin, cloud admin	• Review the statistics of the Kubernetes infrastructure: Clusters, Nodes, Namespaces, Services, Pods, and Workloads. • Review the distribution of the pods across dimensions such as region/datacenter, geo location, or country. • Review the distribution of the pods across namespaces. • Review the list of Kubernetes docker images used in your organization.

Indicators

Clusters

A Kubernetes cluster is a set of nodes that run containerized applications. The Clusters indicator displays the daily total count and discovery trend of the Kubernetes clusters discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Cluster Analytics [sn_cow_k8s_cluster_analytics] table to compute the Clusters indicator.

Nodes

A node is a worker machine in Kubernetes and may be either a virtual or a physical machine, depending on the cluster. The Nodes indicator displays the daily total count and discovery trend of the Kubernetes nodes discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Node Analytics [sn_cow_k8s_node_analytics] table to compute the Nodes indicator.

Namespaces

Kubernetes namespaces provides a mechanism for isolating groups of resources within the cluster. The Namespaces indicator displays the daily total count and discovery trend of the Kubernetes namespaces discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Namespace Analytics [sn_cow_k8s_namespace_analytics] table to compute the Namespaces indicator.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Services

Kubernetes service is an abstraction which defines a logical set of pods and a policy by which to access them (sometimes this pattern is called a micro-service). The Services indicator displays the daily total count and discovery trend of the Kubernetes services discovered across the Kubernetes deployments of your organization.

The Kubernetes Explorer reads the Kubernetes Service Analytics [sn_cow_k8s_service_analytics] table to compute the Services indicator.

The Services indicator is also available on the Services tab of the Kubernetes Explorer.

Breakdowns

- Pod distribution: This breakdown displays the distribution of Kubernetes pods hosted on the on-prem infrastructure and the cloud infrastructure.

  You can filter the breakdown across the following dimensions:

  - Region/Datacenter
  - Geo Location
  - Country

  The Pod distribution breakdown is available on the Overview tab of the Kubernetes Explorer.

- Kubernetes services by platform or Kubernetes services by type: This breakdown displays the distribution of Kubernetes services across dimensions such as platform and type.
- Nodes by region: This breakdown displays the distribution of the Kubernetes nodes across hosting regions.

Filter

You can filter the list by interacting with the data visualizations such as donut and single score card.

Data visualizations

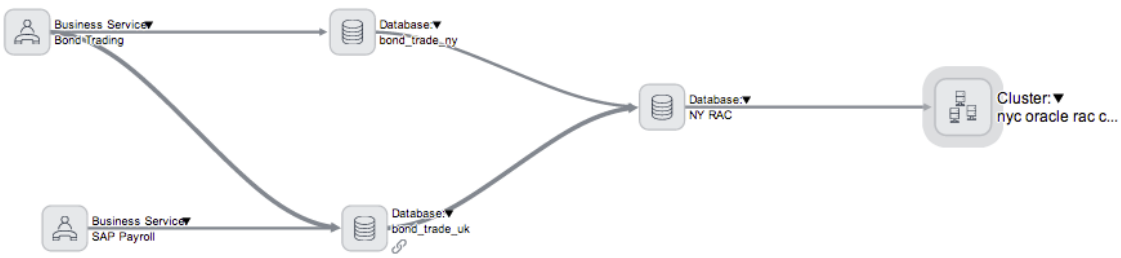
Dependency Views map

ServiceNow® The Dependency Views map shows an overall top-down Kubernetes perspective, starting from a top-level cluster to the container and within the container.

A Dependency Views map has one starting point, called the root CI or root node of the map. The root CI is surrounded by a darker frame that repaints itself with a pulsing effect drawing the attention to the root CI. The maps can show both upstream and downstream dependencies for the root CI. By default the Dependency Views map displays three levels, both upstream and downstream relationships. Administrators can configure the number of levels displayed. The map collapses and expands clusters to make them easier to view. By default, clusters are collapsed.

The Dependency Views module is active in all instances, and includes demo data.

Dependency Views sample map



In a Dependency Views map, map indicators indicate if a CI has any active, pending issues. You can investigate the tasks that are connected to a CI to get more details. When you return to the map from another form, the system restores the last map viewed, using the default filter and layout settings.

Many of the relationships in the map are created through the discovery process. You can also create, define, and delete CI relationships in the map. You can display the map from different

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

perspectives and open specific records that relate to configuration items. The system refreshes the map automatically to reflect changes to the CMDB.

Note:
CIs not extended from the Configuration Item [cmdb_ci] table, aren't displayed in Dependency Views maps and in CI relation formatters.

Roles

Users with the itil and ecmdb_admin roles can view maps and perform all actions in the map. Actions include access to the map views and saved filters, both from the lists in the map and from the **Saved Filters** module.

Cloud License Estimator

Cloud License Estimator enables you to get the estimated resource count for all the cloud resources that are eligible for licensing.

Explore	Configure	Generate Reports
Learn about Cloud License Estimator.	Set up credentials and configure accounts.	Generate reports with Cloud License Estimator.

Exploring Cloud License Estimator

Learn about Cloud License Estimator features.

This application -**Cloud License Estimator Innovation Labs release** - allows you to get the estimated resource count for all the cloud resources that are eligible for licensing.

It validates the#cloud#account details provided by the user and estimates the resource#count#based on the prevailing licensing rules.

The Cloud License Estimator makes it easy for users to get the count of cloud resources along with the required license estimates. Currently, the CLE in Innovation Labs release supports AWS and Azure cloud environments where a user can create a configuration by providing the necessary details and then run the license estimator to get the report. CLE also gives you the option to download the report in pdf format.

Configure Cloud License Estimator

Set up the accounts and credentials needed for Cloud License Estimator.

Before you begin
Role required: admin

Procedure

1. Go to your ServiceNow instance and click on 'All' and search for ITOM Cloud License Estimator
2. Step2. Once you click on 'ITOM Cloud License Estimator', you will be taken to the Cloud License Estimator workspace
3. Click on Go to Credentials to setup the credentials for your Azure/AWS account
4. Click on New to add the credentials for you Cloud Account

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Click on AWS Credentials for adding your AWS cloud account credentials and click on Azure Service Principal for adding your Azure Service Principal.
6. Enter the information in the fields and then click on submit
7. Once you click on submit your credentials wil appear on the screen.

Set up the Credentials for AWS or Azure Cloud Accounts

Cloud provider credentials are necessary to set up the estimator reports.

Before you begin
Role required: admin

Procedure

1. Click on Go to Credentials to setup the credentials for your Azure/AWS account
2. lick on New to add the credentials for you Cloud Account
3. Click on AWS Credentials for adding your AWS cloud account credentials and click on Azure Service Principal for adding your Azure Service Principal.
4. Enter the information in the fields and then click on submit
5. Once you click on submit your credentials wil appear on the screen.

Configure Amazon Web Service Credentials for Cloud License Estimator

Before you begin
Role required: admin

Procedure

1. Navigate to the Cloud License Estimator home page
2. Click on Create Configuration and provide details of the account on which you want to run the license estimator
3. On the Create Configuration form, fill in the fields

   Name – Provide name of the configuration.

   Cloud Provider – Select the Cloud Provider -AWS.

   Account ID – Give your AWS cloud account ID and tick the check box if the account is an management account.

   Credentials – Select the credentials that you have initially setup in the previous steps.

   Config Aggregator Account – Provide the account ID of the aggregator account.

   Config Aggregator Name – Provide name of the aggregator account.

   Config Aggregator Region – Provide name of the region.
4. Click on Active check box
5. Click on Save and run license estimator to run the license estimator for the provided AWS account or Click on Save to Save the configuration and the license estimator can be run on that configuration.
6. After creating the configuration you can see your configurations appearing on the home page

Generate Cloud License Estimator Reports

Generate reports with Cloud License Estimator.

ITOM Visibility reference

Reference topics provide additional information about mapping and fine-tuning application services using ITOM Visibility lists and forms.

Run options for discovery schedules

Both horizontal and top-down discovery use these run options.

Discovery schedule run options

Run option	Description
On Demand	Doesn't run on a schedule. Select **Discover now** to run Discovery. This is the default
Daily	Runs every day. Use the **Time** field to specify the time of day.
Weekly	Runs on one designated day of each week. Use the **Time** field to specify the time of
Monthly	Runs on one designated day of each month. Use the **Day** field to select the day of th specify the time of day. If the designated day doesn't occur in the month, the schedu example, if you designate day 30, the schedule doesn't run in February.
Periodically	Runs every designated time. Use the **Repeat Interval** field to define the time in days, The first Discovery runs at the point in time defined in the **Starting** field. The subsequ **Repeat Interval** period passes. **Note:** For schedules configured as "Periodically", the "Time" column won't display the r determine the next execution time for schedule that is configured to run "Periodi [sys_trigger] table and locate the corresponding schedule record. The **Next Acti** scheduled run.
Once	Run one time as designated by the date and time defined in the **Starting** field.
Weekdays	Runs every Monday, Tuesday, Wednesday, Thursday, and Friday. Use the **Time** field t
Weekends	Runs every Saturday and Sunday. Use the **Time** field to select the time of day.
Month Last Day	Run the last day of every month. Use the **Time** field to select the time of day.
Calendar Quarter End	Runs on March 31, June 30, September 30, and December 31. Use the **Time** field to s the dates, modify the *DiscoveryScheduleRunType* script include.
After Discovery	Allows you to sequentially stagger the schedule. Use this option to run this schedule in the **Run after** field finishes. Select the **Even if canceled** check box to designate tha even if the **Run after** Discovery is canceled before it finishes. • This option isn't valid when Discovery is started via DiscoverNow, or when using th • You can't designate an inactive Discovery schedule.

Plugins or applications installed with ITOM Visibility

Tables that list the plugins or applications that are installed with ITOM Visibility applications. When you update your application, any newly required application dependencies are installed.

Discovery

Plugins or applications installed with Discovery (com.snc.discovery)

Plugin or application name	Description
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Service Watch Suite commons (com.snc.service-watch.commons)	Contains common UI components for Discovery and Service Mapping.
Discovery - IP Based (com.snc.discovery.ip_based)	Contains shared components of horizontal discovery used by Discovery and Service Mapping.

Discovery Admin Workspace

Plugin activated with Discovery Admin Workspace (sn_disco_workspace)

Plugin or application name	Description
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.

Service Mapping

Plugins or applications installed with Service Mapping (com.snc.service-mapping)

Plugin or application name	Description
Service Mapping – Map (com.itom-map-app)	A dependent internal plugin necessary to support the core components of the Service Mapping, Event Management, and Service Operations Workspace ITOM applications.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Plugins or applications installed with Service Mapping (com.snc.service-mapping) (continued)

Plugin or application name	Description
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Event Management and Service Mapping Core (com.snc.service-watch)	Comprises the common components of Event Management and Service Mapping.
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Pattern Designer (NG version) (com.snc.ng.pattern.designer)	The next generation (NG) version of the Pattern Designer that enables you to create, edit, and debug patterns used by horizontal and top-down discovery.
Service Mapping Plus (sn_sm_scoped_app)	Offers extended features for Service Mapping, and if related ServiceNow® Store applications and plugins aren't already installed, it installs them.

Tag Governance

Plugins or applications installed with Tag Governance (sn_itom_tag)

Plugin or application name	Description
Cloud Access Interface (sn_cai)	Provides easy access to the cloud through scripting. You can use this ServiceNow Store application to perform actions on virtual machines provisioned on Amazon Web Services (AWS) and Microsoft Azure.
Certification Core (com.snc.certification_core)	Contains core certification structures such as filters and templates, and provides compliance functionality.
ITOM Visibility License (com.snc.itom.vis.license)	Enables the activation of any ServiceNow Store application that requires ITOM Visibility licensing.
ITOM/OT SU Licensing (sn_itom_licensing)	Calculates and displays how many subscriptions for ITOM applications your organization purchases and consumes.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Flow Designer Action Step - Script on MID (com.glide.hub.action_step.script_mid)	Provides an action step to execute custom JavaScript within a reusable action on a MID Server.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Cloud Discovery Workspace

Plugins or applications installed with Cloud Discovery Workspace (sn_cloud_ops_ws)

Plugin or application name	Description
Discovery and Service Mapping Patterns (sn_itom_pattern)	Provides the latest versions of the Discovery and Service Mapping Patterns released on the ServiceNow Store. ServiceNow releases new patterns on the ServiceNow® Store on a monthly basis, enabling your organization to discover the latest industry-standard devices and applications.
Cloud Provisioning and Governance Core (com.snc.cloud.core)	Contains resource blocks and cloud Application Programming Interface (cloud API) mappings related to Cloud API-based discovery and events processed by either response mapping or calling patterns.
Performance Analytics Content Pack for Cloud Resources (sn_disco_cd)	Displays the aggregated view of all your Cloud Resources. It also provides analytics tables and views that associate tags with resources, enabling you to build your own custom dashboards and reports.
Pattern Designer (NG version) (com.snc.ng.pattern.designer)	The next generation (NG) version of the Pattern Designer that enables you to create, edit, and debug patterns used by horizontal and top-down discovery.

Agent Client Collector for Visibility - Content

Plugins or applications installed with Agent Client Collector for Visibility - Content (sn_acc_visibility)

Plugin or application name	Description
Agent Client Collector for Visibility - Content Content (sn_acc_vis_content)	Provides agent-based infrastructure discovery and collects Software Asset Management (SAM) metrics to support Discovery and Digital End-User Experience (DEX) applications.
Discovery (com.snc.discovery)	Finds applications and devices on your network, and then updates the CMDB with the information it finds.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Agent Client Collector for Visibility - Content Content

Plugins or applications installed with Agent Client Collector for Visibility - Content Content (sn_acc_vis_content)

Plugin or application name	Description
Expanded Model and Asset Classes (sn_ent)	Provides new, expanded model classes, asset classes, and model categories that come with the base system, defined by ServiceNow. Install the Asset Management (com.snc.asset_management) plugin as a prerequisite for using this application.
Discovery – IP Based (com.snc.discovery.ip_based)	Contains shared components of horizontal discovery used by Discovery and Service Mapping.
Agent Client Collector Framework (sn_agent)	Manages Agent Client Collector on the ServiceNow instance and the MID Server.
CMDB CI Class Models (sn_cmdb_ci_class)	Adds class models that extend the CMDB class hierarchy, including class descriptions, identification rules, identifier entries, and dependent relationships if applicable. Applications such as Discovery and Service Mapping can use these class extensions to populate configuration items (CIs) and discover various technologies and software.

- Plugins activated with ITOM Optimization
- Applications installed with Now Assist for ITOM

ITOM Health

The ServiceNow® ITOM Health product includes the ServiceNow® Event Management and ServiceNow® Metric Intelligence applications, which help you track and maintain the health of services in your organization.

Features of ITOM Health

Event Management

Event Management gathers alerts from infrastructure events captured by third-party monitoring tools. Event Management uses IT-related information gathered by Discovery to map alerts to configuration items. Based on the collected information, Event Management then provides dashboards showing a consolidated view of all service-impact events.

Agent Client Collector

Use the ServiceNow® Agent Client Collector application to monitor your service availability, examine the health and performance of your environment, and ensure that your infrastructure and its applications are running properly. You can also

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

proactively analyze your IT infrastructure to spot issues and prevent service outages, using Metric Intelligence. Using advanced machine learning to analyze information about your IT infrastructure, the Metric Intelligence application automatically determines dynamic thresholds and identifies anomalies that may indicate potential service outages.

Health Log Analytics

The ServiceNow® Health Log Analytics application predicts IT issues before they impact users. The application helps you solve problems faster by ingesting, understanding, and correlating machine-generated log data in real time. It notices any deviation from normal behavior when it happens and alerts you of possible business-impacting issues. Health Log Analytics receives and processes logs via the MID Server and sends events to the ServiceNow® Event Management application.

Service Operations Workspace for ITOM

Service Operations Workspace for ITOM is a configurable workspace that provides a unified experience for multiple IT Operations Management workflows. Service Operations Workspace for ITOM enables you to manage the life cycle of alerts, including running actions to resolve alerts and identifying the underlying issue of an alert.

ITOM Health licensing

The ServiceNow AI Platform® uses a licensing method where your organization is billed for using ITOM Health applications. ITOM Health and Health Log Analytics are available as separate licenses. The ServiceNow Product Documentation doesn't provide information on prices, packaging, or other details determined by your organization customer contract. For general information about licensing and subscriptions, see ITOM/OT SU Licensing and subscriptions.

Using guided setup to implement IT Operations Management applications

IT Operations Management Guided Setup provides a sequence of tasks that help you configure IT Operations Management applications on your ServiceNow instance. To open IT Operations Management guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**. For more information about using the guided setup interface, see Using guided setup .

Configure the MID Web Server extension

The MID Web Server is an extension that enables external clients to push metric data and events to the MID Server. Configure the MID Web Server extension to enable ITOM Health features (Event Management, Agent Client Collector, and Health Log Analytics).

ITOM Health use case

Modern organizations are turning to artificial intelligence (AI) technologies within IT operations (AIOps) to tackle the escalating volumes and diversity of data. AIOps platforms offer solutions for analyzing data, automating processes, and predicting issues preemptively, addressing the growing complexity of IT environments.

Key features of the ITOM Health use case include:

- Ingesting events and metrics through base-system integrations with chosen monitoring systems.
- Processing events and metrics to create alerts.
- Correlating alerts and conducting root cause analysis.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Detecting anomalies within the system.
- Calculating the impact on application services.
- Utilizing the Service Operations workspace for operational management.
- Automating remediation actions based on alerts.

Application service maps are instrumental for Network Operations Center (NOC) operators located at central hubs as they facilitate precise prediction of root cause alerts and correlation of these alerts with discovered topology data. This correlation enables accurate prediction of service impact, allowing for effective impact analysis to determine the effect on application services, visualized within the application service map.

Products that add value to ITOM Health

In the context of ITOM Health, which focuses on maintaining the health and performance of IT systems and infrastructure, there are several ServiceNow products that can add significant value:

Discovery

Discovery automatically identify and collect information about IT assets, configurations, and relationships, providing organizations with a comprehensive inventory to effectively manage and monitor their IT infrastructure.

Service Mapping

Service Mapping offers detailed information about application instance services within the [cmdb_ci_service_discovered] table. This data helps establish connections between infrastructure and application configuration items (CIs) stored in the [cmdb_ci_appl] table, enhancing visibility into IT environments and facilitating efficient management and monitoring processes.

Service Portfolio Management

Service Portfolio Management (SPM) offers the associated product model, while Software Asset Management (SAM) and Hardware Asset Management (HAM) provide life-cycle data for Technology Portfolio Management (TPM). Together, they enable comprehensive management of IT assets, ensuring effective utilization, compliance, and optimization throughout their life cycles.

Products that benefit from ITOM Health

Incident Management

Incident Management tools leverage downstream information from Event Management to create incidents swiftly, ensuring timely resolution of issues.

Customer Service Management (CSM)

Customer Service Management (CSM) systems benefit from ITOM Health by utilizing application service impact data to identify affected users promptly, enhancing customer support efficiency and satisfaction.

ITOM Health for AIOps operators

Learn how to operate networks efficiently, within operational and environmental limits. Detect alerts, analyze them, and take corrective action to maintain the health of your IT operations.

The AIOps Experience app provides the following consolidated platform for managing alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Management - Resolve health issues with alert aggregation and root cause analysis (RCA) for discovered services, application services, and automated alert groups. For more information, see Event Management.
- Service Reliability Management - Respond, collaborate, track, and self-remediate when working on alerts and incidents. For more information, see Service Reliability Management.
- CSDM - Maintain optimal IT operations by standardizing data models and processes. For more information, see Applying the CSDM guidelines to ITOM Health.
- Express List - Identify health issues across the datacenter on the Service Operations Workspace. Efficiently monitor systems and services, resolve alerts, evaluate the alert impact, track issues, and report incidents. For more information, see Express List in the Service Operations Workspace for ITOM.
- AIOps dashboards - View comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. The dashboards provide actionable insights that facilitate proactive responses to potential issues. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.
- Health Log Analytics - View log data, alerts, and error rate information on the Health Log Analytics operational dashboard to identify the root cause of an issue. Thereby enabling you to triage-related logs and analyze the raw data to help prevent IT issues before your users are affected. For more information, see Using Service Operations Workspace for ITOM Log Analytics.
- Now Assist - Investigate the alert more effectively with an alert analysis using generative AI. The alert analyses include a human-readable brief of the alert and technical information. For more information, see View an alert analysis by Now Assist in Express List.
- Agent Client Collector Monitoring - Monitor your service availability, examine the health and performance of your environment, and verify that your infrastructure and its applications are running properly. For more information, see Agent Client Collector Monitoring.
- IT Operations Management (ITOM) Optimization - Provide automation for the cloud workflows used to manage the cloud resources throughout their life cycle. For more information, see ITOM Optimization.

About events and alerts in ITOM Health

Learn the difference between events and alerts, and alert types and statuses.

Whenever an issue occurs on your network, such as a computer going down or a database failure, the event monitoring tools send events to your ServiceNow instance. The Event Management application then processes the events and generates alerts to indicate that an action must be taken to resolve the issue.

Events and alerts

An event is a change or occurrence in the normal operations of a service, API, system network, process, or workflow. Events can be triggered by manual input, such as pressing a button, or they can be generated automatically. They can be pulled (observed) or pushed (logged) to a system for tracking. Use event data to track system changes over time and trigger logic to escalate an

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

event to an alert if a specified performance threshold is breached. Event Management generates alerts based on event rules.

An alert is something that needs your attention but doesn't necessarily require an immediate response. Events that meet or exceed a defined condition or threshold to indicate they require immediate attention or action trigger alerts.

As events occur Event Management generates alerts, applies alert management rules, and prioritizes alerts for remediation and root cause analysis.

Alert states

There are four alert states, each of which have different execution flows and associated code.

- Open - The first stage in the processing of an alert.
- Closed - Closing an alert also closes any related incident that is not already resolved or closed.
- Reopen - When events are generated that are related to an existing closed alert, the alert is reopened. Alerts can also be reopened manually.
- Flapping - Flapping is a state when multiple open-close events are generated in rapid succession for an associated closed alert.

Alert priority and severity

The two most common characteristics of an alert are the priority and the severity.

- For better triage and focus, alerts that have a higher priority are brought to the top of the alert list. This placement brings to your attention those alerts that require you to handle them at a higher priority than other alerts. The priority of an alert helps you determine how important the impact is to application services. Your Event Management administrator configures the algorithm used to calculate priority.
- The Severity of an alert indicates how serious the underlying issue is. The following table lists the default severities.

Severity	Description
Critical	The resource is either not functional or critical problems are imminent.
Major	Major functionality is severely impaired or performance has degraded.
Minor	Partial non-critical loss of functionality or performance degradation occurred.
Warning	Attention is required even though the resource is still functional.
OK	An informational message that an alert is created. The resource is still functional. No action required.
Clear	The alert no longer needs action.

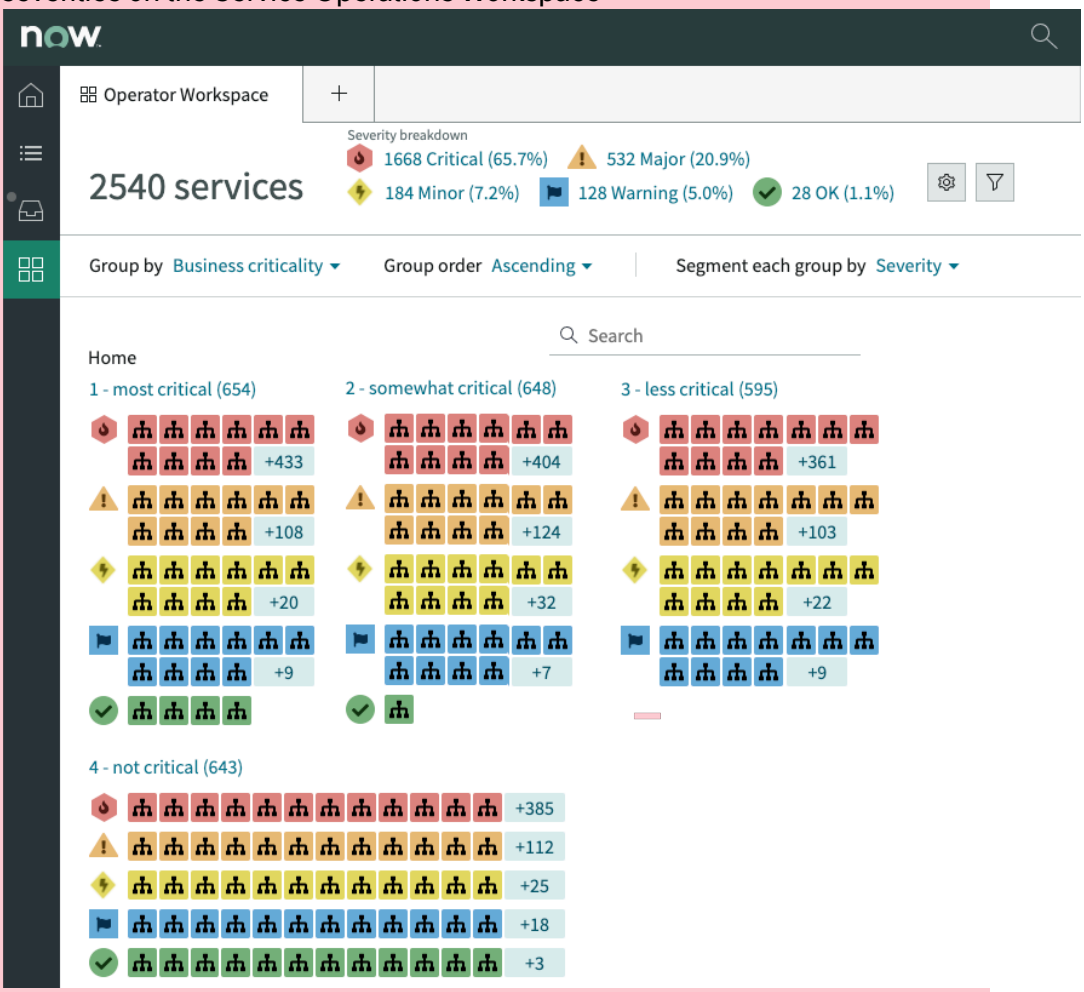
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the severities on the Service Operations Workspace dashboard.



Alert types and correlated alerts

Alerts are often related, or correlated, to each other. For example, if a router goes down, several separate alerts could be generated, one for each server connected to the router. Event Management can group alerts automatically based on specified correlation rules, with one primary root alert at the top and secondary alerts under the primary alert. You can choose to suppress secondary alerts to reduce the amount of alert noise and focus on the primary alert. You can also group alerts manually. In addition, you can manually attach additional alerts to a primary alert.

In the following example, if a router goes down on your network, network communication is also affected for connected servers, assuming they can't reach any other routers. The router outage becomes the primary alert and the alerts generated on the server are secondary alerts correlated under the router alert.

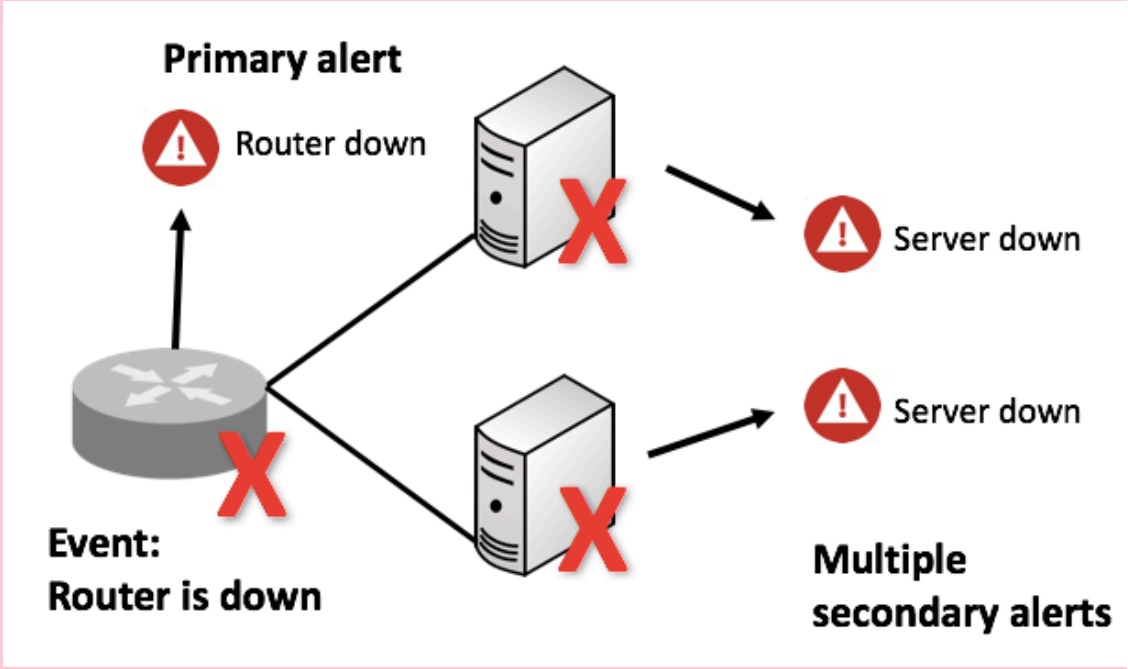
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Secondary alert generation



To learn more about the correlation types, see Alert grouping types and creation methods.

Alert flapping

An alert can flap, meaning that it gets multiple open-close events in rapid succession. Flapping indicates that Event Management can't detect whether the underlying events are genuine. These events could indicate small issues with the way CIs are configured, or larger issues, like network outages.

For example, a server that hosts a web service that has too many active processes might trigger an event about excessive CPU usage. If several events based on the CPU usage are triggered, Event Management may put the alert in the flapping state. This depends on the thresholds set by the administrator.

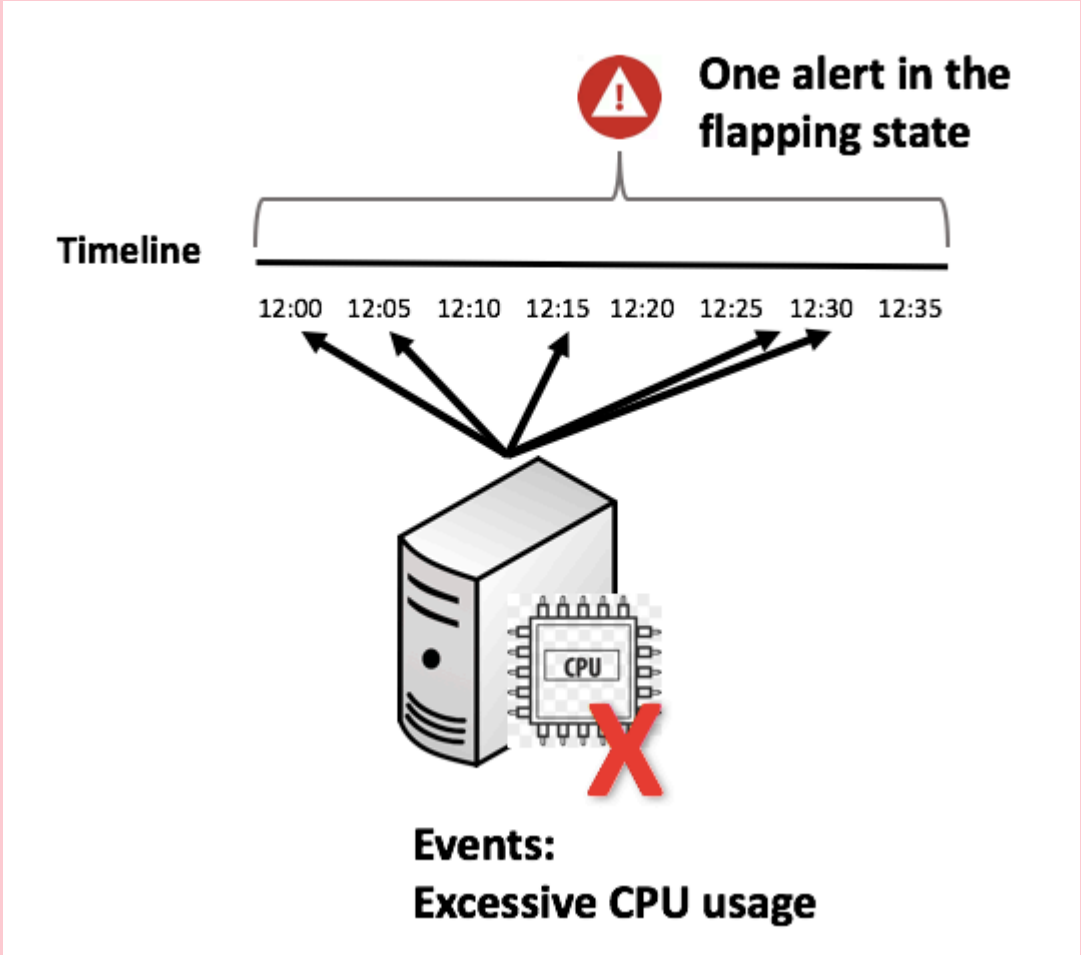
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert flapping diagram



As another example, consider a loose network cable that causes momentary, repeated network outages. In this case, if there was no set threshold for this type of alert set by the administrator, then Event Management won't considers it as a flapping alert.

About application services in ITOM Health application services

Learn about application services ITOM Health so that you can optimize, deploy, and manage them.

ITOM Health application services

ITOM Health application services are a set of interconnected applications and hosts that are configured to offer a service to the organization. The application service can be as follows:

- Internal - such as an organization email system
- customer-facing - such as an organization website
- Instance in a development environment - an instance of a business application or system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

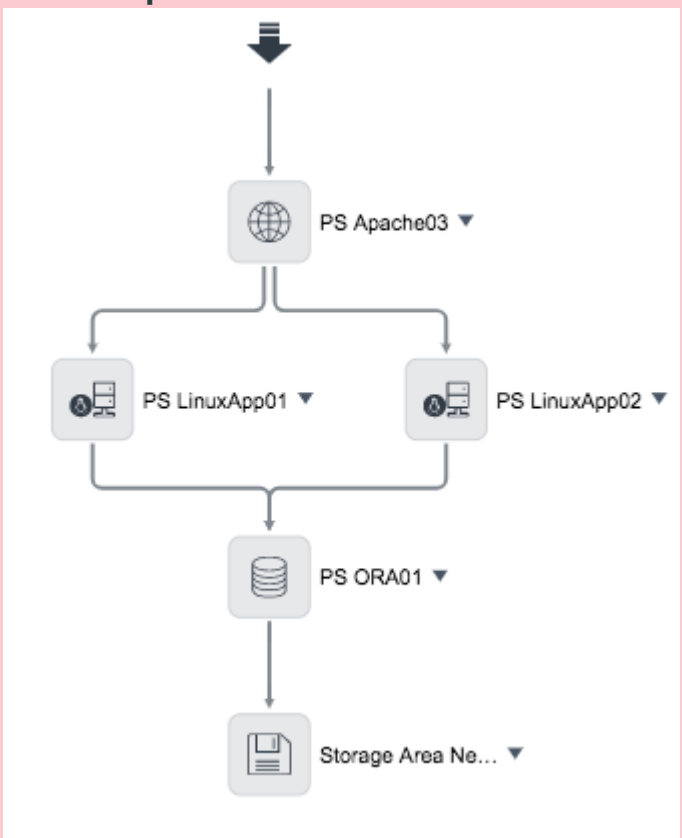
ServiceNow applications refer to devices and applications that comprise an application service as configuration items (CIs).

The various CIs and the relationships between them, that comprise an application service, are stored in the Configuration Management Database (CMDB).

Each application service contains an entry point as the top-level CI. An entry point is a point where customers can access an application service. Typically, it's a URL, or a combination of the IP address and port for an application service in enterprise deployments. For cloud-based deployments, an entry point can be a URL to a cloud resource like an AWS gateway.

Each component that makes up an application service is referred to as a configuration item or CI. As shown in the following diagram, the service map provides a visual representation of an application service. Service maps show active alerts for CIs and the relationships between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The application service map is available for all application services.

Service map



In the example, you're viewing a Web Portal application service map with the following CIs:

- **PS Apache03**: An Apache web server that hosts a company website.
- **PS LinuxApp01** and **PS LinuxApp02**: Two Linux servers that share the workload from the web server.
- **PS ORA01**: A database server that both Linux servers must access.
- **Storage Area Network 001**: A mass storage device on which the other CIs depend.

To view service maps like this on the Service Operations Workspace dashboard and what an application service looks like when an alert is associated with a CI, see View unified service map and the impact paths in Service Operations Workspace.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Types of application services

Event Management classifies application services into three types: discovered, manual, or a combination of both.

- Discovered service - an application service that the Service Mapping application finds (if your organization uses Service Mapping). Service Mapping discovers application services using patterns and by following traffic connections.
- Dynamic CI groups, which act as application services.
- Tag-based application services - Service Mapping can create application services based on these tags.
- Manual service - an application service that your administrator configures by selecting and adding each CI and specifying the relationships between CIs.
- Dynamic application service - includes only CIs that are part of CI relationships stored in the CMDB.

Alert impact

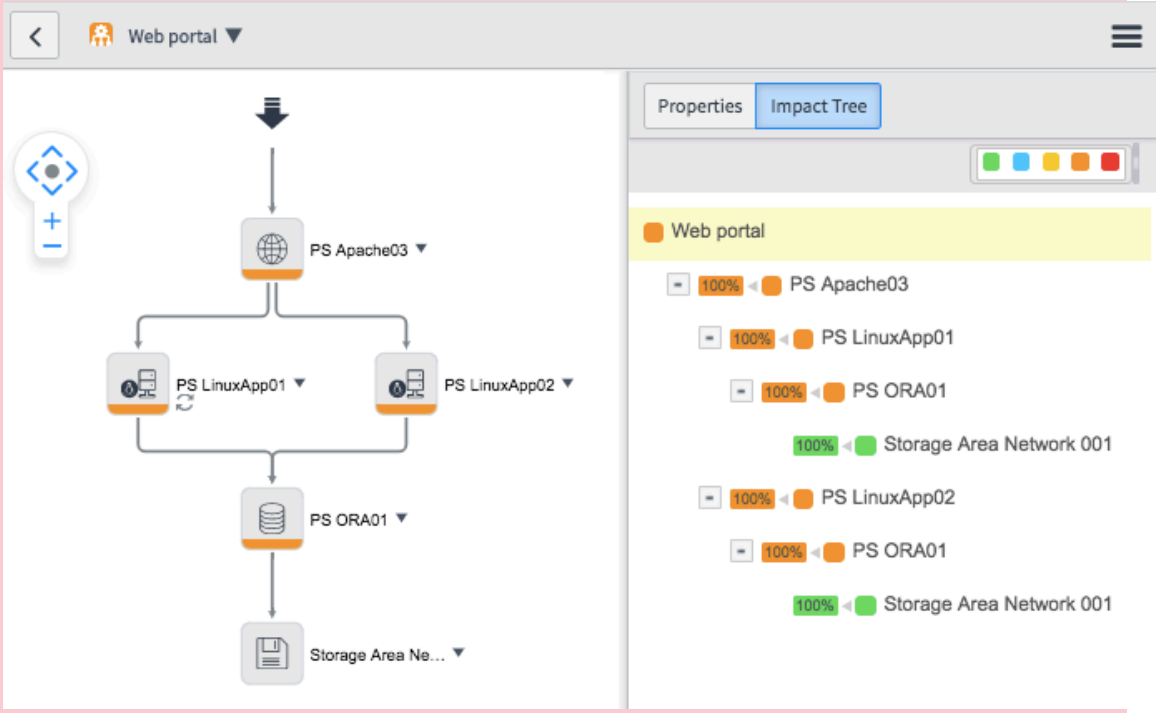
Application services are critical to the operations of your organization. If an issue occurs on one CI, the entire application service can be affected. Part of your role as an AIOps operator is to analyze alerts on CIs and see how they impact the application service as a whole and then remediate or solve the underlying issue. Your administrator can configure the impact rules that go into the calculations for the severity of an alert.

Use the Service Operations Workspace dashboard to view the impact tree for an application service and understand the relationship between the severity of an alert and the overall application service. As shown in the following figure, the service map shows active alerts for CIs and the relationships between the CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services. For more information, see View the impact tree.

In the following example, you can see how a **Major** alert on an Oracle database (**PS ORA01**) also causes a major alert on its parent CIs and on the Web portal application service itself.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact tree



Application services and CSDM

You can create an application service to adhere to the Common Service Data Model (CSDM) standards and to standardize the organization, maintenance, and monitoring of services. CSDM helps you streamline service types and service offerings. You can add relationships between application services and other service-related objects in the CSDM: Business Application, Technical Service Offerings, or Business Service Offerings. For more information, see Applying the CSDM guidelines to ITOM Health.

Related applications and DPM

Digital Portfolio Management (DPM) enables you to use related applications to view and edit service details in the plan-build-run life cycle. All related applications are optional, so they aren't required to use the DPM experience. For more information, see Digital Portfolio Management Workspace homepage.

[End]

Event Management

ServiceNow® Event Management is a robust application that helps keep your IT systems healthy by spotting problems quickly and fixing them. It collects events from different sources, figures out what's causing the issues, and converts them into alerts. These alerts are then analyzed, grouped, and acted upon to resolve issues and maintain system health.

Event Management seamlessly integrates with various monitoring tools via connectors and listeners, enabling comprehensive data collection and correlation. Available as a separate subscription from the main ServiceNow platform, Event Management allows organizations to tailor their usage to specific needs, ensuring effective and efficient incident management without unnecessary overhead.

Exploring Event Management

Explore Event Management to understand its overview, process flow, user roles, and benefits for comprehensive IT issue monitoring and resolution.

Event Management provides comprehensive monitoring, analysis, and remediation of IT issues by effectively managing various components within an IT environment. These components include discovered services, application services, dynamic CI groups, and alert groups.

- Discovered Services: Defined by interrelated Configuration Items (CIs) from the CMDB, a discovered service is identified through Service Mapping. It includes a service map with mapping relationships, an impact tree showing outage severity, active and related alerts, and CI properties. This service information is displayed on dashboards, the Alerts list, and the Events list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Application Services: Created by selecting specific CIs, application services allow for targeted monitoring and management. For more details, refer to the Application Services documentation.
- Dynamic CI Groups: These are collections of CIs grouped based on shared criteria, such as location. Dynamic CI groups help populate application services, simplifying management.
- Alert Groups: Alert groups organize sets of alerts to streamline maintenance and management, making it easier to respond to IT issues efficiently.

Process flow

Event Management receives external events and generates alerts based on predefined rules. The MID Server polls external event tracking tools and sends data to Event Management for storage and processing. Events are stored in the Event [em_event] table, and alerts are created by matching event rules. Alerts are then transformed and enriched with additional content, accumulated if thresholds are met, and mapped to specific fields. The system searches for matching message keys to update existing alerts or create new ones, associating related events under a single alert. Alerts are bound to specific Configuration Items (CIs) for root cause analysis. For more information, see Event Management process flow.

Users

Role title [name]	Description
Admin [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts
Operator [evt_mgmt_operator]	Manages alerts, including closing and acknowledging them. Oversees the overall Event Management process, ensuring events are properly categorized, prioritized, and routed for resolution.
Team Operator [evt_team_operator]	Manages Event Management operations within a specific team as defined in the **Assignment Group** field. This role allows the operator to read and write alerts exclusively for their assigned team. Additionally, the operator can make configuration changes specific

Role title [name]	Description
	to their team, including updates to Alert Automation and the Integrations Launchpad. **Note:** The evt_team_operator role must be assigned to an assignment group to view and manage alerts for that group. If the role is created but not associated with any groups that have alerts assigned, the operator cannot see any alerts.
User [evt_mgmt_user]	Manages the lifecycle of alerts, including performing basic operations such as viewing and acknowledging them.

Benefits

- Rapid Issue Detection: Quickly identifies and highlights potential IT issues.
- Efficient Alert Handling: Aggregates and correlates alerts for streamlined management.
- Automated Actions: Initiates automatic remediation processes to speed up issue resolution.
- Comprehensive Monitoring: Integrates with multiple tools for a complete system overview.
- Root Cause Analysis: Offers tools to identify underlying causes of issues.
- Customizable Rules: Tailors event and alert management rules to specific needs.
- Reduced Downtime: Minimizes system downtime with prompt problem resolution.
- Enhanced Visibility: Real-time dashboards offer insights into system health.
- Cost Efficiency: Lowers operational costs by preventing prolonged issues.

Event Management process flow

Event Management collects, analyzes, and converts events into alerts, enabling efficient tracking and remediation.

Event Management receives external events and generates alerts based on event and alert management rules. Events are sent directly to your instance via email server, script, SNMP trap, or web service API. The corresponding alerts appear on dashboards for tracking and remediation purposes.

As the computer, software, or service generates events, the MID Server polls the external event tracking tool. The MID Server, maintaining a connection to Event Management, sends the information to your instance for storage, processing, and remediation.

The instance stores events in the Event [em_event] table and attempts to generate alerts based on predefined rules and event mappings. Regardless of whether an alert is generated, the original event is available for review and remediation. Alerts are generated according to the following process flow.

1. Match Event Rule: Find the best matching event rule for an event.

   A rule is matched if the source of the event matches the source specified in an existing rule. Additionally, a rule is matched if the event matches the optional rule filter and the event additional_info value matches the rule Additional Information filter. A rule without any filter is ignored, such as when the source filter or Additional Information filter is missing. If multiple

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

rules are defined for the same type of event, use the rule order to determine the sequence of rule application.

2. Ignore Rule: If the rule **Ignore** check box is selected, no alert is generated. However, the event is still available for review and remediation.
3. Apply Transforms:
   - If transforms have been defined, apply them.
   - If compose parameters are set, apply the additional content to display to the user in the alert.
4. Threshold Accumulation: If Active in the threshold section is selected, accumulate all events until the threshold is met, then generate a single alert for the events.
5. Event Field Mapping
   - Search for an event field mapping even if there was no event rule.
   - If an event field mapping is found, apply the mapping information.
   - If the event has no severity after the event transformations, retain the event for reference purposes and do not generate an alert.
6. Alert Generation
   - Search the Alert [em_alert] table for a matching message key.
   - If a matching message key exists, update the alert according to the event information.
   - If a matching message key does not exist, create an alert.
   - If another event has the same matching key, associate the events under a single alert.
   - For root cause analysis purposes, bind the alert to a specific Configuration Item (CI).

© 2025 ServiceNow, Inc. All rights reserved.

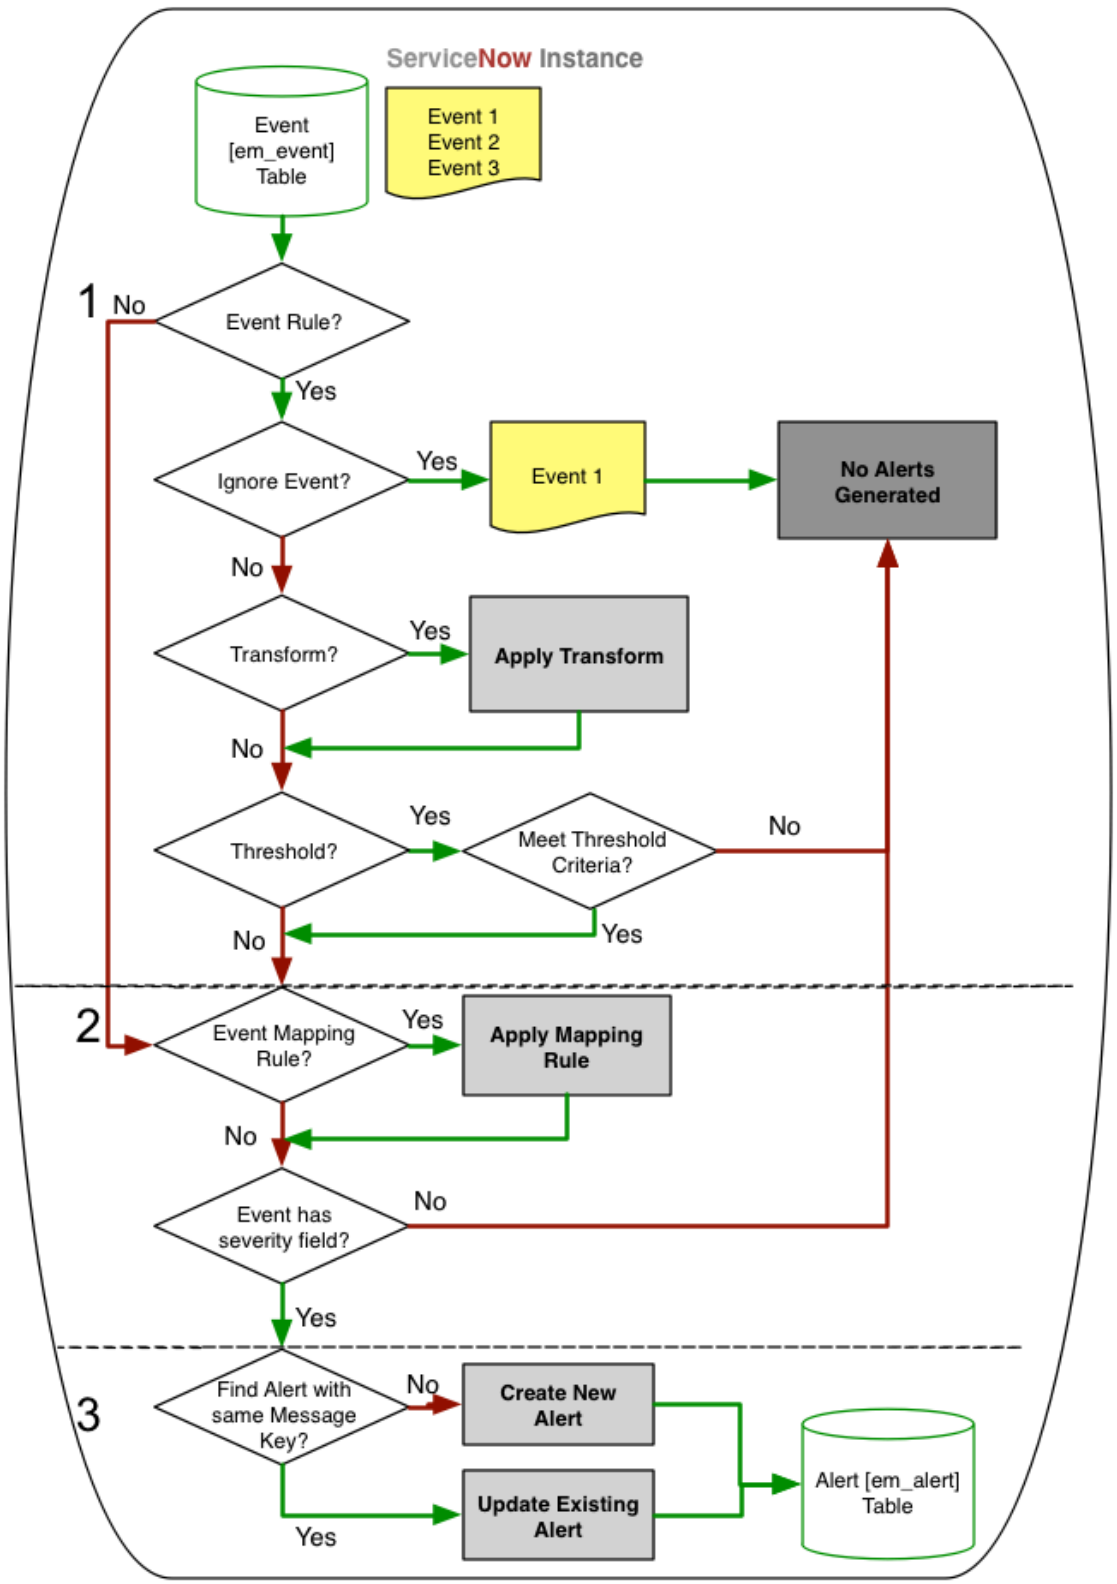
Event workflow



Event Management architecture

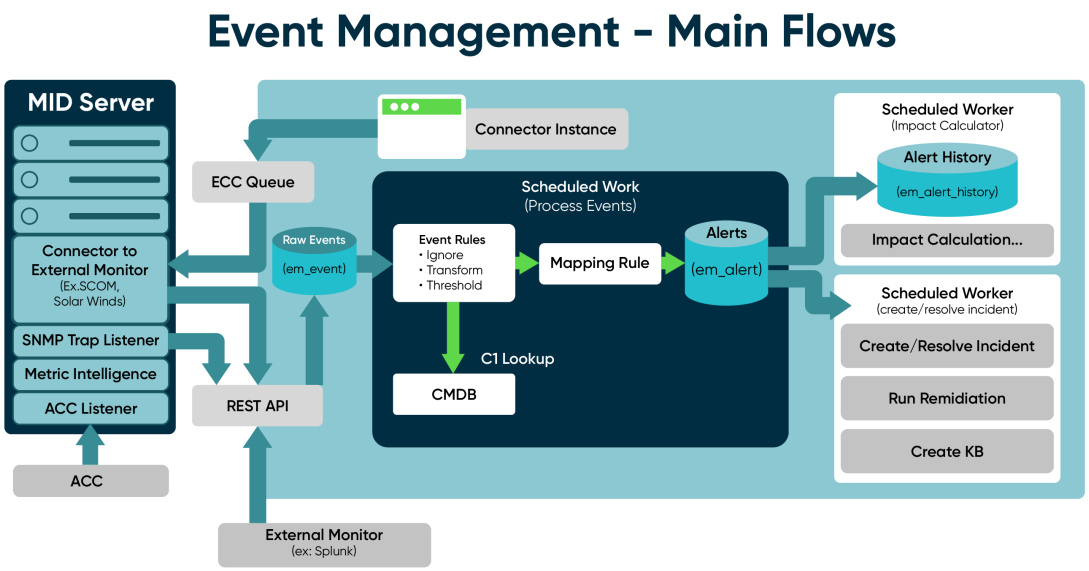
Event Management architecture integrates data collection, processing, and alerting into a unified system for streamlined IT issue detection and resolution.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Architecture

As events occur on various systems, the MID Server connector instance sends them to the main instance. Event Management generates alerts, applies alert management rules, and prioritizes alerts for remediation and root cause analysis. This information can be viewed on dashboards, the alert list in Alert Intelligence, or from a service map.

Event Management architecture



Configuring Event Management

Event Management administrators administer events, manage and monitor alerts, aggregate alerts, and work review and monitor services' status with the Operator Workspace service monitor.

Event Management operators find alerts, analyze them, and take action to resolve the underlying issue.

Request Event Management

Event Management plugin (com.glideapp.itom.snac) requires a separate subscription and must be activated by ServiceNow personnel. This plugin includes demo data and activates related plugins if they are not already active.

Before you begin

Role required: admin

About this task

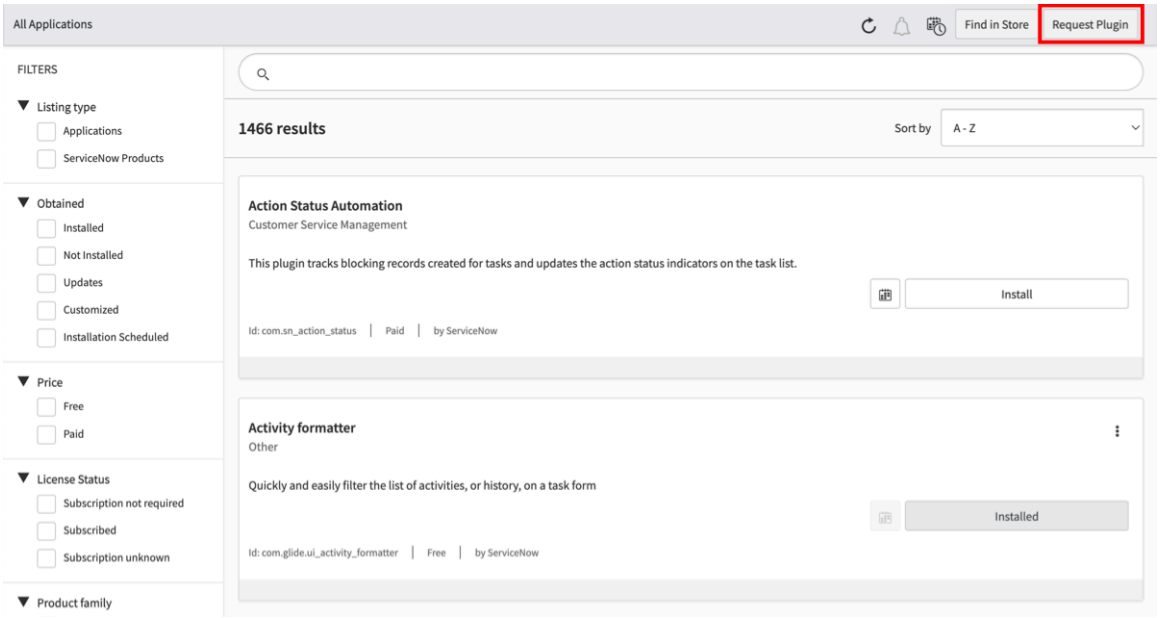
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

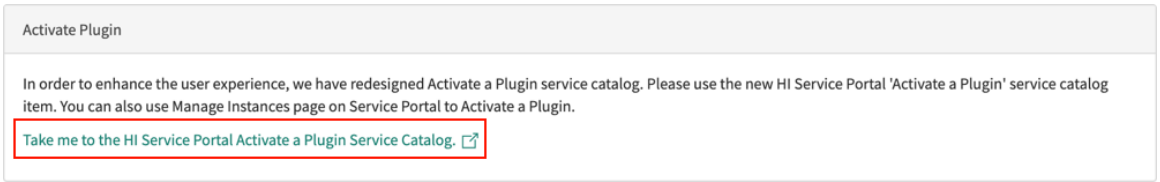
Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate. **Note:** If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin.

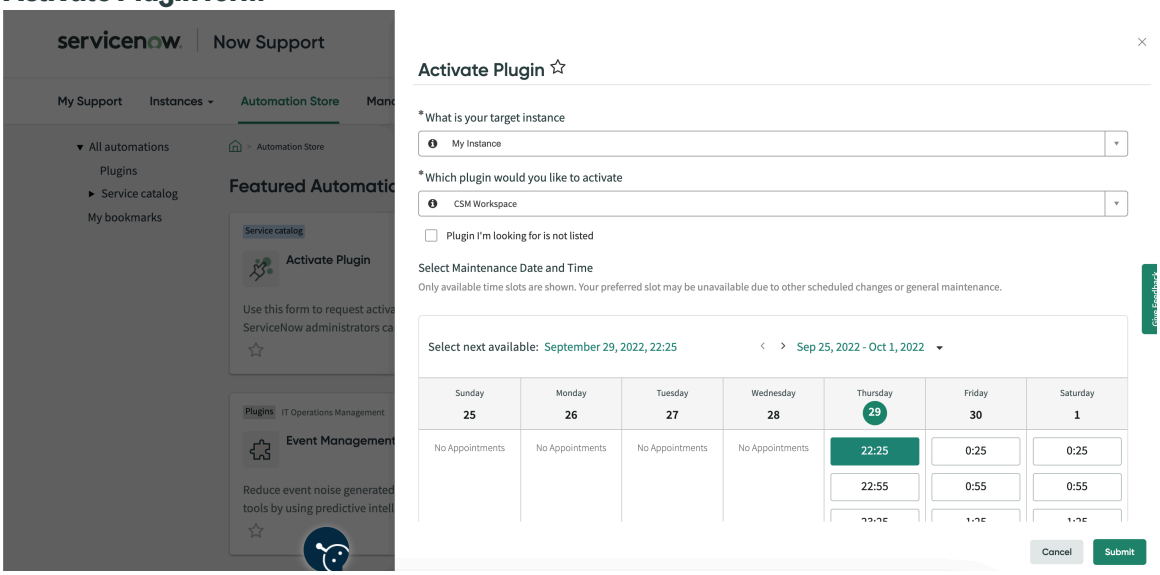
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Install Event Management

Retrieve the most updated apps for the Event Management application (com.glideapp.itom.snac) in the ServiceNow® Store. Periodically check the ServiceNow® Store for new app versions.

Before you begin

- Ensure that the application and all of its associated ServiceNow Store applications have valid ServiceNow entitlements. For more information, see Get entitlement for a ServiceNow product or application.
- Role required: admin

About this task

The following items are installed with Event Management:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Roles
- Scheduled jobs
- Tables

For more information, see Components installed with Event Management.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. Find the ITOM Health application using the filter criteria and search bar.

   If you cannot find the application, request it from the ServiceNow Store.
3. In the Application installation dialog box, review the application dependencies.

   Dependent plugins and applications are listed if they will be installed, are currently installed, or need to be installed. If any plugins or applications need to be installed, you must install them before you can install Event Management.
4. **Optional:** If demo data is available and you want to install it, select the **Load demo data** check box.

   (Optional) Demo data comprises sample records that describe application features for common use cases. Load demo data when you first install the application on a development or test instance.

   Important:
   If you don't load the demo data during installation, it's unavailable to load later.
5. Select **Install**.

Enhance Event Management performance

The Event Management Accelerator plugin ensures that Event Management maintains performance at a high level. This plugin is optional.

Before you begin

Role required: admin

About this task

The *em_alert_history* and *em_impact_status* tables can grow to be very large, negatively impacting Event Management performance. Installing the Event Management Performance Accelerator plugin ensures that Event Management performs at a high level. The plugin includes fix scripts that populate missing data, update key fields to maintain data accuracy, and create indexes to enhance performance. These actions help optimize large datasets and reduce the impact on query speed and overall system responsiveness.

When upgrading from an earlier version with more than 5 million records in either the *em_alert_history* or *em_impact_status* tables, you must activate this plugin manually. When there are less than 5 million records, it runs automatically. You can customize this number by modifying the *evt_mgmt.plugin_activation.table_max_size* property.

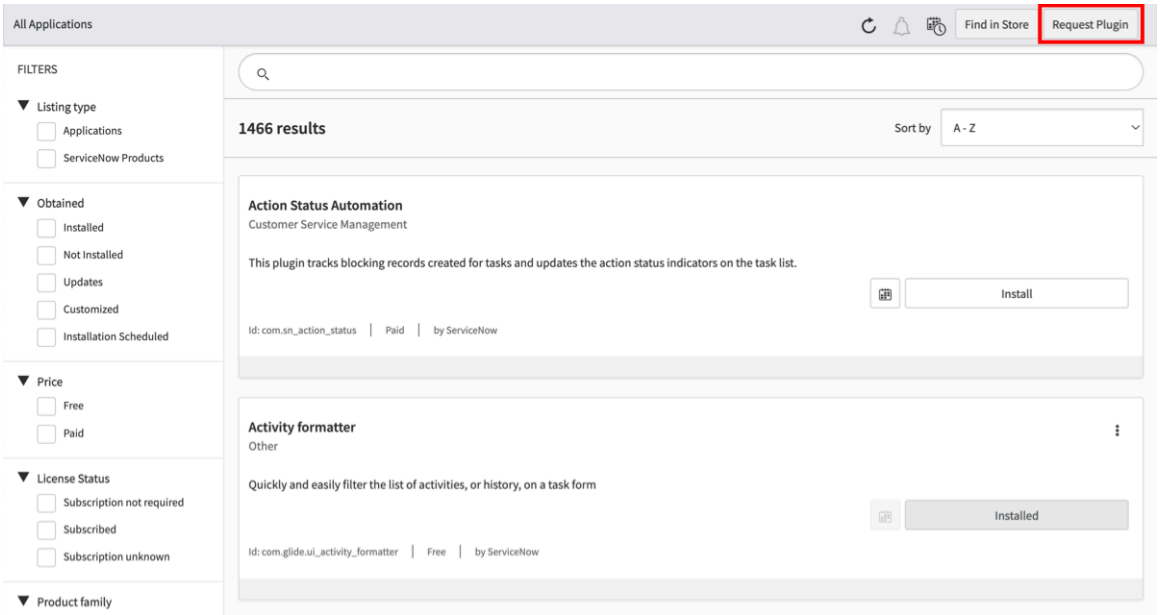
To purchase a subscription, contact your ServiceNow account manager. The account manager can arrange to have the plugin activated on your organization's production and subproduction instances, generally within a few days.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

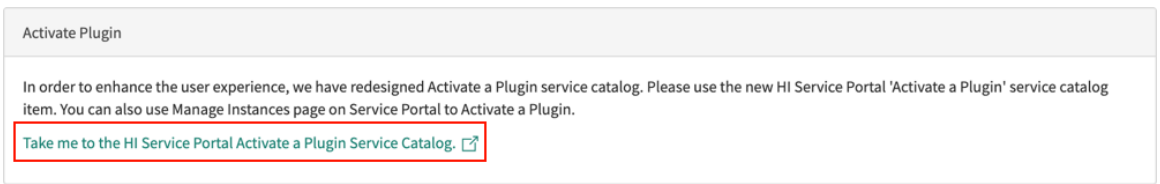
If you don't have an account manager, decide to delay activation after purchase, or want to evaluate the product on a subproduction instance without charge, follow these steps.

Procedure

1. Navigate to **All** > **System Applications** > **All Available Applications** > **All**.
2. On the All Applications page, select **Request Plugin** to open the **Activate Plugin** form on Now Support.



3. On Now Support, select the link to access the Now Support Service Portal Service Catalog.



4. Select your instance.
5. Select **Actions > Activate Plugin**.
6. On the **Activate Plugin** form, provide the following information.

Activate Plugin form

Field	Description
What is your target instance	Instance on which to activate the plugin.
Which plugin would you like to activate	Name of the plugin to activate.

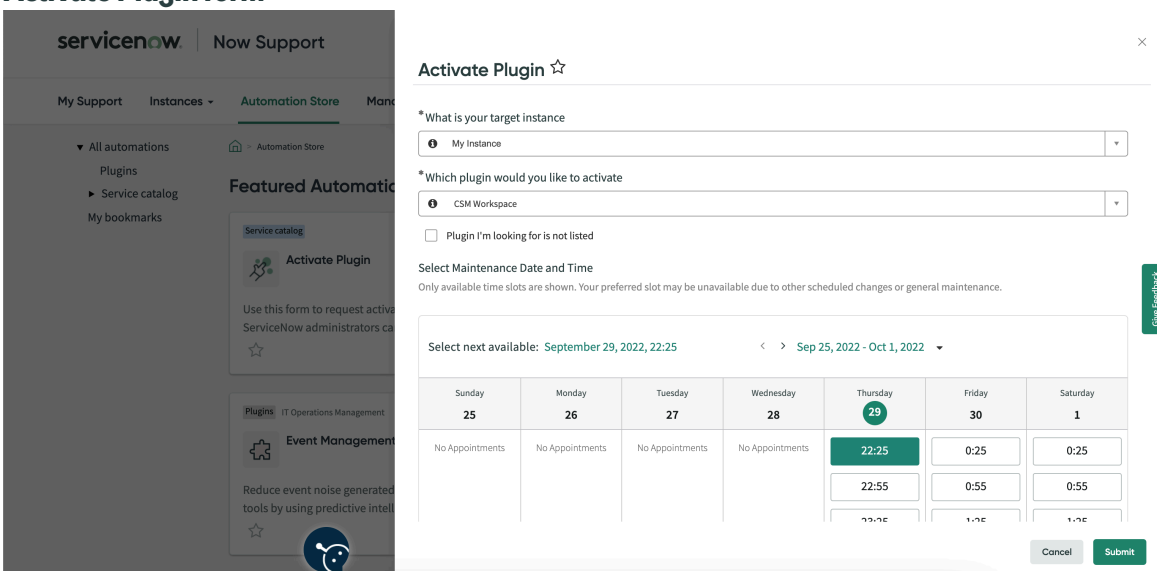
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: If the system does not list the plugin you want or if you are activating the plugin on an OEM or on-premise instance, select the **Plugin I'm looking for is not listed** check box and then enter the name of the plugin.
Select Maintenance Date and Time	The date and time to activate the plugin. **Note:** Plugins are activated in two batches, once in the morning and once in the evening, on every business day in the US Pacific time zone. If the plugin must be activated at a specific time, enter the request in the **Reason/Comments** field.

Example

For example, see the following form to activate the CSM Workspace plugin on an instance named My Instance.

Activate Plugin form



7. Select **Submit**.
   For additional details about requesting a plugin, see Requesting a Plugin from the Service Catalog [KB0751715] article in the Now Support Knowledge Base.

Event Management setup

After activating Event Management, set it up to receive and process events, and generate and analyze alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management setup without using guided setup

Set up Event Management by completing these tasks in the following order:

1. Configure a MID Server to receive and process events via the MID Server.
2. Configure the MID Web Server extension.
3. Configure Configure Event Management connectors.
4. Configure event field mappings and Binding alerts to CIs to manage alert generation.
5. Alert management rules for resolving alerts, perform, and CI remediation for alert management.
6. Request Service Mapping and get a top-down discovery to receive CI relationships for software and hardware.
7. Configure impact calculation for services, to establish priority for alert resolution.
8. Configure alert groups to consolidate related alerts.
9. Configure the Predictive Intelligence plugin (com.glide.platform_ml) to enable machine learning and finding similar alerts.
10. Configure any other general tasks that appear in this section as appropriate.

Note:
Event Management does not support creating incidents on remote instances.

Event Management setup using guided setup

Event Management guided setup provides a sequence of tasks that help you configure Event Management on your ServiceNow instance. To open Event Management guided setup, navigate to **Guided Setup** > **ITOM Guided Setup**. For more information about using the guided setup interface, see Using guided setup.

Event Management during a platform upgrade

During a platform upgrade Event Management jobs whose **Upgrade safe** flag is marked as `true` remain running.

During an upgrade of the platform, the Event Management connectors are working and continue to retrieve events. The events are being processed, transformed to an alert using event rules and if there is a suitable alert management rule, a task is created. However, the impact calculation is not supported during the platform upgrade. When applying configuration changes or upgrades, all impacted MID Servers restart.

Note:
Event Management jobs that started running before the platform upgrade commenced continue to run during the upgrade.

The following Event Management jobs remain running as their **Upgrade safe** flag is marked as `true` :

- Event Management - Connector execution
- Event Management - Update stuck connect
- Event Management - Alert Priority Queue
- Event Management - Close flapping alerts
- Event Management - Close threshold alert
- Event Management - Evaluate Scoped Alert Rules Management0

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Event Management - Maintenance Calculator
- Event Management - Process events

During the platform upgrade, all other Event Management jobs wait for the platform upgrade to finish.

Note:
During an Event Management plugin upgrade, all Event Management jobs do not work.

MID Web Server

The MID Web Server is part of the common infrastructure of the MID Server.

The MID Web Server extension provides options for authentication and data security, and runs for as long as it is enabled. The extension starts a web server on the MID Server to handle web requests from external systems. The raw data is pushed to the extension, either from a client or with a customized script. The data is collected by the MID Server and is transmitted to the ServiceNow instance.

The MID Web Server extension supports MID Server clusters that are configured for failover. When selecting a MID Server cluster option, an algorithm determines which MID Server in the cluster runs the extension. The extension can run on only one MID Server. If the MID Server in the cluster that runs the MID Web Server extension goes down, the extension automatically starts to run on the secondary MID Server, which is activated when the primary MID Server goes down.

Configure the MID Web Server extension

Configure a secure MID Web Server extension

Configure the MID Web Server extension

The MID Web Server is a MID Server extension that enables developing REST APIs to send events and metrics to the MID Server. The extension is leveraged by other MID Server extensions, such as Metric Intelligence, MID WebService Event Listener, and the Agent Client Collector websocket endpoint extension.

Before you begin

- Deploy and start a MID Server.
- Enable the MID Web Server [com.snc.sa.mid.webserver] plugin.

Role required: agent_admin.

About this task

Agent Client Collector supports the following authentication strategies:

- **Keybased**: For backwards (pre-Yokohama release) compatibility only. See Configure key-based MID Web Server authentication.
- **API key**: See Configure MID Web Server API key authentication.
- **mTLS**: See MID Web Server and agent mTLS Authentication.

Procedure

1. Navigate to **All** > **MID Server** > **Extensions** > **MID Web Server**.
2. In the MID Web Server Contexts list, click **New**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the values on the Event Management MID Web Server extension form.
4. Click **Save** to save the data.
5. Restart the MID Web Server extension to apply your changes.
6. Navigate to **All** > **MID Server** > **Extensions** > **MID Web Server** and select the MID Server you just created.
7. In the **Related Links** section, click **Start** to start the extension.

Configure a secure MID Web Server extension

Configure a TLS listener for extra security and encryption of data transferred to and from the MID Web Server extension. Access both a private key and a certificate (or certificate chain) from a Java keystore to use during the TLS handshake where the MID Web Server and the client acknowledge each other.

Before you begin

Role required: agent_client_collector_admin

Procedure

1. Navigate to **MID Server** > **Extensions** > **MID Web Server**.
2. Select **New**.
3. In the **Authentication Type** field, select an authentication type to be used.
   - Keybased – See Configure key-based MID Web Server authentication
   - Basic – Standard username/password authentication
   - API key – See Configure MID Web Server API key authentication
   - mTLS – See MID Web Server and agent mTLS Authentication
4. Select either the MID unified keystore or the web server keystore.
   The MID Web Server unified keystore is the most efficient option. If you want to enable backward compatibility and the ability to store keypairs in an additional keystore, use the Web server keystore (which allows you to use the MID unified keystore as well).

Related topics

Connect the agent to the MID Server using mTLS

Configure key-based MID Web Server authentication

Provide added security to your MID Web Server extension by using key-based authentication. Generate an authentication token to be sent in the Authorization header of incoming client requests.

Before you begin

Note:
This procedure is only for compatibility with releases prior to Yokohama. For details on the procedure in the Yokohama release for configuring the MID Web Server, see Configure the MID Web Server extension.

- Deploy and start a MID Server.
- Configure a MID Web Server extension and select Keybased as the authentication type. For details, see Configure the MID Web Server extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: agent_admin

Procedure

1. Using a script program, create a token by constructing a string using defined elements of the HTTP/HTTPS request (HTTP verb, content type header, and request path, received from the client accessing the MID Web Server extension endpoints).
2. Create an HMAC (Hash Message Authentication Code) of the string by signing the generated string with the auto-generated secret key that is displayed in the **Secret Key**.
   This key is unique per context.
3. Provide information to send this authentication token in the request Authorization header.

Item	Value
Path to a web service API for sending raw data	URL format: `https://<MID Server IP address>:<port number>/api/mid/sa/metrics` Use a port number that matches one of the port numbers set up in the Web Server extension. Example: `http://10.10.10.10:8097/api/mid/sa/metrics`
Request type	POST
Date format	`yyyy-MM-dd'T'HH:mm:ss.SSS'Z'` For example: 2016-06-08T20:54:58.917Z
Content-Type	application/json

Use the following request elements to generate the required string: HTTP-Verb, Content-Type, Date, and request path. Specify these elements and place them in this order:

- HTTP-Verb + "\n" +
- Content-Type + "\n" +
- Date + "\n" +
- Request-Path

For this example, the request string is:

```
POST\napplication/json\n2016-06-08T20:54:58.917Z\n/api/mid/sa/metrics
```

For the timestamp requirement, a valid timestamp that uses HTTP date header is required for authenticating the request. Ensure that the timestamp is within 15 minutes of the MID Server.

Example: How to generate the HMAC of the string that uses defined elements of the HTTP/HTTPS request, using Java

```
package sample;
import com.glide.util;
```

© 2025 ServiceNow, Inc. All rights reserved.

```
import java.security.SignatureException;

import javax.crypto.Mac;
import javax.crypto.spec.SecretKeySpec;

public class AuthUtil {

private static final String HMAC_SHA1_ALGORITHM = "HmacSHA1";

/***
 * Generates base64-encode the HMAC(Hash Message Authentication
 Code) of input data
 *
 * @param data
 * @param key
 * @return
 * @throws java.security.SignatureException
 */
public static String signData(String data, String key) throws
 java.security.SignatureException {
 String result;
 try {
  // get an hmac_sha1 key from the raw key bytes
  SecretKeySpec signingKey = new SecretKeySpec(key.getBytes(),
 HMAC_SHA1_ALGORITHM);

  // create hmac_sha1 Mac instance and initialize with the
 signing key
  Mac = Mac.getInstance(HMAC_SHA1_ALGORITHM);
  mac.init(signingKey);

  // compute the hmac on input data bytes
  byte[] rawHmac = mac.doFinal(data.getBytes("UTF-8"));

  // base64-encode the hmac
  result = Base64.encode(rawHmac);

 } catch (Exception e) {
  throw new SignatureException("Failed to generate HMAC : " +
 e.getMessage());
 }
 return result;
}
}
```

Configure MID Web Server API key authentication

Authenticate incoming requests from clients to the MID Web Server extension using API key authentication. API authentication is a secure and simple way to authenticate your request. You can create or modify a MID Web Server API key.

Before you begin

Create a MID Web Server extension to use API Key authentication, as described in Configure the MID Web Server extension. Ensure that you select **API Key** in the extension's **Authentication Type** field.

Role required: event_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

By default, the maximum number of API keys you can create on an instance is 10. To change this number, modify the *mid.webserver.max.api.keys* property value on the System Properties page.

When working in the global domain while Domain Separation is enabled, API keys are available to all extensions, regardless of their domain. When working in a specific domain, API keys are available to extensions in that domain, its parent domains, and the global domain.

You can configure API keys to expire on a specified date.

When creating a new extension with API key authentication (or updating an existing one to use API key authentication), the system checks for an available API key for the extension. If there is no available API key, the system creates one.

Procedure

1. Navigate to **All** > **MID Server** > **Profiles and Deployments** > **MID Web Server API Key**.
2. Either create a new API key or modify an existing API key.
   - To create a new API key:
     a. Select **New**.
     b. On the MID Web Server API Key form, fill in the fields.

MID Web Server API Key form

Field	Description
Name	Name for the API key.
Active	Option for activating the API key.
Authentication key	Read-only encoded value of the authentication key. No value appears until after you configure the key.
Expires	Option for setting an expiration date for the API key. Expired, deactivated, or deleted API keys are not accepted by the web server extension.

     c. Select **Submit** to save the API key.

        The API key appears on the Mid Web Server API Keys page.

   - To modify an existing API key:
     a. Navigate to **MID Server** > **Profiles and Deployments** > **MID Web Server API Key**.
     b. Select an API key on the page.
     c. In the **Related Links** section, select **View API Key**.
     d. Copy the API key that appears in the MID Web Server dialog box.

        When connecting to a MID Web Server extension configured with API Key authentication, place an API key that the extension has access to in the Authorization header of the request in the following format:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`Key <API_KEY>`

where `<API_KEY>` is the value of the API key displayed after selecting **View API Key**.

e. Select **Submit**.

MID Web Server and agent mTLS Authentication

Mutual authentication using the Transport Layer Security protocol (mTLS) is a secure, certificate-based authentication scheme. With mTLS, the server (the MID Web Server extension) and the client (the agent) authenticate each other.

TLS authentication occurs when a client (such as a web browser) authenticates the server it's accessing by validating the certificate presented by the server. The client verifies that the certificate (or certificate chain) is signed by a trusted certificate authority (CA). The client must have access to a bundle of CA certificates, which it uses to validate the server certificate.

When mTLS is configured, the client presents a certificate or certificate chain to the server, and the server authenticates the client in the same way that the client authenticates the server (mutual authentication).

In addition to verifying the certificate signature, some TLS implementations also check the revocation status of the certificate. In these cases, the Online Certificate Status Protocol (OCSP) is used. In this protocol, the verifying party sends a request to the OCSP responder set up by the CA that issued the presented certificate. (The responder's address is typically embedded in the CA-issued certificates). The response indicates whether the presented certificate is revoked.

Before enabling mTLS, you must first create keys and certificates, install the .pem file on your MID Server, and connect the agent to your MID Server.

Related topics

Configure the MID Web Server extension

Configure mTLS authentication for a MID Web Server

Create keys and certificates

Create keys and certificates in your root directory to enable Transport Layer Security (TLS) setup. TLS setup is necessary before you can configure mTLS on the MID Web Server and agent.

Before you begin

- Ensure that there are no keys installed in the MID unified keystore by running the following command:

  ```
  bin/scripts/manage-certificates.(sh/bat) -l
  ```

  When there are no keys installed, the output is: `defaultsecuritypairhandle`

- Invalidate your MID Server.

  If additional keys exist in the output, reinstall those keys after invalidating the MID Server.

- Ensure that the MID Server is connected to the instance.
- Select a directory in which you want to create certificates, to be called the *`root`* directory.

Note:
The commands specified in the following procedure are relevant only for a Centos7 host. When working with another OS, use the commands relevant for your host.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: agent_client_collector_admin

Procedure

1. In your root directory, create subdirectories for your certificates.

```
mkdir -p labca labmid labacc;
```

2. In your root directory:

   a. Generate a custom certificate authority key pair.

```
openssl ecparam -list_curves;
openssl ecparam -out labca/ec-labcakey.pem -name prime256v1
 -genkey;
ls labca/;
```

   The generated output is the `ec-labcakey.pem` file.

   b. Run the following commands:

```
openssl ecparam -in labca/ec-labcakey.pem -text -noout;
openssl req -x509 -new -nodes -key labca/ec-labcakey.pem
 -sha512 -days 365 -out labca/labcacert.pem -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>
 Lab/OU=<organization unit>/CN=<cn abbreviation>";
openssl verify labca/labcacert.pem;
```

   The generated output is:

   - `labca/labcacert.pem: C = <country>, ST = <state>, L = <location>, O = <organization>, OU = <organization unit>, CN = <cn abbreviation>`
   - `error 18 at 0 depth lookup: self signed certificate`
   - `OK`

   Note:
   The `error` message can be ignored.

3. Prepare the MID Web Server key and certificate.

   a. Run the following commands in the root directory:

```
sudo cp -a
 labca/labcacert.pem /etc/pki/ca-trust/source/anchors/;
sudo update-ca-trust extract;
openssl verify labca/labcacert.pem
```

   The generated output is: `labca/labcacert.pem: OK`

   b. Run the command `"hostname --all-fqdns"` to obtain all of the valid hostnames for the specific VM.

   c. Run the following commands:

```
openssl req -new -newkey rsa:4096
 -keyout labmid/rsa-labmidkey.pem
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
 -sha512 -nodes -out labmid/mid.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<o
rganization unit>/CN=<hostname>";
openssl x509 -req -days 365 -in labmid/mid.csr -CA
 labca/labcacert.pem -CAkey labca/ec-labcakey.pem
 -CAcreateserial -extensions SAN -extfile
 <(cat /etc/pki/tls/openssl.cf <(printf
 "\n[SAN]\nsubjectAltName=DNS:<hostname>")) -out
 labmid/mid.crt;
```

Enter the FQDN as the `<hostname>` value in the previous command. If more than one fqdn value is returned by the command, use the value with the following format: `hostname.domain.domain.com`.

The generated output is: `Signature ok subject=/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<organization unit>/CN=<mid server host fqdn>: Getting CA Private Key`

4. In your root directory, combine the key and cert files into one file, named `mid.pem`.

```
cat labmid/rsa-labmidkey.pem labmid/mid.crt > labmid/mid.pem;
```

What to do next

Install the .pem file in the MID unified keystore and set up the MID Web Server.

Install the .pem file in the MID unified keystore and set up the MID Web Server

Install the .pem file into the MID unified keystore and set up the MID Web Server to enable configuring mTLS on your MID Web Server and agent.

Before you begin

Copy the `labmid/mid.pem` file (created in the Create keys and certificates procedure) to your MID Web Server host directory.

Role required: agent_client_collector_admin

Procedure

1. Access the `agent` subdirectory under the MID Server's host directory.
2. Run the following commands:

```
bin/scripts/manage-certificates.sh -a midwss /<path>/mid.pem;
bin/scripts/manage-certificates.sh -l;
```

The relevant part of the output is, `"defaultsecuritypairhandle,midwss”`

3. Validate your MID Server on the instance.
4. Select the MID Server on the instance and select **Setup ACC listener**.
A new MID Web Server is created.
5. Navigate to the newly created MID Web Server record (*`ecc_agent_ext_context_webserver`*) on the instance.
6. On the instance, select the MID Web Server and set the **Keystore certificate alias** value to **midwss**.
7. Select **Save**.
8. Restart the MID Web Server.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next
Connect the agent to the MID Web Server using TLS.

Connect the agent to the MID Web Server using TLS

Connect the agent to the MID Web Server to enable configuring mTLS on your MID Web Server and agent.

Before you begin
Ensure that you have installed the .pem file and set up the MID Web Server. For details, see Install the .pem file in the MID unified keystore and set up the MID Web Server.

Role required: agent_client_collector_admin

Procedure
1. Add the `labcacert.pem` file to your agent host's truststore.

```
sudo cp
 -a /<path>/<to>/labcacert.pem /
etc/pki/ca-trust/source/anchors/;
sudo update-ca-trust extract
openssl verify /<path>/<to>/labcacert.pem
```

   The generated output is `/<path>/labcacert.pem: OK`

2. Configure the `acc.yml` file to use TLS.

   a. Set the *`insecure-skip-tls-verify`* property to **false**.

   b. Set the *`backend-url`* property to use the MID Server's FQDN.

```
backend-url="wss://<mid server fqdn>:<mid web server port>/
ws/events"
```

3. Restart the agent.

```
systemctl restart acc;
```

4. Verify in the logs that the agent is connected to the MID Server.

What to do next
Configure mTLS authentication for a MID Web Server.

Configure mTLS authentication for a MID Web Server

Enhance security in your MID Web Server extension by enabling mTLS authentication.

Before you begin
Ensure that you have enabled Transport Layer Security (TLS) on the agent. For details, see Connect the agent to the MID Server using mTLS.

Ensure that the *`insecure-skip-tls-verify`* parameter in the `acc.yml` configuration file is set to **false**. For details on the `acc.yml` file, see Configuration file options.

Role required: agent_client_collector_admin

About this task
The MID Web Server extension searches the following locations (in the specified order) to access the truststore location and password:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Truststore location: The *mid.webserver.truststore.path* JVM system property.

  If that property is empty, the extension retrieves the location from the *javax.net.ssl.trustStore* JVM system property.

  If no location is specified, the truststore location defaults to the absolute path of the `cacerts` file of the JRE running the MID Server.

- Truststore password: The **Truststore Password** field on the extension form in the instance.

  If that field is empty, the system retrieves the password from the *javax.net.ssl.trustStorePassword* JVM system property.

  If no location is specified, the password defaults to *changeit*.

Procedure

1. Navigate to the root folder of your MID Server.
2. Run the following command to add your certificate to the MID trust store:

```
./jre/bin/keytool -importcert
 -file /etc/pki/ca-trust/source/anchors/labcacert.pem
 -destkeystore ./jre/lib/security/cacerts -alias mtlsca
```

3. Enter **changeit** when prompted for a password.
4. Select **yes** on the confirmation message window to indicate that you trust the certificate.
5. Run the following command to verify that your certificate was successfully added to the MID trust store.

```
./jre/bin/keytool -list -keystore ./jre/lib/security/cacerts
 -alias mtlsca
```

6. Enter **changeit** when prompted for a password.
7. In the MID Server wrapper override configuration file (`wrapper-override.conf`, located in the `home/conf` directory of the MID Server), configure the revocation of client certificates in the *mid.webserver.cert.revocation.check.enabled* property.
   - If you have a custom internal certificate, set to **false** by adding the following line to the `conf/wrapper-override.conf` file on the MID Server:

```
wrapper.java.additional.4=-Dmid.webserver.cert.revocation.che
ck.enabled=false
```

   - When enabling this property (**true**), configure the *mid.webserver.ocsp.responder.url* property with the OCSP responder URL. This value overrides any URL embedded in the certificate.
8. If you have changed properties in the wrapper override configuration file, restart the MID Server.
9. On your ServiceNow® instance, access the MID Server record and change the value of the **Authentication type** field to **mTLS**.
10. Restart the MID Web Server.
11. Verify that the MID Web Server and websocket endpoint are up and running.

What to do next

Connect the agent to the MID Server using mTLS.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connect the agent to the MID Server using mTLS

Before configuring mTLS authentication on the agent, you must run a series of commands that enable configuring Transport Layer Security (TLS) authentication.

Before you begin

Ensure that you have performed the following tasks:

1. Create keys and certificates
2. Install the .pem file in the MID unified keystore and set up the MID Web Server
3. Connect the agent to the MID Web Server using TLS
4. Configure mTLS authentication for a MID Web Server
5. Connect the agent to the MID Server using mTLS

Role required: agent_client_collector_admin

Procedure

1. Generate a key for your agent.

```
openssl ecparam -out labacc/acc.key -name prime256v1 -genkey
```

2. Generate a certificate request for your agent, according to the following format:

```
openssl req -new -key labacc/acc.key -out labacc/acc.csr -subj
 "/C=<country>/ST=<state>/L=<location>/O=<organization>/OU=<org
anization unit>/CN=<cn abbreviation>/emailAddress=<email
 address>"
```

   For example:

```
openssl req -new -key labacc/acc.key -out labacc/acc.csr
 -subj "/C=US/ST=NC/L=Raleigh/O=ServiceNow/OU=ITOM
 Lab/CN=acclinux/emailAddress=john.smith@servicenow.com"
```

3. Generate a signed certificate for your agent.

```
openssl x509 -req -days 365 -in labacc/acc.csr -CA
 labca/labcacert.pem -CAkey labca/ec-labcakey.pem
 -CAcreateserial -extensions client -out labacc/acc.crt
```

4. In the `labacc` folder, copy your key and certificate files to the agent host's virtual machine.

```
cp ./acc.key <agent host config folder>
cp ./acc.crt <agent host config folder>
```

   The configuration folder paths depend on your OS.

   - Linux: `/etc/servicenow/agent-client-collector/`
   - Windows: `C:\ProgramData\servicenow\agent-client-collector\config\`
   - macOS: `/Library/Application\ Support/servicenow/agent-client-collector/`

5. Navigate to the location where you copied the `.key` and `.crt` files from.
6. Run the following commands to update the files' read permissions and enable the agent to read from them.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Linux:
  a. `chown servicenow:servicenow acc.key`
  b. `chmod 0400 acc.key`
- Windows:
  a. Select and hold (or right-click) the `.key` file and select the **Security** tab from the file properties.
  b. Add the *`servicenow`* user to the list of users with read access to the file.
- macOS:
  a. `chown _servicenow:_servicenow acc.key`
  b. `chmod 0400 acc.key`

Note:
The agent must be run with the default servicenow user.

7. In the acc.yml configuration file, add the following parameters to specify the path to your key and certificate files.

```
key-file: "<path to acc.key file>/acc.key"
cert-file: "<path to acc.cert file>/acc.crt"
```

8. Restart the agent.
   - Linux: `systemctl restart acc`
   - Windows:
     a. Open the Services application.
     b. Select and hold (or right-click) the Agent Client Collector entry and select **Restart**.
   - macOS:
     a. `launchctl unload -w /Library/LaunchDaemons/com.sn.acc.plist`
     b. `launchctl load -w /Library/LaunchDaemons/com.sn.acc.plist`
9. Check the logs to verify that the agent was able to connect to the instance using TLS.

   Agent Client Collector logs are accessible from:

   - Linux: `/var/log/servicenow/agent-client-collector/acc.log`
   - Windows: The location specified by the `log-file` configuration flag. The default location is: `C:/ProgramData/ServiceNow/agent-client-collector/log/acc.log`

     If the `C:/ProgramData` directory is hidden (such as on older Windows versions), change the Explorer filter to show hidden elements.
   - macOS: The default location is: `/Library/Application\ Support/servicenow/agent-client-collector/log/acc.log`

General preferences

Self-health

By default, the self-health monitoring feature is not enabled. To enable it, navigate to **Event Management** > **Settings** > **Properties** and select **Yes** for the *Enable Event Management self-health monitoring* (evt_mgmt.self_health_active) property. Use this feature to monitor and track many Event Management features.

Note:
CIs used in the self-health service are created in the CMDB.

Use the following settings to help with preventing performance degradation.

Topic	Details
Business rules	• Avoid writing business rules for event [em_event] tables, as they do not run in the current default REST URL that is used for event injection. • Business rules that are written for alert [em_alert] tables must be highly efficient or they may result in performance degradation. Instead of writing a business rule, consider whether it is more appropriate to write a job. An inefficient business rule can cause incident creation for an alert to fail and the alert impact calculation to fail. • Do not write async business rules for alert tables. • Business rules must not change the **Category** field on event [em_event] tables.
Scaling up	Check the average event processing time before scaling up event throughput when first starting with Event Management. Do this check after an initial flow of events and all rules are in place. If processing time takes over a few milliseconds per event, determine the cause for the processing slowdown before continuing to scale. Performance duration can be checked in the Performance Statistics [sa_performance_statistics] table.
Configure for large-scale environments	• Set the **Enable multi node event processing** (*evt_mgmt.event_processor_enable_multi_node*) property to **Yes**. Enable multi-node in production environments and set values based on the size of the deployment and expected event rate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Topic	Details
	• Set the **Number of scheduled jobs processing events** (*evt_mgmt.event_processor_job_count*) property to 4. • If you are sending events from a custom source, verify that events have**Message Key** or **Source**, **Node**, **Type**, and **Resource** data.
Latency issues for receiving events	Check the following settings: • Verify that the **Bucket** field in the event [em_event] table is set to a value that is greater than zero (*0*). • Navigate to **System Scheduler** > **Scheduled Jobs** and search for *- process events**. Check that all *- process events** jobs exist according to the **Number of scheduled jobs processing events** (*event_processor_job_count*) property configuration. Verify that the **State** is *Running* or *Ready*. If the state is *Queued* or *Error*, set the job state to *Ready*.
Archive events	• Avoid changing the default retention time for events. • To log events for a longer time, create an archive table and a job that copies new events to it. Do this by scheduling a job to regularly back up events [em_event] to a custom table. • Do not extend table rotation by adding more days.

Event integration

SNMP traps

- Use a monitoring tool to send SNMP traps, rather than sending them directly from devices.
- To avoid having to rewrite event rules, upload MIBs prior to defining the event rules.

Web service API

- Using a web service API for integration can reduce the number of event rules needed. This action avoids having to transform events (prepared data is sent in an event to the instance).
- Use dedicated credentials for integration. Optionally, designate credentials specific to each event source.

CloudWatch

Use dedicated credentials for integrating CloudWatch with ServiceNow.

Email

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use email only if the source has a low volume and other options are not available, such as, running a script or forwarding an SNMP trap.

Event rules

Configuration settings when creating event rules:

- Write Event Rules to apply to the broadest number of events possible. More specific rules can then be created as necessary and should use a lower-order value.
- If a more general rule can achieve the same outcome, avoid writing Event Rules that apply only to a certain subset of events.
- When Event Rules are applied to events, no changes are made to the original event. All processing occurs in memory, so use the **Processing Notes** field and/or use the **Check Process of Event** UI action link to troubleshoot.
- If you change a rule/transform that has existing mapping rules, you should review and retest with events that are either actual or simulated.
- Ensure that the **From** field value exactly matches a string in the JSON in the *additional_info* field of an event. This matching happens when a rule has been configured based on information in a MIB file. If the MIB file is not uploaded, the JSON for the SNMP trap shows varbinds (variable binding) with dotted names, instead of the translated name in the MIB. The event field mapping rule then fails to be applied.
- Establish a consistent naming convention. A common convention is: *<customer acronym>.<Event Source>.<Description>*. For example, *ACME.OEM.Normalize*
- If two Event Rules have similar conditions set, use the **Order** field to control which Event Rule runs.
- Use Event Rules to associate an alert with a CI.

Additional settings for constructing event rules:

Desired result	Required activity
Effective de-duplication and enabling efficient parallel event processing	Populate the **Source**, **Node**, **Type**, **Resource**, **Metric Name** fields.
CI binding	• Bind to host - by populating the **Node** field and optionally **CI identifiers**. • Binding to application and / or device – by populating the **CI Identifiers** field and the **Additional information** field.
Alert Correlation, using alert aggregation	Populate the **Resource** and **Metric Name** fields. **Note:** If CI is also bound, Alert Correlation is improved.

Custom event fields

Include additional fields in the **Additional information** field of the event only.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Do not add additional fields to an event by adding a custom field to the event [em_event] table.

Do not add columns to the event [em_event] table.

For information about how to include additional fields in events, see Custom alert fields.

De-Duplication

Configuration settings for de-duplication.

- The **message_key** field is used for De-Duplication. If reliable message key values are not provided with the source event, it is important to have a well-defined plan for constructing these identifiers.
- If the message key is not defined, then the default message key is *<Source + Node + Type + Resource + Metric Name>*.
- The guideline is to have the event source populate the *<Source + Node + Type + Resource + Metric Name>* fields out-of-the-box and populate the message key. This action enables a better distribution of event processing among instance workers and nodes.
- If the source event does not have values for these fields, make sure to populate them using transform rules. This action does not affect event processing, but is used for de-duplication. Populate as many of these fields as possible before they are sent to the instance. This action provides better distribution of events over the processor workers, and therefore better throughput and scale.

CI binding

- Where possible, always attempt to bind an alert to a CI.

  Note:
  Although Event Rules are defined on events, CIs are bound to alerts that result from those events, and are not bound to the event.

- To bind a host, machine or any device with an IP, populate the event **Node** field with a unique host name, FQDN, IP, or MAC address. If other identifiers are necessary to identify a host, then populate the ci_identifiers field with a JSON format. The JSON format must contain the **CMDB** field name and value to perform the match.

  Note:
  The event **Node** field must be populated from an event rule or populated with a unique host name from the source before the event is inserted.

- The primary binding strategy is to use the **Node** field. If the **Node** field is not pre-populated in the event, it can be populated using event rules.

Alert settings

Alert lifecycle

General alert functionality:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- An alert is opened whenever an event is not ignored or its threshold is exceeded by an event rule, and de-duplication does not identify the event as belonging to an existing alert.
- An alert is closed when a closing event is sent on the same message key, or the alert is closed manually.
- An alert is reopened if an opening alert that has the same message key is sent within the timeframe defined in properties (default is one hour).
- If an alert is opened and closed at a high rate, as defined in properties, it becomes flapping. When this opening and closing rate stops, the alert goes out of flapping state.
- If an incident is opened from an alert, that alert remains open as long as the incident remains open. By default, when either the incident or the alert is closed the other is closed as well. This behavior can be configured using properties.
- Do not close an alert when creating a corresponding incident.
- Do not delete an open alert. Close an alert first and then delete it.
- Use `Acknowledge` to denote that the alert is known, and can temporarily be ignored.
- Do not use `Acknowledge` to mark an alert as needing attention.
- Do not create alerts in any of these states:
  - `Closed`
  - `OK`
  - `Open`
- The `evt_mgmt.alert_auto_close_interval` property automatically closes alerts after the specified period. Do not specify 0, as this value disables the feature and may lead to performance degradation.
- Do not create alerts in `OK` state. In some monitoring systems `OK` denotes that an issue has been resolved, while in other monitoring systems `OK` is used to denote events that are not of operational significance. For the former case, use `Clear` instead of `OK` using a Mapping Rule. For the latter case, have an Ignore rule, unless the events are of specific value.

Alert action rules

- A scheduled job applies Alert action rules to new Alerts every 11 seconds. If an Alert Rule does not immediately start, allow 10–15 seconds before you start troubleshooting.
- Use the **Order** field to control which Alert Rule runs if two Alert Rules have similar conditions set.
- Use Alert action rules with Task Templates to populate static values in an incident. Use the populator script to assign dynamic values in the incident. The populator script can return a value of `false` to abort incident creation.
- Create a user called Event Management (or a similar name). Then the **Created by** field in a task template (for example, **Incident**) can be set to indicate that user was the source of the task.
- To perform any dynamic value assignment or to override OOB dynamic value assignment, use the **EvtMgmtCustomIncidentPopulator** script include.

Remediation

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Always set orchestration workflow properties to the Remediation Task [em_remediation_task] table.
- Use ECC Queue and **Workflow** > **Live Workflow** > **All Contexts** to find more detailed information on remediation activities.

Business rules

- Business rules created on alert tables should not take more than a few milliseconds. In place of using a business rule, consider if the same functionality can be achieved using a job.
- Do not use business rules to associate an alert with a CI. Use event rules to do binding instead of using business rules.

Planning

- Organize event source configuration of filters, modules, and so on, into multiple parallel efforts, rather than in serial.
- Validate processed event formats to ensure that data that is parsed is aligned with desired results.
- Test production events in a non-production environment. Integrate with non-production element managers and ServiceNow instances. If non-production element managers are not available, send events from element managers to both production and non-production environments.

Services and dashboard

- Use Service Groups to group services into logical groups to reduce the number of services displayed on the Service Health dashboard.
- Import manually built service maps.

Metric Intelligence collector logs and files

Metric Intelligence collector logs and files are located under the path `$(MID_SERVER_DIR)/agent`. Use these logs and files for troubleshooting and monitoring purposes.

Location of Metric Intelligence collector logs and files

Log or file	Path
PowerShell metric collector log file	Logs/retrieve_metrics{connector instance ID}.log
PowerShell output file	work/metrics/metrics_output_{connector instance ID}.txt
PowerShell input file	work/metrics/parameters_{connector instance ID}.txt

Metric Intelligence performance can be checked in the MID Server log file when the *`mid.log.level`* MID Server parameter is in debug mode.

Metric Intelligence performance numbers are available in the Performance Statistics [sa_performance_statistics] table. To view the performance numbers, filter the Performance Statistics list for **Metric Collector**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Domain separation and Event Management

Domain separation is supported in Event Management. Domain separation enables you to separate data, processes, and administrative tasks into logical groupings called domains. You can control several aspects of this separation, including which users can see and access data.

Support level: Basic

- Business logic: Ensure that data goes into the proper domain for the application's service provider use cases.
- The application supports domain separation at run time. The domain separation includes separation from the user interface, cache keys, reporting, rollups, and aggregations.
- The owner of the instance must set up the application to function across multiple tenants.

Sample use case: When a service provider (SP) uses chat to respond to a tenant-customer's message, the customer must be able to see the SP's response.

For more information on support levels, see Application support for domain separation.

How domain separation works in Event Management

When domains are separated in Event Management, users can only see and manage alerts and events in their own (tenant) domain.

A domain column is present for Event Management tables that are provided in the base system. The column displays the name of the domain to which the event or alert belongs.

Note:

If the domain column does not display in the list, click (Update Personalized List) and add the required column. In addition, you can add a column that displays the domain path.

For information about domain separation limitations in Event Management, see Configure Event Management domain separation.

Related topics

Domain separation for service providers

Configure Event Management domain separation

You can configure Event Management for **domain separation** to create logically defined domains that limit unauthorized access to data. When domains are separated in Event Management, users can only see and manage alerts and events in their own (tenant) domain.

Before you begin
Role required: evt_mgmt_admin and evt_mgmt_integration

About this task
Activate the **Domain Support – Domain Extension Installer** plugin and configure the MID Server for Event Management.

The following Event Management features have limited domain separation support.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Features with limited domain separation support

Feature	Support
Event – alert flow	Supported. Separation is based on the domain user that sent events. User access is required for the credentials of the sending API events or in the configuration of the MID Server reporting events. In a multi-domain environment, each MID Server can serve only one domain according to the integration user that it uses. In the configuration of the connector instance, make sure that the MID Server uses the same domain as the Connector instance.. To configure pull connectors to support custom domain separation, see Personalize domains for pull connector events to use in event creation.
Impact calculation	Supported. Segregation is based on the manner in which CIs are segregated.
Application services	Partially supported. Segregation is based on the manner in which CIs are segregated.
Dynamic CI groups	Partially supported. Segregation is based on the manner in which CIs are segregated. **Note:** The discovery process does not segregate CIs by domain.
Remediation	Supported. While editing alert management rules, users can only apply relevant workflows. For more information on domain separation in the Flow Designer, see Domain separation and Flow Designer.
Alert Aggregation	Supported. In domain-separated environments, alert groups are created only for alerts in the same domain.

Procedure

1. If it is not already active, activate the Domain Support – Domain Extension Installer plugin.
2. Configure the connector instance to be in the same domain as the MID Server.

Event Management Integrations

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error.

Events are processed and alerts are generated based on the following factors:

- Event collection configuration via a MID Server, script, SNMP trap collector, or email message.
- An Event rule, alert binding, or event field mapping configuration for processing events from various sources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

Integration with external events

Event Management receives external events via an integration or scripts. If you are using a script to collect events, no configuration is required. All other integrations require configuration.

When an integration is configured, Event Management can collect events that are sent directly to the ServiceNow AI Platform instance or via the MID Server, SNMP trap or email.

The integration with external systems can be initiated from a ServiceNow AI Platform instance using a pull connector, or from an external system using a push mechanism.

Integration via a ServiceNow AI Platform instance

The ServiceNow AI Platform instance includes push connectors that help external monitoring systems to integrate with Event Management directly.

You can configure the authentication in the ServiceNow AI Platform instance and update the external monitoring systems to use endpoints to send the events for the push connectors that are available. For more information, see Push Connectors.

Integration via MID Server

The MID Server facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

Connector operation	Description
Pull	You can configure connector instances to use connector definitions (script instructions). This enables the MID Server to connect to external servers to obtain event information using a pull operation.
Push	You can configure external systems to push event information to the ServiceNow AI Platform instance via MID Server. For example, you can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.

Standard event form

A standard event form must be used by all events, regardless of how they arrive at the ServiceNow AI Platform instance. For more information, see Event field format for event collection.

Event Management Connectors domain personalization

Create events in different domains for all Event Management connectors using just a single connector instance by personalizing domain separation of Event Management connectors.

How the domain is identified

In a ServiceNow instance, events are created within the logged-in or MID Server user domains. However, you can create events in a different domain by providing metadata values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The logged-in user or the MID Server user must have access to the provided domain. The connector resolves the domain based on the provided identifier and creates events in that domain.

System properties provide the default metadata that sets the domain-separated table to identify the domain. For more information, see Domain properties installed with Event Management.

Connector Exceptions

You cannot personalize domain separation for the following pull connectors:

- SCOM
- IBM Netcool (supports only IBM Netcool_v2)
- HPOM
- Hyperic

You cannot personalize domain separation for the following push connectors:

- SAP SolMan Transform Script
- bmcTrueSight Transform Script
- Transform Generic Events MID
- TransformEvents_xmlSample

Related topics

Domain separation and Event Management

Personalize domains for pull connector events to use in event creation

Configure pull connectors to personalize domain separation of events so you can use them to create events in domains other than the user's currently logged-in or MID Server domain.

Before you begin

Make sure that you have the following setup:

- You have read access to the domain information table for the evt_mgmt_integration role (default table: core_company). For more information, see Configure an ACL rule.
- You enabled the *evt_mgmt.connector_enable_custom_domain_separation* system property .
- You installed the following plug-ins on your ServiceNow instance:
  - Event Management *com.glideapp.itom.snac* plug-in
  - Event Management connectors *sn_em_connector* plug-in
  - Domain Support - Domain Extensions Installer *com.glide.domain.msp_extensions.installer* plug-in

  You can download the plug-ins from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances** > **.**
2. On the **Connector Instances** list, deactivate the connector instance of the connector for which you want to configure domain separation by selecting it and clearing the **Active** check box.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Update**.
4. Navigate to **All** > **Event Management** > **Integrations** > **Connector Definitions**.
5. From the **Connector Definitions** list, select your connector definition.
6. Determine whether all events should be created in a provided domain or determined by a domain provided in the payload of each event.

   a. In the **Connector Parameters** table, double-click **Insert a new row**

   b. Choose the event creation domain definition location.

   - To have all events be created in the provided domain, enter `payloadDomainInfoFieldValue` in the **Name** column.
   - To have events be created in the domain provided in the payload of the event, enter `payloadDomainInfoFieldName` in the **Name** column.

   Note:
   If both the *`payloadDomainInfoFieldValue`* and the *`payloadDomainInfoFieldName`* are provided, the domain provided in the payload of the event takes precedence.

   c. Select **Update**.

7. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
8. On the **Connector Instances** page, select your connector instance from the list.
9. In the Connector Instance Values list, provide a value in the **Value** field of the parameters.
10. Select **Save**.
11. Select **Test Connector** to verify the connection between the MID Server and the connector.
    - If the test is successful, a confirmation message appears.
    - If the test fails, a message provides instructions to correct the problem.

    On a successful test, an onscreen message appears. If the test fails, follow the onscreen message instructions to correct the problem and then run another test.

    Note:
    Use a network tool such as *`ping`* to verify whether the credentials are correct and network connection from the MID Server to the connector server.

12. After the connector is verified, select the **Return to Connector Instance** link.
13. Activate the connector instance by selecting **Active** and **Update**.
14. **Optional:** Configure the domain for events by providing domain metadata through the connector parameters.

    For example, to use the User [sys_user] table for a single connector instance in the **Connector Definitions** form, create parameters with the following names, and add their values in the **Connector Instance** form.

    - *`connectorDomainInfoTableName`* - sys_user

    Note:
    The table must be domain separated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- *connectorDomainInfoColumnName* - user_name
- *connectorDomainIdColumnName* - sys_domain
- *connectorDomainPathColumnName* - sys_domain_path

For more information, see Connector domain metadata.

Result

The Event Management connector is set up for domain separation.

Personalize domains for push connector events to use in event creation

Configure push connectors to personalize domain separation of events so you can use them to create events in different domains other than the user's currently logged-in or MID Server domain.

Before you begin

Make sure that you have the following setup:

- You have read access to the domain information table for the evt_mgmt_integration role (default table: core_company). For more information, see Configure an ACL rule.
- You enabled the *evt_mgmt.connector_enable_custom_domain_separation* system property.
- You installed the following plug-ins in the ServiceNow AI Platform® instance:
  - Event Management (*com.glideapp.itom.snac*)
  - Event Management connectors (*sn_em_connector*)
  - Domain Support - Domain Extensions Installer (*com.glide.domain.msp_extensions.installer*)

    You can download the plug-ins from the ServiceNow Store.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.
3. On the **Push Connector** screen, scroll down to the **Push Connector Configurations** list and select **New**.

   Note:
   If this list is not displayed, you must create a push connector configuration parameter. For more information, see Create a push connector configuration parameter.

4. In the **Push Connector Configurations** screen, determine whether events should be created in the provided domain or the domain provided in the payload of each event.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If both the *payloadDomainInfoFieldValue* and the *payloadDomainInfoFieldName* parameters are provided, then the *payloadDomainInfoFieldName* takes precedence.

5. Select **Submit**.

Result
Events are created in the domain referred to by the domain identifier.

Note:
The table that stores domain information records (for example, core_company) must be domain separated. For more information, see Domain-separate a custom table.

Configure Event Management connectors

Event Management provides many connectors to pull or push events from external devices. Connectors are available from the ServiceNow store as well as from third parties. You can also create custom connectors.

Provided connectors (pull)

This table lists the connectors that are provided with Event Management.

Note:

- The Azure Metrics and AWS CloudWatch Metrics connectors display in the base system only when the Operational Intelligence plugin (com.snc.sa.metric) is activated.
- All connectors support external credential storage solutions. For details on configuring external credential storage, see External credential storage configuration.

Connectors	Supported version	Description
Azure Monitor		Send alert state changes to the Azure Portal.
HPOM	08.60.005	Receive events from the HP Operations Manager (HPOM).
Hyperic	5.8.4.0	Receive events from the VMware vRealize Hyperic server.
Logicmonitor	156	Receive events from the Logicmonitor server.
IBM Netcool	8.1.0	Receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers.
Icinga2	2.4.1	Receive events from the Icinga2 server.

Connectors	Supported version	Description
Apache Kafka Consumer Connector	• 3.0.0 • 3.2.0	Receive events from the Apache Kafka server.
ServiceNow Cloud Observability	2.1.1 or higher	Receive events from the ServiceNow Cloud Observability platform.
NagiosXI	5.5.2	Receive events from the Nagios XI server.
NNMi	10.30.653	Receive events from the NNMi server.
OBM, also known as OMi v2	10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01	Receive alerts from the OBM server.
OMi	10.01, 10.10, 10.11, 10.12, 10.60, and 10.61	Receive alerts from OMi server.
Op5	7.3.15	Receive alerts from an OP5 Monitor.
Opsview	5.4.0	Receive alerts from an Opsview Monitor
PRTG	21.3.71	Receive alerts from a Paessler PRTG Network Monitor source.
SAP Solution Manager	7.2 740 SP16	Receive alerts from an SAP Solution Manager Monitor source.
SCOM	• 2007 – version 6.1.7221.0 • 2012 - version 7.1.10226.0 • 2016 - version 7.2.117190	Alert and metric collection from the Microsoft System Center Operations Manager (SCOM).
SolarWinds	• NPM 12.0 • SAM 6.2.4	Receive events from the SolarWinds monitor.
vCenter	6.5	Receive events from your VMware vSphere environment.
vRealize	VMware vRealize Operations Manager Supported version: 8.10.0	Receive events from the vRealize Operations Log and Event Management servers.
Zabbix	5.0.9	Receive alerts from the Zabbix server.

Provided connectors (push)

This table lists the connectors that are provided with Event Management. Generic push connectors are also provided, one for event collection through the MID Server and the other through the instance.

Before you begin, ensure the Event Management Connectors plugin is installed in the ServiceNow AI Platform instance. You can download the plugin from the ServiceNow Store website.

Connectors	Description	Supported authentication
AWS	Use the connector to process Amazon Web Services (AWS) alarms as events. The event collection is through the instance.	N/A
Azure	Use OAuth authentication to process Azure platform event messages. The event collection is through the instance.	• Integrate Azure Monitor with OAuth authentication • Integrate Azure Monitor with basic authentication
Configure Azure Monitor Bi-directional connector	Use the Azure Monitor Pull connector to send information from ServiceNow Event Management to the Azure Portal.	Basic authentication
Microsoft Azure MID Push Connector	Collect JSON formatted event messages sent from Microsoft Azure. The collection is through the MID Server.	Basic authentication
BMC TrueSight	Collect JSON formatted event messages sent from BMC TrueSight Operations Management (TrueSight). The event collection is through the MID Server.	Basic authentication
New Relic	Collect JSON formatted event messages sent from New Relic. The event collection is through the instance.	Basic authentication
Dynatrace	Collect JSON formatted event messages sent from Dynatrace. The event collection is through the instance.	• Integrate Dynatrace with OAuth authentication • Integrate Dynatrace with basic authentication
Datadog	Collect JSON formatted event messages sent from Datadog. The event collection is through the instance.	• Integrate Datadog with OAuth authentication • Integrate Datadog with basic authentication

Connectors	Description	Supported authentication
	notifications when events and alerts are triggered.	
Oracle Enterprise Manager trap collection	Configure the SNMP trap connector to receive Oracle Enterprise Manager Cloud Control SNMP traps. Event Management can process these traps as events.	Basic authentication
Grafana	Collect JSON formatted event messages sent from Grafana. The event collection is through the instance.	Basic authentication
EIF listener	Configure the EIF listener context to receive EIF events. Event Management can process these EIF events as ServiceNow events.	Basic authentication
Integrate Honeycomb events	Configure the Event Management environment for the collection of events from Honeycomb by authenticating Honeycomb as a data source. In the Honeycomb platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.	Basic authentication
Integrate Instana events	Configure Instana with Event Management by adding a standard webhook in the Instana console.	Basic authentication
Integrate Scout APM events	Enable the collection of events from Scout APM by authenticating Scout APM as a data source to integrate it with Event Management	Basic authentication
Integrate Panopta as a data source	Configure the Panopta cloud-based monitoring solution with Event Management.	Basic authentication
URL format for generic JSON This URL can be used as-is and requires an event rule to be configured.	Configure this generic JSON target URL and configure an event rule to collect events:`https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source=genericJson`	N/A

Site24X7 Integrate with this application for one-directional transfer of events from Site24x7 to Event Management	Site24x7 Integration

Create a custom pull connector

You can create a customized pull connector that requires a script, connector definition, and connector instance, to retrieve events on behalf of an event source.

Before you begin

Role required: evt_mgmt_admin

About this task

A custom connector script can make remote API calls for a new event source to send events to the ServiceNow instance. You can create a script, and then add it as part of a new Event Management connector definition and connector instance. This procedure automatically creates a JavaScript code file using the name that you enter in the **Name** field as the filename. The JavaScript custom code that accomplishes these actions must:

- Connect to an event monitoring tool.
- Retrieve events from an event monitoring tool.
- Send events to the Event [em_event] table using a web service API. See REST API.

Each connector definition is specific to an event source vendor. The connector definition specifies the MID Server script include that pulls events from the external event source. In addition, the connector definition specifies what connector instance value parameters are needed to connect to the external event source host.

Procedure

1. Create a custom MID Server script include.
   This example uses Groovy (deprecated). In place of a script include in Groovy, it is recommended to use JavaScript.

   a. Implement these methods:

   - `@Override OperationStatus testConnection()`
   - `@Override OperationStatus execute()`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Design the class to extend the *ThirdPartyConnector*.

Example

```
public class HypericConnector extends ThirdPartyConnector
```

c. Import platform classes for event creation, sending, logging, and third-party connector base classes.

Example

```
package com.service_now.mid.probe.tpcon.test

import com.glide.util.Log
import com.service_now.mid.MIDServer
import com.service_now.mid.probe.event.IEventSender
import com.service_now.mid.probe.event.SNEventSender
import com.service_now.mid.probe.tpcon.OperationStatus
import com.service_now.mid.probe.tpcon.OperationStatusType
import com.service_now.mid.probe.tpcon.ThirdPartyConnector
import com.snc.commons.eventmgmt.Event
```

d. Connect to the data collector, such as SCOM or VMware vRealize Hyperic (Hyperic), with the API provided by the collector.

e. Use the *context* parameters to set the event field values that came from a connector instance.

Example

```
def authString = (context.username +
 ':'+ context.password).getBytes().encodeBase64().toString()
def urlStr = 'http://'+context.host + ':'
 + context.parameters.port + '/' + apiFunction
```

f. Implement the *execute* function in the script.
It reads events from the connector using its API to create Event objects and send them to the ServiceNow instance. For example:

Example

```
GPathResult alertsResponse1 =
 readAlerts('hqu/hqapi1/alert/find.hqu?begin=' + lastSignatureStr +
'&end='+ tillStr +'&count=1000000&severity=1&inEscalation=false&notFixed=false');
Event event = new Event()
event.emsSystem = context.name
event.source = "Hyperic"
event.description = it.@reason
event.type = it.@name
...
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
IEventSender eventSender =
 MIDServer.getSingleton(SNEventSender.class)
    for (Event event  : list) {
        eventSender.sendEvent(event)
     }
```

2. Navigate to **MID Server** > **MID Server Script Files** and create a script.
3. Specify the **Parent** field as *Groovy*, complete the form as appropriate, and then click **Submit**.
4. Navigate to **Event Management** > **Integrations** > **Connector Definitions** and create a connector definition.
5. In the **Groovy script to run** field, select the MID Server script file, complete the form as appropriate.
   In addition to **username** or **host**, you can add any other parameter, for example, **port**, and then click **Submit**.
6. Navigate to **Event Management** > **Integrations** > **Connector Instances** and create a connector instance.
7. In the **Connector definition** field, select the connector definition, complete the form as appropriate, and then click **Submit**.
8. To confirm or debug the script, use debug printouts from Groovy to the MID Server log.
9. To monitor incoming events using the custom connector instance, navigate to **ECC** > **Queue** and filter on **ConnectorProbe**.
10. Create a custom connector definition.
    a. Navigate to **All** > **Event Management** > **Integrations** > **Connector Definitions**.
    b. Click **New**.
    c. In the **Name** field, type a descriptive name for the connector definition.
    d. In the **Script type** field, select **Javascript**.
    e. Right-click the form header and select **Save**.
    The **Javascript to run** field is automatically populated with the name of the JavaScript template file.
11. To edit the default JavaScript file, click the information icon ( ) to the right of the JavaScript file name and follow these steps:
    a. Specify the information required for the **testConnection** function.
    This function tests the connector definition to verify if the connection to the target is valid.
    b. Specify the information required for the **execute** function.
    This function retrieves the information from the external source.
    c. Specify the information required for the **retrieveKpi** function.
    This function retrieves the metric data from the external source.
12. **Optional:** You can replace the default JavaScript with your JavaScript code.
13. Fill in the fields, as appropriate.

Connector Definition form

Field	Description
Default schedule	The number of seconds between attempts to receive events.
Bi-directional	Specify to enable the external monitoring system to be updated if the alert is changed. There is default implementation for SCOM.
Alert field identifier	Specify the alert field that, if changed manually, causes the external monitoring system to be updated. **Note:** This field appears only if **Bi-directional** is selected.
Collect metrics	Select to enable the collection of metrics. **Note:** Metrics are collected only for SCOM external event sources.
Metrics collection default schedule (seconds)	Specify the number of seconds of information that must be collected. The default is 10 seconds. **Note:** This field appears only if **Collect metrics** is selected.
Connector Parameters	Specify the parameters to enable communication with an event server.
Connector Definition to MID Server Capabilities	The MID Server name to process events from the event server. If not specified, an available MID Server is used.

14. Click **Submit**.

Configure a pull connector

Configure a pull connector to schedule the frequency of event collection.

Before you begin

Before starting this procedure:

- Locate or define a connector definition.
- Create the credentials to connect to the event source.
- If the connector instance is to be used for the collection of Metric Intelligence metric data, the Metric Intelligence plugin must be activated.

Role required: evt_mgmt_admin

About this task

You can use a connector instance to control the location and manner in which events arrive from external sources. You can optionally select to collect Metric Intelligence information from the external sources that you are connecting to. The Metric Intelligence feature is for the analysis of trends, threshold definitions, and anomaly detection. You can run a test to confirm that connector instance parameters let the MID Server receive events from a supported external event source to the Event [em_event] table. The test also confirms:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The MID Server is running.
- The host is running on the IP address that is in the **Host IP** field.
- Both the MID Server and the host are running in the same domain.
- The connector instance value fields are valid.
- A connection can be made to the event source, using API, to retrieve events.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Connector Instance Form

Field	Description
Name	A unique name for the connector instance record, such as the name of event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Connector definition **Note:** Metric Intelligence connectors (such as the AWS CloudWatch and AzureConnector), appear in the base system only if the Metric Intelligence plugin (com.snc.sa.metric) is activated.	The vendor and protocol used to gather events from the external event source. Select the connector definition that matches the source of external events. The options available in the base system are, for example: ○ AWS CloudWatch ○ AzureConnector ○ HPOM ○ IBM Netcool ○ NagiosXI ○ NNMi ○ OMi ○ SCOM ○ SolarWinds ○ Op5 ○ PRTG ○ vCenter ○ Zabbix For a list of the connector definitions available in the base system, see Configure Event Management connectors.
Host IP	The IP address of the event source host. The system uses this IP address to select the appropriate MID Server for communicating with the event source host.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Credential	The record from the Credentials [discovery_credentials] table containing valid credentials to the event source host.
Event collection last run time	The date and time of the most recent event import. The value of this field is automatically populated.
Last event collection status	The status of the last import. The value of this field is automatically populated. ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the external event source. This value cannot be lower than the minimum schedule property, which by default is 120 seconds.
Last error message	Last error message received by the connector. If the test connector fails, an error message appears in this field.
Active	This option appears only after the form has been saved. Do not select this check box until after you test the connection between the MID Server and the connector. Select this check box to enable pulling events from this external event source.
Bi-directional	Select to invoke the bi-directional option. This option is available only when the specified connector definition has been configured with bi-directional values. When selected, this option enables the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional status** option appears only when this option is selected. This option appears only if the connector definition that is selected is SCOM.
Last bi-directional status	The value of this field is automatically populated. The status values are: ○ **None** - A valid connection has not yet been established. ○ **Success** - A successful connection was established. ○ **Error** - A connection was established. However the external event source was not updated. This option appears only if the connector definition that is selected is SCOM.
Metrics collection	Designates collection of Metric Intelligence metric data.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Note: The metrics connector supports working against the SCOM database (MSSQL) that is configured to work with SSL. This option appears only if the connector definition supports metric collection, such as SCOM.
Metrics collection last run time	The date and time of the most recent metric data collection. The value of this field is automatically populated.
Last metrics collection status	Status of the metric data collection activity. The value of this field is automatically populated. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and if the **Metrics collection** option is selected.
Metrics collection schedule (seconds)	The time, in seconds, to repeat the metric data collection scheduled job. This option appears only if the connector definition that is selected supports metric collection (such as SCOM) and when the **Metrics collection** option is selected.
Metrics database host	Enter either the IP address or the host name of the metrics database host. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connect using a named instance	Select to specify the MSSQL named instance to connect to. This option appears only if the connector definition that is selected is SCOM.
Metrics database named instance	The name of the metrics database instance. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database port	The port used by the metric database. The connection is made using JDBC. The base system value is 1,433. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Database login with Windows authentication	Perform database login with the credentials of the log-on user that is defined on the MID Server service. This option appears only if the connector definition that is selected is SCOM.
Metrics collection running	When selected, indicates that the Metric Intelligence collection is running.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Metrics database credential	Credentials for the metric database. This option appears only if the connector definition that is selected supports metric collection (such as SCOM).
Connector Instance Values	The related list containing connection parameters for the event source host. The list of parameters depends on the selected connector definition.
MID Servers for Connectors	The name of theMID Server to process events from the event server.

4. Right-click the form header and select **Save**.
5. Click **Test connector** to verify that the MID Server can communicate with the external server host.
6. If the test fails, follow the instructions on the page to correct the problem and then run another test. The description of the reason for failure is shown in the MID Server log, according to the type of error, such as Events, Metrics, or Bi-Directional.
7. After a successful test, select the **Active** check box and then click **Update**.
8. Confirm that Event Management processes events using this connector instance by manually creating an event.

Related topics

Configure Event Management connectors

Configure a default MID Server for connectors

You can set a default MID Server for connectors to ensure that there is always a MID Server available to receive external events.

Before you begin

Role required: evt_mgmt_operator

About this task

The default MID Server must have connectivity to all external event sources.

Procedure

1. Enter `sys_properties.list` in the navigation filter to open the System Property [sys_properties] table.
2. Select the `mid.server.connector_default` system property.
3. On the form, fill in the fields.

Task Template form

Field	Description
mid.server.connector_default	Default MID Server for connectors

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Determines the MID Server connectors to use when no MID Server is specified. Must match a MID Server name. ○ **Type**: select `string` from the list ○ **Value**: enter the name of an existing MID Server, for example, SNC MID Server ○ **Location**: System Property [sys_properties] table

Note:
You can reset the default MID Server by clearing the *`mid.server.connector_default`* property or by updating the value of this property to a different MID Server. This property is not automatically reset in all scenarios.

4. Click **Update**.

Configure the Dynatrace metrics connector instance

Configure the Dynatrace connector instance to receive Metric Intelligence raw data from the Dynatrace server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

- Create an access token in Dynatrace with Read Metrics (metrics.read) scope permissions, to enable fetching metric data. This token is used in the connector to call the Dynatrace REST API.
- Configure the Service graph connector for Dynatrace. This is configured in the instance and discovers Dynatrace CIs. For details on configuring this connector, see Configure Service Graph Connector for Observability - Dynatrace using guided setup.

Role required: evt_mgmt_admin

About this task

By default, the Dynatrace service graph connector discovers CIs and supports metric collection for the following entity types:

- HOST
- APPLICATION
- SERVICE
- PROCESS_GROUP_INSTANCE

Configure other entity metrics for collection when creating event rules for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Dynatrace connector instance form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Dynatrace parameters.
   For details on the connector instance value parameters, see Dynatrace connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Dynatrace connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metric) page.

Connector instance metrics page - New record

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **Dynatrace connector instance**. All metrics are collected for the Dynatrace connector instance.
Metric type	The name of the Dynatrace entity type which the metric belongs to.
Metric ID	The Dynatrace metric ID of the metric being collected.
Active	Select for the metrics to collect.

   - Ensure that the CIs related to the metrics exist in the instance.
   - Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.
9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

Configure the Nagios metrics connector instance

Configure the Nagios metric connector instance to receive Metric Intelligence raw data from the Nagios server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Create basic authentication credentials on ServiceNow instance with Nagios SQL database username and password.
- ServiceNow does not support discovery for Nagios. Therefore, create the CI entry manually in the respective table using the hostname configured on the Nagios platform.

Role required: evt_mgmt_admin

About this task

By default, CI binding will occur for the following entities:

- HOST HTTP Endpoint: The event rule applies to the Nagios metric HTTP if you are running a check that includes command_name as service_http.
- MySQL Instance: The event rule applies to the Nagios metric MySQL if you are running a check that includes command_name as mysql.

If you are running any other checks on HTTP endpoints or MySQL, you can edit the existing event rule to add the command_name. For other entities, configure event rules based on CI binding requirements.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Nagios connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Nagios parameters.
   For details on the connector instance value parameters, see Nagios connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Nagios connector to use.
6. Ensure that the CIs related to the metrics exist in the instance.
7. Create an event rule to perform CI binding, as needed.
   For details, see Create or edit an event rule.
8. Select **Test Connector** to verify the connection between the MID Server and the connector.
9. After a successful test, select the **Active** check box and then select **Update**.

Configure the Zabbix metrics connector instance

Configure the Zabbix Metric connector instance to receive Metric Intelligence raw data from the Zabbix server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Create basic authentication credentials on ServiceNow instance with Zabbix server username and password.

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

ServiceNow does not support discovery for Zabbix, so CI entries must be manually created in the appropriate table using the hostname configured in the Zabbix platform.

- Create an Event Rule to bind specific CIs.
- Users can add tag information to Zabbix items, and the relevant tags will be included in the metric-to-CI records. These tags can also be used as filter conditions in the Event Rule for CI binding.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Zabbix connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory Zabbix parameters.
   For details on the connector instance value parameters, see Zabbix connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the Zabbix connector to use.
6. Select **Test Connector** to verify the connection between the MID Server and the connector.
7. After a successful test, select the **Active** check box and then select **Update**.

Note:
ServiceNow supports only unsigned float and unsigned integer metric types for Zabbix.

Configure the SolarWinds metrics connector instance

Configure the SolarWinds connector instance to receive Metric Intelligence raw data from the SolarWinds server.

Before you begin

To activate metric collection, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Configure the Service graph connector for SolarWinds. This is configured in the instance and discovers SolarWinds CIs. For details on configuring this connector, see Service Graph Connector for SolarWinds.

Role required: evt_mgmt_admin

About this task

By default, the Solarwinds Metric Connector Collects metrics from the following tables:

- Orion.CPULoad
- Orion.NPM.InterfaceTraffic
- Orion.VolumePerformanceHistory
- Orion.VolumeUsageHistory
- Orion.ResponseTime

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New** and create a connector instance.
   For details on the connector instance fields displayed on the page, see Solarwinds connector instance form.
3. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. **Optional:** In the Connector Instance Values section, you can edit the values of the mandatory SolarWinds parameters.
   For details on the connector instance value parameters, see Solarwinds connector instance value parameters.
5. In the MID Servers for Connectors section, add a MID Server for the SolarWinds connector to use.
6. In the Related Links section, select **Configure metrics to collect**.
   Only metrics with the value **Active=true** are collected by the instance.
7. Configure the metrics you want the instance to collect with the value **Active=true**.
   Metrics with the value **Active=false** are not collected by the instance.
8. **Optional:** Select **New** to create new metrics.
   Configure the fields on the Connector instance metrics - New record (sn_em_connector_instance_metrics_solarwinds) page.

Connector instance metrics page - New record

Field	Description
Metric name	Display name for the metric to be configured in the ServiceNow instance.
Metric connector instance	Set by default to **SolarWinds connector instance**. All metrics are collected for the SolarWinds connector instance.
Additional columns	(Optional) List of additional columns to fetch for CI-related information. For example: DateTime, Node, Resource. If **DateTime** is not provided, the current time is used as the metric timestamp. If **Node** and **Resource** are provided, they are populated accordingly. To reference fields from a parent table, use dot-walking format, such as `Interface.InterfaceName`. If a field should populate a specific standard field (like **Resource**), use an alias with the same name. For example, to use `InterfaceName` as the resource, specify it as `Interface.InterfaceName AS Resource`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Table Name	Name of the table from which metrics are collected.

- Ensure that the CIs related to the metrics exist in the instance.
- Create an event rule to perform CI binding, as needed. For details, see Create or edit an event rule.

9. Select **Test Connector** to verify the connection between the MID Server and the connector.
10. After a successful test, select the **Active** check box and then select **Update**.

> **Note:**
> Ensure that **Registration Mode** is enabled for the SolarWinds source in the Metric Sources table.

Configure event collection from HP OMi

Configure the HP Operations Manager (OMi) connector instance to receive alerts from the HP OMi server.

Before you begin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, and 10.61.
The OMi connector is not supported on versions below version 10.

Create Basic Auth type of credential to connect to OMI.

Role required: evt_mgmt_admin

Procedure

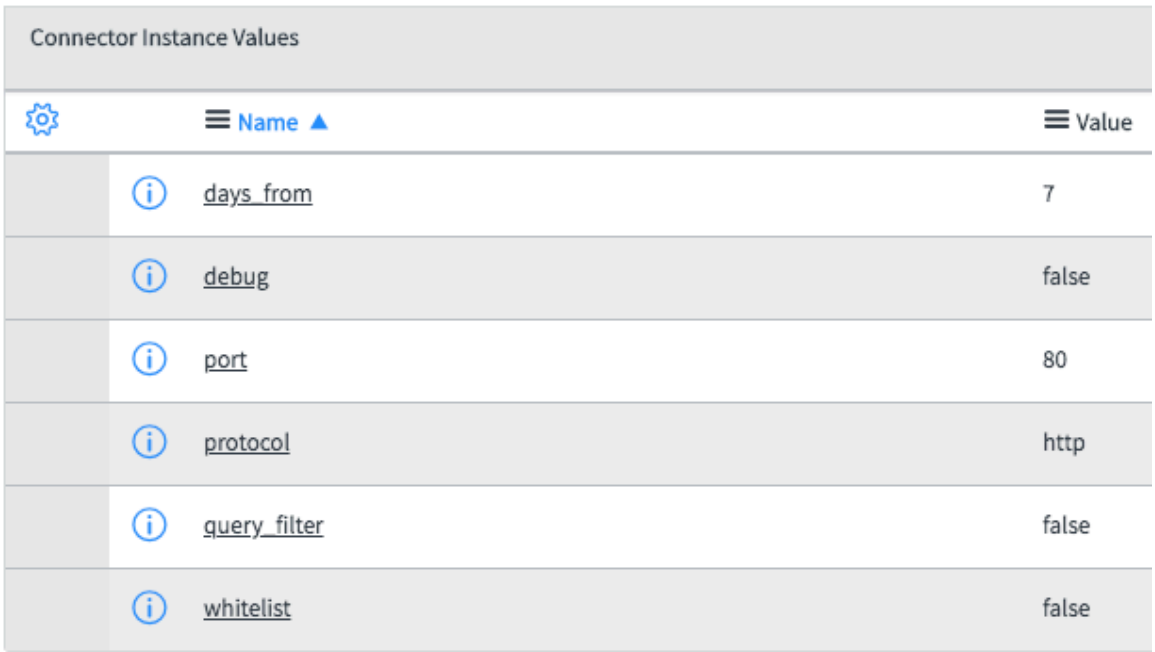
1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OMi connector.
Description	Description for the use of the OMi event collection instance.
Host IP	Specify the OMi IP address.
Credential	Click in the **Credential** field. Select a Basic Auth credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials using Basic Auth type. If you create the credentials, save them using a unique and recognizable name, for example OMiOPS.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run time status. Automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Connector Definition	Select **OMi**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



4. In the Connector Instance Values section, specify the OMi values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. Default `7`.

   b. **debug**.
   Default `false`. To enter debug mode, specify `true`.

   c. **port**.
   Default `80`.

   d. **protocol**.
   Default `http`.

   e. **query_filter**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

- A filter property that specifies an event attribute, such as, `related_ci`
- A supported operator, for example, `OR` or `AND`
- A value for the filter property, for example, `admin` or `integrator`

Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OMi API call. For detailed information on how to build the filter query, see "Filtering by Event Attributes: query" in the HP OMi Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

```
event_list?query=assigned_ user%20EQ%20"admin"
```

To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

f. inclusion list.
Default value:`false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

> **Note:**
> Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HP OMi server.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure event collection from HPOM

Configure the HPOM connector instance to receive events from HP Operations Manager (HPOM).

Before you begin

Role required: evt_mgmt_admin
Supported version: 08.60.005.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create an HPOM connector instance with the following details:

Field	Value
Name	Specify a unique name for the HPOM connector instance.
Host IP	Specify the HPOM IP address.
Credential	Click in the **Credential** field. Select a credential from the list or click the search icon. Either select the required credentials from the list or click **New** and create the required credentials.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	If you create the credentials, save them using a unique and recognizable name, for example, HPOMOPS.
Schedule (seconds)	The frequency in seconds that the system checks for new events from HPOM.
Description	Type a description for the use of the HPOM event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **HPOM** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory HPOM parameters.
   - **driver**. Specify the driver to be used to make the call. This driver is specific to the type of database you are calling into.
     - For an IBM DB2 Universal driver, specify: com.ibm.db2.jcc.DB2Driver
     - For an Oracle driver, specify: oracle.jdbc.OracleDriver
     - For a Microsoft SQL driver, specify: com.microsoft.sqlserver.jdbc.SQLServerDriver
     - For a MySQL driver, specify: com.mysql.jdbc.Driver
     - For a Sybase driver, specify: com.sybase.jdbc3.jdbc.SybDriver
   - **url**. Specify a URL. The JDBC protocol uses a connection string to establish the authentication and other parameters to establish a connection between the client and the database. Each database has its own connection string format. In the following URLs, replace the variables, for example, <username> and <password>, with your values.
     - For an IBM DB2 Universal URL, specify: [jdbc:db2://sysmvs1.stl.ibm.com:<port number>/<database name>:user=<username>;password=<password>]

       For example: jdbc:db2://sysmvs1.stl.ibm.com:5021/regionsdb:user=example;password=wlrs21.
     - For an Oracle URL, specify: [jdbc:oracle:thin:@<IP address>:<port number>:<database name>]

       For example: jdbc:oracle:thin:@172.31.255.255:4028:OracleMain.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For a Microsoft SQL URL, specify: [jdbc:sqlserver://<IP address>;user=<username>;password=<password>]

  For example: jdbc:sqlserver://localhost;user=example;password=w3lrs2.

- For a MySQL URL, specify: [jdbc:mysql://<IP address>/database?user=<username>;password=<password>]

  For example: jdbc:mysql://localhost/database?user=example;password=65wlrs.

- For a Sybase URL, specify: [jdbc:sybase:Tds:<IP address>:<port number>/<database name>?user=<username>;password=<password>]

  For example: jdbc:sybase:Tds:172.31.255.255:4100/SYBMAIN?user=example;password=wlrs1m.

5. Use a network tool, such as ping, to verify that the HPOM server is running and the IP address matches the value in the *Host IP* field.
6. Click **Test connector** to verify the connection between the MID Server and the HPOM connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the HPOM server.

8. After a successful test, select **Active** and then click **Update**.

Configure a pull connector

Configure event collection from Hyperic

Configure the Hyperic connector instance to receive events from the VMware vRealize Hyperic server.

Before you begin
Role required: evt_mgmt_admin
Supported version: 5.8.4.0.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a Hyperic connector instance with the following details:

Field	Value
Name	Specify a unique name for the Hyperic connector instance.
Host IP	Specify the Hyperic IP address.
Credential	In the Credentials form, click **New** and create the required credentials. Save the credentials using a unique and recognizable name, for example, HypericOPS.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Schedule (seconds)	The frequency in seconds that the system checks for new events from Hyperic.
Description	Type a description for the use of the Hyperic event collection instance.
Connector definition	The vendor and protocol used to gather events from the external event source. Select the **Hyperic** connector definition.
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory Hyperic parameters.
   a. **port** Default value 7080.
   b. **protocol** Default value http.
5. Click **Test connector** to verify the connection between the MID Server and the Hyperic connector.
6. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Hyperic server.

7. After a successful test, select the **Active** check box and then click **Update**.

Configure a pull connector

Configure event collection from IBM Netcool

Configure the IBM Netcool_V2 connector to receive events from IBM Netcool/OMNIbus Object Servers and Impact Servers. The IBM Netcool_V2 connector uses REST API calls and is bidirectional.

Before you begin

For the IBM Netcool_V2 connector:

- Role required: evt_mgmt_admin
- Perform connector validation on IBM NetCool/OMNIbus version 8.1.0.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

To use IBM Netcool_V2 connector, configure a connector instance for the MID Server.

Note:
The IBM Netcool connector is deprecated and only IBM Netcool_V2 connector is supported.

Procedure

1. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Specify a unique name for the Netcool connector instance.
Description	Type a description for the use of the Netcool event collection instance.
Host IP	Specify the Netcool IP address.
Credential	In the Credentials form, click **New**, and create the required credentials. Save the credentials using a unique and recognizable name, for example, NetcoolOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Netcool. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector definition	Select IBM Netcool_V2 to gather events from the external event source.
MID Servers (MID Server for Connectors section)	Specify a MID Server that is up and is valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and click **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the value of the required Netcool parameters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Verify that Netcool servers are up and running:
   For the IBM Netcool_V2 connector, use this REST API call to verify that the Netcool API is up and running: `http://hostname:port/objectserver/restapi/alerts/status`
6. Right-click the form header and click **Save**.
7. Click **Test connector** to verify the connection between the MID Server and the Netcool connector.
8. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.
9. After a successful test, select the **Active** check box and then click **Update**.

Configure a pull connector

Configure event collection from an Icinga2 connector

Configure the Icinga 2 (Icinga) connector instance to receive events while monitoring your network resources.

Before you begin

Role required: evt_mgmt_admin

Supported version: 2.4.1.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Connector Instance form

Field	Description
Name	Descriptive and unique name for the Icinga connector.
Description	Description for the use of the Icinga event collection instance.
Connector definition	Name of the required connector definition. Select **Icinga2**.
Host IP	IP address where Icinga is installed.
Credential	Permission to connect to Icinga. Click the search icon in the **Credential** field. Use Basic Authentication credentials. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, ICINGA2CHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from Icinga. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

   a. debug: Display debug messages. Default value: false. Specify true to see debug messages.
   b. logPayloadForDebug: Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: `5665`.
protocol	Type of protocol. Default protocol type: `https`.
alert_type	Provide the Icinga alert type details. There are 2 types of an alert in Icinga2: SOFT and HARD SOFT: Connector instance will pull a soft alert. HARD: Connector instance will pull a hard alert.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the Icinga connector.

   a. Click **Test Connector**.
      If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from Logicmonitor

The Logicmonitor pull connector sends information from Event Management to Logicmonitor. It sends responses received from a Push connector in a bi-directional environment to Logicmonitor.

Before you begin
Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the**Apply additional matching rules**check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

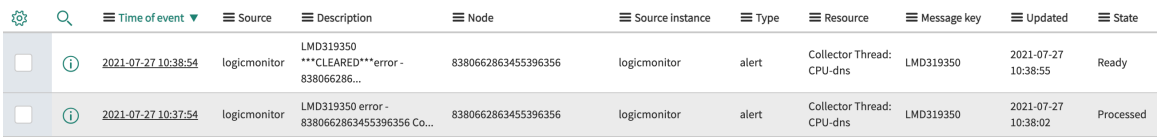
Note:
This feature applies only to active event rules.

Procedure

1. Navigate to**All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.

2. Click**New**.
The**Connector Instance New Record**page appears.

3. Enter values in the required fields, which are indicated by a red asterisk.
When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source.



Time of event	Source	Description	Node	Source instance	Type	Resource	Message key	Updated	State
2021-07-27 10:38:54	logicmonitor	LMD319350 ***CLEARED***error - 838066286...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:55	Ready
2021-07-27 10:37:54	logicmonitor	LMD319350 error - 8380662863455396356 Co...	8380662863455396356	logicmonitor	alert	Collector Thread: CPU-dns	LMD319350	2021-07-27 10:38:02	Processed

The source of events is**logicmonitor**so you should create an instance with the name`logicmonitor`.

All > Active = true

Name	Active	Event collection last run time	Connector definition	Last event collection signature	Last event collecti
logicmonitor	true	2021-07-27 11:21:41	Logic Monitor		Success

Note:
The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.

4. Select the**Active**check box and click**Save**.
The LogicMonitor pull connector does not retrieve Events or populate the Events [em_event] table.

Configure event collection from NNMi

Configure the HP Network Node Manager i (NNMi) connector instance to receive events while monitoring your network resources.

Before you begin

Supported version: 10.30.653.
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

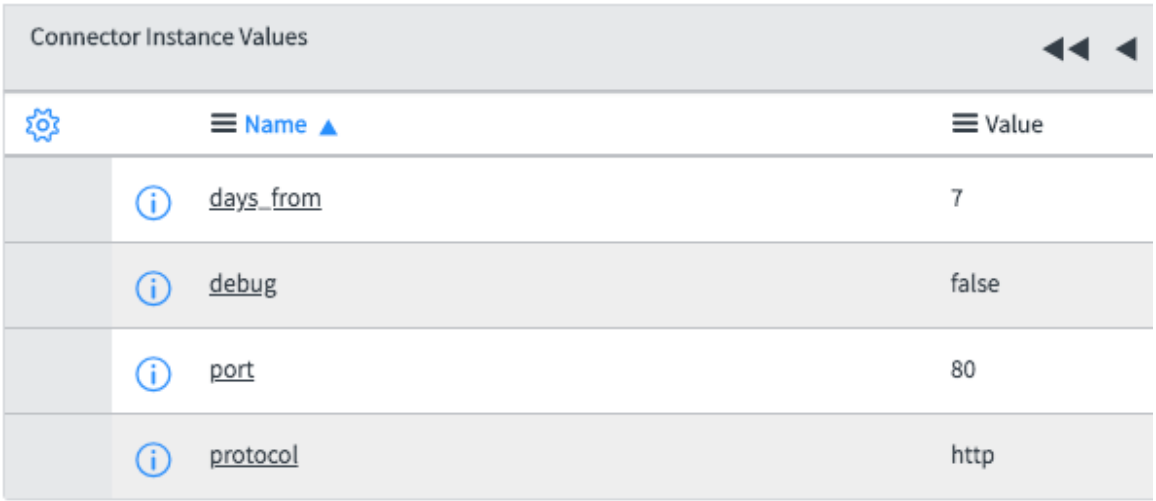
Connector Instance form

Field	Description
Name	Descriptive and unique name for the NNMi connector.
Description	Description for the use of the NNMi event collection instance.
Connector definition	Name of the required connector definition. Select **NNMi**.
Host IP	IP address where NNMi is installed.
Credential	Permission to connect to NNMi. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, NNMiCHCK. The selected credentials use basic authentication.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from NNMi. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, verify and where required, modify the default connector instance values.

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: `7` days. **Note:** The maximum number of past events that can be collected is 3,000. The first time that the connector runs, it collects all events (up to the 3,000 limit) that were created from the `days_from` date until the current date.
debug	Display debug messages. Default value: `false`. Specify `true` to see debug messages.
port	Number of the connector port. Default value: `80`.
protocol	Type of protocol. Default protocol type: `http`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

   You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the NNMi connector.

   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

b. After a successful test, select the **Active** check box.

9. Click **Update**.

Configure event collection from NagiosXI

Configure the NagiosXI connector instance to receive events from the Nagios Core monitor.

Before you begin

Supported version: 5.5.2.
The NagiosXI connector instance requires a credential that lets the instance access NagiosXI accounts. You can use an existing credential or create a new one. For more information, see Create Nagios XI server credentials.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.

2. Click **New**.

3. On the form, fill in the fields.

Field	Description
Name	Descriptive name for the Nagios connector.
Description	Description for the use of the NagiosXI event collection instance.
Host IP	Specify the Nagios XI IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Nagios XI server credentials. Ensure that the user password contains the NagiosXI user API key, for example 04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSRYe4QDrHPFndYbV
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency, in seconds, that the system checks for new events from Nagios. The default value is 120 seconds.
Last error message	The last error message is automatically updated.
Connector Definition	Select **NagiosXI**.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify the Nagios values.
   - **initial_sync_in_days**. Specify the number of days for which events must be collected at the first collection cycle. Default value `7` days.
   - **port**. Default value `80`.
   - **protocol**. The default protocol type is `http`.
   - **time_zone**. The default time zone is `GMT`; update this value to the Nagios timezone. For example, if Nagios is sending the events according to the EDT time zone, update this value to `GMT-04:00` (abbreviations such as **EDT** are not supported).
   - **severity_by_state_type**. The default value is `false`. When set to `true`, the state_type is used along with the state to determine the severity which creates less critical events as shown in the following mapping table.

Mapping Table

_state_type(Connect definition parameter)	State (Nagios JSON payload attribute)	State_type (Nagios JSON payload attribute)	ServiceNow Severity
false	2	0/1	1 (Critical)
false	1	1	1(Critical)
false	1	0	2(Major)
false	0	0/1	5(OK)
true	0	0/1	5(OK)
true	1	0	4 (Warning-soft -> Warning)
true	2	0	2(Critical-soft -> Major)
true	3	0	4(Unknown-soft-> Warning)
true	1	1	3(Warning-hard -> Minor)
true	2	1	1(Critical-hard -> Critical)
true	3	1	3(Unknown-hard -> Minor)

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

If this message appears: `Connection test failed: Failed to connect to Nagios on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Nagios events.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Nagios Core monitor.

9. After a successful test, select the **Active** check box and then click **Update**.

Create Nagios XI server credentials

Create credentials to access Nagios XI server.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `Nagios authentication`.
User name	Name to identify the user. Ensure that the user password contains the NagiosXI user API key, for example, `04lquEPqf4JimWCm8RWbJokOpW8LYBUfEvJp9OSHSRY`
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The credential for use with the Nagios XI server connector is created.

Credentials and connection information

Configure event collection from OBM

Configure the Operation Bridge Manager (OBM), also known as OMi v2, connector instance to receive alerts from the OBM server. The OBM connector script OBM v2 will be available after installing the Event Management Connectors app.

Before you begin

Role required: evt_mgmt_admin

Supported versions: 10.01, 10.10, 10.11, 10.12, 10.60, 10.61, and 11.01.

About this task

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OBM connector.
Description	Description for the use of the OBM event collection instance.
Host IP	Specify the OBM IP address.
Credential	Select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example OBMOPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time value is automatically updated.
Event collection schedule (seconds)	Frequency in seconds that the system checks for new events from OBM. The default value is 120 seconds.
Last error message	The last error message is automatically updated
Connector Definition	Select **OBM V2**. **Note:** This script will be available after installing the Event Management connector scoped app.
MID Servers (MID Server for Connectors section)	Specify the MID Server to run the OBM connector instance. You can configure several MID Servers. If the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	first server is down, the next MID Server If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

3. Right-click the form header and select **Save**.
   The parameters that are relevant to the OBM connector appear.
4. In the Connector Instance Values section, specify the OBM values.

   a. **days_from**.
   Specify the number of days for which events must be collected on the first collection cycle. The default value is `7` days and data can only be pulled a maximum of 7 days from the OBM system.

   b. **debug**.
   The default value is `false`. To enter debug mode, change the value to `true`.

   c. **port**.
   The default value is `80`.

   d. **protocol**.
   The default value is `http`.

   e. **query_filter**.
   The default value is false. If you do want to use this extra filter to query events, specify the event attributes. For example, `assigned_user = "admin" AND title = "My Title"`. The query filter criteria are:

   - A filter property that specifies an event attribute, such as, `related_ci`
   - A supported operator, for example, `OR` or `AND`
   - A value for the filter property, for example, `admin` or `integrator`

   Everything from the query_filter field undergoes URL encoding and is then passed as a parameter to the OBM API call. For detailed information on how to build the filter query, see "Filtering by Event Attributes: query" in the OBM Extensibility Guide. For example, to query the events for a list of events that are assigned to the admin user, specify:

   `event_list?query=assigned_ user%20EQ%20"admin"`

   To nest query_filter event attributes, specify the hierarchy using square brackets "[ ]".

   f. **inclusion list**.
   The default value is `false`. Specify a comma-separated list to include this feature to add attributes that should be collected and added to the Event Management **Additional information** field.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Use a network tool, such as ping, to verify that the OBM server is running and the IP address matches the value in the **Host IP** field.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure OP5 or OP5_v2 connector

Configure the OP5 or OP5_v2 Monitor connector instance to receive alerts from an OP5 Monitor source.

Before you begin

The OP5_v2 connector is supported in Event Management connectors version 2.3.0 - August 2022, available from the ServiceNow Store.

Supported version:

- OP5: 7.3.15
- OP5_v2: 8.3.8

Role required: evt_mgmt_admin

About this task

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the OP5 or OP5_v2 connector.
Description	Description for the use of the OP5 or OP5_v2 event collection instance.
Host IP	Specify the OP5 or OP5_v2 IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OP5OPS.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from OP5 or OP5_v2.

Field	Value
Last error message	The last error message is automatically updated.
Connector definition	Select **OP5** or **OP5_v2**.
Connector Instance Values section	The parameters that are specific to **OP5** or **OP5_v2** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the OP5 or OP5_v2 values.

   a. **days_from**.
   Specify the number of days for which events must be collected at the first collection cycle. Default value `7` days.

   b. **debug**.
   Displays debug messages. Default value: false. Specify true to see debug messages

   c. **logPayloadForDebug**.
   Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.

   d. **port**.
   Default value `443`.

   e. **state_types**.
   Specify filters for event collection based on the **state_types** attribute. You can filter events based on state type. Specify the type, for example, `soft` or `hard`.

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
8. After a successful test, select the **Active** check box and then click **Update**.

Configure Opsview_v2 connector

Configure the Opsview_V2 connector instance to receive alerts from an Opsview Monitor source.

Before you begin

Ensure you have the supported version of the Opsview_V2 connector: 6.7.0.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the Opsview connector.
Description	Description for the use of the Opsview event collection instance.
Host IP	Specify the Opsview IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, OpsviewOPS. **Note:** User should have the CONFIGUREVIEW role with access to 'VIEW ALL, CHANGE NONE'.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from Opsview.
Last error message	The last error message is automatically updated.
Connector definition	Select **Opsview_v2**.
Connector Instance Values section	The parameters that are specific to Opsview_V2 display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the Opsview_v2 values.

   a. days_from.

   Specify the number of days for which events must be collected at the first collection cycle. Default value 7 days.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. **debug**.
Display debug messages. Default value: false. Specify true to see debug messages.

c. **logPayloadForDebug**.
Display payload related debug messages. Default value: false. Specify true to see payload related debug messages.

d. **eventtype_filter**.
Specify filters for event collection based on the eventtype attribute. Specify one of these values 0,1,2,3.

e. **port**.

Default value is 80.

.

f. **protocol**.
The default protocol type is HTTPS.

5. Right-click the form header and select **Save**.
6. To verify the connection between the MID Server and the connector, select **Test Connector**.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
If this message appears: `Connection test failed: Failed to connect to Opsview on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the Opsview events.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Opsview Monitor source.

8. After a successful test, select the **Active** check box and then select **Update**.

Configure PRTG connector

Configure the PRTG connector instance to receive alerts from a Paessler PRTG Network Monitor source.

Before you begin
Role required: evt_mgmt_admin
Supported version: 21.3.71.

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance with the following details:

Field	Value
Name	Descriptive name for the PRTG connector.
Description	Description for the use of the PRTG event collection instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Host IP	Specify the PRTG IP address.
Credential	Either select the required credentials from the list or click **New** and create the required credentials. If you create the credentials, save them using a unique and recognizable name, for example, `PRTG0PS`.
Event collection last run time	The last run time value is automatically updated.
Last event collection status	The last run time status is automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from PRTG.
Last error message	The last error message is automatically updated.
Connector definition	Select **PRTG**.
Connector Instance Values section	The parameters that are specific to **PRTG** display here when the form is saved.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Instance Values section, specify the PRTG values.

   a. **add_columns**.
   Specify which columns to be returned by the connector. Separate the names with a comma and without a space between the names. The output is stored in the **Additional information** field of the event. Default value `false`. If `false` is specified, only the default list of columns is retrieved: parent, name, type, objid, tags, message, status, priority, datetime, actions, baselink, basetype, modifiedby.

   > **Note:**
   > Only columns names that are applicable to the **Message** content type can be specified.

   b. **date_format**.
   The format date and time. Default format M/d/yyyy/ h:mm:ss a. If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event will not be processed correctly.

   For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *`2019/06/27/ 11:25:00 a`*, modify the **date_format** value to *`yyyy/M/d/ h:mm:ss a`* to match the format of the received event.

   In the **date_format**, `a` represents AM, and `p` represents PM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the **days_from** field, specify the number of days for which events must be collected at the first collection cycle.
Default value `7` days.

d. **debug**.
Default value `false`.

e. **port**.
Default value `80`.

f. **protocol**.
The default protocol type is `http`.

g. **prtg_api_fetched_events_num**.
Maximum number of events, per query, that can be fetched from the PRTG client into the MID Server. Default number: `50,000`.

h. **time_zone**.
The default time zone is the `GMT` time zone; update this value to the PRTG time zone. For example, if PRTG is sending events according to the `EDT` time zone, update this value to `GMT-4` (abbreviations such as EDT are not supported).

5. Right-click the form header and select **Save**.
6. Click **Test Connector** to verify the connection between the MID Server and the connector.
7. If the test fails, follow the instructions that the error issues to correct the problem and then run another test.
If this message appears: `Connection test failed: Failed to connect to PRTG on test connector. Invalid API Key`, then enter the API Key for the specific user to be able to read the PRTG events.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to PRTG.

8. After a successful test, select the **Active** check box and then click **Update**.

Apache Kafka Consumer Connector

The Apache Kafka Consumer connector instance enables you to create events from messages collected from the Apache Kafka topic as a JSON payload that contains essential information in a data block.

Apache Kafka is a distributed publish-subscribe messaging system that receives data from disparate source systems and makes the data available to target systems in real time.

You can use this connector to create ServiceNow events from Kafka messages. Messages in the Kafka topic must be in JSON format.

Like other message broker systems, Kafka facilitates the asynchronous data exchange between processes, applications, and servers.

Kafka software runs on one or more servers. Each node, called a broker, in a Kafka cluster helps producer applications write data to topics, which are where records are stored and published.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Consumer applications read from topics. Topics are divided into partitions to make them more manageable and Kafka guarantees strong ordering for each partition.

Configure the Apache Kafka Consumer connector

Configure the Apache Kafka Consumer connector instance to create events from streaming messages collected by the Apache Kafka connector.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Select **New**.
3. On the form, fill in the fields.

Connector instance form

Field	Value
Name	Descriptive and unique name for the Kafka Consumer connector.
Description	Description to be used by the Kafka Consumer event collection instance.
Connector definition	Name of the required connector definition, which in this case should be Kafka Consumer.
Host IP	The host IP. **Note:** This field must contain a value to complete the creation process so the placeholder 1.1.1.1 should be entered as a temporary value.
Event collection last run time	This field is automatically set to the last runtime value.
Last event collection status	This field is automatically set to the last runtime status.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the Kafka Consumer. The default value is 60 seconds.
Last error message	This field is automatically set to the last error message.

4. For PLAINTEXT or SASL_PLAINTEXT, in the **Credential** field, create a Basic authentication credential.
   Use the **Kafka SSL credential** type for a new Kafka pull connector instance with **SASL_PLAINTEXT** authentication. Go to step 5.

   Use the **Kafka SSL credential** type when the Kafka server's **sasl.enabled.mechanisms** or **sasl.mechanism** parameter's value don't equal **PLAIN**. Go to step 5.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Select the Search icon next to the **Credential** field.

b. On the Credentials screen, select **New**.

c. From the list of available credentials, select **Basic Auth Credentials**.

d. On the Basic Authentication screen, give information for either PLAINTEXT authentication, which doesn't require credentials, or SASL_PLAINTEXT authentication, which requires credentials.

- For PLAINTEXT authentication, in the **Name** field, type any value and leave the **User Name** and **Password** fields empty.
- For SASL_PLAINTEXT authentication, give a name for the credential in the **Name** field, preferably prefaced by SASL. Provide the user name and password In the **User Name** and **Password** fields.

e. Select **Submit**.

5. For a SASL_PLAINTEXT, SSL, or SASL_SSL authentication credential, in the **Credential** field, create a Kafka SSL credential.

a. Select the Search icon next to the **Credential** field.

b. On the Credentials screen, select **New**.

c. From the list of available credentials, select **Kafka SSL Credentials**.

d. On the Kafka SSL Authentication screen, fill in the Kafka SSL credentials fields. For the Kafka SSL credentials fields descriptions, see .

Note:
If you clear the **Disable hostname verification** field, then in the **Additional Kafka consumer properties** field, enter the value of the *ssl.endpoint.identification.algorithm* parameter the same as of the Kafka server parameter value. For example:

```
ssl.enabled.protocols=TLSv1.2,TLSv1.1,TLSv1;
sasl.jaas.config=org.apache.kafka.common.security.plain.Pl
ainLoginModule required username=<username>
 password=<password>;
sasl.enabled.mechanisms=PLAIN;ssl.endpoint.identification.
algorithm=;
```

e. Select **Submit**.

6. Right-click the form header and select **Save**.
7. In the table presenting the connector instance values, verify the populated connector instance values based on your Kafka setup and the message (JSON payload) that you received from the Kafka topic.

   Change the connector instance values if necessary.

© 2025 ServiceNow, Inc. All rights reserved.

Connector instance Values table

Field	Description
authentication_type	The Kafka Consumer authentication type. The currently supported values are: ○ PLAINTEXT (no authentication) (Default) ○ SASL_PLAINTEXT (basic authentication – user name and password)
bootstrap_servers	The servers that establish the connection with the Kafka cluster. Values in this field should be in the form host1:port1, host2:port2, and so on (comma-separated). This field is required.
consumer_group_name	The Consumer group name. If the same Kafka topic is being consumed from two different instances, use different consumer group names so all events are captured for both instances. This field is required.
time_of_event_field	The name of the field in the JSON payload/message that includes the time of the event. If a field in the JSON payload/message includes the time of the event, that value should be the value for this parameter. If no time field value is given, then the received time of the event in the ServiceNow instance is set as time_of_event. The time_of_event field should be a first-level field in the JSON payload/message. Nested field names aren't allowed.
timezone	The time zone of the time_of_event field in the JSON payload/message. The timezone value isn't used when the time_of_event field is empty. For example, if the time_of_event in the payload/message is in the IST time zone, the value would be GMT+0530.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Default: GMT.
date_format	The date_time format of the time_of_event field in the JSON payload/message. If no time field value is given, then the time when the event was received in the instance in GMT time is used. The date_time value isn't used when the time_of_event field is empty. Default: yyyy-MM-dd HH:mm:sss.
debug	Displays debug messages. Default value: false. Specify true to see debug messages.
logPayloadForDebug	Displays payload related debug messages. Default value: false. Specify true to see payload related debug messages.
topic	The Kafka topic from which the messages are fetched. This field is required.

8. In the **MID Servers for Connectors** section, specify a MID Server that is up and is valid.

   Note:
   You can configure several MID Servers. If the first server is down, the next MID Server is used. If that MID Server isn't available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the **MID Servers for Connectors** section.

   If you do not specify a MID Server, an available MID Server that has a matching IP range is used.

9. Right-click the form header and select **Save**.
10. Test the connection between the MID Server and the Kafka Consumer connector.

    a. Select **Test Connector**.

    b. If the test connection fails, verify whether the credential is valid, and that the network is connected from the MID Server to the Kafka broker.

       Note:
       Kafka topic name validation occurs only in **Test Connector** validation.

11. After a successful test, make the connector instance active by selecting the **Active** check box.
12. Select the **Update** button.

What to do next

After the connector is created, you must map the fields. For more information, see Map Kafka message payload attributes to alert fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Map Kafka message payload attributes to alert fields

Map Kafka message attributes to alert fields to make alerts based on the messages more meaningful. Use event field mapping to map Kafka severity values to appropriate ServiceNow values.

Before you begin

Role required: evt_mgmt_admin

About this task

Depending on your payload, Use event field mappings to provide more comprehensive information in an event alert by substituting values from the event field mapping rule into the event. Depending on your payload, transform information in events to populate specified alert field values and compose alert fields from various values to generate alerts for tracking and remediation. If needed, use both event field mappings and alert rules.

The following table compares a message received from a topic and a flattened payload in the event **Additional info** field. The message received from a topic is flattened as a single field and appears in the event **Additional info** field. Use these flattened messages to create event rules and mappings.

Actual versus flattened payload

Actual Payload inserted into a topic	Flattened payload in the Additional Info field

<pre>{
"version": "v0.1.0",
"name": "fibsrc",

	}</pre>

Procedure

1. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event field mappings.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
   b. In the Event Field Mapping window, select **New**.
   c. In the Name field, enter a name for the field mapping.
   d. In the Source field, enter **Kafka Consumer**.
   e. In the Mapping type field, select the appropriate mapping type
   f. For a list of the available mapping types, see Event Field Mappings.
2. To map the Kafka message attributes to the predefined alert fields to generate alerts by creating event rules.
   a. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
   b. Select **New** .
   c. In the Name field, enter a name for the event rule.
   d. In the Source field, enter **Kafka Consumer**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. Select **Event Filter**.

f. Enter the appropriate filter according to your requirement.

g. Select **Transform and compose alert output**.

When creating event rules, the event fields are displayed in the Event Rules Transform and Compose Alert Output tab. Because the Kafka message varies from user to user, you must transform the event fields to the alert fields to see the details in the alert.

Note:
Because the severity value is required to create an alert, you must map the **Severity** field using event rules or event field mappings. If the Severity field is empty, the event isn't processed and enters into an error state.

h. Map the fields of the event and **Additional Info** field to the fields of the alert.

i. Select **Binding**.

j. Enter the appropriate binding according to your requirement.

k. Select **Submit**.
For more information, see Create or edit an event rule.

3. In the All Events screen, check whether any of the events from Kafka are in an error state due to a missing event rule and provide missing rules.

a. Navigate to **All** > **Event Management** > **All Events**.

b. In the All Events table, open any Kafka consumer event that shows Error as the state in the **Severity** column.

The message received from the Kafka consumer can vary. Because the connector cannot know the attributes that will be received, you must map the **Severity** field or other event fields to the fields in the message to ensure that alert fields are correctly populated.

c. On the All Events screen, create a new event rule by selecting **Create Event Rule**.
For more information on creating event rules, see Event Rules.

If no event field mappings exist to handle the new type of event, create event field mappings.
For more information, see Create event field mappings.

Result

Your Apache Kafka consumer connector is configured. When new messages arrive into the Kafka topic, they are received into the ServiceNow instance as events, and alerts are then created from those events.

Configure SAP Solution Manager connector

Configure the SAP Solution Manager (Solman) connector instance to enable communication between the SAP Solution Manager and Event Management.

Before you begin

Role required: admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Supported versions: Tested on SAP Solution Manager 7.2. Might also work on other versions.

About this task

This configuration enables you to update the SAP Solution Manager with the statuses that have been updated by ServiceNow. For general information about the SAP Solution Manager, see SAP configurations enabling the SAP Solution Manager connector.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a connector instance.
3. Fill in the fields on the form.

Connector instance form

Field	Description
Name	Descriptive name for the SAP Solman connector.
Description	Description for the use of the SAP Solman event collection instance.
Active	Option that activates the connector instance. Select this option only after running a successful test.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **SAP Solman**.
Host IP	The IP address where SAP Solman is installed.
Credential	Required credentials entered either by selecting them from the results of a search through the search icon or by clicking **New**. or creating them. If you create credentials, save them using a unique and recognizable name, such as SAPSOLMANOPS.
Event collection last run time	The last run time value. Automatically updated.
Last event collection status	The last run time status. Automatically updated.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SAP Solman.
Bi-directional	Ensure that you select this option to invoke the bi-directional exchange of values to-and-from the external event source. The **Last bi-directional** status option appears only when selecting this option.
Last bi-directional status	This field appears only when **Bi-directional** is selected. This field is automatically populated with the most recent bi-directional status.
Last error message	Last error message. Automatically updated.
Connector Instance Values section	The parameters that are specific to SAP Solman, automatically displayed when saving the form.
MID Servers (MID Server for Connectors section)	MID Server that is up and valid. You can configure several MID Servers so that if the first server is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	according to the order in which their details are entered into the MID Server for Connectors section. If no MID Server is specified, an available MID Server that has a matching IP range is used.

4. Right-click the form header and select **Save**.

   The connector instance values are added to the form and the parameters that are relevant to the connector appear.

5. In the Connector Instance Values section, specify the default connector instance values.
   - **Client**: Default value = `001`
   - **Port**: Default value = `8000`
6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector. If the test fails, follow the instructions in the error message and then run another test.

   Note:
   Use a network tool such as *`ping`* to verify the credentials and the network connectivity from the MID Server to the SAP Solman monitor.

8. After a successful test, select the **Active** check box and click **Update**.

Use the SAP Solution Manager Push connector

SAP configurations enabling the SAP Solution Manager connector

Configure your SAP environment to work with the ServiceNow Event Management platform so you can use the SAP Solution Manager connector.

When integrating your SAP environment with Event Management, the SAP Solution Manager sends events through a MID Server to Event Management, which generates an alert from the event.

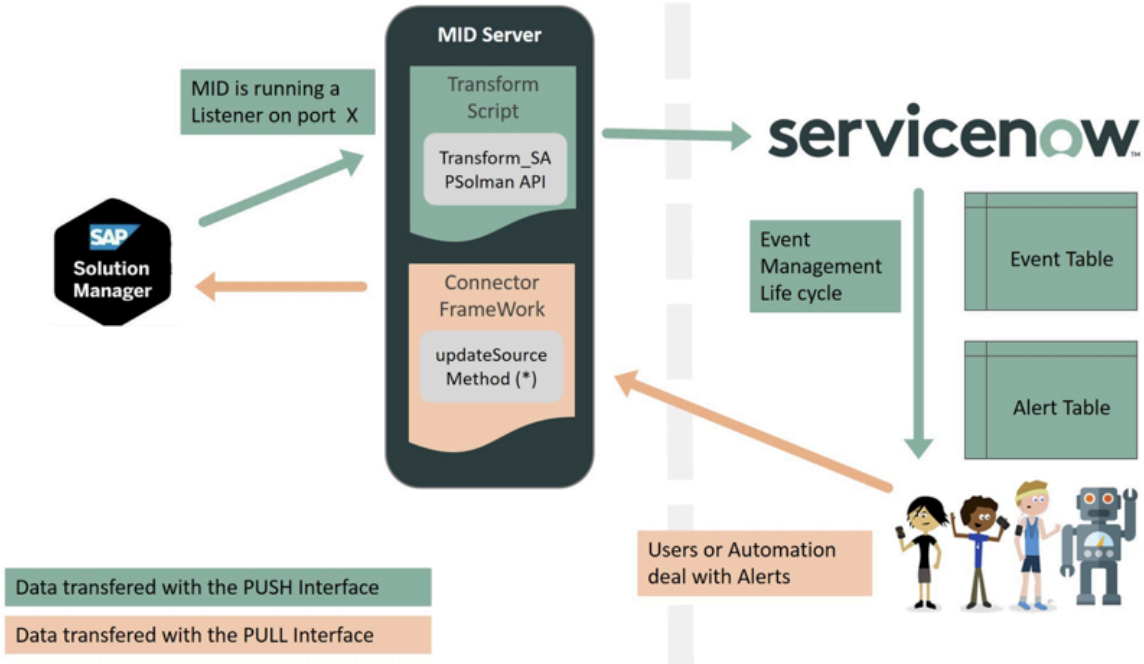
After the MID Server processes events, you can perform the following actions in the SAP Solution Manager:

- Add comments
- Confirm alerts
- Set status to **Externally Managed**

The following diagram illustrates the flow of data between SAP and Event Management.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAP Solution Manager connector



Data moves between SAP and Event Management using both Push and Pull interfaces.

- **Pull interface**:

  The Connector Update Queues table [em_connector_update_queue] lists manual updates of alerts and sends them to the SAP Solution Manager.

  The table's business rule identifies each manual update of alerts in Event Management and updates the connector queue with these changes. By default, changes to all alert fields are tracked. For information on adjusting this setting, see the SAP Solution Manager documentation.

  The Event Management - Queue connector processor scheduled job removes alert changes from the queue and sends them to the MID Server. By default, the system performs this process in batches of 1,000 alerts. You can customize this batch size by setting the `evt_mgmt.max_update_source_records` property.

  Note:
  You must define the Pull interface to enable bi-directional functionality in the SAP Solution Manager connector. For details, see the SAP Solution Manager documentation.

- **Push interface**: Because SAP can only push data to an external source, the integration uses the Push interface to store alerts sent from SAP to Event Management.

  SAP alerts create events in Event Management that use both event rules and CI identification rules to create Event Management alerts.

  After Event Management creates alerts, a business rule listens for a change to the alert. If it detects a change, Event Management updates the SAP Solution Manager alerts.

Use the SAP Solution Manager Pull connector

The SAP Solution Manager Pull connector sends information from Event Management to the SAP Solution Manager. The Pull connector sends responses received from a Push connector in a bi-directional environment.

Before you begin

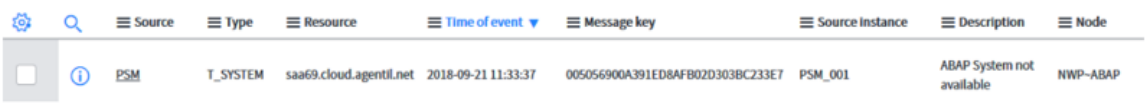
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Event Connectors (Pull)** > **Connector Instances**.
2. Click **New**.
   The **Connector Instance New Record** page appears.
3. Enter values in the required fields, which are indicated by a red asterisk.
   The Connector Update Queues table [*em_connector_update_queue*] lists manual updates of alerts and sends an event to the SAP Solution Manager, using the Pull interface.

   Note:
   When adding bi-directional functionality for a Push connector, the Connector Instance name must match the Source Instance field of the event generated by that source. The **Connector Instance** field value is a combination of `SID + _ + Mandant`.

   For example, the following image displays an event generated by the instance source **PSM_001**. To enable sending information back, you would have to name your connector instance **PSM_001**.



Source	Type	Resource	Time of event	Message key	Source instance	Description	Node
PSM	T_SYSTEM	saa69.cloud.agentil.net	2018-09-21 11:33:37	005056900A391ED8AFB02D303BC233E7	PSM_001	ABAP System not available	NWP~ABAP

4. Set the following values for the connector instance:
   - **Client**: Represents the client value in SAP, usually 001.
   - **Port**: The SAP Solution Manager WebService port. Default value = 8000.

   The following table lists the actions you can perform in Event Management, and the resulting updates occurring in SAP Solution Manager.

Event Management actions and SAP Solution Manager updates

Action in Event Management	Result in SAP Solman
Close an alert.	Confirms an alert in the alert inbox. The alert is removed.
Select the **Maintenance** setting in an alert.	Adds a comment indicating that the alert is in Maintenance mode.
Clear the **Maintenance** setting in an alert.	Removes the Maintenance mode comment.
Select the **Acknowledged** setting in an alert.	Adds a comment indicating that the alert is in the Acknowledged mode.
Clear the **Acknowledged** setting in an alert.	Removes Acknowledged mode comment.

Note the following behaviors:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The Update queue business rule in the Alert table identifies each manual update of the alert and updates the connector queue accordingly. By default, changes to all alert fields are tracked.
- The Event Management — Queue Connector Processor job removes alert changes from the queue and sends them to the MID Server. By default, Event Management performs this dequeue process in batches of 1,000 alerts. You can configure the batch size by setting the `evt_mgmt.max_update_source_records` property.

Use the SAP Solution Manager Push connector

The MID Server web service Event Collector enables you to collect alerts sent from the SAP Solution Manager through event stream notification capabilities. The interface runs both a Push and a Pull interface to interact directly with the SAP Solution Manager.

Before you begin

- Deploy and start the MID Server.
- Configure and start the MID Web Server.
- Configure and start the MID Server web service Event Collector.

Role required: evt_mgmt_admin

About this task

SAP Solution Manager sends JSON formatted event messages to the MID Server. The MID Server parses the collected alert messages and transforms them using the SAP Solman Transform [*TransformEvents_SAPSolman*] script.

JSON formatted messages are collected using basic authentication. For details on other supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push connectors**.
2. Select the **SAP Solman Transform Script** script.
3. Use the following URL to push alert messages from SAP Solution Manager to the MID Server: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`, where the following are true:
   - **MID_Server_IP** is the IP address of the MID Web Server extension
   - **MID_Web_Server_Port** is the listening port of the MID Web Server extension

What to do next

Create an Remote Function Call (RFC) in the SAP Solution Manager and install a transport, as described in Configure RFC in SAP Solution Manager.

Related topics

Configuring MID Servers

Configure the MID Web Server extension

Configure the MID WebService Event Collector Context

SAP Solution Manager setup configurations

As part of the SAP Solution Manager setup, you must perform several configurations to enable SAP Solution Manager to interact with Event Management.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Configure RFC in SAP Solution Manager

As part of enabling communication with Event Management, you must create a Remote Function Call (RFC) in the SAP Solution Manager and install a transport.

Before you begin

Role required: evt_mgmt_admin

Download the following .psm files and import them into the SAP Solution Manager system.

- https://downloads.docs.servicenow.com/resource/enus/cad/K900249.PSM
- https://downloads.docs.servicenow.com/resource/enus/cad/R900249.PSM

Procedure

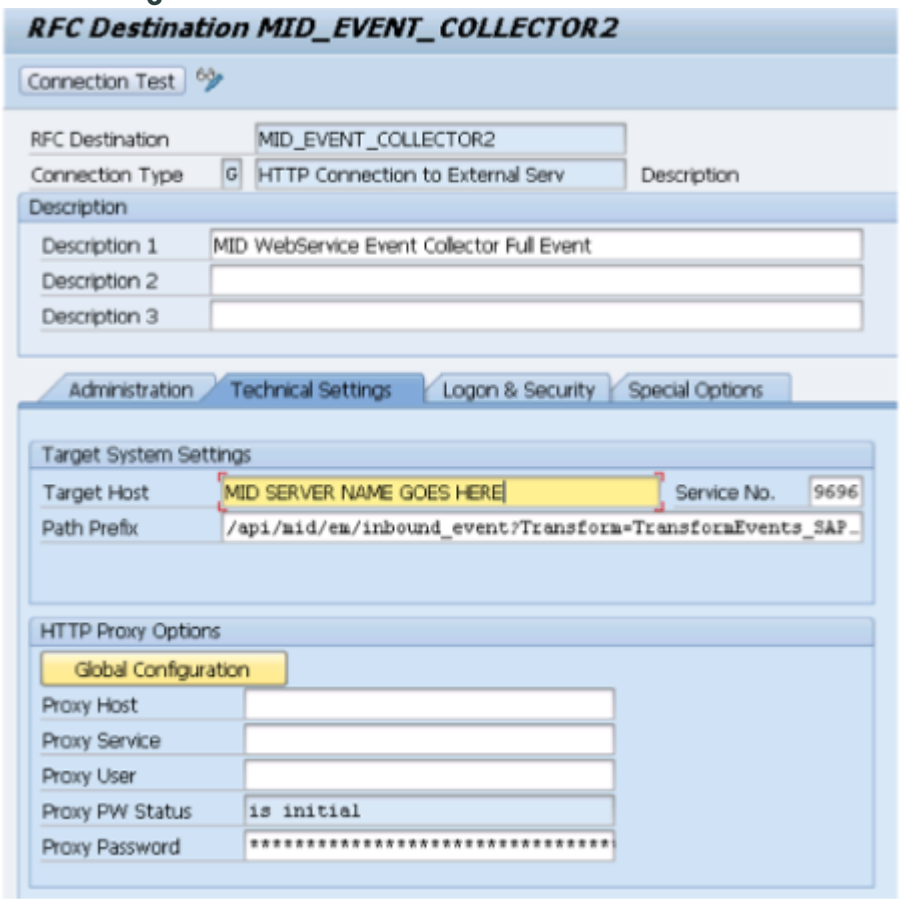
1. On the SAP UI, enter the transaction code `SM59` and create a new RFC with the following parameters on the **Technical Settings** tab:

RFC parameters

SAP Parameter	Value
RFC Destination	MID_EVENT_COLLECTOR2
Target Host	Name of the MID Server.
Service No	Listener port on the MID Server
Path Prefix	The URL of the MID Server transform script: `/api/mid/em/inbound_event?Transform=TransformEvents_SAPSolman`

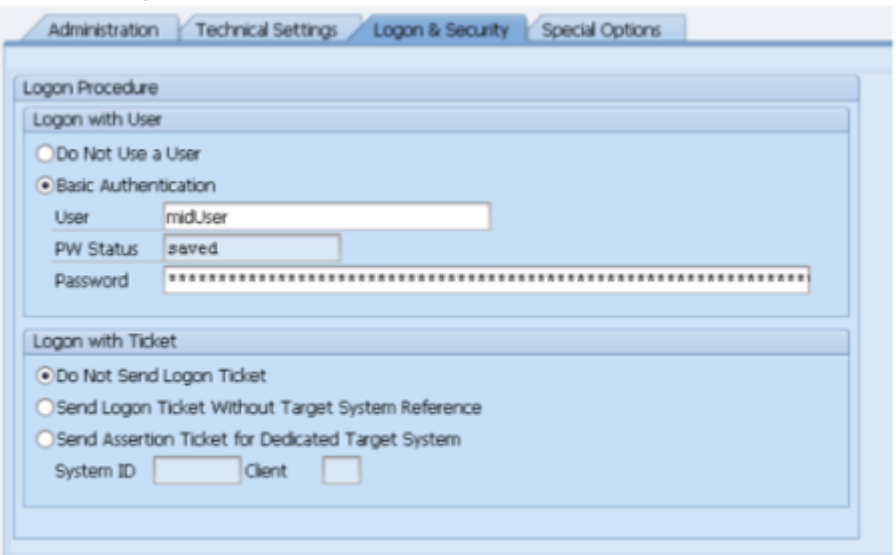
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Technical Settings tab



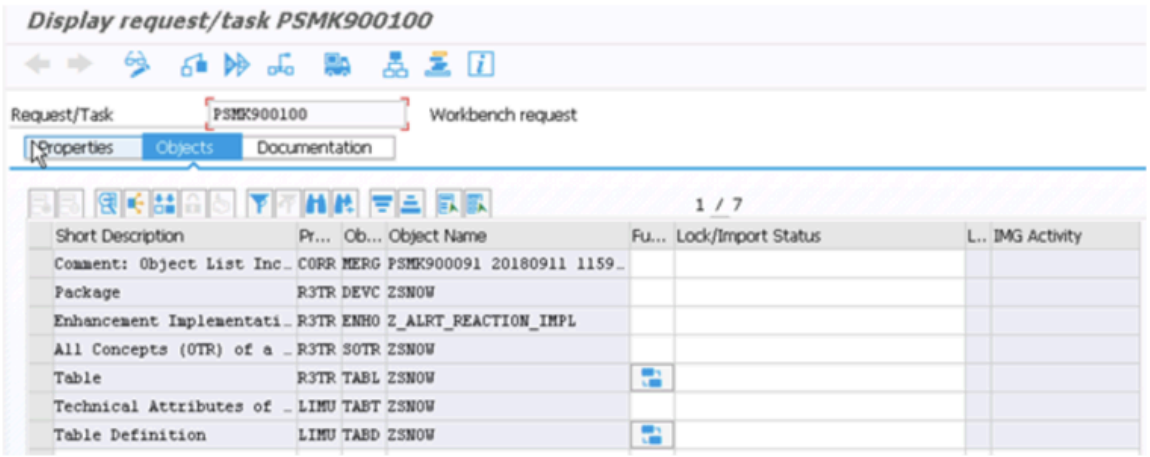
2. On the **Logon & Security** tab, select **Basic Authentication** and enter your Event Management logon credentials in the **User** and **Password** fields.

Logon & Security tab



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

A custom SAP BADI (Business Add-in) named Z_ALRT_REACTION_IMPL is created and stored as a workbench transport request. After installation, this BADI calls the RFC to connect to Event Management.



Configure SAP to forward alerts to your BADI

After setting up SAP Solution Manager monitoring, you must configure SAP to forward alerts to the BADI (Business Add-in) you create as the first step in the SAP integration setup.

Before you begin

Role required: evt_mgt_admin

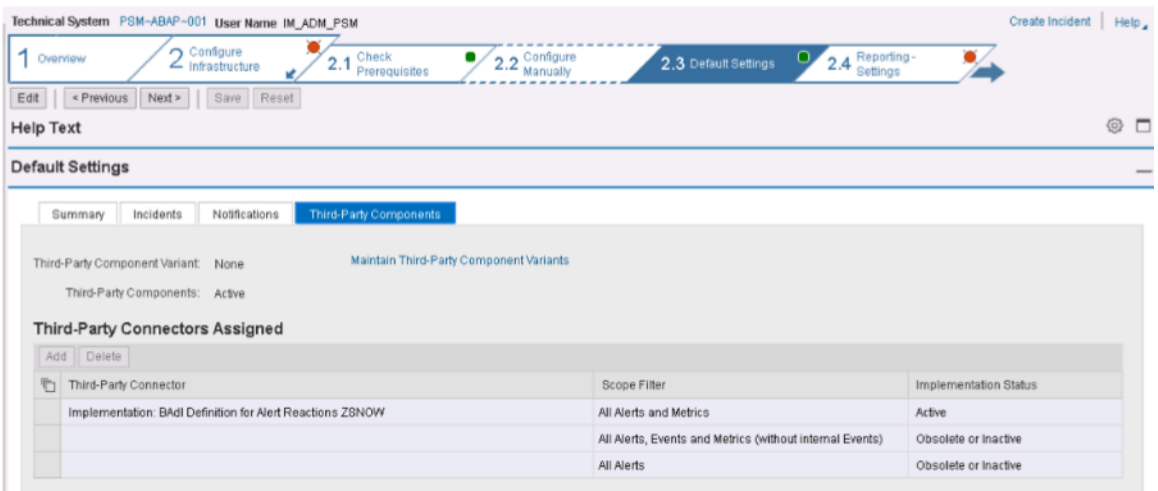
About this task

Third-party alerts get forwarded globally. You can configure the alert reaction only for a specific monitoring template.

Procedure

1. On the SAP UI, navigate to **Application Operations** > **System Monitoring**.
2. In the ribbon at the top of the System Monitoring configuration page, select **2 Configure Infrastructure** > **2.3 Default Settings**.
   The **Default Settings** page appears.

Default Settings page



3. Configure and activate a third-party component.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Enter edit mode by clicking the **Edit** button.

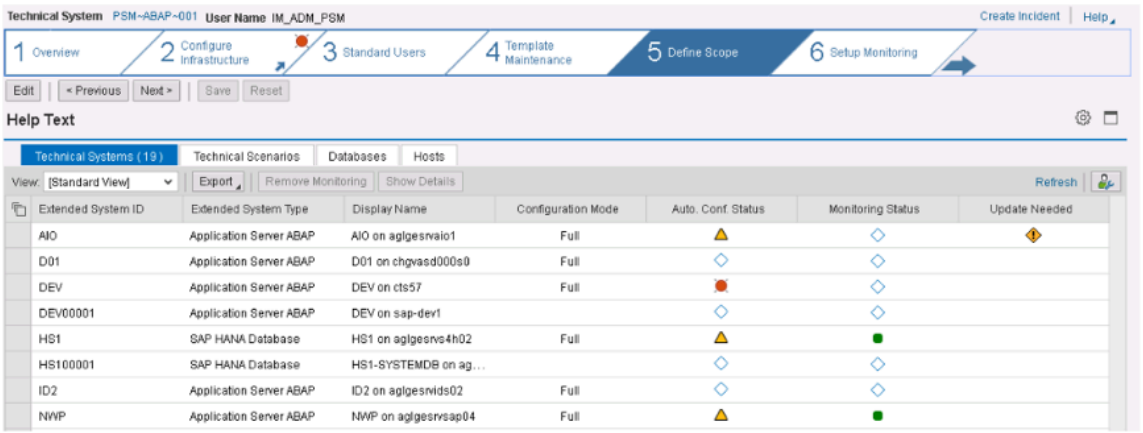
b. Select the **Third-Party Components** tab.

c. Click **Add** and add the following value as the third-party connector: `Implementation: BADI Definition for Alert Reactions ZSNOW with scope = All Alerts and Metrics`.

d. Click **Save** to activate third-party components globally.

4. Define the objects to which the monitoring template will be assigned.

a. In the ribbon at the top of the page, select **5 Define Scope**.
The Define Scope page appears.



b. Select the managed object to which you want to assign the monitoring template.
The monitoring template is assigned to the selected objects.

5. Reactivate the monitoring of templates.

a. Select ***6 Setup Monitoring***.

b. Search for and locate entries with **Setup Status = Reconfigure Required** and assign the monitoring template to those entries.

c. Select **Apply** and **Activate**.
When the jobs finish, verify that the **Assignment Status** is green.
All templates and active alerts assigned to the selected objects use the new forwarding method.

What to do next

View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

Configure the alert inbox in SAP Solution Manager

Configure SAP solution manager to retrieve alerts in the system by enabling the alert inbox with the SOA manager.

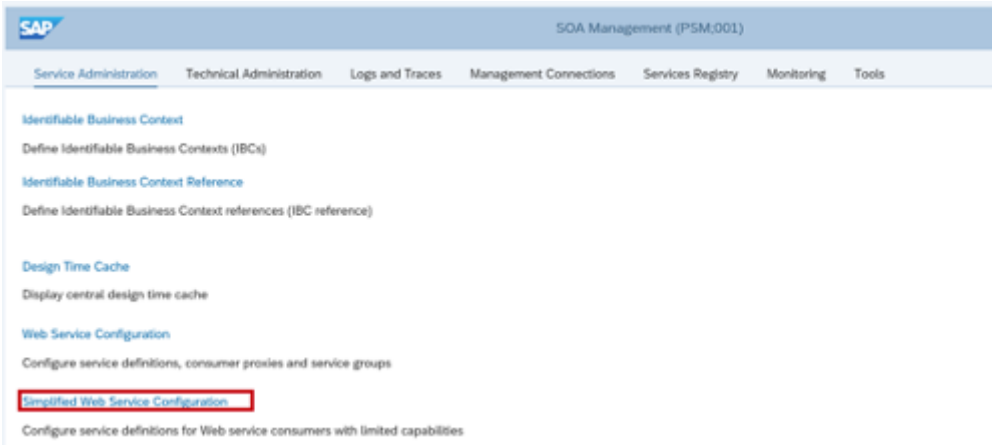
Before you begin

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to SOA MANAGER in your solution manager: `/sap/bc/webdynpro/sap/appl_soap_management?sap-client=XXX&sap-language=EN#`
2. Select **Simplified Web Service Configuration**, then validate the form to activate the service. You must use simplified mode else the resulting web services is different with other modes and not compatible with the connector.



3. Select **Search**.
4. Check the row with the creation type **Simple consumer related**.
   If anything goes wrong, check Configuring a Service Provider (Simplified)

What to do next

View alerts generated in SAP Solution Manager to see any pressing issues, as described in View alerts in the SAP Solution Manager inbox.

View alerts in the SAP Solution Manager inbox

You can view alerts generated in SAP Solution Manager to see any pressing issues. All alerts also forward to Event Management automatically.

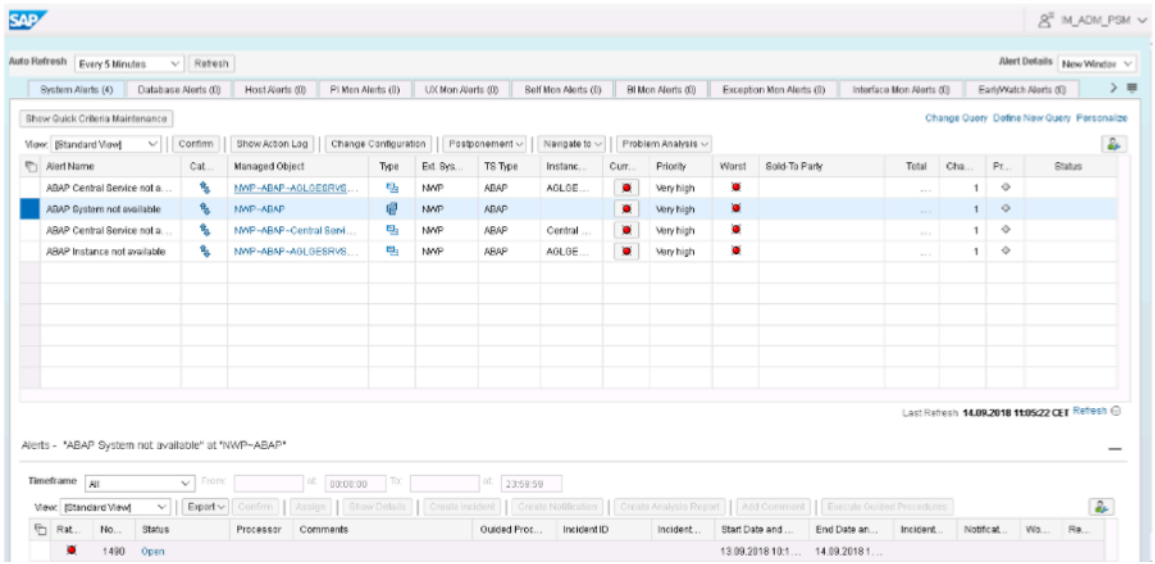
Before you begin

Role required: evt_mgt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

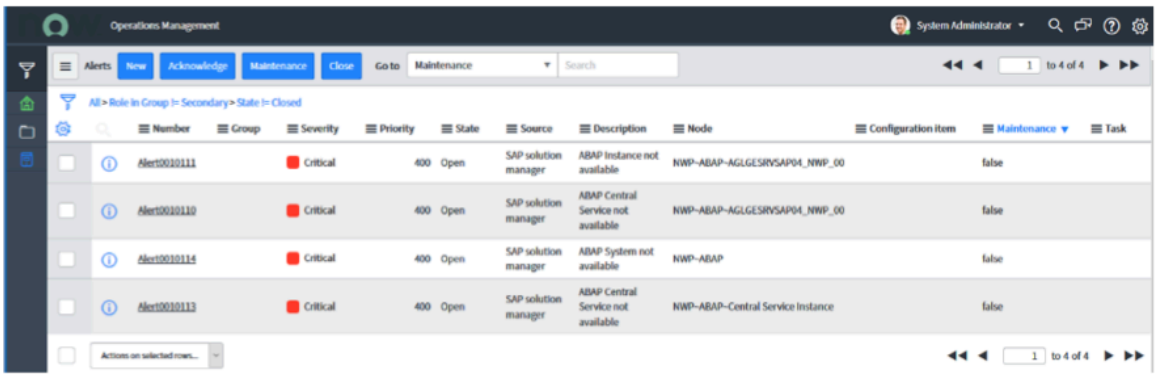
Procedure

1. On the SAP UI, open Solution Manager and select the **System Alerts** tab.



The system alerts are listed on the page.

2. Navigate to (**Event Management** > **All Alerts)** to view the alerts in Event Management.



The following table describes the field mapping between SAP Solution Manager and Event Management for alerts.

Field mapping for SAP Solution Manager and Event Management

SAP Field	Event Management Field	Description
severity	severity	SAP uses a number from 1 (less critical) to 9 (more critical)
message_key	message_key	SAP message group ID, messageGUID
description	description	Event description
source	source	SAP system ID
managed_object_type	type	The type of the object, such as Host or Instance
node	node	Object name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

SAP Field	Event Management Field	Description
managed_object_name	resource	Solution manager node name
N/A (there is no value provided by SAP. Event Management generates the indicated field.)	source instance	The event class must match the connector pull instance name, with the structure <Source>_<Client>.
source	additional_info.sid	SAP system ID
rating	additional_info.rating	Event color in SAP
resource	additional_info.mandant	SAP mandant
metric_name	metric_name	Metric name for the SAP event
time_of_event	time_of_event	Time of event in SAP

Example: High CPU Usage on SAP Host

Scenario: An alert is generated in SAP Solution Manager when the CPU usage on a critical host exceeds 90% for more than 10 minutes.

SAP Solution Manager Alert

Field	Value
Severity	8 (Critical)
Message Key	CPU_Overload_12345
Description	High CPU usage on SAPHost01
Source	SAP_Prod
Type	Host
Node	SAPNode_01
Time	2024-07-31T14:23:00Z

Here's how the alert is mapped in Event Management:

Mapped Event Management alert

Field	Value
Severity	8
Message Key	CPU_Overload_12345
Source	SAP_Prod
Type	Host
Node/Resource	SAPNode_01
Source Instance	SAP_Prod_100
SID	SAP_Prod
Rating	Red

Mapped Event Management alert (continued)

Field	Value
Mandant	100

View and update your SAP Solution Manager certificate

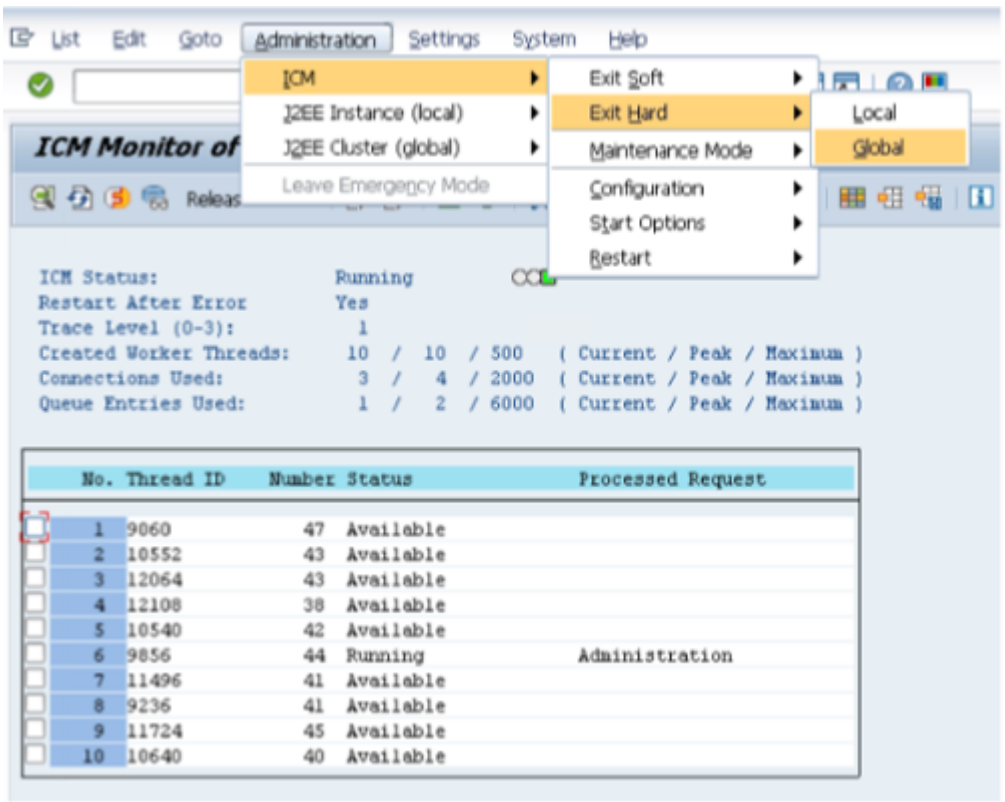
View your SAP Solution Manager certificate, and update the certificate if necessary.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Connect to SAP on client 00.
2. Enter the `strust` transaction.
3. In the Trust Manager UI, open the SSL client.
4. Import the SSL certificate and save it.
5. Use the `smicm` transaction to enable the system to work with both HTTP and HTTPS clients.
6. Navigate to **Administration** > **ICM** > **Exit Hard** > **Global**.



The ICM module restarts.

View the SAP interface log

View the SAP interface log to help you debug issues.

Before you begin

Role required: admin

Configure alert collection from SCOM

Alerts from the Microsoft System Center Operations Manager (SCOM) are collected using the SCOM connector instance.

Before you begin
Role required: evt_mgmt_admin

About this task
The SCOM connector instance requires configuration before receiving alerts and Metric Intelligence raw data from the SCOM server. You can limit the collection of SCOM alerts to only those alerts that belong to the SCOM group that you specify.

Procedure

1. Configure the SCOM connector instance.
2. Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.
3. Limit collected SCOM alerts to specific SCOM groups.

Configure the SCOM connector instance

Configure the Microsoft System Center Operations Manager (SCOM) connector instance to receive alerts and Metric Intelligence raw data from the SCOM server.

Before you begin
To activate **Metric Collection**, ensure that the MID Server that retrieves metrics is configured with the Metric Intelligence extension and that the extension is in **Started** mode. See Manually configure the Metric Intelligence extension.

Windows authentication is used by the connector to access the SCOM database (OperationsManagerDW). Therefore, if **Metric Collection** is selected and the **Database login with Windows authentication** option is also selected, ensure that the MID Server service runs with a user having read access to the SCOM database. Ensure that the correct credentials are used:

1. In the local services, select and hold (or right-click) the MID Server service and select **Properties**.
2. In the **Log On** tab, ensure that **This account** is selected. Include the details of the Windows domain user that has read access to the SCOM database.

Before starting the procedure to configure the connector, ensure that:

- The MID Server is running with a user that has local admin permissions to enable the MID Server to run PowerShell.
- The MID Server user has read access to the SCOM API.
- The MID Server resides in the same domain as the SCOM server.
- The MID Server uses the same time zone as the SCOM server.
- The MID Server is running on Windows.
- The MID Server has .NET framework version 3.5.

If **Bi-directional** is selected, ensure that:

- PowerShell version 3.0 is installed on Windows.
- The MID Server is running with a user that has local admin permissions to enable running PowerShell.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To upgrade an existing SCOM connector:

1. On the Connector Instance - SCOM connector page (**All** > **Event Management** > **Integrations** > **Connector Instances**), clear the **Collect Metrics** check box.
2. Install the *em-connectors* plugin from the store.

Role required: evt_mgmt_admin

About this task

To receive SCOM alerts, you can obtain the redistributable SCOM files from your SCOM application. Add the files to the MID Server, and then configure a SCOM connector instance to collect the alerts and Metric Intelligence raw data.

The collection of Metric Intelligence is performed using JavaScript running JDBC in place of PowerShell.

You can also use this setup for the SCOM managed instance on Azure.

This connector has the *logPayloadForDebug* log parameter enabled, which logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Supported versions:

- 2007 – version 6.1.7221.0
- 2012 – version 7.1.10226.0
- 2016 – version 7.2.117190 and 7.3.13261.0
- 2019 – version 10.19.10050.0
- 2022 – version 10.22.10118.0

Procedure

1. On the SCOM server, download the following files to a local computer.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
A connection cannot be made to SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 and SCOM 2007 from the same MID Server. To work with both SCOM 2012/SCOM 2016/SCOM 2019/SCOM 2022 (any of them) and SCOM 2007 in your instance, do the following before uploading files to your instance:

a. Append .2012 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file, so it becomes: `Microsoft.EnterpriseManagement.OperationsManager.dll.2012`. Do this for 2012/2016/2019/2022.

b. Append .2007 to the end of the `Microsoft.EnterpriseManagement.OperationsManager.dll` file found in the 2007 path.

Using these modified file names enables the relevant MID Server to load the applicable DLL when both SCOM versions are deployed. Do not append 2007 to the `Microsoft.EnterpriseManagement.OperationsManager.Common.dll` file (for SCOM 2007).

At any given time, you can define connectors of either SCOM 2007, SCOM 2012/2016, or SCOM2019. Since SCOM 2012 and SCOM 2016 use the same library files, they are able to work at the same time. Although, SCOM 2019 uses the different SCOM DLL files so you cannot configure SCOM 2012, 2016, and 2019 all together. Each SCOM connector can use the database of another connector, for metric support.

2. Navigate to **MID Server** > **JAR Files**.
3. Select **New** and add a separate record for the SCOM version for each of the DLL files that you downloaded from the SCOM server.

   a. In the **Name** field, specify the SCOM version and an identifier to make the name unique, for example `2012 1`.
   If you are using SCOM 2016, specify 2012 as the version.

   b. Select the paper clip icon in the form header and then attach one of the appropriate DLL files that you downloaded.

   c. Select **Submit**.

4. Repeat step 3, creating a separate record for each of the remaining DLL files.
   Ensure that you have a unique identifier after the SCOM version for each file that you attach, for example `2012 2`.
5. Navigate to **Event Management** > **Integrations** > **Connector Instances**.
6. Click **New** and create a new connector instance.
   For details on the connector instance fields displayed on the page, see SCOM connector instance form.
7. Select and hold (or right-click) the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
8. In the Connector Instance Values section, you can edit the values of the mandatory SCOM parameters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. **login_with_windows_authentication** Default value: **false**.
Set to **true** to enable SCOM event collection and the bi-directional exchange of event values to work with Windows authentication.

When invoking this value, ensure that you do the following on the MID Server:

i. Navigate to the list of local services, select and hold (or right-click) the MID Server service, and select **Properties**.

ii. In the **Log On** tab, ensure that **This account** is selected with the details of the user in the Windows domain with read access to the SCOM database.

b. **metric_chunk_size**: Default value: 50000.

c. **scom_date_format**: Default format: M/d/yyyy/ h:mm:ss a
If you receive an event whose date is in a different format, modify this value to match the format of the incoming event. If you do not, the event does not process correctly.

For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *2019/06/27/ 11:25:00 a*, modify the **scom_date_format** value to *yyyy/M/d/ h:mm:ss a* to match the format of the received event.

In **scom_date_format**, `a` represents AM, and `p` represents PM.

d. **scom_initial_sync_in_days**: Default value: 7.

e. **scom_version**: It is mandatory to specify the SCOM version.
Select from 2022, 2019, 2016, 2012, or 2007.

f. **stop_isMonitorAlert_bidirectional**: Boolean.
Set to **true** to stop only SCOM monitoring alerts bi-directionally. Stopping SCOM monitoring alerts can prevent false alarms on the SCOM console when attempting to update the alerts. When set to **false**, SCOM monitoring alerts continue running bi-directionally for all types of SCOM alerts.

Default value = false.

9. Select and hold (or right-click) the form header and select **Save**.
10. Restart the MID Server service to copy the files.
11. Select **Test connector** to verify the connection between the MID Server and the connector.
If the test fails, correct the problem by following the instructions issued by the error and then run another test.

Note:
Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SCOM.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

12. After a successful test, select the **Active** check box and then select **Update**.

Note:

The default binding rules that contain SCOM as the external source, that applies to IT alerts and Metric Intelligence raw data, are the following SCOM Management Packs:

- All OS Management Packs
- MS SQL Server
- IIS

Example:
If bi-directional is configured, the bi-directional exchange of values to-and-from the external event source is enabled.
These scenarios describe the default bi-directional functionality for SCOM connectors:

- When an alert is resolved in SCOM, it is auto-closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because during each collection cycle, all alert changes are updated.
- When an alert is manually closed in ServiceNow, it is auto-closed in SCOM. If the alert state is changed to **Reopen**, SCOM is also updated.
- When an incident is created and associated to an alert in ServiceNow, SCOM receives the incident number as a ticket ID. However, the state of the incident is not available on SCOM. Therefore when the incident is resolved in ServiceNow, SCOM is not updated as the incident number remains the same. When the alert is associated with a new incident, the new incident number is updated in SCOM.

Limit collected SCOM alerts to specific SCOM groups

Limit the collection of SCOM alerts to only those alerts that belong to the specified SCOM group.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Use the SCOM Authoring workspace and Operations console to define a SCOM group and ensure that the group contains the required computers or instances.
   For further information about SCOM groups, see the SCOM documentation.
2. Create a role that has a scope of the SCOM group.
3. Add the new role to the SCOM user.
4. Assign the role to the user defined in the credentials given to the SCOM connector instance.
5. Remove all other roles from the user.

Result
Only alerts from the specified SCOM group arrive at the instance.

SCOM metric event rules

The base system comes with Microsoft System Center Operations Manager (SCOM) metric event rules. SCOM metric event rules bind event metrics to configuration items (CIs).

When an event's metrics match the event filter conditions, the metrics bind to the indicated CI. The event rules that come with the base system are:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Base system metric event rules

Rule Name	CI type
SCOM Metrics - Windows Server	cmdb_ci_win_server
SCOM Metrics - IIS Web Server	cmdb_ci_microsoft_iis_web_server
SCOM Metrics - SQL Server Reporting Services	cmdb_ci_db_mssql_reporting
SCOM Metrics - MS SQL Database	cmdb_ci_db_mssql_database
SCOM Metrics - MSFT SQL Instance	cmdb_ci_db_mssql_instance

You can create a custom event rule to bind metrics with other CI types. For details, see Create or edit an event rule.

If the event rule filter doesn't match, the default rule, *SCOM Metrics - Default* (CI type = *cmdb_ci_hardware*) is invoked. The order number of the default event rule must be higher than the order number of any SCOM event rules (both those that come with the base system and any custom rules), so that all other rules are checked for matching before invoking the default rule. For details on event rules, see Event rules.

Configure event collection from SolarWinds monitor

Configure the SolarWinds monitor connector instance to receive events from the SolarWinds monitor.

Before you begin

Supported versions:

- SAM 6.2.1
- NPM 2024.1

Note:
The SolarWinds monitor connector instance can import events from:

- Network Performance Monitor (NPM)
- SolarWinds Service & Application Monitor (SAM)

The SolarWinds monitor connector instance requires a credential that lets the instance access SolarWinds monitor accounts. You can use an existing credential or create a new one. The provided user must have access to the SolarWinds API to receive events from the SolarWinds connector.

Role required: evt_mgmt_admin and evt_mgmt_integration

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Type a descriptive name for the SolarWinds monitor connector.
Description	Type a description for the use of the SolarWinds monitor event collection instance.
Connector Definition	Select **Solarwinds_v2**.
Host IP	Specify the SolarWinds monitor IP address.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create SolarWinds monitor credentials.
Event collection last run time	The last run time value of the scheduled job. This field is updated automatically.
Last event collection status	The last event collection status. This field is updated automatically.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from the SolarWinds monitor server.
Last error message	The last error message received by the connector is automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
5. In the Connector Instance Values section, specify these fields:

Field	Value
initial_sync_in_days	Specify how many days the initial pull must contain to retrieve events. The default value is 7 days.
nodes_custom_properties	Specify the SolarWind monitor property names that are associated with the relevant node. This information is added to the **Additional Information** field of the event in JSON format. The SolarWinds monitor custom properties are user-defined fields, for example, country, building, or serial number, that you can associate with monitored network objects. Separate multiple entries with a comma.
Port	Specify the value of the port. By default, the value is 17774. **Note:** For version 2023.1 and above, the port is 17774.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. **Optional:** Name of a MID Server.
   If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section. The privileges that are required for the user account that is used for the MID Server to collect events from SolarWinds monitor is that of evt_mgmt_integration.
7. Click **Test connector** to verify the connection between the MID Server and the SolarWinds monitor connector.
   If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to SolarWinds monitor.

8. After a successful test, select the **Active** check box and then click **Update**.

Configure a pull connector

Create SolarWinds monitor credentials

Create credentials to access SolarWinds monitor.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `SolarWinds authentication`.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all

Credentials and connection information

Configure event collection from vCenter
Configure the VMware vCenter Server (vCenter or vCenter_V2) connector instance to receive events from your VMware vSphere environment.

Before you begin
Events collected by this connector are events that match the vCenter ESX Servers event rule. Supported version: 7.0.2.00500.

Role required: evt_mgmt_admin

About this task
Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

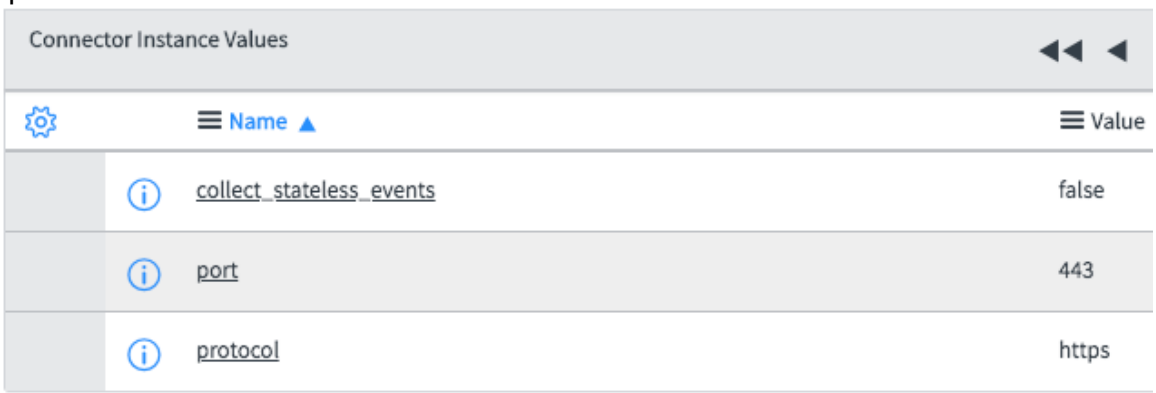
Connector Instance form

Field	Description
Name	Descriptive and unique name for the vCenter connector.
Description	Description for the use of the vCenter event collection instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Connector definition	Name of the required connector definition. Select **vCenter** or **vCenter_V2** (vCenter_V2 is located in the Event Management connectors scope).
Host IP	IP address where vCenter is installed.
Credential	Permission to connect to vCenter. Click the search icon in the **Credential** field. Either select the required credentials from the list or click **New** and create the required credentials on the Credentials form. If you create the credentials, save them using a unique and recognizable name, for example, vCenterCHCK.
Event collection last run time	Last run time value. Automatically updated.
Last event collection status	Last run status. Automatically updated.
Event collection schedule (seconds)	Frequency, in seconds, that the system checks for new events from vCenter. The default value is 120 seconds.
Last error message	Last error message. Automatically updated.

4. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. In the Connector Instance Values section, specify the vCenter values.

Field	Value
collect_stateless_events	Events that have a status (stateful) are collected when this field is set to `false` (default). These events are of type AlarmStatusChangedEvent and AlarmClearedEvent. If this field is set to `true`, events of other types are collected as well.
port	Specify the value of the port. Default value: `443`.
protocol	Specify the protocol. Default value: `https`.

6. **Optional:** In the MID Servers for Connectors section, specify a MID Server that is up and is valid.
   If no MID Server is specified, an available MID Server that has a matching IP range is used.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

7. Right-click the form header and select **Save**.
8. Test the connection between the MID Server and the vCenter connector.
   a. Click **Test Connector**.
   If the test fails, follow the instructions that the error issues to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the external monitoring tool.

   b. After a successful test, select the **Active** check box.
9. Click **Update**.

Configure event collection from vRealize

Configure the VMware vRealize Operations (vRealize or vRealize_V2) connector instance to receive events from the vRealize Operations Log and Event Management servers. vRealize uses basic authentication. vRealize_V2 uses token-based authentication.

Before you begin

Role required: evt_mgmt_admin

Supported version: 8.10.0.

Note:
Connect to vRealize using a local account with at least Read-only vRealize Operations permission. You can use an existing credential or create a new one.

About this task

This connector has the *debug* and *logPayloadForDebug* log parameters enabled. The *debug* parameter logs debug messages, such as calls made to the source system to retrieve events. The *logPayloadForDebug* parameter logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New** and create a vRealize Operations connector instance with the following details:

Field	Value
Name	Specify a unique name for the vRealize Operations connector instance.
Host IP	Specify the vRealize Operations IP address.
Credential	Select the credential with basic authentication that you created for this connector. vRealize_V2 uses token-based authentication providing that the user can generate the token. For more information, see Create vRealize credentials.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
Schedule (seconds)	The frequency in seconds that the system checks for new events from vRealize Operations.
Description	Type a description for the use of the vRealize Operations connector.
Connector definition	The vendor and protocol used to gather events from the external event source. Select **vRealize** or **vRealize_V2** (vRealize_V2 is located in the Event Management connectors scope).
Last error message	The last error message is automatically updated.
Last run time	The last run time value is automatically updated.
Last run status	The last run time status is automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

3. Right-click the form header and select **Save**.
   The connector instance values are added to the form and the parameters that are relevant to the connector appear.
4. In the Connector Parameters section, specify the values of the mandatory vRealize Operations parameters.

   a. **port**: Default value = `443`.

   b. **protocol**: Default value = `https`.

   c. **days_from**:
   Number of days worth of data to be pulled on the first event collection run. Default value = `14`. The **days_from** option is available only when using vRealize_V2.

5. Click **Test connector** to verify the connection between the MID Server and the vRealize Operations connector.
6. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to vRealize.

7. After a successful test, select **Active** and then click **Update**.

Create vRealize credentials

Create credentials to access vRealize.

Before you begin

Role required: evt_mgmt_admin

About this task

Create Basic Auth type of credential to connect to vRealize.

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.
3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, `NewvRealize`.
User name	Name to identify the user. ○ If the username is internal in vRealize, use it as is. ○ If vRealize is integrated with Active Directory (AD), use the format `DOMAIN\username@sourceauth`. For example, `local\administrator@All vCenter Servers`.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result

The credential for use with the vRealize connector is created.

Configure event collection from Zabbix server

Configure the Zabbix server connector instance to receiving alerts from the Zabbix server.

Before you begin

Supported versions: from 3.0.0 up to 7.0.0
The Zabbix server connector instance requires a credential that lets the instance access Zabbix server accounts. You can use an existing credential or create a new one.

Role required: evt_mgmt_admin

About this task

This connector has the *logPayloadForDebug* log parameter enabled, which logs event and metric payloads from the source system. Once debugging is complete, set this parameter to **false** to prevent overloading the system.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
2. Click **New**.
3. On the form, fill in the fields.

Field	Description
Name	Descriptive name for the connector.
Host IP	IP address for the Zabbix server.
Credential	Select the credential with basic authentication that you created for this connector. For more information, see Create Zabbix server credentials.
Schedule (seconds)	Frequency, in seconds, that the system checks for new events from the Zabbix server.
Description	Description for the use of the Zabbix server event collection instance.
Connector Definition	Name of the connector definition. Select **Zabbix**.
Last error message	Last error message. Automatically updated.
Last run time	Last run time value. Automatically updated.
Last run status	Last run time status. Automatically updated.
MID Servers (MID Server for Connectors section)	Optional. Name of a MID Server. If no MID Server is specified, an available MID Server that has a matching IP range is used. In the MID Servers for Connectors section, specify a MID Server that is up and valid. You can configure several MID Servers. If the first is down, the next MID Server is used. If that MID Server is not available, the next is selected, and so on. MID Servers are sorted according to the order that their details were entered into the MID Server for Connectors section.

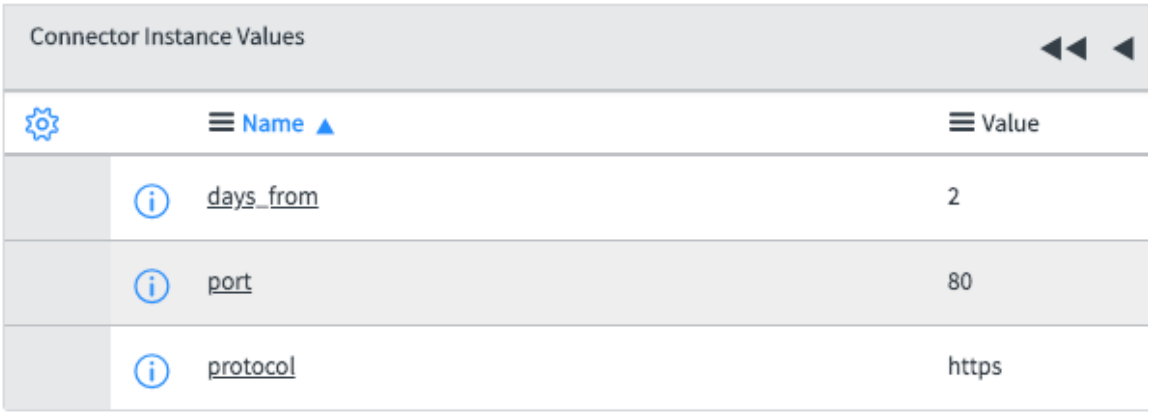
The connector instance values are added to the form and the parameters that are relevant to the connector appear.



5. Verify and modify the values, as needed.
   In the Connector Instance Values section, the default connector instance values appear.

Fields in the Connector Instance Values section

Field	Description
days_from	Number of days for which events must be collected at the first collection cycle. Default value: 2 **Note:** The maximum number of past events that can be collected is 3,000. The first time that this connector runs, the number of past events is counted in the past from the current date.
port	Port number. Default: 80
protocol	Protocol type. Default: `https`

6. Right-click the form header and select **Save**.
7. Click **Test Connector** to verify the connection between the MID Server and the connector.
8. If the test fails, follow the instructions that are issued by the error to correct the problem and then run another test.

   Note:
   Use a network tool, such as ping, to verify credential correctness and network connectivity from the MID Server to the Zabbix server.

9. After a successful test, select **Active** and then click **Update**.

Create Zabbix server credentials

Create credentials to access Zabbix server.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Click **New**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Select **Basic Auth Credential**.
4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential. For example, you might call it `Zabbix authentication`.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential as it attempts to log on to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Click **Submit**.

Result
The Basic Auth credential for use with the Zabbix server connector is created.

Credentials and connection information

Configure a push connector

You can configure listeners and connectors to push event information to the instance or MID Server.

Event Management receives external events through a push connector or script. If you are using a script to collect events, no configuration is required. All other methods of collecting events require configuration.

After event collection configuration, Event Management can collect events that are sent directly to the instance, or via the MID Server, SNMP trap, or email.

Note:
Integrating with push connectors is only available by installing the Event Management Connector plugin from the ServiceNow Store.

Standard event form

All events must use a standard event form, regardless of how they arrive at the instance. For more information, see Event field format for event collection.

Event collection

Event Management facilitates communication and movement of data between external applications, data sources, services, and the ServiceNow AI Platform instance.

Event collection modes	Description
Provided by the base system	Listeners and connectors provided with the Event Management application: • AWS CloudWatch, see Integrate AWS platform as a data source. • Azure event messages, see Integrate Azure Monitor as an authenticated data source. • BMC TrueSight events, see Event collection from BMC TrueSight and BMC TrueSight_v2. • Datadog events, see Integrate Datadog platform events. • Dynatrace events, see Integrate Dynatrace platform events. • Google Cloud Platform (GCP) events, see Integrate Google Cloud Platform (GCP) events • New Relic events, see Integrate New Relic platform events. • Generic event collection through the MID Server. • Generic event collection through the instance. Where event messages are received in XML, you can base your script on the example XML transform script provided with the base system.
Via MID WebService	You can configure the MID WebService Event Collector to push event messages to the MID Server. For more information, see Pushing events to the MID Server using web service API.
Create your own content	You can configure your own listener: • Via MID WebServer API. See Pushing events to the instance using web service API. • Via Custom Transformation. See Event collection from custom payloads.
Via SNMP	SNMP listeners provided with the Event Management application: Generic SNMPv2. See Configure event collection for SNMP traps. In addition, you can create your own custom listener. See Integrate with push connectors.
Via Email	Email listener. See Configure event collection from email.

Push connector instance form

Configure ServiceNow Cloud Observability event collection

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

Procedure

1. Create a CI.

> **Note:**
> Discovery for ServiceNow Cloud Observability services is not supported. Create a CI manually in a ServiceNow instance (cmdb_ci_service_auto table) to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

   a. From the navigation bar, click#**Alerts**.

   b. Select the#**Notification destinations** #tab.

   c. Select#**Create a destination**.

   d. Select **webhook**.

   e. In the Name field, enter a name for the webhook.

   f. In the URL field,#provide the webhook URL.

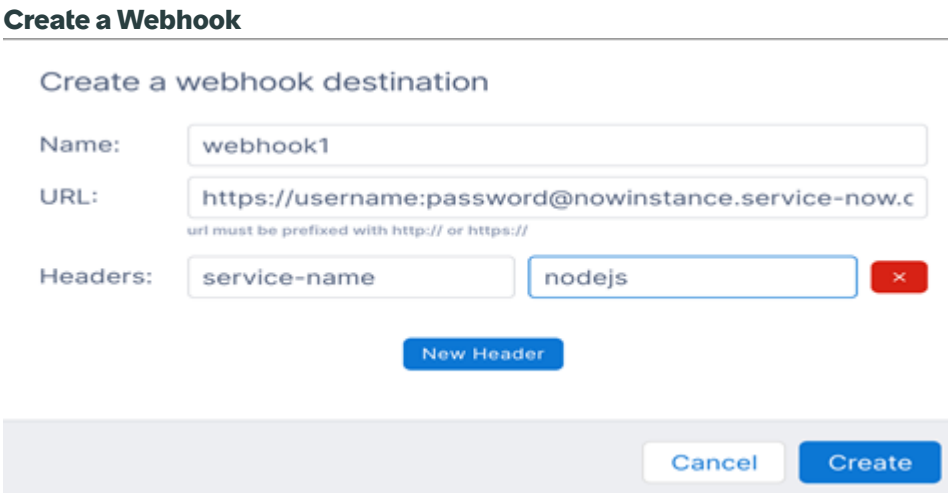
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This is the default #format of the URL to push events from#ServiceNow Cloud Observability to the#ServiceNow AI Platform Instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

g. Select **New Header**.

h. In the Headers field, enter the **service-name** and define its **value**.

> **Note:**
> In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the**cmdb_ci_service_auto table**.



i. Click **Create**.

3. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, click#**Alerts**.

b. Select#**Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. In the Notification Rules area, in the Send Notifications to fields, select the notification destination as **webhook** and search for the destination name for the webhook that you created in step 2.

e. Select **Save**.
The default severity for stream based alerts is **Critical**. You can change the default in the #Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

Configure a MID Server for event collection using a push operation (listener)

The MID Server supports the collection of event messages, using the MID Web Server to collect data from external sources and transforming (parsing) them to the format required for event fields in the event [em_event] table. The transformed events are then transmitted to the instance.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Web Server extension enables external clients to push metric data and events to the MID Server. See Configure the MID Web Server extension. Use the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. See Configure the MID WebService Event Collector Context.

Configure a MID Server with either *`EventManagement`* or *`All`* in the Supported Applications List.

To ensure uninterrupted services, consider also configuring a failover MID Server cluster.

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
2. Double-click the MID Server that you want to configure, or click **New** to create a new MID Server.
3. In the **Supported Applications** section, click **Edit**.
   a. Click **Edit**.
   b. In the slushbucket, either select **Event Management** or **ALL** and click the **>** add button.
   c. Click **Save**.
4. To ensure that the MID Server is validated, under Related Links, select **Validate**.
   For more information, see Validate a MID Server.
5. Click **Update**.

What to do next

Configure the MID WebService Event Collector to enable a URL method to push event messages to the MID Server. For more information, see Configure the MID WebService Event Collector Context.

Related topics

- Configure key-based MID Web Server authentication
- Configure the MID Web Server extension

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector to provide a URL method to push event messages to the MID Server.

The MID WebService Event Collector, by default, enables you to connect to an event generator and send event messages through the MID Server, using a URL in the format: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The JSON v2 format is the same as the format that clients use to send event messages to the instance. This URL provides good performance.

For more information, see Configure the MID WebService Event Collector Context.

Note:
Event Management accepts events in the timezone of the MID Server through which the listener has sent the event message. If you require a different timezone, you can configure the script as required, see Integrate with push connectors.

URL to push custom payloads

The MID Server can also receive a custom payload in JSON, XML, or plain text format. In this case, the MID Server transforms the event messages using the script include that you provide, and then sends the events to the instance. The URL in this case is:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}` For an example of a script include, see the default `TransformEvents_xmlSample` script include.

For an example of how the MID WebService Event Collector transforms JSON formatted event messages, see Event collection from BMC TrueSight and BMC TrueSight_v2.

To send events in generic JSON format, you can use the URL in this format:

`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform=TransformEvents_MidJsonGeneric`

In this case, the `TransformEvents_MidJsonGeneric` MID script include that is provided in the base instance transforms the event messages into the event fields. All fields are added as **Additional Information** fields into the ServiceNow event that is generated.

Note:
The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.

The REST API URL for validating connectivity is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/ping`

Script include to transform collected events

Use the required MID Server script include to transform (parse) collected event messages and populate them into the mapped event field. The MID Server script include name is composed of a prefix and suffix. The prefix is the mandatory text `TransformEvents_` and the suffix is the transform name on the URL, for example, `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/xmlSample` . The composed script name is therefore `TransformEvents_xmlSample`.

You must supply a script include that receives the event messages in a text variable. The script must have a `transform()` function that performs the transformation and prepares the return array of Event objects. When the Event Management plugin is activated, you are provided with the `TransformEvents_xmlSample` sample include script that transforms events from XML format.

Note:
Event fields that are not identical to fields in the event table are saved in the **Additional information** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event message headers

Specify the relevant request header value for the **Content-Type** field according to the format of the event message.

Request header values for the Content-Type

Message format	Content-Type value
JSON	application/json
XML	application/xml
text	text/plain

Authentication and data security options

Options for authentication and data security:

- **Authentication type**, which can be set to either `API Key`, `mTLS`, or `Basic`.
- **Secure Connection**, which lets you choose whether incoming and outgoing data is secured when transmitted. If you choose the advanced secured option, it requires that you obtain a certificate from a well-known certificate authority, and then provide the **Keystore Certificate Alias** and the **Keystore Password**.
- **Use MID Unified Keystore**, which provides encryption protection and enables you to install a custom certificate in the MID Server unified keystore. For details, see Install custom certificates in the MID Server unified key store.
- Users must supply a script that receives the JSON, XML, or text formatted event messages in a text variable. The script must have a transform() function that performs the transformation and prepares the return array of event objects. The `TransformEvents_xmlSample` include script that transforms events from XML format is provided as an example when the Event Management plugin is activated.

For more information about authentication and data security, see Configure the MID Web Server extension.

Pushing events to the instance using web service API

Pushing events to the instance using web service API

You can use a web service interface, supported by ServiceNow, that operates on the JSON object as the data input and output format.

Before you begin

Role required: evt_mgmt_integration

About this task

To insert records in the event [em_event] table with a single call, use this web service API:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Note:
Business rules on the event table are not invoked when this URL is used.

Do not add additional fields to an event by adding a custom field to the event table [em_event]. However, additional fields should be included in the **Additional information** [additional_info] field of the event. For more information about how to include additional fields in events, see Custom alert fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The URL in the format: `http://<instancename>.service-now.com/em_event.do?JSONv2&sysparm_action=insertMultiple` is also supported in case you do want to activate Business rules. However, the performance of the first URL is superior.

To work with the URL that ends with `=insertMultiple`, add the following properties, with their respective values, to the MID Server:

- "mid.probe.event.queue.compress" - value: false
- "mid.probe.event.bulk_size" - value: 100
- "mid.probe.event.endpoint.url" - value: em_event.do?JSONv2%26sysparm_action=insertMultiple

Procedure

1. Send the request with these headers:

Parameter	Type	Description
Accept	String	The acceptable type for this message. The default value is `application/json`.
Content-Type	String	The content type for this message. The default value is `application/json`.
POST	String	The request type is POST, with one or more trailing records.

2. One or more events in JSON format can be sent as the payload of the web service call. Event fields that should be populated are:

Variable	Description
source	The name of the event source type. For example, SCOM or SolarWinds.
event_class	Specific instance of the *`source`*. For example, `SCOM 2012 on 10.20.30.40`
node	The **node** field should contain an identifier for the Host (Server/Switch/Router/etc.) that the event was triggered for. The value of the **node** field can be one of the following identifiers of the Host: ○ Name ○ FQDN ○ IP ○ Mac Address If it exists in the CMDB, this value is also used to bind the event to the corresponding ServiceNow CI.
resource	If the event refers to a device, such as, Disk, CPU, or Network Adapter, or to an application or service running on a Host, the name of the device or application must be populated in this field. For example, `Disk C:\` or `Nic 001` or `Trade web application`.
metric_name	Name of the metric that triggered the alert. For example, `Used Memory` or `Total CPU utilization`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variable	Description
type	The type of event. This type might be similar to the **metric_name** field, but is used for general grouping of event types.
message_key	This value is used for de-duplication of events. For example, there might be two events for the same CI, where one event has CPU of 50% and the next event has CPU of 99%. Where both events must be mapped to the same ServiceNow alert, they should have the same message key. The field can be left empty, in which case the field value defaults to `source+node+type +resource+metric_name`. The **message_key** should be populated only when there is a better identifier than the default.
severity	Severity of the event. ServiceNow values for severity range from 1 – Critical to 5 – OK, with the severity of 0 – Clear. Original severity values should be sent as part of the additional information.
additional_info	This field is in JSON key/value format, and is meant to contain any information that might be of use to the user. It does not map to a pre-defined ServiceNow event field. Examples include IDs of objects in the event source, event priority (if it is not the same as severity), assignment group information, and so on. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed.
time_of_event	Time when the event occurred on the event origin. The format is: yyyy-MM-dd HH:mm:ss The specified time must be according to GMT.
resolution_state	Optional – To indicate that an event has been resolved or no longer occurring, some event monitors use 'clear' severity, while other event monitors use a 'close' value for severity. This field is used for those monitors proffering the latter. Valid values are New and `Closing`.

3. To create multiple records with a single call, trigger the event web service using the following URL, where the <instance name> variable is replaced with the name of the required instance:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Example
Example showing the payload for two events that are sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "D:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk D: on computer
 V-W2K8-abc.abc.com is running out of disk space. The value
 that exceeded the threshold is 38% free space.",
      "additional_info": {
        "scom-severity": "Medium",
        "metric-value": "38",
        "os_type": "Windows.Server.2008"
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
      }
    },
    {
      "source": "SCOM",
      "event_class": "SCOM 2012 on scom.server.com",
      "resource": "MSSQL-database-name",
      "node": "other.node.com",
      "metric_name": "DB Allocated Size (MB)",
      "type": "Database Storage",
      "severity": "3",
      "description": "High number of active connections for
 MSSQL-database-name running on name.of.node.com. Active
 connections exceed 5000.",
      "additional_info": {
        "scom-severity": "Medium",
        "metric-value": "38",
        "os_type": "Windows.Server.2008"
      }
    }
  ]
}
```

4. To create one record with a single call, trigger the event web service using the following URL, where the <instancename> variable is replaced with the name of the required instance:
`https://<instancename>.service-now.com/api/global/em/jsonv2`

Example
Example showing the payload for one event that is sent in a single web service call:

```
{
  "records": [
    {
      "source": "SCOM",
      "event_class": "SCOM 2007 on scom.server.com",
      "resource": "C:",
      "node": "name.of.node.com",
      "metric_name": "Percentage Logical Disk Free Space",
      "type": "Disk space",
      "severity": "4",
      "description": "The disk C: on computer
 V-W2K8-dfg.dfg.com is running out of disk space. The value
 that exceeded the threshold is 41% free space.",
      "additional_info": {
        "scom-severity": "Medium",
        "metric-value": "38",
        "os_type": "Windows.Server.2008"
      }
    }
  ]
}
```

Pushing events to the MID Server using web service API

Configure the MID WebService Event Collector Context

Configure the MID WebService Event Collector Context to provide a URL method to push event messages from an external source to the MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The default format of the URL to push event messages from an external source to the MID Server is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2`. This URL provides good performance.

From an external source, to push event messages that are not in jsonv2 format, the format of the URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Name_of_Transform_Script}`, where the *`{Name_of_Transform_Script}`* variable is the full name of the script and always begins with the text: `TransformEvents_`.

For example, assume the following values:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- {MID_Server_IP}: 10.118.69.27
- {MID_Web_Server_Port}: 8097
- Transform script name: EventsToProcess

The URL to be used is therefore: `http://10.118.69.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Note:

- The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.
- The date format for events is yyyy-M-d h:mm:ss.

  If you receive an event whose date is in a different format, you must use a `{transform_script_name}` that is appropriate for the incoming event's date format. If you do not, the event will not be processed correctly.

  For example, if an event arrives on June 27, 2019 at 11:25 AM with a listed date of *`2019/06/27/ 11:25:00 a`*, use a `{transform_script_name}` with a date format of *`yyyy/MM/dd/ HH:mm:ss a`* to match the format of the received event.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID WebService Event Listener**.
2. In the MID WebService Event Collector Contexts list, click **New**.
3. On the form, fill in the fields.

MID WebService Event Collectors Context form

Field	Description
Name	A unique name for this collector for easy identification.
Short description	Enter a brief, meaningful description of this collector.
MID Web Server Extension	Specify and then start the MID Web Server extension. The supported authentication methods are listed in the **Authentication Type** field of the MID Web Server extension. For information about how to configure a MID Web Server extension, see Configure the MID Web Server.
Status	This field is auto-populated with the status of the MID Web Server extension. This field is blank until the MID Web Server extension is started. After issuing a command to the MID Web Server extension, one of the following values is displayed: ○ **Started**: The collector is running. ○ **Stopped**: The collector is not running. ○ **Offline**: The MID Server is down.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Error**: The collector failed with an error (the error message is displayed in **Error Message**). ○ **Warning**: A run-time exception has occurred.
Execute on	**Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
MID Server	The **Specific MID Server** or **Specific MID Server Cluster**, as defined on the specified MID Web Server extension.
Executing on	The name of the MID Server on which the MID Web Server extension is running.

4. Right-click the form heading and click **Save**.
5. Under **Related Links**, click **Start** to start the collector.

Commands in the Event Management Context form

Related Link	Description
Start	If it is not running, start the collector. This action verifies that a web service API endpoint with the Event Management application is running on the MID Server.
Stop	Stops the running collector on the configured MID Server. If the collector is not running, no action is taken.
Restart	Stops, then starts the collector on the configured MID Server.
Update parameters	Sends updated parameters to the collector. Parameters are also updated when the Event Management MID Server context extension is updated. If you click this control when the collector is not running, no update is made.

Example:
Showing the use of the URL to transform JSON v2 formatted event messages

Assume that JSON v2 formatted event messages are sent to the MID Server. When using the `jsonv2` URL, there is no need to use a script include.

Data for the JSON v2 example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
Event message format	jsonv2

Replace the variables in the default format of the URL `http://<my-instance>.service-now.com/api/global/em/jsonv2`with values from the preceding table:`http://10.218.64.27:8097/api/global/em/jsonv2`

Example showing the URL to push messages not in jsonv2 format

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The format of the URL to push event messages from an external source that are not in jsonv2 format is `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event/Transform={Name_of_Transform_Script}` where the {Name_of_Transform_Script} variable is the full name of the script and always begins with the text: TransformEvents_. The script name must be specified as the `Transform` header parameter and must always start with the prefix `TransformEvents_`.

For this example, assume that the script name is EventsToProcess, the URL is therefore:`http://10.138.64.27:8097/api/mid/em/inbound_event/TransformEvents_EventsToProcess`

Example showing JSON v2 formatted event messages

Note:
When copying and pasting the text following, hidden characters might also be copied and can cause unexpected results.

```
curl -v -H "Accept: application/json" -H "Content-Type:
 application/json" -X POST --data "{
    "records":
    [ {
         \"source\" : \"Simulated\",
        \"node\" : \"nameofnode\",
        \"type\" : \"High Virtual Memory\",
        \"resource\" : \"C:\",
        \"severity\" : \"5\",
        \"description\" : \"Virtual memory usage exceeds 98%\",
        \"ci_type\":\"cmdb_ci_app_server_tomcat\",
        \"additional_info\":\"{\\\"name\\\":\\\"My
 Airlines\\\"}\"
      },
      {
      \"source\" : \"Simulated\",
      \"node\" : \"01.myairlines.com\",
      \"type\" : \"High CPU Utilization\",
      \"resource\" : \"D:\",
      \"severity\" : \"5\",
      \"description\" : \"CPU on 01.my.com at 60%\"
      }
   ]
}" -u UserName:Password
 http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/jsonv2
```

Example:
Example showing JSON v2 formatted event messages with MID Web Server API key

Note:
When copying and pasting the text following, hidden characters might also be copied and can cause unexpected results.

```
curl --location -g --request POST
 'http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/json
v2' \
--header 'Accept: application/json' \
--header 'Content-Type: application/json' \
```

- Event collection from Google Cloud Platform

Event collection from custom payloads

The MID WebService Event Collector enables you to collect event information from custom payloads in JSON, XML, or plain text format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

The MID Server transforms the collected event messages and populates the Event table fields (em_table) in the instance. The collection of formatted event messages is described in this procedure using basic authentication. For information about supported authentication methods, see Configure the MID Web Server extension.

The format of the required MID Server URL is: `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script_name}`. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For information about the collection of JSON v2 event messages, see Configure the MID WebService Event Collector Context.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The URL in the format `http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/{transform_script_name}` is also supported.

Procedure

1. Configure the MID WebService Event Collector, see Configure the MID WebService Event Collector Context.
2. Start the MID WebService Event Collector.

Example:
Transformation of XML formatted event messages using the custom payload URL

Assume that XML formatted event messages are sent to the MID Server. Use this example to return an array of event objects from the collected event messages. The name of the MID Server script include is composed by appending a suffix to the default `TransformEvents_` prefix. For the purposes of this example, the user supplied the xmlSample script include. Using these details, the name of the MID Server script include is `TransformEvents_xmlSample`. The MID Server transforms the collected event messages by parsing the messages using the script include and then transmitting them to the instance.

Data for the XML example

Field	Value
MID_Server_IP	10.218.64.27
MID_Web_Server_Extension_Port	8097
transform_script_suffix _name	xmlSample

Replace the variables in the URL with the values from the above table:
`http://10.218.64.27:8097/api/mid/em/xmlSample`

Note:
When copying and pasting the text below, hidden characters might also be copied and can cause unexpected results.

Example showing XML formatted event messages:

```
<records>
    <event>
    <source>My Source</source>
    <node>host1</node>
    <type>type1</type>
    <severity>3</severity>
    <description>Virtual memory usage exceeds 98%</description>
    </event>
    <event>
    <source>My Source</source>
    <node>host2</node>
    <type>type2</type>
    <severity>2</severity>
    <description>Virtual memory usage exceeds 90%</description>
    </event>
    </records>
```

Integrate with push connectors

Integrate with a push connector to connect to an external event source. Push connectors process the collected event messages and transform them to the required event format.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed.

Role required: evt_mgmt_admin

Note:
If you are upgrading a ServiceNow AI Platform instance from Paris or earlier, you can use legacy listener transform scripts. See Use legacy listener transform scripts for further information.

About this task

The push connectors accept event messages that are generated by external event sources. Configure a connector to listen to an external event source. Using a custom push connector, send the event messages through either the MID Server or the instance.

Note:
You can use this generic JSON target URL to collect events:`https : /<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source=genericJson`. This URL can be used as-is and requires that an event rule be configured.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Click **New** or click the push connector that you want to modify, for example, AWS or Azure.
3. On the form, fill in the fields.

Field	Description
Name	Unique name for this push connector for easy identification.
Description	Enter a description for the use of the push connector.
Header name	Specify the name of the header that you want the value for, such as Set-Header.
Header value	The value of the header name that you want the value for, such as Set-Header.
Type	Select to send events either `Instance` or `MID`. In each case, use the URL of the selected type. See the description of the **URL parameter value** field.
Active	Select to enable pulling events from this external event source.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
URL parameter value	○ Send events to the instance. Use the URL in this format for all connectors: `https://<<INSTANCE>>/api/sn_em_connector/em/inbound_event?source={URL_parameter_value}` ○ Send events through the MID Server. Use the URL in the format:`http://{MID_Server_IP}:{MID_Web_Server_Port}/api/mid/em/inbound_event?Transform={Transform_script}` **Note:** Sending events to the MID Server requires the prior configuration of the MID WebService Event Listener extension.

4. In the Script section:
   - If the value selected for the **Type** field is `MID`, the **Transform script** field appears. In this field, specify or search for the name of the MID script include that accepts event messages that the required external event source generates and that the script parses into the required event format. Use this naming convention for the script: `TransformEvents_<your source>`
   - If the value selected for the **Type** field is **Instance**, the **Script** editor appears. In the **Script** editor, enter the customized script that accepts event messages that the required external event source generates and that the script parses into the required event format.

Example
This example shows the fields that have been transformed, being added to an event form.

```
(function process(/*RESTAPIRequest*/ request, body) {
 /*Function that receives a JSON object, adding all its fields
 to the Additional information object. The field name is a
 concatenation of the field key and the parent field key if it
 exists.*/
 function updateAdditionalInfo(event,
 field,jsonObject,additionalInfo) {
        for (var key in jsonObject) {
            var newKey = key;
            if (field != "") {
                newKey = field + '_' + key;
            }
   // You can do some transformation here and set fields on the
 event
   //if(key == "MySource")
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  //   event.source = jsonObject[key];
           additionalInfo[newKey] = jsonObject[key];
       }
    }

   try
{
       gs.info("TransformEvents_generic received body:" +
body);
 var jsonObject = JSON.parse(body);
       var event = new GlideRecord('em_event');
 event.source = "GenericJson"; //TODO: Need to define
       event.event_class = "GenericJsonClass"; //TODO: Need to
define
       event.severity = "5";

       var additionalInfo = {};
       updateAdditionalInfo(event,
"",jsonObject,additionalInfo);
 /*Iterates over Additional information JSON object and
adds all nested objects' fields as fields of the Additional
information object*/
       var notDone = true;
       while (notDone) {
           notDone = false;
           for (var key in additionalInfo) {
               if
(Object.prototype.toString.call(additionalInfo[key]) ==
'[object Object]') {
                   notDone = true;
                   updateAdditionalInfo(event,
key,additionalInfo[key],additionalInfo);
    additionalInfo[key] = "";
               }
           }
       }
 gs.info("TransformEvents_generic generated additional
information:" + JSON.stringify(additionalInfo));
       event.additional_info = JSON.stringify(additionalInfo);
       event.insert();
}
catch(er){
 gs.error(er);
 status=500;
 return er;
}
return "success";
})(request, body);
```

Use legacy listener transform scripts

Use legacy listener transform scripts when upgrading a ServiceNow AI Platform instance from Paris or earlier. These scripts can be run as part of existing integrated systems, or in unison with Event Management push connectors.

You can use listener transform scripts to ensure that previous integrations are supported. For example, if you are using the `https://<instance-name>.service-now.com/api/`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

`global/em/inbound_event` endpoint in various existing integrations, you can continue to use this endpoint in a Quebec or later ServiceNow AI Platform instance.

If you want to use the Event Management push connectors, download the plugin from the ServiceNow Store website. You can then access the push connectors in the ServiceNow AI Platform instance, and the `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint is also created.

Use the legacy endpoint with push connectors

You can continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint with the push connectors, by deactivating the relevant transform scripts. To deactivate a script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**. Then click the relevant script in the displayed list, and clear the **Active** check box in the form.

Use the legacy endpoint and deactivate all listener transform scripts

You can also continue to use the `https://<instance-name>.service-now.com/api/global/em/inbound_event` endpoint but deactivate all listener transform scripts to use the push connectors instead. To deactivate all scripts, navigate to **System Properties** > **All Properties**, locate the *sn_em_connector_listener_table_for_InboundEvent* property, and set its value to **True**.

Migrate custom listener transform scripts to the push connectors module

If you have created custom listener transform scripts, they must be migrated to the push connectors module if you want to use the new `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event` endpoint. To migrate the custom script, navigate to **Event Management** > **Integrations** > **Listener Transform Scripts**, click the relevant listener transform script, and select the displayed script. Then navigate to **Integrations** > **Push Connectors**, click **New**, and paste in the script you copied from the listener transform script.

Integrate AWS platform as a data source

Integrate Amazon Web Services (AWS) with Event Management. To add AWS platform as a data source, configuration is required in the AWS platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Download the Event Management Connectors plugin from the ServiceNow Store.

Role required: evt_mgmt_admin

About this task

When an AWS platform alarm arrives, Event Management:

- Extracts information from the original AWS platform alarm to populate the required event fields and inserts the event into the database.
- Captures the content in the **additional_info** field.

The AWS platform push connector is located in **Event Management** > **Integrations** > **Push Connectors**. In the Push Connectors page, click **AWS Events Push Connector**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The AWS push connector that is provided in the base system handles AWS CloudWatch alarms only and not CloudWatch events created through event rules. To handle Simple Notification Service (SNS) alarms that are other than AWS CloudWatch, create a new push connector or customize the AWS push connector.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the AWS platform console, select **Simple Notification Service** .
   If an SNS topic does not exist, create one.
2. Under the SNS topic, create a new subscription.

   a. Take **Topic ARN** from the topic that you created.
   The Amazon Resource Name (ARN) is necessary for binding an Event Management alert to a CI.

   b. Set **Protocol** to: *`https`*.

   c. In the ServiceNow instance, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Set **Endpoint** to: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=aws`

   If AWS platform multi-factor authentication (MFA) is enabled, when signing in to the AWS platform website, you're prompted for the user name and password, as well as an authentication code from the AWS platform MFA device of the user.
3. Wait until the subscription changes from `Pending` to `Confirmed` and the subscription ARN is populated.
   This can take a few minutes.
4. Create alarms in AWS platform to send to Event Management and link the alarms to the SNS topic that you created.
   Raw message delivery must not be enabled in AWS alarm. These following event rules are provided with the base system:

Event rule	Description
AWS host binding	Bind AWS platform alarms, on either the host or virtual machine (VM), to the host Hardware CI.
AWS - General	Bind AWS platform alarms on the Load Balancer (LB) to the Cloud Load Balancer CI, Amazon Relational

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event rule	Description
	Database Service (RDS) to the Cloud Database CI, and Host or Virtual Machine (VM) to the Virtual Machine Instance CI. **Note:** To bind events from the Host or Virtual Machine to the Virtual Machine Instance CI, disable the AWS host binding rule.

Note:
For the push connector to handle the incoming event, you must sent a request header **x-amz-sns-message-type** with value **Notification**.

This example shows a JSON string for AWS VM binding:

```
{
"Type" : "<type>",
"MessageId" : "<message ID #>",
"TopicArn" : "<topic arn>",
"Subject" : "ALARM: \"<alarm type>\" in <location>",
"Message" : "{\"AlarmName\":\"<alarm
 name>\",\"AlarmDescription\":<alarm
 description>,\"AWSAccountId\":\"<account ID
 #>\",\"NewStateValue\":\"ALARM\",\"NewStateReason\":
\"Threshold Crossed: <threshold and datapoint which
 it crossed>.\",\"StateChangeTime\":\"<date and
 time>\",\"Region\":\"<location>\",\"OldStateValue\":\"OK\",
\"Trigger\":{\"MetricName\":\"CPUUtilization\",\"Namespace\":
\"<namespace>\",\"Statistic\":\"<statistic
 name>\",\"Unit\":null,\"Dimensions\":[{\"name\":
\"InstanceId\",\"value\":\"<dimension
 value>\"}],\"Period\":<period
 number>,\"EvaluationPeriods\":<number of evaluation
 periods>,\"ComparisonOperator\":
\"GreaterThanOrEqualToThreshold\",\"Threshold\":<threshold
 number>}}",
"Timestamp" : "<date and time>",
"SignatureVersion" : "<version number>",
"Signature" : "<signature>",
"SigningCertURL" : "<URL>",
"UnsubscribeURL" : "<URL>"
}
```

5. To enable multiple member accounts to forward CloudWatch or EventBridge events to a centralized account, where a single SNS topic delivers them to the ServiceNow Event Ingestion endpoint, you need to make configuration on AWS side.
   To configure it, see https://repost.aws/knowledge-center/cloudwatch-cross-account-sns.
   This design simplifies integration, avoids duplicating SNS topics across accounts, and provides a single entry point for all monitoring events flowing into ServiceNow.

Related topics

Event field format for event collection

Integrate with push connectors

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate AWS with REST API key token

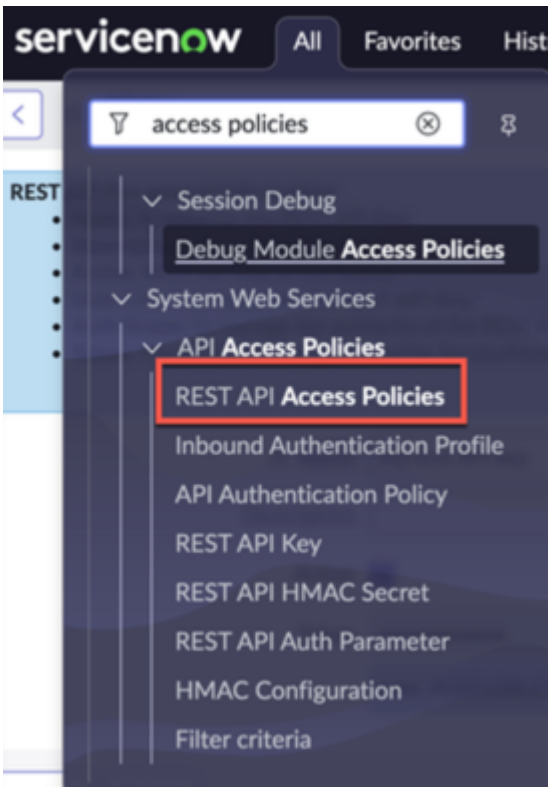
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin

Role required: evt_mgmt_integration

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

Note:
The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

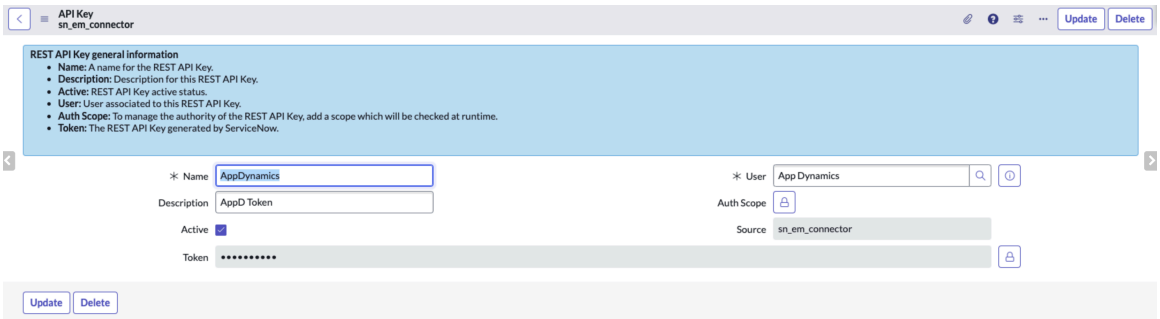
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



6. In the AWS environment, under **Simple Notification Service**, create a new topic and then create a new subscription by selecting the topic that you have created.
7. In the Create Subscription window, enter the ServiceNow endpoint value in the **Endpoint** field. Format of the api-key value must be: `https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]`.

   The [AUTH TOKEN] value is the system-generated token displayed in the **Token** field.

Integrate Azure Monitor as an authenticated data source

Integrate Microsoft Azure with Event Management by adding the Azure Monitor as an authenticated data source.

You can configure the Event Management environment for the collection of events from Azure Monitor by setting your ServiceNow AI Platform instance as the rest endpoint.

Once the endpoint is configured, when an Azure Monitor alert message arrives, Event Management:

- Authenticates the Azure Monitor alert message with the relevant ServiceNow user, using OAuth configuration or a standard webhook.
- Extracts information from the original Azure Monitor alert message to populate required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Azure Monitor V1 or V2 access tokens. For more information, see Integrate Azure Monitor with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Azure Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Azure Monitor with basic authentication.

What to know before you begin

You can use your integrated Azure Monitor as a data source only after you have verified the following:

- For both methods of authentication, the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.
- The Event Management Connectors plugin is installed in the ServiceNow AI Platform instance. You can download the plugin from the ServiceNow Store website.
- Azure Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Discovery for Microsoft Azure Cloud.

Event Rules and Event Field mappings

These event rules and event field mappings are provided with the base system:

Module	Description
Event Rules	**Azure Monitor**: A general event rule to handle all Azure Monitor events.
Event Field Mappings	**Azure Monitor - ci_type**: To map ci_type of events based on resourceType field. A base set of mapping pairs are provided.

These are the mappings provided with the base system in **Azure Monitor - ci_type**:

Transform Value Pairs

Event Mapping Pairs

Key	Value
microsoft.compute/virtualmachines	cmdb_ci_vm_object
microsoft.documentdb/databaseaccounts	cmdb_ci_cloud_database
microsoft.sql/servers	cmdb_ci_cloud_database
microsoft.web/sites	cmdb_ci_cloud_webserver
microsoft.cache/redis	cmdb_ci_cloud_database
microsoft.documentdb	cmdb_ci_cloud_database
microsoft.sql/servers/databases	cmdb_ci_cloud_database

Note:
You can add new mapping pairs to the Event Field Mapping - **Azure Monitor - ci_type** as per the requirement, to map events to the respective ci_type based on resourceType.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note:
This feature applies only to active event rules.

If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Severity mapping from Azure severity to ServiceNow event severity

Azure severity condition	ServiceNow event severity
When an Azure alert monitorCondition is Fired	
Azure Sev0	ServiceNow Critical (severity "1")
Azure Sev1	ServiceNow Major (severity "2")
Azure Sev2 and Sev3	ServiceNow Warning (severity "4")
Azure Sev4	ServiceNow OK (severity "5")
When an Azure alert monitorCondition is resolved	
Any Azure severity	ServiceNow CLEAR (severity "0")

Integrate Azure Monitor with basic authentication

Integrate Microsoft Azure with Event Management by adding a standard webhook in Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Roles required: evt_mgmt_admin and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Azure by authenticating Azure Monitor as a data source. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Procedure

1. In the ServiceNow AI Platform, create a user account or identify an existing ServiceNow user for this integration.
   Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. In your Azure Monitor portal, update the Azure Monitor alert rules to use an action group with a standard webhook:

   a. Create an action group with *`action type=webhook`*, and provide the URL that includes the user ID and password of the ServiceNow user in the endpoint.
   For example:

   ```
   https://<username>:<password>@<instance-name>.service-now.com/
   api/sn_em_connector/em/inbound_event?source=azuremonitor
   ```

   Note:
   If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

   b. In the Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

Result
Alerts start flowing from the Azure Monitor into the Event Management plugin. The plugin extracts information from the original Azure Monitor alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

What to do next
If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Integrate Azure with REST API key token

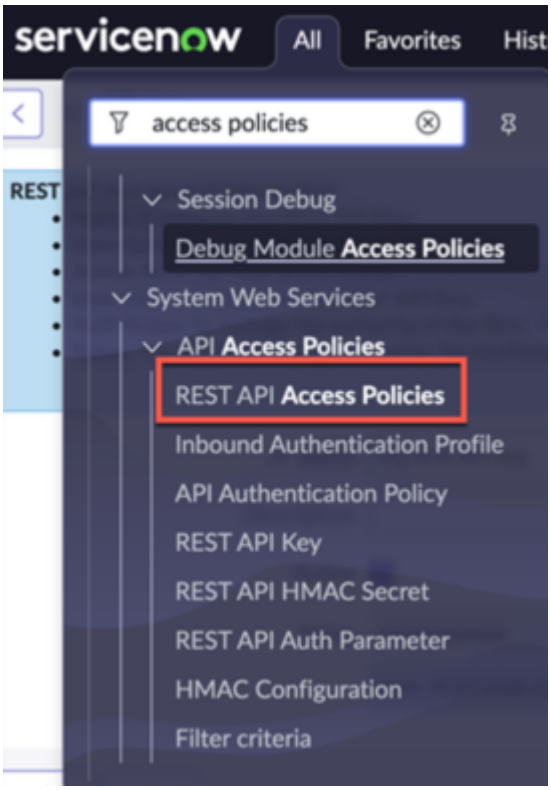
Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

Before you begin
Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

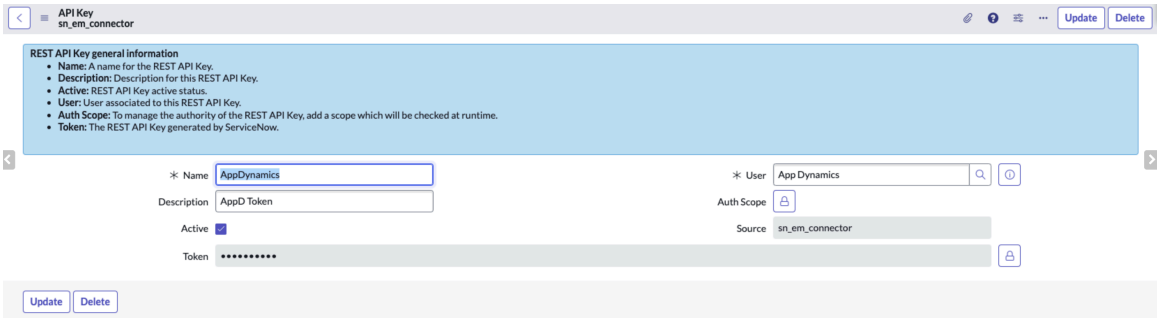
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Azure Monitor with OAuth authentication

Integrate Microsoft Azure with Event Management by authenticating Azure V1 or V2 tokens in the Azure Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

Roles required: evt_mgmt_admin, web_service_admin, and oauth_admin

About this task

Configure the Event Management environment for the collection of events from Azure Monitor. In your Azure Monitor portal, set your ServiceNow AI Platform instance as the rest endpoint using V1 or V2 tokens.

Procedure

1. In the Azure Monitor portal:

   a. Perform app registration and expose an API.
   For more information about registering an app and exposing an API in Azure, see https://docs.microsoft.com/en-us/azure/active-directory/develop/quickstart-configure-app-expose-web-apis.

   b. Create an action group with a secure webhook, and provide the rest endpoint as `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If you have multiple tenants on the Azure portal and you want to use bidirectional functionality to acknowledge, close, or reopen an alert on the Azure Portal, then the URL for the secure webhook has to be in the following format: `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=azuremonitor&event_class=<new_connector_instance_name>`. The <new_connector_instance_name> is the new Azure pull connector instance that you need to create for each tenant with other Azure service principal credentials. To know how to create the pull connector, see Configure Azure Monitor Bi-directional connector.

For servicenowservices.com instances, the rest endpoint has to be `https://<instance-name>.servicenowservices.com/api/sn_em_connector/em/inbound_event?source=azuremonitor`.

For more information about adding a secure webhook to an action group, see https://docs.microsoft.com/en-us/azure/azure-monitor/platform/action-groups.

c. Navigate to **Alerts** > **Manage Alert Rules**.

d. In the Secure Webhook section, make sure that **Yes** is selected for the **Enable the common alert schema** option.

e. Add the action group with the secure webhook to an alert rule.

2. In the Azure Monitor portal, verify which Azure token is in use by your registered application.

a. Navigate to **App Registration**, and select the registered application.

b. In the Manage section, click **Manifest**.

c. In the editor screen, select the **Microsoft Graph App Manifest** tab and locate the *requestedAccessTokenVersion* parameter or select the **AAD Graph App Manifest** tab and locate the *accessTokenAcceptedVersion* parameter.
If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **2**, the integration must use V2 tokens.

If the value of *requestedAccessTokenVersion* or *accessTokenAcceptedVersion* is **1** or **null**, the integration must use V1 tokens.

3. In your ServiceNow AI Platform instance, ensure that the ServiceNow user is assigned with the correct Application (client) ID or Application ID URI.
Also ensure the relevant ServiceNow sys_user is assigned the evt_mgmt_integration role.

a. Navigate to **System Security** > **Users and groups** > **Users**.

Note:
To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

b. Verify that the **Source** field for the ServiceNow sys_user is populated with the correct Application (client) ID or Application ID URI, as defined in the Azure Monitor portal.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the application is using an Azure V1 token, the **Source** field must be populated with the Application ID URI of the registered application. If the application is using an Azure V2 token, the **Source** field must be populated with the Application (client) ID of the registered application.

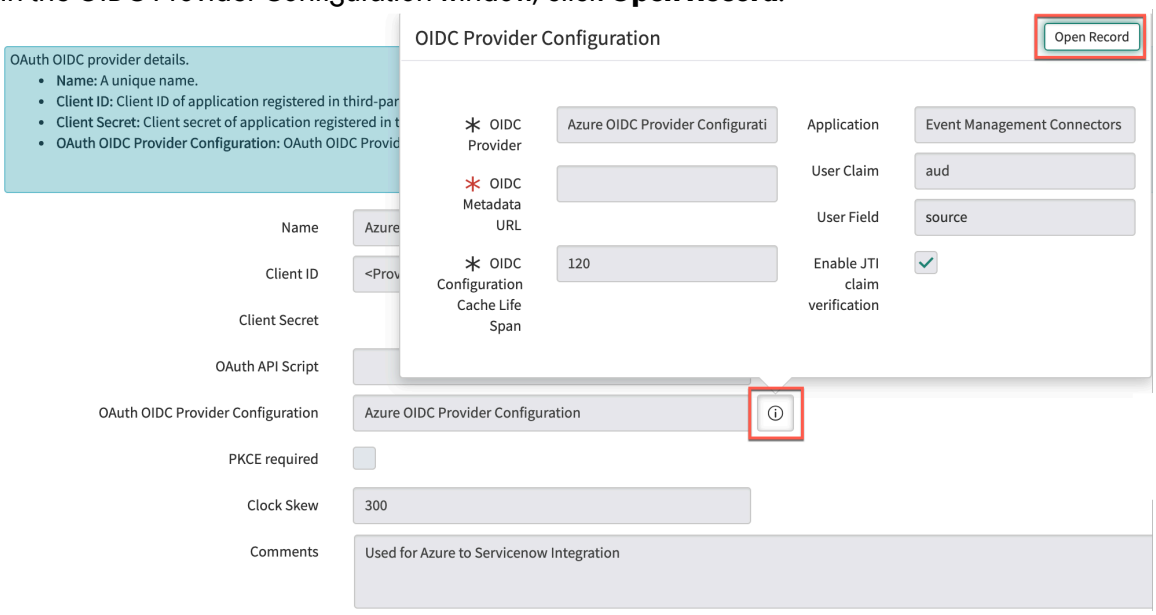
If the **Source** field is not displayed, change the form layout to display this field. Click the context menu icon ( ) and select **Configure > Form Layout**. Move **Source** to the Selected list.

Note:
If your ServiceNow AI Platform instance version is earlier than Paris Patch 2 or Orlando Patch 9, the **Source** field value must be enclosed in square brackets. For example, `[api://azuretest]`.

4. In your ServiceNow AI Platform instance, navigate to **Event Management** > **Integrations** > **Azure OAuth Config**.
5. Click **Azure OAuth OIDC Entry** and enter the `Client ID`.
   If the registered application is using an Azure V2 token, the `Client ID` should be the same as the `Application (client) ID` of the app registrations defined in your Azure Monitor portal.

   If the registered application is using an Azure V1 token, the `Client ID` should be the same as the `Application ID URI` of the app registrations defined in your Azure Monitor portal (the exposed API).

6. In the **OAuth OIDC Provider Configuration** field, click the info icon ( ).
7. In the OIDC Provider Configuration window, click **Open Record**.



8. Enter the `OIDC Metadata URL` according to the Azure token used by the registered application, as shown in the following table.

Result

When an alert is created in Azure Monitor as part of the alert rule, the notification is sent to the ServiceNow AI Platform using the secure webhook endpoint. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events. If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector .

Configure Azure Monitor Bi-directional connector

The Azure Monitor Pull connector sends information from ServiceNow Event Management to the Azure Portal. The pull connector sends the alert state changes from the ServiceNow environment to the Azure Portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

When an alert is triggered in the Azure Portal a Secure Webhook is created to send the alert notifications into ServiceNow. The Azure Monitor Connector will receive the alert notification as an event in the ServiceNow instance.

The Azure Monitor Bi-directional connector is supported in the following ServiceNow AI Platform versions:

- Quebec Patch 9 or later.
- Rome Patch 3 or later.
- San Diego.

Role required: evt_mgmt_admin

About this task

When you configure the Azure Monitor Bi-directional Connector, the bi-directional exchange of values to and from the external event source is enabled. When an alert is **Acknowledged**/**Closed**/**Reopened** on the ServiceNow instance, the state changes in the Azure Portal alert using the bi-directional connector.

These scenarios describe the default bi-directional functionality for the Azure Monitor connector:

- When an alert is closed in the Azure Portal, it is automatically closed in ServiceNow. However, it is updated irrespective of the bi-directional feature because closing the event received from the Azure Portal will close the alert.
- When an alert is manually closed in ServiceNow, all the associated Azure alerts will be closed in the Azure Portal.
- If the alert state is changed to **Reopen** in ServiceNow, all the associated Azure alerts will be opened in the Azure Portal.
- When an alert is **Acknowledged** in ServiceNow, all the associated Azure alerts will be acknowledged in the Azure Portal.

Note:
For changing the alert state on the Azure Portal, Mid Server gets access token connecting to https://login.microsoftonline.com/ and to change the alert state on the Azure portal Mid Server calls changestate API on URL https://management.azure.com/ as described in https://learn.microsoft.com/en-us/rest/api/monitor/alertsmanagement/alerts/change-state?view=rest-monitor-alertsmanagement-2023-07-12-preview&tabs=HTTP.

Procedure

1. For a single tenant, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **Azure Monitor**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Select the **Active** check box.

  For this configuration, the Host IP field has no functional impact, so a dummy IP address (1.1.1.1) is provided.

- In the **Credential** field, add the Azure Service Principal credentials that has authorization to perform actions.

  To change the alert state, the service principal must have the Microsoft.AlertsManagement permissions and the Monitoring Contributor role.

- Select or add the MID Server to be used for this connector.

  If alerts on the MS Azure portal are not updating as expected, check the MID Server logs for errors.

2. For multiple tenants, perform the following steps:
   - Navigate to **All** > **Event Management** > **Integrations** > **Connector Instances**.
   - Select **New**.
   - In the **Name** field, enter the name of <new_connector_instance_name> that you have mentioned in the URL for secure webhook at Integrate Azure Monitor with OAuth authentication.
   - In the Host IP, enter any dummy IP address such as 1.1.1.1.
   - In the **Credential** field, add the Azure Service Principal credentials of that tenant that has authorization to perform actions.
   - Select the **Bi-directional** check box.
   - Select or add the MID Server to be used for this connector.
   - Select **Submit**.
   - Select the **Active** check box.
   - Select **Update**.

What to do next

Multiple alerts from the Azure Portal may be mapped to a single ServiceNow alert by de duplication. The mapping between the ServiceNow alert and Azure alerts will be maintained in the sn_em_connector_event_data table. The retention of records will depend on the alert's state:

- If the Azure Bi-directional Connector is not active, the records will be deleted in 2 days.
- When the Azure Bi-directional Connector is active:
  - If the alert is in a closed state, then it will retain the data for 7 days. This duration can be customized by the sn_em_connector.eventdata_closedevent_interval system property.
    - If the closed alert is re-opened in 7 days then it will reopen the corresponding closed alerts from the Azure Portal.
    - If the closed alert is re-opened after 7 days then it will not reopen the corresponding closed alerts from the Azure Portal.
  - If the alert is in an open state, then it will retain the data for 30 days. This duration can be customized by the sn_em_connector.eventdata_openevent_interval.
    - If you want to close or acknowledge an open ServiceNow alert in 30 days, you will be able to close or acknowledge all corresponding Azure alerts on the Azure Portal.
    - If you want to close or acknowledge an open ServiceNow alert after 30 days, you will not be able to close or acknowledge all corresponding Azure alerts on the Azure Portal.

Event collection from Microsoft Azure Monitor

The MID WebServer Event Collector enables you to collect JSON formatted event messages sent from the Microsoft Azure portal.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

On the Azure portal, alert correlation rules are defined through the *`Correlate alerts`* setting within Alert Processing Rules. When *`Correlate alerts`* is assigned on the Azure portal, the Azure Monitor alerts received on the ServiceNow® instance within 60 minutes are grouped using tag based alert clustering.

JSON formatted event messages are sent from Microsoft Azure. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidAzureMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Azure Monitor Mid Push Connector**.

The default format of the URL to push event messages from Microsoft Azure to the MID Server is `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Serv api/mid/em/inbound_event?Transform=TransformEvents_MidAzureMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

Procedure

1. In the Azure Monitor Portal, make sure the MID Server IP is accessible from the Azure portal and the MID rest point is accessible from Microsoft Azure or install the MID Server on a Azure VM and provide the Azure VM public address in the URL and allow the mid_web_Server_port in **Azure VM** > **Networking Settings** > **Inbound port rules**.
2. Create an action group with a webhook and provide the rest endpoint as `http://<MID_Web_Server_User>:<MID_Web_Server_Password>@<MID_Server_IP>:<MID_Web_Se`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
api/mid/em/inbound_event?
Transform=TransformEvents_MidAzureMonitor
```

Note:
For more information about adding a webhook to an action group, see Create and manage action groups in the Azure portal on the Microsoft documentation site.

3. In the Webhook section, make sure **Yes** is selected for the **Enable the common alert schema** option.
4. Navigate to **Alerts** > **Manage Alert Rules**.
5. Add the action group with the webhook to an alert rule.

What to do next
If you want to send alert state changes on the ServiceNow instance from the ServiceNow alerts to the Azure Portal, you need to enable the Azure Monitor Bi-directional connector. For more information, see Configure Azure Monitor Bi-directional connector.

Event collection from BMC TrueSight and BMC TrueSight_v2

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from BMC TrueSight Operations Management (TrueSight), previously known as BMC ProactiveNet Performance Management (BPPM), utilizing event stream notification capabilities.

Before you begin
Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration.
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task
JSON formatted event messages are sent from BMC TrueSight. The MID Server transforms the collected event messages by parsing them using the TransformEvents_bmcTrueSight script include, located here: **Event Management** > **Integrations** > **Listener Transform Scripts**. In the Listener Transform Scripts page, click **TransformEvents_bmcTrueSight**.

The default format of the URL to push event messages from BMC TrueSight to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight`.

The default format of the URL to push event messages from BMC TrueSight_v2 to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_bmcTrueSight_v2`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server Extension. However, encode the password in BASE64. For example, if the MID Web Server Extension password is `admin`, in this case use `YWRtaW4=` as the password for MID_Web_Server_Password. To determine the BASE64 value, you can use the utility at this website: https://www.base64encode.org/

The following procedure describes the collection of JSON formatted event messages using basic authentication. For more information about supported authentication methods, see Configure the MID Web Server extension.

Procedure

1. In BMC TrueSight, set the MID WebService Event Collector as the target for BMC TrueSight notification, using these parameters:

Variables in the generic BMC URL

Variable	Description
serverHost	Name of the BMC TrueSight server.
port	Number of the BMC TrueSight port.

2. In the message body and generic BMC URL, replace the parameters with the values in the preceding table and connect to BMC TrueSight.
Use the BMC Publish-Subscribe REST approach to create a stream event subscription and send event messages in JSON format. The generic format of the BMC URL to create a stream event subscription is: `http|https://<serverHost>:<port>/bppmws/api/stream/subscribe?dataType=event`. For example: `http://TrueSight1server:40/bppmws/api/stream/subscribe?dataType=event`.

Result

Example of mapping event messages to event fields in the Event (em_event) table

Event field	Event message
node	mc_host
type	mc_object_class
metric_name	mc_parameter
resource	mc_object

Integrate Dynatrace platform events

Integrate Dynatrace with Event Management by adding the Dynatrace Monitor as an authenticated data source.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Dynatrace Monitor V1 or V2 access tokens. For more information, see Integrate Dynatrace with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Dynatrace Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Dynatrace with basic authentication.

Note:
When a problem is reopened in Dynatrace, the original start time is retained and not updated to the time of reopening. This behavior is intentional and reflects how Dynatrace manages the problem lifecycle. Problems reopened within the defined reopening period (typically 30 minutes) are treated as a continuation of the original issue. The start time continues to reflect the timestamp of the earliest triggering event, even after reopening.

Do not use the evidence details timestamp as a substitute for the problem start time. The evidence timestamp refers to individual contributing events within the problem. It is part of the Root Cause Analysis (RCA) and does not indicate the start or duration of the overall problem.

Starting from the Xanadu release, the base system rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the connector.

Note:
This feature applies only to active event rules.

Integrate Dynatrace with basic authentication

Integrate Dynatrace with Event Management by adding a standard webhook in the Dynatrace console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that configuration items for the hosts managed by Dynatrace exist in the ServiceNow AI Platform instance. These CIs can be physical or virtual and can be either manually created or discovered via IP discovery or Cloud Discovery.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Roles required: evt_mgmt_integration and web_service_admin

About this task

Configure the Event Management environment for the collection of events from Dynatrace by authenticating Dynatrace as a data source. In your Dynatrace console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In your Dynatrace console, define Host Naming rules:
   a. Navigate to **Settings** > **Monitoring** > **Host Naming**.
   b. Define the Host Naming rules for each cloud provider (Azure/AWS/GCP) to uniquely identify a CI from ServiceNow.
   This ensures the ServiceNow CIs can be uniquely identified from the payload received from Dynatrace.

   Note:
   You do not need to create a Host Naming rule for VMware machines because Dynatrace manages them as physical servers.

2. Define anomaly detection rules:
   a. Navigate to **Settings** > **Anomaly Detection** > **Infrastructure**.
   b. In the **Hosts** tab, define rules on when to create alerts on the managed hosts.
3. Define the integration settings:
   a. Navigate to **Settings** > **Integration** > **Problem notifications** > **Add notifications**.
   b. In the Set up custom integration form, add the Webhook URL: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace`
   For basic authentication, select **Create basic authorization header**. You can see the username and password fields for the user.
   c. Enter the user name and password of the relevant user.

      Note:
      Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. In the Custom payload section, add in the following payload structure for the events that will be generated.

```
{
  "connectionId": <connections_alias_sys_id>,
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

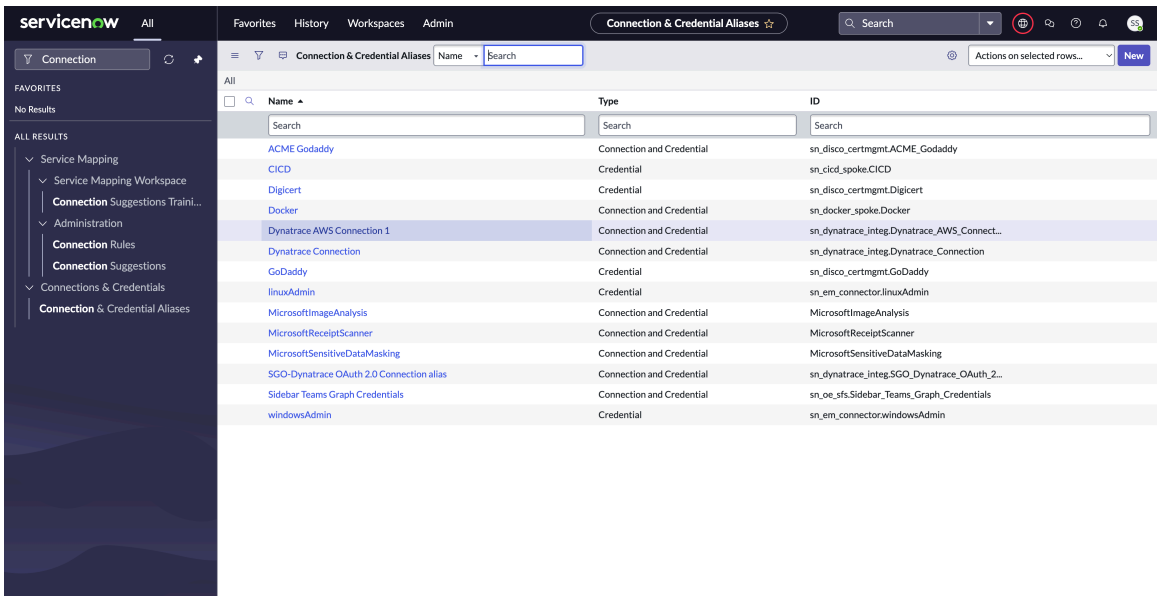
```
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
  "Tags": "{Tags}"
}
```

Note:

For the <connections_alias_sys_id>:

i. Navigate to **All** > **IntegrationHub** > **Connection & Credentials** > **Connection & Credential Aliases**.

ii. Select to open the connector for which you want to get the <connections_alias_sys_id>.



iii. Right-click the context menu (☰) and then select **Copy sys_id**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result

Alerts start flowing from the Dynatrace console into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note:
By default, host binding is enabled for Dynatrace events for all providers (Azure/AWS/Google). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Dynatrace - General** event rule. For further information about Event rules, see Event rules.

Integrate Dynatrace with OAuth authentication

Integrate Dynatrace with Event Management by authenticating Dynatrace V1 or V2 tokens in the Dynatrace Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Dynatrace exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Dynatrace integration with OAuth authentication is available starting from the Washington DC platform release or later.

Procedure

1. Configuration on the ServiceNow instance.

   a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.
      - Type: true|false
      - Value: true

   b. Create an OAuth Entity endpoint for clients to access the instance.

      i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

      ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

      iii. To create an OAuth client record, select **Submit**.

   c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

      i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

      ii. Open the created OAuth client record.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

iii. From the page header, select the **More** options icon.

iv. Select **Configure** > **Form Layout**

v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

vi. **Save** or **Update** the form.

vii. For the **OAuth Application User** field, select the user.

The user must have the evt_mgmt_integration role that will be used to create the events sent by Dynatrace.

Note:
To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Dynatrace console, define the integration settings.

a. Navigate to **Settings** > **Integration** > **Problem notifications** > **Set up notifications**.

b. In the Set up custom integration form, webhook URL.

```
https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=dynatrace
```

c. Enable **Use OAuth 2.0 for authentication**.

d. In the OAuth 2.0 credentials section, perform the following steps.

i. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.

ii. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

iii. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.

iv. Select **Save**.

e. In the Custom payload section, add in the following payload structure for the events that will be generated. Ensure that `ImpactedEntities` and `ProblemDetailsJSONv2` are passed as JSON objects, not strings.

```
{
  "ImpactedEntities": {ImpactedEntities},
  "ImpactedEntity": "{ImpactedEntity}",
  "PID": "{PID}",
  "ProblemDetailsHTML": "{ProblemDetailsHTML}",
  "ProblemDetailsJSONv2": {ProblemDetailsJSONv2},
  "ProblemDetailsMarkdown": "{ProblemDetailsMarkdown}",
  "ProblemDetailsText": "{ProblemDetailsText}",
  "ProblemID": "{ProblemID}",
  "ProblemImpact": "{ProblemImpact}",
  "ProblemSeverity": "{ProblemSeverity}",
  "ProblemTitle": "{ProblemTitle}",
  "ProblemURL": "{ProblemURL}",
  "State": "{State}",
```

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
  "Tags": "{Tags}"
}
```

Result

Alerts start flowing from Dynatrace agents into the Event Management plugin. The plugin extracts information from the original Dynatrace alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

Note:
By default, host binding is enabled for Dynatrace events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Dynatrace - General event rule. For further information about Event rules, see Event rules.

Integrate New Relic platform events

Integrate New Relic with Event Management by adding a standard webhook in the New Relic old and new consoles.

Before you begin

Verify that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from New Relic by authenticating New Relic as a data source. Set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook. Use procedure step 1 for the new console. Use procedure step 2 for the old console.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. For the new console:

   a. Create a destination.

      i. Navigate to **Alerts & AI** > **Destinations**.

      ii. In the **Add destinations** section, select the **Webhook** channel type.

      iii. In the **Webhook name** field, enter the webhook name.

      iv. In the **Endpoint URL** field enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

      v. In the **Basic Auth** section, enter your user name and password.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

vi. Select **Save destination**.

b. Create a policy.

i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

ii. Select **New Alert policy** and define a policy.

iii. Select **Set up Notifications**.

iv. In the **Add Channel** section select **Webhook**, and then select the destination that you created in the previous substep.

v. In the **Payload template** section, paste the following JSON payload.

```
{ "account_id": {{nrAccountId}}, "account_name": {{json
 accumulations.tag.account.[0]}}, "closed_violations_count":
 {{closedIncidentsCount}}, "open_violations_count":
 {{openIncidentsCount}}, "condition_description":
 "{{escape accumulations.conditionDescription.[0]}}",
 "condition_family_id":
 {{accumulations.conditionFamilyId.[0]}}, "condition_name":
 "{{escape accumulations.conditionName.[0]}}",
 "current_state": {{json state}}, "details":
 {{json issueTitle}}, "duration": {{#if
 issueDurationMs}}{{issueDurationMs}}{{else}}0{{/if}},
 "event_type": "INCIDENT", "incident_acknowledge_url":
 {{json issueAckUrl}}, "incident_id": {{json issueId}},
 "incident_url": {{json issuePageUrl}}, "metadata":
 { {{#if locationStatusesObject}}"location_statuses":
 {{json locationStatusesObject}},{{/if}} {{#if
 accumulations.metadata_entity_type}}"entity.type":
 {{json accumulations.metadata_entity_type.[0]}},{{/if}}
 {{#if accumulations.metadata_entity_name}}"entity.name":
 {{json accumulations.metadata_entity_name.[0]}},{{/if}}
 "section": "metadata" }, "owner": {{json owner}},
 "policy_name": {{json accumulations.policyName.[0]}},
 "policy_url": {{json policyUrl}}, "runbook_url": {{json
 accumulations.runbookUrl.[0]}}, "severity": {{json
 priority}}, "targets": [ { "id": "{{labels.targetId.[0]}}",
 "name": "{{#if accumulations.targetName}}{{escape
 accumulations.targetName.[0]}}{{else
 if entitiesData.entities}}{{escape
 entitiesData.entities.[0].name}}{{else}}N/A{{/if}}",
 "link": "{{issuePageUrl}}", "product":
 "{{accumulations.conditionProduct.[0]}}", "type": "{{#if
 entitiesData.types.[0]}}{{entitiesData.types.[0]}}{{else}
}N/A{{/if}}", "labels": { {{#each
 accumulations.rawTag}}"{{escape @key}}": {{#if
 this.[0]}}{{json this.[0]}}{{else}}"empty"{{/if}}{{#unless
 @last}},{{/unless}}{{/each}} } } ], "timestamp":
 {{updatedAt}}, "violation_callback_url": {{json
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
issuePageUrl}}, "violation_chart_url": {{json
violationChartUrl}} }
```

vi. Select **Send test notification** to get the test event in your ServiceNow instance.

vii. Select **Save message**.

viii. Select **Activate workflow** to activate the workflow.

c. Create alert conditions to apply to the policy:

i. Navigate to **Alerts & AI** > **Alert Conditions & Policies**.

ii. Select **Create alert condition**, define the required alert details, and add it to the policy you created in the previous step.

iii. Select **Save Condition**.

2. For the old console.

a. Create a notification channel.

i. Navigate to **Alerts & AI** > **Notification channels**.

ii. In the **Channel details** tab, select the **Webhook** channel type.

iii. In the **Base Url** text box, enter: `https://<InstanceName>.service-now.com/api/sn_em_connector/em/inbound_event?source=newrelic`

iv. In the Basic Auth section, enter the user name and password of the relevant user.

> **Note:**
> Verify the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

v. In the **Custom Payload** section, select **Add Custom Payload**, and select the **JSON** payload type.

vi. Paste the following JSON payload into the **Custom Payload**.

```
{ "account_id": "$ACCOUNT_ID", "account_name":
 "$ACCOUNT_NAME", "closed_violations_count_critical":
 "$CLOSED_VIOLATIONS_COUNT_CRITICAL",
 "closed_violations_count_warning":
 "$CLOSED_VIOLATIONS_COUNT_WARNING",
 "condition_description": "$DESCRIPTION",
 "condition_family_id": "$CONDITION_FAMILY_ID",
 "condition_name": "$CONDITION_NAME", "current_state":
 "$EVENT_STATE", "details": "$EVENT_DETAILS",
 "duration": "$DURATION", "event_type":
 "$EVENT_TYPE", "incident_acknowledge_url":
 "$INCIDENT_ACKNOWLEDGE_URL", "incident_id": "$INCIDENT_ID",
 "incident_url": "$INCIDENT_URL", "metadata":
 "$METADATA", "open_violations_count_critical":
 "$OPEN_VIOLATIONS_COUNT_CRITICAL",
 "open_violations_count_warning":
 "$OPEN_VIOLATIONS_COUNT_WARNING", "owner": "$EVENT_OWNER",
 "policy_name": "$POLICY_NAME", "policy_url": "$POLICY_URL",
 "runbook_url": "$RUNBOOK_URL", "severity": "$SEVERITY",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
"targets": "$TARGETS", "timestamp": "$TIMESTAMP",
"violation_callback_url": "$VIOLATION_CALLBACK_URL",
"violation_chart_url": "$VIOLATION_CHART_URL" }
```

b. Create a policy.

i. Navigate to**Alerts & AI** > **Policies**.

ii. Select**New Alert policy**and define a policy.

iii. In the**Notification Channels**section, select**Add**, select**Webhook**, and then select the channel you created in the previous step.

c. Create alert conditions to apply to the policy:

i. Navigate to**Infrastructure** > **Settings** > **Alerts**.

ii. Select**Create alert condition**, define the required alert details, add it to the policy you created in the previous step.

iii. Select**Create**.

Result

Alerts start flowing from the New Relic console into the Event Management plugin. The plugin extracts information from the original New Relic alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to**All Events**to see the events.

Note:
By default, host binding is enabled for New Relic events for all providers (Azure/AWS/GCP). If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the**New Relic - General**event rule. For further information about Event rules, see Event rules.

Integrate New Relic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

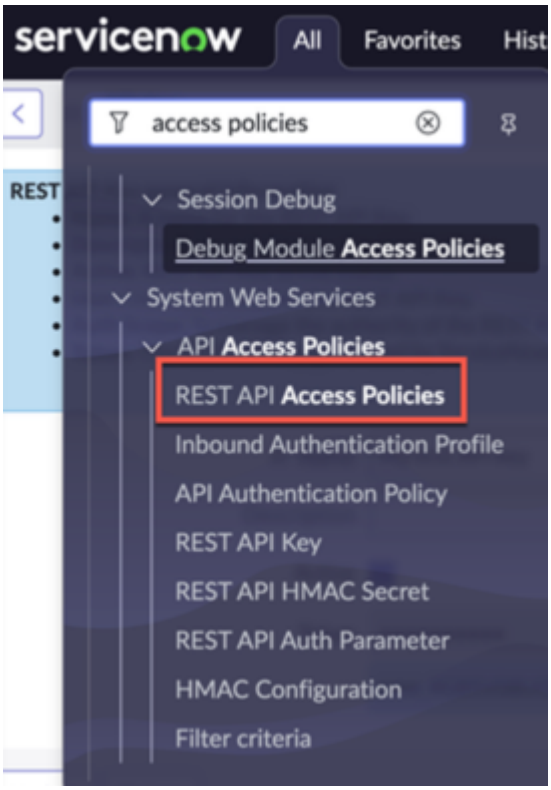
Before you begin

Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

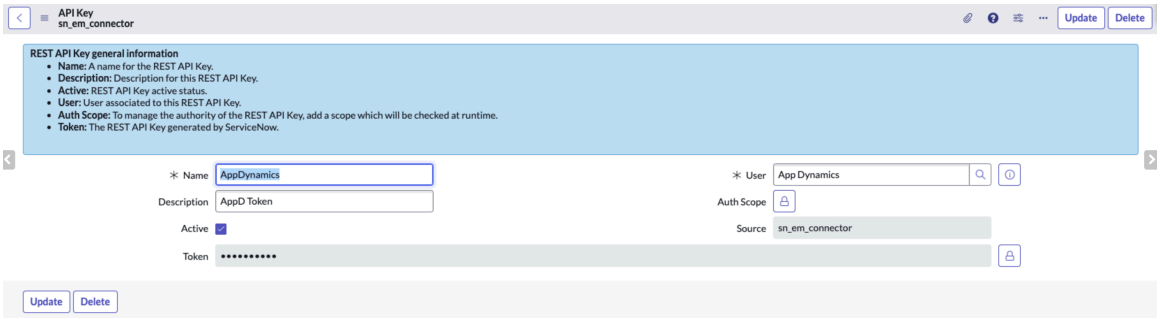
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Catchpoint events

Integrate Catchpoint with Event Management by adding an alert webhook in the Catchpoint platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Catchpoint by authenticating Catchpoint as a data source. In the Catchpoint platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Catchpoint platform, create an alert webhook destination.

   a. Login to the Catchpoint platform.

   b. Navigate to **Catchpoint** > **Setting** > **API** > **Alert Data Webhook** to set the webhook endpoint.

   c. In the API Alert Webhook, provide the following details.

API Alert Webhook form

Field	Value
Name	Any name based on your requirement.
URL	The default format of the URL to push events from Catch Point to the ServiceNow AI Platform instance, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	em/inbound_event? source=catchpoint.
On Failure Alert	The email address for the API Alert webhook.
Notification Trigger	Select based on your requirement. The default value is 3.
Add the following headers	▪ Authorization: **Basic {Base 64 | username:password}** ▪ Content-Type: **application/json**
Format	Select **Template** and add the following template: `{ "Source": "CatchPoint", "severity": "${notificationLevelId}", "alertType": "${AlertType}", "time_of_event": "${alertCreateDateUtc(YYYY-MM-DD HH:MI:SS)}", "monitorType": "${Switch(${MonitorTypeId},'0', 'IE','2', 'Object','3','Emulated','8', 'Ping','9', 'Tracert','10', 'DNS-Traversal','11', 'Ping-TCP','12', 'DNS-Exp', '13','DNS-Direct', '14','Tracert-UDP', '15', 'Port-TCP','16', 'FTP','17', 'Data-Push-API','18', 'Chrome','19', 'Playback', '20', 'Playback-Mobile', '21', 'SMTP', '22', 'Port-UDP', '23', 'Ping-UDP', '24', 'Streaming', '25', 'API', '26', 'Mobile', '27', 'SFTP', '28', 'SSH', '29', 'Tracert-TCP')}", "testName": "${TestName}", "testId": "${TestId}", "testUrl": "${TestUrl}", "testPath": "${testPath}", "testLink": "${testLink}", "productName": "${ProductName}", "clientId": "${ClientId}", "productId": "${productId}", "nodeName":"${nodeDetails("${nodeName}")}",`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Value
	"nodeClientServerAddress":"${nodeDetails(\"${NodeClientAddress},\"),}", "nodeServerAddress": "${nodeDetails(\"${nodeServerAddress},\"),}", "Labels" : "${testLabels}", "addtionalInformation": "Test initial URL: ${testUrl}\n\nAlert type: ${AlertType}\n\nScatter Chart: ${scatterplotChartURL}\n\nWaterfall Chart: ${waterfallChartURL}\n\nTest properties: ${testLink}\n\nTest time of run / Test time of alert (Central Time): ${reportDateLocal(YYYY-MM-DD HH:MI:SS)} / ${alertCreateDateLocal(YYYY-MM-DD HH:MI:SS)}"}

2. For the HTTP Endpoint monitoring tests, in the ServiceNow instance, create a CI.

> **Note:**
> The Catchpoint connector supports multiple types of monitoring tests such as Endpoint, Networking, and others. The following steps apply only to the HTTP Endpoint monitoring tests.

   a. Navigate to **Configuration** > **CI Class Manager**.

   b. Click **Hierarchy** and search for **HTTP(S) Endpoint**.

   c. In the CI Type field, select **cmdb_ci_endpoint_http**.
   If the services are not modeled, then you should manually add the CIs under the [cmdb_ci_endpoint_http] table. Also, the manual endpoint should be removed before the automatic discovery of services. For other type tests CI bindings, you can create Event rules based on their requirements.

Result

Alerts start flowing from the Catchpoint connector into the Event Management plugin. The following table shows how the Catchpoint severity mapping translates into the ServiceNow mapping.

Severity levels between Catchpoint and ServiceNow

Catchpoint severity	ServiceNow severity
0	Warning
1	Critical
2/3	Clear

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate Datadog platform events

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using Datadog Monitor V1 or V2 access tokens. For more information, see Integrate Datadog with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for Datadog Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate Datadog with basic authentication.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Integrate Datadog with basic authentication

Integrate Datadog with Event Management by adding a standard webhook in the Datadog console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

- Role required: evt_mgmt_integration
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

About this task

Configure the Event Management environment for the collection of events from Datadog. In your Datadog console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Procedure

1. In the Datadog console, add cloud provider tags:

   a. Navigate to **Menu** > **Infrastructure** > **Infrastructure List**

   b. Click **Inspect** for the VM on which the Datadog agent is installed.

   c. Click **Edit Tags** and add the *cloud_provider* tag.
   The tag should be suffixed with the value of **aws**, **azure**, or **gcp** to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. Click **Save Tags** to save the new tag.

> **Note:**
> Datadog adds the *cloud_provider* tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

2. In the Datadog console, add a webhook:

a. Navigate to **Menu** > **Integration** > **Integrations**, and search for webhooks.

b. Create a webhook that includes the user ID and password of the ServiceNow user in the endpoint.
For example, use `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=datadog`.

> **Note:**
> Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

c. Add in the following payload structure.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

3. In the Datadog console, define rules:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Menu** > **Monitors** > **Manage Monitors**, and configure rules on when to create a problem from Datadog on the managed hosts.

b. In the **Notify your team** section, select the webhook on which the problem should be notified.

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

Note:
By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the **Datadog - General** event rule. For further information about Event rules, see Event rules.

Integrate Datadog with OAuth authentication

Integrate Datadog with Event Management by authenticating Datadog V1 or V2 tokens in the Datadog Monitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

The Event Management plugin must be installed on the ServiceNow AI Platform instance.

Verify Configuration Items for the hosts managed by Datadog exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.

Role required: evt_mgmt_integration

About this task

Datadog integration with OAuth authentication is available starting from the Washington DC platform release or later.

Procedure

1. Configuration on the ServiceNow instance.

a. Create *glide.oauth.inbound.client.credential.grant_type.enabled* system property to use Client Credentials grant type for OAuth inbound integrations.

- Type: true|false
- Value: true

b. Create an OAuth Entity endpoint for clients to access the instance.

i. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.

ii. On the interceptor page, select **Create an OAuth API endpoint for external clients** and then fill in the form.

iii. To create an OAuth client record, select **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. Add the OAuth Application User and the Default Grant Type to the created OAuth client record.

i. On the OAuth Entity form, add the **OAuth Application User** and the **Default Grant Type** fields to use the Client Credentials grant type for OAuth inbound integrations.

ii. Open the created OAuth client record.

iii. From the page header, select the **More** options icon.

iv. Select **Configure** > **Form Layout**

v. On the Form Layout page, add **OAuth Application User and Default Grant Type** from the list of fields.

vi. **Save** or **Update** the form.

vii. For the **OAuth Application User** field, select the user.

The user must have the evt_mgmt_integration role that will be used to create the events sent by Datadog.

Note:
To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

viii. Set **Default Grant Type** field value to **Client Credentials**.

2. In the Datadog console, add cloud provider tags.

a. Navigate to **Menu** > **Infrastructure** > **Infrastructure List**.

b. Select **Inspect** for the VM on which the Datadog agent is installed.

c. Select **Edit Tags** and add the cloud_provider tag.

The tag must be suffixed with the value of aws, azure, or gcp to identify the AWS, Microsoft Azure, or Google Cloud Platform (GCP) provider options. For example: cloud_provider:aws.

d. Select **Save Tags**.

Note:
Datadog adds the cloud_provider tag by default when the Azure and Google integration is installed on the Datadog agent. Tags can also be added at the cloud provider level. Datadog collects all the tags defined at the VM level on the cloud.

3. In the Datadog console, add a webhook.

a. Navigate to **Menu** > **Integration** > **Integrations** and search for webhooks.

b. On the webhook tile, select **Configure**.

c. Select the **Auth Methods** tab and then select **New Auth Method**.

d. Enter the name and select the protocol as **OAuth 2.0 Client Credentials**.

e. Provide Access token URL as `https://<instance_name>.service-now.com/oauth_token.do`.

f. Provide the value for **Client ID** with the client id of the OAuth Entity Client created in ServiceNow instance.

g. Provide “Client secret” with the client secret of the OAuth Entity Client created in ServiceNow instance.

h. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

i. Create webhook URL as

```
https://<instance-name>.service-now.com/api/sn_em_connector/
em/inbound_event?source=datadog
```

j. Select the OAuth Method created in the previous steps in AuthMethod dropdown.

k. Add in the following payload structure.

```
{
    "body": "$EVENT_MSG",
    "last_updated": "$LAST_UPDATED",
    "event_type": "$EVENT_TYPE",
    "title": "$EVENT_TITLE",
    "date": "$DATE",
    "org": {
        "id": "$ORG_ID",
        "name": "$ORG_NAME"
    },
    "id": "$ID",
    "alert_id": "$ALERT_ID",
    "alert_metric": "$ALERT_METRIC",
    "metric_namespace": "$METRIC_NAMESPACE",
    "alert_priority": "$ALERT_PRIORITY",
    "alert_transition": "$ALERT_TRANSITION",
    "alert_status": "$ALERT_STATUS",
    "alert_title": "$ALERT_TITLE",
    "alert_type": "$ALERT_TYPE",
    "host_name": "$HOSTNAME",
    "priority": "$PRIORITY",
    "tags": "$TAGS",
    "alert_scope": "$ALERT_SCOPE"
}
```

Result

Alerts start flowing from Datadog agents into the Event Management plugin. The plugin extracts information from the original Datadog alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to All Events to see the events.

Note:
By default, host binding is enabled for Datadog events for (AWS/Azure/GCP) providers. If all hosts in the environment are discovered using Cloud Discovery by providing credentials and discovered resources are in the cmdb_ci_vm_object list, then the VM binding may not occur. To resolve this, you must enable the Datadog - General event rule. For further information about Event rules, see Event rules.

Integrate Google Cloud Platform (GCP) events

Integrate Google Cloud Platform (GCP) with Event Management by adding a standard webhook in the GCP console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Verify Configuration Items for the hosts managed by GCP exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- The Event Management Connector plugin supports GCP alert data in JSON 1.2 format only.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from GCP. In your GCP console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting**, and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the user name and password of the relevant ServiceNow user.

      Note:
      Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use`https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=googlemonitor`.
2. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting**, and select **Create Policy**.
   b. Configure policy conditions that initiate alerts when the conditions are violated.
   c. Select the webhook on which the problem should be notified.

      Note:
      If you need to directly open an incident in the GCP console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**.

Result

Alerts start flowing from GCP into the Event Management plugin. The plugin extracts information from the original GCP alert message to populate the required event fields and inserts the event

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

into the database. In your ServiceNow AI Platform instance, navigate to**All Events** to see the events.

GCP does not send values such as the severity level in the payload. The default severity is Minor, which can be changed in the*Push Connector Configuration* section of **Push Connectors** > **Google Monitor Push Connector**. The valid values of severity are**1- Critical**,**2- Major**,**3- Minor**,**4- Warning**, and**5- Info**.

Note:

To map the GCP hosts to the**cmdb_ci_server**record instead of**cmdb_ci_vm_object**, disable the**Google Monitor - General**event rule created for GCP. For further information about event rules, see Event rules.

Event collection from Google Cloud Platform (GCP)

The MID WebService Event Collector enables you to collect JSON formatted event messages sent from Google Cloud Platform (GCP).

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Google Cloud Platform. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidGoogleMonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Google Monitor Mid Push Connector**.

The default format of the URL to push event messages from the GCP to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

The following procedure describes the collection of JSON formatted event messages using basic authentication.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the Google Cloud Platform (GCP) console, make sure the MID Server IP is accessible from the GCP console and MID rest point is accessible from GCP or install the MID Server on a GCP VM and provide the GCP VM external IP address in the URL.
   In the GCP console, create a firewall rule.
   a. Navigate to **VPC Network** > **Firewall** > **Create Firewall**.
   b. Set the direction to **ingress** to allow the mid_web_server_port to connect.
   c. Add the GCP VM that the MID Server is installed on to the **Applicable to instances** list.
2. In the GCP console, add a webhook.
   a. Navigate to **Monitoring** > **Alerting** and click **Edit Notification Channels**.
   b. In the Webhooks section, click **Add New**.
   c. Select the **Use HTTP Basic Auth** check box, and enter the username and password of the MID Webserver User.

      Note:
      Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   d. Enter the endpoint URL.
      For example, use `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidGoogleMonitor`
3. In the GCP console, create an alerting policy.
   a. Navigate to **Monitoring** > **Alerting** and click **Create Policy**.
   b. Configure the policy conditions that initiate alerts when the conditions are violated.
   c. Select the webhook notification channel on which the problem should be notified.
   d. Select the **Notify on incident closure** check box to send the closure events to the MID Server and save the alert policy.

      Note:
      If you need to directly open an incident in the GCP Console from the alert, navigate to **Quick Response (in Alert)** > **Show Incident in GCP Console**. For more information about creating an alert policy, see Managing alerting policies on the Google Cloud documentation site.

Result

GCP does not send values such as the severity level into the payload. The default severity is Minor, which can be changed in the *Push Connector Configuration* section of **Push Connectors** > **Google Monitor MID Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate Grafana events

Integrate Grafana with Event Management by adding a standard webhook in the Grafana console.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- The CI binding happens through the IP, instances should be discovered as servers to initiate the binding. CIs discovered through cloud or CIs in **cmdb_ci_vm_object** don't get bounded as Grafana doesn't provide any information for object IDs.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Grafana. In your Grafana console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Note:
Perform steps 1 and 2 for Grafana v7.4.3. For Grafana v9.3.2. skip to step 3.

Procedure

Grafana v7.4.3

1. In the Grafana console, create a notification channel.
   a. Navigate to **Alerting** > **Notification Channels**.
   b. Click **New Channel** and select the type as **Webhook**.
   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.
   d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.

      Note:
      Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   e. Click **Test** to verify the connection.
2. In the Grafana console, create alerting rules.
   a. Click **Edit** on the required panel and then **Create Alert**.
   b. In the **Alert** tab, add the following tags:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tags	Description
Severity	(This tag is optional and has to be lower cased.) Severity with which the alert has to be created.
Count	(This tag is required, otherwise the alerts don't close automatically in ServiceNow.) The number of devices, hosts, or servers monitored by this alert rule.

c. Add the notification channel under **Notifications** in the alert rule.

d. Click **Save**.

e. Navigate to **Alerting** > **Alert Rules** to access the created rule.

Grafana v9.3.2.

3. In the Grafana console, create a contact point.

   a. Navigate to **Alerting** > **Contact Points**.

   b. Click **New Contact Point**, enter a name, and select the type as **Webhook**.

   c. Enter a URL.
   For example, use `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=grafana`.

   d. Under the **Optional WebHook** settings, select the HTTP Method, **POST**, and enter the user name and password of the relevant ServiceNow user.

   Note:
   Ensure that the selected user is assigned the evt_mgmt_integration role. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

   e. Click **Save** and **Test** to verify the connection.

4. In the Grafana console, create a notification policy.

   a. Navigate to **Alerting** > **Notification Policies**.

   b. Select **New Policy**, add matchers.
   Matchers are labels that direct alert rules to the contact point.

   c. Select your contact point.

   d. Select **Save Policy**.

5. In the Grafana console, create alert rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Alerting** > **Alert Rule**.

b. Select **New Rule**.

c. Set the Query and Alert Condition.

d. Set the data source, metrics, and the necessary filters.

e. Set the alert evaluation behavior.

f. Enter the rule name.

g. In the summary and annotations section, add a summary or a description.

h. From the scroll down, select **+Add New**.

i. Enter the node, resource, and metric information.
This information is required for the node, resource, and metric_name fields for the event.

> **Note:**
> Use the value string to pass these values. For example, a node can be {{ $values.C0.Labels.instance }}.

j. Under custom labels, provide the required labels to direct your notifications to the appropriate contact point.

> **Note:**
> You can also pass the severity under custom labels. The same is used for events. The available severity options are: critical, major, minor, warning.

k. Click **Save**.

Result
Alerts start flowing from Grafana into the Event Management plugin. The plugin extracts information from the original Grafana alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

> **Note:**
> - For Grafana v7.4.3, you may see extra clear events coming into ServiceNow which aren't bound to an alert. Ignore them as they're created to overcome the issue of Grafana not sending information in the clear notification.
> - A severity parameter is added which is used only for Grafana 8 and above. The provided value is used as a severity for an event if the severity isn't passed in custom labels.

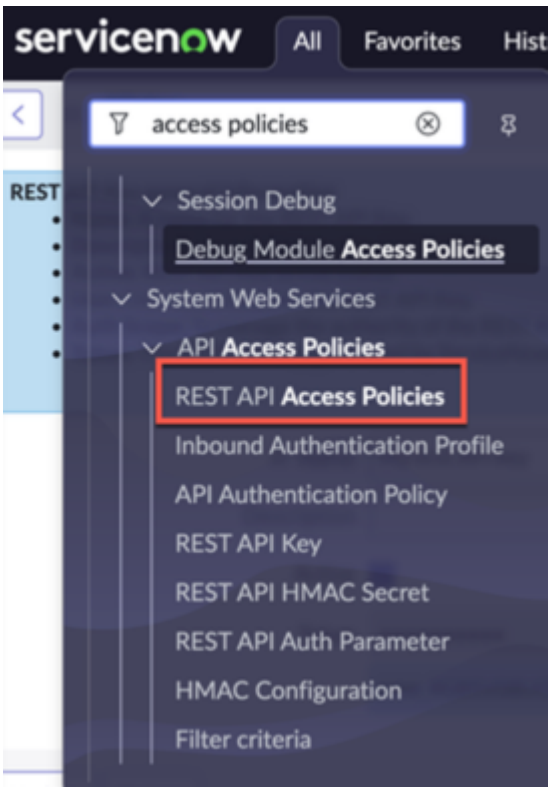
Integrate Grafana with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_integration

Procedure
1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

API Key

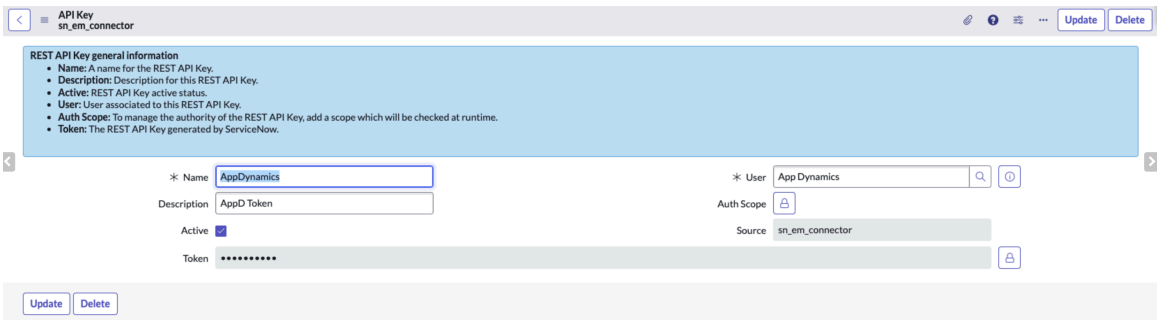
Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate Honeycomb events

Integrate Honeycomb with Event Management by creating a webhook and configuring it as a trigger in the Honeycomb platform.

Before you begin

Discovery for Honeycomb services and datasets is not supported. For event/CI binding to work, manually create a CI in the ServiceNow instance.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from Honeycomb by authenticating Honeycomb as a data source. In the Honeycomb platform, set your ServiceNow AI Platform as the rest endpoint using a webhook.

Procedure

1. In the Honeycomb platform, create an integration of *`type=webhook`*.

   a. Navigate to **Usage** > **Integrations**.

   b. Select the **Add Integration** button.

   c. Enter values in the **Name** and **Webhook URL** fields.
   When enting the Webhook URL, use the following format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=honeycomb`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

d. In the **Provider** field, select **Webhook**.

e. Select **Add** to complete webhook creation.

2. Add the webhook to a trigger.
   a. Navigate to **Triggers** > **Create New Trigger**.
   b. Add a name and description for the trigger in the relevant fields.
   c. In the **Alerts** section, configure the threshold and frequency in the relevant fields.
   d. In the **Recipients** section, select **Add Recipient** and select the webhook created in step 1.
   e. Select **Save Trigger**.

> **Note:**
> To view the trigger in the Honeycomb platform, navigate to **Quick Response (in Alert)** and select **Show Trigger in Honeycomb**.

Result

Alerts flow from the Honeycomb connector into the Event Management plugin. The plugin extracts information from the original Honeycomb trigger message to populate the required event fields, and inserts the event into the database. You can view the events in your ServiceNow AI Platform instance by navigating **All Events**.

Honeycomb does not send severity information in the trigger message. The default severity for the Honeycomb alert is *`3 - Minor`*, which can be changed in the Push Connector Configuration section of **Push Connectors** > **Honeycomb Push Connector** . The valid severities are: *`1- Critical`*, *`2- Major`*, *`3- Minor`*, *`4- Warning`*, and *`5- Info`*.

Integrate Instana events

Integrate Instana with Event Management by adding a standard webhook in the Instana console.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_admin

Procedure

1. In the Instana console, navigate to **Settings** > **Events & Alerts** > **Alert Channels**.
2. Open the **Add Alert Channel** dropdown and select the **Generic Webhook** option.
3. In the **Webhook URLs** field, create an alert channel by entering the following URL:
   `https://<instance>.service-now.com/api/sn_em_connector/em/inbound_event?source=instana`
4. To authenticate the ServiceNow URL, enter the following in the **Custom HTTP Request Headers**:

Field	Value
Key	Authorization
Value	Basic <base64_encoded username:password>

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Configure Instana to create alerts for event types or events.

   a. Navigate to **Settings** > **Events & Alerts** > **Alerts**.

   b. Select **New Alert**.

   c. In the **Events** section, select one of the following:
      - Alert on Event Type(s)
      - Alert on Event(s)

   d. When creating alerts for event types:
      i. Select the type of events for which you want alerts to be created, such as **Critical Issues**, **All Incidents**, **Warning issues**, and so forth.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   e. When creating alerts for events:
      i. Select the events for which you want alerts to be created.
      ii. In the **Alerting** section, select the **servicenow** alert channel.

   When Instana creates an alert, the alert is sent to the ServiceNow instance. Alerts created for the host entity are bound to the Server (cmdb_ci_server) table, and alerts created for the website entity are bound to the HTTP(S) (cmdb_ci_endpoint_http) table.

   Add other entity types in the Instana - ci_type Event Field Mapping table to ensure that the entity binds with the correct CI in the ServiceNow instance.

6. To view the event in the Instana source system, you can access it from a ServiceNow instance:

   a. Navigate to **All** > **Event Management** > **Service Operations Workspace**.

   b. Select **All Alerts**.

   c. Select the relevant alert.

   d. On the **Details** tab, locate the **Actions** section on the right side of the page and in the **Show Event on Instana UI** cell, select **Launch app**.

Integrate ServiceNow Cloud Observability Events

Integrate ServiceNow Cloud Observability with Event Management by adding a standard webhook in the ServiceNow Cloud Observability platform. Download the Event Management Connector plugin from the ServiceNow Store so you can integrate with ServiceNow Cloud Observability.

Before you begin

- Role required: evt_mgmt_integration

About this task

Authenticate ServiceNow Cloud Observability as a data source to enable Event Management to collect events from ServiceNow Cloud Observability. In your ServiceNow Cloud Observability platform, use a standard webhook to set your ServiceNow AI Platform instance as the rest endpoint.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Ensure the evt_mgmt_integration role is assigned to the selected user. To ensure proper authentication, use the least privileged user with the evt_mgmt_integration role, rather than a high privileged user.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. Create a CI.

   Note:
   Discovery for ServiceNow Cloud Observability services isn't supported. Create a CI manually in a Service Instance (cmdb_ci_service_auto) table to enable binding.

   a. Navigate to **All** > **Configuration** > **Application Service**.

   b. Select **New**.

   c. In the form, enter the name.
   The name must be the service name provided in the ServiceNow Cloud Observability platform.

   d. From the Operational Status list, set the operational status to **Operational**.

   e. Select **Next**.

   f. Select **Done**.

2. In your ServiceNow Cloud Observability platform, create a notification destination.

   a. From the navigation bar, select **Alerts**.

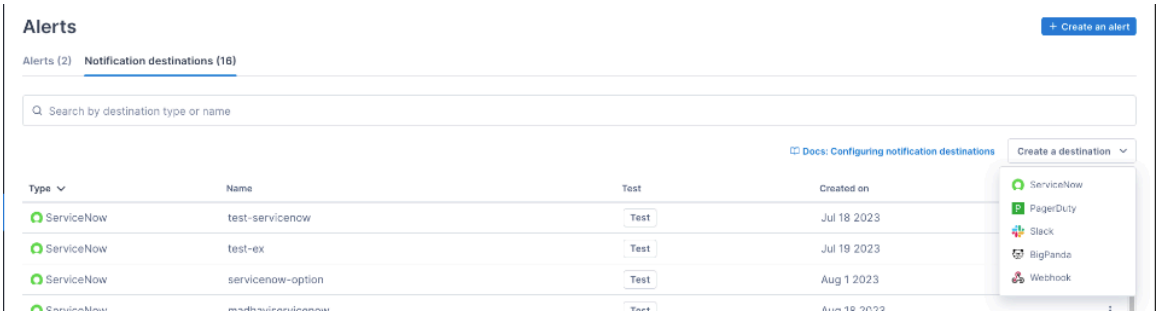
   b. Select the **Notification destinations** tab.

   c. Select **Create a destination**.

   d. Select **ServiceNow** or **webhook**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Use the ServiceNow destination to connect only with the ServiceNow platform. If you have any issues with the ServiceNow destination, then use the **webhook** destination option.



3. In your ServiceNow Cloud Observability platform, create a ServiceNow notification destination.

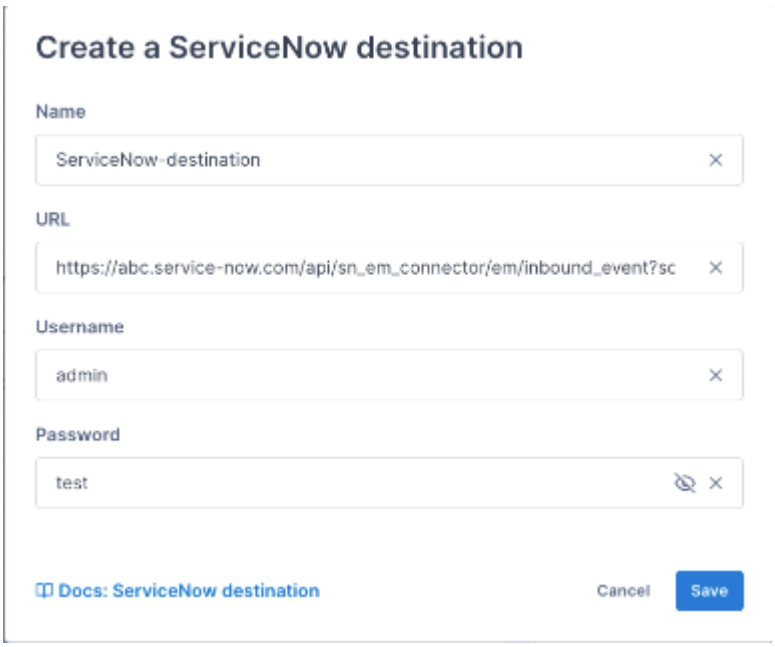
   a. In the **Name** field, enter a name for the ServiceNow destination.

   b. In the **URL** field, provide the ServiceNow instance URL.
   This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<instance-name>.servicenow.com/api/sn_em_connector/em/inbound_event?source=lightstep`

   c. In the **Username** field, enter your ServiceNow user name.

   d. In the **Password** field, enter your ServiceNow user password.

Create a ServiceNow destination



Note:
In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *`cmdb_ci_service_auto`* table.

   e. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. **Note:**
   If you have any issues with the ServiceNow destination in the previous step, then use the **webhook** destination option.

   In your ServiceNow Cloud Observability platform, create a **webhook** notification destination.

   a. In the **Name** field, enter a name for the webhook destination.

   b. In the **URL** field, provide the webhook URL.
   This is the default format of the URL to push events from ServiceNow Cloud Observability to the ServiceNow AI Platform instance. Use this format: `https//<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=lightstep`

   c. Select **Payload Template**.

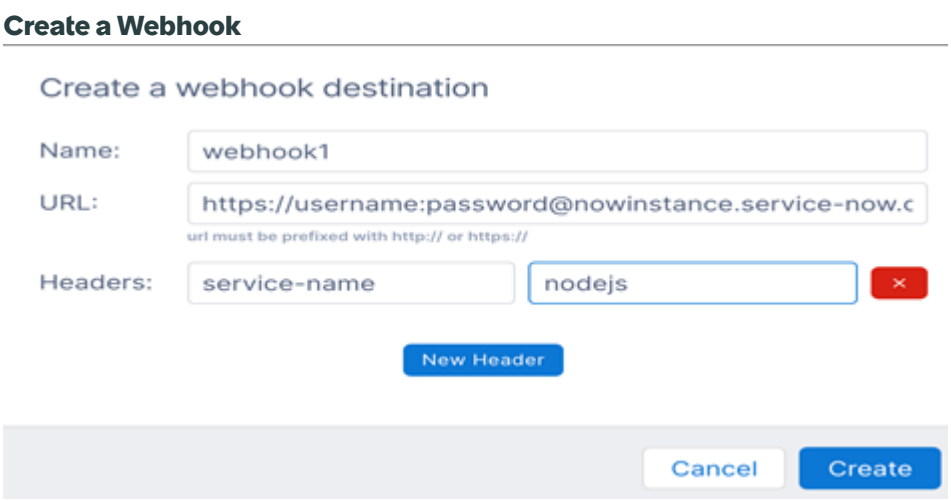
   d. Select the **ServiceNow Event Management** option.

   Note:
   In a ServiceNow instance, CI binding occurs only if the name of the service in the ServiceNow Cloud Observability platform value matches the name fields of the CI you created in the *cmdb_ci_service_auto* table.

   e. If you selected the **Default Template** option in the previous substep, then select **New Header** and in the **Headers** field, enter the **service-name** and define its **value**.

   Note:
   In a ServiceNow instance, CI binding occurs only if the **service-name** header value matches the name fields of the CI you created in the **cmdb_ci_service_auto table**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



f. Select **Create**.

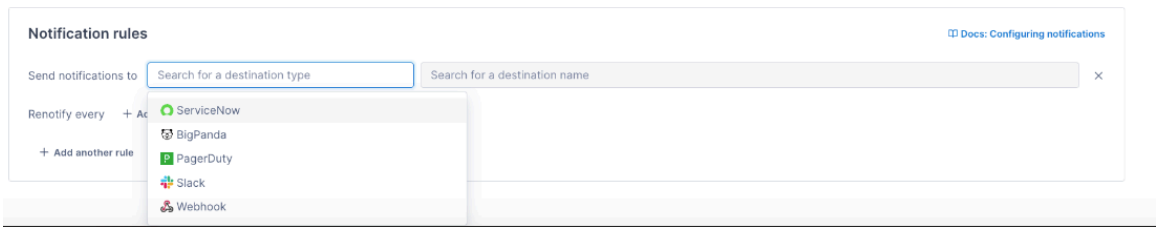
5. In the ServiceNow Cloud Observability platform, configure an alert.

a. From the navigation bar, select **Alerts**.

b. Select **Create an Alert** and enter an alert name.

c. In the Alert Configuration area, define the threshold.

d. According to the destination that you created, in the **Notification Rules** area, in the **Send Notifications to** field, select your notification destination type and search for the destination name.



e. Select **Save**.
The default severity for stream-based alerts is **Critical**. You can change the default in the Push Connector Configuration area of an ServiceNow AI Platform instance. The valid severity values are:

- 1- Critical
- 2- Major
- 3- Minor
- 4- Warning
- 5- Info

Integrate Logicmonitor events

Integrate Logicmonitor with Event Management to send events into ServiceNow by adding a webhook using Basic Authentication, it will also be available with bi-directional functionality.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- The Event Management plugin must be installed on the ServiceNow AI Platform instance.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Logicmonitor. In your Logicmonitor console, set your ServiceNow AI Platform instance as the rest endpoint using a standard webhook.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.

      Note:
      If you are using the bi-directional Connector update, do not select the **Acknowledged** check box. Doing so can trigger a loop back to the Alert and close the Alert record unintentionally.

   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `https://{Instance-name}.service-now.com/api/sn_em_connector/em/inbound_event?source=logicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.

b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.

c. Under the Stages section, select the Add icon to add a stage and click **Save**.

d. When you create the new stage, select the Add icon again to search for the user and add the integration as the Contact Method and click **Save**.

3. After creating the escalation chain, configure alert rules for the chain you created.

a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.

b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.

c. Under the Escalation chain menu, select the escalation chain you created.

d. Click **Save**.

Note:
To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

Event collection from Logicmonitor

The MID WebService Event Collector enables you to collect JSON formatted event messages from the Logicmonitor.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure that you:

- Deploy and start the MID Server. See MID Server configuration .
- Configure and start the MID Web Server. See Configure the MID Web Server extension.
- Configure and start the MID WebService Event Collector. See Configure the MID WebService Event Collector Context.

Role required: evt_mgmt_admin

About this task

JSON formatted event messages are sent from Logicmonitor. The MID Server transforms the collected event messages by parsing them using the TransformEvents_MidLogicmonitor script include, located here: **Event Management** > **Integrations** > **PushConnectors**. In the Push Connectors page, click **Logicmonitor Mid Push Connector**.

The default format of the URL to push event messages from Logicmonitor to the MID Server is `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.

Variables in the default URL

Variable	Description
MID_Server_IP	IP address of the MID Web Server Extension.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Variables in the default URL (continued)

Variable	Description
MID_Web_Server_Port	Listening port of the MID Web Server Extension.
MID_Web_Server_User	Username for the MID Web Server Extension.
MID_Web_Server_Password	Password of the user of the MID Web Server.

Procedure

1. In the Logicmonitor console, create a custom HTTP Delivery integration.
   a. Navigate to **Settings** > **Integrations** and click **Add** > **Custom HTTP Delivery Integration**.
   b. In the Manage Custom HTTP Delivery Integration form, fill in the **Name** and **Description** field and select the **Use the same URL and data to notify on various alert activity** check box.
   c. Specify when to send a notification on alert activities by selecting the **Acknowledged**, **Cleared**, and **Escalated/De-escalated** check boxes as needed.
   d. In the HTTP method menu, select **HTTP POST**.
   e. Fill in the **Username** and **Password** field, and enter a URL with the format as, `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=TransformEvents_MidLogicmonitor`.
   f. Under the Alert Data section, select **Raw** and select the format as **JSON**.
   g. Add the custom payload provided in the description of the connector.
   h. Click **Test Alert Delivery** to verify the connection or **Save**.
2. When you're finished creating the integration, create an escalation chain for the alert settings.
   a. Navigate to **Settings** > **Alert Settings** > **Escalation Chains** and click **Add**.
   b. In the Manage Testing chain form, fill in the **Name** and **Description** field and select the rate at which the alerts should be notified.
   c. Under the Stages section, select the Add icon to add a stage and click **Save**.
   d. When you create the new stage, select the Add icon again to search for the user and add the integration as the Contact Method and click **Save**.
3. After creating the escalation chain, configure alert rules for the chain you created.
   a. Navigate to **Settings** > **Alert Settings** > **Alert Rules**, and click **Add**.
   b. On the Add Alert window, configure the conditions that initiates the alerts when conditions are violated.
   c. Under the Escalation chain menu, select the escalation chain you created.
   d. Click **Save**.

Note:
To map the CI to the **cmdb_ci_vm_object** record instead of the **cmdb_ci_server**, enable the event rule created for Logicmonitor. The Logicmonitor's collector name, which comes in as a hostname in the payload, should be the same as the object_id of the virtual machine discovered in the **cmdb_ci_vm_object** record.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Integrate Oracle Cloud Infrastructure alarms

Integrate Oracle Cloud Infrastructure (OCI) alarms with Event Management to send events into ServiceNow by adding a https subscription using Basic Authentication.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Oracle Cloud Discovery must be performed to ensure that the created alerts are bound to the configuration items in the ServiceNow AI Platform. For more information, see Oracle Cloud Infrastructure Discovery.
- Role required: evt_mgmt_integration

About this task

The Oracle Cloud Notifications service enables you to set up communication channels for publishing messages using topics and subscriptions. When a message is published to a topic, the Notifications service sends the message to all of the topic's subscriptions.

When an Oracle Management Cloud alert is raised, worsens in severity, or clears, you may want to be actively notified through an https custom URL to the ServiceNow instance. The Oracle Cloud connector will be used to create events in ServiceNow®.

You can configure the Event Management environment for the collection of alarms from Oracle Cloud by setting your ServiceNow AI Platform instance as the https subscription.

Procedure

1. In the Oracle Cloud console, set up a https subscription.

   a. On the Create Subscription form, under the Configure Subscription section in the Protocol list, select **HTTPS (Custom URL)**.

   > **Note:**
   > When the subscription is created, the password will not be shown in clear text.

   b. In the URL field, enter a URL with the format: `https://<username>:<password>@<instancename>.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   For example, `https://oracleevents:oracleevents@instance1.service-now.com/api/sn_em_connector/em/inbound_event/oraclecloud`.
   When the subscription is created with the ServiceNow instance URL, the Oracle Cloud Push connector will receive a payload that will confirm the subscription and is moved to an **Active** state in the Oracle Cloud console.

2. In the Oracle Cloud console, you can create an alarm definition and set the notification destination with the topic containing the https ServiceNow subscription.

   a. Navigate to **Observability & Management** > **Alarm Definitions**.

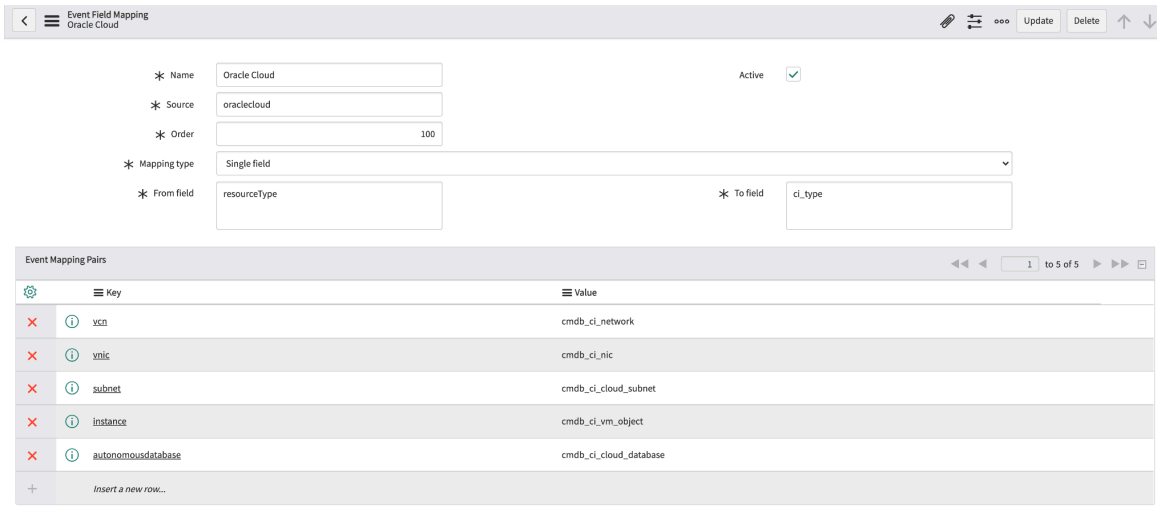
   b. Click **Create Alarm** or select an existing alarm that you want to set the topic containing the https ServiceNow subscription.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

c. In the Destinations section in the Topic list, select the topic with the https ServiceNow subscription.
When an alarm is triggered in the Oracle Cloud console, the same alarm will be received in the Oracle Cloud Push connector in the ServiceNow instance and an event will be created.

Result

Depending on the Oracle Cloud alarm resource, the alert will bind to the CI using the following Event Field Mapping:



You can create other event rules or modify the Event Field Mapping to map to other resource types.

Once the https subscription is configured and an Oracle Cloud alarm triggers a message in Event Management the message:

- Authenticates the Oracle Cloud alarm message with the relevant ServiceNow user given in the https subscription.
- Extracts information from the original Oracle Cloud alarm message to populate the required event fields and inserts the event into the ServiceNow AI Platform database.
- Captures specified content in the **Additional Information** field of the event form.

Integrate Prometheus events

Integrate Prometheus with Event Management by adding a standard webhook in Prometheus's Alert Manager.

Before you begin

- Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.
- Verify Configuration Items for the hosts managed by Prometheus exist in ServiceNow. These CIs can be physical or virtual, and can be either manually created or discovered using IP discovery or Cloud discovery.
- Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from Prometheus.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Starting from the Xanadu release, the OOTB (Out-Of-The-Box) event rules provided with the connector, which you have not previously used (i.e., neither activated, deactivated, nor modified), will now have the **Apply additional matching rules** check box set to true. Previously, this check box was disabled. This change allows you to execute more event rules or automation using the same filter conditions for the events.

Note:
This feature applies only to active event rules.

Procedure

1. In the Prometheus instance, add a webhook.
   a. Navigate to Alertmanager.yml and add a webhook entry under the recievers.
   b. Enter the endpoint uRL. For example, use `https://<instance-name>/service-now.com/api/sn_em_connector/em/inbound_event?source=prometheus`.
   c. Type `basic_auth` underneath *`http_config`*.
   d. Add a username and password under *`basic_auth`*, then add the created webhook name in the receiver under *`route`*.
2. In the Prometheus instance, create an alert rule.
   a. Create a file for the alert rule and add its' path inside prometheus.yml under *`rules_files`*.
   b. Create the alert rule as per the prometheus format using PromQL.
   c. Restart AlertManager and Prometheus to reflect the changes.

Result

Alerts start flowing from Prometheus into the Event Management plugin. The plugin extracts information from the original Prometheus alert message to populate the required event fields and inserts the event into the database. In your ServiceNow AI Platform instance, navigate to **All Events** to see the events.

If severity isn't received in the payload, the default severity is Major, which can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **Prometheus Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

Note:

To map hosts to the *`cmdb_ci_vm_object`* record instead of *`cmdb_ci_hardware`*, enable the **Prometheus VM Binding** event rule created for Prometheus. For further information about event rules, see Event rules.

Integrate Sentry events

Integrate Sentry with Event Management by adding a standard webhook in the Sentry platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for Sentry services are not supported. You must create a CI manually in the [cmdb_ci_service_auto] table to enable binding by completing the following steps:

1. From the navigation bar, go to **Configuration/Application Service**.
2. Provide the project name you are monitoring on the Sentry application.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Set the operational status to **Operational**.
4. Click **Next** then **Done**.

Role required: evt_mgmt_admin

About this task

Configure Event Management for the collection of events from Sentry by authenticating Sentry as a data source. In your Sentry platform, use a standard webhook to set your ServiceNow AI Platform as the rest endpoint.

Procedure

1. In the Sentry console, create an internal integration.
   a. Navigate to **Settings** > **Developer Settings**.
   b. Click **New Internal Integration**.
   c. In the Internal Integration Details section, on the Sentry Integration Details page, fill in the fields.

Sentry Integration Details

Fields	Description
Name	Name of your integration.
Webhook URL	The default format of the URL to push events from Sentry to the ServiceNow AI Platform instance. For example, `https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sentry`.
Alert Rule Action	Option to enable the integration. **Note:** When enabled, the integration becomes available in the Issue Alert and Metric Alert rules in Sentry. The alerts will be sent to the ServiceNow instance.
Schema	Schema for your UI components. This field should be left empty.
Overview	Description for the integration.
Authorized JavaScript Origins	Auth Tokens from the browser to enable the origins of the pages making the requests. This field should be left empty.

   d. In the Permissions section, under Issue & Event, specify the level of access you want. You can select **Read**, **Read & Write**, or **Admin**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

e. In the Webhooks section, select the **Issue** check box.

f. Click **Save Changes**.

2. In the Sentry console, create alert rules and configure them to receive alerts for issues from Sentry to the ServiceNow instance.

a. Navigate to **Alerts** > **Create Alert Rule**.

b. Select the alert type and click **Set Conditions**.

> **Note:**
> The Issues alert type creates issue alerts. The other alert options create metric alerts.

c. On the Alert Rule page, create either an issue alert or a metric alert.

Alert Rule

Option	Description
Issue alert	i. Enter the environment, team, and alert name for your alert. ii. Under Set conditions, enter the **When** and **If** conditions that will trigger the alert. iii. For the **Then** condition, select **Send a notification via an integration** and select your internal integration from the list. iv. Set the action interval for the alert.
Metric alert	i. Add a filter to your transactions. ii. Select the function and time interval. iii. Set the thresholds that will trigger the alert. iv. Add the actions to be performed when the thresholds defined are met. v. Add your internal integration from the list to the list of actions to receive the alerts. vi. Add a rule name and team for the alert.

d. Click **Save Rule**.

Integrate Scout APM events

Enable the collection of events from Scout APM by authenticating Scout APM as a data source to integrate it with Event Management.

Before you begin

The Event Management plugin (com.glideapp.itom.snac) must be installed.

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Discovery for Scout APM applications is not supported. To enable binding, you must manually create a CI in a ServiceNow instance in the Service Instance [cmdb_ci_service_auto] table.

Role required: evt_mgmt_admin

Procedure

1. Enable Scout APM monitoring as an application service on your ServiceNow instance.
   a. Navigate to **Configuration** > **Application Service**.
   b. Provide the application name that you are monitoring.
   c. Set the operational status to Operational.
   d. Select **Next**
   e. Select **Done**.
2. Log in to the Scout APM console.
3. Create a notification channel.
   a. Navigate to **Organization** > **Alerts & Notifications**.
   b. Select **New Webhook**.
   c. Provide the name of the webhook and the webhook URL.
      Use the following URL format: `https://<USERNAME>:<PASSWORD>@<INSTANCE_NAME>.service-now.com/api/sn_em_connector/em/inbound_event?source=scout`
   d. Validate whether the webhook is operational by selecting **Send Test Alert**.
      A new event appears on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.
4. In the Organization section, create a new notification group.
   a. On the **Alerts & Notifications** page, navigate to **Organization** > **Notification Groups**.
   b. Add a name for the group and select the webhook channel you created.
   c. Select the **Create Notification Group** button.
5. In the application section, create alert conditions and configure them to receive alerts for notifications from Scout APM to the ServiceNow instance.
   a. Navigate to **Applications** > **Alert Conditions**.
   b. Select the type of alert condition.
      For more information, see the Scout APM documentation.
   c. Select **Create Alert condition**.
   d. In the Alert Conditions table, select the notification group you created.
      The alert condition is displayed on the Scout console.
6. Configure error notifications to receive alerts for errors from the Scout APM to the ServiceNow instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. Navigate to **Application** > **Error Notifications**.

b. Add a name and description for the notification.

c. Select the notification group that you created.
The Scout APM notification channel is configured with the error notifications.

d. Select the **Add Notification Group** button.
For any new error notifications in the Scout APM application, a new event will be generated in the Events [em_event] table.

Result
You can view all notifications on your ServiceNow instance in the Events [em_event] table with the data source as Scout APM.

Integrate Sumo Logic events

Use the Sumo Logic push connector to integrate Sumo Logic with Event Management by adding a standard webhook in the Sumo Logic platform.

Before you begin
Ensure that the Event Management connector's plugin is installed on the ServiceNow AI Platform instance.

Role required: evt_mgmt_integration

About this task
Configure the Event Management environment for the collection of events from Sumo Logic by authenticating Sumo Logic as a data source. In the Sumo logic site, set your ServiceNow AI Platform instance as the rest endpoint using a webhook.

Procedure
1. In the Sumo Logic site, create a notification destination.
2. Go to Monitoring and select **Custom Webhook**.
3. Fill in the form with the Name, Description, and the URL.

   Use this URL format to push events from Sumo logic to the ServiceNow Instance `.https://<username>:<password>@<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=sumologic`

   Note:
   Use a credential having the evt_mgmt_integration role as the username and password.

   In the Payload section, use the following template:

```
{
    "type": "{{MonitorType}}",
    "node": "{{ResultsJSON._sourceHost}}",
    "metric_name": "{{Name}}",
    "description": "monitor Query: {{Query}}\n
 Trigger Condition:{{TriggerCondition}}\n
 Trigger Value:{{TriggerValue}}\n Trigger Time
 Range:{{TriggerTimeRange}}\n View Trigger
 Query:{{TriggerQueryURL}}\n View Monitor:{{QueryURL}} \n
 Results:{{ResultsJSON}}",
```

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
    "name": "{{Name}}",
    "short_description": "{{Description}}",
    "MonitorType": "{{MonitorType}}",
    "Query": "{{Query}}",
    "QueryURL": "{{QueryURL}}",
    "ResultsJson": "{{ResultsJson}}",
    "NumQueryResults": "{{NumQueryResults}}",
    "Id": "{{Id}}",
    "DetectionMethod": "{{DetectionMethod}}",
    "TriggerType": "{{TriggerType}}",
    "TriggerTimeRange": "{{TriggerTimeRange}}",
    "time_of_event": "{{TriggerTime}}",
    "TriggerCondition": "{{TriggerCondition}}",
    "TriggerValue": "{{TriggerValue}}",
    "TriggerTimeStart": "{{TriggerTimeStart}}",
    "TriggerTimeEnd": "{{TriggerTimeEnd}}",
    "SourceURL": "{{SourceURL}}",
    "alertResponseUrl": "{{alertResponseUrl}}"
  }
```

Log Monitors Type events can be created without CI binding since you're receiving the node value as "node": "{{ResultsJSON._sourceHost}}" in the event payload from Sumo Logic. You can create events but you can't bind them since you don't get them as host names for the log monitor type. A push connector parameter was created - "create_log_monitorType_events" with a value of False. If the param value is False, the payload is ignored, and "log" events aren't created. If you change the param to True, events are created, and then you must define event rules for CI binding.

Refer to the following ServiceNow Severity Mapping with Sumo logic TriggerType table:

Severity Mapping

Sumo Logic Trigger Type	Severity
Critical	Critical
Warning	Minor
MissingData	Warning
ResolvedCritical/ResolvedWarning/ ResolvedMissingData	Clear

Integrate Sumo Logic with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

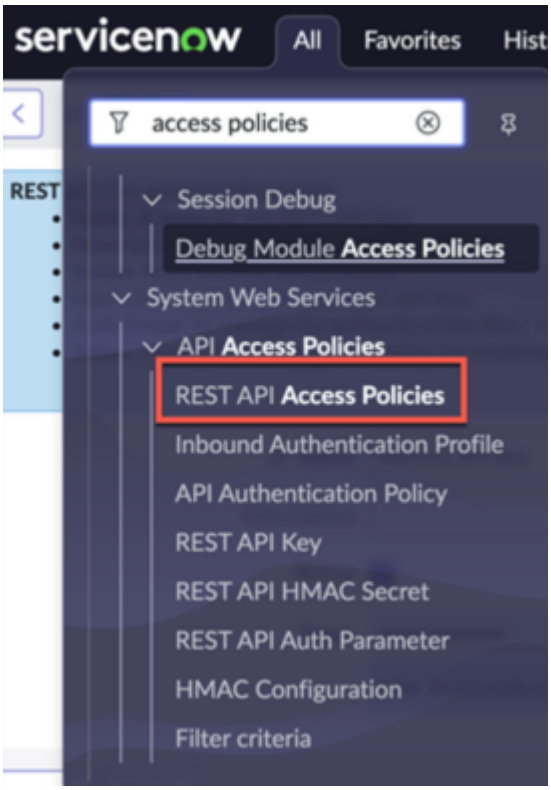
Before you begin

Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

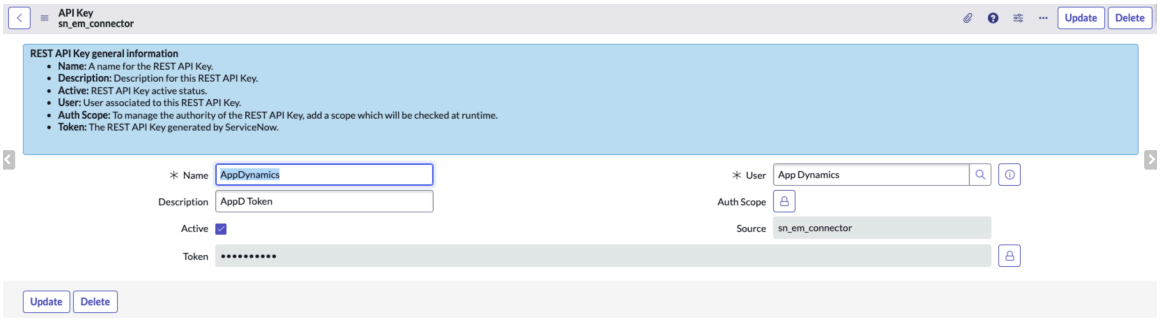
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated by the ServiceNow AI Platform. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Integrate ThousandEyes platform events

Integrate ThousandEyes with Event Management by adding a standard webhook in the ThousandEyes console.

What authentication is used

There are two methods of authentication:

- OAuth authentication: Provides enterprise-grade authentication to keep your enterprise environment safe. Authentication is performed using ThousandEyes Monitor V1 or V2 access tokens. For more information, see Integrate ThousandEyes with OAuth authentication.
- Basic webhook authentication: Provides a basic standard of authentication, without the need for ThousandEyes Active Directory. This authentication can be especially useful for distributed small teams, such as SRE or DevOps teams. For more information, see Integrate ThousandEyes with basic authentication.

Integrate ThousandEyes with basic authentication

Integrate ThousandEyes with Event Management by adding a webhook in the ThousandEyes platform.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Discovery for ThousandEyes services is not supported, so you must create a CI manually in the ServiceNow instance for event binding to work.

Role required: evt_mgmt_admin

About this task

Configure the Event Management environment for the collection of events from ThousandEyes by authenticating ThousandEyes as a data source. In your ThousandEyes platform, set your ServiceNow AI Platform instance as a rest endpoint using a webhook.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In the ServiceNow instance, complete the following steps to create a CI.
   a. From the navigation bar, navigate to **All** > **Configuration** > **CI Class Manager**.
   b. Click **Hierarchy** and search for `HTTP(S) Endpoint`.
   c. Select **CI List** and create a new CI.
2. In the ThousandEyes platform, create a notification destination.
   a. From the navigation bar, navigate to **Alerts** > **Alert Rules**.
   b. Click on any existing alert rule and select the **Notification** tab.
   c. Select **Edit Webhook** and enter the following information.

Edit Webhooks

Field	Description
Name	Enter a name for the webhook.
URL	Provide the webhook URL. **Note:** The default format of the URL to push events from ThousandEyes to the ServiceNow instance is `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=thousandeyes`.
Auth Type	Select **Basic**.

   d. Click **Add New Webhook**.

Result

The default severity for the ThousandEyes alert is **Major -2**, which can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid values of severity are **1- Critical**, **2- Major**, **3- Minor**, **4- Warning**, and **5- Info**.

The default timezone of the ThousandEyes alert is GMT, if you want to send the alert in a different timezone, it can be changed in the *`Push Connector Configuration`* section of **Push Connectors** > **ThousandEyes Push Connector**. The valid value format is **GMT+01:00**, **GMT +02:00**, **GMT-05:30**, **GMT-02:00**, etc.

Integrate ThousandEyes with REST API key token

Integrate using an API key to establish secure communication and automate data exchange via REST API. This simplifies integration, enabling seamless access to services and enhancing operational efficiency.

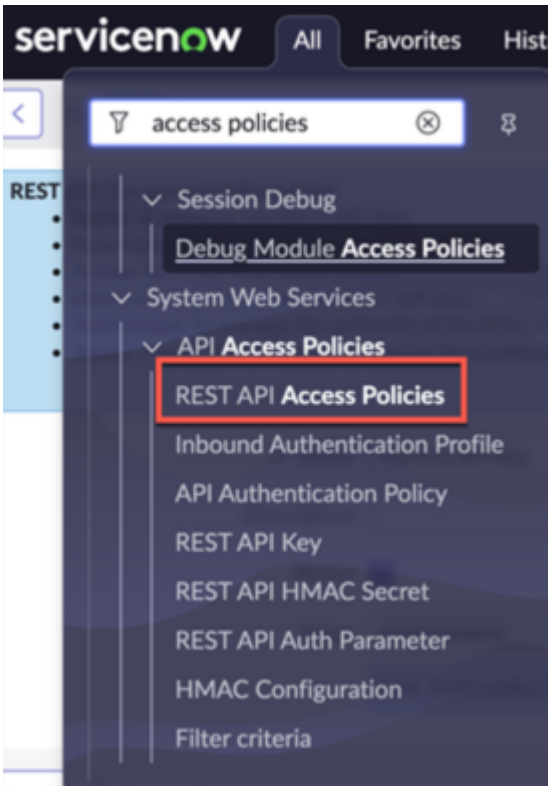
Before you begin

Role required: evt_mgmt_integration

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **System Web Services** > **API Access Policies** > **REST API Key**.



2. Select **New**.
3. On the form, fill the fields.

> **Note:**
> The user needs to be created with the evt_mgmt_integration role. Create a new one on the sys_user table to use here to facilitate the right access.

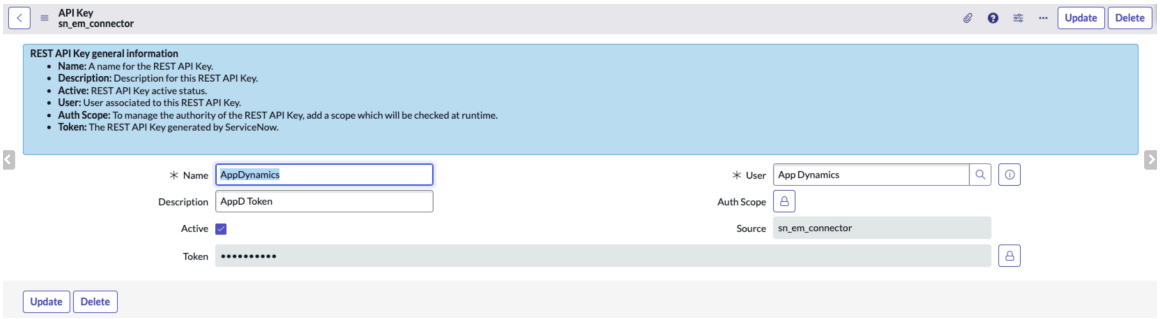
API Key

Field	Description
Name	Name to identify the REST API Key
Description	Description for the REST API Key.
Active	Status of the REST API Key.
User	User associated to the REST API Key. Use the look-up icon to select the user.
Auth Scope	Option to add auth scope to manage the authority of the REST API Key.
Token	The REST API key generated. Copy the key to use as part of the REST API call within the Header or Query parameter.
Expiry	Time after which the credential is no longer valid. Empty value means no expiration.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Unlock Auth Scope and add: UserAccount.
5. Use the form menu and select **Save**.

   The system generates a token and saves it in the **Token** field. To see the token, use the lock icon and copy the contents display below the field. This is your query parameter (or header) value when your other system sends a REST API request to ServiceNow.



Result

Now you are ready to start sending events. In your monitoring tool you can send events either with the header or the query `param: x-sn-apikey`. For example:

```
https://[INSTANCENAME].service-now.com/api/sn_em_connector/em/inbound_event?source=[SOURCENAME]&sys_id=[SYSID OF PUSH CONNECTOR INSTANCE]&x-sn-apikey=[AUTH TOKEN]
```

Integrate ThousandEyes with OAuth authentication

Create credentials in the instance and configure the ThousandEyes webhook.

Before you begin

Role required: web_service_admin

Procedure

1. Navigate to **All** > **System OAuth** > **Application Registry** and then select **New**.
2. Select **Create an OAuth API endpoint for external clients**.
3. Copy the automatically generated field **Client ID**.
   The **Client ID** is used when configuring the ThousandEyes SeviceNow integration.
4. Unlock the **Redirect URL** field and assign the value: **https://app.thousandeyes.com/webhooks-oauth-callback/**
5. Configure the Access and Refresh token lifespans by providing a value in seconds.
6. Open the ThousandEyes webhook configuration and complete the following fields:

   Name

   Any name

   URL

   ServiceNow ThousandEyes Push connector end point

   Select Auth Type

   OAuth

   Grant Type

   Implicit

   Auth URL

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

https://servicenow_insatnce>.service-now.com/oauth_auth.do

Client ID

Paste the Client ID automaticcally generated in Step 3.

7. Select **Get Token**.
8. Once the ThousandEyes connector navigates to a webpage requesting to connect to your ServiceNow account, select **Allow**.
9. Provide account credentials which have the **web_service_admin** role.

Integrate Panopta as a data source

Integrate the Panopta cloud-based monitoring solution with Event Management. To add Panopta as a data source, configuration is required in Panopta.

Configure Panopta

To prepare Panopta as a datasource, follow the procedure described in this link: How do I integrate with ServiceNow.

When the Event Management integration is configured in Panopta, add the integration to any of your Panopta Alert Timelines so that the ServiceNow instance receives incident events accordingly.

Optional Event Management configuration

Configure an alert action rule for launch in context of Panopta. For more information, see Launch web application from alert and Create or edit an alert action rule.

Related topics

Configure Event Management connectors

Integrate Event Integration (EIF) format event connector

Use the push connector that allows events to be forwarded from products, generally from IBM, that support the Event Integration (EIF) format to a MID Server.

Before you begin

Ensure that the Event Management Connectors (sn_em_connector) plugin is installed on the ServiceNow AI Platform instance.

Ensure the MID Server is assigned with `EventManagement` or `ALL applications`.

Role required: evt_mgmt_integration

About this task

Configure the Event Management environment for the collection of events from products that support the EIF format to a MID Server.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **EIF listener context**.
2. Click **New**.
3. Create a new EIF listener context by completing the EIF listener context form:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the form, fill in the fields.

EIF listener context form

Field	Description
Name	Unique name for the EIF listener context.
Short Description	Short description of the MID Server extension execution context.
Port	Port for the EIF listener to receive EIF events. The default value is **9998**. However, if the port is already in use, you can use any other free port instead.
Status	The status of the EIF listener. This field is blank until the listener is run. After the listener has run, the value is automatically populated to one of the following statuses: ▪ Started: The listener is running. ▪ Stopped: The listener is not running. ▪ Offline: The MID Server is down. ▪ Error: The listener failed with an error.
Execute on	The MID Server location for running the listener.
MID Server	The name of the designated MID Server when you select **Specific MID Server** in the **Execute on** field.
Executing on	The name of the MID Server on which the extension is running. This field is automatically populated with the name of the MID Server even if it's down. If you stop the extension, this field is empty.

b. On the form, you can select the related links on the EIF listener context form.

Commands available on the EIF listener context form

Related Link	Description
Start	Select this option if the listener is not running. The listener is started on the configured MID Server and port number.
Stop	Select this option to stop the running listener on the configured MID Server.
Restart	Select this option to stop then start the listener on the configured MID Server and port number.
Update Parameters	Select this option if you want to make changes to the listener configuration of the current running listener. If the parameters

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related Link	Description
	are valid, the listener disconnects and reconnects with new parameters.
Test Parameters	Select this option to test if the port is a valid number.

4. When you're finished, right-click the form header and select **Save**.
5. Click **Update**.
6. If you want to check the incoming EIF traffic, complete the following steps:
   a. Navigate to **MID Server** > **Servers**.
   b. Select the MID Server the EIF extension is running.
   c. Under the **Configuration Parameters** tab, add the **mid.log.level** properties.

What to do next
If the MID Server fails to start, you can review the MID Server log errors.

EIF events warning severity

If the EIF event payload has a warning severity, it will be mapped differently in the ServiceNow instance.

EIF events severity	ServiceNow events severity mapping
UNKNOWN	Warning
Warning	Minor
Minor	Major
Critical	Critical
Fatal	Critical

Create a push connector configuration parameter

Some connectors have no parameters that are shipped out of the box. Therefore, it's necessary to create and add the parameter to the push connector configurations list in the form layout before adding the new parameter.

Before you begin
Role required: evt_mgmt_admin, personalize_form

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connectors**.
2. Open a push connector.
3. On the **Push Connector** form, right-click on the form header and select **Configure** > **Form Layout**.
4. In the **Available** list, search for **Push Connector Configurations** > **Push Connector**, and move it to the **Selected** list.
5. Select **Save**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

6. In the Push Connector Configurations [sn_em_connector_push_config] table, double-click on **Insert a new row** to add a new push connector configuration parameter.
7. Select **Update**.

Result
Push Connector Configurations list added to push connector form layout. You can now create push connector parameters.

Configure a push connector instance

Configure a push connector instance to receive the events from an external system.

Before you begin
Ensure that you've defined a push connector definition.

Role required: evt_mgmt_admin

About this task
You can use a connector instance to receive the events coming from external sources. You can create the following type of push connector instances:

- Instance type
- MID type

Procedure
1. Navigate to **All** > **Event Management** > **Integrations** > **Push Connector Instances**.
2. Select the connector instance that you want to configure, or select **New** to create a push connector instance.
3. On the **Push Connector Instance** form, fill in the fields.

   For more details, see Push connector instance form.
4. Select **Submit** or **Update**.

Result
The push connector instance form is saved and now you can receive the events from an external system.

Configure event collection for SNMP traps

The SNMP listener runs on the MID Server, which acts as a collection endpoint for SNMP traps. The MID Server sends the traps to the ServiceNow instance for further processing as an event by Event Management.

Before you begin
Role required: agent_admin

Note:

- To view the MID SNMP Trap Listener in the UI: agent_admin
- To perform other operations, any one of the following roles is required: agent_admin, evt_mgmt_integration, or evt_team_operator

Ensure that the MID Server is assigned with either `EventManagement` or `ALL applications`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

Use the **MID SNMP Trap Listener** to listen for SNMP traps. In this configuration, the specified MID Server acts as a collection endpoint for SNMP traps.

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID SNMP Trap Listener**.
2. Click **New**.
3. Complete the SNMP Trap Collector Context form.
4. Right-click the form header and select **Save**.
5. In the **Credentials for SNMPs** section, specify the required SNMP v3 credentials that the SNMP listener uses for authentication.

   Note:
   The **Credentials for SNMPs** section appears only when `v3` is selected in the **SNMP version** field.

6. In the **Related Links** section, click **Test parameters**.
7. Click **Update**.
8. **Optional:** If the MID Server fails to start, review the MID Server log errors.

   (Optional) When working with object identifiers (OIDs), the OID trap counter may cause problems activating event rules. To remove the trap counter from the OID, navigate to **MID Server** > **Properties** and set the **mid.em.snmp_old_key_counter_cut.enabled** property to **true**.

What to do next

In **Related Links**, these actions may be run against the SNMP traps listener:

Commands available in the SNMP trap listener form

Related Link	Description
Start	If it is currently not running, starts the listener. The listener is started on the configured MID Server and port number.
Stop	Stops the running listener on the configured MID Server. If the listener is not running, no action is taken.
Restart	Stops, then starts the listener on the configured MID Server and port number.
Test parameters	Tests that the port is a valid number.
Update parameters	If you make changes to the listener configuration, use this option to update the parameters of the currently running listener. First, the parameters are tested for validity. If the parameters are valid, the listener disconnects and reconnects with the new parameters.

Note:
Updates to the SNMP trap listener take effect only after clicking **Restart** or **Update parameters**.

Related topics

SNMP probe MIB modules

Configure the SNMP traps listener to receive OEM traps

Configure the SNMP traps listener to receive OEM traps

Configure the SNMP trap listener to receive traps from Oracle Enterprise Manager (OEM).

Before you begin

Role required: evt_mgmt_admin

About this task

Event Management can process Oracle Enterprise Manager Cloud Control SNMP traps as events. For the SNMP trap listener to receive traps from OEM, you must designate the MID Server that runs the SNMP trap listener as a recipient of the trap. Upon receiving an OEM trap, the MID Server sends the trap to the ServiceNow instance for further processing as an event by Event Management.

The `OEM 12c Trap` event rule is provided with the default base instance, as well as these alert action rules:

- `Oracle EM Launch Target Status`
- `Oracle EM Launch View Event`

Procedure

1. Navigate to **All** > **Event Management** > **Integrations** > **MID SNMP Traps Listener**.
2. Click **New**.
3. Fill in the fields, as described in Configure event collection for SNMP traps.
   For the **SNMP version** field, select: `v1 and v2c`.
4. Click **Submit**.

Note:

Ensure all required SNMP MIB files are uploaded on the instance. For more information, see Load a MIB module.

.

What to do next

In Oracle Enterprise Manager Cloud Control, configure the MID Server as a trap listener target.

Configure SNMP Trap collection for high availability

For SNMP traps, the MID Server requires failover configuration for the trap listener.

You can configure two MID Servers for failover. Because the SNMP Trap listener on the MID Server receives inbound traffic on the IP address and port of the MID Server, you configure each MID Server to receive the same SNMP traps. Only one MID Server is active at any point in time, therefore Event Management does not receive duplicate traps.

Configure message keys to spread SNMP object identifiers

By default, most SNMP trap events are processed by a single Event Management processing job. This can negatively effect event processing. Configure message keys on the MID Server to ensure that more than one processing job is invoked, ensuring optimal SNMP trap performance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **MID Server** > **Servers**.
   The **MID Servers** page opens.
2. Select the relevant MID Server and on the MID Server page, select the **Configuration Parameters** tab.
3. Click **New**.
4. In the **Parameter name** field, select *mid.snmp.event.oid.keys*.
5. In the **Value** field, enter a comma separated list of OIDs to be used for the message key.
6. Click **Submit**.

   Note:
   The OID trap counter may cause problems activating event rules. To remove the trap counter from the OID, navigate to **MID Server** > **Properties** and set the **mid.em.snmp_oid_key_counter_cut.enabled** property to **true**.

7. To set conditions in a script that determine the message key to be used based on the SNMP traps received:
   a. Navigate to **MID Server** > **Script Includes**.
   b. Locate and select **SNMPTrapKeyFilter**.
   c. In the **Script** field, set conditions for which OIDs are to be used based on the SNMP trap event received.
   d. Select the **Active** check box to activate the script.
   e. Click **Update**.

Configure event collection from email

Configure an inbound email action to send email notifications when events and alerts are triggered.

Before you begin
Role required: evt_mgmt_admin

About this task
When you add an inbound email action to send email, Event Management uses inbound email actions to process inbound email in the same manner as any external event. The email content is used to generate and update events, use rules to generate alerts, or change event severity. The severity is updated after the impact calculation and stored in the em_impact_status table.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Inbound Email Configuration** section, in the **Email receiving enabled** option, select **Yes** to enable the collection of events from email.
3. To configure the email information to pass to Event Management for event and alert processing, navigate to **System Policy** > **Email** > **Inbound Actions** and in the list of Inbound Email Actions records search for and open the default **create event** form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

a. On the **Inbound Email Actions** form, specify these values.

Field	Value
Active	Select the check box to enable the email notification.
Target table	Select **Event [em_event]**.
Action type	Select **Record Action**.

b. Select the **Description** tab and enter a description for the email message.

c. Select the **Actions** tab and select these **Field Actions**.

- **[Severity] [To] [<the event severity>]**
- **[Type] [From email] [<portion of the email>]**

  For example, you can select **Subject** as the portion of the email to use.

4. To customize the inbound parameters and map the text to event variables, add a **Script**.

   Example
   For example:

```
current.source = 'email';
current.event_class = 'email';
current.description = email.body_text;
current.time_of_event = new GlideDateTime();
current.insert();
```

5. From the instance, send an email that contains matching data, and then confirm that the event or alert information appears in Event Management.
   For more information sending email messages to create an instance, see Inbound email actions.

   Note:
   Ensure that the user who sends the email has the role **evt_mgmt_integration**.

6. Select **Submit**.

Result
The inbound email is sent to the em_event table and regular Event Management processes continue, for example, event rules and alert management rules run.

Event forwarding

Accelerate the event processing testing life cycle by forwarding a stream of events from your ServiceNow production environment to your non-production environment.

Use event forwarding to forward events from one instance to another, for example, from a production to a non-production instance. Event forwarding enables you to test and evaluate event rules, event field mappings, alert management rules, alert correlation, and so on, without having any impact on your production environment.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Not all monitoring sources can send events to multiple target instances. In such cases, you can configure a scheduled job to periodically forward the event stream from your ServiceNow instance that is connected to the monitored source to other instances.

Set up event forwarding

Create an event forwarding configuration record to enable events to flow from one ServiceNow instance to another instance. Forwarding events to multiple target instances requires creating separate configuration records for each target instance.

Before you begin

You must have a credential with the evt_mgmt_integration role, which enables you to create events in the target instance. If you don't have this credential, see Create basic auth server credentials for information on how to create it.

Role required: evt_mgmt_admin

About this task

The source instance, which forwards events to a target instance, must have a user with the evt_mgmt_integration role, a password for the credential, and a new event forwarding record. The target instance, which receives events from the source, must have a credential with the same user name and password as the source instance.

The event forwarding record contains details about the target ServiceNow instance URL to which events are to be forwarded along with the credentials to connect it.

You must create a separate configuration record for each target instance to forward events to multiple target instances. Events are then sent to each target instance with an active event forwarding configuration.

Procedure

1. On your source instance, navigate to **All** and enter `sn_em_connector_event_sync_configuration.list` in the filter navigator.
2. On the **Event Sync Configurations** page, select **New**.
3. On the **Event Sync Configuration** page, in the **Instance url** field, enter the target ServiceNow URL to receive events in the format `https://<your_instance>.service-now.com`.
4. In the **Credentials** field, provide the credentials for the target instance by either entering them or searching for them.
   - To enter your credentials, start typing and then select the credential from the drop-down list.
   - To search for your credentials, select the Lookup using list icon ( ) to select your credential from the credentials lookup table.
5. Select **Save**.
6. Select **Test Connection** to validate the connection to the target ServiceNow instance.
   - If the connection succeeded, a confirmation message displays.
   - If the connection didn't succeed, check your credentials and the instance URL.
7. When validated, select the **Active** check box to activate the event forwarding to the target instance and select **Submit**.
   The configuration is created and is listed on the **Event Sync Configurations** page.
8. For multiple targets, repeat the steps for a separate configuration record for each instance.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Related topics

Periodically run an event forwarding job

Periodically run an event forwarding job

Schedule an event forwarding job to periodically send events to all target instances with active event forwarding configurations when the monitoring source can't send events to multiple target instances.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize the *event - forwarding* job behavior through related system properties. For more information, see Event forwarding properties.

Note:
To minimize the performance impact, the scheduled job sends events not older than the latest hour when it ran for the first time after setting up event forwarding.

Procedure

1. Navigate to **All** > **Scheduled jobs** > **Event Management - Event Forwarding Job**.
2. On the **Scheduled Script Execution** page, select the **Active** check box.
3. In the **Repeat Interval** field, set the appropriate time interval for the job to run periodically.

   The default value is for the job to run every minute.
4. Select **Update**.

Result
The event forwarding job runs periodically based on the repeat interval that you set. Events are sent to all target ServiceNow instances that have active event forwarding configuration records.

If the admin account is disabled, configure the user of the scheduled job. By default, it's admin, but in this case, it must be changed.

Note:

If the event forwarding to the instance failed due to any reason, the **Last Event Forwarding status** field displays `Failed` with a corresponding error message displayed in the **Last Event Forwarding error** field. The target instance generates a self-health monitoring event during the next successful event forwarding indicating the failure of event forwarding for the specified time range.

Create basic auth server credentials

Create credentials to access a ServiceNow instance.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Connections & Credentials** > **Credentials**.
2. Select **New**.
3. Select **Basic Auth Credential**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the form, fill in the fields.

Basic Auth Credentials form

Field	Description
Name	Enter a unique and descriptive name for this credential.
User name	Name to identify the user.
Password	Password to use this credential.
Active	Option to enable the use of this credential.
Order	The order (sequence) in which the platform tries this credential while it attempts to log in to devices. The smaller the number, the higher in the list this credential appears. Establish credential order when using large numbers of credentials or when security locks out users after three failed login attempts. If all the credentials have the same order number (or none), the instance tries the credentials in a random order. Default value: `100`

5. Select **Submit**.

Result
The Basic Auth credential for use with the server instance is created.

Processing Events

Event processing is the process of taking events or streams of events, analyzing them and taking automatic action. The process includes viewing events, event binding, event rules and event field mapping.

An event is a notification from one or more monitoring tools that indicate something of interest has occurred, such as a log message, warning, or error. Events are processed and alerts are generated based on the following factors:

Event collection configuration via a MID Server, script, SNMP trap collector, or email message.

An Event rule, alert binding, or event field mapping configuration for processing events from various sources. When a package of events that contains events with a custom (non-supported) state is processed, the events with the custom state are not processed.

For more information, see Exploring Event Management.

View events

Event Management tracks individual events to manage external systems. These events are notifications from monitoring tools indicating occurrences of interest, like log messages, warnings, or errors. Event Management gathers events from external sources and stores them in the Event [em_event] table, offering a list of raw incoming events.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, evt_mgmt_user, or evt_mgmt_integration

Note:
Ensure that you do not change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The event monitoring tool generates the values of the source and resource fields. Event Management implementers can define event types and register nodes to help uniquely identify incoming events and create alerts for the specific needs of the enterprise. Event Management uses this information to determine whether to create an alert or update an existing one.

An event source may generate duplicate events with the same identifying information. For events with the same identifying information, Event Management uses the time interval between events to determine whether the events represent an existing issue or new issue.

Additional fields should be included in the **Additional information** field of the event. Do not add additional fields to an event by adding a custom field to the event [em_event] table. For more information about how to include additional fields in events, see Custom alert fields.

Note:
Avoid writing business rules for event [em_event] tables, as they can result in performance degradation.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.

   The All Events list displays the following columns.

All Events list

Column	Description	Populated by
Time of event	The time that the event occurred, in the network node time zone. The system supports time resolution in seconds.	External event monitoring tool
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.	External event monitoring tool
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.	External event monitoring tool
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.	External event monitoring tool
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.	External event monitoring tool
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.	External event monitoring tool
Metric Name	Unique name that describes which metrics are collected and for which this alert has been created.	External event monitoring tool
Message Key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.	External event monitoring tool
State	The status of the event:	Event

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description	Populated by
	○ **Ready**: Event has been received and is waiting to be processed. ○ **Queued**: Event is queued by the event processor job. ○ **Processed**: Event was successfully processed. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank. ○ **Ignored**: Value is not in use.	
Severity	Mandatory. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.	Event
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.	A matching event rule or event field mapping

2. To review a single event, click the required row in the **Time of event** column.
3. To review the event rules that processed the event, in the **Related Links** section click **Check process of event**.
   For further ways to see which event rules were applied to the event, you can display the `Event rule` and `Processing Notes` fields in the Events list.

Optional event fields to display the applied event rule

Column	Description
Matching Event rule	The event rule that matches the current event rule definitions. This information is primarily used to create event rule recommendations for events that currently are not covered by rules. If event rules have been modified, this information can be retrieved from the Processing Notes field, described below. **Note:** This field does not show the history of event rules that were applied to the event.
Processing Notes	Information related to the binding to CI type and the event rules that were applied to the event.

4. To create an event rule for an event that is not associated with an event rule:

   a. Click the event.

   The event opens in the Event form.

   b. Click **Create Event Rule**.
   The fields of the new Event rule are populated with data from the event. You can use the event information, for example, when composing fields for alerts.

Team-based integrations in Event Management

Team-based integrations empower teams to optimize event processing within Event Management to enhance efficiency and operational effectiveness.

Team-based integrations provides the following capabilities:

- Assign teams to particular connectors, providing a structured approach to integration efforts.
- Enable each team to define and apply custom rules, enabling a more targeted and straightforward handling of event processing.
- Route alerts automatically to the appropriate team members responsible for the integrated systems based on integration ownership and configuration item (CI) ownership.
- Enable seamless integration and automation through the automatic assignment of alerts to appropriate team members based on integration ownership and configuration item (CI) ownership.

Customize event rules, event mapping, and the precedence of team rules for team-based integrations. For more information, see Team-based integration properties.

Event rules

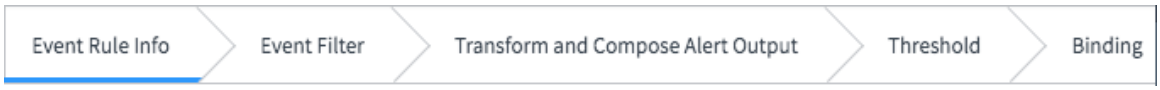
Use event rules to generate alerts for tracking and remediation. Event rules are stored in the Event Rule [em_match_rule] table. Configure and customize event rules to manage events and alert generation.

Event rules do not change the event records in the Event table. Changes to event data are stored in the ServiceNow instance memory.



Use the Event rule designer to create and configure event rules. You can use the default event rules or event rules that you have created to:

- Apply an event rule filter to determine whether the rule applies to an event.
- Apply a transform with **Event Match Fields** and optional **Event Compose Fields** to format the alert text.
- Apply a threshold to create custom alerts for rapidly recurring events.
- Automatically create or close alerts.
- Bind alerts to CI information from the CMDB.
- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

Create or edit an event rule

You can create event rules to generate alerts for tracking and remediation. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to general rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

View the list of available event rules on the **Event Rules** page to determine whether you want to create or edit an event rule.

You can create rules that:

- Transform information in events to populate specified alert field values and compose alert fields from various values.
- Configure threshold rules that create or close alerts only when the incoming matching events exceed the specified threshold.
- Bind alerts to CIs using CI identifiers.

Options to create the rule are:

- Create an event rule and assign event fields for alert generation.
- Create a rule from an existing event or group of events that don't have a rule. In this case, the event fields are copied to the Event Match Fields section of the rule.
- Edit an existing event rule.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For Team-based integrations, select an assignment group.
- Run multiple sequential rules defined for the same event by selecting the **Apply additional matching rules** check box. The event rules run in ascending order as defined in the **Order** field. Event rules applied to assignment groups only run after the global rules have run.

You can refresh an existing event rule with new event data. For more information see, Refresh event rules.

Note:

- Event rules that aren't configured to perform any action are skipped. Therefore, if the rule isn't configured as ignore, threshold, or binding, it's important to specify either the match or the composed fields.
- Make sure that you don't change the **Classification** field value in event [em_event] tables, either manually, by script, or by event rule.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules** and take one of the following actions.

Option	Description
Create an event rule from an existing event	**a.** Select the link for unassociated events or grouped events that aren't mapped to the rules.  **b.** Select the event that you want to use for cre ating the rule. The event fields are copied to the Event Field Rules section of the rule.
Edit an existing event rule	In the event rule list, select the required event rule to be modified. The event rule opens in the event rule designer where you can modify the values of the fields. Select **Save and Upgrade**  to modify the rule when the following banner message appears and you want to convert the event rule. `Rule cannot be viewed in the event rule designer. To modify the rule click 'Save and Upgrade'.`
Create an event rule	Select **New**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Ensure that **Active**

is selected.
When the rule is deactivated, Event Management finds and applies another event rule. An alert is still created for the event unless *Ignore* is selected in another applicable rule or when configuring the filter for this event rule.
3. Enter a unique and meaningful name and fill in the form.

Event Rule Info form

Field	Description
Source	Category to which this matching rule applies. The mapping rule only applies to events with the same event class value. If this value is empty, apply the rule to all events.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Description	Type additional information that describes the event rule.
Apply additional matching rules	Select to apply additional event matching rules according to the Order field. The last rule with binding settings sets the CI binding. When selected, the Thresholds tab is inactive.
Assignment group	For team-based integrations, select an assignment group. If no assignment group is defined in the event rule, then this event rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.

4. **Optional:** Define the event rule using these Event Rule Designer features.

Option	Description
Event Filter	Define a filter to restrict to which events the event rule must apply. See Filter the events that an event rule applies to.
Transform and compose alert output	Configure the customization of alert content. See Configure an event rule to customize alert content.
Threshold	Create or close alerts according to the spec ified threshold. See Set a threshold to sup press alert generation.
Binding	Configure event rules to automatically bind alerts to CI information from the CMDB. See Binding alerts to CIs.

5. Select **Save**, **Submit**, or **Update**.

Use event input information

The **Event Input** pane that is included in the steps to create an event rule provides a reference to the information that you can use when configuring an event rule.

In the **Transform and compose alert output** pane, you can also drag the information into the required fields to customize alert content. The fields in the right-hand pane appear as a reference to which fields, expressions, and their values are available when working in the Event Rule designer. The fields that display in the Transform and compose alert output left-hand workarea become the fields in the generated alert form. In addition, you can define alert tags that are specific for customization.

General components and navigation

The Event Input pane consists of these sections:

- Event Additional Info
- Expressions
- Event Raw Info

The Event Input pane displays in all Event Rule designer sections, except for the Event Rule Info section. The fields in the right-pane can be modified only in the Transform and compose alert output section. In all the other sections, the Event Input pane is read-only and available for reference purposes.

Note:

If **Accessibility enabled** 
is selected in System Settings, standard edit mode is not available .

Edit modes

Mode	Description
Standard edit mode	Text selected in the left-hand workarea cannot be edited. Undo is not available. In this mode, you can only mark the text or values and transform it by selecting a field name.
Regex edit mode	Edit text in the left-hand workarea by selecting it, as required. After you have edited the text, you cannot go back to the standard mode. **Undo** is not available. However, **Reset** is available, returning the field to its original value. You can compose text using regular expression (regex) format conventions, for example, type (.*) to create a field name. You

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Mode	Description
	cannot use field values like: type "$" to include the value of a field and specify the name of the field in parentheses {}. You can include special characters in a field by "escaping" them, that is, by prefixing the character with a "\". For example, to include a "\" in your text, enter "\\".

Event additional info

The Event additional info section displays default event form fields, plus fields that were created to display in alerts and that are added to the **Additional information** section of the alert.

When configuring text in the fields in the left-hand workarea, you can drag field names and/or their value from this section into the fields.

Expressions

The Expressions section is available only if an additional information field was created. You can create expressions from event raw data or from additional information data.

1. Click in a field in the **Event Input** pane to perform transformation actions.
2. Create an expression by transforming information and associating it with a field name. Either select a field name from the suggested list, or create a field name, as required.

3. Click in a field in the **Event Input** pane. In the left-hand workarea, select the required information.

Create expressions by transforming information and associating it with a field name. Select a field name from the suggested list, or you can create a field name, as required.

Event raw info

The Event raw info section is always available. Its contents are the fields from the Event form.

To transform text, click a field in the right-panel to open it in the work area on the left-panel, in the Mark Expressions section. You can select text in the **Mark Expressions** section where the selected text becomes the value of a newly created field. Name the new field. This new field is added to the Expressions section.

Note:
When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Controlling how fields appear:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Use the exclusion list [em_event_rule_black_list] table to hide fields from the right-pane.
- Use the em_event_rule_order form to order the position of each field.
- Fields that are not in the exclusion list and also not part of the em_event_rule_order table, still appear in the event rule designer, in the right-panel and in the **Transform and Compose Alert Output** tab.

Related topics

Create or edit an event rule

Configure an event rule to customize alert content

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

Filter the events that an event rule applies to

Define a filter to restrict to which events the event rule must apply. Configure the filter by providing a set of conditions that each event must match to be either excluded or included from applying to the event rule.

Before you begin

Ensure that a name is specified for the event rule.
Role required: evt_mgmt_admin

About this task

To construct the required condition statement, you can use event fields as well as additional fields that are defined in the **Additional Information** field of the event. Use these fields to configure conditions that can exclude events. Alternatively, you can filter incoming events to ensure that only those events that meet the required conditions are included.

Note:
Event rules filter is case-sensitive.

While working in the Event Filter tab:

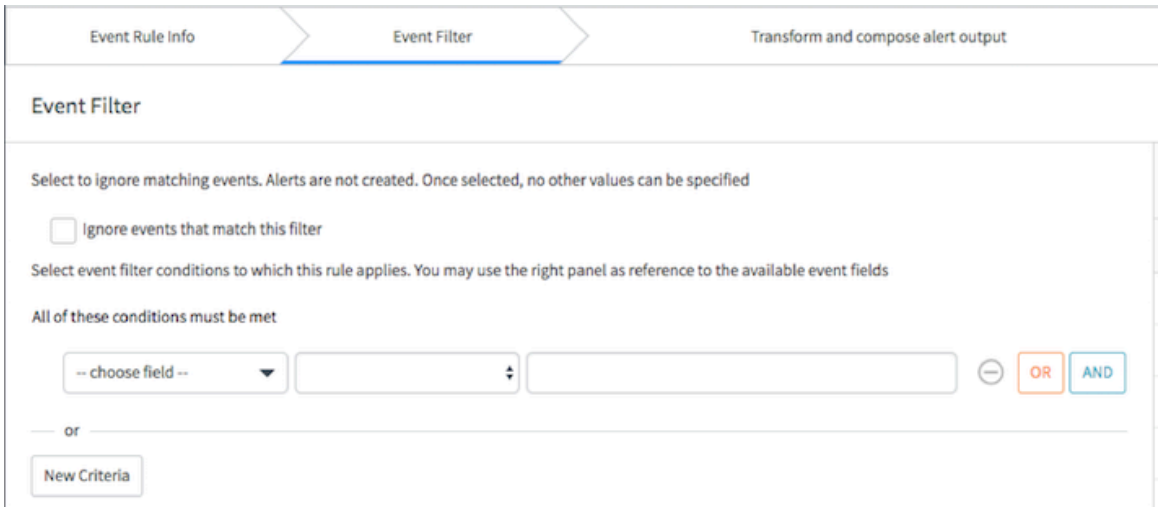
- In the Event rule list, if you selected a recommended rule or an existing rule, the filter fields are populated with values from these events. You can use these filter fields to compose filter conditions.
- You can click another tab (for example, **Threshold**), work in that area and then return to work in the Event Filter area without losing information.
- Use the right-panel as a source of reference for which fields are available to be used when composing filter conditions.

Note:
Event filters created on additional_info fields only perform a string comparison and not a numeric comparison, even if the information entered into the value field appears as if it is numeric, as depicted in the following graphic:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Event Filter**.



4. To ignore events, select **Ignore events that match this filter**.
   All events that match this event rule are ignored. You can add more conditions to the filter by clicking either **OR** or **AND**.

   Note:
   Even if an event is ignored by an event rule, the event is still recorded in the Event [em_event] table. Select this option to inhibit an alert from being created and be associated with the event.

5. To configure conditions to which the event rule must apply, click **New Criteria**.
   You can add further conditions by clicking either **OR** or **AND**.

   Note:
   The **%** character is not supported in filter conditions.

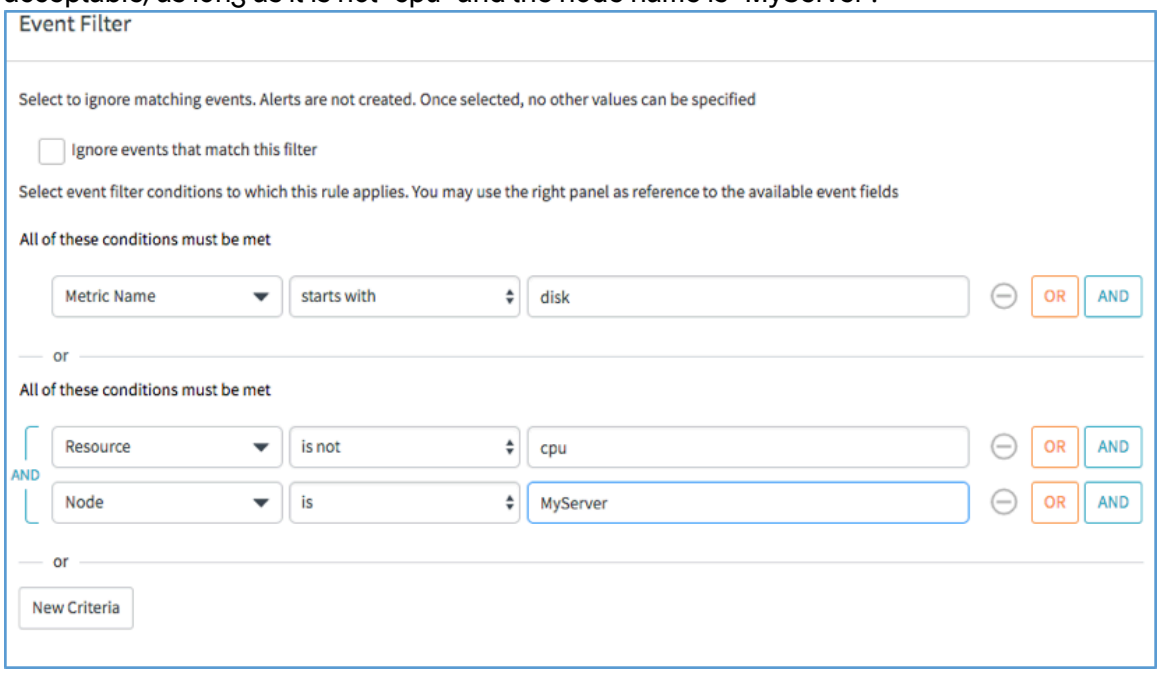
6. You can add field names to the Event Rule Simple Field Black Lists [em_event_rule_black_list] table to either show or hide fields from the filter.

   - To remove fields from the filter and the right panel, add a new black list field with **Show in rule** not selected.
   - To remove fields only from the filter and still enable it to appear in the right panel, add an exclusion list field with **Show in rule** selected.

7. Click either **Save** or **Submit**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:
Example showing filter conditions that are specified to run a rule when the metric name starts with the word "disk". For this example, any resource is acceptable, as long as it is not "cpu" and the node name is "MyServer".



Example to filter events using time conditions. In the **Select Field or add New** field, select `Time of event`.

Specify the required time conditions, for example, anytime after yesterday.

Find events that are not matched to rules

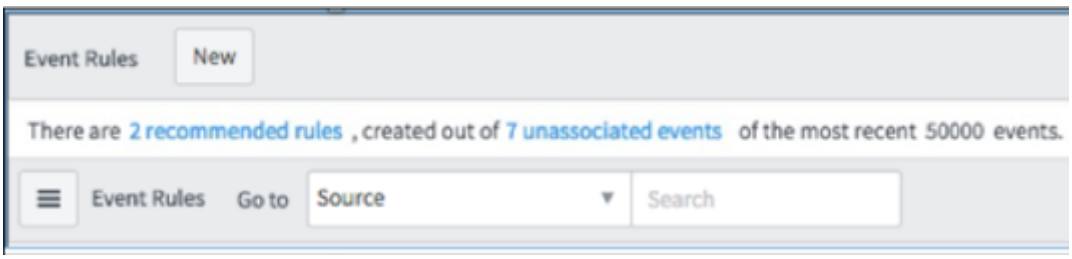
Find events that are not matched to any rules, and determine if it is necessary to create event rules to manage them.

Before you begin
Role required: evt_mgmt_admin

About this task
This task describes how to find events that are not matched to rules.

Procedure
1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Near the top of the form, click the link for events or grouped events that are not mapped to rules.

Example



What to do next
Create an event rule. For example, event rules are useful for managing events that occur regularly.

View event rules

You can view all event rules on the Event Rules list.

Before you begin
Role required: evt_mgmt_admin

Procedure

Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.

Event Rules list

Field	Description
Name	The event rule name.
Override default binding	Legacy binding criteria. If, in the **Bind** section criteria have not been specified or if the specified bind criteria are not matched, then the legacy binding criteria are considered.
Order	Order in which an event rule is evaluated when multiple rules are defined for the same type of event. Event rules are evaluated in ascending order.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Updated	Update date and time for the rule.

Note:
You can filter the Event Rule list to display the required subset of the information. However, if you create a favorite link after filtering, when the link is clicked the Event Rule list does not display the correct filter.

Configure an event rule to customize alert content

You can configure an event rule to customize alert content. You can customize the order of the fields and select which fields display. The fields in the left-hand work area of the **Transform and Compose Alert Output** section of an event rule are the fields that appear in the generated alert.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize alert content by adding the required event fields and modifying the text in the fields.

Note:
When creating regex expression for input, ensure that you create input with the variables in sequential order. While variables can be skipped for inclusion, the selected order must be maintained.

Format alert text by using one or both of these methods:

Format alert text

Format method	Description
Transform	Create a field to display in an alert. The field and its value appear in the **Additional Information** section or in the **Alert Tags** section. In the **Event Input** pane, the new field is listed in the **Expressions** section.
Compose	Determine which text to display in the selected field.

Note:

- Configure which fields display in the **Event Input** pane by configuring the exclusion list [em_event_rule_black_list].

  A field entered into the exclusion list that already appears in an existing event rule is not removed from the rule; instead, it is moved to the **Manual Attributes** section in the rule.

- Control the order of event form fields by configuring em_event_rule_order.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Click **New** or open an event rule.
3. Click **Transform and compose alert output**.

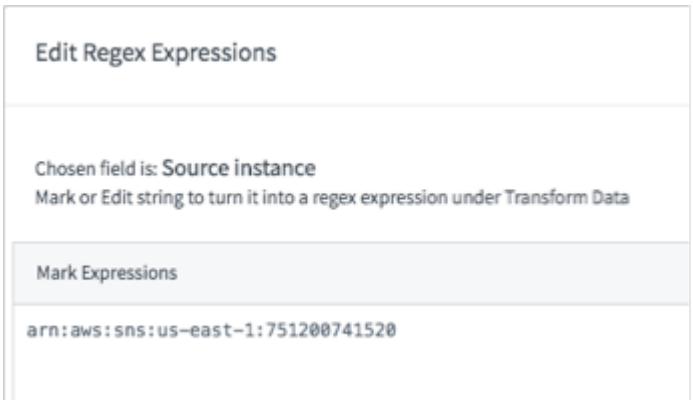
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

In this section, you can use the **Transform** mode and the **Compose** mode.

4. To transform information in fields—standard mode:

> **Note:**
> In this step, the selection of text is made in standard edit mode. In this mode, undo is available.

a. Click the required field in the Event Input pane. The value and contents of the selected field appear in the workarea on the left.

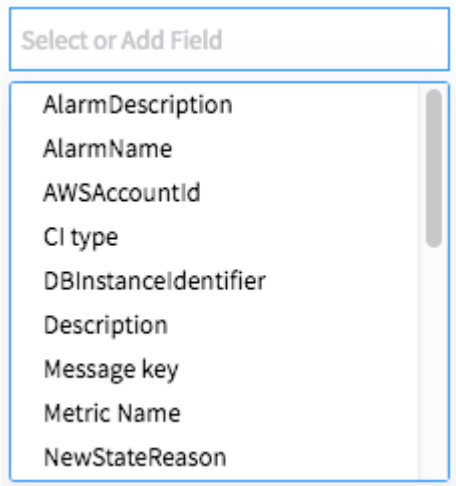


b. Select standard edit mode .

c. Using the pencil cursor, highlight the required text. You can double-click text in the field to select a word or select the required text and symbols.

> **Note:**
> If **Accessibility enabled** Accessibility enabled is selected in System Settings, standard edit mode is not available .

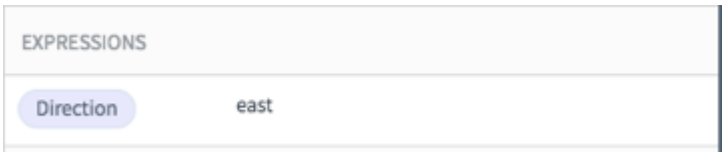
d. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane and the selected text is highlighted. Both the text and the expression name are highlighted in the same color. Each additional expression that you create, plus its value, is highlighted in a different color.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Transform field names cannot contain a ‘ (single quote) character.

e. Click **Done**. The expression name appears in the **Expressions** section of the **Event Input** pane.



f. If you click an expression or its value in the **Event Input** pane, the details display in the workarea on the left.

5. To transform information in fields—regex mode:

Note:

- In regex mode, undo is not available.
- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text `vhxy2stlgwc_8888_hec03v012979`, the regex

  ```
  ^([^_]+)_
  ```

  looks as if it should catch the text `“vhxy2stlgwc”` that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows:

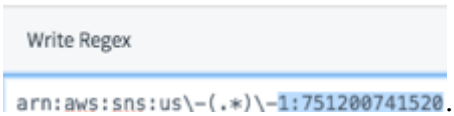
  ```
  ^([^_]+)_.*
  ```

- The Java Matcher parser is used for the regex engine. Ensure that you use a Java parser to test the regex.
- If the regex does not match the entire string when parsing data, the event rule will not capture the event, and no parsing takes place.
- The Java regex engine “matches” method is used. With this implementation, the regex engine attempts to match the entire input sequence against the specified pattern. Other matching methods, for example, the find method, are not supported.
- No regex flags are set by default, except the `Pattern.DOTALL` flag. With this implementation of Java regex, the DOT character ‘.’ matches any character, including a line terminator.
- Aside from `Pattern.DOTALL`, other regex flags cannot be changed.
- `Lookahead` is supported. However, `Lookbehind` is not supported.

a. Click the required field in the Event Input pane. The value and contents of the selected field appears in the workarea on the left.

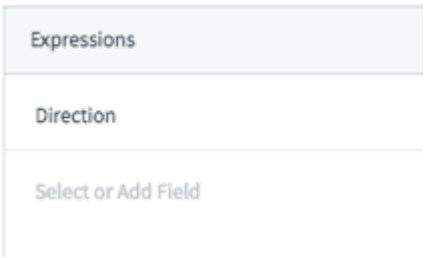
b. Select regex edit mode .

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

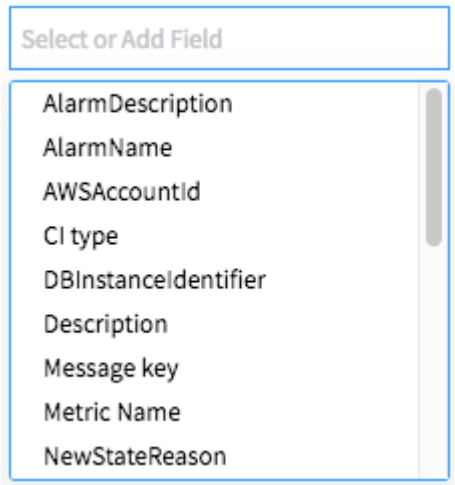


c. Select the required text and symbols `arn:aws:sns:us\-(.*)\-1:751200741520`. Replace the highlighted text with (.*) to create a regex expression.

d. In the **Expressions** pane, click the **Select or Add Field** field.



e. Select a field name from the list or enter the required expression name. Fields that appear in the list are existing event fields, additional info fields or previously defined alert tags (fields prefixed with "t_"). The field name appears in the **Expressions** pane.



Note:
Transform field names cannot contain a ‘ (single quote) character.

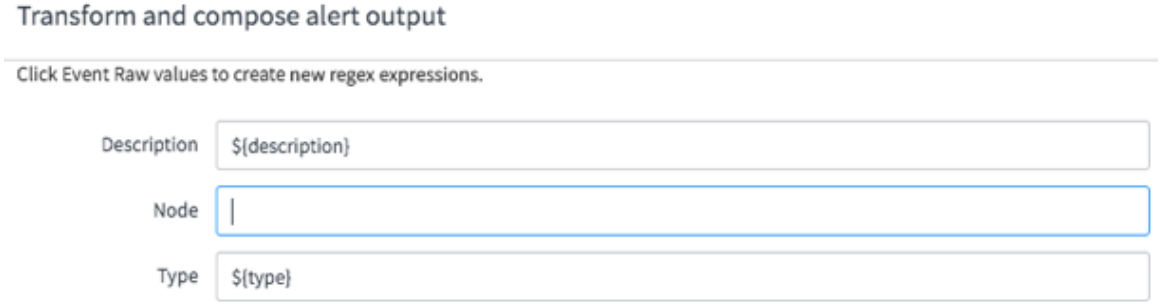
f. Click **Done**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:

- When building a regex expression from variables that are highlighted in the event, place the selected variables in the same order that they appear in the event field.
- When composing the event rule regex, specify the terms using an exact match of the input from the event fields. For example, for the text vhxy2stlgwc_8888_hec03v012979, the regex ^([^_]+)_ looks as if it should catch the text “vhxy2stlgwc” that appears before the underscore. However, it does not work as this text is not an exact match. Use the full regex, as follows: ^([^_]+)_.*

6. To compose text, in the Transform and compose alert output section, click in the required field.



Compose text in the alert fields by performing any of these actions:

- Drag a field from the Event Info pane into the required field.
- Use the Event Info pane as a reference of which fields are available. Write the field name details, using the format ${<fieldname>}, where "$" means "use the value". Between the brackets, the name of the event field replaces the <fieldname> variable.
- Freely enter text, spaces, or characters. For example, use spaces or underscore symbols (_) to make the text in the alert field readable.

7. To specify fields that must display in the generated alert, select the **Manual attributes** check box.

Note:
These fields, and their values, display in the **Additional Information** section or in the **Alert Tags** section for attributes prefixed with "t_".

a. In the left-hand column, enter a value.

b. In the right-hand column, either drag a value from the Add or Expression fields or type in a value.
When entering a value with attributes prefixed with "t_", a drop-down list appears with all the previously defined "t_" attributes.

8. Click **Save** or **Update**.

What to do next

You can filter event rules. See Filter the events that an event rule applies to.

Related topics

Create or edit an event rule

Use event input information

Alert tags

Filter the events that an event rule applies to

Set a threshold to suppress alert generation

The event threshold is the rate upon which Event Management generates an alert. Receiving multiple events for a device over a short interval may warrant creating an alert, as the condition may be serious. However, receiving events over a longer interval may indicate a less serious situation which would not warrant creating an alert.

Before you begin

Role required: evt_mgmt_admin

About this task

You can configure the properties in an event rule to create alerts, suppress alert generation, or close existing alerts according to a specified threshold. The threshold is based on the value of event fields or number of occurrences over a specified period.

> **Note:**
> **Field Name** can be the name of any numeric field in the **Additional information** field of the event. Therefore, if CPU is an additional information field for a specific event, then CPU can be used as a **Field Name**.

Assume that you want to generate an alert when CPU utilization reaches or exceeds 80% three times with no more than 20 seconds between any two consecutive events. Create an event rule with these settings (an explanation for each value is given in parentheses):

- **Create Alert Operator**: *>=* (operator to determine whether utilization of **Field Name** reaches or exceeds the specified value)
- **Field Name**: *CPU* (events regarding high CPU usage)
- **Threshold Value**: *80* (percent)
- **Occurs**: *3* (three events occur where the CPU usage is at or above ">=" 80%)
- **Over(seconds)**: *20* (20 seconds or less between events)

To demonstrate how the preceding settings are evaluated, assume that the following events are received:

Scenario	Outcome
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=80 • Third event elapse time 60, CPU=70	In this scenario, no alert is generated since one event has a CPU utilization that is under 80%.
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=90 • Third event elapse time 70, CPU=95	In this scenario, an alert is not generated since the elapsed time in one event is over the specified 20 seconds.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scenario	Outcome
Reported elapsed time and the CPU usage for each event: • First event elapse time 20, CPU=85 • Second event elapse time 40, CPU=95 • Third event elapse time 60, CPU=90	In this scenario, an alert is generated since in all events the elapsed time is within the specified time and the CPU usage is over 80%.

Note:

- When configuring an event rule to create or close alerts according to a threshold, events that arrive at the same second, as determined by the *time_of_event* field, are skipped. This occurs because these events are considered to be duplicates.
- When threshold conditions are configured, alerts close when the **Close Alert Operator** condition is met, and not when an event is received with **Severity = Clear** or **Resolution state = Closing**.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Create or open an event rule.
3. Click **Threshold**.
4. Select **Active**.
   If **Active** is not selected, the fields on this page do not appear.
5. In the **Create Alert Operator** field, select an operator.
   - If you select **Count**, specify the corresponding **Occurs** and **Over(seconds)** fields.
   - If you select any operator other than **Count**, the **Field name** and **Threshold value** fields appear. Specify the required values in these fields.

     Note:
     The value of the **Threshold value** property can be the name of any field in the **Additional information** of the event. For example, if CPU is a field in **Additional information** for a specific event, then `CPU` can be used as the **Threshold value**.

   - In the **Occurs** field, specify the required value.
   - In the **Over(seconds)** field, specify the required period.
6. To automatically close alerts, in the **Close Alert Operator** field, select an operator.
   Extra fields appear according to your selection.
   - If **Count** is specified as the operator for the **Create Alert Operator** field, then the selection in the **Close Alert Operator** field is either `None` or `Idle`. Specify the required value.
   - If you select **Idle**, configure the **Over(seconds)** field.
   - In the **Close Alert Operator** field, if you select an operator other than **Idle**, then configure the **Threshold value**, **Occurs**, and **Over(seconds)** fields.
7. Click **Save** or **Submit**.

Example:

To create an alert when a specific event occurs 5 times in 10 minutes, in **Threshold**:

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. In the **Field name** field, specify the name of any field that exists in the **Additional information** field in the event. The value of the field is irrelevant.
2. In the **Create Alert Operator** field, select `Count`.
3. In the **Occurs** field, specify `5`.
4. In the **Over** field, `600` (10 * 60 seconds).
5. Click **Save** or **Submit**.

To create an alert when a specific event occurs 5 times in 10 minutes with a metric value greater than 55. Assume that "metric_value" is a field in the **Additional information** of the event. Specify:

1. Select the *`Active`* check box.
2. In the **Create Alert Operator** field, select `>=`.
3. In the **Field name** field, specify **metric_value**.
4. In the **Threshold value** field, specify `55`.
5. In the **Occurs** field, specify `5`.
6. In the **Over** field, specify `600` (10 * 60 seconds).
7. Click **Save** or **Submit**.

Binding alerts to CIs

CI binding or linking is the process of finding and connecting a Configuration Item (CI) from the Configuration Management Database (CMDB) to an alert, using the logic defined in event rules. This helps ensure alerts are tied to the right IT components for better visibility and faster issue resolution.

Understanding CI binding

Binding alerts to CIs links incoming alerts to the correct Configuration Item (CI) representing a specific host, such as a computer, server, router, or virtual machine in your IT infrastructure. This ensures accurate alert tracking, simplifies troubleshooting by identifying the source of issues, and maintains a historical record of alerts tied to specific systems.

In IT Operations Management, the relationship between alerts and CIs plays a critical role in effectively managing services and infrastructure. A CI represents a component within your IT environment, such as a server, application, or database. Linking alerts to CIs ensures that alerts and incidents are directly associated with the affected component, enabling accurate impact analysis and faster resolution.

In dynamic and large-scale environments, it's often challenging to pinpoint which CI is responsible for triggering an alert. Alerts are generated from raw event data captured across multiple sources, but this data may not explicitly reference a CI. Without a reliable method to bind alerts to CIs, IT teams face the risk of:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Poor visibility into service impact.
- Longer mean time to resolution (MTTR).
- Inefficient alert management processes.

Event rules provide a structured way to analyze incoming event data, enrich it with additional context, and map it to the correct CI. These rules act as a bridge, transforming raw event data into actionable alerts linked to CIs. For example, event rules can:

- Parse incoming event data: The process involves breaking down raw event data to extract important details, such as hostnames, IP addresses, or service tags. These details are then used to analyze the event—identifying its source, type, and impact—and to enrich the alert by adding relevant context, like affected services, priorities, or resolution steps, ensuring it's actionable for IT teams.
- Match patterns: Here, the extracted event details—such as hostnames, IP addresses, or service tags—are compared against entries in the CMDB to identify the corresponding Configuration Item (CI) based on predefined rules or logic. Once matched, the alert is linked to the CI, providing context about the affected IT component for better visibility and faster resolution.
- Bind the CI to the alert: At this point, the alert is automatically associated with the identified CI. It ensures that the alert is connected to the right IT component in the system, making it easier to track and manage, and helping teams quickly address the issue.

Types of CI binding

Binding type	Description
Implicit Node binding (Default binding)	Binds alerts to host CIs by matching the **Node** field in the event with attributes like Name, FQDN, IP, or MAC address.
CI field matching binding	Binds alerts using the **CI Identifier** field, a JSON structure containing column names and values (e.g., Name, FQDN, IP, or MAC Address).
CI identification binding	Binds alerts to specific applications on hosts using event rules.
Process-level binding	Binds alerts to application CIs by matching process-related attributes.
Device-level binding	Binds alerts to device CIs by matching event data with attributes like hostname, IP address, or MAC address.

Key benefits

- Improved service visibility: Alerts linked to CIs provide a clear picture of which IT components are affected.
- Enhanced automation: Automated CI binding reduces manual effort, ensuring consistency.
- Faster resolution: Teams can quickly diagnose and resolve issues by focusing on the impacted CI.

Example use case

Scenario: A company's email server named MailServer-01 goes down.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Process:

1. Alert generation: An alert is triggered when MailServer-01 becomes unresponsive.
2. CI binding: Event Management automatically looks for MailServer-01 in the CMDB (Configuration Management Database).
   - If found, the alert is linked to this specific server (CI).
   - If not found, the alert remains unlinked until more information is provided.

Result: The alert now shows that MailServer-01 is the affected system.

- Impact: IT teams immediately know which server to investigate.
- Efficiency: They don't need to check other infrastructure components or systems, saving time and effort.

This direct link helps streamline troubleshooting by pointing to the exact problem source.

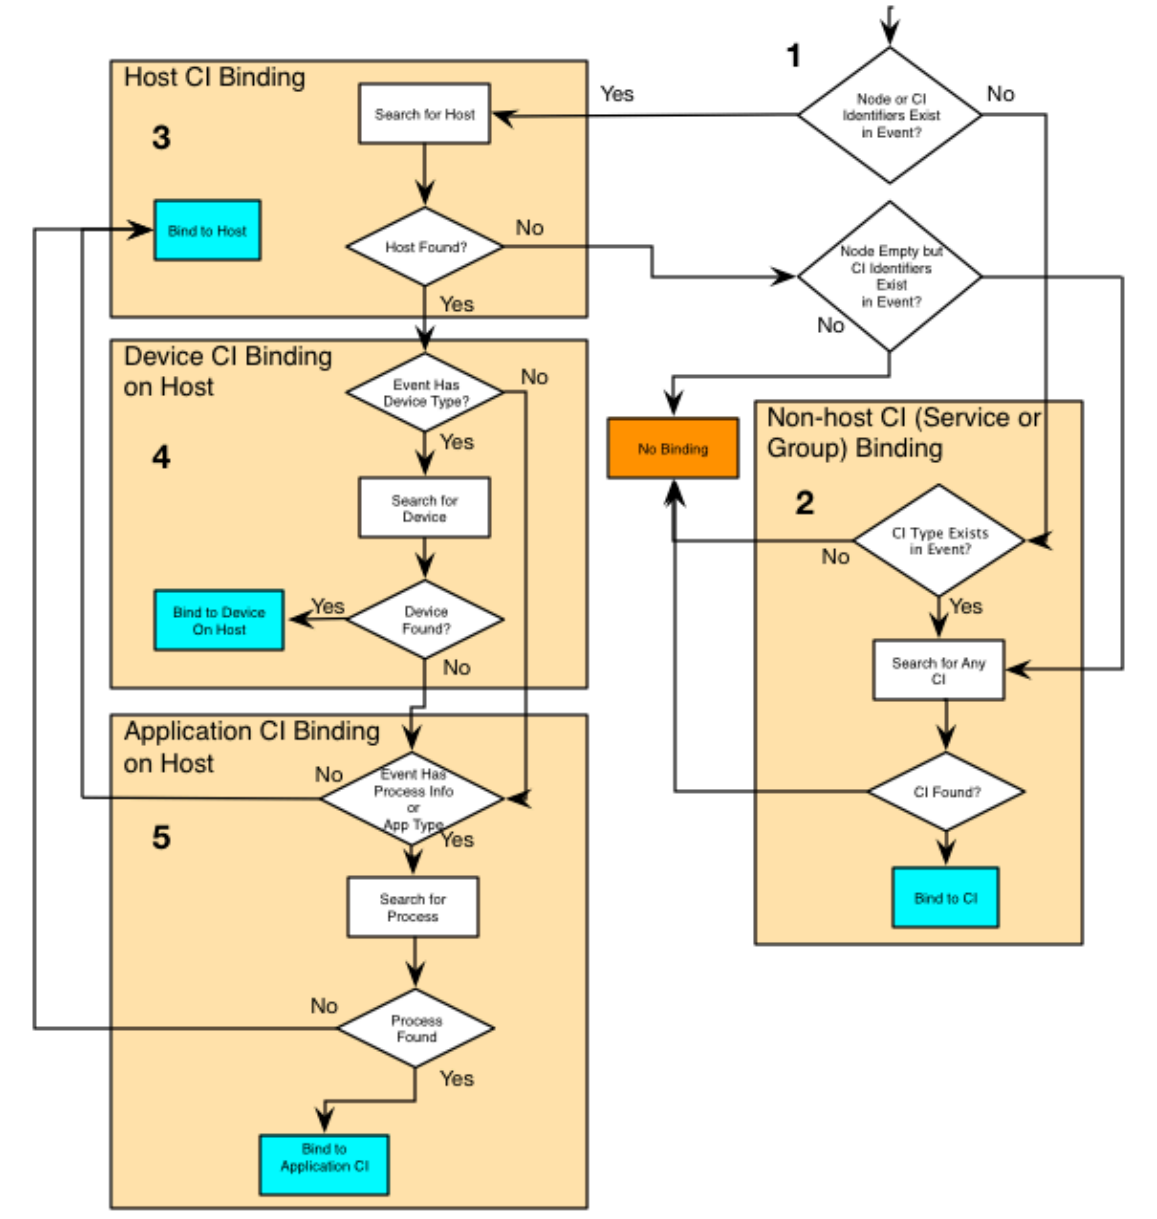
CI binding to alerts: Flow diagram



Process of linking CIs to alerts

1. Event Arrival: When an event is received, Event Management checks for node or CI identifiers.
2. Is Node Value Present?
   - Yes: If a node value is provided, Event Management searches the CMDB for a matching host.
   - No: If no node is found, the system attempts to bind the alert using other available details, such as:
     - Alert Type
     - Additional Information
     - CI Identifier
3. Host and CI Type Detection:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Both Found: If both a host and CI type are identified, the alert is linked to the corresponding device CI.
- Host Only Found: If only a host is identified, the system links the alert to an application CI.

Additional Considerations

- Event Processing Notes: The event can include the binding process flow in its **Processing Notes** field, providing insights into the binding actions.
- Binding to Retired CIs: By default, events do not bind to CIs with a Retired status. To enable binding to these CIs, set the *evt_mgmt.ignore_retired_cis_in_binding* property to false.
- Specifying CI Statuses for Binding: You can configure the *evt_mgmt.install_status_list_to_ignore_in_binding* property by specifying CI status numbers to control which CIs are considered for binding. For example:

CI Statuses

Status Number	Status
1	Installed
2	OnOrder
3	InMaintenance
4	PendingInstall
5	PendingRepair
6	InStock
7	Retired
8	Stolen
100	Absent

Note:
To specify multiple statuses, separate each status number with a comma.

Binding alerts to a specific host CI (default binding)

Binding alerts to Configuration Items (CIs) using the **Node** field or the **CI Identifier** field ensures accurate event association. By comparing an event record's **Node** or **CI Identifier** value, alerts are linked to the right system. This improves response, root cause analysis, and impact assessment by providing clear visibility into affected assets.

How default binding works

The system can perform default binding using the **Node** field or the **CI Identifier** field from the event record.

When an event enters the system, a key field like **Node** is available in the event record. However, there is no **Node** field in the CI. Instead, the node value from the event is compared with various attributes in the host CI, such as Name, Fully Qualified Domain Name (FQDN), IP, or MAC address. If a match is found, the alert is linked to the corresponding CI. This is the default method for binding alerts to CIs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The property *sa.active_operation_status* is used by the default binding mechanism, specifically when binding via IP/MAC using the node field in the event. When an event attempts to bind to a host through the node field (using IP/MAC), the system ignores hosts whose operational status is not included in this property and the operational status of the host must also not be null. By default, the property value is "1", which corresponds to Operational. You can extend the list to include additional statuses, and any status in the list is not ignored during binding.

Example: If *sa.active_operational_status* = "1,2", then both Operational and Non-operational hosts are considered valid for binding. The status attribute is defined by the following values:

- 1 – Operational
- 2 – Non-operational
- 3 – Repair in Progress
- 4 – DR Standby
- 6 – Retired

Note:
In this binding process, the CI must be a host. Host CIs include Computers, Operating Systems (OS), Switches, Routers, or any CI type/class that extends the [cmdb_ci_hardware] table, meaning the CI type or class must be a hardware component.

If no match is found using node, the system looks at the **CI Identifier** field on the event record. The **CI Identifier** is a JSON structure containing column names and values for comparison (e.g., Name, Fully qualified domain name, IP, or MAC Address). The JSON is: {"column_name":"<column_value>"}. For example, if we want to bind to a CI identified by **serial_number** whose value is **Dell Latitude 7420 Laptop**, the JSON is: `{"serial_number":"Dell Latitude 7420 Laptop"}`. If a match is found, the alert is linked to the corresponding CI.

Difference between binding with Node vs. CI Identifier

In default binding, the system considers all fields in the **Additional Information** field and attempts to match their values with the CI table. The **CI Identifier** field allows specifying particular fields for matching, even if they are not present in **Additional Information**. This process uses a predefined JSON structure and applies only when the CI is a host.

Note:
Even if the **Node** or the **CI Identifier** successfully binds the alert with the CI, event rules further determine how the binding occurs using the **Override default binding** check box available in Event rules. This ensures that alerts are bound correctly based on business logic, not just direct matches. This ensures that alerts are bound correctly based on business logic, not just direct matches.

Example: Resolving a CI Using Node and Event Rules

Imagine a server (Server-123) in your network generates an event. The event record contains a **Node** field with the value "Server-123.example.com".

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

1. Matching with CI Attributes:
   a. The system checks the Node value against the CMDB.
   b. It compares "Server-123.example.com" with the FQDN, IP, MAC address, or Name of existing host CIs.
   c. If a match is found (e.g., FQDN in the CMDB is also "Server-123.example.com"), the alert is linked to that CI.
2. Applying Event Rules: Even if the Node resolves to Server-123, additional event rules might determine if the alert should be linked differently. For example, an event rule may specify that alerts from Server-123 should be linked to a parent CI (like a cluster) instead of the individual server.

Overriding default binding

Overriding default binding allows flexibility in linking alerts to CIs beyond the default Node-based matching. This helps customize alert binding based on business needs, ensuring accurate associations and preventing mislinked alerts, improving incident management and root cause analysis.

By default, alerts are bound to CIs by matching the node value in the alert with attributes like Name, FQDN, IP, or MAC Address in the CI. However, if you want to change this behavior—either by using additional criteria or ignoring the node altogether—you can use the **Override Default Binding** check box.

This allows for two scenarios:

1. When Binding Type = CI Field Matching
   - If the CI is a host, the Node is required for binding. For more information, see Bind host CIs using CI field matching.
   - If the CI is not a host, the Node must be empty. For more information, see Bind non-host CIs using CI field matching.
2. When Binding Type = CI Identification. For more information, see Bind alerts to CIs using CI identification.

This flexibility ensures alerts are linked correctly based on specific business needs.

Bind host CIs using CI field matching

When CI Field Matching is used and the CI is a host, the Node value from the alert is used for binding. The system compares the Node with attributes like Name, FQDN, IP, or MAC Address in the CMDB to find a match. This ensures that alerts are correctly linked to the corresponding host CI.

Before you begin

Role required: evt_mgmt_admin

About this task

When an event enters the system, key field like **Node** is available on the event record. In CI there is no field like **Node**. However, the value of Node from the event is compared with different values in the host CI such as Name, Fully qualified domain name (FQDN), IP, or MAC Address. If a match is found, the alert is linked to the corresponding CI. This is the default binding of alerts to CIs. In this binding, the CI must be a host. Host CIs include Computers, OS, Switches, Routers—essentially any CI type or class that extends the [cmdb_ci_hardware] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues

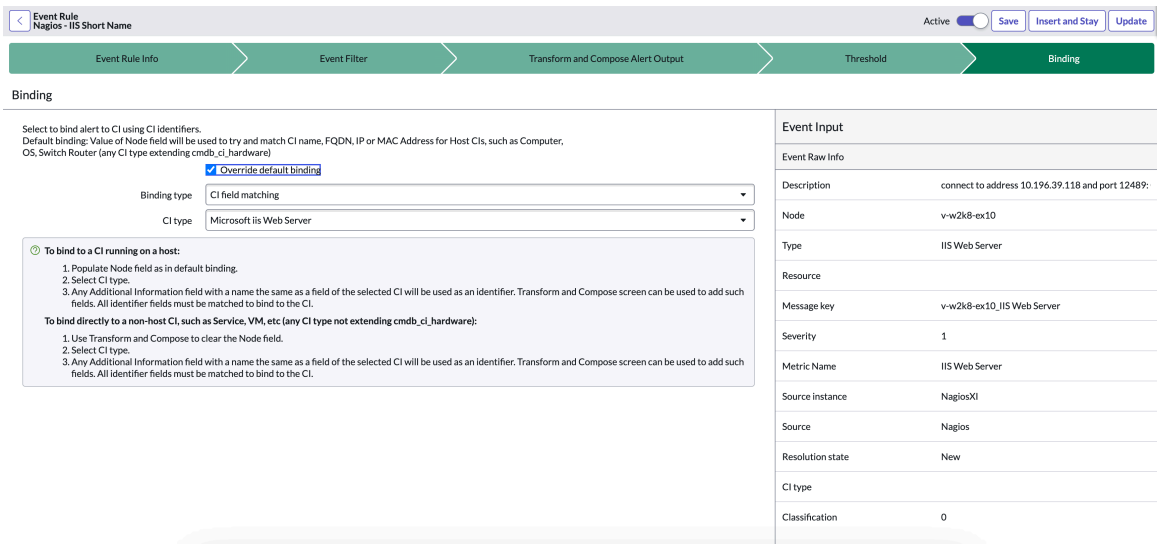
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

successfully. For information on how to create a manual field, see Bind CIs using CI field matching and handling column name differences.

Note:
Even if the node successfully binds the alert with the CI, event rules further determine how the binding occurs.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. In the **CI type** field, select the appropriate type of hardware component (such as a server, router, or storage device) that the CI type represents.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI. For example, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.
7. Select **Submit**.

Bind non-host CIs using CI field matching

Bind alerts to a specific device

Bind each alert directly to the originating device to establish a clear source of impact. This ensures accurate troubleshooting, reduces noise from unrelated alerts, and helps teams focus on resolving the right issue faster.

Before you begin
Role required: evt_mgmt_admin

About this task
In IT environments, multiple devices like switches have many smaller components, such as ports. When something goes wrong, it's not enough to just say the switch has an issue—the system needs to pinpoint exactly which port is causing it. Binding alerts to the specific port that

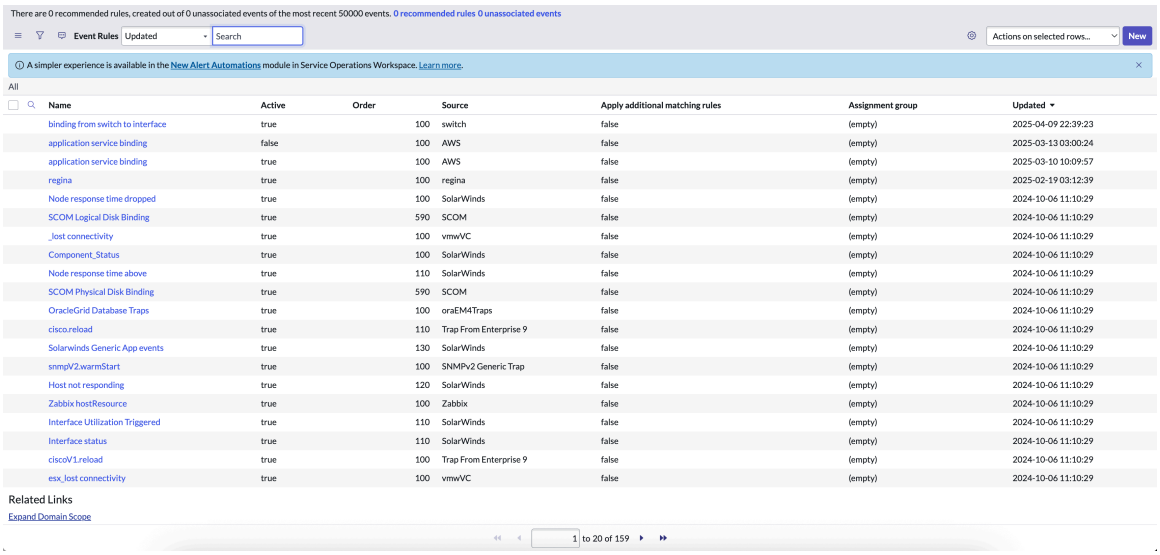
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

triggered the issue allows teams to act faster and fix the real issue without wasting time checking the entire switch or unrelated components.

The following example procedure shows the alert binding configuration for a switch named IP-Switch-1, ensuring alerts target the correct port. The event rule setup starts by enabling the **Override default binding** option and selecting **CI field matching** as the **Binding type**. Choosing **Switchport** as the **CI type** instructs the system to bind alerts to individual ports. The Binding Device Map defines how the system links the switch (cmdb_ci_ip_switch) to its ports (dscy_switchport) using the cmdb_ci reference field. This map guides the binding logic. Under **Configuration** > **Network** > **Switches**, selecting **IP-Switch-1** reveals its switchports and interface names. When an incoming event includes a matching interface name in the **Additional information** field, the system binds the alert directly to the correct port—ensuring precise and meaningful alert context.

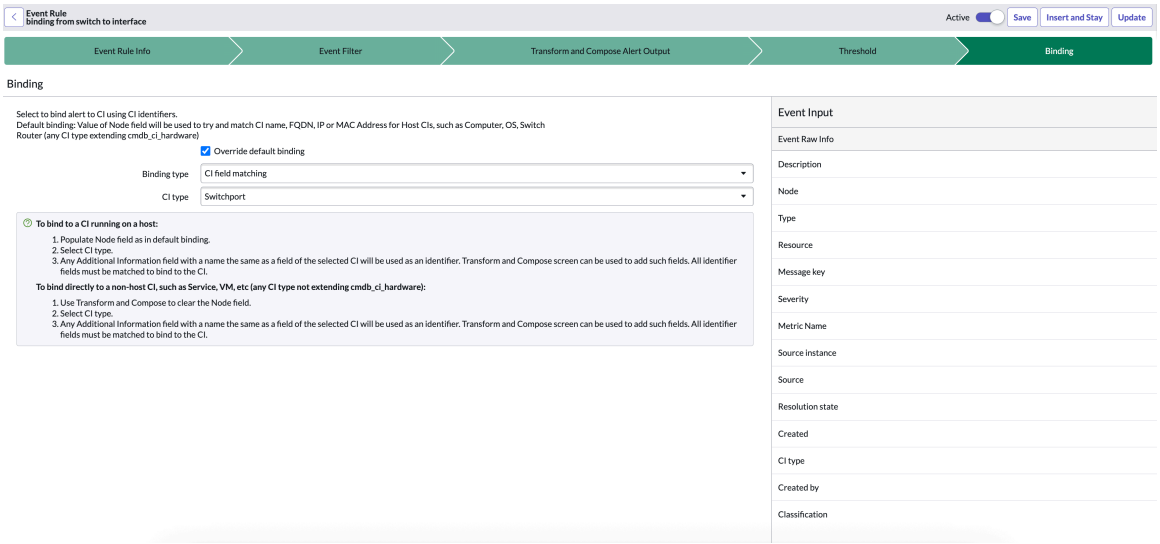
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.

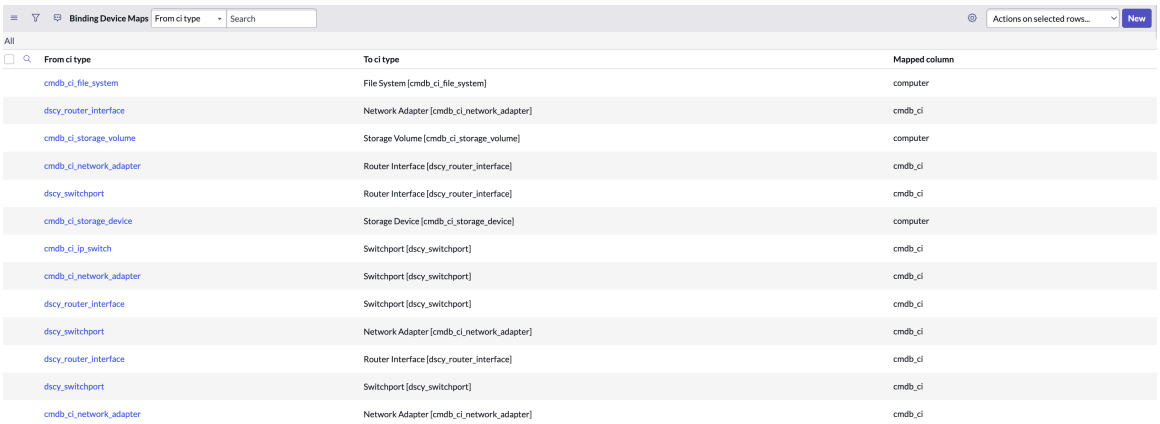


3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.
6. In the **CI type** field, select **Switchport**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

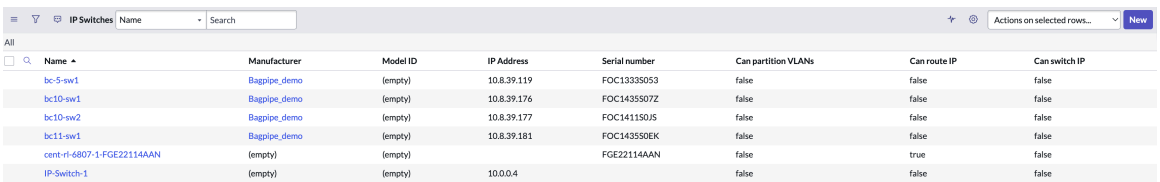


7. Navigate to **All** and search `em_binding_device_map.list`.
   The Binding Device Maps page opens. Here the column values **From ci type** is mapped to **To ci type** using the **Mapped column**. For example, **cmdb_ci_ip_switch** is mapped to the Switchport [dscy_switchport] table using the reference field **cmdb_ci**.



From ci type	To ci type	Mapped column
cmdb_ci_file_system	File System [cmdb_ci_file_system]	computer
dscy_router_interface	Network Adapter [cmdb_ci_network_adapter]	cmdb_ci
cmdb_ci_storage_volume	Storage Volume [cmdb_ci_storage_volume]	computer
cmdb_ci_network_adapter	Router Interface [dscy_router_interface]	cmdb_ci
dscy_switchport	Router Interface [dscy_router_interface]	cmdb_ci
cmdb_ci_storage_device	Storage Device [cmdb_ci_storage_device]	computer
cmdb_ci_ip_switch	Switchport [dscy_switchport]	cmdb_ci
cmdb_ci_network_adapter	Switchport [dscy_switchport]	cmdb_ci
dscy_router_interface	Switchport [dscy_switchport]	cmdb_ci
dscy_switchport	Network Adapter [cmdb_ci_network_adapter]	cmdb_ci
dscy_router_interface	Router Interface [dscy_router_interface]	cmdb_ci
dscy_switchport	Switchport [dscy_switchport]	cmdb_ci
cmdb_ci_network_adapter	Network Adapter [cmdb_ci_network_adapter]	cmdb_ci

8. Navigate to **All** and search `switches` and select **Configuration** > **Network** > **Switches**.
   The IP Switches page opens.



Name	Manufacturer	Model ID	IP Address	Serial number	Can partition VLANs	Can route IP	Can switch IP
bc-5-sw1	Bagpipe_demo	(empty)	10.8.39.119	FOC13335053	false	false	false
bc10-sw1	Bagpipe_demo	(empty)	10.8.39.176	FOC1435S07Z	false	false	false

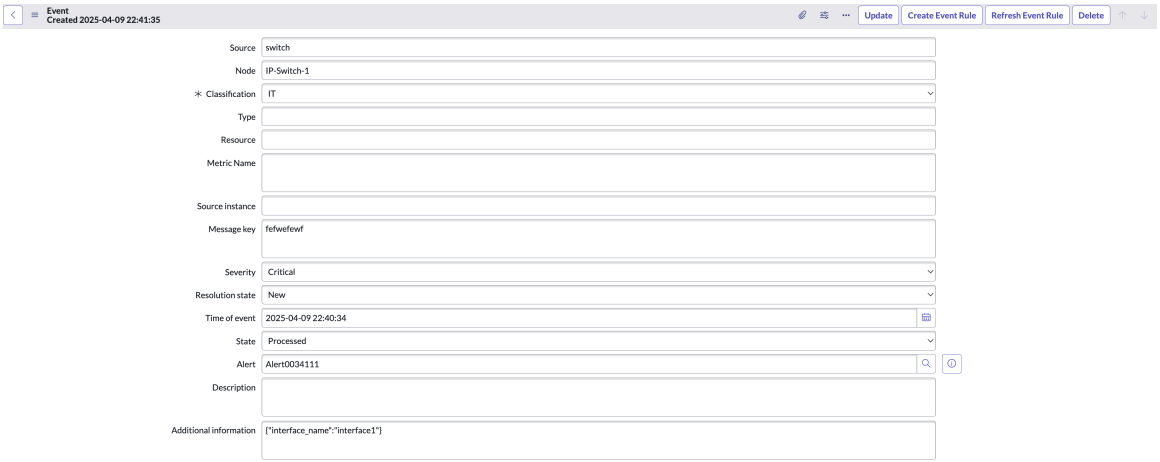
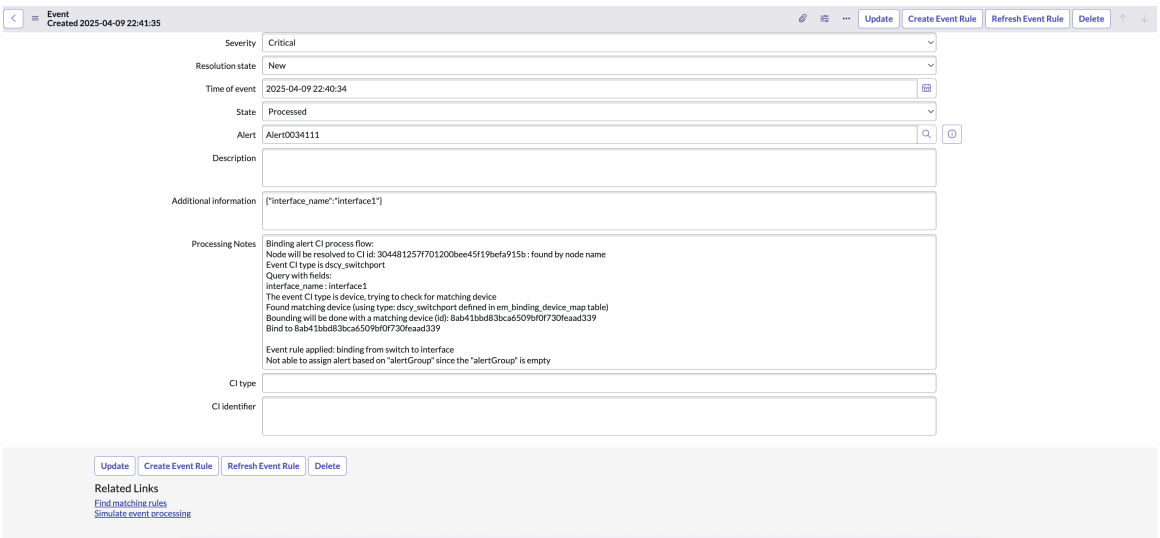
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching device.



Bind alerts to a specific process

Bind specific server processes to their corresponding Configuration Items (CIs) in the CMDB to ensure accurate mapping and visibility. This binding is crucial for identifying service dependencies, reducing ambiguity from generic process names, and enabling effective monitoring. It supports faster alert resolution, impact analysis, and better alignment between infrastructure and application components in dynamic environments.

Before you begin

Role required: evt_mgmt_admin

About this task

Sometimes, when an alert (or event) comes into the system, it needs to be connected — or "bound" — to a Configuration Item (CI) in the CMDB. By default, the system binds alerts to host specified in the **Node** field of the event. Imagine a situation where you have a Windows server running multiple processes, like MSFT SQL Instances and SQL Server Analysis Services. The challenge is to bind an event to the specific process instance rather than just the host server, as multiple processes could have the same generic name, such as MSSQLSERVER, leading to ambiguity.

The following example procedure uses a Windows server as the host, MSFT SQL Instances as the CI class of the process, and MSSQLSERVER as the process name. The following steps are

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

based on the assumption that the event **Node** field of the event provides the host name, and the **Additional Information** field contains specific process details required for binding.

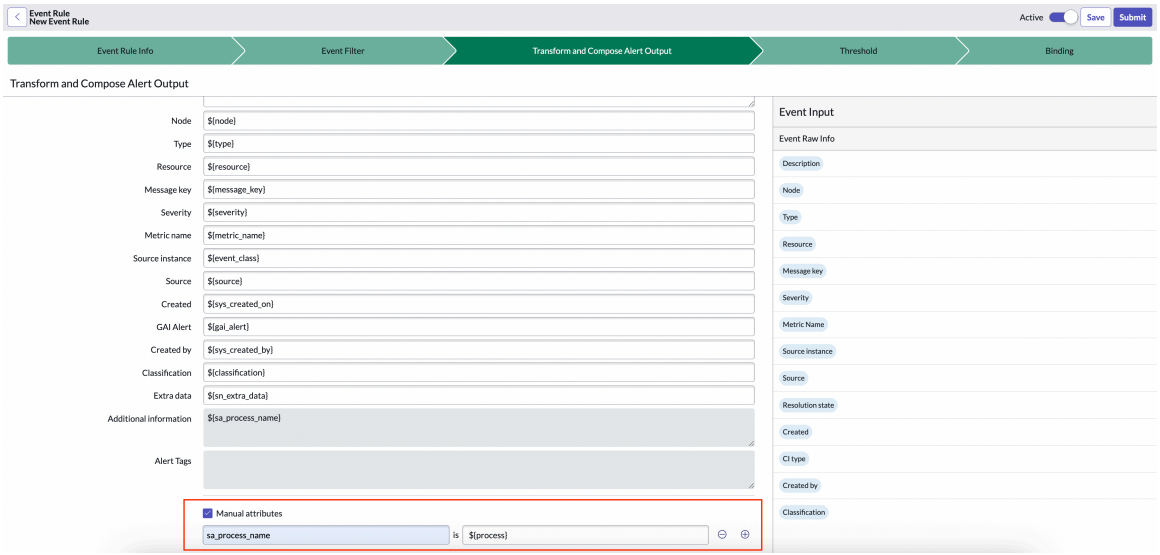
Alert-to-CI Binding via Process Mapping

Action	Steps
Set event rule: Add process name	Add the process name `sa_process_name` in the event rule.
Set event rule: Define CI type	Select the target CI type in the event rule. For example, MSFT SQL Instances.
Define process mapping	Navigate to the Process to CI Type Mapping table [em_binding_process_map] and add an entry mapping a CI type (e.g., MSFT SQL Instances) to a process name (e.g., MSSQLSERVER).
Bind CI to alert	When an event is triggered, the system: **1.** Applies default binding to identify the host. **2.** Checks the CI type specified in the event rule. **3.** Looks up the Process to CI Type Mappings table [em_binding_process_map] for a matching process name and CI type. **4.** Searches the CI Relationships table [cmdb_rel_ci.list] for a Runs on::Runs relationship between the process and the host CI. **5.** Binds to a process when values from the **CI Type** column match the corresponding entries in the **Process** column in the Process to CI Type Mappings table [em_binding_process_map].

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New**.
3. Select the **Transform and Compose Alert Output** tab and perform the following steps:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

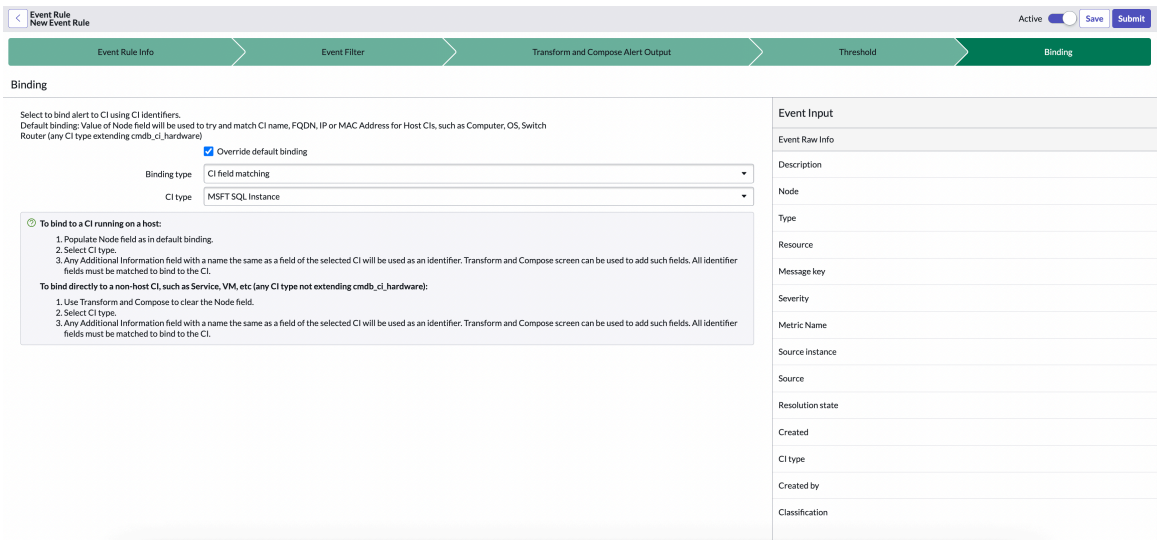


a. Select the **Manual attributes** check box.

b. Enter `sa_process_name` is `${process}`.

sa_process_name is a special variable name used to specify the name of the process to search for. ${sa_process_name} will appear in the **Additional information** field of the event. Instead of `${process}`, you can enter any other field name from which the variable `sa_process_name` derives its value.

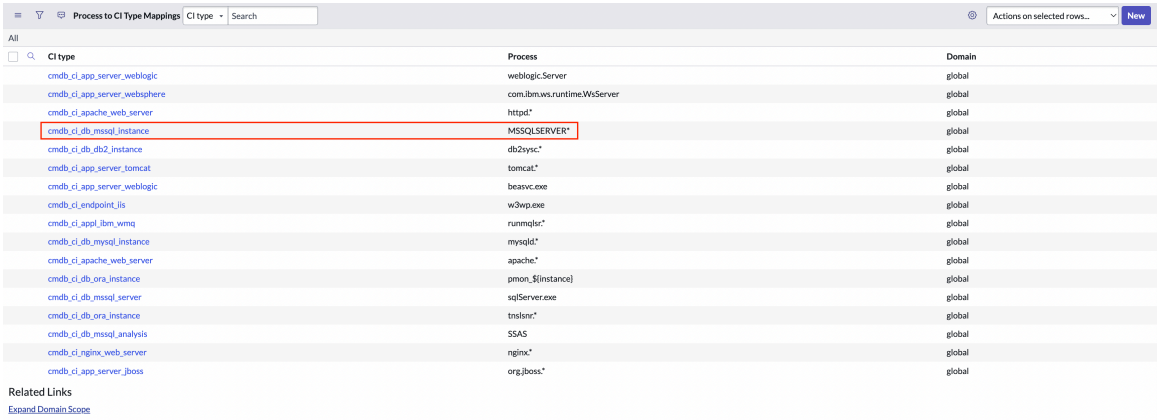
4. Select the **Binding** tab.
5. Select the **Override default binding** check box.
6. In the **Binding type** field, select **CI field matching**.
7. In the **CI type** field, select **MSFT SQL Instances**.
   The **CI type** determines the specific CMDB table where the system searches for the matching CI.



8. Navigate to **All** and search `em_binding_process_map.list`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

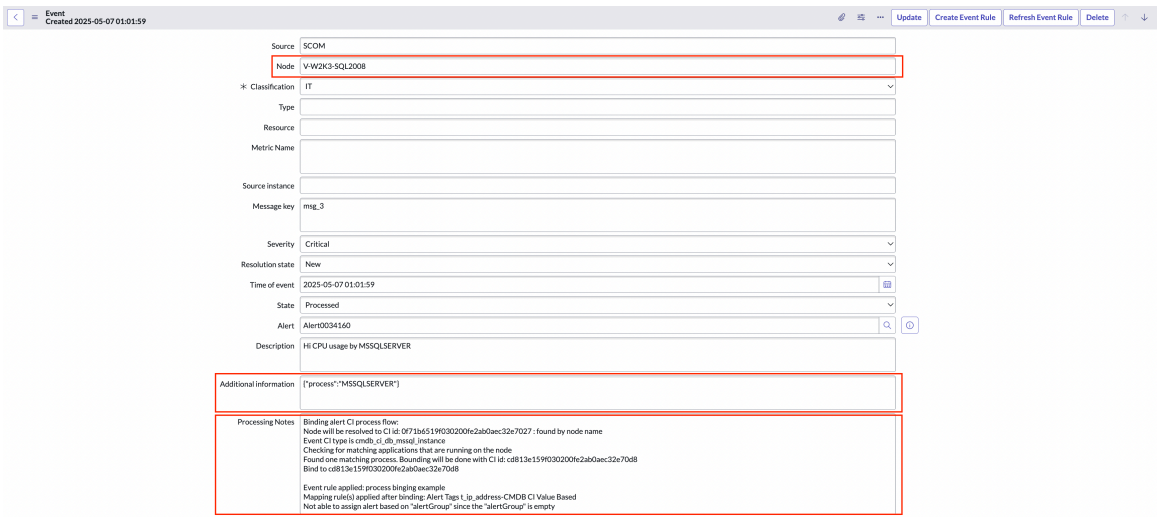
The Process to CI Type Mappings page opens. Here the values from the **CI type** column are mapped to entries in the **Process** column. For example, **cmdb_ci_db_mssql_instance** is mapped to the **MSSQLSERVER** process.



9. **Optional:** Navigate to **All** and search `cmdb_rel_ci.list`.
   The CI Relationships page opens.
10. **Optional:** Verify that the node is in a Runs on::Runs relationship with the appropriate process.

11. Navigate to **All** > **Event Management** > **All Events**.
12. Create an event with **Node** value as the name of the host such as Windows Server (V-W2K3-SQL2008).
    The **Additional information** field in the event has a key called **process** whose value is **MSSQLSERVER**.

    In the following image, you can see the processing notes indicating that the binding has occurred between the alert and the matching process.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Bind non-host CIs using CI field matching

If no match is found using the **Node** field, the system uses the **CI identifier** field to match alerts with non-host CIs based on attributes like Name, FQDN, IP, or MAC. This ensures accurate alert association, improving visibility, troubleshooting, and root cause analysis for diverse infrastructure components.

Before you begin

Role required: evt_mgmt_admin

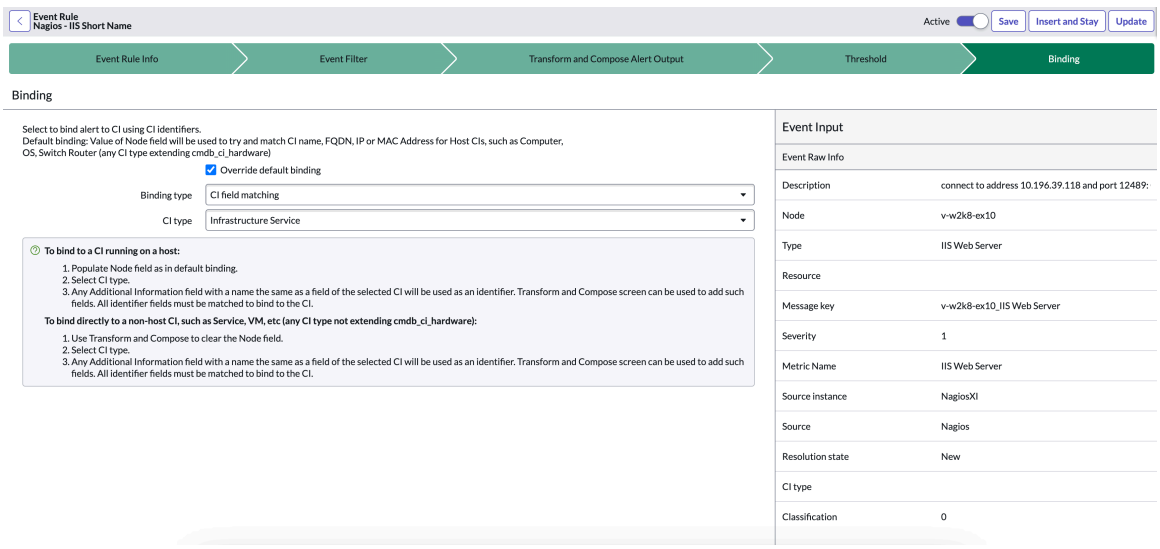
About this task

If no match is found using the **Node** field, the system looks at the **Additional information** field of the alert. When you select a CI type, such as File System, the system automatically searches for a matching record in the [cmdb_ci_file_system] table. It uses the details provided in event rule record, specifically in the **Additional information** field, to refine the search. For example, if the **Additional information** field contains values like `{"mount_point": "/snap/amazon-ssm-agent/9565", "name": "/dev/loop0"}`, the system looks for a record in the [cmdb_ci_file_system] table that matches these values. If a match is found, the system binds the CI to the alert, ensuring accurate identification and association. Similarly, if the **CI type** is **Network Adapter**, the system searches in the [cmdb_ci_network_adapter] table.

There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column, ensuring the matching process continues successfully. For information on how to create a manual field, see Bind CIs using CI field matching and handling column name differences.

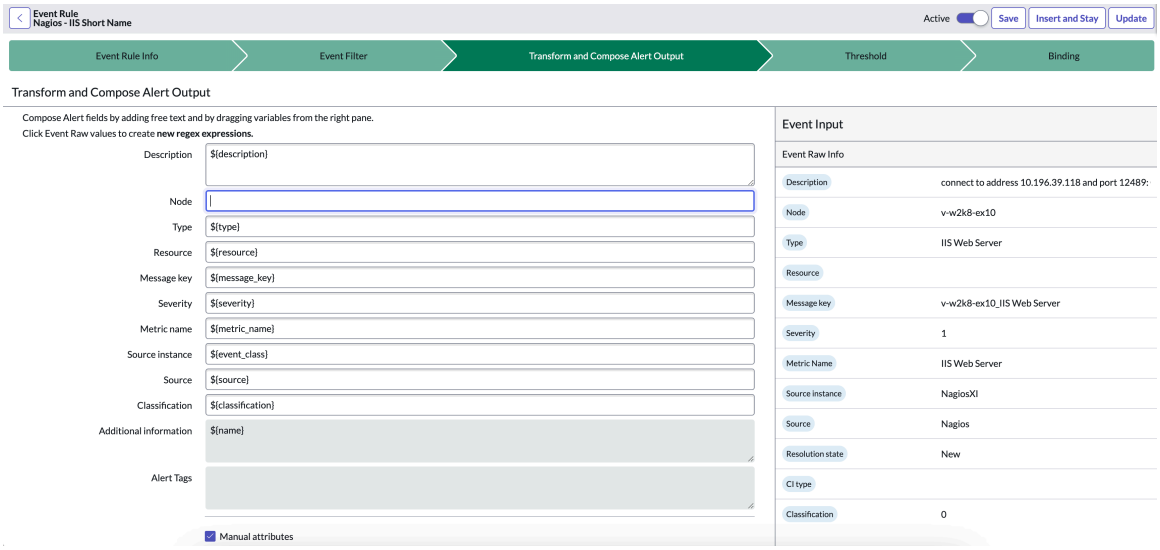
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI field matching**.



6. Select the **Transform and Compose Alert Output** tab.
7. Clear the **Node** field value.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



8. In the **CI type** field, select the non-host CI.

   A non-host CI type is any CI type that does not extend the [cmdb_ci_hardware] table, such as a Service or VM. The **CI type** determines the specific CMDB table where the system searches for the matching CI.

9. Select **Save**.

Bind CIs using CI field matching and handling column name differences

Bind CIs by matching event **Additional information** fields with CI attributes. If column names differ, manually create an additional key-value pair to align with the CI table, ensuring accurate CI association.

Before you begin

Role required: evt_mgmt_admin

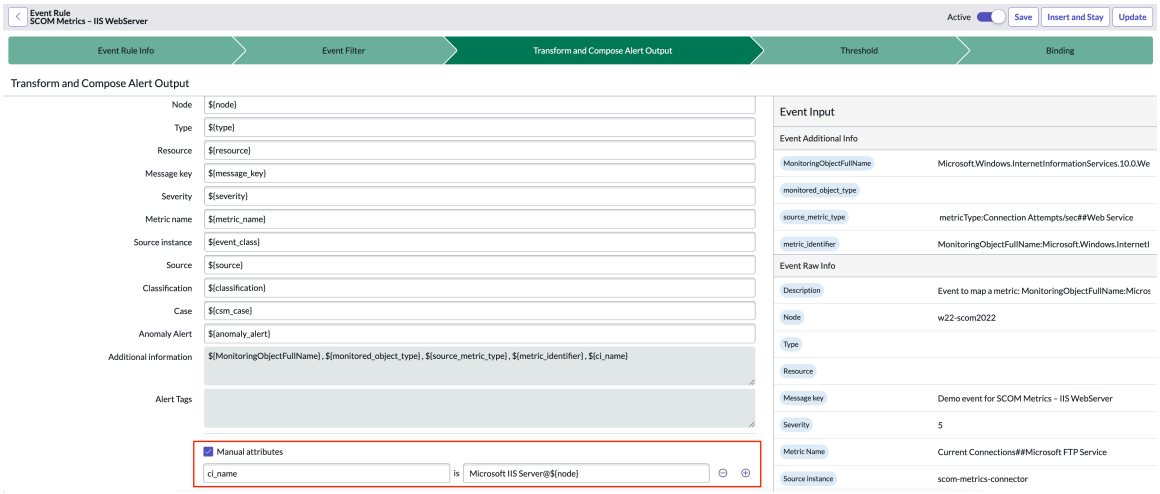
About this task

If no match is found using the **Node** field, the system looks at the **Additional information** field in the event record. There may be cases where no match is found because the column names in the event record and the table differ for the same item. In such cases, you can manually create an additional key-value pair with a name matching the table column and add it to the **Additional information** field, ensuring the matching process continues successfully.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields, or open an existing event rule record to modify it.
3. Select the **Transform and Compose Alert Output** tab.
4. Select the **Manual attributes** check box.
5. In the **Field Name** and **Field Value** fields, enter the corresponding field name and specify the source field from which the value should be populated.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Use the add icon (⊕) icon to add multiple fields as needed.

6. Select **Save**.
   The fields are created in the event rules record. However, when any alert is generated from an event using the event rule, the manually added fields appear in the **Additional information** field of the alert.

Bind alerts to CIs using CI identification

Bind alerts to specific applications on hosts using event rules to ensure accurate tracking and to improve issue resolution speed—leading to efficient remediation and better alignment of alerts with the right resources.

Before you begin

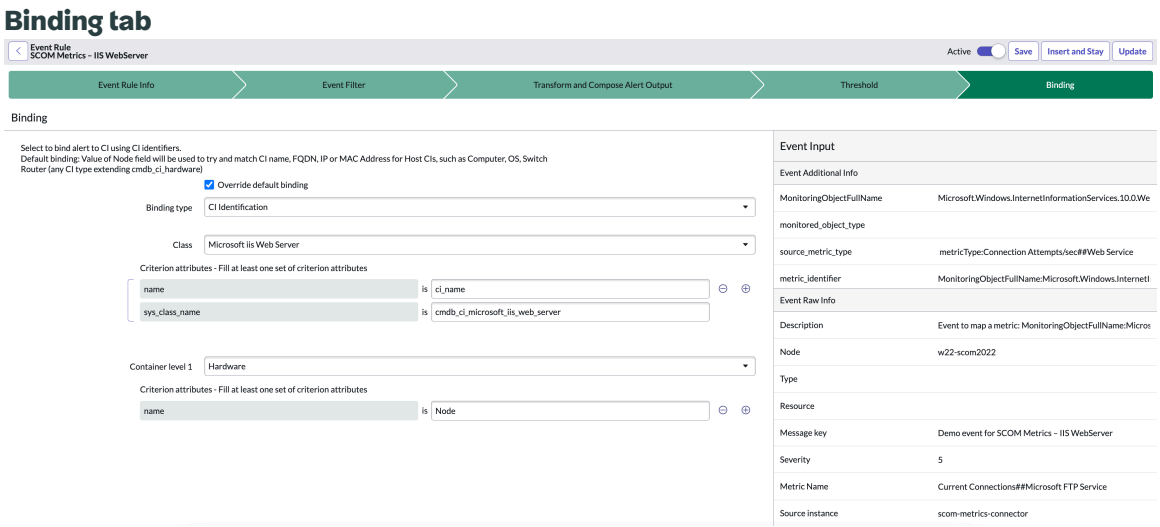
Role required: evt_mgmt_admin

About this task

Before going through the procedure, let's first understand how this binding works with an example. Suppose an out-of-the-box event rule, SCOM Metrics – IIS WebServer, generates an alert for a Microsoft IIS Web Server running on a host. Instead of binding the alert to just the host machine, you want it to be associated with the specific application (IIS Web Server) where the issue occurred. Here's how the system ensures accurate binding.

Let's say in the **Binding** tab, the **Class** and **Container Level 1** are defined along with their respective attributes, as shown in the image.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



The binding procedure follows these steps:

1. Identifying the Host (Container Level 1)

   Since the Microsoft IIS Web Server runs on a host (in this case Hardware), the system first locates the host, which is defined as **Container Level 1**. The name field is used to identify the host, and its value is taken from the **Node** field of the event. Using this name, the system searches the CMDB to find a matching host CI.

2. Identifying the Microsoft IIS Web Server CI on the Host

   Once the host is identified, the system looks for a Microsoft IIS Web Server CI under that host with the following attributes:

   - name = ci_name
   - sys_class_name = cmdb_ci_microsoft_iis_web_server

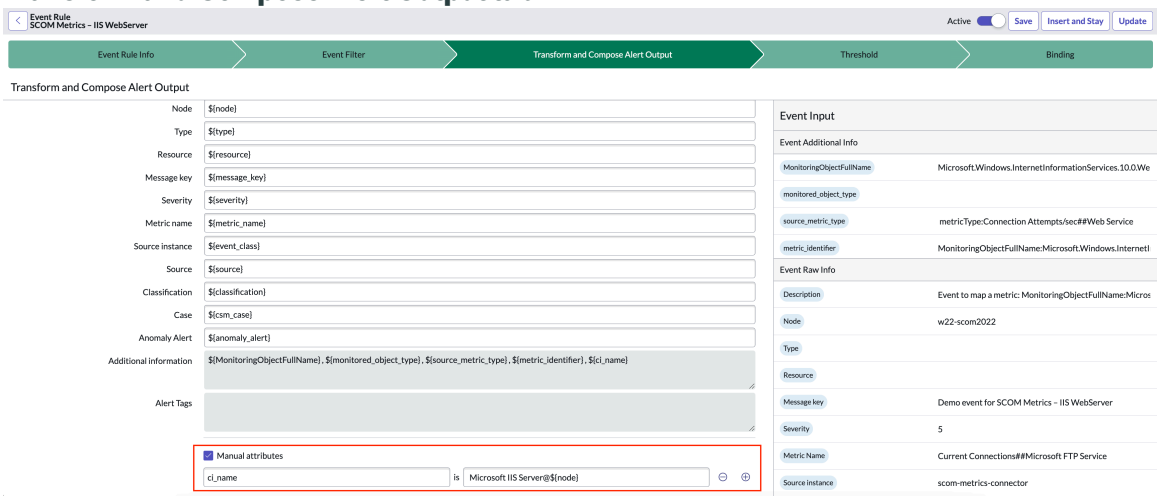
   Here, ci_name is derived from the key-value pair defined in the **Transform and Compose Alert Output** tab of the event rule. Assume that in the **Transform and Compose Alert Output** tab of the event rule, the **Manual attributes** check box is selected and the following key-value pair is already added:

   - **Field Name**: `ci_name`
   - **Field Value**: `Microsoft IIS Server@${node}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

This ensures that `ci_name` appears in the **Additional information** field of the alert and is used when configuring the attribute field of the CI class.

Transform and Compose Alert Output tab



If a matching Microsoft IIS Web Server CI is found on the identified host, the alert is bound to the correct application CI rather than just the host. This ensures more precise incident tracking and resolution, linking the alert to the actual service affected instead of only the machine it runs on.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Select **New** and complete the required fields of the event rule.
3. Select the **Binding** tab.
4. Select the **Override default binding** check box.
5. In the **Binding type** field, select **CI Identification**.
6. In the **Class** field, select a CI class.
7. In the **Select an identifier** field, select an identifier for the class.

   An identifier for a class is a set of rules that helps the system recognize and match CIs correctly. Think of it like a fingerprint for each type of CI (such as a server, router, or application). The identifier uses key attributes—like a serial number, hostname, or IP address—to make sure that when new data comes in, it gets linked to the right CI instead of creating duplicates. For more information on CI identification rule, see Create a CI identification rule.
8. In the **Add value** field, add the exact value or specify the source field from which the value for the field must be populated.

   Add or remove fields using the add (⊕) and the delete (⊖) icons.

   Note:
   While filling in the CI Class attributes, if you do not find the attribute you need, you can use the **Transform and Compose Alert Output** tab of the event rule to add the necessary key-value pair. For more information, see Configure an event rule to customize alert content.

   The event rule transformation and composition is useful when relevant information exists in a different field but needs to be extracted or reassigned for proper alert processing. This is especially important when the required attribute is not directly available and must be manually defined.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For example, suppose the **Additional information** field of an alert contains the alert name under the **Node** field. However, for correct processing, we need this value to appear under the **Name** field instead. Since there is no existing name attribute in the event, we can manually create one using the **Transform and Compose Alert Output** tab in the event rule. Here's how:

a. Select the **Transform and Compose Alert Output** tab.

b. Select the **Manual attributes** check box.

c. Add the following key-value pair:

- **Field**: Name
- **Field Value**: Node

This configuration ensures that the system extracts the **Node** value and maps it to the name field, making it available for CI binding and alert correlation.

9. In the *Container level 1* area, specify the host.
10. In the **Select an identifier** field, select an identifier for the container.
11. In the **Add value** field, add the exact value or the field that is the source for the **Select an identifier** field of the container.

    Add or remove fields using the add (⊕) and the delete (⊖) icons.
12. Select **Save**.

Example: Binding alerts to non-host CIs

Bind alerts to an application service (a non-host CI) using event rules and event field mapping. This example demonstrates how to achieve this by leveraging the IP address associated with the service.

Before you begin

Role required: evt_mgmt_admin

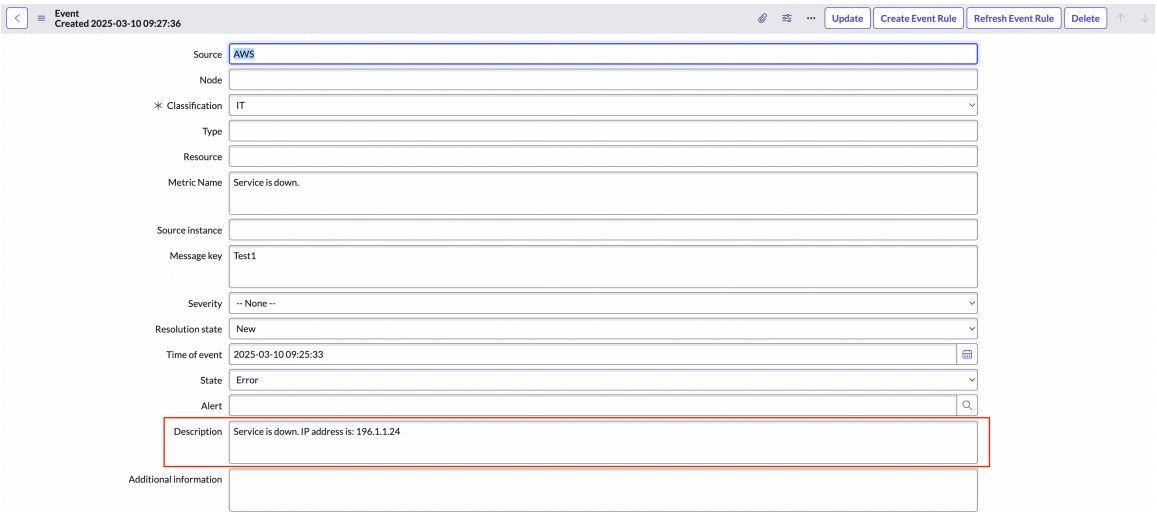
About this task

When an event is generated, it may not always include the exact name of the Application Service it affects. Instead, it might provide details such as an IP address. In this example, suppose application services are identified by IP addresses. Since the goal is to bind the alert to an Application Service, you need to determine which service name corresponds to the given IP address.

To achieve this, follow these steps:

1. Match the correct Application Service: Override the default binding and select **Binding Type** as **CI field matching**. The binding process needs to associate the alert with an Application Service, not a host. In the event rule, set the **CI Type** to **Application Service** so that the system searches for the service in the Application Service table (cmdb_ci_service_auto).
2. Extract the IP address from the event description: The event might contain a message like `Service is down. IP address is: 196.1.1.24`. You need to extract the IP address from this description for further processing.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

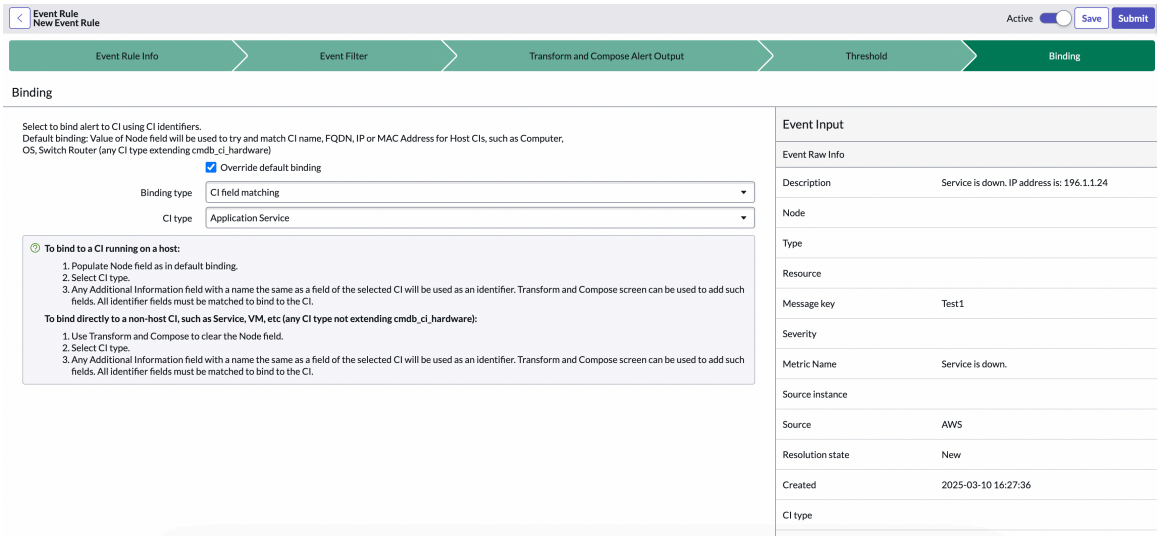


3. Translate the IP address into a service name using Event Field Mapping: Use Event Field Mapping to look up the extracted IP address in the CMDB and find the associated application service. Once a matching service is found, its name is stored in the **Name** field of the event.
4. Bind the alert to the correct Application Service: If the service name is identified, the alert's CI is populated with that service.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the specific event for which you want to create an event rule.
3. Select **Create Event Rule**.
   The new event rule page opens. Some fields in the event rule are populated based on the event record data, such as the Source field value.
4. In the **Event Rule Info** tab, in the **Name** field, enter `application service binding`.
5. Select the **Binding** tab.
   In this tab, you select the CI type as a service (non-host) instead of a host because the goal is to bind alerts to an Application Service, not to a physical or virtual machine.
6. Perform the following steps:
   a. Select the **Override default binding** check box.
   b. In the **Binding type** field, select **CI field matching**.
   c. From the **CI type** list, select **Application Service**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



7. Select the **Transform and Compose Alert Output** tab.

   In this tab, you extract the IP address of the application service into a manually created field. Extracting the IP allows the system to look up the corresponding service in the Application Service table (cmdb_ci_service_auto). Without extracting the IP, the system wouldn't be able to determine which Application Service the event belongs to, making it difficult to bind the alert correctly.

8. Perform the following steps:

   a. Clear the **Node** field.

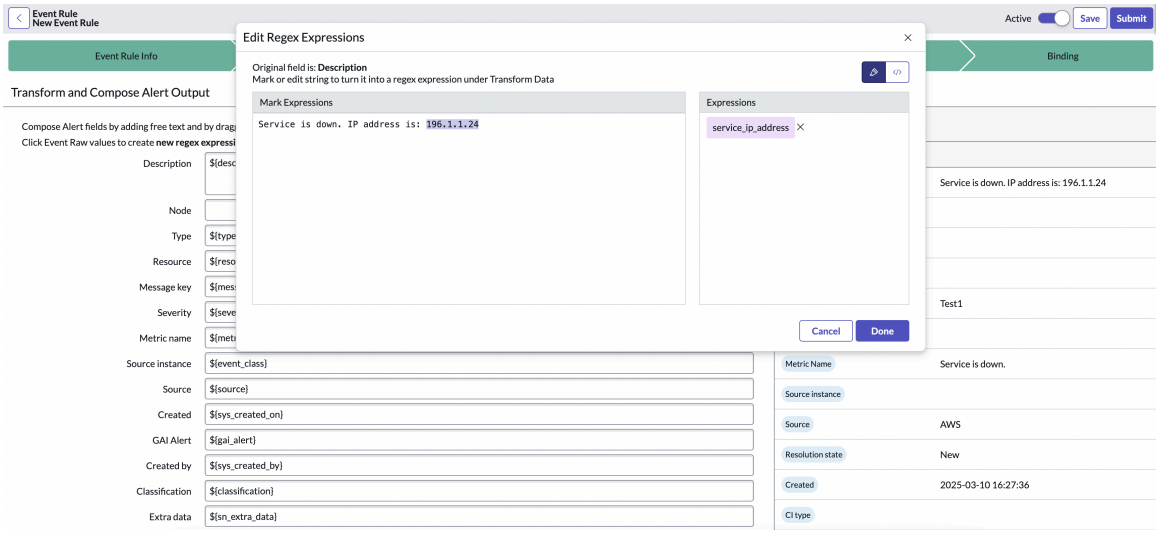
      When an event is processed, it often comes with multiple fields of information. The **Node** field typically contains the host or device name. However, since the goal is to bind the alert to an Application Service rather than a host, clearing the **Node** field ensures that the system focuses on identifying the correct service instead of mistakenly associating the alert with a host CI.

   b. Under **Event Input** > **Event Raw Info**, select **Description**.

      The Edit Regex Expressions window opens.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

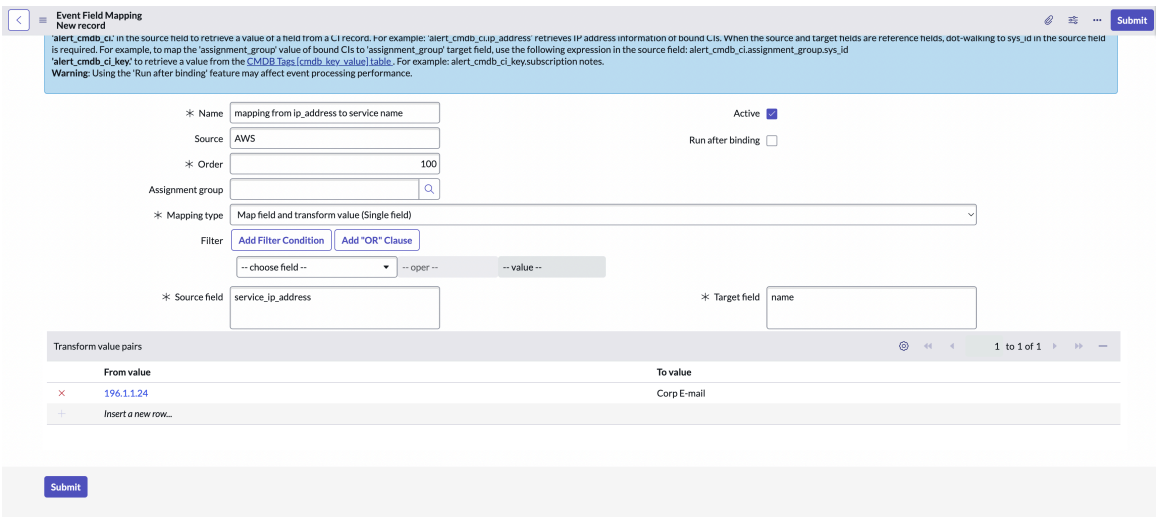
c. In the Mark Expressions section, select the IP address, manually enter a field name (e.g., service_ip_address), and press Enter to save it.



d. Select **Done**.

The IP address is extracted into the newly created **service_ip_address** field, which is added to the **Additional info** field of the alert. This allows it to be used later to identify the corresponding Application Service.

9. Select **Submit** in the event rule to save your changes.
10. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
In Event Field Mapping, configure the extracted IP address to map it to the corresponding service name. The event provides only an IP address, but alerts need to be associated with a service name (not just an IP). The system needs to map this IP to its corresponding Application Service so that teams can easily identify the impacted service.
11. Select **New**.
The Event Field Mapping window opens.
12. Perform the following:



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Action
Name	Enter the name of the mapping. Example: mapping from ip_address to service name.
Source	Enter `AWS`. **Note:** The source is the same as the one in the Events record.
Mapping type	Select **Map field and transform value (Single field)**
Source field	Enter `service_ip_address`.
Target field	Enter `name`. The target field value is the column name in the Application Service table (cmdb_ci_service_auto) where the source field value is searched.
Transform value pairs	
From value	196.1.1.24
To value	Corp E-mail

13. Select **Submit**.

    The system extracts the IP address of the service from the event and stores it in the **service_ip_address** field. Since the Application Service table (cmdb_ci_service_auto) does not have a column for searching by IP address, the Transform value pairs feature is used to map the IP address to a name—in this case, Corp E-mail and and saves it in the **name** field within the **Additional info** field of the alert. The **Target field** specifies where to search for the Corp E-mail in the Application Service table. The system looks for Corp E-mail in the **name** column of

© 2025 ServiceNow, Inc. All rights reserved.

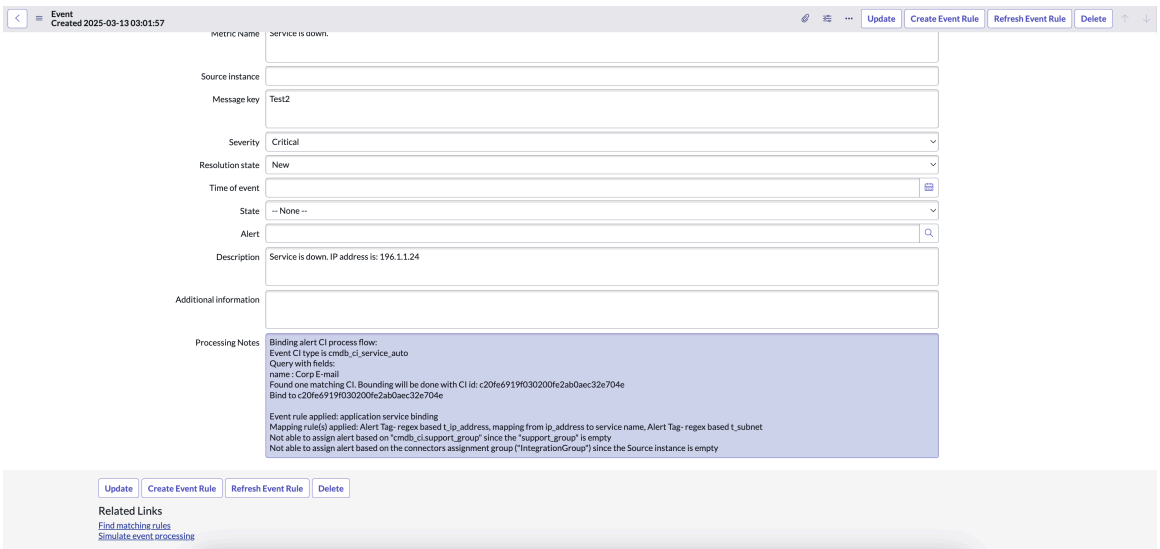
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

the Application Service table (cmdb_ci_service_auto). If a match is found, the alert is bound to the corresponding Application Service.



Example: Bind alerts to CIs using dynamic CI types

Use event field mapping to dynamically bind alerts to the appropriate CIs based on event attributes, eliminating the need for separate event rules for each CI. This approach simplifies configuration, improves accuracy, and enhances alert binding.

Before you begin

Role required: evt_mgmt_admin

About this task

In general, for an event generated from a specific source mentioned in the **Source** field, the system applies the corresponding event rule. The override default binding option in an event rule specifies a specific CI class for binding. However, in a more dynamic use case, the CI class is not predefined and can change based on event attributes. For example, suppose a customer has multiple CIs with the same name, but each CI belongs to a different CI class. In the traditional event rule method, as the CI class (or the CMDB table) is defined for a CI, the mapping is incorrect because the system searches in the same CI class for all CIs with the same name and attributes, instead of looking in the specific CMDB table defined for each CI class.

To resolve this—in other words, to determine the correct CI class to search—the system uses the **CI type** field from the event to identify the CI class. By using an event field mapping that maps from event attributes to CI type, it becomes possible to know which CMDB table to search, ensuring that the CI is correctly mapped to the event.

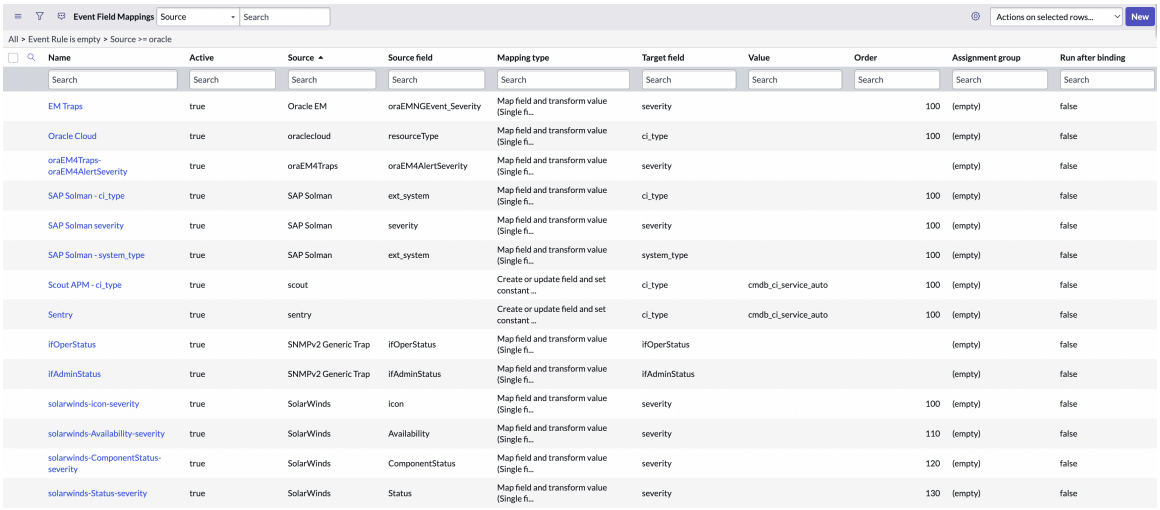
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

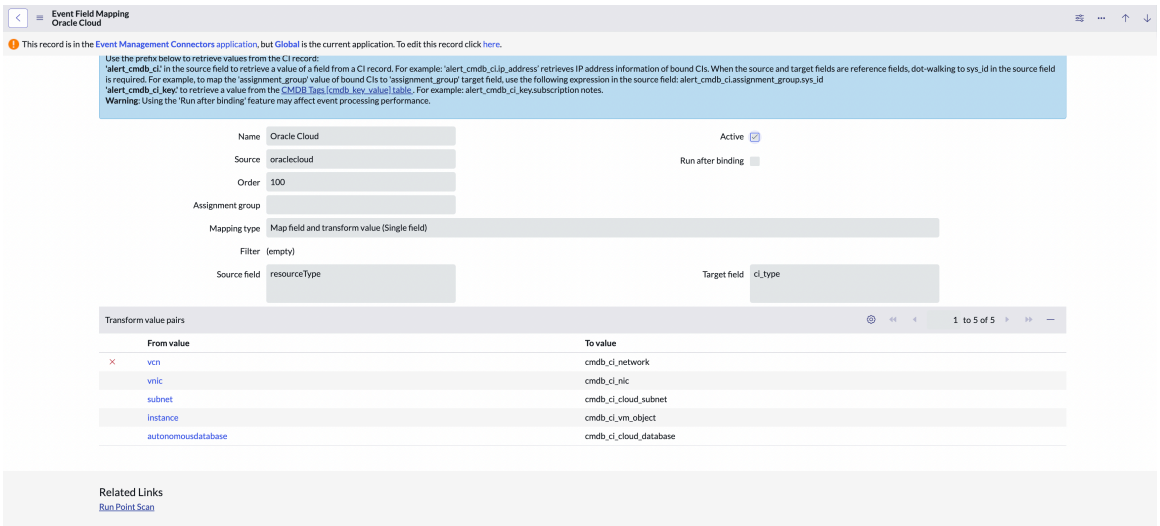
Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.



2. Select **Oracle Cloud**.

   This is an existing event field map used as an example. The event field map details page opens.



3. Review the event field mapping details page and understand the relevant fields and their corresponding values.

Event Field Mapping fields

Field	Description
Name	Event field map name.
Source	Event monitoring software that generated the event. In this case, oraclecloud.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Mapping type	Select **Map field and transform value (Single field)**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source field	**resourceType** is a field that is defined in the **Additional Information** field of the event defined by the Oracle Cloud system. The possible values of **resourceType** are listed in the **From value** column, while the corresponding CMDB tables for those values are specified in the **To value** column in the Transform value pairs section. If **resourceType** is **instance**, the system searches in the [cmdb_ci_vm_object] table for CI binding.
Target field	The **CI type** field (**ci_type**) in an event is a special field that provides the CI class name, indicating which CMDB table to search. The **CI type** field values are listed in the **To value** column in the Transform value pairs section.
Transform value pairs	
From value	Lists the possible values of the event field (e.g., `resourceType`) that are derived from the event data.
To value	Specifies the corresponding CMDB table associated with each value listed in the **From value** column. Indicates the CI type to bind the alert to.

View patterns for event group creation

Event groups are sets of events that do not have a matching event rule. You can view the patterns in a group of events to learn the impact of creating a rule based on the event source and description patterns.

Before you begin

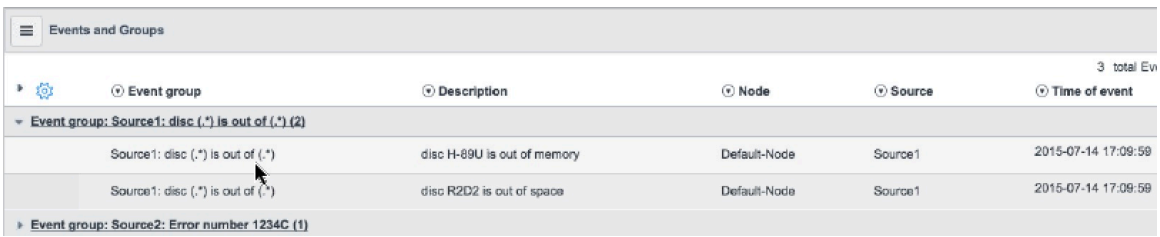
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Events are grouped according to their source and description.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Rules**.
2. Wait for the group calculation to complete and then click the created link.
   If there are not enough events, the calculation will not create groups.
3. In the list of events, select an event.
4. To change the pattern of an event, double-click the pattern, make your changes, and then click **Update**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Refresh event rules

Manually update event rules to reflect current event information because once an event rule is created, the **Event Additional info** and **Event Raw info** fields are not automatically updated.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Select the event.
3. Select **Refresh Event Rule**.
4. Select the event rules to refresh.
5. Select **Refresh Selected**.

   If you selected multiple event rules, then the last selected item in the list opens in the Event Rule Designer.

Note:
If the current event rule regex expressions do not match the selected event after the refresh, the update fails and an error message appears specifying the problematic fields. This safeguard ensures that your previously defined event rule regex expressions are not broken due to the refresh.

Find rules that will be applied to an event

View the rules that will be applied on an event to determine how this event will be processed.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **Event Management** > **All Events**, and then click an event number.
2. Under **Related Links**, click **Find matching rules**.
3. Review the information that appears in the blue box at the top of the page, and review all **Processing Notes** to find rules that apply to an event.

Related topics

View events

Simulate event processing

You can simulate event processing logic on events and display the resulting alert to better understand which rules are executed on a given event and how the event fields change after the rule is executed.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Open the event you want to simulate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the **Related Links** section, select **Simulate event processing.**
4. In the info message that appears at the top of the screen, select the link to the created simulated alert.
5. **Optional:** View which event rules and event field mapping rules were applied and the event field values by selecting the **Activities** tab.

Event field mapping configuration

Use Event field mappings rules to map values from specific fields to values in other fields.

Event Management stores event field mappings in the Event Field Mapping [em_mapping_rule] table. The mappings apply after event rule processing and prior to alert generation. The mapping values from the Event Mapping Pair [em_mapping_pair] table apply to the alert. The original event severity remains unchanged.

For example, if events come with the field "**org_severity**" with the values "*Low*, *Medium*, *High*" and you want the alert **Severity** to hold this value, create an event field mapping rule that maps the field **org_severity** to **Severity**, with these values:

Example showing org_severity mapped to Severity

Original org_severity value	Map to alert Severity value
Low	Warning
Medium	Major
High	Critical

Default event field mappings

Event Management provides default event field mappings for commonly used system monitoring tools. The Transform Value Pairs from event field mappings format the incoming event data for Event Management.

You can view the default event field mappings and mapping pairs by navigating to **Event Management** > **Rules** > **Event Field Mappings** and double-clicking **Name**.

Create event field mappings

Use event field mappings to map values from specific event fields to values in other fields to provide more comprehensive information in an alert. Use team-based integrations in event rules to make sure that connector ownership and execution of rules give precedence to global rules. Teams can maintain consistency and hierarchy while offering flexibility and customization options.

Before you begin

Role required: evt_mgmt_admin

About this task

Create the rule to match the event by its class and original values. Also, specify the new values to replace the original values in the event.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Event Field Mapping**.
2. Select **New** or open an existing rule to edit and fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Field Mapping form

Field	Description
Name	Event field mapping name.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Order	Number to define the order in which this action should be processed. Actions with lower numbers are processed first.
Assignment group	For Team-based integrations, select an assignment group. If no assignment group is defined in the event field-mapping rule, then this rule is considered global. When the rules are running – first the global rules run and then the rules that belong to the assignment group that the event's source instance belongs to.
Mapping type	Mapping mechanism that is used to change an event field value. ○ **Map field and transform value (Single field)**: Maps the **Source field** value to the matching value in the Transform value pairs [em_mapping_pair] table and populates the **Target field**. Source and Target fields may be event fields, additional info fields, or alert tags. ○ **Create or update field and set constant value (Constant)**: Sets a constant value to a **Target field**. The **Target field** may be an event field, additional info field, or alert tag. ○ **Map field (Copy field)**: Copies the exact value of a Source field to the specified Target field. The Source and Target fields may be Event field, Additional info field, or alert tags. ○ **Map field and transform value using regex**: Generically maps the value from the Source field to the matching value in the Transform value pairs table and populate the **Target field**. Source and Target fields may be event, additional info, or alert tags fields. ○ **Map field using regex**: Copies the value from a generically defined **Source field** to the **Target field**. The Source field must be a field from the event additional info field. The Target field may be the field of event, additional info, or alert tag. With this type, you can generically find the name of the Source field by using a regular expression (regex).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Map field and copy value from regex group**: Copies part of the Source field value to the Target field. Source and Target fields may be event fields, additional info fields, or alert tags. Define a regex to specify what part of the **Source field** should be copied. ○ **Advanced mapping using script**: Implements your own logic for event values transformation by using a script. When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance. ○ **Map field from reference table** Use this rule type to extract a **Source field** value from the selected **Reference table** by matching the **Field to match**value to the **Matching alert field** value and then mapping the **Source field** value to the **Target field**. The **Matching alert field** and the **Target field** may be event fields, additional info fields, or alert tags.
Filter	A condition for event field mapping. Select **Add Filter Condition** or **Add "OR" Clause** to configure multiple conditions.
Active	Activates or deactivates the event field mapping. If possible, find and apply another event field mapping rule.
Run after binding	○ When selected, the rule is executed after the CI binding phase. ○ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example: Use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance. **Note:** This check box is displayed only for the following Mapping types: **Map field and transform value (Single field)**, **Map field (Copy field)**, **Map field and transform value using regex**, **Map field and copy value from regex group**, and **Map field from reference table**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- If you selected **Map field and transform value (Single field)**, fill in the fields as appropriate.

Map field and transform value (Single field) fields

Field	Description
Source field	Event field to map - includes all event and additional info fields. Note: For Additional info fields use: "additional_info.<field name>". When the 'Run after binding' check box is selected, you can use the **alert_cmdb_ci** and the **alert_cmdb_ci_key** prefixes to receive CI related data.
Target field	Event field where the mapping rule inserts or updates the value. When this field is identical to the **Source field**, the mapping rule updates the value in memory of the event field. Alert tags can also be defined by using the *<t_>* prefix.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the following prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	Select **+** to add more **Key** fields, as required.

Typical use case: To map the 'event_severity' field in the additional info field with possible values [such as WARNING, MINOR, CRITICAL, CLEAR, MAJOR] to the severity field, configure the following:

- Source field: 'event_severity'
- Target field: 'severity'
- Transform value pairs:
  - From value: 'WARNING', to value: '4'
  - From value: 'MINOR', to value: '3'
  - and so forth...

- If you selected **Create or update field and set constant value (Constant)**, fill in the fields as appropriate.

Create or update field and set constant value (Constant) fields

Field	Description
Target field	The **Target field** may be an an event field, additional info field, or alert tag. Typical use case: Set alert severity to 1 for all events that match the filter.
Value	Value you want to use for the **To field**. This field is displayed when the **Mapping type** is **Constant**.

Typical use case: Set alert severity to 1 for all events that match the filter.

- If you selected **Map field (Copy field)**, fill in the fields as appropriate.

Map field (Copy field) fields

Field	Description
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To copy the IP field from the event additional info field to the alert field node, use the following:

- 'Source field': ip
- 'Target field': node

○ If you selected **Map field and transform value using regex**, fill in the fields as appropriate.

Map field and transform value using regex

Field	Description
Source field	Source field value to be copied to the **Target field** field. The **Source field** may be an event field, additional info field, or alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record:

Field	Description
	▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: To map severity from the field color in the Additional info field to the Severity field, use:

- Source field: 'color'
- Target field: 'severity'
- Transform value pairs:
  - From value: !*red', To value: '1'. This covers both 'dark red', 'light red', and other values containing 'red' and maps them all to '1'.
  - and so forth...

Key fields (Transform Value Pairs section)

Field	Description
Key	Value that the mapping rule searches for. Whenever the event field has this value, the mapping rule adds the value listed in the **Source field** field to the field listed in the **Target field**. This field is displayed when the **Mapping type** is **Map field and transform value (Single field)**. Select **+** to add more **Key** fields, as required.

- If you selected **Map field using regex**, fill in the fields as appropriate.

Map field using regex fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The **Source field** must be a field from the event additional info field. With this type, you can generically find the name of the

Field	Description
	Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.

Typical use case: To map the 'region' field from the additional_info field that appears as 'tags.region' or 'tags|region' or 'cloud.region' to an alert tag *t_region*, use:

- 'Source field': *region
- 'Target field': t_region

- If you selected **Map field and copy value from regex group**, fill in the fields, as appropriate.

Map field and copy value from regex group fields

Field	Description
Source field	Generically defined Source field value to be copied to the **Target field** field. The Source field must be a field from the event additional info field. With this type, you can generically find the name of the Source field by using a regular expression (regex).
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** to retrieve a field from the CI record. For example, use 'alert_cmdb_ci.assignment_group' to populate (and transform) an alert 'assignment_group' field with the value of the CI's assignment group. Dot-walk to a related record

Field	Description
	is also possible. For example, use alert_cmdb_ci.asset.model ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.
Regex group expression	.*_.*_(.*)_.*

Typical use case: To extract the third octet from the IP and save it in the additional info *third_octet* field, use:

- 'Source field': ip
- 'Target field': third_octet
- 'Regex group expression': .*_.*_(.*)_.*

- If you selected **Advanced mapping using script**, fill in the fields as appropriate.

Advanced mapping using script fields

Field	Description
Script	The code editor gives text editor support for inline scripts. The code editor has these features for the supported language services and Inline scripts: Syntax coloring, indentation, line numbers, and automatic creation of closing braces and quotes, Auto-suggestions, and auto-completions. Editing tips: ▪ To insert a fixed space anywhere in your code, press the Tab key. ▪ To indent a single line of code, select in the leading white space of the line and then press Tab. ▪ To indent one or more lines of code, select the code and then press Tab. ▪ To decrease the indentation, press Shift +Tab. ▪ To remove one tab from the start of a line of code, select in the line and press Shift +Tab. ▪ To declare variables, use the var keyword so that they remain within the proper JavaScript scope.
Run after binding	When the 'Run after binding' check box is selected, the rule is executed after the CI binding phase and uses the dedicated

Field	Description
	script that also has the sys_id of the CI in the input parameters. **Warning:** Complex scripts may affect event processing performance.

- If you selected **Map field from reference table**, fill in the fields as appropriate.

Map field from reference table fields

Field	Description
Reference table	The reference table. Select the table from where the field is to be mapped to the Target field in the event.
Field to match	The field from the Reference table to be matched with the Matching alert field from the event. It's used to filter out the Reference table records.
Source field	**Source field** value to be copied to the **Target field** field. The **Source field** is the field of the table that was selected as the Reference table.
Matching alert field	Event field to find matching Reference table records. The **Matching alert field** is matched with the **Field to match** field. The Matching alert field may be the Event field, Additional info field, or the Alert tag.
Target field	Event field where the mapping rule inserts or updates the value. The **Target field** may be an event field, additional info field, or alert tag.
Run after binding	▪ When checked, activates Event field mapping after CI binding. ▪ Use the relevant prefix to retrieve values from the CI record: ▪ **alert_cmdb_ci.** In the **Matching alert field**, to retrieve a value of a field from a CI record. For example: 'alert_cmdb_ci.ip_address' retrieves IP address information of bound CIs. When the **Matching alert field** and the **Field to match** fields are reference fields, dot-walking to sys_id in the **Matching alert field** is required. For example, to use the 'assignment_group'

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	value of bound CIs to match with the **Field to match** field, use the following expression in the **Matching alert field**: alert_cmdb_ci.assignment_group.sys_id ▪ **alert_cmdb_ci_key.** to retrieve a value from the CMDB Tags table. For example, alert_cmdb_ci_key.subscription notes. **Warning**: Using the 'Run after binding' feature may affect event processing performance.

Typical use case: Extract 'short_description' from the 'pc_vendor_cat_item' records matching its 'name' field with the 'cat_item_name' field in the Additional info field of the event and map it to the 'description' field on the event in the following fields:

- 'Reference table': pc_vendor_cat_item
- 'Field to match': name
- 'Source field': short_description
- 'Matching alert field': cat_item_name
- 'Target field': description

3. Right-click the form header and select **Save**.
4. Select **Submit**.

Example:
The following values comprise a predefined rule that is applied to events in the *`Trap From Enterprise 9`* class. If the events contain the `snmpTrapOID` element with a value of `iso.org.dod.internet.private.enterprises.cisco.0.0`, the mapping rule changes the value to `reload` in the alerts. If the events contain the `snmpTrapOID` element, a value of `iso.org.dod.internet.private.enterprises.cisco.0.1`, the mapping rule changes the value to `tcpConnectionClose` in the alerts.

Field	Values
Name	cisco.snmpTrapOID
Source	Trap From Enterprise 9
Mapping type	Map field and transform value (Single field).
Source field	snmpTrapOID
Target field	snmpTrapOID
Transform Value Pairs	• Pair 1 ○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: reload • Pair 2

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Values
	○ **Key**: iso.org.dod.internet.private.enterprises.cisco.0 ○ **Value**: tcpConnectionClose

What to do next

Test an event field mapping by sending an event that includes a field that is present in the event field mapping.

Event identifiers

Event fields uniquely identify each event. Event Management uses this information to determine whether to create a new alert or update an existing one.

- By default, each event is uniquely identified by the **Message Key**.
- If the **Message Key** is not populated, the system concatenates the **Source**, **Type**, **Node**, **Resource**, and **Metric Name** fields to populate the **Message Key**.
- If identifiers are not supplied in the event, you can add them with event rules.

Alert tags

Alert tags allow consolidation for all normalized fields and improve the admin experience to transform and normalize alert fields (key/value) enabling reuse of normalized fields across different sources. This improves alert quality for correlation and provides more out-of-the-box TBAC (Tag Based Automatic Correlation) definitions.

Example: Field normalization in alert management

In some cases, the same information may exist under different field names across data sources. For instance, an incoming event from one source has the location stored under the field **region**, but in other source, the same information is captured under **impacted_region**. To avoid confusion and enable consistent grouping, filtering, or automation, we normalize these fields by creating a unified field — for example,**t_region**. This field pulls the value from **region** or from **impacted_region** depending what field is present in the event. This way, the normalized field **t_region** always holds the location value in a consistent manner, regardless of the original source field.

Alert tags field appears in the Alerts form. These tags are created by Event Rules and in Event mapping and are saved in the alert tags' table [em_alert_tags]. The naming convention used to create key/value pairs is t_<tag name>. This enables reusing tags in the event rules by allowing users to select tags that were previously defined. When new alert tags are defined, TBAC (Tag Based Alert Clustering) tags are automatically created. Using these TBAC tags, you can create new TBAC alert clustering definitions from the new source of tags.

Event field format for event collection

Event Management requires all events to use a standard form, regardless of how they arrive at the instance.

In the application navigation filter, enter `em_event.list`.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form

Name	Description
em_event.source [Source]	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
em_event.node [Node]	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
em_event.type [Type]	Optional. The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
em_event.resource [Resource]	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
metric_name [Metric Name]	The name of the metric that has been measured, such as DB `Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
em_event.event_class [Source instance]	If the em_event.node field is not specified, it is mandatory for alerts to be created automatically. Values for the em_event.event_class field originate from either the source generating the events or by event rule. Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
em_event.message_key [Message key]	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
em_event.ci_type [CI type]	String containing information about CI type. Maximum length: 100 characters.
em_event.severity [Severity]	Event severity options are: • **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major**: Major functionality is severely impaired or performance has degraded. • **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning**: Attention is required, even though the resource is still functional. • **OK**: An alert is created. The resource is still functional. • **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event form (continued)

Name	Description
em_event.resolution_state [Resolution state]	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. • **New**, the resolution on corresponding alerts is open. • **Closing** event state closes corresponding alerts.
em_event.time_of_event [Time of event]	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
em_event.state [State]	Current processing state of the event: • **Ready**: Event has been received and is waiting to be processed. • **Processed**: Event was successfully processed. • **Ignored**: Value is not in use. • **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
em_event.alert [Alert]	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
em_event.description [Description]	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
em_event.additional_info [Additional information]	Optional. A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.
processing_notes [Processing Notes]	Display of the events processing log.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Custom alert fields

You can populate custom alert fields with data contained in **Additional information** field of the event.

Valuable data contained in **Additional information** fields of events can be useful, for example, for reporting. Alert fields are automatically populated from fields that have the same name in the event. This behavior holds true for **Additional information** event fields and for **Additional information** fields that Event Rule adds. Therefore, to populate a custom alert field with the value in **Additional information** fields, use the custom field name in the **Additional information** field. You can also use Event Rules for this purpose. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON format when the event is processed. For more information, see Configure an event rule to customize alert content.

The short description field of an alert is automatically written using the type, node, and description of the alert. To prevent the short description field from being over-written, open the *sys_properties* table, locate the *evt_mgmt.override_alert_short_description* property, change the value to `false`, and then click **Update**.

Depending on permissions, you may only be able to create fields with the **user_** prefix. If so, use Event Rules to create an **Additional information** field with the same name. To prevent some fields to be copied to the alert field, use the *evt_mgmt.alert_black_list_fields* property and add the field names that must be excluded. By default, the fields that are not copied are:

- message_key
- category
- additional_info
- sys_updated_on
- sys_updated_by
- sys_created_by
- sys_created_on
- sys_mod_count
- sys_id

Testing and sending events

You can manually test and send events to confirm that Event Management properly manages events and generates alerts.

Before you begin

Role required: evt_mgmt_admin

About this task

For example, you can manually send events to:

- Confirm that the MID Server is using an event connector definition and instance to send events.
- Confirm that event rules, event field mapping, and other configurations do generate alerts.
- Track an operation or action that did not generate an event.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Events**.
2. Click **New** and then fill in the fields.

Event form

Name	Description
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Metric Name	The name of the metric that has been measured, such as `DB Disk Free Space (MB)`, `Disk Writes/sec`, or `Disk Write Bytes/sec`.
Source instance	Name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44. Corresponding field display name is **Source Instance**.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The options are typically interpreted as follows: ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred. ○ **Warning**: Attention is required, even though the resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed. ○ **OK**: An alert is created. The resource is still functional.
Resolution state	Optional. If the field is empty, the resolution on corresponding alerts is still pending. Event state from the event source is either **New** or **Closing**. ○ **New**, the resolution on corresponding alerts is open. ○ **Closing** event state closes corresponding alerts.
Time of event	Time that the event occurred in the source system. This field is a GlideDateTime field in UTC or GMT format. Maximum length: 40 characters.
State	The current processing state of the event:

Name	Description
	○ **Ready**: Event has been received and is waiting to be processed. ○ **Processed**: Event was successfully processed. ○ **Ignored**: Value is not in use. ○ **Error**: Failure occurred while processing the event. For example, the event collection method or event **Severity** is blank.
Alert	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Description	Reason for event generation. Shows extra details about an issue. For example, a server stack trace or details from a monitoring tool. Maximum length: 4000 characters.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.

3. Click **Submit**.

View event processing statistics

Extract statistics from your instance to ensure that performance is not affected and extract metrics related to event processes to monitor event processing status.

Before you begin

Ensure that the *Event Management - Collect xmlstats* job is active. Configure this scheduled job by navigating to **System Definition** > **Scheduled Jobs**.

You can control the processing of event statistics using the *evt_mgmt.event_processing_stats_period* property. For information about configuring this property, see Configure statistics processing period.

Role required: evt_mgmt_operator

About this task

You can view key metrics from the instance to ensure that performance is not affected and monitor the status of the processing of events. For more information about viewing self-health monitoring statistics, see View self-health monitoring statistics for Metric Intelligence.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. In a browser where the instance is running, run the XML Stats script by appending the following text to the instance URL: `xmlstats.do?include=XMLStatsEm`
2. Press **Enter**.
3. Monitor the event processing metrics that are reported to ensure that events are processed according to accepted benchmark values.

Result

Example: Sample output after running the XML Stats script

```
<xmlstats created="Tue Oct 23 04:01:25 PDT 2018"
 includes="XMLStatsEm" version="2">
<itom_event_management>
<event_processing>
<processed count="47" max_process_time="10"
 mean_process_time="5" record_time="2018-10-23 11:00:41"/>
<ready count="7" oldest_ready_event="37" record_time="2018-10-23
 11:00:41"/>
<error count="5" record_time="2018-10-23 11:00:41"/>
<total_created count="5" record_time="2018-10-23 11:00:41"/>
</event_processing>
</itom_event_management>
</xmlstats>
```

The event processing metrics in the report are described in the following table.

Note:
The default processing cycle is events created in the last hour and updated in the last minute.

Event processing statistics

Metric	Description
Event processing statistics	
processed count=n	Number of events processed by the instance.
max_process_time=n	Longest time taken by the instance to process an event.
mean_process_time=n	Average time taken by the instance to process the events in this cycle.
Event ready statistics	
ready count=n	Number of events that are in Ready state and are available to be processed. Default processing cycle: events created in the last hour and updated in the last minute.
oldest_ready_event=n	Longest time taken by an event to remain in Ready state. If this metric has a value that is bigger than your benchmark figure, investigate the event further to determine what is impeding the processing. Default processing cycle: events created in the last hour.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event processing statistics (continued)

Metric	Description
Other processing statistics	
error count=n	Number of events for which errors were reported. Default processing cycle: events created in the last hour and updated in the last minute.
total_created count=n	Overall number of events that were processed during this event processing cycle. Default processing cycle: events created in the last hour.

Enable processing of event process statistics

Enable the system property that switches on statistics processing for events to let the platform collect and analyze metrics such as event volume, processing flow, and handling time. This helps you monitor system performance, identify bottlenecks, and optimize event handling for faster and more efficient operations.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Select **New** and fill in the form.

System property fields

Field	Description
Name	Name of the property you are creating.
Description	Narrative that describes the property and its function.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the `gs.getProperty()` method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

3. Select **Submit**.

Configure statistics processing period

Set the time period, in seconds, for collecting event processing statistics. For example, you can set a time period twice as long as the default 60 seconds to collect more statistics.

Before you begin

Role required: evt_mgmt_admin

About this task

Use the *evt_mgmt.enable_event_processing_stats* property to configure the XMLStatsEm script time to collect event processing statistics. The default value of this property is 60 and the unit is second. Set the property values to run the script over a longer or shorter period. For example, set a shorter period of statistics collection so fewer CPU resources are used.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the *evt_mgmt.enable_event_processing_stats* property.
3. Either configure the value of an existing *evt_mgmt.enable_event_processing_stats* property to run the XMLStatsEm script over a shorter or longer time period or create a new property if it does not exist already.
   - If the property exists, set the property to the required time period to enable the XMLStatsEm script time to collect event processing statistics and click **Update**.
   - If the property does not exist, click **New**, fill in the form, and click **Update**.

System property fields

Field	Description
Name	Name of the property you are creating.
Description	Narrative that describes the property and its function.
Choices	Comma-separated values for a choice list. If you need a different choice list label and value, use an equal sign (=) to separate the label from the value. For example, Blue=0000FF, Red=FF0000,Green=00FF00 displays Blue, Red, and Green in the list, and saves the corresponding hex value in the property value field.
Type	Data type, that is selected from a list (for example, integer, string, or true|false).
Value	Desired value for the property. When retrieving properties using the *gs.getProperty()* method, treat the results as strings. For example, a true|false property returns 'true' or 'false' (strings), not the Boolean equivalent.
Read roles	Roles that have read access to this property.
Write roles	Roles that have write access to this property.

Add a system property

Manage and monitor alerts

An alert is a notification for selected events that are considered to be important and require attention. Event Management generates alerts based on event rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can monitor and resolve alerts in ways that are based on alert impact calculations and alert configuration and property settings.

Alert management rules for resolving alerts

You can configure Event Management to respond to alerts automatically. An alert management rule determines the required alert response, such as to open an incident, knowledge base article, open a task, launch remediation action.

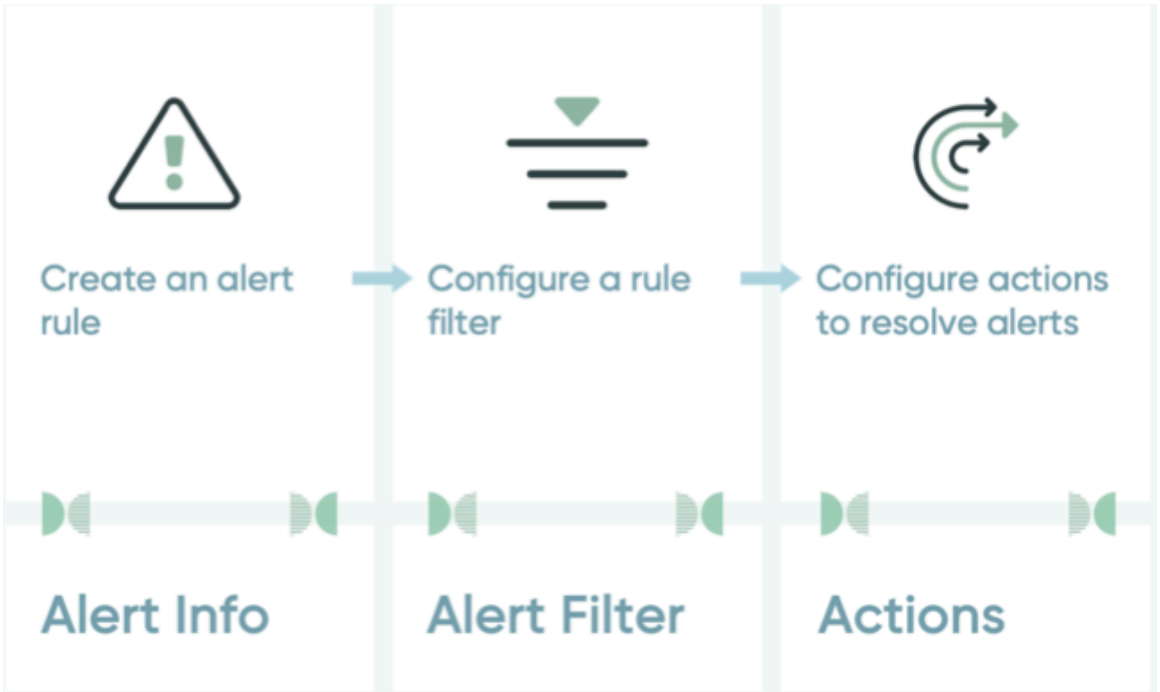
Alert management rules provided with the base system as a store application (Alert Rules Management [sn_em_arm]) to help you respond to alerts. You can create filters to specify conditions for the rule so that the remedial action specified in the rule takes effect only when the conditions are met. For example, launch the required subflow or open an incident based on an alert. The alert's execution history is automatically updated to indicate the actions that were invoked.

Users with the evt_mgmt_admin role can use the alert management rule designer to create and customize alert management rules to act on specified alerts. Define rules with filters to determine which alerts the rule applies to. You can create rules to launch applications, URLs, subflows, remediation actions, or take other actions, such as to open an incident. For more information, see Create an alert management rule.

Users with the evt_mgmt_operator role can manually run alert management rules.

Alert management rule flow

The flow to create and run an alert management rule is:



Alert management rule components

Component	Description
Alert Info	Configure a name and general information for the rule.
Alert Filter	Specify a filter to determine to which alerts the rule applies. You can specify the related list conditions.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert management rule components (continued)

Component	Description
	Note: The fields that are not supported for alert filtering are: Overall Event Count, Priority, Priority Group, Priority Breakdown, Tags, and Impacted Services.
Actions	Specify the response to the alert, such as to run a subflow, perform remediation action, launch an application, or launch a URL in a browser.

How rules are applied to updated alerts

Alert management rules run on all updated open alerts. Rules don't run on closed alerts, even if they've been updated. The filters determine whether the rule's actions apply to the alert. For example, if a rule's condition indicates that an email message is sent when the alert severity changes to Major, the rule applies to an alert updated by a severity change from Warning to Major.

Use of filters and other actions

Filters ensure that the rule is invoked only when the configured condition occurs, and not for every update of the alert. For example, you can configure a rule so that updates that aren't relevant (such as a **Work notes** field update) don't cause the rule to run. As another example, a filter condition can specify that the alert management rule runs only when the alert severity is critical.

You can perform the following actions:

- Specify a filter that determines which alerts the rule applies to.
- In the Related List Conditions section of the form, configure additional conditions, for example, with an *`Alert > Parent`* relationship, to filter for any alerts that were received today.
- Respond to alerts. For example, by using subflows and workflows, create incidents for primary alerts with critical severity, or open a search engine in a browser to search for data according to the description field of the alert.
- Apply remediation. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Note:
For enhanced performance of *`Event Management - Evaluate Scoped Alert Rules Management`* scheduled jobs, use subflows instead of workflows.

Scheduled jobs that check alert management rules

Alert management rules are checked every 11 seconds by the default *`Event Management - Evaluate Scoped Alert Rules Management0`* scheduled job. The job then executes the required actions. For large-scale environments, you can add more than one job. Please contact Customer Service and Support.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Only new users from Vancouver and up get two scheduled jobs: *Event Management - Evaluate Scoped Alert Rules Management0* and *Event Management - Evaluate Scoped Alert Rules Management1*. Users upgrading from previous family releases remain with a single scheduled job *Event Management - Evaluate Scoped Alert Rules Management0*.

Don't modify the *sn_em_arm.alert_management.num_of_jobs* property.

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management (**Event Management - Evaluate Scoped Alert Rules Management0**) jobs run independently of each other. For more information about coordinating the alert response and the automated alert grouping, see Synchronizing alert response with automated alert grouping.

Migrate existing alert action rules

Existing alert action rules from an earlier release can be migrated to become alert management rules. You can modify an alert action rule only after migrating it to an alert management rule. For more information, see Migrate an alert action rule to an alert management rule.

Create an alert management rule

Create an alert management rule to track alerts and resolve them by determining the required response, for example, to open an incident or launch remediation action.

Before you begin

To enable remediation with a subflow, you can use a subflow that is available with the base system, or you can create your own subflow. For details, see Create a custom subflow for alerts.

Role required: evt_mgmt_admin, flow_designer

About this task

Use alert management rules to track and resolve alerts.
While working in the alert management rule designer, you can work in multiple sections without losing information in any section.

Note:

- Alert management rules that are not configured to perform any action are skipped and the rule is automatically set to inactive.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Create alert management rules that:

- Locate other alert management rules that have relevance to the selected alert.
- Determine when the execution of the rule takes place.

Alert management rules do not necessarily complete in the order in which they are invoked.

You can configure alert management rules to:

- Automatically generate and link incidents, tasks, or knowledge articles to alerts.
- Automatically apply a remediation workflow or enable users to manually run remediation.
- Automatically construct a URL according to the value of specified fields in the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To assist you, several alert management rules are provided with the base system. You can use them as presented or you can use them as examples to build custom alert management rules.

Alert management rules provided with the base system

Rule	Description	Active
Open sensor dashboard in PRTG	The sensor dashboard in the Paessler PRTG Network Monitor (PRTG) application opens.	Yes
Oracle EM Launch Target Status and View Events	Launch Oracle Enterprise Manager to view: • Target Status • Event for alerts from source Oracle EM	Yes
Drilldown to OMI	Drill down to the HP Operations Manager i (OMi) application.	Yes
Create Incident on Primary Critical Alert	Create an incident for primary critical alerts. The incident can be created automatically or manually.	No
Search Google for "description"	Open Google Search in a browser to search for data according to the description that appears in the alert.	Yes
Create Incident	Create an incident for all alerts that are not in maintenance state. The rule runs automatically on selective update.	No
Create Incident Manually	Manually create an incident for alerts that are not in maintenance state.	Yes
Create Major Incident Candidate	Create a major incident candidate for all alerts that are not in maintenance state and are not secondary alerts. A major incident candidate can be promoted to become a major incident.	No
Create Major Incident	Create a major incident for all alerts that are not in maintenance state and are not secondary alerts.	No

If your instance was upgraded from Kingston, the alert action rules that were provided with the Kingston base system are available to you. However, if you modified any of the rules, the changes made are not carried over.

Alert management rules run 5 seconds after an alert is updated, resetting the timer if updates occur within that window. This delay ensures remediation actions, such as incident creation, are triggered only when the issue is clear and stable, reducing duplicates and unnecessary noise. To change the default 5-second delay, create the `evt_mgmt.alert_rule_delay` property on the **All** > **System Properties** > **All Properties** and change the value. To know how to create a property, see Add a system property.

Procedure

1. Navigate to **Event Management** > **Rules** > **Alert Management Rules**.
2. Click **New** and then fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert Management Rule form

Field	Description
Name	Unique name for the rule.
Active	Check box for enabling the rule. If this check box is selected, you must specify: ○ in the **Alert Filter** section, an alert filter ○ in the **Actions** section, at least one of any of these actions: ▪ active subflow ▪ workflow ▪ quick response
Order	Order in which rules are evaluated when multiple rules are defined for the same alert. Alert management rules are evaluated in ascending order. The default value is `100`.
Multiple alert rules	Instruction about whether to search for additional rules: ○ **Search for additional rules**: Execute the current rule then continue and execute other matching rules in the order of rule priority, where the lower number has the higher priority. ○ **Stop search for additional rules**: Execute only the current rule for the alert that matches the filter. When selecting this option, a rule configured second in a rule hierarchy may run before the results of the first rule take effect.
Description	Descriptive text for the rule.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.

3. Click **Alert Filter** and specify conditions for alerts that this rule is applied to.

Alert Filter stage

Field	Description
Rule is activated when	Rule execution takes place when: ○ **Alert changes to filter**–content changes to the alert cause the alert to match the filter. If the filter is matched on following update of the alert, the rule is not applied. If the alert was closed and then reopens, at the next update of the alert and the filter is matched, the rule is applied. Thereafter, when there is an update of the alert, the rule is no longer applied.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Alert matches filter**–the content of the alert matches the filter. On following update of the alert and if the filter is matched, the rule runs and is applied to the alert. The rule remains applied for every matching update.
Alert filter	
Preview	Function to preview alerts that match the specified condition. A hyperlink shows how many alerts match the filter.  If you click the hyperlink, the browser opens another tab that lists alerts in the Alerts [em_alert_list] table. The list shows which alerts match the rule, including closed alerts. Alerts that have already been run by the rule are not marked in any way. You can click any alert to view further details.
Conditions	Conditions that, if fulfilled, cause the filter to be applied. For more information about building conditions, see Using the condition builder. To add another condition, click **New Criteria**. **Note:** The **Created on** condition is not invoked when running the **Event Management - Evaluate Alert Management Rules** job. Instead, use the **Updated on** condition, as the job detects alerts based on the time they were updated and not on the time they were created.
Related List Conditions	Conditions to include a relationship with another table in the filter. **a.** Click **Table** and select the required table. **b.** Specify the conditions for this filter. For more information about creating related lists, see Add related list conditions.

4. Click **Actions**.
   In this section, you can configure the following action types as a response to alerts or to remediate alerts:
   - Remediation Subflows: Execute a subflow provided with the base system.
   - Launch Applications: Open applications and browsers that you configure.

   Note:
   The Remediation Workflows option is deprecated. To enable flows to be triggered by alerts, use the Flow Designer.

5. **Optional:** In the Remediation Subflows section, follow these instructions to add subflows:

   a. Under **Subflow**, double-click the cell.

   b. Click the search icon.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The list of subflows provided with the base system appears. For more information, see Event Management subflows in the base system.

c. From the subflow list, select a subflow.

d. Repeat, adding as many subflows as required.

(Optional)

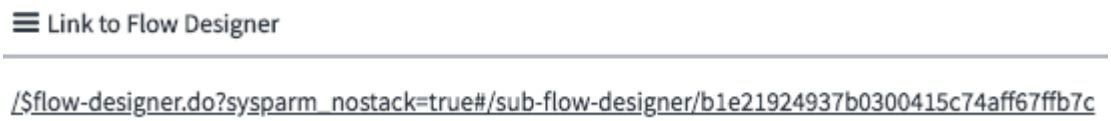
e. To specify when the subflow must be executed, double-click the cell under **Execution**.

Subflow execution options

Name	Description
Automatic	The subflow is executed automatically when the rule is matched.
Manual	Execute the subflow if required when the rule is matched.
Both	When the rule is matched, the subflow is executed automatically and you can optionally execute the subflow again manually.

f. Under **Automatic executions limit**, double-click the cell and enter the integer number of times to execute the subflow.
After the subflow has been executed the indicated number of times, it does not run anymore.

g. To enable the subflow to be executed, double-click the cell under **Active** and select `true`.
A link in the cell under **Link to Flow Designer** appears only after a subflow has been selected and the rule has been saved.



6. To add instructions to launch applications or to open browser windows, in the Launch Applications area:

a. Under **Display Name**, double-click the cell.
Specify a name for the link.

b. In the **URL** field, compose the URL using data from the alert in the format:`http://${source}.com:${port}/${cmdb_ci.name}`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The **Active** field is automatically updated.

Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

7. Click **Submit**.

Result

The alert management rule is added to the list of available rules that can be used to resolve alerts.

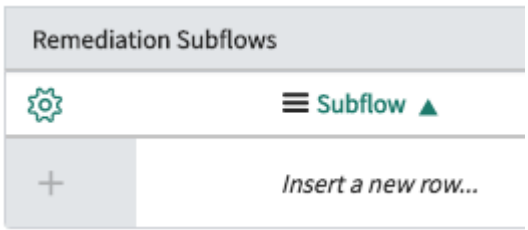
Apply a quick response in an alert

Event Management subflows in the base system

The subflows provided with the base system appear in the Remediation Subflows area of alert management rules.

Accessing the subflows

Navigate to **Event Management** > **Rules** > **Alert Management Rules** and click **New**. Click the **Actions** tab. In the Remediation Subflows area, double-click the **Insert a new row** field.



Click the search icon to add subflows. The list of subflows that are provided with the base system appears.

Subflows in the base system

Name	Description
Acknowledge Alert	Subflow to mark the alert as being Acknowledged. Acknowledge an alert to show that further attention is required.
Attach Knowledge Article (legacy)	Subflow to attach a knowledge article to the alert. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Knowledge article** column to the Alert Management Rules [em_alert_management_rule] table, and select an article to attach to an alert when the rule executes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

Name	Description
Change Alert to Maintenance Mode	Subflow to mark the alert as being in Maintenance.
Close Alert	Subflow to mark the alert as being Closed.
Create Incident	Subflow to create an incident. Fields from the alert are used to populate the matching fields in the incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • The alert management job runs even if the alert grouping job is not complete, if a specified time frame has passed. When this occurs, you can enable the *Avoid INTs on secondary alerts* rule to prevent incidents from being created for secondary alerts (when the *evt_mgmt.avoid_int_enabled* property is enabled), since an incident already exists for the primary alert.
Create Major Incident Candidate	Subflow to create a major incident candidate. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, a major incident candidate is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident from Alert	Subflow to create a major incident from alert. Fields from the alert are used to populate the matching fields in the major incident that is created.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

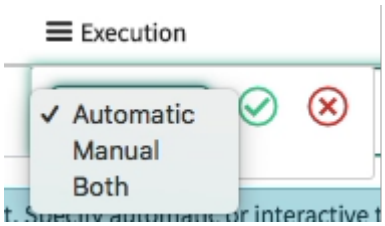
Name	Description
	Note: • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident with Impact	Subflow to create a major incident from an alert in which the **Impact** field is also taken as input. Fields from the alert are used to populate the matching fields in the major incident that is created. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, an incident is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Major Incident Candidate with Impact	Subflow to create a major incident candidate in which the **Impact** field is also taken as input. Fields from the alert populate the matching fields in the major incident candidate that is created. A major incident candidate can be upgraded to become a major incident. **Note:** • If there is an existing incident that is attached to the alert, this subflow is not activated. • If the alert is in Maintenance, a major incident candidate is not created. • If the **Role in group** is **Secondary**, the major incident candidate is not created.
Create Task (legacy)	This subflow uses a task template, if provided, or the *EventMgmtCustomIncidentPopulator*

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Subflows in the base system (continued)

Name	Description
	script for instances migrated from legacy releases (prior to the London release). If configured, apply the task template. **Note:** Add the **Task template** column to the Alert Management Rules [em_alert_management_rule] table, and select a task template and task to apply when the rule executes.
Overwrite Alert Template (legacy)	This subflow applies the alert template. This subflow is provided for instances that are migrated from legacy releases (prior to the London release). **Note:** Add the **Task type** column to the Alert Management Rules [em_alert_management_rule] table, and select an alert template to apply when the rule executes.

1. Select the subflow that you need.
2. To customize a subflow, see Create a custom subflow for alerts. This topic also describes the input parameters in a subflow.
3. To specify when the workflow must be executed, double-click the cell under **Execution**.



.

Create a custom subflow for alerts

You can create a subflow according to your requirements. For example, you can resolve alerts, notify teams, or run remediation actions.

Before you begin

Role required: evt_mgmt_admin, flow_designer

About this task

Copy an existing subflow, and then customize it. Publish the custom subflow so that it is available to be used to resolve any alert. For more information, see Create a subflow.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If your ServiceNow instance uses domain separation, you must ensure that the new custom subflow that you created operates only on the data of the designated domain.

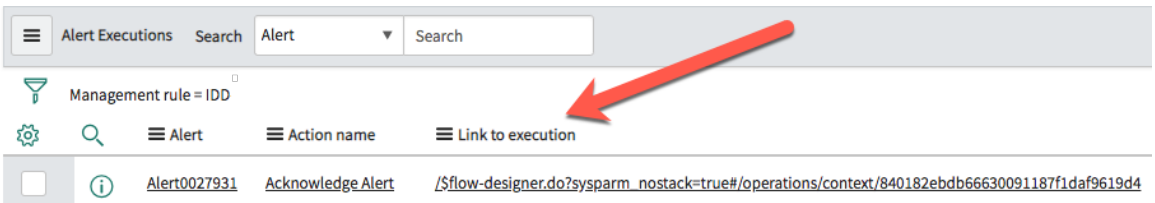
Procedure

1. Navigate to **All** > **Process Automation** > **Flow Designer**.
2. In the Flow Designer window, click **Subflows**.
3. Click **Create Incident**.
   The Create Incident subflow opens in Flow Designer in read-only format. The inputs in the Create Incident subflow are described in the following table.

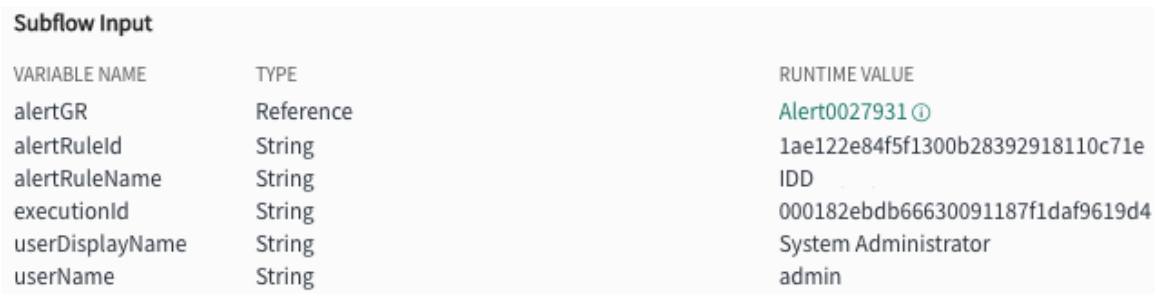
Create Incident input parameters

Value	Description
alertRuleName	The name of the alert management rule that specifies this subflow, for example `IDD`.
alertRuleId	The sys_id of the alert management rule, for example, `1ae122e84f5f1300b28392918110c71e`.
alertGR	The alert record that matches the filter that is defined in the alert management rule, for example, `Alert0027931`
executionId	The ID of the execution to be retrieved, for example, `000182ebdb66630091187f1daf9619d4`
userName	The current user's name, for example, `admin`.
userDisplayName	The name that the current user specified to be displayed, for example, `System Administrator`.

For example, in an alert management rule that has processed alerts, in the Alert Executions area, click the **Link to execution** of the required alert.



The Flow Designer opens. Click **Subflow Inputs and Outputs**. The input variable names of the subflow are displayed with their respective values.



4. In the subflow header, click more actions and select **Copy subflow**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. In the **New Subflow Name** field, enter the name of the new subflow.
6. To limit the application scope of the subflow, in the **Application** field, select the required application, otherwise select `Global`.
7. Click **Copy**.
   The new subflow is created and is opened as a tab in the subflow designer editor. The inputs provided by the template appear.

   Inputs are fixed and cannot be added to.

   In the editor, you can delete subflow inputs or outputs, as required.
8. To delete an input, click .
   Inputs are fixed and cannot be added to.
9. Create subflow outputs by defining the names and data types.
   a. Click to add output.
   b. Define the name and the data type.
10. To save the subflow in draft status, click **Save**.
11. To save and publish the subflow so that it can be used in the alert management rule designer, click **Publish**.

Result

Include the modified subflow in an alert management rule to resolve alerts according to your customized requirements.

Subflows

Alert executions information

Alert executions information provides a reference to the alert management rule actions that are performed. This information appears in the Alert Management Rule record only if an alert matches the filter in the rule and an action was performed. You can click any link in the Alert Executions list to open the referenced item.

Alert Executions

In the Alert Management Rule record, the Alert Executions list shows key related records for the rule.

Note:
The Alert Executions list in the Alert Management Rules record shows alert execution information and lists the alert management rules that the selected alert matched.

Alert Executions list

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Information in the Alert Executions list

The columns in the Alert Executions list are populated with details of the alerts that matched the alert management rule and the actions that ran. The listed alerts match the filter in the rule.

View alert execution information

You can click any link in the Alert Executions list to view the alert execution information of the referenced item. This information appears in the Alert Management Rule record only after an alert matched the filter in the rule and an action was performed.

Before you begin

Role required: evt_mgmt_admin

About this task

Among the information shown in the Alert Executions list is:

- The list of alerts that matched the filter of the rule.
- The tasks, including incidents, that were opened.
- Which remediation workflows ran and which subflows ran.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
2. In the Alert Management Rules list, click the rule.
   If an alert matched the filter in the rule and an action was performed, the Alert Executions list appears in the Alert Management Rules record. The list appears irrespective of the stage of the selected alert management rule.

Alert Executions list

Column	Description
Alert	Alert number of the alerts that matched the alert management rule.
Action name	Name of the action that was taken to resolve the alert (subflow or workflow).
Link to execution	Link to the action execution log that was created when the action was performed.
Related task	Link to the task that was created when the alert was resolved. For example, if the action for a rule is to create an incident, this field provides the incident number with a link to open the incident. A link is provided to the workflow remediation task that is created to monitor the remediation.
Log	Notice or information showing the result of the execution action, for example, how executions took place, "`1 out of 2 executions`". When the alert closes, the execution count number (the first number) resets to 0. This information does not indicate that the subflow was executed successfully, rather that the call to that subflow was successful and that the subflow is correctly configured.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Automatic run	Indication of how the action ran: automatically (true) or manually (false).
Created	Date and time that the entry was created.

Migrate an alert action rule to an alert management rule

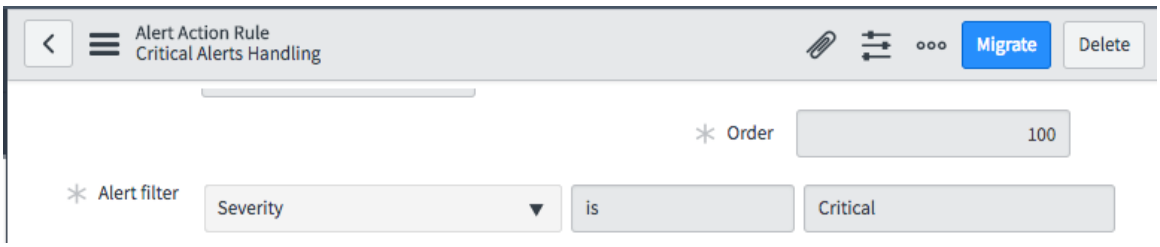
Existing alert action rules from an earlier release can be executed, but cannot be modified. Alert action rules that have been migrated become alert management rules and all the definitions of the alert action rules are migrated to the alert management rule format. Migrated rules can be modified.

Before you begin
Role required: evt_mgmt_admin

About this task
Existing alert action rules are active, read-only rules. An alert action rule can be modified only after it is migrated to an alert management rule.

Procedure
1. Navigate to **All** > **Event Management** > **Rules** > **Alert Action Rules**.
2. Select an alert action rule to migrate or delete.

Alert Action Rule record



3. Click **Migrate**.
   If you clicked **Migrate**, the list of migrated rules can be found, together with new alert management rules, by navigating to **Event Management** > **Rules** > **Alert Management**.

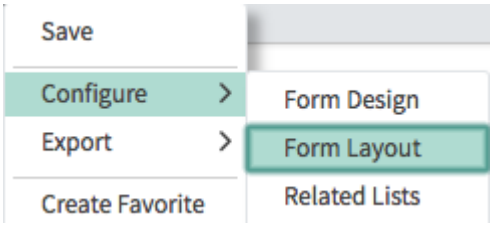
   After a successful migration, all the definitions of the alert action rules are migrated to the alert management rule format.

Result
When an alert action rule has been migrated successfully, the alert action rule can no longer be modified. However, the new alert management rule can be modified.

What to do next
If the alert action rule that was migrated had a task template, you can customize the alert management rule designer to display the task template name.

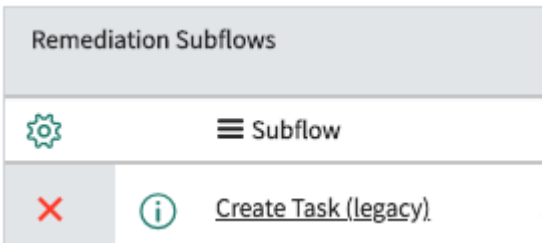
1. In the header of the alert management rule, click **Additional actions** .
2. Select **Configure** > **Form Layout**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. In the **Available** pane, select **Task template** and move it to the **Selected** pane. Position it as required.

4. In the **Task template** field, select the required template.
5. In the Actions tab, in the Remediation Subflows area, select the Create Task (legacy) subflow to run the task template.



Related topics

Apply a quick response in an alert

Synchronizing alert response with automated alert grouping

Synchronize alert response with grouping by ensuring alert management jobs runs after alert grouping jobs—this prevents duplicate actions like incident creation on secondary alerts.

Before you begin

Role required: admin

About this task

By default, the alert grouping job (**Service Analytics group alerts using RCA/Alert Aggregation**) and the alert management job (**Event Management - Evaluate Scoped Alert Rules Management0**) run independently of each other. To synchronize the alert response with automated alert grouping (for example, to avoid creating an incident on a secondary alert), you must enable the property *evt_mgmt.avoid_int_enabled* to ensure that the Alert Management job is executed after the Alert Grouping job is completed. This property is accessible from the Event Management Properties page (**All** > **Event Management** > **Administration** > **Event Management Properties**). In addition, you must configure the relevant alert management rule (for example, for incident creation), to filter out all secondary alerts.

Note:
If only one alert exists when the Alert Management job runs, an incident is created. When a second alert arrives later, the next Alert Grouping job forms a group, makes the new alert as secondary, and creates a new incident.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. If you want to avoid incidents on secondary alerts, select the **Enable Avoid Incidents on Secondary alerts and wait for Grouping job to be executed** check box.
3. Select **Save**.
4. To filter out secondary alerts, navigate to **All** > **Event Management** > **Rules** > **Alert Management Rules**.
5. Select the relevant rule.
6. In the Alert Management Rule form, select the **Alert Filter** tab.
7. In the Condition area, select **And**.
8. Add a condition:
   - **Role in Group**
   - **is not**
   - **Secondary**
9. Select **Update**.

Configure alert remediation actions

Run commands to perform alert remediation on remote Linux and Windows CIs.

Before you begin

Install the following plugins:

- IntegrationHub Enterprise spokes plugin
- ServiceNow IntegrationHub Action Step - PowerShell
- ServiceNow IntegrationHub Action Step - SSH

For Linux: Ensure that the remote Linux host is reachable using the MID Server IP address that runs action scripts.

For Windows:

- Ensure that Powershell v3.0 - 5.0 are supported and installed on the Windows target server.
- Enable Powershell remoting on the remote Windows target server.
- Ensure that the remote Windows target server is reachable using the FQDN from the MID Server that runs action scripts.

Add credentials to the credential aliases that come with the base system:

- linuxAdmin
- windowsAdmin

Role required: evt_mgmt_admin or flow_designer

Procedure

1. Access remediation actions in one of the following ways:
   - Quick actions in an alert, as described in Apply a quick response in an alert.
   - The Playbook tab in Service Operations Workspace, as described in Run actions to resolve alert issues .

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. Configure additional input in the alert's **Additional Information** field, using this format:

   ```
   {"remediation_action_resource":"<mandatory input>"}
   ```

   The mandatory input per action is described in the following table.

Action name	Mandatory input in Additional information field
Stop Windows Process	Process ID
Restart Linux Service	Service Name
Kill Linux Process	Process ID
Get Windows Processes	N/A
Stop Windows Service	Service Display Name
Restart Windows Service	Service Display Name
Get Windows Services	N/A
Stop Linux Service	Service Name
Start Windows Service	Service Display Name
Suspend Windows Service	Service Display Name
Get Linux Services	N/A
Run Linux Top for Memory	N/A
Show Disk Space Used	N/A
Run Linux Top	N/A
Start Linux Service	Service Name
Show Disk Space Used	N/A

Result

After executing an alert action, the results are noted in the *`Work Notes`* field of the alert.

CI Remediation

Alert and configuration item (CI) remediations help troubleshoot and resolve underlying problems that generate alerts. Remediation is based on Orchestration workflows that can be scripted to perform remediation tasks such as gathering system information or rebooting a server.

Event Management provides a framework for configuring and implementing a system-wide remediation plan to resolve, minimize, or prevent problems that generate events and alerts. Configure alert management rules to remediate alerts and CI remediation rules to remediate a set of CIs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert remediation

Use alert management rules to associate specific alerts with a remediation workflow. You can apply a workflow to alerts manually. Alternatively, you can configure the alert management rule that executes a workflow automatically for alerts that match the rule criteria. The workflow can also be scripted to request user approval before executing subsequent workflow tasks. The workflow is paused for user approval, even if it was automatically triggered.

CI remediation

Configure remediation more comprehensively by creating CI remediation rules to manually apply remediation to specific CIs.

Remediation tasks

When a remediation workflow is executed, a remediation task is created to capture details such as the time that the workflow started to run, the alert that triggered the remediation workflow (if relevant), and the CI that was remediated. View these tasks to track remediation activities in the organization.

Related topics

Migrate an alert action rule to an alert management rule

Create or edit CI remediation

Create a CI remediation rule that lets users manually apply an Orchestration workflow for resolving issues with specific CIs associated with alerts. Define these CIs in the CI filter conditions of the rule.

Before you begin

Create the workflow to remediate CIs. In the workflow settings, select **Remediation Task [em_remediation_task]** in the **Table** field.

Then submit the workflow definition, and add the following conditions to the workflow properties:

- **[Run Remediation][is][true]**
- **[Workflow][is][<name of the new workflow that you just created>]**

  For example, if the name of the workflow is `CI remediation`, add this condition:

  [Workflow][is][CI remediation]

After you finish configuring the workflow, make sure that you publish it. For more details, see Create a workflow.

Role required: evt_mgmt_admin

About this task

A CI remediation rule associates a set of CIs that might experience problems with a remediation workflow. The remediation workflow can either resolve the underlying problem or help troubleshoot the problem that generated the alert. For example, you can proactively configure a workflow with the appropriate response actions for predictable alerts. For more details, see the Event Management Remediation short video.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **CI Remediations**.
2. Click **New**, or select a CI remediation to edit.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Fill in the fields, and click **Submit** or **Update**.

CI remediation form

Control	Description
CI filter	Conditions to match the CIs that you want to apply this remediation to.
Orchestration workflow	The remediation workflow to apply to CIs that match the filter conditions.

Result
In service maps that are opened from the Event Management dashboard, this remediation can be applied to any CIs that match the filter conditions.

View remediation tasks

Event Management automatically creates a remediation task to capture every remediation that was applied to a CI or to an alert. It gives you an overall view of remediation activities in the organization.

Before you begin
Role required: evt_mgmt_user

Procedure

Navigate to **All** > **Event Management** > **Remediation Tasks**.

Column	Description
Number	Number assigned to this task.
Configuration item	Item or service affected by this task.
Priority	Priority that was assigned to this task, based on impact and urgency.
State	State of the task, which can be open or closed.
Assigned to	Person that this task was assigned to.
Short description	Description for the task.
Task type	This task type is a remediation task.

How alerts work with CIs in maintenance

When a CI is in maintenance, the impact tree, the service map, and Alerts tab are updated based on various factors.

Event Management Part 2 | Impact Tree Watch this brief video to learn about how alerts work with CIs.

A CI is in maintenance when:

- A change request is scheduled for the CI.
- The **Install Status** field on the CI record is set to **In Maintenance**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To customize how alerts work with CIs in maintenance, see Create maintenance rules.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with an active change request  If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green. For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active.	An active change request has the following values: • The **State** is **Scheduled** or **Implement**. • The current time is between the Planned start date and Planned end date on the change request. OR • The current time is between the Actual start date and Actual end date on the change request. You can monitor the progress of the change request. Wait until the change request moves to the **Review** or **Closed** state. Then you can address all alerts for the affected CI and any alerts that generated between start and end dates. Use the impact tree, topology, and Alerts tab to show the calculated impact severity. **Note:** The **Maintenance** check box for an alert is selected when the **Install Status** field on the CI record is **In Maintenance**. This **Maintenance** check box indicates that the alert must be hidden from the **Alerts** tab.
CI with no active change request and not in maintenance When there is no active change request for a CI and when the CI is not in maintenance, impact calculation resumes. The impact tree, the service map, and Alerts tab show the calculated impact severity for alerts.	An inactive change request has the following values: • The **State** is **New**, **Assess**, **Authorize**, **Review**, **Close**, or has no changes at all. • The **State** is **Scheduled** or **Implement**. However, the current time is before or after the planned or actual date ranges on the change request. You can monitor the progress of the change request. When a CI has an inactive change request, you can address the corresponding alerts as appropriate.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

How CIs in Maintenance appear in Event Management	Description and the optimal time to resolve the alert
CI with no active change request and in maintenance If no active change request is scheduled for the CI and if the **Install Status** of the CI is **In Maintenance**, all alerts on this CI are excluded from impact calculation. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.	All alerts on a CI with an inactive change request and **In Maintenance** has no impact calculation.

SLAs for application services and CIs

Event Management supports the creation of SLAs for application services and for CIs.

You can monitor and manage the quality of the application services offered by your organization. For example, you might want to set up an SLA that is triggered when the max alert severity of an application service or CI is **Critical**, and measure the time it takes to bring the application service or CI back to the **OK** state, when the conditions that caused the alert have been resolved.

SLAs and the Task table

You can create SLA definitions only for tables that extend the Task table. The Event Management application provides a table named Event Management SLA [em_ci_severity_task], which extends the Task table. Use this table in your SLA definitions to specify the severity level that should trigger and stop the SLA. During alert impact calculation, changes in the severity level of application services and CIs are automatically updated in the Event Management SLA table. Scheduled jobs keep the information in this table up to date.

How the Event Management SLA table is populated

The Event Management SLA table is populated differently for application services and CIs:

- For application services, the system automatically populates the Event Management SLA table when an application service is created or when its max severity is changed.
- For CIs, you must first identify which CIs can be made available for SLAs by creating an SLA configuration record. The system then automatically populates the Event Management SLA table with the CI max severity is changed.

Note:
Duplicate CIs are not added to the Event Management SLA table even if the same CI matches more than one SLA configuration filter.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an SLA configuration for CIs

Create an SLA configuration from the Event Management application to determine which CIs are available for SLAs.

Before you begin
Role required: evt_mgmt_admin

About this task
The SLA configuration record is a filter on a table in the system. Select a table that has the CIs for which you want to create an SLA.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **SLA Configuration**.
2. Click **New**.
3. Fill in the form fields (see table).

SLA Configuration form fields

Field	Description
Name	Provide a descriptive name.
Table	Select a table with the CIs for which you want to create the SLA. You can also use the Configuration Item to Host View [query_based_service_basic_view] table, which is used by Dynamic CI Groups.
Filter	Configure the filter for the records.

4. Right-click the header and select **Save**.

Example:
The following is an example.

If you want to run an SLA on all Linux servers for major and critical alerts, first create an SLA configuration on the Linux Server [cmdb_ci_linux_server] table. Then create the SLA definition with this filter:

- `CI.class` is `Linux Server`
- `Severity` is `Major` or `Critical`

What to do next
Create an SLA definition on the CIs that match this SLA configuration.

Limit the records for the SLA configuration filter

If too many records are returned by the SLA configuration filter, you can add a property to set the maximum number of records.

Before you begin
Role required: evt_mgmt_admin

About this task
By default, the size of dynamic CI group records is limited to 10,000 elements. Exceeding this limit can affect system stability. If the filter configuration for a specified dynamic CI group returns too many records, you can limit the number of records that are returned by setting the value of the sa.qbs.max_num_of_cis property. For more information, see Create a Dynamic CI Group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Enter `sys_properties.list` in the application navigator.
2. Add the following property:
   sa.qbs.max_num_of_cis
3. Set the value to an integer that represents the maximum number of records to return.

Create an SLA definition for a CI or application service

You can create SLA definitions for CIs and application services just as you can for other task records in the instance.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Service Level Management** > **SLA** > **SLA Definitions**.
2. Click **New**.
3. Fill out the fields on the SLA Definition form.
   For a description of each field, see Create an SLA definition for a CI or application service.
4. For the **Table** field, select **Event Management SLA [em_ci_severity_task]**.
5. Configure the **Start condition** filter by adding conditions, such as:

SLA filter conditions

For all CIs where the **Severity** is **Critical**		
Type	**is**	**CI** **Note:** Event Management SLAs work only on CI classes from Service Instance [cmdb_ci_service_auto].
Severity	**is**	**Critical**
For a specific service, such as Email, when the **Severity** is **Critical**		
Application Service	**is**	**Email**
Severity	**is**	**Critical**

6. Configure pause, stop and reset conditions.
7. Click **Submit**.

Alert lifecycle configuration

Event Management provides various modules, templates, and properties for configuring alerts and the actions that execute for these alerts.

Configure the alert active interval

The active interval property (**evt_mgmt.active_interval**) determines how Event Management handles a new event that is similar to events that appear on an existing closed alert. Based on the active interval, event, and existing closed alert information, the alert is reopened and the event information is added to the existing alert or a new alert is created.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
When the new event is received and the alert is already closed, Event Management compares the time since the last alert update (**sys_updated_on**) and the active interval property value. Then, the system either updates the existing alert or creates a new alert (if the original alert is closed), as explained in the following table. If the alert is open, Event Management automatically updates it without checking the active interval property value.

Scenario	Result
The new event occurs before the active interval elapses for the existing closed alert.	The event is identified as a recurrence of an existing issue. The alert is updated with the event information and the alert is reopened.
The new event occurs after the active interval elapses for the existing closed alert.	A new alert is created because the event is identified as a new issue. The event information is added to the new alert.

Change the active interval by editing the **Active interval (in seconds), within which a new event reopens a closed alert** property value.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Change the number of seconds for the **Active interval (in seconds), within which a new event reopens a closed alert** property.
3. Click **Save**.

Configure alert flapping

Set flapping properties to determine when an alert enters and exits the flapping state. Flapping can indicate configuration problems (that is, thresholds set too low), troublesome services, or real network problems.

Before you begin
Role required: evt_mgmt_admin

About this task
Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

Procedure
1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. Edit the following properties, as appropriate.

3. Click **Save**.

What to do next
You can monitor the **Event Management** > **All Alerts** list for alerts that are in the flapping state. For details, see View alerts in the flapping state.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert priority

Determine the order in which to handle alerts according to the alert priority score. Multiple factors determine the alert priority score and this value changes with changes to the underlying factors.

Multi-factor decisions

The value of the alert priority score is a composite of the value of the category and its relative weight. You can configure the factors that make up the score, as described in the following sections, according to *`Category order`*, *`Category value mapping`*, and *`CI type weight factor mapping`*. The categories are:

- *`Accumulated categories`* - These categories accumulate items with different sub-types that may have a different status or weighing factor. For example, services that are factored according to different criticality or services that are factored according to cost.
- *`Choice-list categories`* - A list of items. You can map any of the items to a different value, thereby changing the priority for that item. For example, critical severity, which has the value of 1 by default, can be mapped to 4 to give it a higher weight in the calculated alert priority score.

List of categories

Category	Description
Accumulated categories	
Number of impacted business-services	This category is factored by the business-criticality of the service. An alert that has an impact on one service has a lower priority score than an alert that has an impact on many services. For example, if a router is down, then it might affect many services and a higher priority ensures that this alert is handled before handling another alert that has an impact on fewer services. An alert that has an impact on many non-critical services must be handled with priority. However, if an alert has an impact on only a few services, but they are critical services, then this alert has a higher priority.
CI type	This category distinguishes between various CI types. For example, an alert on a CI type that is a router or switch may have a higher priority than an alert on another CI type, like a server or application.
Number of Secondary alerts	Alerts that have characteristics similar to other alerts are usually grouped together, such as alerts with the same message key. A parent alert which has many secondary alerts has a higher priority than a parent alert that has only a few secondary alerts. All secondary alerts of a parent alert are counted. If a secondary alert is closed, it is no longer correlated to the parent alert. If a parent alert is closed, all secondary alerts are no longer correlated and their priority value is calculated accordingly.
Choice-list categories	

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of categories (continued)

Category	Description
Alert state	Priority score is not calculated for an alert that is in *Closed* state. The available states with their default values are: • Open = mapping value 1 • Reopen = mapping value 2 • Flapping = mapping value 3
Alert severity	The priority score reflects the level of seriousness of the underlying alert, for example, an alert that has severity of *Critical* has a higher weighted value than an alert with a severity of *Minor*. Priority is not calculated for an alert that has a severity of *OK*. The available levels are: • Critical • Major • Minor • Warning
Role	The priority score reflects the role of the alert. The priority score is higher for an alert that has a role of *Parent*, next is the role of *None*, and the least weight is given to an alert with a role of *Secondary*. A parent alert that has many secondary alerts has a higher value than a parent alert that has less secondary alerts. The available roles are: • Parent • None • Secondary

Structure of the alert priority score

Weighted value for each category

Each category has its own placement in the alert priority score, according to its order and limit. You can configure the order and limit, as described in Modify the alert priority score, below. There are only positive numbers.

All category values are mapped from the *em_alert_priority_category_mapping* table, except for the following:

- CI Type: Mapped from the *em_alert_priority_ci_type* table.
- Secondary: Value is the number of secondary alerts and is not mapped from any table.

Note:
To ensure optimal memory protection, alert groups with more than 1000 alerts may not have an accurate priority score.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example constituents of alert priority score of 7302020.003

Category	Score
Services	(7.0, 1000000.0) For example, if there are 2 impacted services whose business criticality priority score is as follows: • Service1: Business criticality priority score = **3** • Service2: Business criticality priority score = **4** The sum of the business criticality priority scores is **7**, so the computed priority value is 7,000,000 (7 * 1,000,000) **Note:** The business criticality priority score is the mapped value (**Value after mapping**) in the application services entries of the Alert Priority Category Mappings table (em_alert_priority_category_mapping).
Severity	(3.0, 100000.0)
CI type	(20.0, 100.0)
Role	(2.0, 10.0)
Secondary	(0, 0.01)
State	(3.0, 0.001)

Using the scores from the preceding table, the alert priority score is computed as follows:

```
(Services value * 1,000,000) + (Severity value * 100,000) +
(CI type value * 100) + (Role value * 10) + (Secondary value) +
(State value * 0.001)
```

Replacing the values of the categories from the preceding table into the formula:

```
(7 * 1,000,000) + (3 * 100,000) + (20 * 100) + (2 * 10) + (0 *
0.001) + (3 * 0.001) = 7,302,020.003
```

In the **Priority Breakdown** area of the **More Information** tab, the alert priority value is displayed as 7302020.003. In the Alerts list, this value is displayed as 7302 (number of thousands).

Note: If you have customized business criticality values that differ from the out-of-box values, add an entry to the Alert Priority Category Mappings table [em_alert_priority_category_mapping].

Effect of category limits

Limits placed on categories enable overflow values to affect the next category that is ranked higher in priority order. Each accumulated category has a predefined limit. If the count goes above that limit, 1 is added to the next higher-order category. For example, if the number of CI types goes over the limit, then 1 is added to the next category (Severity) which is higher in priority: `yyy-zzz becomes yy(y+1) -000`

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Display in All Alerts list

In the **All Alerts** list, the alert priority score value is displayed in the **Priority** column. For display purposes only, the actual calculated alert priority score is divided by 1000, while in the database, for calculation and sorting purposes, the full computed value is used.

The detailed computation of the alert priority of the selected alert is displayed in the **Priority Breakdown** area **More Information** tab.

Calculating the alert priority score

Calculating alert priority is based on all of a group's alerts, and not only the group's primary alert. Priority is calculated for alerts that match these conditions:

- State not-equal to **Closed**
- Severity not-equal to **OK**

Alerts that are queued for priority calculation are listed in the `em_alert_trigger_queue` table. In the Scheduled Jobs table, there are two `Event Management - Alert Priority Queue` jobs. These two jobs can run in parallel. You can use *`Insert and Stay`* to create another job. The `Event Management - Alert Priority Queue` job runs once every minute and calculates priorities in batches of 1000 open alerts. There are multiple factors that determine the value of the priority of an alert. A change in severity triggers an immediate update of the alert priority score. In this case, only the severity-part of the priority is changed, together with severity information in the **Priority Breakdown** area of the **More Information** tab.

Triggers that cause recalculation

Triggers that can cause the alert priority score to be recalculated are:

List of recalculation triggers

Trigger	Effect on the alert priority score
New alert	The generation of a new alert is a trigger to calculate the alert priority score.
Existing alert that changes from closed to any other state	Priority is not calculated for a closed alert, so if the alert state is changed from its current state of closed to open, reopen, or flapping, that change is a trigger to recalculate the alert priority score.
Role change, between primary, secondary, or none	Changes in role are a trigger for the alert priority score to be recalculated. For example: • An alert whose type has changed to `Primary`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `None`, triggers the alert priority score to be recalculated. • An alert whose type has changed to `Secondary`, triggers the alert priority score to be recalculated.
CI type	When a CI becomes bound to alert, that change is a trigger to recalculate the alert priority score. This trigger to recalculate the priority occurs once only, when the CI is bound to the alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

List of recalculation triggers (continued)

Trigger	Effect on the alert priority score
Change of number of secondary alerts	A change in the number of secondary alerts triggers the alert priority score to be recalculated.
Severity	A change in severity is a trigger to recalculate the alert priority score. For example, changing from OK to `Major` triggers the score to be recalculated. Unlike the other triggers listed above, a change in severity triggers an immediate update of the severity part of the alert priority score calculation.

Modify the alert priority score

You can change the importance of some categories of the alert priority, by modifying their order and/or their weight, as described below. For example, if the CI type is higher in importance than the number of impacted services, you can change their respective order. As a result, the number of services is now multiplied by 100, while CI type is now multiplied by 1000000.

Note:
The changes that you make, using this advanced procedure, change the default method of calculating the alert priority score. Alerts that might otherwise not have a high score, by changing these configurable values, change the way you determine the order in which to handle alerts.

Changing category order

Navigate to the *`em_alert_priority_category_order`* table. In the **Order** column, you can change the order of the required category.

Category value mapping

The *`em_alert_priority_category_mapping`* table shows the configuration value for each category choice. Each value in a drop-down list of categories can be remapped to a different value by configuring this table.

CI type weight factor mapping

Navigate to the *`em_alert_priority_ci_type`* table. You can add a new CI, for example, `DualCore`CPU and in the **Priority** column, you can change the priority of the required category. In addition, you can edit existing Type and also change its priority value. This table is used to map the value of each CI type, for example, a mainframe that is CI_type: cmdb_ci_mainframe might have a priority of 80, while a server with CI type: cmdb_ci_server might have a priority of 60. The mapping enables you to customize the priority of the various Ci types.

Alert assignment groups for teams

Alert assignment groups assign alerts to the right teams promptly and automatically, improving overall incident management capabilities.

Admins determine the alert assignment group priority, making sure that alerts are routed to the appropriate team members.

The Alert assignment group is determined by the *`evt_mgmt.alert_auto_assignment_field`* property value. As an admin, you can choose to set the assignment group based on the alert fields using the property value and the order of the comma-separated fields by editing the property value.

Assigning alert assignment group precedence

Assign alert assignment group precedence to make sure that alerts are routed to the appropriate team members.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** and search for `sys_properties.list`.
2. In the **Search** field, enter `evt_mgmt.alert_auto_assignment_field` and select the property record.
   For more information on the property, see Team-based integration properties.
3. In the **Value** field, enter the assignment group precedence.
   Set the assignment group precedence according to the order of the comma-separated fields such as cmdb_ci.support_group, IntegrationGroup.
4. Select **Update**.

Related topics

- Team-based integration properties

Configuring Express List views for users and user groups

Centrally control what users monitor by predefining views in Express List and assigning them to users and user groups.

As an Event Management admin, you can create Express List views to ensure that users focus on specific services, priorities, or alerts. Event Management enables you to define the filters, column order, and filter attributes for an Express List view and then assign the view to individual users and user groups.

Users belonging to a group can only see the predefined views you assigned to that group and their own saved views. If a user belongs to multiple groups, they can see the views you assigned to all of these groups. Users can switch between views and modify and save all views except their assigned default view. However, they can't override settings in any of their assigned views and modify or share their default view.

The filter conditions builder enables you to configure AND and OR conditions between attributes.

© 2025 ServiceNow, Inc. All rights reserved.

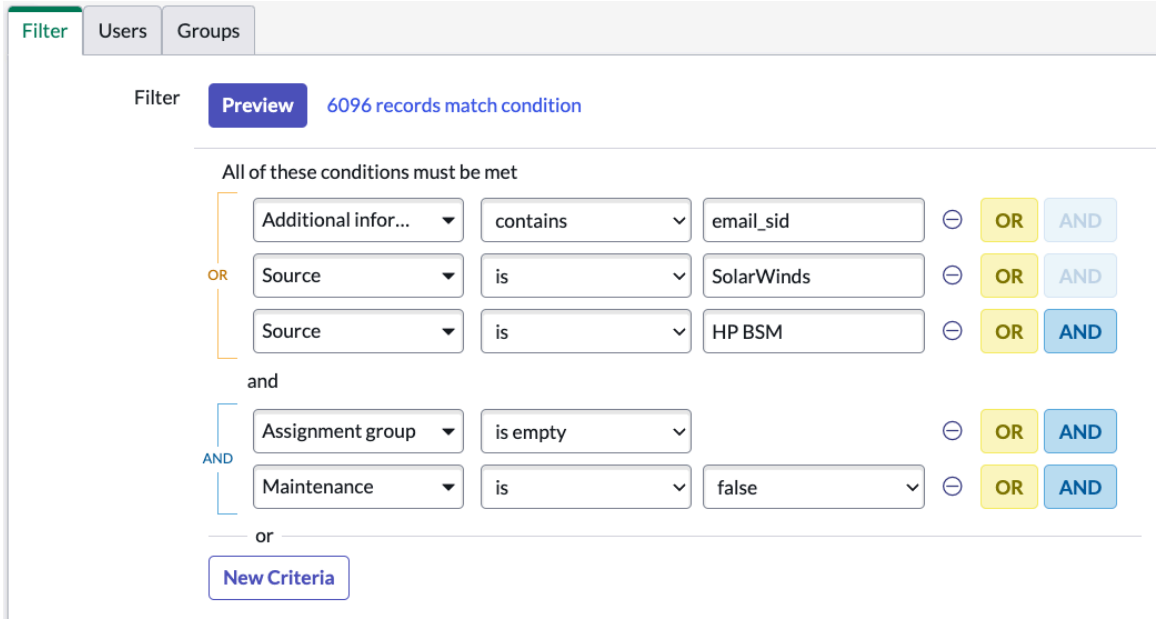
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Express List view filter conditions



For example, the admin can configure conditions that allow the user to see only alerts that are not assigned to an assignment group or in maintenance. In the example, the alerts must also contain a value of email_sid and must be from one of the specified sources.

Related topics

Create a predefined Express List view for users

Use an assigned Express List view

Create a predefined Express List view for users

Configure an Express List view for users to make sure that they focus on specific services, priorities, or alerts. You can set the filters, column order, and filter attributes for this view and assign it to individual users or user groups.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select **New**.
3. On the **Express List View** form, fill in the fields.

Express List View table

Field	Description
Name	Unique name of the Express List view.
Primary Sort By Field	The field by which to sort the Express List. Default: Initial event generation time.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Secondary Sort By Field	The field by which to sort the results of the primary sort-by field. This field is optional.
Order	The order of this Express List view, if multiple views exist.
Order of Primary Sort By Field	The sorting order of the Primary Sort By Field: Ascending or Descending.
Order of Secondary Sort By Field	The sorting order of the Secondary Sort By Field, if set: Ascending or Descending.
Default	Option to set this Express List view as the default view for the assigned user or group. If multiple default views exist, the value set in the Order field determines their order.

4. Set filter conditions for the Express List view.

Note:
When you include even a single unsupported filter in your Express List view, it prevents the Event Management operator from modifying the settings of any filters in this view, including those that are supported. If you want to allow operators to adjust their personal view, make sure to only include supported filters.

a. In the **Filter** tab, select a field, an operator, and one or more values for a condition.

Note:
The default field is State.

b. **Optional:** Perform the following tasks:

Task	Procedure
Add a filter condition	i. Select either the AND or the OR operator. ii. Select a field, an operator, and one or more values for the condition.
Add an alert tag filter condition	i. In the Alert Tags Filter section, select **Insert a new row...**. ii. Select the required tag, operator, and value for each tag filter.
Add an additional set of alert tag filter conditions	i. In the Alert Tags Filter section, select **New Criteria**. ii. Add the required tag filter conditions.
View the number of results a query with the configured conditions would return	Select **Preview**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Assign users and groups to the Express List view.

6. From the form menu, select **Save**.
   The following tabs display:
   - The **Express List Table Fields** tab shows the fields to be displayed as table columns in Express List.
   - The **Express List View Field Attributes** tab shows the filter attributes for the open alerts in Express List.
7. **Optional:** Add table fields and field attributes to the Express List view.

8. **Optional:** Exclude fields or field attributes from the Express List view by deactivating them.

   Note:
   You can view the updated state of a field or a field attribute in the table by selecting the list controls icon ( ) and then selecting **Refresh List**.

9. When you're satisfied with the Express List view, select **Update**.

Assign users and groups to predefined Express List views

Assign individual users and user groups to preconfigured Express List views to make sure that they focus on specific services, priorities, or alerts.

Before you begin

For more information about predefined Express List views, see Configuring Express List views for users and user groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Express List Views**.
2. Select the predefined Express List view that you want to assign to a user or group.
3. Assign users or groups to the selected Express List view.

4. Select **Update**.

Alert impact calculation

Impact calculation shows the magnitude of an outage on CIs, services, alerts, and alert groups. The system uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. The severity appears on the impact tree, application services maps, and dashboards.

Impact calculations are available for application services alert groups. The following factors are used to calculate the overall impact of an outage.

- Impact rules.
- Number of related active alerts.
- Past history of the affected CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

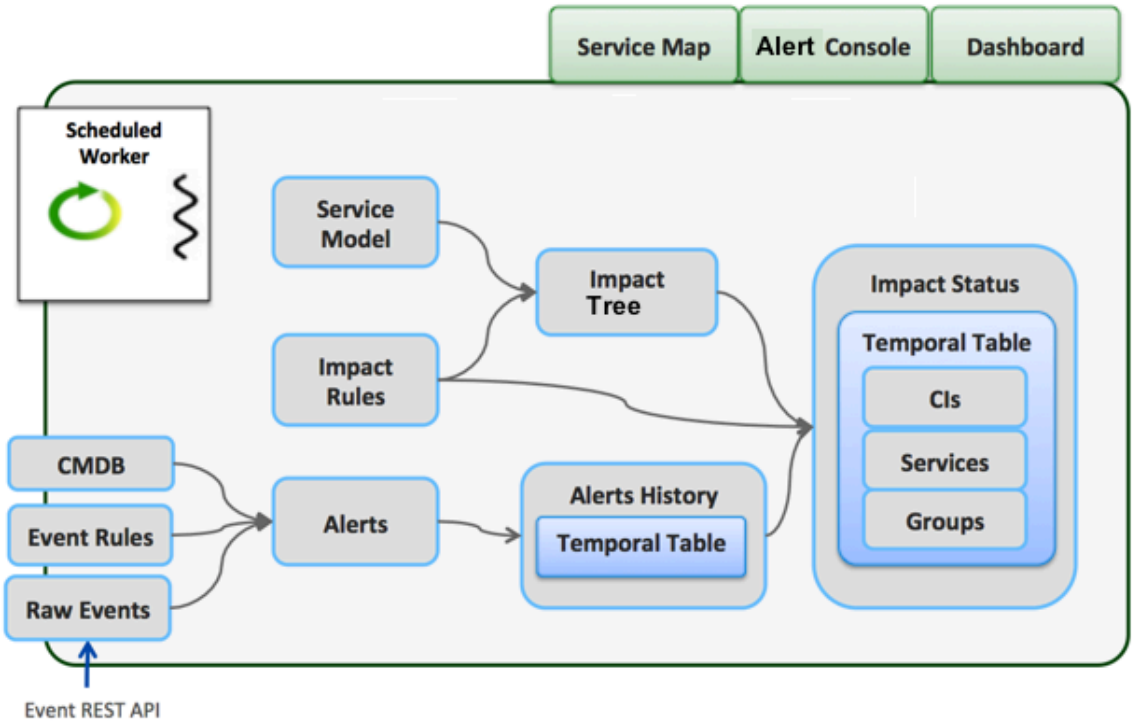
- Relationships between CIs for a particular application service or application services.
- If the CI element includes a network or storage devices.
- Alerts on CIs in the maintenance state are excluded from impact calculation.

Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

If there is a connection between services, the impact of one service on the other is also calculated.

Impact calculations use information from various sources to set the alert severity



How impact is calculated

Impact calculation varies depending on the CI relationships for a application service or application services. Additional factors, such as change requests, network paths, storage paths, and related CIs all affect impact calculation.

Services

The following impact calculation flow operates for alerts where the outage does not affect a network or network storage. Event Management performs the following steps:

1. Create a service map. Use the Service Configuration Item Associations [svc_ci_assoc] and CI Relationships [cmdb_rel_ci] tables to create child-parent relationships in the application service or application services.
2. If there is no CMDB path from the service to the CI but an association appears in the svc_ci_assoc table, show a Depends-on relationship between the application service and the CI. Otherwise, show no connection.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. For an application services, if the CIs assigned to the service are also connected to the service in the CMDB, the map keeps the hierarchy between CIs as they appear in CMDB. The CI service assignments appear in the Service Configuration Item Associations section of the Application service form. If there is no connection to the service in the CMDB, the CIs appear directly under the application services in the map.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Change requests and the In Maintenance status

If an active change request is scheduled for the CI or if the **Install Status** of the CI is **In Maintenance**, all alerts on the affected CI are excluded from impact calculation. The Alerts tab also temporarily hides all corresponding alerts. The impact tree shows the CI in green with a note of **(In Maintenance)**. The impact tree and the service map temporarily show CIs in green.

Note:

- CIs are considered to be in maintenance not only when an active change request is scheduled, but also when the **Status** field of the CI is set to **In Maintenance**.
- When a child CI is put in maintenance, it also places the parent CI in maintenance.

For a service, all alerts on CIs in the service are also hidden from the Alerts tab. The entire service is shown in green on the impact tree. For a host with an active change request, the host applications are considered as one unit. All child applications are treated in the same manner as the host until the change request is no longer active. For additional information, see How alerts work with CIs in maintenance.

Network paths

To account for network redundancy, Event Management uses a separate impact calculation. You can see network topology or path changes in the application service. The following impact calculation flow operates for alerts where a network path is affected. Event Management performs the following steps:

1. Create a application service map for the affected network.
   - Use the host ID and target IP information from the alert and the network path from the Network Paths [sa_network_paths] table.
   - Use the elements in the network path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path, from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the network path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the application CI where the path originated from.
3. Calculate all redundant elements in the path with the redundancy rule by reducing the severity on the impacted CIs by one level. For example, if the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

severity is *Critical*, the redundancy rule decreases severity by one level to *Major*.

4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Storage paths

To account for storage device redundancy, Event Management uses a separate impact calculation. You can see impact tree updates when the network storage topology changes from the application service. Event Management performs the following steps for alerts that contain storage CIs:

1. Create a application service map for the affected storage device:
   - Use the storage device in the sa_fs_to_storage_path table. The storage device definition uses the file system information in the path.
   - Use the elements in the storage path that derive from the Configuration Item [cmdb_ci] table. Also, use the elements that are associated to the path from the Infra Path To Elements [sa_infra_path_assoc] table.
   - Set the relationships. The application CI has a Depends on::Used by relationship on an element in the path that is defined in the CI Relationship [cmdb_rel_ci] table. In the relationship, the application CI is the parent and the element in the storage path is the child.
2. Calculate a separate severity for each regular element in the path. Each regular element in the path contributes its own severity to its ancestors up to the original application CI the path.
3. Use the redundancy rule to calculate redundant elements in the path by reducing the severity on the impacted CIs by one level. For example, if the severity is *Critical*, the redundancy rule decreases by one level to *Major*.
4. Create the impact tree. Mark the magnitude of an outage by 100% down, 60% affected, 40% impaired, or 20% impaired. If the items in two or more clusters are affected, the impact is 100% down.

Related CIs

As alerts generate for a CI, additional impact calculations run for related CIs. For example additional impact calculations run for a application service dependency to a CI that is not actually part of the application service. These related CIs are not discovered as part of the service. Instead, the related CIs are specified by an infrastructure relationship definition.

The following impact calculation flow operates for alerts with CIs that have a dependency to related CIs which are considered outside the application service. Event Management performs the following steps:

1. Derive relationships between the application service CIs and related CIs. Use the relationships, impact rules, and other data from the Infrastructure Relations [em_impact_infra_rel_def] table.
2. Add related CIs to the impact tree and alert list on the Event Management dashboard.
   - Use data from the Infrastructure Relationship [em_impact_infra_rel_def] table to show containment links to the host.
   - Use the Impact Status [em_impact_status] and Alert History [em_alert_history] tables to determine the status.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact rules

Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs.

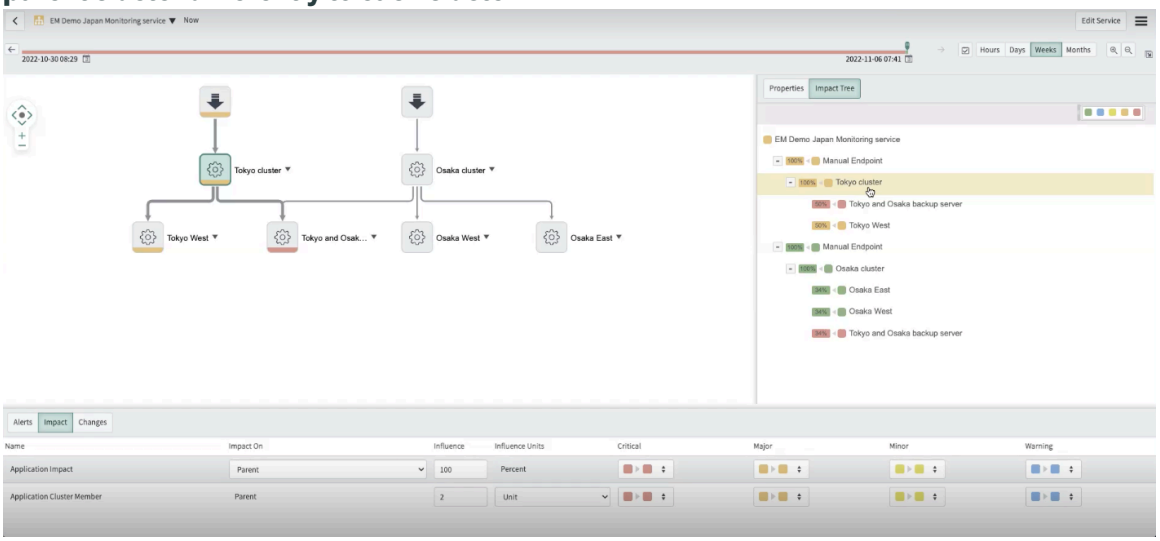
The Impact Rule [em_impact_rule] table contains impact rules that show the applicable CIs, application services, and settings for impact. The following default impact rules are available.

Application Cluster Member

Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**.

You can configure different impact rules per cluster and thus the child CI impact propagation to the parent (for the same child CI) will be different. Therefore, you can manually create groups of Cis (aka manual clusters) and configure the impact rule at the cluster level for downstream towards the cluster children.

Example where the same child CI will propagate its impact to its parent cluster differently to each cluster



In the above example, there are two entry points. The Osaka cluster on the right-hand side has three CIs. The Tokyo cluster on the left-hand side has two CIs. The Tokyo and Osaka backup server has shared parents - Tokyo cluster and Osaka cluster. On the right-hand panel you can see the Impact Tree where the Tokyo cluster has two Application Cluster Members with 50% influence each and the Osaka cluster has three with 34% influence each.

For manual cluster configuration there are two rows: Application Impact and Application Cluster Member. The children are displayed since the Impact On field was selected as Parent and not Application Service. In the Application Cluster Member row the Influence field is configured to two. This implies that the minimum amount of children who fail (and that they propagate the failure upwards to their parents) are two. The Osaka cluster is configured to three. The percentage is different for the Tokyo and Osaka backup server for each cluster (50% and 34%). As you can see, even though the Tokyo and Osaka backup server failure is Red Critical, it influences the parents differently. The Osaka cluster remains green even though the Tokyo cluster failure is Orange Major.

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

displayed in the alert area under the Map View when you select **Alerts**. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

The following impact fields are displayed when you select **Impact**.

Inclusion

Determines the impact on entities with a Contains relationship. This rule is read-only.

Infrastructure Dependencies

Determines the definition of impact propagation for CIs in infrastructure relationships.

CI application service

Determines how impact applies to parent or child entities that are part of an application service.

CI Impact

Applies to applications services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

CI Parent in Application

Sets impact only on the parent entity.

Network Path

Determines how impact applies to parent or child entities that are part of a traditional network.

OS Cluster Member

Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down.

Storage Path

Determines how impact applies to parent or child entities that are part of a storage network.

Properties

In addition to configuring impact rules, you can configure properties for impact calculation.

Configure these properties, as appropriate:

Impact Calculation Properties

Property Name	Description
`evt_mgmt.impact_calculation.alert_group_support`	Enable alert group support.
`evt_mgmt.impact_maintenance.sleep_time`	Minimum time in seconds for checking CI maintenance: checks both the Status field on the CI and any change request schedule for the CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact Calculation Properties (continued)

Property Name	Description
`evt_mgmt.impact_calculation.alert_delay`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate for the late arrivals or slow business rules defined on the em_alert table. Default = 2000 msec. Used when alerts and events are processed one at a time (when the `evt_mgmt.max_objs_in_alert_query` property is not defined or is set to **1**).
`evt_mgmt.impact_calculation.alert_delay_when_processed_in_ba`	The delay after creating or updating an alert, before it is used for impact calculation and grouping. Used to compensate the late arrivals or slow business rules defined on em_alert table. Default = 30000 msec. Used in large customer environments with high traffic, when alerts and events are processed in batches (when the `evt_mgmt.max_objs_in_alert_query` property is set to a value greater than **1**).

For more information, see Event Management - Impact calculation [KB1157218].

Understand Service Maps

Service maps show active alerts for CIs and the relationships between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

About Service Maps

A service map shows alerts with impacted CIs and CI interdependencies. For example, changes to a connection between a host and hypervisor appear on the service map. As service map definitions change, the service map, alert, and impact information updates accordingly. From the Quebec release, there is enhanced visibility. When the alert is bound to the entry point, the service map identifies an entry point problem.

Note:
Alerts will not be displayed for the entry points on the service map.

You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

The following icons are used in service maps. The icon shapes are slightly different for application services.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service map icons

Icon	Description
	Represents applications such as Microsoft IIS or SQL servers.
	Represents physical and VM computers and servers.
	Represents the network starting point. For example, Layer 3 devices appear toward the top of the map, and connected software and services appear near the end of the map.
	Shows the number of redundant CIs.
	Shows the workload between machines.
	The gray connector shows a relationship between CIs.
	Each CI with no active alerts box represents a network CI. A gray box represents a CI with no active alerts. Information about the CI is hidden.
	Hides multiple CIs that are designated as redundant.
	An impacted CI displays the color that represents the severity of the alert associated with the CI. • **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent. • **Major (orange)**: Major functionality is severely impaired or performance has degraded. • **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred. • **Warning (blue)**: Attention is required, even though the resource is still functional. • **OK (green)**: An alert is created. The resource is still functional. • **No color**: No active alerts.
	Represents a fiber channel, hard drives, or other data storage devices.
	Represents related web services for the network such as NGINX or JBoss web server.

Note:
Session timeout settings don't apply to this screen. The session remains connected, even when there is no human interaction. If this setting is a concern, either log out or close the active tab in the browser.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

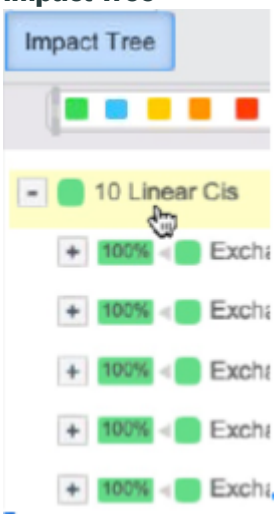
About this task
The impact tree shows the result of impact rules on CI parent and child relationships. The tree represents a service map with CIs from the Service Configuration Item Associations [svc_ci_assoc] table. When related CIs are connected but not part of the service map, the impact for the related CIs can also appear in the impact tree.

The numbers or percentages on a parent CI summarize overall severity based on alerts from child CIs. The parent severity is based on impact rule computations.

You can also learn about the impact tree from the following video tutorial.

Event Management Part 2 | Impact Tree

Impact Tree



Procedure
1. Open the service map for the service from the Application service list.
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Click **View service** next to the service.
2. On the service map, click a CI that has a severity color.
3. Click the **Impact** tab.
4. From the **Impact Tree** tab in the side pane, expand the parent CI and click the CI that generated alerts.
5. Use the severity color to locate CIs that contain alerts:
   - **Critical (red)**: Immediate action is required. The resource is either not functional or critical problems are imminent.
   - **Major (orange)**: Major functionality is severely impaired or performance has degraded.
   - **Minor (yellow)**: Partial, non-critical loss of functionality or performance degradation occurred.
   - **Warning (blue)**: Attention is required, even though the resource is still functional.
   - **OK (green)**: An alert is created. The resource is still functional.
6. Do one or more of the following.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Option	Description
Adjust impact rules	**a.** Click the **Impact** tab. **b.** Review and adjust the impact rules as necessary.
Remediate an alert	**a.** Click the **Alerts**. **b.** Right-click the alert and select **Run remediation**.

Network paths appearing in the impact tree can use a large amount of resources, which degrades system performance. To disable network paths from appearing in the impact tree, navigate to **System Properties** > **All Properties** and set the *evt_mgmt.network_path_excluded* property to **true**.

To view impact tree using Service Operations Workspace, see View impact tree using Service Operations Workspace.

Adjust impact rules for a CI

Configure impact rules to customize the impact calculation for discovery services and manual services. The impact rules update the overall alert and show the impact on related CIs. When you change impact rules, the updates apply to alert severity in places such as the Event Management dashboard and Operator Workspace.

Before you begin

Role required: evt_mgmt_admin

About this task

You can view and adjust the impact rules of CIs from the application service map of a service.

Note:
Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

Procedure

1. Open the application service map from either the Event Management dashboard or the Application service list.

Option	Description
From the Event Management dashboard	**a.** Navigate to **Event Management** > **Dashboard**. **b.** Double-click the tile of the application services.
From the Application Service list	**a.** Navigate to **Event Management** > **Services** > **Application Services**. **b.** Click **View Map** next to the application services.

2. On the application service map, click a CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Below the map, click the **Impact** tab and then adjust the impact rules accordingly.

Impact Rules

Field	Description
Name	The name of the impact rule. ○ **Application Cluster Member**: Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. **Note:** To configure a manual cluster, see Configure a manual cluster ○ **Application Impact**: Determines how impact is applied to a specific CI, the overall application service, or parent/child entities within an application service. For the Application Impact rule, you can choose from the following Impact options: **Application Service** or **Parent**. ▪ If no CI is selected, the alert rule applies to the entire application service. ▪ If you select a specific CI, you can define whether the rule applies to the service or its parent. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Infrastructure Dependencies**: Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **OS Cluster Member**: Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network.
Impact On	The valid type of service for this impact rule. ○ **Application Service**: The impact rule applies to a application service. ○ **Parent**: The impact rule applies to the parent CI.
Influence	The value to allow the impact rule to set on the parent. Set a value on the parent. This field works with the **Influence Units** field.
Influence Units	The unit of measurement to show impact on the parent. Set the highest value on the parent CI. Set lower values on each child CI. When alerts occur for several child CIs, Event Management calculates the sum of the **Influence Units** of each affected child. If the sum exceeds the parent **Influence Units** value, the parent receives the highest severity in the set. This field works with the **Influence** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Percent**: When the percentage exceeds the **Influence** value, apply the impact on the parent. ○ **Number**: When the number exceeds the **Influence** value, apply the impact on the parent. For example, you can set the parent **Influence Units** to **100%** and the child CIs to these values: ▪ Child 1: 34% ▪ Child 2: 34% ▪ Child 3: 34% ▪ Child 4: 70% When alerts for Child 3 and Child 5 have the Critical severity, the severity of the parent is set to Critical because the sum is greater than 100% (34% + 70% = 104%).
Impact when Critical	The alternative impact to use when the calculated severity is Critical. If the column to the right of **Impact when Critical** has a higher severity, update all right-most columns with the same or a lower severity as **Impact when Critical**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Major	The alternative impact to use when the calculated severity is **Major**. If the column to the right of **Impact when Major** has a higher severity, update all right-most columns the same or a lower severity as **Impact when Major**. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Minor	The alternative impact to use when the calculated severity is **Minor**. Controls the field values to the right of this field. If the **Impact when Warning** column has a higher severity, use the **Impact when Minor** value for both fields. To make sure the topology and impact tree accurately show impact, always update each column accordingly. ○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).
Impact when Warning	The alternative impact to use when the calculated severity is **Warning**. To make sure the topology and impact tree accurately show impact, make sure that the columns to the left have higher severities.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Critical**: Red (highest severity). ○ **Major**: Orange. ○ **Minor**: Yellow. ○ **Warning**: Blue (lowest severity).

What to do next
Review the changes on the impact tree. For example, if you changed a number or percentage influence for child CIs, review the impact tree updates accordingly.

View an alert impact on CIs in a service map

You can view service maps to see active alerts for CIs and the relationship between CIs. By viewing this information, you can better understand the source of alerts and take remediation steps. The service map is available for all application services.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can open a service map from these places:

- From the Application services list, you can view service maps for application services.
- From the Monitored services list, you can view service maps for monitored services.

Procedure
1. Open an application service map:
   a. Navigate to **Event Management** > **Services** > **Application Services**.
   b. Next to the service, click **View Map**.
2. Do one or more of the following.

Related topics
Alert impact calculation

Understand Service Maps

Create an infrastructure relationship for related CIs

Infrastructure relationships show CIs that are connected to a application service but are not necessary parts of the service. Infrastructure relationships are only available for application services.

Before you begin
Role required: evt_mgmt_admin

About this task
When you create a CI infrastructure relationship, the information is stored in the Infrastructure Relations [em_impact_infra_rel_def] table. When alerts generate, the related CI accompanies the application service information on the Event Management dashboard and in the impact tree. Additional information for the related CIs only appears on a related dependency view map for the application service. The following default infrastructure relationships are available.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default infrastructure relationships

Infrastructure relationship	Impact rule	Description
cmdb_ci_appl	OS Cluster Member	Shows alert impact between hardware and software applications.
cmdb_ci_esx_server	Infrastructure Dependencies	Shows alert impact between VCenter and ESX clusters.
cmdb_ci_kvm	Infrastructure Dependencies	Shows that alert impact on Linux Kernel-based Virtual Machine (KVM) connectivity.
cmdb_ci_vm_zones	Infrastructure Dependencies	Shows alert impact on the Solaris VM zones.

For example, based on of the cmdb_ci_vm_zones Infrastructure relationship definition, Event Management adds ZoneServer@mmp1 to the application service. The Containment rule manages impact severity on alerts.

Related CIs appear on the BSM

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Infrastructure Relations**.
2. Click **New**.
3. Fill in the fields, as appropriate.

Infrastructure Relations form

Field	Description
Child Type	The table that contains data about the child entity.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Parent Type	The table that contains data about the parent entity.
Relation Type	The relationship between the child and parent entities.
Impact Direction	The impacts direction to show on the application service map. ○ **From Child to Parent**: When an alert is regarding a child, show the impact on the parent. ○ **From Parent to Child**: When an alert is regarding a parent, show the impact on the child entity.
Impact Rule	The impact rule to calculate infrastructure relationships: ○ **OS Cluster Member** : Determines how host cluster members affect the overall cluster status based on a percentage or number of cluster members. For example, if a three-host cluster requires **60% Influence** to set the severity of **Major**, each member has **20% Influence** (60% divided by 3). The severity of the entire cluster can only change to **Major** when two or more cluster members have a severity of **Major**. The entire cluster is also considered to be down. ○ **Application Cluster Member** : Determines how application cluster members affect the overall impact of the cluster. For example, if a three-member cluster requires **90% Influence** to set the severity for the entire cluster to **Major**, each member has **30% Influence** (90% divided by 3). The severity of the entire cluster can only change to **Major** when all three members have a severity of **Major**. ○ **Infrastructure Dependencies** : Determines the definition of impact propagation for CIs in infrastructure relationships. ○ **CI Application Service**: Determines how impact applies to parent or child entities that are part of an application service. ○ **CI Parent in Application**: Sets impact only on the parent entity. ○ **Inclusion**: Determines the impact on entities with a Contains relationship. This rule is read-only. ○ **Network Path**: Determines how impact applies to parent or child entities that are part of a traditional network. ○ **Storage Path**: Determines how impact applies to parent or child entities that are part of a storage network. ○ **CI Impact** : Applies to application services. Determines the relationship between service members. The impact from child to parent CIs is always 100%. For example, the parent impact severity is derived from the child CI with the highest severity.

4. Click **Submit**.

View impact of child service on parent service

In the map view of an application service, the severity of a child service is propagated to its parent service.

Before you begin

Role required:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- for application services, evt_mgmt_admin
- for discovered services, service_mapping_admin

About this task

In the map view of a discovered application service, you can see that the severity of a child service is propagated to the parent service.
An application service is affected by the severity of alerts that are directly associated with it and alerts on the CIs that are in the service. If the severity of a child service is higher than that of its parent service, on the map view the parent service shows the severity of the child service. In the map view, the **Impact Tree** list shows the CIs. The color of the CIs indicates the alert severity. The child service is also affected by application services that are under it.

Example where the parent service shows the severity of the child service

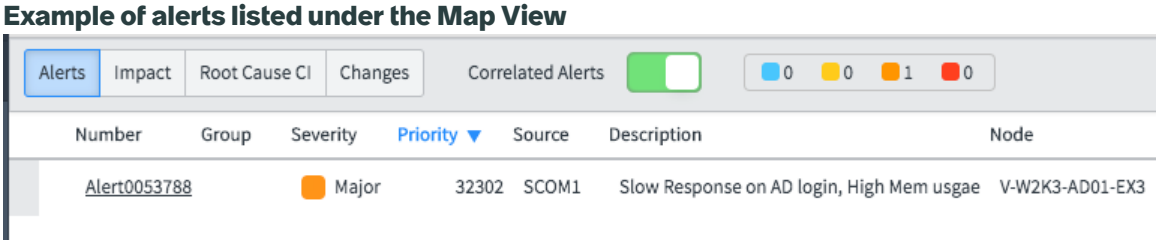
If a loop is created, for example, by connecting a parent service to a sub-service, this relationship can be viewed in the map view. The impact of this loop is not calculated and the Impact Tree does not display this relationship. For example, assume that there are three CIs, A, B, and C, where C is a sub-service to B and B is a sub-service to A. The relationship of the A connected service to C is displayed in the map view. However, this relationship is not shown in the Impact Tree.

Note:
A message appears in the system error log in the following format, where the sys_id of the service and the node changes accordingly: `Found loop in ServiceId:[sysId], and node:[sysId]. Removing this relation to avoid impact loops`

For example, `Found loop in ServiceId:409d4fd59f030200fe2ab0aec32e705c, and node:df5cf6159f030200fe2ab0aec32e70a2. Removing this relation to avoid impact loops`

Click a service or CI to see the alerts that are associated with it. For example, if you click the high-level application service, the alerts that are associated with it are displayed in the alert area under the Map View. The alerts listed are those of the selected service. Alerts of child-services are listed when those services are selected.

Example of alerts listed under the Map View



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

Open an application service map:

a. Navigate to **Event Management** > **Services** > **Application Services**.

b. Select **View Service** next to the service.

c. On the right-hand panel, select **Impact tree**.

d. On the lower panel, select **Impact**.

Result

In the service map, you can visually verify that the service health of the sub-service is rolled-up to the parent service. At the bottom of each icon of an impacted CI is a colored bar that represents the severity of the alert. This color bar also displays in the bottom bar of its parent service. For manual cluster configuration, you can modify the Application Impact and Application Cluster Member.

Probable Root Cause Analysis (RCA)

Shorten the mean time to repair (MTTR) by discovering the root cause of an alert.

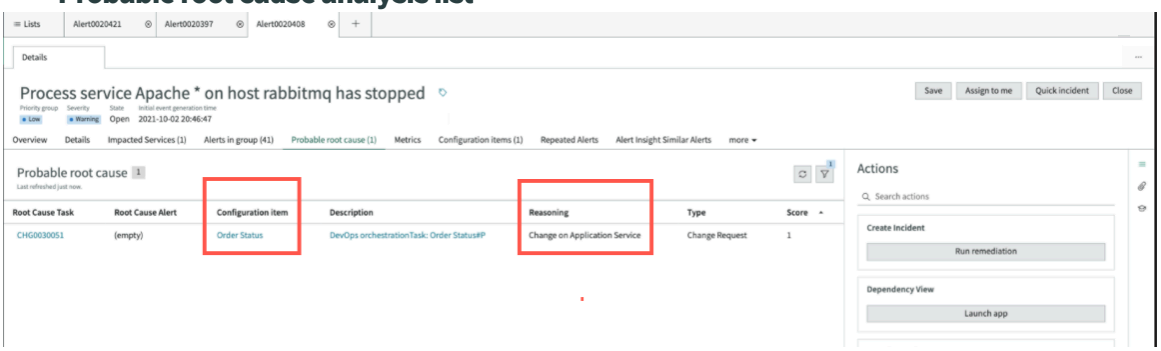
Probable root cause analysis (RCA) provides a list of probable root causes for alerts. This capability uses existing data in IT Service Management to help you determine the root cause of an issue.

RCA takes three factors into consideration: Alerts, configuration item (CI) topology, and change requests on the CIs. It extracts CIs from alerts or alert groups and analyzes the CI relationships in the CMDB. It then uses a set of configurable filters to consider relevant change requests on the CIs as possible root causes.

Change requests can be related to a time frame or to a CI, the application service it belongs to, or the software installed on it. For example, a CI must be upgraded or a security patch installed on it. A change request on one CI can affect other CIs.

RCA maps the alerts and change requests to the CIs. It proceeds to calculate the root cause score, a logical score used for sorting probable root causes. The calculation of this score is based on change requests on CIs, and on alerts on a crucial CI called the Topology Origin CI. The root cause score determines how RCA populates the probable root causes list.

Probable root cause analysis list



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, the list shows the five probable root causes with the highest score. It lists the CIs related to each alert, and the reason RCA identified them as probable root causes.

Scoring for probable root causes is determined by the following criteria, in the indicated order (lower number = higher priority):

1. Change on a CI that originates from topology.
2. Change on a related CI originates from topology.
3. Change on a CI.
4. Change on a related CI/change on an application service/change on software.
5. Alert on the CI that originates from topology.

To disable the Probable Root Cause Analysis feature, you must create the property *sa_analytics.disable_prc* and set the value to `true`. For more information on how to create a property, see Add a system property.

Customize RCA settings

Modify default settings that determine RCA behavior.

Before you begin

Role required: evt_mgmt_admin

About this task

Default filter settings control which change requests RCA considers as possible root causes. You may want to change certain default settings, for example to make RCA ignore standard change requests.

You can also change the number of probable root causes shown in the list. By default, the list shows the five probable root causes with the highest root cause score.

By default the RCA calculation is enabled. You can disable it by changing the default *sa_analytics.disable_prc* value to True.

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Do one or both of the following, as needed.
   - Change default filter settings:
     a. Select **New**.
     b. In the **Name** field, specify the name of the property for which you want to change the default setting.

     The new property must have the same name as the related property in the table.

Property	Description	Type	Default value
sa_analytics.rca.filter_category	The categories of change requests that RCA considers as possible root cause.	string	" "
sa_analytics.rca.filter_type	The types of change requests that	string	"standard,normal,emergency"

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
	RCA considers as possible root cause.		
sa_analytics.rca.filter_change_state	The state of change requests that RCA considers as possible root cause.	string	"-1,0,3,7,8,157"
sa_analytics.rca.filter_time_interval_in_hours	The time interval, in hours, during which change requests occurred that RCA considers as possible root cause.	int	168
sa_analytics.rca_use_legacy_query	Use legacy less efficient queries for RCA calculation.	Boolean	False
sa_analytics.rca.get_tasks_for_impacted_cis	Include change requests for impacted services in the RCA list.	Boolean	True
sa_analytics.rca_scoring_by_time_proximity	Enable sorting of RCAs by time proximity to the alert.	Boolean	True
sa_analytics.rca_cmdb_relation_levels	Number of levels to search related configuration items.	int	3
sa_analytics.rca_time_filtering_by_planned_time	Enables filtering of change requests by planned time.	Boolean	True
sa_analytics.rca_time_filtering_by_actual_time	Enables filtering of change requests by implementation time.	Boolean	True
sa_analytics.rca.upper_filter_time_in_hours	Determines the time in hours for the upper bound for change requests filtering.	int	1
sa_analytics.rca.order_by_scoring_for_virtual_alerts	When scoring for virtual alerts RCAs for virtual alert – order the records by scoring of PRCs of the corresponding secondaries.	Boolean	True
sa_analytics.rca_same_reasoning_prioritize_newer	When 2 PRCs have the same reasoning, prioritize the one with the most recent change request	Boolean	True

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description	Type	Default value
	during scoring calculations.		
sa_analytics.rca.prefer_cr_on_app_service	In case there is the same change request on application service and on CI, prefer the one from application service.	Boolean	False

c. Enter a valid value for the property.

> **Note:**
> The value you set for the new property overrides the default value for the related property.

- Change the maximum number of probable root causes shown in the list:

  a. Find the property *sa_analytics.rca_task_table_max_records*.

Property name	Description	Type	Default value
sa_analytics.rca_task_table_max_records	The maximum number of probable root causes shown in the Probable root causes list.	integer	5

  b. Replace the default value with a new valid value.

- Disable RCA by creating the *sa_analytics.disable_prc* property.

  a. Select **New**.

  b. Fill in the form with the following values.

Property name	Description	Type	Value
sa_analytics.disable_prc	Disabling the Probable root cause.	Boolean	True

3. Click **Submit**.

Alert similarity

Finding alerts that are similar to the alert that you are currently investigating can help save troubleshooting time by seeing how similar alerts were resolved.

Finding similar alerts

Alert similarity applies natural language processing (NLP) based on ServiceNow AI Platform machine learning (ML) as implemented in Predictive Intelligence.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

ML logic filters out irrelevant information and provides further information to help you understand the cause of alerts. You can view solutions used to resolve similar alerts and the probable root cause.

ML helps find similar alerts based on text found in these alert record fields:

- Configuration item.Class
- Metric name
- Description

Additional alert information

In the Alert Workspace, select the required alert and click **Insight** to view additional information about the alert.

In the Alerts list, select the required alert and use the Alert Insight tabs on the right side of the alert record to view additional information about the alert. For example, you can view the top recent alerts for the current CI and similar CIs to find the most suitable solution towards resolving the alert.

The alert insight tabs are:

- Impacted Services
- Flapping
- History
- Activities
- More Information
- Repeated Alerts
- Similar Alerts
- CI Incidents
- CI Change Requests
- CI Problems
- Related Incidents
- Related Change Requests
- Related Problems

For more information about the alert insight tabs, see Alert insight information.

Find similar alerts

You can find alerts similar to the alert currently being investigated. Save troubleshooting time by reviewing similar alerts to see how they were resolved.

Before you begin

Ensure that the Predictive Intelligence plugin is activated. To activate this plugin, see Activate a plugin.

Ensure that the `evt_mgmt.similarity_use_ml` property is set to `true`.

Role required: evt_mgmt_admin

About this task

Save time in resolving the current alert by reviewing how similar alerts were resolved. Provide resolution consistency by resolving similar alerts in the same way.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the list of alerts, click the alert record that you want to investigate.
3. In the alert record, click the **Similar Alerts** tab.
   Alerts that are similar to the alert that is being investigated are listed.

   By default, up to 10 similar alerts are listed. You can modify this value by setting the `evt_mgmt.similarity_max_similar_alerts_shown` property.

4. If you configured a threshold, in the Related links area, click **Show Similarities Details**.
   The Sys ID and confidence level of each similar alert is displayed. The Confidence level is an indication of how the similar alert matches the parameters that you set. As an example, a high confidence percentage value indicates a higher likelihood of similarity of the alerts to the values that you set.

   You can modify the value of the threshold by setting the `evt_mgmt.similarity_use_threshold` property.

Similarity solutions

Similarity solutions enable you to use Machine Learning (ML) to compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Training a similarity solution

To train a similarity solution, you collect words to compile a collection that Machine Learning (ML) can use to compare text in the **Short Description**, **Description**, **Source**, **Type**, **Resource**, and **Metric Name** fields in a resolved alert to see whether the words in the set match words in an open alert. The resolved alert, which is similar to an open alert, provides an example to show how the open alert can be resolved.

To train a solution, the filter must return at least one record. If your filter returns no records, update it.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The preferred number of records for training a solution is between 30,000 records and 300,000. If you submit more than 300,000 records, the most recent 300,000 records are used to train the solution. Use only authentic records from the database.

- Ensure that the records you train are not too old and that they are relevant to your business needs. Keep the words in the collection current.
- Do not use hard-coded dates as filters because these filters are not updated when you retrain solutions unless you update them manually before every retraining. Instead, use relative date filters, for example, the last 3 months, last 6 months, or last 12 months.
- Perform training as needed until it provides an acceptable similarity solution. This practice provides you time to review and update your solution definition.

Fields to include in the solution

Record the fields that are likely to contain words and phrases that help the system identify similar records for your solution.

The similarity fields that you select should be a subset of your input field selections. For example, if you select fields from incident records that are in Open state, do not select **Close note** as a similarity field. Because open records do not include **Close note** fields, the text cannot be similar.

The similarity fields are available to users when they create records.

About the similarity score

The similarity score is a measure from 0-100 of the degree of similarity between two alert records. Alert records that have a similarity score higher than the threshold that you specify is returned by the solution.

Review similarity examples and their scores using the **Show training progress** feature to determine whether to either increase or decrease the solution threshold. You can change the threshold value in the **Threshold for Similarity Score** field.

View training solution progress

Training times vary based on the number of records and classes within the training set. The more records and classes you use, the longer the training can take. For example, a data set containing 100,000 records and several hundred classes can take around five hours to complete.

To show the training solution progress, the ML solution automatically performs the following activities when you select **Show training progress** on the Solutions page. For more information, see View solution training progress.

Solution training activities

Activity	Description
Fetching files for training.	The system downloads the training records and sends them to the nearest training service.
Preparing the data.	The system removes duplicate records from the training set.
Training the solution.	The training service trains the solution.
Uploading the trained solution.	The training service uploads the solution as attachment records.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an Event Management similarity solution

Create and train a solution that applies machine learning to a collection of words to target and suggest similar alerts in your instance dataset. For example, you can compare the text in a resolved alert record to an open alert record to reuse its resolution approach.

Before you begin

Role required: evt_mgmt_admin

About this task

The encryption scheme that you use can affect whether you can train solutions.

- If your data is encrypted by Full Disc Encryption (FDE), you can train solutions.
- If the field you are using for training is encrypted using Field Encryption, ensure that the shared service worker user has the correct encryption module role that has been used for encryption.
- If you are using Edge Encryption, training is not supported.

Note:
This feature supports only English language processing.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solution Definitions**.
2. Click **New**.
3. On the form, fill in the fields.

ML Solution Definition form

Field	Description
Solution Template	Use to define a word collection.
Label	Unique name for the similarity solution.
Name	Field that is auto-populated with a system-assigned name that is similar to the label name when the solution is created.
Table	Table that contains the records to use for the word collection, for example, the Incident table or the Asset table. When you assign a table value, a link appears that shows the number of records that match your current conditions.
Filter	Conditions that you want to apply to the training records. To train a solution, the filter must return at least one record. If your filter returns no records, update it.
Input Fields	Record the fields that contain the text and context that you want to include in your word collection. The field data type can be a string, reference, choice, or HTML, such as **Short description** and **Description**. **Note:** **Journal type** is not a supported data type. Good candidates for your input fields have text that is relevant to the solution. For example, if you are configuring a solution to find similar incident records, you can select the **Short Description**, **Description**, **Resolution notes**, and **Close notes** fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Training Frequency	Training is performed once by the system, by default. Because your data can age over time and degrade the accuracy of recommendations, consider invoking scheduled trainings once your solution definition is fairly stable.
Domain	On instances where domain separation is active, select the domain whose target records you want to use for your word collection. Create a separate similarity solution definition record for each domain whose field values you want to use for your word collection.
Similarity Fields	Record fields that are likely to contain words and phrases that help the system identify similar records for your solution. To change your **Similarity Field** choices, click the Lock icon ( ) to open the field and make your updates. Click the icon again to close the field and save your updates.
Similarity Window	The period in which you want to look for similar records. If you have a smaller number of total incoming records, a larger window might be best. However, if the window is too large, you may retrieve records that are not as useful. If the window is too small, you might not retrieve enough similar records. For example, if you are looking for similar incident records that are open, you can select **Last 1 day**. This selection targets the most recent records, many of which could still be open.
Similarity Window Filters	Filter conditions for your similarity window. These filters define the dataset conditions under which your similarity results are determined. For example, if you are looking for similar incident records that are open, you can filter your search by creating conditions such as: **[Incident state] [is] [In progress]** These filters are applied in addition to the **Input Field** filters.
Window Refresh Frequency	Frequency to refresh the similarity window. For example, if your window contains incident records that are open, you can select a refresh frequency value of **Every 15 minutes**. New incidents typically occur frequently throughout the day so this frequency increases the likelihood that newly opened records are included in the refresh. **Note:** If your similarity window is composed of records such as Knowledge article records, which are typically not created often, you can choose a larger refresh frequency such as **Every 1 day**.

4. Click **Save** to save the solution definition record so you can return to it later, or click **Submit & Train** to create the solution definition record and train it.
5. If you submitted the solution for training, click **OK** on the **Training Activation** window to confirm.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
The system schedules the solution for training with the nearest training service. You and other users subscribed to the Predictive Intelligence Notifications category receive a notification when the training completes, including any errors that might have occurred in the training. When training is complete, the system uploads the solution as an Attachment record.

What to do next
Review the trained similarity solution examples in the **Similarity Examples** related link on your ML Solution Definition form.

View Event Management solution training progress

View solution training progress or statistics to determine whether a solution is available or how long the next training cycle might take to complete.

Before you begin
Role required: evt_mgmt_admin

Procedure
1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, select the solution whose progress or statistics you want to view.
3. Click the **Show training progress** related link.
   The ML solution automatically performs activities that appear in the Training Progress pop-up window.

   The system shows a Training Progress pop-up window. In the following example, the progress failed.

   If the training is a success, all bars would be fully blue and the progress for each step would show 100%.

What to do next
See Review Event Management similarity examples.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Review Event Management similarity examples

Review the similarity examples and scores that the system provides during solution training to see how the selected alert record compares to existing alert records. For example, you can modify the similarity score threshold to increase the accuracy of your similarity recommendations.

Before you begin

Train a similarity solution in a ServiceNow datacenter. For more information, see Create an Event Management similarity solution.

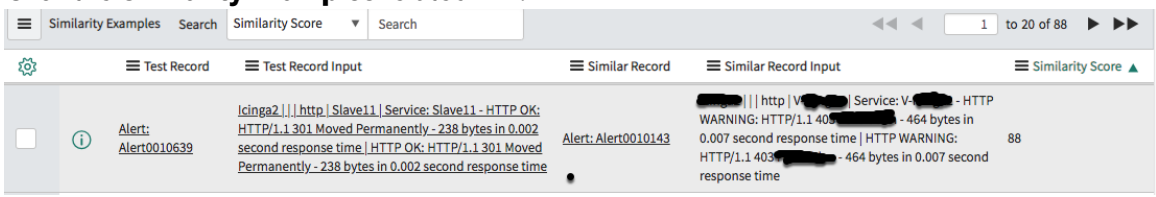
Role required: evt_mgmt_admin

About this task

Adjust the current threshold to provide useful results. For example, a low similarity score has more coverage but less precision.

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, locate your solution and click the Information icon (ⓘ).
3. Click **Open Record**.
4. Click the **Similarity Examples** related link.



5. Review the similarity examples and their threshold scores to determine the accuracy and coverage levels you want applied to your solution similarity results.
   The higher the similarity score, the more precise it is and the less coverage it offers. The lower the similarity score, the more coverage it has and the less precision it offers.
6. Based on your review, determine whether to increase or decrease the similarity score threshold value for your similarity solution

   The solution returns only similarity results that have a score that is higher than the threshold. If the current threshold is not providing useful results, adjust the threshold value.
7. Navigate to **Predictive Intelligence** > **Similarity** > **Solutions**.
8. In the ML Solutions list, locate your solution and click the Reference icon (ⓘ).
9. Click **Open Record**.
10. In the Solution Statistics tab, enter a new value in the **Similarity Score Threshold** field.
    For example, suppose that the current score is 80. Based on your similarity example review, you might want to update the field by entering a higher score of 90, which will return fewer results but ones that are more similar to the alert record under review. A lower similarity score has more coverage but less precision.
11. Right-click in the form header and click **Save**.
    Your solution uses the new similarity threshold value. In the example, the solution returns similar results that have a score higher than 90.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate Event Management solution version

The system activates the most recent version of the solution, but you can activate any previously trained Event Management solution version if it is more appropriate.

Before you begin

Because you might have created more than one solution, you can choose to activate the solution that is most appropriate.
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Predictive Intelligence** > **Similarity** > **Solutions**.
2. In the ML Solutions list, click the Reference icon (ⓘ) for the trained solution that you want to activate.
3. Click **Open Record**.
   You can assign a title to the solution using the `evt_mgmt_similarity_solution_title` property. The default value is `ml_x_global_alert_similarity`. This property changes the value in the **Solution Name** field.
4. In the solution record, click **Activate**.
   The system activates this solution version and deactivates any other solution version.

Self-health monitors for Event Management

Use the Event Management self-health monitors to track Event Management features and resolve issues.

Monitor Event Management to detect and resolve issues

Enable the self-health feature to help detect and troubleshoot Event Management health issues. Some configuration is required before the self-health feature can display meaningful data. Once configured and the related scheduled jobs are enabled, the Service Operations Workspace displays data that is automatically collected and calculated on a recurring schedule.

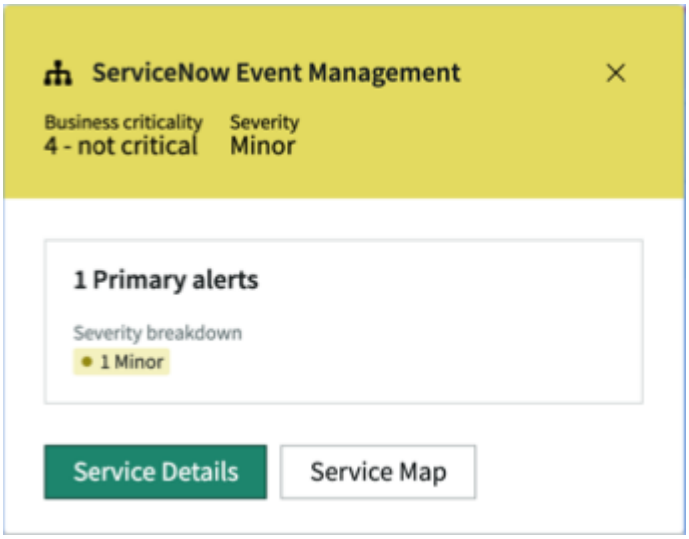
Note:
Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

The self-health feature creates CIs in the CMDB to represent the components of the self-health service. Use the provided monitors to monitor and track the health of services and Event Management features.

Event Management self-health can:

- Trigger alerts when there is an issue with Event Management.
- Display the **ServiceNow Event Management** application services in Service Operations Workspace. Use Service Operations Workspace to view alerts by application service, technical service, and alert groups. You can double-click a tile to view general information about the service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



- Click **Service Details** to view details of the service.
- Click **Service Map** to view a map representation of the **ServiceNow Event Management** application services to see the relationships between CIs in the **ServiceNow Event Management** application services.

Self-health monitoring process workflow

After the *Event Management – self-health monitoring* property is enabled:

1. The **ServiceNow Event Management** application services is automatically created.
2. Jobs are automatically scheduled to run scripts that configure what must be monitored.
3. The Monitoring States [em_monitor_state] table is updated after each event run that the configuration scripts trigger.
4. The alerts that are generated are monitored.

   The service displays the status of the monitored entity. For example, alerts are displayed in the Event Management dashboard, Service Operations Workspace or All Alerts list.

You can resolve the alerts according to the underlying issue by using **Quick Response** on the standard platform interface. For details, see Apply a quick response in an alert.

Jobs scheduled to process scripts

The jobs scheduled to run by default after the *Event Management – self-health monitoring* property is enabled are:

- The `Event Management - Insert Health Monitor` scheduled job which runs the scripts.
- The `Event Management - Update Health Monitor` scheduled job which runs the update scripts. This job runs once every minute.

Start or stop self-health monitoring

You can control the starting or stopping of the self-health monitor feature by configuring the self-health monitoring property. The first time that the self-health monitoring property is enabled, it automatically creates the ServiceNow Event Management application services.

Before you begin

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task
Configure the self-health monitoring property to monitor and track application services and Event Management.

Procedure
1. Navigate to **All** > **Event Management** > **Event Management Properties**.
2. Locate the *Enable Event Management self-health monitoring* (*evt_mgmt.self_health_active*) property.
   Select one of these values:

Enable Event Management self-health monitoring property

Field	Description
Enabled	The ServiceNow Event Management application services is created and set to monitor self-health. Events are received and alerts are generated.
Alerts Only	The ServiceNow Event Management application services and the CIs related to it are not created. Alerts are created but are not bound to a CI.
Disabled	The ServiceNow Event Management application services is not operational. Events are not received, and alerts are not generated.

3. Click **Save**.

Result
The ServiceNow Event Management application services is set according to the value selected for the *evt_mgmt.self_health_active* property.

Configure the Event Management - Insert Health Monitor scheduled job

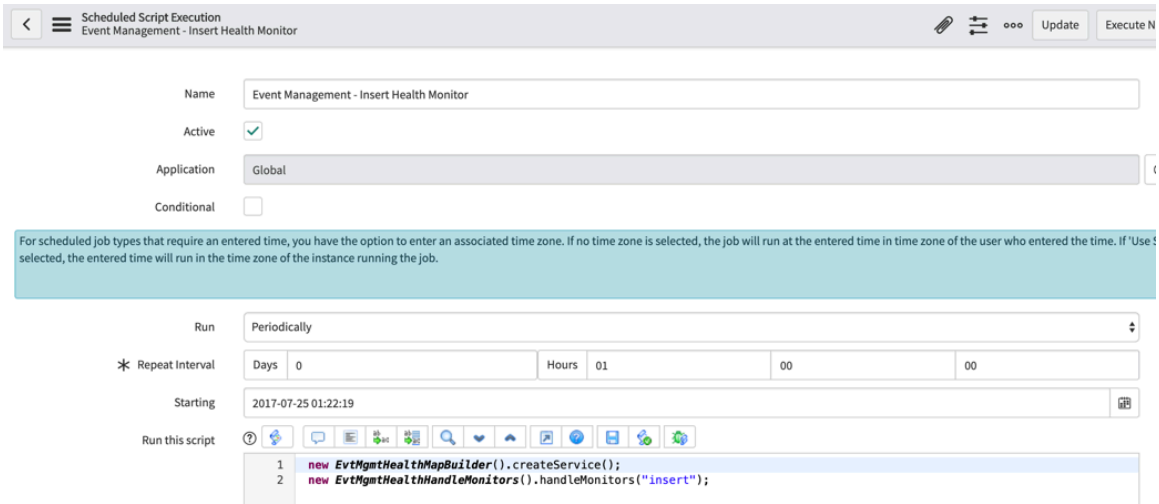
Determine what the Event Management - Insert Health Monitor scheduled job is to monitor. After the job runs, you can view the **ServiceNow Event Management** application services.

Before you begin
Ensure that the *Enable Event Management — self-health monitoring* property is enabled on the Event Management Properties page (**Event Management** > **Event Management Properties**).

Role required: evt_mgmt_admin

Procedure
1. Navigate to **System Definition** > **Scheduled Jobs**.
2. Locate and select the **Event Management - Insert Health Monitor** job.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Modify the scripts indicated in the **Run this script** field to determine what the scripts are to monitor.

Monitor self-health with domain separation

Use domain separation to enable self-health to display Event Management health issues that are based on data, rules, and settings from the logged in user domain. The selected domain must not contain any child domains.

Before you begin

Ensure that the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated and that the MID Server you're connecting to is configured for Event Management.

Role required: evt_mgmt_admin

About this task

Self-health monitoring is domain aware. If the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin has been activated, then self-health displays health issues based on data, rules, and settings from the logged in user domain. If rules and settings aren't defined for a child domain, then the settings of the parent are applied, recursively.

Note:
To generate self-health monitoring events in the domain-separated instance, you must specify the domain of these generated events. This is done by specifying the `sys_id` of the required domain in the *`evt_mgmt.domain_self_monitoring`* property.

When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin isn't activated, adding, or removing a connector or MID Server is immediately reflected in the map.

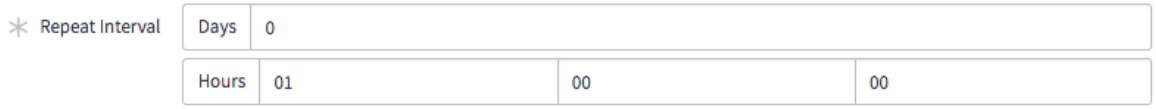
When the Domain Support — Domain Extension Installer (com.glide.domain.msp_extensions.installer) plugin is activated, updates are done periodically according to the interval specifications of the Event Management — Insert Health Monitor scheduled job.

Procedure

1. Navigate to **All** > **System Scheduler** > **Scheduled Jobs**.
2. In the **Schedule** list, locate and select the Event Management — Insert Health Monitor job.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. In the Event Management — Insert Health Monitor job, under Related Links, select **Configure Job Definition**.
4. Set the required periodic update time in the **Repeat Interval** field by specifying the required values.
   The default interval is one hour.

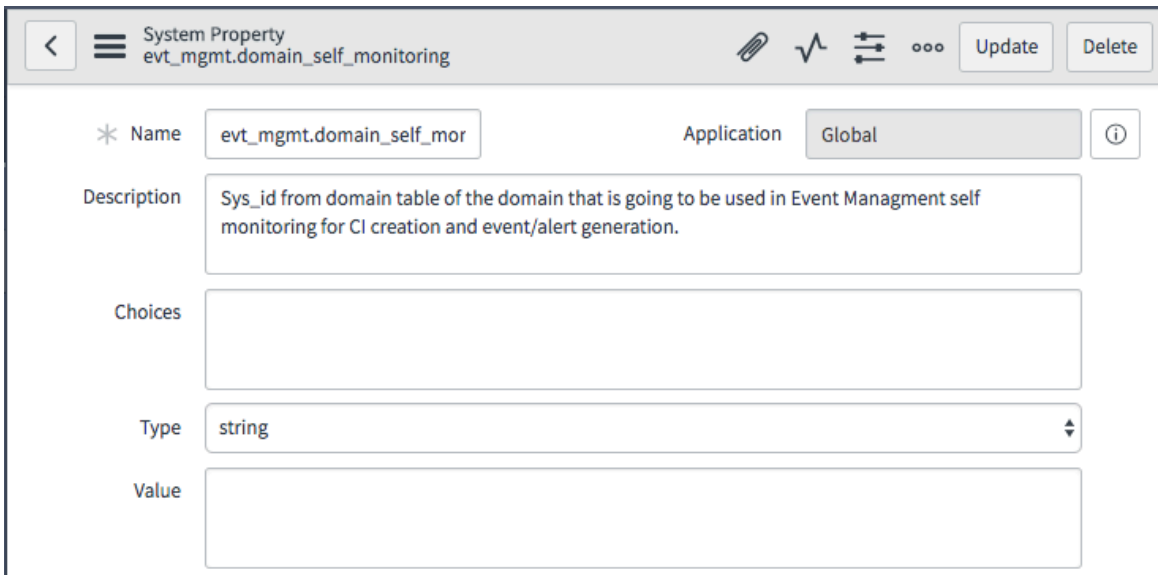


5. Select **Update**.

Result

Further configuration is required for CI creation, receipt of events, and alert generation. The `sys_id` of the domain must be specified in the **Value** field of the *`evt_mgmt.domain_self_monitoring`* property.

1. Navigate to **System Properties All Properties**.
2. Locate and select the *`evt_mgmt.domain_self_monitoring`* property.



3. In the **Value** field, specify the `sys_id` of the domain.
4. Select **Update**.

Domain separation setup and basic administration

Configure a self-health monitor

You can configure a self-health monitor to track Event Management components and see that they do not exceed the specified threshold.

Before you begin

Role required: evt_mgmt_admin

About this task

The Monitoring Configurations [em_monitor_conf] table lists the records that determine which Event Management components are being monitored. Each record contains the health

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

monitor script that is relevant to what you are monitoring. If you intend to create a new health monitor script, you must configure a monitor to match the purpose of the custom script. You can configure the monitoring configuration records to track the items that are important to you. For example, you can modify the threshold aspect in the *Connector's Idle state monitoring* record, by specifying that the monitoring job frequency is 90 seconds instead of 120 seconds.

Note:
Each of the monitoring configuration records can be disabled.

If a monitoring configuration specifies a threshold, the configuration value determines what alert severity to display. Threshold values specify the delay time values in units of minutes.

After the *Event Management - self-health monitoring* property is enabled, these jobs are automatically scheduled to run scripts that configure what must be monitored:

- The Event Management - Insert Health Monitor scheduled job runs the scripts. Determine what must be monitored by adding or modifying the script in this job, which runs once every hour.
- The Event Management - Update Health Monitor scheduled job runs the update scripts. This job runs once every minute.

Use the following procedure to configure whether a monitoring configuration can run and set the frequency of the monitoring job. You can specify the threshold values that, if exceeded, trigger an alert.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Self-Health Monitoring**.
2. From the Monitoring Configurations list, select a monitoring configuration record and modify the required field.
   On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Active	Check box for enabling the monitoring configuration to be active.
Monitoring job frequency [seconds]	Frequency that the monitoring job is run.
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the **Critical Threshold**, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.

3. Click **Update**.

Result

The values in the modified monitoring configuration record are compared to the actual values as they occur in events that are received. Alerts are created according to the configuration settings.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Example:

Example 1: Use the following procedure to modify the **Critical Threshold** field of the **Connector's Idle state monitoring** monitor from 30 seconds to 35 seconds. This field determines the number of seconds that pass before an alert is generated when the **Critical Threshold** idle state value of a connector is exceeded. In this example, the **Critical Threshold** field is modified from 30 seconds to 35 seconds.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connector's Idle state monitoring**.
3. In the **Critical Threshold** field, modify the value to `35`.
4. Click **Update**.

Result The threshold value of the **Critical Threshold** field is increased from `30` to `35`, thereby increasing the number of seconds that pass before an alert is generated for this threshold.

Example 2: This example describes the configuration of the severity threshold when using the **Connectors Status** monitor. The **Connector Status** monitor has a true (= value 1) or false (= value 0) configuration for the severity threshold. For this monitor, where a threshold has the value `1`, then that severity is displayed. Only one severity threshold can have the value`1`. This example assumes that the required severity displayed is `Minor`.

1. Navigate to **Event Management** > **Settings** > **Self-Health configuration**.
2. From the Monitoring Configurations list, select **Connectors Status**.
3. In the **Minor Threshold** field, specify the value `1`.
4. Click **Update**.

Result The monitor issues an alert if the threshold value of the **Minor Threshold** field is exceeded.

What to do next

Create a customized monitor. A template is provided to assist you to create script that can monitor the specified components. For more information, see Create a self-health monitor to use custom health monitor script.

Create a self-health monitor to use custom health monitor script

You can create a self-health monitor to use custom health monitor script to monitor specified Event Management components.

Before you begin

Role required: evt_mgmt_admin

About this task

To augment the self-health monitors that are provided with the base system, you can create a self-health monitor to monitor the components that you specify. The health monitor scripts that are provided with the base system are listed in the following table.

Health monitor scripts provided with the base system

Health monitor script	Used by a monitor to:
Check delay in event processing	Monitor the duration of events [in minutes] that remain in Ready state and are not processed.
Connectors Monitor	Monitor:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health monitor scripts provided with the base system (continued)

Health monitor script	Used by a monitor to:
	• Whether the time that a connector in idle state surpassed the threshold [in minutes] configured. • The active status of connectors.
Get Event Processing state	Monitor the time that events are in Ready state. Alerts are sent when this time exceeds the threshold.
MID Server Threshold Alerts	Monitor MID Server health. Events are sent when changes in MID Server state are detected.

You can create alert management rules to respond to and remediate the issues detected by self-health. Alerts are generated based on the specified severity and threshold. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring** for the monitors that are provided with the base instance to monitor the issues detected by self-health, which are:

Monitor	Description
Connector's idle state monitoring	Monitor to verify whether any of the connectors were in idle state that surpassed the threshold [in minutes] that was configured. Health Monitor script selected: `Connectors Monitor`.
Connectors Status	Monitor to track the active status of the connectors. Select only one threshold to configure which severity to invoke using 1 to select the threshold field or 0 to ignore the threshold field. For more information, see Connector status example. Health Monitor script selected: `Connectors Monitor`.
Delay in event processing	Monitor to track the duration of events [in minutes] that remain in Ready state and were not processed. This duration period initiates an alert for the event processing CI with severity according to the configured thresholds [minutes]. Health Monitor script selected: `Check delay in event processing`.
Event Processing job	Monitor the state of the event processing jobs. An alert is generated when the idle time of a job exceeds the configured threshold. Health Monitor script selected: `Get Event Processing state`.
MID Server MID Server Threshold Alerts	Monitor MID Server MID Server health. Events are sent when issues with MID Server availability and resource thresholds are detected.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Monitor	Description
	Health Monitor script selected: `MID Server Threshold Alerts`.

Note:
To prevent a self-health monitor from detecting the connector status, at any time you can clear the **Active** check box of the monitor and then click **Update**.

Procedure

1. Navigate to **Event Management** > **Administration** > **Self-Health Monitoring**, and click **New**.
2. On the form, fill in the fields.

Monitoring Configuration form

Field	Description
Name	Descriptive and meaningful name for the monitor.
Description	Text narrative that describes the monitor.
Active	Check box to enable the monitor.
Monitoring job frequency [seconds]	Frequency that the monitoring job should run. Default: `120` seconds.
Last Run	Last run date and time. These values are automatically updated.
Script	Monitoring script. Click the search icon. The existing scripts are listed in the Health Monitor Scripts screen, or click **New** to create a custom health monitor script. For more information about creating a custom health monitor script, see step 3.
Note: Regarding all the following threshold configuration fields: All monitored values are compared against the thresholds. If a monitored value exceeds a threshold, an alert with the appropriate severity is issued.	
Critical Threshold	Any point above the value is considered a critical consequence.
Major Threshold	Any point above the value, but below the value of the Critical Threshold, is considered a major consequence.
Minor Threshold	If exceeded, the value is considered a minor consequence.
Warning Threshold	If the value is exceeded, a warning is issued.
Additional information	Further information about the monitor.

3. To create a custom health monitor script, on the Monitoring Configuration form, next to the **Script** field, click the search icon to open the Health Monitor Scripts form, and click **New**.
4. On the form, fill in the fields.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Health Monitor Script form

Field	Description
Active	Check box to enable the monitor.
Description	Text narrative that describes the custom script.
Name	Descriptive and meaningful name for the custom script.
Script	Custom script to run when called from a monitor. A script template is provided as a guide. You can use the Health monitor scripts provided with the base system as examples of how to author the script, and use the script editor tools. Ensure that the custom script includes: Run the monitor function, which is called according to the "monitoring job frequency" setting *`runUpdateHealthMonitorScripts(scriptId)`*. Add this function to run the monitoring logic. Specify the configuration function that is called every hour *`runInsertHealthMonitorScripts(scriptId)`*. Add the configuration logic and add a CI if needed. In the navigation pane search field, enter `em_monitor_state.list`. In the Monitoring States [em_monitor_state] table, specify the initialization of the monitor record in the required record. Use the helper functions defined in *`EvtMgmtHealthMonitorCommon`* and *`EvtMgmtEventAlertGenerator`* script includes: ○ EvtMgmtHealthMonitorCommon ○ healthMonitorCommon.shouldRun ○ healthMonitorCommon.calculateSeverity ○ EvtMgmtEventAlertGenerato ○ openAlert ○ closeAlert

You can use the Monitoring Configurations [em_monitor_conf] table for self-health monitoring configuration, the Health Monitor Scripts [em_monitor_scripts] table for scripts, and Monitoring States [em_monitor_state] table for displaying the results of the monitor, as initialized inside *`runInsertHealthMonitorScripts`*.

For more information about script includes and APIs, see:Script includes that are installed with Event Management

5. Click **Submit**.

Result

To monitor the Event Management components that you specify, you can configure a self-health monitor that uses the custom health monitor script that you created.

View the Event Management self-health application services map

You can view Event Management application services maps to have a visualization of the data on configuration items (CIs) that comprise this service, and the relations and connections between these CIs.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

Role required: evt_mgmt_admin

The Event Management application services topology map only displays MID Servers that have passed validation and connectors that are active.

About this task

The Event Management components that are monitored by the self-health application services are listed in the following table:

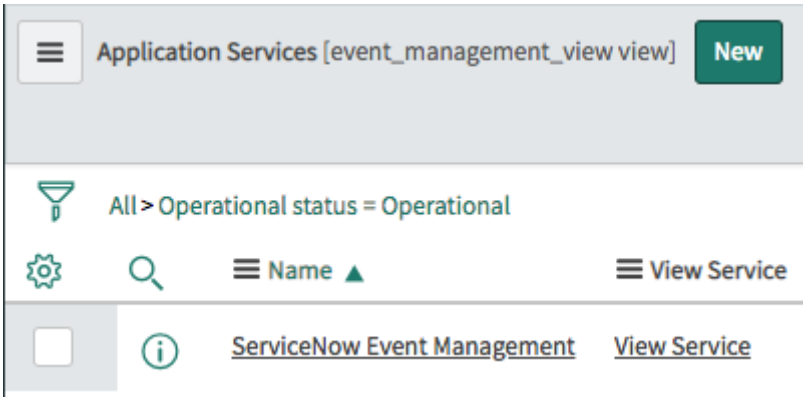
Components monitored by the self-health application service

Component	What is monitored
Event connectors	For each connector: • Status: Success or Error • Delay: Elapsed time from 'last run time' (above threshold)
Event processing jobs	For each event processing job: • Number of actual jobs executed compared to the number of jobs configured to run. • Delay of any of the event processing jobs above the time set as threshold. • Duration of events in Ready state compared to the specified threshold. • Delay of event rule processing above the set threshold. If there is a delay, an alert is generated and the event rule is disabled.
MID Servers	MID Servers that have been validated are displayed. The MID Server status and the `Ecc_agent_issue` table are monitored. An event is triggered whenever this table is updated. The MID Server status is displayed, either **Up** or **Down**. For information about MID Server health, see MID Server heartbeat

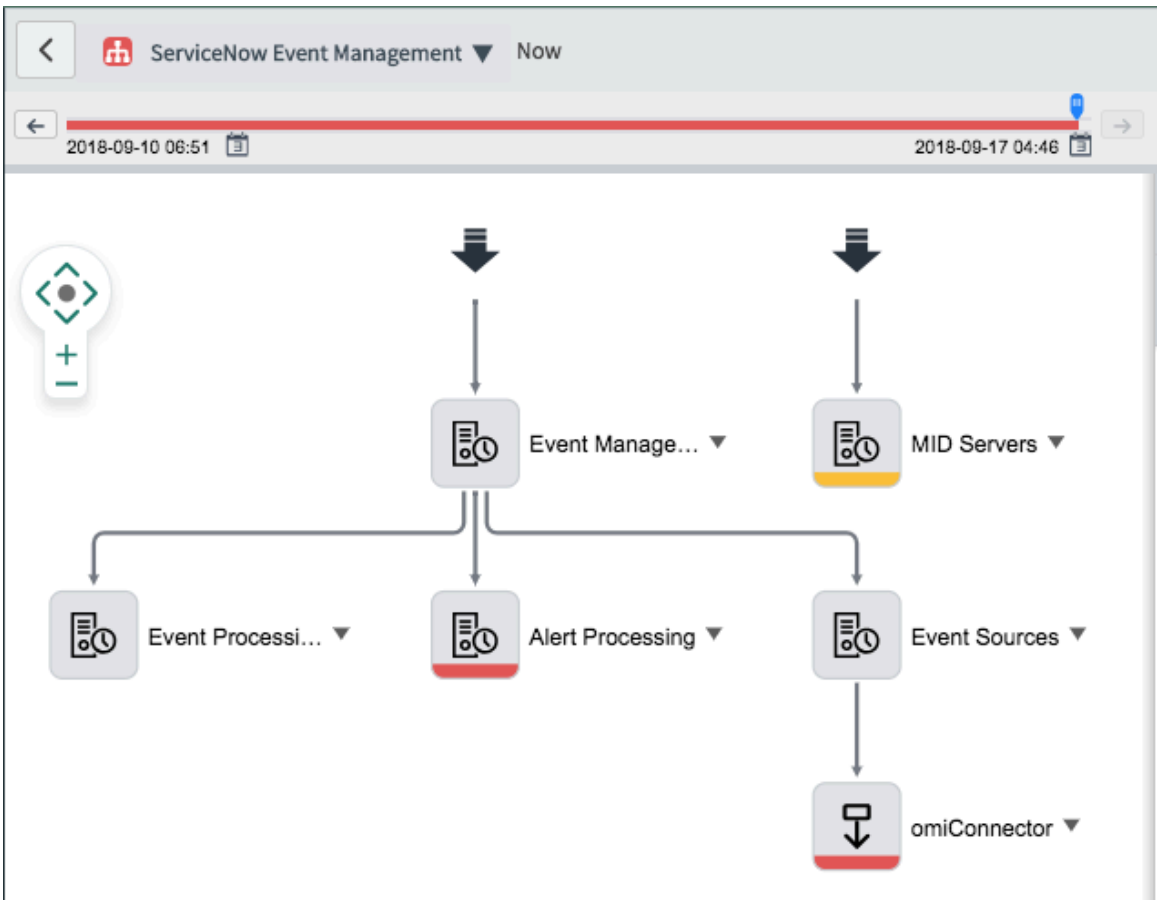
Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click the **ServiceNow Event Management** application services.
3. On the **Application Services** page, locate **ServiceNow Event Management** and click **View Service**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Displayed on the map are the related MID Servers and the Event Management object, as depicted in the following image; these MID Servers have an **UP** status. MID Servers are updated when they are created or deactivated.



Under the Event Management object is Event Processing, Alert Processing, and Event Sources (for example, connectors). Only **Active** connectors are shown; when a connector is created, the connector is displayed only after it has been activated. The status of active connectors is updated and the status of non-active connectors is not displayed.

In the preceding image, the health of Event Management components is displayed. The omniConnector component has a red bar, indicating that a critical alert has occurred that affects this connector. In addition, this critical alert impacts the parent Alert Processing object, which as a result, has a red bar.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Result
You can select the configuration item that has a critical alert and change the impact from parent to application service.

Create maintenance rules

Use maintenance rules to mark CIs in maintenance status. When in maintenance status, these CIs are excluded from impact calculation.

Before you begin
Role required: evt_mgmt_admin

About this task
You can define rules to mark CIs that match the specified criteria as being in maintenance status. The marked CIs populate the Impact Maintenance CIs [em_impact_maint_ci] table.

Note:
When running maintenance rules, the cmdb_ci status of matching CIs is not changed. However, matching CIs are flagged in the em_impact_maint_ci table by these rules and this status is considered for impact and alert calculations.

The field flagged by this rule as being in maintenance status is the CMDB status field.

Note:
To activate a maintenance rule, select the **Active** field in the maintenance rule. To deactivate a maintenance rule, clear the **Active** field.

The maintenance rules provided with the base instance are:

Default maintenance rule	Description
CI in Change Window	Where the CI has an active change window, the matching CIs are marked as being in maintenance status. The rule runs a query against the change request [change_request] table to determine whether the rule is applied. All these conditions in the change_request table must be met: • **State** is one of these options: Scheduled, Implement, Work in Progress, or Open/New (state in (-2, -1, 1, 2)). • **Approval** is Approved (approval = 'approved'). • The change request window is active, that is, the current time is between **Planned start date** and **Planned end date**, or the current time is between **Actual start date** and **Actual end date**. • The change request record is not an on-hold record (on_hold='false'). **Note:** All these conditions must be present for the CI to be placed in maintenance status by this rule. For example, if the

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default maintenance rule	Description
	State of the change request approval status is `Change is waiting for approval`, then the change is not added to the em_impact_maint_ci table.
Maintenance status of CI	CIs whose CMDB status field is **In Maintenance** are flagged by this rule as being in maintenance status. By default, retired CIs are not included in CIs that are **In Maintenance**. To include retired CIs: **1.** Navigate to **All Properties**. **2.** Select **New**. **3.** Configure the *`evt_mgmt.maintenance_rule_include_retired`* property with **Value = true**. **Note:** Including thousands of retired CIs may decrease system performance.

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Maintenance Rules**.
2. Click **New**.
3. Fill in the fields, as appropriate.

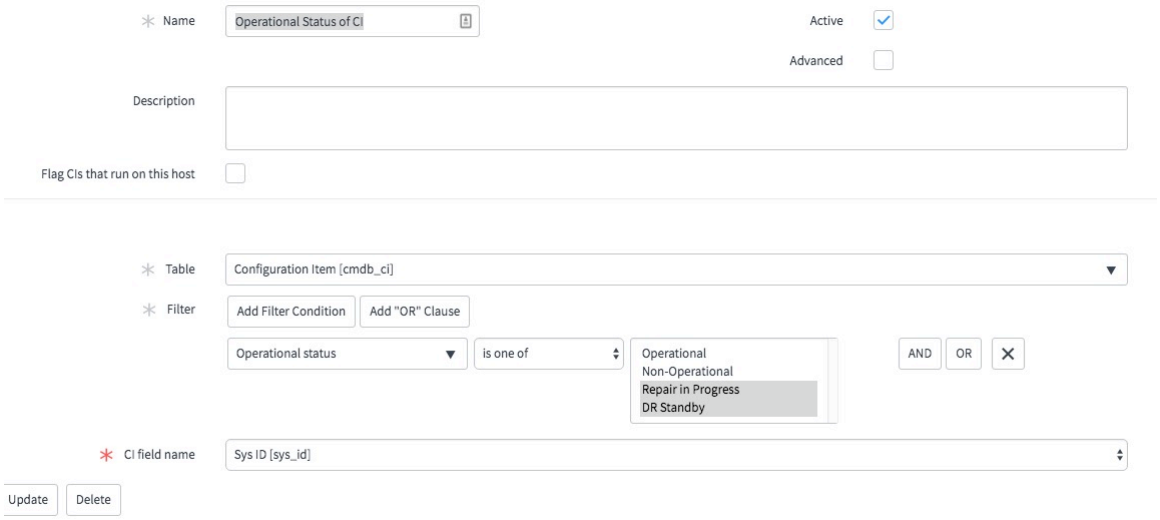
Column heading	Description
Name	The maintenance rule name.
Active	Select to activate the maintenance rule.
Advanced	Select to enable the optional script section to display.
Description	Information that describes this maintenance rule.
Flag CIs that run on this host	Select to flag all applications running on the recognized host as being in maintenance.
Table	Select the table that contains the CI that you require.
Filter	Specify how to select the data.
CI field name	Select the CI from the list. The list is populated according to your selection in the **Table** field.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column heading	Description
	If a CMDB table, or a table derived from CMDB, was selected, specify `sys_id` for the **CI field name**. Otherwise, specify the required CI field that you want to use. See the examples.

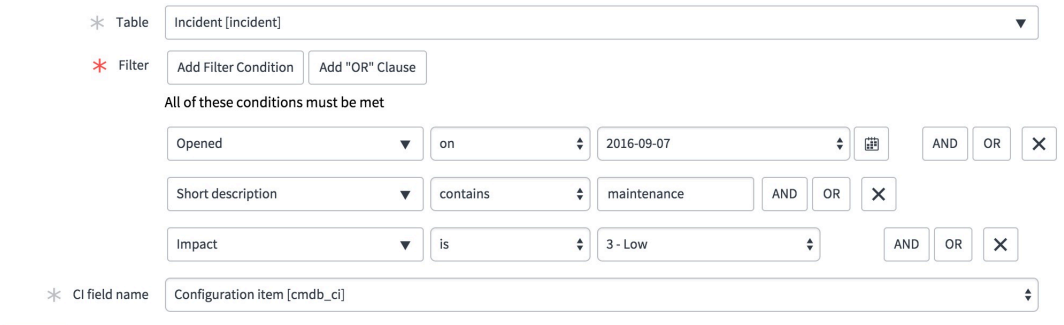
4. Click **Submit**.

Example:
Example of a maintenance rule using a CMDB table.
Assume that a company defines a CI as being in maintenance when the Operational Status of the CI is either **Repair in Progress** or **DR Standby**.



Example of a maintenance rule using a table other than CMDB.

Assume that a company uses Incident records to track maintenance. Any maintenance request is translated to an incident when it has a description that starts with “Performing maintenance on CI”. As long as the status of such an incident is open, this status indicates that the maintenance is in progress. For the **CI field name** field, specify a CI name from the table that was chosen, in this case **Incident**.



Example of a maintenance rule that uses the advanced script feature.

In the Maintenance Rule page, select the **Advanced** option. Customize the provided example script:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var now_GR = new GlideRecord('cmdb_ci');
gr.addQuery('name', 'your_name_here');
gr.query();
while (gr.next()){
 result.push(gr.sys_id +'');}
```

The return value for this example script is a text string that represents an array of CI IDs, for example, ['sys_id1','sys_id2','sys_id3'].

You can use this script as an example to prepare your own customized script.

```
(function findCisInMaint(){
  var result = [];

  //Your code goes here, this is an example of setting CIs in maintenance
  var gr = new GlideRecord('cmdb_ci');
  gr.addQuery('name', 'your_name_here');
  gr.query();
  while (gr.next()){
   result.push(gr.sys_id +''); //The array should be a string array, make sure to add strings
  }

  //Make sure to create a string representation of the array
  return JSON.stringify(result);

 })();
```

Resolve an incident related to an alert

When you resolve an incident that is associated with an alert, the alert can also close according to the *evt_mgmt.incident_closes_alert* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Open an incident.
2. Click **Resolve Incident**.

   The corresponding alert is closed, resolved, or left alone as specified by the *evt_mgmt.incident_closes_alert* system property.

   The alert may not close immediately when the incident is closed. Depending on the value of the *evt_mgmt.alert_rule_close_delay* parameter, the alert may close 5 seconds after the last alert update. This value (in seconds) is defined in the parameter. To use the property, you need to create the property with the same name and assign the required value to it. For more information on how to create a property, see Add a system property.

Close an alert

Close an alert by an event or a user action. Closing an alert also closes any related incident that is not already resolved or closed.

Before you begin

Role required: evt_mgmt_admin or evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

An alert can be closed manually, automatically by a close or clear event, or when a related incident is resolved. Whether the alert is closed when the incident is closed is determined by the *evt_mgmt.incident_closes_alert* property.

When a Clear event is triggered for an open alert, the corresponding alert is set to the "Closed" state. Closing an alert also closes any related incident that is not already resolved or closed. This default behavior can be configured using the *evt_mgmt.alert_closes_incident* property.

Procedure

1. Navigate to **Event Management** > **All Alerts**.
2. Select the alert you want to close.
3. In the Alert Form, select **Close**.
   The alert closes without confirmation. If the alert has any resolved or closed incidents, a work note is added to the incident indicating that the related alert was closed.

   If an alert has an open incident that is not related to any other open alerts, the incident is either closed, resolved, or left unchanged based on the *evt_mgmt.alert_closes_incident* property.

Reopen an alert

Additional events can cause reopening of alerts, or you can reopen an alert by changing its state. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the *evt_mgmt.alert_reopens_incident* property.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

When an alert is reopened, the related incident is processed as follows:

- If the incident is not *Resolved* or *Closed*, a work note is added to indicate that the related alert was reopened.
- If the incident is *Resolved* or *Closed*, the incident is reopened, a new incident is created, or nothing is done, depending on the *evt_mgmt.alert_reopens_incident* property value.
  - If the incident is reopened, work notes are added to the incident.
  - If a new incident is created, any matching alert management rule, alert action rule, and task template applies to the incident. If there is no matching alert action rule or template, fields from the existing incident are copied to a new incident.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search by alert number.
3. In the **State** field, click **Reopen**.
4. Click **Update**.

Alert insight properties

Use these properties to configure alert insight.

The role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The following alert_insight properties are under sys_properties.

Property	Usage
Time Frame	
evt_mgmt.alert_insight_alert_history_min	Set the time frame (in minutes) to retrieve repeated and similar alert data. Default `43200` (30 days) **Note:** Alerts are retrieved regardless of their state (open / reopen / flapping / closed).
evt_mgmt.alert_insight_closed_alert_window	Set the time frame (in minutes) to retrieve alerts that were already closed. It is the time after the alert last updated date. Default: `4320` (3 days)
Similarity	
evt_mgmt.alert_insight_alert_same_as_filter	This property is a comma-separated string that defines which of the alert fields is used to consider alerts to be similar. Default: `source,type,resource,metric_name`
Related CIs	
evt_mgmt.alert_insight_related_cis_topology_levels The relationship types are: • CMDB based (metadata rules and suggested relations) • Within application services • Within Alert groups	For 'Within application service' relationship type, this property sets the depth or the maximum level of relationship of retrieved CIs. Default: `3`
Score	
evt_mgmt.alert_insight_group_mapping	This property sets the score for within alert group relations. Default: 2
evt_mgmt.alert_insight_level_1_mapping	This property sets the score for level 1 relationship. Default: `3`
evt_mgmt.alert_insight_level_2_mapping	This property sets the score for level 2 relationship. Default: `2`
evt_mgmt.alert_insight_level_3_mapping	This property sets the score for level 3 relationship. Default: `1`
Maximum related tasks	
evt_mgmt.alert_insight_max_tasks	Maximum related tasks to retrieve for alert insight. Default: `10`

Metadata rules consideration

The parent-child relationship of CIs is considered. Dependent relationship rules consist of hosting and containment rules, each type modeling the data from a different perspective of the CI.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

To manage dependent relationship rules:

- To access rules at the class level, use the CI Class Manager. Navigate to **All** > **Configuration** > **CI Class Manager**.
- To access grouped rules, use the Metadata Editor. Navigate to **All** > **Configuration** > **Identification/Reconciliation** > **Metadata Editor**.

Containment rules represent configuration hierarchy of CIs, describing which CI contains which other CIs.

Hosting rules represent placement of CIs in a business definition, describing what CIs run on.

Modify the alert insight properties to configure the way alert information and analysis appears in the Alert Insight pane.

Related CIs configuration

The following properties control which CMDB relationships to consider for related CIs. The CMDB relationships include regular CMDB relation rules, metadata rules (containment rules and hosting rules), and suggested relations.

Property	Usage
evt_mgmt.related_cis_get_all_relation_types	Get all relation types, not including metadata rules. Default: `false`
evt_mgmt.related_cis_use_containment_rules	Use metadata containment rules. Default: `true`
evt_mgmt.related_cis_use_hosting_rules	Use metadata hosting rules. Default: `true`
evt_mgmt.related_cis_use_suggested_relations_rules	Use suggested relations rules. Default: `false`
evt_mgmt.related_cis_validate_relation_rules	This property controls whether to validate relation of CI according to metadata rules. Default: `true`

Score

Scores are configured per relation type or depth. Scores are accumulated. The higher the score, the more relevant is the related CI to the current CI.

Example: For a CI that was found at level `2` in the same application service of the current CI, the score is `2`. The same CI is in the same alert group, so there is an extra score of `3`. The accumulated score is therefore `2+3 = 5`.

Affiliation type

The Affiliation Type column in the **Related Incidents**, **Related Change Requests**, and **Related Problems** tabs shows the type of relationship that the CI of the selected alert and the related CI have.

To see affiliation type relationships, navigate to **All** > **Configuration** > **Identification/ Reconciliation** > **Metadata Editor**.

The parent-child relationship between configuration items is considered.

Rotate event tables and alert table cleanup

The growth of data tables impedes performance. Preserve instance performance by event table rotation and alert table cleanup for status and alert history retention.

Containing the growth of event tables

By default, the Event Management event [em_event] table uses table rotation. The table rotation schedule ensures that new data is written to one of the tables in the rotation group. According to the value of **Clean base rotation** setting, the base table is deleted and then a new round of writing the tables in a daily rotation commences. By default, this table deletion occurs after seven rotations.

To back up events to a custom table, see Event Management configuration preferences.

Containing the growth of alert tables

By default, a scheduled job cleans out the alert [em_alert] table. Alert table cleanup is recommended for status and alert history retention.

Related topics

Table rotation

Modify event table rotation

Table rotation is used by Event Management, by default, to contain the growth of event [em_event] tables within the rotation table group.

Before you begin

Role required: evt_mgmt_admin

About this task

Table rotation ensures that event tables grow to a reasonable size.
Each table rotation has a schedule, according to which new data is written to one of the tables in the rotation group. A table rotation group includes the original table plus several additional tables. After the rotation procedure has written the last table in a rotation, the rotation overwrites the first table in the rotation. By default, the table rotation for Event Management is to rotate the em_table to an offload table and the base table cleanup takes place after seven table rotations. For information about backing up events to a custom table, see Event Management configuration preferences.

Procedure

1. Navigate to **All** > **System Definition** > **Table Rotations**.
2. Select the [em_event] table rotation group to modify.
3. Edit the required fields.
4. Select **Update**.

Purge impact status and alert history

Automatically cleans up outdated impact statuses and alert history from the database to free up space, improve system performance, and ensure only relevant data is retained.

Before you begin

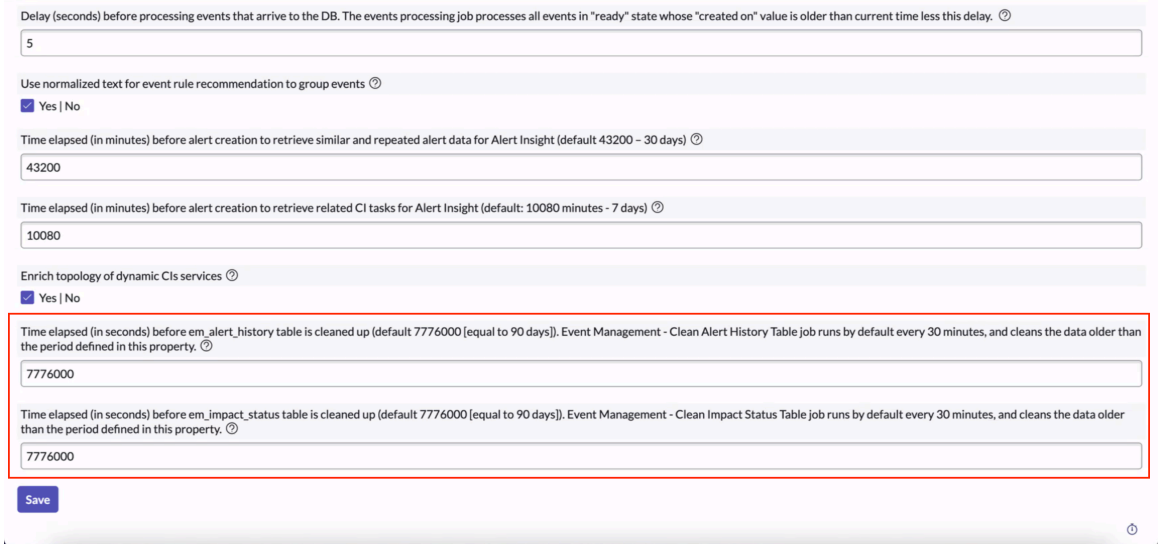
Role required: evt_mgmt_admin

About this task

If records are older than 90 days, by default they are purged. If records are retained for a longer period, larger volumes of data are stored, and performance may be impacted. The data cleanup is done by two jobs: Event Management - Clean Alert History Table and Event Management - Clean Impact Status Table.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Event Management Properties**.
2. To shorten the retention period, use the highlighted properties.



Related topics

Clean alert history and impact status tables

Schedule jobs to mark and remove old alert records in the Alert History [em_alert_history] and Impact Status [em_impact_status] tables, to prevent the tables from becoming overloaded with data.

Before you begin

Role required: evt_mgmt_admin

About this task

Schedule the following jobs to remove old alert records:

- **Backfill**: Determines when alerts are to be marked for deletion.
- **Clean**: Deletes the alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
The records in the [em_alert_history] and [em_impact_status] tables are deleted by default after three months. This is controlled by the properties *evt_mgmt.impact_calculation.cleanup_age_seconds.em_alert_history* and *evt_mgmt.impact_calculation.cleanup_age_seconds.em_impact_status*. The default value is 7,776,000 seconds (equivalent to 90 days).

Procedure

1. Navigate to **All** > **System Definition** > **Scheduled Jobs**.
   The **Scheduled Jobs** page appears.
2. To determine how often to mark alerts for deletion on the **Impact Status** table:

   a. Locate and select the **Event Management - Backfill Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

Scheduled Script Execution page

   b. In the **Repeat Interval** field, configure how often you want the job to run.
   To run the job immediately, select **Execute Now**.

   c. Select **Update**.

3. To remove old alerts from the **Impact Status** table:

   a. Locate and select the **Event Management - Clean Impact Status Table** job.
   The **Scheduled Script Execution** page appears.

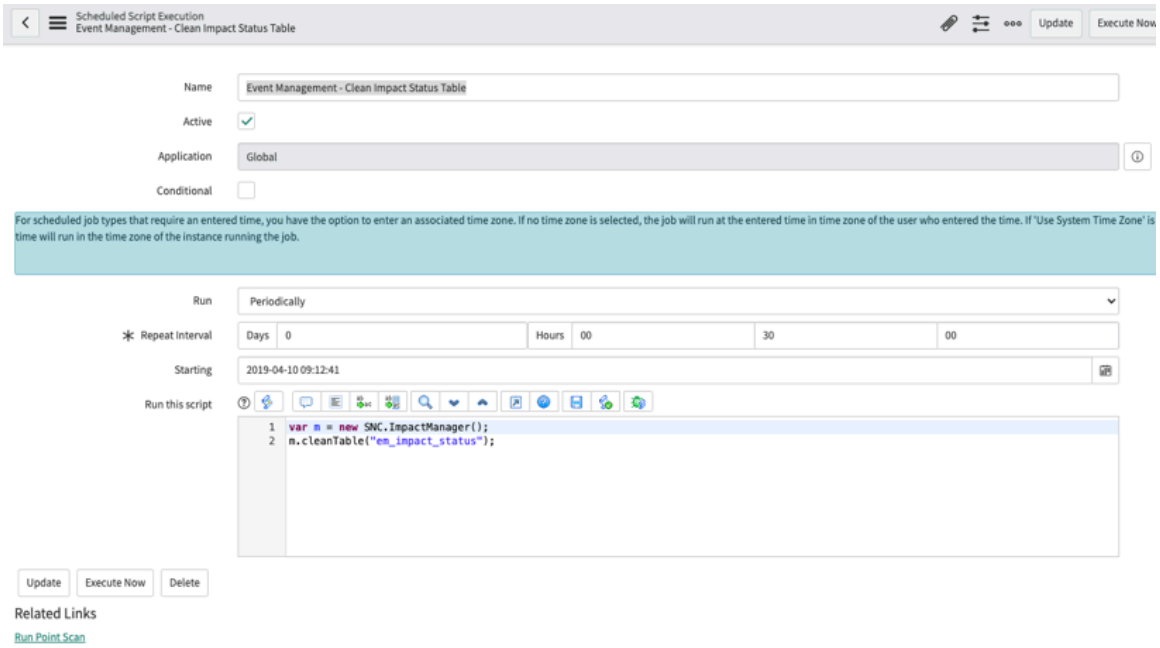
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



b. In the **Repeat Interval** field, configure how often you want the job to run.
To run the job immediately, select **Execute Now**.

c. Select **Update**.

4. Repeat steps 2 and 3 to perform the Backfill and Clean jobs on the **Alert History Table**.

Alert table clean up

The Scheduled Jobs feature runs a script to automatically close alerts in the Alerts [em_alert] table that meet specific conditions, helping reduce alert noise and keep the system clean and efficient.

Before you begin

Role required: evt_mgmt_admin

About this task

When the Event Management plugin is activated, by default a job is scheduled to run the `Event Management - auto close alerts` script to automatically close alerts in the alerts table that meet the specified conditions. The default retention policy for closed alerts is that the system deletes closed alerts if it is not updated for 90 days. For more information on the scheduled job, see Table cleaner.

Due to the high level of traffic to the table, you cannot audit the Alert table [em_alert] as a whole. Instead, audit selected fields of interest on the table.

Procedure

1. Set the table to `audit = true`.

2. Set `audit = true` on the relevant fields.
To avoid an excess of audit records, audit only the fields that are necessary for auditing.

Result

The `Event Management - auto close alerts` script runs automatically and repeatedly at the scheduled time and closes alerts that meet the specified conditions.

Alert grouping

Alert grouping is the process of organizing and consolidating related alerts into sets based on common characteristics or criteria. This helps in simplifying alert management by reducing noise, making it easier to prioritize, track, and address issues efficiently. Grouped alerts provide a clearer overview of related incidents, facilitating quicker root cause analysis and remediation.

Understanding alert grouping

Watch this brief video to learn how alert grouping organizes alerts into clusters based on specific criteria.

Video explaining how alert grouping organizes alerts into clusters based on specific criteria.

How alert grouping works

Alert grouping enhances operational efficiency and optimizes alert management by categorizing alerts. Here's how it works:

1. Event consolidation: Event Management collects alerts from multiple sources, providing a centralized view of notifications and alerts. This consolidation enables teams to manage alerts more efficiently and recognize critical issues more easily.
2. Contextual Enrichment: Alerts are enriched with data from the Configuration Management Database (CMDB), which contains detailed information about applications and infrastructure components. This context allows teams to better understand the significance of alerts and prioritize responses based on their impact.
3. Intelligent Correlation: Event Management utilizes different types of machine learning algorithms to automatically group related alerts. This intelligent grouping reduces alert noise by combining similar alerts, allowing teams to concentrate on significant issues rather than being inundated with multiple notifications.

Benefits of alert grouping

- Creating automated alert groups by aggregating alerts based on predefined patterns.
- Correlating alerts using timestamps and CI identification to form automated alert groups.
- Forming CMDB based alert grouping by correlating alerts based on CI relationships in the CMDB.
- Correlating alerts based on text similarity of alerts using NLP (Natural Language Processing).

Related topics

- Synchronizing alert response with automated alert grouping

Alert grouping and use cases

Alert grouping methods range from user-defined approaches, like Manual, Rule-based, and Tag-cluster, to advanced, fine-tunable algorithms, including Automatic, CMDB, Text-based, Log Analytics, and Network Traffic-based grouping.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases

Type	Description	Use case
Log Analytics Grouping	Alerts are grouped based on the analysis of log data. This involves correlating log entries to identify related alerts and issues. By leveraging log patterns and sequences, this method can detect complex, multi-step problems across the IT environment.	An online gaming company enhances server stability by implementing proactive log analytics. They monitor logs from game servers in real-time and use analysis tools to detect patterns of errors that occur before crashes. For instance, the analysis reveals that certain error patterns appear about 30 minutes prior to server crashes. By setting up automated alerts for these patterns, the company can initiate remediation actions, such as restarting services or reallocating resources, before a crash occurs. This proactive approach prevents disruptions, minimizes downtime, and improves the gaming experience by addressing issues before they impact players.
Rule-based Grouping	Alerts are grouped according to predefined rules and criteria set by users. These rules might include specific conditions, such as thresholds or event types. This method is effective for consistent and repeatable patterns but requires maintenance of the rules.	In a data center managing an e-commerce website, rule-based alert grouping helps handle high traffic during events like flash sales. Alerts about server issues, such as high CPU usage, are designated as parent alerts. These parent alerts are linked to child alerts that report related problems, like slow database queries. The rules ensure that server-related alerts are grouped with their symptoms, allowing the IT team to quickly identify and address server overload issues. This approach improves issue resolution efficiency and minimizes downtime.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
Automated Grouping	Advanced algorithms automatically identify and group related alerts based on patterns and similarities in the alert data. This method leverages machine learning and AI to adapt to new and unknown issues, providing proactive alert management. Event Management groups alerts that are similar, but not necessarily identical, based on the proximity in time of the last event generation. Alerts with the same CI and the same pattern identifier are grouped together. Automatic alert grouping consists of the following components. • Alert Aggregation Learner (**Service Analytics Alert Aggregation Learner - Daily**): This offline job runs daily to process past alerts and perform statistical analysis to build alert patterns. For details, see Configure pattern based alert grouping. • Real-time Alert Aggregation job (**Service Analytics group alerts using RCA/ Alert Aggregation**): This job runs every minute to generate alert aggregation groups based on alert patterns, CMDB relationships, text similarity, user-defined alert clustering tags, and network traffic connection between processes.	A large financial institution uses machine learning to manage alerts from numerous servers and applications. The system analyzes historical alert data to recognize patterns, such as database server failures frequently being accompanied by client connection errors. It then automatically groups related alerts together. For instance, when a new database server failure alert is detected, it is grouped with previous connection error alerts. This automated grouping helps the IT and security teams quickly identify and address issues, improving response times and reducing downtime.
CMDB-based Grouping	Alerts are grouped based on Configuration Item (CI) relationships and dependencies from the Configuration Management Database (CMDB). This	A telecommunications company uses CMDB data to manage alerts related to their network infrastructure. Alerts related to a specific network router and its connected

© 2025 ServiceNow, Inc. All rights reserved.

Alert grouping types and use cases (continued)

Type	Description	Use case
	approach ensures that alerts related to specific infrastructure components or services are grouped together, providing context-aware alert management.	devices are grouped together based on their CMDB relationships, enabling the network team to see all related issues and address the root cause efficiently.
Network-traffic based Grouping	Network-traffic-based alert grouping analyzes network connections between processes across hosts to identify related alerts. This method leverages service candidates detected through ML Service Mapping, ensuring that alerts related to network traffic issues are grouped together for better context and faster alert resolution.	A cloud-based e-commerce platform experiences transaction slowdowns, causing delays in payment processing. Traditional alerting generates separate alerts for API timeouts, database lags, and network issues, making it difficult to pinpoint the root cause. With Network-Traffic Based Grouping, alerts are automatically grouped based on process-to-process connections identified through ML Service Mapping. The system detects that payment gateway services, fraud detection, and order processing are part of the same service candidate. This reveals that an overloaded fraud detection process is causing transaction bottlenecks. By scaling up the service, the team quickly resolves the issue, minimizing downtime and improving customer experience.
Text-based Grouping	Alerts are grouped by analyzing the text content of alerts to identify similarities and related issues. Natural language processing (NLP) techniques are used to find commonalities in alert description, metric name, and ci class, making this method effective for unstructured data.	In an organization that uses Zoom rooms for virtual meetings, the IT team receives numerous alerts when the Zoom room server experiences an outage. Each alert might indicate a different Zoom room being down, such as Zoom room no 10 is down, Zoom room no 11 is down, and so on, with the only difference being the room number.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
		For organizations with a CMDB, these alerts can be grouped using CMDB relations, as the system can correlate the alerts based on the server's impact on all associated Zoom rooms. However, for organizations without a CMDB, text-based grouping can be used. The system applies natural language processing to group alerts with similar descriptions, helping the IT team quickly identify that multiple Zoom rooms are affected by the same underlying server issue. This approach allows the IT team to efficiently address the root cause of the problem, reducing downtime and improving response times.
Tag Cluster Grouping	Alerts are categorized and grouped using tags or labels that represent common attributes, such as application, server type, or geographic location. This method allows for flexible and dynamic grouping based on evolving tagging strategies.	An organization without a CMDB manages a Linux server running various services. The IT team uses a **Node** field in each alert to identify the server, and they group all events related to services on the same server based on this node value. For example, they cluster alerts like Service A down and Service B high CPU usage together if they share the same node value. This approach helps the IT team address server-related issues more efficiently. By clustering alerts for the same node, application, or IP address, the team streamlines their response efforts and resolves issues more effectively, even without a CMDB.
Manual Grouping	Users manually select and group related alerts based	A system administrator receives multiple alerts about

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types and use cases (continued)

Type	Description	Use case
	on their expertise and understanding of the system. This approach allows for precise control but can be time-consuming and may miss automated correlations.	different services failing on a single server. The admin manually groups these alerts, recognizing that they are all related to a single hardware failure on that server, and prioritizes fixing the hardware issue to restore all services.

Manual and rule-based alert grouping differs from algorithm-based grouping mainly in how the parent alert is chosen. In manual, rule-based, or log analytics grouping, one of the real alerts is designated as the parent alert. In Automatic, CMDB, Text-based, Tag Cluster modes, and Network Traffic, a virtual alert, representing the oldest and most severe alert in the group, is created as the parent alert.

Note:
In domain-separated environments, alert groups are created only for alerts within the same domain.

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on different grouping types, see Alert grouping types and creation methods.

Scheduled jobs and parameters for alert grouping

Automate alert organization by configuring jobs to group alerts based on predefined criteria and parameters.

To group alerts in Automated, CMDB, Text-based, Tag Cluster, and Network Traffic Correlation groups, the scheduled job named **Service Analytics group alerts using RCA/Alert Aggregation** is typically run once per minute. This job handles the grouping of alerts based on the specified method. Additionally, you can run multiple scheduled jobs in parallel to manage alert grouping more efficiently. For further details, see Run multiple scheduled jobs for alert grouping.

To define which alerts are grouped, the following parameters are used:

- *sa_analytics.aggregation_enabled*: This parameter enables alert grouping created by the schedule job. Set the property *Enable alert aggregation for Automated, CMDB, and Text-Based groups* to `true` to activate this feature.

  Note:
  This property also applies to Tag Cluster and Network Traffic Correlation grouping.

- *sa_analytics.agg.query_dynamic_window*: By default, this is set to 10 minutes (600 seconds). It defines the maximum time difference allowed between the last event generation times of two alerts that can be grouped together.
- *sa_analytics.agg.query_max_group_lifetime*: This parameter specifies the maximum time period from the generation of the first alert to the last alert in a group, with a default of 30 minutes (1800 seconds). If events arrive with a delay exceeding this period, the *sa_analytics.agg.group_expiration_time* parameter can be used to extend the grouping time beyond 30 minutes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
Some parameters, such as **sa_analytics.agg.query_dynamic_window**, **sa_analytics.agg.query_max_group_lifetime**, and **sa_analytics.agg.group_expiration_time**, are not provided out of the box. To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

Example: How alerts are grouped

For tag-cluster grouping, alerts are added to a group based on the timeframe parameter defined in the alert tag clustering settings. For automated, CMDB, and text-based, network traffic grouping, alerts are aggregated as follows.

Consider the following alerts with the same CI. (All of them may be added to the same CMDB group).

- Alert1: Initial event generation at 01:00:00 AM
- Alert2: Initial event generation at 01:11:00 AM
- Alert3: Initial event generation at 01:13:00 AM
- Alert4: Initial event generation at 01:16:00 AM
- Alert5: Initial event generation at 01:25:00 AM
- Alert6: Initial event generation at 01:34:00 AM
- Alert7: Initial event generation at 01:43:00 AM

Alert1 and Alert2 are not grouped due to the time gap exceeding 10 minutes. Alert2 and Alert3 create a group at 01:13:00 AM. The 10-minute dynamic window starts at 01:13:00 AM, with the following:

- Alert4 is added to the group at 01:16:00 AM, restarting the 10-minute window.
- Alert5 and Alert6 are added to the group as their event times are within the 10-minute window.
- Alert7 is not added to the group because it arrives 9 minutes after Alert6, exceeding the *sa_analytics.agg.query_max_group_lifetime* limit of 30-minute maximum group lifetime from the initial group creation (01:13:00 AM + 30 minutes = 01:43:00 AM).

Configure scheduled job-based alert grouping

Set up rules and parameters to group related alerts automatically, streamlining alert management and reducing alert noise.

Before you begin
Role required: evt_mgmt_admin

About this task
The scheduled job Service Analytics: Group Alerts Using RCA/Alert Aggregation helps in grouping alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. On the Alert Correlation Properties page, enable the relevant properties.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Enable CMDB correlation (*sa_analytics.agg.query_cmdb_correlation_enabled*).
- Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
- Enable ML based Automation correlation (*sa_analytics.specific_patterns_enabled*).
- Enable Text based correlation (*sa_analytics.text_based_group_enabled*).
- "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together (*sa_analytics.agg.group_alert_with_same_group_by_fields*).
- Max number of relations between CIs in a topology which form a CMDB group (*sa_analytics.agg.query_cmdb_graph_walk_nodes*).
- Use all CMDB relations for CMDB group correlation (*evt_mgmt.related_cis_get_all_relation_types*).

3. Select **Save**.

   To group alerts without a CI as Text-based or ML based groups, set *sa_analytics.enable_no_ci_grouping* to `true`. Ensure the Feature Identifier includes both the node and metric name. For details on configuring the feature identifier, see Specify and manage pattern identifier attributes for alert grouping.

4. **Optional:** Set *evt_mgmt.alert_groups_reasoning.enable_worknotes* to `none` to prevent group reasoning work note display.

   (Optional) By default, a work note appears in the **Activities** tab when a group is created or updated, showing the grouping reason.

Run multiple scheduled jobs for alert grouping

Run multiple scheduled jobs in parallel to group alerts. This helps prevent overwhelming the system during surges (alert storms).

Before you begin

Role required: admin

About this task

The current scheduled job operates with a single thread. During alert surges (alert storms), processing takes significantly longer. To address this impact, now multiple jobs can process alerts within the scheduled job. This enhances scalability and improves overall performance during high-volume periods.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The number of jobs to be running in the alerts processing is defined in a new property *sa_analytics.agg.alert_grouping.num_of_jobs*. The job number is sent as a parameter to the relevant method.

Note:
In this scenario, the procedure for increasing the scale-out from no scale-out (single job) to 2 jobs is shown.

You can efficiently manage and run multiple scheduled jobs in parallel to group alerts using specific properties. These properties allow you to tailor the grouping criteria to meet your needs, ensuring that alerts are processed based on assignment groups, domain separation, or group-by fields. The available properties are:

- *sa_analytics.agg.group_alert_with_same_assignment_group_only*: Groups alerts that share the same assignment group. By default, the value is set to false. If you want to set this property to true, create a property with the same name and set the value to true.
- *sa_analytics.agg.group_alert_with_same_domain_only*: Groups alerts that belong to the same domain. By default, the value is set to true.
- *sa_analytics.agg.group_alert_with_same_group_by_fields*: "Group by" property, with comma-separated list of field names that need to have matching values across alerts to allow alerts to be grouped together. The property can contain alert field names (such as assignment_group), CI field names (such as alert_cmdb_ci.location), alert additional info field names (such as additional_info.state) or alert tags (such as t_data_center). When the specified field values match each other between alerts, those alerts can be grouped together.

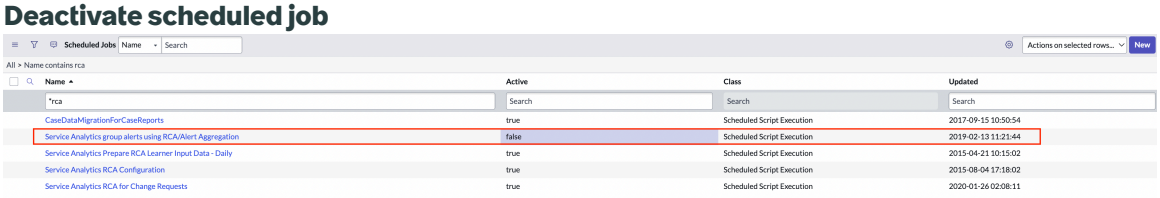
Note:
To ensure efficient scale-out, at least one of these properties must be defined to establish some form of separation or grouping logic. This is necessary to ensure that all alerts belonging to the same group are processed correctly by specific jobs, creating a logical division of alerts.

Without setting at least one of these properties to true, the alerts will not be properly segregated. For instance, if you do not define any grouping logic (set any property to true) and both the assignment group and domain separation are set to false, the scale-out will not work, and all alerts will be processed by a single scheduled job.

Procedure

1. Navigate to **All** > **System definition** > **Scheduled jobs**.
2. Locate the scheduled job: Service Analytics group alerts using RCA/Alert Aggregation.
3. For all existing scheduled jobs Service Analytics group alerts using RCA/Alert Aggregation, set the value in the **Active** column to **false**.

Deactivate scheduled job



4. Create a new property *sa_analytics.agg.alert_grouping.num_of_jobs*, or if it already exists, update the property to the desired number of multiple scheduled jobs for alert grouping such as 2 or 4.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Clone the scheduled job definition from the Scheduled jobs [sys_auto] table to the desired number of multiple scheduled jobs for alert grouping.
6. In the new jobs, in the Run this script section, call the new JS function queryS0 (instead of old query() function) and transfer to it the job number as input parameter.

   Note:
   Job numbers must start at 0 and follow consecutively: 0, 1, 2, 3, 4...

7. Fix hashes in the [sa_analytics_status] and [sa_hash] table by selecting the earliest hash with the same prefix, cloning it, and adding the hash name suffix, for example, "_groupingX", where X is the job number.

   In the case of scaling out from no scale-out (single job) to 2 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`

   In the case of scaling out from no scale-out (single job) to 4 jobs, and for the hash name `last_alert_process_time`, clone it to maintain the same value as in `last_alert_process_time`:

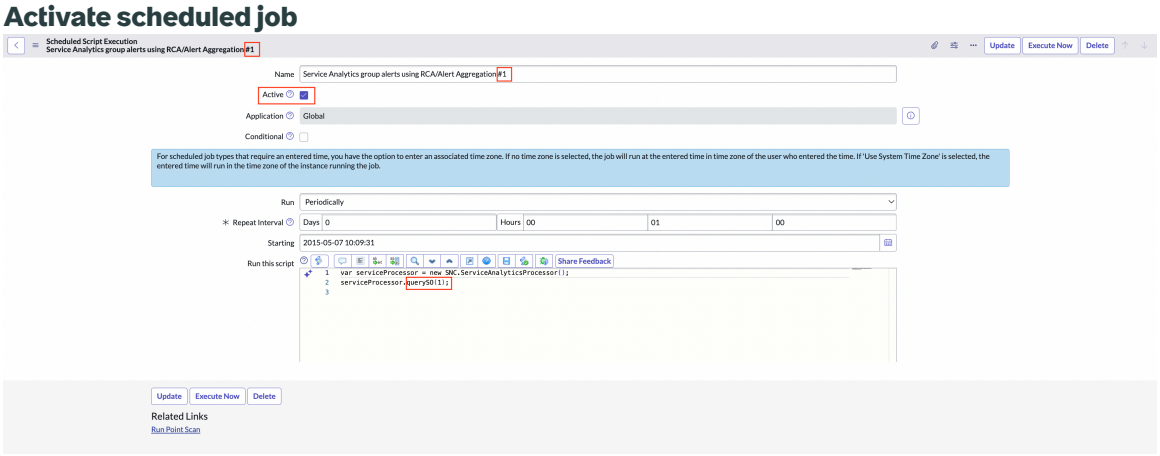
   - `last_alert_process_time_grouping0`
   - `last_alert_process_time_grouping1`
   - `last_alert_process_time_grouping2`
   - `last_alert_process_time_grouping3`

Hashes to be cloned

Hash name	Table
query_job_last_run	sa_hash
last_alert_process_time	sa_analytics_status
last_staging_table_update_time	sa_analytics_status
last_staging_table_truncate_time	sa_analytics_status
analytics_trigger_g1	sa_hash

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

8. Activate the new jobs by selecting the **Active** check box for each job.



Result

The scheduled job Service Analytics group alerts using RCA/Alert Aggregation is set up to run multiple jobs simultaneously for alert grouping.

Configure alert correlation logic order

Improve alert management by enabling users to customize correlation logic order. This feature empowers you to fine-tune correlation methods to their specific needs, enhancing alert prioritization and response efficiency.

Before you begin

Role required: admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *sa_analytics.agg.query.group_logic_order*.

   Default value is “CMDB,NETWORK_TRAFFIC,TAG_BASED,PATTERN,TEXTBASE". This is a comma separated list of the grouping types in the order of their execution.

   Note:
   If one of the grouping types is not specified in the property, it needs to be added manually. Alert correlation rules are trigger-based and applied immediately when an alert is created or updated, before other grouping algorithms.

   - CMDB: CMDB grouping
   - NETWORK_TRAFFIC: Network traffic grouping
   - TAG_BASED: Tag cluster grouping
   - PATTERN: Automated CI-based patterns grouping
   - TEXTBASE: Text-based grouping
3. Use the property *sa_analytics.agg.query.group_logic_order* to define or modify the order of correlation methods based on your preferences.

Configure filters for automatic alert groups

Filter alerts and alert groups to reduce alert noise. Only alerts that match the filter are included in the group of the selected group type (Automated, CMDB, or Text).

Before you begin

Role required: evt_mgmt_admin

About this task

If your filter specifies alerts whose configuration item class is not Linux, then only alerts with non-Linux configuration items are included in the group of the selected group type.

Note:
After the filter is created, it will only apply to new alerts.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filter**.
2. On the Automatic Group Filters page, either select an existing group filter or create a new filter.
3. If you are creating a new filter:
   a. Select **New**.
   b. Enter a name for the filter in the **Name** field.
   c. Select the alert group type:
      - Automated
      - Test
      - CMDB

      You can assign more than one group type with a single filter condition.

      Each group type can have only one active filter.
4. In the **Alert Filter** section, create conditions for the alert to meet to be included in the group.
5. Save the alert group filter.
   - For an existing alert group filter, select **Submit**.
   - For a new alert group filter, select **Update**.

Result

The filter condition appears on the SA Grouped Alert Filters page in the **Alert filter** column.

Apply alert group filters to aggregated groups

Reduce noise by locating only aggregated alert groups that match a configured filter. Aggregated groups are groups created for alerts with identical CIs and pattern identifiers.

Before you begin

Note:
This procedure is relevant for advanced configuration only.

Role required: evt_mgmt_admin

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Automatic Group Filters**.
2. On the Automatic Group Filters page, add the **Aggregated** column.
   a. Select the Personalize List icon ( ) in the upper right corner.
   b. Move the **Aggregated** entry from the **Available** list to the **Selected** list.
   c. Select the up/down arrows to determine where the **Aggregated** entry is to appear on the form.
   d. Select **OK**.
3. On the Automatic Group Filters page, double-click the value in the **Aggregated** column.

   Aggregated groups apply only to automated alert groups. When the Aggregated option appears, it is automatically activated for an automated alert group.

   Note:
   If the value of the **Automated** field changes, the value of the **Aggregated** field also changes. You can change the value of the **Aggregated** field only if the value of the **Automated** field is true.

4. Select **true** for the specified filter to apply to groups with identical CIs and pattern identifiers or select **false** to ignore the filter and create aggregated groups for all alerts in the system.

Related topics

Specify and manage pattern identifier attributes for alert grouping

Alert grouping types and creation methods

Explore different alert grouping types, understand their descriptions, and learn about their creation methods to enhance problem identification and streamline alert management.

Viewing and managing alert groups

Navigate to **Event Management** > **All Alerts** to view all alert groups. The icon in the **Group** column denotes the alert group type, while alerts not associated with any group have no entry in the **Group** column. Double-click the **Group** column to open the Grouped Alerts dialog, where you can view all alerts in the group and manually add or remove alerts.

Note:
An alert can belong to only one alert group at a time.

Types of alert grouping

Alert grouping types

Type	Ico	Description	Creation method	Additional information
Log Analytics	L	Log Analytics groups are formed when the system identifies multiple related Log Analytics alerts, grouping them based on their significant connections.	Created as part of log analytics event processing.	Kinds of Health Log Analytics alerts

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping types (continued)

Type	Ico	Description	Creation method	Additional information
Rule-based	R	Rule-based groups consist of related alerts that are organized based on compliance with alert correlation rules, which determine how alerts are grouped according to their relationships.	Created via business rule (Calculate correlation rule) on em_alert table when alert is created or updated.	Create an alert correlation rule
Automated	A	Automated groups are formed by alert aggregation and include a virtual alert as the primary alert of the group. An Aggregated automated group is created when two or more alerts share the same CI type and metric name.	Created via scheduled job.	Automated alert grouping
CMDB	C	CMDB groups are formed based on CI relationships in the CMDB, specifically for CIs that are not included in rule-based or automated groups.	Created via scheduled job.	CMDB based alert grouping
Network traffic based	N	Network traffic alert groups are formed by analyzing network traffic connections between processes across hosts. This method leverages service candidates identified through ML Service Mapping to group alerts related to network traffic issues.	Created via scheduled job.	Network traffic based alert grouping
Text	T	Text groups are formed by grouping alerts based on similar text from frequently used words in following fields. • Description • Metric Name • CI Class	Created via scheduled job.	N/A
Tag Cluster	Tag	Tag Cluster groups are formed by grouping alerts according to user-defined tag-based alert clustering definitions.	Created via scheduled job.	Tag cluster alert grouping
Manual	M	Alerts grouped manually by users to organize related issues.	Created manually by the user.	Create alert group manually

For information on scheduled jobs and parameters, refer to Scheduled jobs and parameters for alert grouping. For detailed information on configuring alert correlation logic order, see Configure alert correlation logic order.

Log analytics alert grouping

ServiceNow Health Log Analytics identifies patterns in log data and learns pattern behavior. When its artificial intelligence engine detects anomalous behavior, it sends an event to the ServiceNow Event Management application.

Log analytics alert groups are created by the Health Log Analytics application. For more information, see Types of Health Log Analytics alerts.

Rule-based alert grouping

Rule-based alert grouping is created by alert correlation rules. These rules allow you to manually classify alerts as primary or secondary and establish a relationship between them. Use alert correlation rules to group related alerts. The rule runs only for new alerts or alerts whose status changed from close/flapping to open/reopen.

Example: If rule-based alert grouping is applied, secondary alerts indicating that virtual machines or applications on the offline server are also down and are grouped under the primary alert, which is the root alert for the server that is offline. You can view rule-based alert grouping in Express List of Service Operations Workspace (ITOM). For more information, see Viewing links between alerts in rules-based alert groups.

Primary and secondary alerts

- Primary alert: Identifies the root cause of an alert group and represents its secondary alerts.
- Secondary alert: Related to the same issue, they are grouped under the primary alert. The purpose of secondary alerts is to determine which alerts to suppress, reducing alert noise and allowing you to focus on the primary alert.

How primary and secondary alerts interact

In rule-based alert grouping, one of the real alerts is designated as the primary alert. Primary and secondary alert filter conditions specify which alerts are classified as primary and which as secondary. The filter criteria are applied to the Alert [em_alert] table.

In this alert grouping, both primary and secondary alerts are visible but secondary alerts are grouped under the primary alert. The property **Keep the secondary alert open even when primary closed. for manual or rule based** (*evt_mgmt.rule_based_manual_closure*) controls whether secondary alerts remain open or are closed when the primary alert is closed.

If the property is not selected (i.e., set to No), after the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), and the secondary alerts are closed and become stand-alone. If you select the checkbox for the property (i.e., set it to Yes) and the primary alert is closed, the parent reference is removed from the secondary alerts (the grouping is dissolved), causing them to become stand-alone open alerts.

Alert hierarchy

Only one level of secondary alerts is permitted. In situations where a secondary alert has its own secondary alert, the Event Management application flattens the hierarchy to preserve only two levels.

For example, assume alert A is the primary alert and alert B is the secondary alert. If alert C becomes a secondary alert for alert B, the application flattens the hierarchy so that A remains the primary and B and C become sibling secondary alerts, one level below A.

As another example, assume that there are three correlation rules that produce the following results:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Rule 1 (with an Order value of 1): B becomes a primary alert for A.
- Rule 2 (with an Order value of 2): A becomes a primary alert for C and D.
- Rule 3 (with an Order value of 3): E becomes a primary alert for A.

When alerts B, C, D, and E are triggered, they all appear in the alert list separately because there are no correlations between them.

When alert A is triggered:

1. Rule 1 makes A a secondary alert under alert B.
2. Rule 2 makes both C and D secondary alerts under alert A, and the hierarchy is flattened so that A, C, and D become secondary alerts to the primary alert B.
3. Rule 3 is not applied because multiple parents are not allowed—A already has B as its primary.

Therefore, if all alerts are triggered, only B appears as the primary alert for A, D, and C, while E remains a standalone alert.

Create an alert correlation rule

Create an alert correlation rule to designate primary and secondary alerts. The primary alert is identified as the root cause of the alert group and the secondary alerts are grouped under the primary alert.

Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Rules** > **Alert Correlation Rules**.
2. Click **New**.
3. On the form, fill in the fields.
   For information on the fields, see Alert correlation rule form.
4. Select **Submit**.

Result

A rule-based alert group is created when a new alert is generated or when the status of an existing alert changes from Closed or Flapping to Open or Reopened, provided the filter criteria are matched.

Automated alert grouping

Automated alert grouping is a process that uses historical data to automatically organize similar alerts into groups. These alerts could be system issues, like server errors or network outages. By grouping related alerts together, it helps teams quickly identify patterns, manage recurring problems, and reduce the noise from too many individual alerts.

Imagine you're monitoring a city's traffic system. You get a lot of alerts—like reports of accidents, traffic jams, and road closures. Automated alert grouping works like a smart assistant that organizes these alerts based on patterns, so you can see related issues together and respond more efficiently. These automated alert groups are displayed in the Express List within the Service Operations Workspace.

How do you enable this grouping

To enable machine learning-based automation for alert correlation, set the property **Enable ML based Automation correlation** (sa_analytics.specific_patterns_enabled) to true.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

If the Domain Support - Domain Extensions Installer is activated, alert aggregation patterns are created based on the domain level defined in the sa_analytics.agg.learner_domain_level property. By default, this domain level is set to two, which corresponds to the second level in the domain hierarchy. For example, in a company, Level 1 might represent the company itself, while Level 2 could represent departments or teams within the company. Alerts are grouped based on this second level, like sorting them by department or team. For more details, Domain separation and Event Management.

How does it work

Automated alert grouping uses machine learning (ML) and historical data to identify patterns among alerts. It looks at specific characteristics, called pattern identifiers—such as the type of issue, the affected system, CI or metric that happened multiple times within a similar time period—to determine if alerts are related. The Alert Aggregation Learner uses algorithms to group alerts based on patterns. Specifically, it uses pattern-based algorithms and probabilistic methods to analyze incoming alerts and identify related ones.

Think of it like noticing that accidents often happen at a particular intersection at rush hour. The system groups similar alerts (like recurring traffic jams at the same spot) together based on certain identifiers (like location or type of problem). The system follows these key steps to group alerts effectively:

- Analyze Historical Data: The system studies past alerts to learn patterns and relationships.
- Apply Machine Learning: ML algorithms analyze historical alert data to identify patterns and relationships among alerts. It enables the system to learn from past incidents and improve its ability to group similar alerts together over time.
- Group Similar Alerts: Alerts with matching patterns are automatically grouped together.

Imagine you're managing a city's traffic system, and you receive multiple alerts:

- 8:00 AM: Accident on Main Street
- 8:05 AM: Traffic jam near Main Street
- 8:10 AM: Road closure on Main Street

Automated alert grouping works like a smart assistant by analyzing these alerts and recognizing a pattern. It groups them together because they all relate to Main Street, likely stemming from the same accident. This helps you see the bigger picture quickly and focus on resolving the root cause (the accident), rather than addressing each alert separately.

Benefits

- Find Recurring Issues: Quickly spot patterns (like a server consistently overheating).
- Save Time: Handle groups of related alerts instead of individual ones.
- Improve Response: Focus on fixing the root cause rather than dealing with scattered issues.

Understanding pattern identifiers

A pattern identifier is a set of criteria or attributes (such as alert type, affected system, etc.) used to group similar alerts. It helps to identify recurring issues, making it easier for teams to respond and address ongoing problems.

How pattern identifiers group alerts

Consider a network monitoring system that generates alerts for various issues, such as high CPU usage, memory leaks, or connection timeouts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Pattern Identifier: Metric Name and CI

- Alert 1: High CPU usage on Server A at 10:00 AM
- Alert 2: High CPU usage on Server A at 10:05 AM
- Alert 3: Memory leak on Server B at 10:10 AM
- Alert 4: High CPU usage on Server A at 10:15 AM

In this case, the pattern identifier could be set to the Metric Name (e.g., high CPU usage) combined with the Configuration Item (CI) (e.g., Server A). Alerts 1, 2, and 4 would be grouped together because they share the same metric (high CPU usage) and the same CI (Server A), indicating a recurring issue that may need further investigation. Alert 3, however, would not be included in this group because it has a different metric (memory leak) and CI (Server B).

Note:
The set of alert fields used for the pattern identifier is also referred to as Feature Identifier Attributes or simply attributes.

How to configure effective pattern identifiers

To configure effective pattern identifiers for alert grouping, follow these three key steps to ensure accurate and meaningful analysis of alerts.

Step	Action	Description
Create an event rule	Define an event rule. To know how to create an event rule, see Create or edit an event rule.	Set up an event rule to populate the relevant alert fields for the pattern identifier.
Manage pattern identifier	Add relevant alert field to the pattern identifier. To know how to add fields to the pattern identifier, see Specify and manage pattern identifier attributes for alert grouping.	After adding the relevant alert fields, select **Deploy** to activate the pattern identifier.
Choose relevant identifiers	Select alert fields that clearly identify the problem. For example, if the issue is that a service is offline or there's no connection to the database, look for specific values in the alert that indicate this. Add these types of fields to the pattern identifier. By default, we provide the **Metric Name** field as a pattern identifier.	• Avoid overly unique fields (e.g., date) that make pattern identification difficult. • Avoid overly common fields that result in too many alerts being grouped together, making patterns indistinguishable.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Alert grouping and Learned Patterns

Learn how alert patterns are discovered, grouped, and displayed in the system.

Concept	Description
Pattern discovery	When a set of alert fields matches, the alerts are grouped into a "Learned Pattern." For example, alerts with the same Priority Group and Resource are grouped into a pattern.
Pattern reporting	These patterns are displayed on the Learned Patterns report found under **Event Management** > **Administration** > **Learned Patterns**.

Managing Pattern Attributes and Time Frame

Learn the process of managing pattern identifier attributes, deployment of new sets, and how the system identifies issues.

Concept	Description
Active pattern identifier attributes	Only one set of attributes can be active at a time. **Note:** The new set replaces the current one after deployment.
Purpose and time frame	Pattern grouping identifies issues within the last 30 days, controlled by the **sa_analytics.agg.learner_period_days** property.
Issue identification	To identify an issue, the system utilizes a combination of Configuration Items (CIs) and Pattern Identifiers (sometimes referred to as Feature Identifiers). By default, a Pattern Identifier is defined as the Metric Name, but this can be modified. Two alerts are considered similar if they share the same CI and Pattern Identifier, although fields such as Source, Severity, Description, and others may differ. For more information, see Specify and manage pattern identifier attributes for alert grouping. **Note:** The Alert Aggregation Learner also identifies patterns of alerts within manual alert groups.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Concept	Description
	In some cases, you can create patterns from alerts where the CIs share the same value in a specified field. For example, to build patterns from alerts with the same CI **Location** field, enter `location` in the *`sa_analytics.agg.learner_group_by_property`* property. For more information, Configure scheduled job-based alert grouping. When working with CI-based groups, ensure that the pattern identifier includes both the node and the metric name. For details on configuring the Feature Identifier, see Learned patterns report. **Note:** Alerts that lack a CI can still be grouped together as Text-based or CI-based alert groups, treating a node as a CI. To enable this functionality, set the sa_analytics.enable_no_ci_grouping property to true.

Configure pattern based alert grouping

Configure the Alert Aggregation Learner (Service Analytics Alert Aggregation Learner - Daily), an offline job that runs daily to process past alerts. It identifies patterns of related alerts using a combination of pattern-based and probabilistic techniques, enabling quicker detection and resolution of recurring issues.

Before you begin

Role required: evt_mgmt_admin

About this task

The Alert Aggregation Learner tracks manual additions and removals of alerts from automated alert groups. If you undo any previous alert additions or removals, the automatic process adjusts accordingly.

You can review user additions and removals from automated alert groups and undo any action to prevent it from being automatically repeated. The Alert Aggregation Learner also identifies patterns in manual alert groups, enabling automatic formation of new alert groups based on these patterns when new streams of alerts arrive.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Corrlelation Properties**.
2. Enable the following properties.
   - Enable alert aggregation for Automated, CMDB, and Text-based groups (*`sa_analytics.aggregation_enabled`*).

     Note:
     When disabled, disables all other groups.

   - Enable ML based Automation correlation (*`sa_analytics.specific_patterns_enabled`*).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. **Optional:** To configure the time period for the Alert Aggregation Learner to process alerts, perform the following steps:
   a. Navigate to **All** > **System Properties** > **All Properties**.
   b. On the System Properties page, select the *sa_analytics.agg.learner_period_days* property.

      If the property doesn't exist, you need to define it.

   c. Set the property's **Value** to the number of days by which you want alert aggregation learner job to process.

      Note:
      Values larger than 30 days increase job processing time. For optimal performance, use values of 30 days or less.

Specify and manage pattern identifier attributes for alert grouping

The Alert Aggregation Learner analyzes alerts and identifies patterns using a defined set of alert and configuration item (CI) attributes. By configuring these attributes as pattern identifiers, you can control which characteristics are used to group alerts. This customization creates meaningful alert groups, improving alert management and response times by reducing noise and enabling focus on critical issues.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **Event Management** > **Administration** > **Manage Pattern Identifier**.
2. On the SA Alert Aggregation Pattern Attributes page, select **New** to create a new pattern identifier, or open an existing pattern identifier.
   The SA Alert Aggregation Pattern Attribute page opens.
3. Select the Unlock Feature Identifier Attributes icon ( ) and move attributes from the **Available** list to the **Selected** list.

   Note:
   Properties from CMDB CI via dot-walking are not populated.

   The **Configuration Item** attribute is automatically considered as an identifier and should not be added explicitly to the Feature Identifier Attributes section. The pattern is defined as a combination of the configuration item and your selected feature identifier attributes.

4. Selecting the Lock Feature Identifier Attributes icon ( ).
5. Select **Submit** for a new pattern identifier or **Update** for an existing pattern identifier.
6. Navigate back to the SA Alert Aggregation Pattern Attribute page by opening the pattern identifier.
7. Activate the pattern identifier attributes by selecting **Deploy**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

What to do next

- Ensure a corresponding event rule exists: Verify that there is an event rule set up to assign or populate the newly defined pattern identifier attributes to the incoming alerts. Event rules define how attributes are assigned to alerts based on certain conditions.
- Run the Service Analytics Attribute Populator for Historical Alerts job: After the new event rule is in place, this job is used to retroactively populate the pattern identifier attributes for existing alerts that were created before the new attributes were defined. It ensures that even past alerts (historical alerts) have the necessary attributes filled in for grouping them properly.

Learned patterns report

The Learned Patterns report helps assess the efficiency of alert aggregation and identify recurring alert patterns. It enables proactive issue resolution, enhancing overall system performance by providing insights into frequent alerts.

Navigating and sorting the report

To access the Learned Patterns report, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

Sorting Options: You can sort patterns by Pattern Score, Frequency, and Size to prioritize which alerts to address first.

Metrics and data in the report

The report displays key metrics associated with learned patterns, including:

- Frequency: The occurrence count of pattern identifier attributes (CI/MetricName).
- Pattern Identifier Attributes: Describes how alert grouping combines relevant pattern attributes to create a learned pattern. These patterns can reappear across multiple alerts, often indicating the same underlying issue.
- Presentation Format: Metrics are shown in a table format, organized by learned patterns.

This report allows you to:

- Focus on Higher Frequency Alerts: Allocate resources to higher-frequency alerts to expedite the resolution of numerous alerts.
- Target Larger Patterns with Lower Frequency: Allocate resources to larger learned patterns with lower frequency for targeted analysis.

Pattern group details and identifier attributes

- Expand a pattern group to display details about all the identifier attributes that are associated with the pattern.
- Sort the entries within each pattern by Configuration Item and Feature Identifier.

Column	Description
Configuration Item	CI associated with the combined pattern identifier attributes.
Feature Identifier	Feature identifier used for the combined pattern identifier attributes.
Frequency	Number of times the combined pattern identifier attributes appear in the data set.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Column	Description
Size	Number of occurrences of the combined pattern identifier attributes (like Configuration Item and Feature Identifier) within a learned pattern.
Score	Calculated score that combines the frequency and size of the learned pattern. The formula for this score is: `Score = Frequency × (Size + 1)`. This score helps prioritize patterns based on their recurrence and size, making it easier to focus on high-priority patterns.
CI Link	Link in the **Configuration Item** column to view details of the CI information.

Exclude patterns from learned patterns

Exclude CI-based or CI class-based alerts and patterns when you encounter alerts incorrectly added to a learned pattern by the Learned Patterns job. For example, a pattern might include an alert that occurred at the same time as other alerts but is not actually related to them. This maintains accuracy, ensuring better alert groupings and improved management efficiency.

Before you begin

Role required: evt_mgmt_admin

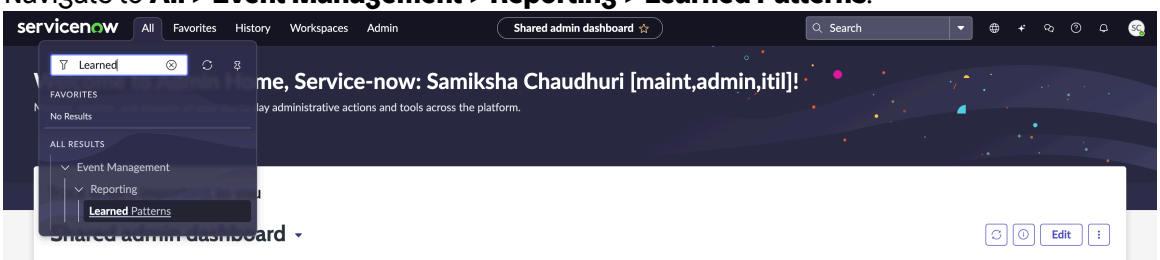
About this task

You select the incorrect alert in a pattern to exclude the entire pattern to which it belongs.

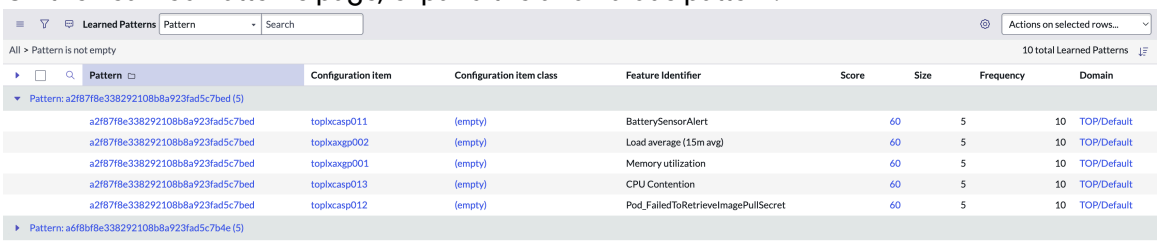
> **Note:**
> When you exclude an incorrect alert, any other patterns containing that alert are also excluded.

Procedure

1. Navigate to **All** > **Event Management** > **Reporting** > **Learned Patterns**.



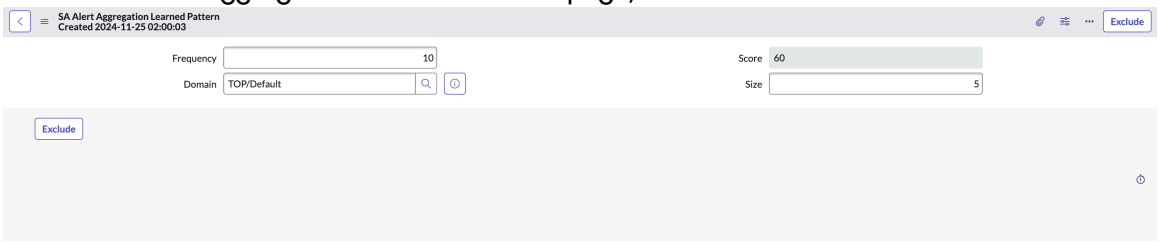
2. On the Learned Patterns page, expand the anomalous pattern.



3. Select the pattern name to open it for exclusion.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. On the SA Alert Aggregation Learned Pattern page, select **Exclude**.



Result

The entire pattern is removed from the Learned Patterns report and listed on the Excluded Patterns page, located at **Event Management** > **Administration** > **Excluded patterns**.

If the pattern includes other alerts, you can restore it by reclaiming those alerts as a learned pattern. For further details, see Restore excluded patterns.

Restore excluded patterns

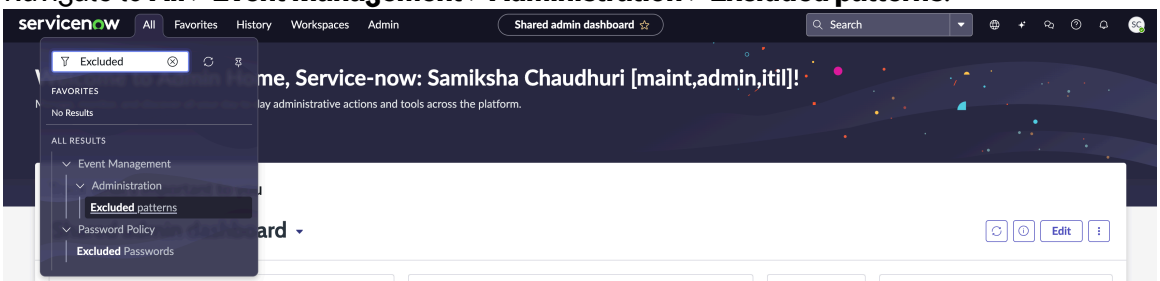
Restoring excluded patterns to the learned patterns report lets you reintegrate valuable insights lost due to incorrect alerts. This flexibility maintains accurate alert aggregation and enhances monitoring. For example, if you excluded a pattern due to an incorrect alert, you can restore it without that alert, ensuring relevant data remains accessible for analysis and decision-making.

Before you begin

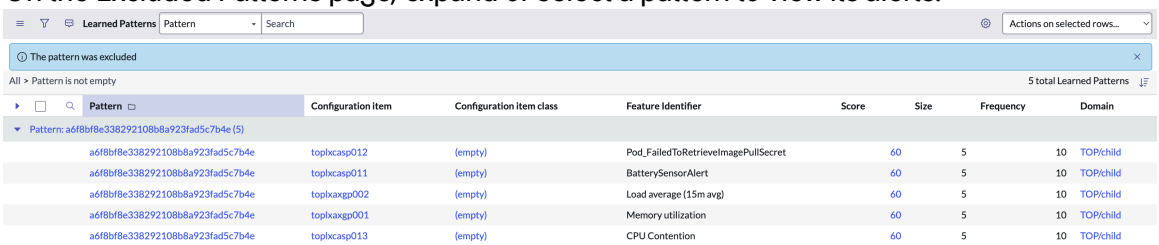
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Excluded patterns**.

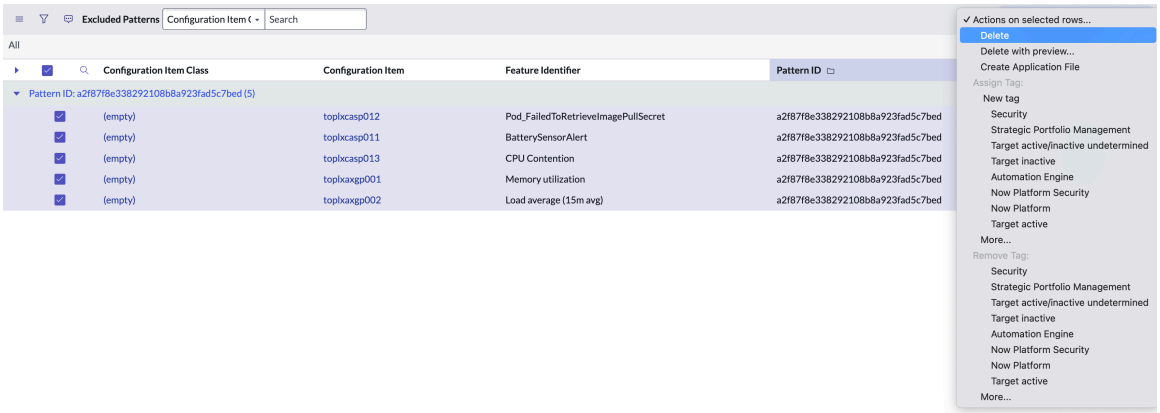


2. On the Excluded Patterns page, expand or select a pattern to view its alerts.



3. Select the patterns you want to restore.
4. In the **Actions on selected rows** drop-down menu, select **Delete**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. In the confirmation window, select **Delete**.
6. Run the Learned Patterns scheduled job.
   a. Select **System Definition** > **Scheduled Job**.
   b. On the Scheduled Jobs page, search for the Service Analytics Alert Aggregation Learner - Daily job.
   c. Open the Service Analytics Alert Aggregation Learner - Daily job.

   d. Select **Execute Now**.

Result

The pattern appears with its restored alerts on the Learned Patterns report page. To access this page, navigate to **Event Management** > **Reporting** > **Learned Patterns**.

CMDB based alert grouping

CMDB based alert grouping helps organizations manage alerts by organizing them according to their related configuration items (CIs) within the Configuration Management Database (CMDB). This method group alerts based on CI relations in applications or infrastructure components, allowing teams to better understand the impact of issues, respond more effectively to alerts, and maintain service availability.

CMDB alert groups are created based on the current relationships between CIs in an organization. This means that when several alerts are triggered on different CIs—for example, if a server is experiencing issues — alerts are grouped based on CI relationships.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

By default, all the existing connections between CIs are used to group alerts. However, given the complexity of IT systems, there are many types of relationships, and organizations can filter which ones to consider when aggregating alerts. For instance, you can filter relationship types by suggested relationships that appears in the CMDB Group CI Relations [em_suggested_relation_type] table. You can also filter using the hosting and containment rules (dependent relationship rules).

For example, if a server is hosting multiple applications, and there's a problem with that server, all the alerts related to both the server and the applications it hosts can be grouped together. This helps the IT team quickly identify and address the root cause of the issue rather than dealing with each alert in isolation. Similarly, if different processes are running on a server, grouping alerts based on those processes allows teams to see how problems in one area might affect others, leading to a more comprehensive understanding of the situation.

The CMDB alert groups are effectively displayed in the Express List within the Service Operations Workspace, which allows teams to easily monitor and manage related alerts. This feature enhances operational efficiency by providing a clear view of alerts that are interconnected based on the current relationships among configuration items (CIs).

Use cases for CMDB based alert grouping

Use cases for CMDB grouping enhance alert management by correlating alerts based on Configuration Item relationships, improving visibility, and facilitating more efficient troubleshooting.

Common CMDB grouping use cases

In the context of CMDB grouping, organizations face several challenges when managing alerts related to Configuration Items (CIs).

Common use cases

Use Case	Challenges	Solutions
Shared Configuration Item (CI) Scenario: An organization monitors a database server experiencing multiple issues, resulting in numerous alerts related to different applications using that database.	• Delayed response: Teams may respond to alerts in isolation, potentially overlooking related alerts, leading to delayed resolutions. • Inefficient resource allocation: Time and resources may be wasted on investigating separate alerts that are actually related. • Lack of context: Alerts related to the same CI can be scattered across different alert groups, making it difficult to see the full picture.	• Aggregate alerts related to the same CI into a single group for a unified view. • Facilitate faster alert resolution by addressing all related alerts together.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Common use cases (continued)

Use Case	Challenges	Solutions
Hosting/Containment Relations Scenario: A physical server hosts several virtual machines (VMs), and an alert is generated for a hardware failure on the server. Multiple alerts also arise for the VMs due to their reliance on the server.	• Visibility into dependencies: Teams may lack visibility into how CIs are interconnected, leading to inefficient troubleshooting processes. • Complex alert resolution: Understanding which CIs are affected and how they relate can be complicated, resulting in longer resolution times. • Resource drain: Mismanagement of alerts can lead to duplicated efforts across teams, wasting time and resources.	• Group alerts using CMDB hosting/containment rules to aggregate alerts related to the physical server and its hosted VMs into a single alert group. • Provide a comprehensive view of all alerts tied to the physical server's failure. • Focus remediation efforts on the physical server while monitoring the VMs to ensure all aspects are addressed efficiently.
Applicative Relations Scenario: An enterprise application relies on multiple micro-services, and an issue arises with one of these services, generating alerts across several components, complicating diagnosis.	• Understanding application dependencies: Teams may find it challenging to trace how application components interact, making it difficult to pinpoint issues in complex systems. • Slow incident resolution: Without a clear understanding of applicative flow, alert resolution can be slow and labor-intensive. • Inconsistent monitoring: Alerts related to applications may not be consistently monitored or prioritized, leading to potential oversights.	• Implement grouping based on applicative flow relations to aggregate alerts related to the affected microservice and its dependent components. • Utilize dependency maps to visualize how different services interact. • Streamline the resolution process by addressing grouped alerts related to the application, improving response times.

CMDB alert grouping — properties and functionality

Learn about the key properties and functionality of CMDB alert grouping, which facilitate efficient alert organization based on relationships and enhance the overall effectiveness of alert management.

Properties for managing CMDB alert group creation

Use the properties listed in the following tables to control CMDB alert group creation. For more information, see Configure scheduled job-based alert grouping.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Setting
Enable CMDB correlation *sa_analytics.agg.query_cmdb_correlation_enabled*	Enable this property to automatically use CI relationships for alert aggregation, correlating alerts and creating CMDB alert groups.
Max number of relations between CIs in a topology that form a CMDB group *sa_analytics.agg.query_cmdb_graph_walk_nodes*	Set the maximum number of enabled relations between CIs in a topology that form a CMDB group. For example, if you set this property to 3, a CI associated with an alert will automatically be grouped with similar CIs within three hops or less. **Note:** This property setting impacts all types of relations used for alert aggregation. Using a value greater than 4 may negatively affect the performance of the alert aggregation job.
Use all CMDB relations for CMDB group correlation *evt_mgmt.related_cis_get_all_relation_types*	Set to true if you want to use all relationship types for CMDB grouping. The default setting for new users is that the option is set to true, meaning all relationship types are used for grouping. Set the property to false to filter the relations.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

In some use cases, you may need to ignore or exclude certain CI relationships from automatic alert group creation. In this case, the *evt_mgmt.related_cis_get_all_relation_types* property must be set to false, and the properties in the below table must also be configured.

Note:
If the *evt_mgmt.related_cis_get_all_relation_types* property is set to false, and the relationship isn't specified in the [em_suggested_relation_type] table, the relationship is not considered for alert aggregation.

Properties for managing automatic creation of CMDB alert groups for advanced use cases

Property	Setting
Enable Suggested Relations for CMDB Correlation *sa_analytics.agg.query_cmdb_suggested_relationship_enabled*	Keep this property enabled to use any suggested relationships defined in the CMDB Group CI Relations [em_suggested_relation_type] table when

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Properties for managing automatic creation of CMDB alert groups for advanced use cases (continued)

Property	Setting
	forming CMDB alert groups. To include a new relationship, add it to this table. This property is enabled by default.
Use CMDB relationship based on host-containment Metadata rules *evt_mgmt.related_cis_use_containment_rules*	Containment rules specify which configuration item classes can be contained within another item through a specific relationship when creating a service template. Keep this property enabled when forming CMDB alert groups to use any host-containment rules defined in the Metadata Editor. For more details, see CMDB dependent relationship rules. This property is enabled by default.
Enable filtering by dependent relationship rules *evt_mgmt.related_cis_use_hosting_rules*	Hosting rules define what classes of configuration items are hosted on other classes of configuration items. Keep this property enabled when forming CMDB alert groups to apply any hosting rules, which define which classes of configuration items are hosted on other classes. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
Ignore CMDB alert groups from forming due to CI applicative flow relations *sa_analytics.agg.ignore_cmdb_applicative_flow*	Set this property to true to prevent CMDB groups from forming based on applicative flow relations for CI relations in application services. This property is hidden and enabled by default. **Note:** If you need to change the default value, add the property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.
sa_analytics.applicative_flow_rd_enabled	This property is hidden and enabled by default.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Event Management stores a map of related CIs in the Event Management CI Graph Reuse [em_ci_graph_reuse] table for each processed CI. You can adjust the storage period by modifying the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, with the default set to one day (86,400 seconds). This process enhances the search performance of relations in the CMDB. To disable the storage process during advanced use-case configurations, set the property value to zero.

Note:
If you need to change the default value, add the *sa_analytics.agg.query_cmdb_graph_reuse_period* property, as it does not exist in the instance by default. For more information on how to create a property, see Add a system property.

View the Dependency map for CMDB alerts

The Dependency map illustrates how and why alerts are grouped, simplifying troubleshooting and issue management. It reveals connections between CIs within a CMDB alert group, enhancing visibility into their relationships. Additionally, if a CI is not part of the group but connects to other alert CIs, it remains visible on the map, aiding alert resolution and proactive management.

Before you begin

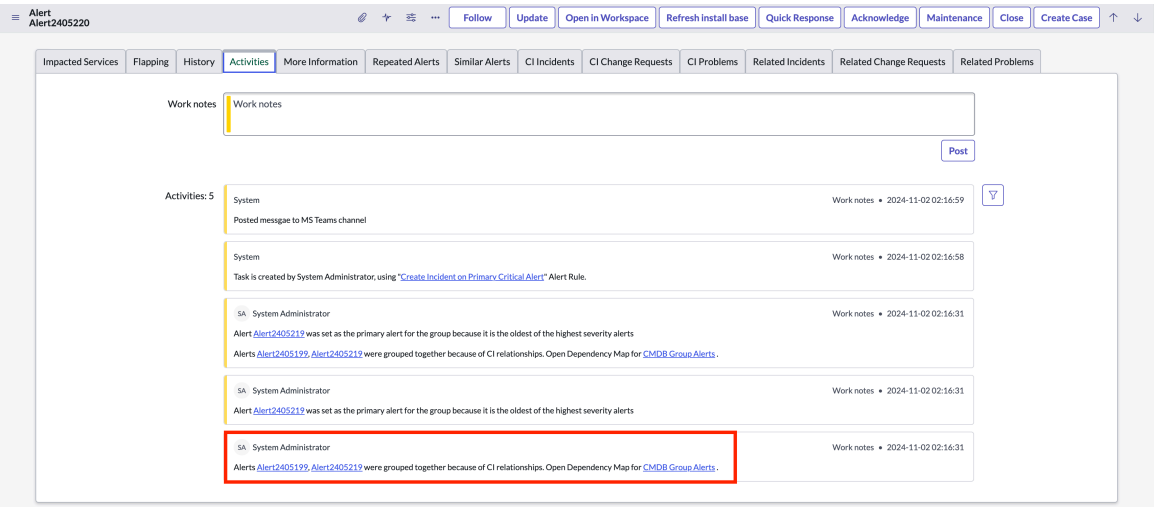
Role required: evt_mgmt_user, evt_mgmt_operator

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Search for the CMDB group.
3. Open a CMDB group alert.
4. Scroll down and select the **Activities** tab.

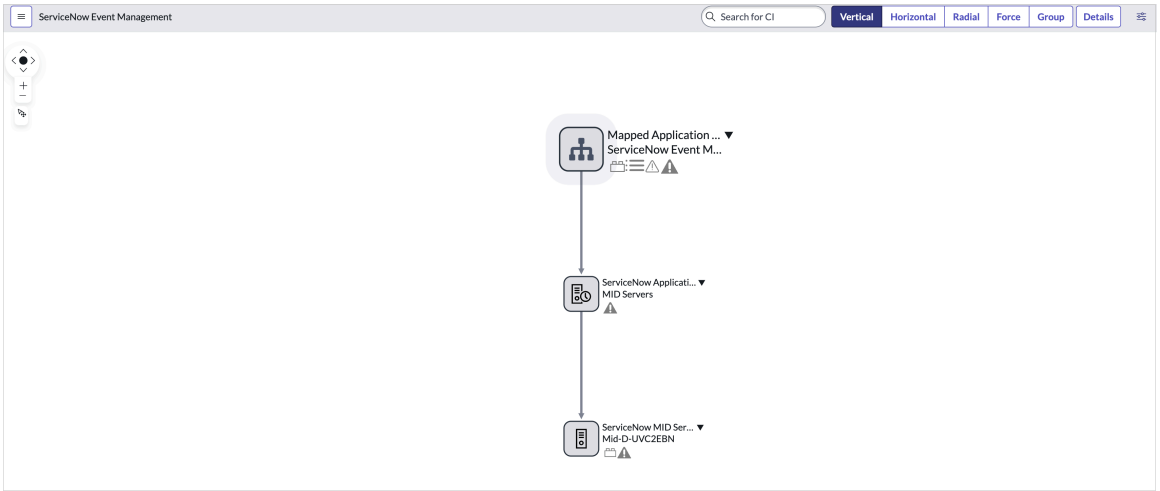
   You may see a message similar to the following:

   ```
   Alert2405199 and Alert2405219 were grouped together because of
   CI relationships. Open Dependency Map for CMDB Group Alerts.
   Open Dependency Map for CMDB Group Alerts.
   ```



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

5. Select the link to see the dependency view of the CMDB alerts.



Add a CI relationship to CMDB Group CI Relations

Add a CMDB group CI relationship for a CI class to enable accurate alert group generation.

Before you begin

Role required: evt_mgmt_admin

About this task

Configure the *sa_analytics.agg.query_cmdb_suggested_relationship_enabled* property to further enhance alert grouping by using suggested relationships. For more information on properties, see CMDB alert grouping — properties and functionality.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.

   a. Click **New**.

   b. Complete the form.

Suggested Relationship fields

Field	Description
Base class	The base class in the relationship serves as either the parent or the child, depending on the type of relationship established.
Relationship	The type of relationship that defines how two or more entities are connected.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Dependent class	The class that relies on another class in the relationship, serving as either the parent or the child depending on the relationship type.

2. Click **Submit**.

Example: CMDB Group CI relation

Base Class	Relationship	Dependent/Target Class
Oracle	Is Hosted On	Linux Server
Oracle	Is Hosted On	Solaris Server

Note:
The same parent class and relationship can appear more than once.

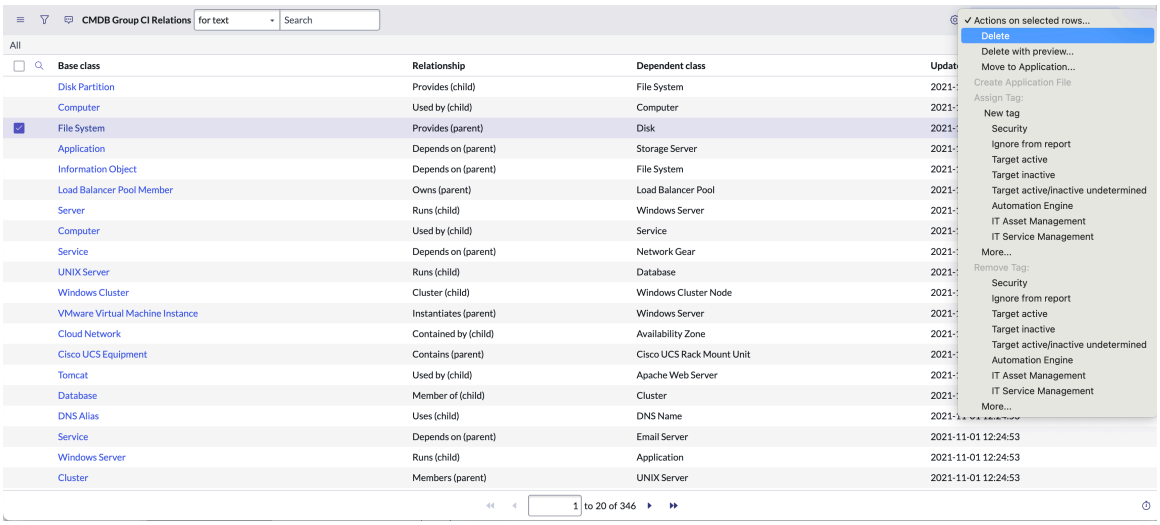
Delete a CI relationship from CMDB Group CI Relations

Delete a CMDB group CI relationship to limit available relationships for CMDB alert grouping, helping to reduce noise and improve alert relevance.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **CMDB Group CI Relations**.
2. Select the checkbox next to the CI relationship you want to delete.
3. Select the Actions menu and then select **Delete**.



4. On the confirmation window, select **Delete**.
The CI relationship is deleted.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Network traffic based alert grouping

The Network traffic based alert grouping method groups alerts by analyzing network traffic connections between processes across hosts. It leverages service candidates identified by ML Service Mapping to group alerts related to network traffic issues. This ensures alerts from directly connected processes within the same service candidate are grouped together, offering a more contextual view of network incidents.

Service candidates are potential collections of processes within your IT environment that are identified based on their network connections and interactions. They represent different services or functions that your IT systems provide, even if they are not fully detailed in your system's configuration database. For example, service candidates might group together all the processes involved in email delivery, even if the configuration details are incomplete.

ML Service Mapping uses machine learning to automatically discover and map out these service candidates. It identifies how different processes and components are connected and grouped together based on their network traffic and interactions. This helps in understanding and organizing the IT services and their components, making it easier to manage and troubleshoot issues. For example, ML Service Mapping might automatically identify and map the connections between email servers and mail clients based on their network interactions.

Note:
Network traffic based alert grouping is enabled for new customers starting with the Yokohama release. Existing customers need to enable the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) manually.

How it works

- Host identification: Alerts related to network issues are generated from various sources.
- Network context identification: The correlation process uses horizontal discovery results and ML Service Mapping to identify the most relevant service candidates and network connections.

  This process uses the results of the scheduled job **Event Management - Populate Service candidate process to process mapping - Daily**, which runs once a day and is used to store process-to-process connections for Host CIs in the format required by the alert grouping algorithm.

- Alert grouping: Alerts are grouped based on direct process-to-process connections within the context of the same service candidate. Grouping is updated in real-time as new alerts are received.

Benefits

- Improved accuracy: By leveraging network traffic connections and service candidates, this method provides high accuracy in grouping alerts, minimizing false positives.
- Enhanced coverage: It effectively groups alerts even in environments with low CMDB maturity, covering a broader range of alerts and issues.
- Streamlined resolution: IT teams can quickly identify and resolve related issues in bulk, reducing the volume of alerts to manage and improving operational efficiency.

Enable network traffic-based alert grouping

Activate network traffic-based alert grouping to automatically correlate and reduce alert noise by grouping related events based on network traffic patterns. This helps improve efficiency in alert response and streamlines alert management.

Before you begin

Ensure the Service Mapping Plus application (sn_sm_scoped_app) is installed.

Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Ensure that the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*) is selected.

Disable network traffic-based alert grouping

Disable network traffic-based alert grouping to prevent alerts from being grouped solely by network activity, reducing noise during traffic spikes and ensuring critical issues stand out for quicker resolution.

Before you begin

Role required: evt_mgmt_admin

About this task

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Alert Correlation Properties**.
2. Clear that check box for the property Enable Network Traffic correlation (*sa_analytics.agg.query_network_traffic_correlation_enabled*).
3. Set the property *sa_analytics.enable_process_mapping_calculation* to false.

Follow up on work notes and review service candidate

Track and follow up on work notes while reviewing the service candidate to ensure all actions and updates are captured. This helps maintain clarity and continuity in the review process, reducing the chances of missed details.

Before you begin

Role required: evt_mgmt_admin and sm_admin

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.

   Note:
   Scroll down to an alert with **Network Traffic** as the group, and in the **Group** column, right-click and select **Show Matching**. This displays all alerts related to **Network Traffic**.

2. For the alert whose work notes you want to see, select the alert number.
3. On the Alert page, scroll down and select the **Activities** tab.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

You can view the work notes for the selected alert.

4. In the work notes, select the service candidate to view details.
   The Application Service Candidate page opens.
5. Select **Preview Map Graph** to view the service candidates mapping in the form of a graph.
   Service candidates mapping provides a visual representation of how different service candidates are connected, making it easier to understand relationships, identify potential issues, and analyze dependencies more effectively.

Tag cluster alert grouping

Tag cluster alert grouping enables you to easily create groups of alerts. It is a non-code method of alert grouping that correlates alerts without having to use CMDB or model training. This simpler way of grouping similar alerts reduces the overall noise of a large quantity of alerts.

Tag cluster alert grouping is enabled immediately after the activation of the Tag-Based Alert Clustering Engine application, available in the ServiceNow Store. This grouping is applied according to the correlation logic order specified in the Configure alert correlation logic order. Alert grouping tags are attached to definitions on a many-to-many (M2M) basis. Multiple tags can be linked to a single definition, and a tag can be part of multiple definitions. Groups formed from tag cluster alert grouping definitions are classified as the Tag Cluster group type.

Tag cluster alert grouping supports domain separation, allowing different domains to have their own distinct alert grouping configurations and logic.

First, create alert grouping tags to define the criteria for grouping alerts. You can set the tags to require an exact match, an approximate ('fuzzy') match, or a character pattern match.

You can also use preconfigured tags to speed up alert clustering. These predefined tags are mapped from alerts and are based on information from sources such as the Alert field, Alert tags, or Alert additional info. If the required data is missing and the selected tag source is Alert CI or Alert CI key, the tag is populated using the Configuration Item (CI) value from the Configuration Management Database (CMDB). Predefined tags are easily identified by their description, which includes out of the box.

You can attach one or more tags to an alert clustering definition, which specifies the conditions for alert correlation. You can either create your own alert clustering definition or use a predefined one provided by the application. Predefined definitions come with associated tags.

Important:
Make sure to activate predefined definitions before use. In new systems, several definitions are active by default. The remaining ones must be activated. For more information, see Activate a predefined alert clustering definition.

Once one or more alert clustering tags are attached to a definition, the system collects alerts and checks if their tags match all the tag values specified in the definition. Alerts with matching or similar tag values are grouped together. New incoming alerts join an existing group if their tags match the tags in the definition used to create the group.

For tag-cluster grouping, alerts are added to a group based on the timeframe defined in the alert clustering settings. The time between the initial alert (virtual alert) and subsequent alerts is evaluated. If two new alerts are received, and their time difference falls within the defined timeframe, they are added to the group. The initial event's generation time is used to determine the relevance of the timeframe.

Create alert clustering tags

Create streamlined alert correlations with alert clustering tags by grouping alerts that share identical or similar tags based on your configured match method. This reduces noise, enhances incident prioritization, and improves operational efficiency, enabling faster issue resolution and response times.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Tags**.
2. Click **New**.
3. Fill in the values on the Event Management tag based alert clustering tag form.
4. Select **Submit**.

Result
The tag appears in the Tag Based Alert Clustering Tags table.

Create an alert clustering definition

Define alert clustering conditions to trigger one or more alert clustering tags, which help create alert groups from fewer alerts. Creating alert groups from fewer alerts reduces noise, making it easier to identify critical incidents, prioritize responses, and manage issues effectively.

Before you begin
Role required: evt_mgmt_admin

About this task
To create a tag def users need to use filter to define on which alerts the definition will apply and define a grouping criteria by specifying which field values should be compared to create a group.

Procedure

1. Navigate to **All** > **Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select **New**.
3. Configure the fields on the Event Management tag based alert clustering definition form.
4. Select **Save**.

Result
The definition appears in the Tag Based Alert Clustering Definitions table and Service Operations Workspace (ITOM) > Grouping automation. Alert groups created by this definition are categorized as Tag Cluster groups.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Activate a predefined alert clustering definition

Activate the predefined alert clustering definitions provided with the Tag-Based Alert Clustering Engine application before use. Utilizing these preconfigured definitions minimizes setup time and ensures a more efficient configuration process, allowing for quicker implementation and streamlined alert management.

Before you begin

Important:
If you are already using the Tag-Based Alert Clustering Engine application, all the predefined definitions are inactive and must be activated. In contrast, new customers will find several definitions active by default, allowing for immediate utilization of the alert clustering capabilities without additional setup.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Clustering Definitions**.
2. Select a predefined definition.

   Note:
   For a complete list of the available predefined definitions, see List of predefined tag-based alert clustering definitions.

3. On the Tag Based Alert Clustering Definition form, select the **Active** check box.
4. Select **Save**.

Result

In the Tag Based Alert Clustering Definitions table, the **Active** field for the activated definition displays the value **true**. You can now associate an alert clustering tag with this definition, enabling effective grouping of alerts based on the defined criteria.

Attach a predefined tag to a tag-based alert clustering definition

Get started faster with alert clustering by attaching a predefined alert clustering tag to a tag-based alert clustering definition in Event Management. By associating a predefined tag, you ensure that alerts meeting the specified criteria are grouped effectively, facilitating quicker identification and response to related incidents.

Before you begin

Role required: evt_mgmt_admin

About this task

The Tag Based Alert Clustering Engine application comes with a set of predefined alert clustering tags. Attach a tag to a tag-based alert clustering definition to specify the conditions that must be met for alert correlation. This enables effective grouping of alerts based on shared characteristics, improving the accuracy and efficiency of incident response and management.

Procedure

1. Navigate to **All** > **#Event Management** > **Tag Based Alert Clustering Engine** > **Alert Clustering Definitions**.
2. Select a definition.
3. Under the Tag Based Alert Clustering Definitions Tags M2M section, select **Insert a new row**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

4. Use the search field to locate a predefined alert clustering tag, and then select the green check mark to confirm your selection.

   Note:
   Predefined tags are recognizable by their description, which includes “out of the box.” For a complete list of the available predefined tags, see List of predefined alert clustering tags.

5. Select **Save**.

Result
The predefined alert clustering tag is now attached to the tag-based alert clustering definition. This association enables the effective grouping of alerts based on the specified criteria, facilitating improved alert management and response efficiency.

Text-based alert grouping

In text-based alert grouping, alerts are organized and correlated based on specific text patterns or keywords within the alert content. This approach dynamically groups alerts that share similar textual characteristics, such as error messages or event descriptions, allowing for more flexible and adaptive management of alerts.

The EM Alert Clustering Solution is a method used to correlate alerts based on similarities in specific fields and form clusters or groups. In ServiceNow Event Management, it creates clusters based on the Description, Metric name, and Configuration item.Class fields. This solution organizes alerts into text-based groups, and when a new alert arrives, the ML Predictor identifies the appropriate cluster, grouping alerts within the same cluster.

Note:
The ML Predictor job is asynchronous and assigns real-time alerts to clusters, which may result in slight delays. This delay can cause text-based groups to be created several minutes later, as the alert grouping job runs once per minute. If prediction results are not available during a run, they are rechecked in the next grouping job.

For text-based logic to execute, you must have the Predictive Intelligence plugin (com.glide.platform_ml) installed and the EM Alert Clustering Solution definition activated.

There are specific settings or limits used to control the behavior of text-based alert grouping. These thresholds define the criteria for how alerts are grouped based on text patterns or attributes. The text-based thresholds are:

- Cluster quality threshold: The Cluster quality threshold (*sa_analytics.alert_grouping_tb_cluster_quality_threshold*) determines the minimum quality required for an alert cluster to be considered valid. This threshold ensures that only clusters with a minimum level of similarity and reliability are used. Clusters that meet this threshold are considered valid, improving the precision of the groupings and reducing noise from irrelevant or low-quality clusters. The range of the threshold is from 1 to 100 and the default value is 70.
- Alert rank threshold: The Alert rank threshold (*sa_analytics.alert_grouping_tb_alert_rank_threshold*) defines the minimum rank required for an alert to be included in a group. This threshold ensures that only alerts with a certain level of similarity are grouped together, filtering out lower-ranked alerts to maintain the quality of the alert group. The default value is 0.3, where smaller values indicate better similarity.

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
To use these properties, you need to create properties with the same names and assign the required values to them. For more information on how to create a property, see Add a system property.

The EM Alert Clustering Solution definition is located in the [ml_capability_definition_clustering] table. To access it, navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.

To verify if the solution definition is active, see Verify text-based clustering solution. To disable the EM Alert Clustering Solution definition, disable text-based alert grouping by setting the property *sa_analytics.text_based_group_enabled* to `false` and clearing the **Active** check box in the EM Alert Clustering Solution definition.

Example of text-based alert grouping

Scenario	Example
Network Connectivity Problems: There are widespread network connectivity issues affecting multiple departments.	Alerts from various network monitoring tools might report issues like Network segment down, High packet loss, or Connectivity issues in subnet. Text-based alert grouping uses the EM Alert Clustering Solution and ML Predictor to streamline alert management. The EM Alert Clustering Solution employs Natural Language Processing (NLP) algorithms to analyze and identify common text patterns in alerts such as Network segment down or High packet loss. It then clusters these alerts based on their text similarity, grouping related issues together. The ML Predictor further enhances this process by evaluating new alerts in real time and assigning them to the appropriate existing clusters based on their text patterns. This dynamic grouping provides a consolidated view of the connectivity problems, allowing network engineers to quickly diagnose and address the root cause of the issues more efficiently.

Verify text-based clustering solution

Event Management uses Natural Language Processing (NLP) algorithms to identify common text patterns in alerts and create alert groups through clustering. This approach not only organizes similar alerts efficiently but also reduces noise and helps focus on significant issues, enhancing overall alert management.

Before you begin

Ensure that the Predictive Intelligence plugin (com.glide.platform_ml) is installed.

Ensure the parameter *sa_analytics.text_based_group_enabled* is set to `true`.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Note:
If the Predictive Intelligence plugin is not installed, the text-based logic will not execute, even if *sa_analytics.text_based_group_enabled* is set to true. This is because text-based grouping relies on clustering alerts based on the description, metric name, and CI class. Without the plugin, clustering cannot be performed, and as a result, text-based groups will not be created, regardless of the active status.

Ensure that there are at least 100 alerts in the Alerts table [em_alerts].

Role required: evt_mgmt_admin

Procedure

1. Navigate to **Predictive Intelligence** > **Clustering** > **Solution Definitions**.
   The Clustering Definitions page opens.
2. Select EM ALert Clustering Solution.
3. Verify that the **Active** check box is selected.
4. Select **Update & Retrain**.
   For more information on ML solutions, see Reviewing your ML solution training jobs.

Manual alert grouping

Manual alert grouping involves organizing and categorizing alerts based on user-defined criteria and direct intervention.

You can manually select and group alerts to better manage and resolve incidents by tailoring the grouping based on specific needs, relevance, or context. This approach ensures that alerts are categorized effectively, enhancing overall incident management and response efficiency.

Create alert group manually

Manually create an alert group to organize and manage related alerts when not using scheduled jobs. This provides flexibility to group alerts on-demand for effective resolution.

Before you begin
Role required: evt_mgmt_admin

Procedure

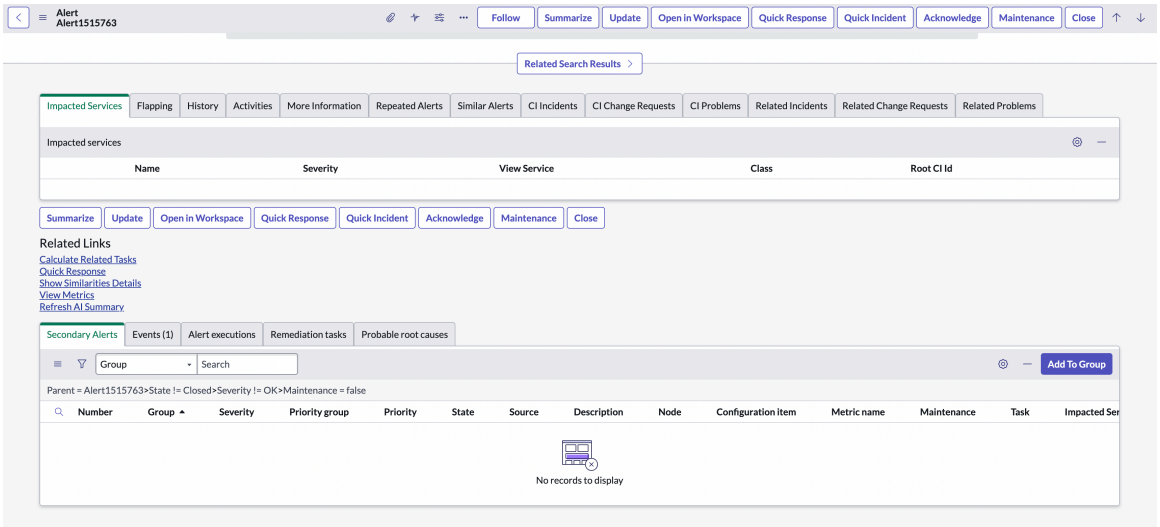
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.

   The alert will be used to create an alert group, designated as the primary alert, to which you can add secondary alerts.

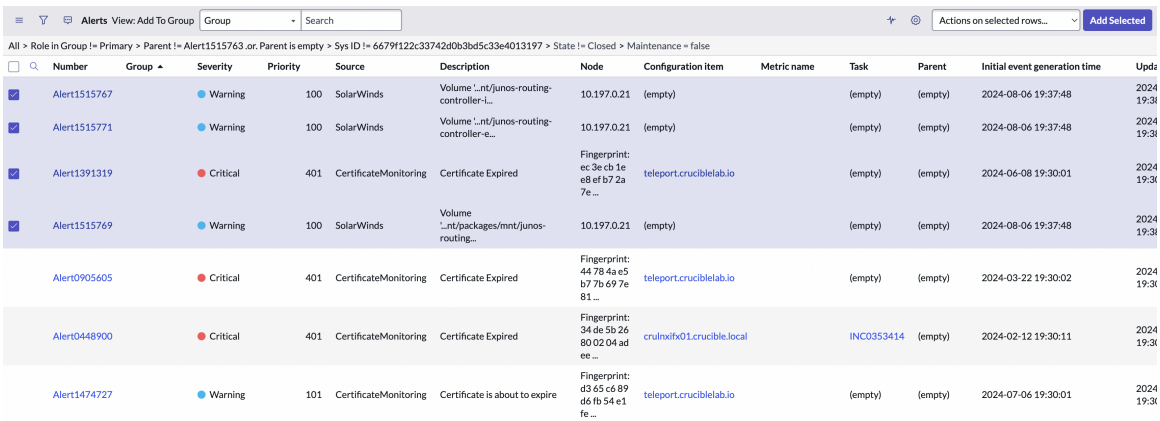
   Note:
   A closed alert cannot be assigned as a parent alert.

3. Scroll down and in the **Secondary Alerts** tab, select **Add To Group**.

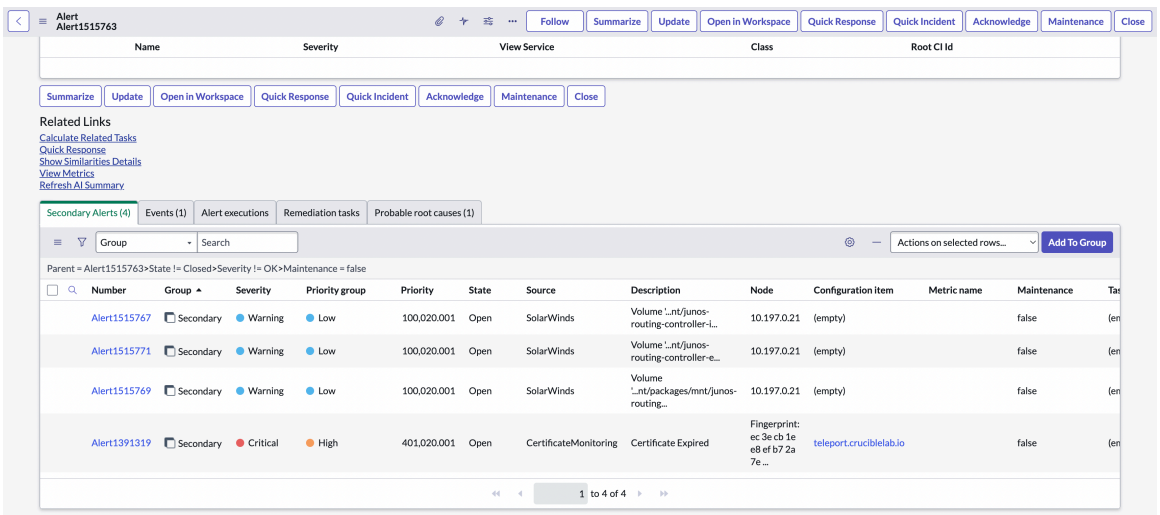
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Select the check boxes for all alerts you want to add to the group as secondary alerts and select **Add Selected**.



5. In the **Secondary Alerts** tab, view the alerts that have been added as secondary.



Add secondary alert manually to an existing alert group

Add any relevant alert discovered during the review of an automated alert group as a secondary alert to improve the group's completeness and utility for incident troubleshooting.

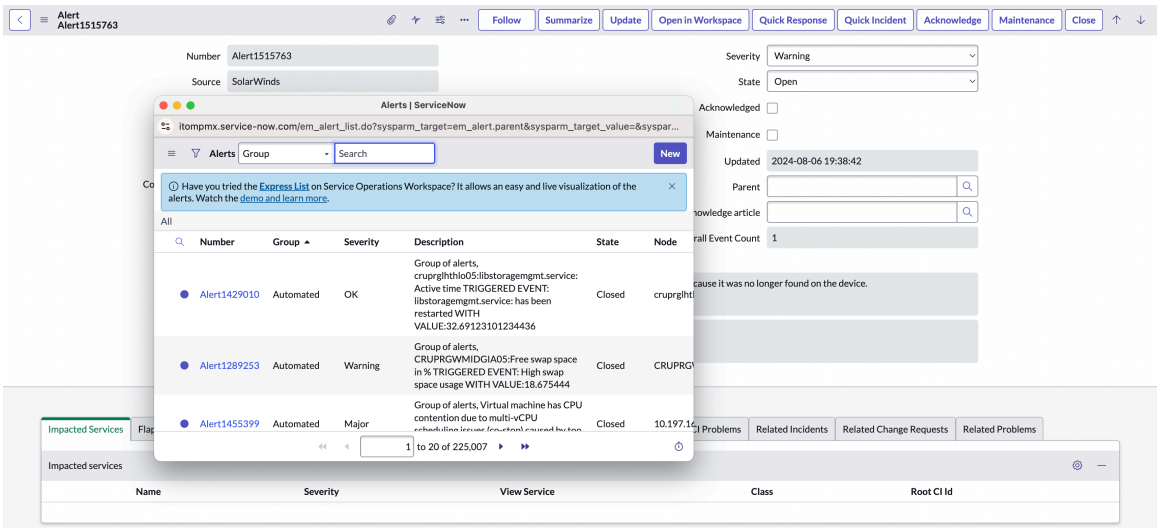
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

About this task
The alert you select to add to a new group may already be part of another group. Adding it to the new group will automatically remove it from its current group, changing its group association. Alternatively, you can update the alert's parent to move it to a different group. By specifying a new parent, the alert is transferred to the new parent's group and removed from the previous one. This can be accomplished by updating the **Parent** field on the alert form or by modifying the **Parent** column in the Alerts list.

Note:
When you add an alert to a group, this action is logged as feedback for alert grouping as part of the process. Currently, the feedback option is available but does not trigger further actions after being logged. Future enhancements to this feature are being considered.

Procedure
1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert.
3. In the **Parent** field, search for the alert you want to assign as the parent for the selected alert.



4. Select the parent alert number.
5. Select **Update**.

Result
The alert is added as a secondary alert to the selected parent alert.

Remove an alert from an alert group

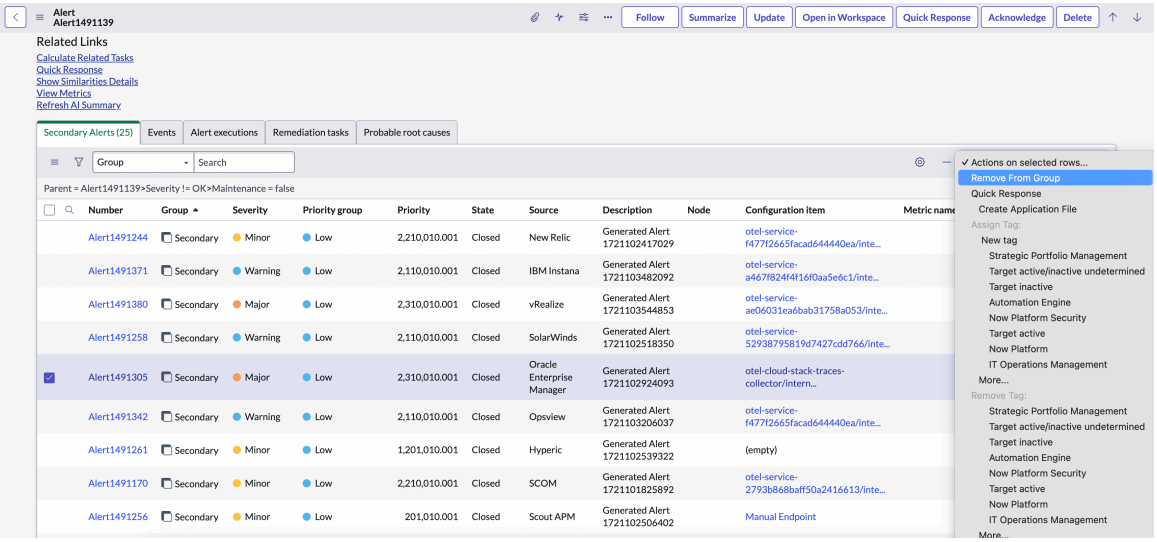
Remove an alert if you want to improve the group's accuracy and usefulness in troubleshooting an incident. If this action leaves the group with one or no alerts, the group is deleted and no longer displays as an alert group.

Before you begin
Role required: evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Select the alert number to open the alert group.
3. Scroll down to view the **Secondary Alerts** tab.
4. Select the check box next to the alert you want to remove from the group.
5. From the Actions on selected row menu, select **Remove From Group**.



Result

The alert is removed from the group.

Configure work notes to capture alert grouping justifications

As alerts are added to a group, a message is recorded in the alert's Work notes field to explain why the alert was included in the group. Define alert types for creating these worknotes related to alert group reasoning.

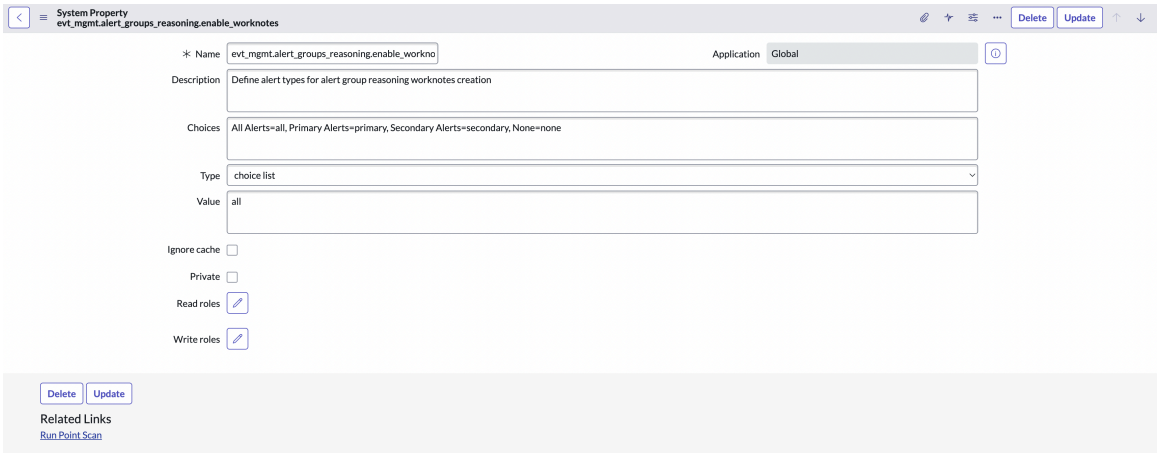
Before you begin

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **System Properties** > **All Properties**.
2. Search for the property *`evt_mgmt.alert_groups_reasoning.enable_worknotes`*.
3. Open the property.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. In the **Choices** field, define alert types for creating worknotes related to alert group reasoning.

Property values

Value	Description
All Alerts	Work note information is generated for every alert.
Primary Alerts	Work note information is generated only for primary alerts.
Secondary Alerts	Work note information is generated only for secondary alerts.
None	No work note information is generated.

5. Select **Update**.

Alert grouping types and creation methods

Application services in Event Management

An application service is a set of interconnected applications and hosts which are configured to offer a service to the organization.

For general information on application services, see Application services.

Manually create an application service in Event Management

You can manually create an application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

An application services is a set of interconnected applications and hosts which are configured to offer a service to the organization. Application services can be internal, like an organization email system or customer-facing, like an organization website. Use application services to organize, maintain, and monitor services in your organization.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.
2. Click **New**.
3. On the form, fill in the fields.

Create a Service form

Field	Description
Name	Enter a unique application service name.
Owned by	Specify an owner who is responsible for this application service in the organization
Add entry points:	
CI Type	Select the CI type (CI class) for the CI you are adding. Every CI belongs to a CI type which contains a set of attributes configured for this kind of CI, for example, cmdb_ci_appl for applications.
CI Name	Select the CI from the list of CIs of the selected CI type.

The CI type list includes only allowed CI types. For example, you cannot add an application cluster.

4. Click **Submit**.

What to do next

For details on grouping application services, see Group application services.

For details on controlling user access to application services, see Control user access to application services.

Convert manual services to application services

You can convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Before you begin

Role required: evt_mgmt_admin

About this task

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services.
During the conversion process:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.
- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

Application service does not support these CI types:

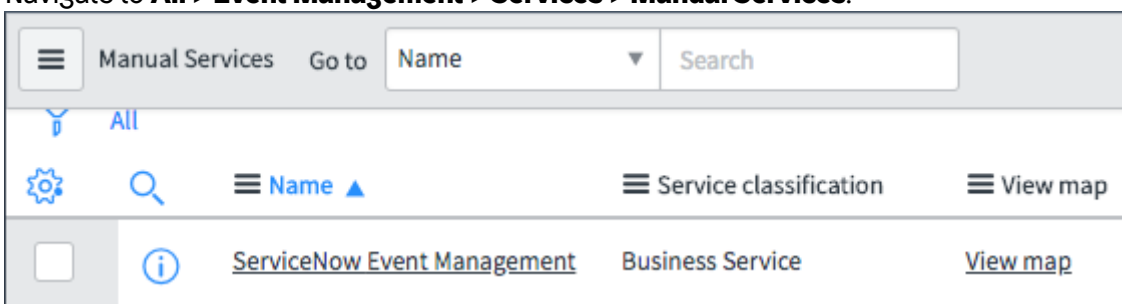
- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

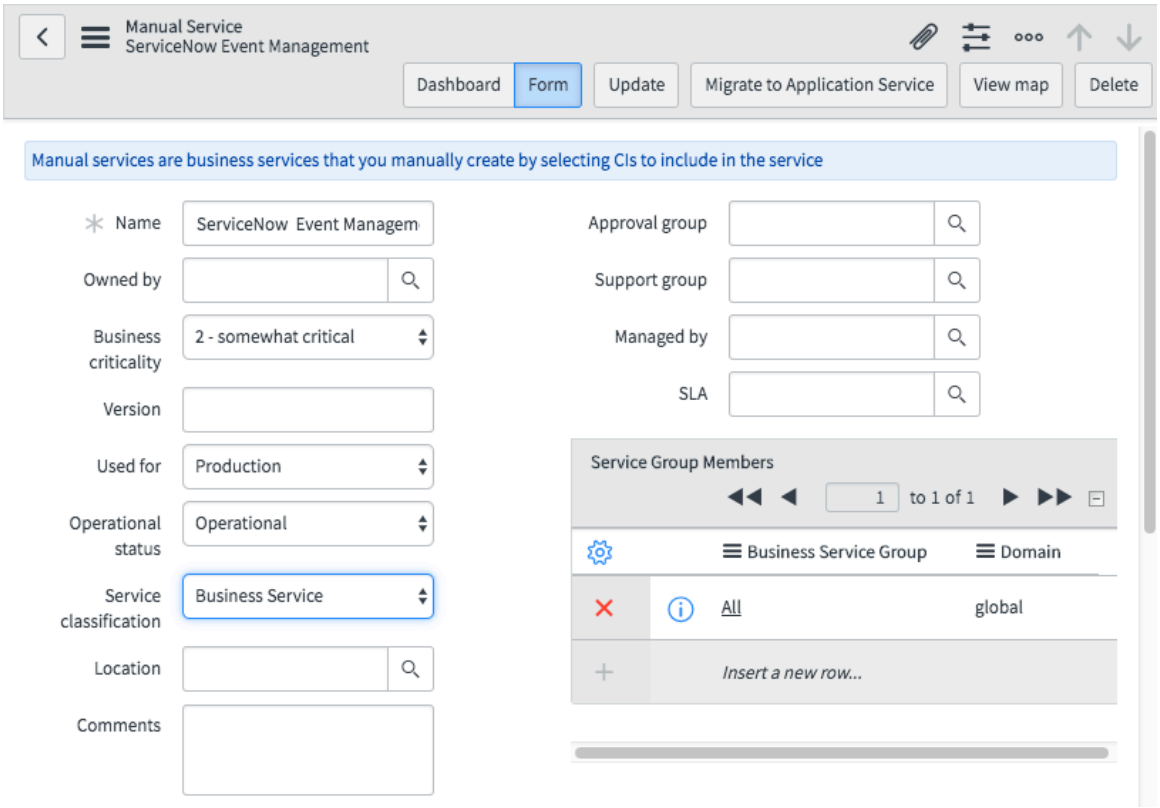
Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Manual Services**.



2. Select the manual service that you want to convert to an application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



3. Click **Migrate to Application Service**.
4. Click **OK**.

Result

- The CIs from the manual service are added to the converted application services.
- After the conversion process is complete, the application services form opens.

Convert manual services to application services using API

You can use a JavaScript API to convert existing manual services to application services. Event Management can use application services to monitor service performance and identify health issues.

Manual services are no longer supported and this service type, as well as discovered services, have been replaced by application services. Any existing manual services must be converted to application services. Ensure that any automation of manual services (such as business rules or scheduled jobs) have been built and tested before converting to application services.

Note:
Manual services are static and retain their original structure after conversion to application services. To update imported manual services with the existing CMDB state, either populate the original manual services to ensure that all CIs are assigned to the correct service, or run the **update with CMDB changes** option after the conversion.

During the conversion process:

- The manual service record is moved from the Manual Services [cmdb_ci_service_manual] table to the Mapped Application Service [cmdb_ci_service_discovered] table by changing the record class.
- All the original manual service attributes, such as, name, owner, and operational status, are retained in the application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The configuration items (CIs) of the manual service are retained in the application services after the conversion.
- The system queries the CMDB for the latest CI changes and applies CI impact rules.

The maximum number of CI connections added to application services during this operation is controlled by the sa.service.max_ci_service_population property. By default, the value is 1,000 (one thousand connections). Increasing the number of CI connections may cause performance issues. To adjust the maximum number of added CI connections, add the sa.service.max_ci_service_population property, as described in Add a system property.

Attempting to process more CIs than the value specified in the sa.service.max_ci_service_population property causes the operation to fail.

Run the conversion process in small chunks of approximately 10 at a time, to make it easier to pinpoint the problematic service in the event of a conversion problem.

Application services do not support these CI types:

- cmdb_ci_endpoint
- cmdb_ci_translation_rule
- cmdb_ci_config_file
- cmdb_ci_qualifier
- cmdb_ci_application_cluster

If the preceding CI types are used in the manual service that you want to convert, the conversion fails. CIs of this type should be removed before conversion. They can be replaced by adding new CIs to the application services after conversion.

If your ServiceNow instance uses domain separation, the conversion fails if CIs from multiple domains are in the same service. Replace or remove relevant CIs before conversion. The converted application services contains only CIs assigned to the same domain as the application services.

The JavaScript API is:

```
BusinessServiceManager.migrateManualToApplicationService(String
 service_id)
```

Parameters

Name	Type	Description
service_id	String	sys_id of the manual service to be converted

Returns

Type	Description
Boolean	`true` for a successful conversion, `false` for a conversion that failed

Where the `sys_id` of an existing manual service is `451047c6c0a8016400de0ae6df9b9d76`, run the following API to convert it to an application services:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

```
var bsManager = new SNC.BusinessServiceManager();
var res =
 bsManager.migrateManualToApplicationService("451047c6c0a8016400
de0ae6df9b9d76");
```

Configuring CIs in a manual service as a manual cluster

Configure or modify a CI as a specific CI or a generic CI class in a manual service (that was not discovered automatically) as a manually defined cluster. A manual cluster delivers redundancy capabilities in the cluster and provides continued operations or services of the entire cluster in case of failure of one or more CIs in that cluster.

Manual cluster allows you to group CIs under a logical cluster in a service. In the impact tree you can set the relative impact of a cluster member on the cluster.

Note:
Creation of nested manual clusters (cluster inside cluster) is currently not supported.

Once the CI is defined as a manual cluster its impact calculation shows the magnitude of an outage on its children CIs. Impact calculation uses factors such as impact rules and CI relationships to calculate the severity of a generated alert. Impact rules, which are used for impact calculation, estimate the magnitude or severity of an outage based on affected CIs and determines how the impact applies to parent or child entities that are part of an application service.

The magnitude of an outage can be 100% down, 60% affected, 40% impaired, or 20% impaired.

Redundancy is defined in impact rules. For example, you can define that the parent CI is critical if at least two child CIs are critical. The impact from child to parent CIs is not always 100%. If the CIs of all three children are affected, the impact is 100% down.

In a service map, you can configure or modify a specific CI or a generic CI class in a manual service as a manually defined cluster. When configuring as a generic CI class, all the CIs of the selected class in that service are configured the same.

Note:
Visual representation of a manual cluster may differ from the visual representation of a cluster that is discovered automatically.

Related topics

Alert impact calculation

Configure a manual cluster

Provide redundancy capabilities of an entire cluster in case of failure of one or more CIs in that cluster. By viewing the relative impact of a cluster member on the cluster information, you can better understand the source of alerts and take remediation steps.

Before you begin

Role required: evt_mgmt_admin

About this task

In a manual service that was not discovered automatically, you can manually group a specific CI or a generic CI class under a logical cluster. The relative impact of a cluster member on the cluster can be configured in the impact tree.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

For more information, see Alert impact calculation.

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. Select **New**.
3. In the **Select a Service containing this manual cluster** section, select an application service to contain the new manual cluster based on a specific CI or general CI class.
   The cluster number is automatically generated and appears in the **Number** field.

   a. Select the Lookup using list icon ( ) in the **Service** field.

   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   To define a new application service, see Manually create an application service in Event Management.

   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).

4. In the **Select a Specific CI or generic CI class** section, in the **Defined As** field, select whether to define the manual cluster as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. In the **Provide a Description** section, either provide a description in the **Description** field or leave it blank to contain an automatically generated description when you select **Save** or **Submit**.

   The **Description** field is automatically updated when you select **Save** or **Submit**.
   The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.

6. Activate the cluster by selecting the **Activate** check box.
7. Select **Submit**.

Result

The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Configuring CIs in a manual service as a manual cluster

Modify a manual cluster

Modify an existing manual cluster by changing the service, the specific CI, the generic CI class, or the description in case of an incorrect initial configuration, changes in the network, or other issues.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin
Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Manual Clusters**.
2. From the list, select a manual cluster.
3. Change the service containing the manual cluster by selecting a different one in the **Select a Service containing this manual cluster** section.
   The cluster number appears in the **Number** field.
   a. Select the Lookup using list icon ( ) in the **Service** field.
   b. In the CMDB CI Service [cmdb_ci_service_discovered] table, select a manually created service.
   c. **Optional:** Preview the record by selecting the Preview this record icon ( ).
4. In the **Select a Specific CI or generic CI class** section in the **Defined As** field, modify the manual cluster either as a specific CI of a manual cluster or as a generic CI class of a manual cluster that will be applied to all CIs of this class.
   - Specific CI - In the **Configuration item** field, select the Lookup using list icon ( ) and select the configuration item.
   - Generic CI class – In the **Configuration item class** field, select the configuration item class.
5. **Optional:** In the **Provide a Description** section, modify the description in the **Description** field.

   (Optional) The **Description** field is automatically updated when you select **Save** or **Submit**. The automatically generated description consists of the configuration item name and the service name. For example: `CI <Alert Processing> in service <linuxApplService> (*** auto generated ***)`.

   To prevent an automatic update of the Description field and retain your changes, delete the (*** auto generated ***) suffix that appears as part of the description.
6. Activate or deactivate the cluster by selecting or clearing the **Activate** check box.
7. Select **Update** to save your changes.

Result
The manual cluster is saved in the EM Impact Manual Cluster [em_impact_manual_cluster] table. The impact calculation is recalculated automatically.

Related topics
Configuring CIs in a manual service as a manual cluster

Create an alert query

An alert query is a set of alerts that meet specific criteria for a particular service.

Before you begin
Navigate to **Event Management** > **Administration** > **Event Management Properties** and ensure that the **Enable alert query support** (*evt_mgmt.impact_calulation.alert_group_support*) property is set to **Yes**.

Role required: evt_mgmt_admin or evt_mgmt_operator

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

The main motivation to use alert queries is a modeling solution based on data contained in the alert itself, as an alternative to using either discovered, application, or technical services. Create an alert query to combine similar alerts that meet the specific criteria.

You can learn about Event Management basics, including alert queries, from this video:

Getting started with Event Management

Procedure

1. Navigate to **Event Management** > **Services** > **Alert Queries**.
2. Select **New**.
3. On the **Alert Query** form, fill in the fields.

   For a description of the field values, see Alert Query form

   Note:
   In the **Filter** field:

   - When defining an alert query filter, include only fields that appear in the Alert Histories [em_alert_history] table. Impact calculation is based on Alert History data and fields such as Overall Event Count, Priority, and Priority group are not copied to the Alert Histories [em_alert_history] table.
   - Do not specify a dynamic time condition. For example, in the filter, do not specify `Created` condition of `Last 45 minutes` because impact calculation is triggered by a change of alert or alert query. However, for the dynamic time condition, none of these conditions have changed.

     
   - Some filters may slow down impact calculation. To solve this problem, adjust your alert query by adding an appropriate index, as described in Index suggestions for slow queries.

4. Select **Update**.

Related topics

Create alert group manually

Create a service group

Create service groups to combine similar services. Organize services by groups to perform actions simultaneously on multiple services and to control user access to services.

Before you begin

Role required: evt_mgmt_admin

About this task

Service groups are a way to organize and group services based on the application services or technical services they impact. Instead of looking at individual service from different infrastructure components (like servers, databases, or applications), Service groups help consolidate them under the umbrella of a service group. Application service groups enable faster identification of alert impact. Service groups appear in the **Group by** option on the Service Operations Workspace dashboard.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Groups**.
2. Click **New**.
3. In the **Name** field, enter the name of the new service group.
4. **Optional:** In the **Parent Group** field, enter the name of another group in which to embed the new group.
   Users with access to a parent service group automatically have access to all its child groups.
5. Click **Submit**.

Related topics

Assign a role to a service group

Group application services

Assign a role to a service group

Assign an Event Management role to the application service group to ensure that group members can manage and act on alerts.

Before you begin

Configure a service group to enable users to manage application services or alert groups.

Role required: evt_mgmt_admin

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Service Group Responsibilities**.
2. Click **New**.
3. In the **Application Service Group** field, select the name of the service group.
4. In the **Role** field, select an Event Management role:
   - evt_mgmt_admin
   - evt_mgmt_integration
   - evt_mgmt_operator
   - evt_mgmt_user
5. Click **Submit**.
6. To find users who are assigned to the role, navigate to **User Administration** > **Users** > **Roles** and search for the role.

About this task
In Event Management, Service Mapping relationships appear on alerts. You can view the related CI and other information in the Event Management dashboard. The mapping relationships appear in a service map with the generated alert, any CIs that are bound to the alert, and all related CIs.

Procedure

Use Service Mapping to get top-down discovery information.
Service Mapping, which is closely related to Event Management, provides tools to discover the relationships between network, hardware, software, storage, and other devices.

Request Service Mapping

Configure email notification on application service severity change

Configure an email notification to notify users when there is an application service severity change.

Before you begin
Role required: evt_mgmt_admin

About this task
Configure an email notification to notify users when there is an application service severity change. The notification involves specifying when to send it, who receives it, and what it contains.

Procedure

1. Navigate to **All** > **System Properties** > **Email Properties**.
2. In the **Outbound Email Configuration** section, in the **Email sending enabled** option, select **Yes** to enable sending severity information by email.
3. Click **Save**.
4. Navigate to **System Notification** > **Email** > **Notifications**.
5. Click **New**.

   a. In the **Email Notification Actions** form, specify these values.

Field	Value
Name	Type a descriptive name, for example, *`Application Service severity change`*.
Table	Select the required service type and its corresponding table: Alert Group, Discovered Service, Technical Service, or Application service.
Active	Select the check box to enable email notification.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

b. Click the **Who will receive** tab.
In the **Users** area, search for and select the required user (the user does not require System Administrator credentials). Repeat this step for as many users that are required to receive this notification.

c. Click the **When to send** tab and in the **choose field** box, search for and select *Severity*.

d. Click the **What will it contain** tab and in the **Subject** field, type meaningful text that makes it clear to the receiver of the email notification what the content of the email is.

e. In the **Message HTML** message area, using the **Select variables** functions, compose the conditions under which the email notification is to be sent.
For example, configure these variables to change severity:

```
severity changed
```

```
Severity: ${severity}
```

```
on application service
```

```
Name: ${name}
```

6. Click **Submit**.

Configure contextual colors and icons

Use the **Contextual colors and icons** form to configure color, text, and icons to have different default or custom contexts, identified by a context ID.

Before you begin
Role required: evt_mgmt_admin

About this task
You can customize the colors or icons of elements in the **Contextual colors and icons** form to affect the displayed colors or icons of severities in related Event Management screens, either when accessibility mode is off or on. For more information about accessibility, see Accessibility features .

In each color selection field, you have the option of entering the value of the color as any of the following Cascading Style Sheet (CSS) formats that determine how HTML elements should be displayed:

- Name: predefined color names, for example, red, green, olive, blue, darkblue, or lightblue
- RGB decimal: RGB(102, 153, 204)
- RGB hex: #223344

See the following websites for information about CSS color declarations (including hex or RGB notation):

- HTML Colors (W3CSchools) for more information on hex and RGB notation.
- HTML Color Names (W3CSchools) for valid color names.

The context IDs that are provided with the base instance are:

- information_severity
- warning_severity

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- minor_severity
- major_severity
- critical_severity
- topology_connection

Procedure

1. Navigate to **All** > **Event Management** > **Administration** > **Contextual colors and icons**.
2. Click **New** or modify an existing configuration.
3. Configure the following fields.

Item	Description
Context details	
Context ID	Enter a unique ID for the context, for example, clear_severity.
Context Name	Readable name for the context. This text is available to be read out by screen readers.
Batch	The batch that this context is a member of.
Description	Description of uses for the context.
Colors **Note:** For each entry in the color fields, after you enter a color code, a block appears to the right of the field showing the specified color. Use of invalid color codes triggers an appropriate error notification.	
CSS Color	The corresponding CSS color code for the context color name.
CSS Color on Interaction	CSS color code that appears on hover or focus.
Accessible CSS Color	Accessible CSS color code that appears when accessibility mode is enabled.
Accessible CSS Color on Interaction	Accessible CSS color code that appears on hover or focus.
Icons	
Icon	Icon that is displayed when the context includes an icon.
Accessible Icon	Icon that is displayed when the context includes an icon and when accessibility mode is enabled. To add your own icon, or to see a list of available icons, see Upload one or more images.

4. Click **Submit**.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

View Event Management license usage

Event Management is licensed based on the number of CIs bound to alerts during the last year. For alerts that are not bound to CIs, the system calculates the number of nodes (servers) that can send events to the instance directly or through a third-party monitoring tool during the last year.

Before you begin
Role required: evt_mgmt_admin or evt_mgmt_operator

About this task
The **Event Management - Node Count Store** job calculates the number of unique nodes that send event information, either directly or through third-parties, to Event Management and are eligible for licensing in the last year. The information from this job is stored in the License Usage [em_unique_nodes] table for visibility by all users. CIs bound to alerts are counted towards licensing; if there are no CIs that are bound to alerts, the event node field is used. Node is a reference to a server, not the instances of the software on it. Your node count is based on the amount of infrastructure (servers for example) that will be sending events.

Procedure

Navigate to **All** > **Event Management** > **Reporting** > **License Usage**.

The table is filled automatically based on the alerts in the system. The user has no permission to edit the table. It is used to calculate the usage of the Event Management licensing.

Using Event Management

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

This guide can assist you on a regular basis.

View alert information

View a list of all alerts for application services s, and then manage individual alerts as necessary.

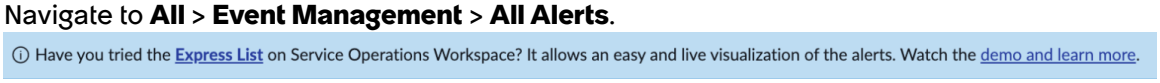
Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
Multiple related events may correlate into a single alert. Event Management only creates alerts when one or more events meet the conditions defined in event rules, alert action rules, and alert configuration settings.

When updating an alert, empty field values do not override values inherited from the alert's event.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.



Note:
To stop the message from appearing, set the *show_sow_enhanced_experience_message* property in the [sys_properties] table to false.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

2. To view or manage an alert, click the alert number.
3. Review the information on the Alert form.
   You can click tabs on the form for further information.
   - To view flapping information, click the **Flapping** tab.
   - To view alert history, click the **History** tab.

Alert form

Field	Description
Number	If an alert was created as a result of the event, this field contains the unique ID that Event Management generates to identify the alert.
Source	Event monitoring software that generated the event, such as SolarWinds or SCOM. Maximum length: 100 characters.
Node	Node name, fully qualified domain name (FQDN), IP address, or MAC address that is associated with the event, such as IBM-ASSET. Maximum length: 100 characters.
Type	The metric type to which the event is related, such as Disk or CPU, which is used to identify an event record from which alerts are created. Maximum length: 100 characters.
Resource	Node resource that is relevant to the event. For example, Disk C, CPU-1, the name of a process, or service. Maximum length: 100 characters.
Configuration item	JSON string that represents a configuration item. For example, `{"name":"SAP ORA01","type":"Oracle"}`. The CI identifier that generated the event appears in the **Additional information** field. Maximum length: 1000 characters. Note: Reference pop-ups and click-throughs are hidden by default for read-only fields. For **Configuration item** and other read only fields, you can optionally change the read-only setting. For more information, see Configure pop-ups on read-only fields. Click to open the alert in dependency view.
Task	The corresponding task for the alert, such as an incident, change, or problem.
Metric Name	Unique name that describes which metric data is collected.
Description	A description of the alert.
Message key	Unique event identifier to identify multiple events that relate to the same alert. If this value is empty, it is generated from the **Source**, **Node**, **Type**, **Resource**, and **Metric Name** field values. Maximum length: 1024 characters.
Severity	The severity of the event. The value for this field is copied from the event unless the event closes the alert, in which case the previous severity is retained for reporting. ○ **Critical**: Immediate action is required. The resource is either not functional or critical problems are imminent. ○ **Major**: Major functionality is severely impaired or performance has degraded. ○ **Minor**: Partial, non-critical loss of functionality or performance degradation occurred.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ **Warning**: Attention is required, even though the resource is still functional. ○ **OK**: An alert is created. The resource is still functional. ○ **Clear**: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The state of the alert. ○ **Open**: The alert requires user action. ○ **Reopen**: The previously closed alert requires additional user action. ○ **Flapping**: After the alert has been closed, it receives a high frequency of identical events from the same source that causes many alert reopenings. User action is required. ○ **Closed**: The alert is closed and no further user action is required.
Acknowledged	Select **Acknowledged** to indicate that a user has acknowledged the alert.
Maintenance	A check box that shows whether the resource that is affected by the alert is in maintenance.
Updated	The most recent time that the alert information was updated.
Parent	○ If this field is blank, you can specify an alert number. The current alert becomes a secondary alert to this parent alert. ○ If an alert number is displayed, then the current alert is already a secondary alert to this current alert, which is the parent alert.
Feedback	This field appears in alert forms only if the alert being modified is a parent alert. Your response provides feedback about the accuracy and usefulness of the group. Possible values are: ○ None - No value was selected. ○ No Feedback - There is no feedback for this alert. ○ Yes - The alert group is accurate and useful. ○ No - The alert group is not accurate and not useful. **Note:** Currently, the feedback option is available but does not trigger further actions after being logged.
Knowledge article	The knowledge article associated with the alert, if any.
Overall Event Count	The counter is increased every time an event is bound to the alert. The count value is kept even after the actual event has been purged. Primary alerts (virtual alerts) are updated based on their secondary alerts. The actual number of events that affected the alert is displayed. **Note:** Do not create an Alert Group based on Event Count. Where an Alert Group is based on Event Count, the impact of the group does not calculate properly because the Event Count field is not copied to the em_alert_history table for impact calculation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
Source instance	The name of the machine or software that generated the event. For example, SolarWinds on 10.22.33.44.
User name and role	The user and role of the person who made the most recent alert updates.
Acknowledged	The **Acknowledged** check box value after the most alert recent update. ○ *True*: The **Acknowledged** is selected. ○ *False*: The **Acknowledged** check box is cleared.
Correlated Alerts section	The secondary alerts that are correlated with this alert, where this alert is the primary alert. For more information, see Rule-based alert grouping.
Primary Alerts section	The primary alert that is correlated with this alert, where this alert is a secondary alert. For more information, see Rule-based alert grouping.

Additional tabs.

Field	Description
Impacted Services tab	
Impacted Services	The impacted services that are related to this alert are listed. For more information, see View the impact tree.
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.
History tab	
Initial event generation time	The time when the event that generated the alert first occurred. This time is the platform processing time, not the source system time.
Last event generation time	The last time the event that is linked to the alert occurred. This time is the platform processing time, not the source system time.
Created	The time that the alert was created.
Work notes	The additional notes about the alert.
Activities tab	
Activity	A record of the work that was performed. The text has a date and time stamp.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
More Information tab	
Priority Breakdown	Displays the computation of the alert priority score.
Additional information	A JSON string that gives more information about the event. The JSON data is supported for String values only, other value types are not supported. You must convert numbers to String values by enclosing them in double quotes. For example, this value is not supported: {"CPU":100 } while this value is supported: {"CPU":"100"}. Another example of a valid JSON string is: {"evtComponent":"Microsoft-Windows-WindowsUpdateClient","evtMessage":"Installation Failure: Windows failed. Error 0x80070490"}. This information can be used for third-party integration or other post-alert processing. Values in the **Additional information** field of an Event that are not in JSON key/value format are normalized to JSON key/value format when the event is processed. For example, assume that the following plain text is in the **Additional information** field "Connection instance is successful". When the event is processed, all this plain text becomes one JSON string and might not be useful within an alert. In the resultant alert, this string is in the **Additional information** field in JSON key/value format, containing the data: {"additional_content": "Connection instance is successful"}.

What to do next

You can respond to the alert in the following ways:

Alert response options

Option	Description
Submit	Save the modifications that were made to the form and return to the **Alerts** list.
Acknowledge the alert.	Click **Acknowledge**. If the alert is reopened, this button reappears so you can reacknowledge the alert.
Create an incident.	Click **Create incident**. For more information, see Create an incident or security incident from an alert.
If Security Incident Response is activated, create a security incident response.	Click **Create Security Incident**.
Designate that the alert is in maintenance.	Select the **Maintenance** check box. For more information, see View all alerts by the maintenance status.
Close the alert.	Click **Close**. For more information, see Close an alert.

Security incidents created from events and alerts

Priority group

For better triage and focus, alerts that have a higher priority are brought to the top of the alert list. This placement brings to your attention those alerts that require you to handle them at a higher priority than other alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The priority group indicates which alerts should be attended to first. Priority is calculated for each open alert and then mapped into one of four priority categories.

Thresholds

Thresholds on the calculated priority are used to determine to which category the alert is mapped to. Alerts with a priority above the value of the *evt_mgmt.top_priority_group_threshold* property are categorized as **Urgent**, which is the highest priority. The default value of this threshold is 1M.

Priority group categories

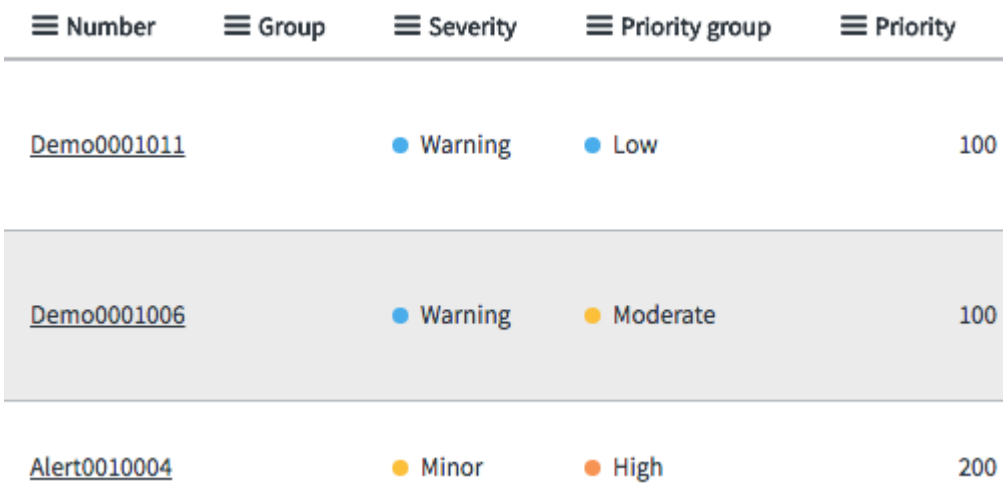
The priority groups into which alerts fall are listed in the following table.

Alert priority groups

Priority group	Icon
Urgent	
High	
Moderate	
Low	

The value of the alert priority group is more meaningful than the alert severity on its own. For example, an alert with a severity of Major, may not be in need of resolution ahead of an alert whose priority is Critical. The combined group priority value takes the weight of each factor into account, giving you a better indication of which alert to attend to first.

The alert priority group is available in alert lists in the Dashboard, Alert Intelligence, and All Alerts page. For example, in the **All Alerts** list, the alert priority group is displayed as depicted in the following image.



Triggers that cause recalculation

Changes to open alerts trigger the recalculation of the priority and then the alert is again categorized into the relevant priority group. Closed alerts are not considered for alert priority group calculation.

Alert execution information

Alert execution information provides a reference to the actions that have been performed concerning the alert. Among the information presented is which alert management rules ran on the alert, incidents that were opened, and which remediation workflows ran.

Alert Executions

In an alert form, the Alert Execution tab shows key related records for the alert. For example, it shows which actions were performed and which alert management rules were run. If an incident was opened, the related tasks are shown.

Alert Executions

Fields in the Alert Executions section

Field	Description
Alert	Reference to the alert that ran under this rule.
Action name	Indicates how the alert was resolved.
Link to execution	Link action that was taken to resolve the alert.
Related task	Link to the incident that was created when the alert was resolved.
Log	Link to the log that details the actions taken to resolve the alert
Automatic run	Indicates if the rule was automatic (true) or manual (false).

Action name

This indicates what occurred, for example, if an incident was created.

Log

The log reveals which alert management rule initiated the action. It shows, for example, automatic execution 1 out 3, or manual execution, 2 out of 4.

View alerts in the flapping state

You can view alerts that are specifically in the flapping state.

Before you begin

Before starting this procedure, ask your administrator to configure alert flapping properties.
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Flapping occurs when the event source continues to generate events even after its associated alert has been closed. Flapping causes the resource's status to repeatedly fluctuate between the *OK* severity and a severity requiring attention, for example, *Critical*.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The frequency of events from an identical source within a given time interval determines whether an alert is in a flapping state or a new issue has occurred. Based on the *evt_mgmt.flap_frequency* and *evt_mgmt.flap_interval* property values:

- If the same issue is recurring, Event Management associates the new event with the existing alert and the state of the alert is set to **Flapping**.
- If the issue occurs after the time interval expires, Event Management creates an alert.

For example, you can respond to an alert by rebooting a problematic server. After no events are generated for several minutes, it is assumed that the issue is fixed and the alert is closed. If the reboot did not actually fix the issue, this server can generate more events later. Then additional alerts are generated for the same issue.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the number of an alert that is in the **Flapping** state.
3. On the alert, click the **Flapping** tab.

Flapping tab on Alert form

Field	Description
Flapping tab	
Flap count	The number of times the alert has flapped—that is, has fluctuated between a closed and a non-closed state—within the flap interval since the start time in the **Flap start window**.
Flap start window	The initial start time to measure the flapping occurrences.
Flap last update time	The last time flapping occurred. This time is the platform processing time, not the source system time.
Flap last state	The state before the alert entered the flapping state.

4. If the **Parent** field is empty, address this alert as a new issue.

Related topics

Configure alert flapping

View all alerts by the maintenance status

The **Maintenance** status indicates that the CI is under maintenance. For example, there is a software upgrade, and the issues can result from that activity, therefore all maintenance alerts are discarded.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

The alert maintenance status can change due to any of these reasons:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- A user selected the **Maintenance** check box on the alert, or selected the alert from the list view, and then clicked the **Maintenance** UI action.
- A new alert that had been bound to a CI whose status is in maintenance status on the CMDB table.
- If all previous events associated with the alert are in maintenance, the alert **Maintenance** field can automatically be set to *true* showing maintenance is in progress. However, if an alert **Maintenance** field is *false* but the related CI status is changed to *In Maintenance* after the alert was created, any subsequent events do not put the alert into maintenance. For example, if an alert is generated for a router and later the router is taken down for maintenance, it is still assumed that there was a problem before maintenance started and the issue must not be ignored.

Note:

- If a maintenance flag was set on an alert in Geneva, after upgrading to Helsinki it affects the impact as a regular alert.
- If an alert is bound to a CI by a user action (such as an alert management rule) and the CI is in the Maintenance state, you must manually bind the CI to the alert and mark it with the **In Maintenance** status.

Procedure

1. Navigate to **All** > **Event Management** > **All alerts**.
2. Review the **Maintenance** column for each alert.
   A value of *true* indicates that the CI is under maintenance.

Note:
If the **Maintenance** field is not visible on the Alert form, personalize the list to add the field. For more information, see Personal lists.

Collaborate from within an alert

You can collaborate with colleagues and write work notes while working in an alert.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
You can select to work either in a compact view of Connect that overlays the standard user interface or in a full-screen workspace. The conversations are not copied into the alert.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the required alert.
3. In the alert screen, click **Follow**.
   The label of the button changes to **Following**, showing the current connection to collaboration status.
4. To view the Connect sidebar in a full window, click the down arrow in the **Follow** button and select **Open Connect Full**.
   You can write text in the **Worknote** field. This text is not copied into the alert.
5. To collaborate with colleagues or with support, click the **Add User** icon.
6. To conclude the Connect collaboration session, click **Following**.

© 2025 ServiceNow, Inc. All rights reserved.

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Create an incident or security incident from an alert

When an alert must be escalated and assigned to someone who can resolve the underlying issue, you can open an incident.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
If Security Incident Response is activated, a security incident can be created.

You can manually create incidents and security incidents from the Alert form. To prevent duplicate tasks, the system checks the conditions of all task templates before creating an incident.

You can customize the created incident using the *EvtMgmtCustomIncidentPopulator.populateFieldsFromAlert* script include. The customization includes mapping fields from the alert to the incident or aborting the incident creation according to customized conditions. For more information, see Custom alert fields.

You can populate incident fields using custom alert fields values that where populated from additional information fields. Use the *EvtMgmtCustomIncidentPopulator* script include to copy the values to the incident after copying the data to the alert. For more information, see Custom alert fields.

Note:
If Security Incident Response is activated, the base system includes an alert action rule called **Create security incidents for critical alerts**. This alert action rule creates security incidents when critical security events are reported.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Click the alert **Number**.
3. To create an incident:
   - To create an incident, click **Quick Incident**.
   - To create a security incident, click **Create Security Incident**. You must install the Security (secops) plugin to enable this option.
4. Click **Update**.

Result
The created incident appears in the **Task** field of the Alert form.

Related topics

Security incidents created from events and alerts

Place an alert into maintenance

You can manually place any alert into maintenance to hide it from the Alerts list and Agent Workspace.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator

About this task
Placing the alert in maintenance does not place the CI into maintenance. The **Status** field on the CI record remains the same.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Perform one of the following actions.

Option	Description
To put multiple alerts into maintenance	Select the check boxes next to each alert, and then click the **Maintenance** UI action at the top of the list.
To put one alert into maintenance	Open the alert, and either select the **Maintenance** check box and click **Update**, or click the **Maintenance** UI action at the top of the list.

Alert insight information

Alert insight aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the selected alert.

Use alert insight to find a solution and help find the root cause of the alert

Results from data analysis provide further information about the alert, beyond that of the alert form. This aids faster alert triage, enabling a quicker way to find a solution and expose the probable root cause of the alert.

Information shown is from repeated alerts, similar alerts, incidents, problems, and change requests on the same CI, similar CIs, and other CIs that are related by CMDB relations or grouping.

Apply a quick response in an alert

In an alert, use the *Quick Response* feature to apply remediation to the alert or to launch a web application.

Before you begin

Role required: evt_mgmt_operator, evt_mgmt_admin

About this task

Quick Response is a feature that enables you to perform a quick action on the selected alert. The action is to apply remediation or to launch an application. If you have upgraded from Istanbul or earlier, this feature is a combination of the **Remediation** and **Launch an application** features.

If you select a remediation link when invoking a Quick Response, a workflow is executed according to the criteria specified in the alert management rule. Click a launch application link to launch the web application that was configured in the alert management rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. In the Alerts list, right-click the required alert and select **Quick Response**.

Launch web application from alert

Monitor service health

On the Operator Workspace, you can view alerts by application services, technical service, and alert group. For services, you can also open a service map to view relationships between CIs in the service.

Before you begin
Ask an administrator to create at least one application services, technical service, or alert group if none of these items exist.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
The Operator Workspace tiles represent a service, alert group, or CI. The tile color represents the overall alert severity.

Note:
Event Management Dashboard is not supported for new instances in the Paris release. However, instances upgraded from a release prior to Orlando that use Event Management Dashboard can continue to do so.

These tile icons are available:

Dashboard tile icons

Icon	Meaning
	Represents the status of a mapped application services.
	Represents the status of an Alert group with a set of corresponding open alerts.
	Represents the status of a dynamic CI group.

Each tile represents the highest severity of an alert for the service, alert group, or CI. For example, a tile appears in red if an alert is critical. A green tile indicates either information alerts or no currently active alerts. As the alert severities change, the tile colors update accordingly. The following severities are available:

- **Red**: critical severity (highest severity). Immediate action is required. The resource is either not functional or critical problems are imminent.
- **Orange**: major severity. Major functionality is severely impaired or performance has degraded.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **Yellow**: minor severity. Partial, non-critical loss of functionality or performance degradation occurred.
- **Blue**: warning severity (lowest severity). Attention is required, even though the resource is still functional.
- **Green**: informational. No severity. An alert is created. The resource is still functional.

Procedure

To integrate with Operational Intelligence, activate the Operational Intelligence (com.snc.sa.metric) plugin.
Follow the steps in the Get started with Metric Intelligence topic. Metrics information appears on the **Metrics** tab in the Service Operations Workspace.

Related topics

View metric values in the Insights Explorer

View discovered service history

The discovered service history shows the frequency of discovered services for a particular time period.

Before you begin
Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task
The discovered services history appears only when there are multiple discovered services that occur over a period. A discovered service is a service that is discovered by Service Mapping. The discovered services history is not available for application services. If no discovered services are generated for a particular service, the discovered services history is hidden.

Procedure
1. Navigate to **All** > **Event Management** > **Service Operations Workspace**.
2. Click a service tile and click **Service Map**.
3. Click the **History map** button.
   The history timeline appears, with changes to the service indicated by a clock icon ( ).

4. To view a map showing changes in the service's severity, click the More icon ( ) and select **Advanced map**.

   The displayed color corresponds to the discovered services severity, and the length of the bar in each color corresponds to how long the discovered services stayed at that severity.

   The following table explains the severity colors:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service severity colors

Severity	Icon color
Critical	Red
Major	Orange
Minor	Yellow
Warning	Blue

5. To change the information that appears on the discovered services history Advanced map, click a history icon.

   - **Calendar icon**: Show information for currently active discovered services.
   - **Hours**: Show information for discovered services that occurred in the past hour.
   - **Days**: Show information for discovered services that occurred in the past 24 hours.
   - **Weeks**: Show information for discovered services that occurred in the past week.
   - **Months**: Show information for discovered services that occurred in the past month.

Monitor alerts for an application services

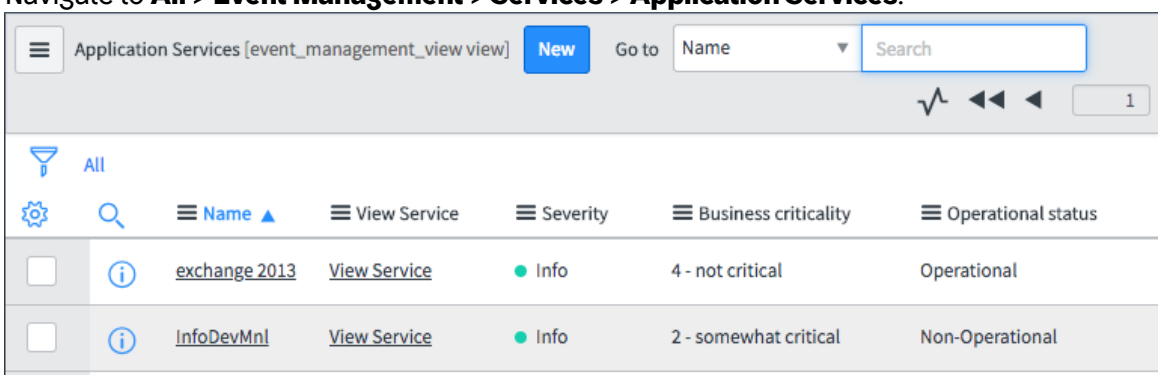
To view information for application services only, navigate to the application services list. From this list, you can open service maps to view and manage alerts for the CIs in each service.

Before you begin

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

Procedure

1. Navigate to **All** > **Event Management** > **Services** > **Application Services**.



2. In the row of the required application services, click **View Map**.
3. Do one or more of the following.

View monitored services

View all services that Event Management supports, such as, alert groups, discovered services, application services, and technical services. According to the type of service, you can view service definition details or drill down into the service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Before you begin

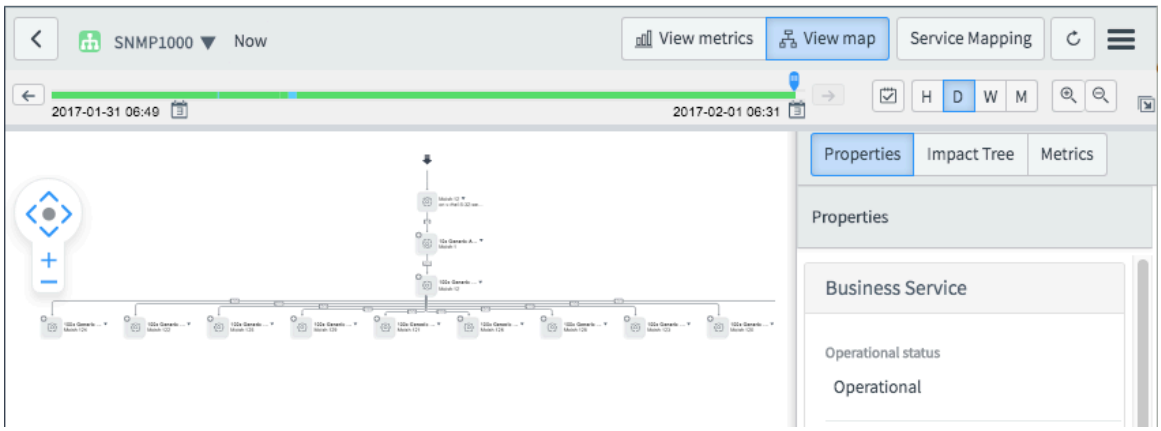
Role required: evt_mgmt_user

Note:
Application services that were created before activating the Event Management plugin are not listed in the in the **View Service** column of the Monitored Services list.

Procedure

1. Navigate to **All** > **Event Management** > **Monitored services**.
2. Click **View Service** to open the view that is relevant to that service.
   When you drill down to the contents of the service, either a map, alert list, or CI list appears according to the type of service.

   For example, if you click **View Service** for SNMP1000, you can drill down to the contents of the service and the related topology map appears.



3. To view service definition details of a service, click the name of the service on the **Monitored services** page.

   For example, in the **Name** column, click SNMP1000 (SNMP1000).

Monitor service health

Use the Event Management overview dashboard

The Event Management overview module uses Performance Analytics to present data from your instance for you to better visualize and understand your processes and drive continual improvement.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

About this task

From the Xanadu release onward, the Event Management overview module has been deprecated and replaced with the AIOps dashboards. The dashboards deprecated include the following:

- Event Management insights
- Event Management scorecards
- Event Management overview

The AIOps dashboards offer comprehensive visualizations of critical operational data. You can monitor key performance indicators (KPIs), track service health, and gain valuable context on the overall IT environment. For more information, see AIOps Dashboards in Service Operations Workspace for ITOM.

Performance Analytics and Reporting

Launch web application from alert

You can launch a web application from an alert that matches the conditions set in an alert action rule.

Before you begin

Create an alert action rule that is configured to prepare a URL when the conditions that you stipulate are met. For example, based on the results when the alert parameters are resolved, this feature can open a Knowledge Base article or construct a URL.

Role required: evt_mgmt_admin, evt_mgmt_operator, or evt_mgmt_user

About this task

Right-click an alert in All Alerts or the Alert list in the Event Management Dashboard (for instances upgraded from a release before Orlando), and choose **Quick Response**. Click the required link to launch the web application that was configured in the alert action rule. For further information, see Migrate an alert action rule to an alert management rule.

Procedure

1. Navigate to **All** > **Event Management** > **All Alerts**.
2. Right-click the required alert and select **Quick Response**.
   A window appears with a list of available web applications that were configured in the alert action rule and the filter that matches the alert. To see the target URL, point to the cursor over the application name.

   Note:
   If one or more of the alert action rule parameters cannot be resolved, the related application name appears in black. When the alert parameters are resolved, then the application name becomes a link.

3. Click the name of an application to open the URL in another tab or window in your browser.

Example:

A common use case is launch in context to the source management system.
Other examples include to search in knowledge bases, not only within ServiceNow, but externally as well. Any URL-based action can utilize the alert parameters and the URLs can refer to wikis, messaging services, REST APIs, and so on.

Event Management Operator Tutorial

As an Event Management operator, your role is to find alerts, analyze them, and take action to help resolve the underlying issue.

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Take the tutorial

Before you can work as an operator, you should take a tutorial to become familiar with several Event Management concepts and understand what operators typically do on a regular basis.

Start the tutorial by clicking the first lesson:

Lesson 1	An overview of events and alerts
Lesson 2	An overview of application services
Lesson 3	Event Management operator workspaces
Lesson 4	What operators do

An overview of alerts for Event Management operators

As an Event Management operator, you need to understand how an alert is generated from an event, what to look for in an alert, and how alerts can be grouped together.

This is the first lesson in the Event Management tutorial.

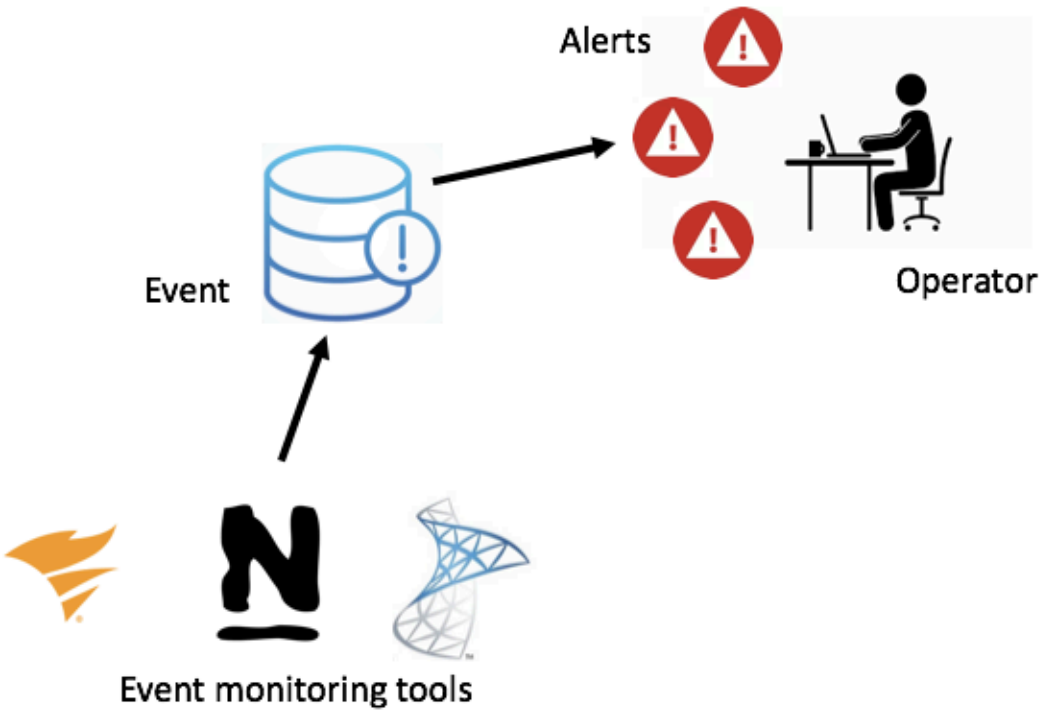
Lesson 1	○	**An overview of events and alerts**
Lesson 2	○	An overview of application services
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

Your organization already has an event monitoring tool in place, such as Microsoft System Center Operations Manager (SCOM), Nagios, SolarWinds, and so on. When an issue occurs on your network, such as a computer going down or a database failure, the event monitoring tools send events to your ServiceNow instance. The Event Management application processes the events

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

according to the settings that your administrator configured, and then generates alerts. An alert is an indicator that the issue requires some type of action.

Alert generation



As an Event Management operator, your role is to view alerts and, depending on how Event Management is implemented in your organization, take an action to help resolve the underlying issue or notify someone who can. Later in this tutorial, you will see the phases of a typical alert management process.

Alert priority and severity

The two most common characteristics of an alert are the priority and the severity.

- The priority of an alert is a score that helps you determine how important the impact is to application services. Multiple factors determine the alert priority score. Your Event Management administrator can configure the algorithm that the Event Management application uses to calculate priority.
- The severity of an alert is an indicator of how serious the underlying issue is. The event monitoring tool in your organization usually sends severity values with the event, which then gets carried over in the alert. These are the default severity types that you will see in this tutorial:

Severity	Description
Critical	The resource is either not functional or critical problems are imminent.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

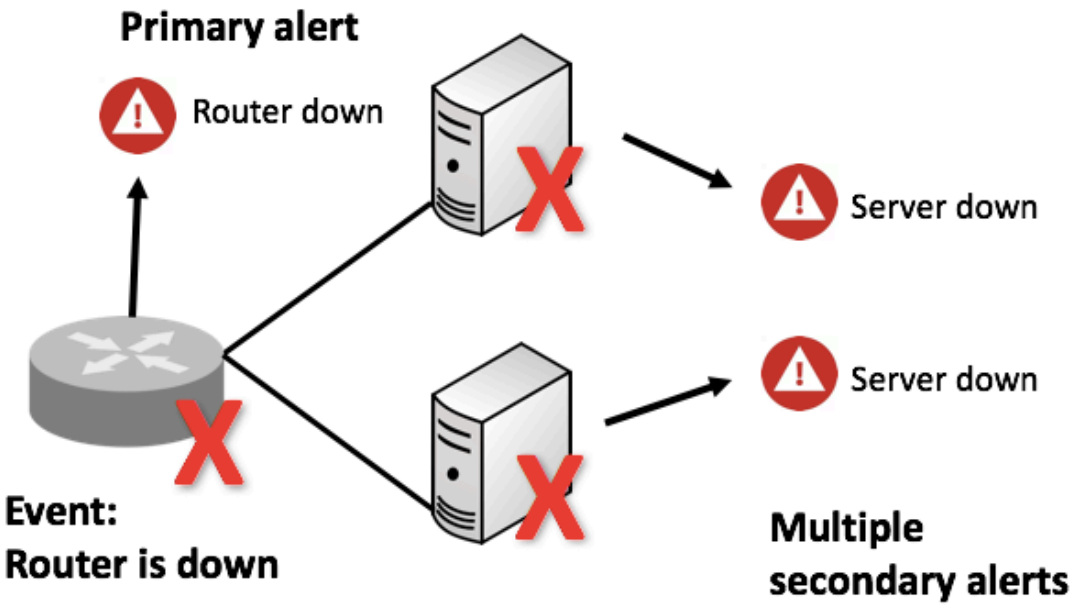
Severity	Description
Major	Major functionality is severely impaired or performance has degraded.
Minor	Partial, non-critical loss of functionality or performance degradation occurred.
Warning	Attention is required, even though the resource is still functional.
OK	No severity. An alert is created. The resource is still functional.
Clear	The alert no longer needs action.

Correlated alerts

Some alerts are related to each other. For example, if a router goes down, several separate alerts could be generated, one for each server connected to the router. All of these alerts are related, or correlated. To help you manage correlated alerts, Event Management can automatically group them and establish a two-level hierarchy with one root alert, called the primary alert, at the top, and other related alerts, called secondary alerts, under the primary alert. When you view alerts, primary alerts stand out by default so you know which alert to focus on without being distracted by the secondary alerts.

In our example, if a router goes down on your network, network communication is also affected for connected servers, assuming they cannot reach any other routers. The router outage becomes the primary alert and the alerts generated on the server are secondary alerts that are correlated under the router alert.

Secondary alert generation



Depending on your organization's Event Management implementation, alerts might be grouped automatically based on correlation rules that your administrator sets up. Your instance can also

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

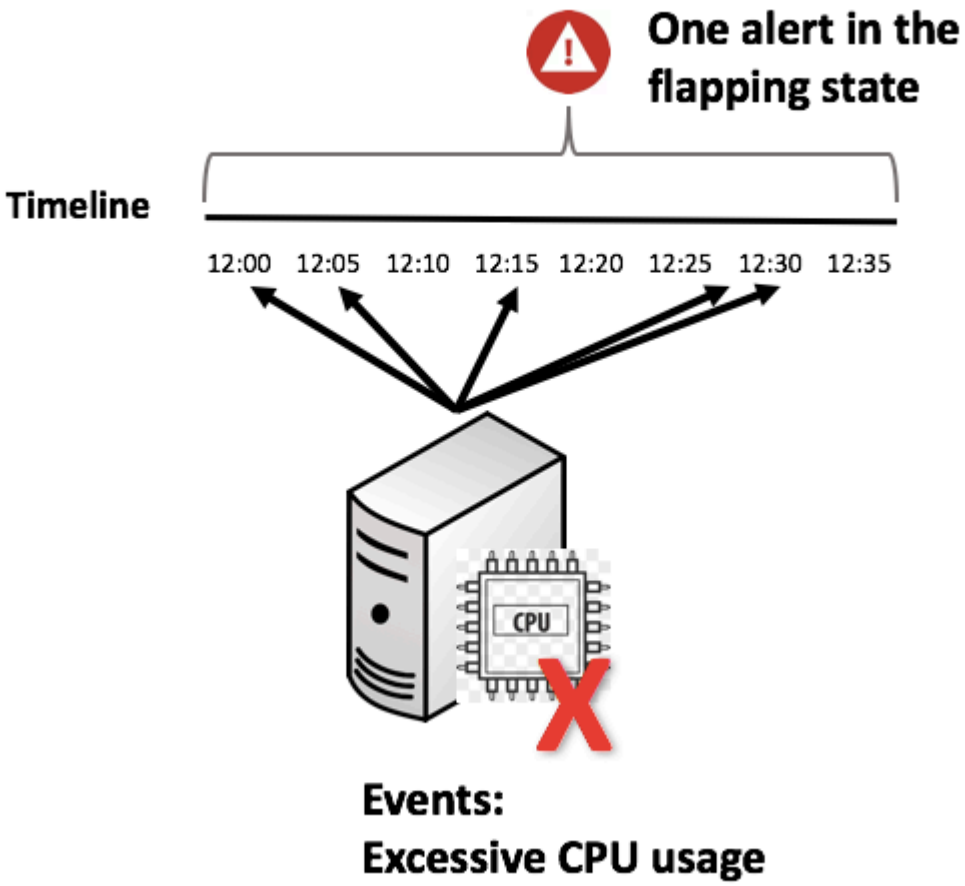
learn how to improve the way it correlates alerts based on these rules. As an operator, you should still verify the accuracy of the correlation and, if necessary, manually correlate additional alerts with the primary alert. Later in the tutorial, you will learn how to do this.

In this tutorial, you will learn how to manually correlate alerts.

Alert flapping

An alert can flap, meaning that it gets multiple open-close events in rapid succession. Flapping indicates that Event Management does not know whether the underlying events are genuine or not. The events could indicate small issues with the way CIs are configured, or larger issues, like network outages.

Alert flapping



For example, if a server that hosts a web service has too many active processes, it might trigger an event about excessive CPU usage. Since CPU usage can fluctuate rapidly depending on web service requests, several events might be triggered, leading to the alert being put in the flapping state. As an operator, you might need to create an incident to have the server restarted, or someone might have to reconfigure the CPU, or possibly make a hardware change on the device.

As another example, consider a loose network cable that causes momentary, repeated network outages. The thresholds that your administrator configures might not be optimal for this kind of alert and Event Management considers it a flapping alert.

Continue the tutorial

Proceed to the next lesson: Application services for Event Management operators.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services for Event Management operators

As an Event Management operator, you need to understand what application services are.

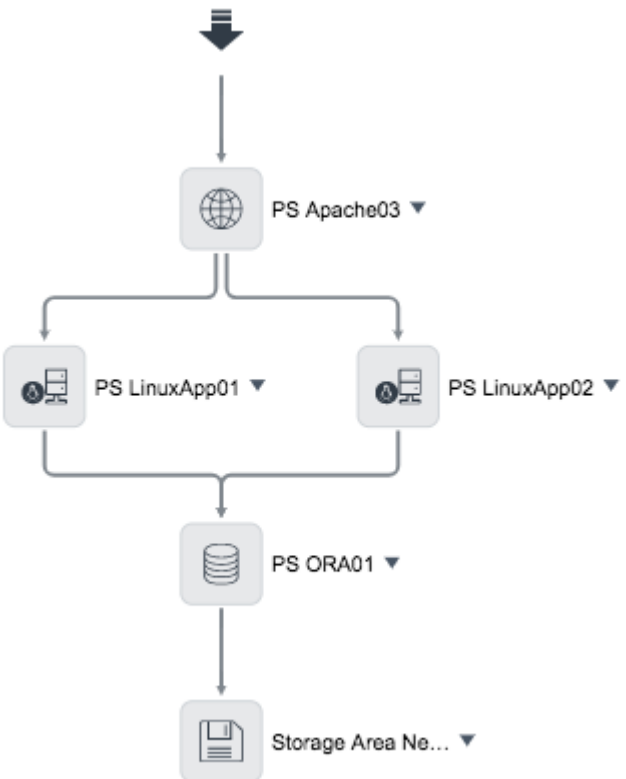
This is the second lesson in the Event Management tutorial.

Lesson 1	✓	An overview of events and alerts
Lesson 2	○	**An overview of application services**
Lesson 3	○	Event Management operator workspaces
Lesson 4	○	What operators do

An application service is a collection of components, such as network devices, computers, and applications that offer a service to your organization. The services can be something like an email system or a website that tracks orders or requests in a database. Your administrator should have already specified the application services in your ServiceNow instance.

Each component that makes up an application service is referred to as a configuration item or CI. This service map provides a visual representation of an application service:

Service map



In this example, you can see a Web Portal application service with these CIs:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- **PS Apache03**: An Apache web server that hosts a company website.
- **PS LinuxApp01** and **PS LinuxApp02**: Two Linux servers that share the workload from the web server.
- **PS ORA01**: A database server that both Linux servers need to access.
- **Storage Area Network 001**: A mass storage device on which the other CIs depend.

You can see service maps like this on the Service Operations Workspace dashboard. Later in this tutorial, you will learn about the dashboard and what an application service looks like when an alert is associated with a CI.

Types of application services

Event Management classifies application services into the following types:

Technical services

A technical service is a dynamic grouping of CIs based on some common criteria. For example, a technical service could be comprised of all web servers or all Oracle databases for a specific location, like North America.

Application services

An application service can consist of discovered services, manual services, or both. A discovered service is an application service that the Service Mapping application finds (if your organization uses Service Mapping). A manual service is an application service that your administrator configures by selecting and adding each CI and specifying the relationships between CIs.

Alert groups

Alerts that are grouped together, either manually or automatically.

Alert impact

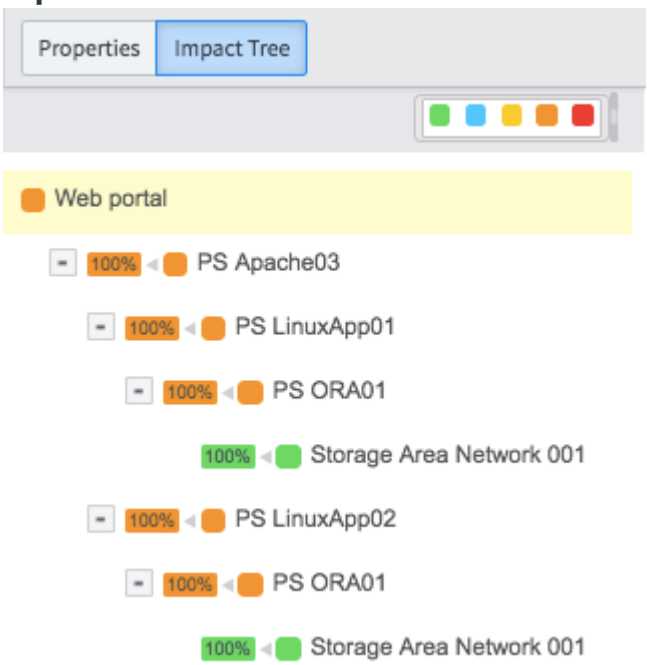
Application services are critical to the operations of your organization. If an issue occurs on one CI, the entire application service can be affected. Part of your role as an operator is to analyze alerts on CIs and see how they impact the application service as a whole, and then take an action to help remediate or solve the underlying issue. Your administrator can configure impact rules that go into calculations for the severity of an alert.

Later, when you learn how to use the Service Operations Workspace dashboard, you will learn how to view an impact tree for an application service so you can understand the relationship between the severity of an alert and the overall application service.

In this example, you can see how a **Major** alert on an Oracle database (**PS ORA01**) also causes a major alert on its parent CIs and on the Web portal application service itself.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Impact tree



Continue the tutorial

Proceed to the next lesson: Event Management operator environment.

Event Management operator environment

As an Event Management operator, your primary work environment is the Service Operations Workspace dashboard.

In this, the third lesson in the Event Management tutorial, you get an overview of your workspaces so you know how to find the information you need.

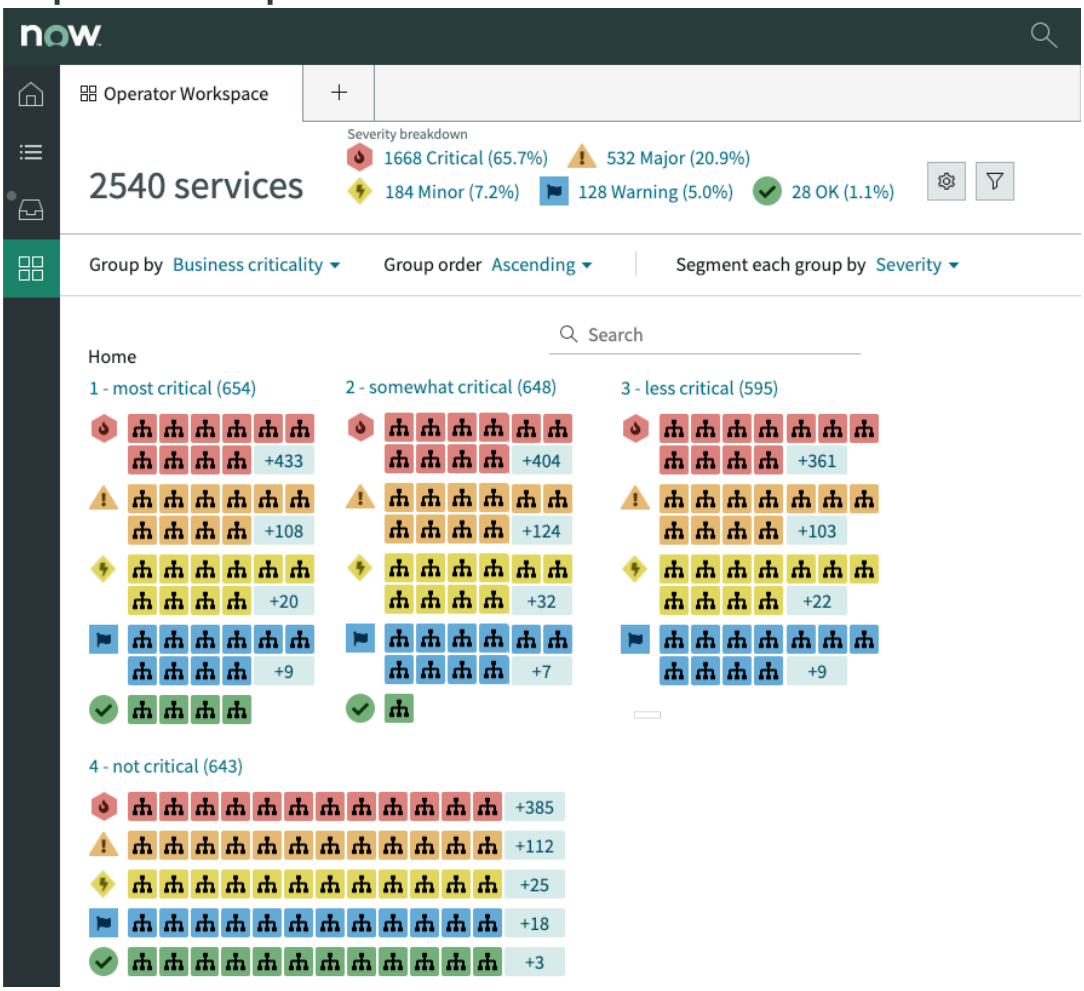
Tutorial lessons		
Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	○	Event Management operator environment
Lesson 4	○	What operators do

The Service Operations Workspace dashboard

Your main area of work is the Service Operations Workspace dashboard, which provides a view that focuses on how alerts relate to application services. From here, you can drill into each application services to see the affected CIs and get an understanding of the overall impact of whatever caused the alert. To open the dashboard, navigate to **Event Management** > **Service Operations Workspace**.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Service Operations Workspace



The main sections of the dashboard are:

Banner

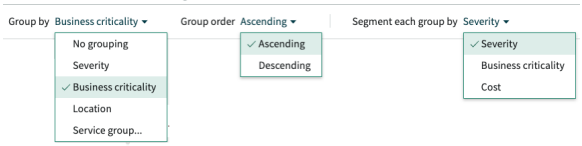
The banner contains controls that show or hide application services based on the criteria you select:

Click a severity level to show or hide application services based on the alerts associated with them.

Use the **Group** and **Segment** controls to organize the view.

Note:
Your administrator assigns an application the criticality and cost value to your application services.

Group and Segment filters

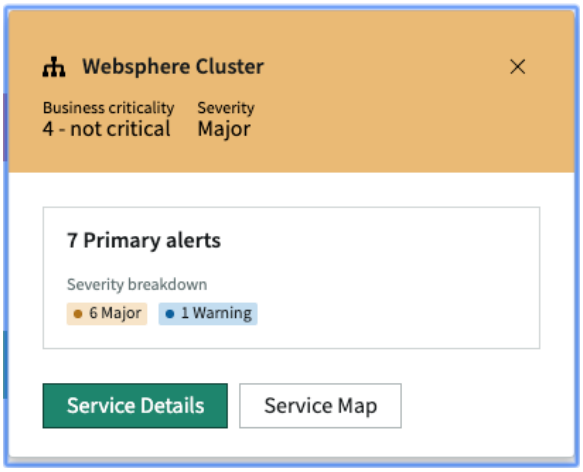


© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Application services

The Service Operations Workspace dashboard displays tiles that represent application services. The color of a tile represents the severity of the alerts that are associated with the application service.

Click a tile to show a summary of alerts associated with the application service. Click to view details or the service map.



Alerts

Click the List icon (

). On the Lists tab, click the kind of alert to view.

You can filter or sort the list to find an alert. Sort by any alert details, such as the **Priority**, which considers multiple factors for how serious the alert is, or the **Severity**, which is value provided by the event monitoring tool.

Open any alert by clicking the number.

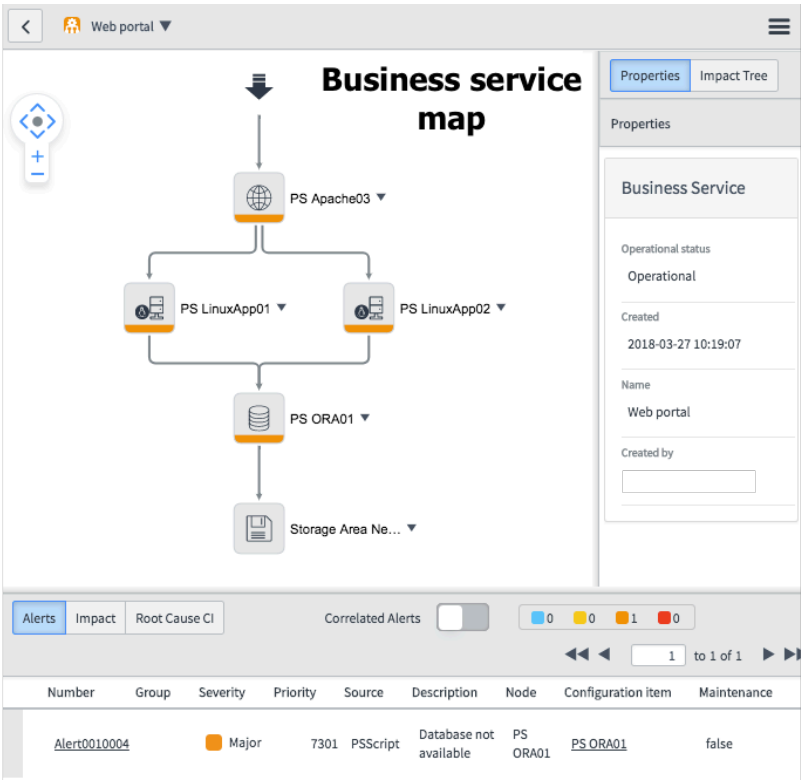
You will learn about what each of the columns means for an alert later on when you analyze an alert.

Application service map views on the Service Operations Workspace dashboard

Double-click the name of an application service tile to open one of the application service map views. The view that you see depends on the type of application service.

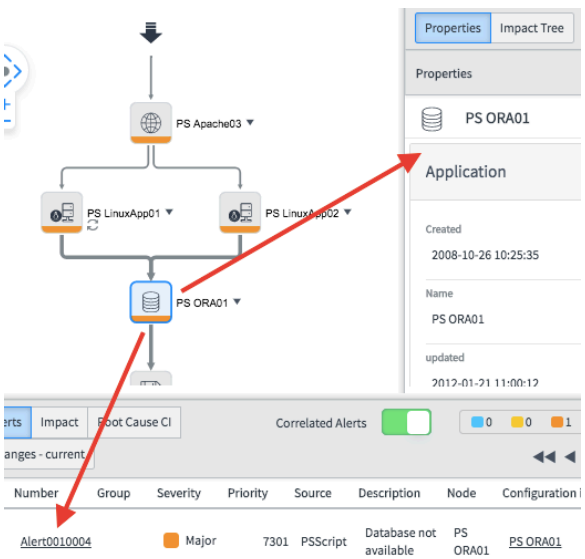
For a manual or standard application service, this view appears:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



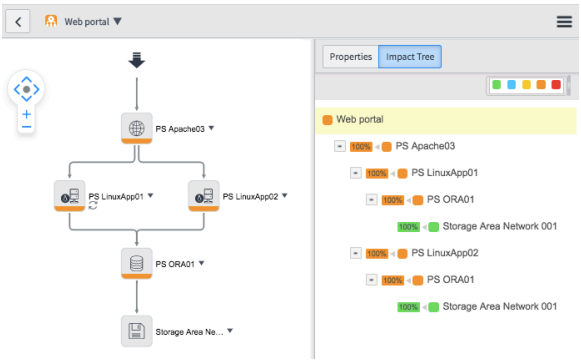
The application service map that you were introduced to in a previous lesson appears in the main panel. This is what you can do from this view:

Click any of the CIs to see the alerts only for that CI and to display the details about that CI in the **Properties** pane.



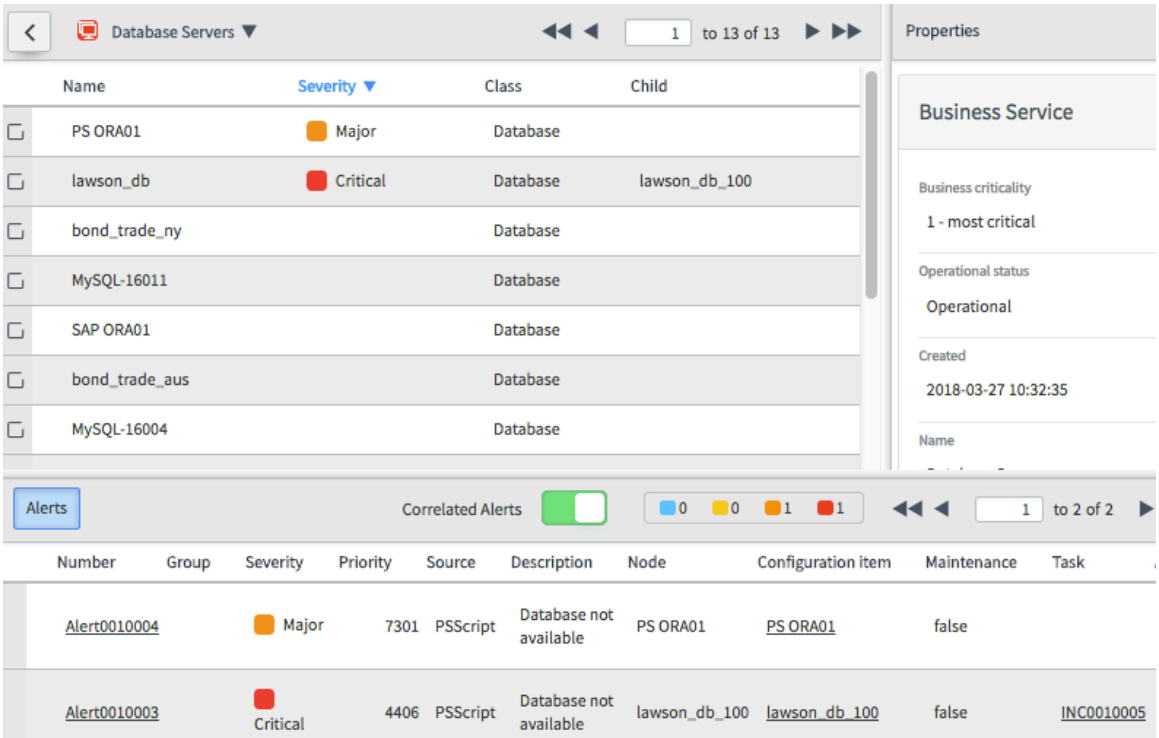
Click **Impact Tree** to see the state of all the CIs and how they affect each other when receiving an alert. You will learn more about the impact tree later on in the tutorial.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



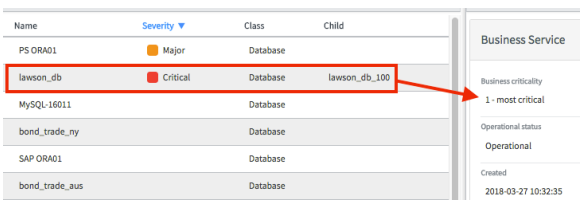
Open any alert from the **Alerts** list at the bottom by clicking the number.

For a technical application service, this view appears:



This is what you can do from this view:

Click any CI to view details about it.



Open any alert from the **Alerts** list at the bottom by clicking the number.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Continue the tutorial

Proceed to the next lesson: What Event Management operators do.

What Event Management operators do

As an Event Management operator, your typical workflow involves three phases: analyzing an alert and its effect on application services, taking some type of action, and making sure the alert is finally closed.

This is the last lesson in the Event Management tutorial. In this lesson, you will run through the three phases of a typical operator day-to-day workflow.

Lesson 1	✓	An overview of events and alerts
Lesson 2	✓	An overview of application services
Lesson 3	✓	Event Management Service Operations Workspace
Lesson 4	○	**What operators do**

Your organization will have specific policies and procedures that may differ from the phases outlined in this topic. In addition, your administrator might have customized the Event Management application so that some of these phases are automated and do not actually require any action on your part.

For the purposes of this tutorial, we will walk you through each phase and allow you to perform the tasks manually.

Phase 1	Analyze and acknowledge an alert	In this phase, you will find an alert to work on, analyze the details, and acknowledge it so that other operators know it is a legitimate alert.
Phase 2	Triage an alert	In this phase, you take an action to help remediate the issue that caused the alert. The most common action to take is to create an incident and assign it to someone who can solve the underlying issue.
Phase 3	Close an alert	In this phase, you will verify that the alert is resolved, and then close the alert.

Start here

Start out by learning how to Analyze and acknowledge an alert.

Operator phase 1: Analyze and acknowledge an alert

As an Event Management operator, the first thing you should do is access alerts and then find the ones you want to focus on. You can open the Alert form to analyze the details, and then

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

acknowledge it to let other operators know that the issue causing the alert should be addressed in some way.

Before you begin

Phase 1	◯	**Analyze and acknowledge an alert**
Phase 2	◯	Triage alerts
Phase 3	◯	Close an alert

You must understand both of your operator environments: the Service Operations Workspace dashboard and Service Operations Workspace. Review Event Management operator environment if you have not already done so. This tutorial uses the Service Operations Workspace dashboard.

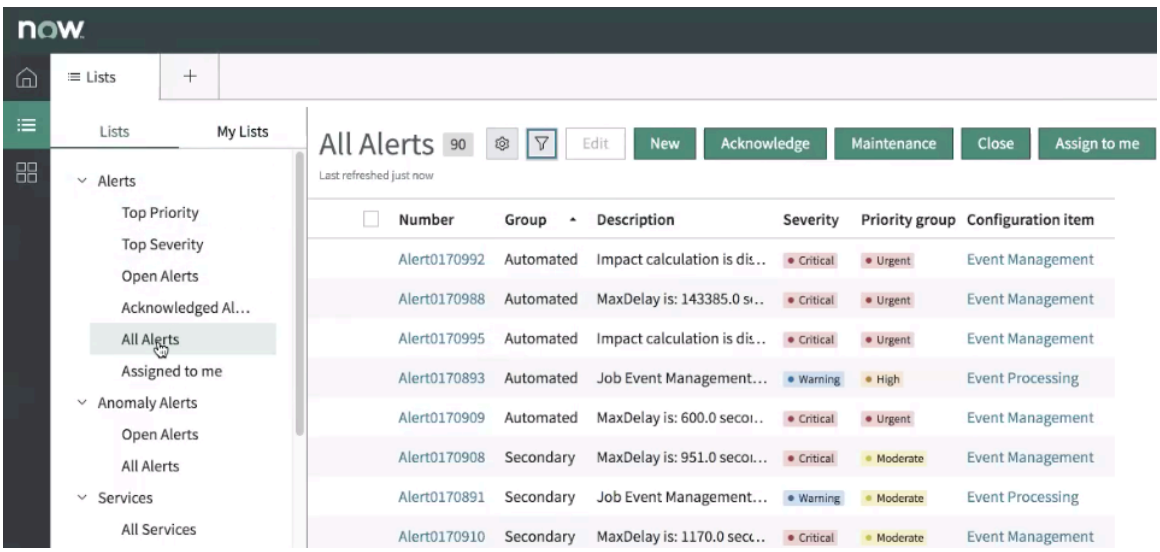
Role required: evt_mgmt_operator

Procedure

1. Navigate to **Event Management** > **Workspaces** > **Service Operations Workspace**.

   In the list, click **Alerts** > **All Alerts**. By default, all alerts appear in the list sorted by **Group**. Click any heading to sort by that value. To view current filter settings, click the filter icon

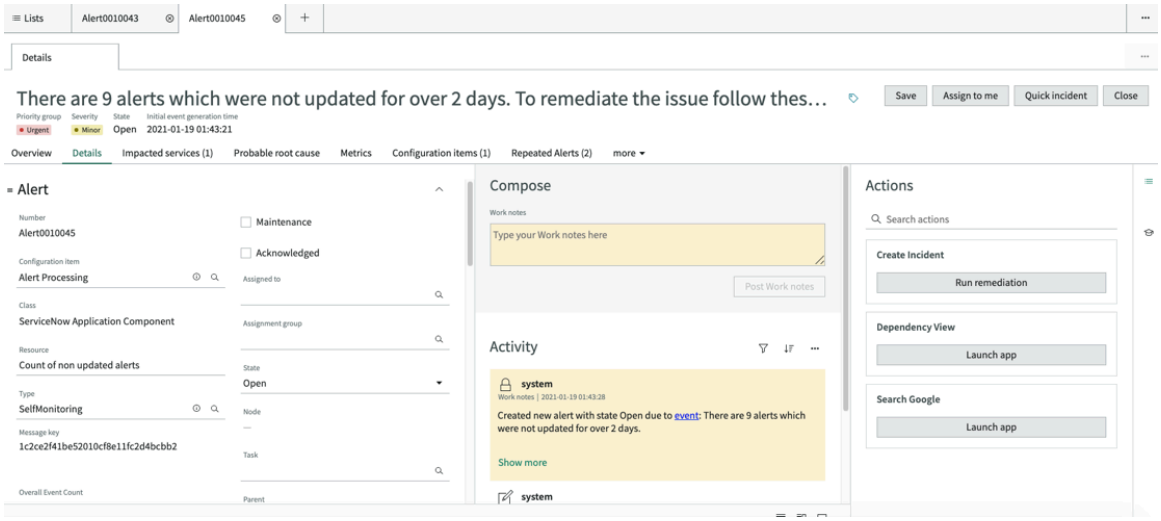
   . To modify filter settings, click **Advanced view**.



2. Find the alerts to focus on by clicking **Application Services** > **Services**, or by using any of the filtering and sorting options.
3. Click an alert name to open the **Details** tab for the alert.

   Example
   The important fields on the form and related items are described after the screenshot.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



Fields on the Alert Details tab for an alert that is associated with a single CI

Field	Description
Number	The automatically generated alert number that you saw in the list of alerts on the Service Operations Workspace dashboard.
Node	The name of the CI with which the alert is associated. The event that generated the alert occurred on this CI. You might see a computer name, or an IP address or MAC address of a device.
Resource	The object on the node that caused the event. You might see values like the name of a hard disk, a CPU, or the name of a process or a service. You can add information to this field if necessary.
Configuration item	The CI in the CMDB to which this alert applies. If the **Node** field is filled in but this field is empty, and if you know which CI the node represents, you can enter the CI in this field to manually associate the alert with it. **Note:** Your administrator can configure rules that automatically bind CIs to an alert, usually based on what is in the **Node** field. However, it is possible that the system is unable to find the correct CI to bind the alert to. In this case, you might need to manually select a CI. For the purposes of this tutorial, we assume that the correct CI is bound to the alert. When an alert contains a CI, the **Overview** tab opens when selecting the alert.
Task	Any existing task that is associated with the alert, such as an incident, change request, or problem, is shown in this field. When you first look at an alert, this field is blank. You can associate a task when you triage the alert. You associate an incident to an alert and assign the incident to someone at a later stage in this tutorial.
Description	A description of the alert that came from the alert monitoring software in your organization. You can add information if necessary.
Severity	Severity value for the alert:

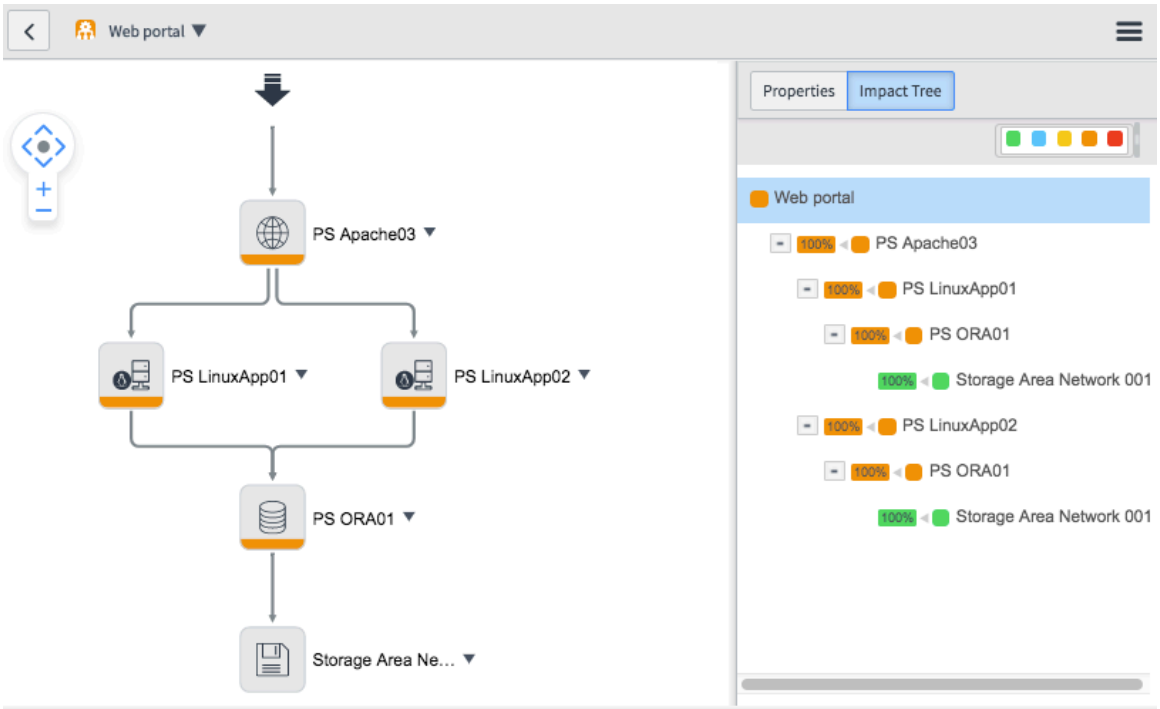
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	○ Critical: Immediate action is required. Either the resource is not functional or critical problems are imminent. ○ Major: Major functionality is severely impaired or performance has degraded. ○ Minor: There is a partial, non-critical loss of functionality, or performance has degraded. ○ Warning: Attention is required even though the resource is still functional. ○ Info: An informational message. An alert is created, but the resource is still functional. ○ Clear or Resolved: No action is required. An alert is not created from this event. Existing alerts are closed.
State	The processing state that the alert is in. A newly generated alert is in the **Open** state. Other states are: ○ **Reopen** indicates that a previously closed alert is open again, and it requires your attention. ○ **Flapping** indicates that the alert is receiving a high frequency of identical events from the same source, which can cause many alerts to re-open even after it is closed. ○ **Closed** indicates that the alert is closed and does not require any further action. You will close an alert as part of the last stage in this tutorial.
Maintenance	Indicates that the alert does not need to be worked on and is hidden from the list of alerts in the Service Operations Workspace dashboard. In this example, we do not want to put the alert in maintenance.
Acknowledged	Indicates that an operator verified that the alert is genuine and is triaging it. You acknowledge the alert at a later stage in this topic. Your Event Management administrator can also have alerts automatically acknowledged immediately after they are generated. If this is the case, the **Acknowledge** check box on the Alert form might already be selected.
Parent	Displays a value only for secondary alerts. The value indicates the alert number of the parent alert. The field is empty for primary alerts (alerts with no parent alert).
Knowledge article	Any existing knowledge base (KB) article that is associated with the alert. When you first open an alert, this field is blank. You can associate a KB article when you triage the alert.

4. Click the **Impacted Services** tab and then click the service name.
   Before you acknowledge the alert, you might want to learn more about the services that are affected due to the service that is the source of the alert.

   The service opens and displays the **Details** tab. Click **Service Map** to view the map of related application services.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



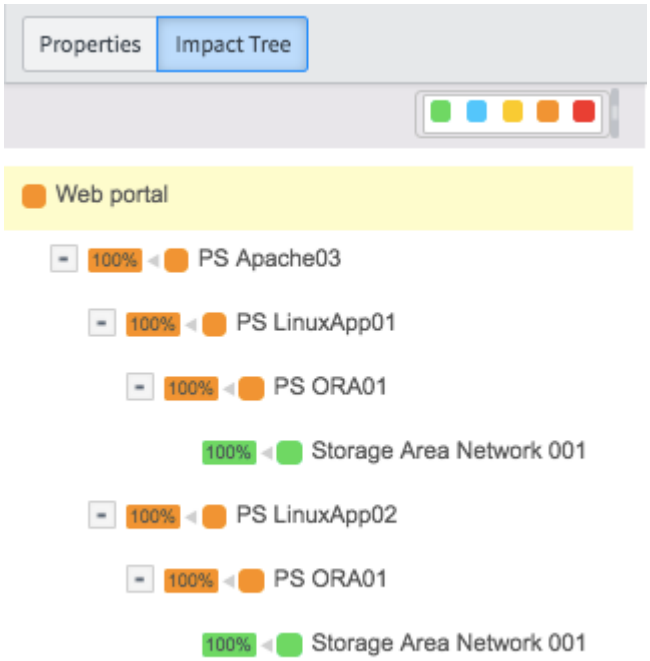
Notice that the major severity indicator in orange is displayed on several CIs. It starts with the Oracle database (**PS ORA01**) and propagates up to all CIs that depend on the database. From this, you can surmise that the alert with the highest level of severity on the Oracle database indicates the root cause of the issue.

This does not necessarily mean that the system generated separate alerts for each CI, but it is possible. When you triage an alert, you can determine whether alerts on other CIs should be correlated under a primary alert.

5. Click the **Impact Tree** tab and review the impacts on each CI.

   The percentages next to each CI in the impact tree show you the effect on each CI. In this example, each CI is impacted 100% by the alert, which means the underlying issue that led to the alert is serious enough to impact the functionality of the application service.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

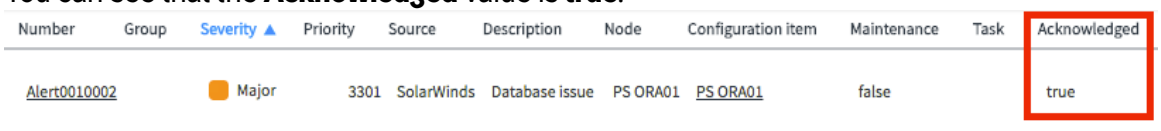


6. Acknowledge the alert.

   Acknowledging an alert does not assign it to you, nor does it create a task like an incident or change request. It simply lets other operators know that you are aware of the issue. After you acknowledge an alert, you will take further action during the triage stage.

Option	Description
Acknowledge a single alert	With this process, you can acknowledge only the alert that you are viewing. **a.** Open the Alert Details form as described earlier. **b.** Select the **Acknowledged** check box.
Acknowledge one or more alerts	With this process, you can acknowledge one alert or multiple related alerts. **a.** Open the list of alerts as described earlier. **b.** Select each alert to acknowledge. **c.** Click **Acknowledge**.

7. Navigate back and look for the alert that you acknowledged.
   You can see that the **Acknowledged** value is **true**.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	Acknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false		true

What to do next

Go to Operator phase 2: Triage an alert.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Operator phase 2: Triage an alert

After you analyze and acknowledge an alert, you must triage it. The triage phase involves verifying alert correlation and taking an action to help resolve the issue that caused the alert. This topic covers the most common triage task: creating an incident from an alert.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

Role required: evt_mgmt_operator

Procedure

1. Before you start to work on the alert, check whether other alerts should be correlated with the one you just reviewed:

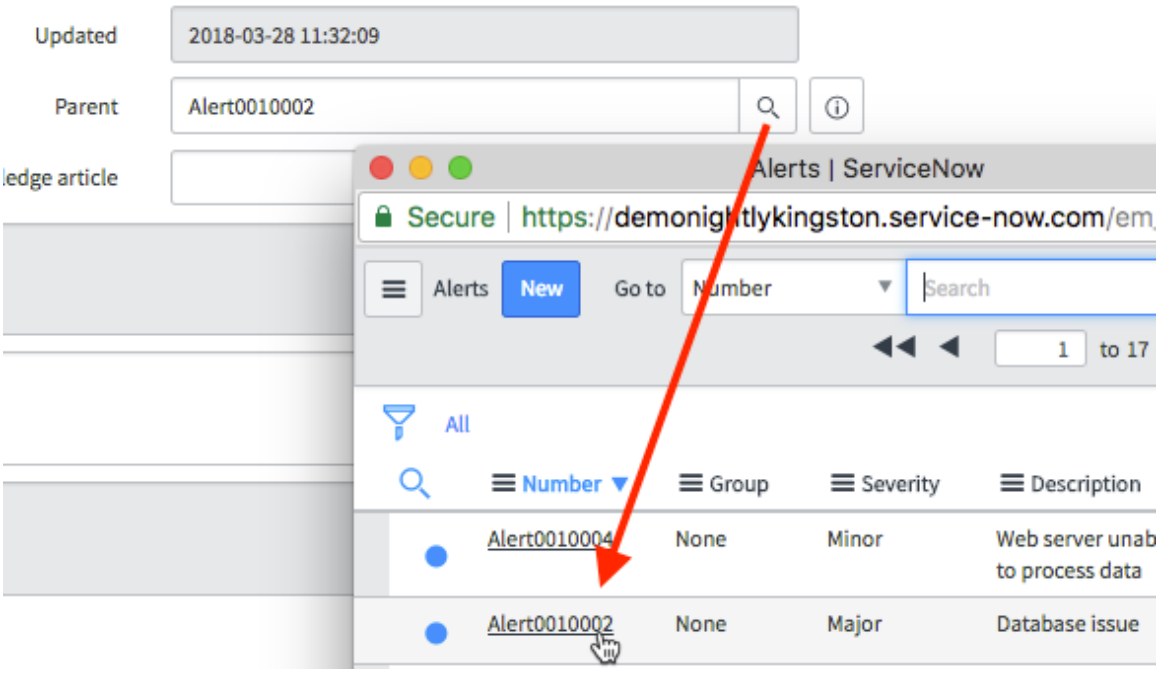
   a. Navigate to **Event Management** > **Service Operations Workspace**.

   b. Click the same application service tile and review the alerts in the **Alerts** list.

   c. If multiple alerts are present, open one to determine if it is related to the other alert, or if the underlying issue is the same in both alerts.
   For example, if an alert is associated with a web server and there is already an alert for the database issue, correlate the web server alert as a secondary alert with the database alert as the primary alert.

   d. Open the secondary alert, click the lookup icon ( ) in the **Parent** field, and then select the primary alert.
   This creates a primary (parent) / secondary (child) relationship between the two alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



e. Repeat this process to correlate as many secondary alerts as necessary.

f. Navigate back to the Service Operations Workspace dashboard and verify that the primary alert displays an icon in the **Group** column.

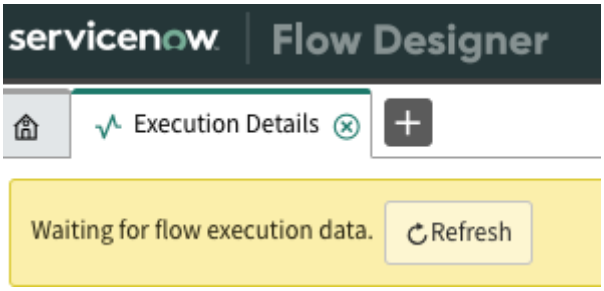
Note:
Your administrator can set up rules that let the system automatically correlate alerts so that you do not need to do so manually. In that case, a **Feedback** field appears on the Alert form. Select **Yes** if the system correlated the alert correlated correctly, or **No** if not. Currently, the feedback option is available but does not trigger further actions after being logged.

2. Open the primary alert.

3. On the Alert form, click **Actions** > **Create Incident**.
If your organization uses Security Incident Response, the button is **Create Security incident**.

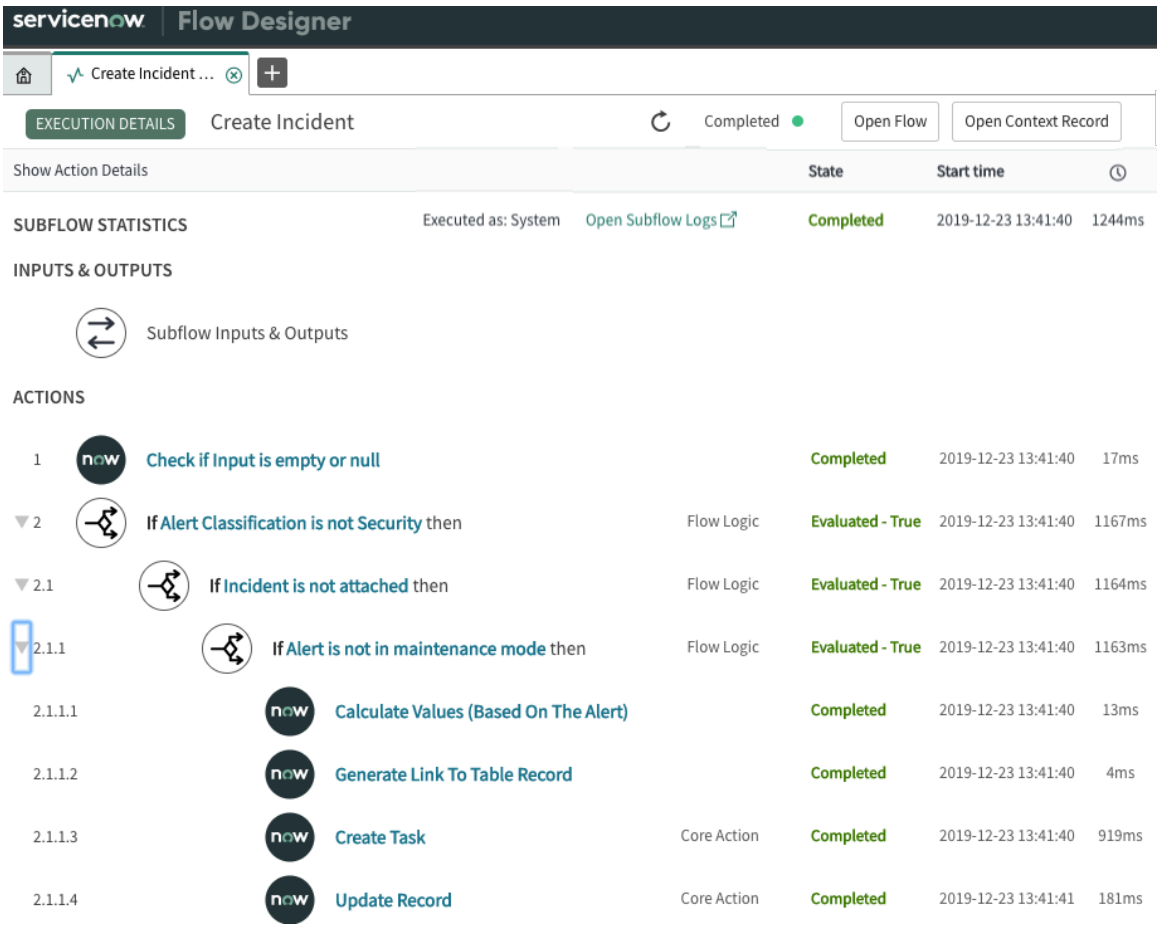
The Flow Designer opens.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



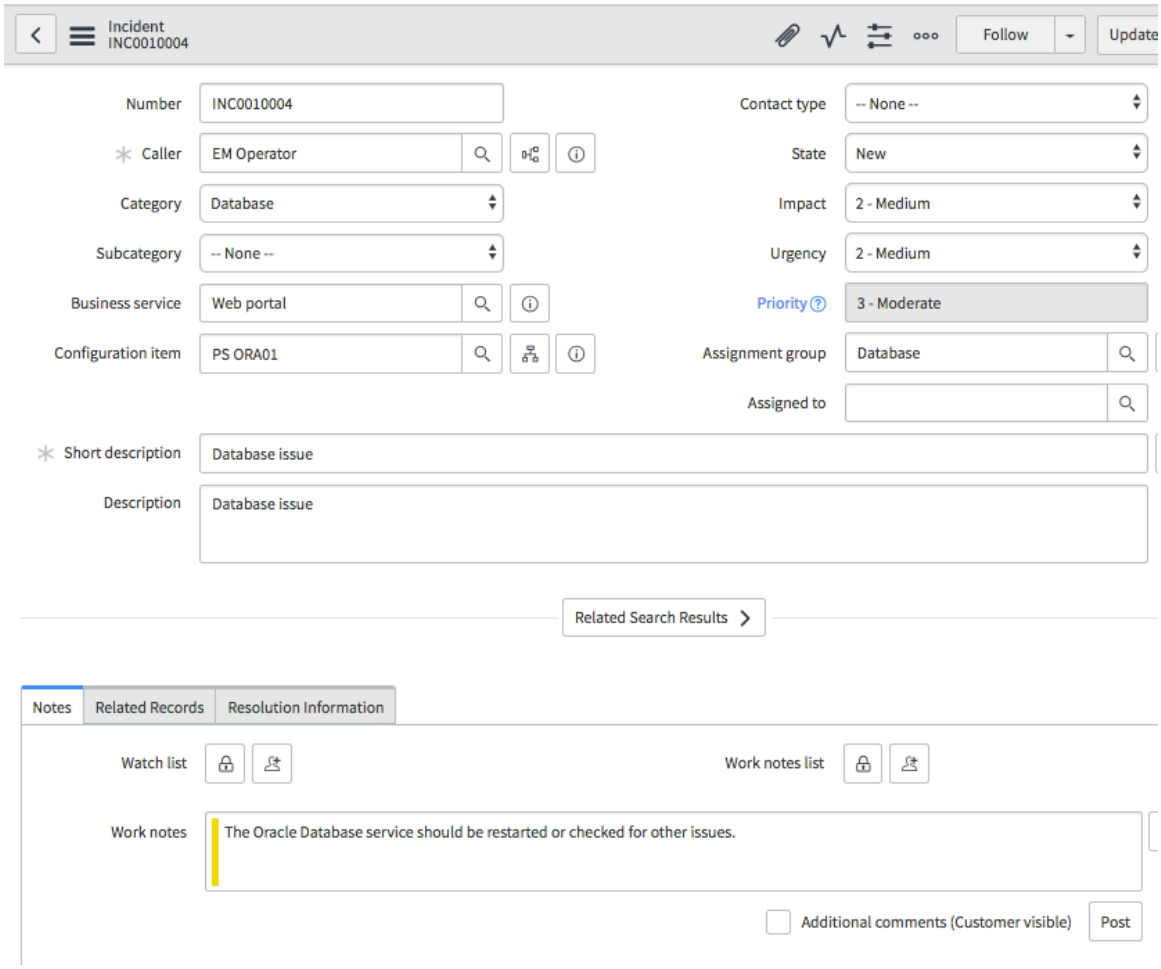
4. Click **Refresh**.

   The **Execution Details** page opens.



5. Click **Open Context Record** and then fill in the Incident form.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

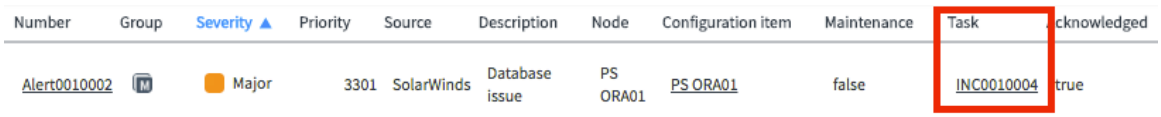


Field	Description
Caller	Click the lookup icon ( ) and then select your name. The caller is the person who discovered the issue that led to the incident.
Category and Subcategory	Select a category that best describes this alert. In this example, **Database** is the best choice.
Application service	Select the application service to which the CI belongs. In this example, the application service is **Web portal**.
Configuration item	If it is not already populated, select the CI. In this example, the Oracle database (**PS ORA01**) is automatically populated into the field.
Impact and Urgency	Select the impact and urgency levels that you think appropriate.
Assignment group Assigned to	Click the lookup icons ( ) for both or either of these fields, and then select the group or the individual that can handle the issue.

6. Click **Submit** to create the incident.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The Alert you are working on reappears. On the Alert form, the incident is populated in the **Task** field. You can also see the incident number in the Task column on the Service Operations Workspace dashboard.



Number	Group	Severity ▲	Priority	Source	Description	Node	Configuration item	Maintenance	Task	cknowledged
Alert0010002		Major	3301	SolarWinds	Database issue	PS ORA01	PS ORA01	false	INC0010004	true

What to do next

There are other tasks you perform as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Run a remediation workflow on an alert

As an Event Management operator, you can also run a workflow on your ServiceNow instance that helps remediate the alert. For example, you might run a workflow that automatically restarts a server on your network, which might resolve an alert about CPU usage.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

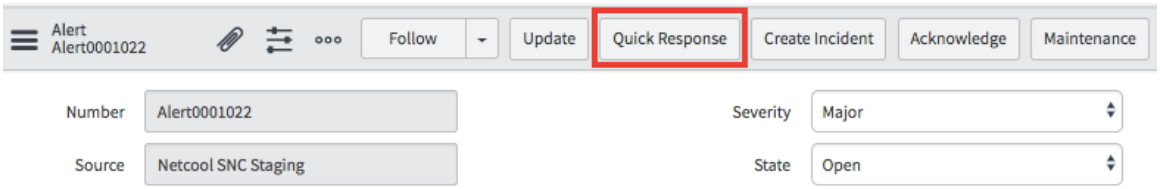
Note:
You can run a remediation workflow if your administrator already set up workflows for you to choose from. You should be familiar with your organization's policies regarding triaging of alerts.

Role required: evt_mgmt_operator

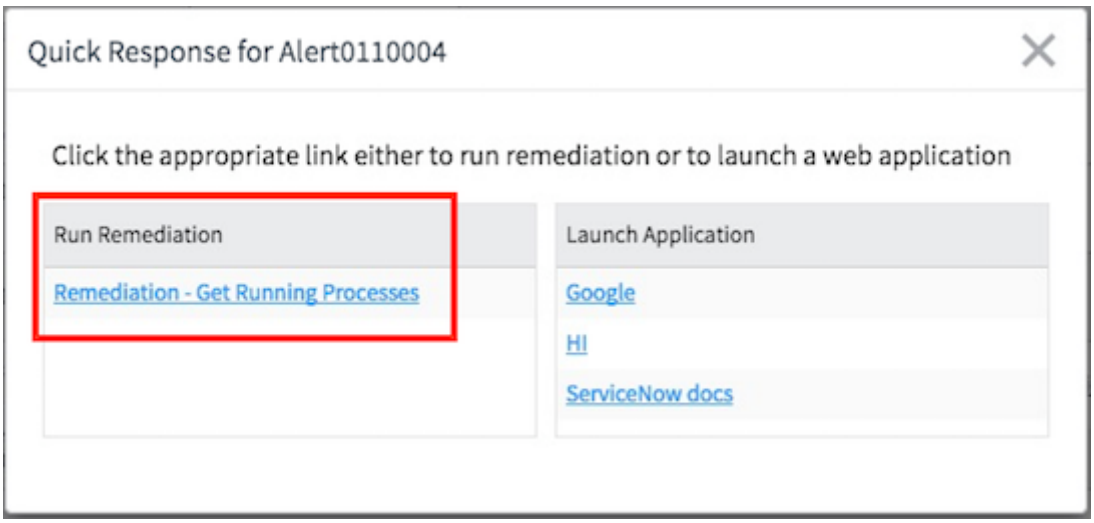
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the remediation under **Run Remediation**.



What to do next

There are also other tasks you can take as part of the triage stage:

- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Launch a web application from an alert

As an Event Management operator, you can also launch a web application from an alert. The web application might be a console for the event monitoring tool that your organization uses, or any external website that provides additional information you might need about the alert.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**
Phase 3	○	Close an alert

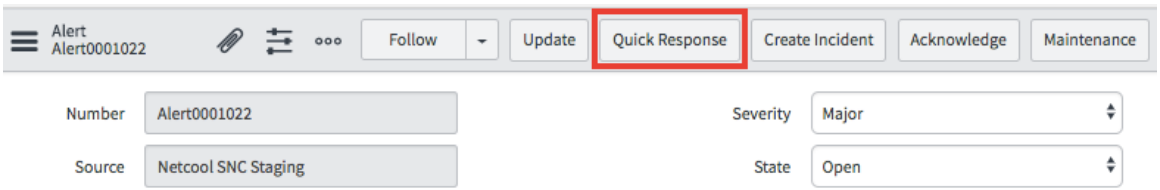
Role required: evt_mgmt_operator

You can launch a web application if your administrator has set up a link to the application. You should be familiar with your organization's policies on triaging alerts.

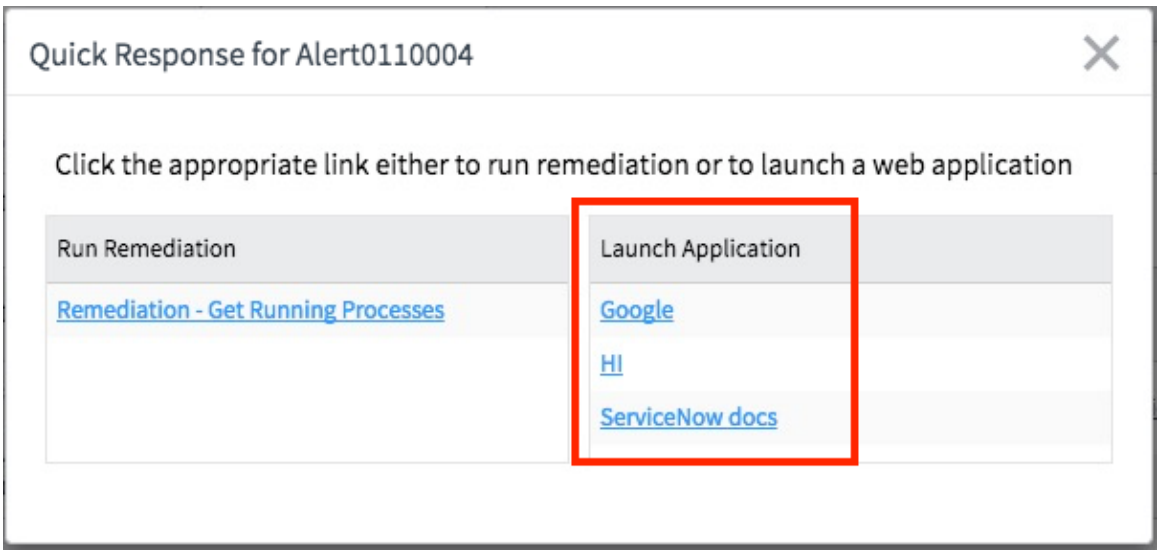
About this task

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click **Quick Response**.



3. In the Quick Response window, click the name of the application under **Launch Application**. Your administrator has specified which applications should appear in the list.



What to do next

There are also other tasks you can take as part of the triage stage:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Associate a knowledge base article with an alert

As an Event Management operator, you can associate a knowledge base (KB) article with the alert to capture additional information about the alert. This might include a procedure that someone has to follow to resolve the underlying issue on your network, or a best practice to prevent the issue from reoccurring.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1		Analyze and acknowledge an alert
Phase 2		**Triage alerts**
Phase 3		Close an alert

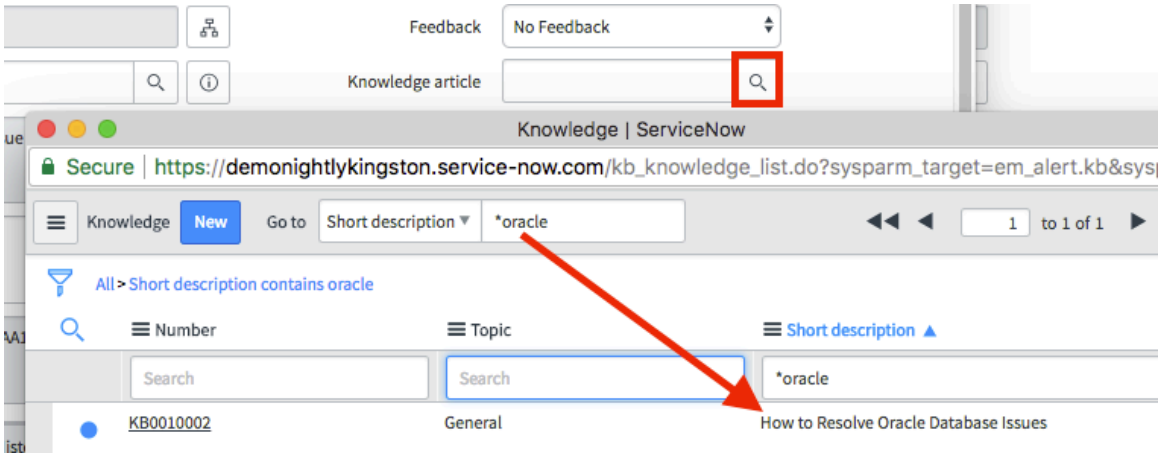
This task assumes that your organization uses the Knowledge Base application in your ServiceNow instance.

Role required: evt_mgmt_operator

Procedure

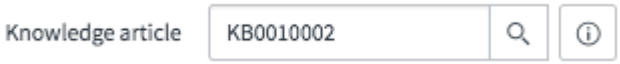
1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. On the Alert form, click the lookup icon ( ) next to the **Knowledge article** field.
3. Filter the list of existing KB articles by first selecting a field, such as **Short Description**, and then entering related text into the search text field.
   You can use the `contains` (*) operator to search for articles that contain keywords. For example, entering `*oracle` in the short description filters the KB articles that contain the word `oracle` somewhere in the short description.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. If you cannot find any related KB articles, you can click **New**, create a new one, and then click **Submit**.

   The KB article number appears in the **Knowledge article** field on the Alert form.



5. Click **Update** on the Alert form to save the information.

What to do next

There are also other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Put an alert into maintenance to temporarily hide it from the Service Operations Workspace dashboard if the alert does not require action at this time.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Put an alert into maintenance

As an Event Management operator, you can put an alert into maintenance if the alert does not require any further action, but you still want to keep the alert active. Putting the alert into maintenance hides it from the Service Operations Workspace dashboard so that other operators do not need to access it, but it does not close the alert.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	✓	Analyze and acknowledge an alert
Phase 2	○	**Triage alerts**

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 3	Close an alert

Role required: evt_mgmt_operator

Procedure

1. From the Service Operations Workspace dashboard, open the alert that you acknowledged in Phase 1: Analyze and acknowledge an alert.
2. Select the **Maintenance** check box and click **Update**, or click the **Maintenance** button at the top of the list.
3. Click **Update**.
4. Navigate to **Event Management** > **Operators Workspace**.

   Notice that alerts in maintenance are not visible in the list by default. The filter excludes alerts where `Maintenance | = | true`.

What to do next

If the issue that led to the alert still needs further attention later, navigate to **Event Management** > **All Alerts**, open the alert, and then clear the **Maintenance** check box and click **Update**. From there you can perform other triage actions.

There are other tasks you can take as part of the triage stage:

- Run a remediation workflow on an alert if your Event Management administrator already set up a workflow in your ServiceNow instance and your policies allow you to trigger it from the alert.
- Launch a web application from an alert to open a website or an event monitoring tool that provides more information about the alert.
- Associate a knowledge base article with an alert if there is existing information about the alert that might help resolve the underlying issue.

If you do not need to perform any other triage actions, proceed to Phase 3: Close an alert.

Operator phase 3: Close an alert

After you take action on an alert, you can verify several items on the alert and then close it.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Phase 1	Analyze and acknowledge an alert

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Phase 2		Triage alerts
Phase 3		**Close an alert**

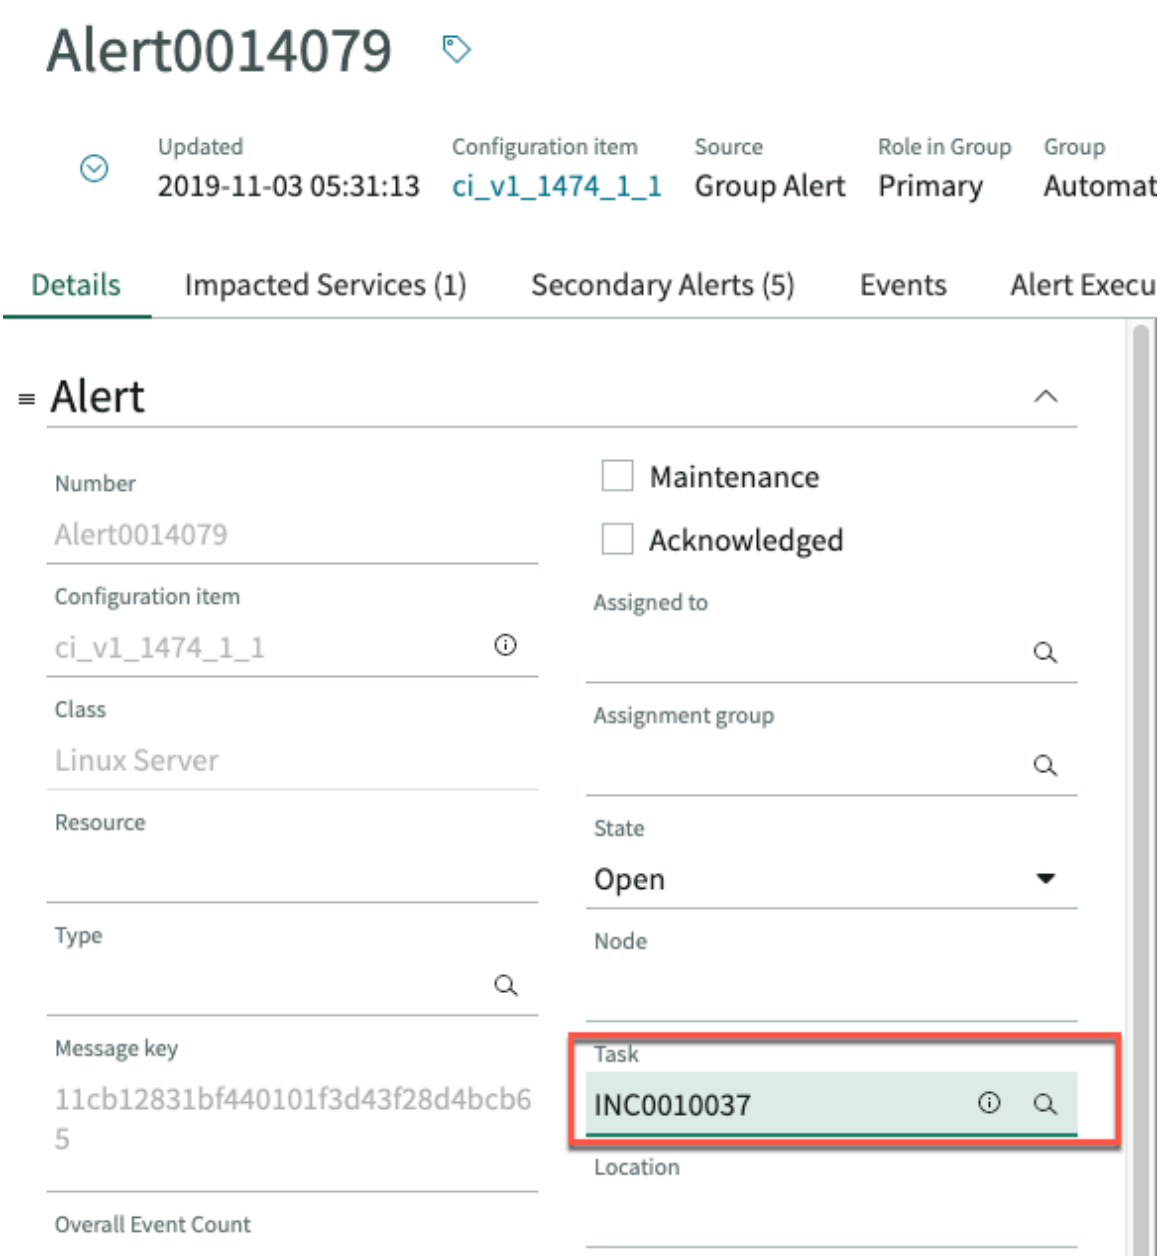
Role required: evt_mgmt_operator

About this task

Procedure

1. Navigate to **Workspace Experience** > **Workspaces** > **Service Operations Workspace**.
2. Find the alert you want to close.
   If the alert does not appear in the list, for example because it is in maintenance, change the filter options as needed.
3. Click the alert number to open the Alert Details tab and review key information about the alert.

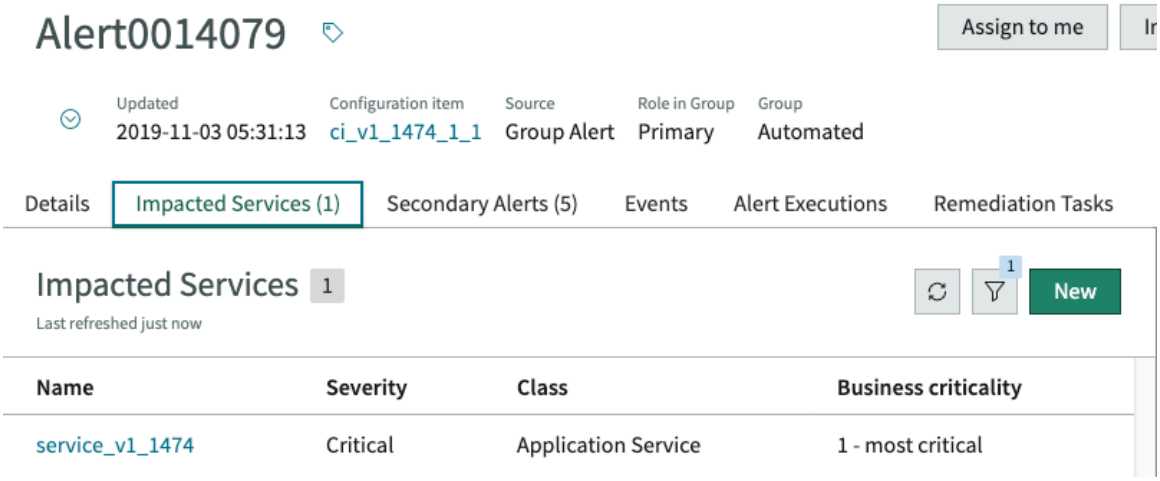
© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



4. Review information about application services on the **Impacted Services** tab.

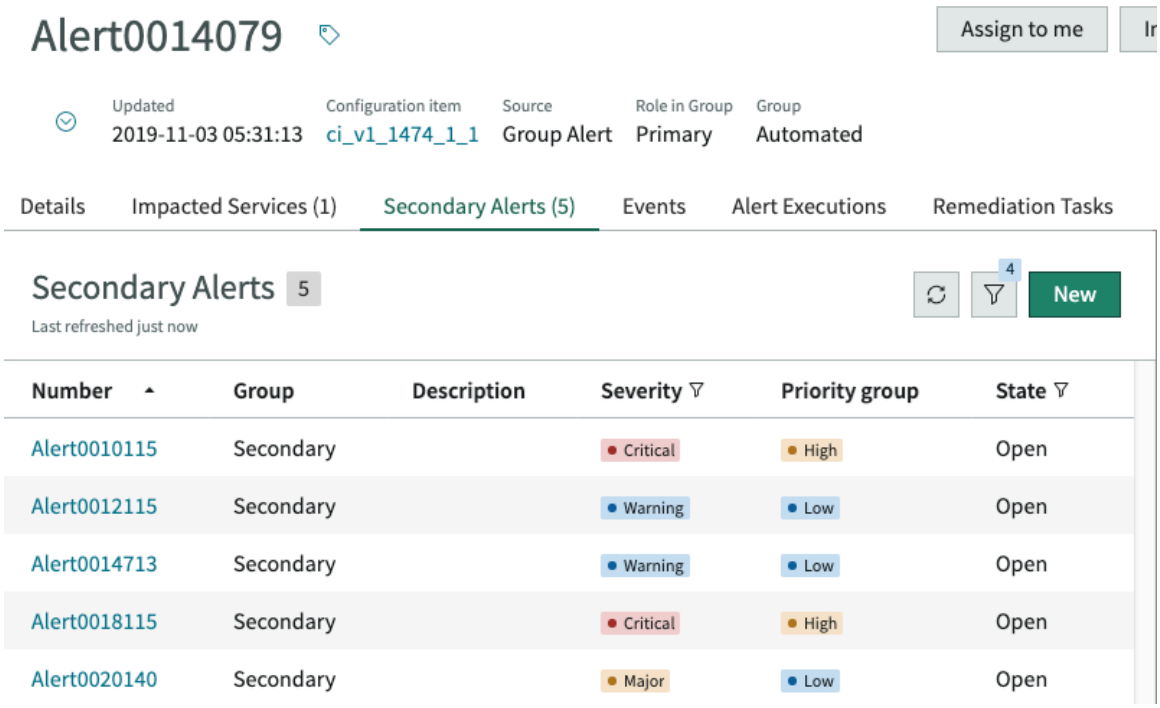
   In this example, the service_1474 application service appears in the list.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



If you need more information about an application service and want to see the service map, click the service name and then click **Service Map**.

5. Look at the alerts related to this application service, and modify the correlation if necessary. The process for a primary alert differs from the process for a secondary alert.
   - On a primary alert, the secondary alerts that are correlated with the primary appear on the **Secondary Alerts** tab.



Typically, you do not have to do anything with the secondary alerts unless you want to add more secondary alerts or remove the correlation altogether.

Note:
When you close a primary alert, the secondary alerts are also closed by default.

   - On a secondary alert:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The alert number of the primary alert appears in the **Parent** field. You do not have to do anything with the parent alert, unless you want to re-correlate this secondary alert with another primary alert, or remove the correlation altogether by clearing the field.

Note:
When you close a secondary alert, the primary alert is not closed. You must close the primary alert separately.

6. When you are sure the underlying issue causing the event and corresponding alert has been rectified, click **Close**.
   If you think that the alert needs attention, do not close it. Instead, put it into maintenance by selecting the **Maintenance** checkbox.

What to do next

You are finished with the Event Management Operator tutorial, which covers a basic workflow of analyzing alerts, triaging them, and closing them out.

After you close an alert, you might need to follow up on these items:

Reopen an alert

If you think an alert requires further action, you can manually change its state to **Reopen**. When an alert reopens, any associated incidents can also be updated or reopened according to the incident state and the rules that your administrator configured.

Note:
Any time you reopen an alert, always go through the triage and close phases again.

Work with alerts in the flapping state

In some cases, the same event that created the alert you just closed could be triggered again, even repeatedly, in a short amount of time. If this occurs, the **State** of the alert that you just closed changes to **Reopen**, and eventually to **Flapping** depending on settings that your administrator configures.

See Handle alerts in the flapping state for more information on what to look for.

For a summary of other tasks that you might need to perform at some time, see Advanced tasks for the Event Management operator.

Advanced tasks for the Event Management operator

As an Event Management operator, you might need to perform additional tasks that are outside of your typical workflow, or tasks that you need to perform only once.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Advanced task	Description
Customize your alert list view	Get to the alerts you need to analyze as soon as possible.
Work with flapping alerts	If an alert is in the flapping state, it means that the underlying issue keep reoccurring. You should triage the alert again and look for another solution.
Handle alerts while CIs are in maintenance	Learn how to handle alerts on a CI that is in the maintenance state, which means it is undergoing some type of change.
Adjust alert impact while triaging an alert	You can change impact rules, which affects how alert impact is calculated and alert severity.

Customize your alert list view

You can create one or more customized alert list views that show only the information pertinent to you. For example, you might want to focus only on the alerts for application services in a specific location, or only the alerts for application services of high criticality.

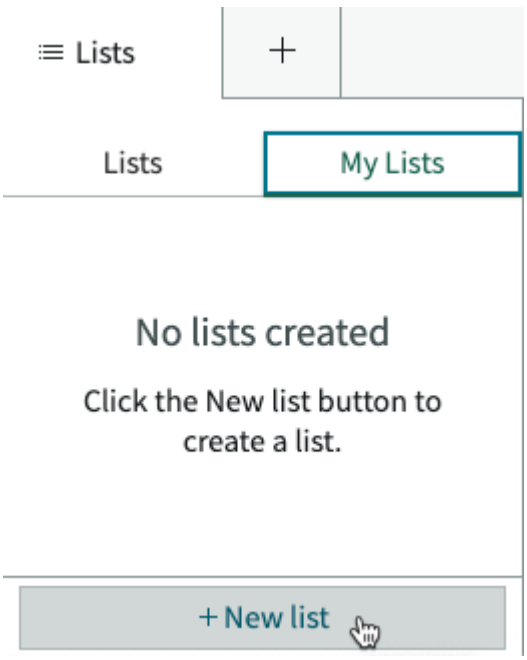
Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

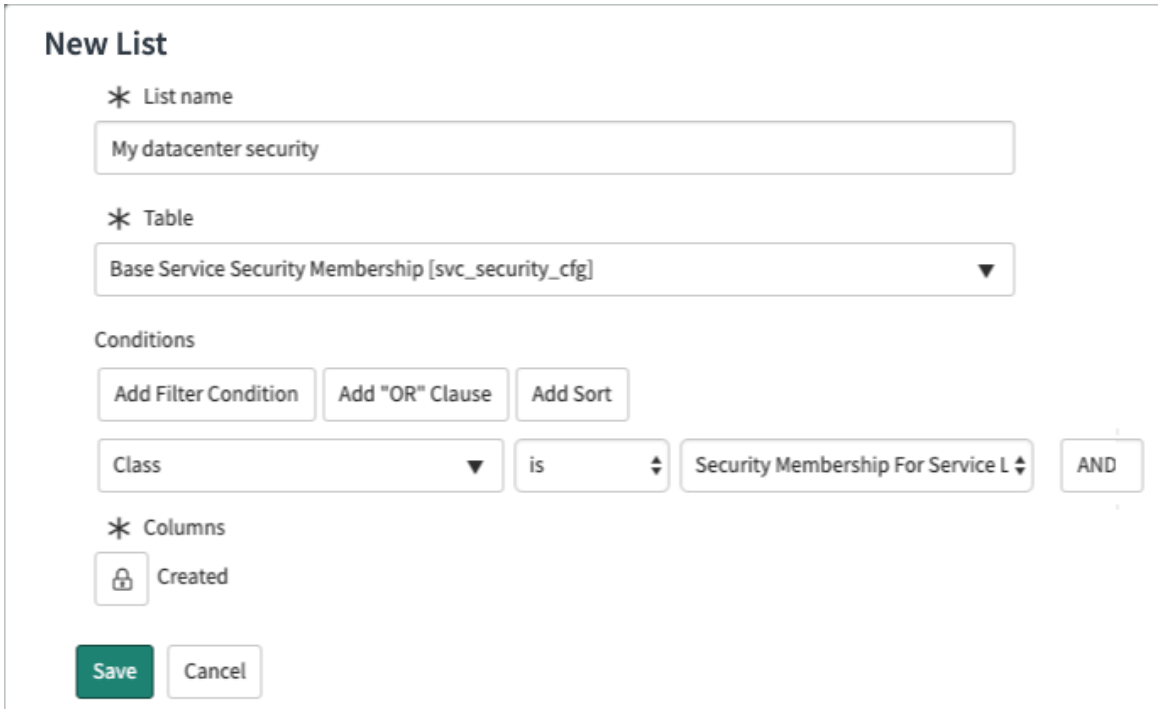
Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. On the **Lists** tab, click **My Lists**.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. Click **+ New list**, fill in the form with name and filter conditions, and then click **Save**.



The list appears on the **My Lists** tab.

Note:
The list applies only to application services, and not to application service groups. The groups appear whether or not they match the filter, and whether or not they contain any services that match the filter.

Work with flapping alerts

If an alert is in the flapping state, you might need to triage the alert again.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

If an event repeatedly triggers the same alert in a short amount of time, the alert is put into the flapping state, even if an operator closed it previously. The event can also be fluctuating between severity levels, such as Info and Critical. You should triage the alert again, and take action to try to prevent the event from reoccurring.

Note:
Your Event Management administrator can configure several settings that determine when to mark an alert as flapping, and other settings that determine what action you can take. This topic covers a generic example.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Procedure

1. Find alerts in the flapping state:
   a. Navigate to **Event Management** > **Operators Workspace**.
   b. Modify the list of alerts by clicking the filter icon ( ) and specifying criteria to find flapping alerts.
   Click **Advanced view** to modify filter settings. For example, you can specify:
   `State|is|Flapping`.
2. Click the alert number to open it.
3. On the alert, click the **Flapping** tab and review the information:

Field	Description
Flap count	The number of times the alert started flapping since the time in the **Flap start window** field.
Flap start window	The time that flapping started.
Flap last update time	The last time flapping occurred. This time is the instance processing time, not the source system time.
Flap last state	The state of the alert before it entered the flapping state.

4. Decide which action to take based on how often flapping has occurred.
   You can do any of the following, depending on what your organization's standard operating procedures are and what your Event Management administrator configured:
   - Run a remediation workflow that might do something like reboot a server or reset a router.
   - Access a web application, like the application for your event monitoring software on your network.
   - Modify an associated incident or a KB article to include additional information or steps.
5. After you are certain that the underlying issue is addressed, close the alert.

Handle alerts while CIs are in maintenance

When an alert occurs on a CI that is in the maintenance state, the alert state is also changed to maintenance. You should find and monitor the states of these alerts. Later, when changes on the CI are complete, finish triaging the alert and close it.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Before completing this task, familiarize yourself with basic form configuration in an instance. You might need to add fields and related lists to forms.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

The example in this topic assumes that a network administrator opened a change request to reconfigure a problematic web server.

Role required: evt_mgmt_operator

Procedure

1. Find alerts in maintenance:

   a. Navigate to **Event Management** > **Operators Workspace**.

   b. Click the filter icon ( ) and in the Filter box, click **Advanced view** and specify:

   `State|is|Maintenance`.

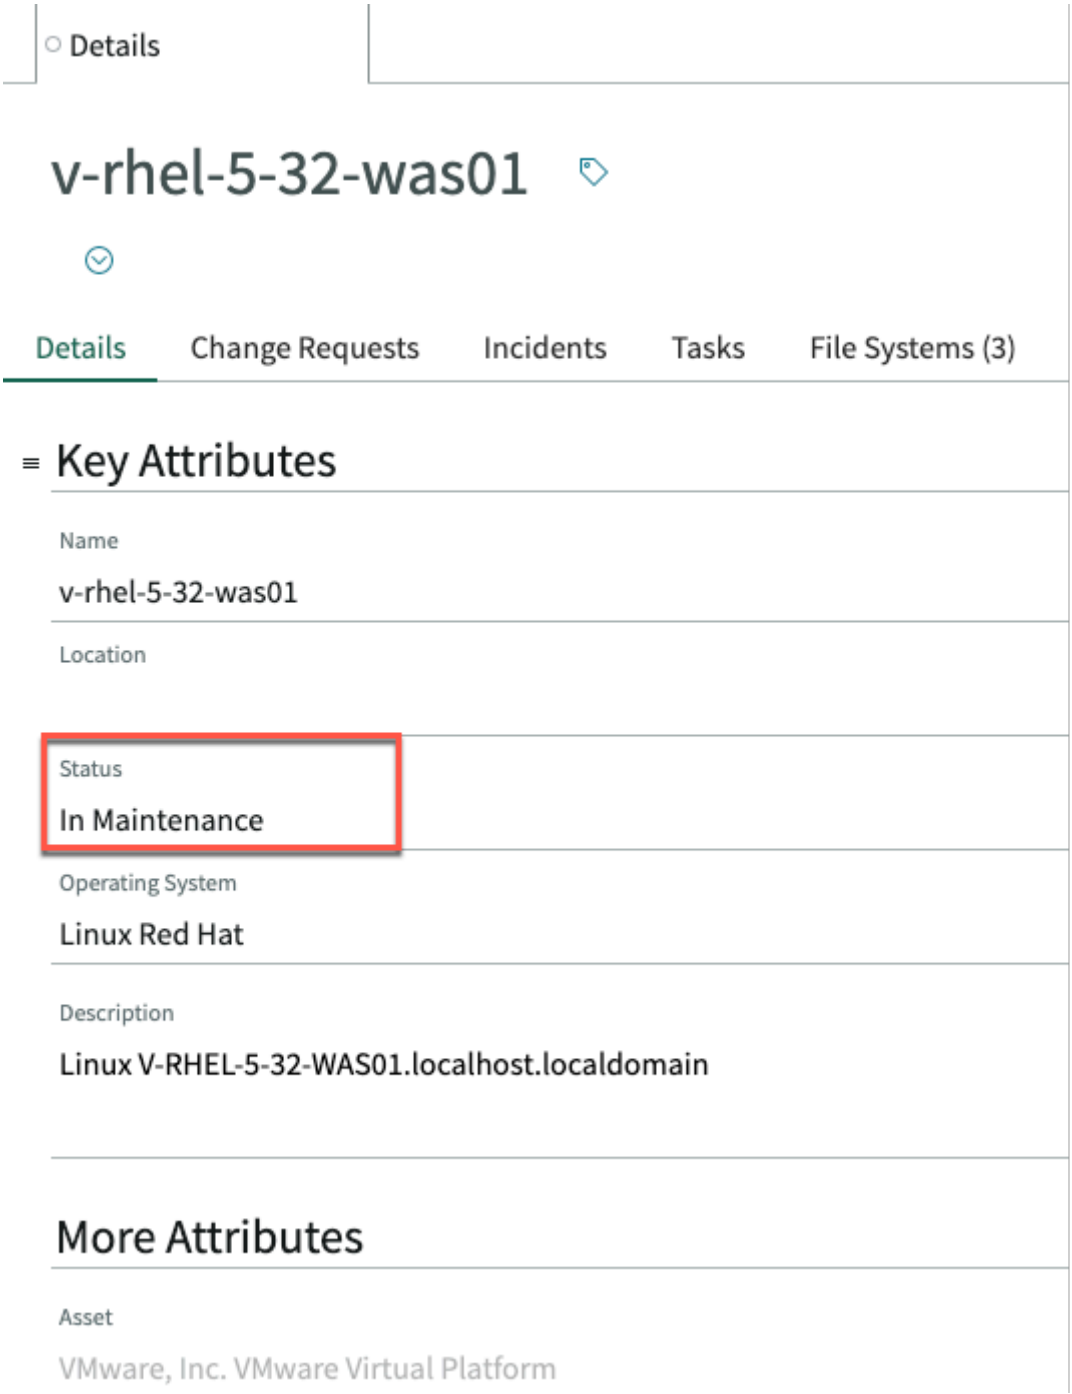
2. In the list of alerts, find an alert with a value in the **Configuration Item** column.
   This is the CI on which the alert occurred.
3. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the web server is **In Maintenance** and there is a change request scheduled so that someone can reconfigure it.

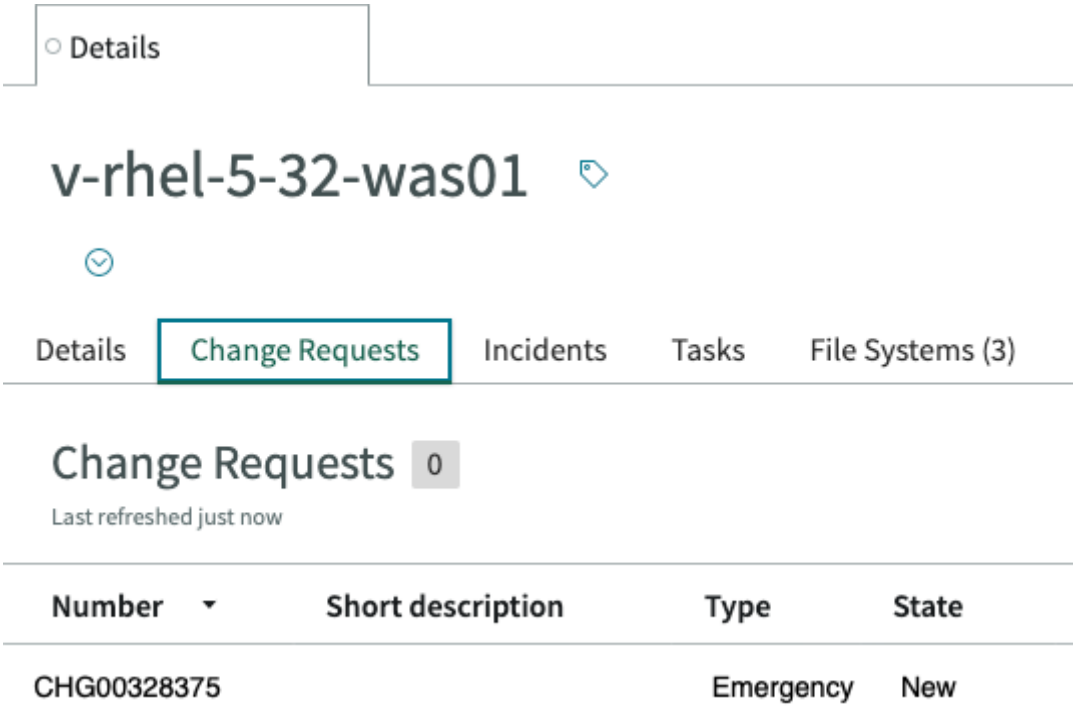
4. Click the CI name to open the form that displays information about the CI.

   In this example, the status of the server (on the **Details** tab) is **In Maintenance**. You can view the scheduled change request on the **Change Requests** tab (someone will reconfigure the CI).

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.



5. At this point, you should not modify the alert associated with this CI.
   You can open the change request to see if a schedule is attached, or coordinate with your team to find out when the CI will no longer be in maintenance.
6. After you verify that the **Status** field on the CI is not **In Maintenance**, open the alert again and clear the **Maintenance** check box.
7. Continue to triage the alert.

Adjust alert impact while triaging an alert

As an Event Management operator, you might need to modify the impact that an alert has on an application service and on the CIs in a service. Do this when you think that the impact does not accurately represent what you see in your network environment so other operators and administrators see the correct impact information.

Before you begin

Note:
The Operator Workspace interface is available only to customers who have upgraded from a release prior to the Utah release. New customers as of the Utah release can use the Service Operations Workspace for ITOM, which offers an enhanced UI for managing alerts.

Role required: evt_mgmt_operator

About this task

Before you make any modifications to impact calculations, make sure that you understand how the application services and the CIs actually function. You might need to perform tests on network infrastructure or contact someone who can.

Procedure

1. Navigate to **Event Management** > **Operators Workspace**.
2. Double click the name of the application service that has the alerts you want to modify.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

3. On the Details tab, click **Service Map**.
4. On the **Service Map** tab, click **Full Map** Tree.
5. On the map, click **Impact Tree**.
6. Analyze the application service to see whether the impact tree accurately reflects the impact of the alerts based on what you know about the CIs involved.

   In this example, a critical alert indicates a serious issue with a Linux server that is part of a Web portal application service.

   Notice that the impact on the Web portal itself is red, meaning critical, even though only one of the Linux servers that it relies upon actually has a critical alert. The other Linux Server does is not impacted by the alert. Assume for this example that the Linux servers perform different roles for the web service, and that even though **PS LinuxApp02** has a critical alert, the **PS LinuxApp01** server can adequately provide all the necessary services to keep the application service operational.

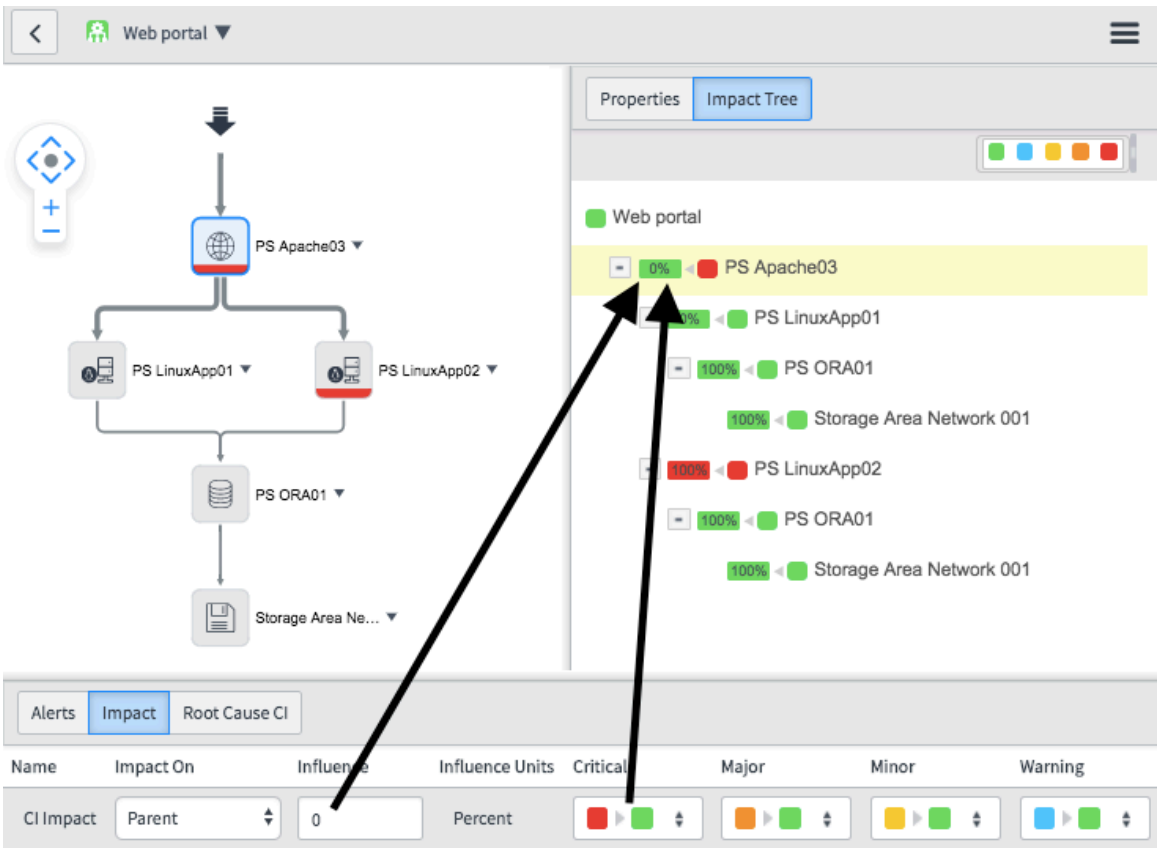
7. Click the **PS Apache03** CI, and then click **Impact** to display the impact rules for the CI. By default, the CI impact rule appears, showing you this information:

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- The **Impact On** and **Influence** columns show you that the CI (**PS Apache03**) should inherit 100% of the impact of all child CI impacts, which in this case includes the critical impact on the **PS LinuxApp02** server. This setting is why the **PS Apache03** web server, and the application service as a whole, inherits the impact 100%.
- The **Critical** column shows you that a critical alert (red) is inherited as critical alert (red).

8. Change the **Influence** value to 0 since the web server is still operational, and then change the **Critical** column to indicate that a critical impact status (red) should be inherited as a non-impact (green).
9. Wait for the dashboard to update automatically, or click **Event Management** > **Service Operations Workspace** and double-click the same application service to get an updated application service map.

   Notice that the influence on the Apache web server is 0% and the impact status is green. Also notice that the critical alert status (red) remains unchanged, even though the impact changed to green.



10. Navigate back to the Service Operations Workspace dashboard.
    Notice that the application service is now green, indicating that the overall application service is operational. The critical alert still displays at the bottom in the Alerts list, indicating that there is still an issue that you or other operators can address.

What to do next

Your administrator might configure additional impact rules that display when you click a CI in the application service map. You can make adjustments to the **Influence** fields on any impact rule to get the most accurate impact tree.

Event Management reference

Reference topics provide additional information about mapping and fine-tuning application services using Event Management lists and forms.

Components installed with Event Management

Activating the Event Management (com.glideapp.itom.snac) plugin adds several roles, scheduled jobs, and tables.

Note:
The Application Files table lists the components that are installed with this application. For instructions on how to access this table, see Find components installed with an application.

Roles installed with Event Management

Roles used by the Event Management application.

Event Management adds these roles.

Role title [name]	Description	Contains roles
Event Management Administrator [evt_mgmt_admin]	Has read and write access to all Event Management features to configure Event Management. **Note:** Exercise caution with the evt_mgmt_admin role, as it can be elevated to the admin role. A user with the evt_mgmt_admin role has the ability to add and modify scripts that run on a global scope. Ensure proper access control. With this role, the user can create and/or update the following scripts: • Alert correlation rules • Alert management rules • Maintenance rules • Advanced scripts • Event field mapping • Pre- and post-binding scripts	• evt_mgmt_user • template_editor_global
Event Management Operator [evt_mgmt_operator]	In addition to the evt_mgmt_user permissions, can also activate operations on alerts such as acknowledge, close, open incident, and run remediations.	evt_mgmt_user
Event Management User [evt_mgmt_user]	Has read access to all Event Management features. Has the itil role to be able to manage incidents that are created from alerts.	itil

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Role title [name]	Description	Contains roles
Event Management Integrator [evt_mgmt_integration]	Has create access to the Event [em_event] and Registered Nodes [em_registered_nodes] tables to integrate with external event sources.	

Scheduled jobs installed with Event Management

List of scheduled jobs that are provided with Event Management.

To review the list of scheduled jobs, navigate to **System Scheduler** > **Scheduled Jobs**. Event Management adds the following scheduled jobs.

Scheduled job	Description
Event Management — Connector execution job	Compares current time with time when active connector instances were last run and sets relevant connectors to execute. Runs every 10 seconds.
Event Management — Handle Impact Stuck Service	Releases stuck services and marks them as requiring rebuilding in the Impact Changes table to rebuild the impact tree. Runs every 2 minutes, 31 seconds.
Event Management — Impact Calculator Trigger	Trigger the impact calculation. The Event Management dashboard and impact tree are refreshed using the calculated figures. Runs every 6 seconds.
Event Management — Impact Topology Consumer	Consumes topology changes and marks the related services as 'require rebuilding' in the Impact Changes table to rebuild their impact trees. Runs every 19 seconds.
Event Management — Update stuck connectors	Release connector instances that are stuck. Runs every 2 minutes.
Event Management — Alert Priority Queue	Calculate alert priority. Two Alert Priority Queue jobs are active and available and can be run multi-thread. Runs every minute.
Event Management — Auto Close Alerts	Alerts that are idle longer than 7 days (default time period) are closed. Modify the default using the `evt_mgmt.alert_auto_close_interval` property. Runs every 10 minutes.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Calculate Alert Priority Grouping	Runs and calculates the priority groups: urgent, high, moderate and low for the alerts according to the highest and lowest priority score in the system. Runs every 30 minutes.
Event Management — Close Flapping Alerts	Close flapping alerts. Runs every 5 minutes.
Event Management — Close Threshold Alerts	Close threshold alerts. Runs every 2 minutes.
Event Management — Evaluate Scoped Alert Rules Management0	Execute alert management rules. Two separate jobs run to ease the load on the system. Runs every 11 seconds.
Event Management — Evaluate Scoped Alert Rules Management1	
Event Management — Filter Services for Impact - Queue Handler	Process changes from em_impact_inclusion_class and em_impact_filter_service. Runs every minute.
Event Management — Impact Tree Builder	Handles all services with changes from the em_impact_changes table and rebuilds their impact trees. Runs every 11 seconds.
Event Management — Insert Health Monitor	Job to produce the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Maintenance Calculator	Calculate the maintenance for CIs. Runs every minute.
Event Management — Node Count	Calculate license usage. Runs once every hour.
Event Management — Populate Impacted Services Table	Scan cmdb_ci_service_auto and copy all services to em_impacted_service, along with all related classes to em_impact_inclusion_class. Runs once after upgrade.
Event Management — Process Events	Job that runs and processes each Ready event (apply event rule, mapping rule, and create or update alert)

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
	Runs every 5 seconds.
Event Management — Process Metric Binding	Process metric binding. Runs every 5 seconds.
Event Management — Process Records in em_extra_data_json	Creates events for log analytics anomalies. Runs every 13 seconds.
Event Management — Queue Connector Processor	Bi-directional functionality. Processes all pending alerts in the Update Queue and sends them to the MID Server. By default, this dequeue process is performed in batches of 1,000 alerts. Runs every 30 seconds.
Event Management — Recalculate Impact for Groups	By default, this job is not active. Can be run on demand to correct the impact on service groups. Runs on demand.
Event Management — Recover Stuck Events	Handle all events that are in queued state and switch back to Ready to handle events from the beginning. Runs at system startup.
Event Management — Update Health Monitor	Update the **ServiceNow Event Management** application services. Runs once every hour.
Event Management — Update SLA Configuration Result	Synchronizes the CIs that match the SLA configuration filter with the Event Management SLA [em_ci_severity_task] table. Runs every 10 minutes.
Event Management — Update SLA Severity	Updates Event Management SLA [em_ci_severity_task] table with the new severity. Runs once every minute.
Event Management — Convert IT Service	Run this property on demand to convert manual services to application services. Runs every 30 minutes.
Event Management — Collect xmlstats	Collect event processing statistics. Runs once every minute.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Scheduled job	Description
Event Management — Impact Calculator for Alert Groups and SLA	Calculates the effect of alerts on alert group services.
Event Management — Manual Impact Calculator Trigger	Manually trigger of Impact Calculation on all operational Services.
4x Event Management — Impact Calculator for BS_0	Calculates the impact of alerts on application services, and builds the impact tree on the Event Management dashboard. Four separate jobs run to ease the load on the system.
4x Event Management — Impact Calculator for BS_1	
4x Event Management — Impact Calculator for BS_2	
4x Event Management — Impact Calculator for BS_3	
Event Management — Backfill Alert History table	Locates redundant records in the em_alert_history table and cancels them.
Event Management — Backfill Impact Status table	Locates redundant records in the em_impact_status table and cancels them.
Event Management — Impact for Groups	Calculates the impact of alerts on service groups.
Event Management — Clean Alert History Table	Cleans the Alert History (em_alert_history) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.
Event Management — Clean Impact Status Table	Cleans the Impact Status (em_impact_status) table by removing records more than 90 days old. You can customize the amount of time after which alerts are removed by configuring *evt_mgmt.impact_calculation.cleanup_age_sec* in the sys_properties.list table.

Event Management adds the following scheduled jobs to support alert aggregation and RCA.

Name	Description
Service Analytics Purge Old Observation Data — Daily	Cleans the staging data.
Service Analytics Prepare RCA Learner Input Data — Daily	Prepares RCA input data. Stores and probes MID Server to learn statistical information about alerts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description
Service Analytics group alerts using RCA/Alert Aggregation	Applies RCA and alert aggregation to open alerts and prepares automated alert groups.
Service Analytics Alert Aggregation Learner — Daily	Learns information about existing alerts and groups new open alerts.
Service Analytics RCA Configuration	Configures root cause analysis.
Service Analytics Check File System Space on Analytics MID — Daily	Checks disk usage on the dedicated MID Server, and generates an event if it exceeds the threshold set in the *sa_analytics.rca.mid_max_allowed_space* property.
Service Analytics Gather Value Report Data — Daily	Gathers data for the Value Report.
Service Analytics — Update virtual alerts for aggregation groups	Update the virtual alerts that were created to represent alert aggregation groups, with any changes to alerts belonging to that group. Runs every minute.
Service Analytics Attribute Populator for Historical Alerts	Populate attributes used in feature identifier for historical alert data using event rules. Runs on demand.
Event Management - Analytics Alert Syncer	Gathers alert data that is used by grouping job.

Properties for personalizing domain separation for Event Management connectors

Properties provide the metadata to identify the domain.

You can change the values if you want to use any other table or fields for domain identification but make sure that the table is domain separated.

Note:
When personalizing domain separation for event management connectors, all the properties can be overridden at the connector level as well.

There are three caches maintained for personalizing domain separation (main, user_access, missing_domain). You can create a few system properties to control them.

Default System Properties

Property	Description
evt_mgmt. connector_domain_info_table_name	The table where you store domain information for personalizing domain separation. • **Type**: string • **Default value**: core_company
evt_mgmt. connector_domain_info_column_name	The field name in the table to identify the provided domain for personalizing domain separation.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Default System Properties (continued)

Property	Description
	• **Type**: string • **Default value**: name
evt_mgmt. connector_domain_id_column_name	The field to get domain ID from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain
evt_mgmt. connector_domain_path_column_name	The field to get the domain path from for personalizing domain separation. • **Type**: string • **Default value**: sys_domain_path

Property	Description
evt_mgmt.connector_custom_domain_sep_cache_expire_in_seconds	For personalizing domain separation, if you don't want your main cache to expire every week.
evt_mgmt.connector_custom_domain_sep_user_access_on_domain_cache_size	For personalizing domain separation, if you want to increase the size of the user access cache.
evt_mgmt.connector_custom_domain_sep_missing_domain_cache_expire_in_seconds	For personalizing domain separation, if you want to increase the expire time for cache storing information regarding

ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Property	Description
	the missing domain.
evt_mgmt.connector_custom_domain_sep_cache_size	For personalizing domain separation, if you need more main cache size for storing domain information.

Tables installed with Event Management

Tables that are provided when Event Management is activated.

Event Management adds these tables.

Table	Description
Alert [em_alert]	Alerts that Event Management manage.
Alert Correlation Rule [em_alert_correlation_rule]	Rules specifying primary and secondary correlated alerts.
Alert Aggregation Group Alerts [em_agg_group_alert]	Stores alerts associated with aggregated alert groups.
Alert Aggregation Group [em_agg_group]	Relationships between aggregated groups and primary alerts.
Alerts History [em_alert_history]	History of alerts. Used for impact calculation.
Alert Rule [em_alert_rule]	Mappings of alert fields to the Incident [incident] table.
Alert Template [em_alert_template]	Alert templates. This table extends the Template [sys_template] table.
Event Management SLA [em_ci_severity_task]	Event Management SLA tasks for CIs and services.
Connector Definition [em_connector_definition]	Settings for gathering events from external event sources.
Connector Instance	Connection details for external event sources.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[em_connector_instance]	
MID Server to Connector Instance [em_connector_instance_to_mid]	Mappings of MID Servers to connector instances.
Event Management License Usage [em_unique_nodes]	When events are received by ITOM Health, an entry is added or updated in this table based on the monitored target specified in the received message. The entry links to its corresponding CMDB CI. If none is found, the entry is assigned *Type = Unknown*.
Event [em_event]	Events received by Event Management.
Event Filter [em_event_filter]	Storage for defined event filters.
Event Match Rule [em_match_rule]	Updated events for alert processing. Used by event rules.
Event Match Field [em_match_field]	Mappings of event fields to alert fields. Simple mapping. Used by Event Rules.
Event Compose Field [em_compose_field]	Mappings of event fields to alert fields. Composite mapping. Used by Event Rules.
Event Mapping Rule [em_mapping_rule]	Updated event fields for alert processing.
Event Processing Statistics [em_event_stats]	Statistics on Event Management performance.
Event Type [em_event_type]	Event types.
Task Template [em_incident_template]	Templates that define how to populate new tasks. For example, how fields of an incident that is being created from an alert, must be populated. This table extends the Template [sys_template] table.
Registered Nodes [em_registered_nodes]	Registered nodes data.
Threshold Rule [em_threshold_rule]	Alert threshold rules.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
Binding Device Map [Em_binding_device_map]	Event binding to network paths and storage paths.
Process to CI Type Mappings [Em_binding_process_map]	Event binding to specific processes.
CI Remediation [em_ci_remediation]	Remediation rule definitions.
Impact Graph [em_impact_graph]	Impact tree of CIs containing CI hierarchy and impact rules to be used for impact calculation.
Impact Graph History [em_impact_graph_history]	History of changes in impact tree.
Impact Rule Definitions [em_impact_rule_definition]	Definition of rules used for impact calculation.
Impact Rule instance [em_impact_rule]	Rules based on impact rule definitions.
Infrastructure Relations [em_impact_infra_rel_def]	Child-parent pairs or CI types. CIs matching these definitions are added to impact trees.
Impact Maintenance CIs [em_impact_maint_ci]	CIs that are in maintenance and therefore are excluded from impact calculation.
Impact Status [em_impact_status]	Calculated status of CIs and services to be displayed in the dashboard and service maps for dynamic CI groups.
SLA Configuration [em_sla_configuration]	SLA configuration records that identify the CIs that SLAs can run on.
Service Analytics Metric Type Registration [sa_metric_registration]	Source registration details for processing raw data.
Health monitor scripts [em_monitor_scripts]	These scripts determine how to monitor or check, for example, when using the Connectors Monitor script. You can create customized script to monitor a device or an entity. The scripts provided with the base instance are: • Check delay in event processing • Connectors Monitor

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
	• Get Event Processing state • MID Server Threshold Alerts
Monitoring configuration [em_monitor_conf]	Use this table to configure what to monitor according to the scripts that are listed. Configure how often to run each script. If a script has a threshold, it determines what alert severity to display. Threshold values are in units of minutes and specify the delay time. Navigate to **Event Management** > **Settings** > **Self-Health configuration** to see the list of Monitoring Configurations or to create a new one. Use this script to test Data Center Monitoring. The scripts provided with the base instance are: • Connector's idle state monitoring-monitor to verify whether any of the connectors was in idle state that surpassed the threshold [in minutes] that was configured. • Connectors Status- monitor to track the active status of the connectors. • Delay in event processing-monitor to track the duration [in minutes] of events that remained in 'ready' state and were not processed. • Event Processing job-monitors the state of the event processing jobs. • MID Server Threshold Alert-monitors MID Server health.
Monitoring Event Management Jobs [em_monitor_jobs_state]	Monitor Event Management jobs by adding the relevant jobs to the table. **Note:** The following jobs are not monitored by this table: • Event Management - Process Events • Event Management - Impact Tree Builder • Event Management - Recover Stuck Events • Event Processing
Monitoring state [em_monitor_state]	Use this table to set the threshold for each connector. When there is a value above the threshold, an alert is generated.
EM XMLStats Data [em_xmlstats_data]	Self-health statistics and diagnostic details for Metric Intelligence and Event Management, which are used to produce the XMLStats page.

Event Management adds the following tables to support alert aggregation and RCA.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
SA RCA Status [sa_rca_status]	Information (such as IDs) for the latest messages that were sent to the ECC Queue for a service during RCA.
SA RCA Output [sa_rca_output]	RCA learner output data.
SA RCA Group [sa_rca_group]	Automated alert groups for the RCA query.
SA Analytics Alert Staging [sa_analytics_alert]	Staging table for alerts used for analytics.
SA RCA Input [sa_rca_input]	Input data for the RCA learner.
SA Analytics Status [sa_analytics_status]	Last run information to be used for alert aggregation and RCA.
SA RCA Group Alert [sa_rca_group_alert]	Alerts associated with automated alert groups.
SA RCA Service Configuration Item Association [sa_rca_svc_ci_assoc]	Associations between CIs and services.
SA Alert Aggregation Learned Pattern [sa_agg_pattern]	Learned patterns from alert aggregation.
SA Alert Aggregation Learned Pattern Elements [sa_agg_pattern_element]	CI/Metric Name pairs associated with learned patterns.
SA Alert Aggregation Query Group Patterns [sa_agg_group_pattern]	Relationships between groups discovered in alert aggregation queries and patterns found in learning.
SA Alert Aggregation Query -- Staged (Recent) Alerts [sa_agg_group_alert_staging]	A staging table for alerts that have not yet been associated with any aggregated alert group.
SA Agg Pattern Attribute [sa_agg_pattern_attribute table]	CI/alert attributes to be used for finding patterns for alert aggregation.
SA Alert Attribute Populator Status	State and statistics for attribute populator job.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Table	Description
[sa_alert_attribute_populator_status table]	
SA Alert Aggregation Learned Pattern Elements Pair wise Mutual Information and Joint Probability [sa_agg_pattern_element_pair]	Pairwise probabilities for pattern elements.
EM Agg Group Prediction [em_agg_group_prediction]	Alert predictions for alert groups.

Event Management Platform Analytics Solutions

Platform Analytics Solutions contain preconfigured dashboards. These dashboards contain actionable data visualizations that help you improve your business processes and practices.

Platform Analytics Solutions

Platform Analytics data visualizations use Performance Analytics indicator data to show you data over time, helping you analyze your business processes and identify areas of improvement. With Platform Analytics Solutions, you can get value from Performance Analytics for your application with minimal setup. You can always create your own objects as well.

To enable the solution for Event Management, an admin can navigate to **Performance Analytics** > **Guided Setup**. Click **Get Started** then scroll to the section for Event Management. The guided setup takes you through the entire setup and configuration process.

Related topics

- Platform Analytics Solutions
- Activate your Performance Analytics subscription

Customize Performance Analytics widgets

Customize the appearance of widgets when viewing Performance Analytics visualizations.

Before you begin
Role required: user

Procedure

1. Navigate to **All** > **Performance Analytics** > **Dashboards**.
2. On the **Dashboards** page, select a dashboard to view.
3. Select the Sharing icon ( ) on the top right corner of the page.
4. Move to the top section of the relevant widget and select the Edit Widget icon ( ).
5. In the Edit Widget dialog box, configure the options.
   For details, see Performance Analytics Edit Widget dialog box.
6. Select **Done** in the Edit Widget dialog box.

What to do next
Users with the admin role can customize colors and fonts.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

- For more information on customizing colors, see Performance Analytics widgets.
- To customize fonts, navigate to **sys_ux_theme_property.list** and edit the applicable fonts.

Machine learning solutions for Event Management

Build solutions for Event Management with Predictive Intelligence.

Solution definition

Solution Definition for Event Management

Solution Definition	Description
Closed alert similarity	Closed alert similarity is a similarity solution definition that is used to recommend similar Alert records based on these fields: Description, Node, Resource, CI Type,Source, and Metric Name from the Alert [em_alert] table. Results are visible to users on the Alert form and on the Similar Alerts tab in Workspace.
EM Alert Clustering Solution	EM Alert Clustering Solution is a clustering solution definition used in Event Management. Allows building clustering models enabling identification of common text patterns in alerts to create alert groups. Text clusters are based on these fields: Description, Metric Name, Configuration Item Class from the Alert [em_alert] table.

Performance Analytics Edit Widget dialog box

Fields in the dialog box for editing a Performance Analytics dashboard widget.

Section	Description
Show real-time updates	Select for updates to appear in the widget in real-time.
Show	Select or clear the boxes to show or hide the following on the widget: • Border • Header • Title
Title alignment	Select the alignment of the widget title: • Left • Center • Right
Title color	Select to configure the color of the widget title.
Header color	Select to configure the color of the widget header.
Interactivity	Select from the displayed options.

Event Management MID Web Server extension form

Fields in the form for creating or modifying a MID Web Server extension.

MID Web Server Context form

Field	Description
Name	Unique name for the extension for easy identification.
Short description	Brief, meaningful description of the extension.
Status	This field is auto-populated with the status of the extension. The field is blank until the extension is started. After issuing a command to the extension, one of the following values is displayed: • Started: The extension is running. • Stopped: The extension is not running. • Offline: The MID Server is down. • Error: The extension failed with an error. The error message is displayed in the **Error Message** field. • Warning: A run-time exception has occurred. The extension continues to work.
HTTP/HTTPS Port	Port number the extension listens on for incoming requests.
Authentication Type	The available authentication types are: • **API Key** (default): Any client connecting to the extension must enter an API key into the request's authorization header. For details on viewing existing API keys, see Configure MID Web Server API key authentication. • **Keybased** (deprecated and kept only for compatibility with releases prior to the Yokohama release): The value in the **Secret Key** field is used to generate an authentication token sent in the **Authorization** header of incoming client requests. For details, see Configure key-based MID Web Server authentication. • **Basic**: Define a username and password in the **Basic Auth User** and **Basic Auth User Password** fields, which appear when selecting this option.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
	• **mTLS**: A certificate-based authentication that uses the TLS protocol. For details, see MID Web Server and agent mTLS Authentication.
Secret Key	The value generated when Keybased authentication is selected for the value in the Authentication Type field.
Basic Auth User	Username to be used when selecting Basic authentication.
Basic Auth User Password	Password to be used when selecting Basic authentication.
Secure Connection	Option to indicate that the extension is to use the TLS protocol to encrypt incoming connections. A certificate and private key combination must also be provided to the extension. When selecting this option, the **MID Server Unified Keystore** check box appears.
Use MID Unified Keystore	Option for using the MID Server Unified Keystore option for a secure connection. Clear this option to use **Web Server Keystore**. For details, see Configure a secure MID Web Server extension.
Keystore Certificate Alias	The alias name of the keypair inside the selected keystore that the extension uses to establish a secure connection. Leave this field empty to use the default alias when using the MID Unified Keystore or when using the Web Server Keystore with a single alias.
Keystore Password	The password for the Web Server Keystore when it is used to establish a secure connection.
Keystore Key Password	The password of the private key entry mapped to the specified alias of the Web Server Keystore. This field can be left empty if the password matches the entry in the Keystore Password field.
Truststore Password	The password to the truststore that holds the Certificate Authority (CA) certificates used to validate the signatures of the client certificates. Appears when the **mTLS** authentication type is selected.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

MID Web Server Context form (continued)

Field	Description
	Leave this field empty if the extension is configured to use the cacerts truststore of the JRE running the MID Server.
Error Message	Message describing any error that causes a command, such as Start or Stop, to fail. This field appears only when the value in the Status field is Error.
Execute on	Location for running this extension. The available options are **Specific MID Server** or **Specific MID Server Cluster**.
MID Server	Depending on your selection in the **Execute on** field, the name of the designated MID Server or MID Server cluster. • If you selected **Specific MID Server**, the name of the designated MID Server. • If you selected **Specific MID Server Cluster**, the name of the designated MID Server cluster.
Executing on	Displays the name of the MID Server on which the extension is running even if the MID Server is down. If the user stops the extension, this field is empty.

Event Management tag based alert clustering tag form

The form for creating or modifying a tag based alert clustering tag displays detailed information about the tag.

Tag based alert clustering tag form

Field	Description
Name	Name of the clustering tag. Defaults to a description of the configured tag (such as, **Exact match on Alert Field "metric name"**). The default name is visible only after saving the tag. Tag names must be unique.
Customized name	Select the check box to customize the value in the **Name** field.
Domain	The domain in which the current record was created. Read-only.
Description	Enter an optional description of the tag.
Source	Select the source from which to choose the field to be matched.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering tag form (continued)

Field	Description
	• **Alert field** • **Alert additional info** • **Alert CI** • **Alert CI key** • **Alert tags** If you select **Alert additional info**, choose an **Additional Info Key** instead of a field. **Alert additional info** is a field on alert containing the key value pair in Jason format and we can use a specific key. **Alert CI key**: Create CMDB key values to cluster alerts based on CMDB Key Values [cmdb_key_value] table. Key values provide an additional method for determining commonalities between alert CIs.
Selected field	Indicate the field that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert Field** or **Alert CI** in the **Source** field. If you select **Alert CI** in the **Source** field, you need to select a CMDB key. A CMDB key is assigned to the CI of the alert.
Key	Indicate the Key that has to match between alerts for the alerts to be included in a group. Appears when you select **Alert additional info** in the **Source** field, or appears when you select **Alert tags** in the **Source** field. When **Alert additional info** is selected, enter the name of one of the fields in the additional info field. When **Alert tags** is selected, enter the name of the relevant alert tag.
CMDB key	Indicate the CMDB key to match for the alerts to be included in a group. Appears when you select **Alert CI Key** in the **Source** field.
Match method	Select the type of match required for the alerts to be included in a group.

Tag based alert clustering tag form (continued)

Field	Description
	• **Exact**: Indicates that the field value must be an exact match for the alert to be included in a group. For example, you can configure an alert clustering tag indicating that the alert's **Metric name** field must be an exact match to form a group. When invoking that tag, all alerts with identical values in the **Metric name** field are included in the same group. • **Fuzzy**: Indicates that the field value needs to be an approximate match (depending on the value configured in the **Similarity** field) for the alert to be included in a group. • **Pattern**: Indicates that the field value needs to follow the pattern in the **Pattern** field. For correct syntax and usage examples, see Pattern matching.
Similarity	Specify the similarity percentage that must be met by the alerts to be included in a group. For example, entering 50 indicates that at least 50 percent of the indicated value must appear in the alert for the alert to be included in the group. Appears only when **Fuzzy** is selected as the **Match Method** value. Default value = 90

List of predefined alert clustering tags

A list of the predefined alert clustering tags provided with the Tag Based Alert Clustering Engine # application.

Predefined alert clustering tags

Name	Source	Match method
CI	em_alert.cmdb_ci	Exact match
Description	em_alert.description	Exact match
Metric Name	em_alert.metric_name	Exact match
Node	em_alert.node	Exact match
Resource	em_alert.resource	Exact match
Source	em_alert.source	Exact match
Source instance	em_alert.event_class	Exact match

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Predefined alert clustering tags (continued)

Name	Source	Match method
Type	em_alert.type	Exact match
Assignment group	em_alert.assignment_group	Exact match
CI Class	cmdb_ci.sys_class_name	Exact match
Dns domain	cmdb_ci.dns_domain	Exact match
ip address	cmdb_ci.ip_address	Exact match
Location	cmdb_ci.location	Exact match
Environment	cmdb_ci.environment	Exact match
CI name	cmdb_ci.name	Exact match
Namespace	cmdb_ci.namespace	Exact match

Predefined tags extracted from connector payload

Name	Description	Default mapping from CMDB
t_ip_address	IP address	cmdb_ci.ip_address
t_application	Application	-
t_region	Region	-
t_location	Location	cmdb_ci.location
t_environment	Environment	cmdb_ci.environment
t_namespace	Namespace	cmdb_ci.namespace

Event Management tag based alert clustering definition form

The form for creating or modifying a tag based alert clustering definition displays detailed information about the definition.

Tag based alert clustering definition form

Field	Description
Name	Name of the alert clustering definition. Definition names must be unique.
Active	Select to activate the definition. This option is selected by default.
Order	The order by which definitions are tested for incoming alerts. Those with lower Order values are tested first. When an alert matches one of the definitions' filters, it continues searching for more definitions. Default value = 1000

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
Domain	The domain in which the current record was created. Read-only.
Assignment group	Assignment group that works on the alert. If no assignment group is defined in the alert rule, then this alert rule is considered as a global rule. When the rules are running – first the global rules run and then the rules that belong to the assignment group of the alert.
Description	Enter an optional description of the alert clustering definition.
Filter	Set conditions that incoming alerts must meet to be measured by the alert clustering definition's tags. If the tags correspond to alerts that exist in the system and are within the **Clustering timeframe (minutes)** value, the incoming alerts join with the existing alerts to form an alert group. After configuring the filter, you can click the **Preview** button to view how many existing alerts match the filter's condition. **Note:** • Matching alerts are not automatically included together in an alert group. Alerts are grouped only if they have corresponding alert clustering tags. • Filter parameters are case sensitive by default. To disable case sensitivity, set the *sa_analytics.correlation_case_sensitive* parameter to **false**. • You can also configure alert fields to be excluded from the search, using the *sn_em_tbac.tag_excluded_alert_fields* property. By default, the following are excluded by this property: ○ type ○ event_class
Override group description	Default group descriptions begin with a "Group of alerts" prefix, followed by the description of the primary alert in the group. You may override this group description by selecting the **Override group description** check box. Then, in the **Custom description**

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Tag based alert clustering definition form (continued)

Field	Description
	field, type a description. This description is used as the description of the groups that are created by this alert clustering definition. **Note:** You cannot save the form if you left the Custom description field blank or with the default 'Group of alerts' text.
Clustering timeframe	The maximum time, in minutes, allowed between the first alert and subsequent alerts for them to be grouped together. For example, a value of 60 indicates that any alert generated within 60 minutes of the first alert in the group (the oldest alert) is included in the alert group. Any alert generated after this 60-minute window from the initial alert is not included in the group. Permitted values = 0-1440
Tag Based Alert Clustering Definitions Tags M2M	Select the alert clustering tags to be assigned to the alert clustering definition. Alerts that meet the criteria specified in the selected tags are included in the alert group. The available options are the tags created on the **Tag Based Alert Clustering Tags** page.

List of predefined tag-based alert clustering definitions

A list of the predefined alert clustering definitions provided with the Tag Based Alert Clustering Engine#application.

Predefined alert clustering definitions

Name	Description	Order
Group alerts from the same Application	Group all alerts from the same application, created in the last 10 minutes. In new systems, this definition is activated by default.	9010
Group all alerts from the same IP address	Group all alerts from the same IP address, created in the last 10 minutes.	9020
Group all alerts from the same Namespace	Group all alerts from the same namespace, created in the last 10 minutes. In new systems, this definition is activated by default.	9030
Group all alerts from the same Subnet	Group all alerts from the same subnet, created in the last 10 minutes. In new systems, this definition is activated by default.	9040

Predefined alert clustering definitions (continued)

Name	Description	Order
Group alerts from the same CI class and Location	Group all alerts from the same CI class and location, created in the last 10 minutes.	9050
Group alerts from the same Application and Environment	Group all alerts from the same application and environment, created in the last 10 minutes.	9060
Group all alerts from a similar Node	Group all alerts from a similar node name, created in the last 10 minutes.	9070
Group alerts from the same Location and Assignment group	Group all alerts from the same location and assignment group, created in the last 10 minutes.	9080
Group alerts from the same Region and Metric	Group all alerts from the same region and metric, created in the last 10 minutes.	9090
Group alerts from the same CI class and Metric	Group all alerts from the same CI class and metric, created in the last 10 minutes.	9100
Group alerts from the same Node and Metric	Group all alerts from the same node and metric, created in the last 10 minutes.	9110
Group alerts from the same Assignment group and Class	Group all alerts from the same assignment group and class, created in the last 10 minutes.	9120
Group alerts from the same Type, Metric and Source	Group all alerts from the same type, metric, and source instance, created in the last 10 minutes.	9130
Group alerts from the same CI	Group all alerts from the same CI, created in the last 10 minutes. **Important:** When this rule is active, CMDB grouping must be disabled.	9140
Group alerts from the same Node	Group all alerts from the same node, created in the last 10 minutes. In new systems, this rule is activated by default.	9150

Domain properties installed with Event Management

Use the domain properties installed with Event Management to provide the metadata that points to the appropriate table to identify the domain so that you know which domain to create the event in.

Default domain metadata properties

Property
evt_mgmt. connector_domain_info_table_name
evt_mgmt. connector_domain_info_column_name

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.

Default domain metadata properties (continued)

Property
evt_mgmt. connector_domain_id_column_name
evt_mgmt. connector_domain_path_column_name

Connector domain metadata

Override push connector default domain metadata values installed with Event Management with the values in the event HTTP request, including the URL, headers, request body (payload), and connector parameters. Override pull connector domain metadata values with connector parameters only.

Domain metadata parameters

Name	Description	Overrides System Property
connectorDomainInfoTableName	Name of the table containing the records with the domain information.	evt_mgmt.connector_domain_info_table_name • **Type**: string • **Default value**: core_company
connectorDomainInfoColumnName	Name of the column that has a value that should be matched with the domain identifier. For example, you might want to identify a record in the Domain Info table that has a matching value in the **company_name** field.	evt_mgmt.connector_domain_info_column_nar • **Type**: string • **Default value**: name
connectorDomainIdColumnName	Name of the table column that stores the domain ID.	evt_mgmt.connector_domain_id_column_name • **Type**: string • **Default value**: sys_domain
connectorDomainPathColumnName	Name of the table column that stores the domain path.	evt_mgmt.connector_domain_path_column_na

Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Name	Description	Overrides System Property
		• **Type**: string • **Default value**: sys_domain_path

Order of preference for accessing domain metadata

You must provide domain metadata to configure personalized push connector domains. The metadata in preferred accessing order are:

1. Push connector parameters
2. URL query parameters
3. HTTP headers
4. Request body (payload)
5. Default system properties

URL query parameters

Push connectors have the following URL syntax:

- Instance Type: `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>`
- MID Server type: `http://<MID_Server_IP>:<MID_Web_Server_Port>/api/mid/em/inbound_event?Transform=<connector-transform-script-name>`

You can include domain metadata as additional query parameters in the ServiceNow push connector webhook URL. For example, if the domain information source is the sys_user table, the URL could be `https://<instance-name>.service-now.com/api/sn_em_connector/em/inbound_event?source=<connector-source>&connectorDomainInfoTableName=sys_user`

Request headers

Any of the domain metadata properties can be passed as part of HTTP request headers. Check the documentation from your third-party monitoring tool for information about how request headers are set.

Request body (payload)

You can reference domain metadata from the request body (JSON payload) by setting the metadata parameters as root-level keys in the payload. The following example shows how the *connectorDomainInfoTableName* and *connectorDomainInfoColumnName* parameters might be passed as part of the request body:

```
{
    “source”: “Azure Monitor”,
    “host”: “127.0.0.1”,
    “company”: “ServiceNow”,
    “connectorDomainInfoTableName”: “sys_user”,
```

"connectorDomainInfoColumnName": "first_name"

}

Note:
For information on connector parameters, see Personalize domains for push connector events to use in event creation.

Dynatrace connector instance form

The Dynatrace connector instance form displays the fields you must fill in when creating a Dynatrace connector instance.

Connector instance page

Field	Description
Name	Unique name for the Dynatrace metric connector instance.
Description	Description for the use of connector instance.
Connector Definition	The connector definition to be used by the connector. Select **Dynatrace Metrics**.
Host IP	Hostname/IP address of the Dynatrace server.
Credential	Select the search icon and select the existing API key credential. If this credential does not exist, create a new credential, as follows: **1.** Ensure that you have an access token with Read Metric (metrics.read) permissions, created on the Dynatrace UI. **2.** Select **New** after selecting the search icon. **3.** Select **API Key Credentials**. **4.** In the **API Key** field, enter the access token from the Dynatrace UI. **5.** In the **Name** field, enter a descriptive name to uniquely identify the credential. **6.** Fill in any other relevant fields, and select **Submit**.
Metric collection	Selected by default. Read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the metric connector pulls metrics from the Dynatrace server. Default: 60.
Active	Select to activate the connector instance.

Dynatrace connector instance value parameters

The following table displays the Dynatrace connector instance value parameters that you can fill in, as needed, when creating a Dynatrace connector instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
initialSyncInMins	Number of minutes before the current time that the initial metric collection runs. For example, if the value is 15, the connector fetches metrics from the past 15 minutes. Default: 15
logPayload	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default: false
maxMetricsPerQuery	Maximum number of metric ids to query per API call to Dynatrace. The value cannot exceed 32, the maximum limit allowed by Dynatrace. Default: 32
pageSize	Maximum number of records to return in an API response from Dynatrace. Default: 500
port	Port number for the Dynatrace server to connect to. empty
protocol	Protocol to use when connecting to the Dynatrace server. Default: https
throttleApiCalls	Determines whether throttling is enabled. When enabled (**true**), a limit is set on the number of API calls to Dynatrace per minute. Default: false
requestPerMinute	The limit on number of API calls to Dynatrace per minute. Relevant only when *`throttleApiCalls`* = **true**. Default: 1000

Push connector instance form

Push Connector Instance form displays the fields that you must fill when you create or modify a connector.

Field	Description
Name	A unique name for the connector instance record, such as the name of an event source host.
Description	Any optional information that the administrator wants to use to identify this record.
Push Connector definition	Select the definition for the external system from which you want to receive events. You can select any existing definition, for example: • Thousandeyes • Dynatrace • Catchpoints For a list of the connector definitions available in the base system, see Configure Event Management connectors. **Note:** If there are available configuration parameters for the push connector type you select, they appear under Push Connector Instance Configuration Parameters.
MID Server	It shows the list of MID Servers that has at least one MID Server Event Listener context up and running. The MID Server section appears only when the MID type of definition is selected.
URL	This field is auto-populated only after saving the details of the connector instance. Instance: The URL has to be configured in an external system with the ServiceNow credential having a evt_mgmt_integration role to receive the events. MID push connector instance: The URL has to be configured from an external system with Configure the MID Web Server extension credential to receive the events.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Field	Description
	This field appears only after the form has been saved.
Active	Select this check box to enable receiving the events from this external event source. This field appears only after the form has been saved.

Nagios connector instance value parameters

The following table displays the Nagios connector instance value parameters that you can fill in, as needed, when creating a Nagios connector instance.

Connector instance value parameters

Parameter	Description
debug	Set to **true** to enable debug logs. Default: false
max_fetch_interval_min	Limits metric history retrieval to prevent system overload. Default: 180 minutes
offset_min	Adds a small time buffer to ensure no metrics are missed. Default: 5 minutes

Nagios connector instance form

The Nagios connector instance form displays the fields you must fill in when creating a Nagios connector instance.

Connector instance page

Field	Description
Name	Unique name for the Nagios metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Nagios Metrics**.
Metrics database host	Host IP address of the host where the Nagios server collects metrics.
Metrics database credentials	Credentials required to access the Nagios database.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Nagios server. Default: 60 seconds.
Active	Option to activate the connector instance.

Zabbix connector instance form

The Zabbix connector instance form displays the fields you must fill in when creating a Zabbix connector instance.

Connector instance page

Field	Description
Name	Unique name for the Zabbix metric connector instance.
Description	Brief explanation of the purpose or use of the connector instance.
Connector Definition	Connector definition to be used by the connector. Select **Zabbix Metrics**.
Host IP	Host IP address of the host where the Zabbix server collects metrics.
Credential	Credentials required to access the Zabbix database. Select the search icon and select the Basic Auth credential. • Name: Provide the unique name for Zabbix cred. • UserName: Provide Zabbix server username • Password: Provide Zabbix server password • Select **Submit**.
Metric collection	Option is pre-selected and read-only.
Metric collection schedule (seconds)	Time interval (in seconds) at which the connector retrieves metrics from the Zabbix server. Default: 60 seconds.
Active	Option to activate the connector instance.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Zabbix connector instance value parameters

The following table displays the Zabbix connector instance value parameters that you can fill in, as needed, when creating a Zabbix connector instance.

Connector instance value parameters

Parameter	Description
api_endpoint_suffix	Set this value based on your Zabbix server web interface installation: https://www.zabbix.com/documentation/current/en/manual/installation/frontend#welcome-screen Default value: /zabbix/api_jsonrpc.php [For Apache Server]
debug	Set to **true** to enable debug logs. Default value: false
enable_batch_processing	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: false
groupids	Provide the host group IDs. These IDs will be used to fetch metrics from the hosts attached to the specified groups. This applies only if `enable_batch_processing` is set to true.
logPayloadForDebug	Determines whether to print the raw log payload. Set to **true** only for debugging purposes, as printing the raw payload quickly fills up the MID Server logs. Default value: false
max_fetch_interval_min	Configured from the 'max_fetch_interval_min' parameter: If the time exceeds 'max_fetch_interval_min', fetching starts from 'max_fetch_interval_min' before the current time; for an INITIAL run without 'lastMetricSignature', the time is set to 'max_fetch_interval_min' before the current time. Default value: 180 minutes
max_hosts_per_batch	If batch processing is enabled, metrics details are fetched in batch with 1000 (can be altered by setting appropriate value to - 'max_hosts_per_batch' parameter) hosts per batch. Default value: 1000
offset_min	Specifies the time offset in minutes for adjusting the fetch start time relative to the current time. Default: 5 minutes
port	Port number for the Zabbix server to connect to.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries.
Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance value parameters (continued)

Parameter	Description
	Default value: empty
protocol	Protocol to use when connecting to the Zabbix server. Default value: http
with_triggers	It will fetch the trigger information. Default value: false

Note:
When monitoring a large number of hosts in Zabbix, fetching massive metric data can impact performance and cause API timeouts; enabling batch processing (enable_batch_processing = true) mitigates this by fetching metrics in batches (default: 1000 hosts, configurable via *max_hosts_per_batch*), though it increases network calls and must be used when monitoring 10,000+ hosts or facing performance issues.

SCOM connector instance form

The SCOM connector instance form displays the fields you must fill in when creating a SCOM connector instance.

Connector instance page

Field	Description
Name	Unique name for the SCOM connector instance.
Description	Description for the use of the SCOM event collection instance.
Active	Select to activate the connector instance. Appears only when selecting a connector instance that has already been created.
Connector definition	The vendor and protocol used to gather events from the external event source. For a regular SCOM connector, select **SCOM**. For a connector instance that you want to monitor metrics, select **SCOM Metrics**. When selecting this option, the fields in the **Connector instance - metrics fields** table appear.
Assignment group	Select the group to whom the connector instance is assigned. For example, this may be a group of administrators or a support group.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Host IP	Specify the SCOM IP address. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Credential	Select Windows credentials. **Note:** When configuring Windows credentials, if the credential applies to specific MID servers, ensure that the MID Servers you specify on the credential record match the MID Servers specified in the **MID Servers for Connectors** section on the Connector Instance form. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection last run time	The last event collection run time value updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last event collection status	The last event collection run time status updates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Event collection schedule (seconds)	The frequency in seconds that the system checks for new events from SCOM Operations. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Bi-directional	Select to invoke the bi-directional option. This option enables the bi-directional exchange of values to-and-from the external event source. There is default implementation for SCOM. The **Last bi-directional status** option displays only when this option is selected. This field does not appear when **SCOM metrics** is selected as the Connector definition.

© 2025 ServiceNow, Inc. All rights reserved.
ServiceNow, the ServiceNow logo, Now, and other ServiceNow marks are trademarks and/or registered trademarks of ServiceNow, Inc., in the United States and/or other countries. Other company names, product names, and logos may be trademarks of the respective companies with which they are associated.

Connector instance page (continued)

Field	Description
Last bi-directional status	The value of this field populates automatically. This field does not appear when **SCOM metrics** is selected as the Connector definition.
Last error message	The last error message field is automatically updated. This message is the last error message received by the connector. If the test connector fails, an error message is displayed in this field. This field does not appear when **SCOM metrics** is selected as the Connector definition.
MID Servers (MID Server for Connectors section)	Specify one or more MID Servers that are up and valid. MID Servers sort according to the order that their details were entered into the MID Server for Connectors section. The port requirement from the MID Server to the SCOM server is `1433`. If the specified MID Server is in a cluster, it may not be selected and another available MID Server is selected in its place. Ensure that the specified MID Servers match the MID Servers specified on the Windows Credentials page, as the connector uses Windows credentials to access MID Servers. If no MID Server is specified, an available MID Server that has a matching IP range is used.
